hampered in their development by a qualifying phrase of this kind in the policy. I feel that there are ample checks and balances for controlling an unrealistically expanded military program in the present setup of the Council. I also feel that the military part of the program is of greatest importance.”

b. Mr. Burden also expressed himself as follows: “I have also been troubled for a long time by the phrase in the present NSC paragraph that the ‘United States is a *recognized leader* in this field.’ It does not seem to me that this is a strong enough. If there are only two major powers in the race, what does a “recognized leader” really mean? I would suggest some language along the following lines:

“The United States should continue actively and with a sense of urgency to pursue programs to develop and exploit outer space as necessary or desirable to insure the attainment of national objectives and the achievement of scientific, military and political purposes. These programs and the national policy should be designed to secure and maintain a national position of supremacy, or at the minimum, equality, in outer space.”

c. Dr. Waterman has suggested that objectives (1) and (3) read as follows: “(1) A broad-based scientific and technological program for the development and scientific exploitation of space flight and planetary-interplanetary exploration;” and “(3) a civil space program designed to develop and promote the peaceful use of outer space;”

3. The point made by Mr. Burden and repeated in the foregoing item 2-b is so fundamental that it should be discussed at a meeting of the NASC. I suggest therefore, that if this part of the paragraph is approved as now drafted, it be done with the understanding that the NASC will consider this matter at its meeting on June 29 and possibly on June 30.

4. We appreciate the opportunity to make these comments on that portion of the basic national security policy that is of such direct concern to the NASC.

/S/ Franklyn W. Phillips
Acting Secretary

166. Memorandum From the JCS to Secretary of Defense¹

JCSM-239-59

Washington, June 20, 1959

SUBJECT

Basic National Security Policy (NSC 5906) (U)

1. The Joint Chiefs of Staff submit herewith their views regarding a draft statement of policy on the above subject prepared by the National Security Council Planning Board for consideration by the National Security Council at its meeting on 25 June 1959.

2. The *majority* view submitted by the Chief of Staff, U.S. Army, the Chief of Naval Operations, and the Commandant of the Marine Corps, with specific regard to paragraphs 3, 10, 12, 15 and 16 is attached as Appendix "A". The minority view on these same paragraphs submitted by the Chief of Staff, U.S. Air Force is attached as Appendix "B".

3. The Joint Chiefs of Staff are in agreement that you should:

a. Support the Planning Board majority view on the following paragraphs: 5, 13, 17, 42*b*, 43*c*, 44, 57 and 62.

b. Support the Defense-JCS proposal in paragraph 23.

c. Support the Department of State proposal on page 29, paragraph 38 and the majority proposal on page 30, paragraph 38*d*.

d. Support the State-Defense-JCS proposal on paragraph 39.

e. Support State-Defense proposal in paragraph 43*f*.

f. Support the Defense-Treasury-Budget-CEA proposals in paragraph 55.

g. Note the understanding of the Joint Chiefs of Staff that paragraph 58 will be the subject of separate NSC action and that the views of the Joint Chiefs of Staff on the subject are in preparation and will be furnished to you by separate memorandum.

For the Joint Chiefs of Staff:

Arleigh Burke
Chief of Naval Operations

OPERATIONS; AND THE COMMANDANT OF THE MARINE CORPS*

on

BASIC NATIONAL SECURITY POLICY (NSC 5906) (C)

1. The Chief of Staff, U.S. Army; the Chief of Naval Operations; and the Commandant of the Marine Corps have reviewed the draft statement of policy (NSC 5906) prepared by the National Security Council Planning Board for consideration by the National Security Council at its meeting on Thursday, 25 June 1959.

2. In the past, the United States has assumed that possession of the nuclear deterrent would severely curb the scope of USSR military actions in conflict short of general war. This assumption was based on our possession of the sole capability to employ massive nuclear retaliation at a time of our choosing should a situation get out of hand. Even though there may have been questions in the minds of many as to what circumstances would be critical enough to evoke a nuclear reaction from the United States, the United States did have the known capability to employ a nuclear attack without receiving unacceptable damage in return. Possession of this capability gave confidence to our allies and inhibited the USSR. With the removal of this inhibition due to their achievement of a capability to launch a crippling attack against the United States, Soviet actions can be expected to become more aggressive and venturesome, including resort to limited wars of increased scope and severity. On the other hand, our allies have already shown signs of a decreasing confidence in our ability to provide a meaningful security to the Free World. Therefore, the Chief of Staff, U.S. Army; the Chief of Naval Operations; and the Commandant of the Marine Corps believe that present Basic National Security Policy is not responsive to the present or prospective world situation. They, therefore, hold that the military strategy outlined in NSC 5906 should be changed.

3. U.S. military strategy should be designed to cope with a condition of relative nuclear parity, in which it is recognized that general war will result in mutual devastation. To do so, it must provide not only for an evident, secure nuclear retaliatory capability and an acceptable doctrine for its use, but it must also provide an evident, adequate and

flexible capability for military operations short of general war and an acceptable doctrine for the use of that capability against the full range of possible Communist aggressions. The former is a primary requirement, but its existence does not meet the total threat to our security. In a time of relative nuclear parity, the ability to conduct operations short of general war is of increasing importance. The deterrence of limited Communist aggression, and Free World confidence that such aggression will be deterred will depend more and more on the strengthening of U.S. limited war capabilities. The United States should possess a capability and a doctrine which are flexible enough to enable it to deter or to defeat limited Communist aggression with the degree of force necessary to achieve the objectives of the United States at the time. Three issues are fundamental to the necessary revision of our military strategy:

a. Relationship Between Strategy and Policy Objectives. U.S. strategy must serve our national policy objectives of maintaining the cohesion of the Free World and influencing the policies of the Communist Bloc in directions compatible with U.S. security interests. This strategy must also provide definitive terms of reference which will permit a measurement of adequacy of retaliatory and defensive forces, thus facilitating the allocation of resources among the various elements which make up the total U.S. military posture.

b. Nuclear Weapons Policy. Relative nuclear parity has already made the policy of massive retaliation unacceptable as anything but a deterrent to total nuclear warfare. Therefore, the United States can no longer place main reliance on nuclear weapons for other forms of conflict, and must maintain forces capable of reacting to limited aggression with nuclear and/or non-nuclear means, whichever is in the best interests of the U.S. in the situation then existing.

c. Limited War. With regard to limited war, it is necessary that no restriction be placed, by definition, on the locale, intensity, duration, or participants. In effect, limited war is recognized as any armed conflict short of general war.

4. The military elements of national strategy, as outlined in NSC 5906 (majority view), do not provide for the flexibility and range of response essential to U.S. security in a time of relative nuclear parity. Additionally, they do not fulfill the Foreign Policy Requirements considered by the Secretary of State to bear upon U.S. strategy. These elements permit an interpretation which places undue reliance on nuclear weapons to a degree incompatible with the Foreign Policy Requirements. Further, they define limited war in a manner which will prevent the U.S. developing the capabilities necessary to a broad range of response to limited communist aggressions. Modification of certain paragraphs will, however, correct these deficiencies and provide a military strategy which is realistic, and is responsive not only to foreign policy requirements, but also to the threat as discussed in the version of paragraph 3 which is supported by the majority of the NSC Planning Board.

5. In view of these considerations and the additional reasons noted in the Annex hereto, it is recommended that you concur with the changes to paragraphs 10, 12, and 16 of NSC 5906 which have been suggested by the Department of State. It is further recommended that you continue to support the majority proposal for revision of paragraph 3, NSC 5906, and support the version of paragraph 15, NSC 5906 proposed in subparagraph d of the Annex hereto.

Annex to Appendix A

It is recommended that with respect to the following portions of NSC 5906, the Department of Defense adopt the position indicated below:

a. Page 3, Paragraph 3—Continue support of the majority proposal.

REASON: The majority proposal is a clear and complete description of the basic threat. Further, it emphasizes flexibility of the threat posed by the hostile Soviet and Chinese Communist regimes, and the dangers of gradual erosion of the Western position.

b. Page 10, Paragraph 10—Support the State-AEC proposal.

REASON: There is currently no definition of general war in the policy. The definition the Department of State proposes to incorporate in paragraph 10 is realistic in a time of relative nuclear parity and will provide the necessary flexibility.

c. Page 11, Paragraph 12—Support State OCDM proposal.

REASON: It is essential that U.S. policy in an era of relative nuclear sufficiency be flexible and provide for the application in each situation of whatever forces and weapons or mix of weapons best serve U.S. interests. The United States must not be programmed into a one weapon military posture which will allow it to respond to limited aggression—be that aggression large or small—only by initiating or threatening to initiate large scale nuclear warfare. The majority proposal with its “main” reliance upon nuclear weapons, regardless of the types of conflict, is inconsistent with the majority proposal on paragraph 3, which recognizes the possibility of serious differences in outlook and policy among Free World nations on the use of nuclear weapons. The present degree of U.S. reliance on nuclear weapons, particularly for meeting or deterring limited aggression, disturbs large segments of the Free World and impedes the fulfillment of our national policy objective of maintaining the cohesion of the Free World. This condition further substantiates the need for a more flexible national policy concerning the employment of nuclear weapons.

d. Page 12, Paragraph 15—Delete and substitute:

“15. So long as the Soviet leaders are uncertain of their ability to neutralize the U.S. nuclear retaliatory power, there is little reason

to expect them deliberately to initiate general war or to take actions which they believe would carry appreciable risk of general war, and thereby invite destruction. Therefore, in carrying out the central aim of deterring general war, the United States must develop maintain, and secure, as part of its military forces, sufficient nuclear retaliatory capability to reduce the Soviet power complex to impotency. Security of our nuclear retaliatory forces is essential to permit reasonable size and to lessen the need for their immediate or automatic release in order to avoid their destruction. The United States must also develop and maintain adequate military and non-military programs for continental defense. The national effort devoted to continental defense should provide for early warning and defense of retaliatory forces. It should also provide a level of defense in vital areas sufficient to require a significant enemy effort to counter it, leaving no single threat totally unopposed."

REASON: The above proposal provides specific terms of reference against which the adequacy of the retaliatory and defensive elements of the deterrent can be measured and will facilitate the difficult decisions concerning the allocation of resources among the various types of forces which make up the total U.S. military posture. Until some rational limit can be placed on the size of the retaliatory force the continued and unlimited expansion of such forces will absorb resources sorely needed to develop other forces designed to provide essential flexibility of response.

e. Page 13, Paragraph 16—Support the State proposal which is reproduced on pages 61 and 62 of the Annex to NSC 5906.

REASON: The State proposal properly emphasizes the increasing importance of further developing and maintaining the capability, including a nuclear capability, to oppose limited aggression. Further, it allows much needed political flexibility in that it does not require in advance that the United States, once committed to action in a limited war, must apply unlimited force to achieve military victory regardless of consequences, but leaves the United States free to fight for a limited objective if such is the best course under the conditions then existing.

Appendix B

Paper Prepared by the Chief of Staff of the Air Force

Washington, undated

VIEW OF THE CHIEF OF STAFF, U.S. AIR FORCE

on

BASIC NATIONAL SECURITY POLICY (NSC 5906)

1. The Chief of Staff, U.S. Air Force has reviewed the draft statement of policy (NSC 5906) which was prepared by the National Security

Council Planning Board for consideration by the National Security Council at its meeting on Thursday, 25 June 1959.

2. It is the view of the Chief of Staff, U.S. Air Force that there has been no change in the international situation since the recent approval of the basic military strategy section contained in NSC 5810/1 which would necessitate any change in the military section of Basic National Security Policy. The Chief of Staff, U.S. Air Force recommends, therefore, that the Joint Chiefs of Staff representative's proposal for Paragraph 3, the majority view in Paragraphs 10 and 12, and Paragraphs 15 and 16 as they now appear in NSC 5906, are suitable as the basic statement of United States policy. It should be noted that except for minor changes in Paragraph 3, all of these paragraphs are identical with those in the currently approved NSC 5810/1.

3. In reaching this conclusion, the following areas have been especially considered:

a. The basic U.S. security objective should continue to be the maintenance of a position of military strength which will permit aggressive political action to achieve, by peaceful means, U.S. national objectives. The military forces and tasks, and their priorities, necessary to provide the position of strength to permit the exercise of U.S. initiative in world affairs are correctly and adequately described.

b. The over-riding military requirement continues to be the development and maintenance of adequate and safe-guarded strategic military power.

c. Primary reliance on nuclear weapons as a deterrent, and for selective use in actual conflict, is the keystone of U.S. policy and posture. This concept is the only course of action open to the United States compatible with the economic well-being of the United States and the free world and hence with the preservation of our fundamental values and institutions.

d. With regard to Paragraph 16, it is the view of the Chief of Staff, U.S. Air Force that within the total U.S. military forces there must be a capability of deterring or, if necessary, defeating, local aggression with forces able also to contribute in general war. In the opinion of the Chief of Staff, U.S. Air Force, the United States has in being and has, in fact, demonstrated that it has forces ready and capable of responding rapidly and flexibly to local aggression and to carry out initial general war tasks.

4. Notwithstanding the existing disagreements regarding military priorities and force structure, I am of the firm conviction that the military strategy as currently expressed in NSC 5810/1 provides suitably flexible, current, adequate and clear policy guidance to the Joint Chiefs of Staff and the military departments. It in no way pre-judges military requirements to the detriment of any one Service's ability to carry out its proper responsibilities for the national security. Further, it provides the very basis required by the Joint Chiefs of Staff to enable them to

carry out their responsibilities to assure the security of the Nation under any and all conditions.

5. It is recommended that the foregoing constitute the basis of the Department of Defense position on NSC 5906 at the National Security Council meeting on 25 June 1959.

167. Briefing Note for the June 25 NSC Meeting¹

Washington, June 23, 1959

Basic National Security Policy (NSC 5906)

We are now to begin the annual Council review of basic national security policy. In preparing the draft which is before you, the Planning Board first studied and discussed two pertinent National Intelligence Estimates ("Main Trends in Soviet Capabilities and Policies, 1958–1963", NIE 11–4–58; and "Estimate of the World Situation", NIE 100–59), which have already been discussed by the Council (at its meeting on March 5, 1959, NSC Action No. 2055.)

The Planning Board then had the benefit of comments on the existing basic policy paper (NSC 5810/1) from 22 outside consultants, who met in small groups with the Planning Board in five different meetings. Subsequently, in the light of changes suggested by all the agencies concerned and taking into account the consultants' comments, the Planning Board has rewritten the paper. During the past ten days, 15 of the consultants have come back and gone over the revised draft. I shall summarize their principal comments, where pertinent, as I go through the paper.

I wish to make clear at the outset that there are four paragraphs of existing policy which the Planning Board did not consider: Paragraphs 13 and 14 (reprinted as 15 and 16), which deal with general and limited war; Paragraph 47 (now 58) on the mobilization base; and Paragraph 48 (now 59), which deals with the strategic stockpile. With those four exceptions, the Planning Board has considered every paragraph word

¹ Source: Basic national security policy. Top Secret. 10 pp. Eisenhower Library, Whitman File.

by word, having devoted all or the major part of 11 meetings to substantive discussion.²

With respect to the language of 13 of the paragraphs as printed in the new draft (Paragraphs 1, 2, 4, 11, 14, 21, 22, 24, 50, 53, 56, 60, and 64), the Planning Board recommends no change. Other paragraphs were revised in one respect or another and agreed to at the Planning Board. There are 9 wholly new paragraphs. In 15 of the paragraphs there are splits, in some cases more than one.

I now propose to go through the paper, not dwelling on the unchanged paragraphs, or on the less important agreed revisions, unless someone wishes to raise a question about any one of them.

Paragraph 3 (p. 3), which is split, gives an evaluation of the basic threat to the U.S. from the Sino-Soviet Bloc. The majority proposal stresses that the “danger to U.S. security from the Communist threat lies not only in general war or local aggression but [also]³ in the possibility of a future shift in the East-West balance of power” which “could be caused by a gradual erosion of Western positions via means short of force, and over time by a continued growth of over-all Communist strength at a rate significantly greater than that of the West.”⁴

The JCS Planning Board Advisor preferred the language of the old paper, with the slight amendments indicated by the underscoring in the left-hand column.

(Call on: SECRETARY HERTER
ALLEN DULLES
ADMIRAL BURKE)

Paragraph 5 (p. 6) describes the *basic task* for the U.S. in general terms, pointing out the need, among other things, for adequate military strength and civilian preparedness. Treasury and Budget in their split wish to emphasize “while preserving fundamental American values and institutions”. Other Planning Board members felt that this thought was repetitious, being covered generally in Paragraph 1 and specifically in Paragraph 2.

(Call on: SECRETARY SCRIBNER
MR. STANS)

² Includes June 22 meeting with consultants; excludes 5 earlier meetings with consultants and 2 meetings on the NIE's. [Footnote is in the original.]

³ All brackets are in the original, except for those identifying footnotes in the original.

⁴ The majority proposal also points out such factors as the rapidly growing Soviet nuclear capabilities, which have made their leaders feel freer to adopt an aggressive posture in peripheral areas; the Soviet regime's ability and willingness to identify itself with political and social discontent, and to exploit instability; and the ability of Communist leadership to act ruthlessly and rapidly and to repudiate agreements without being subject to moral restraints.

Paragraph 6 (p. 7) summarizes the objectives toward the achievement of which detailed guidance comes later in the paper. The paragraph is virtually unchanged from existing policy save for the addition of subparagraph *b*. However, I should point out that a number of the consultants felt that the U.S. should not *take the initiative* in promoting sound economic growth and acceptable political development in the Free World.

Paragraph 7 (p. 8) is a revision of earlier language which called for presenting the true image of the United States, a concept which had puzzled the consultants.

Paragraph 10 (p. 10) is the general paragraph on deterrence and, as the majority would have it, is unchanged. State and AEC, however, wish to define the term "general war" by adding the words "a war in which the survival of the United States is at stake." Adoption of such a definition would mark a change in present policy which "is based upon the assumption that any war with the USSR would be general war." (NSC 5904/1, p. 2, footnote)

(Call on: SECRETARY HERTER
Mr. McCONE)

Paragraph 12-a (p. 11), which deals with the use of nuclear weapons, presents one of the most important splits in the paper. However, in view of its relation to paragraphs 15 and 16, which are the subject of separate treatment, I propose that we do not this morning seek to deal with 12-a.

Paragraph 13 (p. 12) sets forth our policy on chemical and biological weapons. The majority would leave the language of the existing paper unchanged, but Budget and Treasury propose that the President decide on the *stockpiling* of such weapons, as well as their use.

(Call on: MR. STANS
SECRETARY SCRIBNER)

Paragraphs 15 and 16 (pp. 12-14), as I explained at the beginning, were not considered by the Planning Board and are not up for Council consideration today.

Paragraph 17 (p. 14) deals with the "cold war" contribution which the capabilities of U.S. military forces can make. Existing policy is continued, but there is a split in that USIA proposes deleting the clause which uses the term "cold war." It may be noted that Paragraph 9, as agreed to by the Planning Board, would sanction the use of the term "cold war."

(Call on: MR. GEORGE ALLEN)

Paragraph 18 (p. 14) deals with U.S. bases overseas. It omits the reference to the possibility of "a small net expansion" of the base

system, which was written into basic policy last year. The revised language reads:

“The entire overseas base system should continue to be reviewed periodically in order to assure that base requirements are adequately met and are related realistically to developments in weapons technology and other factors.”

The last sentence of Paragraph 18 (which is unchanged) deals with the positioning of IRBM's around the Soviet periphery. While I have not yet discussed this in the Planning Board, I believe that IRBM's should be the subject of a separate paragraph and not included in the paragraph on U.S. overseas bases. I am therefore going to propose to the Council, on my own motion, the following new paragraph:

“18–A. IRBM's will be positioned only in those NATO and other Free World nations which demonstrate a desire to have them, and pressure will not be exerted by the U.S. to persuade reluctant nations to accept them. The determination as to the positioning of additional IRBM's will be made by the President.”

Paragraph 19 (p. 15) treats generally of strengthening the collective defense system. As revised, it contains the new guidance that the U.S. should, as practicable, “induce Western European and other allies with well-developed economies to increase their share in collective defense.”

Paragraph 23 (p. 16) proposes a major change in policy and is split. Present policy provides in essence that the U.S. should seek *to prevent* the development by additional nations of nuclear weapons capabilities (NSC 5810/1, Paragraph 18, p. 7). Some of the consultants felt that such a policy is impractical because, as one of them put it, “the black art is too well known.” The new majority proposal is that the U.S. should seek *to prevent or retard* the development by additional nations of nuclear weapons capabilities; but, failing that, should (1) exchange with, or provide to, selected allies (additional to the U.K.) information on nuclear weapons and (2) even be prepared to make available nuclear weapons themselves to such allies. The Defense-JCS version would sanction exchanging with, or providing to, additional selected allies information on nuclear weapons, but it would not go so far as to be prepared to make *nuclear weapons* available to selected allies. Both proposals would, of course, be subject to obtaining the necessary legislative authority.

(Call on: SECRETARY HERTER
MR. McCONE
SECRETARY McELROY
ADMIRAL BURKE)

Paragraph 24 (p. 16), which is unchanged from present policy, says that the U.S. should consider the long-term development of a NATO nuclear weapons authority.

The consultants were generally of the opinion that our policy should combine the first part of the majority proposal in paragraph 23 with paragraph 24. That is, our attitude toward providing nuclear weapons or weapons information to additional allies should be negative; but if pressed by an ally, such as France, for example, we should consider the matter not on a bilateral basis, but in a NATO context. The Planning Board seemed receptive to such an approach.

(Call on: SECRETARY HERTER
MR. McCONE
SECRETARY McELROY
ADMIRAL BURKE)

Paragraph 25-a (p. 18) is a revised general guidance paragraph on providing military assistance to nations "whose increased ability to defend themselves and to make their appropriate contributions to collective military power is important to the security of the United States."

Paragraph 25-b (p. 19) is new and deals with military aid to *other* nations, including uncommitted nations. It reads:

(Read Paragraph 25-b, p. 19)

Paragraph 25-c (p. 20) is also new and grows out of the OCB conclusions on the overseas internal security program.

Paragraph 26 (p. 20) is a new item of guidance and would encourage, in less developed nations, the participation of indigenous military forces in economic, social, and psychological programs.

Paragraph 28 (p. 21) is the general paragraph on military research and development which is in existing policy, with two new sentences added on nuclear weapons R & D. They read:

(Read Paragraph 28-a, p. 21, last two sentences)

Par 29 [p. 23] is a new paragraph which amplifies and strengthens a similar statement in the old policy [last sentence of old 22]. It takes the position that, given an adequate Free World deterrent posture, the Bloc will place chief reliance on non-military means and that the U.S. should accordingly give increased attention to non-military aspects of the contest. As a result of its discussion with the consultants, the PB decided it would be wise to recognize here that the Soviets also use military assistance, and to include language to reflect this.

Par 30 [p. 23] is a revision of old 22 and 23 which stresses that:

"The ability of the Free World to deal successfully with the competition of the Sino-Soviet Bloc will depend in large measure on demonstrated progress in meeting the political, economic and ideological aspirations of Free World peoples. In the long run, it is in the interest

of the United States and of the Free World that this progress be accompanied by the spread of individual freedoms and the growth of democratic institutions and practices.”

I believe that this is consistent with the discussion last week on military takeovers.

Par 31 [p. 24] involves revisions the most significant of which is the addition of subparagraph *e*. (read subparagraph *e*)

Par 32 [p. 25] represents a somewhat more qualified U.S. attitude toward the use of the UN. [At the beginning of the second sentence, what is now “make effective use” was “make maximum effective use”. In the second sentence, at the bottom of page 25, the parenthetical language has been inserted as a qualification. Finally, the last sentence, a new one, reflects the new voting patterns caused by the entry of many new nations.]

Par 33 [p. 26] has been revised to reflect the improved economic situation in Western Europe. While still strongly supporting European integration, U.S. financial assistance to that end is drastically curtailed. [The FY 1960 Budget called for \$3.5 million for the three continuing programs mentioned in the footnote.]

Par 35 [p. 27] is old 30, considerably revised. Old 30 said that independence of neutral less developed nations from Sino-Soviet control serves U.S. interests; the new language says that such independence “meets the minimum U.S. objective”. There is new language which says to avoid insofar as possible courses of action which appear to reflect more consideration by the United States for neutrals than for friendly nations. Further, there is new language which calls for providing incentives where feasible for the eventual incorporation of less developed nations in effective regional collective defense systems, for encouraging a maximum identification of interests and attitudes between these neutral nations and the U.S. and its allies, and for promoting practical forms of cooperation in non-military fields. A minority of the consultants advocated a still harder line toward neutralist nations.

To here June 2.⁵

Par 36 [p. 28], a new paragraph which would apply world-wide a policy contained in the current Latin America paper (NSC 5902/1), deals with maintaining contact with selected non-Communist opposition elements. I believe that we should add “through appropriate channels”.

⁵ The Council reached this point in its discussion of Basic Policy (Through Para. 35). Discussion on remaining sections of the Basic Policy and Briefing Note will be contained in the subsequent Memorandum. [Footnote is in the original.]

168. Memorandum for the Record¹

S/P-59146

Washington, June 30, 1959, 2:30–5 p.m.

*State-Defense Meeting on Military Paragraphs of NSC 5906**Participants**State*

Secretary Herter

Under Secretary Dillon

Assistant Secretary Smith

Mr. Mathews

NSC

Mr. Gray

Defense

Secretary McElroy

Deputy Secretary Gates

Admiral Radford

Mr. Williams

(Note: The first 45 minutes of this meeting were taken up by a Defense briefing on nuclear weapons.)

Secretary McELROY opened the discussion and made the following major points in the course of the meeting:

1. The policy set forth in the current key military paragraphs of Basic National Security Policy is flexible enough to take care of the military situations facing us around the globe. The language might be improved (although any change now would have an unsettling effect on our allies and within State and Defense) but the policy is right. Some of the language changes proposed in the Planning Board seem to have dangerous policy implications.

2. If there really is any question as to our determination to use nuclear weapons in limited war as required, State is fully justified in raising the questions it has and in being worried about our military posture. The President should affirm in the NSC his willingness to use tactical nuclear weapons in limited war when necessary.

3. The military cannot support State in the range of commitments it has assumed around the world unless nuclear weapons can be used as needed.

4. Defense is going just as far as it can to adapt nuclear weapons to meet all military needs.

5. The longer a limited war lasts, the greater the danger of general war. We should, therefore, not hesitate to use nuclear weapons promptly to discourage the enemy.

¹ Source: State-Defense meeting on military paragraphs of NSC 5906, use of nuclear weapons in limited war. Top Secret. 4 pp. NARA, RG 59, S/P Files: Lot 67 D 548, Military and Naval Policy. Prepared on July 1.

6. The Defense position is determined by McElroy, Gates, Twining and Radford, who have the responsibility. The Chiefs who favor a different position will be given an opportunity to present their views in the NSC.

Secretary HERTER made the following major points:

1. There are increasing indications that our allies and the uncommitted countries are not sure that they want our protection if this means nuclear war. One symptom is the trend among some NATO members to seek joint control over the decision to use nuclear weapons in the NATO area; France wants to extend joint (tripartite) control to the whole world.

2. In a situation of US and USSR nuclear sufficiency, we should not automatically use nuclear weapons in limited war. If it proved necessary to use them, we would, of course, do so.

Under Secretary DILLON made the following major points:

1. State's "Summary Statement of Foreign Policy Requirements Bearing upon US Strategy" calls for forces with a dual capability, the non-nuclear component of which should be strengthened.

2. He understood the Defense position to be that we must use nuclear weapons to deter and fight limited war or put many more men and resources into our limited war capability. If our present planes can't operate efficiently with iron bombs, we would need a new air force. Our Navy would have to be enlarged to fight without nuclear weapons.

Admiral RADFORD made the following major points:

1. In consequence of a Presidential decision in 1953, our whole military establishment is built on the use of nuclear weapons in any kind of military situation. Our present planes cannot operate efficiently with iron bombs and we have far too few planes to conduct non-nuclear air warfare. Nuclear weapons are essential for anti-aircraft and anti-submarine defense.

2. There are, however, practical restrictions on the use of nuclear weapons. There would be no casual use; use would be in accordance with careful prior planning.

3. It would take five years to reconstruct our military establishment to fight limited war without nuclear weapons.

4. The US could not keep its present forces in the West Pacific unless they were armed with and could use nuclear weapons. If we found it necessary to put ground forces in Viet Nam, they would have to have nuclear weapons to keep from being overrun.

5. There is no reason why nuclear weapons can't be used against us in the less developed areas. The Chinese Communists can handle planes that can deliver nuclear weapons.

6. Basic National Security Policy should state that nuclear weapons will be used whenever such use is to our military advantage.

7. The definition of general war in the current strategic concept gives us the opportunity to take advantage of overt Soviet participation in military action against us to launch our strategic power against the USSR (the Admiral attributed this view to the President). If the USSR is willing to fight us openly, it must be ready for general war.

Assistant Secretary SMITH made the following major points:

1. The US-USSR strategic balance has changed since 1953, and decisions made then as to our military posture are not necessarily valid in 1959. It was this consideration which led the President at the conclusion of the 1958 review of Basic National Security Policy to direct that the military paragraphs of that document be kept under continuing review.

2. The definition of general war in the current strategic concept is too restrictive. When rigidly applied as in the State-Defense limited war study of 1958 it results in unrealistic assumptions about the non-use of nuclear weapons by the Communists in limited war. The military have, moreover, found it necessary to disregard the definition in some of their planning for certain contingencies.

3. State is trying to prevent our becoming dependent upon nuclear weapons in almost all kinds of military situations.

Mr. GRAY made the following major points:

1. The basic issues are

a. to what extent should nuclear weapons be used in limited war,
b. what is general war,
c. does local aggression occur only in less developed areas and
d. is the prompt defeat of local aggression by application of the degree of force necessary the best way to avoid general war or are there cases in which a lesser response to restore the *status quo ante* would be the best way to avoid general war.

2. We muddled through the 1958 Quemoy crisis without any clear understanding as to whether and in what circumstances we would use nuclear weapons.

169. Letter From Smith (S/P) to Herter¹

Washington, July 1, 1959

Dear Mr. Secretary:

Before your meeting with the President tomorrow on military policy, I hope that you will have a chance to read this letter.

I thought yesterday's meeting with Secretary McElroy and Admiral Radford was discouraging. At Geneva, Secretary McElroy seemed sympathetic to the foreign policy considerations that you urged on him. However, Admiral Radford's views seem to have changed Secretary McElroy's mind.

Nothing that I heard at yesterday's meeting led me to doubt the validity of the position that present American military posture and doctrine do not meet the imperative requirements of US foreign policy. It seemed clear to me from the discussion that we do not have a significant limited war capability unless it is assumed that we will automatically use nuclear weapons in almost any kind of military situation. As Admiral Radford made clear, the prospect is for rapidly increasing dependence on nuclear weapons. This means that any limited engagement will likely result in total war. I think you put your finger on a striking fact in pointing out yesterday the anomaly of our planning for the use of weapons having a yield of over 1 megaton for tactical purposes.

Not only is the present military posture incompatible with American foreign policy requirements, but it is also deemed to be wrong by a majority of the Joint Chiefs of Staff—by those Services which would have to bear the brunt of fighting limited wars. This is not a new conclusion of the Army, the Navy, and the Marines. They argued strongly against the present military doctrine in the NSC last year. Our present military doctrine is also considered to be wrong by the Chairman of the Atomic Energy Commission.

Every officer in the State Department concerned with this problem has been briefed on the proposed State Department position and has endorsed it.

¹ Source: Bureau comments on NSC 5906 and use of nuclear weapons in limited war. Top Secret. 6 pp. NARA, RG 59, S/P Files: Lot 67 D 548, Military and Naval Policy.

The following excerpts from Bureau comments are pertinent:

EUR

"EUR strongly supports the Department of State proposal in the annex for revision of paragraph 16 (old paragraph 14), as well as the State-OCDD version of paragraph 12a."

FE

"FE strongly urges NSC adoption of the State-OCDD proposal on paragraph 12a relating to the retention of both a US conventional and nuclear capability to fight limited wars. If our country were ever to lose the freedom to choose the weapons needed to do the job, it could be confronted with a local aggression where it would either have to use weapons so destructive and provocative of counteruse as to risk general war and, in any event, lose the war politically, or, where, knowing the disastrous consequences of thus opposing the aggression, we would be frozen into inaction.

"FE strongly endorses the State Department's proposal for the revision of paragraph 16 as noted in the annex of the draft statement."

AF

"*Paragraph 12a*: The State-OCDD proposal, stressing preparedness for limited war fought with or without nuclear weapons, is essential with reference to Africa.

NEA

"NEA feels strongly, however, that the State proposals in para 10 (definition of general war), para 12a (concerning US preparedness to fight limited war with or without nuclear weapons), and paras 15 and 16 (concerning the maintenance of ready forces with flexibility to fight limited wars of varying natures) are of critical importance for the carrying out of US foreign policy in the NEA area.

ARA

"In particular, we welcome the greater clarity of the document, the somewhat more positive approach to economic questions, and the greater flexibility which adoption of the Department's position on the military portions of the policy would give us with respect to limiting armed conflicts and avoiding having to rely principally on strategic nuclear capabilities to deter local wars."

U/MSC

"U/MSC strongly supports the State position on these paragraphs and wishes to point out in addition that the decision taken on resolving the basic split on the development of a conventional capability by US forces also has definite repercussions in terms of US military assistance policy. If the US is not to develop a conventional capability of its own, we must either take major steps to develop a conventional capability among our allies and rely on them to do the job for us, or adopt the conclusion that any limited war will automatically lead to general nuclear war, in which case the development of foreign forces with a conventional capability is a waste of time and the taxpayer's money, and our allies should be so advised."

IO

"I attach the greatest importance to our proposed Paragraph 16, lest we end up under a nuclear umbrella that protects only bastion America, all other free-world positions having, in the meantime, eroded."

At yesterday's meeting, Admiral Radford expressed some impatience that the State Department was raising the question of the use of nuclear weapons in limited war at this time. You will recall that during last year's review of Basic National Security Policy, Secretary Dulles reluctantly concurred in the language of the existing military paragraphs only on the condition that they would be promptly reviewed by the Departments of State and Defense. The President directed that a review be undertaken.

I think that the issue of the political and military impact of present American military posture and doctrine is a central problem facing the US in its struggle with world communism. Our influence around the world is not as great as it should be. I think it will be less next year and in the years to come unless we get away from "massive retaliation" and the type of Military Establishment which this doctrine is developing. I hope you will stress the urgent need for this policy change on the President tomorrow.

The decision will be a crucial one for American foreign policy in the period ahead.

Respectfully,

Gerard C. Smith

170. Note From Lay to the NSC¹

Washington, July 1, 1959

NOTE BY THE EXECUTIVE SECRETARY
to the
NATIONAL SECURITY COUNCIL
on
COMPARATIVE EVALUATIONS GROUP

REFERENCES

- A. NSC Actions Nos. 1833 and 1909
- B. NSC 5815

The President, on the recommendation of the Secretary of Defense, has this date approved the addition of the Deputy Secretary of Defense to the membership of the Comparative Evaluations Group established in accordance with NSC 5815.

Accordingly the enclosed directive, incorporating the above amendment to NSC 5815 approved this date by the President, is circulated herewith for the information of the National Security Council and for implementation by all appropriate Executive departments and agencies of the U.S. Government.

The enclosed directive is being given special limited distribution, and the contents should be subject to special security precautions, with access thereto limited to those individuals having a strict "need to know" in the performance of their official duties.

James S. Lay, Jr.
Executive Secretary

Enclosure

National Security Council Directive 5908

NSC 5908

Washington, July 1, 1959

DIRECTIVE
on
COMPARATIVE EVALUATIONS GROUP

1. There is hereby established under the National Security Council, pursuant to the provisions of Section 101 of the National Security Act, a Comparative Evaluations Group responsible for the preparation of comparative evaluations of U.S. and Soviet capabilities in selected weapons systems.

2. The Comparative Evaluations Group shall consist of the Chairman, Joint Chiefs of Staff, who shall serve as Chairman of the Group; the Under Secretary of State; the Deputy Secretary of Defense; the Director of Central Intelligence; the Chairman of the President's Board of Consultants on Foreign Intelligence Activities; the President's Special Assistant for Science and Technology; and the President's Special Assistant for National Security Affairs.

3. The secretariat services for the Group shall be performed by the NSC Representative on Internal Security.

4. The Comparative Evaluations Group shall meet at regular intervals, and not less than every three months.

5. The functions of the Comparative Evaluations Group shall include:

a. Recommending to the President suitable topics in the field of weapons systems for comparative evaluations of U.S. and Soviet capabilities.

b. Determining the scope of each of the studies approved by the President.

c. Determining the procedures to be followed in connection with such studies, including the time limit within which the studies are to be completed and submitted to the President.

6. Oral presentation of such comparative evaluations to the National Security Council or other groups shall be as determined by the President.

7. In view of the sensitive nature of the materials to be included in studies made by the Group, special security precautions shall be applied thereto. Distribution of the studies prepared by the Group shall be limited to two copies—one to be maintained in the files of the National Security Council, the other in the files of the Chairman of the Group.

171. Memorandum of Conversation¹

Washington, July 2, 1959

SUBJECT

Military Paragraphs of Basic National Security Policy

PARTICIPANTS

The White House
The President
Gordon Gray
General Goodpaster

State Department
Secretary Herter
Gerard C. Smith

Defense Department
Secretary McElroy
Deputy Secretary
Thomas S. Gates, Jr.
Admiral Arthur W. Radford

The President looked at the statement of issues which had been prepared by Gordon Gray, a copy of which is attached. He said it is almost impossible to define general war and limited war. One cannot plan out these things precisely in advance.

Secretary Herter said that just last year Mr. Dulles in going along with the military paragraphs of the Basic National Security Policy paper had urged a restudy because of the State Department's concern that nuclear weapons were to be considered conventional, that any engagement between Soviet and American forces would be total war, and that we seemed to have no leeway in the matter of fighting small engagements without using nuclear weapons.

The President recalled that he, Admiral Radford, and General Taylor had had a long discussion of this matter sometime ago. The President pointed out that the Japanese and Russians in the 30's had had large-scale military engagements without any formal declaration of war. The President speculated that it might be possible for us to have something like three battalions engaged in Iran against Soviet forces without general war. He said, however, if our vital interests became involved, we certainly should use nuclear weapons. Secretary Herter agreed.

The President said that he had tried to find language to meet this problem which he seemed to equate to the problem of how much authority should be delegated to field commanders to use nuclear weapons.

¹ Source: Inconclusive discussion of role of nuclear weapons in limited war. Top Secret. 13 pp. NARA, RG 59, S/P Files: Lot 67 D 548, Military and Naval Policy.

The President said that the crux of the matter was that we just could not deploy ground forces all over the world. Main reliance would have to be placed on nuclear weapons and mobile forces.

The Secretary pointed out the possibility that sometime in the future we might have to introduce forces into Africa, at which time we would not want to use nuclear weapons. He also cited the Lebanon example, where the military had wanted to go ashore with nuclear weapons, but the State Department urged against it.

The President referred to Khrushchev's statement to Harriman recently that if the Chinese tried to take Formosa the Russians would assist them, and that the Russians had already made rockets available to the Chinese which could strike Formosa.

The President speculated that the Soviets are wrestling with the same problem that we are considering this morning.

Returning to the question of when nuclear weapons should be resorted to, the President expressed some puzzlement. He said certainly they should not be resorted to carelessly, but if substantial American troops were involved they should have nuclear weapons handy.

Secretary McElroy then pointed out that General Twining agreed with him (McElroy) that the present policy should be retained. Unless we could use nuclear weapons, we could not participate in limited wars.

The President recalled that during the last war American troops had had available, if necessary, mustard gas, but that it had never been used. He wondered at what point in the spectrum between harassment and limited war we should resort to nuclear weapons. Secretary McElroy then said there were significant budget considerations in the proposed policy changes.

The President then referred to the impossibility of our stationing garrisons all over the world. The President said that Secretary McElroy's point of view was our present policy and it was being implemented. He recalled that when we reduced our forces in Korea, we beefed up the remaining forces with nuclear capability.

Admiral Radford then said that the State Department wanted the military to fight with conventional weapons until it was decided to go to nuclear weapons. "We are past that point", he said. In 1953, we took a crucial decision to convert our present forces to nuclear weapons capability. The fact that they are nuclear capable permits us to use small scale units to do a job which otherwise could only be done with much larger forces.

There was then a discussion about the question of delegation of authority to employ nuclear weapons. The President expressed some concern about the possibility of poor judgment by some local commander.

Secretary Herter referred to the possibility of using tactical weapons in excess of 1 megaton, as reported at last Tuesday's briefing by

Admiral Parker. Admiral Radford then said that Parker's briefing was not very good. He recalled that we are concentrating on small weapons. He said that General Lemnitzer and Admiral Burke had told him that there was no real difference between the State and the Defense language, but that they preferred the State language. Admiral Radford said that the State language would require a US capability to fight a limited war with or without nuclear weapons. He pointed out that the earlier policy on nuclear weapons had already been watered down. Their use now is only authorized to meet national objectives and not military objectives. He said this change fuzzed up the issue.

The President then speculated about what type of force one would have to employ, say, if our intervention in Cuba was requested. He later concluded that no nuclear capability would be required in such case. The President said that he thought we were having difficulty because we were trying to find generalized language to cover a multitude of contingencies.

The President said we need plans to guide the various levels of the military. Certainly our forces need to have nuclear weapons. The real problem was when would the weapons be used.

Admiral Radford said that if there was any chance that our forces would have to fight without nuclear weapons, a whole different force structure would be required.

The President said that he had seen studies indicating that the availability of nuclear weapons does not result in a saving of manpower.

Admiral Radford then went back to the 1953 decision on the "new look".

The President recalled that the pre-Korea military budget had gone down to about \$11 or \$12 billion and that was where he and Louis Johnson differed.

The Secretary then reverted to the Cuban discussion and agreed with the Presidents conclusions.

The President said that we have no lack of conventional weapons. Secretary McElroy pointed out that nuclear weapons were not useful for close-in fighting. It was generally agreed that the Latin American area offered no problem.

The President said what we needed was a meeting of the minds and not fixed slogans. He said all agreed that one should not use a sledge hammer to drive tacks.

Secretary McElroy said that the present language suited him and that any changes would be misinterpreted to suit the preconceptions of various people. He said that unless a policy change was to be made, we should not change the language.

Secretary Gates pointed out that a real policy change is being urged. He would not say that the State Department was urging a new policy change, but some people were.²

The President then reviewed the history of the deployment of nuclear weapons to American forces abroad. He felt that no large forces should be deployed without nuclear weapons. Secretary Herter stated that he had no objection to this conclusion. There was further discussion about the delegation of authority matter.

Secretary Herter then raised the question about the non-nuclear capability our forces would have. He was glad to hear what Secretary McElroy had said that we were continuing to develop better conventional weapons.

The President said that perhaps some slight change in words was needed, but he did not know. He repeated that “formed units” must have defensive nuclear capability. Both Secretary McElroy and Admiral Radford jumped in to make sure by “defensive” the President did not mean to rule out weapons systems to take out strike bases deep in China.

Mr. Gray said that the State Department wanted to increase our limited war capability. The President stated his understanding that we had a good conventional capability. Secretary McElroy said that that was true in cases involving ranges up to 2,000 yards. In the case of 15–20 miles, we will lack conventional fire power. The President asked him if we had thrown away all of our artillery. Secretary McElroy indicated that this would be the case soon. The President expressed some doubt as to the wisdom of this course. The President pointed out that we may be called on for aid by the OAS. He felt that with one present-day American division with its conventional arms, it could handle any Western Hemisphere problem. He recognized that we are in a transitional stage, pointing out that the day of very small nuclear weapons was not very far away. When one gets down to .02 kiloton weapons, the distinction we are talking about now would no longer have reality.

Mr. Gray said that the proponents of a policy change wanted to change the emphasis somewhat away from strategic bombing capability. The President expressed the belief that our military units should be given good training in conventional weapons. He stated that it had taken years for the cross-bow to become obsolete. We should organize our forces to use the weapons we have.

There was more discussion of the delegation problem.

Secretary Herter then read an excerpt from the Summary Statement of Foreign Policy Requirements which proposes that nuclear weapons

² At a meeting after the President's meeting between McElroy, Radford, Gates, Gray and Smith, Smith made it quite plain that the State Department was proposing a real change. [Footnote is in the original.]

should be used in limited hostilities, but only as a last resort. The President expressed the opinion that State was perhaps over-cautious. He also felt that the matter of word changes in Basic Policy was not important.

The question was raised as to the possibility of limited war in Europe. Mr. Gray suggested that there was some opinion in the State Department that this was possible. Secretary Herter said, "yes, that only recently Mr. Murphy had said that he thought there could be limited hostilities over Berlin with the matter being referred to the UN. The President said that that would only be a barroom brawl. There was then some discussion as to whether there could be a limited war with China.

Secretary Gates then said some people were concerned that the emphasis on strategic retaliatory forces would squeeze out funds for and interest in conventional weapons.

Admiral Radford pointed out that never before in peace time did we have such large forces for Latin America type of operations.

The President pointed out that if the Soviets wanted to take Europe they would have to blast out positions with nuclear weapons, in which event the size of our forces there would not make much difference.

Secretary McElroy said that his discussions with the military commanders indicated that they feared that nuclear weapons would not be used.

The President then gave an analogy of the use of a pistol in retaliation for an attack by a hoodlum in the street. One is justified in using the pistol if one's life is really endangered, but not if the circumstances indicate that no such danger exists.

The President said we cannot organize now for the situations that may take place in 1965. We should go carefully and wisely. We should try to use the necessary degree of force without starting a war.

Secretary Herter said that he agreed that if it was essential we should use nuclear weapons. He pointed out, however, how fearful world opinion was of any use of nuclear weapons. The President expressed the view that world opinion was wrong.

The President then speculated that a very low yield nuclear weapon would not be worth its cost and that if we used nuclear weapons we should use large enough ones to do the job.

Mr. Smith then pointed out that one matter had not been mentioned. All of our assumptions about the use of nuclear weapons in limited war start with the proposition that they will not be used against us. Admiral Radford and Secretary McElroy denied this with some heat. It was pointed out that the limited war study of 1958 had made this assumption and that the Joint Chiefs had refused to study limited war with the State Department on any other basis. Mr. Gordon Gray confirmed accuracy of this. Admiral Radford said the military actually were prepared for two way use of nuclear weapons in limited war.

There was some discussion about the 1958 assumptions and no clear conclusion as to their validity. Certainly SAC would have to be kept on a complete alert during any such period.

The meeting then broke up without any conclusion.

Memorandum From Phillips to Lay

Washington, July 2, 1959

SUBJECT

Paragraph 62 of the Basic National Security Policy (NSC 5906)

REFERENCE

Memorandum from NASC Acting Secretary dated 19 June 1959

1. Comments on the subject paragraph provided by certain members of the National Aeronautics and Space Council were forwarded to you with reference memorandum.

2. Following is a summary of the discussion on the subject paragraph that took place at the June 29, 1959 informal meeting of the NASC:

The explanation given as the basis for the Budget and Treasury proposal represented by the bracketed phrase was that it presents a position previously stated by the Department of Defense as noted in the last paragraph, item 6 of the NASC minutes for the April 27, 1959 meeting. There was discussion to the effect that, although this is an accurate statement of Defense position, including it in the policy seems inappropriate. Alternate wording for the phrase was proposed as follows:

(2) A military space program designed to exploit the application of advancing space technology whenever that exploitation will sensibly extend U.S. military capabilities;

It was the consensus that this wording appeared to be a reasonable compromise, and that it should be forwarded to the NSC for their consideration. There was further discussion of the first sentence in the paragraph, in particular the phrase, "to insure that the U.S. is a recognized leader in this field." It was proposed that the following be substituted for the first sentence:

The U.S. should continue actively and with a sense of urgency to pursue programs to develop and exploit outer space capabilities as needed to insure the attainment of national objectives in scientific, military and political areas. These programs should be designed to secure and maintain for the U.S. a position of supremacy in outer space activities without requiring that the U.S. be the leader in every phase of space exploitation.

Discussion of this point resulted in agreement that the sense of the first sentence of the paragraph as proposed by NSC is that the U.S. should be at least on a par with the USSR, but not necessarily ahead. There was no agreement on re-phrasing this sentence to further clarify this point.

/S/ Franklyn W. Phillips
Acting Secretary

174. Memorandum of Conversation with the President¹

Washington, July 7, 1959, 12:10 p.m.

PRESENT

Bryce Harlow
General Goodpaster
Gordon Gray

I first informed the President that Mr. McElroy had asked whether Admiral Radford might attend the meeting of the National Security Council on Thursday, July 9. I indicated to the President that I had some question about the wisdom of this course. The President felt to the contrary; that inasmuch as Mr. McElroy had made Admiral Radford his Military Advisor during the absence of General Twining; and if Mr. McElroy wished him present, he should be allowed to attend.

¹ Source: President's approval of attached guidelines for Harlow's discussion with Jackson on Congressional hearings on the NSC. No classification marking. 3 pp. Eisenhower Library, White House Office Files, Project Clean Up, Staff Memos. Drafted on July 8.

Mr. Harlow and I then discussed with the President the situation appertaining to the Jackson Committee investigation. The President approved the guidelines, attached, as a basis for Mr. Harlow's discussion with Senator Jackson.

Gordon Gray
Special Assistant to the President

Enclosure

Paper Prepared by the NSC

Washington, July 6, 1959

PROPOSED GUIDELINES

1. The proposed study would not involve a Congressional investigation of the National Security Council.

2. The Executive Branch personnel would not be asked to testify with respect to the substantive consideration of matters by the National Security Council or its subordinate machinery. The operating Departments of Government would provide any testimony about their policies or activities and without reference to substantive consideration of such matters by the National Security Council or its subordinate machinery.

3. Study of the National Security Council and its subordinate machinery would be limited to matters involving composition, organization and procedures. Executive Branch officials would be authorized to make full disclosure as to such matters subject to appropriate security safeguards in case of classified projects.

4. Any testimony by present or former Government officials regarding the National Security Council and its subordinate machinery would be taken in Executive session. Consideration of the publication of such testimony taken in Executive session would be as agreed between the Subcommittee and a representative designated by the President. This Presidential representative would be authorized to attend all hearings of the Subcommittee relating to the National Security Council or its subordinate machinery, and would be provided a transcript of the testimony taken in Executive session as a basis for reaching the decisions as to publication referred to above.

5. It would be understood that the purpose of testimony regarding the composition, organization and procedures of the National Security Council and its subordinate machinery would be for background information in considering various proposals for new legislation. Such testimony would not be intended to generate legislative proposals designed

to delimit the Constitutional privilege of the President to obtain advice through such organization and procedures as he deems appropriate.

175. Memorandum From Gray to Haydn Williams¹

Washington, July 8, 1959

Herewith the Issues for Discussion as presented in the meeting with the President on July 2nd. I have expressed to you my concern that this paper not be widely distributed and you gave me your assurance on this point. Indeed, I would like to understand that after the principals have been briefed, and certainly at the conclusion of the National Security Council meeting, this copy will be destroyed.

The basic of this request is that this paper has no status and was used in a privileged discussion with the President. Furthermore, I have indicated to you that left to my own devices, I would not have framed the issues in quite this way. This statement resulted from efforts to get agreement as to the issues as between State and Defense.

Gordon Gray

Special Assistant to the President

Same letter to: Rear Admiral C O Triebel

Howard C. Furnas

Enclosure

Paper Prepared by the NSC

Washington, undated

ISSUES FOR DISCUSSION

1. Have we arrived at the point of general war when sizeable USSR and US forces are directly engaged? Alternatively, do we believe that a situation of general war will exist only when the circumstances indicate that the survival of the US is at stake?

¹ Source: Transmits discussion paper on uses of nuclear weapons in limited war. Top Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Review of Basic National Security Policy.

2. Should the US place main but not sole reliance on nuclear weapons and consider them as conventional weapons from a military point of view; or should the US develop and maintain flexible and selective capabilities for limited war in order to insure that any significant US participation in limited hostilities would not have to be nuclear?

3. Should it be assumed that local or limited aggression will occur only in the under-developed areas or is it conceivable that a limited war could be fought in developed areas such as non-NATO Europe or Japan? What about Communist China?

4. With respect to local or limited aggression, would US objectives be served by prompt and resolute application of force necessary to defeat such local aggression; or might US interests be served in certain cases by restricting the application of force to that degree necessary to achieve objectives of limiting the area and scope of hostilities and restoring the status quo ante?

It is agreed that with respect to local or limited aggression the use of any US force will be applied in a manner and on a scale best calculated to avoid hostilities from broadening into general war.

176. Memorandum From Whisenand to Gray¹

Washington, July 8, 1959

SUBJECT

General Twining's Views on Basic National Security Policy

1. At the request of the Secretary of Defense, the attached statement of General Twining's views on the current review of Basic National Security Policy is forwarded for your information and use.

2. The forwarding of this material directly to you has been approved, personally, by General Twining.

James F. Whisenand

Paper Prepared by the JCS

Washington, undated

VIEWS OF CHAIRMAN, JOINT CHIEFS OF STAFF ON BASIC NATIONAL SECURITY POLICY (THESE VIEWS WERE PROVIDED TO THE SECRETARY OF DEFENSE ON 8 MAY 1959)

1. I would like to dispense with the philosophy which accompanies the arguments that are being advanced for changing our present Basic National Security Policy and deal directly with the consequences and major implications of such changes if they were to be made.

TACTICAL FORCES

2. The first major implication is with respect to limited war situations. We would no longer consider atomic weapons as an integral part of our military establishment, to be used when militarily advantageous to us. Regardless of the military disadvantages, we would attempt to fight on land, at sea, and in the air with conventional forces, and we would use nuclear weapons only as a last resort. This change of policy could have the following consequences:

a. Decision to use nuclear weapons could come too late (in a situation such as an invasion of Formosa).

b. Unacceptably heavy attrition of our limited forces could occur in an attempt to conduct a conventional campaign under conditions which, from a military standpoint, clearly call for the early use of nuclear weapons.

c. The change in policy would leak to the world, and our posture for deterrence of Soviet-inspired local aggression, the world over, would suffer greatly.

3. With respect to watering down our present policy for the use of nuclear weapons when militarily advantageous to us, I would point out that over a period of years we have progressively reduced the size of our military establishment and the number of major combat units in our land, sea and air forces. Every reduction has been justified by the President, by the Secretary of Defense and by the Chairman of the Joint Chiefs of Staff on the basis of increased firepower inherent in modern weapons. Concurrent with these reductions, and facing a numerically superior enemy on all fronts, we have integrated atomic firepower into our land, sea and air forces under the assumption that this firepower, *while not to be used initially in a limited engagement*, would be immediately responsive to the military situation if required.

4. In fact, all of our forces, strategic and tactical, land, sea and air, are reliant on atomic firepower if they meet serious, sustained

resistance. Under present policy, our forces can enter an engagement against overwhelming numbers of Soviet proxy troops with confidence in the outcome, because the atomic firepower can be used if needed, and can be used before our own forces are decimated. To actually apply the suggested new policy would reduce our tactical flexibility and capability in one stroke to the level which the Soviet Union would like to see. This is not to say that we are completely powerless without nuclear weapons. We have demonstrated twice within the last year that we can react quickly and with effective results in local and limited actions. However, at Lebanon the first unit in the area was a Marine BLT with organic atomic capability, the Sixth Fleet was offshore with atomic capability, and the U.S. Air Force units at Adana had an atomic capability. Similarly, during the Taiwan incident the atomic capability of our deployed tactical forces was always in the background. These two operations might have come off differently, in a tactical sense, short of general war, if the atomic backup had been absent, or if the enemy knew we would hesitate to use it.

5. There are times when political considerations are overriding. There are also times in which military realities must be the basis for political decision. In this case, any serious attempt to change the present policy on the use of nuclear weapons would have to be phased over a period of years, and we would have to be willing to double or triple the budget, over a period of years, to provide any semblance of the limited war combat capability which we possess today.

STRATEGIC FORCES

6. The second major implication bears on our strategic nuclear forces. Under a budgetary and personnel ceiling roughly approximating what we now have, the power of our strategic nuclear forces would progressively decline as “conventional” capability and “limited war” capability, in consonance with the revised policy, demanded more and more of the resources available. This is the specific objective of some elements of the military establishment.

7. Under the assumption of no major increase in available resources, within a few years we could be in the following tragic condition:

a. Having a capability for attacking only a restricted strategic target system, as opposed to Soviet capability to attack thousands of targets, we would have no effective strategic deterrent. We would have little counter-force capability, no strength in foreign policy as engendered by Soviet knowledge of a preemptive capability, and no possible strategic military response to any Soviet action, short of a Soviet-initiated attack on our population centers, and, even in this event, it would be doubtful that a retaliatory capability geared to a few hundred cities could survive to perform its task.

b. Paralleling this decline in the strategic capability we would have increased “limited war” and “conventional” capability to some degree,

but this increase would be insignificant in comparison to opposing Soviet Bloc forces, and would still be far below the requirement for meeting either a Soviet non-nuclear challenge, or limited nuclear challenge, in Europe, in the Far East and in the Middle East.

8. In summary, the net effect of the revisions in the Basic National Security Policy which have been suggested, if actually implemented, would be as follows:

One: Due to the fear of use of nuclear weapons on the part of some elements of the Government, political restrictions on their use would be imposed which would reduce to an unacceptable level the combat capability of our tactical forces, land, sea and air.

Two: Our strategic nuclear capability would decline to relative impotency in the matter of a few years.

Three: The only alternative to these consequences would be a vastly increased budget and personnel ceiling.

9. In my judgment, we should not tamper with the present wording in the military section of the paper. There has been no change in our basic policy of containment and deterrence, and there has been no change in our defense funding policy. The present military section of NSC 5810/1 provides adequate guidance for the development of properly balanced military forces, establishes a reasonable policy for the use of nuclear weapons, and should not be changed.

177. Briefing Note for July 9 NSC Meeting¹

Washington, July 8, 1959

Basic National Security Policy (NSC 5906)

Today we resume consideration of Basic National Security Policy (NSC 5906) by taking up the military section, which begins with paragraph 10.

One thing which has given me concern is that nowhere in these paragraphs do we refer specifically to control of the seas, although we do talk about our retaliatory power; general war; local aggression; and continental defense.

¹ Source: NSC 5906, basic national security policy. Top Secret. 5 pp. Eisenhower Library, Whitman File, NSC Records.

Paragraph 10 (page 10) is the general paragraph on deterrence and, as the majority would have it, is unchanged. State and AEC, however, define the term “general war” by adding the words “a war in which the survival of the United States is at stake.”

It is my impression that a large part of State’s concern arises out of the strategic concept which was circulated to the Council in March 1957 in connection with the Mobilization Base Planning. In that document general war is defined as:

“A war in which the armed forces of the USSR and of the United States are overtly engaged.”

It would appear that this concern of the State Department could be met by a definition in the Strategic Concept which could describe general war as

“A war in which sizeable numbers of the armed forces of the USSR and of the United States are overtly engaged.”

If this is the case there would appear to be no need to change the existing language of paragraph 10. In such an event the statement in NSC 5904/1, “U.S. Policy in the Event of War” (footnote, page 2), that “U.S. policy is based upon the assumption that any war with the USSR would be general war”, should be changed to incorporate the new definition.

(Call on: SECRETARY HERTER
SECRETARY McELROY
(MR. McCONE))

Paragraph 12-a (page 11) presents the issue concerning limited war capabilities in conventional terms and also the extent of our reliance on nuclear weapons in limited war. The majority would continue the language of the existing policy paper, which reads in part:

“It is the policy of the United States to place main, but not sole, reliance on nuclear weapons;” and “to consider them as conventional weapons from a military point of view. . .”

The State Department has a proposal, in which OCDM joins, to change the policy so that we would

“place main reliance on nuclear weapons in *general war*, remaining prepared to fight *limited war* with or without such weapons.” [Emphasis supplied]²

It is my understanding that State’s interpretation of this language is not that we should be prepared to fight any war short of general war solely without nuclear weapons. I shall ask Secretary Herter to elaborate on this.

²Brackets are in the original, except for those delinating illegible text in the original.

(Call on: SECRETARY HERTER
SECRETARY McELROY)

Paragraph 13 (page 12) sets forth our policy on chemical and biological weapons. The majority would leave the language of the existing paper unchanged, but Budget and Treasury propose that the President decide on the *stockpiling* of such weapons, as well as their use.

It is my understanding that the Director of the Bureau of the Budget feels that we are either spending too much or too little on these weapons, and his effort is to clarify our posture with respect to the employment of such weapons.

(Call on: Mr. STANS)

Paragraphs 15 and 16 (pages 12 to 14) were not considered by the Planning Board. There is no issue in the paper before you on paragraph 15. However the Chiefs of Staff of Army and [illegible in the original]. As to paragraph 16 the issue is posed by the State submission which appears in the Annex on page 61.

There are two issues posed by this paragraph. *First*, shall we consider that the term "limited aggression" (I would hope that we can substitute *limited* aggression for *local* aggression) refers only to conflicts in the less developed areas; or is it conceivable that a limited war could be fought in *developed* areas such as NATO Europe, non-NATO Europe, or Japan? What about Communist China? Could our problem be met by directing our planning against the contingency of limited aggression using the term to refer to conflicts occurring *outside of the NATO area*?

(Call on: SECRETARY HERTER
SECRETARY McELROY)

The *second* issue in this paragraph is this: With respect to local or limited aggression, (a) would U.S. objectives be served by prompt and resolute application of force necessary to defeat such local aggression; or (b) might U.S. interests be served in certain cases by restricting the application of force to that degree necessary to achieve objectives of limiting the area and scope of hostilities and restoring the *status quo ante*?

It is agreed that with respect to local or limited aggression the use of any U.S. force will be applied in a manner and on a scale best calculated to avoid hostilities from broadening into general war.

(Call on: SECRETARY HERTER
SECRETARY McELROY)

Paragraph 17 (page 14) deals with the "cold war" contribution which the capabilities of U.S. military forces can make. USIA proposes deleting the clause which uses the term "cold war". (It may be noted that paragraph 9 sanctions the use of the term "cold war" and is already tentatively agreed to by the Council.)

(Call on: MR. GEORGE ALLEN)

Paragraph 18 (page 14) deals with U.S. bases overseas. It omits the reference to the possibility of “a small net expansion” of the base system, which was written into basic policy last year. The revised language reads:

“The entire overseas base system should continue to be reviewed periodically in order to assure that base requirements are adequately met and are related realistically to developments in weapons technology and other factors.”

The last sentence of paragraph 18 (which is unchanged) deals with the positioning of IRBM’s around the Soviet periphery. While the Planning Board has not as such recommended any change in policy, on my own motion I submit that IRBM’s should be the subject of a separate paragraph and not included in the paragraph on U.S. overseas bases. I therefore propose to the Council the following new paragraph:

“IRBM’s will be positioned only in those NATO and other Free World nations which demonstrate a desire to have them, and pressure will not be exerted by the United States to persuade reluctant nations to accept them. Proposals for the positioning of IRBM’s outside the NATO areas will be subject to approval by the President.”

Paragraph 19 (page 15) treats generally of strengthening the collective defense system. As revised, it contains the new guidance that the United States should, as practicable, “induce Western European and other allies with well-developed economies to increase their share in collective defense.”

Paragraph 20 (page 15) is amended to say that we should educate not only our *allies*, but the *Free World* as a whole as to the importance of nuclear weapons as an integral part of the arsenal of the Free World.

178. Memorandum of Meeting with the President¹

Washington, July 15, 1959

Present:

General Goodpaster

1. I indicated to the President that I wished to talk with him further about paragraph 12 *a* of Basic National Security Policy. I reported that

¹ Source: Discussion of proposed changes to paragraph 12–a of NSC 5906, basic national security policy. Top Secret. 7 pp. Eisenhower Library, White House Office Files, Project Clean Up. Drafted on July 17.

the Planning Board had spent some further time on this paragraph on July 14. I said I felt we were pretty well narrowing the issues down to two questions which I showed him on the attached sheet.

I said that it seemed to me now clear that at the Planning Board level the State Department view was that we do not *now* have an adequate conventional limited war capability and that the State Department effort would be to enlarge our *present* capabilities. I said that one way to "smoke out" this issue would be insert the words "continue to" in the fifth line if the redraft of paragraph 12 *a*, marked "NSC", attached.

I then pointed out to him that the Defense Department felt that the only criteria that should govern the use of nuclear weapons were military criteria and that the Defense Department would want 12 *a* to read: "Planning should contemplate situations short of general war where the use of nuclear weapons manifestly not be militarily necessary nor militarily appropriate to the accomplishment of national objectives . . ."

The President said that he felt that this definition was too narrow and agreed that the insertion of the word, "deemed" before "appropriate" in the eighth line would more nearly meet his views.

I also pointed out to the President that the JCS had objected to the phrase, "organized units" and had proposed a substitution therefor of the phrase "designated commanders." I suggested to the President that this probably was not quite what he had in mind and offered the language "combatant forces" which he thought well of.

The President expressed his displeasure at not being able to find language which was clear and decisive and would communicate to everyone concerned his clear intention. I pointed out to him that it would be unlikely that he would wish to change this language next year and that a new administration would likely not rush in with major changes in basic policy at the beginning and that therefore we were writing language for the next two or three years, or possibly more. Therefore, it was necessary that the language be clear and definitive and understood and accepted by all.

Attached are redrafts of the paragraph reflecting JCS, Defense and other views.

2. I then said to the President that I had read and considered Mr. C. D. Jackson's letter and that I thought well of his suggestion. I also indicated I felt that he should be present. The President agreed and said he had already written Mr. Jackson a letter agreeing to the meeting, adding a couple of names to the list and saying that the timing would depend only upon whether it was important to have Mr. Herter present.

3. I referred to the conversation I had had with the President on July 13 relative to the Defense Department concern about State Department position papers for the Geneva Conference. I said that I had had a long talk with Mr. Murphy and he had also talked with Mr. McElroy and I felt

that the matter was substantially straightened out. The difficulty had been that the State Department had released to Defense a staff working paper which purported having departmental concurrence, which Mr. Murphy said did not indeed have departmental concurrence. He said some of the individual concurrence shown on the paper had not in fact been given. I said to the President that he need not at the moment concern himself any further with this problem.

Gordon Gray

Special Assistant to the President

Attachment

Washington, undated

1. Do we now have the necessary conventional capabilities for meeting limited war requirements?

(State, Army, Navy say “No”)

2. Will the use of nuclear weapons be based solely on military criteria; that is to say, are there situations where political considerations could override military desirability?

(Defense seems to say “Yes” to the first, “No” to the second)

NSC Draft

Washington, July 9, 1959

REDRAFT OF PARAGRAPH 12–a

It is the policy of the United States to place main, but not sole, reliance on nuclear weapons; to integrate nuclear weapons with other weapons in the Armed Forces of the United States; and to use them when required to meet the nation’s war objectives. Planning should continue to contemplate situations short of general war where the use of nuclear weapons would manifestly not be militarily necessary nor deemed appropriate to the accomplishment of national objectives, particularly in those areas where main Communist power will not be brought to bear. All deployed combatant forces will be prepared to use nuclear weapons when required in defense of the command. Advance authorization for the use of nuclear weapons is as determined by the President.

Attachment**JCS Draft**

Washington, July 9, 1959

REDRAFT OF PARAGRAPH 12-a

It is the policy of the United States to place main, but not sole, reliance on nuclear weapons; to integrate nuclear weapons with other weapons in the Armed Forces of the United States; and to use them when required to meet the nation's war objectives. Planning should contemplate situations short of general war where the use of nuclear weapons would manifestly not be militarily necessary nor militarily appropriate to the accomplishment of national objectives, particularly in those areas where main Communist power will not be brought to bear. All designated commanders will be prepared to use nuclear weapons when required in defense of the command. Advance authorization for the use of nuclear weapons is as determined by the President.

Attachment**Defense Draft**

Washington, July 9, 1959

REDRAFT OF PARAGRAPH 12-a

It is the policy of the United States to place main, but not sole, reliance on nuclear weapons; to integrate nuclear weapons with other weapons in the Armed Forces of the United States; and to use them when required to meet the nation's war objectives. Planning should contemplate situations short of general war where the use of nuclear weapons would manifestly not be militarily necessary nor militarily appropriate to the accomplishment of national objectives, particularly in those areas where main Communist power will not be brought to bear. All deployed organized units will be prepared to use nuclear weapons when required in defense of the command. Advance authorization for the use of nuclear weapons is as determined by the President.

Attachment**Others Draft**

Washington, July 9, 1959

OTHERS REDRAFT OF PARAGRAPH 12–a

It is the policy of the United States to place main, but not sole, reliance on nuclear weapons; to integrate nuclear weapons with other weapons in the Armed Forces of the United States; and to use them when required to meet the nation's war objectives. However we should be prepared to cope with situations short of general war where the use of nuclear weapons would manifestly not be militarily necessary nor appropriate to the accomplishment of national objectives, particularly in those areas where main elements of Soviet and Chinese Communist power will not be brought to bear. All deployed organized units will be prepared to use nuclear weapons when required in defense of the command. Advance authorization for the use of nuclear weapons is as determined by the President.

179. Briefing Note for the July 16 NSC Meeting¹

Washington, July 15, 1959

Basic National Security Policy (NSC 5906)

We resume consideration of Basic National Security Policy by taking up NSC 5906 and also a 4-page change sheet which was distributed to you this morning. These changes were made in the Planning Board, taking into account the comments of the Consultants and further consideration by the departments and agencies.

Paragraph 19 (page 15) treats generally of strengthening the collective defense system. As revised, it contains the new guidance that the United States should, as practicable, "induce Western European and other allies with well-developed economies to increase their share in collective defense."

Paragraph 20 (page 15) is amended to say that we should educate not only our *allies*, but the *Free World* a whole as to the importance of nuclear weapons as an integral part of the arsenal of the Free World.

¹ Source: NSC 5906, basic national security policy. Top Secret. 7 pp. Eisenhower Library, Whitman File, NSC Records.

Paragraph 23 (page 16), which is split, proposes a major change in policy with respect to the development of nuclear capabilities by additional nations. Present policy provides in essence that the United States should seek *to prevent* the development by additional nations of nuclear weapons capabilities (NSC 5810/1, paragraph 18, page 7). The new majority proposal is that the United States should first seek *to prevent or retard* development by additional nations of nuclear weapons capabilities.

The majority proposal goes on to say:

(Read Revised Para. 25–b)

The Defense-JCS version would not have us seek to prevent or retard the development by additional nations of nuclear weapons; it would sanction exchanging with, or providing to, additional selected allies information on nuclear weapons; but it would not go so far as to be prepared to make *nuclear weapons* themselves available to selected allies. (The Joint Chiefs in their formal comments support this version).

Inescapably related is *paragraph 24* (page 18), [which states present policy to the effect that the United States should consider the long-term development of a NATO nuclear weapons authority.]²

Defense and JCS would leave Paragraph 24 unchanged. The majority, however, views the question with greater urgency and would say in Paragraph 23 c:

(Read Revised Para 23 c)

Paragraph 25–a (page 18) is a revised general guidance paragraph on providing military assistance to nations “whose increased ability to defend themselves and to make their appropriate contributions to collective military power is important to the security of the United States.”

Paragraph 25–b (page 19) is new, and deals with military aid to *other* nations, including uncommitted nations. It reads:

(Read paragraph 25–b, page 19)

Paragraph 25–c (page 20) is also new, and grows out of the OCB conclusions on the overseas internal security program.

Paragraph 26 (page 20) is a new item of guidance and would encourage, in less developed nations, the participation of indigenous military forces in economic, social, and psychological programs.

Paragraph 28 (page 21) is the general paragraph on military research and development which is in existing policy, with two new sentences added on nuclear weapons R & D. They read:

(Read paragraph 28–a, page 21, last two sentences)

We now resume discussion of the political and economic section at the point where we left off at the Council meeting three weeks ago, and take up paragraph 36.

² Brackets are in the original.

Paragraph 36 (page 28) a new paragraph which would apply world-wide a policy contained in the current Latin America paper (NSC 5902/1), deals with maintaining contact with selected non-Communist opposition elements. I believe that we should add “through appropriate channels”.

Paragraph 37 (page 28) seeks to spell out more clearly our general attitude toward newly-emerging nations.

The third sentence is new, and grows out of our delays in the Guinea case. It reads:

(Read third sentence of paragraph 37)

The fourth sentence is new, and applies world-wide a policy idea contained in the Horn of Africa paper (NSC 5903). The sentence here reads:

(Read fourth sentence of paragraph 37)

Paragraph 38 (page 29) is new. The first sentence is agreed. Then we had a split which has since been resolved. At the end of the last sentence of this paragraph, which sentence outlines the factors to be taken into account when the United States is determining an independent course, Defense proposes to add: “recognizing, however, that the United States should not allow the attitudes and emotions of the mother country unduly to influence actions essential to attaining or preserving U.S. objectives in emerging or newly independent countries.”

(Call on: SECRETARY McELROY
SECRETARY HERTER)

Par 39 (p. 31) is old 34, broadened at the suggestion of OCB to include, in subparagraph *b*, U.S. action against non-Communist elements hostile to U.S. interests. State, Defense and JCS want to keep subparagraph *a* as it was in the old paper. Treasury would change the last clause, as indicated in the second bracket.

(Call on Under Secretary Scribner
Secretary Herter
Secretary McElroy
Admiral Burke)

Par 41 (p. 32) is new. It recognizes foreign labor’s importance in opposing Communist efforts to control foreign trade unions.

Par 42 (p. 32) is an agreed paragraph on our foreign economic policy except for the last sentence in *b*. Budget and Treasury would like to keep this sentence, which was the second sentence in old 29–*a*. Several of the consultants and most of the PB questioned this sentence. One argument against it was that there is no functional relationship between economic development assistance on the one hand and other economic assistance and military assistance on the other. Another argument against it was that it simply doesn’t happen. Mr. Randall supports the majority.

(Call on Mr. Stans
Under Secretary Scribner
others)

At the bottom of page 33, in the third line of *b*, the PB agreed that "public capital" should be deleted and "such assistance" substituted. If there is no objection, this change will be made.

Paragraphs 43 and 44 (beginning on p. 34) are old 27 extensively reorganized, rewritten, and enlarged. There was a split in 43-*d* which has since been resolved by changing the first sentence. 43-*d* now reads as follows:

"Utilize and support the efforts of Free World international financial institutions to the maximum extent possible to promote economic development and to bring about economic reforms in less developed nations."

There was also a split in *f* which has also been resolved by rewriting the subparagraph. It now reads:

"Make U.S. public capital available in adequate amounts on a long-term basis for the purpose of supplementing the capital available from other sources for sound economic development in less developed areas. U.S. lending agencies should be assured of continuity in order to contribute to this purpose."

Turning to par 44, subparagraph *a* is new, and I would like to read it.
(Read 44-*a*)

In 44-*b* there was a split, but State has withdrawn its objection to the bracketed language. The last sentence in 44-*b* was agreed to by the PB, but I would like to read it because it is new and because it was the result of considerable debate.

(Read last sentence of 44-*b*)

Par 45 (p. 42), is new, and incorporates what is already in the approved economic defense policy (NSC 5704/3).

Par 51 (p. 44) on the conduct of negotiations with the USSR, is largely an updating of old 39, I would, however, call your attention to the last sentence, which has been added for unmistakable clarity: "Agreements affecting strength and deployment of military forces should include provisions for effective safeguards against violations and evasions."

Par 52 (p. 45) is the general paragraph on disarmament contained in existing policy, with a slight clarification at the beginning. The old language reads:

"Safeguarded arms control should be sought with particular urgency, in an effort to reduce the risk of war, etc."

There was a feeling in the P/B that the phrase "particular urgency" might be misinterpreted as applying to the urgency of entering into negotiations, rather than to the urgency of developing arms control measures first and then negotiating. The opening sentence has therefore been revised to read:

"Efforts to develop safeguarded arms control measures should be continued with particular urgency, and agreement thereon sought, in an effort to reduce the risk of war, etc."

No change in policy is intended.

Par 54 (p. 47) contains two new sentences. They are:

(read the last two sentences of 54)

Since the PB prepared this paper, the OCB has been working on the problems connected with U.S. personnel overseas, and pointed out the need for policy guidance on this subject. I agreed, with PB concurrence, to propose a paragraph which would come after 54, to read as follows:

(read 54A from the blue page dated July 7)

180. Memorandum From Haydn Williams to Twining¹

Washington, July 20, 1959

SUBJECT

Basic National Security Policy (NSC 5906)

1. Secretary McElroy has requested that I bring to the attention of the Joint Chiefs of Staff his views regarding the redraft of paragraph 12-*a* of NSC 5906 prepared by Gordon Gray on the basis of oral remarks by the President. The text of this redraft is set forth in the enclosure to this memorandum.

2. Secretary McElroy finds the redraft of paragraph 12-*a* acceptable. However, in view of the widely divergent interpretations placed upon it following its circulation, he has recommended that the following note be made a part of the NSC Record of Action:

“Paragraph 12-*a* of NSC 5906 was approved by the President with the understanding that it is not to be interpreted as a change in policy but rather as a clarification of existing policy with respect to the use of nuclear weapons and the requirement for maintaining balanced forces.”

3. Defense tabled the above note at last Friday’s Planning Board meeting, at which time it was concurred in by the majority of the Planning Board including State. In tabling this note and accepting the redraft of paragraph 12-*a* at the Planning Board, Defense did so with the understanding that:

a. The first sentence of the redraft applies across the board, i.e., to general *and* limited war.

¹ Source: Possible revisions to paragraph 12-*a* of NSC 5906, basic national security policy. Top Secret. 3 pp. NARA, RG 59, S/P-NSC Files: Lot 62 D 1.

b. The second sentence of the redraft covers limited war situations in areas where the main Communist power (Sino-Soviet bloc Power) would not be brought to bear: Central and South America, the Caribbean and Africa. In these areas the use of nuclear weapons would be manifestly neither militarily necessary nor politically appropriate. In areas such as the Middle East, South Asia and Southeast Asia, the decision as to the use of nuclear weapons in limited war would be made in the light of the then existing circumstances, including the involvement or non-involvement of main Communist power. In areas where main Communist power would be clearly involved, it is anticipated that nuclear weapons would be used. Such areas would include hostilities on the mainland of China and Korea. The possibility of limited war on the Continent of Europe involving sizable forces of the U.S. and the USSR is ruled out; situations short of limited war such as incursions, infiltrations and hostile local actions, involving the U.S. and the USSR, are covered by the NATO political directive and strategic concept.

c. The third sentence of the redraft provides that in all contingencies covered in sub-paragraph *b* above, deployed U.S. combat units will have a nuclear capability and designated major commanders of such units will be prepared to use this capability when required in defense of their commands.

d. There is no controversy regarding the fourth sentence of the redraft.

The above is based upon our understanding of the President's views and those expressed by Mr. McElroy.

4. Secretary McElroy is interested in discussing the foregoing paragraph with the Joint Chiefs of Staff within the next few days.

/s/ Haydn Williams

Deputy Assistant Secretary

Enclosure

Paragraph Prepared by Gorden Gray

Washington, July 9, 1959

REDRAFT OF PARAGRAPH 12-a

It is the policy of the United States to place main, but not sole, reliance on nuclear weapons; to integrate nuclear weapons with other weapons in the Armed Forces of the United States; and to use them when required to meet the nation's war objectives. Planning should contemplate situations short of general war where the use of nuclear weapons would manifestly not be militarily necessary nor appropriate to the accomplishment of national objectives, particularly in those areas where main Communist power will not be brought to bear. All deployed organized units will be prepared to use nuclear weapons when required in defense of the command. Advance authorization for the use of nuclear weapons is as determined by the President.

181. Telegram Tocah 162 to Herter in Geneva¹

Washington, July 20, 1959, 9 p.m.

Tocah 162. For Secretary from Acting Secretary. Reference: Cahto 154.

At PB meeting Friday Defense member indicated SecDef willing go along with Gray's paragraph 12-a as drafted providing agreement reached on inclusion of following sentence as footnote or in record of action:

"Paragraph 12-a of NSC 5906 was approved by the President with the understanding that it is not to be interpreted as a change in policy but rather as a clarification of exiting policy with respect to the use of nuclear weapons and the requirement for maintaining balanced forces."

Department PB member said proposal probably acceptable to State but would prefer have language above in record of action rather than footnote. Treasury, Budget, OCDM agreed; Chiefs reserved; sentence believed satisfactory because makes no change in substance of Gray S draft paragraph 12-a which we willing accept. Additionally, refers "requirement" for balanced forces which not elsewhere mentioned.

Remaining question merely whether policy is to be considered "change" or "clarification" but since we have already agreed to Gray formula further argumentation this point in NSC would certainly be unproductive. Accordingly I called McElroy and confirmed Department's acceptance of his suggested sentence for inclusion in record of action. When I saw him on Sunday I told him that we felt language represented new policy but if he preferred to call it clarification that would be satisfactory by us as long as it understood that new language as such would henceforth be guiding without reference to superseded languages. This seemed satisfactory to McElroy and unless you have other instructions this is line I intend to take in NSC.

Dillon

182. Telegram Cahto 159 From Herter in Geneva¹

Geneva, July 21, 1959

Cahto 159. For Acting Secretary From the Secretary.

Reference Tocah 162. I endorse the line you proposed in reftel. However there should be further monkeying with the buzz saw at the next NSC meeting or should you in your discretion feel warranted you could convey to NSC following message from me:

QUOTE. Whether proposed changes are considered new policy or clarification of old policy does not strike me as an important distinction. The Council decision being proposed is important, as is evidenced by the unusual amount of top governmental consideration which has been given to it.

My predecessor proposed a change or clarification of our military strategy more than a year ago. He agreed to a continuation of the old language in NSC 5810 on condition that it be immediately subjected to interdepartmental review. It should be recalled that during the 1958 and 1959/NSC discussions the majority of the Joint Chiefs believed that a policy change/clarification was a first importance.

The Department of State submitted to NSC sometime ago a paper on Foreign Policy Requirements to be considered in connection with the development of military strategy. This paper was prepared originally in response to a request by the Department of Defense for foreign policy guidance. My responsibility as Secretary of State will be discharged if the military paragraphs of the basic paper meet these foreign policy requirements. The details of force levels and budget division among the military services is not my business. However, I assume that the "clarification" phrase "and the requirement for maintaining balanced forces" would permit the US to have a military capacity to engage to some significant extent in limited hostilities without the necessity for automatic resort to nuclear weapons.

I understand that there has been some suggestion that opinion in the Department of State is divided on the necessity for and the meaning of the proposed change/clarification in policy. I can assure you that the Department of State is unanimous on the above position and speaks with one voice. UNQUOTE.

183. NASC Paper¹

Washington, July 23, 1959

BASIC NATIONAL SECURITY POLICY (NSC 5906)

PROPOSED REVISIONS

Page 48, paragraph 55–b:

a. Delete the first sentence of the paragraph (including the split language), and substitute therefor the following:

“The goal of our economic policy is the achievement, within a framework of free competitive enterprise and reasonable price stability, of vigorous, orderly and sustainable economic growth and progress, including the efficient employment of resources at high levels.”

b. In the first line of subparagraph *b*–(1), substitute the work “could” for the word “would”.

Page 49, paragraph 55–c–(2): Delete the first clause and the footnotes relating thereto, and substitute the following: “Strive for a vigorous, orderly and sustainable economic growth;”.

Page 50, paragraph 55–d, line 6: Insert the word “reasonable” before the word “price”, and the words “and competitive” after the word “free”.

*PROPOSALS FOR MODIFYING PARAGRAPH 62 OF NSC
5906 PUT FORWARD AT THE INFORMAL MEETING OF THE
NATIONAL AERONAUTICS AND SPACE COUNCIL*

Pages 54–55:

a. Delete the first sentence of the paragraph and substitute therefor the following:

“The United States should continue actively and with a sense of urgency to pursue programs to develop and exploit outer space capabilities as needed to ensure the attainment of national objectives in scientific, military and political areas. These programs should be designed to secure and maintain for the United States a position of supremacy in outer space activities without requiring that the United States be the leader in every phase of space exploitation.”

b. Delete section (2) of the paragraph and substitute therefor the following:

“(2) a military space program designed to exploit the application of advancing space technology whenever that exploitation will sensibly extend U.S. military capabilities;”.

184. Memorandum of Conference with the President¹

Washington, July 27, 1959

OTHERS PRESENT

General Twining
General Goodpaster

The President greeted General Twining warmly, told him how delighted he is that he is making a good recovery, and welcomed him back to duty. He asked to what extent General Twining had found it possible to keep up with developments while convalescing. General Twining said he had kept up fairly well, having talked frequently with Mr. McElroy and General Picher.

The President said that one matter now current that concerns him very much is a question over basic military concept under discussion in the national security policy paper. It seems that the Army and the Navy want to divert money from our "big deterrent" to small war forces. He recalled that we had had a thorough study of this in 1953, culminating in the so-called "new look". He did not think that we had gone too far in the direction suggested by that study, but Army and Navy seemed to think we had. He said he had developed language which seemed to him to express the position correctly, and there was agreement on this language. Mr. McElroy, however, wants to say that the new language does not in any way change the policy that has been in effect in the Department of Defense, and to this statement the Army and the Navy seemed to be opposed.

General Twining said that the State Department also has asked for substantial increases in conventional forces. The President commented that the State Department has now accepted the language of which he was speaking.

On another subject, the President recalled that, in connection with his reorganization plan of last year, a new procedure for three- and four-star officers had been instituted. He now thought that perhaps there is reason not to apply this procedure to officers who have a purely single service function, such as the Chiefs of Bureaus in the Navy and of Technical Services in the Army. He does not want to put work before the JCS that is simply time consuming or pro forma—on which they have no judgment to contribute. He asked General Twining to give some thought to this matter.

¹ Source: Basic national security policy; Department of Defense reorganization; Net Evaluation Subcommittee. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

General Twining said he wished to raise the question whether the net evaluation subcommittee, which is carrying out a special study this summer, with its regular report deferred until next January, might skip making a full study in mid-year 1960. The President suggested that he talk to Gordon Gray about this. The President commented on a study which he had suggested within recent days—to see what this country would really look like five days or so following nuclear attack. He had suggested that it ought to be conducted by a very small group—say five officers in the grade of Major or Lt. Colonel, plus a representative from OCDM. The task would be not to produce a long dissertation but to use imagination, and by pictures and figures try to convey just what the situation would be.

The President asked General Twining to what extent plans and operations in the Pentagon seemed to have been slowed down by the fire. General Twining said no slow down seems to be noticeable. The President reiterated what he has said on many previous occasions—that he feels there is a lot of unnecessary activity going on in the Pentagon, if one could only get at determining just what could be eliminated.

As the meeting ended the President asked General Twining how he is feeling from the standpoint of energy and personal comfort. General Twining said he is feeling quite good, but that it will be six to eight weeks, the doctors tell him, before he will be really recovered.

A.J. Goodpaster
Brigadier General, USA

185. Memorandum of Meeting Between Eisenhower and Gray¹

Washington, July 27, 1959, 10:30 a.m.

1. Robert Gray, Secretary to the Cabinet, joined us to discuss the Cabinet paper "Removal of Papers by Retiring Department and Agency Heads" (CP 59–58/4). I pointed out to the President that the paper which he had approved did not specifically advert to classified documents of the National Security Council and that it seemed well to have the covering memorandum make some reference to these

¹Source: Study of aftermath of nuclear war; Wheelus Air Force Base; basic national security policy; Senate consideration of NSC structure. Top Secret. 5 pp. Eisenhower Library, White House Office Files, Project Clean Up, Staff Memos.

papers. Thereupon Mr. Robert Gray presented to the President the draft document which is attached to Mr. Lay's copy of this memorandum. The President approved the document and Mr. Robert Gray left the meeting.

2. I then asked the President whether he would be willing to see Mr. Charles A. Haskins for a few minutes at the conclusion of my business with the President to discuss the Jackson Committee study in view of the fact that Mr. Haskins was to be the President's personal representative. I indicated that I felt that it would make Mr. Haskins a more useful representative from the point of view of morale and it seemed to me important for Mr. Haskins to hear from the President the limitations he wished put upon the scope of the study. The President said he would see Mr. Haskins and I added that Mr. Edward McCabe would come in at the same time.

3. I then discussed the draft Record of Actions of the NSC meeting of July 23 with the President and called his attention particularly to item 1c. I indicated that the Office of Civil and Defense Mobilization had requested that it participate in any such study. I also pointed out to him that there was a difference of view between Defense and the Bureau of the Budget as to the second sentence in paragraph 1c. Defense wishing it deleted and Budget wishing it retained even though it might be modified in some respects.

The President said that he wanted no "ponderous studies" on this subject and that he wished an examination to be made by capable junior officers. He wasn't even sure that he wished the study to be an NSC undertaking. However, he thought that such a study might be just for the benefit of the members of the National Security Council. He felt that he would like a picture of what the military believes to be the situation after a nuclear exchange. He would like to know what they felt to be the status of our resources, how we would have to use them, and in what way we would have to use them. For example, would our remaining resources be necessary for the purpose of winning the war or would the problem be one of survival.

He then recalled that the request that he had made in the July 23 meeting was that junior staff officers make the study and that the senior officers of the Services should not involve themselves except as they took an interest in what their subordinates were doing. The President felt that he would like to know what really would be the military problem under the conditions of a nuclear exchange and thought it was possible that such a study would show that rather than planning to increase and enlarge the military services in such a situation, quite a different approach might be indicated. He reiterated that perhaps our

whole “mobilization base” thinking for such an emergency is obsolete, adding that a study might suggest an enlargement.

I indicated to the President that we would reflect that he had made a request for a study by junior staff officers with the participation of staff from OCDM. He approved this approach.

4. I then presented the attached draft memorandum to the President for his approval. I reminded him that he had directed that this procedure be followed some weeks ago, but that I had delayed taking action at Mr. Harr’s request until we were nearer the point of having a new Chairman of the OCB. Mr. Harr had felt and I had agreed with him that the letter of appointment to the new Chairman might be used as an occasion to indicate that the action concerning progress reports was not a downgrading of the OCB but rather put a heavier requirement upon the OCB.

I pointed out to the President that the State Department legislation had now been passed by the Congress and he would soon be in a position to appoint Mr. Murphy. The President approved the attached draft.

5. I reported to the President that in connection with current discussions about aid to Libya and certain possible covert actions in that country there had emerged for the first time to my knowledge the fact that the military perhaps did not consider the Wheelus base in Libya an essential base. I said this was not the final position of the JCS but that the Joint Staff had concluded that although the Wheelus base had very important peacetime functions, especially for training, there was no general war role for it. I told the President that I supposed that this was because of the comparative vulnerability of this base to Soviet IRBMs.

The President asked me whether the military wished to abandon it and have the Soviets take it over. I replied that I was sure that the military would not like such a result but that the reexamination was in part forced by an awareness that we probably cannot meet Libyan demands.

I repeated that this was not a final judgment but that I thought that the President ought to know that for the first time questions were being raised about the necessity for the base.

6. I reported to the President with respect to a 5412 activity, which is the subject of a specific memorandum.

7. I then discussed paragraphs 12 *a* and 16 of the Basic Policy paper. As to 12 *a*, I reported to the President that the Secretaries of State and Defense seem now to be in agreement on the version of 12 *a* which is attached, calling his attention to the footnote which would appear in the Record of Actions. I said to the President that we thus had an agreement between the principal department heads but that there was

still some disagreement within the military establishment. I said that I feared, for example, that the Chief of Staff of the Army would not find the footnote compatible to his thinking and that he had tended to interpret the language in paragraph 12 *a* in a way quite different from the interpretation placed upon it by the Chief of Staff of the Air Force and by the Secretary of Defense. Thus, I felt that the problem with respect to this paragraph as we would discuss it in the NSC meeting on July 30 would be whether he wished to allow those who found themselves in disagreement, to speak to it, recommending that he do so. The President agreed and said that he would welcome any further comments but he was in accord with my suggestion that this be the last meeting on the subject.

I then showed the President the draft of paragraph 16, which is attached. I pointed out to him that it defined local aggression as conflicts occurring outside of the NATO area.

This draft recognized that the engagement of sizeable US and USSR forces in NATO could not be considered local aggression and that short of such a situation we were reaffirming our commitment to NATO and NATO planning. The President agreed with this saying that in such a situation the decision could not be a unilateral US decision.

I also called the President's attention to the word "balance" in the second line, pointing out that the Defense Department would probably object to it (it having been a State Department submission at the Planning Board) and that I personally would recommend against it in the light of the footnote to paragraph 12 *a*, and also because the reference here was to capability and not to forces. It seemed to me that what we really required was a flexible and selective capability. The President agreed and felt also that in the third line, the word "as" should be changed to "in cases" and the inter-lineation in the attached draft was in his own hand.

8. At this point Mr. McCabe and Mr. Haskins came into the meeting. I introduced Mr. Haskins to the President, pointing out to the President that the subject of the discussion was the Jackson Committee study.

The President began by stating that Mr. Haskins had been designated his representative in accordance with the guidelines agreed upon by the President and Senator Jackson. He then made the following points:

(1) There is a precedent for a Presidential representative to sit in at Congressional hearings in the case of the Immigration Committee, an arrangement which the President had established with General Swing. When that Committee has dealt with special cases (presumably the admission of defectors to this country under the exceptions procedure

of the McCarran-Walter Act), the President's representative has on occasion drawn the line with respect to the scope of Committee questioning, and the Committee has acceded.

(2) Of course, nobody is going to get into the substance of national security matters; that is out of bounds. That would open up the way for Senators to talk to their constituencies and to the press.

(3) The Jackson Committee at first went far afield, but has now decided to limit the inquiry. NSC discussion is advice given to the President and as such it is privileged.

Mr. Gray indicated that it seemed to him that problems with the Jackson Committee could arise in two ways: First would be the question of release of testimony taken in executive session. This matter could be dealt with by use of the Committee transcript, and Mr. Haskins would not be forced to take a position until after consultation with Mr. McCabe and others. The second and more difficult problem involves the issue of whether a question put to a witness involved substantive matter. At this point the President's representative would find it necessary at least to raise a question with the Committee Chairman.

Mr. Haskins then raised with the President the need for a clear understanding of the exact scope of his responsibilities as the President's representative, pointing out that questions might arise as to the interpretation of the agreed guidelines and particularly as to where the line between substance and procedure was to be drawn.

In response the President made the following points:

(1) That of course Mr. Haskins was not going to the Committee just to sit there as an observer; that it was up to Mr. Haskins to raise a warning light and, should the occasion arise, to say, "Now just a minute."

(2) That Mr. Haskins was not to challenge the Chairman of the Committee, but that he was to point out where in his opinion he thought they were getting close to the dividing line.

(3) That it is far better to stop something in advance rather than to let it get into the record and then have to try to take it out of the record later.

Gordon Gray
Special Assistant to the President

Revised Paragraphs for NSC 5906

Washington, undated

10. [Par. 8 of NSC 5810/1, amended.]² A central aim of U.S. policy must be to deter the Communists from use of their military power,

¹ Source: Transmits revised paragraphs of NSC 5906. Top Secret. 8 pp. Eisenhower Library, Whitman File, NSC Records.

² All brackets, except those that indicate footnotes in the original, are in the original.

remaining prepared to fight general war, should one be forced upon the United States. This stress on deterrence is dictated by the disastrous character of general nuclear war, a danger of local conflicts developing into general war, and the serious effect of further Communist aggression. Hence the Communist rulers must be convinced that aggression will not serve their interest: that it will not pay.

12-*a*. [Par. 10-*a* of NSC 5810/1, amended.] It is the policy of the United States to place main, but not sole, reliance on nuclear weapons; to integrate nuclear weapons with other weapons in the Armed Forces of the United States; and to use them when required to meet the nation's war objectives. Planning should contemplate situations short of general war where the use of nuclear weapons would manifestly not be militarily necessary nor appropriate to the accomplishment of national objectives, particularly in those areas where main Communist power will not be brought to bear. Designated commanders will be prepared to use nuclear weapons when required in defense of the command. Advance authorization for the use of nuclear weapons is as determined by the President.³

15. [Par. 13 of NSC 5810/1, unchanged.] In carrying out the central aim of deterring general war, the United States must develop and maintain as part of its military forces its effective nuclear retaliatory power, and must keep that power secure from neutralization or from a Soviet knockout blow, even by surprise. The United States must also develop and maintain adequate military and non-military programs for continental defense. So long as the Soviet leaders are uncertain of their ability to neutralize the U.S. nuclear retaliatory power, there is little reason to expect them deliberately to initiate general war or actions which they believe would carry appreciable risk of general war, and thereby endanger the regime and the security of the USSR.

16. [Par. 14 of NSC 5810/1, amended.] Military planning for U.S. forces to oppose local aggression will be based on a flexible and selective capability, including nuclear capability for use in cases authorized by the President. Within the total U.S. military forces there must be included ready forces which, in conjunction with indigenous forces and with such help as may realistically be expected from allied forces, are adequate (a) to present a deterrent to any resort to local aggression, and (b) to defeat such aggression, or to hold it pending the application of such additional U.S. and allied power as may be required to

³ Paragraph 12-*a* of NSC 5906 was approved by the President with the understanding that it is not to be interpreted as a change in policy but rather as a clarification of existing policy with respect to the use of nuclear weapons and the requirement for maintaining balanced forces. [Footnote is in the original.]

defeat it quickly. Such ready forces must be highly mobile and suitably deployed, recognizing that some degree of maldeployment from the viewpoint of general war must be accepted. When the use of U.S. forces is required to oppose local aggression, force should be promptly and resolutely applied in a degree necessary to defeat such local aggression. Force should be applied in a manner and on a scale best calculated to prevent hostilities broadening into general war. Local aggression as the term is used in this paragraph refers to conflicts occurring outside the NATO area in which limited U.S. forces participate because U.S. interests are involved. The possibility of local aggression involving sizable forces of the United States and the USSR is ruled out. Incidents in the NATO area such as incursions, infiltrations and hostile local actions, involving the United States and the USSR, are covered by the NATO political directive and strategic concept.

62. [New] *Outer Space*. The United States should continue actively [and with a sense of urgency]⁴ to pursue programs to develop and exploit outer space as needed to achieve scientific, military and political purposes.

Objectives should include: (1) a broad-based scientific and technological program in space flight and planetary-interplanetary exploration which will extend human knowledge and understanding; (2) a military space program designed to extend U.S. military capabilities through application of advancing space technology, [only in fields where such applications show promise of offering advantages over other possible means for achieving required capabilities];⁵ (3) a civil space program designed to promote the peaceful uses of outer space; and (4) as consistent with U.S. security, achievement of international cooperation in the uses of and activities related to outer space—for peaceful purposes, and with selected allies for military purposes.

⁴ Treasury-Budget propose deletion. [Footnote is in the original.]

⁵ Budget-Treasury proposal. [Footnote is in the original.]

187. Letter From Furnas to Smith (S/P)¹

Washington, July 30, 1959

Dear Gerry:

The military paragraphs of Basic National Policy were disposed of by the NSC this morning in a way which I think should please you. There was practically nothing new or interesting in the discussion, and the Acting Secretary took the line set forth in the exchange of telegrams you've seen. Paragraph 12–a stood as written with McElroy's note as a footnote. Twining commented that the language is all right with him so long as it is not a change of policy. He said he would have preferred the old but if the new one is agreed to he will not object. Paragraph 16 as agreed to in the Planning Board was amended only slightly and should cause us no serious trouble. Its main feature is that it leaves open the possibility of non-general war engagements between US and USSR forces so long as "sizeable" forces are not involved. Everyone agreed that the determination as to what is a sizeable force must be a question of judgement and needs to be looked at in individual circumstances. The "Radford Doctrine" is now out. Since paragraph 16 as now agreed to invalidates the present strategic concept and is satisfactory to the Department, Mr. Dillon withdrew our proposed definition of general war in paragraph 10.

The problem in the paragraph on enhancing the nuclear capability of selected allies is not yet fully resolved but will probably be settled before the end of the day. Only JCS is opposed to the version you last saw, and I believe they are coming around.

Attached are copies of paragraphs 12–a and 16 as they came out of this morning's meeting.

Sincerely,

Howard Furnas

P.S. Sorry to miss you next week, but I'm off to Georgian Bay. Glad this ball-game didn't go into extra innings. I feel that we just pushed over that winning run in the last of the ninth. Regards, HF.

[Footnote is in the original.]

188. Minutes of Cabinet Meeting¹

Washington, July 31, 1959, 9–10:40 a.m.

The following were present:

President Eisenhower

Mr. C. Douglas Dillon for Sec. Herter	Gen. Goodpaster
Sec. Anderson	Mr. Robert Gray
Mr. Thomas S. Gates for Sec. McElroy	Mr. Gordon Gray
AG Rogers	Mr. Harr
Mr. Edson O. Sessions for PMG	Mr. Kendall
Summerfield	Dr. Kistiakowsky
Mr. Fred Aandahl for Sec. Seaton	Mr. Morgan
Sec. Mueller	Dr. Pearlberg
Sec. Benson	Maj Eisenhower
Sec. Mitchell	Mr. Stephens—(in part)
Sec. Flemming	Capt Aurand—(in part)
	Mr. Patterson
Director Stans	
Gov. Hoegh	
Mr. John F. Floberg, AEC	
Dr. Raymond J. Saulnier, CEA	
Dr. Arthur Maxwell, Navy	
Dr. James H. Wakelin, Navy	

[Omitted here is the beginning of the minutes.]

Phase IV of OPERATION ALERT, 1959—Gov. Hoegh noted that the President's original suggestion for this fourth phase was for a 10-day "buttoned-up" period in October. Because many of the relocation sites are on college campuses—which would be active in October—and because of the cost involved, Governor Hoegh recommended an alternate procedure. Since, except for its final communications, the new underground facility at High Point will be completed by October, Gov. Hoegh's proposal is that there be a 2-day "familiarization test" of that facility by members of the Cabinet, other agency heads, and some 650 of the 2750 personnel for whom High Point is their emergency duty station.

The President approved the proposal of the Director of the Office of Civil and Defense Mobilization for Phase IV of OPERATION ALERT, 1959 as follows: (a) A familiarization test of the protected facility at High Point from 10:30 A.M., October 19, to 4:00 P.M., October 20; (b) Participation by heads of departments and major agencies plus 25 per cent of the agencies' emergency staffs designated to operate from High Point (of column three of Attachment B to approved Cabinet

¹ Source: Civil defense exercise and planning. Confidential. Extracts—4 pp. Eisenhower Library, White House Office Files, Cabinet Secretariat.

Paper 59–98/1); (c) Specific guidelines for Phase IV to be developed by the Office of Civil and Defense Mobilization in consultation with the interested agencies, through the Interagency Test Planning Group.

Funding of the Delegate Agencies' Civil Defense and Defense Mobilization Function—Gov. Hoegh described the manner in which Executive Branch agencies have been buffeted about by conflicting instructions from the House Appropriations Subcommittees—which this year have all but cut out funds for the “delegate agencies”. (Under this “delegate agency” program, for example, the Labor Department prepares emergency manpower plans, HEW would prepare a HEW post-emergency attack health and welfare plan, etc.—this being considered a more proper execution of departmental responsibilities than to have OCDM itself hire new people of its own to do such planning.)

Gov. Hoegh and Sec. Flemming emphasized that this “game” between the Executive and Legislative Branches has this year turned into a “procedural tragedy”.

The President spoke very strongly about the need for enough non-military defense to ensure that our \$40 billion military defense effort is not wasted. The feeling was expressed that the degree of balance between these two aspects of our national security program borders on the ridiculous; the cuts the House has made in *civil* defense could make our *military* defense nearly useless.

The President expressed his strong conviction that civil defense and defense mobilization activities are as vital to the total national security program of the country as is the armor around a tank; convinced that these activities are in effect armor around our nation and our civilization, the President approved Director Hoegh's initiating steps which would: (a) Bring to the attention of the Congressional Leaders the severe cuts made in the delegate agency financing; (b) Have prepared a supplemental appropriation making up the amount cut below the FY 1960 budget request for the delegate agencies, together with a strong transmittal message setting forth the President's views; (c) Enable an Administration-wide effort to be made, through speeches and other public statements by Cabinet and agency heads (except State and Treasury), to bring forcefully to public attention the vital requirement for balance in our national security program, i.e., an effective non-military as well as military defense.

[Omitted here is the remainder of the minutes.]

Mr. Minnich

(Note: This account based on Mr. Patterson's summary memorandum prepared for General Persons' information and on the Record of Action.)

189. Memorandum of Meeting Between Eisenhower and Gray¹

Washington, August 3, 1959, 11:10 a.m.

1. I took up with the President the Record of Actions of the NSC meeting of July 30, 1959. I reported to him that the Defense Department wished to add some language to paragraph 16 which he approved. I also pointed out that the Defense Department wished to delete the qualifying clause of paragraph 62 *b*. The President instructed me to leave the language as it was written and asked me to remind the Defense Department that this was language that he had suggested in the Council meeting. The President also approved the small change in the language of the Record of Actions which related to paragraph 58 of NSC 5906 (Mobilization Base).

With respect to paragraph 62 on Outer Space, I reported to the President that there was some unhappiness among the operators, including specifically Mr. Harr and the OCB Staff, about the Council action in deleting references to psychological values. The President had said that he had not intended to eliminate psychological factors and thought that the word “political” adequately took care of the situation. However, he said that in order that no one misunderstand he would put a footnote to the word “political” which would read substantially as follows: “The term political includes consideration of psychological factors.”

2. In connection with space problems, I said to the President that I was concerned about the adequacy of our machinery for dealing with some of the very difficult questions which we will be confronted with in the future. I expressed the view that the Space Council could not be as fully effective as some people had hoped. The President reminded me that he had not sought the creation of the Space Council but had been forced to accept it as a compromise with the Democratic leadership. I indicated that it was not clear to me just what space responsibilities the NSC now had. The President agreed that there probably would arise jurisdictional problems and asked me to prepare a directive for his signature which would go to the Space Council and other appropriate agencies under which the Special Assistant to the President for National Security Affairs would be made a sitting member of the Space Council and be given the specific responsibility of dealing with problems arising out of either conflict of jurisdiction or lack of clearly defined jurisdiction. The directive would provide

¹ Source: Basic national security policy; Space Council/NSC coordination. Top Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Staff Memos.

that any problems the Special Assistant could not solve with respect to machinery should be taken to the President.

3. I discussed two 5412 matters with the President, which are the subject of a separate memorandum.

4. I presented to the President a draft of a memorandum to the Secretary of Defense, Chairman, JCS, and the Director, OCDM concerning the President's request for a study of the requirements of the mobilization base under conditions of a nuclear exchange. The President approved the memorandum with one editorial change that he made.

Gordon Gray

Special Assistant to the President

cc: Mr. Lay

190. Memorandum of Conference with the President¹

Washington, August 4, 1959, 11 a.m.

OTHERS PRESENT

Dr. Kistiakowsky
Major Eisenhower

The President opened by asking Dr. Kistiakowsky if he had seen the memorandum from Secretary Gates to General Goodpaster, dated July 27th, on the subject of military department contracts for space activities. The President is primarily afraid of the development of "squatters' rights" by the individual services. He has asked Mr. McElroy to take a look at this subject, and also told Mr. McElroy that if Dr. York is not available to advise him, he should contact Dr. Kistiakowsky. He said that even \$500,000 is a lot of money. Dr. Kistiakowsky agreed, and said that the situation is not quite so bad as it looks, since the total funds allowed would be some \$3.5 million, of which \$2.5 million would go to "systems planning" and only \$1.0

¹ Source: Service involvement in space activities; need for single, global military communications system; ICBM basing. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

million in new research. He mentioned that he received a memorandum from General Goodpaster on this subject and was putting together his own comments on the individual programs for submission to the President.

* * *

Dr. Kistiakowsky then gave his briefing, which is appended hereto.

The President had the following comments to make with regard to this briefing:

a. He approved the idea of a single global military communications system, as recommended by Dr. Baker. He took note of Dr. Kistiakowsky's statement that close coordination with Dr. York will suffice to convince the Secretary of Defense of the necessity to develop only one new ambitious system of this type.

b. With regard to ICBM bases, the President agreed with Dr. Kistiakowsky that it is possible that our philosophy of high reliability of missiles is not right. He felt it would perhaps be better to produce cheaper missiles and cheaper dispersed and hidden bases with a much lower level of reliability than we now demand. Conceivably, one group could handle one missile; and each missile could have its target predetermined. In this connection, Dr. Kistiakowsky pointed out that the inspection conducted by General Betts will probably not save much money on the ATLAS and TITAN programs since the 15 squadrons of these are already programmed for long lead-time items. He feels, however, that his inspection of MINUTEMAN would save a lot of gold plating in that vast program. If the MINUTEMAN becomes as complicated as the ATLAS and TITAN systems, its value is lost.

c. With regard to test talks at Geneva, the President recognized that our problems are getting more complex all the time.

d. As a general comment, the President cautioned against a situation whereby we tend to take the sum total of everybody's optimum requirements and thereby break ourselves. He hopes that the studies on targeting which are being conducted will be helpful in this regard. He also expressed satisfaction at Dr. Kistiakowsky's ferreting out of these trouble areas.

John S.D. Eisenhower

191. Presentation by Kistiakowsky to the President¹

Washington, August 4, 1959

MR. PRESIDENT:

With your permission I will report to you on three subjects: the progress in global military communications; the problem of ICBM bases; and the problem of nuclear test suspension negotiations.

I.

As you know, the three Services are involved in planning global communications systems of a most advanced nature which are not closely coordinated. A panel, headed by Dr. W. O. Baker of your Science Advisory Committee, has been looking into the problems of present and future military; communications and especially into the CRITICOMM System. The main emphasis of its findings is that a great deal of improvement is possible with the present type of communications, by making limited technical changes and additions, and simultaneously aiming toward maximum possible sharing of the facilities by the Services. The Director of Defense Research and Engineering and the Assistant Secretary of Defense for Supply and Logistics also have been emphasizing the advantages which may result from the improvements in present facilities over focusing of attention on the as yet unproven future developments. Due to these efforts, there has been a gratifying improvement in the handling of critical messages. For instance, the median-average-time for handling such messages is down to 13 minutes this June as contrasted with 52 minutes from June to December 1958. [*text not declassified*] It appears, Mr. President, that the concerted efforts to make the best possible use of the present facilities are bearing fruit and further improvements are definitely to be hoped for.

II.

In response to Dr. Killian's memorandum of last winter concerning the cost and complexity of missile bases, the Office of the Secretary of Defense undertook a study of this problem, and General Betts, who conducted the inquiry, just told me informally about his findings. In essence they are these:

The complexity of earliest missile bases will be almost beyond imagination. An example is that under the floor of the Command Post at the Vandenberg Air Force Base, controlling only three Atlas missiles,

¹ Source: Global military communications; ICBM basing; Geneva disarmament negotiations. Secret. 4 pp. Eisenhower Library, Whitman File, DDE Diaries.

there are 30,000 relays. The Air Force, however, has made earnest efforts to reduce the complexity in the design of later squadrons, while at the same time improving dispersion and hardening. The result is that the fully dispersed and hardened squadrons are expected to cost less than the early installations. The high cost and complexity of the early installations must be largely blamed on lack of experience and the speeded up program, which allowed little time for testing of base designs.

Even in the later installations, there appears to remain some gold-plating. Starting now, changes could be profitably made only in Atlas squadrons after the 8th, and in Titan squadrons after the 6th, since the detailed base designs are already too advanced on the others. The OSD has now directed inquiries to the Air Force as to why certain items couldn't be eliminated or a simplified in the late squadrons, but these are not the major items.

The complexity of the ground installations is very largely due to a high degree of automation. This, in turn, is an unavoidable consequence of the requirement to have a 15 minute response time. Unfortunately, nothing much in the way of simplicity is gained by changing from 15 to, say, 20–25 minutes. To simplify base design drastically one needs to go to manual operations, and that probably means 1 to 2 hours response time.

The fully dispersed and hardened squadrons of 9 missiles each are expected to cost in the neighborhood of \$130 million each. The costs may be higher, however, because the estimates of the cost of hook-up and check-out of ground equipment have been rising from 5 to 15 million dollars per squadron and some people are pessimistic enough to think that they may actually turn out to be some \$30 millions. This part of the program may become the time-controlling factor for achieving operational ICBM force, as it is for Thors in England, because of shortage of competent engineers to do the job.

III.

Since July 23, when Mr. Dillon presented to you a plan for changing the objectives of our Geneva negotiations on nuclear test suspension, I have been trying to analyze the technical aspects of the plan and have discussed the matter with selected members of your Science Advisory Committee, including Dr. Killian.

Recently I presented my considerations to Mr. Dillon and with his knowledge would like to present them now to you. Mr. Dillon wished me to tell you that because of the British reaction to his message and the coming end of the Foreign Ministers Conference, the urgency of talking to Gromyko has been reduced.

As you recall, Mr. President, the plan presented by Mr. Dillon involves approaching Gromyko with the proposal that a treaty be

negotiated for the cessation of atmospheric and outer space nuclear tests, with a complete Geneva monitoring system, except for on-site inspections. There is to be also a joint test program to study seismic monitoring, including tests in big holes. Pending the outcome of such study, the parties to the treaty retain freedom of weapons development by means of underground nuclear tests.

A point to note is that purely theoretical considerations about tests in outer space and underground indicate that in both instances evasion could be achieved by the use of elaborate and costly procedures. The plan which proposes a monitored ban on space tests but postpones a ban on underground tests is therefore technically not self-consistent. The plan calls for a billion dollar monitoring organization, which could not be technically justified for monitoring atmospheric tests, and which provides no complete protection against outer space tests. Moreover, it does not prevent weapons development because of uncontrolled underground tests.

The proposal to undertake jointly with the Soviets the study of seismic monitoring and of means to control evasion involving shots in big holes suffers from another technical weakness. It is impossible to predict how long the investigation will take. Intuitively it seems probable that a sort of a race will develop between improved means of detection and of evasion, and so the operation may drag on for years without conclusive results.

One alternative to the State Department plan is to propose cessation of atmospheric tests, but of no others. Since this measure would involve virtually no aspects of arms limitation, and the monitoring of atmospheric tests can be done from outside USSR, technical arguments for a monitoring organization inside USSR would be weak. We might thus lose the advantages of an organization within the USSR and of a beginning toward arms limitation measures.

Another alternative might be to continue with negotiations for a treaty based on the original Geneva monitoring system, insisting on a sufficiently large on-site inspection quota that an adequate deterrent against invasion by underground tests would result, except by the use of the big holes.

Judging by the past Soviet reaction, they are not likely to accept a hundred or so on-site inspections, and hence the result of such a move might be a suspension of negotiations due to their unwillingness to accept reasonably effective monitoring.

However, they might accept. The question as to whether a treaty which may then result would safeguard our security, cannot be answered on a technical basis, although some technical factors have an important bearing on the over-all conclusion.

The treaty would define a monitoring system which would be admittedly not fully effective. Evasion with up to megaton weapons, but at extremely high cost, would be theoretically possible in outer space. For somewhat smaller weapons, and at somewhat lower but still rather high cost, the evasion would also be theoretically possible underground by using large holes. Both techniques would require major development programs on the part of the Soviets to make them practical and detection proof. The underground technique with its large earth-works would be very sensitive to our presently planned advanced reconnaissance systems.

The technical requirements and uncertainties of clandestine testing underground and in outer space, together with the attendant risk of disclosure by the diverse intelligence sources available to the United States, could constitute an adequate deterrent to USSR evasion—particularly if the Soviets conclude that the technical gains possible through continued testing under these conditions are limited. Whether this adds up to an adequate safeguard for us is consequently not a technical question.

These, Mr. President, are the considerations involved, which I thought might be useful to you if the result of the impending discussions with the British is a change in our tactics at the Geneva negotiations.

192. Note From Buford to Martin¹

Washington, August 5, 1959

Following our conversation this morning regarding the attached alternative sentences in paragraph 16 I notified Jimmy Lay that we much preferred the second alternative but would be willing, if there were some strong objection from other quarters, to accept the first alternative. Jimmy informed me then that Gordon Gray had seen the President this morning on some other matter and in the course of their discussion had shown the President the two alternatives. The President indicated that he much preferred the second alternative. Apparently Mr. McElroy was there or came in shortly thereafter and Mr. McElroy agreed with the President's choice. Mr. Lay therefore is circulating an approved Record of Action incorporating the second alternative.

¹ Source: Eisenhower's preferred revision of paragraph 16 of NSC 5906. Top Secret. 2 pp. NARA, RG 59, S/P-NSC Files: Lot 62 D 1.

Mr. Lay also told me that Hadyn Williams of Defense was somewhat upset by this development and indicated that he planned to discuss the matter further with Mr. McElroy.

A. Sidney Buford, III

Attachment

Revised Paragraphs

. . . . The possibility that local aggression could occur in the NATO area or elsewhere involving sizable forces of the United States and the USSR is ruled out.

Alternate

. . . . Conflicts occurring in the NATO area or elsewhere involving sizable forces of the United States and the USSR should not be constructed as local aggression.

Enclosure

Memorandum From McElroy to the Special Assistant to the President for National Security Affairs

Washington, August 10, 1959

SUBJECT

Priorities for Ballistic Missile and Space Programs

REFERENCES

NSC Actions Nos. 1846, 1941, 1956, 2013 and 2081

At the meeting on 18 May 1959 the National Security Council noted, under NSC Action No. 2081, that the President has established the following programs as having the highest priority above all others for research and development and for achieving operational capability; scope of the operational capability to be approved by President:

(Order of listing does not indicate priority of one program over another.)

- (1) ATLAS (ICBM) Weapon System.
- (2) TITAN (ICBM) Weapon System.
- (3) THOR-JUPITER (IRBM) Weapon Systems.
- (4) POLARIS (FBM) Weapon System.
- (5) Antimissile-missile defense weapon system, including active defense and related early warning for defense of the United States proper.

(6) Space programs determined by the President on advice of the National Aeronautics and Space Council to have objectives having key political, scientific, psychological or military import.

It is believed that the weapon systems and related programs included in the above listing should be re-examined for the following reasons:

(a) The THOR–JUPITER IRBM programs are well advanced and deployment problems appear to be such that the need for a special priority to procure these items no longer exists. The highest Department of Defense priority will meet the needs of the THOR and JUPITER programs.

(b) The MINUTEMAN ICBM weapon system, now in the research and development stage, has progressed sufficiently to justify the assignment of the highest national priority to this weapon system. The assignment of priority is in consideration of the projected military importance of this system and the demonstrated need for this priority to achieve earliest possible operational capability.

(c) It is believed that the intent of the priority on antiballistic missile defense weapon system, including active defense and related early warning for defense of the United States proper, would be more easily realized by defining the programs now being carried out within this area. The present projects now considered to properly belong within the antiballistic missile defense category are:

- (1) NIKE-ZEUS Weapon System
- (2) Ballistic Missile Early Warning System (BMEWS) Phase I, including Project DEW DROP

In view of the above, the following recommendations are presented:

- (a) Delete the THOR-JUPITER (IRBM) Weapon Systems
- (b) Delete the antimissile-missile defense weapon system, including active defense and related early warning for defense of the United States proper
- (c) Add the MINUTEMAN (ICBM) Weapon System (now in research development)
- (d) Add NIKE-ZEUS Weapon System
- (e) Add Ballistic Missile Early Warning System (BMEWS) Phase I, including Project DEW DROP

Attached is a brief description of each project recommended for inclusion in the national priority list.

/s/ Neil McElroy

Attachment 1

Washington, undated

MINUTEMAN (ICBM) WEAPON SYSTEM

The MINUTEMAN program is an Air Force development to provide a second generation intercontinental ballistic missile using 3-stage solid propellant propulsion to deliver thermonuclear warheads on targets up to 6500 nautical miles from launch points.

This project is now in advanced research and development and is approaching component final design. The decision for production and deployment has not been made.

Attachment 2

Washington, undated

NIKE-ZEUS WEAPON SYSTEM

The NIKE-ZEUS is being developed by the Army to provide a defense against all forms of the ballistic missile threat out to a range of 75 nautical miles. An early system demonstration against simulated targets up to 130,000 feet altitude is scheduled during 1961 at the White Sands Missile Range, with full system capability demonstration against actual ballistic missile targets up to 500,000 feet altitude in 1962.

The engineering design of the system is essentially complete and major components are now being fabricated or installed for tests. The decision for production and deployment of this system has not been made.

Attachment 3

Washington, undated

BALLISTIC MISSILE EARLY WARNING SYSTEM (BMEWS) PHASE I, INCLUDING PROJECT DEW DROP

BMEWS is an Air Force project to provide a ballistic missile early warning system with radars to be located at Clear, Alaska; Thule, Greenland; and a site in the United Kingdom. The system is designed to give warning of a mass ballistic missile attack on the North American continent.

Site I at Thule, Greenland is more than 50% complete. Construction at Site 2 at Clear, Alaska will begin this summer. Negotiations for Site 3 in the United Kingdom will begin in August 1959.

Site 1 will be operational in September 1960, Site 2 in September 1961, and Site 3 approximately 36 months after completion of negotiations with the United Kingdom.

The Air Force Project DEW DROP is a 630 mile long Tropospheric Forward Scatter Communications System which will link the BMEWS station at Thule, Greenland with Cape Dyer, Baffin Island and existing rearward communications to the United States.

The equipment for DEW DROP is already installed and is under final test. The system will be operational in December 1959.

194. Memorandum From Twining to the JCS¹

CM-386-59

Washington, August 24, 1959

SUBJECT

Target Coordination and Associated Problems

REFERENCE

CM-380-59, dated 17 August 1959

1. In reference memorandum I indicated to the Secretary of Defense that he would be advised of the views of the Joint Chiefs of Staff on the matters discussed in the memorandum.

2. In order to expedite resolution of several issues related to targeting which are hampering current planning, there is provided in the attachment hereto a list of the specific questions for consideration by the Joint Chiefs of Staff.

3. I am of the opinion that additional elaborate and time-consuming studies on the part of the Joint Chiefs of Staff are not necessary to the resolution of most of the questions set forth in the attachment. Accordingly, I recommend:

a. That the Joint Chiefs of Staff provide the Secretary of Defense their views on the questions posed in the following numbered paragraphs of the attachment by 15 September 1959: Paragraphs 1 *c*, 1 *d*, 2 *a*, 2 *b*, 2 *c*, 2 *d*, 2 *e*, 2 *j*, 2 *k*, 3 *a* and 3 *b*.

b. That the Joint Chiefs of Staff provide the Secretary of Defense their views on the remaining paragraphs by 1 December 1959.

N.F. Twining

Chairman

Joint Chiefs of Staff

*SPECIFIC QUESTIONS TO BE ANSWERED WITH REGARD TO
TARGET COORDINATION AND ASSOCIATED PROBLEMS*

1. Strategic Targeting Policy:

a. What should be our policy for development of a national strategic target system?

¹ Source: Target coordination. Top Secret. 4 pp. NARA, RG 218, JCS Files, CJCS 381 (1957-1959).

b. What categories of targets should be included in the national strategic target system?

c. What agency should apply our strategic targeting policy, develop the national strategic target system, and keep it up-to-date?

d. What agency should review the national strategic target system for consistency with policy and approve it as a basis for further analysis?

2. Integrated Operational Plan:

a. Do we need a single integrated operational plan for attack of the national strategic target system?

b. If we do need a single integrated operational plan for strategic attack, what agency should develop this plan? What agencies should review it and approve it?

c. Should any force without an all-weather capability be allocated strategic targets? If so, under what conditions?

d. Should our aircraft carrier forces be relieved of responsibility for H-hour coverage of targets on the national strategic target list?

e. If the attack carrier forces were to be relieved of this responsibility, how should their nuclear attack mission be stated?

f. Is there an immediate need for the establishment of a Unified Strategic Command?

g. If the answer to the above question is negative, is a Unified Strategic Command viewed as desirable for the more distant future?

h. If a Unified Strategic Command is not established in the proximate future, is there a requirement for the integration of operational plans for the employment of POLARIS submarines with CINCSAC's operational plan?

i. If so, how should this be accomplished?

j. Does the Joint Chiefs of Staff organization need policy control of an agency capable of operational analysis and war gaming of operational plans?

k. If so, what agency should perform this function for the Joint Chiefs of Staff?

3. Operational Control of Atomic Strike Forces:

a. As a general policy, should unified commanders having an area responsibility be responsible for H-hour attack of targets on the national strategic target list?

b. Should the operation of the Joint War Room Annexes and the Joint Coordination Centers be continued?

c. Should any additional measures be taken to improve the coordination of forces operating under the operational control of the various commanders?

195. Cabinet Paper¹

C-59-78/2

Washington, September 10, 1959

Proposed Policy on Strategic Materials

For consideration by the Cabinet, attached is a revised brief and Cabinet paper prepared by the Director of the Office of Civil and Defense Mobilization following discussions with the Director, Bureau of the Budget; the Administrator, General Services Administration; and the Civil and Defense Mobilization Board.

This paper constitutes the proposed Administration position on stockpile disposals and contains six specific recommendations.

Principal changes include rewording of Recommendation 2 and deletion of Recommendation 6 from the August 20 paper.

The Office of Civil and Defense Mobilization staff report (classified SECRET), and Defense Mobilization Order V-7, entitled "General Policies for the Stockpile of Strategic and Critical Materials," should be removed from the August 20 paper and attached to the revised version.

In considering the attached recommendations, the attention of Cabinet members is called to CP-58-78/1.

Robert Gray*Secretary to the Cabinet***Attachment****Paper Prepared by the Director of the Office of Civil and Defense Mobilization**

CP-59-78/3

Washington, September 30, 1959

THE CABINET***POLICIES WITH RESPECT TO STOCKPILING****Problem:*

Various questions have arisen on strategic materials policy. What should continue to be the basis of stockpiling in the light of the prospective needs and supply capabilities for materials in national emergencies? What should be done about disposal of excess stocks of materials? Should surplus inventories be channeled to Government users, such as

¹ Source: Proposed policy on strategic materials. R-Privileged. 8 pp. Eisenhower Library, Whitman File, Cabinet Series.

the Bureau of the Mint and arsenals? What preference should be given to disposals from the Defense Production Act inventory? Should a more intensive effort be made to cancel contracts for delivery of materials in excess of stockpile objectives?

Discussion:

1. *Character of the Strategic Stockpile*

The *strategic stockpile* has been accumulated as an industrial materials inventory for meeting military, defense-supporting and essential civilian needs. It contains raw and semi-processed forms of minerals, metals, industrial oils, fibers and certain other materials such as crude natural rubber that are basic to manufacturing. It is not an end-product stockpile to be used directly by ultimate consumers.

2. *History of the Strategic Stockpile*

The *strategic stockpile* originated because of experience of the U.S. in relying on foreign sources of supply for materials that are indispensable to meeting military and other essential needs of the U.S. in time of emergency. The U.S., despite its enormous productive capacity, is seriously deficient in some raw materials. This problem of dependence is recognized in the first section of the postwar Stock Piling Act passed in 1946.

The U.S. is completely dependent on foreign areas for one-third of the 75 materials on the current stockpile list. It is completely self-sufficient in peacetime in only 3 of the materials. These are molybdenum, magnesium and vanadium. In other cases, the U.S. has varying degrees of foreign dependence.

The strategic stockpile as originally established under the Stock Piling Act was on a 5-year basis and had only one set of objectives which assumed partial dependence on foreign sources.

In 1954 following a review by a Cabinet Committee on Mineral Policy, long-term objectives were added which completely discounted for a 5-year period the supplies originating beyond North America and comparably accessible areas. In the same year, the one-year rule was introduced which provided that when a metal or mineral is declared to be strategic and critical the long-term stockpile objective shall not be less than 1 year's normal U.S. use.

Also in 1954 the Agricultural Trade Development and Assistance Act was passed which provided for accelerated barter of agricultural commodities for strategic materials on the assumption that it is better to have non-deteriorating materials with low storage costs than to retain surplus agricultural commodities that are subject to deterioration and have high storage costs.

Early in 1956, all cash purchasing for the strategic stockpile was cut back to meeting needs for a 3-year emergency period, but minimum and long-term objectives were kept on a 5-year basis.

On June 30 last year, the planning period for all stockpile objectives was reduced from 5 years to 3 years. This cutback followed an extensive review by the Special Stockpile Advisory Committee (Pettibone Committee) and by the Executive Branch.

3. Basis of the Strategic Stockpile Objectives

Strategic stockpile objectives generally represent estimated deficits of materials for an emergency period after taking account of the availability of materials from domestic production and imports under emergency conditions.

Requirements are computed to reflect military, defense supporting and essential civilian needs of the U.S. in emergencies. An allowance may be made for exports where the U.S. is the essential source of supply. For example, in molybdenum the U.S. produces most of the total world supply. Therefore, our allies would be dependent on the U.S. for this material.

Estimates of supplies for the emergency period are based on the world-wide availability of materials and the vulnerability of the sources of supply under emergency conditions. Discounts are applied to reflect the risks involved internally in supply countries, the risks of concentration of the source, the risks of overseas shipping and the vulnerability of domestic sources to destruction.

The difference between the requirements estimate and supply estimate is the deficit to be met by stockpiling, unless other measures provide a better solution.

Stockpile objectives are computed at two levels: the basic objective level, which assumes partial dependence on areas beyond North America and comparably accessible areas, and the maximum objective level, which provides a higher degree of security by completely discounting sources beyond North America and comparably accessible areas.

Cash procurement for the strategic stockpile is generally limited to meeting the basic objectives. Only 3 relatively minor materials are now included in the procurement program. These are jewel bearings, diamond dies and amosite asbestos.

4. Requirements for Strategic Materials and Over-all Status of Government Inventories

The grand total requirements for strategic materials would amount to about \$15 billion for a 3-year emergency, or about \$5 billion per year, at December 31, 1958 prices. This requirement is somewhat below the over-all industrial potential of the U.S.

Domestic production would be relied upon to provide considerably more than half the total supply of strategic materials required. This estimate allows for possible loss of the production base where there is

extreme concentration of capacity but does not yet include allowances otherwise for massive nuclear damage.

Imports of strategic materials from nearby areas would be relied upon to provide \$2.3 billion in materials in the 3-year emergency.

After allowing for U.S. production and nearby imports (excluding overseas sources), about \$4 billion in strategic materials would need to be supplied by the strategic stockpile.

Total Government inventories of strategic materials amounted to about \$7.2 billion on December 31, 1958, valued at market prices as of that date. The composition of the inventory was as follows, in millions of dollars:

Stockpile-Grade Materials Having Objectives

Strategic stockpile	\$5,777
Defense Production Act inventory	632
Supplemental stockpile	327
Commodity Credit Corp. inventory (obtained by barter)	245
Tin inventory (residual from Texas smelter)	9
Department of the Interior inventory (domestic purchases)	13
<i>Materials Not Meeting Specifications or Having Objectives</i>	170
	<hr/> \$7,173

The total quantity of strategic materials *on order* for all Government programs, including barter, was about \$865 million on December 31.

Thus the total market value of materials *on hand or on order* was about \$8 billion or about twice the total of the present maximum stockpile objectives.

In view of this status of the strategic materials programs, the two chief problems now relate to (1) the size and character of the stockpile needed in the light of present-day conditions and (2) policy on disposal of materials that are not needed. These problems and collateral policy problems are discussed below.

Recommendations:

Recommendation #1. Determination of Strategic Stockpile Objectives

Determine stockpile objectives on the basis of time required for supplies of materials in a national emergency to match essential needs of the emergency. Until such time as the essential needs of the nation after a nuclear attack (including reconstruction) can be determined by a pending OCDM study, the period of emergency used as a basis for planning will be limited to a maximum of three years; provided that, until such determination is made, the maximum

objective shall not be less than six months' usage by industry in the United States in periods of active demand.

Defense Mobilization Order V-7, issued on June 30, 1958, provided for reducing all stockpile objectives from a 5-year to a 3-year basis. The period applies to various national emergencies during which deficiencies of the supply of basic materials for industry may occur. This action was taken after a review by the Pettibone Committee, Interdepartmental Materials Advisory Committee, Defense Mobilization Board and National Security Council. The period is being restudied by the National Security Council and is subject to change. Pending a determination of needs after a nuclear attack on the U.S., the planning period would be limited to 3 years, but a shorter period would be used where an analysis would lead to the conclusion that supplies could feasibly match requirements in less than 3 years. (Some of the stockpile objectives currently assume a deficit of supply only over a period of 6 months to 2 years until capacity can be restored to adequate levels or alternate materials can be utilized.)

The recommendation also recognizes that a deficit of materials supply may occur after a nuclear attack on the U.S. Such a deficit, of course, could never be larger than the consuming capacity of industry as rehabilitated and would need to take into account also rehabilitated supply capacity. After a devastating attack, some stockpiles of basic industrial materials in or near consuming areas doubtless would be needed. Generally stockpile objectives established for an emergency short of an attack on the U.S. would be adequate for an emergency after an attack. In some cases, however, the objectives calculated to meet the first contingency are so small that their adequacy for the second contingency may be questionable. The recommendation provides, therefore, that until the needs after a nuclear attack, including those for reconstruction, have been determined, the maximum objectives shall be not less than 6 months' usage of the materials by industry in periods of active demand. This level of the maximum objectives would not require any new purchases but would require retaining some materials that otherwise would be regarded as surplus.

"In establishing requirements of specification-grade nondeteriorating materials, which are mostly metals and minerals, consideration may be given to such factors as increasing essentiality in the light of technological change, special usefulness for reconstruction after a nuclear attack, depletion of reserves, and other pertinent factors."

Recommendation #2. Disposal of Excesses

"Dispose of excesses whenever possible under the following conditions: (a) approval of Departments of Interior, Commerce, State, Agriculture, Defense, and other agencies concerned, (b) appropriate consultation with the industries concerned, (c) avoidance of serious disruption to usual markets

of producers, processors, and consumers, (d) avoidance of adverse effects on international interests of the U.S., and (e) preference to disposal of excess materials from DPA inventories. Generally expedite disposals of excess materials that deteriorate, that are likely to become obsolete, or that do not meet quality standards."

The Stock Piling Act requires that disposals of materials from the stockpile shall give due consideration to protection against disruption of usual markets, and current policy requires that similar protection be provided for disposals from the Defense Production Act inventory. Current policy also requires that disposals shall not adversely affect the international interests of the U.S. Continuation of these policies is recommended.

Expeditious disposal would be favored for (1) materials that are subject to deterioration or obsolescence, (2) nonspecification-grade materials and (3) materials that do not have stockpile objectives. In the case of deteriorating materials, measures other than stockpiling, such as research to develop readily-available substitutes, should be emphasized for meeting emergency needs. Materials that are not directly applicable to objectives also should be available disposal.

Recommendation #3. New Legislation

At appropriate time submit proposed legislation, subject to interagency clearance, to achieve better coordination and management of the diverse stockpile programs.

The Stock Piling Act has not been revised since its enactment in 1946. Meanwhile other stockpile legislation has been added piecemeal. It is believed that a general revision of the legislation should be submitted to recognize changed conditions, especially the greater domestic hazard resulting from nuclear warfare, and to coordinate the various enactments relating to the strategic stockpile, Defense Production Act inventory, supplemental stockpile, and the residual tin inventory accumulated from the operation of the Texas City tin smelter. Proposed legislation has already been partly cleared with agencies concerned. This proposed legislation should be completed and submitted to Congress.

Recommendation #4. Relationships Between Disposals and Barter

Continue using barter to obtain materials within strategic stockpile objectives. Consider establishing more definite standards for determining when to barter for materials beyond maximum objectives. Avoid simultaneous barter and sale of identical materials.

Barter should continue to be used to reduce the Government's cash outlays for the strategic stockpile. Beyond that, there is a need for coordinating barter acquisition policy with disposal policy for strategic

materials. Should the Government, for example, barter for more metallurgical manganese or sell a part of the inventory already on hand?

Recommendation #5. Government Use of Excess Materials

Require Government organizations which use strategic materials directly to use excess inventories when this would be consistent with the over-all disposal policy and in the best interest of the Government.

Channeling of excess strategic materials to Government agencies, such as the Bureau of the Mint, Atomic Energy Commission and arsenals, which are direct users of such materials should be authorized when feasible and consistent with general disposal policy. Required use of the materials in prime contracts and especially in subcontracts, however, is considered to be inadvisable because the quantities on individual contracts would be small and probably would add to the cost of the contracts by departing from normal supply channels, introduce uncertainty that the precise qualities of materials needed could be obtained readily, and unjustifiably complicate the bookkeeping involved. Also such required use would have substantially the same effect as an outright disposal.

Recommendation #6. Cancellation of Commitments

Continue to seek mutually satisfactory cancellation of contracts to deliver excess materials and include possible cancellation by payment of above-market premiums specified in the contracts. This would include payments to contractors on account of anticipated net profits. Negotiations to that end should be conducted in the light of over-all interests of the Government and in the light of possible contract adjustments through cash payment, payment in kind, or barter of excess property.

Current policy authorizing cancellation of deliveries in excess of objectives has functioned satisfactorily, but very little more can be accomplished by further negotiation unless some additional incentives are included.

Implementation: If approved, the Office of Civil and Defense Mobilization will initiate actions, in cooperation with the agencies concerned, to carry out the above recommendations.

Concurrences: Office of Civil and Defense Mobilization, BoB, GSA, and all members of the Civil and Defense Mobilization Board concur in the Recommendations as amended.

Attachments: OCDM staff paper on "The Program for Strategic Materials".

196. Minutes of Cabinet Meeting¹

Washington, September 11, 1959, 9—10:40 a.m.

The following were present

President Eisenhower

Mr. Douglas Dillon for Sec. Herter

Mr. Fred Scribner for Sec. Anderson

Sec. McElroy

AG Rogers

PMG Summerfield

Sec. Seaton

Sec. Benson

Sec. Mitchell

Sec. Mueller

Sec. Flemming

Gov. Hoegh

Director Stans, BoB

Mr. Ralph Reid

Dr. Saulnier, CEA

Mr. John A. McCone, AEC

Mr. George Allen, USIA

Mr. Kendall

Mr. Gordon Gray

Mr. Robert Gray

Dr. Kistiakowsky

Dr. Paarlberg

Mr. Minnich

[Omitted here is discussion of other subjects.]

Stockpiling—Gov. Hoegh went over the Cabinet paper, pointing out the history of stockpiling and outlining the current situation as regards excesses. He explained that the excess resulted from the reduced goals as a result of the three-year concept, the change in strategical concepts, the expansion of some sources of supply, and obsolescence of some materials; of a slightly different nature were the excesses resulting from operations under P.L. 480. He presented several charts giving the quantitative status of selected materials. He pointed out that at present there are over \$7 billion worth of materials in the stockpile, of which \$3.76 billion were for filling established objectives; the remainder is excess.

¹ Source: Approval of policy on stockpiling. Confidential. Extracts—4 pp. Eisenhower Library, Whitman File, Cabinet Series.

Under the proposed plan, \$4.22 billion worth would constitute objectives, leaving an excess of \$2.95 billion.

Gov. Hoegh repeatedly emphasized that disposal of excesses would be undertaken only if the market conditions for the item were satisfactory and if disposal would not adversely affect our foreign relations. He made clear that it is proposed at this time to sell only natural rubber. There will be further interagency discussions prior to any disposal of aluminum. As regards other minerals, the market is not in satisfactory condition at this time.

Gov. Hoegh also stressed the importance of pressing again next year the general legislation which would eliminate the requirement for a six-month waiting period prior to any disposal.

Gov. Hoegh then went over the specific recommendations in the Cabinet Paper. Following this, Sec. Benson inquired whether the three-year requirement was based on estimates of need in an all out war. Gov. Hoegh said the basis was that of a three-year period of emergency, not necessarily related to the duration of any potential war. The President added a word about his own concern with having resources at hand for accomplishing recovery in the event of nuclear attack.

Mr. Stans highly recommended approval since the paper contained all the needed safeguards.

Mr. McElroy suggested that the paper be amended to eliminate the requirement that all the agencies approve each disposal action—something that would be pretty cumbersome. The President said that concurrence rather than approval would be satisfactory but that specific agreement seemed to be needed. Mr. Flemming concurred with the President's view.

Dr. Flemming inquired whether Sec. Mitchell should be consulted because of the relationship of any strike. Sec. Mitchell indicated that satisfactory arrangements for this were already established.

The paper was approved.

[Omitted here is discussion of other subjects.]

197. Memorandum From Allen Dulles to Eisenhower¹

Washington, September 12, 1959

SUBJECT

Soviet Guided Missile Estimate

1. The United States Intelligence Board has this week brought up to date its estimate as to the current status of the Soviet Guided Missile Program. I enclose a copy for your information.

2. In the course of its review the Board made use of a panel of distinguished military and civilian experts involved in our own Guided Missile Program. Their findings and recommendations are also attached.

3. It occurred to me that you might find this latest thinking of ours of use in preparation for your forthcoming talks with Chairman Khrushchev.

Allen W. Dulles

Director

Enclosure

Memorandum From Hyland to Allen Dulles

Washington, August 25, 1959

SUBJECT

Report of DCI Ad Hoc Panel on Status of the Soviet ICBM Program

1. This Panel, consisting of the below membership and meeting at your request, has reviewed available evidence relating to the Soviet ICBM program. We have also reviewed the Guided Missiles and Astronautics Intelligence Committee (GMAIC) report on this subject, dated 21 August 1959 and have discussed their report with the (GMAIC) members.

Mr. L.A. Hyland, Chairman
Mr. Charles R. Irvine
Major General John B. Medaris
Dr. William J. Perry
Dr. W.H. Pickering

¹ Source: Transmits report on Soviet guided missile estimate. Top Secret. 4 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, CIA.

Rear Admiral W.F. Raborn
Major General Osmond J. Ritland
Dr. Albert D. Wheelon

2. Based on the foregoing, this Panel has arrived at the following conclusions:

a. Evidence acquired, primarily at the TYURA TAM missile test range, indicates the Soviets are following an orderly, and effective ICBM program, and intend to acquire a substantial capability at the earliest reasonable date. We believe the Soviets are now testing the initial complete system capable of the intercontinental range required by their needs. Although there is only indirect evidence of KAPUSTIN YAR support to this program, it is considered reasonable that the ranges have been mutually supporting with respect to component testing and shared experience.

b. The Panel believes that a Soviet IOC capability with a very few operational missiles (10)² is at least imminent. This number of missiles, however, represents only a highly limited capability, and an operational capability sufficient to assure the application of effective force in the international field (100 missiles) will probably not be available until late 1960 or later. It is also believed that the Soviet determination as to their balanced needs may result in a deployment of not more than 400 to 500 ICBM's which could be attained by the latter part of 1962. The Panel no longer believes that this latter capability will be obtained in two years after IOC, as the evidence is now firm that the Soviets are not engaged in a "crash" program.

c. Regarding the characteristics of the ICBM at IOC, the Panel finds the subject thoroughly discussed in the GMAIC report and, on most points, generally valid. Two additive statements to the GMAIC report are submitted, however, and in one instance, the Panel favors the minority statement, as follows:

(1) In the area of system mobility vs fixed sites, we find the GMAIC statement well considered. We believe further that whatever the operational launching mode, the Soviet railroad will play a central role in the operational deployment and usage of ICBMs.

(2) The Panel considers the determination of the CEP to be extremely important, but does not find hard evidence to substantiate the CEP figures in the GMAIC report. Recent successes in the U.S. program indicate that achievement of CEPs considerably better than 3 n.m. theoretical and 5 n.m. operational may not be as difficult a problem as initially believed. Recognizing the difficulties of equating U.S.

² There is no evidence to support or deny the present availability of ten IOC missiles. However, the test program observations support the judgment that the ten IOC missile availability is imminent and that the probable production buildup to an accumulation of 100 is reasonable by late 1960 or later. [Footnote is in the original.]

accuracies with Soviet capabilities, the Panel believes the statement should be: "The operational CEP of the Soviet ICBM at IOC will not be worse than 5 n.m. and may very well be better."

(3) Available evidence does not adequately support a probability of more than one basic type ICBM currently being flight tested at TYURA TAM. Variations noted in current test programs could well be achieved through relatively minor modifications. Such changes would also be sufficient to accommodate specific special missions, such as certain space requirements. The current missile should be capable of delivering a warhead of at least 6000 pounds to a range of about 5500 n.m., or with warhead reduced to the order of 3000 pounds could achieve 7500 n.m. range.

d. Positive evidence relative to Soviet ICBM production facilities or operational deployment sites continues to be missing. The Panel believes that intelligence on the status of the Soviet program requires these inputs if it is to be as precise as national security demands. Recognizing that these types of data have not been accumulated on other types of offensive missiles either, some adjudged to have been operational for several years, the Panel giving consideration to collection means available to the U.S. finds this situation alarming.

e. The Panel can see no indications that the Soviet space program has interfered with their ICBM program, nor vice versa. The Panel considers that the Soviet facilities are probably adequate to handle both programs even under a program more accelerated than observed heretofore. While the Soviet space program, observed to the current time, appears to have utilized considerable ICBM hardware, there appears to be no deficiency in reserve missiles or equipment.

3. Available intelligence information continued to be inadequate for assessing the Soviet ICBM threat. We therefore strongly recommend that:

a. All collection concepts capable of providing data on the status of Soviet ICBM accuracy, deployment and production be vigorously pursued.

b. Continued effort be directed toward determining Soviet ICBM characteristics by directing specific attention to the acquisition of readable telemetry data prior to first stage burnout and to the intercepts of the ICBM beacon prior to final burnout. Additional collection should be directed to the reentry phase including the type of nosecone, fuzing and arming techniques, and possible use of penetration aids.

c. Present ELINT capabilities be augmented by passive tracking capabilities such as interferometer techniques.

d. [*text not declassified*] activities be directed toward acquiring data concerning ICBM deployment, production rates and goals, and future ICBM design concepts.

Chairman

198. Memorandum of Conference with the President¹

Washington, September 16, 1959

OTHERS PRESENT

Secretary McElroy
General Goodpaster

Mr. McElroy first discussed with the President a draft memorandum on space and satellite activities that General Randall had sent to me. After discussion, the President indicated his approval of the memo, on the basis of assurances given to him by Mr. McElroy. Mr. McElroy said that Defense is negotiating to turn AMBA over to some agency other than the Army—probably NASA—since it is getting so expensive to support. The President said that the assignments called for in the draft memorandum must be “mutually exclusive,” i.e., when one service has the assignment the others will not duplicate its project. The President asked if all solid propellant work is being assigned to one service. Mr. McElroy said that the advanced research is being done in ARPA, with applications in each of the services. The President asked how Mr. McElroy now feels about the Minuteman project. Mr. McElroy said that Defense feels very good about it, expecting to have operational missiles delivered in FY-63. He commented that our scientists are now expecting that both we and the Russians will achieve increased accuracy. As a result, we must give more consideration to dispersion and mobility, perhaps putting the Minuteman on rail-road firing platforms. The President thought there would be great savings if we can get out of the hardening of missile sites. Mr. McElroy said Defense is going some distance in that direction already, cutting down its hardening to twenty-five pounds to the square inch overpressure rather than one-hundred pounds. The President added that the Titan may be becoming unnecessary. Mr. McElroy said it provides a better booster for missiles of very long range. If our scientists do not see a way of attaining extremely large thrust with solid fuels, there will remain a need for high-grade liquid rockets—undoubtedly using storable propellants.

The President then turned to our financial situation. He said it is getting quite serious, and some would in fact call it desperate. Within a few days we will be paying 5% for six-months' short-term bills. This situation could be eased by printing additional money, but this would make further inflation inevitable. It was a terrible blow to the nation's

¹ Source: Ballistic missiles; budget problems. Secret. 3 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on September 18.

welfare that the Congress did not pass the interest legislation proposed. The bankers, some of whom initially opposed the legislation, are now seeing the significance of the situation, are terribly worried, and will be put to work on the Congress at once. He did not rule out the possibility of calling a special session once this additional process had been advanced. Under present trends in FY–60, we are running at an annual rate \$1.9 billion over our estimates, with but a one-half billion dollar increase in our income. An announcement at this time that we expect a deficit this year would really “blow the top” off the money market.

The President thought Mr. McElroy should go to work on the target of reducing military and civilian personnel in the armed forces. He said Mr. McElroy will have to be emphatic in holding the line, and that he will support him.

Mr. McElroy said that major actions are already being taken in the Pentagon along these lines. The Air Force has recommended reducing its own strength by 20,000 military personnel and 7000 civilian personnel. The F–108 project is expected to be cancelled within thirty days. Mr. McElroy said Defense is cutting down on its total outlays, and also on what is being spent overseas.

The President commented in this connection that he is holding \$50 million out of the medical research appropriations from the Public Health appropriation. Mr. McElroy said that he feels Defense has gotten hold of its expenditure rate and is now keeping books on this for the first time. He credited Mr. McNeil with this work, and said that Mr. McNeil had deeply appreciated the nice letter the President sent him accepting his resignation. The President recalled that Mr. McNeil had resisted this type of financial control for several years.

The President said he wanted someone to advise Governor Brucker that, with regard to the new construction starts, we should take our time over preparatory work, and not jump into their initiation. He asked me to be in touch with General Bragdon to get a list of the 67 new starts with the object of working on this right in the White House.

The President said he thought that in General Lemnitzer Mr. McElroy had a very excellent man who would do everything possible to carry out Mr. McElroy's desires. Mr. McElroy said that General Twining continues to wish to withdraw in about mid-year 1960. He said he had asked General Twining if he thought General Lemnitzer would be ready to take on his assignment, and General Twining enthusiastically said he would.

Mr. McElroy then discussed briefly his own personal situation, which requires that a change be made before too long.

Reverting to the subject of the budget, Mr. McElroy said that the Defense Department had taken some medicine and must take a good

deal more. The regrettable thing is that many of the actions now being taken could have been taken a year ago with no or little damage. He thought by hard work we could hold to the present rate of spending but felt that to go below it would be "murder." Because of the gradual increase in unit costs as well as the reduction in credits from MSP, a level budget really is a requirement to cut back. The President said every time he receives a survey of the financial picture it presents the situation in blacker colors. The defeat on the long-term interest rates really hurts us in attempting to put our national debt on a longer term basis. He repeated the sentiment on this is now turning and that bankers are getting worried. Mr. McElroy said that while it is a rough thing to state, we may in fact need a little "shake out" in some of the present industrial excitement to slow things down. The President said that commercial banks are now dumping their government bonds in order to get money for term lending at high rates. He could not imagine anything more contrary to the nation's interest.

A.J. Goodpaster
Brigadier General, USA

Draft Revision

Washington, August 29, 1959

BASIC NATIONAL SECURITY POLICY

59. *Mobilization Base*.² The mobilization base consists of the military logistics base and the civilian readiness base and should emphasize those elements that will increase U.S. D-Day readiness and capability.

a. Military Logistics Base.³ The military logistics base should be designed to provide for the forces and the logistic requirements of: (a) cold war (b) opposition to local aggression, and (c) general war. The general objective of the military logistics base is to achieve a degree of war readiness which will provide for meeting foreseeable military contingencies. The highest priority will be placed upon achieving and

²“For planning purposes, the mobilization base is defined as the total of all resources available, or which can be made available, to meet foreseeable wartime needs.

“Such resources include the manpower and material resources and services required for the support of essential military, civilian, and survival activities, as well as the elements affecting their state of readiness, such as (but not limited to) the following: manning levels; state of training; modernization of equipment; mobilization materiel reserves and facilities; continuity of government; civil defense plans and preparedness measures; psychological preparedness of the people; international agreements; planning with industry; dispersion; and stand-by legislation and controls.”

(This is the definition of the term “Mobilization Base” adopted by NSC Action No. 1756, subsequently approved by the President.) [Footnote is in the original.]

³The military logistics base is defined as the total of all resources available, or which can be made available, to the military effort in order to meet foreseeable wartime needs. [Footnote is in the original.]

maintaining optimum readiness for the active forces. To achieve this objective, implementation of the military logistics base planning, in addition to providing for a continuing deterrent (including force and equipment modernization), should be sufficiently flexible to meet the requirements of the following:

- (1) Cold war including periods of heightened tension.
- (2) Opposition to local aggression, in accordance with paragraphs 12-a and 16 above, by:

- (a) U.S. active forces, supplemented as necessary, without degrading the general war posture to a militarily unacceptable degree.
- (b) Allied forces, to the extent it is essential they be provided support for combat operations from U.S. resources.

Planning for [illegible in the original] opposition to local aggression will include arrangements for the timely provision of personnel same as and combat essential materiel to insure the continued maintenance of an acceptable general war posture.

(3) General War:

- (a) The active forces as of D-Day.
- (b) The selected reserve forces having an initial general war mission.
- (c) Additional forces necessary for continued support and reconstitution of forces required to achieve national objectives.

Planning for general war will include appropriate consideration of nuclear damage.

b. Civilian Readiness Base. The general objective of the civilian readiness base is to provide for the mobilization and management, for war and survival purposes, of all resources and productive capacity not under military control which can be made available to meet essential military and civilian requirements in any international emergency affecting U.S. national security interests. In developing this base, emphasis will be placed upon meeting the following goals:

- (1) Support of the military logistics base, as set forth in *a* above.
- (2) Implementation of the national policies set forth in paragraphs 58 (Civil Defense), 60 (Strategic Stockpiling) and 64-g (Manpower).
- (3) Maximum feasible support from U.S. trade and other economic policies for both the cold war efforts of the United States and the war-time readiness posture of U.S. industry and that of our allies.
- (4) Development and maintenance in a high state of readiness of (measures) essential
- (5) Develop plans essential to recovery in the event of general war.

STATE-OCDM-COMMERCE

to national survival and to retain a capacity for quick recovery in the event of general war.

BUDGET-TREASURY

to survival as a nation, including minimum civilian needs and continuity of government.

64. *f.* Develop and maintain suitably-screened, organized and trained reserve forces of the size necessary to support the military logistics base (Par. 59–*a*).

Enclosure

Memorandum From Twining to McElroy

Washington, September 28, 1959

SUBJECT

Basic National Security Policy—Mobilization Base (U)

1. The Joint Chiefs of Staff have reviewed the proposed revisions of paragraphs 59 and 64-*f* of NSC 5906/1 (Basic National Security Policy) submitted by the NSC Planning Board for consideration by the National Security Council at its meeting on Thursday, 1 October 1959.

2. It is their view that the proposed revisions are militarily acceptable, except:

a. The subparagraph following paragraph 59 *a* (2) (b). Change to read as follows:

“Planning for *cold war and* opposition to local aggression will include . . . general war posture.”

REASON: The requirements for cold war, as well as those for opposition to local aggression, may affect the posture for general war. This rewording will preserve the intent of this paragraph as contained in the memorandum by the Deputy Secretary of Defense, dated 24 August 1959, to the Chairman, Joint Chiefs of Staff, and concurred in by the Joint Chiefs of Staff in their memorandum, JCSM-357-59, dated 31 August 1959.

b. Paragraph 59 b. The Joint Chiefs of Staff have no comment on the divergencies.

REASON: Consideration of the two divergencies in this paragraph will require a decision as to what proportion of its national resources the United States will allocate to Civil Defense. The present divergencies of wording appear to be largely a question of semantics. The Joint Chiefs of Staff are interested in the protection and recovery of the nation should it be subjected to an attack, and therefore any wording which would indicate a policy of at least minimum protection of the civilian population and the eventual recovery of the country is satisfactory to them.

3. It is recommended that the above form the basis of your views before the National Security Council.

For the Joint Chiefs of Staff:

N.F. Twining
Chairman
Joint Chiefs of Staff

201. Memorandum From Smith (S/P) to Herter¹

Washington, September 29, 1959

SUBJECT

Basic National Security Policy; Revision of Paragraph 59 (Mobilization Base)

Discussion:

On October 1 the NSC will consider this subject which was deferred during the basic policy review to allow Defense and OCDM additional time to work out an agreed draft revision. The proposed new mobilization base policy would replace a policy in existence since 1957. The main purpose of the changes is to carry out the instructions of the President, who last December asked Defense and OCDM to inject more realism into mobilization planning. He suggested that in view of the likely character of general nuclear war, it is unrealistic to expect, and to plan for, (1) the availability of a six-month period for civilian and military buildup between the beginning of mobilization and the outbreak of hostilities, and (2) a World War II type buildup of forces.

The new policy contains three important changes:

1. *The M + 6 months concept is abandoned.* The new policy does away with the M + 6 months concept and calls for planning for a military logistics and civilian readiness base flexible enough to meet any foreseeable military contingencies, placing the emphasis upon optimum readiness and capability for active forces. The new policy is expected to result in planning involving (a) a somewhat shorter time period than six months for achieving military readiness, and (b) force levels of lesser magnitude, particularly for non-active forces. The exact details of time periods and planned force structures are not yet known and will depend upon the planning experiences of the next few months. It would be unfortunate, however, if Council approval of the new concept were to be interpreted as agreement to further reductions in present U.S. ground force strength.

2. *Planning for general war will now take into account estimates of damage from nuclear attack both on the U.S. and on U.S. forces abroad.* Previously, this problem had been ignored in mobilization base planning because of the difficulty of making such estimates and of factoring them into plans.

3. *The new policy distinguishes between requirements for general war, and those for limited war.* The previous concept was that readiness for general war would automatically satisfy the requirements for limited war because the latter would require only a small portion of the general war resources. The new policy recognizes that there must be separate

¹ Source: Recommends State Department position on paragraph 59 of NSC 5906. Top Secret. 3 pp. NARA, RG 59, S/P-NSC Files: Lot 62 D 1.

readiness planning for limited war because different weapons, combinations of forces, etc., will be involved.

The new policy states the purpose of civilian readiness to be to support the essential military and civilian requirements in an emergency. Subparagraph *b. (3)* is of particular importance to the Department. It is intended to point up the relationship between U.S. trade and economic policies and the civilian readiness base, and to emphasize that such matters as the strength of our alliances and the wartime readiness of our allies' industries, as well as our own, are affected by U.S. tariff policies, import quotas, etc.

The difference of view on page 4 concerns the degree to which planning should include measures essential to *recovery* of the nation after general war, in addition to measures essential for survival. Budget and Treasury believe the explicit mention of recovery will result in greater expenditures (e.g. for stockpiling of industrial and other items) than would be the case under a policy such as the existing one where only survival is named as an objective. OCDM, supported by State and Commerce, considers it appropriate to include *recovery* because that objective is part of OCDM's responsibility, and because recovery must be an integral part of the U.S. objective of survival in general war.

The proposed change in paragraph 64 *f* is to be consistent with new paragraph 59.

Conclusion:

While the Department has no direct responsibility for mobilization planning, the degree of U.S. military and civilian readiness for an international emergency possibly leading to hostilities would exercise considerable influence upon foreign policy alternatives which might be available to the U.S. The new concept appears to be more realistic and workable than the old and should result in more effective measures to improve the readiness posture of the U.S. It also takes account of the importance of planning for a limited war readiness and capability.

Recommendation:

That you concur in the revised paragraph, supporting OCDM in its split with Budget-Treasury.

Concurrence:

E—Mr. Fuqua (in draft)

202. Briefing Note for October 1 NSC Meeting¹

Washington, September 29, 1959

MOBILIZATION BASE

Our first item, Mr. President, is a new mobilization base paragraph for the basic national security policy. When the Council wound up its basic policy discussions in July, this was one of the two paragraphs left in their old form for further work by the agencies. The other one concerned stockpiling, and the PB hopes to be able to present a revision of that paragraph to the Council soon.

In reading this revision of the mobilization base paragraph, you may have noticed that it has been changed considerably in *form*. It is now divided into two sections, one on what is called the “military logistics base” and one on what is called the “civilian readiness base.” This change in form reflects, I believe, the fact that the term “mobilization base” no longer means what it used to. Before the Korean War, the term referred to a foundation on which expansion could take place after general war began. Accordingly, “mobilization base” still suggests all kind of World War II thinking. The PB considered this semantic problem, but decided not to propose a new term at this time.

Turning to the substance of the paper, I should first like to highlight for you the changes in subparagraph *a*, the military section. The first one is the abandonment of the M-plus-6-months concept. This is the second time in the last 2½ years that mobilization base thinking has undergone a drastic change, with all that such a change means for procurement, reserves, industrial planning and so forth. In early 1957 we went from a concept of M-plus-36-months to one of M-plus-6. This substantial step was reflected in our 1957 Basic National Security Policy statement. Defense *now* feels that planning should not envisage a 6-month mobilization, but rather one of smaller proportions. For that reason, the old M-plus-6 language has been dropped, and the more flexible language in 3(c) at the top of page 3 substituted. Paragraph 64–f also has been appropriately revised. The second change in the military section involved the insertion of the sentence on nuclear damage just above the middle of page 3. Although this represents a change in the basic policy paragraph, it is not new policy since it reflects the President’s decision made last December (Action 2019–*b*). A third change does not clearly come through in the text. It consists of Defense’s intention to make separate analyses of general war needs and local war needs. You may know that it has always been assumed in the past that preparation

¹ Source: Mobilization base paragraph of NSC 5906. Top Secret. 3 pp. Eisenhower Library, Whitman File, NSC Records.

for general war would serve also to meet the needs of local war. Now this assumption will no longer be made, and a separate analysis of local war needs will be conducted.

Before we turn to subparagraph-*b*, I want to mention the JCS proposal to add three words to the last sentence on page 2. They would have it read: "Planning for *cold war and* opposition to local aggression will include . . ." Is there any objection?

Are there any other comments on this military logistics base section?

In subparagraph-*b*, the only substantial change proposed is that of going beyond *survival* to plan for *recovery*. Here we have a split, which is shown on page 4. OCDM, State, and Commerce would like to speak of "national survival and recovery," whereas Budget and Treasury would like to retain the language in the old paper, which uses the phrase "survival as a nation." The JCS have made a comment to this effect:

Consideration of this split will require a decision as to what proportion of its national resources the United States will allocate to Civil Defense. The present-language difference appears to be largely a question of semantics. The Joint Chiefs of Staff are interested in the protection and recovery of the nation should it be subjected to an attack, and therefore any wording which would indicate a policy of at least minimum protection of the civilian population and the eventual recovery of the country is satisfactory to them.

Dr. Saulnier is unable to be here today, but he has sent me the following comment:

"I prefer the State-OCDM-Commerce language because it makes quite explicit the need for readiness measures essential to recovery, as well as to survival during the attack. We should take the measures that are truly needed to effect recovery from an attack. Actually, recovery would seem to be implied by the word "survival," so that either alternative could be employed, but I would prefer the more explicit form."

In the absence of Mr. McCone, who is overseas, the AEC informs me that it has no comment on this or any other part of the paper.

CALL ON: Mr. Patterson
Mr. Staats
Secretary Herter
Mr. Scribner
Secretary Mueller
General Twining

In connection with this question of survival and recovery, you will recall that the President recently asked for an informal study by staff officers in Defense and OCDM on the wartime situation which would probably exist following a nuclear exchange between the U.S. and the USSR. (Action 2110-*c*)

203. Memorandum of Discussion at the 420th NSC Meeting¹

Washington, October 1, 1959

SUBJECTDiscussion at the 420th Meeting of the National Security Council, Thursday,
October 1, 1959

Present at the 420th NSC Meeting were the Secretary of State, presiding; the Acting Secretary of Defense (Gates); and the Acting Director, Office of Civil and Defense Mobilization (Patterson). Also attending the meeting and participating in the Council actions below were Mr. Fred C. Scribner, Jr., for the Secretary or the Treasury; the Acting Director, Bureau of the Budget (Staats); the Attorney General (Item 1); and the Secretary of Commerce (Item 1). Also attending the meeting were the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Director, U.S. Information Agency; the Assistant to the President; the Special Assistants to the President for National Security Affairs and for Science and Technology; the White House Staff Secretary; from the Department of State—the Under Secretary of State (Dillon), Assistant Secretary Gerard C. Smith, Assistant Secretary G. Lewis Jones, and Messrs. Armin Meyer and Howard Furnas; from the Department of Defense Assistant Secretary E. Perkins McGuire and Assistant Secretary John N. Irwin II; the Executive Secretary, NSC; the Deputy Executive Secretary, NSC; and Mr. Charles Haskins, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. BASIC NATIONAL SECURITY POLICY

(NSC 5906/1; NSC Action No. 2114–c; Memos for NSC from Executive Secretary, same subject, dated September 21 and 29, 1959)

Mr. Gray said the first item on the agenda was a new mobilization base paragraph for Basic National Security Policy. Some members of the Council might form the impression that the divergence of view reflected in the draft paragraph was a matter of semantics only; actually hidden behind the language differences were policy differences involving billions of dollars. He hoped the Council would discuss the issues which he would point out, and would not devote much time to redrafting the language of the paragraph.

Mr. Gray then began reading his Briefing Note (a copy of which is filed in the Minutes of the Meeting and another copy of which is attached

¹ Source: Agenda item 1: Basic National Security Policy. Top Secret; Eyes Only. Extracts—8 pp. Eisenhower Library, Whitman File, NSC Records.

to this Memorandum). After Mr. Gray had referred to the sentence in the draft mobilization paragraph dealing with planning ("Planning for opposition to local aggression will include arrangements for the timely provision of personnel and combat essential materiel to insure the continued maintenance of an acceptable general war posture.") and had indicated that the Joint Chiefs of Staff proposed adding the words "cold war and" before "opposition", Mr. Allen said he would like to find out more about the meaning of "cold war planning", especially as it concerned the timely provision of personnel. Mr. Gray said one illustration of cold war planning was the use made of the Sixth and Seventh Fleets in the cold war. General Twining pointed out that the Lebanon operation was another example of cold war use of military force.

Mr. Gray then completed the reading of his Briefing Note and made some additional comments regarding the "split" between State, Commerce, and OCDM on the one hand and Budget and Treasury on the other. He said it would be possible for the US to develop a high state of readiness for (1) survival (2) survival and rehabilitation, (3) survival, rehabilitation and recovery, (4) survival, rehabilitation, recovery and reconstruction. Readiness for category (4) would permit stockpiling of anything anyone could think of. Perhaps the niceties of language did not sufficiently emphasize the "split", which he hoped he had not characterized unfairly.

Secretary Herter felt the problem was largely a matter of semantics, involving the difficulty of finding the right language. Providing for recovery was a matter of degree; and the degree was a pragmatic question affected by budgetary and other considerations, including the question of who stockpiles recovery items. Secretary Herter then said his experience in State government led him to raise another question, i.e., the relation of the National Guard to mobilization. He was unable to see where the National Guard fitted into the mobilization policy except in connection with minimum civilian needs and recovery. The principal function of the National Guard as a disciplined group would be to help salvage civilian resources. He wondered how the present concept of the National Guard conformed to a national point of view under nuclear war conditions. State Governors had often suggested that the National Guard be organized in regional commands on the ground that nuclear war would not follow State lines. Of course, the Guard could be "federalized", i.e., placed under Federal jurisdiction. The US was now spending large sums to provide the National Guard with modern war equipment which it might not need if it performed a recovery role. Secretary Herter confessed that he was thoroughly confused as to the National Guard's function in survival and recovery.

Mr. Gates said the old mobilization base plan provided for forty to sixty National Guard divisions integrated with the Army. Some vestiges of this kind of thinking still remained in the military services. In

a new mobilization policy it would be desirable to be specific about National Guard functions. However, the practical problem was a political one; neither the National Guard nor the Army would agree to the proposition that the Guard should become a militia to enforce martial law under conditions of nuclear attack on the US. Mr. Gates, on the contrary, was sure the National Guard would become just such a militia. Enforcement of martial law had been openly adopted as a mission for the National Guard in Canada. Our dilemma is that we know what the role of the National Guard will be in nuclear war, but we can't put it down on paper.

Secretary Herter wondered whether the issue should not be met head on. Mr. Gates said that in any future war our mobilization base will be what we have in readiness on the day of the attack. Nevertheless, Congress continues to legislate for the National Guard on a different basis. It would be more realistic to assume that in the event of nuclear war, the National Guard will be federalized and will enforce martial law. Secretary Herter felt it was foolish for the Federal Government to provide the National Guard with expensive equipment which it might never use.

Mr. Gray pointed out that the draft mobilization paragraph, under the heading "general war," referred to active forces, selected reserve forces having an initial general war mission, and additional forces. Mr. Gates said the issues raised by the language of the paragraph were not identical with National Guard issues. Mr. Gray suggested that the draft paragraph might perhaps make it clear that planning is under way and direct the responsible agencies to submit proposals which would be specific as to recovery stockpiles. Not much progress would be made by leaving fuzzy language in the paragraph.

The Attorney General thought that since the Government could not continue after a nuclear attack unless the country recovered from the attack, there was little difference between the alternative versions of the draft paragraph. Secretary Mueller said Mr. Gray's suggestion would allow for greater flexibility. Mr. Gates agreed that the paragraph could be completely "open-ended."

Mr. Scribner thought that if the language of present policy were changed, the change would indicate to those Government officials who desire an expansion of the mobilization base that expansion is possible. The Attorney General felt that if the purpose of the draft paragraph was to give a signal to the staffs of the various agencies, the signal should be given in more precise terms. Mr. Gray suggested the Council might regard the draft paragraph as a paragraph for planning purposes and ask Defense and OCDM to submit the programs contemplated.

Mr. Patterson said the draft paragraph, if adopted, would be authority to develop proposals for consideration through the budgetary

process. He felt the mobilization pattern had been set in US Policy in the Event of War (NSC 5904/1) and in the Strategic Stockpiling question considered by the Cabinet. It was difficult to define the terms, but survival and recovery were recognized as essential objectives. Language which did not include both these terms could carry the implication that no measures for recovery would be included in the mobilization base. He felt the NSC would not wish to be put in the position of hamstringing recovery.

Mr. Staats said the Bureau of the Budget was concerned lest the language proposed by State, OCDM, and Commerce in the draft paragraph indicate to some that large recovery stockpiles would be established. If the mobilization base paragraph was being formulated for the first time Budget would not feel so strongly, but in contrast to existing policy the State-OCDM-Commerce proposal placed undue emphasis on recovery. Mobilization planning was covered by existing law and policy. Stockpiling had been considered by the Cabinet, which had directed a further study. He would prefer to postpone further consideration of this paragraph until the stockpiling study was completed, at which time the Council would be in a better position to judge the implications of the proposed policy language. The State-OCDM-Commerce proposal prejudged the stockpiling study and might also require a change in the law, since it went beyond the language of the OCDM statute.

Mr. Patterson felt it would be undesirable to postpone a policy decision on mobilization pending the outcome of a study of one phase of stockpiling, which would require nine months or a year. Such a postponement would put the brakes on progress and planning. He wondered what harm there would be in adopting a mobilization paragraph which would merely provide the opportunity for mobilization programs to be considered on their merits in the normal process of government.

Secretary Herter asked whether assumptions for the study called for by NSC Action 2110-c (the wartime situation which would probably exist following a nuclear exchange between the US and the USSR) had been worked out. Mr. Patterson answered in the affirmative. Secretary Herter said he seemed to recall that Dr. Kistiakowsky thought there were no agreed assumptions as to the extent of nuclear damage.

Mr. Gray believed the Net Evaluation study provided as satisfactory a crystal ball on damage as anyone was likely to find. He suggested amendment of the draft paragraph by striking the words "maintenance in a high state of readiness."

Mr. Scribner said measures essential to survival as a nation ought to be kept in a high state of readiness. No one objected to recovery; the question was whether scarce resources could best be used for defense

or for recovery. He suggested a subparagraph on survival and a separate subparagraph on recovery.

Mr. Gates suggested the word “plans” might be used instead of “measures.” Mr. Gray said this wording would enable OCDM to move ahead. The Attorney General confessed that all the drafting proposals so far advanced seemed to him to have exactly the same meaning.

Secretary Herter said the words “develop and maintain” were of key importance; these words meant that whatever plan is developed goes immediately into force.

At Mr. Gray’s suggestion, Mr. Scribner restated his proposal as follows: “(4) Development and maintenance in a high state of readiness of measures essential to survival as a nation, including minimum civilian needs and continuity of government (5) Development of plans essential to national recovery in the event of general war.”

Mr. Patterson asked what was meant by “minimum civilian needs.” Mr. Gray said OCDM had been operating under this phrase for several years. Mr. Patterson said that under the formula “minimum civilian needs” there was nothing to prevent the minimum being reduced. Mr. Gray wondered whether OCDM wanted to do anything it could not do under the Treasury proposal. He suggested that the Treasury language might be adopted while sympathy might be extended to OCDM.

The National Security Council:

a. Noted and discussed the draft revision of paragraphs contained in NSC 5906/1, transmitted by the reference memorandum of September 21, 1959; in the light of the views of the Joint Chiefs of Staff thereon, transmitted by the reference memorandum of September 29, 1959:

(1) Paragraph 59 (Mobilization Base), prepared by the NSC Planning Board on the basis of a draft submitted by the Department of Defense and the Office of Civil and Defense Mobilization after review of current mobilization base policy pursuant to NSC Action No. 2114-c.

(2) Paragraph 64-f (Manpower), prepared by the NSC Planning Board in the light of its review of the Mobilization Base paragraph.

b. Adopted as a recommendation to the President the revisions of paragraphs 59 and 64-f of NSC 5906/1 enclosed with the reference memorandum of September 21, 1959, subject to the following amendments:

(1) *Page 2, subparagraph 59-a-(2):* In the last sentence of this subparagraph, insert the words “cold war and” between “Planning for” and “opposition”.

(2) *Page 4, subparagraph 59-b-(4):* Include the Budget-Treasury version in the right column, delete the State-OCDM-Commerce version in the left column, and add the following subparagraph (5):

“(5) Development of plans essential to national recovery in the event of general war.”

c. Agreed to recommend to the President that the following be presented to the Council at the earliest practicable date: A report by the Office of Civil and Defense Mobilization presenting a general description of the anticipated effect on the current mobilization base program of the policy on the "Civilian Readiness Base" contained in the above-mentioned paragraph 59-*b* of NSC 5906/1.

NOTE: The actions in *b* and *c* above subsequently submitted to the President for consideration.

The revisions of paragraphs 59 and 64-*f* of NSC 5906/1, as approved by the President, subsequently circulated to all holders of that paper.

The recommendation in *c* above, as approved by the President, subsequently transmitted to the Director, OCDM, for appropriate implementation.

[Omitted here is the remainder of the memorandum.]

Marion W. Boggs

204. Memorandum of Meeting Between Eisenhower and Gray¹

Washington, October 12, 1959, 10 a.m.

1. I first discussed the Record of Actions of the NSC meeting of 1 October. I reported to the President that Secretary of State Herter presided in the absence of the Vice President. I discussed the action on the new mobilization base paragraph which had been agreed upon in the Council and recommended for his approval. I pointed out to him that the new paragraph is divided into two sections: one is what is called "Military Logistics Base" and one on what is called the "Civilian Readiness Base." As far as the Military Logistics Base was concerned, the M-6 months concept has been abandoned and the period will be something shorter. Also, the military section involves the addition of a directive on nuclear damage. Finally, the new language, although not explicit, reflects the fact that Defense and JCS have accepted a new approach and will make separate analyses of general war needs and local war needs. I reminded the President that in the past the JCS had taken the position that preparation for general war would serve also to meet the needs of local war.

With respect to Civilian Readiness, I pointed out to the President that the policy now would require a high state of readiness of measures

¹ Source: Mobilization base, Service roles and missions, international information activities report, long-range planning, VOA broadcasting, organization for space activities, future NSC activities, and Berlin. Top Secret. 7 pp. Eisenhower Library, White House Office Files, Project Clean Up, Meetings With the President. Drafted October 14.

for survival, specifically including minimum civilian needs and continuity of Government. With respect to recovery in the event of general war, the policy would direct planning towards this end. I pointed out to the President that no one at the moment was quite sure about the extent and nature of recovery measures and the Council had not felt it prudent to direct that these be maintained in a high state of readiness. I also pointed out to the President that the action called for a report from OCDM as to what the planning would involve so that the President could then have a judgment as to what measures should be directed. The President said he thoroughly agreed with this approach.

With respect to the request that OCDM make this report, I indicated to the President that the Draft Record also requested Defense to report on the general effect of the changes in the military section. I indicated that I was encountering considerable resistance from Defense and JCS to the inclusion of this request in the Record of Actions largely at least on the ground that it was not specifically agreed upon in the Council meeting although I had indicated an intention to call for a report. I said that the JCS particularly felt that too many requests for studies were being levied upon them by the NSC. I told the President that I was in negotiation with respect to the inclusion of this request for a study, with the Office of the Secretary of Defense and with General Twining, and that I would include it if I could get their agreement; otherwise, we would approach the problem in a different way.

In this connection I told the President that we were having considerable difficulty in getting ahead with some of the studies which had been requested. For example, I reported that the Maritime Study had come back without the factoring-in of nuclear damage and that I had declined to accept the report for the Council.

The President then said that with respect to our problems for the future, perhaps he would get Secretary McElroy and the Chiefs to go again to some point removed from Washington and their staffs, to discuss the question of where we were really going with respect to our military establishment. He wonders whether we're facing up realistically to the problems ahead and said that he was not too impressed with the continuation of our thinking on the basis of roles and missions for particular services. I indicated to the President that I thought the Chiefs were working very hard at their problems despite their fundamental differences and the President agreed, saying that he thought that this was about the best set of Chiefs of Staff that he had had in his administration.

We discussed then some of the fundamental differences such as those deriving from the question of "how much is enough" of retaliatory capability.

2. I then reported to the President on the new policy for Finland.

3. I reported to the President that I had done nothing with respect to recruiting members or staff for the new committee to review the report of the old President's Committee on International Information Activities because Mr. Sigurd Larman had been out of the country and was due back only that day. However, I had arranged for quarters and financing. The President said he continued to think well of having Mr. Larman as the Chairman and authorized me to explore the matter with Mr. Larman, agreeing, if necessary, to write him a letter.

4. I then again discussed with the President the proposal of the Institute for Defense Analysis to broaden its interests and capabilities to include economic, social and political fields so that it might be in a position to make studies for the government in non-military fields just as it had done on weapons systems. I reported to the President that except for OCDM the departments represented on the Council took a rather negative view of the IDA proposal. I said to the President that I was reopening the question because I was still convinced that in some way we should try to do long-range planning, or at least thinking, in economic and political fields as well as in the military field and, I did not think we had adequately faced up to the problem. Furthermore, I reported that there was developing in many quarters an interest in such a thing and described to him as an example, the proposed University of Chicago group under the leadership of Dr. Bothwell and I said that something similar was going on at Ohio State University and other places.

The President then said that this was the kind of thing that he was now thinking about for his National Goals Commission for which, of course, he had been unable to get financing. I suggested to the President that there might be a possibility of combining the National Goals Commission with the kind of proposal that was coming out of IDA and the University of Chicago with the purpose of obtaining financing. For example, Dr. Bothwell had indicated that the Foundations would look favorably upon his proposal if they were satisfied with respect to leadership and also with respect to some sort of sponsorship or interest on the part of the Federal Government. The President seemed interested in this approach and I offered to discuss it with General Persons.

5. I then reported to the President on my discussions with Secretary Herter and with Mr. George Allen with respect to the objectivity of the Voice of America broadcasting in relation to the President's discussion with Premier Khrushchev about jamming. I said that Mr. Allen agreed with the prescription but felt he still had some problems which he would like discussed with the President. As an example, he did not know quite what to do with a situation as was involved in Mr. Walter Robertson's speech to the United Nations concerning Communist China, which was made of course as an official representative of the U.S. This was not

propaganda cooked up by USIA but simply the reporting of an event. However, Premier Khrushchev would probably take offense at it. The President observed that he could see some of the difficulties but wondered whether the Voice of America could not simply forego broadcasting this particular item to the Soviet Union but proceed with broadcasts to the Far East and Asia, for example.

6. I reported to the President that I detected mounting unrest not only in Government but out of Government, about our organization for space activities. I said that there was not only an inherent friction between the military establishment and the space agency which would always derive from jurisdictional problems but there was beginning to be thoughtful concern from outside of Government. As an example, I described the visit of Mr. Ralph Davies from the Management Consultant firm of Klein and Saks, who offered the services of his firm in developing a most effective organization within government. I acknowledged to the President that this matter was not precisely within my charter. However, I said it seemed to me that this was becoming a very important problem and one which would get increasing visibility.

The President said that he had always felt that the emphasis on space should be on peaceful uses and that the Defense interest should develop only when a specific military application was clearly discernible. I said that there was a question of whether the Army Ballistics Missile Agency should stay under the Army or be transferred to the Space Agency. The President indicated that his personal view was that it should be so transferred and that Mr. McElroy had demonstrated an interest in this matter by memorandum just before he left on his current trip.

I asked the President if he had anything specifically before him on the general problem and he indicated that he did not. I then agreed to discuss it with General Goodpaster.

7. I then said to the President that I would like to talk to him for a few minutes about the posture, character and activities of the National Security Council in the next 15 months. I said that perhaps the problem might be stated in an over-simplified way: as to whether the Council should be an active or a passive body. I said to the President that I wished to take the liberty of observing that for my own part I was eager to serve him in any way he found my services useful; that I was not interested in being a custodian or a caretaker. I said that with respect to what is now being called "The Thaw" might require many revisions of many papers if the thaw was really meaningful or if it was not, in the nature of the things we may have very little paper work to do in the next 15 months. In the last months of the Administration there would probably be little in the way of development of new policies and we would probably find ourselves running out of backlog. At this point the President interrupted to say that he did not think that the thaw really

was a thaw and that he immediately saw no basis for contemplating serious changes in our overall policies.

I then said to the President that he many times had indicated his impatience with too many papers and too much fussing with language. He replied that General Cutler had never been able to bring himself to present matters to the Council for discussion but preferred the academic approach of wrestling with language. He said that what he would like to do in the next 15 months would be to spend the time of the Council in discussing the major problems facing the Government. I then said that I would like to make three points: First, there would continue to be some policy papers, which the President acknowledged. Second, that it was important that the discussion topics be dealt with in some sort of framework or the meetings would be incoherent and range over too wide a variety of problems without being productive. I reminded the President of the meeting following his stag dinner on September 10 in which the discussion was disorganized and diffuse. He agreed, saying that unless there were some guidelines the Council would find itself discussing the World Series. Finally, I pointed out to him that in some important matters there had been what I called "exclusions" that is to say, that he had expressly not wished the Council to deal with certain matters.

I referred first to disarmament and said that I acknowledged that the Council should probably not discuss disarmament until the Coolidge Report is completed but at that time I thought the Council should get into this field. Second, I pointed to discussions for preparation for Summit meetings which had not really been discussed in the Council. I reminded him of the old Summit Committee which had not really ever been active. Third, I pointed out that the Council had really never gotten into serious consideration of all the problems relating to NATO. With respect to the latter the President said that this would be a very real problem for us in the months ahead because of the necessity of U.S. troop reduction.

At this point the President said that he was still thinking about the Berlin and German situation. He said that if we make the assumption that East and West Germany are not to be reunited in a decade, which appeared to him to be the only assumption that can be made, then what is our solution for Berlin? He felt that we might get something which Chancellor Adenauer could live with. The President felt that we should continue to maintain such forces in Berlin as an indication that our position has not changed at all. In any event, he felt that this might be a topic of fruitful discussion.

The President then said he did not wish to think in terms of any exclusions in the months ahead and that the Council should discuss every problem of consequence which was in its field of interest.

The President then said that he looked upon the Council and its machinery for the next few months as follows: First, he would like to keep the OCB and the Planning Board active in their respective roles. As for the OCB he wanted it to continue to study and review progress under our policies and to make a decision whether to recommend any change in the policies. On the other hand, he wished to keep OCB paper work at a minimum and OCB reports at a minimum, consistent with the guidelines he had previously established.

As far as the Council itself, and the Planning Board are concerned he would like to devote a major portion of the time to an identification on what is going on and what we should be doing about it and a discussion of these problems.

He felt that we should spend more time in discussion, and with respect to many topics discussed there need not necessarily be a Record of Actions.

For example, he cited the changing face of war and what that means to us now and in the future.

He said we were not adequately thinking of the great problem of the U.S. in sustaining itself in the free world which must grow in morale and economic strength.

He said that we must address ourselves to those countries on the periphery of the Eurasian land mass which the USSR can destroy without war.

He said that with respect to whether the Council should be active or passive he had never allowed any of the members of the Council an excuse to be away from the meetings. This was one reason why he attended meetings regularly himself. If we were to drift toward attendance by deputies and under secretaries there would be no point in his participating. He therefore continued to think of the Council as an active vigorous body and not as a passive one.

I then summed up to the President, saying that on the basis of this discussion, it seemed to me that we would be dealing in the Council for the next few months with three main types of items: First, of course, would be the necessary new policy papers or revised policy papers. Second, the Council would devote itself more to the discussion of major problems and policies which might or might not result in a Record of Actions. Third, out of the Council meetings in the next 15 months would come some policy decisions but that there would also come, what the President has frequently referred to as "legacies of thought" for the next Administration.

Gordon Gray

Special Assistant to the President

205. Memorandum of Discussion at the 421st NSC Meeting¹

Washington, October 15, 1959

SUBJECT

Discussion at the 421st Meeting (Special) of the National Security Council, Thursday, October 15, 1959

Present at the 421st (Special) Meeting of the National Security Council were the President of the United States, presiding; the Vice President of the United States; the Secretary of State; the Acting Secretary of Defense (Gates); and the Acting Director, Office of Civil and Defense Mobilization (Patterson). Also attending the meeting and participating in the Council actions below were the Secretary of the Treasury and the Acting Director, Bureau of the Budget (Staats). Also attending the meeting were the Members of the Comparative Evaluation Group (Mr. Gerard C. Smith for the Under Secretary of State; the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Chairman, President's Board of Consultants on Foreign Intelligence Activities (Hull); the Special Assistant to the President for Science and Technology; and the Special Assistant to the President for National Security Affairs); Vice Admiral John H. Sides, USN, Director, Weapons Systems Evaluation Group; Lt. General Earl W. Barnes, USAF (Ret.), Central Intelligence Agency; J. Patrick Coyne, Secretary, Comparative Evaluations Group; Brig. General Andrew J. Goodpaster, White House Staff Secretary; Mr. Richard Dubois, Weapons Systems Evaluation Group; Colonel Earle MacFarland, Jr., Central Intelligence Agency; Major John Eisenhower, Assistant White House Staff Secretary; and Mr. James S. Lay, Jr., Executive Secretary, NSC.

For a summary and discussion of the main points taken at the meeting see the File on COMPARATIVE EVALUATION GROUP in Mr. Lay's Safe (3rd Report) and the following Record of Actions.

1. COMPARATIVE EVALUATIONS GROUP

(NSC Action No. 2004; Note following the Record of Actions for the 404th NSC Meeting; NSC 5908)

Noted and discussed the third report of the Comparative Evaluations Group, pursuant to NSC 5908, as presented orally at the meeting by the Director, Weapons Systems Evaluation Group.

¹ Source: Agenda item 1: Comparative Evaluations Group; Agenda item 2: Outer Space Science and Technology; Agenda item 3: History of the Development of Long-Range Guided Missiles Weapons Systems. Top Secret. Extracts—3 pp. Eisenhower Library, Whitman File, NSC Records.

2. OUTER SPACE SCIENCE AND TECHNOLOGY

Noted the President's request that the Special Assistant to the President for Science and Technology, with the participation of the National Aeronautics and Space Administration, the Department of Defense, the Central Intelligence Agency, and other interested departments and agencies, arrange for the preparation of a study, to be presented to a joint meeting of the National Security Council and the National Aeronautics and Space Council, appraising the relative capabilities of the United States and the USSR in the field of outer space science and technology.

NOTE: The above action, as approved by the President as of October 26, 1959, transmitted to the Special Assistant to the President for Science and Technology, the Administrator, NASA, the Secretary of Defense, and the Director of Central Intelligence for appropriate implementation.

3. HISTORY OF THE DEVELOPMENT OF LONG-RANGE GUIDED MISSILES WEAPONS SYSTEMS

a. Noted the President's request that the Secretary of Defense arrange for the preparation for the President during the next three months of a factual history of the development by the United States of long-range guided missiles weapons systems (including ICBMs, IRBMs, fleet ballistic missiles, and aerodynamic long-range missiles).

b. Noted the President's request that the Director of Central Intelligence arrange for the preparation for the President of a history of the development by the USSR of long-range guided missiles weapons systems, complementary to the study referred to in *a* above.

NOTE: The action in *a* above, as approved by the President, subsequently transmitted to the Secretary of Defense for appropriate implementation.

The action in *b* above, as approved by the President, subsequently transmitted to the Director of Central Intelligence for appropriate implementation.

[Omitted here is the remainder of the memorandum.]

Marion W. Boggs

206. Memorandum of Conference with the President¹

Washington, October 21, 1959

OTHERS PRESENT

Dr. Glennan, Dr. Dryden, Mr. Horner, General Persons, Dr. Kistiakowsky, Secretary McElroy, Secretary Gates, Dr. York, General Twining, Mr. Staats, Mr. Hagerty, Mr. McCabe, General Goodpaster

Dr. Glennan said the group had come in to discuss the transfer of ABMA to NASA. Underlying considerations were that there is not a clear military requirement for a super-booster, whereas in the field of space activities there is a need to go ahead with the development, and the program should be based on a single super-booster. At the present time there are two programs each of about \$3/4 billion total. If these are put together the total cost would be between \$3/4 billion and \$1 billion, rather than a billion and a half. Mr. McElroy said this matter has been thoroughly discussed in Defense. The President asked whether Governor Brucker had been in these discussions. In this connection he said he had no doubt that Brucker was ready to carry on loyally once a decision was made. Mr. McElroy said that the Army is now out of the space business, and is well resigned to an alternative use of ABMA. There were two options—to turn it over to NASA or to the Air Force. The JCS have looked at the problem and have concluded that it would be better to retain the agency in the Department of Defense. The office of the Secretary of Defense, however, favors a transfer to NASA.

The President asked how ABMA would handle the Pershing missile if this change were made. Mr. McElroy said that the Army can handle the Pershing missile other than at ABMA. Mr. McElroy said there are two questions. First there was now a divided project for a super-booster, and this should be consolidated. Second, there is the question whether ABMA should go to NASA or elsewhere. On these, he thought that the big booster responsibility should be shifted to NASA and that the ABMA group should be shifted to NASA to work on it. The President said he saw no sense in Defense having a super-booster project. Defense should take advantage of the NASA work. In fact, he saw no problem in this except the possibility of a morale problem at ABMA. Mr. McElroy commented on one further point. Over the years he said the U.S. has given fluctuating support to science. He acknowledged they had also given fluctuating support to defense. However, the

¹ Source: Transfer of ABMA to NASA. No classification marking. 3 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on October 23.

Defense people thought there is better assurance of public support for a large booster project over the years if it is put in Defense than if it goes into a civilian agency. The President did not give very much weight to this consideration.

The President then commented that this shift will force us to focus on the development of a super-booster, which to him is the key to a leading position in space activities. Dr. Glennan commented that there will still be need for interim vehicles and for collateral NASA activities. He commented that if ABMA is transferred, with a \$140 million budget for FY-61, he could foresee saving approximately half of this out of the consolidated activity. The President said that a caustic budget review of space activities is required. The question is one of priorities. He thought the super-booster is the key to successful competition and we should concentrate on that. He recalled his principle of attacking one enemy or one principal objective at a time. The NASA budget must go through the whole process of review. He recognized that there are of course many things—instruments, payloads, etc.—which must be brought along in order to make effective use of the booster when available.

Dr. Glennan then presented the gist of the Defense/NASA proposal on the transfer (as set out in the joint letter of himself and Mr. McElroy to the President).

The President said that this field breaks into three main elements in his view. The first is that we must get what Defense really needs in space; this is mandatory. The second is that we should make a real advance in space so that the United States does not have to be ashamed no matter what other countries do; this is where the super-booster is needed. The third is that we should have an orderly, progressive scientific program, well balanced with other scientific endeavors. He thought that these efforts should be carried out in agreement between DOD and NASA, efficiently and wisely. To this end he thought this transfer was a good one to make. He thought, however, that there is need for Defense and NASA to do a real job with ABMA and the Army in order to get them to understand the reasons for the transfer, and not only accept it but support it.

Mr. McElroy said there will not be a perfect meeting of the minds. He anticipated that Congress will bring out whatever dissent exists. The President said he is more interested in good working relations between NASA and Defense. NASA can do a fine job of service to Defense, as NACA did before it. He stressed that this must be carried down and explained to the people really involved, however. He then raised the question whether the transfer should be announced at once or whether some time should be spent explaining it to the people involved. Dr. York commented that there had been so many leaks on the matter that an announcement seemed imperative.

Secretary Gates repeated that there would be controversy over this in the testimony given to the Congress. The President intervened at this point saying it never would have occurred to him in his military service, once a decision had been made by higher authority, to make public his personal convictions where they differed from this decision. He said he would like to see the next Quantico Conference devoted to loyalty—to the principle that when a decision is made all join in carrying it out. Mr. Gates said that many people in the military service think that there will be a requirement on the part of Defense for a super-booster and would like to keep an “in-house” capability for the production of such a booster in the Defense Department.

Dr. Glennan said he saw two problems in making an announcement—the first pertaining to the group at Huntsville and the second to the Congress. The President said that Congress will not have the courage to get into this matter if there is not too much dissension within Defense. He then outlined the kind of announcement he had in mind—stressing his admiration for the fine performance of ABMA, its tremendous accomplishments under Army aegis, and the need for bringing this talent to bear on a consolidated super-booster program. He asked for a draft announcement along these lines to be furnished to him for release later in the day at Augusta.

A.J. Goodpaster
Brigadier General, USA

207. Memorandum From Gates and Glennan to Eisenhower¹

Washington, October 21, 1959

SUBJECT

Responsibility and Organization for Certain Space Activities

The Secretary of Defense and the Administrator of NASA have agreed upon, and recommend to the President, certain actions designed to clarify responsibilities, improve coordination, and enhance the national space effort. The actions recommended below are consistent

¹ Source: Responsibility and organization for certain space activities: transfer of ABMA to NASA. No classification marking. 4 pp. Eisenhower Library, Whitman File, DDE Diaries.

with the steps taken by the Secretary of Defense to clarify responsibilities and assignments in the field of military space applications within the Department of Defense.

The Secretary of Defense and the Administrator have agreed upon and recommend to the President the following actions:

A. The assignment to NASA of sole responsibility for the development of new space booster vehicle systems of very high thrust. Both the DOD and NASA will continue with a coordinated program for the development of space vehicles based on the current ICBM and IRBM missiles and growth versions of those missiles.

B. The transfer from the Department of the Army to NASA of the Development Operations Division of the Army Ballistic Missile Agency, including its personnel and such facilities and equipment which are presently assigned and required for the future use of NASA at the transferred activity, and such other personnel, facilities and equipment for administrative and technical support of the transferred activity as may be agreed upon.

C. The provision by the Army to NASA of such administrative services as may be agreed upon to effect a smooth transition of management and funding responsibility of the transferred activity.

The Secretary of Defense and the Administrator of NASA are in agreement on the following:

1. The nation requires and must build at least one super booster and responsibility for this activity should be vested in one agency. There is, at present, no clear military requirement for super boosters, although there is a real possibility that the future will bring military weapons systems requirements. However, there is a definite need for super boosters for civilian space exploration purposes, both manned and unmanned. Accordingly, it is agreed that the responsibility for the super booster program should be vested in NASA. It is agreed that the recommendations to center this function in NASA and to transfer the Development Operations Division of ABMA to NASA are independent of any decisions on whether either or both of the super booster systems currently under development are continued in their presently conceived form.

2. The transfer of the Development Operations Division of ABMA shall include transfer of responsibility for Saturn, together with 1960 funds allocated for the project, and transfer to the NASA 1961 budget of such amounts as may be approved for this project in the 1961 Department of Defense budget.

3. In carrying out its responsibilities, NASA will keep the Department of Defense thoroughly and completely informed on its booster program and will be fully responsive to specific requirements of the Department of Defense for the development of super boosters for future military missions as requested by the Secretary of Defense.

4. It is NASA's intent to center at the transferred activity the bulk of its space booster vehicle systems work, including an appropriate research and development effort, and ultimately, substantial responsibility for NASA launch operations.

5. It is agreed that NASA will provide support to the Department of Defense and military services at the transferred activity in the same manner as it now does at all other field centers.

6. The management and employment of the transferred activity will be the responsibility of NASA, and no commitment is possible with respect to levels of staffing or funding for the operation. NASA, however, will make every possible effort within its responsibilities and resources to utilize the capabilities of the Development Operations Division of ABMA.

7. The transfer of personnel, facilities, and equipment will be on a nonreimbursable basis.

8. The Department of the Army will provide and maintain on a reimbursable basis station-wide services as required by NASA within the Redstone Arsenal complex.

9. NASA will provide for continuation, transfer, or phasing out of military projects under way at the transferred activity as may be requested and to the extent funded by the Department of Defense, and will undertake at the transferred activity such additional military projects as may be agreed upon by NASA and the Department of Defense.

10. The Department of Defense, the Department of the Army, and NASA, recognizing the value to the nation's space program of maintaining at a high level the present competence of ABMA, will cooperate to preserve the continuity of the technical and administrative leadership of the group.

11. The detailed implementation of the actions proposed will be accomplished through the subsequent negotiation of cooperative agreements between the Department of Defense and NASA.

The Secretary of Defense and the Administrator of NASA have reached agreement and recommend approval of the above actions in the firm belief that the national space effort requires a strong civilian agency and program and a strong military space effort by the Department of Defense, and clear lines of responsibility and authority if the U.S. is to employ its best efforts in the exploration of outer space and to assure the defense of the nation.

If the President approves the recommended actions set forth in A, B, and C above, the Secretary of Defense and the Administrator of NASA will proceed immediately to form the necessary staff teams to develop the required implementing documents.

T. Keith Glennan
Administrator, NASA

Thomas S. Gates
Acting Secretary of Defense

208. Memorandum From Smith (S/P) to Herter¹

Washington, October 29, 1959

SUBJECT

Force Cuts Discussion with DOD on October 24, 1959

I have read the memorandum of the conversation which you had on October 24 with Secretaries Anderson, McElroy and Gates about the possibility of force cuts abroad.

Having given a good deal of attention for some years to the subject matter of that conversation, I thought that a few observations might be of some use.

I gather that the real argument for force withdrawals is based on economic pressures and that the military arguments given are more or less rationalizations. If economic factors require us to weaken American military influence abroad, I think it is most important that we not fool ourselves by rationalizing such retraction as being warranted by the military situation.

Secretary McElroy is reported as having commented “. . . that as long as the US was committed to the principle that any war with the Soviet Union was general war, the need for NATO defenses diminished.”

You are aware that the principle relied on by Secretary McElroy has in the past several years come under increasingly heavy fire. Almost two years ago Foster Dulles on a number of occasions told the Secretary of Defense and the President that he believed this principle was obsolescent and that we should be developing a new strategic concept and military posture to implement it.

The drift of Secretary McElroy's thinking seems to be that it is in the US security interest to more and more depend on the total war nuclear deterrent. For example, Secretary McElroy is reported as saying that there is a need to modify the shield and sword concept.

This can only mean that he favors a modification in the direction of the “trip-wire” concept which requires fewer conventional forces and places a heavier deterrent burden on the general war strategic bombing capability. The NATO military authorities believe just the opposite. They are pressing for a buildup of the shield forces.

This problem is directly related to your efforts during the past year to reduce America's dependence on the total war threat and to restore some balance in our military establishment. As a result of your efforts,

¹ Source: Effect of force cuts on foreign and defense policy. Top Secret. 3 pp. NARA, RG 59, S/P Files: Lot 67 D 548, Military and Naval Policy.

a small advance in this direction was made in Basic National Security policy this year. I believe that any move which will increase our dependence on the strategic bombing deterrent would be contrary to the new emphasis on maintaining balanced forces which the President approved only a few months ago.

I am struck by the likely effect of the force cuts on our limited war capability. Irwin touched on a very sore point indeed in stating "by moving air strength out of Europe, we would limit US capability for responses to problems in the Middle East, and in the Far East would reduce flexibility to meet local situations there." Such limitation is completely at odds with the policy which you have urged many times of beefing up our capability to meet limited situations.

I think there is a good deal of sense in Irwin's point that there is a degree of "schizophrenia in at one and the same time moving in the direction of nuclear test suspension and pursuing a trend toward increased development and dependence on nuclear weapons as a result of budgetary and balance of payment pressures."

The statement on page 7 of the report referring to "our growing dependence on nuclear weapons in limited war situations" seems to fly in the face of the recent Presidential decision calling for greater "balance" in our military establishment.

There is no comfort in Secretary McElroy's stated belief that in a limited war situation the "use of tactical nuclear weapons would not necessarily start a general nuclear war." If there is even a 50-50 chance that their use would start a general nuclear war, I would think that they would be completely ruled out as limited war weapons by the dictates of common sense.

I share Tom Gates' expressed feeling that perhaps the courageous thing to do would be to raise taxes rather than permit budget considerations to reduce our military power.

There seems to me to be no greater problem facing this Government than whether or not to warp our military doctrine and stunt our military establishment to meet temporary economic pressures. We face the alternative of whether to run an *uncertain* risk of some loss of confidence in the dollar or the *certain* risk of loss of confidence in America's determination to make common cause with its allies and maintain a rational and credible deterrent to communist aggression. If this happens, the standing of the American dollar and a great deal more besides will inevitably be prejudiced.

I hope that you will urge this line vigorously upon the President. It seems especially important that American military influence abroad not be reduced at this time of pre-Berlin negotiation and post-Khrushchev visit.

Enclosure

Memorandum From Hoegh to Lay

Washington, October 28, 1959

SUBJECT

Policy on Strategic Materials

The following language is recommended for inclusion as Paragraph 60 of the Basic National Security Policy:

A stockpile of strategic and critical materials as authorized under P.L. 520, 79th Congress, should be maintained. Objectives for the strategic stockpile should be determined on the basis of the time required for supplies of materials in a national emergency to match essential needs of the emergency. Pending a determination of the essential needs of the nation after a nuclear attack (including reconstruction), the planning period should be limited to a maximum of three years, provided that until such determination is made the "maximum objective *should* not be less than six months usage by the U.S. industry in periods of active demand.

The suggested language is in accord with the policy on strategic materials approved by the President following the Cabinet meeting of September 11, 1959.

210. Memorandum of Discussion at the 422d NSC Meeting¹

Washington, October 29, 1959

SUBJECT

422nd NSC Meeting, Thursday, October 29, 1959

Present at the 422nd NSC Meeting were the President of the United States, presiding; the Secretary of State; the Acting Secretary of Defense (Gates); and the Director, Office of Civil and Defense Mobilization. Also

¹ Source: Agenda item 1: Significant World Developments Affecting U.S. Security; Agenda item 4: U.S. Overseas Military Bases; Agenda item 5: Status of National Security Programs as of June 30, 1959, The USIA Program (NSC 5912). Top Secret; Eyes Only. Extracts—7 pp. Eisenhower Library, Whitman File, NSC Records.

attending the meeting and participating in the Council actions below were the Acting Secretary of the Treasury (Scribner); the Director, Bureau of the Budget; and the Chairman, Atomic Energy Commission (Item 3). Also attending the meeting were the Director of Central Intelligence; the Chairman, Joint Chiefs of Staff; the Director, U.S. Information Agency; the U.S. Representative to NATO (W. Randolph Burgess); the Under Secretary of State for Political Affairs (Murphy); the Deputy Director, U.S. Information Agency; the Special Assistants to the President for National Security Affairs, for Science and Technology, and for Security Operations Coordination; Assistant Secretary of State Gerard C. Smith; Assistant Secretary of Defense John N. Irwin II; the White House Staff Secretary; the Assistant White House Staff Secretary; Mr. Frederic Bundy, U.S. Information Agency; the Executive Secretary, NSC; Mr. Robert H. Johnson, NSC; and Mr. Charles Haskins, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. *SIGNIFICANT WORLD DEVELOPMENTS AFFECTING U.S. SECURITY*

The Director of Central Intelligence began his briefing by stating that during the past week—on the 22nd and 25th—two ballistic missiles had been launched from Tyura Tam which had gone 4700 nautical miles landing in a new impact area in the Pacific 700 miles from Midway. He reminded the Council that sometime back there had been two other “long” shots into this same area. He was inclined to credit Khrushchev’s statement that these earlier shots had been overshots. The two recent shots, however, had landed in the new impact area as planned. Using a map he indicated the course of these missiles and the location of the impact area. He reminded the Council that in an earlier briefing he had described this impact area and the heavily instrumented vessels which the Soviets had positioned in this area for detection purposes.

In the case of each of these last two shots the vehicle had been sighted during the terminal part of its flight by American observers from a nearby island. The first of them had also been seen from American aircraft; monitoring of the count-down had given us sufficient time to get planes in the air. There were no reports as yet as to whether the second shot had been observed from U.S. aircraft. Preparation for these two launchings had been long and elaborate. They may have had something to do with the Russian space program—for example, with the development of a recoverable nose cone. The missiles had had a lower trajectory than they were capable of. If the trajectory had been raised, they could have gone farther; the Russians in future shots may therefore have problems in avoiding coming too close to Midway.

The Director indicated that the scientific office of CIA had been analyzing the Soviet moon photograph. The photograph was probably

genuine, and, if so, represented a technical feat of singular importance. The Russians had had to overcome great technical problems in controlling from such a great distance the equipment which took the picture and transmitted it back to the earth. The photographs were being studied further. If the Russians should make the film available, more careful analysis would be possible.

[Omitted here are agenda items 2 and 3.]

4. U.S. OVERSEAS MILITARY BASES

(NSC Actions Nos. 1876, 2034 and 2070; Memos for NSC from Executive Secretary, same subject, dated January 14 and March 17, 1958)

At the end of the discussion of Moroccan bases, the President referred to the study by the late Frank Nash of U.S. overseas bases. He said that he believed that the base system should be looked at by an official who would go and study it every six months. He felt that we had our heads in the sand on the bases—the foreign countries concerned were excited about national aspirations and sovereignty and we were in the position of being blackmailed. He noted that only this morning, in connection with the paper on Libya, it had been indicated that we were likely to have trouble at Wheelus. He thought that the base agreements which had been made ten years ago were beginning to be outmoded. We could not continue to depend on these facilities on the same basis as in the past. He was tired, he said, of repetitions of formal studies, but he wanted someone to go off and look at the base situation and then to come back and report. Responding to the President's point, Secretary Gates said that he would have someone look again at the Nash Report. Secretary Herter suggested that anyone who went overseas to survey U.S. bases should include the Prime Minister of Morocco in his consultations.

The National Security Council:

Noted the President's request that the Secretary of Defense designate an official to re-examine the U.S. overseas military base system and review the findings and recommendations thereon contained in the Report to the President by the late Mr. Frank C. Nash (enclosure to the reference memorandum of January 14, 1958), reporting the results of such re-examination and review to the President within six months.

NOTE: The above action, as approved by the President, subsequently transmitted to the Secretary of Defense for appropriate implementation.

5. STATUS OF NATIONAL SECURITY PROGRAMS AS OF JUNE 30, 1959: THE USIA PROGRAM (NSC 5912)

Mr. Allen began his briefing by pointing out that the activity in which USIA was engaged was really an additional aspect of the conduct of our foreign relations. It had very recently been added as an activity of governments. Traditionally, communications between countries had

been on a government-to-government basis. If a diplomat appealed to the people of a country over the heads of the leaders, he would, in the past, have been rapped over the knuckles. Now, however, practically all governments were speaking directly to the peoples of other countries. This sort of activity was growing very rapidly. Mr. Allen stated that some of those who were involved in this aspect of the conduct of our foreign relations had to remind themselves of the relatively small part that it still played in the conduct of those relations. Diplomacy was still the most important means by which nations spoke to each other. However, even those activities that were primarily important as communication between governments, such as the President's trip to Europe, had an important aspect of communication with peoples as well. For example, one important aspect of the President's trip to Europe was his appearance on television with Prime Minister Macmillan. This appearance had been credited with having an important effect upon the outcome of the British elections.

Mr. Allen then displayed a chart organized on the basis of media and showing the share of the Communist World, the Free World, and the U.S. in the output of the various means of international communication. He noted that 600 million books each year crossed international boundaries either through direct export or through publication by one country in another. Of this world total 25 per cent was Communist, 75 per cent Free World. The U.S. accounted for 17 per cent of the world total and USIA inspired publication of 3 per cent of that total. USIA last year published 17 million books of which 9.5 million were in foreign languages and 7.5 million in English. Mr. Allen displayed examples of the books published under USIA auspices in foreign languages. He said that these books fell into two main categories: those dealing with Americanism and those which were anti-Communist. In most cases USIA inspires publication either by agreeing in advance to buy a certain number of copies or by paying for translation and helping the publisher obtain copyright privileges. He also displayed student editions which were sold for as little as ten or fifteen cents. He said that the U.S. had often been rawhided on the grounds that the Communists were flooding world markets with literature while the U.S. was doing nothing. However, in some cases the U.S. had flooded the market to such an extent and put the price so low that the value of a book as paper was greater than its value as literature. Thus a book published in India in the Gujarati language had been distributed in quantities that were greater than the traffic would bear and as a result copies had turned up in the paper pulp shops in Bombay.

Turning to the press, Mr. Allen pointed out that one million words a day crossed international boundaries of which 30 per cent were Communist and 70 per cent Free World. One-half of the total was accounted for by the U.S. and five per cent, or 50,000 words per day,

was accounted for by USIA. He noted that there were 10,000 hours of international broadcasting every week of which 25 percent were Communist and 75 per cent Free World. USIA accounted for 6 per cent. Referring next to motion pictures, he stated that 2700 feature films are produced each year of which 12 per cent are Communist and 88 per cent Free World. The U.S. accounted for 10 per cent. USIA produced no feature films, only documentaries.

Mr. Allen then went on to state that exhibitions were often the most effective way of reaching people. As an example, he pointed out that, when he first went to Belgrade as Ambassador, Tito had just broken with the Kremlin and had been afraid to show any sympathy with the U.S. The Yugoslavs would not go to the USIA Library. However, USIA had had a display window on the main street which was changed each week. When the people of Belgrade promenaded on this street every evening, the area around the USIA window was mobbed. Mr. Allen also noted that the Moscow Exhibition had been the most spectacular single incident involving USIA programs during the last year; it had been attended by three million Russians. He noted the role of the performing arts in USIA programs and called attention to programs for sending American athletes and lecturers abroad.

He pointed out that the people-to-people program provided a means through which the American people could make contacts with people with similar interests in other countries. He noted that the business community was now getting into this program in a big way. He suggested that official visits were one of the most important ways of communicating with peoples and in this connection mentioned the impact of the Vice President's visit to the USSR on the Russian people. He again emphasized the impact of the President's trip to Europe on European peoples and went on to point out that in the history of the U.S. no President had visited the area of Asia and the Middle East where one-half the population of the world lives. He noted the speculation in the press that the President might make a trip to this part of the world. He stated that, if the President should make such a trip, it would greatly overshadow USIA efforts in its impact upon the peoples of this area in addition, of course, to its importance in providing opportunities for communication between the President and the leaders of countries in the area.

Mr. Allen suggested that the American people and other peoples of the world were alert to propaganda. In the light of this alertness USIA could take two approaches to its job. It might conceal itself as much as possible, making use of local publications, the furnishing of background information to local newspapers and similar activities. Often this was the most effective way of doing the job. On the other hand, Mr. Allen felt that the main effort should be to make the label "USIA" something not to be ashamed of—something to be respected. He believed that our efforts should be directed toward creating a situation

where people would say “This is the American Government speaking and therefore what is said is correct, is true.” We should concentrate more and more on creating an atmosphere where we would not be ashamed, but would actually be proud, of USIA. This atmosphere, he indicated, already exists in some places. For example, he pointed out that a newspaper publisher in Bombay had indicated to him that he considered material more, rather than less, reliable when it bore the USIS label. If we took this course, Mr. Allen suggested, it would tend to get USIA increasingly out of gray or covert operations. USIA would then not have to be continually withdrawing from positions or having to explain embarrassing situations. Other agencies of the government, he felt, could handle covert activities.

Mr. Allen said that the business community was becoming more interested in building a better impression overseas and that Mr. Clarence Randall as well as Mr. White of Republic Steel had been very helpful in this respect. However, there was still considerable resistance in the business community based upon the view that business should not become involved in working hand-in-glove with the government overseas. For example, Mr. Humphrey of U.S. Rubber argued that American business overseas was highly regarded and that if the government got us into trouble overseas, it was up to the government to get us out of trouble. Mr. Humphrey did not want business tarnished with anything looking like government propaganda. However, some business leaders were working to get the business community to recognize that their overseas operations sink or swim with the U.S. posture overseas. The business Council for International Understanding, which was to meet on Friday, had been helpful in developing people-to-people projects.

Mr. Allen then referred to Voice of America construction activities. He stated that the principal construction underway was the big facility being built on the East Coast of the U.S. When this facility was completed, we would be able to send a strong signal abroad even if our installations abroad were knocked out. Next in importance to this East Coast facility was the important relay base we were building on the West Coast of Africa in Liberia. Liberia actually welcomed this facility. Mr. Allen noted that in some areas of the world listening to short-wave broadcasts was on the decline as local stations were developed, but in an area like Africa, where people were just acquiring enough money to be able to afford to buy radios, short-wave broadcasting was of increasing importance. In this connection he pointed out that Phillips had sold three thousand radio sets during the month of July in the Belgian Congo and that 90 per cent of these had been bought by Africans.

Finally, Mr. Allen stated that those who were engaged in the USIA type of activity realize that sometimes the best policy is to keep quiet.

For example, the State Department had a year ago set up a group to do something about Antarctica. This group had decided that a conference should be called of the eleven nations that had worked in Antarctica during the Geophysical Year in order to develop a formula for continued international cooperation. When the State Department note had been sent to the eleven nations, there had been talk within USIA of putting it on VOA and exploiting it heavily. Mr. Allen, however, had taken a contrary position. He had felt that if we had started bragging, our action would have been viewed as a propaganda stunt rather than as a real effort to get agreement and therefore that we would have prejudiced the changes of getting an agreement. He noted that there was now a real possibility of getting a solid agreement on Antarctica.

The President concluded the meeting by telling the Council a story. He said that a wealthy friend of his, who had recently died, had told him when he was 75 years old that he could not remember any time during the 75 years when he had learned anything while talking.

The National Security Council:

Noted an oral presentation on the status of the U.S. Information Agency Program, by the Director, U.S. Information Agency, based upon Part 5 of NSC 5912 and recent developments.

Robert H. Johnson

211. Memorandum From Lay to Holders of NSC 5912¹

Washington, October 30, 1959

The enclosed Part 1 (The Military Program) is transmitted herewith for insertion in NSC 5912.

Part 1 has been given a special limited distribution, and access to it should be on a strict need-to-know basis.

James S. Lay, Jr.
Executive Secretary

*NSC 5912, PART 1, THE MILITARY PROGRAM**I. OBJECTIVES OF THE MILITARY PROGRAM.*

The basic national objective of the United States is to preserve and enhance the security of the United States and its fundamental values and institutions. The primary threat to fulfillment of this objective is that posed by an aggressive and deeply hostile International Communism. All elements of U.S. national power must be resolutely directed toward meeting this Communist challenge.

The objectives of the U.S. military programs, in support of the basic national objective and in light of the primary threat, are to provide:

An effective nuclear retaliatory capability, adequately safeguarded and ready for immediate action.

An adequate continental defense system.

Highly mobile and suitably deployed ready forces, with the capability to respond selectively and flexibly to local aggression, using all weapons (including nuclear weapons), as required to achieve national objectives, and to carry out general war tasks.

A capability of maintaining control of essential sea areas and air communications.

A cold war contribution of U.S. military power to reinforce and support, in appropriate ways, overt and covert political, economic, psychological, technological and cultural measures.

*II. SUMMARY EVALUATION OF OUR ACTUAL AND
POTENTIAL CAPABILITIES TO FULFILL CURRENT MILITARY
COMMITMENTS AND BASIC OBJECTIVES AS OUTLINED IN
NSC 5810/1.*

Through FY 1960, the nuclear strike forces of the United States will continue to provide a capability to inflict such loss and damage upon an enemy as to achieve a significant margin of advantage which, if exploited effectively in conjunction with other military operations, would permit the United States and its Allies to prevail in general war. Despite continued improvement in the quality and posture of the nuclear retaliatory forces of the United States and its Allies, as presently programmed, and within current expectation for Fiscal Years 1961 and 1962, Soviet technological advances will probably continue to diminish the present margin of U.S. military superiority. By the end of FY 1962 with a continuance of present trends and programs on both sides, and with no major technological break-throughs on either side in the intervening years, the most probable position will be that each side will possess military strength of potentially decisive proportions. While operational factors which apply in the initial action may lead to advantage for either side, an advantage, possibly conclusive, will accrue to the side taking the initiative.

Additional improvements have been made in North American defense during FY 1959, particularly in the areas of warning and defense against the air breathing threat; however, concurrent Soviet offensive improvements have made any relative U.S. gain questionable. The North American defense system is not capable of preventing an attack which could seriously damage the United States although it should significantly degrade any such attack and it does complicate seriously the attackers' problems.

The ready forces of the United States are capable of responding selectively and flexibly to local aggression and to meet the initial requirements of general war. However, while the over-all nuclear posture of all Services has improved, modernization of non-nuclear fire support has not kept pace. The scope and timing of response to local aggression would be limited by a number of factors, including: the nature and location of the aggression, the degree to which maldeployment for initial tasks of general war could be accepted, the availability of transportation, and whether or not nuclear weapons are to be employed. The over-all military capabilities of our Allies to support U.S. and collective defense organization strategic concepts possibly increased in the Far East during FY 1959, but probably decreased on balance in the Middle East and has not significantly changed in Europe. The capabilities of our Allies to assist in coping with local aggression vary from country to country. With few exceptions, the capabilities of our Allies to assist in coping with local aggression in other than their own general area are very limited.

The United States and its Allies are capable of controlling essential air communications except on the periphery of the Soviet Bloc. Extreme difficulty will be incurred in controlling essential sea areas until such time as the Soviet submarine capability is reduced to manageable proportions. The mining, mine countermeasures and harbor defense programs continue to be only partially satisfactory.

The military forces, as the largest segment of U.S. population abroad, are capable of significant reinforcement of overt and covert political, economic, psychological, technical and cultural measures to achieve national objectives. Although this capability has not been fully exploited, increased emphasis has been given to cold war activities and the U.S. position has thus been strengthened in several areas.

A. AN EFFECTIVE NUCLEAR RETALIATORY CAPABILITY,
ADEQUATELY SAFEGUARDED AND READY FOR IMMEDIATE
ACTION.

The *Strategic Air Command* (SAC) has primary responsibility for nuclear retaliation and is charged with exploiting U.S. current superiority in nuclear weapons and long-range delivery systems against selected

targets and target systems at the outbreak of hostilities. Total SAC force has been reduced from 44 (11 heavy, 28 medium and 5 reconn.) wings of bomber and reconnaissance aircraft at end FY 1958 to 43 (11 heavy, 28 medium and 4 reconn.) wings at end FY 1959, one medium reconnaissance wing having been inactivated. Programmed changes during FY 1960 will result in the inactivation of another medium reconnaissance wing and activation of one strategic missile wing, retaining the total of 43 wings (comprised of 12 heavy, 27 medium, 3 reconn. and one strategic missile wings).

Combat capability of SAC heavy bomber wings increased during FY 1959 as two more B-30 wings converted to B-52s, bringing total to 9 equipped² B-52 wings. Two more redesignated wings are in process of being equipped with B-52s. By end FY 1960, 11 wings will be fully converted to B-52s, and one additional wing will be in the process of converting from B-47 medium bombers to B-52s. While combat capability of SAC heavy bombers is improving through introduction of new equipment, the B-47 medium bomber fleet is approaching obsolescence. These aircraft, which make up the bulk of the bomber force and have now been in service about 7 years, have recently undergone a major safety-of-flight structural reinforcement to extend their usefulness.

As the Soviet delivery capability increases, the vulnerability of SAC bases and in turn, the SAC nuclear retaliatory forces within and outside the United States, continues to be a matter of great concern. To reduce vulnerability, SAC dispersal and alert programs are being implemented. The status of these programs is:

1. *Heavy bomber dispersal.* Although there is a goal to have no more than one heavy bomber squadron on any one base, 33 squadrons are presently located on 18 bases. By end FY 1960, 36 squadrons are programmed to be dispersed on 27 bases, i.e., three bases each with three squadrons, three bases each with two squadrons, and 21 bases each with one squadron. (See Dispersal map, Sec. VIII).

2. *Medium bomber dispersal.* At present, there are 28 wings on 18 bases. At end FY 1960, 27 wings are programmed to be located at 18 bases (nine bases each with two wings, and nine bases each with one wing).

3. *Alert.* As of 30 June 1959, 268 bombers with associated tankers were on continuous 15-minute alert. By end FY 1960, approximately 335 SAC bombers with associated tankers are expected to be on continuous 15-minute alert. A test of the airborne alert concept was completed on 30 June 1959 and the results are being evaluated.

²Note: An "equipped" unit possesses 50% or more of authorized number of aircraft. [Footnote is in the original.]

The first *ATLAS intercontinental ballistic missile complex*, at Vandenburg AFB, initially programmed to be operational in June 1959, is now scheduled to be operational before the end of October 1959. A second complex for the first squadron is programmed to become operational before the end of CY 1959. The second *ATLAS* squadron, programmed for Warren AFB, is scheduled to become operational prior to the end of FY 1960. The research and development programs for the *TITAN* and *MINUTEMAN* are progressing satisfactorily. The first *TITAN* squadron is programmed by the Air Force to be operational by end FY 1961 and the first *MINUTEMAN* squadron during FY 1963.

Supplementing the SAC retaliatory capabilities are the *USAF tactical nuclear strike forces*. In the *Pacific*, these forces consist of 3 wings of tactical fighters, one wing of tactical bombers and 2 squadrons of *MATADOR* tactical missiles, all to continue in the program during FY 1960. In the United Kingdom, Europe and the Middle East, tactical nuclear strike forces consist of 6 tactical fighter wings permanently deployed plus 4 squadrons on continuous rotation from the United States; one wing of tactical bombers, and 3 squadrons of tactical missiles (2 *MATADOR* and one *MACE*). The tactical nuclear strike units in these areas are programmed to remain unchanged during FY 1960 except for converting one of the 2 *MATADOR* squadrons to *MACE* missiles. Nuclear-capable tactical air forces in the United States, capable of augmenting forces overseas, consist of 6 tactical fighter wing equivalents which continue in the program through FY 1960. One bomber wing and 6 tactical fighter wings were inactivated during FY 1959.

Continuing progress is being made in providing the above delivery systems with weapons and warheads having improved weight to yield ratios. Continuing dispersal of nuclear weapons to combat units in the field has improved greatly the operational readiness of our offensive forces. This action, coupled with streamlining of our release procedures, has reduced substantially the reaction time of these forces to counter enemy aggression. However, due to political denial of storage rights in certain countries, weapons allocated to some combat units are not immediately available to those units. Action is continuing to obtain the authority for dispersal of nuclear weapons to those additional countries.

Certain *major U.S. Navy forces*, with the primary mission of maintaining control of essential sea areas and air communications, possess a significant nuclear retaliatory strike capability. This capability is primarily in the attack carrier striking forces with a secondary capability in missile delivery from surface ships and submarines. There are 14 attack carriers (including 2 new carriers in “shakedown” status) and 16 associated carrier air groups of which 4 to 5 attack carriers with their attached air groups are normally in position to strike assigned targets. Deliveries of new jet aircraft and modernization and new construction

of attack aircraft carriers have materially increased the Navy's nuclear weapon delivery capability. The 4 CVA 59 (FORRESTAL) class carriers have markedly increased this capability in fleet operations. Included in the naval forces are *Marine Corps forces* which contribute to the over-all nuclear retaliatory capability. This includes one Marine aircraft wing in the Pacific (2/3 wing in 7th Fleet and 1/3 wing in other Pacific areas). One Marine division in the Pacific (2/3 division in 7th Fleet and 1/3 in other Pacific areas) and one Battalion Landing Team (BLT) with Sixth Fleet in the Mediterranean can contribute to a nuclear retaliatory capability when deployed into position. Two Marine aircraft wings and 1-8/9 divisions, all nuclear capable, located within CONUS are available for augmenting overseas forces. Fleet Marine Force troops reinforcing the division in the Pacific had both 8" howitzer and HONEST JOHN equipment while the BLT with the Sixth Fleet was reinforced by an 8" howitzer unit.

The present *Naval capability for guided missile delivery of nuclear warheads* from surface ships and submarines is represented by the REGULUS I system for which nuclear warheads are stockpiled. REGULUS I system is now installed in 4 submarines and 3 heavy cruisers. There are 11 other submarines equipped with REGULUS radar guidance system (TROUNCE) to provide terminal control of a REGULUS missile launched from either a submarine or cruiser. By end FY 1960, one more submarine will be equipped with REGULUS I system. Normally 1/3 to 1/2 of these ships are deployed and contribute to capabilities of unified commands.

The first 5 *Fleet Ballistic Missile (FBM) submarines* authorized, for which money was appropriated by Congress, are under construction. Congress appropriated funds for 4 additional FBM submarines in the FY 1959 budget, plus additional funds to lend assurance to the achievement of an effective early operational capability for the POLARIS missile. In December 1958, funds for one of these submarines were released for obligation in FY 1959. Excellent progress has been made in the POLARIS missile development and the system support programs.

Nuclear delivery systems organic to deployed *major U.S. Army forces* contribute to the nuclear retaliatory capability. In Europe, the Army currently maintains 2 REDSTONE missile groups, 8 CORPORAL missile battalions, 5 HONEST JOHN rocket battalions, 5 HONEST JOHN batteries, six 280mm gun battalions (to be reduced to 4 during FY 1960), nine 8-inch howitzer battalions and five 8-inch howitzer batteries. In the Pacific, the Army currently maintains one 280mm gun battalion, one HONEST JOHN battalion, two 8-inch howitzer battalions, three 8-inch howitzer batteries and 3 HONEST JOHN batteries. Nuclear warheads are stored in the immediate vicinity of the above units thereby insuring maximum operational readiness. New weapons design and missile check-out procedures have appreciably reduced

reaction time. Nuclear delivery units in the United States capable of augmenting forces overseas include one medium missile command (HONEST JOHN and CORPORAL), one air transportable missile command (HONEST JOHN) and one REDSTONE missile group. By end FY 1960, eight of the newly developed air transportable LACROSSE missile battalions will be available for U.S. Army forces deployed in CONUS, Europe and Pacific. The planned transition from the liquid-fueled REDSTONE and CORPORAL missiles to solid propellant and all-inertial guidance system for the PERSHING and SERGEANT systems will greatly improve mobility and reaction time. One SERGEANT missile battalion will also be activated during FY 1960. Current developmental progress of the PERSHING missile indicates that it will have an operational capability in FY 1963.

In opposing U.S. retaliatory forces, the *Soviet Bloc air defense* system has the following general capabilities:

1. Capabilities are greatest against penetration conducted during daylight and in clear weather, at altitudes between 5,000 feet and about 45,000 feet.

2. At altitudes above about 45,000 feet enemy air defense capabilities decrease progressively as altitude is increased, except in the areas equipped with surface-to-air missiles where capabilities are unimpaired to at least 60,000 feet.

3. At altitudes below about 5,000 feet, enemy capabilities decrease progressively as altitude decreases and are probably seriously reduced at altitudes below about 1,500 feet.

4. Against penetrations conducted at night and under conditions of poor visibility, the capabilities of the enemy system are greatly reduced because of the limited availability of all-weather fighters and surface-to-air missiles.

5. Against varied penetration tactics utilizing altitude stacking, diversionary maneuvers, decoys, and electronic countermeasures, the capabilities of the enemy system are diminished through disruption and saturation.

The degree of advantage accruing to the United States and its allies as a result of retaliatory attacks would depend on a number of strategic and operational considerations, to include exercise of initiative, the amount of warning of Soviet attack, the degree of protection, and the mobility or concealment afforded military forces and installations, particularly those from which our retaliatory effort would be launched. It is estimated that enemy losses sustained as a result of a U.S. retaliatory attack would provide a margin of advantage to the United States and its allies which, if exploited in conjunction with other military operations, would assure eventual victory.

B. *HIGHLY MOBILE AND SUITABLY DEPLOYED READY FORCES WITH THE CAPACITY TO RESPOND SELECTIVELY AND FLEXIBLY TO LOCAL AGGRESSION USING ALL WEAPONS (INCLUDING NUCLEAR WEAPONS) AS REQUIRED, AND TO CARRY OUT GENERAL WAR TASKS.*

1. *Over-all Capabilities.*

a. *U.S. Army* forces are capable of reacting selectively and flexibly and with appropriate means to situations ranging from local aggression to general war. Integration of organic nuclear delivery systems in the reorganized infantry, armored and airborne divisions has increased the operational capability of the Army to engage in nuclear warfare. The dual capability of individual weapons systems has been improved by a new high explosive warhead for HONEST JOHN rocket, which is now available in limited quantities, and will be further improved by activation of LACROSSE missile battalions scheduled for FY 1960. Introduction of DAVY CROCKETT [*text not declassified*] atomic weapon planned for FY 1961 will further enhance nuclear capabilities of Army forces. Exploitation of the helicopter, together with introduction of self-contained, readily transportable combat units provides an increased degree of flexibility and mobility. The Army considers that principal limitations on effectiveness of Army forces are: insufficient manpower and funds; lack of modernization of non-nuclear weapons and equipment; an insufficiency of combat support and logistic support; lack of forward depots, and insufficiency of adequate high speed troop lift.

b. *Naval.* Highly mobile and strategically deployed ready naval forces have the capability and flexibility to respond selectively and with the degree of force necessary to meet local aggression and to carry out general war tasks. U.S. naval forces have increased their nuclear and non-nuclear capability which adds materially to the effectiveness of the ready forces. The Navy has continued integration of guided missiles weapons systems into fleet operations. BULLPUP air-to-surface missile, a close air support guided missile, is now in the combat inventory of Atlantic and Pacific Fleets in limited quantities. Atlantic Fleet has a limited capability in surface-to-air missiles for fleet air defense with 3 TERRIER equipped ships and the USS GALVESTON now conducting evaluation of TALOS shipboard system. All attack carriers are equipped with SIDEWINDER and some with SPARROW III air-to-air missile squadrons for air defense operations. Included in naval forces are Fleet Marine Force ground and air units with capability to employ nuclear and non-nuclear weapons, either surface or air launched. The vertical assault technique developed by Navy and Marine Corps no longer ties an initial assault to the shore line but permits landing of troops quickly and selectively to points up to 50 miles inland.

Capability to conduct vertical assault operations was increased materially by conversion of 2 CVS's to LPH's, bringing to 3 the number

of interim LPH's available. One of these ships is assigned to Atlantic Fleet and 2 to Pacific Fleet. Two of the LPH's are capable of carrying a fully combat-ready BLT and one helicopter squadron, while one LPH is capable of carrying one-half BLT and one helicopter squadron.

c. *Air Force.* There was a substantial reduction in the number of USAF tactical air wings world-wide during FY 1959. These forces were reduced from a total of 45 wings at end FY 1958 to 35 wings at end FY 1959, and are being reduced further to 34 wings at end FY 1960. *Nevertheless, tactical as well as strategic air units retain a capability to respond effectively to general war or local aggression, resulting from improved nuclear delivery means, decreased reaction time and increased mobility.* However, our present programs do not compensate entirely for future improvements and increase in Soviet capability. The most pressing problems in the tactical area concern the slow rate of aircraft modernization and the need for improved ground environment systems which can control effectively both air defense and tactical air weapon systems in overseas areas.

d. In the succeeding paragraphs the ready forces capable of responding selectively and flexibly to local aggression and general war are treated by geographical areas.

[Omitted here is the remainder of Section II of the report.]

III. EVALUATION OF OUR ACTUAL AND POTENTIAL CAPABILITIES TO PROVIDE AN ADEQUATE CONTINENTAL DEFENSE SYSTEM.

A. *OBJECTIVES OF THE DEPARTMENT OF DEFENSE CONTINENTAL U.S. DEFENSE PROGRAMS (Based on NSC 5802/1).* To be prepared at all times to counter an attack on the North American Continent in such a way as to deter Soviet attack, or, if an attack occurs, to insure our survival as a free nation. Such preparation requires that the United States achieve and maintain, in collaboration with Canada and other Free World nations, a continental defense readiness and capability which will protect and permit the launching of our nuclear retaliatory forces, even in the event of surprise attack. Such preparation should: (1) Provide warning to alert the nation to impending attack; (2) counter enemy subversive and clandestine efforts; (3) prevent the threat of nuclear destruction from unduly restricting U.S. freedom of action or weakening national morale; (4) maintain adaptability to make timely changes as technology permits and as the nature of the threat changes; (5) provide appropriate measures of protection for the civil population; and (6) include appropriately organizing, protecting, and placing in a condition of readiness the resources of the country essential to national survival.

B. *ESTIMATED SOVIET THREAT AND CAPABILITIES.*

1. Current Soviet capabilities for full-scale air attack on the continental United States depend mainly on their long range aviation. Although still consisting primarily of medium bombers capable of

attacking the continental United States only through the extensive use of one-way missions, Soviet long range aviation has continued to be improved by the phasing-in of additional jet bombers, more realistic and larger scale training exercises, improvement of potential staging bases in the Arctic, development of in-flight refueling, and improvement of electronic equipment for ECM, bombing, navigation, and other purposes. Nuclear weapons storage sites have been identified at many home bases of the Soviet long range aviation force and it is believed that nuclear bombs are now the primary weapon of this force. The number of aircraft launched against the United States in an initial attack, even under conditions where surprise was a major Soviet consideration, could range in the several hundreds.

2. It is estimated that the USSR is developing and stockpiling a versatile group of nuclear weapons with yields ranging from about 1 KT to about 12 MT.

3. For planning purposes, it should be considered that the Soviets will probably attain an operational capability with ten ICBMs in the first half of 1960, with a possibility of this occurring in the latter part of 1959.

4. The USSR probably now has a limited number of submarines capable of launching subsonic, cruise type missiles with a range of 150-200 nautical miles. These missiles could be launched by a submarine only after surfacing. Additional submarines could be converted to include this capability in four to six months from the time the decision is made to do so. At least 3 Z-Class submarines may have been converted to include a missile capability, possibly of the short range ballistic type.

5. Clandestine attack on the United States by sabotage, biological warfare, and placement of nuclear weapons, could occur against specifically selected targets.

C. SUMMARY EVALUATION OF U.S. AIR DEFENSE CAPABILITY AND PROBLEMS. The absolute capability of our forces to defend the United States against air attack by air breathing weapon systems has progressively increased. This over-all increase results from establishment of North American Air Defense Command; installation of additional early warning radar coverage (including full activation of Aleutian extension of Pacific DEW lines); provision of more effective control of the air defense system through automation; increased coverage of the sea surveillance system; and availability of improved weapon systems including those with nuclear warheads. *Although U.S. air defense capabilities have improved during FY 1959, Soviet nuclear weapons development and improved delivery capabilities during same period have made any relative U.S. gain questionable.* Soviets are probably now capable of exploiting weaknesses in our air defense system at very high and low altitudes and of utilizing electronic countermeasures, sabotage, and deception to contribute to their attack. The estimated Soviet initial limited ICBM capability will provide an additional means of exploiting

weaknesses in the continental air defense system. This system cannot be expected to counter completely an all-out attack of the magnitude which the Soviets are capable of launching against the North American continent. *Solutions to the following problems are being pursued on a high priority basis as funding permits:*

1. Procurement, training and retention of the highly skilled personnel required by modern and increasingly complex defense systems.
 2. Detection of airborne vehicles at very high and very low altitudes, and development and availability of weapons which can be effectively used at these altitudes.
 3. Development and implementation of measures to overcome or counteract enemy electronic countermeasures.
 4. Development of a system which can be used in the defense against enemy ballistic missiles.
 5. Development of an effective and integrated sea surveillance system which will provide for detection, identification, and tracking of surface ships and submarines operating within missile launching range of the North American continent toward the goal of development of the capability to establish control over the submarine or surface ship prior to the launching of its missile.
 6. Identification and engagement of hostile aircraft as far from our borders as possible.
 7. Means to shorten the long lead time involved in the completion of programmed improvements to the systems.
- [Omitted here is the remainder of the report.]

212. Memorandum of Discussion at the 423d NSC Meeting¹

Washington, November 5, 1959

SUBJECT

Discussion at the 423rd NSC Meeting of the National Security Council, Thursday, November 5, 1959

Present at the 423rd NSC Meeting were the President of the United States, presiding; the Secretary of State; the Secretary of Defense; and

¹ Source: Agenda item 4: Status of National Security Programs as of June 30, 1959: The Atomic Energy Program. Top Secret; Eyes Only. Extracts—5 pp. Eisenhower Library, Whitman File, NSC Records.

the Director, Office of Civil and Defense Mobilization. Also present and participating in the Council actions below were the Acting Secretary of the Treasury (Scribner); the Acting Attorney General (Walsh) (Item 1); the Director, Bureau of the Budget; the Chairman Atomic Energy Commission (Item 4); and Mr. Philip Ray for the Secretary of Commerce (Item 1). Also attending the meeting were the Director, U.S. Information Agency; the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Under Secretary of State (Dillon); Special Assistants to the President for Foreign Economic Policy, for National Security Affairs, and for Science and Technology; the White House Staff Secretary; Assistant Secretary of Defense John N. Irwin II; from the Atomic Energy Commission Brig. General Alfred D. Starbird, Edward J. Block and Bruce Mercer; Howard Furnas, Department of State; the Assistant White House Staff Secretary; the Executive Secretary, NSC; the Deputy Executive Secretary, NSC; and Mr. Charles Haskins, NSC.

There follows a summary of the discussion and the main points taken.

[Omitted here are agenda items 1–3.]

4. *STATUS OF NATIONAL SECURITY PROGRAMS AS OF JUNE 30, 1959: THE ATOMIC ENERGY PROGRAM*

(NSC 5912; Memo for NSC from Executive Secretary, subject: "Peaceful Uses of Atomic Energy" transmitting Report by AEC and State on Implementation of NSC 5725/1, dated September 2, 1959)

Mr. Gray said the Planning Board was examining all of the status reports, but had decided that some of them need not be scheduled for Council discussion. However, the Planning Board thought the AEC Report should be discussed by the Council because it deals with one of the major national security programs. Mr. Gray then called on Mr. McCone.

Mr. McCone said he would treat the highlights of the AEC program of \$2-¾ billion, 70–75 per cent of which is designed to meet Defense and military requirements, the balance being intended for peaceful purposes. Turning to uranium procurement and deliveries, Mr. McCone displayed and discussed a chart setting forth estimated uranium deliveries based on domestic, overseas, and Canadian commitments. He indicated that through recent stretch-out agreements with domestic suppliers and the Canadian Government we would be able to reduce our requirements in 1960, 1961 and 1962, increasing them in 1963, 1964 and 1965, thereby substantially decreasing and leveling off appropriations for uranium deliveries. Despite the reduction in uranium procurement, the U-235 production rate would be maintained by the CASCADE improvement program and by a recycling the cost of which would be only half the cost of uranium procurement. Savings between uranium commitments for 1960 as against 1967 would amount

to approximately \$360 million. Mr. McCone believed the present program could adequately meet present military requirements for uranium, but was uncertain about the new requirements which had just been presented by Defense.

Again displaying a chart, Mr. McCone indicated that plutonium production was slightly in excess of requirements now, but that in 1962 we would be short by an insignificant factor in the amount necessary to meet military requirements. He concluded, however, that our plutonium production program was satisfactory and that through improved processes we could produce more plutonium if necessary.

Mr. McCone remarked that our nuclear weapons program had been discussed in detail a few months ago with the President and accordingly would not be covered in detail in his briefing.

Mr. McCone next turned to naval nuclear propulsion. He indicated that by December 31, 1959 we would have one POLARIS and eight other nuclear submarines; by December 31, 1960 we would have five POLARIS and thirteen other nuclear submarines. The GEORGE WASHINGTON, the first POLARIS submarine, will be undergoing sea trials in the near future. The nuclear-powered cruiser LONG BEACH should be operating by the end of 1960, after launching this spring and sea trials in July. The nuclear-powered aircraft carrier ENTERPRISE and the nuclear-powered destroyer BAINBRIDGE should be operating by the latter part of 1961. The naval nuclear propulsion program was summarized as consisting of six land-based prototype reactors, 37 submarines, and 3 surface vessels. Mr. McCone concluded his remarks on maritime nuclear propulsion by indicating that minor modifications in design were being made in the N.S. (Nuclear Ship) SAVANNAH.

In passing, Mr. McCone remarked that we have eight or nine military package power plants in various sizes and types and indicated that they were particularly important in view of their significant contribution to technology.

Mr. McCone then briefly described the PLUTO, ROVER and SNAP devices and the air nuclear propulsion program. He recalled to the President the thermo-couple principle which was embodied in one of the SNAP devices shown to the President, and indicated we were developing more of this type. All of the SNAP devices are being utilized for auxiliary power in space vehicles. A careful review is being made of the SNAP program, which will run to \$300–\$400 million from the point of view of cost and effectiveness as compared to other power sources such as solar heat. PLUTO involved the development of a ram jet to propel low-level unmanned supersonic missiles. Three to four years would be required for the development of this ram jet, but the program offers good prospects. ROVER is a nuclear propulsion system for a space vehicle; again three to four years of development will be required before

its full possibilities are known. Mr. McCone recalled to the President a recent review of the aircraft nuclear propulsion program and indicated that the development rather than the hardware stage of the program is being emphasized as a result of such review. He said we had developed a reactor which would fly a plane, but the reactor would not fly the plane very well. By postponing the hardware stage two or three years, we could probably develop a better reactor for aircraft propulsion. Mr. McCone thought that the Russians were probably coming to a similar conclusion. He noted that the Russians were somewhat evasive in this area, but believed they had been unable to solve the ceramics problem and did not consider it likely they would surprise us with a technical break-through in aircraft nuclear propulsion.

Mr. McCone then turned to the peaceful uses of atomic energy. He displayed charts comparing the nuclear power program of the U.S. and the USSR. During his Moscow trip he had learned of various slippages in the Soviet power program and believed that these resulted from Russian awareness of the difficulties and the cost associated with the development of nuclear power. The Soviets are apparently cutting back or slowing down all phases of their power reactor program except for those projects which are already so far advanced in construction that it would be uneconomical to waste the work already done. The Chairman believed that we were well ahead of the Soviets in our domestic power program. He noted in particular that the DRESDEN Reactor was the largest in the world used exclusively for electrical power. When completed, the U.S. power reactor program would have a capacity of approximately one million KWE.

The President said that Khrushchev during his visit here had remarked that the Russians were eliminating a large number of projects in their nuclear power program.

Mr. McCone said the Soviet slow-down did not, however, apply to the peaceful uses research program, which was broadly based and competently staffed. He had been particularly impressed during his trip to the USSR by the ability of the Soviets to manage and direct their technical personnel, to make prompt decisions, and to carry them out very quickly. He cited their completion of construction of the OGRA, a large controlled thermo-nuclear device, within eleven months of the date of initiating design. The AEC was carefully reviewing means of improving U.S. ability to direct its technical effort, a review that might be helpful in other areas such as space.

Mr. McCone concluded his briefing with a discussion of our high energy physics program, an area in which we are well ahead of the Russians. In connection with our four high energy accelerators, Mr. McCone said a careful review was being made of the Stanford accelerator to resolve some technical problems, such as the question of whether the accelerator could withstand earthquakes.

The President asked whether it would not be wise to remove expensive equipment from tunnels in an earthquake area. Mr. McCone said some scientists believed that the tunnel would not be ruptured by an earthquake.

The National Security Council:

Noted and discussed an oral presentation of the status of the atomic energy program, by the Chairman, Atomic Energy Commission, based on Part 3 of NSC 5912 and recent developments.

Marion W. Boggs

213. Memorandum of Conference with the President¹

Washington, November 5, 1959

Dr. Kistiakowsky
General Goodpaster

The President said he had had a question on nuclear weapons testing at his press conference. He had brought out that the problem of atmospheric testing can apparently be managed. The Soviets now seem to be ready to have serious technical discussions concerning inspection of underground testing. Dr. Kistiakowsky said that the problem is extremely difficult. The McRae report brings out that there is no immediate need for the resumption of testing, but that over the longer term testing will give valuable progress, the nature of which cannot be estimated now. In his judgment the questions regarding suspension of testing are now a matter of political judgment rather than technical. Although the safety test question had been emphasized a great deal, in actual fact it is not of great importance since the tests may be conducted with zero or essentially zero yield. In addition, there will always be some possibility of nuclear accident, and the problem recently raised is probably not of tremendous importance.

After an explanation of possibilities for nuclear accident by Dr. Kistiakowsky, the President commented that the possibility seemed to

¹ Source: Possibility of suspending nuclear testing; reliance on deterrence; making choices in defense programs; problems with Titan; problems with federally-funded research. Secret. 3 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on November 6.

be greater than he had previously realized. He summed up his instructions regarding the safety tests as telling the AEC to go as far as they can without risk of a nuclear explosion. When they reach the point of risk they are to come back to him. He emphasized that they should get on with this testing and not try to get into political questions.

Dr. Kistiakowsky said the President's Science Advisory Committee has put the greatest amount of study to date into military R & D budget. He will be taking up their findings with Dr. York and Secretary McElroy. The group will then be ready to come in and see the President.

The President said he is getting the impression that disarmament is not possible in the nuclear field. Probably we must get better and better weapons of our own in that field. At the same time he thinks that our concept of defending all around the world will not work. It is not practicable and is too great a burden for us. Mr. McElroy is planning to cut 14 air squadrons and 50,000 men in the Air Force. He feels that a new conception of defense is needed involving greater reliance on the deterrent. We must be able to return a tremendous blow. Short of that, a few mobile forces and a few carriers to move out from a central reserve must be provided. He does not think we can have such a thing as a perfect defense. Dr. Kistiakowsky said that without some military concepts, his group finds it impossible to make the judgments which need to be made in the scientific field. He was happy to see that their thinking runs along the line of the President's. The President said our great problem is that our people want to do everything, and to start programs in all directions. Dr. Kistiakowsky said that in the field of strategic attack, for example, if everything were done that is now being planned and programmed we would have a fantastic overkill capability.

Dr. Kistiakowsky next said that there is evident need for a policy statement on space activities, since there is great confusion around the country. The President asked for a draft of a statement that he might make, either at a press conference or otherwise. Dr. Kistiakowsky said he would prepare one.

Dr. Kistiakowsky referred to troubles the Titan program is having. There has been an eight-month flight delay. The program is not in good shape, and the failure is essentially managerial. The Martin Company is spread over too many projects. A group from BMD is now taking over the Denver plant, at least long enough to put it on its feet. He said there is a good chance that they will still catch up with their schedule. The President said this is most surprising to him since the Denver plant was most impressive, and that people (including me) had told him that the Titan was a better missile than the Atlas. Dr. Kistiakowsky said that

it is. The problem is not one of design, but one of management and production.

Dr. Kistiakowsky next said that the Federal Council for Science and Technology is making some progress, putting emphasis for example on oceanography, materials research and the atmospheric sciences. The Council gets agreements in principle, but little then seems to happen. There are obstacles in practice, many of them genuine, since the agencies have their own fields and laws. Progress is very slow and laborious.

The President said that if this situation is due to specific obstacles or attitudes, he will take quick action if the group will simply advise him where action is needed. If on the other hand it is just due to the nature of our enormous federal government, and its built-in bureaucracy, then all he could advise is to keep nagging. Dr. Kistiakowsky said he believes it is almost entirely the latter. He said there is, for example, no uniformity in practices regarding grants and aids to private research. Some grants include provision for construction of facilities; others prohibit this. The President said there would seem to be need for a group, perhaps under Dr. Kistiakowsky, to survey these grants before commitments are made, against such questions as whether adequate talent—both individual competence and numbers of people—exists. In many cases mediocre talent is no good at all. He could take a look at the programs at Defense, at AEC, Agriculture and Public Health Service as a start. A very exact and clear-cut check should be made as to whether talent exists, whether it will have to be robbed from other programs, whether skills are of secondary caliber, etc. Dr. Kistiakowsky mentioned in this connection that he is coming to believe that the real question regarding technical manpower is whether there is in fact a shortage. He knows of great hoarding by industries. Defense contracts in fact encourage this since they are on a straight cost basis. The President asked Dr. Kistiakowsky to give him the questions and suspicions that he has. He said he would be quite ready to get the senior officials of Defense and the AEC in to his office and ask them to explain this.

A.J. Goodpaster
Brigadier General, USA

214. Memorandum of Conference with the President¹

Washington, November 17, 1959

OTHERS PRESENT

Dr. Glennan, General Goodpaster

Dr. Glennan said the ABMA transfer is going very well. He is receiving excellent cooperation from the Army and expects to have detailed papers ready before Congress reconvenes. He foresees certain problems when the Congress does reconvene. Although the big booster project is now being cleared up, there is still confusion regarding duality of management of the space program. He then read to the President excerpts from a memorandum on space organization (copy attached).

The President said he regards the space organization as having a major role in proving out what can be done in the field of space boosters. The military forces can then take over developments which they regard as having promising military applications.

The President suggested that Dr. Glennan next take up with the Department of Defense the proposals he had outlined. He said he was not aware of the great confusion to which Dr. Glennan had referred. Dr. Glennan said this is a concept the newspapers are trying to create and the Congress is trying to exploit. The President said it is quite acceptable to him to try to clarify the situation. This effort should not, however, be put on the basis that the Soviets hit the moon or took pictures of it. In his mind the real question is what should we—the United States—do. It seems that everything centers on the development of the big booster. He thought we should take one or two particular projects that we want to carry out and concentrate on those. Dr. Glennan said that the greatest problem is how to get into a real perspective regarding space that makes sense. He thought a Presidential public statement is essential.

The President said that such a statement could be very brief. He would simply state what the law meant to those who proposed it. This could be put into proper language and placed before the American people. As to the budget and the program for space, he said he felt that should be thought out very carefully. He does not like the idea of growing and growing with no foreseeable limit. Instead we should try to find a level that seems about right. Dr. Glennan said that to develop payloads

¹ Source: Transfer of ABMA to NASC; defense budget; reorganization of space activities. Confidential. 3 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on December 1.

for the Saturn missile will take about three years and will be quite expensive. The building of a booster puts a “hump” in what would otherwise be a steady or level curve. The President said that the field of payloads is not an entirely new one. He did not think that we have to carry on expensive testing of Atlas, Titan, etc., just to hit the moon since these are being well checked out by the military forces. Dr. Glennan said he has one more immediate space shot in view—an attempt to orbit the moon using an Atlas-Able missile. Beyond this all others are scientific shots, for the study, exploration and investigation of space phenomena.

The President then spoke of his desire to see our country put on a sound fiscal basis. Sputnik gave a surge to defense spending from which we have not recovered. He said that if he has to approve another unbalanced budget he would be obliged to regard his Administration as discredited. He thought the key to our space program was the Saturn or the big booster. The job from now on is to develop it at a carefully determined speed, to decide what kind of instrumentation we would like for it to have, to consider how much of this has already been developed and what else is needed. He would concentrate on these tasks.

Referring again to the question of reorganization, Dr. Glennan said his proposal involves certain changes in the law including the elimination of the Space Council, the setting up of a NASA General Advisory Council, and the establishment of a Military Applications Committee, wholly within Defense, in lieu of the existing civilian military liaison committee.

The President recalled that Congress had wanted to put the responsibility directly on the President for deciding what would go into NASA and what into Defense. This part of our job is very much behind us, and it would seem that there is less need for the Space Council and for this activity of the President. He asked Dr. Glennan to try to work the matter out with the Secretary of Defense, and if the latter agreed get the proposal published and on the record.

The President told Dr. Glennan there is one thing he would like very much to see and that would be for Dr. Glennan to put his face sternly against the working of Parkinson’s law, to hold his staff strictly limited to essentials. Dr. Glennan said this is difficult in the case of the ABMA since the Von Braun group increased about 1000 in the last year. He doubted that he could cut it back this year but would do so next year through not putting work there. Finally, Dr. Glennan said he would like to have a new name for the ABMA center. There are not many names of people famous in space activity. He asked whether the President would be favorable to naming it the George C. Marshall Center. The President said that he would, even though there was not much logical connection. Dr. Glennan said the matter would be studied further.

Brigadier General, USA

215. Memorandum From Smith (S/P) to Herter¹

Washington, November 18, 1959

SUBJECT

Long-Range Security Policy

INTRODUCTION

I believe that an essential element of an effective foreign policy is a respected military force with appropriate strategy for its use.

I am concerned about the damage to our foreign policy to be expected from our likely military posture in years to come if current trends are not changed.

For several years, the Secretary of Defense has indicated in reports to the National Security Council that the US is losing its margin of military superiority over the Soviet Union.² During these same years, however, forward military programs have given no prospect of a change in these trends.

The Department of State for several years has believed that present military policy is wrong. During these years it has tried without success to modify our almost complete dependence on nuclear weapons.

The latest effort was on April 25, 1959, when you submitted to the Secretary of Defense the "Summary Statement of Foreign Policy Requirements Bearing Upon US Strategy" [copy attached].³ This statement was later submitted to the NSC as the views of the Department of State. It is generally recognized that these requirements were not met in the military paragraphs of the basic policy paper, approved by the President on August 5, 1959. This basic paper expressly states that military policy was not thereby changed.

The purpose of this memorandum is to focus attention on the impending loss of American military superiority and to urge that a new long-range effort be made to halt present trends.

¹ Source: Long-range security policy; includes two covering memoranda, December 9 and 11. Top Secret. 8 pp. NARA, RG 59, S/P Files: Lot 67 D 548.

² In the Department of Defense status report as of June 30, 1958, it was estimated that "... recent Soviet technological advances and the concurrent quantitative reductions in U.S. forces have combined to diminish that margin of U.S. military superiority. If these trends continue, it is estimated that this superiority will be lost in the foreseeable future."

The latest status report [June 30, 1959] is more specific. "By the end of FY 1962, with a continuance of present trends and programs on both sides, and with no major technological breakthroughs on either side in the intervening years, the most probable position will be that each side will possess military strength of potentially decisive proportions." [Footnote and brackets are in the original.]

³ All brackets are in the original.

I. *THE NEED*

As the nuclear weapons balance between the US and the USSR evens off, it seems that the chances will become smaller that nuclear weapons can be used effectively by the US in wars in the Middle East, Far East and Southeast Asia. Since we did not use nuclear weapons in limited war when we had, in effect, a monopoly, it hardly seems likely that we would use them after losing the monopoly. It also seems quite unlikely that the USSR would initiate the use of nuclear weapons in a limited aggression. Under such circumstances, a tacit ban on the first use of nuclear weapons may well come about.

In order to retain military influence around the world at a time when both sides will probably be deterred from using nuclear weapons, we should develop a significant non-nuclear military force while retaining an adequate nuclear retaliatory force for insurance. The existence of a significant non-nuclear military force may also be a necessary condition precedent to getting on with safeguarded nuclear disarmament.

II. *THE CAPABILITY*

It is gradually being recognized that there is no inherent lack of conventional force capability in the free world. American example and strategy have been the key influence in free world military thinking. This example and strategy have not put a premium on conventional force build-up by industrialized countries.

Now, however, the strong economies and reviving peoples of Western Europe have the manpower and the industrial potential to support non-nuclear forces adequate to deter or to hold off a Soviet conventional attack in Europe. The missing element seems to be American leadership and incentive and determination here and abroad to make the necessary effort.

Non-nuclear deterrence of Chinese communist aggression in the Far East is obviously a tougher problem. However, it should be well within the bounds of possibility for the combined beefed-up conventional forces of the US, the UK, Japan, Canada, Australia, and New Zealand, and the free Southeast Asian countries, as well as the present forces of the Chinese Nationalists and the Republic of Korea, to deter or stand off Chinese communist conventional attack.

The Korean war occurred at a time when the US was the only free nation with any real military power. In the coming era, the situation could be far different. We have many allies with large non-nuclear force potential.

III. *THE PROSPECT*

It must be admitted that there would be great difficulty in moving away from our present policy of threatening to use nuclear weapons to

deter any kind of aggression. There still may be substance to the argument that the continuing threat to employ nuclear force keeps down the risk of war. But with each passing month, this nuclear threat becomes less credible and the temptation to the communists to resort to limited force will increase if some supplementary deterrent is not developed.

Certainly it will require a great wrench to our post-war accustomed manner of thinking about the role and nature of forces in free world defense to face a future without leaning so heavily on the crutch of nuclear weapons.

Our great dependence on the nuclear deterrent has lulled Americans into forgetting that in the last analysis their security is no greater than their will to fight for their country. Nuclear weapons have obscured this responsibility. Nuclear weapons have also permitted budgetary rationalizations, which in turn only increased our nuclear dependence.

If we are to affect the trends which the Joint Chiefs and the Secretary of Defense find are decreasing our relative military power, we will have to find ways of breaking out of this blind circle. We will have to find the dynamism to support a different military policy. That same new dynamism will be essential if we are to keep freedom alive in the rugged peaceful competition with communism which lies ahead.

In view of our deep commitment to nuclear weapons, it will take a relatively long time to get away from excessive dependence on them. There will be many painful "withdrawal symptoms". But the switch is within the bounds of possibility—and within a reasonable time span. A recent paper prepared at a high level in the Pentagon included the following statement: ". . . it would be at least five to ten years before the U.S. military establishment could be converted to a modern non-nuclear force capable of deterring or fighting a general war."

President Eisenhower's great dedication to the cause of peace and his expressed wish to leave a legacy of constructive thinking for the future may offer the combination necessary to start the turn away from our present military stance. A "respectable" military posture not based almost entirely on the total-war threat might in the long run be of even greater significance for peace than the major efforts which the President is now making in the international political field.

There is still time during the last year of his Administration for a start to be made in a new direction.

IV. CONCLUSION

I recommend that if these views commend themselves, you present them to the President and urge that the Secretary of Defense ask the Joint Chiefs of Staff to start a study to estimate the possibilities and cost of developing over the next decade a free world military posture which would reduce present dependence on nuclear weapons.

The Administration could do this without calling into question the present military posture—by addressing its attention to the above-mentioned five to ten year period when new factors will cause and require radical changes in our military posture.

“Summary Statement of Foreign Policy Requirements Bearing Upon US Strategy”, dated April 24, 1959 [S/P–59110–1 C]

Enclosure

Memorandum From Smith (S/P) to Krebs

Washington, December 9, 1959

The attached memo of November 18 was returned today.

I would much appreciate knowing whether or not the recommendation on page 5 commended itself to the Secretary.

Encl.

Memo, re long-range security policy [S/P–59204–1A]

Enclosure

Memorandum From Krebs to Smith (S/P)

Washington, December 11, 1959

I inquired of the Secretary whether the recommendation at the conclusion of your memorandum of November 18th had commended itself to him. He replied that while he had read the memorandum carefully, he had not yet made up his mind definitely as to the merits of the proposal and would like to think about it a bit more before deciding definitely whether to speak to the President about it.

Max V. Krebs

S/P Memorandum of November 18

216. Memorandum of Conference with the President¹

Augusta, Georgia, November 18, 1959

OTHERS PRESENT

General Twining, General White, General Lemnitzer, Admiral Burke, General Pate,
General Goodpaster

The President said he had wanted to talk with the Chiefs on the problems of the coming year and specifically on the military program. What he had in mind was an exchange of ideas with them. He commented that he was deeply disappointed in General Taylor's action in putting out a book, but was not going to let that keep him from speaking frankly and meeting both formally and informally with the Chiefs whenever there seemed to be reason to do so.

General Twining said Secretary McElroy had had the Chiefs and the Service Secretaries in to meet with him on his return to Washington the previous Monday. He said the main concern in the Chiefs is that expenditures are increasing for many things that do not give a return in combat capability today. The President said he realized this but felt that our military leaders must from time to time take a new look at things that have become simply a matter of habit. He had two or three specific items in mind. The first of these is the 6th Fleet in the Mediterranean.

Admiral Burke said that there would be some advantage to putting the 6th Fleet under SACLANT and deploying it in the Atlantic. There is need, however, to stabilize the situation in Greece, Italy and Turkey, and the 6th Fleet makes a great contribution in this regard. He felt that the fleet units had to be kept fairly well forward so that, when needed for an emergency, we could move them fairly fast into the troubled area. He cited the wholly unsatisfactory British experience and performance at the time of the Suez operation. He added that the fleet does not involve much drain on our dollar reserves.

The President said he is getting extremely annoyed with the Europeans who are tending to lean much too heavily on us. In fact, everyone is relying on us around the world. The British, for example, want us to maintain their interest in Kuwait. He said he saw the use for carriers in peacetime but thought they had no real value in an all-out war. They would be hit in port. Admiral Burke commented that the carriers are moved at odd times, on no fixed schedule, so that an enemy

¹ Source: General discussion of the U.S. military program: force levels, B-70, budget. Secret. 9 pp. Eisenhower Library, Whitman File, DDE Diaries.

could never be sure where they were. The President said it would be a simple matter to reconnoiter them.

He went on to say that when we put our forces in Europe in 1951 we said they were being put there temporarily. Since that time, however, our government has taken the stand that we must not pull anything back, that the shock to the Europeans would be too great. Admiral Burke commented that the 6th Fleet also has amphibious lift, which is very expensive to maintain. No one else has it. The British capability is nothing short of pitiful when one considers that this is a type of force they particularly need. The President said the French, Germans and British are all steadily increasing their gold reserves. Their budgets are not being overstrained. In 1951 and 1952 we made sacrifices. It is hard for him to see why they do not now pick up a fair share of the burden. He thought there is no reason we could not cut down the number of our carriers on station. What troubled the President is that, in America's anxiety to make the free world safe, we make ourselves vulnerable to our allies taking advantage of us. There is, of course, no possibility of doing anything suddenly. The Europeans have told their people too long that their safety depends on the U.S. He recalled that de Gaulle said he was unhappy with regard to command arrangements and thought these should be more on a national basis than at present. The President told him that there would then be no reason for U.S. forces to be in Europe. Admiral Burke said he had been meeting with Admiral Lambe of Britain and Admiral Nomy of France. Nomy is in an extremely embarrassing position because he recognizes the logic of collective defense as against the de Gaulle proposals. The President said he had told Admiral Lambe when he saw him that he was asking our people to restudy our naval position in the Mediterranean. Admiral Burke commented that the French naval people want to work closely with us. The President said he is trying to save something in annual costs and simply wanted to know if we had to pull down somewhere what we would then do with the 6th Fleet. He wants the other countries to pick up responsibilities. Admiral Burke mentioned that in this budget the Navy is reducing its strength by fifty destroyers. The President said we tend more and more to get other people into the habit of expecting us to pick up the responsibilities and the costs. We should maintain the reserves for the whole free world, and rely on local people to provide the localized elements of defense, especially on the ground. We should provide air, naval and mobile land forces. In that way we would be putting our strength into the types of forces that give greatest over-all strength. He asked Admiral Burke to make a further study of this matter.

The President next raised with General Lemnitzer the question of the strength of the National Guard and Reserve forces. General

Lemnitzer said that these have been greatly reorganized and tightened up. Paid drill strength has been cut down from 1,254,000 in 1954 to 700,000 at the present time. We have cut down manning levels, knocked out ten divisions, and cut down the number of battle groups in sixteen divisions. We have reduced from 11,000 to 8,800 units. We are giving the National Guard and Reserves more of a civil defense mission. We have just completed this reorganization, and an attempt to make a further change coming at this time would inflame the whole National Guard and Reserve structure. He said that with the six months' training program now in effect, and the elimination of excess units, we now have six good divisions. To attempt to decrease to 630,000 would explode the situation, he felt.

The President said he had recommended a strength of 630,000 for the last several budgets. If we are not careful, we will get into the position of making recommendations simply to fight politicians rather than to solve military problems. He recalled that he had called for State Guards to be established, with the rest of the structure brought under Federal control. This had been bitterly opposed. The biggest mission of the Reserves today is rehabilitation in case disaster should occur through nuclear war. He thought it is wrong to keep the National Guard and the Reserves in an antiquated concept. He realized that he had been defeated by the National Guard and Reserves on this issue, and realized that he would probably be defeated again. General Lemnitzer said it had taken tremendous effort, but he had gotten agreement from the National Guard and Reserves on a 700,000 man force. He said he has resisted pressures for an increase in the strength of units. He has had a restudy of the pentomic division made, under a guideline that he would not approve an increase of even one man in total strength.

The President said he was going to stick with his 630,000 man recommendation. He wants to tailor the force to the real need. He commented that defense will never be as sound on an unstable economy as it will be on a sound one. The Chiefs to him are the hinge between the professional forces and the supporting nation. He referred briefly to the so-called new look concepts, and commented that the old relations between military forces and the nation in time of war are changing. General Lemnitzer said that the National Guard and Reserve units are undoubtedly the best nucleus on which to carry out rehabilitation in case of nuclear attack. He must sell and develop this concept gradually, however. The President commented that we have got to keep our economy expanding through private initiative by three to four percent a year. To do this we must keep our dollar sound. In addition, it is the currency base throughout the world. We must not permit a run on the dollar to develop. Our people must support their military

program by current taxes and not by deficit financing. The result is that we must cut off every unnecessary excrescence. He said he is fighting to get the budget below \$80 billion, which is an enormous figure in his judgment, and he is the first President to have stressed economy in recent years. He said he knows that every man in Defense is concerned regarding our security and safety. Someone must however look at the Defense establishment afresh and restudy its needs, since changes in technology change the needs of defense. He felt we are putting too much money in certain things—particularly the traditional things—and are not giving tough enough restudy aimed at eliminating everything not needed. Some increases are inevitable. For example, there is an increase of \$70 million this year in retired pay. A number of these things add up very quickly. Now the question is how we do what needs to be done within a pattern that will keep our economy healthy and expanding.

The President reiterated that he felt we should go to the 630,000 man National Guard and Reserve force. We should get what we need for the job these forces do. He recognized that the Congress might override him, and recalled that they had overridden him as Chief of Staff in providing retired pay for National Guard and Reserve inactive service. Admiral Burke asked if there is any way to get the states to pick up more of the cost of National Guard forces, and General Lemnitzer said he saw no hope of this. The President said he wanted to have whatever meetings are needed to find a program in which all would believe. Then he thought all should stand and present this to the people, to the Congress, etc. with unity. Each staff must accept this as the view of its own Chief. As to General Taylor's opposition to his policies, he was confident that Taylor would not get enough support to override him. He reiterated that he thinks that the Chiefs must look for every excrescence. He said he is afraid of some of the things we are doing in science, devoting resources to many unnecessary things. He said that whenever the Chiefs want to see him they could do so, and that he had in mind to see them at least once a month. He asked them to continue to work on what they think is right, taking account of the fact that a sound economy and a sound defense are inseparable.

He repeated that he did not favor the 700,000 man program for the National Guard and the Reserves. General Lemnitzer said that one problem in the reduction is that it looks like an arbitrary 10% cut. The President commented that the other services are cutting personnel through a wringer process and that this reflects the results of advances in technology that come from our outlays on science. General Lemnitzer said he has taken a hard look at personnel, which is now stretched to the breaking point, with 40% of the people

overseas. The President commented that he has not pressed the Army for cuts this year. He added that other nations are profiting from the presence of our forces and building up their reserves while we serve as the world's banker.

The President said he realized the problem of the individual Chiefs before Congress. They demand the "personal views" of the Chiefs. General Lemnitzer said they frequently ask what was the original recommendation made by the Chiefs.

The President then turned to the question of the B-70. General White showed charts showing the declining trends in major aspects of the Air Force program. He said the Air Force is cutting personnel and units in order to maintain modernization. The President said that he had approved the B-58 program going ahead at a reduced level as part of our interim defense measures. He said the B-70 left him cold in terms of making military sense. General White conceded that there are great questions involved, but thought we would be going too fast and too far to eliminate it at this time. He said it is the only aircraft left in the Air Force under development. He had dropped the F-108 a short while ago. Both of these were intended to be mach 3, 2,100 mile per hour aircraft. He weighed carefully which one to drop. The primary deterrent to date has been the manned bomber and he did not feel we could rely wholly on missiles, none of which have ever been used in combat, at this time. Unless nuclear testing is resumed, we would find ourselves in the position of never having fired the one weapon we are completely dependent upon. The President said he would have no objection to testing a missile with a live warhead less the nuclear core—the TNT could be fired. General White said that the missiles give the President no options. Bombers could be gotten aloft to await orders, but missiles cannot be called back. Bombers give the enemy a difficult defense problem since he must defend against several kinds of attack. There is also the psychological effect of manning static weapons like the Coast Artillery of olden days, where training was done with the blitz cloth. He said that bombers can be seen by friend and foe alike and that they have a powerful psychological impact. If the Soviets were to produce an aircraft of this kind it would create great problems for us. He said he would beg that the B-70 be carried as a bare minimum research and development program at the level of \$200 million this year. He said this is a very different aircraft from anything that has gone before. It must pass through the heat barrier and the shape of wing and fuselage must be studied out. The President said he understood the Hounddog missile is very successful and that it can be fired from a B-52 several hundred miles away from the target. The B-70 will not be in production before a date eight to ten years from now. He thought that was getting

too far into a period in which the major destruction would come from missiles. He thought we were greatly overinsuring our ability to hit an enemy. There is no uncertainty that we would be able to hit his cities. He asked whether the Soviets would not be able to hit the B-70 with rockets. General White said that they would, but the B-70 would cross radarscopes so fast as to be a difficult target. The President said he was convinced that the age of aircraft for actual use over enemy territory is fast coming to a close. General White thought it would be worth the money to carry on development of this aircraft for a short while, agreeing that it might be dropped later. The President said he finds the missile a cheaper, more effective way of doing the same thing. General White reverted to the premium we gain from having different systems for attack. The President said that in ten years the missile capacity of both countries will be such as to be able to destroy each other many times over. He thought we are going overboard in different ways to do the same thing. General White commented that this is the last aircraft under development in the world and that he would, if it were left in the program, find money somewhere to hang on to it.

The President said that he questions the bomber having a place after we have produced the kind of destructive power that we have. He saw no need for it. General White said he simply wanted to keep it alive for one more year. The President commented that defensive rocketry would be much more effective against the B-70 than against the Titan and Atlas. He commented that the X-15 is under development, and even it could be used to knock out the B-70. He said that we retired the battleship finally long after the contest was over and asked whether we are not trying to hang onto the old forms of warfare too long in a similar way as regards the bomber. General White thought we were looking too far into the future if we did this and the President said he feels he can look that far in recommending it. General White said if the President would allow him to keep it in the program even on a research and development basis, he would put it into the budget and would not accept an increase even if the Congress tried to force it on him. General Lemnitzer said he was appalled at the estimate of \$200 million just to carry on a research and development program. The President asked the other Chiefs for their views. General White, General Pate and General Twining favored continuation of the project. Admiral Burke opposed it. General Lemnitzer favored it as a research and development project which he thought could be a small fraction of \$200 million.

The President reviewed past examples of weapons that had outlived their era and said he thought we were talking about bows and arrows at the time of gunpowder when we spoke of bombers in the missile age.

The big question to him was that we have got to find a defense program now and in the future within a reasonable budget, i.e., within feasible tax levels such that our people will not start evading the taxes and will be able and willing to support on the basis of the present kind of prosperity and present tax rates. He thought the B-70 is a duplication of something we will have otherwise. He said he would take another look at the B-70 proposition. However, in ten years he saw missiles carrying the burden of warfare. He thought that each Chief must look for every possible saving, even dribbles. We must make every effort to stay within a reasonable level defense program.

General White said he thought that perhaps Air Force management has been discredited. Many of the programs approved last year have now been cancelled and are no longer being continued. The President said the question is simply one of success in rocketry. This success has made possible and necessary reductions in aircraft programs. It is a change in our thinking. General White said there is the question of what is the future of the Air Force and of flying. This shift has a great impingement on morale. There is no follow on to the fighter, and no new opportunity for Air Force personnel. A natural extension of Air Force activity would be into space as flying drops off. He wanted the predominant role in space for the Air Force.

The President said he did not know what our needs were going to be in space. He thought that would be going ahead of current plans and problems. At the time these questions arose, we probably will not have air, navy and ground forces. He commented that he is going to make a change in NASA, cutting back military operations in space to strictly defense activities.

General White said he thought the Department of Defense should establish force objectives extending some three years or so into the future as was done in the Joint Strategic Objectives Plan. The President said that each Service Chief had come down to the meeting with a firm service program. He would like to see the Chiefs come to some basis of principles, give those to the Joint Staff with no other instructions and see what the Joint Staff would develop as to needs. General White thought if this were sent to the Secretary of Defense he should then have the task of making a three-year program and budget.

The President commented that he believes we should have one National War College. He thought that service staff colleges are all right but at war college level we should be talking about the needs of the U.S. and not orienting our thoughts toward services.

In concluding the meeting, the President invited the Chiefs to come in to see him whenever they wished to.

A.J. Goodpaster
Brigadier General, USA

217. Memorandum of Conference with the President¹

Augusta, Georgia, November 21, 1959

OTHERS PRESENT

Secretaries Gates, Brucker, Francke, Douglas, Dr. York, General Brown, Mr. Logan, General Goodpaster

The President said he had met with the Chiefs of Staff to discuss the military program for fiscal 1961. One question in his mind related to the Sixth Fleet in the Mediterranean. He felt that its presence there was largely just a matter of habit. It is no longer the asset it once was to the right flank of the European defense position, because of the advent of long-range thermonuclear missiles. He said he had asked Admiral Burke to take an objective look at this question.

The next item that he had strongly questioned was the B-70. We have the B-58 coming into inventory and various missiles behind it. To put as much into the B-70 project as is proposed and have from it a vehicle nearly ten years from now seemed to him to be a very doubtful proposition. He wondered what the counter measures would be by that time. General White had previously expressed great concern over this, stating that if we drop this weapon we would be standing on our inventory and not going into a new field. The President thought that NACA is conducting forward research in this field, and indicated he did not share General White's concern. Dr. York said he thought the general design of the B-70 aircraft is sound. Technically, it represents a big step forward. For example, there is a change in construction material from aluminum to stainless steel. If we are to go above mach 3, it will be necessary to use steel. For reasons of promoting technical progress, Dr. York said he was inclined to want to go forward with this. Even if there is no good military reason to carry

¹Source: U.S. military program: B-70; national defense system; budget, space activities; missile programs; Panama. No classification marking. 6 pp. Eisenhower Library, Papers, Whitman File, DDE Diaries.

it forward, there are technical reasons to continue with research and development. Secretary Douglas said he did not know whether, when we get down the road, we will want to drop this or not. He felt it was very important, however, to carry forward development work on advanced aircraft. The program as revised calls for two prototype aircraft. The first could fly in 1962. The President said he understood that research would be concentrated on metals, configuration and engines. Dr. York said Dr. Kistiakowsky had asked him to state as his view that it would be useful to continue the development of this aircraft, but not strictly necessary.

The President said he is not at all interested in building an aircraft for civilian transport purposes. The question remains somewhat unresolved in his mind.

The President then said that anything that weakens our economy weakens our defense. He believes every single individual in defense must weigh expenditures in terms of what they mean in weakening our defense through weakening our economy. He had told the Chiefs of Staff they must look for and weed out every expenditure of half a million dollars or a million dollars that is not strictly necessary. He recognized that it would be possible to ask for a tax increase if greater expenditures were needed. He pointed out, however, that even during the war, when motivation was high, there were gray markets and black markets and that higher taxes would begin a widening pattern of tax evasion.

He called on the Secretaries to formulate a national defense system that all could agree upon and support. Then he said he could insist on economy in every other field of government such as public health and public works.

Regarding the aircraft carrier, he said he would approve a conventional carrier. He thought the carriers had value in the cold war, but not much value in a general war. Dr. York and Mr. Franke said that everyone was agreed that there is no need for a nuclear carrier. The problem is that it is not possible to get a conventional carrier from the Congress.

The President said that the Administration has one more year to get the defense establishment in the best possible shape. He thought the best minds were assembled in the Joint Chiefs and the top leadership, that had ever been there. What he wanted was to get a decision that looked good to all, with all supporting it. There must be no undercover sniping at the program.

Mr. Gates said the Defense group had gone back from their meeting of a day or two earlier and had taken out everything possible, leaving questions on the carrier and the B-70. He is having studies started on continental air defense and on communications and intelligence activities to see if further cuts can be made.

Regarding space activities, the President said he had talked with Dr. Glennan. The significance of the space problem is that it affects the morale of our people. In the field of space there are a certain number of things that affect defense directly. Basically, however, the program is scientific. Dr. Glennan had asked for \$930 million, and he has asked Dr. Glennan to cut this down substantially. While space is important to morale, he asks what would happen to the world's morale if our dollar—the world's banking currency—were to soften. He asked the group to look at every project with a jaundiced eye. He said he did not want to gouge Defense because it is the biggest but thought everyone should be tightening up. He added that if he were convinced of the necessity for additional funds for the nation's security, he would instantly go out and get the additional taxes. Mr. Gates said that on some of these decisions the best that could be done was to make an intelligent guess or gamble. Mr. Douglas added that some people had wanted crash programs on the missile output. Referring again to the B-70, the President said he had asked what the other elements in the military situation would be at the time the B-70 became available. What counter-measures would the Soviets have, for example. On the proposal that the B-70 should be used for reconnaissance he commented that we have an excellent reconnaissance vehicle in work right now. He recognized the validity of General White's statement that we must not put all our eggs in one basket and rely wholly on missiles. He thought we were far from doing so, however.

Mr. Gates mentioned a comparative study that is being made on use of missiles and aircraft. Dr. York pointed out that while there is no doubt about missiles from a technical standpoint, they will not be exercised like aircraft, and the parent units may lose their verve, somewhat as the Coast Artillery did in times past.

The President said that all we really have that is meaningful is a deterrent. If the Soviets think the B-70 is more effective than missiles, then it has value. If they do not, it is valueless. Dr. York said that the concentration the President had just suggested on deterrent value should be stated as basic national policy. The President said that beyond the deterrent we would provide for other things such as the cold war. He thought we would be cutting back our base system greatly in future years. He noted that armament is now in a transitional period and that if we are thinking of something that is not operational for eight years this is not a transitional item but is simply a supplement to the missile force.

The President said that, with regard to atomic weapons, if we use thousands of small weapons we would be in a general war situation, in which the hydrogen weapon would be used, making the smaller ones insignificant. He had no objection to a reasonable number for tactical

use. He commented that he was told a year ago that SAC would not take Navy targeting into account. If we are going to fight a nuclear war, it was clear in his mind that we would attack cities and governmental concentrations. Invariably, the reasoning leads us back to perfecting the deterrent. Mr. Douglas said this emphasizes the importance of an invulnerable missile. The President commented that the capabilities of missiles for destruction are beyond human comprehension. It is very difficult to plan, because our plans are developed out of past experience. Dr. York commented that the total deliverable destructive power is the significant thing and the President agreed.

The President asked whether the Polaris program is progressing as rapidly as it should be to justify the preparations we are making. Are its technical problems solved? Dr. York said that perhaps the first or second submarine will not be operational on the exact date planned. However, by the time we reach the eighth or tenth we will be on schedule. The firing methods are sound, and its range is now being worked up to 1200 miles, employing a large nuclear weapon.

The President next referred to the National Guard and the Reserves and his discussion with General Lemnitzer. The latter had made two points—first that he had finally sold the States and the Guard on a force structure based on a strength of 700,000; he had sold them on the idea that their mission includes local defense and rehabilitation. The Guard units are better than ever before. It will be difficult to stick to the Administration figure of 630,000, but this will be done. General Lemnitzer was fearful that the Administration would be defeated on this and at the same time incur the enmity of Congress and the Guard. Governor Brucker reviewed the decrease in Guard numbers both as to personnel and as to units. Five years ago personnel was 1,100,000. It is now 700,000. Units were cut from 11,000 to 8,800. He said various members of Congress had insisted that they were going to put a floor under the strength of the Guard. The President said the big question is how much to fight for what is thought to be right, or how much to bow to expediency. He realized he would probably be defeated on this point and that Congress would take things out of the program that he wanted and put things in that he did not want. However, he felt that we should stick to what he thought was right.

Governor Brucker said he wanted to push as rapidly as possible the preparations for the Kwajalein tests for the anti-ICBM. Secretary Gates said it would be practical to withdraw seven squadrons of aircraft from NATO (really four, since three are troop carriers not fully committed). The President said there was not time left to put this reduction into the present budget. The State Department must have time to prepare the

ground. He agrees that some of our strength could be withdrawn, but it will take time to turn European thinking around on this.

At the President's request Mr. Douglas presented a brief explanation of the funding of the Atlas and Titan missile programs. The President commented that heavy expenditures are coming at the same time as expenditures on our most costly bombers.

As the meeting ended, the Secretary of the Army reported on the situation in Panama. He said he had met with Mr. Herter and that Mr. Merchant was currently in Panama. There is great bitterness there and the Communists are moving into the troublemaking organizations. The President had two comments. First, he said when the conciliatory approach was adopted, we should have announced it publicly. Second, we have always acknowledged Panama's residual sovereignty and we should have flown Panamanian flags as part of a ceremony rather than opposing this. He said he thought some of our local officials had been too stiff-necked and too legalistic. This was a situation where politeness and courtesy would have been extremely effective.

219. Memorandum From JCS to Commander in Chief, SAC¹

Washington, undated

SUBJECT

Instructions for Expenditure of Nuclear Weapons in Emergency Conditions (S)

1. The President has authorized certain Commanders of Unified and Specified Commands to expend nuclear weapons in defense of the United States, its Territories, possessions and forces when the urgency of time and circumstances clearly does not permit a specific decision

¹ Source: Instructions for use of nuclear weapons in emergencies. Top Secret. 9 pp. Eisenhower Library, White House Office Files, Records of the Special Assistant to the President for National Security Affairs, NSC Series, Atomic Weapons, Corr. And Background for Presidential Approval.

by the President, or other person empowered to act in his stead. Such commanders will be called Authorizing Commanders.

2. This authorization by the President is an emergency measure necessitated by recognition of the fact that communications may be disrupted by an attack (as defined in the Enclosure). Each Authorizing Commander must insure that such delegation of authority is not assumed through accident or misinformation. Further, it should be regarded as an authorization effective only until it is possible to communicate with the President or other person empowered to act for him.

3. [*text not declassified*]

4. [*text not declassified*]

a. For the defense of the United States, its Territories, and possessions:

In the United States, its Territories and possessions and in international waters adjacent thereto as defined in Section "A" against attack by sea—(Special Additional Instructions in Section "A" below).

b. For the defense of U.S. forces in foreign territory and in international waters against Sino-Soviet Bloc attacking forces, subject to applicable agreements or understandings, if any, with the government exercising sovereignty over the country or countries concerned—(Special Additional Instructions in Section "A" below).

c. In the event of nuclear attack upon the United States, in retaliation against the enemy identified as responsible for the attack, subject in the case of retaliation from friendly foreign territory to applicable agreements or understandings, if any, with the government exercising sovereignty over the country or countries concerned—(Special Additional Instructions in Section "B" below).

3. *OPERATIONAL LIMITATIONS*. Because of the serious international implications of the use of nuclear weapons by U.S. military forces, it is essential that particularly strict command control and supervision be exercised, and that the use of nuclear weapons be limited to circumstances of grave necessity. 222. Briefing Note for the December 16 NSC Meeting¹

Washington, December 16, 1959

SUBJECT

Emergency Relocation Plan—NSC
(NSC 5521)

1. The Emergency Relocation Plan for the NSC (NSC 5521, approved by the President on 6–9–55) has been reviewed by the Planning Board, and there has been circulated to the NSC a draft revision of the Plan.

2. The review of the NSC Plan was undertaken on the basis that considerable time had elapsed since its approval in 1955, and because the Cabinet approved on 6–9–59 a new Interim Emergency Relocation Plan which OCDM had proposed for the Executive Branch.

3. The Interim Emergency Relocation Plan approved by the Cabinet provides in essence as follows: (a) of the 58 emergency headquarters sites which had been established by agencies in the 300-mile arc extending from Washington, D. C., 17 of those sites were selected as “hardened sites” for operation during the first 30 days after an attack; (b) of the 17 sites selected, 14 will require improved fallout protection through new construction costing an estimated \$12 million, not including cost of blast protection for the State site at Front Royal for which no cost estimates are available, (c) 3 sites (AEC, Raven Rock, and High Point) are already

¹ Source: Emergency relocation plan, NSC 5521. Top Secret. 4 pp. Eisenhower Library, Whitman File, NSC Records.

adequately protected; (d) should an attack emergency arise prior to the availability of the hardened sites, the various agencies' relocation staffs will relocate to the OCDM underground facility at High Point, under the "Interim Plan," to carry on essential headquarters functions under the direction of the respective agency heads or officials designated to act for them; and (e) those relocation forces at High Point will include the member and advisory agencies of the NSC (with the exception of Defense and JCS [*text not declassified*])—although Defense will have 3 liaison representatives at High Point under the "Interim Plan").

4. Substantive provisions of the Emergency Relocation Plan for the NSC, which are recommended by the Planning Board, are as follows:

Paragraph 2, page 1, would be revised to reflect that the wartime composition of the NSC would be *statutory members and advisers* with flexibility reserved to the President as to the designation of additional participants in the policy advisory function of the NSC in wartime. There is no change proposed in the presently approved concept that the President would use the NSC as his key policy advisory body under wartime conditions.

The revised language proposed for paragraph 3-*b* reserves complete flexibility as to the relocation site to which the Vice President would proceed (and the Planning Board understands that the emergency relocation site of the Vice President would most likely be one other than that to which the President might proceed).

Paragraph 3-*c* would be revised to reflect that NSC members and advisers would proceed to the relocation sites of their selection; and the footnote to this subparagraph refers to the Cabinet paper which reflects approval of the new Interim Emergency Relocation Plan for the Executive Branch.

Also, under this paragraph, the NSC staff relocation site would be changed [*text not declassified*]. At that site would also be the Planning Board members, advisers, and designated observers, or their alternates. However, the Chairman of the JCS has recently recommended to the Secretary of Defense that the current allocation of 22 spaces for the Planning Board and NSC Staff at the AJCC be withdrawn. If this recommendation is approved by the Secretary of Defense, provision would then have to be made for the NSC Staff and the Planning Board to relocate to the OCDM High Point site.

5. *JCS views*, received just prior to this meeting, take issue with paragraph 3-*d* and 3-*e* of the proposed revision of the NSC Plan under which the NSC Staff and Planning Board members, advisers, and designated observers (or alternates) would relocate to the [*text not declassified*]. In lieu of such provision, the JCS recommend that the Plan call for (a) the NSC Staff to be relocated to the OCDM protected site [*text not declassified*] and (b) the Planning Board members, advisers, and designated observers to relocate to their respective agency sites and remain available on call by the Chairman of the Planning Board at such place as he might

elect. The JCS views are based on the belief that Planning Board members lose much of their value to the Planning Board when separated from their parent agency. (*Observation:* Such reasoning appears appropriate for consideration in the light of such additional factors as (a) the need for continuous integrated functioning of the Planning Board at a single location, and (b) the availability of communications which would keep the Planning Board members in touch with their parent agencies even though assembled at a distant location on a continuing basis.)

6. CALL ON: OCDM—for any comments on the draft NSC Plan from the standpoint of over-all emergency relocation plans for the Executive Branch.

Defense and JCS—for any comments in elaboration of the JCS views [*text not declassified*] by the NSC Staff and Planning Board.

Enclosure

Washington, December 16, 1959

TESTING NATIONAL SECURITY POLICY-MAKING IN A CRISIS BY WARGAMING

Proposal

Apply the principle of wargaming used extensively by the military to a simulated crisis situation which would call into play a whole range of interrelated political, economic and military decision making.

Purpose

1. To illuminate the functioning and interdependence of the NSC and its constituent agencies in the flow of information, Presidential decision-making and resulting operations during a simulated crisis.
2. To test the response to unforeseen Soviet actions.
3. To test the relocation and readiness plans.
4. To develop a technique for rapidly acquainting the next Administration with the character and range of the kinds of decisions they may be called upon to make.

Scope

Wargaming would focus on the problems of: (1) a period of tension leading either to war or relaxation, (2) limited war, (3) general war.

*Structure**(a) Design of the Game*

A technical committee would be set up to design the game calling upon available experienced resources as may be necessary. This committee would set up the conditions under which the game would be played, including such questions as the freedom of the game; the committee would prepare a scenario, choose the umpire, present and discuss the scenario with the participants.

(b) Who Will Play

The U.S. side will consist of the NSC and its constituent agencies. To test the process of decision-making in the U.S. Government, each of the agencies would provide a participating team. Other allied governments could be represented by individual players as seemed desirable. The Soviet side would be represented by one team chosen by the technical committee.

The moves in the game would be prepared in writing by the staffs assigned to the game. The results of the game should be presented in the form of conclusions and evaluations and might be presented in extended briefing to the NSC.

(c) Cover

The game should be played during and under cover of, but not as a part of, a future Operation Alert, thus minimizing problems of “visibility” and public reaction.

223. Memorandum of Discussion at the 429th NSC Meeting¹

Washington, December 16, 1959

SUBJECT

Discussion at the 429th Meeting of the National Security Council, Wednesday, December 16, 1959

Present at the 429th NSC Meeting were the Vice President of the United States, presiding; the Acting Secretary of State (Dillon); the Acting Secretary of Defense (Douglas); and the Acting Director, Office of Civil

¹ Source: Agenda item 1: Emergency Relocation Plan—National Security Council; Agenda item 4: Topics for Future Discussion or Consideration by the National Security Council. Top Secret; Eyes Only. Extracts—13 pp. Eisenhower Library, Whitman File, NSC Records.

and Defense Mobilization (Patterson). Also present at the meeting and participating in the Council actions below were the Acting Secretary of the Treasury (Scribner); the Director, Bureau of the Budget; the Attorney General (Item 1); and the Chairman, Atomic Energy Commission (Item 1). Also attending the meeting were General Thomas S. White for the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Director, U.S. Information Agency; the Special Assistants to the President for National Security Affairs, for Security Operations Coordination, and for Science and Technology; the Deputy Director, Bureau of the Budget; Mr. Howard Furnas, Department of State; Mr. Haydn Williams, Department of Defense; Mr. Charles Haskins, NSC; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. *EMERGENCY RELOCATION PLAN—NATIONAL SECURITY COUNCIL*

(NSC 5521; Cabinet Paper 59-98/1, June 12, 1959; NSC 5917)

Mr. Gray briefed the Council on NSC 5917. (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another is attached to this Memorandum).

In connection with Paragraph 3-(b) of the Briefing Note, Mr. Gray referred to inter-agency disagreement as to whether blast protection was to be provided for the State Department relocation site. Mr. Stans said this issue would shortly be resolved. OCDM would soon submit a request to proceed with construction for blast protection at Front Royal and at that time the Bureau of the Budget proposed to get the interested parties together for a discussion.

After reading the Briefing Note, Mr. Gray made some observations on war-gaming. He said that in the last seven years there had been very little "play of the problem" by the National Security Council in OPERATION ALERT. Indeed in the last two years the Council had not met at all during OPERATION ALERT. For very good reasons, such as security and "cover", the President had dealt with OPERATION ALERT through the Cabinet and had decided not to make it an NSC operation. However, the result is that we have little idea how the NSC mechanism would function under emergency conditions. We have only a limited idea of the role of the Planning Board in an emergency. OPERATION ALERT in the past had been largely a resources exercise and the participants had been resources agencies which did not deal with the kind of problems that would need to be dealt with by the NSC under the Presidential concept of the Council as a war cabinet. The difficulty of visualizing the exact working of relocation had led to the suggestion that national security policy-making in a crisis be tested by war-gaming, as outlined in the attached paper dated December 16, 1959 which had been

placed before the Council. The President, Mr. Gray continued, might or might not want to authorize a war-gaming exercise, but no doubt he would be interested in the views of the Council on the subject. Mr. Gray then summarized the paragraphs of the war-gaming paper dealing with purpose, scope and cover. At the conclusion of his summary, he informed the Council that this problem had been discussed by the Planning Board the day before and that the general feeling of the Board was that it was worth serious consideration and would help answer such questions as, Should Planning Board Members be relocated with their respective agencies or be relocated in a body? Mr. Gray said in the abstract he could support either answer to this question, but felt that a clearer idea could be obtained by war-gaming. In conclusion Mr. Gray suggested that if the Council thought well of the war-gaming proposal, it might wish to await conclusion of the game before recommending to the President changes in the current relocation plan.

Mr. Patterson said he thought a war-gaming exercise would represent a great gain not only to the NSC, but also to other agencies, and noted that OCDM might be taking another look at the OPERATION ALERT exercise. With respect to the issue which had arisen over blast protection at Front Royal, Governor Hoegh intended to confer with the Secretary of State and the Director, Bureau of the Budget, at an early date on the principles of blast protection.

Mr. Gray noted that the relocation plans now call for the Secretary of State to be at Front Royal, with other Cabinet Members at various other locations, and asked whether the President in time of emergency would be satisfied to have his principal advisers scattered, in view of transportation difficulties and the danger of repeated attacks. Mr. Gray believed the President might want his principal advisers with him. Concepts of this kind had never really been tested, because relocation heretofore had been based largely on the idea of restoring the country after a nuclear attack. Another concept which might be tested by the war-game would be the condition which would arise if the enemy's first attack were directed solely at our retaliatory capability, with our population left largely intact, followed by an ultimatum which called upon us to surrender or suffer attack on our population centers. Mr. Gray called attention again to the fact that the war-gaming paper proposed that war-gaming take place under cover of, but not as a part of, OPERATION ALERT. Mr. Patterson felt that this was a correct concept.

Secretary Dillon thought it would be desirable to determine whether a study would be advantageous before jumping straight into a war-game. He was very concerned about the question of "visibility" and, on the basis of past experience, he was inclined to be pessimistic about preventing leaks. It would be particularly unfortunate to have the war-game exercise leak if it dealt with the concept last described by

Mr. Gray; that is, a Soviet attack on our retaliatory capability followed by an ultimatum to surrender or suffer attack on population centers. He felt the whole idea of a war-game needed more study and that it would be better not to have such a game until further study was completed. He wondered how much time would be required to conduct the war-game.

Mr. Gray said two successive days would probably be required for the senior participants in the game. All preparations would be made in advance and would not involve the senior participants. The two days would allow for two different assumed situations, one to be covered each day. The President, Mr. Gray continued, had always requested Cabinet Members to be available for participation in OPERATION ALERT, but many members had not found participation possible. If the President decided to have a war-game, he would have to request the senior participants to devote two days to the exercise.

Mr. Patterson pointed out that Secretaries Herter and Mitchell had participated in the last OPERATION ALERT. Mr. Patterson also thought that a better name than war-game should be applied to the exercise.

Mr. Gray said he understood the Joint Chiefs of Staff had participated in OPERATION ALERT largely on the logistic side. General White said the Joint Chiefs of Staff, however, had participated in other alert exercises. One such exercise, just completed, had involved the Secretary of Defense and the unified commanders.

Secretary Douglas felt that a clearer statement of the questions to be decided in connection with relocation was needed. There were perhaps good reasons for conducting a war-game, but he felt a more detailed proposal was required before the Defense view on the subject could be formulated. Secretary Dillon said his feelings were similar to those of Secretary Douglas.

Mr. Gray asked whether it was not the consensus of the Council that the notion of a war-game to test national security policy-making in a crisis has possibilities, but that the Council wants further information before proceeding.

Mr. Allen, referring to the paper on war-gaming, asked what "freedom of the game" meant? General White said he assumed this phrase referred to whether or not the game was "canned". Mr. Gray confirmed General White's view. General White said he wished to make two additional points. First, the Joint Chiefs of Staff would like to participate in any military situation assumed as part of the war-game; and secondly, war-gaming would involve a great many people and a great deal of time. Secretary Dillon said State would have problems as to time and personnel if political decisions were involved in the war-game. Mr. Gray said the war-gaming proposal should be discussed further in the Planning Board. He wished to point out, however, that the war-gaming proposal

had virtues apart from the relocation paper. The concept of how the NSC might be used under emergency conditions was important. The Planning Board should therefore prepare a report identifying and analyzing problems involved in alternative concepts for the use of the NSC organization in wartime. The Vice President agreed with Mr. Gray that war-gaming should be further discussed by the Planning Board. Mr. Gray said he would also like to have NSC 5917 referred back to the Planning Board.

The National Security Council:

a. Noted and discussed the draft statement on the subject contained in NSC 5917, in the light of the views of the Joint Chiefs of Staff (transmitted by the reference memorandum of December 16, 1959) and a proposal by the Special Assistant for National Security Affairs for testing national security policy-making in a crisis by a gaming technique.

b. Directed the NSC Planning Board to prepare a report identifying and analyzing questions and problems involved in alternative concepts of the use of the NSC organization in wartime.

c. Referred NSC 5917 back to the Planning Board for revision in the light of the discussion and the report referred to in *b* above.

[Omitted here are agenda items 2 and 3.]

4. TOPICS FOR FUTURE DISCUSSION OR CONSIDERATION BY THE NATIONAL SECURITY COUNCIL

(Memo for NSC Members and Advisers from the Special Assistant to the President for National Security Affairs, same subject, dated December 3, 1959; memos for NSC from the Executive Secretary, same subject, dated December 14 and 15, 1959)

Mr. Gray briefed the Council on each of the topics listed in the NSC Action below and after describing each topic paused to allow opportunity for discussion. (A Copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another is attached to this Memorandum). With respect to some topics, the Council, without discussion, reached the agreement set forth in the NSC Action below. However, certain other topics elicited discussion as indicated in the following paragraphs.

Cuba. Secretary Dillon said the problem of Cuba was extremely complex and delicate, not only because of action taken with respect to Cuba, but also because of the psychological reaction to any actions which might be taken. Since there had been continuing discussions between the President and the Secretary of State with respect to Cuba, Mr. Dillon believed that the Planning Board should not be hasty about taking up Cuban policy until the President and the Secretary of State returned. In any event, the problem of Cuba should be handled under special security precautions. The Vice President did not believe that Cuba should be handled in a routine fashion through normal diplomatic channels. Congress was an important element in the situation. The Administration

must try to guide Congress and not simply react to proposals which may be made in Congress. He urged that between now and January 6 supplementary studies of U.S. strategy toward Cuba should be undertaken. Mr. Gray said there was disagreement within the Government on the basic approach to the Cuban problem. The Treasury's suggestion for a paper on Cuba had been deliberately provocative, that is, intended to elicit discussion. Mr. Gray felt that certain elements in the State Department, particularly Assistant Secretary Rubottom, opposed Planning Board work on Cuba. The Vice President said that when Congress reconvened there would be a great assault on the Administration's Latin American policy. Heavy criticism of that policy was coming from the Republican as well as the Democratic members of Congress. In his view a discussion of Cuba could not be avoided. The problem would soon have far-flung implications beyond the control of the Department of State; and any tendency of State Department officials to attempt to delay action would not be appropriate. Secretary Dillon said he was concerned that a strong attitude which this Government might assume in order to satisfy public opinion would not achieve basic U.S. objectives with respect to Cuba. The Vice President recalled that some State Department officials had earlier taken the position that we would be able to live with Castro. No doubt radical steps with respect to Cuba would create an adverse reaction throughout Latin America, but we needed to find a few dramatic things to do with respect to the Cuban situation in order to indicate that we would not allow ourselves to be kicked around completely. The Attorney General remarked that his Department could be either tough or lenient with respect to anti-Castro elements operating in Florida. He needed policy guidance, however, before specific instructions could be given to FBI agents in the Miami area. Mr. Gray said that a discussion of Cuba by the Council would not mean that the policy would be rewritten in detail, but only that the problem would be discussed on the basis of a paper prepared by the Planning Board, which would be seized of the problem only for the purpose of preparing a discussion outline. Mr. Scribner said Treasury had suggested the question of Cuba not necessarily for the purpose of changing the policy or interfering with State's conduct of our relations with Cuba, but for the purpose of discussing the problem. Secretary Dillon said he had no objection to a discussion of Cuba, but he thought the matter should be handled as a delicate one without wide dissemination of knowledge that it was being discussed. The Vice President felt that Assistant Secretary Rubottom and the Planning Board could probably agree on what matters it would be appropriate to discuss. He repeated his fear that the problem was getting beyond the normal diplomatic province. Secretary Dillon suggested that the Planning Board might go ahead with the preparation of a Discussion Paper. The Vice President felt this was a good solution and added that we should not advertise the fact that we regard the situation in Cuba as

a crisis situation. The Attorney General indicated that from 30 to 40 FBI agents in the Miami area were spending all their time on Cuban affairs, but were having some difficulties because they did not know whether it was our policy to permit anti-Castro activities to continue in Florida or whether such activities should be stopped. Mr. Dulles felt the question of whether anti-Castro activities should be permitted to continue or should be stopped depended on what the anti-Castro forces were planning. We could not, for example, let the Batista-type elements do whatever they wanted to do. However, a number of things in the covert field could be done which might help the situation in Cuba.

Disarmament. With respect to disarmament, Secretary Dillon remarked that this Government would be faced with decisions earlier than planned. The Secretary of State and Mr. Lloyd had agreed that detailed planning was necessary.

Outer Space. With respect to U.S. policy on Outer Space, the Vice President said he would be very much interested in reading the proposed revision of our Outer Space policy. He felt there would be a great deal of discussion of Outer Space soon after Congress convenes.

The Attorney General felt that the Administration should be prepared to present a good case to Congress, not only on Outer Space, but on other matters also. We should think in terms of a persuasive presentation and not permit various segments of the Administration to appear before Congress and talk in different voices. The Vice President agreed that when the President returned from his trip he will have the greatest prestige of any President since Roosevelt. That prestige, properly used and used positively, could have quite an effect. The Attorney General recalled that before 1956 the Administration had had a liaison group which cleared and coordinated presentations to Congress. The Attorney General felt that sometimes the Administration reacted in a frightened manner to Congressional requests; he believed that such reaction was a poor tactic. The Vice President felt the Administration would need a well-understood, affirmative policy with respect to such things as the National Security Council, Cuban Policy, Outer Space, nuclear testing, disarmament, and nuclear power, all of which would probably be investigated by the Congress next year. Mr. Gray recalled that the Outer Space budget was already set for the next fiscal year and suggested that a summary of this discussion might be communicated to General Persons for legislative liaison purposes. The Acting Director, OCDM, Mr. Patterson, said the subject of legislative liaison was perhaps a proper one for Cabinet consideration. The Vice President noted that the subject would be considered by the Cabinet on Friday.

U.S. Foreign Policy and Military Capabilities. Secretary Dillon remarked that this subject should by all means be studied because of its serious implications.

Nuclear Weapons. Mr. McCone remarked that the question of sharing nuclear weapons with our allies would come up immediately when Congress reconvened because of the State-Defense suggestion that GENIE be used by the U.K. under emergency conditions. The Joint Committee was so concerned about this suggestion that it wanted to have a special session to look into the matter, but was finally persuaded to discuss the problem in regular session. The question of other weapons will no doubt be brought up in a general review of our whole policy on sharing nuclear weapons. Mr. McCone felt that this problem was really one to be handled by State and Defense. It was a difficult one because some members of the Joint Committee had previously stated publicly that our policy on sharing nuclear weapons involved no actual U.K. custody of nuclear weapons; contrary to this view, it now appeared that we were about to turn custody of some weapons over to the U.K. He suggested that sharing of nuclear weapons with allies was a topic deserving urgent consideration by the Council.

Basic Organization of the Government for National Security. The Vice President said one subject was missing from the Planning Board's consolidated list of topics, namely, the question of the basic organization of the Government for national security. After seven years of experience with the National Security Council in this Administration and four years' experience with the OCB, he felt national security organization might be a proper topic for Council consideration. A Council discussion of the subject might also be advantageous because the Council is under study by the Jackson Sub-Committee. The Vice President therefore suggested that, subject to approval by the President, the Council examine the operation of the NSC and OCB machinery and consider suggestions which have been made for changes in the present system.

Africa. Mr. Dulles said he did not see any subject related to Africa in the list of topics. Mr. Gray said the Planning Board was already engaged in revising Africa South of the Sahara (NSC 5818).

Changes in the Character of the Cold War. The Vice President said he had had some very helpful discussions with the Director of Central Intelligence on changes in the character of the Cold War. He wondered whether the Intelligence Community might not be asked to give its reactions on this subject. Secretary Dillon said some very difficult concrete problems had arisen in this field. For example, he had found the Belgians were getting ready to do less rather than more with regard to NATO because of what they regarded as a *detente* in East-West relations. In this connection the Vice President felt it might be useful for us to think of our own attitudes: The question was whether we were going to allow Khrushchev, by talking about peace and co-existence, to silence all criticism of past and present Soviet actions.

Long-Range U.S. Policy toward the USSR and its Satellites. With respect to this subject, the Vice President felt we needed to develop a proper policy line on liberation of the Satellites and on all the concepts which had been talked about when the Administration first came into office and which had been modified some what since. He pointed out that we now rule out revolution but say the satellite peoples should have freedom to choose their governments. He felt this would be a very good subject for Council discussion.

Utilization of Non-Military Technological Advances: International Scientific Cooperation. Dr. Kistiakowsky said he would be happy to prepare terms of reference on utilization of non-military technological advances, but he hoped someone else would prepare the paper. Dr. Kistiakowsky then suggested that the Council might also discuss an intensification of efforts to achieve international scientific cooperation which would enhance our leadership among Free World nations and relax tensions by cooperation with the Soviet Union in certain areas. This topic, of course, had less urgency than some of the others mentioned at this meeting.

U.S. Bases Overseas. The Vice President felt that any new report on U.S. bases overseas should take into account the effect of missile developments through about 1965 on our base system. According to his recollection, the Nash Report had dealt with aircraft and had not taken missiles into account.

The National Security Council:

a. Discussed the subject in the light of a list of suggestions by NSC Members and Advisers, prepared by the NSC Planning Board, transmitted by the reference memorandum of December 15, 1959.

b. Agreed, subject to consideration by the President, that:

(1) A Discussion Paper on Cuba should be prepared by the Department of State and discussed in the Planning Board under special security precautions prior to its submission to the NSC.

(2) Discussion of the means by which the U.S. can best obtain the cooperation of De Gaulle in political, economic and military matters should be deferred until after the NATO and Western Summit meetings.

(3) Consideration of a Discussion Paper on the U.S. Attitude toward Nasser and on Poland should be deferred to a later date.

(4) Further discussion of Disarmament should be deferred pending completion of the study in preparation by the Director, Joint Disarmament Study.

(5) The Council on Foreign Economic Policy should be asked to undertake the initial review of Economic Defense Policy (NSC 5704/3).

(6) The Planning Board should give further consideration to development of a paper on Long-Range National Strategies.

(7) Consideration of a Discussion Paper on the future of NATO should be deferred until after the NATO meeting.

(8) The Planning Board should develop Discussion Papers on U.S. Foreign Policy and Military Capabilities, on Implications of the

Development of Additional World Power Centers, and on Proliferation of Nuclear Weapons and of Delivery Systems.

(9) The Planning Board should undertake the immediate preparation of a Discussion Paper on the Implications of Sharing of Nuclear Weapons with Allies.

(10) The Council should discuss the basic organization of the National Security Council, including the Operations Coordinating Board, by examining how it has operated over the years and recent suggestions for changes in the current organization.

(11) The Planning Board should prepare a Discussion Paper on Effects of Change in the Character of the Cold War.

(12) Consideration of a Discussion Paper on the Economic Threat Posed by the USSR and Communist China should be deferred, pending preparation of a study agreed upon by the Planning Board on an Examination of the Principal Factors affecting the Future Power Positions of the Free World and the Sino-Soviet Bloc.

(13) The NSC Planning Board should prepare Discussion Papers on Long-Range U.S. Policy Toward the Soviet Union and the European Satellites and on Long-Range U.S. Policy toward Communist China.

(14) The Council on Foreign Economic Policy should be asked to give initial consideration to a Discussion Paper on Trade Competition Between the U.S. and Europe.

(15) The Planning Board should give further consideration to Discussion Papers on Utilization of Non-Military Technological Advances and on International Scientific Cooperation.

c. Noted that:

(1) A proposed revision of Preliminary U.S. Policy on Outer Space (NSC 5814/1) is scheduled for consideration at a Joint Meeting of the National Security Council and the National Aeronautics and Space Council on December 29.

(2) The Planning Board is currently reviewing and revising U.S. Policy Toward Africa South of the Sahara (NSC 5818).

(3) The current review by the Department of Defense of the findings and recommendations of the Nash Report on Overseas Bases, pursuant to NSC Action No. 2142, should provide a basis for Council discussion of U.S. Bases Overseas, with special emphasis on the implications of developments in the missiles field.

NOTE: The above actions (NSC Actions Nos. 2163, 2164, 2165 and 2166) subsequently submitted to and approved by the President.

NSC Action No. 2166-b-(1) subsequently transmitted to the Secretary of State for appropriate action.

NSC Action No. 2166-b-(5) and -14) subsequently transmitted to the Chairman, CFEP, for appropriate action.

NSC Action No. 2166-c-(3) subsequently transmitted to the Secretary of Defense for appropriate action.

Marion W. Boggs

224. National Intelligence Estimate¹

NIE 11–8–59

Washington, December 23, 1959

SOVIET CAPABILITIES FOR STRATEGIC ATTACK THROUGH MID-1964

NOTE: This is an advance copy of the conclusions of this estimate as approved by the United States Intelligence Board. The complete text will be circulated within five days of this issuance.

- The probable Soviet ICBM force.
- Medium Range Ballestic Missiles
- Long Range Aviation
- Submarine-launched Missiles

SUBJECT

NIE 11–8–59: SOVIET CAPABILITIES FOR STRATEGIC ATTACK THROUGH
MID-1964

THE PROBLEM

To estimate probable trends in the strength and deployment of Soviet long-range air and missile weapons systems suitable for strategic attack, through mid-1964.²

FOREWORD

The critical feature of this estimate is our judgment with respect to the force goals of the existing Soviet ICBM program. This judgment is based in part on calculations regarding Soviet ICBM requirements for various defined strategic purposes. These calculations are especially sensitive to possible differences between our assumptions and those actually made by Soviet planners with respect to two important factors:

a. The probable future performance characteristics of the improving Soviet ICBM.

¹ Source: "Soviet Capabilities for Strategic Attack Through Mid-1964." Top Secret. 12 pp. Eisenhower Library, Whitman File.

² "Strategic attack" as used herein is defined as nuclear attack against retaliatory forces and key war-making strengths in North America, as well as US and Allied retaliatory forces at sea and in overseas areas. The weapons systems primarily considered are heavy and medium bombers assigned to Long Range Aviation, related air-to-surface missiles, ground launched missiles with maximum ranges of 700 nautical miles or more, and submarine-launched missiles. It is recognized that other delivery systems are available for use against targets at sea and overseas. [Footnote is in the original.]

b. The probable future development of the US nuclear retaliatory force.

We have assumed for the Soviet ICBM the performance characteristics estimated for it at various dates in NIE 11-5-59, "Soviet Capabilities in Guided Missiles and Space Vehicles," dated 3 November 1959. Soviet planners may expect a better performance, in which case their estimates of the numbers required would be lower than ours. However, we would expect them to use conservative assumptions in making so vital a calculation.

With respect to Soviet targeting, we have assumed that existing approved US military programs will be carried out. Explicit information on these programs is presumably not available to Soviet planners, but we believe that they have enough general information from open sources to be able to estimate them with fair accuracy. These US programs are, of course, subject to change—as is the Soviet ICBM program also. The present Soviet ICBM program, however, must be based on the present Soviet estimate of the probable future development of the target system.

It is beyond the scope of this estimate to consider what political or military courses of action the USSR might adopt if the development of its strategic attack capabilities were to be as estimated herein. Such matters will be considered in the forthcoming NIE 11-4-59, "Main Trends in Soviet Capabilities and Policies, 1959-1964."

CONCLUSIONS

A. The Soviet rulers probably regard their present strategic attack forces as capable of devastating US and Allied concentrations of population and industry, but incapable of preventing, by military action, the nuclear devastation of the USSR. (Para. 26)

B. The ICBM presents the best prospect of being able to deliver a heavy weight of attack within the least time after a decision to attack, and thereby to prevent the launching or reduce the weight of a US strategic attack on the USSR. Hence, we believe that the future development of Soviet intercontinental attack capabilities will be primarily a function of the development, production, and deployment of ICBMs. Soviet ICBM capabilities will be supplemented by the development of a submarine-launched missile capability and by the maintenance of a substantial long-range bomber capability. (Paras. 30-33)

C. Our analysis shows that a crucial question for this estimate is whether the Soviet rulers would consider it feasible to achieve in 1961, through a rapid deployment of operational ICBMs, such a military, political, and psychological advantage over the US as would enable them to impose their will. After 1961 the numbers of semihardened and hardened US ICBM sites programmed to become operational would result in a steep increase in Soviet ICBM requirements. (Para. 36)

D. On the basis of the estimated reliability and accuracy of the Soviet ICBM, a program to provide 400–500 ICBMs on launcher (540–680 in operational inventory) in mid-1961 would give the USSR a very high assurance of being able to inflict severe damage on SAC operational air bases and unhardened ICBM sites beyond the range of 1,100 n.m. missiles, or considerably less assurance of being able to inflict such damage on hardened ICBM sites as well as unhardened sites and air bases. If the USSR were to exercise this attack capability, it would still have to expect retaliation from bombers then on airborne alert, from all or some of the few semihardened and hardened ICBM sites then operational, and from aircraft carriers and missile-launching submarines then at sea. We believe that Soviet planners would not regard this as a “decisive military superiority,” although it would certainly be a powerful threat with strong psychological and political effects throughout the world.³ (Paras. 35, 39, and Annex A, Para. 2)

E. Such a force goal could be realized in mid-1961 only through a crash program requiring diversion of resources from other programs to which the Soviet rulers have attached great importance, and a level of activity that would tend to stimulate US countermeasures. There is no indication that such a Soviet effort is now underway. We do not believe that the Soviet rulers would make such a heavy investment in a program unlikely to achieve a “decisive military superiority.”⁴ (Para. 40)

F. Every present indication suggests that the Soviet ICBM program, while not a crash program, is designed to provide a substantial ICBM capability at an early date. The goal of the program is probably an ICBM force as large as Soviet planners deem necessary to provide a substantial deterrent and pre-emptive attack capability. In our view, this would be consistent with the present deliberate and orderly tempo of the Soviet ICBM test-firing program, with current Soviet military doctrine, and with the USSR’s observed policy of maintaining a balance among military capabilities designed to accomplish various missions.⁵ (Para. 41)

G. We conclude that the present Soviet ICBM program would provide on the order of 140–200 ICBMs on launcher in mid-1961. Within this range, there is a difference of view among the members of the United

³The Assistant Chief of Staff, Intelligence, USAF does not concur in the last sentence of Conclusion D, Conclusions E and F, and the last sentence of Conclusion H. For his position, see his footnote following Conclusion H. [Footnote is in the original.]

⁴The Assistant Chief of Staff, Intelligence, USAF does not concur in the last sentence of Conclusion D, Conclusions E and F, and the last sentence of Conclusion H. For his position, see his footnote following Conclusion H. [Footnote is in the original.]

⁵The Assistant Chief of Staff, Intelligence, USAF does not concur in the last sentence of Conclusion D, Conclusions E and F, and the last sentence of Conclusion H. For his position, see his footnote following Conclusion H. [Footnote is in the original.]

States Intelligence Board. The Assistant Chief of Staff for Intelligence, Department of the Army, and the Assistant Chief of Naval Operations for Intelligence, Department of the Navy, estimate that the Soviet program is likely to provide about 140 ICBMs on launcher in mid-1961. The Director of Intelligence and Research, Department of State, and the Director for Intelligence, The Joint Staff, believing that Soviet planners would regard the advantages to be gained as justifying additional effort, estimate that the number of Soviet ICBMs on launcher in mid-1961 is likely to be towards the high side of the 140–200 range. The Assistant Chief of Staff, Intelligence, USAF, also estimates that the number of Soviet ICBMs on launcher in mid-1961 is likely to be towards the high side of this range, but it should be noted that he estimates the characteristics of the Soviet ICBM to be considerably better than those estimated by the majority. All members of the United States Intelligence Board believe a Soviet force of more than 200 ICBMs on launcher in mid-1961 to be unlikely. (Para. 47)

H. The development of the Soviet ICBM force beyond 1961 would be likely to be affected by such considerations as the actual development of the target system to be attacked, the prospects for a greatly improved Soviet ICBM, and the prospects (on both sides) for an effective anti-ICBM, as well as by the general development of the world situation and of relations between the US and the USSR. Any figures for future years should be reviewed in the light of such considerations and of evidence on the actual progress of the Soviet ICBM program. Based on our estimate of the USSR's present program and intentions, we believe that the number of Soviet ICBMs on launcher is likely to be in the range of 250–350 in mid-1962, and 350–450 in mid-1963.⁶ (Para. 48)

⁶ The Assistant Chief of Staff, Intelligence, USAF, does not concur in the last sentence of Conclusion D, Conclusions E and F, and the last sentence of Conclusion H. He does not believe that Soviet behavior, as we have observed it, warrants the judgment that their objectives would be satisfied by attainment of only substantial deterrence. At any rate, he does not believe that the economic and physical difficulties involved in attaining "decisive military superiority" would be or are determinative. (See also his footnote to Annex B) Rather, he believes that the Soviet leaders, perceiving the potentialities inherent in ICBMs, are attempting to achieve a capability for decision through exploitation of this force or actual launching, if necessary.

Assuming the improved reliability, accuracy, and war-head of the Soviet ICBM as he estimates them, the Assistant Chief of Staff, Intelligence, USAF believes that the Soviet leaders will assign a high priority to building an ICBM force which would give the USSR a reasonably high assurance of being able to inflict severe damage on SAC operational air bases and at the same time a somewhat lower degree of assurance of similar damage on US ICBM sites. He believes that such an objective could be attained with an operational ICBM force of about 250 (185 on launcher) by mid-1961 and 500 (385 on launcher) by mid-1962. It is generally agreed that the Soviets have both the technical and industrial capability to produce such a force.

I. The USSR will have no serious difficulty in meeting its estimated requirements for 700 n.m. and 1,100 n.m. ballistic missiles. (Paras. 50–52)

J. On the basis of the foregoing conclusions, our numerical estimates of Soviet medium and heavy bombers in Long Range Aviation units, long and medium-range ballistic missiles, and missile-launching submarines are as shown in the following table:⁷⁸

	Mid-1960	Mid-1961	Mid-1962	Mid-1963	Mid-1964
<i>Bombers</i>					
Heavy	135	150	140	130	120
Medium	1,100	1,050	1,000	900	800
<i>Missiles</i>					
700 n.m.					
In Inventory	250	350	450	450	450
On Launcher	110	150	150	150	150

It is the view of the Assistant Chief of Staff, Intelligence, USAF, that Soviet planners will undoubtedly feel that they will have attained a capacity for substantial deterrence and pre-emptive attack by mid-1962, but he believes the long range objective of the Soviet ICBM is "decisive military superiority." He does not believe that the Soviets would be content with conceptual levels of deterrence; they would realize the possibility of error in their own calculations and acknowledge the possibility of Western pre-emption of their deterrent capabilities. This latter contingency would weight the more heavily if the Soviet leaders intended, as he believes likely, to exploit their capabilities in political offensives. In this event, their estimate of the likelihood of Western "desperate" acts would induce them to attempt attainment of total deterrence, i.e., "decisive military superiority."

In view of the potentialities for military superiority inherent in ICBMs for the period of this estimate, the Assistant Chief of Staff, Intelligence, USAF, concludes that the Soviet program is aimed at attaining an operational inventory of 800 (640 on launcher) by mid-1963 and 1,100 (880 on launcher) by mid-1964.

⁷ DISSENTING VIEWS

The Assistant Chief of Staff, Intelligence, USAF does not concur in the numbers of heavy bombers and ICBMs estimated, believing they should be:

	Mid-1960	Mid-1961	Mid-1962	Mid-1963	Mid-1964
Heavy bombers	135	150	175	200	200
ICBM					
In Inventory	50	250	500	800	1,100
On Launcher	35	185	385	640	880

⁸ The Assistant Chief of Staff for Intelligence, Department of the Army, does not concur in the numbers of heavy bombers estimated. In his view, future Soviet heavy bomber strength will approximate the following:

	Mid-1960	Mid-1961	Mid-1962	Mid-1963	Mid-1964
Heavy bombers	125	115	100	75	75

	Mid-1960	Mid-1961	Mid-1962	Mid-1963	Mid-1964
1,100 n.m.					
In Inventory	80	160	240	300	300
On Launcher	50	100	100	100	100
ICBM					
In Inventory	50	175–270	325–450	450–560	^a
On Launcher	35	140–200	250–350	350–450	^b
<i>Submarines</i>					
“Z” class ^c	4	4	4	4	4
“G” class ^d	9	15	18	18	18
Nuclear ^e	—	2	6	10	14

EXPLANATORY NOTES

- ^a At least 450, possibly more.
- ^b At least 350, possibly more.
- ^c Each “Z” class submarine would probably carry two missiles.
- ^d Each “G” class submarine would probably carry about five missiles.
- ^e The associated missile may not become available until 1963, in which case the missile used in the “G” class might be used in this submarine. Each submarine would probably carry 6–12.

225. NSC Report¹

NSC 5919 Washington, December 28, 1959

U.S. POLICY WITH RESPECT TO THE DEVELOPMENT
OF CARGO AIR LIFT

NOTE BY THE EXECUTIVE SECRETARY
to the
NATIONAL SECURITY COUNCIL
on

U.S. POLICY WITH RESPECT TO THE DEVELOPMENT
OF CARGO AIR LIFT

Reference: NSC Action No. 2151–f–(2)

¹ Source: “U.S. Policy With Respect to the Development of Cargo Air Lift.” Confidential. 14 pp. NARA, RG 59, S/S–NSC Files: Lot 63 D 351.

The enclosed draft statement of policy on the subject, prepared by the NSC Planning Board with the participation of representatives of the Departments of Justice and Commerce and the Federal Aviation Agency, is transmitted herewith for consideration by the National Security Council at its meeting on Thursday, January 7, 1960.

It is recommended that, if the Council adopts the enclosed statement of policy, it be submitted to the President with the recommendation that he approve it; direct its implementation by all appropriate Executive departments and agencies of the U.S. Government; and designate coordinating agencies as follows: the Department of Defense for Paragraph 16, the Office of Civil and Defense Mobilization for Paragraph 17, and the Federal Aviation Agency for Paragraph 18.

James S. Lay, Jr.
Executive Secretary

The Administrator, Federal Aviation Agency
The Chairman, Joint Chiefs of Staff
The Director of Central Intelligence

DRAFT STATEMENT
of
U.S. POLICY WITH RESPECT TO THE DEVELOPMENT
OF CARGO AIR LIFT

GENERAL CONSIDERATIONS

1. It is in the [national security]² interest of the United States to have available an efficient and effective civil air cargo fleet, which, in time of peace, as well as in a national emergency, could be used to meet a portion of military air cargo requirements. Such a fleet could also serve as an instrument of [other]³ national policies. The United States does not now have such a fleet.

Conditions Which Have Limited the Development of a Modern Civil Air Cargo Fleet

2. In the commercial field, long preoccupation with the more profitable passenger business and with constant passenger aircraft

²Treasury and Budget propose deletion. [Brackets and footnote are in the original.]

³Treasury and Budget propose deletion. [Brackets and footnote are in the original.]

modernization has resulted in a lack of emphasis on the development of the cargo business and of uncompromised all-cargo aircraft. As a result, commercial cargo planes are merely improvised modifications of passenger configured aircraft. Adaptation of the present essentially passenger configured aircraft to cargo use results in high operating costs, high handling charges, and inflexibility as to operating bases and facilities.

3. In the last several years the Department of Defense has had a higher priority requirement for the development of convertible (troop-cargo) aircraft than for the development of all-cargo aircraft.

4. The characteristics of uncompromised cargo aircraft are unique and differ importantly from the characteristics of presently available passenger aircraft. This difference is not unlike the difference between busses and trucks, or the difference between Pullman cars and freight cars. What is needed to further the sound growth of air cargo are types of aircraft which would (a) have an intercontinental capability, (b) be capable of operating from relatively small unsophisticated airports, (c) employ a minimum of high cost and high maintenance components, and (d) be capable of being routinely operated at a direct operating cost of 3.5 to 4 cents per ton-mile. This last-named capability would make possible air cargo service to the user at about 10 cents per ton-mile, or something less than one-half the present average rates. At present this is considered to be a very economical air cargo charge. A cargo aircraft currently being produced in Canada represents a major step toward achievement of these characteristics, and U.S. aircraft now under development show even greater promise.

5. Aircraft with the characteristics enumerated above could serve civil and many military uses. With the exception of certain outsized and sensitive cargo, the characteristics of most routine military cargo (dimensions, weight and density) are compatible with those of commercial cargo.

6. The U.S. Government maintains a substantial military cargo airlift capability and has not fully utilized in peacetime available civil cargo airlift. The stated basis for this practice has been that the U.S. commercial cargo airlift capability has not been adequate to meet civil requirements and those military requirements which could be moved by civil aircraft during periods of national emergency. However, in recent years, the Department of Defense has increased its use of the civil air cargo fleet by placing contracts with the civil air carriers (11% of the total MATS air cargo traffic in FY 1959), thereby making a contribution to the continued growth of the air cargo industry.

Conditions Which Would Stimulate the Development of a Modern Civil Air Cargo Fleet

7. The conditions may now exist whereby, with minimum measures of government encouragement, the development of an uncompromised civil air cargo fleet would be given the initial incentive it needs.

8. Some U.S. air cargo operators are buying a Canadian-manufactured all-cargo aircraft of advanced turbo-prop design. Direct operating costs of this aircraft will be approximately 3.5 cents per ton-mile, and user costs, approximately 10 cents per ten-mile. Such costs will be competitive with those of other modes of transportation for many types of cargo and are significantly lower than those for any cargo aircraft currently in production in the United States. The efficiency of this aircraft reflects an important technical advance and the related Canadian government program guaranteeing purchase loans up to 80 percent of the investment (available to U.S. purchasers), constitutes an important financial initiative. The potential air cargo market will be greatly stimulated by the introduction of this aircraft.

9. Many of the commercial advantages to be derived from operation of a modern civil air cargo fleet could be achieved by the procurement and use of this Canadian-manufactured aircraft by U.S. civil airlines. Such procurement and use would accord with the principle of sharing the resources of the United States and Canada on a continental rather than a national basis. On the other hand, stimulation of the cargo aircraft manufacturing industry in the United States would encourage (a) development of more efficient cargo aircraft; and (b) retention of U.S. leadership in civil aircraft production to the extent that is considered desirable.

10. *a.* The progressive transfer of non-hard-core traffic to civil carriers is now underway and will be continued as civil aircraft of modern types (e.g., the DC-7F and the L-1049H) become available. Limiting MATS peacetime operation to that required by the war-time "hard-core"⁴ mission would permit the transfer of additional cargo business to civil carriers and could assist in the development of an uncompromised air cargo fleet. As civil air carriers equip themselves with uncompromised cargo aircraft, this orientation of MATS to the "hard-core" function can be further effected, and increased use can be made of the services of such civil carriers.

b. The foregoing would present no risk to the national security, if coupled with guarantees that the civil air cargo potential, as achieved,

⁴ "Hard-core" requirements are those military requirements which, because of their nature or timing, must move in military aircraft manned by military crews. These "hard-core" requirements include highly sensitive operations from the standpoint of security, importance, and quick reaction, such as deployment of initial elements of strategic and tactical units and emergency positioning of support personnel and equipment in anticipation of maximum effort operations. [Footnote is in the original.]

would be immediately and wholly responsive to national defense needs. A stimulus to the purchase of uncompromised cargo aircraft would be given if such transfer of business were limited to those carriers which demonstrate a willingness and ability to so modernize their cargo fleet. The progressive transfer of MATS business, appropriate reductions in average rates, [and the enactment of legislation offering U.S. guarantee loans for the purchase of new all-cargo aircraft]⁵ in addition to a continued rapid growth of commercial demands for air cargo service, should stimulate development of a modern air cargo fleet.

11. It is the general policy of the Federal Government that it will not carry on any commercial activities to provide a service for its own use if such services can be procured from private enterprise through ordinary business channels.⁶ Exceptions to this policy are permitted for various compelling reasons including national security and "relatively large and disproportionately higher costs." In this connection it should be noted that Congress included in the FY 1960 Appropriation Act a provision that \$85 million of the funds appropriated for MATS would be available only for the procurement of commercial air transportation service (passenger and/or cargo). In denying funds in FY 1960 for procurement of ten jet-powered cargo aircraft for use by MATS, Congress also stated in an official report that "adequate transport capacity for this portion of the MATS mission exists in private commercial aircraft during the present cold war situation, and in the civil reserve air fleet in the event of mobilization".

12. The Government requires the immediate availability of the civil air cargo fleet to assist in meeting military and mobilization requirements in time of war, national emergency, or whenever a military situation requires. There is a strong difference of view within the Executive Branch as to whether the U.S. Government does now have immediate availability of the civil air cargo fleet to meet these requirements and as to whether present arrangements under which the Civil Reserve Air Fleet is on call by the Government are adequate.

13. The expansion of a civil air cargo fleet would have the bonus effect of contributing to the fuller utilization of existing U.S. aircraft production capacity to the extent that U.S. (rather than foreign) manufactured aircraft are purchased.

14. The operation, under the U.S. flag, of an uncompromised efficient air cargo fleet would enhance the prestige of the United States, particularly in those overseas areas served by that fleet, and would promote our objective of maintaining U.S. leadership in international civil aviation. Uncompromised cargo aircraft developed for U.S. use

⁵ Treasury and Budget propose deletion. [Footnote and brackets are in the original.]

⁶ See Bureau of Budget Bulletin 60-2, September 21, 1959. [Footnote is in the original.]

would also be useable by indigenous carriers in at least some of the underdeveloped countries. Such aircraft would thus contribute to the implementation of the policy that, as a means of promoting the Free World aviation position in the underdeveloped areas and of neutralizing further Sino-Soviet aviation encroachments in such areas, the United States should encourage the development in the United States and other Free World nations of competitive types of aircraft and aviation equipment suitable for use in underdeveloped areas.⁷

OBJECTIVE

15. A civil air cargo capacity which, together with the military air cargo fleet, is adequate (in quantity and quality), and immediately available, to meet military and mobilization requirements in time of war, national emergency, or whenever a military situation requires.

POLICY GUIDANCE

16. *a.* In the implementation of existing policy which requires that the government divest itself of those activities competitive with private industry, divert progressively and in an orderly manner increasing quantities of non-hard-core Federal cargo airlift traffic from the military cargo fleet to certificated U.S. air carriers⁸ [as civil aircraft, of modern types (e.g., the DC-7F and the L-1049H), become available and can provide civil air cargo capability at reasonable cost⁹].¹⁰ In negotiating contracts for the carriage of MATS non-hard-core cargo by civil air carriers, give preference [to the extent feasible]¹¹ [wherever possible]¹² to those certificated U.S. carriers which demonstrate a willingness and ability to acquire uncompromised cargo aircraft.

b. As civil air carriers equip themselves with uncompromised cargo aircraft, increase the use of such carriers for non-hard-core traffic.

c. Adjust the operations and capability of MATS toward meeting only its wartime "hard-core" mission in accordance with *a* and *b* above. However, at all times:

⁷ See paragraph 31, NSC 5726/1, "U.S. Civil Aviation Policy Toward the Sino-Soviet Bloc". [Footnote is in the original.]

⁸ A certificated air carrier is an air carrier holding an effective certificate issued by the Civil Aeronautics Board authorizing it to engage in air transportation. [Footnote is in the original.]

⁹ The Department of Defense has stated that its criteria for determining comparative costs are on the basis of Bureau of the Budget Bulletin 60-2, September 21, 1959. [Footnote is in the original.]

¹⁰ Budget proposes deletion. [Brackets and footnote are in the original.]

¹¹ Defense-JCS proposal. [Brackets and footnote are in the original.]

¹² Treasury, Commerce, Budget, FAA proposal. [Brackets and footnote are in the original.]

(1) Maintain MATS in a posture adequate to satisfy those wartime military requirements which must be met by military aircraft and those other wartime military requirements which are beyond the capability of civil air carriers; [productively utilize during peacetime the capability so maintained].¹³

(2) Assure that the civil aircraft handling the cargo transferred to the civil air cargo fleet pursuant to *a* and *b* above will be immediately available to meet military and mobilization requirements when necessary.

17. Review the present arrangements under which the Civil Reserve Air Fleet is on call by the Government to assure that the civil cargo air fleet is immediately available to meet military and mobilization requirements.

18. If legislation is proposed which would, through purchase loan guarantees, encourage and facilitate the acquisition by U.S. certificated air carriers of uncompromised cargo aircraft produced by U.S. manufacturers, it should contain provisions to ensure the immediate availability of these cargo aircraft to meet military and mobilization requirements.

Enclosure

Memorandum From Lay to All Holders of NSC 5919

Washington, January 28, 1960

As indicated by the second paragraph of the NOTE following NSC Action No. 2181 (adopted by the National Security Council at the 433rd meeting on January 21 and approved by the President on January 26, 1960), this Action obviated the need for a statement of policy on Cargo Air Lift as proposed in NSC 5919, which was accordingly removed from the NSC agenda.

James S. Lay, Jr.
Executive Secretary

¹³ Proposed by State, Defense, OCDM, JCS. [Brackets and footnote are in the original.]

226. Memorandum From the Acting Assistant Secretary of State for Economic Affairs to Dillon¹

Washington, January 5, 1960

SUBJECT

NSC 5919—"U.S. Policy with Respect to the Development of Cargo Airlift"

I. Problem

The subject paper, prepared by the NSC Planning Board, is due to be considered by the National Security Council on January 8.

II. Discussion

The policy statement is the result of a request by General Persons of the White House that the NSC undertake to resolve certain differences which have arisen in the past between the Federal Aviation Agency and the Department of the Air Force on where the initiative should rest in the development of aircraft designed exclusively for cargo-lift and on the role of the civil air fleet in the carriage of military cargo.

The draft states that establishment of an effective civil cargo air fleet, which could also serve many military purposes, is desirable. It proposes that as much government cargo as possible be transferred progressively from MATS to certificated civil air carriers, giving preference to those carriers which demonstrate a willingness and ability to acquire aircraft designed for the carriage of cargo. It recommends a review of the civil Reserve Air Fleet system to assure that civil cargo aircraft will be available to the defense establishment when needed.

III. Conclusions

The draft statement is a compromise, but appears to represent an orderly program for the development of a civil air cargo fleet and to provide adequate protection for military interests in a time of emergency. However, a substantial increase in international United States civil air cargo operations substituting for the present MATS may create capacity problems under our bilateral air transport agreements, and to minimize these problems as much as possible the Department should be kept closely informed of each stage of development of the program.

IV. Recommendation

It is recommended that the Department take a secondary role in discussion of the paper, but approve its adoption on the understanding that the Department expects difficulty in overcoming capacity problems which may arise in its full implementation.

The Chairman, Joint Chiefs of Staff
The Director of Central Intelligence

Enclosure

Memorandum From Twining to Gates

Washington, January 7, 1960

SUBJECT

U.S. Policy with Respect to the Development of Cargo Air Lift (U) (NSC 5919)

1. The Joint Chiefs of Staff have reviewed the proposed draft statement of policy, subject as above, scheduled for consideration by the National Security Council on Thursday, 7 January 1960.

2. The Joint Chiefs of Staff concur in the purpose of and the general approach taken in the draft statement.

¹Source: Transmits views of the JCS on NSC 5919. Confidential. 4 pp. NARA, RG 59, S/S-NSC Files: Lot 63 D 351.

3. The Joint Chiefs of Staff consider it mandatory that Military Air Transport Service (MATs) be maintained in a posture adequate to satisfy those wartime military requirements which must be met by military aircraft and those other wartime military requirements which are beyond the capability of civil air carriers.

4. From the viewpoint of economy, the Joint Chiefs of Staff consider it necessary to utilize productively that military airlift capability generated by MATs during peacetime.

5. The Joint Chiefs of Staff recommend a review of the present arrangements under which the Civil Reserve Air Fleet (CRAF) is on call to the Government to assure that it is immediately available to meet military requirements.

6. Subject to the comments and recommendations contained in the Appendix hereto, the Joint Chiefs of Staff consider NSC 5919 to be an acceptable policy statement.

For the Joint Chiefs of Staff:

N.F. Twining,
Chairman,
Joint Chiefs of Staff

Appendix

Paper Prepared by the Joint Chiefs of Staff

Washington, undated

SPECIFIC COMMENTS ON NSC 5919

1. *Paragraph 10–a.* Recommend deletion of parenthetical expression “(e.g., the DC–7F and the L–1049H)” from the first sentence.

REASON: It is not desirable to cite any illustrative examples which, by implication, suggest that the need for a modern cargo transport can be satisfied by aircraft which are essentially converted passenger types.

2. *Paragraph 10–b.* Support the majority view.

REASON: Guaranteed loans may encourage and assist in the development and procurement of new all-cargo aircraft. Such aircraft would benefit both the military and commercial air industry as new types of all-cargo aircraft would include more favorable characteristics (e.g., range, economy of operation and ability to operate from unsophisticated airports) than those available in aircraft now used by civil air carriers for movement of cargo.

3. *Paragraph 16-a.* Support the views of the Department of Defense and the Joint Chiefs of Staff.

REASON: Airlift should only be diverted to certificated air carriers as procurement policies and small business interests permit. Also, there may be instances where it would not be feasible from a military viewpoint to divert traffic even though possible, to certified air carriers as such carriers may not be able to provide the desired or economic service required to meet military requirements.

4. *Paragraph 16-a.* Recommend deletion of parenthetical expression "(e.g., the DC-7F and the L-1049H)" from the first sentence.

REASON: Same as for paragraph 1 above.

5. *Paragraph 16-c-(1).* Support the views of the Department of State, Department of Defense, Office of Civil and Defense Mobilization and the Joint Chiefs of Staff.

REASON: If the MATS operation and capability is adjusted toward meeting its wartime "hard-core" mission considerable airlift no doubt will be transferred to commercial air carriers. The peacetime airlift capability of MATS generated during peacetime should be fully utilized by the Services. It is considered unsound and uneconomical to procure airlift from commercial sources and at the same time not utilize that airlift capability generated in realistic training of the military air transport forces.

6. *Paragraph 16-c-(2).* Recommend paragraph be amended (changes indicated in usual manner):

"(2) Assure, by appropriate contracts and agreements backed by necessary legislation, that the civil aircraft handling the cargo transferred to the civil air cargo fleet pursuant to a and b above will be immediately available to meet military and mobilization requirements when necessary."

REASON: To indicate that written contracts with civil carriers and additional legislation are required to assure the availability of civil carriers at all times.

7. *Paragraph 17.* Recommend paragraph be amended (changes indicated in usual manner):

"17. Review the present arrangements under which the Civil Reserve Air Fleet is on call by the Government to assure that the civil-cargo-air fleet is immediately available to meet military and mobilization requirements."

REASON: The Civil Reserve Air Fleet is composed of both civil passenger and cargo aircraft. To conduct a realistic review of present arrangements under which the Civil Reserve Air Fleet is on call by the Government it should be examined from the viewpoint of the entire fleet.

8. *Paragraph 18.* Recommend paragraph be amended (changes indicated in usual manner):

~~"18. If legislation is proposed which would, through Legislation~~ *for purchase loan guarantees, which would encourage and facilitate the acquisition by U.S. certificated air carriers of uncompromised cargo aircraft produced by U.S. manufacturers, it should contain provisions to ensure the immediate availability of these cargo aircraft to meet military and mobilization requirements."*

REASON: The changed wording will provide a positive statement and support paragraph 10–*b* as written.

228. Briefing Note for the January 7 NSC Meeting¹

Washington, January 7, 1960

CARGO AIR LIFT (NSC 5919)

Our first item this morning, Mr. President, is a draft policy paper on the development of cargo air lift.

Last August I was asked to put this subject, which was then at issue between various agencies (notably Defense and FAA), through the NSC machinery and in that way bring it to you for resolution. The paper before you is the product of a number of Planning Board meetings in which Justice, Commerce and FAA participated. Today we have with us for this item the Secretary of Commerce, General Quesada and Chairman Durfee of the CAB.

However, before we go into this paper, the Defense Department has recently submitted to the President a study entitled "The Role of MATS in Peace and War" containing, among other things, a series of recommendations, which, I understand, are not inconsistent with the Defense position in the paper before us, with one possible exception which has to do with whether the Department of Defense will be restricted to the use of *certificated* air carriers for cargo air lift purposes. The Defense Department report, which has been given no distribution up to this time, is not up for consideration by the Council or decision by the President today. However, I believe it will be useful for the Council to know the report's recommendations before it considers the draft policy paper. Therefore, I

¹ Source: Cargo air lift (NSC 5919). Confidential. 6 pp. Eisenhower Library, Whitman File, NSC Records.

have asked the Secretary of Defense to summarize the recommendations which he has submitted to the President in this study.

(PRESENTATION BY THE SECRETARY OF DEFENSE)

The general considerations of this paper state the desirability of an efficient and effective civil air cargo fleet, outline the conditions which have *limited* the development of such a fleet, and spell out the conditions which would *stimulate* the development of such a fleet. Briefly, we do not have an efficient and effective civil air cargo fleet today for several reasons. In the commercial field, long preoccupation with the more profitable passenger business and with constant passenger aircraft modernization has resulted in a lack of emphasis on the development of the cargo business and of uncompromised all-cargo aircraft. In the last several years the Department of Defense has had a higher priority requirement for the development of convertible (troop-cargo) aircraft than for the development of all-cargo aircraft. Finally, the U.S. Government maintains a substantial military cargo airlift capability and has not fully utilized in peacetime available civil cargo airlift.

The first split occurs in paragraph 1. The majority would say that it is in the *national security* interest of the U.S. to have available an efficient and effective civil air cargo fleet, and that such a fleet could also serve as an instrument of other national policies. Treasury and Budget prefer to say simply that such a fleet would be in the interest of the U.S. I understand that there has been some negotiation on this language between General Quesada and Budget and Treasury.

CALL ON GENERAL QUESADA

(others?)

The next split occurs in paragraph 10-*b*, at the top of page 6. The majority believe that a combination of four things would stimulate development of a modern air cargo fleet. These four things are the progressive transfer of MATS business, appropriate reductions in average rates, the enactment of legislation offering U.S. guarantee loans for the purchase of new all-cargo aircraft, and a continued rapid growth of commercial demands for air cargo service. Treasury and Budget propose that the purchase loan guarantee legislation be deleted from the list. It should be noted that this draft policy paper does not recommend a decision to the President on this legislation, which will be coordinated through the usual Budget Bureau process. Normally a question of this kind would not be discussed by the NSC, but the legislation is part of General Quesada's recommended plan for expanding civil cargo air lift. The question, Mr. President, is therefore whether you want to discuss the legislation at this time.

IF PRESIDENT'S ANSWER IS AFFIRMATIVE, CALL ON
SECRETARY SCRIBNER
MR. STANS
MR. QUESADA
SECRETARY MUELLER

Turning to the statement of objective, paragraph 15 on page 9, I should like to read this agreed language.

READ PARAGRAPH 15

The first policy guidance paragraph (par. 16, pages 10–11) is divided into three parts. 16-*a* deals with the first stage of transfer of MATS business to civil carriers. 16-*b* deals with a further transfer as civil carriers equip themselves with uncompromised cargo aircraft. 16-*c* sets limits on the transfer provided for in *a* and *b*.

In the first split in 16-*a*, the majority would make the transfer of MATS cargo business to civil carriers dependent on the availability in the civil fleet of modern types of aircraft, such as DC-7F and L-1049H. The Budget Bureau proposes deletion of this condition on the grounds that it would be inconsistent with the general policy of the Federal Government, referred to in par. 11, not to carry on any commercial activity to provide a service for its own use if such service can be procured from private enterprise. I understand that Budget is now willing to withdraw from proposing the deletion of this condition. The JCS want to delete, here and in paragraph 10-*c*, references to specific aircraft because it is not desirable to site any illustrative examples which, by implication, suggest that the need for a modern cargo transport can be satisfied by aircraft which are essentially converted passenger types. This raises the question as to whether the JCS would support any transfer of business to presently available aircraft.

CALL ON MR. STANS
SECRETARY GATES
GENERAL TWINING
MR. QUESADA

The second split in 16-*a* involves the preference to be given, in contracting out cargo business to the civil carriers, to those carriers which demonstrate a willingness and ability to acquire uncompromised cargo aircraft. Defense and JCS propose that such a preference be given *to the extent feasible*. Treasury, Commerce, Budget and FAA propose stronger wording: that such a preference be given *wherever possible*.

CALL ON SECRETARY GATES
GENERAL TWINING
MR. QUESADA
SECRETARY MUELLER

Turning to 16-*c*, we have another important split. There is agreement on the minimum posture of MATS to be maintained. The split occurs because Defense, JCS, OCSM and State would have MATS "productively utilize during peacetime the capability so maintained". The JCS have made a comment on this, which reads as follows:

If the MATS operation and capability is adjusted toward meeting its wartime "hard-core" mission considerable airlift no doubt will be transferred to commercial air carriers. The peacetime airlift capability of MATS generated during peacetime should be fully utilized by the Services. It is considered unsound and uneconomical to procure airlift from commercial sources and at the same time not utilize that airlift capability generated in realistic training of the military air transport forces.

I believe those opposing this provision fear that it would authorize MATS to continue to carry considerable non-hard-core cargo which would otherwise be transferred to civil carriers under 16-*a* and *b*.

CALL ON SECRETARY GATES
GENERAL TWINING
MR. QUESADA
MR. STANS
(other?)

On paragraph 16-*c*-(2), the JCS want to add the following language: "Assure, by appropriate contracts and agreements backed by necessary legislation, that the civil aircraft" etc. Although I don't believe that there would be any objection to the additional language, the Planning Board proposed that this paragraph be given to Defense for coordination and assumed that Defense would do whatever it felt necessary to implement it.

Paragraph 17, an agreed paragraph, was put in because there is a strong difference of view within the Executive Branch as to whether the Government does now have immediate availability of the civil air cargo fleet to meet military and mobilization requirements and as to whether present arrangements under which the Civil Reserve Air Fleet is on call are adequate. The JCS suggest a language change that would make the paragraph applicable to the entire fleet, passenger as well as cargo. Even though this is a paper on cargo air lift, I don't believe there will be any objection to this change.

Paragraph 18 is also an agreed paragraph. As I stated before, this paper does not attempt to recommend a decision on purchase loan guarantee/legislation. This paragraph simply says that, if such legislation is proposed, it should contain provisions to ensure the immediate availability of the cargo aircraft involved. The JCS suggest some

language changes which seem to be purely editorial in nature. Would you care to speak to them, General Twining?

Finally, I would like to call the Council's attention to the unusual proposal for assigning coordinating responsibility. Instead of assigning the whole paper to one agency, Defense would have coordinating responsibility for paragraph 16, OCDM for 17, and FAA for 18.

229. Memorandum of Discussion at the 430th NSC Meeting¹

Washington, January 7, 1960

SUBJECT

Discussion at the 430th Meeting of the National Security Council, Thursday, January 7, 1960

PRESENT at the 430th Meeting of the National Security Council were the President of the United States, presiding; the Vice President of the United States; Mr. Livingston T. Merchant for the Secretary of State; the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present and participating in the Council actions below were Mr. Fred C. Scribner Jr., for the Secretary of the Treasury; the Director, Bureau of the Budget; the Attorney General (Item 1); the Secretary of Commerce (Item 1); the Administrator, Federal Aviation Agency (Item 1); and the Chairman, Civil Aeronautics Board (Item 1). Also attending the meeting were the Chairman, Atomic Energy Commission; the Director, Central Intelligence Agency; the Director, U.S. Information Agency; the Chairman, Joint Chiefs of Staff; the Special Assistants to the President for National Security Affairs, for Science and Technology, and for Security Operations Coordination; the White House Staff Secretary; the Deputy Secretary of Defense; Assistant Secretary of State Gerard C. Smith; Assistant Secretary of Defense John N. Irwin, II; Mr. Charles Haskins, NSC; Mr. Howard Sturtz, Central Intelligence Agency (Item 3); the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

¹ Source: Agenda item 1: U.S. policy with respect to the development of cargo air lift. Top Secret. Extracts—10 pp. Eisenhower Library, Whitman File, NSC Records. Drafted on January 13.

1. U.S. POLICY WITH RESPECT TO THE DEVELOPMENT OF CARGO AIR LIFT

(NSC Action No. 2151-f-(2); NSC 5919; Memo for NSC from Executive Secretary, same subject, dated January 7, 1960)

Mr. Gray began his presentation of NSC 5919 by referring to a study which the Department of Defense had recently submitted to the President on "The Role of MATS in Peace and War". (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the meeting and another is attached to this Memorandum).

Mr. Gray said the Defense Department report was not up for consideration by the Council or decision by the President at this meeting, but he felt it would be useful for the Council to hear the report's recommendations before considering NSC 5919. Accordingly, he asked the Secretary of Defense to summarize the recommendations which he had submitted to the President in the Department of Defense study. Secretary Gates said Mr. Douglas would present a summary of the Department of Defense recommendations.

Mr. Douglas said the Defense report on "The Role of MATS in Peace and War" had been a long time in preparation. He then read the first conclusion from the report and all the recommendations as follows:

CONCLUSIONS

"Military Airlift Requirements. The size of MATS and the extent and nature of its operations are keyed to approved military wartime airlift requirements. These requirements break down into (1) critical or hard-core² requirements which because of their nature or the nature of the mission to be supported must move in military operated aircraft, and (2) other essential or civil eligible³ requirements which can move in either military or civil operated aircraft.

"Hard-core requirements are applicable in general war situations as well as situations short of general war. Satisfaction of hard-core requirements (general or limited war) is vital to the successful implementation of military strategy. Therefore, MATS must possess adequate capability at all times to meet these requirements on an effective and timely basis.

"Commercial carriers do not now have adequate air cargo capability to accommodate those approved military requirements which could move during emergencies in commercially operated transport aircraft."

²"Airlift requirements which must move in military aircraft, manned and operated by military crews because of special military considerations, security, or because of limiting physical characteristics such as size or dangerous properties. Included in this category are special military deployments involving nuclear retaliatory forces, the SAC post strike recovery mission, tactical deployments, movement of missiles, special munitions, etc. [Footnote is in the original.]

³"These are the so-called 'civil eligible' requirements. [Footnote is in the original.]

RECOMMENDATIONS

"As a result of the study and conclusions arrived at, actions are being taken within the Department of Defense to carry out the following recommendations:

"1. That MATS be equipped and operated in peacetime to insure its capability to meet approved military hard-core requirements in a general war and in situations short of general war, and such other military requirements as cannot be met with certainty by commercial carriers on an effective and timely basis.

"2. That the modernization of MATS hard-core military airlift capability be undertaken as a matter of priority to improve airlift effectiveness and achieve operating savings.

"3. That MATS routine channel traffic (regularly scheduled, fixed routes) operations be reduced on an orderly basis consistent with assured commercial airlift capability and economical use of any MATS capacity resulting from necessary training or other operations related to its hard-core requirement.

"4. That as commercial carriers equip themselves with modern, economical long-range cargo aircraft and further orientation of MATS to the hard-core function is effected, increased use should be made of the services of such commercial carriers for routine logistic supply.

"5. That commercial augmentation airlift procurement policies and practices be better adapted to the long-range Department of Defense requirements for effective overseas commercial airlift service so as to encourage and assist in sound economic growth, development, and maintenance of an increased air cargo capability; that there be explored the feasibility of (1) increasing the amount of MATS overseas cargo airlift moving on a common carriage basis in accordance with certificates of public convenience and necessity issued by the Civil Aeronautics Board; (2) entering into longer term contracts for MATS traffic; and (3) giving some preference in the movement of MATS traffic to those commercial carriers (a) who are effectively committed to the Civil Reserve Air Fleet (CRAF) program, or (b) whose facilities and equipment are most advantageous to the emergency needs of the Department of Defense; and that legislation be sought if necessary to permit accomplishment of any of the foregoing considered desirable.

"6. That the Department of Defense participate in and support governmental programs for the development of long-range, economical turbine-powered cargo aircraft for military and civil application.

"7. That the Department of Defense support proposed legislation for the guarantee of loans for the purchase of modern, newly-developed cargo aircraft by commercial carriers.

"8. *a.* That consideration be given to the use of the Air Force Reserve equipped with transport aircraft that might be available from MATS excesses as augmentation forces for MATS in time of emergency.

"*b.* That a study be made to determine the desirability and feasibility of employing the Air National Guard in a transport role.

"9. That the role of CRAF be re-examined with the objective of insuring optimum effectiveness and responsiveness of commercial airlift services to the Department of Defense under all conditions."

After concluding his presentation of the recommendations from the Department of Defense report, Mr. Douglas observed that the draft policy paper (NSC 5919) was consistent with the Defense report, provided the splits in the policy paper were resolved as Defense desired. However, Mr. Douglas was concerned that in the present situation, with MATS not too large and heaving no surplus above the JCS requirements, we not lead the airline industry to expect a rapid decrease in MATS operation or traffic, even though over a period of time MATS traffic could be expected to decrease substantially. The Department of Defense was interested in the development of a good cargo aircraft, but it should be understood that such a modern cargo airplane would not for some years produce a substantial capacity to meet wartime needs.

Mr. Gray then briefed the Council on the divergence of views in Paragraph 1 of NSC 5919. Mr. Stans felt this difference could be resolved by deleting the word "security" in the first sentence of Paragraph 1 of NSC 5919 and referring at the end of the paragraph to "instruments of national security and other national policies." This revision would change the emphasis from national security to national interest. Mr. Stans believed General Quesada and the Secretary of the Treasury would be satisfied with this revision. Secretary Gates said he could also accept the change proposed by Mr. Stans.

The President remarked that since he was budget-minded these days he wanted to know a little more about cost factors, particularly the cost of keeping MATS in operation and the cost of moving cargo by means other than MATS. Secretary Gates reported that last year MATS operations had been put on an industrial funding basis; accordingly, MATS was now run as a business enterprise. One feature of the cost factor was the Department of Defense practice of asking for competitive bidding for carrying personnel overseas. Sometimes, the low bids have penalized the "flag" lines. Under a low bid of \$75-80 for a one-way trip across the North Atlantic some lines are losing money. The flag lines and other operators are at odds on this question. The President said if the equipment used were subject to the same inspection and if the pilots had similar certificates, he would be inclined to route the traffic by the cheapest means. General Quesada said the difficulty was that the air transport industry was a regulated industry, which made it monopolistic to a degree. Under the competitive bidding system, the concept of a regulated, monopolistic industry was cast aside. He felt the concept of the air transport industry as a regulated industry should apply to Department of Defense operations. As far as safety was concerned, in his view some operators were approaching conditions which he could not approve. He noted that some companies engage in competitive bidding at a time when they do not have any equipment or pilots, so if they obtain the contract by means of a low bid they have to lease equipment

and hire pilots. As an economic matter, the cut-throat competition does not result in building additional modern airplanes. Pilots and equipment shift from one line to the other with no accumulation of transport assets available to the Department of Defense in an emergency. General Quesada repeated that competitive bidding was destroying the principle of a regulated industry.

Mr. Durfee pointed out that the Civil Aeronautics Board had not taken part in the preparation of the draft policy paper. He referred to Page 10 of the paper, which suggested that the present system of negotiating contracts was to be continued. CAB did not approve of the present system of negotiating contracts, but otherwise had no objection to the paper. The present practice of MATS in awarding business by competitive bidding led to cut-throat competition, which concerned the CAB. One of the largest certificated international air cargo carriers was now on the edge of insolvency due to its competitive bidding practices. Since 1958 FAA, the Department of Defense, and CAB had attempted to solve this problem, but had been unable to do so because CAB has no power to regulate international air rates. If and when CAB obtained the power to regulate international rates, it would probably establish a minimum rate, although Defense has objected to such minimum rates on the grounds that (1) all bids would tend to be at the minimum rate and (2) Defense would then have to choose a carrier to which a contract was to be awarded on some basis other than rates. Mr. Durfee felt that this difficulty could, however, be resolved; but unless CAB obtains the power to fix international rates, the present system of contracts may not assist in the development of a modern cargo aircraft.

Mr. Douglas admitted that the situation was difficult. He would like to see the private air carriers build up an increased capacity. However, he felt that Defense had no alternative to awarding contracts on the basis of the lowest bid. Defense had tried various other systems in awarding contracts and had always run afoul of the Comptroller General. Mr. Douglas then pointed out that the Policy Guidance in NSC 5919 might lead to a possible misunderstanding with respect to certificated carriers. This term could be construed to include only a very few carriers and in this case the increase in cost would be high. The Department of Defense could live with some thirty certificated carriers. Mr. Douglas felt the Department of Defense had made considerable progress in increasing the participation of private airlines in MATS business, inasmuch as 53 per cent of the personnel and 18 per cent of the cargo were now carried under commercial contract. The President asked how much traffic was carried by ship. Mr. Douglas said that in the last two years the Air Force had sent 95 per cent of its personnel and dependents by air, while the Army had sent a smaller number by air. Mr. Douglas pointed out that it cost less to send military personnel and dependents by air than to

pay the cabin rate by ship. The President asked whether cargo moved mostly by air or by ship. Mr. Douglas said most of the cargo moved by ship. Since MATS had been put on an industrial funding basis, a great many items formerly carried by air were no longer so carried. However, the industrial funding basis made the whole MATS operation look like a commercial airline operation. MATS should, by contrast, be building up a war capability. The President agreed that war capability should be the criterion of MATS operation, but noted that wartime requirements were sometimes subject to differing interpretations. He believed, in view of the things which had already been said, that this problem should be solved by locking three or four experts in a room until they arrived at a solution.

General Twining pointed out that General Quesada would soon have to testify before Congressional Committees on his program. General Quesada said the basic question was: What is the role of MATS? In his view the present practices of MATS were in conflict with Bureau of the Budget Bulletin No. 60-2. Interrupting, Mr. Douglas said he could not agree with this observation. General Quesada then read extracts from the Bureau of the Budget Bulletin, and concluded that military personnel were moving over routes which were competitive with commercial air carriers. The President said he saw no objection to this practice if that was the most efficient way to run the Department of Defense. General Quesada said the cost factor as between MATS and the commercial airlines were on different bases. Moreover, when MATS was used to transport personnel and goods that could be carried by commercial lines, it was not engaged in training for war. General Quesada said there were seventy-one certificated carriers, 25 of which were now engaged in litigation. He noted that certification has various meanings. An airline can be certificated for an area, for passengers only, or for cargo only. An airline requires a CAB exemption in order to operate outside the field of its certification. He believed Mr. Douglas' fear that the term "certificated carriers" as used in the paper would cover only a small number of carriers was not justified. The President wondered why the word "certification" had to be used. He thought "certified" would do as well. Mr. Douglas said the Department of Defense was willing to use certificated carriers to carry Defense traffic, but pointed out that some satisfactory carriers would be eliminated by this phrase as defined in NSC 5919, because some satisfactory carriers were not certificated.

The President recalled that at one time, in some operations at least, the Government had a list of qualified bidders. Secretary Gates said there was a list of qualified bidders for most operations except for airline operations. Mr. Stans pointed out that the Department of Defense

had some discretion in awarding contracts for carriage of persons and goods by air. The President remarked that if a list of qualified airline bidders were maintained, account could be taken of the experience factor. General Quesada said some airline companies which submit low bids for Defense business had no planes, no pilots and no money; they had only an idea.

The President felt that if the Government could determine how many persons and how much cargo it wished to move by air, normal commercial competition should result in building the airplanes and putting them into operation. He felt that a good war reserve could not be maintained unless MATS could operate in time of peace. However, he would like to simplify the whole problem. Mr. Stans said economic comparison between MATS operation and "contracting out" was not simple. He suggested that the paper should go back to the Planning Board for resolution in the light of the recommendations in the Department of Defense study. The President said he would like to see the interested parties get together and come up with a single recommendation. He had the impression there was plenty of cargo space on airlines at the present time, and apparently there was a great deal of air freight business.

Secretary Mueller observed that the commercial carriers were not developing uncompromised cargo planes because of the competition from MATS. Secretary Gates thought that an uncompromised air cargo plane might have to be developed by the Government. The President wondered whether it was good business to insist on a completely uncompromised air cargo plane. General Quesada said all aircraft at present had been designed basically for the purpose of carrying passengers. If it were possible to design a cargo plane from the ground up, that is, an uncompromised cargo plane, the cost of carrying cargo by air could be reduced by one-half. The air transport industry was now in the position which the highway transport industry would be in if all cargoes were carried by modified buses rather than by trucks. The President observed that it might be a mistake to design planes solely for the purpose of carrying cargo; he thought perhaps on the analogy of ocean freighters, provision might be made even in a cargo plane for carrying a few passengers.

Mr. Gray felt the Council had drifted into a discussion of technicalities. He believed two questions should now be answered: (1) does the Council want the Planning Board to revise NSC 5919 and (2) what should be done with the Department of Defense report on the role of MATS. The President said the Department of Defense report should be made available to the Planning Board, which should coordinate this report with NSC 5919. He felt we must try to arrive at a better

understanding of what we are trying to do before making any decisions. Secretary Gates said it was desirable to make decisions regarding MATS as early as possible because of the need for testimony on MATS before Congressional Committees. The President wondered whether the Defense report had appeared not because he had requested it, but because Congress was conducting an investigation.

Mr. Gray then called attention to Paragraph 18 of NSC 5919 providing that if legislation is proposed which would, through purchase loan guarantees, encourage the acquisition of uncompromised cargo aircraft it should contain provisions to ensure the immediate availability of these cargo aircraft to meet military mobilization requirements. Mr. Stans said the large airlines insisted that they could develop an uncompromised cargo aircraft if they could obtain some of the business now carried by MATS, but the small airlines wanted guaranteed loans. There was thus a difference of opinion in the industry as to whether guaranteed loans were needed. The President said that in the absence of purchase loan guarantees, the business would go entirely to the big airlines. Mr. Douglas believed that the Department of Defense could produce an uncompromised cargo airplane for about \$80 million in development costs. Mr. Stans felt strongly that if the Department of Defense developed an uncompromised cargo airplane, the plane should be turned over to the airlines under a royalty arrangement which would provide for reimbursement of development costs to the Department of Defense. Mr. Douglas said the only reason for Defense development of an uncompromised cargo aircraft was because such an aircraft was needed. General Quesada then expressed the strong conviction that an uncompromised cargo aircraft could be built without cost to the Government. He felt the air transport industry was dynamic and well-financed, and that free enterprise would see to it that an uncompromised airplane was built without cost to the Government, provided the airlines were assured of MATS business. The President said he was almost convinced, but did not wish to adopt a provision which would result in the large airlines obtaining all the business. Perhaps the Small Business Administration could make a small business loan to the smaller companies. Secretary Mueller said the maximum small business loan was \$250,000 which was a small amount in the airline industry, although it might allow a small company to make a start. Mr. Douglas felt that most airlines receiving contracts meet the definition of small business.

General Quesada said he was convinced the air cargo industry had a great potential. Two hundred uncompromised aircraft could reduce the cost of carrying cargo by air by one-half or perhaps even more. At the present time only 4/100 of 1 per cent of the total freight carried was carried by air.

Mr. Gray said the Planning Board would revise NSC 5919 in the light of the discussion and of the Department of Defense report on MATS. The President said the experts should also consult.

The National Security Council:

a. Discussed the subject in the light of the draft statement of policy contained in NSC 5919; the views of the Joint Chiefs of Staff thereon (transmitted by the reference memorandum of January 7, 1960); and an oral summary by the Deputy Secretary of Defense of the recommendations contained in a report submitted to the President by the Department of Defense, entitled "The Role of MATS in Peace and War".

b. Referred NSC 5919 to the NSC Planning Board for urgent review in the light of the discussion at the meeting, the above-mentioned Defense report, and further consultation between the agencies primarily interested.

[Omitted here is the remainder of the memorandum.]

Marion W. Boggs

230. Memorandum From Power (SAC) to White (USAF)¹

Offutt Air Force Base, Nebraska, January 11, 1960

SUBJECT

B-70 Flexibility

1. In furtherance of our recent conversations concerning the flexibility of the B-70 as a weapon system, the following information might be of assistance to you in your future discussions on this subject:

a. The B-70 provides the flexibility inherent in other aircraft to include:

(1) The ability to deliver high yield weapons against pinpoint hardened targets.

(2) The ability to deliver ALBM's.

(3) The ability to utilize currently existing runways suitable for B-52 operations.

¹ Source: B-70 capabilities. No classification marking. 2 pp. Library of Congress, Manuscript Division, Thomas D. White Papers.

b. Over and above the capabilities possessed by other aircraft the B-70 would be capable of the following:

- (1) High resolution reconnaissance with side-looking radars.
- (2) Airlifting its own ground support equipment by pod, thereby permitting rapid dispersal and operation from other than military sites in times of tension.
- (3) Utilization as a ground alert vehicle with a three-minute reaction time.
- (4) Flight at loitering speeds in an air alert posture with Mach 3 capability for delivery on receipt of go-code.
- (5) Carrying a Class A weapon and escaping from the unrestricted free fall of same.
- (6) Being launched in any number simultaneously from numerous sites throughout the United States and arriving simultaneously at the H hour control line with minor range degradation.
- (7) Providing restrike capability with first-strike aircraft in much less time than any other weapon system that might be available in this time period. In the event multiple restrikes are necessary, this would in effect be the same as increasing the size of the strike force.
- (8) Following the missile strike at such a close time interval that maximum disruption would still exist in the enemy's defenses.
- (9) With the advent of reliable warning, being stationed on overseas reflex bases thereby achieving a capability to strike targets within a minimum time interval and recover to a ZI base unrefueled.

c. Other considerations applicable to the B-70 might be:

- (1) It has been estimated that construction of the B-70 would require the Soviet Union to expend approximately 40 billion dollars in order to acquire the defense environment to counter such a weapon system.
- (2) A modified B-70 might well be utilized as a first-stage launch vehicle for satellites.
- (3) The B-70 by virtue of the advanced technology required for its development and production would serve as a very firm stepping stone to more futuristic space vehicles.

2. As you are well aware, the B-70 type vehicle holds much promise in relation to future commercial developments, however my above comments are in consideration of its strategic offensive application only.

General, USAF
Commander in Chief

231. Memorandum of Conference with the President¹

Washington, January 14, 1960

OTHERS PRESENT

Dr. Kistiakowsky, General Goodpaster

Dr. Kistiakowsky met with the President to take up a number of matters bearing on his function as scientific advisor. These are set forth, together with his discussion thereof, in the attached memorandum.

During the discussion the President expressed general agreement with the views presented by Dr. Kistiakowsky. With regard to the proposal for a satellite telescope for astronomical research, the President said he did not feel this should be a crash program but one to be conducted in a rapid, orderly manner.

In discussion of ballistic missiles, the President stated that he remained of the opinion that careful consideration should be given to putting the Polaris missile on the Navy's ships. If this is not to be done, he has a large question in his mind whether Khrushchev is not right, and whether the day of the surface combatant ship is not, in general, past.

With respect to the GAO report concerning the missile program, the President said it is very important that the Air Force get their answers together and have them immediately available for release when the GAO report is made public.

A.J. Goodpaster
Brigadier General, USA

Attachment

Briefing Memorandum Prepared by Kistiakowsky

Washington, January 14, 1960

Notes for Meeting with the President, January 14, 1960

[Omitted here is page 1.]

The remaining items in my report, Mr. President, have to do with military matters.

¹Source: Discussion of issues: Nike-Zeus, Project Corona, Titan, GAO report on management of the missile program, Polaris; includes Kistiakowsky's briefing memorandum. Secret. 5 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on January 15.

4. One of the panels of the PSAC made this fall a very thorough study of the *Nike-Zeus AICBM problem*. It confirmed the findings of two independent recent technical studies in DOD and extended the conclusions further. Specifically, they are that the presently conceived Nike-Zeus system, even if it performs according to expectations, is not a worthwhile investment. If it is considered as a defense of missile sites, it turns out to be cheaper to increase our deterrent strength by adding more such sites than by buying Nike-Zeus, the cost factor being very substantial in this case, of the order of 10 to 1. On the other hand, if one thinks of Nike-Zeus as a defense of population, it turns out to be useless because the enemy can kill people by exploding warheads upwind, of the cities out of the range of Nike-Zeus. Hence, only a comprehensive fallout shelter program in conjunction with the Nike-Zeus could achieve this objective. Because of these very thoroughly documented arguments, our Panel recommended against going into production with Nike-Zeus—a recommendation which was accepted by the Secretary of Defense. We urged further research effort on Nike-Zeus in the hope that this weapons system could be dramatically improved. In the Army there seems to be a sharp split on the issue of our recommendations; people lower in the echelons, who have had an opportunity to look into the technical factors involved, agree with our recommendations, but top echelons are most unhappy about them.

5. I should like to tell you now, Mr. President, about the present status of the so-called *Project Corona*. So far it has not functioned, but every successive launch has resulted in some progress, one difficulty after another being eliminated. All of them are of comparatively trivial engineering nature, and there is a substantial degree of optimism that the next launch, which is scheduled for early February, will see a complete technical success of the entire system.

6. You are already aware in a general way, Mr. President, of the difficulties of the *Titan Project*. I have made a considerable effort to analyze these difficulties and have reached the conclusion that the Air Force is completely correct in its evaluation. This is that the missile is soundly engineered and should show the planned performance. On the other hand, the managerial situation at the Martin Company is very bad and the failures of the last eight months can all be traced to human factors: lack of staff training, low competence, lack of adequate instructions. The Air Force, with a little help from me, has put a heavy pressure on the Martin Company to remedy these weaknesses; changes have been made and we have hopes that the program will shortly get going. If this is the case, Titan could still be operational by mid-'61 as planned, but there is little doubt that in Congress a great deal will be made of the present situation by the critics of the Administration.

7. In this connection, I should like to call to your attention a *report by GAO* on the supposed failings of the Air Force in the over-all management of the *missile program*. This report appears to be an extreme and unwise invasion of the Executive Branch of the Government. GAO, under the guise of managerial criticism, condemns the Air Force and the Defense Department for failure to take certain technical decisions and for use of inadequate scientific talent on the program. The report contends that objectives of the program have not been met. The Air Force is taking vigorous actions to counter the report, urging its revision and also preparing a rebuttal, but I am very much afraid that when and if this report is made public, it will provide ammunition to those who choose to attack your Administration irresponsibly.

G.B. Kistiakowsky

232. National Intelligence Estimate¹

NIE 100–60

Washington, January 19, 1960

ESTIMATE OF THE WORLD SITUATION²

FOREWORD

Although we have tried in this estimate to take as long a view as possible, we have necessarily left out of account some elements that could drastically alter the course of events. Thus, we have not attempted to assess the likelihood or consequences of revolutionary scientific advances of either military or civilian application. Moreover, we have assessed the East-West struggle on the assumption that no major war takes place, and on the other hand, that there is no agreement for large-scale reduction of military capabilities by the major powers.

¹ Source: "Estimate of the World Situation." Secret; Noform. 20 pp. DOS, INR–NIE Files.

² While this estimate summarizes our views on the USSR, a fuller treatment of Soviet trends and developments will be contained in NIE 11–4–59, "MAIN TRENDS IN SOVIET CAPABILITIES AND POLICIES, 1959–1964." Soviet strategic capabilities, including ICBM buildup, will be covered in NIE 11–8–59, "SOVIET CAPABILITIES FOR STRATEGIC ATTACK THROUGH MID-1964." Both these estimates will be published in the near future. [Footnote is in the original.]

SUMMARY OF THE ESTIMATE

1. Over the next decade, we believe that the stature of the USSR and of Communist China in the world will continue to increase markedly, thus posing increasingly serious challenges and a growing menace to the US and the West.³ (*Para. 18*)

2. In the world in general, recent Soviet behavior contributed to a spreading popular impression that the East-West struggle, or cold war, was entering a period of greater movement and fluidity, and that the direction of this movement was toward a diminution of cold war tensions. Viewed objectively and realistically, however, the East-West relationship remains fundamentally hostile. The emerging Soviet ICBM capability, dramatized in the eyes of the world by the Lunik shots, is altering military power relationships. Confidence that the trend of events is in their favor remains a keynote of the behavior of the Soviet leaders, and they assert that the overall growth of their relative power position has now reached the point where major consequences will be manifest on the world scene within the foreseeable future. (*Paras. 13-14*)

3. Our views of Soviet power and policy are fully stated in our forthcoming estimate on this subject. In brief, we believe that:

a. Soviet economic and scientific strength will continue to grow at a rapid rate.

b. The Soviets, despite some force reductions, will maintain a high level of conventional military forces and will greatly increase their long range attack capabilities, above all through a substantial ICBM buildup.

c. In the Soviet view, the emerging standoff of intercontinental striking forces marks a stalemate only of general war capabilities. They consider that this situation of mutual deterrence would open up new opportunities for advancing Communist power by political, economic, and perhaps even limited military means. We believe, however, that even then they would not wittingly assume serious risks of general war. We believe that they would draw back if the Western response were of such vigor that in their view more extensive Soviet involvement would entail either serious risk of general war or net political loss. At the same time, we believe that the chance of their miscalculating risks may increase if they remain convinced that their relative power is growing.

d. Soviet foreign policy will remain devoted to the same objectives as heretofore. At least over a five-year period, elements of both a policy of pressure and one of reducing tensions will probably be adopted at

³ The Director of Intelligence and Research, Department of State, believes that the importance of the ICBM requires that the third sentence of paragraph 2 be inserted in this initial paragraph to read: "In particular, the emerging Soviet ICBM capability, dramatized in the eyes of the world by the Lunik shots, is altering military power relationships." [Footnote is in the original.]

one time or another. The immediate outlook is that the Soviets will continue their present tactics of detente at least through the initial phase of the series of high-level negotiations now in view. In another year or two they may feel that their capabilities in long range missiles have brought them into a period when the relations of military power are the most favorable from their point of view. They will still try to win Western concessions basically through negotiation. But the element of pressure and threat will probably become more pronounced, perhaps much more so, than it is at present. (*Para. 19*)

4. Although the assets of the USSR are formidable, and for the foreseeable future will cause it to gravely threaten US security and that of the Free World generally, some of these assets also contain problems. Chief among these are the Satellite situation, Soviet relations with the underdeveloped areas, and Sino-Soviet relations. In the course of time, it is possible that these problems, coupled with long term evolution within the USSR itself, would limit the effectiveness and even alter the content of Soviet foreign policy. At present, however, we see no basis for estimating that such problems would either diminish Soviet internal power or change the basic objectives of the Soviet leadership. (*Paras. 22–29*)

5. On the Communist Chinese front, tensions have increased in the past year. The Chinese Communists will probably seek to achieve their objectives by political and subversive means with a broad range of tactics, but there are likely to be frequent manifestations of truculence and more, rather than less, of the range of pressures recently exemplified in the Indian border dispute, in Laos, and in Indonesia. (*Paras. 15, 32*)

6. Non-Communist Asia has become somewhat alarmed over Chinese Communist intentions. However, there exists no non-Communist power or grouping of local powers comparable in strength to Communist China. Several individual countries remain particularly vulnerable to Communist influence, and over the next five years there is a fair chance that a Communist regime will come to power in one or another of the countries in the area. US action, however, could in most cases reduce the chance of such a development and in any event could probably prevent any chain reaction if an individual country did go Communist. It is hard to see the situation in the area as a whole improving markedly over this period, and a bellicose Chinese Communist policy could produce widespread turmoil and even major hostilities. (*Paras. 31–40*)

7. Western Europe's economic growth and internal political stability are likely to continue satisfactory, although France's political future is somewhat uncertain. The movement towards economic integration continues to have great momentum, despite current difficulties. NATO confronts serious problems, notably France's pressure for increased status, French development of an independent nuclear capability, and

sentiment among the continental countries for some form of European continental military grouping, possibly related to NATO. Over the next few years, we believe that basic military dependence on the US will keep the alliance together. Nevertheless, its effectiveness will probably be somewhat reduced, and this reduction could attain serious proportions if European confidence in the will and ability of the US to protect Europe from the Communist threat should decline markedly. In any event, unless there is a renewed sense of urgency, Western Europe's increased strength will probably not be applied as fully and cohesively as it might be to the key problems now confronting the West, of maintaining an effective military posture and of providing large-scale aid to the underdeveloped countries. (*Paras. 41, 44–45, 49, 54, 59*)

8. In countries of the underdeveloped world, the complex force of nationalism and growing desires for a better life will be powerful factors shaping the course of events. These countries will continue to expect help from the richer countries, and they will be inclined to accept such help regardless of whether it comes from the East or the West. Inasmuch as these countries generally lack the experienced leadership, the stable political and social institutions, and the material resources to cope with their many problems in orderly ways, there will remain the possibility of violent upheavals and local conflicts. While these outbreaks may not stem from the East-West struggle, they can be expected often to involve the interests of the two sides and to afford opportunities for exploitation. Thus, the underdeveloped world will continue to be a principal area of the contest between the Bloc and the West. (*Para. 80*)

9. The outlook in the various underdeveloped areas (apart from non-Communist Asia, covered in Conclusion 6 above) is mixed. The Middle East will remain very unstable. In South Asia, the future of Afghanistan, in particular, is uncertain. While trade and other economic relations with the Bloc will increase in Africa, and there will be many opportunities for the spread of Communist influence, we do not believe that local Communist-controlled groups will become strongly entrenched in power in any country at least over the next few years, given a reasonable degree of effective attention from the West.⁴ (*Paras. 73–76*)

10. In Latin America as a whole, we do look for some expansion in Communist influence over the next few years, although such an expansion will probably not be widespread, especially in view of the possibilities for US action. However, there is a possibility that one or another country, notably Cuba, could fall under Communist control. Moreover,

⁴The Director of Intelligence and Research, Department of State, the Assistant Chief of Naval Operations for Intelligence, Department of the Navy, and the Director for Intelligence, The Joint Staff, believe that the prospects for Communist groups should be limited further by substituting after "Communist-controlled groups" in the last sentence the words: "will become a major political force in any country. . . ." [Footnote is in the original.]

the Communists or other extremists may achieve such influence that they can put through programs seriously threatening US interests or even security. In any event, the US will be under increasing pressure, and Latin American support for the US, for example in the UN, will almost certainly continue to decline. (*Para.* 79)

11. US policy remains crucial both in itself and for its effect on the rest of the Free World. Indications that the US was not maintaining a firm and effective military and political posture would lead to weakening of the resolve of other free nations. The growth of Soviet ICBM capabilities is creating a serious problem for the US in maintaining among other Free World nations confidence in US willingness to bring its nuclear capabilities to bear as a protection for such nations. A second crucial area affecting US prestige and influence will be that of US economic policy. However much the capacity of other Western nations grows, the Free World will still look to the US for leadership in the problem of channeling Western aid to the “have-not” nations and in the freeing and encouraging of international trade, and will be intensely concerned with the economic policies, both domestic and foreign, adopted by the US. (*Paras.* 82, 84, 86)

DISCUSSION

I. INTRODUCTION

12. The year 1959 saw many events so dramatic and significant as to appear as landmarks in the course of contemporary history. The Lunik shots dramatized the emerging Soviet attainment of an operational ICBM capability and reinforced apprehension in the Free World that the USSR was out-stripping the US. Khrushchev’s visit to the US highlighted a series of top level contacts and negotiations involving the US and the USSR.⁵ Also during the year, publicly aired differences between the USSR and Communist China marred the appearance of unanimity in the Sino-Soviet Bloc. On the Western side, France asserted itself, and the economic resurgence of Western Europe and Japan was manifested most conspicuously by the continuance of a major deficit in the balance of payments of the US. In the underdeveloped areas, events in Cuba, Laos, and Iraq during this year highlighted the continuing East-West conflict for influence, and the danger that some Free World territory may fall under Communist control.

⁵ The Director of Intelligence and Research, Department of State, would further bring out the significance of the second and third sentences by adding at this point: “The Lunik shots emphasized the continuing Soviet armament effort and the basic aggressiveness of Soviet policy, while Khrushchev’s visit indicated that for the short term, at least, the USSR would carry on the present tactics of detente; as between the two approaches, it may be expected that before long the element of pressure and threat will become more pronounced, perhaps much more so than it is at present.” [Footnote is in the original.]

13. In the world in general, recent Soviet behavior contributed to a spreading popular impression that the East-West struggle, or cold war, was entering a phase of greater movement and fluidity, and that the direction of this movement was towards a diminution of cold war tensions. Moreover, the USSR has gained new outward respectability as shown in the rapid growth of Soviet international contacts and the acceptance and furthering of such contacts by the US and other major Western nations. The rivalry between the US and USSR is increasingly regarded in many quarters as a long drawn-out competition between two super-powers rather than as a currently acute conflict likely to produce a large-scale military clash.

14. Viewed objectively and realistically, however, the East-West relationship remains fundamentally hostile. The Soviet ICBM capability is altering military power relationships and in Soviet eyes operates to enlarge Soviet freedom of action and to widen Soviet influence. The economic growth and scientific progress of the USSR greatly enhance the prestige of communism as a system of social and economic organization. Confidence that the trend of events is in their favor remains a keynote of the behavior of the Soviet leaders, and they assert that the growth of their relative power position has now reached the point where major consequences will be manifest on the world scene within the foreseeable future. Even in the present phase of Soviet conduct, politeness is matched by assertiveness and the appearance of conciliation by an unyielding position on most key issues.

15. On the Communist Chinese front moreover, there is not only no relaxation in the atmosphere of the cold war, but on the contrary an increase of tension. Peiping's thrusting policy and expanding economic and military power, against the background of a troubled internal situation have already excited apprehension throughout Asia and may create recurrent acute pressures and dangers over the next few years.

16. In the world at large competition between the West and the Sino-Soviet Bloc is taking place on a wider stage than in the past, with the secondary actors playing greater parts. The increased economic strength of Japan and of the major nations of Western Europe has altered their relationship to the US and freed them for a greater degree of independent action. In the underdeveloped areas, the Bloc is increasingly involved in Latin America, and both the US and the Bloc are increasing their interest in Africa. The smaller nations in all Free World areas are developing roles of their own. These nations find in the UN in particular a sounding board for their grievances and a forum in which they can band together and assert against the great powers a weight disproportionate to their individual or even collective power status.

17. Finally, there is throughout the underdeveloped world increasing awareness of the enormous problems of creating national stability

and improved conditions of life, and of the impact of basic underlying trends—technological advance, changes in the international trade pattern, and population growth. These problems and trends would of course exist and be a central feature of the world situation if there were no East-West struggle. So far as that struggle is concerned, the underdeveloped countries remain generally uncommitted to one side or the other, and are being more and more influenced by their need for aid and their desire to get as much help as possible whether from the West or the Bloc. However these countries may stand ideologically, such pragmatic neutralism seems certain to find new adherents in Africa and Latin America and to remain firmly entrenched in most of Asia and the Middle East, with the possible exception of countries directly threatened by the USSR or Communist China.

18. In the sections that follow, we are generally far more confident of the description of forces at work than we are of our judgments of outcomes, and we have not elaborated all the repercussions of possible developments mentioned. We do believe, however, that the trends presented in this estimate point with assurance to one overall conclusion, that the stature of the USSR and of Communist China in the world will continue to increase markedly over the next decade, thus posing increasingly serious challenges and a growing menace to the US and the West.

II. POWER TRENDS AND POLICY PROBLEMS OF THE USSR

19. We estimate that:⁶

a. Soviet economic and scientific strength will continue to grow at a rapid rate.

b. The Soviets, despite some force reductions, will maintain a high level of conventional military forces and will greatly increase their long range attack capabilities, above all through a substantial ICBM buildup. However, the Soviet leaders probably do not count upon acquiring, by any particular date, a military advantage so decisive as to permit them to plan attacks on Western retaliatory forces with the degree and certainty of success required to insure that they could win a general war without themselves incurring unacceptable damage.⁷

⁶ This paragraph is based on the longer discussion of these matters in the forthcoming NIE 11-4-59, "MAIN TRENDS IN SOVIET CAPABILITIES AND POLICIES." [Footnote is in the original.]

⁷ The Assistant Chief of Staff, Intelligence, USAF, would revise sentence two as follows: "While the Soviet leaders probably do not count upon acquiring *it* by any particular date, *they are vigorously attempting to acquire* a military advantage so decisive as to permit them to plan attacks on Western retaliatory forces with the degree and certainty of success required to insure that they could win a general war without themselves incurring unacceptable damage." [Footnote is in the original.]

c. In the Soviet view, the emerging standoff of intercontinental striking forces marks a stalemate only of general war capabilities. They consider that this situation of mutual deterrence would open up new opportunities for advancing Communist power by political, economic, and perhaps even limited military means. We believe, however, that even then they would not wittingly assume serious risks of general war. We believe that they would draw back if the Western response were of such vigor that in their view more extensive Soviet involvement would entail either serious risk of general war or net political loss. At the same time, we believe that the chance of their miscalculating risks may increase if they remain convinced that their relative power is growing.

d. Soviet foreign policy will remain devoted to the same objectives as heretofore. At least over a five-year period, elements of both a policy of pressure and one of reducing tensions will probably be adopted at one time or another. The immediate outlook is that the Soviets will continue their present tactics of detente at least through the initial phase of the series of high-level negotiations now in view. In another year or two they may feel that their capabilities in long range missiles have brought them into a period when the relations of military power are the most favorable from their point of view. They will still try to win Western concessions basically through negotiation. But the element of pressure and threat will probably become more pronounced, perhaps much more so, than it is at present.

e. On Berlin, we believe that, as long as the Soviets are confident that they can make progress towards their aims in Germany by negotiation and propaganda, they will probably abstain from any major interference with Western access and from making a separate peace treaty with East Germany. If they decide that further progress is impossible by comparatively mild methods, they will probably make the separate peace treaty, though they would not necessarily try at the same time to obstruct Western access to Berlin. On disarmament, the Soviets may actually wish to see a freeze or even a cutback in some armaments in order to improve their potentialities for long-run political and economic competition. However, the Soviets consider great military strength as an essential ingredient in the challenge they pose to the non-Communist world. Moreover, the Soviet aversion to extensive foreign controls and inspection in the USSR persists, and will almost certainly exclude anything more than limited agreements.

20. In the pursuit of their objectives the Soviets clearly consider that their military progress is a major direct factor in their growing power position. Moreover, Soviet achievements in the missile and space fields have already gone far to create an image of Soviet superiority in the eyes of much of the world. During the next decade Soviet space efforts

will be considerable, favoring those space systems having the greatest military potential, but designed also to yield the maximum in scientific gains and in propaganda value.

21. Coupled with this power aspect, Soviet economic growth causes communism to appear to much of the underdeveloped world as a successful model for the handling of massive economic problems. Moreover, the Soviets have had considerable success in identifying themselves, through propaganda and diplomatic proposals, with worldwide desires for a lessening of tensions, most notably on the issue of nuclear testing, and to a lesser degree on the disarmament question generally.

22. With such assets, the USSR will for the foreseeable future continue to gravely threaten US security and that of the Free World generally. Yet as the Soviets seek to expand their influence in the world they confront both external and internal problems, which we believe will arise chiefly with respect to the Satellite situation, Soviet relations with the underdeveloped areas, long-term evolution within the USSR itself, and Sino-Soviet relations. While, at present, we see no basis for estimating that such problems would diminish Soviet internal power or change the basic objectives of the Soviet leadership, they could in the course of time limit the effectiveness or even alter the content of Soviet foreign policy.

23. *The Satellite Situation.* The present tendency in Eastern Europe generally is toward a stabilization and consolidation of Communist rule, with Soviet authority in political and ideological questions more firm than at any time since 1956. An increase in the degree of international acceptance of the East German Regime, or any apparent weakening in the position of West Berlin, could further strengthen the Soviet position in the Satellites. In the long run, however, the Satellites will remain one of the critical problems with which the Soviets will have to cope, given the likely continuation of deep-seated antipathy to Soviet domination. During a period of rising popular expectations and greater contacts with the outside world, the Soviets must endeavor to maintain political structures that can, on the one hand, ensure the required degree of Soviet control and, on the other, be operated without excessive friction, and appear to the world as an attractive image of communism in practice.

24. *Soviet Relations with the Underdeveloped Areas.* The total Soviet presence and the Soviet trade and aid programs in these areas will undoubtedly increase in coming years and will offer opportunities for expanding Soviet influence as well as for assisting local Communist elements. Furthermore, the desire of many of the newly created nations for development of military forces offers fertile ground for a form of Communist influence which could lead to serious consequences. On

the other hand, the experience of the last two years suggests that in some areas the honeymoon period that began in 1954 is drawing to a close and that the USSR will encounter problems as its contacts with the underdeveloped world expand. Developments in Burma, for example, have shown that an initial favorable impact may be vitiated by subsequent frictions, while the effect of Communist policy toward Iraq on Soviet-UAR relations has shown the difficulty of supporting regional rivals. Another sign is the disillusionment of some non-Communist students and trainees visiting Russia, both with ideological communism and with the physical and personal aspects of Soviet life.

25. More broadly, the extension of Soviet Bloc trade and aid programs throughout the world increasingly builds up the impression that the USSR can help any nation it wishes—an impression fortified by the Soviets' own boasting of their economic progress. In effect, the USSR now appears to be a "have" nation, and underdeveloped countries will come more and more to consider that the Soviet Union has an obligation to help them. Hence, Soviet efforts to continue their aid program on a highly selective basis will increasingly encounter the political penalties of aid denied or cut down in the face of hopes built up.

26. *Long-term Evolution within the USSR.* Over the next five years we see no prospect of a change in the Soviet domestic scene so fundamental as to diminish the motivation, will, or capacity of the regime to project its rapidly growing power externally. But popular hopes for a better life are on the rise in the USSR. Some groups seek a greater degree of personal freedom from restrictions and there is a far more universal desire to enjoy more of the economic fruits of Soviet growth. Khrushchev so far has tended to take these sentiments into account and has thus somewhat strengthened the regime. However, looking beyond the next five years, conflicts are likely to arise between the desires of an increasingly significant popular opinion and the ideological impetus and allocation of resources required under a thrusting foreign policy. We do not predict that these conflicts will alter basic Soviet objectives, but their long-run influence could be in the direction of reducing the outward pressure of Soviet policy, particularly if that policy should appear unprofitable.

27. *Sino-Soviet Relations.* Insofar as we can now foresee, the USSR and Communist China will continue to be firmly allied against the West. However, frictions have already arisen over extremist tendencies in Chinese internal policy, over Chinese ideological pretensions, over foreign policy tactics, and probably over whether the USSR should supply nuclear weapons to China. These or other frictions may be magnified in the future. As Communist China progresses and Soviet levers of authority become less effective, Peiping will tend to exercise more

independent judgment on doctrinal and tactical issues, both in domestic and external affairs.

28. Thus, each party to the alliance may come to act more in terms of its view of its own national need and interest. In most cases, the respective views are likely to remain parallel, and on many occasions a forceful Communist Chinese policy may be favorable to Soviet aims. However, if there should be increasing differences over international tactics and policy, as over the Sino-Indian border issue, the Soviets could be considerably embarrassed and their policy impeded.

29. The possibility of tactical or doctrinal differences does not mean that an open Sino-Soviet rupture is in sight. The long range question is not so much one of outright rupture as of growing independence which could produce discord tending to reduce the effectiveness of the alliance in furthering the objectives of both the USSR and Communist China. There will probably be some evidences of such independence over the next five years, although at least for this period both parties will regard the maintenance of the alliance as vital.

III. *THE COMMUNIST CHINESE THREAT TO ASIA*

30. Under the stress of greatly accelerated domestic efforts, including the recently reaffirmed commune program, Communist China clearly faces rough years indeed.⁸ Economic strains and the bitterness generated by vast social changes cannot help but produce an internal climate of great tension, although the regime can probably maintain basic order and prevent major disruptions by a combination of forceful measures and tactical adjustments. Economically, although rapid population growth will absorb much of the increase in agricultural production industrial, growth from the present generally low level will probably continue at rates higher than those of the USSR or any major Western power, or India.

31. Communist China's military capabilities, relative to the rest of Asia, will continue to grow. Over the next five years, Communist China will be producing an increasing portion of its need for conventional military equipment, but will still be heavily dependent on the USSR. Within this same period the USSR may provide limited missile and nuclear weapons support to Communist China, retaining custody of the nuclear components. We have no information indicating that the Chinese Communists have a plutonium production facility presently in operation or under construction, although they are developing

⁸ As to developments in Communist China over the next five years, this section relies principally on NIE 13–59, "COMMUNIST CHINA," dated 28 July 1959. Since the date of that estimate, however, events have pointed even more strongly in the direction of internal stress and external toughness. [Footnote is in the original.]

a raw materials capability and have had considerable basic technical assistance and training from the Soviets. However, assuming that the Chinese Communists have a modest but high priority plutonium production effort underway, they could be in a position as early as 1964 to test a crude nuclear device chiefly of their own development. Even the initial testing of a nuclear device by Communist China would have an important psychological impact, particularly in Asia.

32. The Chinese Communists will probably seek to achieve their objectives by political and subversive means, while not precluding the use of force to exploit targets of opportunity or to respond to situations which they might interpret as a threat to their position in Asia. They will continue to employ a broad range of tactics. Along with occasional manifestations of "Bandung reasonableness," however, the foreign policy of a restive, increasingly powerful, and ideologically extreme Communist China is virtually certain, as recent events have foreshadowed, to include frequent manifestations of truculence and of impatience to emerge as an acknowledged world power. The Offshore Islands situation will not lie quiescent indefinitely, and we shall probably see more, rather than less, of the range of pressures now exemplified on the Indian border, in Laos, and in Indonesia.

33. Over the next several years a number of additional nations, particularly those newly constituted, will probably recognize Communist China. Moreover, if disarmament negotiations are continued or limited agreements are reached, there will be a strong desire among other nations to include Communist China under such agreements. In light of these factors Communist China's admission to the UN will be extremely difficult to prevent.

34. *Non-Communist Asia.* The ruthlessness and aggressiveness of recent Communist Chinese domestic and foreign policies, such as the commune program, Tibet, and the Sino Indian border crisis, have substantially increased apprehensions throughout Asia of Communist Chinese strength and intentions. This increased alarm has produced some strengthening of border security measures and some decrease in regional frictions, and has led some neutralist countries to be more sympathetic to the US.

35. Several individual countries—most notably Laos, Cambodia, Indonesia, and Singapore—remain unstable and particularly vulnerable to Communist influence. Elsewhere the outlook is more hopeful. The succession problems of South Vietnam and Nationalist China can probably be met, although that of the ROK is more doubtful. In Thailand, Burma, and the Philippines, there are indigenous forces that will tend to maintain fair stability.

36. Of the non-Communist countries in the area, Japan alone combines large and growing economic power with a good prospect of

continuing political stability. Having brought its population growth under substantial control, Japan can prosper if it can retain access to US and other Free World markets, and will be in a position to take an increasing role as entrepreneur to the rest of non-Communist Asia. Moreover, given such prosperity, Japan will probably be able to keep local leftists under control. Thus Japan will probably offer to the rest of Asia an example of economic growth and political stability achieved through means other than communism, and will probably continue to identify its interests in international political affairs with those of the West. On the other hand, there is strong domestic pressure in Japan for increased trade and official relations with Communist China; while some expansion in these relations is likely over the next few years, trade levels will probably be limited so long as Japan's Western ties remain strong, and Japan is not likely to take steps that would seriously impair its relations with the US. Japan will probably evidence an increased independence of action in foreign policy. In any event we do not foresee that Japan will develop major military capabilities of its own nor that it would associate itself with any regional military alliance.

37. India, the other potential major power of non-Communist Asia, is now subjected to Chinese Communist pressures such that, even if the present issues were to be resolved, there would be a lasting residue of anti-Chinese and to a lesser extent anti-Communist feeling. India's relations with Pakistan will probably continue to improve, and India will seek to strengthen its northern border defenses and ties. It might also step up efforts to expand its influence in Southeast Asia so as to support non-Communist regimes far more than to date. Although India is not likely to alter its basic neutralist policy or to enter regional alliances, it may look more benevolently on Western policies.

38. Internally India faces many political difficulties, and its economic progress will be slower than that of Communist China. However, if India achieves steady economic growth, it could provide an example in Asia of an underdeveloped country adhering to humane policies and to evolutionary rather than revolutionary change in social values. Such growth could only be attained by an effective and sustained effort within India, and would depend heavily also upon foreign aid.

39. *Prospects for the Growth or Containment of Communist Influence.* In general the non-Communist nations of Asia are subject to the same attraction toward pragmatic neutralism as other underdeveloped areas. Communist Chinese pressure could operate to increase neutralist sentiment, but in some circumstances it might have the opposite effect of strengthening orientation toward the West and increasing sympathy with the US.

40. In light of the number of precarious situations cited above, there is a fair chance that a Communist regime will come to power in

one or another of the countries in the area within the next five years. US action, however, could in most cases reduce this chance and in any event could probably prevent any chain reaction if an individual country did go Communist. It is hard to see the situation in the area as a whole improving markedly over this period, and a bellicose Chinese Communist policy could produce widespread turmoil and even major hostilities.

IV. THE ROLE OF WESTERN EUROPE

41. Western Europe as a whole is likely to prosper over the next few years, and the economies of most countries, especially the major continental states, are likely to grow at rates only slightly below those of the last five years. Economic efficiency is generally increasing rapidly, and the basic terms of trade with underdeveloped areas are likely to continue favorable to Europe for some time to come. Even the availability of oil is far less uncertain than it was a few years back.

42. The movement toward economic integration will continue to have great momentum. However, the current differences between the Common Market (Six) and the European Free Trade Association (Seven) will be difficult to resolve. If, as seems likely, the Six move ahead rapidly—with increasing political consultation among themselves—then the UK and the rest of the Seven will feel increasing compulsion to reach some sort of accommodation embracing the 13 and perhaps others. However, British viewpoints in particular must undergo marked changes before any type of association becomes possible. Moreover, the strong, though declining, protectionist attitudes of the French and their aspirations to lead the continent will have to be modified. Association could also be prevented by serious French domestic difficulties. A continued split between the groups, with rigid economic divisions forming between them, would have serious consequences for the political cohesiveness of the West.

43. *International Economic Policy and Economic Aid.* The prospect of continued sound economic growth carries with it a substantial Western European capacity to reduce trade barriers and to assist in aid to the underdeveloped areas. A great part of the capacity to render assistance will continue to be exerted, particularly by France, in colonial or recently colonial areas, so long as some form of political tie remains. For more general aid and private investment efforts, West Germany has by far the greatest potential, while the UK effort probably can rise only modestly.

44. NATO. NATO faces a serious problem in maintaining firmness and cohesion. One factor creating this problem is a difference of view on policy toward the USSR. Substantial official and public opinion, particularly in the UK, tends to see little likelihood of Soviet military action

in Europe, and the regard the present prospects of reducing tensions through negotiations as favorable. On the other hand, the Governments of France and West Germany stress the continuing seriousness of the Soviet threat to Europe, and are generally opposed to concessions as a price for reduced tensions. The problem is compounded by anti-German sentiment in the UK.⁹

45. The second potentially divisive factor is the desire on the continent, notably in France, for a greater role and voice in decisions. De Gaulle seeks increased status for France and national control of French forces within NATO. Furthermore, there is some support in France, and to a lesser degree among other continental WEU countries, for the creation in the next few years of some form of European continental military grouping, possibly related to NATO.

46. Basic underlying factors are the impact of Soviet military progress and, in some quarters, growing doubts about the adequacy of the US military posture and the future course of US policy. The Soviet ICBM buildup is in itself almost certain to increase doubt as to whether in fact the US would exert its full weight against Soviet pressures in Europe. The level of trust in US support of NATO is not yet seriously reduced. However, West Germany and Turkey in particular, and to a lesser degree other European NATO members are highly sensitive to any apparent US lack of firmness in East-West negotiations or to any suggestion of a substantial reduction in US forces committed to NATO, as possible indications of gradual US withdrawal.

47. The prosperity of the major NATO countries makes them capable of bearing a larger share of the military load. However, the trend of popular feeling is generally against any increase in defense budgets. Arguments over the soundness of NATO military strategy add to the popular reluctance to support defense spending.

48. In this complex situation, current Soviet emphasis on reducing tensions creates a special problem. To the extent that an impression of detente persists, it will be difficult to prevent cuts in defense budgets, to avoid further serious strains within NATO, and to preserve present NATO force goals or to devise a new strategy commanding broad assent and support. If the pressure motif again becomes dominant in Soviet policy, this would probably tend to strengthen NATO ties and stimulate defense efforts.

49. The course of events in key individual countries could, of course, greatly affect the outcome. In France an Algerian solution is

⁹ The Director of Intelligence and Research, Department of State, considers that the last sentence of this paragraph should be eliminated: he believes that anti-German sentiment in the UK is not a significant factor in the differences of view on policy toward the USSR. [Footnote is in the original.]

difficult to foresee except through de Gaulle. His early overthrow or death would probably be followed shortly by a rightist authoritarian regime based on military support. Such a French Government would be likely to pursue policies in Algeria that could seriously injure the West's position in underdeveloped areas. Moreover, the policies of such a regime in this and other respects could well produce critical divisions within France, impede European economic integration, and induce severe strains within NATO and in Franco-US relations. The realities of France's political, economic and military situation would, however, tend to restrain extremist tendencies.

50. If, on the other hand, de Gaulle continues in power and brings off some workable Algerian solution, France would be much strengthened and stabilized. De Gaulle would be likely to press the harder his present efforts to enlarge French influence and, if unsuccessful, would probably act with increasing independence.

51. There are also uncertainties in the prospects for West Germany. Recent events have highlighted the importance of Adenauer's role and the problem of his succession. It appears likely that the CDU will win the 1961 election, and be able to maintain internal stability and economic growth. Adenauer's successors will almost certainly continue the main lines of his foreign policies, although there might be some decline in their devotion to European integration and to close Franco-German rapport.

52. However, West Germany will in any event remain highly sensitive to US policy. Moreover, West Germany's stature within Europe is steadily increasing; militarily, its forces will within a year or so be by far the largest European contribution to the NATO shield in Germany, and its capacity for military production is growing rapidly. If West Germany should come seriously to doubt that the US can and will defend Europe and uphold basic West German national interests, it would be increasingly attracted to schemes for some form of continental military grouping and might hope to become the eventual leader in such a grouping.

53. In any case, some increase in West Germany's assertiveness and independence in foreign policy is probable over the next few years. A West German attempt to resolve the German reunification problem by force is highly unlikely, and only in the event of a serious weakening of the Western alliance might the Federal Republic be likely to seek an accommodation with the USSR. However, if West German policy and opinion were to take on an increasingly nationalistic tone, this might lead to growing distrust both among NATO countries and in the Soviet Bloc, particularly when West German forces have access to nuclear weapons. Thus, NATO relationships could be disturbed, and tensions with the East increased.

54. *Outlook.* Over the next few years, despite these uncertainties, we believe that basic military dependence on the US will hold the NATO

alliance together. Nevertheless its effectiveness will probably be somewhat reduced, and this reduction could attain serious proportions if European confidence in the will and ability of the US to protect Europe from the Communist threat should decline markedly.

55. De Gaulle will probably continue to seek to minimize the degree of integration of NATO forces and to develop France's own nuclear capabilities. However, the achievement of a substantial independent nuclear capability would present enormous economic and technological difficulties for France and would in any event require a period of not less than five years and probably considerably more.

56. In part for this reason, France may at some point solicit the collaboration of West Germany and perhaps of other European NATO countries, in the development of advanced delivery systems and perhaps in the production of nuclear weapons. Adenauer would almost certainly not enter into extensive collaboration under present circumstances. He and his successors would probably adhere to the same position in the future, so long as they were assured of US aid and support and provided also that West German forces could obtain nuclear weapons from the US on acceptable terms. In the latter connection, West Germany and other NATO members are likely in the near future to press for changes in stockpiling arrangements that would provide NATO, WEU, or national participation in control.

57. Apart from the case of France, the independent development of nuclear weapons by West European countries will be inhibited by world opposition to nuclear testing, demonstrated strikingly in the recent UN vote on the French tests, and likely to become increasingly strong whether or not the major powers reach an agreement on the subject. In the face of this opposition, and the costs involved, we now believe that it is an open question whether such countries as Sweden and Switzerland will develop their own weapons. West Germany is unlikely to do so unless denied weapons on acceptable terms by the US, the UK, and France.

58. Over a period of 5–10 years, the emergence of a continental bloc that controlled a substantial nuclear capability and sizable conventional forces, is a possibility. However, any such European turn away from primary dependence on the US would be likely only if European confidence in the US had markedly declined. Moreover, such a union based primarily on West German and French military potential could attain major proportions only under optimum conditions, including at a minimum continued rapid economic progress and internal political stability among the participants.

59. The progress of Western Europe in the past decade, including the stability of West Germany and gradual consolidation of its ties with the West, remains a major gain in the overall Western power position. However, this new strength will probably not be applied as fully and

cohesively as it might be to the key problems now confronting the West, unless there is some return to the sense of urgency that existed when the alliance was formed. Improvements in the present structure of organizations and relationships could be of assistance. In general, however, the Western European public has settled down into a pattern of prosperity in which it will be difficult to arouse great support either for increased defense measures or for large-scale aid to underdeveloped countries.

V. STABILITY IN THE UNDERDEVELOPED AREAS

A. General Problems

Nationalism and Attitudes Toward The Major Powers

60. Generally speaking, the force of nationalist feeling will remain undiminished in the underdeveloped areas. The nations that came into being soon after World War II, now entering their second decade of existence, are becoming somewhat less strident. On the other hand, the newer nations, and those due to emerge in Africa in the future, will have continuing spasms of extreme nationalism, especially where the break with the colonial power is accompanied by bitterness.

61. It is worth noting that the next decade will see not only the throwing off of almost all remaining colonial ties, but probably some additional adjustments of national units. Many new states have been built on uncertain foundations of national identity (e.g., Indonesia, Pakistan, the individual Arab countries). In Africa, where the bulk of the new nations of the 1960's will be, political boundaries bear little relation to tribal or other natural divisions. Moreover, cultural ties, political objectives, and in many cases economic factors often point to wider regional groupings, such as the UAR, Black African federations, and a possible Maghreb grouping in North Africa. The result could be a number of changes in political boundaries, involving partition, some type of federation or both. Such changes would not, however, necessarily reduce the effect of nationalist feeling: at least in the Arab World they could intensify it.

62. The onetime colonial powers are, of course, now largely "ex," save in Africa. Elsewhere in the underdeveloped areas anticolonialism, in its narrow sense of resentment at present or past political domination, is declining and will decline further. The same feelings, however, can be and are applied equally strongly against real or apparent domination in the economic sphere, as illustrated in Latin America. Old-style anticolonialism is being replaced by "have-not vs. have" feelings no less serious and potentially harmful, compounded by regional and color consciousness. For all of these antagonisms, the US is a prime target; if there is any comfort it is that the USSR is becoming more and more tarred with the same brush.

Economic Growth and Aspirations

63. The extent and force of “have-not” feelings are almost certain to be strengthened by the economic course of the underdeveloped areas in the next few years. Even for those nations (e.g., Argentina, Brazil, and Mexico) where something like an economic “take-off” is occurring, the gap between their standards of living and those of the advanced West and the USSR will remain wide. Rapid population growth will greatly contribute to this result, and in other countries that might otherwise appear to be approaching the point of “take-off”—most importantly India—it will probably siphon off a high proportion of potential investment resources into meeting consumption needs. Thus industrial progress could be slowed down and have little effect on popular welfare. With death rates likely to decline more rapidly than birth rates over the next decade, the population problem and its economic impact are likely to become more serious except in a few sparsely settled areas.

64. Moreover, the tremendous dependence of the underdeveloped areas on raw material markets in the West will continue essentially unchanged, and will be an increasingly sore point to local leaders. The best current forecast is that the terms of trade for exporters of agricultural products, and to a lesser extent of industrial raw materials, are likely to remain unfavorable over the next decade in the face of technological substitution and other factors. If so, this will increase pressures on the economic and foreign trade policies of the US and the West, and create both opportunities and pitfalls for the USSR and the Bloc.

65. As to their own hopes for growth, some of the extravagant early expectations of underdeveloped nations with regard to industrialization have by now been dampened by harsh experience and growing realization of the depth and complexity of their problems, and of the need for major social changes before these problems can be effectively tackled. But if the governments of “have-not” nations expect less in the way of visible progress, it does not follow that they will be any less vigorous in their demands upon the “have” nations for capital investment and support. Nor will the pressure on the US and the West be eased much by the fact that the USSR will also be subject to such pressures. The game of balancing economic demands on East and West is one that almost all can play, and most of them will.

Political Stability

66. The problems of developing leadership and effective political systems remain acute throughout the underdeveloped areas. The new nations of Africa appear to be adopting thinly veiled forms of dictatorial control from the outset; in the absence of any military or other trained class, an adequate supply of future leadership is hard to foresee. The longer established nations of Latin America have generally

thrown off military dictatorship in favor of regimes based on middle class support or, in a few cases such as Cuba, on "the street." Between these two, a number of nations in the Far East, South Asia, and Middle East continue to depend heavily on military leadership and influence.

67. Basically, the test of political organization in the eyes of the newer nations is more and more the pragmatic one of whether it appears able to meet their problems of modernization, economic growth, and attaining national power. While democracy as a political theory has wide appeal in terms of its satisfaction of individual aspirations, its appeal is also wrapped up with the image of power and material progress provided by the major Western democracies. On the other side the appeal of communism rests increasingly, at least among leadership groups, on the appearance it presents of a form of organization able to produce rapid progress under conditions similar to those of the underdeveloped countries, as demonstrated in practice by the USSR and Communist China. In general, the traditions of underdeveloped countries and the scope of the problems they confront incline these nations toward the use of state action. The most frequent result in practice will probably continue to be a mixture of native traditions with elements of both systems.

68. Communism has succeeded in some cases in identifying itself with nationalist and anticolonial movements and thus gained strength, particularly in the early stages of new regimes. Local Communists and the international Communist movement will in many areas continue to be able to attract adherents among the frustrated and dissatisfied. However, as Communist strength grows, it tends to arouse resistance among leaders who fear the threat to their own power. The chances of Communist or Communist-dominated governments coming to power will be greatest where strong local Communist groups operate in conditions of serious political, economic, and social instability and dislocation. Such conditions are likely to be widespread in the underdeveloped areas for the foreseeable future.

Local Conflicts

69. There are a great many friction points scattered throughout the world that could produce local conflicts, international or internal, precipitated only secondarily, if at all, by the East-West struggle. The Arab-Israel situation appears the most deep-seated and serious of these; the situation in the Caribbean and Iraq may be even more explosive in the short term. Other possibilities in coming years are Cyprus, Ethiopia-Somalia, Indonesia-West New Guinea, the Pakistan-Afghan tribal areas, and many local situations in Africa and the Arab States.

70. Yet there are factors tending to keep local conflicts from expanding beyond manageable bounds. In most of these cases the forces

locally available will be limited, in light of the difficulties encountered in many underdeveloped nations in developing major military forces, and particularly in becoming proficient with advanced military equipment. Another and more important factor is the growing use and flexibility of UN and other international machinery. The UN seems likely to be increasingly effective in calming situations and facilitating settlements. Moreover, world opinion as experienced in the UN will have to be taken more and more into account by major powers considering intervention in local conflicts.

71. Any spread of nuclear weapons to the underdeveloped areas could, of course, have incalculable consequences for the likelihood and scope of local conflicts. However, we do not believe any of the underdeveloped countries could or would produce its own weapons, even on an initial basis, if for no other reason than expense and prevailing world opposition to nuclear testing. Nor do we believe Western Europe would be a source; the sole possible exception, France supplying Israel, would involve the risk of triggering Soviet nuclear support to the Arab States. Except possibly in such a case, we believe that the Soviets for a variety of reasons would not make nuclear weapons available to underdeveloped countries.

B. Prospects for Particular Areas

72. From these general points, we turn to an appraisal of the prospects for particular areas, taking into account local stages of development and other factors that could operate to affect stability and the chances of Communist success. As noted in Section III, the Far East and Southeast Asia present special cases because of the Chinese Communist threat.

73. *Middle East.* For the short-run, the outlook for Western influence in the Arab World has improved, in large part because Nasser and other Arab nationalist leaders are becoming increasingly aware of the Communist threat.¹⁰ Basic Western interests—access to oil and the maintenance of reasonably stable non-Communist governments—are not incompatible with those of the Arab States themselves. Yet the Arab nations will almost certainly continue to seek economic aid from both sides, and there will remain the possibility of chaotic developments in any one country (Iraq at present) or of conflict between countries. Such developments or a resurgence of the deeply rooted Arab-Israeli conflict would present serious dangers of further Communist inroads. Beyond the Arab World, the situation in Iran is precarious and could turn chaotic. Moreover, continued political instability coupled with Soviet

¹⁰ For a more complete discussion, see the recent NIE 30–59, “MAIN CURRENTS IN THE ARAB WORLD,” dated 25 August 1959. [Footnote is in the original.]

threats or inducements could cause Iran to withdraw from CENTO. All in all, the Middle East will remain very unstable.

74. *South Asia.* In India, moderate political elements will probably be able to maintain control for at least the next few years. However, the departure of Nehru would probably intensify political divisions and might contribute to a decline in the effectiveness of government. Particularly if economic progress diminishes, there is a possibility that Nehru's departure would be followed by such political dislocations as to produce a temporary abandonment of democratic methods, perhaps associated with army participation in the government.

75. Elsewhere in the area, Afghanistan has become deeply involved with the USSR in trade and economic and military aid programs. So long as Western support continues it can probably retain its independence, but even granted such support there is a possibility that it will come under effective Soviet domination within five years or so. Pakistan's military regime can probably keep control and a reasonable degree of stability for some time. Ceylon may emerge under conservative control from its present precarious state, but in any event the outlook is for unstable conditions.

76. *Africa.* Former French North Africa is a special case, with the possibilities ranging from chaos to fairly constructive relationships with France; the economic outlook is generally dim. Those areas of East, Central, and southern Africa which have an acute white settler problem face a grave and increasingly urgent problem of terminating or modifying white control and of forming workable governments. Even if these are solved, the long-term outlook for stability and orderly development is unpromising. Both in these areas and in West Africa, most new nations will turn for aid first to the West and, if unsatisfied, to the Bloc, often with highly unrealistic aspirations and expectations. While trade and other economic relations with the Bloc will increase in Africa and there will be many opportunities for the spread of Communist influence, we do not believe that local Communist-controlled groups will become entrenched in power in any country at least over the next few years, given a reasonable degree of effective attention from the west.¹¹

77. *Latin America.* Latin America's importance in world affairs will grow substantially in coming years. However, even the economic growth of the more advanced countries, much less that of the more backward, will have difficulty in keeping pace with rising popular expectations,

¹¹ The Director of Intelligence and Research, Department of State, the Assistant Chief of Naval Operations for Intelligence, Department of the Navy, and the Director for Intelligence, The Joint Staff, believe that the prospects for Communist groups should be limited further by substituting after "Communist-controlled groups" in the last sentence the words: "will become a major political force in any country. . . ." [Footnote is in the original.]

and in most countries prospects for any substantial improvement are not bright.

78. Communist prospects in Latin America are improving as a result of the area-wide reaction against autocratic or oligarchic rule, the more open political atmosphere, and economic adversity. The major threat of communism lies, as in Cuba at present, in its infiltration of nationalist and revolutionary movements. Soviet Bloc trade and aid programs, and contacts with Communist China, are likely to increase moderately, but will be essentially secondary elements in the Communist threat.

79. In Latin America as a whole we look for some expansion in Communist influence over the next few years, although such an expansion will probably not be widespread, especially in view of the possibilities for US action. However, there is a possibility that one or another country, notably Cuba, could fall under Communist control. Moreover, the Communists or other extremists may achieve such influence that they can put through programs seriously threatening US interests or even security. In any event, the US will be under increasing pressure, and Latin American support for the US, for example in the UN, will almost certainly continue to decline.

80. *Summary.* The complex force of nationalism and growing desires for a better life will be powerful forces shaping the course of events in countries of the underdeveloped world. These countries will continue to expect help from the richer countries, and will be inclined to accept such help, regardless of whether it comes from East or West. Inasmuch as these countries generally lack the experienced leadership, the stable political and social institutions, and the material resources to cope with their many problems in orderly ways, there will remain the possibility of violent upheavals and local conflicts. While these outbreaks may not stem from the East-West struggle, they can be expected often to involve the interests of the two sides and to afford opportunities for exploitation. Thus, the underdeveloped world will continue to be a principal area of the contest between the Bloc and the West.

VI. US INFLUENCE AND PRESTIGE

81. Recent Soviet scientific and economic achievements, viewed against a background of steady growth of the relative power position of the USSR, have erased the picture of unique US power that prevailed between World War II and 1957. The immediate consequences, however, have been mitigated by other events. The course of the Lebanon and Quemoy crises, and to a lesser extent of the Berlin issue, has demonstrated to the world that the US remains able and willing to take firm action; the US entry into high-level contacts and negotiations with

the USSR, while viewed in part as the result of Soviet power gains, has generally been welcomed. The President's visits abroad have done much to evidence US concern for peace and for the welfare of both its major allies and underdeveloped nations. On the Bloc side, the external programs of the USSR have met with checks, and the behavior of Communist China has led to wider recognition, especially in Asia, of the value of the US's countervailing power.

82. Yet the future of US prestige is by no means assured. Since the US will still appear as the principal guarantor of the Free World against the power of the USSR and Communist China, indications that the US was not maintaining a firm and effective military and political posture would lead to a weakening of the resolve of other free nations and encourage them to seek various forms of accommodation.

83. The present period of high-level negotiations confronts the US both with opportunities and with problems, in maintaining the firmness and cohesion of its major alliances and in keeping before the world a picture of the US as a nation genuinely seeking honorable adjustments through peaceful means. Though the tendency to judge the US by more exacting standards than the USSR is less widespread than in the past, it remains true that our allies and other major free nations expect from the US a combination of flexibility and firmness that is often not realistically attainable.

84. *Problems of the US Strategic Posture.* The future relationship between the nuclear striking power of the US and that of the USSR is difficult to predict at present, depending as it does on a wide range of technological and policy factors on both sides. In general, however, the growth of Soviet ICBM capabilities is creating a serious problem for the US in maintaining among other Free World nations confidence in US willingness to bring its strategic nuclear capabilities to bear as a protection for such nations. Particularly in Western Europe, there are signs that this confidence has already been shaken.

85. At the same time, despite the acceptance of reliance on nuclear weapons for basic deterrent purposes, there is strong worldwide sentiment against the use of such weapons, particularly in limited conflicts. We believe that our major allies, at least, will probably continue to support the use of Western (essentially US) nuclear weapons in situations of clearly major consequence, such as Bloc invasion of the NATO area. But in situations of apparently lesser consequence, any US use or threat of nuclear weapons will encounter strong opposition from a world opinion that will increasingly include major US allies

in spite of the advantages such opposition might confer on a Bloc aggressor.^{12,13}

86. *US Economic Policy.* Finally, US economic policy should be singled out as a second crucial area affecting US prestige and influence. In international trade and aid, US response to its balance of payments problem will be closely watched. Any drastic US reduction of aid without some compensating action would weaken US influence in the underdeveloped areas, while extensive US protectionist measures would certainly set off a wave of countermeasures. Basically, however much the capacity of other Western nations grows, the Free World will still look to the US for leadership in the problem of channeling Western aid to the “have-not” nations and in the freeing and encouraging of international trade, and will be intensely concerned with the economic policies, both domestic and foreign, adopted by the US.

¹² The Assistant Chief of Staff, Intelligence, USAF, does not concur in the judgments voiced in the latter portions of this paragraph. He would end the paragraph at the word “consequence” in the second sentence and delete all that follows. Such deletion would eliminate several broad judgments which do not lend themselves to precise interpretation. In particular, the Assistant Chief of Staff, Intelligence, USAF, disagrees with the judgment that “world opinion” would necessarily be against the use, or threat of use, of US nuclear weapons. The Assistant Chief of Staff, Intelligence, USAF, holds the view that our major allies, at least, will formulate their opinions and make their decisions at the time of aggression and on the basis of the issues then involved. Moreover, there appears to be no present evidence to support the implication that the Free World in general, or the major US allies in particular, would capitulate to the Bloc rather than indorse the use of nuclear weapons. [Footnote is in the original.]

¹³ The Director for Intelligence, The Joint Staff, does not concur with this paragraph as written. He believes the paragraph should be rewritten as follows:

“At the same time, despite the acceptance of reliance on nuclear weapons for basic deterrent purposes, *the world is generally in ignorance of the spectrum of weapon yields and delivery accuracies available. As a result, no mental image other than that of a high-yield bomb detonating over a city is commonly evoked by the word ‘nuclear.’ This factor, intensified by Communist propaganda, has created worldwide sentiment against the use of nuclear weapons, particularly in limited conflicts. We believe that our major allies will almost certainly continue to support the use of Western (essentially US) nuclear weapons in situations of clearly major consequence. But in situations not clearly of major consequence, US use or threat of nuclear weapons would probably result in a wide variation of public and official reactions among the non-Communist nations. Thus there would probably be:*

- a. *Strong protests from peoples and governments with no significant issues at stake.*
- b. *Considerable and vociferous unofficial public opposition from those nations with significant issues at stake.*
- c. *Some opposition and only reluctant acceptance by the governments—including major US allies—of those nations with significant issues at stake. The degree of concern of these governments would depend on the seriousness of the issue to them, their understanding of the military requirement for use of nuclear weapons, their confidence in US ability for discrete usage of nuclear weapons, and their view of the feasibility of alternate solutions.”* [Footnote is in the original.]

233. Memorandum From Lay to the NSC¹

Washington, January 19, 1960

SUBJECT

The Role of the Military Air Transport Service in Peace and War

REFERENCES

A. NSC 5919

B. NSC Action No. 2167

The enclosed draft recommendations on the subject, prepared by the Deputy Secretary of Defense, the Acting Secretary of Commerce, the Director, Bureau of the Budget, the Chairman, Civil Aeronautics Board, and the Administrator, Federal Aviation Administration, as a revision of the recommendations contained in the Department of Defense report on the subject, are transmitted herewith for consideration by the National Security Council at its meeting on Thursday, January 21, 1960. It is contemplated that the President's decision following such NSC consideration will be subsequently transmitted to the Secretary of Defense and will not be circulated as an NSC paper.

The original recommendations contained in the Department of Defense report were read at the 430th NSC Meeting (January 7, 1960) at which NSC 5919 "U.S. Policy with Respect to the Development of Cargo Airlift," was considered.

A copy of the Department of Defense report is being attached to this memorandum, for each of the officials who will be attending the NSC Meeting for this subject on Thursday, January 21, with the exception of those who have previously received a copy.

Enclosure

Draft Recommendations Prepared for the NSC

Washington, undated

RECOMMENDATIONS ON THE ROLE OF MATS

1. That MATS be equipped and operated in peacetime to insure its capability to meet approved military hard-core² requirements in a general war and in situations short of general war, and such other military requirements as cannot be met adequately by commercial carriers³ on an effective and timely basis. (It is understood that our hard-core and other military requirements are currently under study in connection with the review of the mobilization base.)

2. That the modernization of MATS hard-core military airlift capability be undertaken in an orderly manner consistent with other military requirements and in keeping with the objectives of par. 1 above.

3. That MATS [routine channel traffic (regularly scheduled, fixed routes) operations]⁴ be reduced on an orderly basis, consistent with assured commercial airlift capability at reasonable cost,⁵ and consistent with economical⁶ and efficient⁷ use, including realistic training, of the MATS capacity resulting from the provisions of par. 1 above.

4. That as commercial carriers make available modern, economical long-range cargo aircraft and as further orientation of MATS to the hard-core function is effected, increased use should be made of the services of such commercial carriers. (It is understood that, for the present, types of aircraft such as the DC-7F and the L-1049H qualify under this paragraph.)

² Airlift requirements which must move in military aircraft, manned and operated by military crews because of special military considerations, security, or because of limiting physical characteristics such as size or dangerous properties. Included in this category are special military deployments involving nuclear retaliatory forces, the SAC post strike recovery mission, tactical deployments, movement of missiles, special munitions, etc. [Footnote is in the original.]

³ Wherever used in these recommendations, "commercial carriers" means U.S.-owned commercial carriers. [Footnote is in the original.]

⁴ Budget, Commerce, FAA, and CAB propose deletion. [Brackets and footnote are in the original.]

⁵ The Department of Defense has stated that its criteria for determining comparative costs are on the basis of Bureau of the Budget Bulletin 60-2, September 21, 1959. [Footnote is in the original.]

⁶ Defense proposal. [Footnote is in the original.]

⁷ Budget, Commerce, FAA proposal. [Footnote is in the original.]

5. That, with respect to services overseas and to foreign countries, commercial augmentation airlift procurement policies and practices be better adapted to the long-range Department of Defense requirements, so as to encourage and assist in sound economic growth, development, and maintenance of an increased air cargo capability; that there be explored the feasibility of (1) (a) increasing the amount of MATS cargo airlift moving on a common carriage basis with certificated carriers and supplemental carriers, [and (b) requiring that all cargo [illegible in the original] be so moved;]⁸ (2) entering into longer term contracts for MATS traffic; and (3) giving preference in the movement of MATS traffic to those commercial carriers (a) who are effectively committed to the Civil Reserve Air Fleet (CRAF) program, (b) whose facilities and equipment are most advantageous to the emergency needs of the Department of Defense, or (c) who are demonstrating a willingness and ability to acquire uncompromised cargo aircraft; and that legislation be sought if necessary to permit accomplishment of any of the foregoing considered desirable. (It is understood that this recommendation will be reviewed after receipt of the report by the Air Force as to the feasibility of the steps outlined above.)

6. That since the development of long-range, economical turbine-powered cargo aircraft is essential to MATS modernization and to long-range evolution of a modern civil cargo fleet, suitable arrangements should be made for Defense and industry participation in the costs of such development.

7. That purchase loan guarantee legislation, if proposed, contain provisions to insure the immediate availability of cargo aircraft covered thereby to meet military and mobilization requirements.

8. That consideration be given to equipping certain Air Force Reserve and Air National Guard units with transport aircraft that might be available from MATS excesses as augmentation forces for MATS in time of emergency. (It is understood that this recommendation will be reviewed after receipt of the above-mentioned report by the Air Force.)

9. That the role of CRAF be re-examined with the objective of insuring optimum effectiveness and responsiveness of commercial airlift services to the Department of Defense under all conditions.

⁸ Defense proposes deletion. [Footnote and brackets not delineating illegible text are in the original.]

234. Briefing Note for the January 21 NSC Meeting¹

Washington, January 20, 1960

THE ROLE OF MATS IN PEACE AND WAR

Our first item, Mr. President, concerns the role of MATS. The Council just two weeks ago looked at NSC 5919, a draft policy statement on cargo airlift, and heard a summary of the recommendations in the Defense report to you on “The Role of MATS in Peace and War”. The Council did not adopt NSC 5919, but referred it back to the Planning Board for urgent review in the light of the Defense report.

In the past two weeks I have worked with the agencies primarily interested in an effort to reach agreement on the recommendations in the Defense report, feeling that in that way progress could be made most speedily. The paper before you is the product of a three-hour meeting with the Deputy Secretary of Defense, the Acting Secretary of Commerce, the Director, Bureau of the Budget, the Chairman, Civil Aeronautics Board, and the Administrator, Federal Aviation Agency. It is contemplated that the President’s decision following our discussion today will be subsequently transmitted to the Secretary of Defense and will not be circulated as an NSC paper.

Turning to the paper itself, paragraph 1 and 2 are agreed revisions of the earlier recommendations of the Department of Defense.

READ PARAGRAPHS 1 AND 2

In paragraph 3, we come to the first split in the paper, at the bottom of page 1. Defense, in its original recommendations, would have provided that the reduction of MATS operations apply only to routine channel traffic, that is, regularly scheduled traffic over fixed routes. The JCS support Defense. Budget, Commerce, FAA and CAB would have the reduction apply to *all* MATS operations.

CALL ON DEPUTY SECRETARY DOUGLAS
GENERAL WHITE
MR. STANS
SECRETARY MUELLER
MR. QUESADA

Looking now at the first line on page 2, Defense and JSC oppose the inclusion of the first footnote on page 2. Their concurrence was based on a misunderstanding.

The next split is also in paragraph 3, at the top of page 2. There is a difference between those who want *economical* use of remaining

¹ Source: The role of MATS in peace and war. Official Use Only. 4 pp. Eisenhower Library, Whitman File, NSC Records.

MATS capacity and those who want *efficient* use. JSC supports Defense in wanting the word *economical*.

CALL ON DEPUTY SECRETARY DOUGLAS
GENERAL WHITE
MR. STANS
SECRETARY MUELLER
MR. QUESADA

The next split occurs in paragraph 4, on the basis of the JCS views just circulated. They would omit the parenthetical sentence on the grounds that civil capacity should not be expanded with converted passenger aircraft. I think that this is an important split because the language is proposed in order to make clear that increased use of commercial carriers does not have to await the development and production of uncompromised cargo aircraft.

Another split occurs in paragraph 5, at the bottom of page 2. This paragraph is concerned with the procurement policies and practices to be followed when commercial airlift services are bought. After a general statement that these procurement policies and practices should be better adapted to long-range Defense requirements, so as to encourage and assist in sound economic growth, development, and maintenance of an increased air cargo capability, there is a list of possibilities whose feasibility is to be explored. The first of these possibilities, (1) (a), is *increasing* the amount of MATS cargo airlift moving on a *common carriage* basis with certificated carriers and supplemental carriers. The second possibility, which is the subject of the split, might be clarified if the language were changed to read “and (b) requiring that all cargo *carried by commercial carriers* be so moved”. This provision would explore the feasibility of eliminating the awarding of contracts on the basis of the lowest competitive bid. Defense objects to listing this possibility as one whose feasibility should be explored.

CALL ON DEPUTY SECRETARY DOUGLAS
MR. QUESADA
SECRETARY MUELLER
MR. STANS

With regard to paragraph 7, the JCS propose that the words “if proposed” be eliminated. This language was put in because handling of this legislation was being left to the regular Budget Bureau process.

The drafting group considered another recommendation which would have been numbered 10, but decided to delete it from the list because it was not the subject of a recommendation in the Defense report. However, the group agreed that the question be raised as to whether the President should be asked to send a letter to the Secretary of Defense asking that two matters be studied:

1. Whether the guidance set forth in these recommendations with respect to the MATS fleet should be applied as appropriate to the operations of the remainder of the military cargo air fleet.

2. Whether there needs to be further integration of the military airlift capability.

CALL ON MR. STANS

DEPUTY SECRETARY DOUGLAS

Reminder: Turning to one last point, the Department of Defense wants its report on MATS to be released to the public, with the recommendations shown in the form approved by the President. In this connection, I'd like to ask Secretary Douglas whether the second sentence of the first footnote on page 1, which talks about the SAC post-strike recovery mission and other matters, is o.k. from the security point of view for release to the public. Perhaps, if there is any question about this sentence, it could just be deleted from the footnote.

CALL ON DEPUTY SECRETARY DOUGLAS

Are there any other comments on this question of releasing the MATS report to the public?

235. Memorandum of Discussion at the 433d NSC Meeting¹

Washington, January 21, 1960

SUBJECT

Discussion at the 433rd Meeting of the National Security Council, Thursday, January 21, 1960

Present at the 433rd NSC Meeting were the President of the United States, presiding; the Vice President of the United States; the Secretary of State; Mr. James H. Douglas for the Secretary of Defense; and the Acting Director, Office of Civil and Defense Mobilization (Patterson). Also present at the meeting and participating in the Council actions below were the Secretary of the Treasury; the Director, Bureau of the Budget; the Attorney General (Item 1); Mr. Philip Ray for the Secretary of Commerce (Item 1); and the Administrator, Federal Aviation Agency (Item 1). Also attending the meeting were General Thomas D. White for the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Director, U.S. Information Agency; the Assistant to the President; the Special

Assistants to the President for National Security Affairs, and Science and Technology; the White House Staff Secretary; Assistant Secretary of State Gerard C. Smith; Assistant Secretary of Defense John N. Irwin, II; the Executive Secretary, NSC; the Deputy Executive Secretary, NSC; and Mr. Charles Haskins, NSC.²

There follows a summary of the discussion at the meeting and the main points taken.

[Omitted here are pages 2–11.]

2. *SIGNIFICANT WORLD DEVELOPMENTS AFFECTING U.S. SECURITY*

[Omitted here are pages 12–13.]

Mr. Dulles felt the Soviets would want to make a good deal of the two kilometers CEP which they say they have achieved. He thought it was possible that the Soviets intended to support their position in forthcoming diplomatic negotiations by a dramatic demonstration of the long range of their missiles. General White, on the contrary, believed that when the Soviets want to achieve maximum diplomatic impact, they will name the time and the target which they wish to hit, and will attempt to put the missile on the target. Dr. Kistiakowsky pointed out that the 24 hour postponement in the launching of the Soviet missile suggested that the Soviets had fired something new rather than an old-type missile.

Mr. Dulles said he was about to appear before a Congressional Committee and predicted that he would be asked about the Soviet firing. The President said that Mr. Dulles could tell the Committee that the Soviet missile had fallen in the impact area and that it had been seen by our observers in the area. The Attorney General felt Mr. Dulles should emphasize that there is no assurance that the Soviet report of the missile CEP is accurate. Mr. Allen said we should perhaps indicate that since our CEP is two miles, we assume Russian accuracy is about the same. The President felt, on the other hand, that we should give no credence to the announced Russian CEP until the Russians predict the exact spot they intend to hit and allow us to observe the firing.

Mr. McCone asked whether there would be other Soviet missile firings in the Pacific. Mr. Dulles said he assumed the firing just described was one in a series of shots.

The President said that in Congressional testimony it could be said by US officials that the Soviet missile had impacted in the impact

²[text not declassified]

area, but we ought not to betray the extent of our surveillance of the area.

Mr. Dulles then turned to Khrushchev's recent speech before the Supreme Soviet. He said this speech was very important and had been the subject of a careful analysis by CIA. He was inclined to accept Khrushchev's statement on manpower strength and on the reductions in certain hardware production. He was willing to accept tentatively Khrushchev's figure of 3.6 million men under arms in all the Soviet forces, although this figure was less than the figure previously carried in intelligence estimates. CIA had already observed the virtual cessation of bomber production in the USSR and cuts in the production of other weapons, e.g. naval vessels. Incidentally, Mr. Dulles noted that the first reports of Khrushchev's speech had lumped submarines and surface ships together as obsolete. This turned out to be an error in translation. Actually Khrushchev had said only that surface ships were obsolete. Mr. Dulles estimated that the reduction in Soviet armed forces proposed by Khrushchev of 1.2 million could probably be effected within two years, by the fall of 1961 according to Malinovsky. Mr. Dulles felt it made a good deal of sense for the USSR to reduce its forces in view of the possibility of serious competition in 1960 through 1962 between the military on the one hand and the civilian economy on the other as represented by the Seven Year Plan. The USSR needed more manpower for its industrial program. Reduction in military manpower would also result in the reduction of 16–17 billion rubles in the explicit Soviet military budget. Mr. Dulles pointed out, however, that the real military budget, as opposed to the announced military budget, of the USSR was 160+ billion rubles. Mr. Dulles did not believe that the reductions announced in the Khrushchev speech would affect previous estimates of Soviet ICBM capabilities. Apparently the Soviet forces were about to undergo a through reorganization. Khrushchev has become a missile enthusiast and wishes to speed up the rationalization of Soviet forces. He may also wish to fix our attention on the missile field, where he thinks the Soviets have superiority. He apparently wishes to achieve armed forces which will consist of strategic attack and air defense forces armed with missiles, ground forces also armed with missiles and having great airborne capability, and a navy consisting largely of submarines. Mr. Dulles said that Khrushchev may be considering a percentage withdrawal of Soviet forces from Eastern Europe. The Khrushchev program of reduction is probably not palatable to the Soviet military and Khrushchev may have had some difficulty getting the military to go along. Evidence of this is the fact that the Chief of Staff and other important military figures did not make speeches before the Supreme Soviet. The demotion of Kirichenko may also have been related to opposition to the Khrushchev military program. Mr.

Dulles concluded by reporting that the tone of Khrushchev's speech reflects the belief that the USSR can overcome capitalism without general war, indicates great reliance on missile forces as a shield behind which communism can compete with the West, and seems to exclude general war as a deliberate Soviet policy.

Mr. Gray asked whether Khrushchev did not express regret that the US military budget provided for no reductions. Mr. Dulles replied in the affirmative. In response to questions, Mr. Dulles said the published Soviet military budget provided for the expenditure of 96 billion rubles. The President said Khrushchev had told him that Soviet military costs were about half US costs. The President assumed Khrushchev must have been using a four-to-one exchange rate between the dollar and the ruble, which led him to conclude that the Soviets probably have a military budget equivalent to about \$48 billion. Khrushchev had also told him that the Soviet scale of military effort was very close to our scale of effort. Mr. Dulles agreed that the total Soviet military effort was comparable to ours. The Vice President asked what percentage of the Soviet GNP was devoted to military purposes as opposed to the US GNP. Mr. Dulles said the Soviets devoted about twice as much of their GNP to military purposes as we did. The President pointed out, however, that the GNP of the US contained a number of items not included in the Soviet GNP, e.g. advertising.

Mr. Dulles concluded his briefing by reporting on Cuba. He said the Soviet exhibit would move from Mexico City and open in Havana about January 30. It was believed that Mikoyan would open the Soviet exhibit. In any case a Soviet team of about eighty officials would appear in Havana. The exhibit would be tailored to the Cuban situation; only part of the exhibit as it appeared in New York City and Mexico City would be found in Havana. Mr. Dulles noted that the Soviet and Cuban embassies in Mexico City were in close contact, probably laying the groundwork for the resumption of diplomatic relations between the two countries. In connection with a resumption of diplomatic relations, the Soviet Union would probably extend a credit of \$5-6 million to Cuba and would probably press for more trade between the two countries. Mr. Dulles hoped that in the long run the Russian concentration on Cuba would become apparent to the world and that this would be a development favorable to the US.

The National Security Council:

Noted and discussed an oral briefing by the Director of Central Intelligence on the subject, with specific reference to the recent Soviet test of a missile which impacted in the Pacific; further evaluation of the recent speech by Khrushchev before the Supreme Soviet of the USSR; and the planned Soviet exposition in Havana, Cuba.

236. Memorandum of Conference with the President¹

Washington, January 21, 1960

OTHERS PRESENT

Secretary Herter, Secretary Douglas, Mr. Farley, General White, General Loper,
Mr. Gordon Gray, General Goodpaster

Mr. Herter said the group wanted to take up with the President the question the President had raised about giving [*text not declassified*]. There was agreement not to raise the matter, and to drop the requested authorization.

Mr. Gray next took up the question of the transfer of the [*text not declassified*] weapon [*text not declassified*] in event of emergency. He recalled that the President's action on this proposal had included an authorization for Defense and State to inform Congress as they deemed appropriate. There was concern that, in the discussion of this matter with the Joint Committee on Atomic Energy, the latter might move over into questions of a general character about [*text not declassified*].

General Loper recalled that, in 1957, the Joint Committee raised with him the question of advance authorization, and he told them that a policy decision had been made, which would not, however, become effective until implementing instructions had been approved by the President and issued. After some further discussion I reviewed in chronological detail the history of the development of advance authorizations to date. I recalled to the President the very tight controls he had established on giving any of this information to anyone, and the view he had expressed that arrangements he makes for the [*text not declassified*].

Mr. Gray suggested that Secretary Douglas might get Senator Anderson, Chairman of the JCAE, not to permit this question to be raised or pursued. Mr. Douglas was unenthusiastic that the suggested action would have any useful result. The President thought it might be possible simply to say that the whole emergency [*text not declassified*] in addition, for extremely critical situations, the President has taken such measures as he deems necessary to enable our major forces to defend themselves.

Secretary Herter stayed a few minutes after the others had gone. He showed the President a memorandum proposing that we tell the

237. Briefing Note for February 4 NSC Meeting¹

Washington, February 3, 1960

Significant World Developments Affecting U.S. Security

The first item this morning is the intelligence briefing, which will be devoted principally to a presentation of the new "Estimate of the World Situation" (NIE 100-60, 1/19/60). This estimate, as you know, is prepared every year at this time by the Intelligence Community.

In other years that estimate has been the kick-off, as it were, for our annual review of Basic Policy.

The last review of Basic Policy was begun in February of last year and the new paper, NSC 5906/1, was approved by the President in August. Indeed, certain portions of the paper (relating to stockpiling) were adopted as recently as December 3.

Accordingly, we are not planning to undertake a complete review of the entire basic policy this year.

238. Memorandum of Conference with the President¹

Washington, February 5, 1960

OTHERS PRESENT

Secretaries Herter, Douglas, Generals Cabell, Twining, Dr. York, Mr. Charyk,
Dr. Kistiakowsky, Mr. Gordon Gray, General Goodpaster

This group met with the President in the Cabinet Room to consider questions relating to military space reconnaissance, surveillance, detection and inspection. Before taking up this subject, General Cabell commented that the intelligence community has as yet not been able to identify the “dark object,” believed to be a Soviet satellite, picked up a few days ago. Dr. York said that it may be a Soviet satellite, but might also be material from a satellite of ours. General Cabell also reported on a recent successful special reconnaissance mission conducted by the British.

[*text not declassified*] He mentioned in particular that this project is planned to terminate with the end of this year, and suggested that this point needs further consideration. He then followed with presentations on the Samos reconnaissance satellite program, which is planned to include both “readout” and recoverable capsule versions. He ended with a description of the Midas early warning satellite.

Dr. Kistiakowsky said that, as spokesman for Dr. Land, who has taken a great interest in this matter, he would like to voice concern about the “readout” satellite. This is an apparatus of very great complexity. It will be very valuable when obtained, and should be the ultimate objective. It will provide a resolution of 20 feet. Since an interpreter can identify an object about two and one-half times as large as this, it will give an ability to recognize objects of fifty feet in dimension. He thought there would be a danger of putting undue confidence in the readout system, and thought that maximum effort should be put into the recovery system. Dr. York said that about three months ago the Air Force was put on to the recovery system as the top priority effort. The readout system is apparently not interfering with or delaying the development of the recovery system.

Assistant Secretary Charyk then described a possible space surveillance system. This is a project under ARPA which has been assigned to the Air Force. The key element is a space surveillance and control center, into which information is fed from all sources, including the U.S. space tracking network. For the project, consideration is being given

¹ Source: Military space reconnaissance. Secret. 3 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on February 8.

to establishment of three very large radars in the U.S. which would give coverage up to a height of 2000 miles against objects with a one square meter cross-section and up to 4000 miles against objects with a ten square meter cross-section. This system is estimated to cost about \$20 million per radar.

The next element in the system is an [*text not declassified*] interceptor satellite system. This is now under consideration—not under development. He described the operation of satellites having such a purpose. In addition, there is some possibility that the Nike-Zeus system could be used to knock down satellites initially at altitudes of 150 miles, perhaps later at altitudes up to 1000 miles. A nuclear weapon explosion would be used to accomplish the destruction.

Dr. Kistiakowsky commented that this proposal raises a difficult policy question—whether we should in fact create a capability to incapacitate satellites. We have supported proposals for the peaceful use of space, utilizing definitions which would permit the use of reconnaissance satellites. Mr. Gray suggested that the emphasis should be on detection and inspection, rather than on shooting satellites down. The Soviets have a great quantity of information about the U.S., and reconnaissance by satellite is not important to them. As previously mentioned in the discussion, it is of tremendous importance to us. Dr. York said it would take about seven years to develop the kind of [*text not declassified*] interceptor satellite that is being discussed. It will cost a very considerable amount of money. If we wish to have this capability, we must start now to develop it, however.

Dr. Kistiakowsky recommended that the project not be advertised publicly. The President agreed and said we should simply state we are investigating outer space. Dr. York said we could simply state that we are working on methods of achieving rendez-vous.

[*text not declassified*]

Secretary Herter said that, in connection with disarmament studies, there is a recommendation to seek an agreement not to use explosives in outer space. He wondered whether inspection can be made as to whether satellites contain explosives. Dr. York said such an inspection could be made on the ground, but could not be made in flight. Mr. Herter asked whether such an inspection on the ground would interfere with our utilization of reconnaissance satellites. Dr. York said we would not be able to keep secret the fact that a satellite is designed for reconnaissance purposes, if it is to be inspected. However, so long as cameras are allowed to be flown in satellites, there will be no problem. [*text not declassified*]

AND POLICIES, 1959–1964

THE PROBLEM

To review significant developments affecting the USSR's internal political situation, economic, scientific, and military programs, relations with other Bloc states, and foreign policy, and to estimate probable Soviet policies and actions over about the next five years.²

SUMMARY OF THE ESTIMATE

PROBABLE TRENDS IN SOVIET EXTERNAL POLICY

1. Over the last year Soviet policy toward the West has veered from extreme provocation in connection with the Berlin issue to a warmly expressed willingness to seek new avenues of accommodation through negotiation. We believe that, fundamentally, this change of tone is derived from tactical considerations and that the principal objectives of Soviet policy vis-a-vis the West remain unchanged. The Soviet leaders currently show great confidence that the trend of events, in what they continue to think of as an inevitable struggle with the non-Communist world, is in their favor. Their rate of economic progress, their scientific and space successes, their advances in missile development, their estimate of the political tendencies in the underdeveloped countries (despite setbacks in some areas) all suggest to them a growing shift in world power relations favorable to the Communist cause. These considerations as seen by the Soviet leaders permit their policy to be less rigid than formerly. From the position of strength which they believe they now have they see themselves as able not only to engage the West vigorously on disputed issues when they wish to do so, but also to relax tensions when expedient without any imputation of weakness. They consider themselves able at the same time to pursue their programs of internal development, including the betterment of living standards and the furtherance of rapid economic growth.

2. We believe that, over the next five years, neither a policy single-mindedly directed at eliminating East-West tensions nor a policy of pressure with a steadily belligerent tone is likely to be followed by the USSR. We expect to see elements of both pressure and detente combined and varied as tactical advantage may suggest. For the nearer future the present emphasis on negotiation and accommodation seems

² The reference to a five-year period is approximate. The estimates on the Soviet economy carry through 1965, to conform to the Soviet Seven-Year Plan. Judgments on many other matters pertain to periods of less than five years, and, particularly on political questions, are intended for the most part to apply for the next year or two. [Footnote is in the original.]

likely to continue; later the motif of pressure and struggle will probably reappear. Whatever alternation of emphasis may occur, however, the swings are likely to fall within a range which excludes, on the one hand, the deliberate assumption of serious and uncontrollable risks of general war, and, on the other, abandonment of the concept of continuing struggle between two irreconcilable worlds.

3. Given Khrushchev's unchallenged personal ascendancy, his views are likely to be the primary determinant in Soviet policy for the present. His attitudes are marked on the one hand by a strong sense of the growth of Soviet military and economic power and by a crude and truculent pride in asserting the claims of that power to the world's attention and deference. He has been free in his vigorous use of missile threats. On the other hand, he apparently thinks it possible to win recognition for Soviet views through persuasion rather than by force alone. He clearly understands the horrors of nuclear war and his proclaimed dedication to economic advance appears to be sincere. He probably genuinely believes that the Soviet system can prove its superiority in "peaceful" competition, although he recognizes that Soviet power plays a vital role in this competition. Thus, the contradictory tendencies toward belligerence and accommodation in Soviet policy are probably in some degree a reflection of the attitudes and personality of Khrushchev, and may persist so long as he is the commanding figure on the Soviet scene.

4. The immediate outlook is that the Soviets will continue their present tactics of detente at least through the initial phase of the series of high-level negotiations now in view. A period of partial detente presumably serves a number of useful purposes from Moscow's point of view. First, it enables the USSR to ascertain through negotiations what positions the West is now willing to take in view of increasing Soviet strength, and provides a suitable and superficially alluring framework for possible Western concessions. Secondly, even barring specific agreements with the West, Moscow probably views high-level East-West talks as an acknowledgment by the West of the permanence, legitimacy, and equal status of the Communist Bloc. Finally, during such a period of detente the Soviets would hope to improve their relative power position still further, since they would expect Western military programs to be carried on with less urgency.

5. Beyond this phase the outlook is less certain. The main influence shaping Soviet policy is likely to be the Soviet leaders' sense of their improved power position relative to that of the West. In another year or two they may feel that their capabilities in long-range missiles have brought them into a period when the relations of military power are the most favorable from their point of view. At some stage, they will almost certainly wish to test the chances of drawing advantage from this situation if it emerges as they expect. They will still try to win Western

concessions basically through negotiation. But the element of pressure and threat will probably become more pronounced, perhaps much more so, than at present. The Soviet leaders may think it possible to undertake more provocative behavior in areas where they are in contention with Western power and influence. In their view, the emerging stand-off of intercontinental striking forces marks a stalemate only of general war capabilities. They consider that this situation of mutual deterrence would open up new opportunities for advancing Communist power by political, economic, and perhaps even limited military means. We believe, however, that even then they would not wittingly assume serious risks of general war. We believe that they would draw back if the Western response were of such vigor that in their view more extensive Soviet involvement would entail either serious risk of general war or net political loss. At the same time, we believe that the chance of their miscalculating risks may increase if they remain convinced that their relative power is growing.

6. Although the Soviets have allowed the Berlin crisis to diminish in intensity, the issues involved in it will remain of high concern to their policy. They will continue to seek an arrangement about Germany under which both sides would accept at least tacitly the indefinite division of the country. To this end, they will continue to press for some form of Western recognition for East Germany. They see such a development not only as a contribution to the stability of Communist power in Eastern Europe as a whole, but also as a blow against West Germany's relations with NATO which it is their consistent purpose to undermine. On the Berlin issue itself, we believe that, as long as the Soviets are confident that they can make progress towards their aims in Germany by negotiation and propaganda, they will probably abstain from any major interference with Western access to Berlin and from making a separate peace treaty with East Germany. If they decide that further progress is impossible by comparatively mild methods, they will probably make the separate peace treaty, though they would not necessarily try at the same time to obstruct Western access to Berlin.

7. In the coming phase of negotiation, the Soviets are likely to continue to give priority to disarmament. By taking the initiative in this field they will expect to earn broad political dividends since hopes for peace throughout the world are associated with a desire for disarmament measures. The Soviets may actually wish to see a freeze or even a cutback in some armaments in order to improve their potentialities for long-run political and economic competition, but we do not believe that they are obliged for economic reasons to seek a far-reaching arms reduction agreement. They would probably not even regard such an agreement as desirable since they consider that their great military strength is an essential ingredient in the challenge they pose to the non-Communist world. Moreover the Soviet aversion to extensive foreign

controls and inspection in the USSR persists, and will almost certainly exclude anything more than limited agreements.

8. Even if Soviet policy seeks stabilization in Europe and a reduction of tensions in relations with the Western Powers, it will probably be increasingly active in the underdeveloped countries of Asia, Africa, and Latin America. The Soviets see in the political ferment in these areas growing opportunities for eliminating Western influence, and ultimately the likelihood of a revolutionary turn which will bring Communist controlled forces to power. The policy of appealing to governments in such areas through trade and aid and other conventional forms of diplomatic influence will probably continue to provide the general framework for Soviet actions. From time to time, however, the Soviets will probably have to decide whether the prospective gains of a local Communist attempt to seize power in one or another country would justify compromising this policy and undertaking the risks and difficulties of supporting revolutionary action. During the period of this estimate there are likely to be cases in which the Soviets will be more disposed than they have recently been to support such militant action by local Communist parties, although they would probably be cautious about involving the Bloc in military support to such action.

INTERNAL DEVELOPMENTS AND THEIR EFFECT ON THE SOVIET POWER POSITION

9. The challenge which the USSR will pose for the West over the next five years will rest upon a continuing growth in the bases of Soviet power—military, economic, and scientific. Advances in these aspects of national power can be expected in a great state which has reached a stage of development in which it can for the first time realize its full potentialities. But this process is accelerated in the USSR by the presence of a political leadership which is single-mindedly committed to the aim of aggrandizing the power of the Communist system. It is always possible that the upward trend in the growth of Soviet power internally could be arrested by the appearance of political instabilities, either within the USSR or in its relations with other Communist states, but at present we see no basis for estimating that this is likely to be the case.

Military Developments

10. The single most important development affecting the structure of Soviet military power during the period of this estimate will be the buildup of an ICBM force. Long-range missiles will enable the USSR to overcome its inferiority to the US in nuclear strategic attack capabilities, as it was unable to do with bomber aircraft. Because of the uncertainties, risks, and high economic cost involved in acquiring ICBM capabilities which would permit them to plan attacks on Western retaliatory forces

with the degree and certainty of success required to insure that the USSR could win a general war without itself incurring unacceptable damage, we do not believe that the Soviets will attempt to build an ICBM force sufficient for this purpose. Nevertheless, they will probably build a substantial long-range missile force. They will almost certainly wish to have a high degree of deterrence, and beyond this, should deterrence fail, a force offering as much promise of success for a pre-emptive attack, or indeed for a retaliatory attack, as can be bought within acceptable margins of economic cost. Also, and again consistent with acceptable cost, the Soviets will probably build up their planned force rapidly in order to capitalize through political exploitation on their lead over the West in missile development. On the basis of these criteria, we estimate that the probable ICBM program will provide in mid-1961 a number of missiles on launcher on the order of 140 to 200.³ More tentatively, because of technical and political factors which may affect Soviet plans in the interim, we estimate that Soviet ICBMs on launcher are likely to number in the range of 250–350 in mid-1962 and 350–450 in mid-1963.⁴

11. Despite the effort which we estimate that the USSR will make to build long-range attack forces, it will almost certainly not do so at the cost of sacrificing its other military capabilities. The Soviets consider that their military policy requires a range of nuclear and nonnuclear capabilities permitting flexibility in the choice of means and the scale of operations in accordance with the political objectives sought in a particular area. The Soviet leaders probably believe that such varied capabilities become even more important under mutual deterrence from general war when, in their view, pressure and threat, maneuvers and coups even undeclared local wars may be undertaken with greater freedom and pushed further than in the past.⁵ Thus we believe that the Soviets will continue to maintain substantial ground, air, and naval forces, and that to the maximum possible extent these forces will be

³ The views of the members of the USIB vary as to the most probable number within this range. See the statement of their separate views in Note A following this summary. [Footnote is in the original.]

⁴ The Assistant Chief of Staff, Intelligence, USAF, dissents from this paragraph. See his statement in Note B following this summary. [Footnote is in the original.]

⁵ The Director for Intelligence, The Joint Staff, and the Assistant to the Secretary of Defense, Special Operations, do not concur in the estimate that the USSR probably believes that it can undertake the actions described with greater freedom and can push them further than in the past. Such a Soviet judgment would, in the view of the above members of the USIB, necessarily involve an estimate by the Kremlin that Western—particularly the United States—response to their pressures and probings would lack the vigor necessary to dissuade them. They do not believe that the Soviets will make such an estimate.

The Assistant Chief of Staff, Intelligence, USAF, would revise the sentence in question as follows: The Soviet leaders probably believe that if *mutual deterrence from general war eventuates*, such capabilities *could* become even more important, when pressure and threat, maneuvers and coups, even undeclared local wars may be undertaken with greater freedom and pushed further than in the past. [Footnote is in the original.]

dual purpose, capable of employing nuclear or nonnuclear weapons, as circumstances dictate.

12. In addition to the buildup of long-range missile capabilities there will be a number of other major developments in the Soviet forces over the period of this estimate. The effectiveness of the air defense system against bomber aircraft will be increased by the new surface-to-air missiles now being installed on a considerable scale for the defense of vital areas, and by additional control and warning systems to improve reaction times. The most significant developments in the ground forces will be the widespread introduction of missiles for tactical use and the achievement of greater mobility resulting from new motorized equipment, transport aircraft, and helicopters. The Soviet Navy will probably continue to give priority attention to the development of submarines, and the buildup of a nuclear-powered and missile-launching submarine force will be the most important addition to Soviet naval capabilities.

Economic Developments

13. Although the continuing rapid expansion of the Soviet economy aimed at in the Seven-Year Plan (1959–1965) will encounter a number of serious problems, we believe that the goal of an 8.6 percent annual increase in industrial output will in the main be achieved. As in the past the plan in agriculture will not be achieved, and net output is likely to rise by about one-fifth in the seven-year period as against a proclaimed goal of about 55–60 percent. The position of the Soviet consumer will continue to improve, though at a somewhat slower rate; consumption goods and services per capita will probably increase about 26 percent during the plan period as compared with a 40 percent gain over the preceding seven years.

14. Even though some goals of the Seven-Year Plan may not be achieved in full, Soviet gross national product (GNP) will probably continue to grow at about 6.0 percent per annum. Such a rate of growth is impressive by any absolute standards and will bring the Soviet economy measurably closer in size and strength to that of the US. Assuming that the US maintains an average annual rate of growth in GNP of about 3.5–4.0 percent, Soviet GNP measured in dollars will increase from about 45 percent that of the US at present to about half that of the US by 1965. However, more important than this rough comparison of the gross size of the two economies is a comparison of the uses to which national resources are put. The smaller Soviet economy has in recent years supported military expenditures which, measured in dollars, were about equal to those of the US. Likewise Soviet investment in the economy as a whole is currently almost equal to that in the US, and Soviet investment in industry may be somewhat greater. As a result of this steady allocation of large resources to growth, by 1965 the absolute annual increment to GNP in the USSR will approach that in the US.

15. The Soviet leaders are aware that sustained and rapid economic growth is an important asset in the world power struggle. It will enable them to carry the burden of competitive armaments more easily. The USSR will be able to enlarge its aid programs, and perhaps ultimately compete in world markets in an important way. This will mean political leverage in many countries. If, in addition, the Soviets can finally raise living standards enough to demonstrate that their system provides for the growth of welfare as well as the expansion of national power, they will expect the influence of communism to spread even more rapidly. The Soviet leaders can be counted on to press the growth of their economy in all ways open to them, including substantial structural reforms when necessary, in order to achieve the political goals which they regard as the real aim of economic policy.

Scientific Developments

16. The achievements of its scientists have become one of the principal instruments of the USSR's prestige and influence, and the Soviet political leadership has been astute in exploiting this fact as a demonstration of the superiority of the Communist system in competition with the West. The Soviet successes arise from a generous commitment of resources over the years to training personnel and providing research facilities, from the fact that the motivations and incentives of scientists in the Soviet environment are high, and especially from the concentration of effort in fields related to national power. The rate of advance of Soviet science appears to be increasing, and the current Seven-Year Plan, which relies heavily on scientific and technological achievements, will provide additional impetus. Thus, significant Soviet advances in science and technology are likely to occur with greater frequency than in the past, and over the next several years, the USSR may achieve world leadership in some additional scientific areas. It will probably add a number of "firsts" in prestige fields. In the immediate future, these are most likely to occur in the Soviet space program, but the quality and intensity of research on such problems as controlled thermonuclear reactions and direct conversion of heat to electricity may produce spectacular results in other scientific fields.

Internal Political Developments

17. The outlook on the Soviet internal political scene points to continuing stability. Khrushchev's position as leader has become virtually unassailable, and if he lives, will probably remain so during the period of this estimate. While there may be elements within higher Party circles which mistrust his leadership, it is unlikely that, in the absence of a major failure of his policies, any effective opposition could form. Given Khrushchev's age, however, the prospect of a new succession problem probably already figures in inner Party maneuvering. Khrushchev's

demise is most likely to be followed by another period of "collective leadership" and a phase of contention for the top position. We continue to believe that the Soviet system has an inherent tendency to revert to one-man dictatorship. The inevitable struggles for power which this produces are not likely to menace the stability of the regime, much less alter the nature of its most basic policies. However, the fact of personal government is likely always to affect profoundly the manner and tone of Soviet policy. Thus, Khrushchev's successor might bring to the conduct of Soviet policy features quite different from those characteristic of the present dictator.

18. The years of Khrushchev's rise to power have been marked by a series of reforming changes intended to cope with problems raised by past policies and with new conditions resulting from rapid industrialization and modernization. The relaxation of police terror and a greater concern for living standards, some greater degree of ideological flexibility, wider foreign contacts, a more pragmatic and innovating spirit applied to institutional arrangements—all these are changes of a more than transitory character which, even if there should be some reversion, will have a lasting influence on the future evolution of the Soviet system. Their main effect for the present has been to give the Soviet people a hopeful sense of forward movement, and therefore probably more satisfaction with the regime and its goals than has existed at any time in the Soviet period. But it does not follow that the changes which have taken place so far forecast a more basic evolution away from totalitarian dictatorship. A modern industrial society is not necessarily incompatible with a totalitarian political system, especially in a nation like Russia with a long authoritarian tradition. In any case, for the period of this estimate we see no prospect of change on the Soviet domestic scene so fundamental as to diminish the motivation, will, or capacity of the regime to project its rapidly growing power externally.

Soviet Relations with Other Communist States

19. The challenge which the USSR presents to the non-Communist world will be much affected by the extent to which Soviet authority over a unified bloc of the Communist states is maintained. In Eastern Europe Soviet authority appears more firmly established than at any time since the events of 1956. Poland's potential instability continues to be an unsettling factor in Eastern Europe, although the disruptive influence of its deviations in internal policy seems to be declining as the Gomulka regime moves toward a tighter discipline. However, there are signs that Communist China is becoming less disposed to accept Soviet guidance in domestic and foreign policy, even though it has outwardly complied on a number of disputed issues in recent months. We believe that the problem of intrabloc harmony is far from being resolved. Disharmony is likely to arise repeatedly with the appearance of new

issues, and in the long run will probably be one of the more critical problems with which the Soviet leaders will have to cope.

20. The main challenge to Soviet authority and unity within the Communist Bloc in the future is likely to come from China. The Sino-Soviet relationship will probably become increasingly complicated and difficult as Chinese power and prestige increase, and as Soviet levers of authority over China become less effective. Frictions have already arisen over extremist tendencies in Chinese internal policy, over Chinese ideological pretensions, over foreign policy tactics, and probably over whether the USSR should supply nuclear weapons to China. These or other frictions may be magnified in the future. The Chinese have always reserved their right to exercise independent judgment on doctrinal and tactical issues. We believe that they will increasingly exercise this right, not only in domestic affairs, where direct Soviet influence has always been minimal, but in external affairs as well. Thus each party to the Sino-Soviet alliance may come to act more in terms of its view of its own national needs and interests. This does not mean, however, that an open rupture is in sight; both parties recognize that their alliance is vital to them in confronting the hostile forces of the non-Communist world.

Note A

Views on the Soviet ICBM Program

We have concluded that the probable Soviet ICBM program would provide on the order of 140–200 ICBMs on launcher in mid-1961. Within this range, the Assistant Chief for Intelligence, Department of the Army, and the Assistant Chief of Naval Operations for Intelligence, Department of the Navy, estimate that the Soviet program is likely to be toward the low side. The Director of Intelligence and Research, Department of State, the Assistant Chief of Staff, Intelligence, USAF, and the Director for Intelligence, The Joint Staff, believing that Soviet planners would regard the advantages to be gained as justifying additional effort, estimate that the number of Soviet ICBMs on launcher is likely to be towards the high side of the 140–200 range.

Note B

Dissent on the Estimate of the Soviet ICBM Program

The Assistant Chief of Staff, Intelligence, USAF, does not believe that Soviet behavior, as we have observed it, warrants the judgment that their objectives would be satisfied by attainment of only substantial deterrence and pre-emptive attack capability. Rather, he believes that the Soviet rulers are endeavoring to attain at the earliest practicable date a military superiority over the United States which they would consider to be so decisive as to enable them either to force their will on the United States through threat of destruction, or to launch such devastating attacks against the United

States that, at the cost of acceptable levels of damage to themselves, the United States as a world power would cease to exist. He further believes that such an objective could be attained by the development of their overall military capabilities which would include an operational ICBM force of about 250 (185 on launcher) by mid-1961, 500 (385 on launcher) by mid-1962, and 800 (640 on launcher) by mid-1963. It is generally agreed that the Soviets have both the technical and industrial capability to produce such a force; the physical difficulties thereby entailed will almost certainly not be the limiting factor.

It is the view of the Assistant Chief of Staff, Intelligence, USAF, that, while Soviet planners will undoubtedly feel that they will have attained a capacity for substantial deterrence and pre-emptive attack by mid-1962 or earlier, the real objective of the Soviet ICBM program is "decisive military superiority." He believes that the Soviets would not be content with conceptual levels of deterrence; they would realize the possibility of error in their own calculations and acknowledge the possibility of Western pre-emption of their deterrent capabilities. This latter contingency would weigh the more heavily if the Soviet leaders intended, as he believes likely, to exploit their capabilities in political offensives. In this event, their estimate of the likelihood of Western "desperate" acts would induce them to attempt attainment of total deterrence, i.e. "delusive military superiority."

[Omitted here is the remainder of the estimate.]

240. Memorandum From Kistiakowsky to Eisenhower¹

Washington, February 12, 1960

SUBJECT

Problems involved in the Minuteman Program

This missile is in several respects a more advanced concept than the Polaris missile and, therefore requires considerable development work before it can become operational.

The main technical problems are:

(a) Development of satisfactory solid propellant grains (that for the first stage weighing about 10,000 lbs) for the three stages which will

¹ Source: Problems involved in the Minuteman program. No classification marking. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

stand long term at air launching sites and truck or rail transportation. Also the development of the interior case insulation for the first stage to protect it against heating.

(b) Development of the swivel nozzles for the first-stage engine which will survive the erosive action of hot gases and will control the direction of the thrust.

(c) Development of a miniaturized inertial guidance system which will not only be accurate enough but will remain so after years of sitting in the hardened sites, with the gyroscopes running all the time.

It is my considered opinion that all these problems will be eventually solved.

The provision of more money could speed up the development somewhat, but not much however, because a number of problems must be solved consecutively and because of limitations on the technical talent available.

(d) In a different class is the problem of the correct design of the overall weapon system. It has already been demonstrated that the Minuteman missile can be launched from a hole in the ground ("In-Silo" launch) and this is not of serious concern. However, the planning of the communications and command structure for the Minuteman force is still in preliminary stages and shows a tendency to grow in complexity so that the overall costs of the system tend to increase. Thus a year or two ago the estimate was \$0.5M per missile. The latest figure I heard was \$1.5M per missile and it is likely to inflate further.

G.B. Kistiakowsky

241. Memorandum of Meeting with the President¹

Washington, February 17, 1960, 3 p.m.

PRESENT

General Goodpaster

1. I presented to the President the draft Record of Actions of the Special Meeting of Friday, 12 February. The President approved it with minor amendments to paragraphs 3 and 7. I had called the

¹ Source: Nuclear stockpile levels, possibility of disciplining Taylor. Top Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Meetings With the President. Drafted on February 19.

President's attention to paragraph 3 pointing out to him that the difference between the 75% and 90% assurance of deliverability made a tremendous difference in numbers of weapons required and in force levels required. I therefore wanted him to be fully conscious of what he was doing when he approved the 75% figure. I reminded him that he had withheld final approval of a portion of a Defense recommendation with respect to the atomic stockpile pending the outcome of the study. General Goodpaster explained in more detail the background.

I pointed out that the Hickey presentation indicated that for the 75% capability our forces and stockpile were now adequate, whereas for the 90% capability they were not adequate, and my purpose was to make sure that at some point attention was directed to leveling off in stockpile requirements.

2. I then reported to the President that Deputy Secretary Douglas, after having studied the matter, had informed me that retired officers were exactly like officers on active duty as far as disciplinary action was concerned. I said that as an example if it could be demonstrated that General Maxwell Taylor had committed some offense he would be just like any officer on active duty. I said that I realized that the President would probably not think of moving against General Taylor which would serve to make him a martyr. The President recalled that in earlier administrations action had been taken against military officers simply for being critical of the administration. He referred particularly to General Johnson Hagood. However, he wished to register the information which I had relayed from Deputy Secretary Douglas.

3. I then discussed with the President arrangements for, and the content of, the two meetings to take place on February 18.

4. I then discussed certain 5412 matters with the President which are the subject of a separate memorandum.

Gordon Gray

Special Assistant to the President

242. Memorandum of Discussion at the 435th NSC Meeting¹

Washington, February 18, 1960

SUBJECT

Discussion at the 435th Meeting of the National Security Council, Thursday,
February 18, 1960

Present at the 435th NSC Meeting were the President of the United States, presiding (for Item 1); Christian A. Herter, Secretary of State, presiding (for Items 2, 3 and 4); Thomas S. Gates, Jr., Secretary of Defense; and Leo A. Hoegh, Director, Office of Civil and Defense Mobilization. Also attending the Council meeting and participating in the Council actions below were Fred Scribner, Jr., for the Secretary of the Treasury, Maurice A. Stans, Director, Bureau of the Budget; and John A. McCone, Chairman, Atomic Energy Commission (Item 1); Also attending the meeting were General Nathan F. Twining, Chairman, Joint Chiefs of Staff; General Lyman Lemnitzer, Chief of Staff, U.S. Army; Admiral Arleigh Burke, Chief of Naval Operations; General Thomas S. White, Chief of Staff, U.S. Air Force; Allen W. Dulles, Director of Central Intelligence; George V. Allen, Director, U.S. Information Agency; Maj. General Wilton B. Persons, The Assistant to the President; Gordon Gray, Special Assistant to the President for National Security Affairs; Karl G. Harr, Jr., Special Assistant to the President for Security Operations Coordination; George B. Kistiakowsky, Special Assistant to the President for Science and Technology; Brig. General Andrew J. Goodpaster, White House Staff Secretary; Gerard C. Smith, Assistant Secretary of State; from the Department of Defense—Dr. Herbert F. York, John N. Irwin, II, Samuel Clements, and Lt.Col. Edward V. Needels; James S. Lay, Jr., Executive Secretary, NSC; Marion W. Boggs, Deputy Executive Secretary, NSC; and Charles Haskins, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

**1. *TECHNOLOGICAL DEVELOPMENTS IN NON-LETHAL
WEAPONS AND DOCTRINE FOR POSSIBLE USE***
(NSC Action No. 2105-*d*; NSC 5906/1, paragraph 13)

Mr. Gray briefed the Council on the background, recalling the 1950 policy that the US will undertake gas warfare only in retaliation against its use by an enemy and the present policy, dating from 1956,

¹ Source: Agenda item 1: Technological Developments in Non-Lethal Weapons and Doctrine for Possible Use. Top Secret; Eyes Only. Extracts—7 pp. Eisenhower Library, Whitman File, NSC Records.

that the US will be prepared to use chemical and biological weapons to the extent that such use will enhance the military effectiveness of the armed forces, the decision as to the use of such weapons being made by the President. Mr. Gray also referred to the view of the Director, Bureau of the Budget, expressed during the review of Basic Policy in July 1959, that we were spending too much money on chemical and biological weapons if we did not intend to use them and too little money if we did intend to use them. Mr. Gray noted that NSC Action 2105 adopted at that time called for the presentation which was about to be made by Dr. York and General Lemnitzer.

Dr. York said that one of the important fields of chemical and biological warfare was controlled temporary incapacitation. Research and development in this field might open up a new dimension of warfare in which incapacitating agents would be used in situations short of all-out war and in situations where the use of nuclear weapons was not possible or feasible. In the term controlled temporary incapacitation, the word "controlled" meant that the time of onset, the duration and the severity of incapacitation could be regulated; the word "temporary" meant that persons subjected to incapacitating agents would eventually completely recover from the direct effects, although minor indirect effects might persist permanently; the word "incapacitation" referred to a variety of effects including extreme irritation, black-out, lethargy, paralysis, discoordinated actions, temporary illness and lack of a will to fight. Dr. York then displayed a chart on chemical incapacitating agents indicating that tear gas (CN-CS) was available now, an anesthetic agent (SN) which caused temporary paralysis would be available soon and a discoordinating agent (K), which would make a cat afraid of a mouse, would be available in the future. A chart of biological incapacitating agents was displayed indicating that an agent causing Q-fever (OU) was available now and NU (VEE) agent would be available soon. A Rift Valley fever agent (FA) and tailored variants of the other agents would be available in the future. Dr. York then reported with the aid of a chart that chemical incapacitation agents had about the same efficiency in the field as tactical nuclear weapons inasmuch as a 10,000 pound missile, 5 per cent of which was chemical agent, could cover one square mile. It was hoped that by 1965 a 10,000 pound missile could cover 10 square miles. Dr. York displayed charts on technical advances and potentials of biological warfare agents indicating that agent concentration and agent storage (now one year; soon to become 3 years) would soon be improved. Charts also showed that the biological decay rate was several per cent per minute and the efficiency of dissemination of biological agents depended on the fraction of the munitions which consisted of the agent.

Turning to weapons systems Dr. York indicated that biological and chemical agents might be disseminated by means of manned aircraft

sprays, drone aircraft sprays, toxic darts, grenades, tactical rockets, special operations, ballistic missiles, or bomblets prepared for use with aircraft, rockets or ballistic missiles.

The US has a relatively poor posture vis-a-vis the USSR, Dr. York continued, our stockpile of chemical and biological agents being one-fourth that of the USSR. Moreover, most of the Soviet agents are lethal. In addition we have trained in chemical and biological warfare only 1/30 of the troops the USSR has trained and we do less in defense against such agents than the Soviet Union does. In the latter connection Dr. York said that the need for research on defense against chemical and biological agents had been strongly indicated by a recent experiment in which an aircraft flew along a flight line of 230 miles releasing simulated agents. After three days the simulated agents covered 300,000 square miles. If the airplane had released powerful chemical or biological agents instead of the simulant, the area would have sustained casualties of 30 per cent. Dr. York then called on General Lemnitzer to continue the presentation.

General Lemnitzer said that Dr. York had described the characteristics of chemical and biological weapons; he would deal with the doctrinal aspects of these weapons. Chemical and biological agents had been very effectively developed since World War II but the doctrine for their use had not changed very much. General Lemnitzer thought that such agents had a number of advantages. They have important search capabilities for use against dispersed or concealed targets; they are flexible, since they can cause either casualties or incapacitation and the length of the latter can be controlled; coverage of a large area is possible; heavy casualties can be inflicted without physical destruction or property damage. Accordingly, chemical and biological agents might have a great potential in future warfare, especially where friendly civilians may be present in an area occupied by enemy forces. General Lemnitzer said he would give three examples of the possible use of chemical and biological incapacitating agents. The first example concerned trouble in South East Asia. He asked the Council to assume that important areas in North Laos had been seized by Communist forces. The task of friendly forces was to retake key areas, capture or disarm the Communist forces and prevent their re-entry into the country. This assumed situation provided opportunity for the use of NU, which caused a form of encephalitis. A lethal agent could not be used under these conditions because friendly civilians and enemy forces were present in the same area. General Lemnitzer then displayed a map of North Laos showing areas assumed to be held by Communist forces and areas on which bomblets of NU would be dropped or which would be subjected to spray from aircraft. He estimated that two medium bomber loads would incapacitate all the people in the area shown on the map. An entire province of North Laos could be covered by the use of more planes. After this biological

agent had had a chance to take effect (three days), parachutists would be flown in to take over the area.

Turning to Example No. 2, General Lemnitzer asked the Council to assume that the Communists had organized a movement in Panama designed to take over the Panama Canal. Stimulated by Communist agitation, mobs had marched on the Canal and had halted operations at two of the locks. It had been decided to disperse the crowd by ordering helicopters to spread tear gas. All persons subjected to the tear gas would eventually recover after breathing fresh air for a sufficient length of time, but immediately on being subjected to tear gas they would be impelled to seek fresh air in the shortest time possible. One helicopter could cover a circle of a thousand yards in diameter in this manner. The apparatus necessary for this use of chemical agents was under development and would soon be available. This procedure would enable friendly forces to regain and maintain control of the Panama Canal locks without bloodshed.

Example No. 3 concerned the Kuwait area. It was assumed that strong insurgent guerrilla forces had seized the oil facilities in the area and had rounded up as hostages several thousand US and UK civilians. Friendly forces were required to regain control of the area before the oil facilities were destroyed and to recapture the hostages before they were executed. A chemical agent sprayed from an aircraft could within five minutes prostrate all personnel in the area for twelve hours, during which time friendly forces could move in and regain control. 2600 pounds of the agent would cover a square mile and there would be no physical damage.

General Lemnitzer said his examples had been confined to incapacitating agents but lethal agents could be used in the same way. The examples had also been examples of catching the enemy by surprise. He had illustrated only an offensive use of chemical and biological agents; however, before using such agents offensively it was necessary to develop a strong capability to defend against them.

Dr. York, concluding the presentation, said that he had been impressed by the development of possibilities in the field of controlled temporary incapacitation over the last several years. He thought it was possible the researchers were on the trail of something revolutionary. The use of chemical and biological incapacitating agents extended from mild control up to effects comparable to those of tactical atomic weapons. The Defense Department proposed to expand the budget for chemical and biological warfare, which was now \$50 million a year, by a factor of three by 1965.

Dr. Kistiakowsky said that the Science Advisory Committee about a year ago had looked into the question of chemical and biological warfare and had concluded that research and development in this field should be continued since the prospects were definitely bright. He

reported that he had independently made his own study of incapacitating agents and had come to the same conclusion. The Science Advisory Committee had recommended that research and development in the field be strengthened. The President said he concurred.

Mr. Stans noted that a year ago he had been told that the US had a \$300 million inventory in chemical and biological agents. He wondered whether this inventory was being reevaluated in the light of recent developments. General Lemnitzer thought the inventory referred to by Mr. Stans was an inventory carried over from World War II. There had been little production of chemical and biological agents since World War II. Mr. Stans asked whether he was correct in understanding that there would be no substantial stockpiling of chemical and biological agents during the research and development period. General Lemnitzer confirmed Mr. Stans' understanding. The President said that since chemical and biological agents could be manufactured at a reasonably rapid rate, capacity for manufacturing rather than a stockpile would be needed. Secretary Gates, referring to public and world opinion on the use of chemical and biological weapons, wondered whether such use should not be put in the same category as the use of atomic weapons; that is, use should be made subject to decision by the President. Mr. Gray read Paragraph 13 of NSC 5906/1 indicating that under present policy Presidential decision is required for the use of chemical and biological weapons.

The President said one great difficulty occurred to him in connection with the use of incapacitating agents. While the use of such agents was a splendid idea, if we tried to use them in a humane manner, our enemy would probably charge us with germ warfare and then would proceed in retaliation to use lethal chemical and biological weapons. He understood that some of these lethal weapons, particularly nerve gas, were quite terrible. Before we used chemical and biological weapons, we would need to have proper defensive equipment. He understood that at the present time US gas masks would not protect against all types of lethal agents. Dr. York said present masks protected against all agents except those absorbed by the skin. He added that we had no protection against bullets and therefore would be in no worse position in chemical warfare than we were in now in other forms of warfare. The President said chemical and biological weapons had considerably less discrimination than a bullet. Dr. York felt that at the very least chemical and biological weapons were no worse than atomic weapons.

Dr. Kistiakowsky said that a sharp distinction should be made between chemical warfare and biological warfare. Chemical warfare, e.g., the use of tear gas, had been accepted throughout the world in police actions, but biological warfare had not been so accepted. Mr. Dulles strongly agreed with Dr. Kistiakowsky, saying that we ought to assimilate our use of incapacitating agents to the use of tear gas. He felt we needed some incapacitating agent which we could use respectably.

General Twining agreed with the President that if we began the use of chemical or biological agents, our enemy would retaliate with lethal agents. If we intend to use incapacitating agents we should publicize their non-lethal effects to the greatest possible extent.

At this point the President left the meeting and the remainder of the meeting was presided over by Secretary Herter.

The National Security Council:

Noted and discussed an oral presentation on the subject by the Department of Defense, prepared pursuant to NSC Action No. 2105-*d*, as presented by the Director of Defense Research and Engineering and the Chief of Staff, U.S. Army.

[Omitted here are pages 7-12.]

Marion W. Boggs

243. Memorandum From Burke to Gates¹

Washington, March 12, 1960

SUBJECT

Survivability of soft bases in United States after Russian missile attack

1. There have been quite a few presentations recently concerning the survivability of important soft targets in Continental United States after a Russian ballistic missile attack. These studies are concerned with the number of missiles which Russia would have to have on launchers to destroy a large number of soft targets in the United States. The conclusions are not exactly alike because they are very dependent upon assumptions which include variables such as:

- a. The number of missiles on launchers available to the Russians at various times
- b. CEP—The Probable Circular Error of the missiles
- c. Missile reliability both on launchers and in flight
- d. Whether missile launching submarines would be used
- e. If missile launching submarines are used—how many

¹ Source: Survivability of soft bases in United States after Soviet missile attack. Top Secret. 3 pp. Naval Historical Center, Burke Papers, Originator File.

f. The degree of destruction which the Soviets might determine they should inflict (estimates range from 70% probability of destroying all soft targets through 90% to 99%)

g. The actual targeting which the Russians might choose, i.e., would they concentrate first on all aircraft bases, next on soft missile sites, and then on hardened missile sites, or would they choose some other order of destruction?

2. Nevertheless, nearly all of the studies show that all soft targets (bases and soft missile sites) could be destroyed by a comparatively few Russian missiles and indicate that our retaliatory capability, when the Russians achieve a significant number of missiles on launchers, is dependent upon getting Polaris submarines and hardened ICBM sites operational as soon as possible—before 1963. These studies show that after some conceivable attacks by the Russians, very few SAC aircraft on United States bases would be available.

3. The presentations indicate that only the capability within the United States is considered, and that the retaliatory capability of the attack carrier striking forces was not included. The exclusion was not because they were unimportant, but because they did not lend themselves readily to mathematical analysis. It is submitted that the Russians, perhaps, would have the same difficulty in correctly appraising the capabilities of such forces. Still the possible actions that are usually recommended are confined to what can be done to achieve a greater retaliatory capability from these forces in the United States after an attack. No statements have been made as to how to increase the retaliatory capabilities which are not subject to Russian ballistic missile attack, i.e., carriers at sea.

4. To get an increase in surviving aircraft at bases in the United States, requires under some circumstances, considerable funds and effort. I believe that we may be overlooking a comparatively inexpensive way of increasing our retaliatory capability during the next few years by increasing the number of attack planes available after an attack by increasing the number of attack carriers at sea.

5. Normally there are about 200 attack aircraft in the 6th and 7th fleets. The carriers and these aircraft are not subject to ballistic missile attack when at sea. If an air attack is launched against any of these carriers we will have considerable warning, much more than any 10 or 15 minutes. This is because timing of an air attack against carriers in an unknown location could not be coordinated with an all-out missile attack for a predetermined specific time.

6. The 200 aircraft mentioned above are near the Soviet Union and, consequently, could attack quickly. There would be attrition in the carrier aircraft during the attacks, of course, but many of them will return to their carriers for use in succeeding attacks. Furthermore, in addition

to the carriers of the 6th and 7th fleets at least an equal number of carriers are available for deployment from United States waters.

7. During the period in which Russia might have a significant ICBM-launching capability and in which we might have neither sufficient numbers of Polaris submarines at sea nor hardened missile sites in the United States, our capability could be significantly increased by increasing the numbers of carriers and carrier aircraft. This could be accomplished by keeping in commission our older attack carriers (those now scheduled to be replaced) and by augmenting the number of attack aircraft. The older carriers kept in commission could continue their usefulness until '63 or '64. When sufficient hardened ICBM and Polaris missiles are operational the attack carrier force could then be returned to present strength.

8. It is recommended, therefore, that consideration be given to increasing the number of carriers and carrier combat aircraft during the next few years if it is determined that an increase in the aircraft surviving capability during this period is necessary.

Arleigh Burke

Note on Op-07 copy:

Please get this to Dr. Kistiakowsky and any other people who can use it.

Note on Op-61 copy:

Please get this to State.

244. Memorandum for the Record of Meeting Between Gates and JCS¹

Washington, March 14, 1960

SUBJECT

Meeting with Secretary of Defense and Joint Chiefs of Staff, 14 March 1960

ADM BURKE: The Secretary of Defense is very much concerned about the various presentations that have been given to him on what Russia could do to the United States with missiles on launcher under the most adverse conditions. All of these presentations that I have seen,

¹ Source: Soviet missile capabilities and request for JCS study on U.S. strategic vulnerabilities. Top Secret; Hold Closely. 2 pp. Naval Historical Center, Burke Papers, Originator File.

and I've seen several of them, pertain only to what would happen against targets in Continental United States. Most of them assume a specific targeting which would be SAC first, then soft missile sites and then hard missile sites. It doesn't take very many missiles under ideal conditions to knock out all of SAC. What these presentations prove is SAC is a useless thing in the missile age, because you can knock out the bases. At the same time, they also prove that until we get POLARIS and hardened sites, within '60 and '61 if Russia did have a significant number of missiles—70, 100, 120, some place along there, if for some reason they did have these missiles on launcher, and if they had a high degree of reliability and other systems, they could knock out most of our retaliatory system in the United States. The cure for that, as I said before, is POLARIS and hardened sites. We don't get any hardened sites until '61. This is all without warning, so the obvious thing to do is push up—accelerate POLARIS, accelerate BMEWS, and SECDEF is considering whether or not to put on an air alert. I think he read that letter on carriers that we wrote on Saturday, and maybe he is considering increasing the number of carriers we have as well as dispersing SAC.

Now, he wants a study made by the Joint Chiefs of Staff on all of this intelligence—a military appraisal of our situation. This means a very important piece of paper because we're going to have to move fast on this thing. Op-06 and Op-92 must get in on this for sure. This problem is going to be turned over to the JSSC. The JSSC will call upon the Service planners.

Here's what I think, and this is from the top of my head. I don't care what you do so long as you follow this. I think you'll agree it's sound. Let's shoot for these things which increase this nation's capital gains, these things which will give us a greater capability and will last for a long time. For example, if you expedite BMEWS, you get BMEWS sooner but you've got a BMEWS for ever and ever. So, let's expedite BMEWS, let's expedite POLARIS. Let us do these things which will increase our military capability over a long period of time. Let us take those things which do not increase our military capability but are only temporary expedients, such things as an air alert where no matter how many air alerts you run today, you're not any better off tomorrow—you've got to run them tomorrow too. Let's examine the cost of these very carefully. Now, carriers come in there. If you keep carriers in existence, it's the operating costs of the carriers, but the airplanes you buy for that carrier are capital gains because you're going to buy those airplanes someday anyway. So that's an actual gain. That increases your military capability, but the operation of your carrier doesn't increase your military capability—you've got to operate it tomorrow. I think that's a pretty sound way to approach

this. There is such a thing as buying the wrong thing, and you've got to watch out for this. For example, if you increase the numbers of ATLASEs in hard targets, you may not want ATLASEs by the time you get them. So, when do you have to make the decision to get more ATLASEs? I mean if you made the decision right now, you don't get ATLASEs until '62 anyway—therefore, do you need to make the decision right now to get ATLASEs in '62 or can you make the decision six months or a year from now and just keep these production lines running longer?

One of the things you've got to consider is when do you make a decision on each of these points? They will vary. The ATLAS decision probably doesn't have to be made now—however, the carrier decision has to be made about a month before the first carrier goes out, and perhaps the decision to get some more carrier airplanes needs to be made pretty quick. Anyway, let's get going.

Arleigh Burke

**245. Memorandum for the Record of Telephone Conversation
Between Eisenhower and Burke¹**

Washington, March 26, 1960, 11:30 a.m.

SUBJECT

Telephone conversation between the President and Admiral Burke, 1130, 26 Mar 1960

1. The President called me to discuss augmentation of the Polaris submarine program. Following are the highlights of this discussion.

2. The President pointed out that the Navy has quite a bit of money in the FY '61 budget for attack submarines and said he thought attack submarines seem to have rather limited usefulness because other people do not have much shipping. He acknowledged that he

¹Source: Discussion of augmentation of the Polaris submarine program. Top Secret; Hold Closely. 2 pp. Naval Historical Center, Burke Papers, Originator File.

was not taking into consideration use of submarines to attack enemy submarines and pointed out that he wondered whether the Navy might consider using this '61 money budgeted for attack submarines to be applied as long leadtime funding for additional Polaris boats.

3. I told him that the '61 budget had money in it for 3 attack submarines in an amount of about \$171M. I pointed out that this was about equal—not quite but within shooting distance of what the long leadtime items would cost for 6 Polaris submarines. I then explained that the disadvantage to this would be that it is partial funding. However, since we have already put in for long leadtime items for 3 Polaris boats anyway, I thought that Congress would understand such a change. The President said then that Mr. Stans had talked with him and had said that actual expenditures for 6 new ones would require operational authority in FY '61 of only \$200M. Completing these 6 boats would require \$600M more in future years and the expenditure in '61 would be only \$21M. I said that essentially Mr. Stans was correct. The expenditures are not very great under such a proposal in '61.

4. The President then indicated he thought we should do this as long as we were not unduly reducing our attack capability against enemy submarines by such a course of action. I agreed and said that, in my belief, over the long run such a course of action would be better. I pointed out that we can build attack submarines a little bit faster than we can Polaris boats primarily because we know more about the building process of regular attack submarines. I explained that taking such a course of action did not mean cancellation of attack submarines in FY '61 but rather deferral until a later date.

5. The President ended up the conversation by telling me to think over this proposition and toward the middle of next week come in and talk with Mr. Stans and Jerry Persons because he, himself, was going to be tied up with Prime Minister Macmillan.

Arleigh Burke

246. Memorandum From Twining to Gates¹

CM-516-60

Washington, April 11, 1960

SUBJECT

U.S. Policy in the Event of War (NSC 5904/1) (C)

REFERENCE

JCSM-149-60 (attached)

1. Attached are the divergent views of the Joint Chiefs of Staff on a proposed amendment to NSC 5904/1, prepared by the NSC Planning Board pursuant to NSC Action No. 2057.

2. The NSC Planning Board has reviewed NSC 5904/1 and has agreed to recommend to the National Security Council that, except for deletion of the footnote on page 2 as an editorial change, NSC 5904/1 not be revised at this time.

3. The Chief of Staff, U.S. Army; the Chief of Naval Operations and the Commandant of the Marine Corps have agreed to deletion of the footnote or as an alternative to change the title of the Section and modify the footnote.

4. The Chief of Staff, U.S. Air Force does not agree to deletion of the entire footnote since the first sentence states U.S. policy which was current when NSC 5904/1 was approved. (17 March 1959). He does agree to the deletion of the second sentence as an editorial change.

5. I consider that NSC 5906/1, which considers the various types of war, provides the Joint Chiefs of Staff with adequate guidance for any amplifying directives to unified and specified commanders. Furthermore, I concur with the view of the NSC Planning Board that deletion of the footnote in NSC 5904/1 would be editorial.

6. Accordingly, I recommend that the footnote be deleted.

N.F. Twining

Chairman

Joint Chiefs of Staff

247. Memorandum From Twining to Gates¹

JCSM-149-60

Washington, April 11, 1960

SUBJECT

U.S. Policy in the Event of War (NSC 5904/1) (C)

1. The Joint Chiefs of Staff have reviewed the proposed amendment to NSC 5904/1, prepared by the NSC Planning Board pursuant to NSC Action No. 2057, and have been unable to reach agreement thereon.

2. Accordingly, forwarded herewith, as Appendix "A", are the views of the Chief of Staff, U.S. Army, Chief of Naval Operations and Commandant of the Marine Corps; and as Appendix "B", the views of the Chief of Staff, U.S. Air Force.

3. It is requested that the Joint Chiefs of Staff be advised of your decision in this matter.

For the Joint Chiefs of Staff:

N.F. Twining
Chairman
Joint Chiefs of Staff

*VIEWS OF THE CHIEF OF STAFF, U.S. ARMY; CHIEF OF
NAVAL OPERATIONS; AND THE COMMANDANT
OF THE MARINE CORPS*

on

US POLICY IN THE EVENT OF WAR (NSC 5904/1) (C)

1. The Chief of Staff, U.S. Army; the Chief of Naval Operations; and the Commandant of the Marine Corps have reviewed NSC 5904/1 in light of the NSC Planning Board's proposal.

2. *a.* The footnote associated with the title of Section B was designed to eliminate from NSC 5904/1 an issue more properly resolved by

¹ Source: Transmits JCS revisions to NSC 5904/1. Top Secret. 4 pp. Library of Congress, Manuscript Division, Twining Papers.

revision of 1958 Basic National Security Policy (NSC 5810/1), and to allow publication of NSC 5904/1 (17 March 1959) before completion of the review of the then current Basic National Security Policy. Although the deletion of the footnote to Section B of NSC 5904/1, as proposed by the Planning Board, would not specifically clarify the definition of the type of aggression being addressed in this section, its deletion without replacement is, in the view of the Chief of Staff, U.S. Army; the Chief of Naval Operations; and the Commandant of the Marine Corps, an acceptable proposal since it is assumed that users of this document will also have knowledge of NSC 5906/1, which considers the various types of war. It is our recommendation that the Planning Board proposal be accepted.

b. The Chief of Staff, U.S. Army; the Chief of Naval Operations; and the Commandant of the Marine Corps cannot, however, concur in any footnote, to the effect that a war with Russia is a general war, since nowhere in NSC 5906/1 is general war so defined. Furthermore, such a definition is considered to be completely unacceptable by reason of inaccuracy. Paragraph 9 of NSC 5906/1 recognizes that we are now engaged in a war with Russia; the cold war. The Chief of Staff, U.S. Army; the Chief of Naval Operations; and the Commandant of the Marine Corps do not consider that this war is comparable to the conditions they envisaged would exist in a general war.

3. If clarification of the subject matter of Section B is considered desirable by the National Security Council, it is suggested that either:

a. The title of this Section be changed to read:

"US POLICY IN THE EVENT OF CONFLICT IN WHICH SIZEABLE FORCES OF THE USSR ARE NOT INVOLVED."

b. or, the following footnote be adopted:

NSC 5904/1, Page 2, Footnote:

"This section of the policy statement addresses itself to those conflicts in which sizeable forces of the United States and USSR are not involved. Present U.S. policy is based upon the concept stated in paragraph 16, NSC 5906/1, that 'conflicts occurring in the NATO area or elsewhere involving sizeable forces of the US and USSR should not be construed as local aggression.'"

Appendix B

Washington, undated

VIEWS OF THE CHIEF OF STAFF, U.S. AIR FORCE
on
U.S. POLICY IN THE EVENT OF WAR (NSC 5904/1) (C)

1. I have reviewed the NSC Planning Board proposal, which recommends that NSC 5904/1 not be revised at this time except for deletion of the footnote on page 2 as an editorial change.

2. I do not agree that deletion of the entire footnote on page 2 of NSC 5904/1 would constitute only an editorial change. The first sentence states U.S. policy which was current on the date it was approved (17 March 1959). The second sentence establishes that the validity of this policy is subject to re-examination when Basic National Security Policy was next reviewed. That review has occurred. There was not action taken in that review which in any way suggested that the statement of policy in the first sentence has become invalid or that national policy in this respect has been substantively altered. It is obvious that the second sentence is no longer appropriate and should be deleted as an editorial change.

3. NSC 5904/1 appropriately amplifies the broad guidance contained in current Basic Policy (NSC 5906/1) in that it provides more definitive and more specific guidance for one area to those agencies directly concerned. This guidance is valid, timely and substantive. To delete the first sentence of the footnote would imply a modification of national policy which has not occurred. In addition, its deletion would remove useful and informative clarification specifically applicable to guidance in this policy.

4. Therefore, I recommend that the Secretary of Defense propose to the National Security Council that the first sentence of the footnote on page 2 be retained and that the second sentence be deleted.

248. Paper Prepared by the NSC Staff¹

Washington, undated

*MEGATONAGE INVOLVED IN PREVIOUS
NET EVALUATION STUDIES*

1955 Study

Under conditions of surprise attack, 600 megatons were delivered on targets in the Continental U.S. In U.S. retaliatory strikes, 9000 megatons were delivered on Soviet targets world-wide.

1956 Study

Under surprise attack conditions, the USSR delivered 4407 megatons on the U.S. (in retaliation, the U.S. delivered 8010 megatons on the Sino-Soviet Bloc). In a condition of full alert, the USSR delivered 5047 megatons on the U.S. (and the U.S. delivered 11,200 megatons on the Bloc).

1957 Study

Under conditions of surprise attack, the USSR delivered 3905 megatons on the U.S. (and in retaliation the U.S. delivered 7896 megatons on the Soviet Bloc). In a condition of full alert, the USSR delivered 5173 megatons on the U.S.

1958 Study

In a surprise attack situation, the USSR delivered 2186 megatons on the U.S. (the U.S. delivered 5810 megatons on the USSR and 705 megatons on China).

249. Paper Prepared by the NSC Staff¹

Washington, April 26, 1960

*PLANNING BOARD QUESTIONS
NET EVALUATION PRESENTATION*

1. What use was made of the 48 hours strategic warning? Why did we not do better than get only 33–1/3% of SAC in the air after getting 48 hours warning?

2. Why was the UK “V” Force destroyed on the ground?

3. What did the Soviet ground forces do? Walk West?

4. Was the new Soviet surface-to-air “Guideline” missile taken into account in developing losses of our attacking forces?

5. Why was less megatonnage dropped on U.S. per this report than in the exercise several years ago?

6. Could the Government relocate upon receipt of strategic warning without attracting wide public attention?

7. Would not the increased weight of the Soviet nuclear warhead mentioned in recent intelligence estimates but not in the intelligence used by NES result in greater megatonnage falling on the U.S.?

8. Why were the 117 Soviet residual ICBM’s left after the 18½ hour exchange not used for further attack on the U.S.?

9. Why did the State governments survive?

10. Was any assessment made of damage to members of the Sino-Soviet Bloc other than the USSR?

11. What activities will the NES Staff be engaged in during the next nine months?

12. Why were only 50% of the weapons striking the U.S. set for ground bursts, while 95% of the U.S. weapons on the USSR were set for ground bursts?

13. Mr. Gray asked General Hickey to consider giving greater emphasis in his introductory remarks to the fact that the attack was war-gamed.

250. Memorandum for the Record¹

Washington, April 29, 1960

SUBJECT

Debrief of NSC Meeting, 28 Apr 1960

MR. GORDON GRAY—Said questions had been brought up in the planning group about the 48-hour warning and about the relocation of the government people, during those 48 hours. With all the military on full alert and with all of this being known, would the Soviets attack then or would they not?

—The second question was what should be done in regard to warning and instructions to the civilian population?

There was a lot of discussion as to difficulties in calling off an attack once it has been ordered, and the possibility that if they tried to call it off somebody wouldn't get the word and it would be launched anyway. Then, the war would be on and they would have lost their initial advantage of a heavy initial attack. In other words, if the Russians tried to call it off and if they weren't successful in calling it off, they would have really lost their nation and not have gained anything by it. It was decided that it was very unlikely that once the Russians decided to launch an attack that they could afford to call it off. The decision had to be made once and for all.

—The next question as to whether to tell our people. A lot of people said that it would be better if the people were not unduly excited and were told it was an exercise, that you wouldn't know for sure that an attack was coming, and that if you told them that an attack was coming for sure, they would probably panic. However, the President said that you should tell the people. I agree, even though a lot of people would panic. If they are not told completely about what is happening, it is going to leak and they will lose confidence in the integrity of their own government in periods of crisis and they will desert and be wholly selfish. In a time of crisis if you told the people the whole business, as much as you possibly can tell them, they would realize that their government is doing everything it possibly can to protect them and that their government is going to fight like hell. You can't play games with people in periods of crisis.

¹ Source: Debrief of the NSC meeting of April 28: Polaris reserves, Soviet intercept capability against aircraft, SAC dispersal, fallout. Top Secret; Hold Closely. 3 pp. Naval Historical Center, Burke Papers, Originators File, 1 March to 30 April, 1960.

COMMENT: This was not brought out at the meeting.

THE PRESIDENT—Then discussed in general the vulnerability of SAC land-based equipment. He asked how long does it take to fire Minuteman and when the research would be done on Minuteman? He asked when Hound Dog would be operational? Then, he noted that the reserves for Polaris were very few, and he thought we should have 100% reserves of Polaris missiles in coastal areas where we could possibly get them.

ADM BURKE—Told him we had 33% reserves in tenders.

THE PRESIDENT—Said he didn't think that was enough, that it should be 100%.

ADM BURKE—Said thank you.

—Then said we had thought of putting reserve missiles in tenders and sending them into safe waters such as Trinidad or African or South American ports.

THE PRESIDENT—Said well, you would have to send a submarine a long distance to get reserve missiles and he thought it would be wise to have some reserves right in the United States.

I heard Mr. Douglas whisper to Andy Goodpaster that it would take weeks to get reload on this basis.

THE PRESIDENT—Then said, in answer to a question, that he wanted to have some residual power left so that he wouldn't be helpless—that, if he had started a war like that, he wanted to be able to finish it, and he was interested in having a capability after the initial strikes were over.

MR. GATES—Asked him if he thought the follow-on strike capability would have any deterrent effect.

THE PRESIDENT—Said no, he just wanted to have military capability afterwards.

MR. MC CONE—Then asked if we had studied the growing intercept capability of the Russians against aircraft. He pointed out that the Russians had been improving their surface-to-air missiles. They had good interceptors, good communications, and there was a lot of intelligence information which indicated that the Russians were really stressing air defense, particularly against high altitude aircraft. With the introduction of missiles into the Soviet arsenal, aircraft were becoming increasingly vulnerable while missiles were not, and yet 90% of our stockpile was now for aircraft delivery and only 10% was for other types of delivery—and, I think he said only 2% was for missile delivery.

It was then brought out there would be a gradual shift from aircraft to missiles, but this would have to be continuously re-examined. The vulnerability of missiles was discussed a little bit but that was not important.

THE PRESIDENT—Then asked about an air alert.

GENERAL LE MAY—Said that, if they had 15 minutes warning, it was not profitable to have an air alert, that the only mission of an air alert was when you didn't have any warning. He then mentioned blind takeoffs in which they had cut down their take-off time to one-third what it had been previously, and that the intervals between aircraft takeoff was now 15 seconds. He said he had some movies which he offered to send to the President.

THE PRESIDENT—Accepted.

COMMENT: This was the first time I had heard of this.

THE PRESIDENT—Then discussed the dispersion of SAC, and again the answer was that it wasn't necessary to disperse SAC much further if they were able to achieve their takeoff capability.

There was then a long discussion as to the amount of long term fallout hazard, particularly Strontium-90 and similar elements. For example, the study said there would be about 3 million additional leukemia and bone cancer cases directly due to Strontium-90 after a 6,000-megaton yield delivery by both sides.

THE PRESIDENT—Thought this was probably low.

They are going to look into it. Nobody knew what they were talking about.

GORDON GRAY—Said he would like to discuss what they would do at the next NESC study.

THE PRESIDENT—Said that doesn't have to be decided here.

Arleigh Burke

251. National Intelligence Estimate¹

NIE 11–5–60

Washington, May 3, 1960

SOVIET CAPABILITIES IN GUIDED MISSILES AND SPACE VEHICLES

THE PROBLEM

To estimate Soviet capabilities and probable programs for the development of guided missiles, and the major performance characteristics and dates of operational availability of such missiles. In addition, to estimate the technical capabilities of the Soviets in space, including the earliest possible dates of achievement of important future space ventures. (The period covered runs through about 1965, except where otherwise stated.)

NOTE

This estimate entirely supersedes the Summary and Conclusions of NIE 11–5–59, dated 3 November 1959, and the Memorandum to Holders of NIE 11–5–59, dated 19 January 1960. In addition, it updates and should be used in conjunction with the Discussion in NIE 11–5–59, pertinent paragraphs of which are cross-referenced at the beginning of each section in this estimate.

Annexes to this estimate entirely supersede the following portions of NIE 11–5–59: Annex A supersedes Table 3 of Section VIII (Possible Soviet Space Development Program); Annex B supersedes Section IX (Summary Tables).

THE ESTIMATE

1. During the last six months we have acquired new evidence on Soviet guided missile capabilities and programs, generally confirming progress along the lines indicated in NIE 11–5–59 and in some cases resulting in refinement or modification of our estimates. Our principal acquisitions relate to: (a) Soviet ICBM characteristics and continued test-firing activities; (b) characteristics and deployment of Soviet surface-to-air missiles; (c) Soviet surface ships for missile launching; and (d) Soviet research and development in cruise-type surface-to-surface systems. Despite this improvement in our knowledge of some Soviet missile programs, serious gaps in our information still exist, especially regarding Soviet ballistic missile production and concepts of deployment, research and development on second generation ICBMs

¹ Source: "Soviet Capabilities in Guided Missiles and Space Vehicles." Top Secret. 21 pp. DOS, INR–NIE Files.

and other ballistic missiles, Soviet programs for submarine-launched ballistic missiles, the USSR's approach to the problem of defense against ballistic missiles, and Soviet space programs.

The Soviet ICBM Program

(See paragraphs 69–84, NIE 11–5–59)

2. Recent test firing activities indicate that the ICBM development program continues in an orderly fashion rather than on a “crash” basis. Since early November 1959, there have been seven generally successful ICBM firings, including two 6,500 n.m. shots to the Johnson Island area in the Pacific. This brings to 25 the total number of firings to ranges of 3,500 n.m. or more.

3. *IOC Date.* Evidence derived from flight tests is considered adequate to gauge the general progress of the program, but we cannot state with certainty the precise timing of the USSR's initial operational capability (IOC); that is, the date at which a few—say 10—series produced ICBMs could have been placed in the hands of one or more trained units at existing launching facilities. We also consider the IOC as marking the beginning of the planned buildup in operational capabilities. [*text not declassified*] We believe, however, that this does not preclude an earlier Soviet decision that the system was satisfactory for initial deployment. Limited number of operational personnel could have received training in conjunction with the test firings. We believe that for planning purposes it should be considered that the IOC had occurred by 1 January 1960.^{2,3}

4. *Production and Deployment.* An exhaustive re-examination has failed to establish Soviet ICBM production rates or to provide positive identification of any operational ICBM unit or launching facility other than the test range. Our belief that series production of ICBMs is under way is based on the time elapsed since the start of test firings in 1957, the generally successful results of the test program, and particularly the increased rate of firings since early 1959, all of which lend credibility to Khrushchev's claim of early 1959 that series production was then beginning. Final assembly of ICBMs may be taking place at more than

² The Assistant Chief of Naval Operations for Intelligence, Department of the Navy, believes there is insufficient information to judge that the conditions for IOC as described in paragraph 3 have been met. He believes therefore that an IOC date of not earlier than mid-1960 should be used for planning purposes. [Footnote is in the original.]

³ The Assistant Chief of Staff for Intelligence, Department of the Army, wishes to clarify his position with respect to the Soviet ICBM IOC date. He believes that as of 1 January 1960 the Soviets had an emergency capability to launch a few series-produced ICBMs against North America, but that these ICBMs probably would have had to have been launched from R&D facilities, rather than from a separate operational facility. However, he agrees that for planning purposes, it is prudent to assume that the IOC had occurred by 1 January 1960. [Footnote is in the original.]

one plant in the USSR; we now have limited evidence pointing to two Soviet cities as possible production sites.

5. There is no new evidence to establish the Soviet ICBM deployment concept. The available evidence suggests that the Soviet ICBM could be rail mobile, but we do not know whether the deployment pattern as a whole will comprise rail mobile units, hard or soft fixed installations, or some combination of these methods. In any case, Soviet ICBM sites are not likely to be found at locations remote from rail support.

6. *Configuration.* On the basis of data obtained from ICBM and space vehicle launchings, we believe the Soviet ICBM to be a one and one-half staged (Atlas type) vehicle or a parallel staged vehicle, with the former now considered somewhat more likely. It almost certainly employs nonstorable liquid propellants. Data acquired on the re-entry vehicles used on the shots to the Johnson Island area indicate that the nosecones employed in those tests were of the ablative rather than heatsink type. We therefore estimate that the Soviet ICBM employs an ablative nosecone. Use of such a nosecone would permit the delivery of a 6,000 pound nuclear warhead to a range of about 6,500 n.m., that is, from virtually any point in the USSR to virtually any point in the US. A reduction in warhead weight would permit a greater range or the incorporation of penetration aids in the nosecone.

7. *Accuracy.* [text not declassified] the Soviet ICBM probably has radio-inertial and not all-inertial guidance. The guidance system is believed to employ radar tracking with radio command, and to include inertial components within the missile. The data available for estimating Soviet CEPs are far from exact; considerable reliance has been placed on general state of the art and US analogy. These factors, together with our estimate of Soviet capabilities in related components such as gyroscopes and accelerometers, point to a *theoretical* CEP at IOC date of about 2 n.m., which we believe would be degraded to about 3 n.m. under operational conditions.⁴ This is an approximate figure and we apply it to all ranges to which ICBMs are likely to be fired.

8. We believe that operational considerations will lead the Soviets to incorporate an all-inertial system in their ICBM sometime during 1961–1962 or possibly earlier. A Soviet all-inertial system, as of today, would probably have a *theoretical* CEP of about 3 n.m., degraded to

⁴ Under operational conditions, *theoretical* CEPs will be degraded by several factors such as: (a) re-entry errors induced by undeterminable winds and air density over the impact area; (b) human and experience factors; and (c) geophysical errors including gravitational anomalies, geoidal uncertainties, and uncertainties of target location relative to launch point and local verticals. [Footnote is in the original.]

about 5 n.m. under operational conditions. Units already equipped with radio-inertial guidance probably would not be retrofitted with the all-inertial system.

9. We estimate that over the next few years, probably not later than during 1963, the operational CEP for a Soviet ICBM system with all-inertial guidance could be reduced to about 2 n.m., and that with radio-inertial guidance, the operational CEP could be made somewhat better. ICBM accuracy under operational conditions could probably be still further improved to about 1 n.m. in 1965–1970. The element of uncertainty in our estimate of CEPs for future years is very great.

10. *Reliability Factors.* The strategic significance of an ICBM force is heavily dependent on the reliability of the system under operational conditions, and on the percentage of missiles which can be kept in commission. We have again reviewed the factors which would affect Soviet ICBM reliability and in-commission rates under various circumstances, taking into account what little intelligence is available, general state of the art, and US analogy. The uncertainties are such that figures can be provided as working assumptions only.⁵

11. On this basis, we believe it reasonable to assume that in mid-1960, some 60–80 percent of the USSR's operational ICBM inventory could be in commission. The lower limit of this range approximates the percentage which might be maintained in commission for an indefinite period. The upper limit might be achieved if the Soviets prepared their force for an attack at a specific time. The in-commission rate would improve as the system matured. Ranges comparable to those given above might approximate 70–85 percent in 1961 and 85–90 percent in 1963.

12. With respect to reliability on launcher and in flight, we assume that in mid-1960, some 50–60 percent of the ICBMs in commission and on launchers could successfully go through count-down, leave their launchers at scheduled times or not later than 15–30 minutes thereafter, and detonate in the vicinity of assigned targets. As in the preceding paragraph, the lower limit of this range approximates the reliability which might be maintained indefinitely, while the upper limit might be achieved if the Soviets prepared their force for an attack at a specific time. The percentage of successful missiles might increase to 55–65 percent in 1961 and 65–75 percent in 1963.

13. *Follow-on System.* During the next few years, the Soviets will probably have under development a follow-on ICBM system, although there is no direct evidence that such a development program is now

⁵ For missiles other than the ICBM, the table of missile reliabilities in NIE 11–5–59 provides the best working assumptions we have been able to derive. [Footnote is in the original.]

under way. We are unable to estimate when the USSR could achieve an IOC with a new ICBM system, but we would expect first flight tests to precede IOC date by some 18 months to two years. Desirable characteristics for such a system might include fast reaction time, storable liquid or perhaps solid propellants, greater flexibility, and less bulk than the present system.

Other Ground-Launched Ballistic Systems

(See Paragraphs 50–68, NIE 11–5–59)

14. Missiles in this category which we know the USSR has developed and continues to improve include those with maximum ranges of about 75 n.m., 200 n.m., 350 n.m., 700 n.m., and 1,100 n.m. (designated SS–1 through SS–5 by US intelligence). All these systems are considered to be operational, but there is little evidence as to their deployment. [*text not declassified*] Although our information points to several plants which may be engaged in the series production of short and medium range ballistic missiles, it is insufficient to establish production rates.

15. There is no new evidence to cause any major change in our estimates of the characteristics of the foregoing ballistic missile systems. We continue to believe that systems with ranges of 700 n.m. and less are road mobile, although missile carriers and support vehicles are readily adaptable to rail transport. The 1,100 n.m. missile is considered suitable for road or rail mobile employment.

Ground-Launched Cruise-Type System

16. Recent Soviet statements, as well as other information, indicate that the USSR has a current interest in cruise-type vehicles. We estimate that the Soviets are developing and could have available for operational use in 1961–1963, a ground-launched, ramjet propelled vehicle, with a speed of about Mach 3, an altitude of 65,000–70,000 feet, and a range in excess of 4,000 n.m. Such a system could be employed for weapon delivery or reconnaissance, and would further complicate Western air defense problems. Although unlikely, it is possible that such a system could be employed as a research vehicle for investigation of structures and propulsion systems in the Mach 3 region.

Air Defense Missile Systems

(See paragraphs 16–39, NIE 11–5–59)

17. *Surface-to-Air*. The flexible, mobile, surface-to-air missile system (SA–2) first identified in East Germany and now extensively deployed in the USSR, is believed to be the mainstay of the Soviet missile defense system against aircraft. The early Moscow system (SA–1) is now apparently being bolstered by the partial introduction of the more effective SA–2 missile (GUIDELINE) into the original herring bone sites and by

the addition of sites of the new type. Both systems are capable of interceptions at medium and high altitudes up to 60,000 feet, and would have some capability up to about 80,000 feet, particularly if carrying a nuclear warhead. The SA-1 system has a low altitude limit of about 3,000 feet. The low altitude limit of the SA-2 is approximately 1,000 feet under ideal siting and engagement conditions. Under usual conditions, it would be considerably higher, and under unfavorable conditions it might be as high as 7,000 feet.

18. Each SA-2 site appears capable of 360° coverage. The system possibly can handle two targets simultaneously, with more than one missile in the air against each target. However, these targets must be within the approximate 12° radar look angle (both horizontal and vertical) of the system's guidance radar during the period from acquisition to intercept. Maximum intercept range will vary depending upon type of target, approach angle, and other operational factors; for example, against a directly incoming, high-flying B-52, SA-2 range would be on the order of 25 n.m. The CEP will also vary under different conditions, but probably approximates 100 feet on the average.

19. The SA-2 system does not appear to be designed or sited to cope with low-level attacks. We continue to estimate that the Soviets are probably developing a surface-to-air system (SA-3) specifically designed for defense against targets down to about 50 feet. It is still possible that such a system could become available for operational use late in 1960, but an initial capability in 1961 now appears more likely.

20. For defense against advanced aircraft and cruise-type missiles, the USSR will probably incorporate technical improvements into the SA-2 system to increase its altitude and range capabilities. Significant improvements could appear in about 1961. In view of the widespread deployment and estimated growth potential of the SA-2, we now consider it very unlikely that the Soviets will develop in the near term an entirely new high-altitude system (previously estimated as SA-4). It remains possible, however, that such a system will be developed at a later date, and we believe it could become operational 2-3 years after the initiation of flight tests.

21. *Antiballistic.* We believe the Soviets are pursuing a very high priority program to develop defenses against ballistic missiles. Solution of the problems of an antimissile missile would involve the development of complex and costly components and their integration into a weapon system with high capabilities for distant detection, discrimination, identification, and interception. The net result would be heavily dependent on tactics, deployment, and the effectiveness of Western countermeasures. While such a system (SA-5) is

probably being developed and could become operational in the 1963–1966 period, we cannot estimate what its capability would be against Western ballistic missiles.

22. The USSR is probably also exploring unconventional techniques for active defense against ballistic missiles. We cannot predict the nature or success of such studies. In any case, continuous research and development in antimissile defenses will be under way during the next five years and beyond.

23. *Antisatellite*. The USSR may also develop a ground or air launched system to counter Western satellites with relatively low, established orbits. However, the Soviets could adapt for this purpose an antiballistic missile system such as that discussed in the preceding paragraph.

24. *Air-to-Air*. We continue to estimate that the Soviets have several types of short range (up to 6 n.m.) air-to-air missiles with HE warheads, for employment with their interceptors. There are some indications that one or more of the foregoing types are now operational with Soviet interceptors, and it is possible that they have been supplied to the East German and Chinese Communist Air Forces. The USSR will probably develop, during the period of this estimate, additional types with longer ranges, more sophisticated guidance, and larger payloads (including nuclear).

Air-to-Surface Missiles

(See paragraphs 40–49, NIE 11–5–59)

25. The current Soviet air-to-surface missile (the subsonic, 55 n.m. AS–1) is designed primarily for use against ships. It could also be used against well-defined radar targets such as prominent coastal installations. It imposes severe limitations on the launching medium bomber aircraft. We believe, however, that a new, transonic missile (AS–3), designed for similar purposes and with a range of about 100 n.m., will probably be ready for operational use in about 1961. It should overcome the limitations of the AS–1, and may be intended to supplement and eventually replace it. We continue to estimate that the USSR will also have available in about 1961 a supersonic missile (AS–2) of at least 350 n.m. range, primarily for use against land targets. This system will probably be compatible with currently-operational Soviet heavy bombers and possibly medium bombers, as well as any follow-on bombers entering service in the next few years. The Soviets could also have in current use an air-launched decoy to simulate medium or heavy bombers, but evidence is still lacking on such a vehicle.

Naval-Launched Missile Systems

(See paragraphs 86–94, NIE 11–5–59)

26. *Submarine-Launched.* Recent evidence continues to indicate an emphasis on ballistic missile armament in Soviet submarines. There has been no additional information on the few submarines believed to have been converted some years ago to topside stowage of cruise-type missiles (SS–7), and they may have been supplanted for operational use by ballistic missile types. A total of about four long range, conventionally-powered “Z” class submarines have been modified by enlarging the sail and installing hatches, probably to accommodate ballistic missiles. Each can probably launch two ballistic missiles (SS–11) against land targets at ranges of 200 n.m. and possibly 350 n.m.⁶ More recently, the USSR has undertaken construction of a comparable new class of submarine, designated “G” class, at least six of which may now be operational. This class is probably also designed to accommodate ballistic missiles. Considering the size and configuration of the “G” class submarines, we estimate that each can probably launch about six missiles (SS–12) with 350 n.m. range. It is possible, but less likely, that the missile has a range of 700 n.m. Although we have no specific information on ballistic missiles employed by these submarines, we estimate that both the SS–11 and SS–12 systems would be capable of achieving 1 to 2 n.m. CEPs under operational conditions. For missile launching, both the “Z” and “G” class submarines would need to be surfaced or more likely with the sail awash. We believe that their missiles do not use solid propellants.

27. We continue to believe that the USSR will develop a system capable of delivering ballistic missiles against land targets from a submerged submarine, although there is still no firm evidence of its development. Assuming that an active program is well under way, a 500–1,000 n.m. system of this type (SS–9) could become operational in 1961–1963.

28. *Other Naval Systems.* The USSR has made further progress in its program of arming surface ships with missiles. Some destroyers have been modified and others newly constructed to launch surface-to-surface cruise-type missiles. Two types of cruise missiles are utilized, with speeds in the Mach 1 region and with effective ranges of about 30 n.m. against ships at sea. With the use of forward sea or airborne observation stations, the range of one (SS–8) could be increased to about 100–150 n.m.

⁶ The Assistant Chief of Naval Operations for Intelligence, Department of the Navy, and the Director for Intelligence, The Joint Staff, believe it probable that a 350 n.m. missile is used with both the “Z” and “G” class submarines. It is believed that the modified “Z” class submarine served as a prototype for the “G” class submarine, and that the 350 n.m. ground launched missile (SS–3), with minor modifications, could be accommodated by vertical tubes observed in the “Z” class submarine and believed to be in the “G” class submarine. [Footnote is in the original.]

against ships or land targets, and the range of the other (SS-13) could be increased to 60–80 n.m.

29. The Soviets are also constructing a new class of motor patrol craft which may be equipped with guided missiles or free rockets. We continue to believe that Soviet ground-launched surface-to-air missiles can be adapted for use by surface ships, but there is no indication that this has yet been done. Although there is no evidence, we estimate that the USSR will probably also develop missile systems for antisubmarine warfare. Such a system (SS-10) could probably enter service between 1962 and 1965.

Space Program

(See paragraphs 107–132, NIE 11–5–59)

30. The USSR's space program to date has been characterized by a series of spectacular "firsts," demonstrating a high degree of technical competence and capitalizing on Soviet possession of very powerful propulsion systems. Nevertheless, the number of launchings to date has been less than we previously expected, and the Soviets do not seem to have followed a systematic program designed to achieve maximum progress toward clearly-defined scientific goals. Partly for this reason we are unable to predict with confidence the future course of the Soviet program.

31. The Soviets could at any time undertake a variety of new ventures, including, for example, the launching of very large satellites containing instrumentation or animals. Such attempts would be useful for scientific purposes, and would undoubtedly be exploited by the Soviets to serve general purposes of policy and propaganda. Other projects, however, and especially that of putting a man in space, would require more preparation and preliminary experimentation than we believe the Soviets have accomplished. We believe the Soviets capable of achieving, within about the next year, one or more of the following:

- a. vertical or downrange flight and recovery of a manned capsule;
- b. unmanned lunar satellite or soft landing on the moon;
- c. probe to the vicinity of Mars or Venus;
- d. orbiting and recovery of capsules containing instruments, animals, and thereafter, perhaps a man.

Annex A

Washington, undated

SUMMARY TABLE, SOVIET SPACE PROGRAM

POSSIBLE SOVIET SPACE DEVELOPMENT PROGRAM

SPACE PROGRAM OBJECTIVES	EARLIEST CAPABILITY DATE
These dates represent our estimate of the earliest possible future time period in which each specific event could be successfully accomplished. We believe that some could have been accomplished in 1959 or earlier, though the Soviets did not choose to do so. Competition between the space program and the military missile program as well as within the space program itself makes it unlikely that all of these objectives will be achieved within the specified time periods.	
<i>Unmanned Earth Satellites</i>	
5,000–10,000 pounds, low orbit satellites	1960
Recoverable (including biological satellites)	1960
Military Satellites—The dates shown are the earliest in which feasibility demonstrations could begin. After feasibility demonstration, militarily useful systems could generally become available in two to three years.	
Surveillance: weather, mapping, and force deployment	1960
Navigation, geodesy, and communications	1960
Early warning	1960
ECM and Elint	1960

(Continued)

SPACE PROGRAM OBJECTIVES	EARLIEST CAPABILITY DATE
<i>Unmanned Lunar Rockets</i>	
Biological probe	1960
Satellite of the moon	1960
Soft landings	1960
Lunar landing, return, and earth recovery	1963–1964
<i>Planetary Probes</i>	
Mars	About October 1960
Venus	About January 1961
<i>Manned Vertical or Downrange Flight</i>	1960
<i>Manned Earth Satellites</i> —The specified time periods for manned accomplishments are predicated on the Soviets having previously successfully accomplished a number of similar unmanned ventures.	
Capsule-type vehicles ^a	Late 1960 or 1961
Glide-type vehicles ^a	1 to 2 years after above
Maneuverable (minimum; conventional propulsion)	1963
Maneuverable (nuclear propulsion)	About 1970
Space platform (minimum, nonecological, feasibility demonstration)	1965
Space platform (long-lived)	About 1970
<i>Manned Lunar Flights</i>	
Circumlunar	1964–1965
Satellites (temporary)	1965–1966
Landings	About 1970

^a Recovery would probably be attempted after the first few orbits but life could probably be sustained for about a week. [Footnote is in the original.]

SUMMARY TABLES, SOVIET MISSILE PROGRAM

SUMMARY TABLE I
PROBABLE SOVIET DEVELOPMENT PROGRAM FOR SURFACE-TO-AIR MISSILE SYSTEMS^a
(GROUND AND NAVAL LAUNCHED)^b

ARBITRARY REFERENCE DESIGNATION	INITIAL OPERATIONAL CAPABILITY DATE ^c	MAXIMUM EFFECTIVE ALTITUDE ^d (IN FEET)	MAXIMUM HORIZONTAL RANGE (NM) ^d	OPERATIONAL ACCURACY ^e (CEP IN FEET)	GUIDANCE	MAXIMUM WARHEAD (LBS. AND TYPE) ^f	REMARKS
			SPEED CLASS				
SA-1	1954	60,000 (min- imum about 3,000).	20 against incoming B-52's at high altitudes	65-120	Track-while- scan radar/ radio command.	450-700 HE or Nuclear	B-200 guidance sys- tem with the single stage V-301 missile deployed only around Moscow at fixed sites. Boosted Guideline also apparently uti- lized in SA-1 system as a partial replace- ment for single stage V-301.
			Mach 2.5.				

See footnotes at end of table.

(Continued)

ARBITRARY REFERENCE DESIGNATION	INITIAL OPERATIONAL CAPABILITY DATE ^c	MAXIMUM EFFECTIVE ALTITUDE ^d (IN FEET)	MAXIMUM HORIZONTAL RANGE (NM) ^d SPEED CLASS	OPERATIONAL ACCURACY ^e (CEP IN FEET)	GUIDANCE	MAXIMUM WARHEAD (LBS. AND TYPE) ^f	REMARKS
OTHER	It is possible that the Soviets will develop and place in operation: A surface-to-air missile system capable of delivering a nuclear or HE warhead to a range of about 100 nm and to altitudes up to about 90,000 feet (previously estimated as SA-4), could become operational two-three years after first flight test. A mobile system for defense against reconnaissance drones and aircraft, helicopters, etc. (about 1965). A mobile system for field force defense against ballistic missiles (by 1967). A shoulder fired guided missile capable of defending small units against slow aircraft and helicopters to a range of about 3,000 meters (1961).						

^a We evaluate this program as “probable” with varying degrees of confidence concerning detailed characteristics. Each missile listed will probably go through various stages of development which are not necessarily reflected in this table. [All footnotes are in the original.]

^b Adaptations of SA-2 and SA-3 would be suitable for cruisers and destroyers and SA-3 for destroyer escorts.

^c Date at which one or more series produced missiles could have been placed in the hands of trained personnel in one operational unit.

^d Maximum altitude is not necessarily achieved at maximum range. A limited capability will exist above the indicated altitude. Range will vary with the size, direction of approach, and altitude of the attacking aircraft.

^e Accuracy varies with target size, speed, altitude, and range.

^f Warhead includes the explosive device and its associated fusing and firing mechanism.

SUMMARY TABLE II
PROBABLE SOVIET DEVELOPMENT PROGRAM FOR AIR-TO-AIR MISSILE SYSTEMS^a

ARBITRARY REFERENCE DESIGNA- TION	INITIAL OPERATIONAL CAPABILITY DATE ^b	GUIDANCE	OPERA- TIONAL ACCURACY (CEP IN FEET)	MAXIMUM WARHEAD (LBS. AND TYPE) ^c	APPROX- IMATE GROSS WEIGHT (LBS.)	COMPATIBLE AIRCRAFT			REMARKS ^e
						Aircraft	Attack Capability	Range (nm) ^d	
AA-1	1955–1956	Radar beam rider.	20	40 HE	200	Flashlight and modified Flashlight.	Rear quarter 360.°	2½ (Tail) 5 (Head-on).	All-weather. Soviet des- ignation "ShM."
						Fresco D, E		2 (Tail only)	
						Farmer B		2 (Tail only)	
						Fagot	Day Fighter.	Limited by radar range to approximately 1 nm.	Limited to clear air mass ^f and tail cone attack.
AA-2	1955–1956	Infrared homing.	10	25 HE	175	Fresco A, B, C			
						Farmer A			
						Faceplate Fitter	Limited all- weather.	2½ Sea Level.	
						Fresco D Farmer B Flashlight			
						Modified flashlight. Fishpot	All-weather.	4 at altitude.	

SUMMARY TABLE III
PROBABLE SOVIET DEVELOPMENT PROGRAM FOR AIR-TO-SURFACE MISSILE SYSTEMS^a

ARBITRARY REFERENCE DESIGNATION	INITIAL OPERATIONAL CAPABILITY DATE ^b	1956–1957	MAXIMUM RANGE (NM)	OPERATIONAL ACCURACY (CEP)	MAXIMUM WARHEAD (LBS. AND TYPE) ^c	CRUISE SPEED (MACH No.)	GUIDANCE	REMARKS
AS-1 ^d			55	150 feet against ships. 1 nm against coastal targets.	3,000 HE or Nuclear.	0.8	Beam riding with semi- active radar homing. Beam riding only against coastal targets.	Primarily anti- ship missile “Komet.”
AS-2 ^e	1961	At least 350		2 nm against land targets.	3,000 Nuclear	1.5 to 2.0	All-inertial.	For use against land targets.

ARBITRARY REFERENCE DESIGNATION	INITIAL OPERATIONAL CAPABILITY DATE ^b	MAXIMUM RANGE (NM)	OPERATIONAL ACCURACY (CEP)	MAXIMUM WARHEAD (LBS. AND TYPE) ^c	CRUISE SPEED (MACH No.)	GUIDANCE	REMARKS
AS-3 ^{f,g}	1961	100	150 feet against ships. 1 nm against coastal targets.	3,000 HE or Nuclear.	1.1	Beam riding with semi- active radar homing. Beam riding only against coastal targets.	Primarily antiship missile.
Decoys	The USSR is probably developing and may now have operational air launched decoys to simulate medium or heavy bombers.						

^a We evaluate this program as “probable” with varying degrees of confidence concerning detailed characteristics. Each missile listed will probably go through various stages of development which are not necessarily reflected in this table. [All footnotes are in the original.]

^b The date at which one or more series produced missiles could have been placed in the hands of trained personnel in one operational unit.

^c Warhead includes the explosive device and its associated fusing and firing mechanism.

^d The BADGER is believed to be the carrier aircraft for the AS-1. Launch altitude is about 15,000 feet. The BADGER’s radius is 1,250 nm when carrying one missile, 1,000 nm with two. This radius can be increased by about 35 percent by a single prestrike aerial refueling.

^e The AS-2 will probably be compatible with the BEAR and BISON, and possibly with the BADGER. The AS-2 will probably weigh 9,000 to 10,000 pounds; two could be carried by both the BEAR and BISON. The BADGER could carry one and possibly two. A range degradation of 8–10 percent for these aircraft when carrying one missile, and 15–20 percent when carrying two is estimated.

^f The BADGER probably would be used as the carrier aircraft for the AS-3. Launch altitude is about 35,000 feet. The BADGER’s radius would be about the same as with AS-1.

^g The Assistant Chief of Naval Operations for Intelligence, Department of the Navy, believes that the AS-3 warhead weight should be 1,000 pounds, and that guidance should be inertial with active radar homing and a provision for command override of the inertial guidance system.

SUMMARY TABLE IV
PROBABLE SOVIET DEVELOPMENT PROGRAM FOR GROUND-LAUNCHED
SURFACE-TO-SURFACE MISSILE SYSTEMS^a

ARBITRARY REFERENCE DESIGNATION	INITIAL OPERA- TIONAL CAPABILITY DATE ^b	MAXIMUM OPERATIONAL RANGE (NM) ^c	GUIDANCE	OPERATIONAL ACCURACY (CEP) ^d	MAXIMUM WARHEAD (LBS. AND TYPE) ^e	CONFIG- URATION	REMARKS
SS-Antitank	Prior to 1958	About 5,000– 6,000 yards.	Command wire link	2 feet	20–40 HE- shaped charge.		
SS-1	1954–1957	75	Radar track-radio com- mand/inertial with terminal correction or all-inertial.	1,200 feet	1,500 HE, Nuclear, CW.	Ballistic	SCUD—Launched from self- propelled tracked vehicle. Road mobile.
SS-2	1954	200	1954: Radar track-radio command/inertial. 1958–1960: All-inertial.	$\frac{1}{3}$ – $\frac{2}{3}$ nm	2,000 HE, Nuclear, CW.	Ballistic	Second generation missile—out- growth of V-2. Road mobile.
SS-3	1954	350	1954: Radar track-radio command/inertial. 1958–1960: All-inertial.	$\frac{1}{2}$ –1 nm	2,000 HE, Nuclear, CW.	Ballistic	Outgrowth of V-2. Probably based on German designed R-10 and Soviet developed Korolov missiles. Road mobile.

ARBITRARY REFERENCE DESIGNATION	INITIAL OPERA- TIONAL CAPABILITY DATE ^b	MAXIMUM OPERATIONAL RANGE (NM) ^c	GUIDANCE	OPERATIONAL ACCURACY (CEP) ^d	MAXIMUM WARHEAD (LBS. AND TYPE) ^e	CONFIG- URATION	REMARKS
SS-4	1956	700	1956-1958: Radar track- radio command/ inertial. 1958-1960: All-inertial (retrofit optional).	1-2 nm.	3,000 Nuclear, possibly CW.	Ballistic	SHYSTER—Road mobile.
SS-5	Late 1958 or early 1959.	1,100	Radar track-radio com- mand/inertial or all-inertial.	2 nm.	3,000 Nuclear	Ballistic	Road and/or rail mobile.
SS-6 (ICBM)	For planning purposes it should be con- sidered to have occurred by 1 January 1960. ^f	6,500 ^g	Radar track-radio command/inertial. 1961-1962, or possibly earlier: All-inertial (retrofit unlikely).	About 3 nm at IOC. See para- graphs 7-9	6,000 Nuclear ^g	Ballistic	Could be rail mobile with rail mobile units, fixed installations or a combination of the two.
OTHER:	The Soviets probably are developing and could have available for operational use in 1961-1963 a ground-launched, ramjet-propelled vehicle with a speed of about Mach 3, an altitude of 65,000-70,000 feet, and a range in excess of 4,000 n.m. Such a system could be used for weapon delivery and/or reconnaissance. Although unlikely, it is possible that such a system could be employed as a research vehicle for investigation of structures and propulsion systems in the Mach 3 region.						

See footnotes at end of table.

(Continued)

SUMMARY TABLE IV—Continued

^a We evaluate this program as “probable” with varying degrees of confidence concerning detailed characteristics. Each missile listed will probably go through various stages of development which are not necessarily reflected in this table. We estimate that considerable energy will be expended on second generation longer range missiles, particularly on an ICBM of greatly improved operational characteristics. [All footnotes are in the original.]

^b Date at which one or more series produced missiles could have been placed in the hands of trained personnel in one operational unit. In the case of the ICBM, it is the date on which a few—say 10—series produced missiles are in the hands of one or more trained units at existing launching facilities.

^c Generally a ballistic missile can be fired to ranges as short as approximately one-third the maximum operational range without serious increase in CEP and to even shorter ranges with degraded accuracy.

^d CEP is the radius of a circle within which, statistically, one-half of the impacts will occur. Inherent missile accuracies are somewhat better than the accuracies specified in the table which take into consideration average degradation factors. The accuracies specified are approximate figures which we apply to all ranges to which the missiles are likely to be fired.

^e The type of warhead employed with Soviet ballistic missiles will vary with the specific mission of the missile. In general, however, we believe that for missiles with maximum ranges of 350 nm or less, high explosive (HE), nuclear, or chemical warfare (CW) warheads will be employed in accordance with Soviet military doctrine, depending upon nuclear stockpiles, missile accuracy, character of the target, and results desired. We estimate that for missiles with ranges of 700 nm and over, only nuclear warheads will be employed, although we do not exclude the possibility of CW use in 700 nm missiles for certain limited purposes. We believe that the USSR is capable of developing techniques for missile dissemination of biological warfare (BW) agents, although we have no specific evidence relating BW and missile research and development. In view of operational considerations we consider BW use in ballistic missiles unlikely, although possible for certain special purposes.

^f The Assistant Chief of Naval Operations for Intelligence, Department of the Navy, believes that an IOC date of not earlier than mid-1960 should be used for planning purposes. The Assistant Chief of Staff for Intelligence, Department of the Army, agrees that it is prudent to assume for planning purposes that the IOC had occurred by 1 January 1960, but believes that the Soviets actually had only an emergency capability at that time. See footnotes to paragraph 3.

^g The current missile is believed to employ an ablative rather than a heatsink nosecone. A reduction in warhead weight would permit a greater range or the incorporation of penetration aids in the nosecone.

SUMMARY TABLE V
PROBABLE SOVIET DEVELOPMENT PROGRAM FOR NAVAL-LAUNCHED
SURFACE-TO-SURFACE MISSILE SYSTEMS^a

ARBITRARY REFERENCE DESIGNATION	INITIAL OPERATIONAL CAPABILITY DATE ^b	MAXIMUM OPERATIONAL RANGE (NM)	OPERATIONAL ACCURACY (CEP) ^c	CONFIGURA- TION	MAXIMUM WARHEAD (LBS. AND TYPE) ^d	GUIDANCE	REMARKS
SS-7	1955-1956	150-200	2-4 nm	Cruise	2,000 lb Nuclear	Inertial	Speed subsonic, low altitude operation. For launch from surfaced "W" class submarine which can carry two missiles. Possibly no longer operational.
SS-8	1958	*100-150	150 ft against ships. 2 nm against land targets.	Cruise	1,000 lb. Nuclear or HE.	Inertial with radar override during mid-course phase. Active radar terminal homing used against ships.	Speed high subsonic, low altitude operation. Launched from destroyers and cruisers.

See footnotes at end of table.

(Continued)

SUMMARY TABLE V—Continued

ARBITRARY REFERENCE DESIGNATION	INITIAL OPERATIONAL CAPABILITY DATE ^b	MAXIMUM OPERATIONAL RANGE (NM)	OPERATIONAL ACCURACY (CEP) ^c	CONFIGURA- TION	MAXIMUM WARHEAD (LBS. AND TYPE) ^d	GUIDANCE	REMARKS
SS-9	1961–1963	500–1,000	1–3 nm	Ballistic	1,000 lb. Nuclear	All-inertial	Launched from sub- merged submarine.
SS-10 (ASW)	1962–1964: (Surface ship- launched), 1963–1965: (Sub marine launched).	20	400 yds. at water re-entry.	Ballistic Launched depth bomb. Ballistic Launched, homing torpedo.	450 Nuclear 150 HE	Inertial Inertial w/self- contained acoustic homing.	Primarily for use against submarines. May pos- sibly be used against surface ship targets. Both configurations available for both submarine and ship launching.
SS-11	1958	'200 (possi- bly 350)	1–2 nm	Ballistic	2,000 lb. Nuclear	All-inertial	Launched from sail awash "Z" class sub. Carrying capacity, two missiles.
S3-12	1959	'350 (possi- bly 700)	1–2 nm	Ballistic	2,000 lb. Nuclear	All-inertial	Launched from sail awash "G" class submarine. Carrying capacity, six missiles.

ARBITRARY REFERENCE DESIGNATION	INITIAL OPERATIONAL CAPABILITY DATE ^b	MAXIMUM OPERATIONAL RANGE (NM)	OPERATIONAL ACCURACY (CEP) ^c	CONFIGURA- TION	MAXIMUM WARHEAD (LBS. AND TYPE) ^d	GUIDANCE	REMARKS
SS-13	1958	°60-80	150 ft. against ships.	Cruise	1,000 lb. Nuclear or HE.	Inertial with radar override during mid-course phase. Active radar terminal homing.	Speed low supersonic with very low altitude operation. Launched from destroyers and cruisers and used against ship targets.
OTHER:	The Soviets now have operational a large motorboat which may be equipped with guided missiles of about 30 nm range, or with free rockets. Feasibility studies indicate that a submarine-launched 100 nm ballistic missile could be developed for antishipping use.						

^a We evaluate this program as “probable” with varying degrees of confidence concerning detailed characteristics. Each missile listed will probably go through various stages of development which are not necessarily reflected in this table. [All footnotes are in the original.]

^b Date at which one or more series produced missiles could have been placed in the hands of trained personnel in one operational unit.

^c CEP is the radius of a circle in which, statistically, one-half of the impacts will occur. Inherent missile accuracies are somewhat better than the accuracies specified in the table which take into consideration average degradation factors.

^d Warhead includes the explosive device and its associated fusing and firing mechanism. The weight of the structure and the heat protection of the nosecone are not included in “payload.”

^e These ranges can be obtained against ship targets only if the launching ship has forward seaborne or airborne observers. Otherwise a maximum range of 30 nm can be attained.

^f The Assistant Chief of Naval Operations for Intelligence, Department of the Navy, and the Director for Intelligence, The Joint Staff, believe it probable that a 350 nm missile is used with both the “Z” and “G” class submarines.

252. Special National Intelligence Estimate¹

SNIE 11–6–60

Washington, May 3, 1960

STRENGTH OF THE ARMED FORCES OF THE USSR

THE PROBLEM

To estimate the strength of the armed forces of the USSR as of 1 January 1960.

THE ESTIMATE

1. On 14 January 1960, Khrushchev declared that the personnel strength of the Soviet armed forces was 3,623,000. We have thoroughly reviewed the evidence available to us, and we conclude that Khrushchev's statement was substantially correct.

2. In a number of instances it is impossible to be confident as to the subordination of elements of the Soviet armed forces. Accordingly, we have presented the estimates in categories corresponding generally to the primary missions or functions which the various elements perform. In this connection, it ought to be noted that the part played by civilians in the Soviet military organization is considerable, especially in research and development, in construction, and in various other support functions.

3. The following paragraphs give estimated strength figures, with explanatory comments. They are followed by a table which presents the same figures in summary form. The evidence is, however, insufficient to establish the precise accuracy of any of these figures.

I. MINISTRY OF DEFENSE 70,000

4. *Headquarters.* The Ministry of Defense—including the General Staff and the Main Staffs of the Ground Forces, Air Forces, Air Defense Forces, and Navy, other staffs and directorates, and military missions abroad—probably comprises about 25,000 military personnel on active duty, as well as an undetermined number of civilians.

5. *Research and Development.* Military scientific research and development in the USSR is conducted largely by civilians. In addition, we estimate that there are about 35,000 active duty military personnel in research and development, primarily subordinate to the Ministry of Defense. These include principally the personnel at missile test ranges, and in electronics, nuclear development, and aviation technology. These are not the only military men in R&D and allied functions, such

¹ Source: "Strength of the Armed Forces of the USSR." Secret. 7 pp. DOS, INR-NIE Files.

as ordnance development, weapons proving, submarine development, etc., but these latter groups we consider to be counted under other headings in this estimate.

6. *Draft Boards.* We estimate on the order of 10,000 active duty military personnel serving on local draft boards, and as military instructors at civilian schools and clubs.

II. THEATER FIELD FORCES 2,445,000

7. *Ground Forces, Field.* Based on identification over the last two or three years, and information on strength levels, in particular of line divisions, we now believe that the Soviet ground forces include:

About 100 combat ready line divisions, at high level (averaging about two-thirds) strength.

About 70 line divisions at low level (averaging about one-third) strength, and requiring replenishment with reserves before combat.

Of the 100 combat ready divisions, we estimate there are 57 motorized rifle/mechanized, 13 rifle, 22 tank, and 8 airborne divisions. Most of the low strength units are rifle divisions, but also in this category are 2 tank, 2 airborne, and 21 motorized rifle/mechanized divisions. The total strength of line divisions is estimated to be about 1,275,000 men.

8. Our estimate of strengths of combat support forces and service support units rests on less certain and less comprehensive information; it is based on known Soviet organization and the requirements of the line divisional force. The combat support forces consist of about 550,000 men organized into some 16 artillery divisions, a substantial number of separate artillery, antiaircraft artillery, antitank and rocket artillery brigades and regiments, as well as other combat support units. Headquarters, service support units, and certain schools account for about 425,000. The ratio of support to line units is austere, with only a little over 25 percent in combat support and about 20 percent in the logistic and administrative tail.

9. *Tactical Aviation.* The operating and support personnel of Tactical Aviation, exclusive of air transport, is believed to be in the neighborhood of 195,000 men. This and other estimates of the personnel strengths of the operational military air components are based on the estimated aircraft Order of Battle, on a detailed calculation of field support requirements, and on some information concerning the actual Soviet support establishment.

III. AIR DEFENSE FORCES 365,000

10. *Antiaircraft Artillery.* The estimate of Air Defense Forces is complicated by the circumstance that a substantial shift from anti-aircraft artillery guns to surface-to-air missiles is in process, and that the subordination of the various AAA units which have been

located is usually not known. Altogether the antiaircraft gun units of the PVO Strany, those guarding air bases, and those protecting key coastal areas and under naval control, probably total about 100,000 men. Additional AAA units are with the field ground forces and are counted with them, although they also contribute to the overall air defense capability of the country. We estimate that as of 1 January 1960 there were at least 60,000 men in surface-to-air missile systems, including men in training.

11. *Fighter Aviation of Air Defense.* The estimate for Fighter Aviation of Air Defense (125,000 men) is calculated from the estimated aircraft Order of Battle, exclusive of transport aircraft.

12. *Warning and Control.* The estimate of 80,000 personnel, from all service branches, for the warning and control system rests on a calculated manning level which we believe appropriate to meet observed standards of operation for Soviet radars.

IV. LONG RANGE ATTACK FORCES 85,000

13. *Long Range Aviation.* Based on the estimated aircraft Order of Battle of this force, not including its transport aviation, the operation and support of Long Range Aviation probably requires about 70,000 men.

14. *Surface-to-Surface Missiles.* The organization, subordination, and manning levels of Soviet long range (700 n.m. and above) missile systems are uncertain. The personnel required to operate these systems on 1 January 1960 was probably no more than 10,000 men. Adding a substantial number for training, we estimate that as of 1 January in all about 15,000 men were serving in the long range missile systems.

V. NAVAL FORCES 495,000

15. The personnel strength of the Forces Afloat is estimated, partly on the basis of information and partly on the basis of Western standards for manning of fleet units, to total about 185,000 men. The number for Ashore Support can only be inferred; we have assumed that the Soviet requirement is for a ratio of one man ashore to each man afloat. Of the Ashore Support strength, 10,000 men are counted in the Ministry of Defense category; the figure carried here is therefore 175,000. We do not know how many, if any, men in training are not in billets afloat or ashore; we estimate that 40,000 men should be counted above the ship and shore total.

16. *Naval Aviation.* We estimate this force to have about 80,000 men in operational units. This estimate is based on a calculation of manning levels comparable to those of the other air forces, but with account of the fact that the great majority of naval air stations are co-located with or near other naval base installations, and obtain a large portion of their support from the general shore support establishment.

17. *Coastal Defense.* There is little evidence concerning the size of coastal artillery; our estimate is about 15,000 men. As earlier noted, antiaircraft artillery for defense of key naval bases and coastal areas is included in our total for antiaircraft artillery. Naval personnel also participate in the overall air defense warning and control system.

VI. MILITARY TRANSPORT AVIATION 55,000

18. The overall Soviet military air transport is estimated on the basis of calculations from the aircraft Order of Battle to total about 55,000 men. The assignments of transport units from Military Transport Aviation are indicated in the Table.

VII. PREOPERATIONAL AVIATION TRAINING 110,000

19. In addition to the more than half-million men in the five operational air forces, there is a substantial preoperational training establishment. In light of the probable requirements of the Soviet Air Forces, we estimate the strength of these training facilities at about 110,000 men. A substantial part of the ground crews and general support personnel probably receive their initial training in courses conducted within the operational field establishment.

VIII. SECURITY FORCES 250,000

20. The strength of the Border Troops of the KGB can be estimated with some assurance; including customs guards, about 5,000 maritime security men, and support personnel, they total about 150,000 men. The strength of the Internal Troops is much more uncertain, but one division and a number of small independent "regiments" (of about 800 men each) have been identified, and there is evidence of many personnel guarding bridges and other installations. In all, we estimate the internal troops to total about 75,000 men. In addition, there are about 15,000 men in special Signal Troop Regiments of the KGB, and on the order of 10,000 men in the Convoy Troops, who guard prisoners in transit and in detention.

IX. NOTE CONCERNING CIVILIANS

21. There are a substantial but unknown number of civilians working for the Soviet military establishment. The major part of scientific research and development with military uses is conducted by the Academy of Sciences, by the State Committees for Defense Technology, Aviation Technology, Scientific-Technical matters, Radio-Electronics, and Shipbuilding, and by the Ministry of Medium Machine Building (nuclear weapons development and production). Moreover, there is evidence that some functions previously conducted by military personnel have in the course of reductions in recent years come increasingly to be filled by civilian employees, particularly in construction activity and other aspects of logistics.

PERSONNEL STRENGTHS OF THE SOVIET ARMED FORCES
1 JANUARY 1960

Ministry of Defense		70,000
Headquarters	25,000	
Research and Development	35,000	
Draft Boards	10,000	
Theater Field Forces		2,445,000
Ground Forces, Field	2,250,000	
Tactical Aviation	195,000	
Air Defense Forces		365,000
Surface-to-Air Missiles	60,000	
Antiaircraft Artillery (Gun)	100,000	
Fighter Aviation of Air Defense	125,000	
Warning and Control	80,000	
Long Range Attack Forces		85,000
Long Range Aviation	70,000	
Surface-to-Surface Missiles (SS–4, 5, and 6)	15,000	
Naval Forces (excluding personnel counted elsewhere)		495,000
Forces Afloat	185,000	
Ashore Support	175,000	
Training	40,000	
Naval Aviation	80,000	
Coastal Defense	15,000	
Military Transport Aviation		55,000

Border Troops	150,000	
Internal Troops	100,000	

253. Memorandum of Discussion at the 443d NSC Meeting¹

High Point, North Carolina, May 5, 1960

SUBJECT

Discussion at the 443rd Meeting of the National Security Council, Thursday, May 5, 1960 (At High Point)

Present at the 443rd Meeting of the NSC were the President of the United States, Presiding; the Acting Secretary of State (C. Douglas Dillon); the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also attending the Meeting and participating in the Council actions below was the Director, Bureau of the Budget. Also attending the Meeting were the Director, U.S. Information Agency; the Director of Central Intelligence; the Assistant to the President; the Special Assistants to the President for National Security Affairs, for Science and Technology, and for Security Operations Coordination; the White House Staff Secretary; the Naval Aide to the President; Herbert York, Department of Defense; Herbert Scoville, Jr. and Colonel John A. White, Central Intelligence Agency; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the Meeting and the main points taken.

The Meeting convened in the President's Conference Room at the High Point Relocation Site. Participants in the Meeting (except for Governor Hoegh who was already at High Point) were flown to the Meeting from Washington as part of OPERATION ALERT 1960. Council Members were not provided with advance notice of the change in the place of the Meeting but were advised by telephone calls from the Office of the Executive Secretary, NSC, beginning at 7:20 a.m. that the Meeting would be held outside Washington and that helicopters would be available for transportation to the site of the Meeting.

Mr. Gray reported that General Twining had been left in Washington, Mr. McCone had a conflicting engagement and was unable to attend and Secretary Anderson was ill. Mr. Gray said he understood Secretary Gates and Mr. Dillon were so completely taken by surprise by the telephone calls this morning they had been unable to obtain official transportation to the site of the helicopter take-off. Mr. Dulles

¹ Source: Operation Alert exercise, and Agenda item 1: History of U.S. and USSR Long-Range Missile Development. Top Secret. 10 pp. Eisenhower Library, Whitman File, NSC Records.

said he was able to obtain official transportation but it broke down in the first hundred yards. Secretary Gates said he had no identification and at first the marines would not let him inside the gates to board the helicopter. Mr. Gray felt the exercise indicated that a meeting of the National Security Council could be assembled on rather short notice. The President believed the exercise of moving a Council Meeting to a relocation site had been a desirable one. He remarked that he had arrived at High Point early in order to inspect the facilities.

1. *HISTORY OF U.S. AND USSR LONG-RANGE MISSILE DEVELOPMENT* (NSC Action No. 2137)

Mr. Gray recalled that at the Council Meeting on October 15, 1959 (NSC Action No. 2137) the President had requested the Secretary of Defense to arrange for the preparation of a factual history of the development by the U.S. of long-range guided missile weapons systems. The President had also requested the Director of Central Intelligence to arrange for the preparation of a history of the development by the USSR of such missile systems. These histories had now been prepared and summaries of them would be presented by Dr. York for the Department of Defense and Dr. Scoville for the Central Intelligence Agency.

Dr. York said that before and during World War II, the development of missiles had been primarily in the hands of the Germans. Following World War, II U.S. armed forces instituted a number of study programs of long-range missiles, which were considered to be missiles with a potential range greater than 1000 miles. He displayed a bar chart entitled "Development of Long-Range Missiles by the U.S." which portrayed our long-range missile programs from 1945 to the present. Dr. York called attention to the Army HERMES B and C programs which involved a winged ram-jet and a study of rocket missiles. All of the study programs, Dr. York went on, were characterized by rapidly changing plans through 1950. Dr. York also called attention to the REDSTONE program which later became the JUPITER program and to TRITON, which was a Navy study at an applied physics laboratory but never an actual missile. However, out of TRITON developed the REGULUS I and REGULUS II, both of which were eventually cancelled because of the prospective development of POLARIS. Dr. York then called attention to a number of Army Air Corps and later U.S. Air Force studies which involved some work on rockets, although the bulk of the work was concerned with air breathers. Most of these studies ended after a year except for SNARK which went on into the development phase. However, at the time of the Korean War it was decided that no program should be given priority unless it involved a missile which could be ready by 1954. After this decision SNARK reverted to study status.

Dr. York then reported on developments which resulted in a change from the emphasis on broad research studies to emphasis on early operational missiles. He referred to the Keller Survey which had examined all types of missiles in order to determine which ones should be selected for development. As a result of this Survey, study of the ATLAS was reinstituted. At this time long-range missile programs had the lowest priority because the yield of the warhead which could be carried in them and the inaccuracy of their guidance systems made them unattractive in comparison to other weapons systems. In 1953 Secretary Wilson ordered a review of surface-to-surface missiles. One committee under Von Neumann studied long-range surface-to-surface missiles while another committee under Trevor Gardiner studied all other missiles. The Von Neumann Committee recommended development of a long-range missile weapons system. Dr. York pointed out that by the time the Von Neumann Committee formulated its recommendations, the thermo-nuclear bomb had been exploded by the U.S. and the possibility of achieving high yields from warheads of limited weight was better understood. A second Von Neumann Committee instituted ATLAS as a development program in 1954 although the final configuration of the ATLAS was not clear at this time. ATLAS at one time was a seven engine vehicle; later its engines were reduced to five in number and then to three as at present. As a result of the studies of the second Von Neumann Committee, the Ramo-Wooldridge set-up, and other studies, a decision was made to provide backup programs for all ATLAS components. These backup programs early in 1955 evolved into the TITAN program. The Killian Committee then made studies of the missile question and concluded that an IRBM could be made operational sooner than an ICBM. The Secretary of Defense, after review of the Killian Committee conclusions, instituted the THOR and JUPITER programs. Originally JUPITER was conceived of as a land or sea missile while THOR was to be a land missile only. As nuclear yields in relation to the size of the warhead increased, it became apparent in the summer of 1956 that the required payload could be delivered by a missile four-tenths the size of the JUPITER. At the same time it became apparent that progress was being made with solid propellants and that liquid fuel rockets would be unsuitable for use in submarines. Accordingly, both JUPITER and THOR became land-based missiles exclusively; POLARIS began to be thought of as the submarine missile. JUPITER and THOR became operational about three years after development of them began. ATLAS became operational about 1959, about 4½ years after it was decided to give the highest priority to the three-engine ATLAS design. POLARIS would become operational about four years after it was instituted.

Dr. York said that 1958 was marked by further progress on solid propellants, progress which led to the initiation of MINUTEMAN. Dr. York then pointed to the figures on the chart which indicated the funds spent or obligated for various missile programs through FY 1960. He pointed out that practically all the funds spent by the U.S. on long-range missiles, amounting to between \$9 and \$10 billion dollars, had been spent since 1953.

The President asked whether the figures given by Dr. York included short-range missiles. Dr. York said he had given the figures for long-range missiles only. Mr. Stans asked why the SNARK was not shown on the chart as operational. Dr. York said SNARK was not operational at the end of 1959; and Secretary Gates added that SNARK was just now becoming operational.

Secretary Gates said that the development of a U.S. long-range missile program, most of which had taken place since 1953, was a remarkable achievement when compared with the development of other weapons systems, e.g. fighter aircraft. The President agreed that the achievement was indeed remarkable but said that it was difficult to explain to the Russians that we had virtually lost the years 1945–1953 so far as the development of long-range missiles was concerned. Dr. York felt that our decisions in the years 1945–1953, not to give the highest priority to long-range missile development, had been based on the fact that we had the nucleus of a strategic air force with bases near enough to the USSR to reach vital targets in that country. By contrast, during this period, the Soviet Union did not have the bases or the means of delivery to place atomic weapons on the U.S.

Dr. Kistiakowsky, noting that he had been associated with some of the early studies, including the Von Neumann Committees, said that in 1953 when a survey of the ATLAS program was made, all the plans provided that ATLAS would carry a Nagasaki-type bomb. Since that time, of course, the yield of the ATLAS warhead has been constantly increased. Secretary Gates thought the concept of the ATLAS had once been the same as the concept of the present Russian ICBM. Dr. York agreed that ATLAS had been through the phase mentioned by Secretary Gates but noted that ATLAS had achieved its present configuration in 1955. Dr. Kistiakowsky said that in addition to the two Von Neumann Committees mentioned by Dr. York there had been a third Von Neumann Committee which had produced information on the new possibilities of achieving high yields in relation to weight of warhead. Dr. York said the seven-engine and five-engine concepts for ATLAS would have made the gross weight of ATLAS about the same gross weight of the present Soviet ICBM.

The President felt the discussion explained why the Soviets had produced such large missiles. Dr. York agreed, adding that the Soviets

had frozen the design of their missiles earlier in history as well as earlier in the design stage. They had frozen their designs at a time when it was thought a very large warhead would be required in order to produce a large explosion.

Mr. Allen asked when the U.S. first conceived the idea of launching an earth satellite. Dr. York said the idea of launching a satellite was an old one in scientific circles. The RAND Corporation had discussed what has now come to be called SAMOS as early as the end of World War II. However, launching an earth satellite required a large rocket so that no one began to think seriously of earth satellites until a large rocket began to be developed. There was no point in time at which it could be said the idea of an earth satellite was conceived but the launching of such a satellite became feasible in 1955 or 1956 when large rockets became available. Mr. Allen asked which missiles were used for launching satellites. Dr. York replied that THOR and JUPITER had been used for this purpose. Unsuccessful attempts had also been made to launch a satellite with the ATLAS. Colonel White pointed out that the so-called "talking satellite" had been launched by an ATLAS. Dr. York said the "talking satellite" was itself an ATLAS placed in orbit. A NASA lunar probe last Thanksgiving using ATLAS as the launching vehicle failed. An attempt early this year to put up MIDAS with an ATLAS also failed. This latter failure was particularly disturbing because ATLAS had failed only three times in the last twenty-three firings. ATLAS and TITAN were only about half as big as the Russian missiles. Our satellite launchers have had only about one-tenth of the thrust of the Russian satellite launchers primarily because we have not yet used ATLAS intensively for space work but have used THOR and JUPITER instead. Mr. Allen asked whether there was much difference between THOR and JUPITER. Dr. York replied that these two missiles were practically the same. The President recalled that there had been a controversy about which of the two missiles would be retained and which would be scrapped. At one time it had been agreed that both THOR and JUPITER would be given the highest priority but that the Secretary of Defense would decide which to keep and which to discard within six months. After the six months period was up, the Secretary of Defense said he needed another year to make this decision.

Mr. Gray inquired about the time which elapsed from the initiation of a missile program to the operational capability of the missile. He said he gathered it was $4\frac{1}{2}$ to 5 years. Dr. York said to be more precise ATLAS became operational after $5\frac{1}{2}$ years, TITAN after $5\frac{1}{2}$ years, THOR and JUPITER after 3 years, POLARIS after $4\frac{1}{2}$ years and MINUTEMAN after $4\frac{1}{2}$ years.

The President asked Dr. York to furnish him with a chart similar to the one displayed during Dr. York's briefing and asked whether, in

addition, it would be difficult to indicate our effort involving short-range missiles on a chart. Dr. York believed a chart showing our work on short-range missiles would be difficult to prepare because these missiles were initiated and then discarded with such great rapidity. About fifty short-range missiles had been developed. The President said in that case he would be satisfied with the chart on long-range missiles.

Mr. Allen asked whether POLARIS would be the next missile to become operational. Dr. York answered in the affirmative, adding that POLARIS would become operational at the end of this calendar year.

Mr. Gray felt that the information in Dr. York's presentation should be made available to the public. He wondered why the chart was classified SECRET. Secretary Gates believed there was no reason for classification of this information. He added that information of this kind had appeared in speeches and testimony already. Dr. York said that an unclassified history of our missile development had been published in the Congressional Record. Mr. Stans felt that if the chart were to be made public, the dollars spent each year on the missile programs shown on the chart should be indicated.

Mr. Allen asked what function TITAN and MINUTEMAN would be expected to perform. Dr. York said TITAN would display the same gross performance as ATLAS but would be a better missile because it was different in significant details, e.g. reaction time. MINUTEMAN would require less logistic support, was adaptable to firing from silos, and could be rail-mobile. The President said he had recently been visited by a Dr. Long, whose appointment had been arranged by Dr. Kistiakowsky. Dr. Long had indicated that scientists think highly of the MINUTEMAN and believed we should be giving it a high priority.

Mr. Allen asked which missile was used for the man-in-space program. Dr. York replied that ATLAS was used for this program primarily because it was a year ahead of other missiles in its development and was more reliable. Secretary Gates said TITAN had the potential of carrying a larger warhead. Dr. York agreed that TITAN had advantages as far as payload was concerned but said that ATLAS was more reliable.

Mr. Gates said he felt we had made a correct military decision when we decided to develop a smaller engine for ATLAS rather than a SATURN-type engine. This correct military decision, however, resulted in our not having large rockets for space programs. Dr. York said the ATLAS became available for space work two years later than the comparable Russian rocket. This caused a big difference in U.S. and Russian space programs. The President said he thought some space work had been done with a combination of ATLAS and THOR. Dr. York said this was not the case; THOR and JUPITER with added stages had been used in space work.

Dr. Kistiakowsky believed that we were equal to or even ahead of the Russians with respect to the scientific information being derived from our earth satellite program. The President agreed but added that the public sometimes asked whether scientific information would enable us to defend ourselves against the USSR. Dr. York said the fact that ATLAS was available two years later than the comparable Russian rocket had attracted a great deal of attention. The President said we know that the Russians were working earlier on the large rocket engine but it was difficult to get the public to appreciate the real significance of missile developments. Mr. Allen said as a result of our recent successes in space activities, we have recouped much U.S. prestige abroad which had been lost after SPUTNIK. Secretary Gates believed it was essential to separate space activities from military requirements in talking to the public about missile programs. The President noted that such a separation was one of the reasons for creating NASA. Secretary Gates believed the public was somewhat fearful of lunar probes. Dr. York said the Russians had simply demonstrated a capability for lunar probes which we knew they possessed. Mr. Stans wondered whether we were making high enough claims for our scientific achievements in space.

The President asked whether PIONEER V was still sending signals. Dr. York said the satellite was still sending on the small radio. The large radio would be turned on when the satellite was 10 million miles out unless the small radio failed before that time.

The President asked when the communications balloon would be put aloft. General Goodpaster said this firing was scheduled for tomorrow.

Dr. Scoville was then called upon to summarize the CIA report on the history of USSR long-range missile development. Dr. Scoville said the Soviets had no guided missile program before or during World War II, although Soviet scientists had worked on liquid fuel propulsion systems. The Soviets had been impressed by German achievements with the V-1 and the V-2. Consequently, immediately after the war they had devoted a major effort to exploiting German scientists and technicians who had been engaged in the German V-1 and V-2 programs. At first these Germans had been exploited in Germany. Later, in 1946, German scientists and technicians had been evacuated to Kaliningrad, near Moscow, where research laboratories had been established to emphasize V-2 development. Here a modification of the V-2 had been tested.

The President asked whether the V-2 had any guidance. Dr. Scoville replied that the V-2 had a type of radio inertial guidance but no terminal guidance.

Resuming his presentation, Dr. Scoville said that the original range of the V-2 of 200 nautical miles was expanded by the Russians to 350 nautical miles. Then, in addition to exploitation of German scientists and technicians, the Russians undertook to build from the ground up a native Russian missile program which led eventually to the Russian ICBM. Khimki became another site for the development of large rocket engines. In 1947 a test program was started at Khimki where the Russians began firing V-2's first over a range of 260 nautical miles, later, in 1949, over a range of 350 nautical miles. The Soviets also put tremendous effort into developing their electronics program. Starting practically from zero they built up an electronics background in five years so that after 1950 they did not have to depend on any outside electronic assistance.

Dr. Scoville reported that less information was available on Russian missile developments during the period 1950 to 1954 [*text not declassified*]. This period must, however, have been a period of design studies. One development of note was the testing in 1953 of the first Soviet thermo-nuclear device which was a very bulky and cumbersome device. At this time the Soviets probably did not realize that high thermo-nuclear yields could be derived from small packages. Consequently, the Russians decided that they would build a large rocket in order to carry a large thermo-nuclear warhead. In 1955 the Russians tested a smaller thermo-nuclear weapon but by that time their ICBM design was frozen. After 1954 the U.S. was able to obtain information about the Soviet missile program because of the establishment of COMINT coverage of Soviet firings. Dr. Scoville then displayed a chart of Soviet missile tests indicating that the Kapustin Yar range had fired about 600 missiles. In 1953 this range was firing a 700 nautical mile missile which reached operational status by the end of 1956. An 1100 nautical mile missile was fired for the first time in June of 1957. At the same time that the 1100 nautical mile missile was being developed, the Soviet ICBM was being developed. Beginning in 1957 firings of the ICBM from Tyura Tam were detected. In addition to Kapustin Yar and Tyura Tam, the Soviets developed a third firing range, Vladimirovka, from which cruise type missiles, both short-range and long-range, were launched, beginning in 1956. The Russians had attempted three flights of HOT CROSS during the past year. Two of these flights had apparently been failures, although not much was known of this program. However, most of the Russian effort has been concentrated on ballistic missiles rather than on cruise-type missiles.

Dr. Scoville reported that the Russians had fired about 730 700 nautical mile missiles with three failures; they had fired about 60 1100 nautical mile missiles with four failures; they had fired twenty-five ICBMs

with five or six failures; and they had launched fourteen HOT CROSS cruise-type missiles with an unknown number of failures.

Dr. Scoville said our information with respect to the production and deployment of Soviet missiles was poor. Missile engine manufacture was apparently started at Dnepropetrovsk in 1957. Movements between Tyura Tam and Kuybyshev seemed to indicate that production facilities started at the latter place in 1957.

Summarizing, Dr. Scoville pointed out that the Russians concentrated a tremendous effort on the ballistic field fifteen years ago. Their ballistic missile program proceeded in an orderly manner from short-range missiles through long-range missiles to ICBMs. In conclusion, Dr. Scoville said he believed the Russians had not put any great emphasis on missiles which could be fired from submarines. No submarine missile firings had been positively identified but submarines had been observed which were believed to have equipment capable of firing missiles with a 350 nautical mile range.

Mr. Allen asked whether the Russians were still using non-Russians in connection with their missile programs. Dr. Scoville reported that all foreigners working on Russian missile programs had been repatriated by 1951. Colonel White added that Germans had continued to work on the Soviet air defense program until two years ago. Mr. Dulles said the problem of ground-to-air missiles was a separate one not dealt with in this report. The Russians had also concentrated great effort on ground-to-air missiles. Concluding, Dr. Scoville said he wished to emphasize the fact that the Soviets had built up a native ballistic missile program and that since the war they had built up from zero an electronic capability which approached that of the U.S.

The National Security Council:

Noted and discussed oral summaries of the reports on the subject by the Secretary of Defense and the Director of Central Intelligence, pursuant to NSC Action No. 2137.

a. Keeping the NSC Planning Board, the Operations Coordinating Board, the Special Assistants to the President for National Security Affairs and for Security Operations Coordination and other components of the NSC Staff informed of research being done within and outside the Government which has significant bearing upon their responsibilities for national security policy-making or operations coordination, placing emphasis upon a high degree of selectivity.

b. Facilitating appropriate access within the Government to such research.

Marion W. Boggs

254. Memorandum for the Record of Meeting Between Sprague and Merchant¹

Washington, May 25, 1960

Manny Sprague came in to see me yesterday afternoon for about half an hour to ask my unvarnished comments on the OCB and its operation. He has similarly privately and alone interviewed every other member of the OCB.

In sum, I told him that I thought the OCB was a necessary coordinating mechanism, given the complexity and size of our government and its responsibilities. I said that with officers in the Department concerned with its functioning I emphasized that they should give it their best efforts and not resent the time demands of chairing working groups since, if the OCB did not exist, their lives would be far more difficult.

I said that I thought OCB by reason of its wide membership and cumbersomeness had the potential of slowing up and making more difficult the function of coordination. However, I said, under Gordon Gray's chairmanship this had not been the case because he was open-minded and reasonable and not seeking to bring into the OCB orbit problems involving two or more members of the Board which were already being adequately coordinated by direct informal procedures.

I made three suggestions. First, I thought the weekly activity report insofar as it comprised summaries of Departmental telegrams on various problems not under current OCB scrutiny provoked needless and time-wasting discussions on matters on which few, if any, of the members were currently informed. These extracts I thought could be usefully dropped from the weekly agenda. Secondly, I said I thought that the OCB luncheons were probably the most valuable aspect of the entire organization and that I would favor seeking to establish a ratio of two luncheons to one full-dress meeting rather than the present one to one ratio. Thirdly, I said that I thought the luncheons would be even more stimulating and useful if they were agendaless and if members did not try to use them for quick clearances, particularly where only a fraction of those present were directly concerned. In other words, I said, I thought the opportunity for unguided, unrecorded discussion of the major problems in the forefront of our minds was the best way to generate ideas or suggestions which could then be worked out and refined or rejected in staff channels.

Finally, we discussed the "P" factor. I reiterated my basic point, which is that good policy makes good propaganda. Hence I believe

¹Source: Operations Coordinating Board. Confidential. 3 pp. NARA, RG 59, Central Files, 100.4-OCB/5-2560.

that the public relations aspect of actions or policy decisions is one of insuring imaginative, effective presentation. I said that the State Department's function, as I saw it, basically is to formulate the soundest possible policy recommendations to the Secretary and the President. In the process there has to be in the policy makers' minds an awareness of the impact of a particular course on public opinion, be it domestic or foreign. The emphasis, however, should be overwhelmingly on the side of the soundness and appropriateness of the policy insofar as it contributed to the national security. It would be wrong to approach any decision from the point of view of seeking something which would have a spectacular effect on public opinion. On this general note our conversation ended.

Livingston T. Merchant

255. Memorandum of Discussion at the 448th NSC Meeting¹

Washington, June 22, 1960

SUBJECT

Discussion at the 448th Meeting of the National Security Council, Wednesday, June 22, 1960

Present at the 448th NSC Meeting were the Vice President of the United States, presiding; the Secretary of State; the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present at the meeting and participating in the Council actions below were the Secretary of the Treasury; the Director, Bureau of the

¹ Source: Agenda item 1: U.S. Policy on Continental Defense: Port Security. Top Secret; Eyes Only. Extracts—5 pp. Eisenhower Library, Whitman File, NSC Records.

Budget; the Acting Attorney General (Walsh) (Items 1 & 2); and the Chairman, Atomic Energy Commission (Items 1 & 2). Also attending the meeting were the Acting Director of Central Intelligence (Cabell); General Thomas D. White for the Chairman, Joint Chiefs of Staff; the Director, U.S. Information Agency; the Under Secretary of State; the Special Assistants to the President for National Security Affairs and for Security Operations Coordination; Assistant Secretary of State Gerard C. Smith; Assistant Secretaries of Defense John N. Irwin, II and Charles C. Finucane; Charles Haskins, NSC; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. U.S. POLICY ON CONTINENTAL DEFENSE: PORT SECURITY

(NSC Actions Nos. 1862-g, 2051 and 2075; NSC 5802/1, paragraph 19; Memo for NSC from Acting Executive Secretary, same subject, dated May 16, 1960; Memos for NSC from Executive Secretary, same subject, dated June 15 and 21, 1960)

Mr. Gray recalled that members of the Council had recently concurred by Memorandum Action in a revised Port Security paragraph (Paragraph 19; transmitted by the reference memorandum of May 16, 1960), proposed by the Secretary of the Treasury for inclusion in U.S. Policy on Continental Defense (NSC 5802/1). Mr. Gray said he had subsequently discussed the revised paragraph, as well as the revised port security program developed by the Secretary of the Treasury to carry out the new policy paragraph, with the President in a meeting also attended by Secretaries Herter, Anderson and Gates. The President approved the revised Paragraph 19 of NSC 5802/1, rescinded the port security program which he had approved on April 21, 1958, and authorized the Secretary of the Treasury to place in effect such port security programs as are necessary and appropriate to implement the revised policy, in consultation with the Secretaries of State and Defense, the Attorney General, and the Director of Central Intelligence (keeping the Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security informed). In discussing the revised port security program, the President had indicated his desire that occasional boarding and searching of Sino-Soviet Bloc vessels before their entry into U.S. ports should be continued. Mr. Gray said the subject was placed on the agenda of this Council meeting in order that the Council may note the action taken by the President, as reflected in the draft NSC Action transmitted by the reference memorandum of June 15, 1960. Mr. Gray said that the Secretary of the Treasury might at this time wish to make some remarks regarding the implementation of the new port security program and that the Council might wish to note these remarks.

Secretary Anderson said he had very little to add to Mr. Gray's introduction of the subject. He would be agreeable to having the record of the meeting show that the new port security program would include provision for occasional boarding and searching of Sino-Soviet Bloc vessels prior to their entry into port. He would also be agreeable to having the record show that the new port security program would be put into effect in consultation with the Secretaries of State and Defense, the Attorney General, and the Director of Central Intelligence and that he would consult with other interested departments, agencies, and committees prior to making any modifications in the program.

Mr. McCone asked whether he was correct in understanding that all Sino-Soviet Bloc vessels would be inspected after their entry into port, while only occasional inspections would be made at the barrier to the port. Secretary Anderson said Mr. McCone's understanding was correct.

Mr. Gray pointed out that the Joint Chiefs of Staff had formulated views, in which the Secretary of Defense had concurred, which were consistent with the provision for occasional boarding and searching of Sino-Soviet Bloc vessels prior to their entry into port. The Joint Chiefs of Staff had indicated that if inspections prior to entry are suspended, thorough and effective inspections after entry must be made. In concurring in the cautionary comments by the Joint Chiefs of Staff, the Secretary of Defense had recommended that they be brought to the attention of those responsible for implementing port security policy. Mr. Gray understood that the Joint Chiefs of Staff want their views to be on record. He asked whether General White wished to add anything. General White called attention to the fact that the Joint Chiefs has also stated that "continuing emphasis must be given to developing improved techniques for detection of nuclear devices in ships, in ships cargoes, released on harbor bottoms and in channels."

Secretary Gates recalled that at the meeting with the President, referred to by Mr. Gray, the President had indicated that the details of the port security program were not a matter for adoption by the NSC. Mr. Gray agreed that the President had not wished to give his specific approval to the revised port security program but had approved only the general guidelines under which the program would operate, i.e., the revised Paragraph 19 of NSC 5802/1.

The National Security Council:

a. Noted the approval by the President on June 11, 1960, of the revised paragraph 19 of NSC 5802/1 transmitted by the reference memorandum of May 16, 1960, following concurrence therein by Memorandum Action by the other members of the National Security Council, the Secretary of the Treasury, the Attorney General, the Director, Bureau of the Budget, and the Chairman, Atomic Energy Commission.

b. Noted the President's rescission as of June 11, 1960, of the Port Security Programs approved by him on April 21, 1958, and his authorization to the Secretary of the Treasury, in consultation with the Secretary

of State, the Secretary of Defense, the Attorney General, and the Director of Central Intelligence (keeping the Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security informed), to put into effect such Port Security Programs as may be necessary and appropriate to implement the revised paragraph 19 of NSC 5802/1.

c. Noted that the Secretary of the Treasury, pursuant to *b* above, would:

(1) Put into effect, in consultation with the Secretaries of State and Defense, the Attorney General, and the Director of Central Intelligence, the Port Security Program contained in the enclosure to the reference memorandum of May 16, 1960, including provision for occasional boarding and searching of vessels prior to entry into port.

(2) Consult with the other interested departments, agencies and committees referred to in *b* above prior to making any modification in that Program.

d. Noted that the comments of the Secretary of Defense and the Joint Chiefs of Staff with regard to the revision of paragraph 19 of NSC 5802/1 (transmitted by the reference memorandum of June 21, 1960) were being referred to those responsible for implementing the policy set forth in the revised paragraph 19.

NOTE: The above action, as approved by the President, subsequently transmitted to the Secretary of the Treasury for appropriate action.

[Omitted here is the remainder of the memorandum.]

Marion W. Boggs

256. Memorandum From Smith (S/P) to Herter¹

Washington, July 13, 1960

SUBJECT

Paragraph 13 of Basic National Security Policy (NSC 5906/1)

DISCUSSION:

Paragraph 13 of NSC 5906/1 is as follows:

“The United States will be prepared to use chemical and biological weapons to the extent that such use will enhance the military

¹ Source: Discussion of paragraph 13 of NSC 5906/1 on chemical and biological weapons. Top Secret. 4 pp. NARA, RG 59, S/P–NSC Files: Lot 62 D 1.

effectiveness of the armed forces. The decision as to their use will be made by the President."

At the time of the Planning Board's last annual review of Basic National Security Policy, several questions were raised, principally at the instance of the Bureau of the Budget, about the validity of this policy guidance. In essence Budget's concern was that research and development for BW and CW weapons is costing too much if the U.S. does not plan to use them, and that perhaps not enough of these weapons are being purchased if they represent a militarily effective addition to our weapons systems. The uncertainty about the U.S. position on BW-CW weapons, according to Budget, was at least partly attributable to Defense's failure to report fully and accurately to Budget on its programs in this field. Submission of this issue to the Council was deferred to allow Defense an opportunity to provide necessary information.

At the moment, except for the type of BW and CW agents available during World War II and Korea (including incendiary agents of the napalm type), plus some new more effective riot control agents, the U.S. has no substantial capability in being, although Defense scientists believe there is promise enough in these weapons systems to warrant further research and development.

As a result of Planning Board discussion, Budget now concurs in continuing present policy with the understanding that Defense will report adequately the status and implications of its current and projected programs and activities. Accordingly, a draft NSC action has been prepared (Tab B) which (1) continues present policy in effect, (2) calls for Defense to make certain reports, (3) reflects the feeling of certain Planning Board members that non-lethal BW-CW agents (e.g., nerve gas or other controlled temporary incapacitants) should be emphasized in research and development programs; and (4) notes the Planning Board's agreement that an exception to the provision for Presidential approval in advance of use of BW-CW weapons should be made in certain cases.

The language of the draft NSC action is, however, not clear on this last subject (Tab B, para. c), and permits the interpretation that existing smoke and incendiary agents (e.g., napalm) may be used without the President's prior approval in situations short of war including the suppression of civil disturbances. Such an interpretation was not intended, of course, and the record should be corrected. Accordingly, your concurrence in the proposed NSC action should contain a statement of your understanding of sub-paragraph c as set forth below. This matter has been discussed with Defense, and there seems to be no disagreement on the point.

The Department does not have detailed information on Defense plans or preparations for the possible use of chemical and biological weapons. We should, therefore, continue to seek such information and be alert to possible foreign policy implications and their bearing on

over-all national strategy, particularly in the light of the possibility that some non-lethal agents may have useful applications in limited military operations.

Recommendation:

That you indicate concurrence on the voting slip attached at Tab A subject to the following interpretation of sub-paragraph c:

“Prior approval by the President is not necessary for the use by US military forces of (a) existing smoke and incendiary agents and riot control agents in appropriate military operations and (b) riot control agents in suppressing civil disturbances.”

Memorandum From Herter to NSC Executive Secretary

Washington, July 21, 1960

SUBJECT

Basic National Security Policy: Paragraph 13 of NSC 5906/1

REFERENCE

Memo for NSC from Executive Secretary, same subject, dated July 5, 1960

As requested, I am indicating below my action with respect to the enclosure to the reference memorandum of July 5, 1960:

Concur: ✓ C.A.H

Do not concur: _____

Comments: My concurrence is subject to this interpretation of sub-paragraph c: Prior approval by the President is not necessary for the use by US military forces of (a) existing smoke and incendiary agents and riot control agents in appropriate military operations and (b) riot control agents in suppressing civil disturbances.

Christian A. Herter
Secretary of State

257. Draft NSC Action¹

Washington, July 19, 1960

Since the breakdown of the Summit Conference in Paris the Soviets have clearly embarked on a major propaganda and agitational campaign with the United States as its chief target. It seems designed to increase international tension, provoke and encourage disorders wherever possible and has involved a wide range of threats, provocation and blackmail. In the field of action the Soviet Government has broken off the disarmament negotiations on June 27 when conceivably with new Western proposals forthcoming, of which the Soviet Government was aware, an opportunity for genuine progress might have presented itself. In addition, on July 1 the Soviets shot down a United States military plane over international waters.

In most respects this campaign has followed the previous cold war propaganda campaigns with one very important innovation. For the first time in its history the Soviet Union has asserted its willingness in recent weeks to give military support to any regime which seems to serve Soviet purposes, and to threaten atomic retaliation against any country which might take action against such regime. Such threats have been made in the case of Cuba with reference to the United States, and in more generalized terms in the case of the Congo. These threats are probably merely part of the current war of nerves designed in the first instance to weaken the prestige and leadership of the United States, to separate it from its allies, and in particular to pose as champion of all colonial or former colonial peoples in the world. Even though there may be no serious intention of acting militarily on these threats, they do appear to enunciate a new doctrine with the Soviet Union coming close to asserting the right of military intervention in any part of the world when it suits its purposes to do so. This is undoubtedly in part a reflection of the Soviet belief in its present military power.

It is this aspect of current Soviet behavior which requires something more in response than mere words. Some form of action should be taken to bring calmly and coldly to the attention of the Soviet Union the dangers of its current attitude. While they may have no intention of acting on these threats, it is nevertheless possible that the Soviets if they feel that this propaganda campaign is succeeding might progressively commit themselves in future courses of action in the military field which would be extremely difficult for them to disavow if ever put to the test. In addition, we must consider the effect of this

¹ Source: U.S. response to Soviet propaganda campaign. Secret. 4 pp. Eisenhower Library, Whitman File, Miscellaneous Material.

Soviet campaign of threat and blackmail on other countries, particularly the uncommitted areas of the world. If this campaign seems to be proceeding without any strong response on the part of the United States, it might well create the impression that the Soviets are in fact in total command of the situation and that the United States is unable or unwilling to devise any appropriate counter.

In surveying the fields in which the United States could take action which might have a salutary and sobering effect upon the Soviet Union and offset any psychological disadvantageous effects of this campaign in certain parts of the world, it would seem that an increase in our military and mutual security budgets through a request for supplementary appropriations in the August session of Congress would be the best for these purposes. It would fall into the category of action and not words; it could be presented in the most sober and calm manner in order to avoid any impression of panic or belief in the imminence of war but would serve as evidence of American determination not to be brow-beaten by Soviet threats or blackmail, and a very timely reminder that the United States has the resources and will if necessary to add in the future even more appreciably to our military defenses if Soviet behavior renders it necessary.

It could be presented to Congress in a very simple message, merely stating that since presentation of the United States military budget and military assistance part of the Mutual Security Act, the world situation due to Soviet actions had considerably worsened, listing if necessary the specific acts and threats which the Soviet Union has indulged in since the collapse of the Summit Conference. This could be set against the backdrop of the calm attitude of the United States and its allies which makes absolutely clear that the responsibility for the increase in international tension is due solely to Soviet actions and attitudes during this period. The ideal thing would be for the Congress to authorize the President to spend at his discretion up to [blank space in the original] dollars to supplement the existing budget, in order to place our forces in a special state of readiness to deal with any contingency that may arise, and to utilize a portion thereof for the increase of the defense systems of our allies and, if conceivable in Congressional terms, a certain portion for emergency economic aid in the event of special need.

The exact Soviet purposes in mounting this extreme campaign is not entirely clear. It most probably does not forecast Soviet military action, but on the other hand the element of uncertainty is sufficient to justify placing ourselves and our allies in a special state of readiness quite apart from the salutary effect such action on our part should have on the Soviet leadership.

258. Special National Intelligence Estimate¹

SNIE 100-6-60

Washington, August 9, 1960

**PROBABLE REACTIONS TO U.S. RECONNAISSANCE
SATELLITE PROGRAMS****THE PROBLEM**

To estimate Soviet reactions to US launchings of earth satellites with military reconnaissance capabilities,² and other world reactions to these launchings.³

THE ESTIMATE**I. INTRODUCTION**

1. Man's excursion into outer space presents many new problems, and adds a new dimension to some old ones. The possibility of military reconnaissance conducted from orbiting space vehicles is one of these problems, which is now coming to the fore because the US has an urgent requirement for photographic and electronic reconnaissance of the Soviet Union and other denied areas.

2. The Soviets are aware of this requirement from the U-2 case and other US air reconnaissance. They have been cognizant of official American interest in reconnaissance satellite systems since 1948, and have noted recent US disclosures of active developmental programs leading toward operational reconnaissance satellites within a few years. They probably realize that satellite systems are not likely in the near term to produce the quality of information that can be obtained by other means. However, they almost certainly do assume that satellite reconnaissance has considerable potential for intelligence collection.

II. PROBABLE SOVIET COURSES OF ACTION

3. There is no doubt that the Soviets do not want the US to orbit military reconnaissance vehicles over the USSR. The Soviet press and

¹ Source: "Probable Reactions to U.S. Reconnaissance Satellite Programs." Secret. 5 pp. DOS, INR-NIE Files.

² This estimate is concerned primarily with photographic reconnaissance systems, although under certain circumstances it would also apply to infrared early-warning or elint vehicles, particularly if the US were to announce that such satellites were engaged in reconnaissance activity. [Footnote is in the original.]

³ It is emphasized that this estimate deals only with foreign reactions to US launching of reconnaissance satellites; it does not consider various other implications of such a program. [Footnote is in the original.]

radio have already branded as reconnaissance activity the launching of various US weather and communications satellites. Clearly, the Soviets prize secrecy as a strategic asset, and want to prevent the US from observing key military and military-industrial installations and preparations. Beyond this, they would regard any publicly avowed US reconnaissance activity as a challenge to their prestige.

4. Notwithstanding these considerations, the Soviet leaders may not choose to react immediately to a US reconnaissance program. The Soviets have made no formal protest about the Tiros weather photographic satellites. They are unlikely to believe that reconnaissance satellites offer much threat to their secrecy for the next year or so, but during the period of developmental testing of the Samos they will have to weigh the consequences of permitting the establishment of a precedent for unchallenged reconnaissance. Moreover, as capabilities of US reconnaissance vehicles grow they will have to review their policy.

5. At present and for some time to come, the Soviets are likely to have only a marginal capability under most favorable conditions for interference with US satellites. Even detection and tracking in the early orbits of any satellite will be difficult. It might take two weeks to discover an unannounced vehicle designed to minimize detection, after which the track could probably be determined in a few days. It will also be quite difficult to identify the function of a new satellite. During the period of US test operations, roughly 1960 through 1962, the Soviets will probably seek to devise and perfect measures for rapidly detecting, identifying, and tracking satellite vehicles and means for jamming or otherwise disrupting the transmission of data from them. They will probably avoid premature disclosure of methods for which the US could develop countermeasures, but they will prepare for later actions to destroy or to neutralize operational US reconnaissance satellites. In the course of its program to develop an antimissile missile system, the USSR could obtain a limited capability to destroy such vehicles after they have made a number of orbits. This capability might be theoretically achievable about in the period 1963–1966, soon after the presently programmed introduction of a US reconnaissance satellite system. However, the capability for a system for destruction of satellites on their first orbit does not appear achievable until the latter part of the decade.

6. Since the technical-military possibilities for destroying the vehicle or neutralizing its transmission will be limited for some time, the Soviets will probably conclude that only two courses are open to them in the next few years: (a) a campaign of pressure to generate political support in the world, particularly through stimulating

tensions, for a cessation of such reconnaissance activity, or (b) not to bring the issue to a diplomatic climax or even to public view before they could destroy the vehicle. The Soviet decision on what to do about US reconnaissance satellites and when to do it will be affected not only by their judgment about the effectiveness of the program, but even more by the extent and nature of publicity attending the future course of the program.

7. There has already been a great deal of unofficial and semiofficial publicity about the US reconnaissance satellite program, and there will probably be more in years to come. However, if the US Government refrained from officially avowing and attempting to justify a reconnaissance program, and perhaps explained the launching of new satellites on other grounds such as scientific research, we believe that the chances are better than even that the Soviets would not press the issue until they were able either to destroy a vehicle, or to establish its mission by authoritative US acknowledgment or other convincing proof.⁴ It is possible that the Soviets would act early in the US development test program, in order to agitate the issue and if possible to inhibit US plans, as well as to lay the foundation for later direct physical action against US reconnaissance vehicles. But we believe that they would probably estimate that all available courses of action—political as well as military-technical—would be of doubtful effectiveness in compelling the US to end the program, and that there was little advantage in forcing the issue, especially during the developmental phase of the program.

8. On the other hand, if and when publicity about the US reconnaissance operation reached a point at which the Soviets thought that their prestige was being threatened, we believe that they would stage a strong campaign of protest. They would probably consider it necessary to oppose vigorously by political and propaganda means any avowed and politically defended US program to penetrate their secrecy, about which they are extraordinarily sensitive. Their reaction would not be less vigorous because of uncertainty over the effectiveness of such a campaign in getting the US to cease the program.

⁴ The Director for Intelligence, The Joint Staff, considers it unrealistic to suggest that the US refrain from avowing a program that is obviously a government activity whose nature, magnitude and even locus is already known to the world at large. He would revise this sentence to read: "However, unless the US Government deliberately provokes sharp Soviet reaction by giving the intelligence implications of the program undue stress in its publicity, we believe that the chances are better than even that the USSR would not press the issue until it was able to destroy or interfere with the effective operation of US reconnaissance vehicles." [Footnote is in the original.]

9. The basis for protests, propaganda, and possible UN action would probably be the allegedly illegal and hostile nature of the intelligence activities of such satellites, and not Soviet claims to sovereignty in outer space itself. They could introduce the issue into the UN, either in terms of a demand on the US to cease, or in terms of a general measure to outlaw any military satellite or space vehicles, including those for reconnaissance. They would probably attempt to raise tensions and to make the issue appear to have dangerous consequences for world peace.

10. They will, in any case, probably exert all efforts to neutralize the transmission of data from vehicles which might be providing useful intelligence. Whenever the USSR does acquire a capability, it will probably seek to destroy US reconnaissance satellite vehicles. Such action might be accompanied by attempts to use heightened anxiety over war for a diplomatic offensive, and also to persuade the world that the USSR had a successful defense against ballistic missiles.

III. NONCOMMUNIST WORLD REACTIONS

11. World reactions to the US reconnaissance satellite program will vary significantly and will be influenced by the international political climate at the time, by the manner in which the US handles the program, and by the Soviet reaction. Unless the USSR stirs up the issue, world opinion will probably be largely indifferent. But if the Soviets stimulate tension—for example by threatening countries which cooperate in a US “spy” program by furnishing facilities for tracking stations—and try to make the issue appear to have dangerous consequences for world peace, the US would have to contend with adverse reactions in neutralist countries and among some segments of opinion in Allied countries from those who would view the US action as provocative and risky.

12. The governments of the principal countries of the Free World, as well as military, official, and some other segments of opinion in these countries, are well aware of the requirement for effective intelligence on the USSR to support the US deterrent posture, and would not object to the reconnaissance satellite program. Many governments would be favorably impressed by evidence that the US could in fact penetrate Soviet secrecy. Favorable reactions in Allied countries might be enhanced by joint Allied association with the program. Nevertheless, in the event of violent Soviet reaction to the program, Free World governments would still have to contend with considerable popular anxiety over heightened international tension. However, most Allied governments would probably support the US program and would endeavor

to persuade their people to accept it, and some other governments would also probably acquiesce.⁵

⁵ The Director for Intelligence, The Joint Staff, considers that paragraph 12, as written, overemphasizes the unfavorable reaction of neutralist elements in the Free World. He believes that restrained, well timed publicity could stimulate both governmental and popular support for a US reconnaissance program and that the governments and informed peoples of the Free World would draw encouragement from the knowledge that the US was able to penetrate Soviet secrecy. This would do much to offset the effects of a violent Soviet denouncement. He would, therefore, substitute the following for paragraph 12:

"12. The governments of the principal countries of the Free World, as well as military, official, and some other segments of opinion in these countries, are well aware of the requirement for effective intelligence on the USSR to maintain Free World security, and would support the US reconnaissance satellite program. Such support could be broadened and reinforced and the impact of violent Soviet denouncements and threats reduced by a restrained, well timed information program. Such a program could have some effect in converting neutralist opposition to acquiescence. Many governments and peoples of the Free World would be favorably impressed and encouraged by evidence that the US could in fact penetrate Soviet secrecy; by the same token they would be discouraged and disappointed if they were given reason to believe that the US was unable to achieve such penetration. Favorable reactions in Allied countries might be enhanced by joint Allied association with the program, though not all objections would be overcome. Even in the event of violent Soviet denouncements and threats, the US program would have substantial popular acceptance as well as the support of most Allied governments." [Footnote is in the original.]

259. Letter From Gates to Goodpaster¹

Washington, August 10, 1960

Dear Andy:

I tabled this paper with the Joint Chiefs of Staff this afternoon, and it is the subject we wish to cover with the President tomorrow morning at 10:15.

In view of the fact that Admiral Burke is planning to attend to protest this proposal, I felt you at least would want to read it first, and perhaps even informally discuss it with the President prior to our arrival. I expect to review the entire subject with the President when we arrive for our meeting.

Sincerely,

Thomas S. Gates

- (g) SM-696-60 dtd 20 July 1960 (Memo to JCS signed by Admiral Blouin, Secretary, JCS)

1. By the referenced memoranda the Secretary of Defense has received for decision or as a basis of discussion with the Joint Chiefs of Staff matters relating to command and control of the Fleet Ballistic Missile Forces, strategic targeting and associated problems.

2. After exhaustive discussion with the Joint Chiefs of Staff and study of the referenced documents, I have concluded as follows:

a. It is neither necessary nor desirable to establish at this time a Unified Strategic Command.

b. The National Strategic Targeting and Attack Policy, attached as Tab A, should be promulgated.

c. A national strategic target list (NSTL) should be developed and maintained which is responsive to the policy.

d. The Joint Staff is not organized, manned or equipped to develop and to maintain the National Strategic Target List (NSTL) responsive to the approved policy.

e. CINCSAC is capable of developing and maintaining the NSTL and should be designated the Director of Strategic Target Planning (Tab B), an agent of the Joint Chiefs of Staff whose responsibilities will be delineated in Tab A.

f. A single Integrated Operational Plan (SIOP) for attack of the targets on the NSTL is needed to insure maximum effectiveness, mutual support of forces, and economy of force.

g. The DSTP should develop the SIOP responsive to the policy (Tab A) in accordance with Tab C.

3. It is desired that CINCSAC be immediately informed of his designation as DSTP, the policy (Tab A[B]), and requested to advise the Secretary of Defense promptly through the Joint Chiefs of Staff of his proposed organization and manning requirements to carry out the functions of DSTP.

4. In the light of the above decisions, the Joint Chiefs of Staff will, as a matter of priority, advise me of their views in regard to the remaining questions stated in CM-386-59, reference (c) above.

Tab A

NATIONAL STRATEGIC TARGETING AND ATTACK POLICY

1. *Intent.* To provide guidance for the optimum employment of appropriate United States atomic delivery forces in the strategic attack against the Sino-Soviet Bloc.

2. *Objectives.* The basic objective of this policy is to establish an essential national task to be accomplished under the several conditions under which hostilities may be initiated. Specific objectives are:

a. Destroy or neutralize the Sino-Soviet Bloc strategic nuclear delivery capability and primary military and government controls of major importance.

b. Destroy the major urban-industrial centers of the Sino-Soviet Bloc to the extent necessary to paralyze its economy.

3. *Method of Accomplishment.* In planning the strategic attack against the Sino-Soviet Bloc war-making potential, a National Strategic Target List (NSTL) and a single integrated operational plan (SIOP) shall be developed which will provide for the optimum integration of the committed forces for the attack of a minimum list of targets, the destruction of which will accomplish the objectives stated in paragraph 2 above.

4. *Responsibilities.* The responsibilities of the Joint Chiefs of Staff, the commanders of unified and specified commands, and of the Director of Strategic Target Planning are as follows:

a. *Joint Chiefs of Staff.* The Joint Chiefs of Staff shall:

- (1) Be responsible for National Strategic Targeting and Attack Policy.
- (2) Review and approve the NSTL and the SIOP.
- (3) Specify the date on which the SIOP will become effective.

b. *Commanders of Unified and Specified Commands.* The commanders of appropriate unified and specified commands shall:

- (1) Provide permanent senior representation at the headquarters of the Director of Strategic Target Planning.
- (2) Commit appropriate forces to the attack of targets of the NSTL and insure the timely execution of these attacks in consonance with the SIOP.
- (3) Program no attacks against targets on the NSTL unless provided for by the SIOP.

c. *Director of Strategic Target Planning.*

(1) There shall be a Director of Strategic Target Planning, who as agent of the Joint Chiefs of Staff, shall:

(a) Organize a Joint Strategic Target Planning staff consisting of personnel from the various services possessing the required skills to perform the targeting and planning functions.

(b) Develop and maintain the NSTL and the SIOP for attack of the targets on the NSTL.

(c) Submit the NSTL and the SIOP to the Joint Chiefs of Staff for review and approval, highlighting points of difference which he resolved during the preparation of the NSTL and the SIOP.

(2) There shall be a Deputy Director of Strategic Target Planning of flag or general rank who shall be selected by the Director of Strategic Target Planning and who shall be of a different service than the Director.

5. *Damage and Assurance Criteria.* Plans and operations directed toward the attack of the NSTL will be based on the criteria set forth below:

a. Damage Criteria. In applying these damage criteria, account will be taken of cumulative damage effects from adjacent nuclear detonations. It is recognized that variations from established probabilities will be desirable in order to adjust to variable target configurations, yields and CEP's of available weapons, characteristics of delivery vehicles, and other operational factors.

(1) Ninety percent probability of severe damage to military targets directly related to atomic delivery capability.

(2) Ninety percent probability of severe damage to military and government controls of major importance.

(3) Ninety percent probability of severe damage to 50 percent of industrial floor space in major urban areas.

b. Assurance Criteria. Taking account of all pertinent operational factors, plans and operations will be based upon achieving a minimum of seventy-five percent assurance of delivery at each bomb-release line (BRL) of the necessary weapons to achieve the specified levels of damage to targets on the NSTL.

Memorandum for General Power, USAF

Washington, undated

SUBJECT

Director of Strategic Target Planning

1. You are hereby designated Director of Strategic Target Planning for the Joint Chiefs of Staff.

2. Your task, responsibility and authority are as contained in the National Strategic Targeting and Attack Policy dated _____.

3. Selected portions of Study 2009 are being forwarded to you under separate cover. Access to this study will be on a strict need-to-know basis in connection with your duties as Director of Strategic Target Planning.

Tab C

Memorandum for the Joint Chiefs of Staff and Unified Commanders

Washington, undated

MEMORANDUM FOR

Director, Strategic Target Planning
Chief of Staff, U.S. Army
Chief of Naval Operations
Chief of Staff, U.S. Air Force
Commandant, U.S. Marine Corps
Commander in Chief, Alaska
Commander in Chief, Atlantic
Commander in Chief, Caribbean
Commander in Chief, Continental Air Defense Command
U.S. Commander in Chief, Europe
Commander in Chief, Naval Forces Eastern Atlantic and Mediterranean
Commander in Chief, Pacific
Commander in Chief, Strategic Air Command

SUBJECT

Implementation of Strategic Targeting and Attack Policy (U)

1. In consonance with "National Strategic Targeting and Attack Policy" dated _____, the Director of Strategic Target Planning (DSTP) will develop for the Joint Chiefs of Staff in conjunction with the unified commanders the National Strategic Target List (NSTL) and a Single Integrated Operational Plan (SIOP) as a matter of priority.

a. NSTL. The NSTL will consist of a minimum number of specific targets whose timely and assured destruction will accomplish the specific objectives set forth in paragraph 2 of the policy.

b. SIOP. The SIOP will be prepared in consideration of the several possible ways in which hostilities may be initiated and will:

- (1) Govern all attacks on all targets listed in the NSTL.
- (2) Determine the targets to be attacked based on the capabilities and limitations of committed forces.
- (3) Determine the effort against each target consistent with the worth of the target and damage and assurance criteria specified in paragraph 5 of the policy.

(4) Integrate individual strikes for mutual support through the establishment of attack corridors, timing, ECM, etc.

2. In accomplishing this task, direct liaison with any agency of the Department of Defense is authorized.

3. In accordance with the foregoing, the DSTP shall submit to the Joint Chiefs of Staff by 14 December 1960 and on (date) of each year thereafter the following:

a. The NSTL, consisting of all installations under attack in the SIOP. These installations will be grouped together by Target Data Inventory (TDI) major reference number.

b. The SIOP in a format which can be readily reviewed by the Joint Chiefs of Staff and the DGZ's selected for various conditions of warning supplemented with:

(1) The list of the weapons, delivery forces, and the unified and specified commanders furnishing those forces programmed for each DGZ.

(2) The list of the installations under attack by weapons assigned to each DGZ.

c. An over-all damage assessment summary by country for each category of essential enemy resources attacked to include the assurance of attaining specified levels of destruction under the following assumed conditions for initiation of war:

(1) U.S. attack with full strategic warning.

(2) U.S. attack with tactical warning under initial circumstances that are reasonably likely to occur.

d. Advise the Joint Chiefs of Staff as appropriate of any temporary inability to attain the levels of destruction or neutralization prescribed.

4. *Participating Commands and Forces.* The commanders of all unified and specified commands shall advise the DSTP of those forces of their commands which have an appropriate capability and which are available for commitment to the attack of targets on the NSTL and which should be included in the SIOP. The inclusion of forces in the SIOP constitutes a first priority commitment.

5. The foregoing responsibilities of the DSTP do not include command authority. It is recognized that points of difference involving tactics, use of forces, etc., may develop between the commanders of unified or specified commands and the DSTP. Such differences will be resolved by DSTP to permit completion of the SIOP and will be highlighted in presentation to the Joint Chiefs of Staff for their review and approval.

6. The unified and specified commanders will meet at the Headquarters, DSTP, Offutt Air Force Base, Nebraska, on 14, 15, and 16 December 1960, to review with the Secretary of Defense and the Joint Chiefs of Staff the initial NSTL and SIOP.

260. Draft Memorandum for the Record¹

Washington, August 11, 1960

SUBJECT

Meeting with the President on SecDef's Proposal to turn Targeting and the Preparation of Single Integrated Operational Plan over to SAC

1. Present:

The President
SECDEF Gates
Deputy SECDEF Douglas
General Twining
Admiral Burke
General Goodpaster
Colonel Eisenhower

2. The SecDef, using his written proposal as a guide, discussed in general the points in his policy paper only. He did not discuss the details contained in his TAB C, a copy of which I do not have but which was, I think, the directive for preparation of the target list and the single integrated operational plan.

3. SecDef stated that he had worked on this for a long, long time with everybody he could think of, and he had drawn it up with the help of Mr. Douglas and General Twining. He said that it did not give any Service all the things it wanted. For example, the Air Force wanted a unified strategic command, and he did not approve of that. The Army originally wanted to have the Joint Staff develop the target list but now went along with this proposal. He repeated the arguments which were used yesterday on the policy for his paper.

¹ Source: Record of a meeting among Eisenhower, Department of Defense leaders, Twining, and Burke on turning over responsibility for targeting and SIOP to SAC. No classification marking. 8 pp. Naval Historical Center, Burke Papers, NSTL/SIOP Briefing. Drafted by Burke.

4. SecDef stated that everybody agreed with this but Admiral Burke and that he felt very much concerned about it and had asked to see the President.

5. I then used my handwritten paper as a basis for discussion with the President and followed it very closely.

6. The final result, after two hours of discussion, was that the President stated he did not want to make a final decision now and perhaps later have to revise it just before he left office. He did want to make the final decision before he left office if it were in any way possible. He in general agreed with Mr. Gates' ideas, but he agreed with my concept that we should try and see what it is before a final decision was made. CINCSAC, with a joint staff and with the help of the Unified Commanders, is to draw up a national target list and a plan in the same manner, and using the same data to present to the Joint Chiefs of Staff by the middle of November or first of December. The Joint Chiefs of Staff, the Services, and everybody else will be given an opportunity to completely analyze, check and correct this plan. After that, if there is disagreement, it may be brought before the President for a decision again.

7. Coming back in the car the people from the Department of Defense wondered how this could be done, and I stated by simply ordering the people in there and asking them to do it.

COMMENTS:

I fear there will be attempts to make the final decision now to do it, and with the idea of making corrections in the procedures in three or four months but not change the method.

8. There were a great many comments most of which I probably have forgotten. The following comments are not in the order that they were made.

9. First, the President said that this was apparently an emotional issue because he could see both from General Twinings remarks and mine that there was emotion involved in this, and he hoped that objective men could arrive at some satisfactory answer.

10. The President believed that this was not a problem which really should have come to him because he felt it was merely a procedural problem. He said Burke agrees that there should be a single integrated operational plan and he agreed that the people have to follow it. He just disagrees on who makes it out. He wants it made by the Joint Staff and the SecDef wants it made by CINCSAC.

11. I said, no, that's not quite it. I think that if SAC makes these two there will be completely different target lists and completely different operational plans than if the Joint Staff makes it. That's one point. The other point is that we, the Joint Chiefs, can exercise control and

influence over the development of these papers if they are CIN Joint Staff, but they cannot do this if they are [illegible in the original] or any other agency. The third point is that I do not believe that all the details or routing, timing, subsidiary targets, ECM and those things should be included in a fixed rigid plan made by one commander for the forces of another commander. I felt that the Unified Commanders should have some leeway.

12. At one point General Twining said that the Navy would not let this thing work, that we would wreck it. Apparently the President has been told this a good many times by somebody. I remonstrated and said I thought that was an unfair accusation, but nobody picked it up much but me, although I think the President did perhaps not like it very much. The President talked on all sides of the problem at various times but obviously wanted to agree with Tom Gates as much as he possibly could. He said as far as who did it was concerned it didn't seem to make any difference to him, the Joint Chiefs would be able to check it.

13. I reexplained the difficulties that the Joint Chiefs would have in checking it and emphasized that if the Joint Chiefs organization could not make the plan out in the first place they would have great difficulty in checking it, particularly if it had to be done in a hurry by the Chiefs themselves.

14. The President was not very much impressed with the NATO difficulties I pointed out because they did not have any capability now. He said of course they would want to get into the planning later on, but that can be done somehow no matter what system we adopted. I didn't bear down on this point.

15. I emphasized many times that I felt that Mr. Gates thought there would be a short target list and an operational plan which would be easily followed, but I suspected something considerably different from this and I thought it was very important that we see what came out of it before we buy it. We went [illegible in the original] this ground over and over and over again. Most of my stuff was in the original paper I wrote, repeating it.

16. Tom got awfully close to accusing me of disloyalty. He didn't quite say it. I don't think he mentioned it. Although I'm not so sure now because this happens too often. Not quite disloyalty, it isn't that, it's just that I'm not a member of the team. The Navy is always the shouter. Nate made no bones about it. He said: Mr. President, unless we make a decision to do this now, an irrevocable decision, the Navy will wreck it. He said if you delay this I am sure Tommy White will come over here and not like it at all. Now the President took him apart on that a little

bit gently. He said he didn't see any reason why they couldn't wait and make a final decision sometime later.

17. I left all of my notes over with Andy Goodpaster and he's going to send them back. I didn't quite read them all and he can get them all down in his notes, see some of the points I didn't make. I didn't quite get finished. The discussion got so hot I never came back to the paper.

18. Goodpaster never entered into the argument. He never does. Mr. Douglas entered into the argument. Everybody did, all three of them did. I have forgotten what points Douglas especially made, except that SAC has this great capability. Of course Polaris entered into it. Service positions entered into it.

19. The President insisted over and over again we've got to have a single plan and people have got to follow it. Don't you agree with that, Burke? Yes, sir, Mr. President, I do agree with it, but the plan has got to be right. It can't be detailed and it's got to be made with the full realization of the other things that have to be done other than this, and to do these things most efficiently there must be enough leeway left to the commanders so that they do them most efficiently, but certainly you are absolutely correct. There must be a list of targets which must be struck at a certain specific time.

20. The President made the point that all he was looking for was the first strike. He said this is the first strike, the first 24 hours. After that of course the Unified Commanders must use their forces the way they see fit under the direction of the Joint Chiefs of Staff.

21. I thought a couple of times that Tom implied that they had to get somebody, if people were objective, they would accept his plan, that's what he was really saying. People who didn't accept the plan were not objective, too much Service bias. Nate picked up right after that and talked about the awful Navy. I thought sure "there goes the whipsaw". I was just about ready to say "if that is your opinion then obviously I shouldn't be here." I just started to say it. I counted and I didn't, but it very nearly came out. Maybe I should have. That was pretty serious.

22. We have got to get the word around somehow that the Air Force is wrecking the hell out of this joint. This is one of them. Either you do it my way or I won't play. That's the Air Force, and they got their way completely on this, except for this one thing—the final decision is not made yet. That's the only thing we got and we've got to throw some of our very best people in this because in this decision Tom Gates, Douglas and Twining have all made up their minds absolutely what they will do in January no matter what decision is made. They talked about it. If

the thing doesn't work in January, then what should we do, get a new SAC commander? Maybe it's the man. That's not it. Douglas said that.

23. The President listened. I really don't know whether I made the points well or not. There's no doubt about it, after two hours you get tired of clawing your way up the cliff over and over again.

24. I think the President was the only one there who would listen at all. The other people, they just don't want to see—I'm afraid. Our job now is to get this paper ready. I suspect they'll call a special meeting of the Joint Chiefs of Staff. Gates and Twining will probably go over this, [illegible in the original] "copy everything down that you can". The only thing I care about is the final result, that the final decision will not be made until the two [illegible in the original] been tested and checked and analyzed by every agency that knows how to do it, and everybody that wants to do it. If the Joint Chiefs of Staff want to do this thing, they can do it, but it must be done quickly. So we've got to get our corps of experts here and this is the most important thing we've got to do. Not to tear it to pieces. We want to make this thing work because if it does work, it will be helpful, but I don't think it can work. But if it does God bless us, let's make it work. What I didn't say to Twining was: Supposing this thing is lousy (and I think it will be) in January, that's the reason why you don't want to give it a trial, that you want to make the decision now because you feel you don't want to let it all show the light of day.

25. I am afraid I used my quota of mercy with the President—which is all right. I think he took the only decision he could take under the circumstances because he could not decide to throw this into the Joint Chiefs of Staff now. He could not have decided that with the Secretary of Defense, the Deputy Secretary of Defense and the Chairman all against it. What disappointed me a little bit was he used so many of their arguments back in trying to persuade me. I know that's a technique.

26. I came away with the same opinion I had when I went in there. I didn't get mad. Nobody got mad. Twining got a little emotional.

27. Captain Aurand, who had been present at the debrief, made the following comments: I think one of the most important points is this business is just the first strike. From there on the Unified Commands do their own planning and also consideration must be given in the initial plan for this posture that it will leave and which the Unified Commanders will be left. Twining cannot ignore that. It can't be that all out.

261. Memorandum for the Record¹

Washington, August 15, 1960

SUBJECT

Conversation with Mr. Gates on the preparation of the NSTL and SIOF, 15 Aug 60

1. I asked for an audience with Mr. Gates at 1345 on Monday.

2. I told Mr. Gates that I had heard enough rumors in regard to my attitude and the Navy's attitude to warrant explaining directly to him what my attitude was so that there would be no doubt whatever in his mind. In addition to the rumors, there was a smear campaign started against Burke and against the Navy which was as yet in the generating stage. Nothing serious had come up yet. They were just laying the groundwork. This was evident in the papers over the weekend. The papers by themselves would not have caused me any concern but I was warned by one of my friends in the newspaper business who called up and asked what was the campaign going on against Burke. What had I done? What was I so uncooperative about? Why was not I a team-player? He thought I was a teamplayer. I told him I did not know what it was all about whereupon he said I just wanted to let you know there are stories that are being spread which you should know about.

3. I told Mr. Gates that because of these stories I wanted him to know directly that although I did not agree one damned bit with his decision and the President's support of his decision, the decision was made and I and the Navy would support it. I told him that he should know that from his past experience and that I was disconcerted first—when General Twining was talking to the President and stated that the only reason this thing might not work would be that the Navy would not want to make it work. As he would remember, I replied that if this plan were put into effect and it failed, it would not fail because the Navy would not try to make it work but because some other group did or because the system itself was wrong. Also I was concerned when I had heard rumors that Mr. Gates had made statements and I think he had made them to me too, that he expected to bear reverberations from the Navy on this, that he expected to be crucified by the Navy, and other similar things. I said he ought to know better than that. The Navy was not going to do any such thing, although naturally there would be great disappointments and there would be some comment but there was not going to be any general attack on Mr. Gates.

¹ Source: Record of a meeting between Burke and Gates on preparation of NSTL and SIOF. Top Secret; Hold Closely; No Distribution. 3 pp. Naval Historical Center, Burke Papers, NSTL/SIOF Briefing.

4. Mr. Gates said he really did know that, but that he particularly did not mean the leadership of the Navy. He knew that we would support the decisions that were made if we accepted the decision at all. If we were to fight we would fight above board. However, he said that he had had great experience since he had been in the Secretary of Defense office. There had been many occasions when subordinate people in all Services kept fighting for their own Services against the decisions of the Secretary of Defense. I said that I did not know about that. I didn't think the Navy was really very much involved in that sort of business. Before the decision was made, that could be true. There would be presentations which all the Services would put on to favor their own projects and that sort of business.

5. I again repeated that I wanted Mr. Gates to know exactly where I stood, that I had taken this thing to the President although I knew when I asked to see the President that the President would have to stand by the Secretary of Defense's basic decision. What I wanted to do then was to impress upon the President and upon the Secretary of Defense, and everybody else two things. First, the responsibilities of the Joint Chiefs of Staff. They had to know what they were doing. They had to get into the basic data. They had to have the basic data available to them. They had to analyze the NSTL and the SIOP. They had to be able to do this completely, thoroughly and in any way it might turn out to be most convenient to do it. This meant that all data, raw data, finished data, working data, everything else had to be made available to the JCS in the event the JCS wanted it. And to the [illegible in the original] of the JCS.

6. Mr. Gates said I certainly had made that point clear enough. And he agreed with it. He was sure the President understood it. The President had said that in different words himself when talking about the means of doing this.

7. I then said the second reason why I wanted to take this to the President was to prevent a snow job. I knew that Mr. Gates expected a reasonable target list and a reasonable operational plan to come out of this organization. I did not think it would come out unless extraordinary efforts were taken. I meant to take those extraordinary efforts. And I wanted to make sure that everybody knew that those extraordinary efforts would be necessary and that was one of the reasons why I wanted to make sure that all of the data would be available for checking. What I was afraid of was that the atomic weapons requirements and the force levels, the disposition of forces, the whole budget procedure could be changed radically if these documents were not well analyzed, studied not only by the Joint Chiefs but also by the Unified Commanders.

8. Mr. Gates agreed with this thoroughly.

9. He then said that one of the reasons and by no means the least reason why he wanted to get this done now was because of what he was afraid was coming in the next Administration regardless of who was elected. He said that this would permit the Joint Chiefs to get hold of SAC. He was going to speak to General Power in very harsh terms. He did not like what Power had done to date. He was going to tell Power exactly what he thought and exactly what Power would have to do in order to make this thing reasonable and to make it work. He also said that this procedure would permit the Navy and the other Services, but mostly the Navy because the Navy had the most to lose, to escape from a more radical reorganization later on. He thought that unless something were done now that we would surely be faced with a strategic command in which SAC or the Air Force would take command of the Naval delivery units sometime in the future. He thought this decision he had made would prevent that. He said that perhaps in two years from now the Navy would feel like giving him a Guggenheim Medal. I said that perhaps that was correct if it came out the way he expected it to come out which I was going to try to make it do, he should have a Guggenheim Medal. The thing that I was still afraid of was that there was a long road ahead, and a lot of turning-off paths, a lot of slippery places and I was still fearful that SAC would get hold of a budget in such a way that nobody could reexamine it.

Arleigh Burke

262. Memorandum of Discussion at the 458th NSC Meeting¹

Washington, September 7, 1960

SUBJECT

Discussion at the 458th Meeting of the National Security Council, Wednesday, September 7, 1960

Present at the 458th NSC Meeting were the President of the United States, presiding; the Secretary of State; the Acting Secretary of Defense (Douglas); and the Director, Office of Civil and Defense Mobilization. Also present at the meeting and participating in the Council actions

¹ Source: Agenda item 4: Civilian Readiness Base. Top Secret; Eyes Only. Extracts—7 pp. Eisenhower Library, Whitman File, NSC Records.

below were the Secretary of the Treasury; the Acting Director, Bureau of the Budget; and the Secretary of Commerce (attending for Items 3 and 4 and participating in action on Item 5). Also attending the meeting were the Chairman, Atomic Energy Commission; the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Acting Director, U.S. Information Agency (Washburn); the Assistant to the President; the Special Assistants to the President for National Security Affairs, for Science and Technology, and for Security Operations Coordination; Assistant Secretary of State Gerard C. Smith; Assistant Secretary of Defense John N. Irwin, II; the Assistant White House Staff Secretary; the Acting Executive Secretary (Boggs), NSC; and Mr. Robert H. Johnson, NSC.²

There follows a summary of the discussion at the meeting and the main points taken.

[Omitted here are pages 2–7.]

4. CIVILIAN READINESS BASE

(NSC Action No. 2114–c; NSC 5906/1, paragraph 59; NSC Actions Nos. 2131–c and 2254; NSC 5912, Part 4)

Governor Hoegh began his presentation by summarizing the provisions of Paragraph 59–b of NSC 5906/1 (Basic National Security Policy) and then took up each of the elements mentioned in that paragraph in turn. In his discussion Governor Hoegh also referred to the national plan for civil defense and defense mobilization which is supported by fifty state plans, 2400 community and county plans, and 240 metropolitan area plans. He said that the national plan had served as a model for many NATO countries. He pointed out that Congressional approval of administrative matching funds for civil defense will make available \$1 million per month and will materially improve civil defense at the state and local level.

Turning first to the civil defense program, Governor Hoegh displayed a chart showing some of the conclusions of WSEG (Weapons Systems Evaluation Group) Study No. 45. In particular he called the Council's attention to the conclusion that, with an assumed 2000-megaton attack on the U.S. and assuming no shelters and no anti-ICBM system, 97 million casualties would occur. With the best possible anti-ICBM system but no shelters, casualties would be 68 million. However, with fallout shelters and no anti-ICBM system, casualties would be 14 million. The report concluded that the effect of fallout shelters in protecting the U.S. population was far more significant than active defense alone, while the two combined would be still better.

² Add Dr. Herbert Scoville Jr., CIA

Mr. Morris Fishow, CIA

Mr. Knight McMahan, CIA [Footnote is in the original.]

Governor Hoegh described the steps that had been taken to implement the present fallout shelter policy. He noted that the information and training program had been accelerated and that \$60 million worth of television and radio time had been provided at a cost of only \$900,000 to the Government. He briefly described the adult education program. He pointed out that sample surveys indicate that 25 per cent of the population can be adequately protected against fallout in existing buildings without structural modification. He noted that research had been accelerated. He stated that over 200 prototype dual-use shelters are being constructed and that the FY 1961 budget provided funds to complete this prototype program. Governor Hoegh said that incorporation of fallout shelters in federal buildings was an essential aspect of federal leadership and example under existing policy but Congress has failed to support this aspect of the program. He noted that federal loan and grant programs, such as those of the Veterans Administration and the Federal Housing Administration (and a number of others), can now be used to assist shelter construction.

Governor Hoegh stated that a Gallup Poll had shown that 71 per cent of the American people favor fallout shelters and 38 per cent had indicated that they would be willing to construct fallout shelters at their own expense up to a cost of \$500. Since fallout shelters can be built for \$100–\$300, this percentage could be increased to 50–60 per cent. Governor Hoegh stated that the construction materials industry had been helpful in promoting the shelter program.

Governor Hoegh emphasized that without federal leadership and example, the national shelter policy would not succeed. Congressional support for the program has been less than expected at the time the policy was adopted; Congress had approved less than one-third of the funds requested. However, Governor Hoegh believed that the policy will eventually produce the desired results. It might be necessary, however, to stimulate action by more funds for education and by more incentives.

Governor Hoegh pointed out that when an enemy attack is detected, we can today warn 376 critical points in the U.S. within fifteen seconds. This was being expanded to 460 points. Our goal in radiological defense is at least one federal monitoring station in each of the three thousand counties by the end of 1963. We now have more than 1500 such stations.

Turning next to support of the military logistics base, Governor Hoegh stated that while the goals of the military logistics program had not yet been translated into detailed industrial requirements, it was clear that overall industrial capacity was sufficient to meet military demands in all situations short of general nuclear war.

Governor Hoegh then briefly discussed the status of the stockpile and manpower programs and stated that he would deal with

that aspect of the mobilization program relating to support for foreign economic policies in connection with the last item on the Council's agenda. He then turned to survival and recovery planning. [*text not declassified*] This program, however, is presently being restudied. The \$3.8 million in the FY 1961 budget to begin the protection program was not appropriated. Reliance, meanwhile, is being placed on the [*text not declassified*]. Governor Hoegh noted that construction would begin in December on the first of the underground regional control centers. He stated that \$212 million in medical supplies were dispersed in 43 federal warehouses or pre-positioned in the states and local communities. Studies indicated that these supplies had a high probability of survival. He referred to the President's approval of a new plan covering requirements for medical supplies estimated at \$723 million.

Concluding his presentation, Governor Hoegh returned to the fallout shelter program. He stated that the basic elements underlying our present policy were sound and workable. It was too early to demonstrate their success or failure. He again emphasized the importance of federal example. Without it, he stated, a more forceful policy and one involving a greater degree of federal financial responsibility would be required.

The President referred to Governor Hoegh's description of the stockpiling program and asked whether the stockpiles, in particular those of strategic metals, were located outside the population centers. Governor Hoegh stated they were located in 240 communities. Much of the materiel, he said, was in the area in which it would be processed; much, of it was in or adjoining a city. The President expressed the view that the stockpiles ought to be away from the cities and that they did not constitute much of a reserve if they were in the cities.

Mr. Gray pointed out that existing policy called for construction of fallout shelters in new federal buildings but that it excluded military buildings. It was not clear, Mr. Gray stated, whether we had plans for inclusion of such shelters in military construction. In response, Governor Hoegh said that Secretary Gates had on July 28 issued a policy which was in line with the policy on non-military construction. It provides for surveys and for incorporation of shelters in military buildings as funds are available. Secretary Douglas observed that no funds have been available for this purpose although they had been requested. Governor Hoegh said that the new DoD policy was helpful and could be quoted in dealings with Congress.

The President inquired as to whether Governor Hoegh thought it would be helpful if he were to build a shelter in his own home. He referred to previous discussion of this question and to the possibility that such action might just scare the American people. Governor Hoegh expressed the view that such action would be helpful in stimulating the people to take action. He noted that Prime Minister Diefenbaker is building himself a shelter and so are twenty-five governors. Secretary

Douglas noted that the President had on other occasions raised questions as to the effect of the U.S. adoption of a major shelter program on our allies. This, Secretary Douglas observed, was a difficult question to answer. The President stated that if the program were on a compulsory basis, the effects would be bad but that as long as it was on the basis of federal leadership and example, with the people taking responsibility for shelter construction, the effects would not be adverse. He asked whether Sweden did not have a large shelter program. Governor Hoegh said that seven countries require that shelters be included in all multiple-family dwellings.

Secretary Douglas asked whether we could really expect much progress in the shelter program without some federal assistance. Governor Hoegh expressed the view that we could. If Congress provided funds for fallout shelters in new federal buildings, it would be the signal to the American people to go to work. Many were building shelters already. As industry gets at this problem and gets its sales force out all over the country selling shelters, there would be a considerable increase in shelter construction.

Mr. McCone inquired whether there was not a Bureau of the Budget policy which prevented construction of shelters in federal buildings. Mr. Staats pointed out that the House Committee had written into legislation a prohibition of shelter construction in federal buildings. Thus, even where the Government had funds available, it could not use them for this purpose. In response to an inquiry from Mr. McCone, Mr. Staats indicated that this prohibition applied not just to 1961 money but to all federal funds. The President observed that if we had a real scare, it would be interesting to see what these same Congressmen would say about shelters. Governor Hoegh observed that the Senate always went along with the Administration on these matters but that the House had been very arbitrary. Mr. Gray noted that Congress had not neglected to construct shelters in new Congressional buildings. Secretary Douglas stated that there was a wider acceptance of the idea of shelters in the military services today than one, two or three years ago. What worried the military was the credibility of our deterrent when the U.S. had done little to protect its own population.

There was some discussion of Governor Hoegh's reference to the fact that surveys indicated that 25 per cent of the population could be protected from fallout in existing buildings. Mr. McCone asked if these buildings were properly sealed. Governor Hoegh said that they were adequate. In the course of this discussion, Governor Hoegh stated that if Congress would provide funds for surveys of existing structures, local governments would provide supplies to stock them. Governor Hoegh noted that General Mills had developed a processed food, a gallon can of which would cost \$2.50 and would provide one person sufficient food for two weeks. He also noted that the best examples of fallout shelters were in Kansas and Oklahoma where people

had suffered from cyclones and where they were constructing cyclone shelters that were also good fallout shelters. In response to a question from the President, Governor Hoegh indicated that 18 inches of concrete or two feet of earth were now considered adequate protection from fallout. Previously two feet of concrete or three feet of earth were considered to be necessary. This difference arose from the fact that earlier studies had indicated that a dosage of 75 roentgens would cause illness whereas recent tests indicated that it took 200 roentgens to produce illness.

The National Security Council:

Discussed the subject, in the light of an oral presentation by the Director, Office of Civil and Defense Mobilization, based upon a report prepared pursuant to NSC Action No. 2131-c and the forthcoming annual report on the status of the civil and defense mobilization program as of June 30, 1960.

5. *U.S. IMPORT COMPETITION AS EXEMPLIFIED BY CASES
UNDER SECTION 8 OF THE TRADE AGREEMENTS EXTENSION
ACT OF 1958*

(NSC Action No. 2166-b-(14); Memo for NSC from Executive Secretary, same subject, dated July 12, 1960)

Governor Hoegh's presentation was based upon the reference memorandum of July 12, 1960. When Governor Hoegh had concluded his presentation, Secretary Herter observed that the guidelines developed by OCDM were very good and that extraordinary good sense had been shown in the examination of these cases. Secretary Mueller stated that he agreed completely with Governor Hoegh's report and noted that a few of the cases that had been brought under Section 8 should have been brought as escape clause actions. In fact, they had been brought as escape clause cases at the same time that they were brought under Section 8 as a device for getting action in one area or the other.

The National Security Council:

a. Discussed the subject, in the light of an oral presentation by the Director, Office of Civil and Defense Mobilization, based on the enclosures to the reference memorandum of July 12, 1960.

b. Concurred generally in the guidelines which the Director, Office of Civil and Defense Mobilization, has applied in making determinations under Section 8 of the Trade Agreements Extension Act of 1958.

Robert H. Johnson

263. Briefing Note for the September 15 NSC Meeting¹

Washington, September 14, 1960

SUBJECT

U.S. Policy on Continental Defense

1. The first item before the Council is a Discussion Paper submitted by the PB on the subject of Continental Defense. The purpose of the paper is to provide the basis for a discussion by the Council of factors which in the judgment of the PB require a reassessment of our Continental Defense Policy. To this end, there are presented in the Discussion Paper six questions, some of the answers to which will have an important bearing on recommendations which the PB will make at a later date for specific revisions of the statement of U.S. Policy on Continental Defense presently set forth in NSC 5802/1.

2. In laying the predicate for the questions subsequently dealt with in the Discussion Paper, the PB has presented in Parts II and III a resume of Soviet Capabilities (drawn from relevant NIE's) and an analysis of U.S. Policies and Capabilities having a bearing on the subject. At the risk of doing an injustice to the PB's assessment appearing on pages 2 through 8 of the Paper, it can be summarized in briefest fashion as follows:

a. Our present Continental Defense Policy was adopted during a period when the Soviet manned bomber force was the primary threat to the protection of our retaliatory capability based on the North American Continent, and that period is drawing to an end. (By the end of 1960 the Soviet ICBM threat will constitute a grave threat to U.S. metropolitan areas—by 1961 it will present an extremely dangerous threat to SAC bomber bases, ICBM sites and command installations—and in a few years the principal threat will be Soviet ICBM's, supplemented by a mix of heavy and medium bombers, increased numbers of submarine-launched ballistic missiles, and possibly cruise type missiles.)

b. The advent of major Soviet ICBM capability, and a consequent reduction in the reliability of our early warning capability, raise a question as to the continuing validity of those provisions of present policy which are geared to the concept that attack warning would permit the launching of a significant portion of our SAC force before its destruction on the ground; would provide the lead time required for alerting key military forces; would permit the making of decisions by key officials

¹ Source: U.S. policy on continental defense. Top Secret. 3 pp. Eisenhower Library, Whitman File, NSC Records.

and the communication of those decisions; and would allow time for evacuation and relocation of the civilian population.

c. Moreover, the present policy places predominant emphasis on *active* defenses as compared with passive defenses for the protection of our retaliatory capability and our population. The PB's paper suggests that continued predominant emphasis on active over passive defenses is questionable. It is reflected in the Discussion Paper that the improvements visualized in 1958 for our active defense against nuclear attack have not materialized—quite to the contrary, it is reported that our major active defense system against ballistic missiles now under research and development (NIKE-ZEUS) would not produce an operational system within the next 10 years, barring unforeseen break-throughs.

d. Therefore, the PB has taken a preliminary look at our present Continental Defense Policy in the light of present-day estimates of an imminent Soviet ICBM capability, and in the light of our actual and potential capabilities and vulnerabilities, and as a result the PB has blocked out the six questions which appear on page 1 of the Discussion Paper and are subsequently discussed at some length in the Paper. I will read the questions as background to a presentation which will be made by the Department of Defense. The Defense presentation will address itself to Questions 1, 2, and 6, and reference will be made to Question 3. After the presentation, I will come back to Questions 4 and 5.

3. *CALL ON* the Secretary of Defense to introduce the Defense presentation.

4. (*After the Defense presentation.*) I would like now to refer briefly to Questions 4 and 5 of the Discussion Paper which were not dealt with in the Defense Presentation:

Question No. 4. The background of this question is set forth in paragraphs 49 through 65 of the Discussion Paper, beginning on page 15. The basic consideration is that our "low key" shelter policy was adopted on the premise that improved *active* defense was attainable—an expectation which is apparently not to be realized for at least 10 years insofar as an anti-ICBM system is concerned. The question posed is whether there should be a substantial increase of emphasis on providing fall-out shelters for the civilian population, or whether there should be a continuation of the present "low key" approach called for in current national policy on "Measures to Carry Out the Concept of Shelter" (NSC 5807/2).

Question No. 5. The background of this question is presented in paragraphs 66 through 69 of the Discussion Paper, beginning on page 20. Involved in this question are the concepts in present policy which call for continuity of wartime Government functions through relocation to hardened sites by those who survive an initial missile attack, and their continued functioning under circumstances characterized

by possible loss of communications and command personnel. Unless someone wishes to express views on this subject, the Council will note that OCDM is studying this question.

5. Perhaps the Council would now like to address itself to the questions posed on page 1 of the Discussion Paper, and to related provisions of the proposed Record of Action which is before you.

Question No. 1. Is there discussion on this question?

Question No. 2. Is there discussion on Question No. 2? The Council will note that paragraph *c* of the proposed Record of Action contemplates a study by the Department of Defense on this subject; and the submission of a report which would be included in the annual report on the status of the military program.

Question No. 3. This question was alluded to in the presentation by the Defense Department. This subject is treated in paragraph *d* of the proposed Record of Action, which provides that I would confer with the President and the Secretary of Defense regarding the proposal for a study relating to the matter.

Question No. 4. Is there discussion on this question? The Council will note that paragraph *a* of the proposed Record of Action contemplates that OCDM is to review the full-out shelter policy and will report on progress of the program in an early report to the Council.

Question No. 5. Is there discussion on this question? It will be noted that paragraph *f* of the proposed Record of Action refers to the current re-examination of the subject by OCDM for use in the review of Continental Defense policy.

Question No. 6. Is there discussion on this question? This subject is covered in paragraph *g* of the proposed Record of Action. In this connection, I propose that paragraph *g* of the Record of Action be revised to read: "Noted that any test which involves destroying a satellite or space vehicle should not proceed without specific Presidential approval."

6. It will be noted that the Discussion Paper does not include the Internal Security provisions of Continental Defense Policy (which are being separately considered in the PB), nor the provisions dealing with Port Security (which have already been revised following separate consideration by the Council).

264. Memorandum From Lay to the NSC¹

Washington, September 28, 1960

SUBJECT

U.S. and Allied Capabilities for Limited Military Operations to 1 July 1962

SUBJECT

Study of "Capabilities for Limited Military Operations"

Transmitted herewith for the information of the National Security Council is the interagency study, "United States and Allied Capabilities

¹ Source: Transmits a study by interdepartmental study group on "U.S. and Allied Capabilities for Limited Military Operations to 1 July 1962." Top Secret. Extracts—11 pp. Eisenhower Library, Records of the Office of the Special Assistant to President for National Security Affairs, Limited Military Operations.

for Limited Military Operations to 1 July 1962," prepared in accordance with the agreements reached between our respective offices. This paper is the product of a special study group composed of representatives from the Department of State, the Department of Defense and the Central Intelligence Agency. While it has not been given formal Departmental or Agency clearance, it has been presented before the Armed Forces Policy Council and discussed by the undersigned.

This work differs from the limited war study of 1958 in several important respects. It takes into account new developments and capabilities to 1 July 1962 and revises certain assumptions made in 1958, particularly with respect to the use or non-use of nuclear weapons by the opposing sides in limited military operations. Also, greater attention is given to logistic capabilities and implications, and thus its scope is considerably broadened.

The study examines the capabilities for the next two years of U.S. and Allied forces to conduct limited military operations in certain hypothetical situations, employing only those weapons systems now in the armed forces inventory or rapidly approaching that status.

Since the situations considered have not been wargamed and are admittedly based on hypothetical but possible circumstances, the conclusions should not be considered as definitive or restrictive either with respect to future policy actions or in determining the size and nature of United States forces required for limited military operations. Nevertheless, the conclusions are important because they indicate certain strengths and weaknesses in U.S. and Allied capabilities and highlight certain issues of a policy nature which affect those capabilities.

In this context it is a useful and meaningful document.

UNITED STATES AND ALLIED CAPABILITIES FOR LIMITED
MILITARY OPERATIONS TO 1 JULY 1962

I—INTRODUCTION

A. *AUTHORITY FOR STUDY*

1. An interagency study of U.S. and allied capabilities for limited military operations was conducted in 1958 pursuant to NSC actions 1842g(4), 1844, 1881, and 1934. Subsequently, it was agreed between the Secretaries of State and Defense, the Director of Central Intelligence and the Special Assistant to the President for National Security Affairs that this study should be periodically reviewed and evaluated. In conversations and exchanges of correspondence during 1959 among the principals concerned, it was agreed that a complete revision should be made, both to account for new developments and to adjust certain assumptions made in the first study, particularly as to the use or non-use of nuclear weapons by the opposing sides in limited military operations. Greater attention was given to logistic implications in the present study, and thus its scope was considerably broadened.

2. Of the 12 geographic areas considered in the 1958 study, the State and Defense Departments agreed on five (Korea, Quemoy/Matsu/Taiwan, Iran, Berlin and Laos/Cambodia/Vietnam) as suitable for more extensive study. Draft terms of reference for the study were then drawn up by the Joint Chiefs of Staff and approved by the Secretaries of State and Defense. Later, the terms of reference were agreed to by the Special Assistant to the President for National Security Affairs and the Special Assistant to the President for Science and Technology. The terms of reference, including the assumptions and scope of the study, are appended as Enclosure "A".

B. *PROCEDURES OF STUDY*

1. An interdepartmental study group, was established with representation from State, Defense (JCS, ISA and DR&E) and CIA. Although the principal from each participating agency drew upon the full resources of his agency, and although meetings were attended by experts on various functional topics and geographic areas, this report represents the views of the interdepartmental study group and does not constitute the official position of any of the participating agencies.

2. The following procedures were used in developing the scenarios, or scripts, for each of the five geographic areas considered in the study: the study group met as a whole to develop general outlines from which the State Department drafted a script on the political situation giving rise to the limited military operations. This was then examined by the group as a whole and when approved in draft, formed the basis for the script on military actions prepared by the Joint Staff. Following

these two steps, the study group made necessary revisions and adjustments and then further developed the political and military situation in the light of such factors as enemy intentions, international (including Communist Bloc) reactions and allied support. CIA drafted that portion of the study dealing with international reactions. Once the basic script had been prepared and approved by the study group, the conclusions were written by the group as a whole.

3. An effort was made by all members of the committee to reflect insofar as possible the views of their agencies. Although the widest possible coordination was achieved, no effort was made to obtain formal agency clearances for the study prior to its completion. Where there were divergencies of views, the matter was resolved in the light of the consensus of the study group.

C. SCOPE OF STUDY

1. The basic assumptions of the study are set forth in the terms of reference appended as Enclosure "A". However, it should be noted that the study had to be conducted within certain artificial limits. For example, each situation had to provide the occasion for U.S. limited military operations. On the other hand, situations likely to lead immediately to general war had to be avoided. Consequently, there was often a conflict between the need to develop a scenario which would permit an examination of U.S. and allied capabilities for conducting limited military operations, and the actual facts of the particular situation, based upon the best current estimates and intelligence. In almost all cases some compromise was necessary, but on the whole, the scenarios developed do reflect both the current situation and the best available judgment of enemy intentions and capabilities and of the probable responses by the United States in the light of existing national security policy. However, since judgments about enemy intentions were specifically designed to support the study, they should not be construed as intelligence estimates for application to actual situations.

2. In several of the studies it was necessary to recognize that when hostilities had reached a certain point it was likely that one side or the other would take steps to terminate it. At the same time it was necessary to continue the development of the situation to permit a more extensive examination of our capabilities. In these cases the device was adopted of noting that the situation might well terminate at a particular "threshold" or level of intensity; but that for the purposes of the study certain assumptions were made to permit the military operations to continue. Where necessary, the military actions were divided into phases in order to take into account alternative assumptions about the most probable ensuing developments.

3. On the matter of weapon systems, the study was based upon those known or expected to be in enemy or U.S. and allied inventories

by the terminal date of the study, 1 July 1962. Therefore, the scenarios could be developed only up to a point to permit examination of particular systems, available and appropriate to the situation.

4. By agreement of the participating agencies, U.S. and allied capabilities for covert military operations and psychological warfare were excluded from the study. The study group recognizes, however, that such capabilities would be relevant to a number of the situations studied.

5. In contrast to the 1958 study in which capabilities for limited military operations were discussed on a general basis and supported by shorter studies of twelve geographical areas, the present study examined five situations (Korea, Taiwan, Iran, Berlin and Laos) which are considered adequately representative of the types of areas and situations in which the United States might conduct limited military operations. Each of the five has been prepared in sufficient detail to stand independently. Together they cover a sufficient range of problems to permit over-all conclusions to be drawn on U.S. and allied capabilities for limited military operations.

II—OVER-ALL CONCLUSIONS

1. U.S. capabilities in conjunction with those of our allies are generally adequate to conduct any one of the limited military operations studied but these capabilities are dependent on prompt action, as required in each case, to:

- a. Initiate partial mobilization.
- b. Augment existing military lift capabilities.
- c. Expand the war production base.
- d. Waive financial limitations.

2. The U.S. overall capability for general war would be degraded initially by any one of the five limited military operations studied, except Berlin, although not to an unacceptable degree. The capability of the U.S. nuclear retaliatory forces for general war would in no case studied, be seriously affected.

3. Although U.S. capabilities might, in some circumstances, be adequate to conduct two of these limited military operations simultaneously, the U.S. over-all capability for general war would, in such circumstances, be degraded to an unacceptable degree.

4. On the basis of the assumptions utilized, the five studies did not indicate a need for change in existing deployments of U.S. forces.

5. Substantial conventional forces—ground, sea and air—were required in all cases studied whether or not nuclear weapons were employed.

6. From the U.S. military point of view, the desirability of initiating the use of nuclear weapons varied in the five cases studied. In Berlin,

Iran, and Laos, their use would not provide a clear military advantage. However, use of [*text not declassified*].

7. Anticipation of the need to initiate a limited military operation along with the earliest possible decisions on its character and objectives, including possible restrictions on weapons systems to be employed, will substantially enhance U.S. and allied capabilities to respond rapidly to the threat.

8. Limited military operations to achieve national objectives are based on a careful balance of political and military considerations which may require restraints on the use of military force. Such restraints may seriously handicap the conduct of military operations and must be kept under continuous review for the purpose of considering their possible revision, where necessary, to achieve established national objectives. The closest possible coordination of political and military decisions and actions will enhance our capability to conduct limited military operations effectively.

9. From a military point of view, it would not be advantageous for U.S. and allied forces to initiate the use of lethal CW/BW agents, principally because current programs provide only a limited capability and because our allies lack protective equipment and training.

10. U.S. employment of non-lethal CW/BW agents would, under certain circumstances, enhance the capabilities of U.S. and allied forces.

11. The United States and its allies presently do not have an adequate capability for counter-guerrilla type limited military operations.

12. If fully committed and used in optimum fashion, the U.S. military airlift, including reserve and national guard, is adequate when augmented from civilian sources for effective support of the individual operations studied in Iran, Laos or Korea, but is not adequate to support two such operations simultaneously.

13. An augmentation of existing sea-lift capabilities would be required in all cases except Berlin. This would vary from a rather small augmentation of existing cargo lift in the Pacific for the Offshore Islands to an extensive augmentation of cargo and passenger lift for Korea—including a transfer from the Atlantic to the Pacific of passenger transports.

14. World-wide strategic communications are adequate to support all operations studied except in Southeast Asia, where they would require considerable U.S. augmentation.

15. Pre-stockage of supplies in the European and Far East areas substantially enhances our capabilities to respond promptly and effectively. Although present pre-stocks in the Eastern Mediterranean and in Southeast Asia are minimal and add little to our capabilities to respond, programmed pre-stocks will partially correct this deficiency by 1962.

16. Transit rights and bases in Italy and Turkey are essential to U.S. limited military operations in Iran. Additional over flight, staging and operational rights in advance of U.S. deployment would enhance our ability to deploy forces rapidly.

17. Transit rights and logistic bases are essential in Japan, Okinawa and the Philippines for the timely and sustained support of operations in the Western Pacific. In addition, similar rights are essential in Thailand, Laos and South Vietnam for successful operations in Southeast Asia.

18. Existing logistic support facilities and air bases in Southeast Asia are inadequate to support sustained operations of U.S. and allied forces. The timing and extent of operations in this area are almost entirely dependent upon the effectiveness of corrective measures to rectify deficiencies.

19. In all cases studied, some degree of mobilization was required, ranging from a modest mobilization of selected reserve units in the Berlin case to a total mobilization of the 1,000,000 man Ready Reserve for Korea.

20. An expansion of the war production base would be required in the event of hostilities in Korea, the Offshore Islands or Laos in order to prevent a dangerous degradation of war reserves in PACOM and CONUS. In the case of Korea and Laos, six months would be required to re-establish these reserves to required levels. In the case of Berlin and Iran, it would be desirable to make preparations for the rapid expansion of the war production base.

[Omitted here is the remainder of the study.]

Enclosure A

TERMS OF REFERENCE FOR STUDY OF CAPABILITIES OF FORCES FOR LIMITED MILITARY OPERATIONS (C)

1. To review and update the joint study of United States and Allied capabilities for limited military operations from the present to 1 July 1962.

THE PROBLEM

2. Limited military operations could be in progress in more than one area of the world simultaneously.

ASSUMPTIONS

3. The U.S. military posture will remain substantially unchanged through 1 July 1962.

SCOPE OF STUDY

4. National policy, as set forth in NSC policy papers, will be used as guidance in the consideration of probable U.S. political and military response to the situations examined by the study. These studies should not be inconsistent with national policy.

5. Because they are the most likely situations which might develop and which could involve the United States in limited military operations, the study will consider the following areas: (a) Korea; (b) Quemoy/Matsu/Taiwan; (c) Iran; (d) Berlin; (e) Laos/Cambodia/Vietnam.

6. However, the situations examined pursuant to NSC Action 1842g(4) may be re-examined and updated as appropriate in light of existing conditions and the National Intelligence Estimates.

7. Examination of each situation will include consideration of:

a. U.S. national objectives, to include deterring Communist limited military aggression or, if necessary, to defeat such aggression in a manner and on a scale best calculated to keep hostilities from broadening into general war,

b. U.S. and foreign political backgrounds and implications,

c. Enemy objectives and capabilities, both nuclear and non-nuclear,

d. U.S. and Allied capabilities, both nuclear and non-nuclear, to include logistic capabilities,

e. Effect on U.S. and Allied posture for general war, and,

f. Special political and military problems involved in the use or non-use of nuclear weapons.

8. The study shall be prepared in sufficient detail so as to supersede, rather than augment, the previous study.

9. The study will not extend to the preparation of detailed plans to deal with each situation.

10. Should a situation reach the point of general war, further examination of that situation will be beyond the scope of the study, except that the considerations under paragraph 7 e shall be assessed.

11. Conclusions will be drawn for:

a. Each situation relating to:

(1) Adequacy of U.S. and Allied military capabilities to deal with that situation.

(2) Foreign policy implications.

(3) Other national security implications revealed by the examination.

b. The over-all study relating to:

(1) Adequacy of U.S. and Allied Military capabilities for limited military operations.

(2) Foreign policy implications.

(3) Other national security implications revealed by the examination.

265. Letter From Smith to Irwin¹

Washington, September 28, 1960

Dear Jack:

I thought your presentation to the Armed Forces Policy Council on Tuesday morning was of great interest and importance.

Having thought a good deal about this subject for some years, I would like to pass on a few personal observations in the hope that they may find reflection in any final version of your statement before the NSC.

I recall the conversation that Secretary McElroy, Secretary Herter, you and I had in Geneva in 1959 about the limited war study which was the predecessor of the present one. That study concluded generally that US limited war capabilities were adequate. I stressed that this conclusion was based on the very optimistic assumption that the US could employ nuclear weapons while the enemy would only use conventional weapons. This assumption is not supported by the pertinent national intelligence estimate.

Secretary McElroy then suggested that our limited war capabilities be restudied to determine their adequacy for use against an enemy using nuclear weapons. The present study, I believe, had its origin in those Geneva conversations.

However, it seems to me that this study still leaves largely unexplored the question of whether our limited war forces would be adequate to fight an enemy who also used nuclear weapons.

In the Off Shore islands case, there is some discussion about the possibility of ChiCom use of nuclear air to air weapons, but no conclusions are drawn as to the result of such use on ChiNat/US ability to control the air over Formosa Strait.

I think it would be a service to direct the Council's attention to a place in the report where the question of the possible military consequences of two-way use of nuclear weapons is considered. On pages 121 and 122, after pointing out that there might be some margin, of advantage to the UN forces from an initial exchange, the following language appears:

"In the event the communists expanded the nuclear exchange to include all of South Korea, the extreme vulnerability of the U.N. LOC would become a major consideration. A relatively few weapons

¹ Source: Questions some of the assumptions about non-use of nuclear weapons by Communist forces made in the limited war study. Secret; Personal. 3 pp. Eisenhower Library, White House Office Files, Project Clean Up, Limited War.

employed on key fixed logistical installations, such as Ascom City and Pusan, would seriously affect the US and Allied capability for sustained combat in Korea. Contrariwise, the communist forces are relatively primitive in nature and their supply requirements are substantially less."

On page 122 and 131, it is concluded that under conditions of a continuing two-way nuclear exchange there would result either a military stalemate or an unpredictable expansion of the conflict. Query as to the significance of this conclusion for any judgment as to the present adequacy of our limited war forces?

I got the impression from listening to the discussion on Tuesday morning that your people continue to assume that there would be US monopoly use of nuclear weapons in limited operations. Is this a wrong impression?

In addition to the proposition "we can't win unless we use nuclear force", I would like to hear more discussion of the question, "Can we win if both sides use nuclear force as our intelligence estimates suggest would occur?"

SNIE 100-7-58 of July 22, 1958, entitled "Sino-Soviet and Free World Reactions to US Use of Nuclear Weapons in Limited Wars in the Far East" concluded, in part, that

"We believe that if the US used nuclear weapons in meeting Bloc local aggression in the Far East, there would be a grave risk that the Communists would retaliate in kind. . . . If, in the case of Communist aggression against South Korea . . . the US nuclear response were limited to Korea . . . the Communists would probably respond in kind in the same area."

An informal check indicates that our intelligence people believe this SNIE is still valid.

I think it would be most helpful if some time in the future the NSC's attention could be sharply focused on the effect of limited enemy nuclear attacks on our forces.

I am inclined to think that if this is ever done it will lead to a change in our policies and financial allocations to limited war forces.

Perhaps a Net Evaluation Committee study of an attack on the Off Shore islands, assuming both sides use nuclear weapons, would be desirable as a next step in exploring the question of whether it is to US advantage to use nuclear weapons in attempting to win a limited war. I would appreciate your reaction to this last suggestion.

Sincerely,

Gerard C. Smith

266. Memorandum From Rathjens to Kistiakowsky¹

Washington, October 5, 1960

SUBJECT

Comments on Attached Study

1. The main conclusion of the study is that U.S. capabilities for the limited operations studied are adequate. The most serious criticism that can be leveled is that this conclusion is not supported by the analysis. Five case studies are discussed as indicated below:

a). *Berlin*: In this instance it is acknowledged that “the adequacy of U.S. and Allied capabilities for limited military operations in defense of Berlin is dependent upon demonstrated U.S. and Allied resolution to risk general war over this issue, and Soviet unwillingness to accept such risk over Berlin.” (p. 23, para. A) In other words, defense of Berlin is dependent on the credibility of the threat of general war, since our limited capabilities are otherwise inadequate!

b). *Laos*: The introduction of Chinese “volunteer forces” is assumed to be beyond the scope of the study (p. 50, para. G), though it is acknowledged that this would be the most probable consequence of the assumed U.S. attack against N. Viet Nam (p. 52, para. 6).

c). *Iran*: It is acknowledged that if the Soviets follow one of the three courses of action proposed—Course I (open intervention with Soviet forces),—the best we could hope for would be to hold the southern part of the country (p. 63, para. d(3)). It is further stated that such Soviet action is considered beyond the scope of the study (p. 81, para A).

d). *Offshore Islands* and e). *Korea*: In these cases, the judgment is reached that we should use nuclear weapons, but the consequences of enemy use are not explored. It is acknowledged that our logistic base is very vulnerable.

In view of the foregoing, I believe the first conclusion of the study might more accurately be rewritten along the following lines:

U.S. and Allied capabilities are adequate provided the Bloc does not take actions for which they are inadequate.

I think this a sad example of people coming up with a conclusion that they think their bosses want to hear, regardless of the facts and any analysis.

2. In a number of places (e.g., page 20, para. E 1) there is a supposition that the Soviets will not expect, will be unpleasantly surprised by, and will therefore back down in the face of a moderately tough

¹ Source: Comments on limited war study. Top Secret. 3 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology.

U.S. response. It seems to me that in most of the contemplated circumstances, especially with reference to China, the aggressive actions by the Bloc will have been taken in the expectation, and in spite of the fact, that we will react as strongly as is indicated in each of the several examples.

3. In several instances in the scenarios (e.g., page 49, para. 5 a, page 77, para. F) it is stated that the guidance provided U.S. commanders is to the effect that "military action should be conventional—until it became clear that over-all national objectives could not be achieved in this way." It seems to me that there is the clear implication that the way to get out of a jam is to start throwing nuclear weapons around. This might have been reasonable in 1950, but seems out of date now that the other guys have large numbers too. There seems to be a lingering idea that the use of nuclear weapons is advantageous for our side, an idea not supported by analysis.

4. Particularly as evidenced in the Berlin example, there is an important point that is developed in these studies, but which doesn't seem to have been quite realized, though it is obvious; that is, that in almost all cases where there is a question of the conflict being expanded, it is the U.S. that must make the decision for a qualitative relaxation of limits, e.g., with respect to Berlin, it is we who must cause the first physical violence (knocking down barriers, detonating mines, etc.), and it would be we who would have to make the decision to introduce nuclear weapons, and eventually we who would have to make the decision to start an all-out nuclear exchange. Because we are quantitatively inferior (and in the case of Berlin, particularly, in such a vulnerable position), the Bloc can always increase the scale of fighting gradually and quantitatively, while we must then either back down or make a qualitative decision. I would submit that it is probably easier to make the decision to send in one more division (especially when you know the other guy doesn't have any more) than it is to make the decision to introduce nuclear weapons or start an all-out TN exchange (when you know the other guy has like capabilities).

5. In summary, I think we are probably in a lot weaker position than the authors of this paper would like to have us believe.

Two detailed comments.

a). Apparently the use of improved types of conventional ordnance by the U.S. was not considered in the analysis on the grounds that the secrets here are too precious to risk in a limited war;

b). The airlift analysis is worrisome. The CRAF (Civil Reserve Air Fleet) is assumed used though the Korean War was not deemed a sufficient emergency, I believe, to require its use. It is untested. The a/c cannot carry vehicles, guns, etc., because of openings and floor loadings. Resupply of forces by air is an operation that can consume a lot of air lift. In a place like Iran, it would require at least 30 days and more likely

45 to get sea lift there. We *might* have enough airlift to get the forces postulated to Iran in the time assumed. I very much doubt we could support them by air once there. (Will look into this further.)

G.W.R

267. Briefing Note for the October 6 NSC Meeting¹

Washington, October 5, 1960

UNITED STATES AND ALLIED CAPABILITIES FOR LIMITED MILITARY OPERATIONS TO 1 JULY 1962

1. The principal item this morning is the 135-page report on UNITED STATES AND ALLIED CAPABILITIES FOR LIMITED MILITARY OPERATIONS TO 1 JULY 1962, prepared by an interdepartmental study group from the Department of State and Defense, including representatives from the Joint Chiefs of Staff, and the Central Intelligence Agency. You will doubtless recall a similar study that was prepared in 1953 pursuant to NSC directive. Following the presentation of the 1958 study to the Council, it was agreed between the Secretaries of State and Defense, the Director of Central Intelligence Agency, and myself, that the study would be periodically reviewed and evaluated. It was later agreed that a complete revision should be made, both to account for new developments and to adjust certain assumptions made in the earlier study. Mr. Irwin, in his presentation today, will tell you of three adjustments, perhaps the most important of which relates to the possible use of nuclear weapons by the enemy.

2. The earlier study considered twelve geographic areas; the present study addresses five: Berlin, Laos/Cambodia/Vietnam, Iran, The Off-Shore Islands, and Korea. These areas were considered suitable for the more extensive treatment that was called for in the new study. The terms of reference, I might add, were drafted by the Joint Chiefs of Staff, approved by the Secretaries of State and Defense, and agreed to by the Special Assistant to the President for Science and Technology and myself. Mr. Irwin will explain to you certain of the basic limitations of the study, but I should like to ask that you also bear in mind:

¹ Source: Limited war study. Top Secret. 4 pp. Eisenhower Library, Whitman File, NSC Records.

(1) That the study does *not* contemplate limited military operations against Soviet Armed Forces; because, under the current strategic concept, overt military engagement of USSR and US Armed Forces is deemed to be general war;

(2) That the study, by agreement, does *not* include US and allied capabilities for covert military operations and psychological warfare;

(3) That the study has *not* been given formal Departmental or Agency clearance.

3. At the last Planning Board meeting a number of questions were raised concerning the study, with considerable emphasis on the problem of the possible use of nuclear weapons by *both* sides in limited military operations. Mr. Irwin will touch upon this and other issues in his presentation. With your permission, however, following his presentation I may wish to return to certain of the Planning Board questions and suggestions.

Mr. Irwin.

(CALL ON MR. IRWIN)

(After Mr. Irwin's presentation)

Thank you, Mr. Irwin.

4. Before asking for comments, I *would* like to suggest a sort of ground rule. I think it fair to say that the one clear point of agreement that emerged from the Planning Board discussion of this subject was agreement that the paper is a useful vehicle for raising problems concerning our posture for limited military operations but that decisions on those problems should await further and more detailed study of each. If you agree, Mr. President, I propose that we proceed on that basis: to identify major issues that require further study.

May I now ask the Secretary of State for comments and perhaps questions.

(CALL ON THE SECRETARY OF STATE)

And now may I call on the Secretary of Defense for his views.

(CALL ON THE SECRETARY OF DEFENSE)

I understand that the Chiefs have certain reservations about the study. Perhaps the Chairman of the Joint Chiefs of Staff would care to present them in greater detail.

(CALL ON THE CHAIRMAN, JOINT CHIEFS OF STAFF)

The importance of prompt action regarding mobilization and an expansion of the war production base has been sharply illustrated. May I ask the Director of the Office of Civil and Defense Mobilization for his views, particularly on these two problems.

(CALL ON THE DIRECTOR, OFFICE OF CIVIL AND DEFENSE
MOBILIZATION)

I appreciate the problem for intelligence in a study of this nature. However, I would much appreciate the comments of the Director of Central Intelligence, and especially those relating to possible enemy reaction to U.S. use of nuclear weapons in a Korean or Off-Shore Island situation.

(CALL ON THE DIRECTOR OF CENTRAL INTELLIGENCE
AGENCY)

And now may I seek the views of science and technology. Dr. Kistiakowsky.

(CALL ON THE SPECIAL ASSISTANT TO THE PRESIDENT
FOR SCIENCE AND TECHNOLOGY)

Are there other comments?

(CALL ON THE SECRETARY OF THE TREASURY)
(CALL ON THE DIRECTOR, BUREAU OF THE BUDGET)

I believe that most of the Planning Board questions have been covered adequately during the course of the discussion,² so I will limit my own observations to two further suggestions:

First, the Off-Shore Islands script covers a most important area of possible conflict, involves the problem of possible use of nuclear weapons, and, at least to me, seem a less contrived situation than that depicted for Korea. For those reasons, I would think that the Off-Shore Islands problem might be usefully and realistically war-gamed. May I suggest, then that the Joint Chiefs be asked to war-game for the Council the Off-Shore Islands script, assuming that the U.S. initiates the use of nuclear weapons as described and that the ChiComs retaliate in kind.

Second, I suggest further that the Joint Chiefs be asked to prepare for the Council a more detailed study of any real deficiencies that are indicated by the paper before us.

² (Attached is a short listed of questions that you may wish to use if certain of the points are not adequately covered in the discussion). [Footnote is in the original.]

268. Memorandum for the Record¹

Washington, October 6, 1960

SUBJECT

NSC Meeting on Limited War, 6 October 1960

Mr. Irwin gave the prepared presentation commencing at 0915 and continued through for approximately 28 minutes without interruption.

Mr. Dillon stated he considered only two of the studies realistic, *i.e.*, Offshore Islands and Korea. He considered it significant that we do not have the capability to defend these two areas without resorting to some form of nuclear weapons. He wonders how a war game or realistic examination of the [*text not declassified*] in these two areas would actually come out. In the next 4 or 5 years, the CHICOMS will have a nuclear capability of their own and may be willing to use it, while the U.S. and USSR may be unwilling to use these weapons. He believes it is in our interest to war game such a situation and get the results quickly.

Mr. Dillon continued that if a two-sided atomic war came out even or ended in a stalemate, this would not be to our advantage. He felt that loss of allies and bases in the Far East would certainly result. He thought we ought to strengthen our conventional forces to meet the Chinese on a conventional basis and wants some sort of answer to a war game of two-sided nuclear war before the new Administration is installed.

Mr. Gates questioned that we would have the ability to fight the Chinese in a conventional sense due to their tremendous advantage in manpower.

Mr. Dillon again pressed for follow-on studies and both Mr. Gates and General Lemnitzer emphasized that the conclusions of such additional studies were entirely dependent upon the assumptions. General Lemnitzer emphasized the terrible vulnerability of the Pusan port complex under the threat of Communist atomic attack in any conventional war in Korea. He stated that in the last Korean conflict, we had alternate plans in case [*text not declassified*] was hit which were never used but that unquestionably that [*text not declassified*] was the best atomic target in Korea.

Mr. Gates, on Mr. Dillon's further request, agreed to do some follow-on studies on the Offshore Islands and Korea but questioned that they would help resolve current problem. General Lemnitzer observed

¹ Source: Record of October 6 NSC meeting on limited war. Top Secret. 2 pp. WNRC, RG 330, OASD/ISA Files: Lot 64 A 2710. Drafted on October 10.

that in a real situation, we would have intelligence on which to base actual decisions.

Mr. Dillon observed that such studies would be of great assistance to State, even though hypothetical.

Mr. Gray recommended that Defense and the Joint Staff prepare follow-on studies of the Offshore Islands and Korea on a two-sided nuclear war basis, with participation by other agencies when necessary.

General Lemnitzer stated that it would be essential to get inter-agency agreement on the basic assumptions, in which case the studies could be undertaken.

Mr. Gordon Gray will prepare a record of action.

James M. Polk

269. Report by IIC–ICIS¹

Washington, October 11, 1960

REPORT BY IIC–ICIS ON STATUS OF THE INTERNAL SECURITY PROGRAMS OF THE U.S. AS OF [illegible in the original]

Introduction

1. This year's status report on Internal Security deals with the 50-old programs which make up the total Internal Security Program of the United States. The over-all program is coordinated by the IIC and the ICIS in their respective areas of responsibility, either pursuant to specific policies and directives or under the broad terms of the charters of the two NSC Committees.

2. Two programs which have a direct bearing on internal security are not reported on because they fall outside the primary responsibility of

¹ Source: Status of the internal security programs. Top Secret. 5 pp. Eisenhower Library, Whitman File.

the Committees. These are the Port Security Program (for which Treasury has primary responsibility,) and the Government Employee Security Program (for which the Civil Service Commission has a coordinating responsibility).

Highlights of Report

3. *These are the highlights* of the report which were considered by the Planning Board:

a. The over-all objective of the Internal Security Program is to maintain the highest practicable state of internal security consistent with our form of government.

b. The primary threat to the internal security of the United States is Communist activity, espionage and sabotage, including the clandestine introduction of nuclear weapons for use against selected U.S. targets in wartime.

c. A summary appraisal of our internal security program leads the Committees to these conclusions:

(1) While total internal security defenses are unobtainable, improvements are considered possible in the areas of Entry and Exit, Physical and Industrial Security, the Security of Vital Data, and in defenses against Clandestine Introduction of Nuclear Weapons.

(2) The Committees find no basis for [illegible in the original] that the completion of over-all program objectives will be achieved in the next year, in the absence of improved measures to meet the internal security provisions of [illegible in the original] National Security Policy.

d. The Investigative Program of the FBI and the other IIC agencies is highlighted by the following:

(1) The identification, penetration and coverage, of the ranks of Communist Party members and supporters requires a full-time, major investigative effort. The FBI continues to develop evidence for use in legal action against subversive individuals and organizations, and the outcome of cases now pending in the Supreme Court will materially affect the prosecutive program.

(2) The FBI is also expending full-time investigative effort to maintain an up-to-date listing of individuals that will be considered for detention as potentially dangerous in a war emergency. (12,000 persons are currently listed, of whom all are aliens).

(3) Intensified coverage of Soviet bloc diplomats and official representatives and the penetration of foreign intelligence operations in the United States also requires a major investigative effort. The number of Soviet bloc official nationals stationed here has steadily increased over the past five years. Of the 557 bloc officials assigned in this country 160 are known or suspected to engage in intelligence operations. The Soviet intelligence potential is doubled by the availability of the other Bloc officials in the United States whose intelligence operations are supervised by the Soviets. [text not declassified].

(4) Comparison studies by the IIC disclose that United States attache personnel stationed in Soviet bloc countries are subjected to

harassment, denials and restrictions which have no counterpart in our treatment of Bloc attache personnel in this country. Meanwhile, Soviet employees of the UN Secretariat remain exempt from travel restrictions which are applied to Soviet nationals in reciprocity for Soviet travel restrictions on U.S. nationals.

(5) *[text not declassified]*

e. *Turning to the investigative aspects* of the Internal Security Program—which will [illegible in the original] the policy recommending and coordinating responsibility of the ICIS—a number of specific programs are treated in the report. Security measures have been established in such areas as:

[text not declassified]

Internal Security controls on seamen coming off Soviet bloc ships.

The screening of Bloc escapees and refugees.

The screening of visa applicants from Communist countries.

Border control measures and standby emergency border controls.

There is also a Watch List program under which selected agencies furnish the State Department a list of their employees who possess information so sensitive that their departure from the U.S. could present a danger to the internal security. Then if a listed employee applies for a passport, State consults with the agency involved.

And (jointly with IIC) a countermeasures program to detect and defend against clandestine introduction and use of nuclear weapons.

Continued improvements in our internal security databases are considered possible and [illegible in the original] in making the internal security problems posed by the following:

The admission of Soviet bloc visitors to the United States under our policy on East-West Exchanges.

The absence of legislation to permit the denial of U.S. passports to Communists.

The lack of legal authority by the Immigration and Naturalization Service to exercise closer controls over the subversive activities of aliens who are in the U.S. prior to their departure under deportation orders.

The absence of an adequate program, under the auspices of OCDM, to provide the necessary physical security protection for key Government and industrial facilities against clandestine attack by nuclear, biological and chemical weapons, on the order of protection which is afforded to facilities which are under the cognizance of NSC and Defense.

Another area in which present measures do not provide a solution to the internal security problem involved has to do with the acquisition of Unclassified strategic data by Soviet Bloc diplomats and official personnel. Present U.S. policy provides that we are to place restrictions "*on the basis of strict reciprocity*" upon travel, photographing, sketching, and such activities of Bloc representatives, as a means of deterring their acquisition of such information. The imposition of these reciprocal restrictions is coordinated by an inter-agency group chaired by State. In the Planning Board discussion, State referred to the difficulty in applying *strict reciprocity* in our dealings with the Bloc countries. The Status Report also reflects the view of Commerce Department (which has a responsibility for seeking equitable exchanges in return for Soviet bloc acquisition of publications) that any restrictions on Soviet access to Government Printing Office materials might seriously interfere with the operations of U.S. publication procurement officers in Russia.

There are also limitations on the program for the development and use of devices to detect the presence of nuclear materials coming into the U.S. at selected ports of entry. Present devices, while improved, cannot positively identify nuclear materials as such—and the prototype of such a discriminating device will not be ready for testing until early in 1961. Steps to improve the operational use of present devices await completion of the review of Continental Defense policy. Meanwhile, under present policy when the devices indicate the presence of a radioactive source in an accompanied Soviet bloc diplomatic pouch, the pouch is not challenged unless the device registers the presence of uranium, plutonium or other neutron source. In any event, the devices cannot be used on baggage which is put on airplane flights which are pre-cleared by U.S. Customs in Canada and at Bermuda, Searches of unaccompanied Soviet bloc diplomatic baggage, effects and [illegible in the original] to be made by Customs under present policy.

4. This concludes a summary of the highlights of the Status Report.

The JSTPS Policy Committee met at 1030, 14 September 1960, in Room 2B-10. The purpose of the initial meeting was to review and approve basic operating criteria and definitions to provide a point of departure for detailed planning actions required in developing the SIOP. The terms of reference, operational concepts and ground rules reflected herein were approved by JSTPS Policy Committee on 14 September 1960.

INTEGRATION AND UTILIZATION OF SIOP FORCES⁵

1. The objectives to be kept in mind in development of the SIOP are:

A. *MUTUAL SUPPORT*. Timing of available forces to take maximum advantage of the principles of mass, crossing tracks, ECM and enemy defensive degradation. (S)

B. *ROUTE COORDINATION*. Strike routes will take cognizance of all preplanned bomb impact points to enhance the probability of successful arrival of a weapon carrier at the bomb release line by reducing the exposure of the weapon carrier to blast, flash and radiation. (S)

⁵ The portions of this paper which have been underlined reflect the topical headings of the briefing presented to the Policy Committee. [Footnote is in the original. Underlined text is printed in italic type.]

C. *TOT RESOLUTION*. When two or more weapons are preplanned for release on the same target or targets in close proximity, provisions must be made to separate the releases by enough time and/or distance to insure that the second and succeeding delivery vehicles will not be exposed to unacceptable blast, flash or radiation. (S)

D. *ECONOMICAL WEIGHT OF EFFORT*. Only the number of weapons required for reaching the desired level of destruction will be programmed. Realistic probability factors will be used for each weapon carrier to determine the number of weapons to be programmed for each target. (S)

E. *OPTIMUM INTEGRATION*. The best use of the capabilities of each system will be made to cover the targets most vulnerable to that system. (U)

2. *BASIC PLANNING FACTORS*.

A. *PLAN FOR CALENDAR YEAR 61 (AMENDED AS NECESSARY TO EXTEND EFFECTIVENESS—1 MAY 1962)*. The JCS directive requires that the SIOP be briefed to the Secretary of Defense, JCS and the Unified and Specified Commander in December 1960 and not later than May of each succeeding year with the second briefing scheduled for 1 May 1962. Experience has shown that development of war plans for more than a year is not realistic due to the changes in our force structure, changes in enemy defensive capabilities and changes in the enemy target system. The initial plan will require a major amendment to extend effectiveness through the period specified for the second briefing. (S)

B. *PLANNING ON BASIS OF FORCES AVAILABLE DURING CY 61*. Those forces available at any time during calendar year 1961 will be given SIOP responsibilities. Application of forces that are not available throughout the life of the plan cannot be given as high a reliability as those continuously available. (S)

C. *OPTIMUM MIXED TARGET SYSTEM*. It is highly desirable to apply the forces available to a common target system which considers targets of primary importance in event of either an initiative or retaliatory execution. (S)

D. *TARGETS WILL BE DELETED INDIVIDUALLY FROM THE NSTL WHEN FINAL PREPLANNED TOT FOR THAT TARGET HAS ELAPSED*. JCS guidance states that NSTL targets cannot be struck except as provided for in the SIOP. The provision for dropping the targets individually is made to enable individual commanders to lay on strikes on a target after the final preplanned TOT for that target has elapsed. However, this provision declares the target available for re-strike in the event sufficient destruction has not been achieved by the SIOP force. (S)

E. *SIOP TERMINATES WHEN PREPLANNED TOT FOR FINAL NSTL TARGET HAS ELAPSED.* After the last SIOP TOT time has passed, any commander can strike any target. SIOP has no further effect and ceases to exist. Definite cut off time will be determined when the SIOP timing has been finalized. (S)

3. DEFINITIONS.

A. *TACTICAL WARNING.* Tactical warning time is that time which each weapons system can be expected to survive enemy action. Time will vary depending upon degree of mobility and/or hardness of the weapon carrier. (S)

B. *ALERT FORCE.* That force which is constantly prepared to execute a preplanned NSTL assignment after receipt of an execution order under conditions of "tactical warning" and within an established time period.

FIXED BASE—15 MIN

MISSILE SUBS—2 HOURS

AIRCRAFT CARRIERS—2 HOURS

This is not an all inclusive list of forces which may be included in the alert force. However, to be included in the alert force there must be a reasonable assurance that the weapon carrier will survive enemy action long enough to be launched effectively. If only a short time is available there must be a high degree of destruction levied upon the primary target system, assuming that the remainder of the U.S. force will be destroyed. (TS)

C. *STRATEGIC WARNING.* That period of time which permits a commander to prepare and position his forces to execute his War Plan. To permit peacetime training and other activities, all of a commander's force cannot be in the desired posture or location to most effectively launch his force against the target system. The time required for generating and positioning his entire force is full strategic warning. (S)

D. *FOLLOW ON FORCE.* That portion of the SIOP Force that is generated after receipt of a preparation order (A-Hour) to execute a preplanned NSTL assignment. This is that position of the SIOP forces following the alert force. This force cannot be counted on for effective utilization without some strategic warning. (TS)

E. INITIAL STRIKE.

- (1) *The total SIOP effort against preplanned NSTL assignments.*
- (2) *Weapons carriers will not be preplanned for recycle assignments.*
- (3) *SIOP assignments remain the responsibility of parent command until assigned SIOP weapon(s) are expended on the assigned target or until the last schedule time for that target has elapsed.*

A weapon carrier which has delivered a weapon on an assigned target will be released to the commander concerned. Until the weapon assigned to an NSTL target is expended or lost the parent commander is obligated to apply that weapon to the assigned target unless the target has fallen out of the NSTL. (In accordance with the definitions previously established in paragraph 2E.) (S)

4. FORCE APPLICATION CONCEPT.

A. *Weapon systems which can launch from a peacetime position under tactical warning to meet committed TOTs will be assigned targets for rollback, corridor development and targets of primary importance within range and penetration capabilities.*

(1) Weapon systems which do not have an all weather capability will be assigned a probability factor reflecting their limitations and potential. All available alert forces will be applied against the target system. Those forces which by virtue of delivery limitation in weather or darkness will be given a lesser probability of delivery than all weather capable systems. Actual probability of the day VFR weapon carriers will be developed. (S)

B. *All forces will be applied in order of arrival at common timing line. A common timing line must be established for the purpose of resolving TOT conflicts and to time the ECM support.* (S)

C. *All forces which cannot launch under conditions of tactical warning will be given follow-on assignments.* These forces will be used to increase the reliability on targets struck by the alert force and to expand the target coverage to lesser priority targets. (S)

D. *Follow-on Force will be applied in order of force generation.* Launch of non-alert sorties will be based upon the time required to prepare for launch after receipt of a preparation of order (A-Hour). (S)

E. *Only sorties capable of strike launching within 48–72 hours under conditions of tactical warning will be included in the tactical warning option (actual cut off time to be determined during the planning process).*

(1) Separate options will be provided to accommodate forces generated for various conditions of strategic warning. (S)

5. TACTICS.

A. *Sorties will be planned to provide a fuel time pad to permit TOT adjustment.* This is required so that a weapon carrier can speed up or delay at the common timing line to assure weapon separation required in the target area. (S)

B. *Tactics employed will be those proven for the weapon system involved. Delivery and penetration tactics for a specific sortie and target will be as determined by the force application team.* No tactics will be planned for the SIOP that have not been accepted by the commander concerned as a reliable and effective tactic. The team which examines the target defensive structure and is responsible for applying the force will determine the penetration and weapon delivery tactic for each sortie and target. (S)

C. *Weapon Separation Criteria for each delivery vehicle will be determined by the command providing that vehicle.* The time and distance criteria used to insure safe separation from nuclear blast and radioactivity will be used in resolving TOT conflicts. Separate criteria must be provided for each type of delivery vehicle (except missiles) from each type weapon being employed. (S)

D. *Range capability will consider the fuel requirements for tactics, wind factors and recovery.* Target coverage for a given weapon carrier must be conservative enough to allow for predictable degradation to range caused by adverse winds or tactics which cause a deviation from optimum range, i.e., low level penetration and/or delivery. Also considered is the point of intended recovery as it affects the area of target coverage. (S)

6. OPERATIONAL ASSUMPTIONS.

A. *All SIOP Forces will be timed relative to a common reference; Designated as "E" hour.* This is required to insure proper timing of the force to take maximum advantage of mass, ECM, roll back, TOT resolution and corridor development. All weapon carriers must launch at a predetermined E/time or on an alternate launch schedule with reference to "E" hour. (S)

B. *All SIOP Forces must be launched on a [illegible in the original]. Conditions of Readiness should be standardized for all SIOP Forces to provide common time for generation purposes. (A-Hour). The JCS will direct advanced conditions of readiness for all SIOP Forces. All CINC Headquarters of SIOP committed forces will be tied to a common alerting system.* All of the above operational assumptions are made to permit initialization of the time for execution purposes. All forces must begin preparation under conditions of strategic warning to permit selection of the best option for execution, the one that takes maximum advantage of forces available for launch at any given time. This can only be done effectively when reliable fast reaction alerting and execution facilities are available. (S)

271. Memorandum of Discussion at the 463d NSC Meeting¹

Washington, October 13, 1960

SUBJECT

Discussion at the 463rd Meeting of the National Security Council, Thursday,
October 13, 1960

Present at the 463rd NSC Meeting were the President of the United States, presiding; the Secretary of State; the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present at the Meeting and participating in the Council actions below were the Secretary of the Treasury; the Attorney General, and the Director, Bureau of the Budget. Also attending the Meeting were the Chairmen, Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security (Item 1); Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Under Secretary of State (Dillon); The Assistant to the President; the Special Assistants to the President for Security Operations Coordination (also acting for the Special Assistant to the President for National Security Affairs), for Foreign Economic Policy, and for Science & Technology; Assistant Secretary of State Gerard C. Smith; Mr. Haydn Williams, Department of Defense; the Acting NSC Representative on Internal Security (Ash); The White House Staff Secretary; the Assistant White House Staff Secretary; the Acting Executive Secretary, NSC (Boggs); and Mr. Robert Johnson, Director, NSC Secretariat.

There follows a summary of the discussion at the Meeting and main points taken.

*1. STATUS OF NATIONAL SECURITY PROGRAMS ON JUNE 30, 1960
(NSC 6013)*

Mr. Harr introduced Mr. Ash who summarized the report. (A copy of Mr. Ash's Briefing Note and a copy of his presentation are filed in the Minutes of the Meeting and other copies are also attached to this Memorandum).

Following Mr. Ash's presentation, the President asked whether, if we develop a machine which will indicate the introduction of nuclear materials and we find that the Soviets are introducing such materials, we should break relations with them. Secretary Herter responded that this would be about as serious an aggravation as one could think of.

¹ Source: Agenda item 1: Status of National Security Programs on June 30, 1960. Top Secret. Extracts—6 pp. Eisenhower Library, Whitman File, NSC Records.

He pointed out that we had had one experience of this sort in connection with an Israeli shipment. We had acted to stop this shipment although it was under diplomatic seals. The Israeli Embassy was as surprised as we were. This was a shipment which was going out from the U.S. to the Ministry of Defense in Israel. It was due to be shipped at five p.m. on the day that we caught it. We did stop it but it turned out to be nothing but radium dials. At that time we decided that we would stop such shipments even if they came in in diplomatic pouches. In this connection Secretary Anderson noted that there was an agreement between Treasury and State that if neutrons were given off by a diplomatic pouch shipment, we would ask the country concerned to open the pouch. If they refused, we would ask them to take the pouch out of the country. All of this was now being done on a very silent basis.

Mr. Harr asked Mr. Hoover and Mr. Doherty whether they had any comments on the status report. Mr. Hoover indicated that he had none. The President asked Mr. Hoover whether he was getting enough people; whether he got all he wanted. In reply Mr. Hoover said that in the last several years Congress had given good cooperation in granting requests which the FBI had been allowed to make through the Bureau of the Budget. The President, turning to Mr. Stans, asked if the Administration had been reasonable in dealing with FBI requests. Mr. Stans said that there had been no difficulties. Mr. Hoover confirmed that there had been complete cooperation during the last two years.

The Attorney General confirmed that Justice had gotten everything it had asked for in this respect. He went on to say that the Martin-Mitchell case demonstrated the importance of doing everything we could to tighten up all along the line on security. There was a tendency, he said, to let down in such matters. The President asked if Martin and Mitchell had had to have visas to get out of the country. Attorney General Rogers stated that they had not needed passports or visas and that the physical situation made it virtually impossible to control movement into Mexico or Canada even if passports were required. The borders were so long it was very easy to slip over them.

Mr. Hoover pointed out that both Martin and Mitchell had been investigated; one by the Office of Special Investigations and the other by Navy Intelligence. In one case emotional instability had been uncovered; a former superior of this individual when he was employed by the Navy had stated that he wouldn't want him back. The other had a homosexual background. Yet both were retained. Mr. Hoover expressed the view that in evaluating the results of investigations, all doubts should be resolved in favor of the Government in sensitive areas. The President turned to General Lemnitzer and suggested that those who had cleared Martin and Mitchell should be investigated. He said he would like to

know who did it and went on to indicate that those responsible should be appropriately disciplined.

Attorney General Rogers stated that the Soviets are exploiting sex situations. Every time a tourist goes to the USSR who has something like this in his background, they try to entrap him. He felt that we should alert people in the Government to this problem. He also expressed his agreement with the principle that all doubts in such cases should be resolved in favor of the Government. The President agreed with this principle and went on to state that if the Supreme Court required the Government to re-employ such individuals, they should be put to work in innocuous activities.

Mr. Dulles pointed out that he had instituted a new system under which the superior of each group of men was responsible for the men under his supervision. If the supervisors had known the conditions under which Martin and Mitchell were living, we could have caught the situation. The President pointed out that someone had received a report in the Martin and Mitchell case and should have acted differently upon it. Mr. Dulles pointed out that the President was talking about the initial investigation whereas what he was thinking about was what happened after an individual came to work for the Government. The President expressed the view that there should be some way to place responsibility for decision and some system for follow-up of responsibility for decision. He then turned to Mr. Ash and asked whether the internal security status report contained recommendations. Mr. Ash noted that the report was simply a status report and did not contain recommendations.

The Attorney General again expressed the view that there should be some way to sound the alert throughout the Government to be stricter in these matters. He stated that the Soviets seem to have a list of homosexuals. They had entrapped students and attempted to black-mail them as a means of getting them to go to work as agents. What worried Attorney General Rogers about Martin and Mitchell was not these individuals alone but the possibility that there is an organized group of such people. Secretary Anderson inquired how good a list we had of homosexuals. Mr. Hoover indicated that we did have a list and that local authorities notified federal authorities when they obtained such information. He also pointed out that a person who had been an employee of a U.S. Government agency until April had been involved in homosexual activities with Mitchell. The President expressed the view that the Attorney General or the FBI should devise a program in the Government so that when a report was obtained on an employee, a full report by the agency back to the Attorney General would be required. This report should indicate the action that the agency had taken. Attorney General Rogers agreed that we needed to do something. He

pointed out that the Russians had entrapped one individual who, in his confession, had stated that there was an international group of homosexuals. Action in this area was so distasteful that you hated to take it, but we needed to be more on the alert. The Attorney General said that he would do something. Mr. Hoover agreed that there should be some kind of follow-up procedure.

Mr. Dulles pointed out that the polygraph provided clues in this area which often led to confessions. Mr. Hoover noted that the polygraph had been used on Mitchell and that it had shown that he had homosexual tendencies. The Attorney General agreed that the polygraph worked well in such cases. Mr. Dulles noted that he got a report every month which listed all those who had been rejected for employment by CIA for such reasons. The President expressed the view that such lists should be given to someone who would have responsibility for watching to ensure that such individuals were not employed by other Government agencies. Everyone who applied for a job should be fingerprinted. Then if you had a fingerprint and an indication that the individual had been rejected for such reasons, you would have a basis for preventing his future employment. Mr. Hoover agreed that this was a useful idea. Mr. Harr then noted that in the Planning Board discussion of the Martin-Mitchell case, reference had been made to certain studies now going on the Government looking toward a tightening up of security procedures. The President concluded the discussion by observing that it was difficult to get rid of such people once they were employed and that the time to catch them was when they came into the Government.

The National Security Council:

a. Noted and discussed the report on the status of the Internal Security Program as of June 30, 1960, prepared jointly by the Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security and transmitted as Part 7 of NSC 6013, as summarized orally at the meeting by the Acting NSC Representative on Internal Security.

b. Noted that studies are presently under way in the U.S. Intelligence Board and in the Interdepartmental Committee on Internal Security concerning, respectively, personnel and physical security measures for the protection of sensitive U.S. information from unauthorized disclosure.

c. Agreed that the personnel security programs of the most sensitive Departments and Agencies of the Executive Branch should be appropriately strengthened and maintained with a view to insuring against unauthorized disclosures of classified Government information, including recognition of the principle that in making determinations as to the qualifications for employment or retention in employment of persons in the Federal service, all doubts must be resolved in favor of the national security interests of the United States.

d. Noted the President's request that the Attorney General, in the light of the discussion and pursuant to his advisory responsibilities under Section 13 of Executive Order 10450, consider the methods and procedures, including reporting and follow-up procedures, which should be instituted by the Departments and Agencies of the Executive Branch to ensure the continued strengthening and maintenance of employee security programs.

NOTE: The action in *c* above, as approved by the President, subsequently circulated to the National Security Council for information and guidance. The President approved the action in *c* above subject to the understanding that it did not authorize increases in personnel or funds for personnel security programs other than such increases as might result from the normal budgetary process.

The action in *d* above, as approved by the President, subsequently transmitted to the Attorney General for appropriate action.

[Omitted here are pages 6–9.]

Robert H. Johnson

272. Briefing Note for November 7 NSC Meeting¹

Washington, November 4, 1960

OUTER SPACE [illegible in the original]

The first item this morning is a presentation by the Defense Department on the Outer Space program being planned or considered under the auspices of that Department.

At the Council meeting on May 31, 1960, Mr. President, you stated that you had reached some different [illegible in the original] that some of the Services were thinking along extremely [illegible in the original] lines with respect to [illegible in the original] military space programs. You expressed concern that there might be not only inadvertent duplication of outer space programs, but possibly also the initiation of some programs so advanced scientifically as to make a re-appraisal advisable. You accordingly requested that the "Department of Defense present to the National Security Council a full report on all of the outer space programs being planned or conducted under the auspices of the Department of Defense."

¹ Source: Outer space programs under the auspices of the Department of Defense. Secret. 2 pp. Eisenhower Library, Whitman File, NSC Records.

You also indicated, Mr. President, that Defense should not make its presentation until after completion of a related study to be undertaken by Dr. Kistiakowsky. (NSC Action No. 2245, approved June [illegible in the original], 1960). The latter study, which related to the [illegible in the original] reconnaissance satellite, was completed and presented to the Council as a special [illegible in the original] on August 25, 1960.

As I have indicated, today's presentation relates to Defense space programs, the Planning Board has suggested that, at a later date, the Council might wish to hear a presentation on other outer space programs, which are being conducted under the auspices of NASA (the National Aeronautics and Space Administration).

We shall now hear the Defense presentation, which will be given by Mr. John H. Rubel, Acting Director of Defense Research and Engineering.

(CALL ON: MR. RUBEL)

273. Memorandum of Discussion at the 466th NSC Meeting¹

Washington, November 7, 1960

SUBJECT

Discussion at the 466th Meeting of the National Security Council, Monday, November 7, 1960

Present at the 466th NSC Meeting were the President of the United States, Presiding; Mr. Livingston T. Merchant for the Secretary of State; the Secretary of Defense; and the Acting Directory, Office of Civil and Defense Mobilization (Patterson). Also attending the Meeting and participating in the Council Actions below were the Secretary of the Treasury; the Director Bureau of the Budget; and the Administrator, National Aeronautics and Space Agency (Item 1). Also present at the Meeting were the Chairman, Atomic Energy Commission; the Chairman, Joint Chiefs of Staff; the Acting Director of Central Intelligence (Cabell); the Director, U.S. Information Agency; from the Department of Defense—Deputy Secretary James H. Douglas, Messrs. Haydn Williams, John R. Rubel, Lt. Col. Paul Nadler, and Col. Harvey

¹ Source: Agenda item 1: Outer Space Programs Under the Auspices of the Department of Defense. Top Secret; Eyes Only. 6 pp. Eisenhower Library, Whitman File, NSC Records.

Shelton; Assistant Secretaries of State Gerard C. Smith and Thomas C. Mann; The Assistant to the President; the Special Assistants to the President for National Security Affairs, for Science and Technology, and for Security Operations Coordination; Mr. Huntington Sheldon, CIA (Items 2 and 3); the White House Staff Secretary; the Assistant White House Staff Secretary; the Acting Executive Secretary, NSC; and the Director, NSC Secretariat (Johnson).

There follows a summary of the discussion of the Meeting and the main points taken.

1. *OUTER SPACE PROGRAMS UNDER THE AUSPICES OF THE DEPARTMENT OF DEFENSE. (NSC Action No. 2245)*

Mr. Gray described the background of the Defense presentation, noting that the Planning Board recommended that NASA be asked to make a similar presentation on its programs, and then called on Mr. John H. Rubel, Acting Director, Defense Research and Engineering, to make the presentation. (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another is attached to this Memorandum. A copy of Mr. Rubel's presentation is filed in the Minutes of the Meeting).

At the conclusion of Mr. Rubel's presentation, the President said that he did not know where the money for such programs was going to come from. It seemed to him that we should finally reach the point where these programs were not constantly going up until they absorbed nine-tenths of our research money. We should determine some sort of level of effort and set a dollar ceiling which would be changed only if there were some sort of startling development that should be exploited. If we continued to budget such programs on the basis that we did not know what they would ultimately cost, expenditures would increase constantly and there would be little hope for free government. We would have to be ruthless with respect to other areas of expenditure if we were to continue to support programs of this sort. He said he had watched these programs go up and that he had supported them and believed in them. Programs which offer real promise should be supported, but in the case of others, we should stay closer to basic research. No one, however, was suggesting elimination of important defense programs. Except for the work which they provided, there was nothing productive about these programs. They did not, for example, reduce costs of U.S. exports. He was for getting useful information, but not for spending billions to put a man on the moon.

Secretary Anderson referred to a statement Mr. Rubel had made in his presentation to the effect that the cost of many of these programs depended upon the life of the satellite involved. He wondered what the problems were with respect to ensuring long life for these satellites. Mr. Rubel said that the principal problem in this respect was an

adequate power supply. Present systems for recharging batteries by sunlight did not provide an adequately reliable power source. We also did not know enough about the space environment in this connection. Bombardment by particles in space reduced the life of satellites. Another problem derived from the fact that we continue to have to use some tubes in these satellites and these have filaments which burn out. The large number of parts in a satellite limit its reliability. The failure of one part could eliminate the capability of a satellite to accomplish its mission. The sequential operation of mechanical elements in the satellites provide opportunities for failure. Finally, we still know relatively little about the effects of the space environment on various materials involved in the satellites such as plastics.

Secretary Anderson next referred to the statement by Mr. Rubel in his presentation that communications are being bounced off the moon. He wondered whether we could not use the existing planets as a means of relaying communications instead of putting up artificial satellites. In response Mr. Rubel said that this was not feasible, partly because we did not have receivers of sufficient sensitivity to receive messages over such long distances and partly because of the large volume of power that was involved in such transmission.

Secretary Anderson next asked whether there was any agreement on a law of space. In the discussion which followed, Dr. Glennan pointed out that while many articles have been written and much discussion of this subject had occurred, there was no definitive statement on the matter.

The President noted that Mr. Rubel had stated in his presentation that navigational satellites would permit the fixing of the position of a ship within a quarter of a mile. He wondered how this compared with the accuracy of ordinary celestial navigation. In the discussion which followed, Dr. Kistiakowsky said that, while it could be done better, on a typical vessel celestial navigation would give a fix of within one to two miles of the actual position. He also noted that in bad weather, it was impossible use to celestial navigation. The President wondered whether the gain in accuracy that was obtained through such navigational satellites warranted the cost that was involved. Secretary Gates expressed the view that the President's point was well taken—that it was easy to spend a lot of money to obtain a ten per cent improvement in accuracy. There was then some discussion of the accuracy of inertial navigational systems in the course of which it was pointed out by Dr. Kistiakowsky that really precise inertial systems cost millions of dollars. The President observed that this cost would not be as great as the cost every year of maintaining a navigational satellite system in being. Dr. Kistiakowsky agreed that this was true. He stated that he was not arguing for or against the TRANSIT system, but it would provide a means by which every merchant vessel, without expensive equipment,

could get accurate navigational fixes regardless of the weather. Secretary Gates observed that the TRANSIT system had been extremely successful and that its cost had been relatively low. The President asked how long a TRANSIT satellite would stay up. Mr. Rubel said that we did not plan to make the system operational until the reliability problem had been solved. When that problem had been solved, it should be possible to keep such satellites in operation for from three to five years. The President said he had no argument with what was being done. However, if one wanted complete assurance of the destruction of a target, one might expend 20,000 rounds of ammunition, but if on the other hand, all one wanted was reasonable assurance of such destruction, 1000 rounds might be sufficient. He indicated that he felt we could go too far in striving for perfection.

Mr. Stans referred to recent press reports on an Air Force program for a "space plane". He had two questions: (a) the relationship of this program to other programs, especially DYNASOAR; and (b) why this was a Department of Defense activity rather than a NASA activity. Mr. Rubel observed that this was one of a series of unauthorized disclosures to the press. The space plane proposal was neither a project nor a program. Last year industry and the Air Force had become interested in the possibility of developing a capability for a special kind of flight. This involved take off from the ground in a conventional manner, then an intake of air into the craft, the liquefaction of this air, and the separation of the oxygen from the nitrogen, and the burning of the oxygen with hydrogen. Convair had prepared a "secret" brochure and had attempted to secure funds for further research. Last year and this year the Air Force had supported some related studies. The Air Force had asked for \$20 million for FY 1962 for this effort. The Air Force had not yet explained what it wished to do with this money. Mr. Rubel again emphasized that no program had been approved.

Mr. McCone inquired as to the prospects of success of SAINT. In response Mr. Rubel said he had no doubt we could develop satellite intercept capability within a time period of three to four years. His only doubt was whether we could do it for the \$61 million which was projected. Mr. McCone suggested that if we could do this, it raised a question of the effectiveness of SAMOS and MIDAS for we had to assume that the USSR could develop a similar capability. Mr. Rubel stated that we did not know enough about the economics of such operations to know whether the development of such a capability by the USSR would be much of a problem in relationship to SAMOS. If a SAMOS satellite were put up over the USSR and if its orbit shifted by 1000 miles on every pass, we did not know how difficult it would be for the Soviets to knock it down. The President asked whether the Russians would not be able to predict its orbit. Mr. Rubel acknowledged that they would be able to predict its orbit on the basis of one or two passes. This was

why the possibility of an intercept capability raised serious doubts as to the feasibility of putting weapons in orbit. However, SAMOS could take millions of pictures in one or two passes. Therefore, it was difficult to know whether the Russians would consider it economical to knock it down. MIDAS, on the other hand, had to remain for a long time in the same orbit. It therefore might turn out to be economical to intercept MIDAS satellites. However, such intercepts would themselves constitute warning of possible attack.

Mr. Gray observed that when the President had requested this presentation, he had been concerned about the possibility that space programs were being undertaken without adequate review. Mr. Gray felt that the monitoring of these programs depended upon the mechanism which the President had approved, especially upon Dr. York's office. His office provided a means by which ideas could be reviewed before they became programs. So long as Dr. York and Dr. Glennan were on top of the situation, we would avoid the possibility that a gleam in someone's eye might become a program before anyone realized that had happened. The President said that he was delighted with the mechanism that he had created. Secretary Gates noted in this connection that the six or eight committees described by Mr. Rubel took the place of eighteen to twenty older coordinating groups. Moreover, this new mechanism had adequate authority behind it.

In connection with a brief discussion that followed of planned space shots which would occur within the next few days, Secretary Gates observed that the miniaturization of equipment which had been accomplished in connection with these various programs was one of the most astounding technical achievements in the history of mankind. It compared favorably with the Russian ability to launch larger payloads.

The National Security Council:

a. Discussed the subject, on the basis of an oral presentation by John H. Rubel, Acting Directory, Defense Research and Engineering, prepared pursuant to NSC Action No. 2245.

b. Noted the President's request that the National Aeronautics and Space Administration present to the National Security Council at an early date a report on the outer space programs now being conducted under the auspices of NASA, and on the level of effort the United States should devote to non-military outer space activities in the future.

NOTE: the action in *b* above, as approved by the President, subsequently transmitted to the Administrator, NASA, for appropriate action.

Robert H. Johnson

274. Memorandum From Kistiakowsky to Eisenhower¹

Washington, November 25, 1960

Carrying out your directive to report to you on the methodology used in the preparation of the Optimized Strategic Target List and the Single Integrated Operational Plan (SIOP), my associates (Dr. H.E. Scoville and Dr. George Rathjens) and I studied the relevant aspects of the activities of the Joint Strategic Planning Staff (JSPS), and I have come to the following conclusions:

1. The staff is following the directives received from the JCS which, in turn, are based on your approval of the NSC action following the presentation of “Study 2009” by General Hickey. The JSPS is making effective use of available intelligence information. I believe that the presently developed SIOP is the best that could be expected under the circumstances and that it should be put into effect.

2. I recommend that an effort be initiated now to review the directive to, and the procedures used by, the JSPS in anticipation of the preparation of subsequent SIOPs for the following reasons:

(a) [*text not declassified*]

(b) [*text not declassified*]

(c) The staff is making extensive use of computers, but I believe that their programming could be improved and that the most competent people (such as available in WSEG, for instance) should become involved. This refinement, the revision of damage criteria, and possibly a re-evaluation of the importance of “counter force” strikes, will become especially important when operational plans are developed for less than our total alert force (the force that may survive a surprise attack by the enemy).

(d) [*text not declassified*]

I attach herewith a summary of our detailed observations, made on the basis of briefings from the Joint Strategic Planning Staff.

Attachment

*Comments on Briefings by the Joint Strategic Planning Staff,
November 3–5, 1960*

The JSPS staff is following quite closely the so-called “Study 2009”—General Hickey’s presentation to NSC—as regards criteria for

¹ Source: Comments on Joint Strategic Planning Staff work on targeting and SIOP. Top Secret. 6 pp. Eisenhower Library, Papers, Whitman File, DDE Diaries.

the selection of targets and the assessment of damage required. Since that study, in turn, followed rather closely the earlier War Plans of SAC, so-called ALPHA and BRAVO, the emerging SIOP is in these respects a refinement, a combination and expansion of earlier SAC plans, rather than a brand new approach.

Much of the briefing emphasized the objective character of the plan of procedure and the extensive use of machine calculations. Actually, however, we found so many consecutive steps involving judgment that this so-called point system of military worth of targets and the machine calculations based on it appear to be of very secondary importance. In fact, some of the machine uses may be unsound. So long as the plan is designed for the entire alert force, this has no grave consequences because of the large number of weapons assumed to be available and, therefore, of exceedingly high expected damage to the Sino-Soviet Bloc. However when, subsequently, operational plans based on smaller forces (assumed to survive surprise attack) will be developed, it will be most important to review the entire procedure and introduce more effective use of mathematical procedures, as otherwise the assignment of forces to targets may be inefficient, and less than optimum effect may be calculated for the retaliatory force still available to us; thus "evidence" may be obtained that we have inadequate forces and the attack, if carried out, will not be optimized.

The steps which are involved in the preparation of SIOP are as follows:

[text not declassified]

In a number of cases the urban and military targets are close enough together that they can be thought of as co-located and, as explained below, ground zeros (DGZ) are so selected as to maximize damage on the complex of targets by quasi-objective machine operations.

[text not declassified]

The next step involves the assignment of available forces against the strategic DGZ (target) list. *[text not declassified]* The assignment is done by a complex procedure, the logic of which is not wholly clear. It is first assumed that every weapon that will be used *[text not declassified]*.

Thus, two very important aspects of the plan, although they are worked out on the machines, are then redone on the basis of judgment, so that the machine calculations are in effect not used. *[text not declassified]*

275. Record of Meeting Between Burke and Aurand¹

November 25, 1960

*ADMIRAL BURKE'S CONVERSATION WITH CAPTAIN
AURAND, 25 NOV 60*

CAPT AURAND: Dr. Kistakoswky saw the President this morning and he really gave him a charge. I didn't even mention it—and when I got up stairs he said, "Pete I'm hearing some things about this Omaha deal that really frighten the devil out of me".

ADM BURKE: Did you get a copy of my letter to Lemnitzer?

CAPT AURAND: No sir. He says this thing will over-kill and what not. He said they are going to make a hell of a lot more bombs than we have now and I think we have too many already. I said those would be relatively cheap if you're going to have to buy a lot more missiles and bombs. He said that's right. Then he started talking about how to knock-off this being sure—you know, times 10 business.

ADM BURKE: That's why I want you to take this memorandum.

CAPT AURAND: He said, you know what I think we could do—he said POLARIS may be the solution to this whole thing, he said what we can do is take the POLARIS boats and say "alright, you're the back-up" and we will let everybody just have one whack—not ten whacks and then we will get a report from these satellite and whatever other reconnaissance we can get and tell the POLARISES to clean up what isn't done. He said that maybe that will cut—

ADM BURKE: Through the Joint Chiefs of Staff.

CAPT AURAND: Well he wasn't—Now, one thing that Kisty told him and he told me this too—I think it's a cover for Kisty and I think I would do this if I were in his place too—he told the President that he recommended that he not disapprove the plan but say that the next plan has got to be brought up along these guidelines.

ADM BURKE: Give the President a copy of this memorandum.

CAPT AURAND: I told him that if he ever approved this plan it would be a prescription for everything you ever heard of. He said, yes the other night when Kisty told him that Powers told him that this thing would never be used as a thing to increase forces and he said that if he said that, he's crazy. He says the plan calls for more forces and if he

¹ Source: Eisenhower's reaction to targeting plan, dispersal sites for President Top Secret. 8 pp. Naval Historical Center, Burke Papers, Transcripts and Phone Calls (NSTL).

believes in the plan, he ought to ask for more forces—he says, that’s the damnest thing I ever heard, I never did think much of that guy Power, he didn’t shut up when I told him to. For 20 minutes all I was doing was saying yes sir, that’s right.

ADM BURKE: Have you ever seen my book?

CAPT AURAND: No sir.

ADM BURKE: You can borrow it tonight if you want to. I want it back though on Sunday. Its a good thing to look through. This is a short summary of the whole works—written by Burke, primarily. This is something that I told Lemnitzer and that is something that is written very restrained.

CAPT AURAND: One other important remark the President made, he said they told me there were 483 targets and he said, God. I said, Mr. President, I have seen and heard of plans that have many times more than that—and he said, well we’ve got to get this thing right down to the deterrence.

ADM BURKE: Maybe you can show the President this thing.

CAPT AURAND: Well, Kisty sure gave him the ungarbled word. I think it was the first time he ever got it from somebody who, in his estimation, is in a position to make a —. You know, he had one session with Tom Gates and Gates was so interested that he asked him to come back and he also asked him if he wouldn’t give this to the Chiefs and Kisty said no, that I told my President that I would take a reading for him and that I’m perfectly willing to give it to you—it’s just the principle of advising, that I didn’t go to look at it from a military view.

ADM BURKE: What you might want to do Pete, is to show this book to Kistakowsky—this is my book—and I have said things about Power in here which I believed—it’s not quite true now because this was written over a period of weeks, but essentially, it is true. Ask Kistakowsky what he thinks of it and maybe the President would want to take a look at parts of that. You can tell him that it’s my book and you got to looking at the thing and you got interested in the thing. That’s my notebook that I carry in my pocket when I talk about it.

CAPT AURAND: Now he almost said that he thought that we ought to go to POLARIS entirely but he revealed the thought by saying, “You know I never have believed that we ought to have one weapon system but” and he never finished the sentence of what else he was thinking but the obvious fill in for that was “POLARIS ought to be it”. He was really steamed up. Fortunately I had it on my check off list to mention it to him and I didn’t even have to say word one. Here is this thing on Theodore Roosevelt. He said that he was glad to find out that

Navy was honest enough to say that things they have tried didn't work just right and was positively for you making sure you knew where the target was before shooting.

ADM BURKE: Yes, they don't know where the target is unless you shoot into these.

CAPT AURAND: I brought up this nuclear sub problem of going into Japan. . . He said that I'm not sure that doing that would solve the problem and in fact, I'm not sure it wouldn't cause more trouble than they had in the first place. He said particularly with the Emperor. And, I got a . . . on the Emperor. The Emperor's safety is the highest priority thing they have. They wouldn't think of letting him ride in an open car, even before the riots.

ADM BURKE: Well, maybe the Emperor's son, the Crown Prince—

CAPT AURAND: I don't think you're going to get much action out of

ADM BURKE: I'm going to write him a letter myself. MacArthur is just a little bit afraid that I had upset his apple cart when I was out there.

CAPT AURAND: He's the kind of guy though, that when he gets a little mad he'll put his heels in.

ADM BURKE: Yes, and he gets vindictive. He also wants to be liked. MacArthur wants to be liked. I know his mother pretty well.

CAPT AURAND: Well, he didn't go for that one very much. Just had the idea, I, on the dotted line, have briefed the incoming staff. I have got one with Salander and Jim Hagerty on the Presidential relocation set-up of communications and all of that but as of now we have three probable places that the President would go. He makes up his mind at the moment. I was thinking that maybe just gratuitously putting in the NORTHAMPTON.

ADM BURKE: More than that. Put in the NORTHAMPTON and say that we are working on this and we will get—she could be used right now except she doesn't have any files aboard for this sort of business—but we are going to convert her and make her a little more suitable. We won't change her ability as far as an operating ship and then tell him that I am playing with the idea of an old conventional submarine and gutting it and putting in communications and things and a small crew up here at the Gun Factory. She would have bunks and emergency communication equipment. She would be primarily for the Joint Chiefs of Staff. Then she would go out in the river and sink to the bottom.

CAPT AURAND: She can't sink very far.

ADM BURKE: Can't sink very far but she can get out of sight.

CAPT AURAND: You don't submerge until you get 30 miles down the river.

ADDM BURKE: You don't steam submerged—but you can submerge in place.

CAPT AURAND: You go down to the bridge—or even past Dalgren—20 feet. I would rather get in a chopper and go to one in the bay myself.

ADM BURKE: If you don't have fall out.

CAPT AURAND: The chopper is perfect for fall out—1500 feet of air is as good as 6 feet of concrete—there is no inhibition on moving by chopper in a fall out situation.

ADM BURKE: Well then just put it in the NORTHAMPTON.

CAPT AURAND: I would like to see him get a good one—give him the TRITON.

ADM BURKE: Oh, hell, the TRITON couldn't get up here.

CAPT AURAND: You can get into Chesapeake Bay.

ADM BURKE: Yes, but she doesn't have the communication equipment.

CAPT AURAND: But she's got the place to do it. You got a CIC in her as big as this room and you got 16 masts to play with.

ADM BURKE: Well, you [illegible in the original] the TRITON.

CAPT AURAND: And just have her hang around Chesapeake Bay.

ADM BURKE: The NORTHAMPTON is better.

CAPT AURAND: Except for the submerging.

ADM BURKE: You could put the NORTHAMPTON there and put the TRITON down as not having as good a facilities but submerging.

CAPT AURAND: Depend upon what the threat is.

ADM BURKE: Yes. Now, you might read that first couple of paragraphs there on the memorandum to Lemnitzer. I think that's something that you can give to the President. That's a very soft sell—that Lemnitzer has bought.

CAPT AURAND: One thing that Kisty said—he said, why the Chiefs gave a directive—the counter force targets were the highest priority and they should be attacked with heavy damage. He said this accounts for 80% of the over-kill.

ADM BURKE: Well, the Chiefs didn't do that. It came out of the Chief's order but Gates gave the Chiefs the choice of signing that thing or him signing it—that's what it amounts to.

CAPT AURAND: I would like to hold this sort of in reserve. I'm sure that he's going to follow this Omaha thing. I told him that you were going out there and it will undoubtedly come up again.

ADM BURKE: I think you should talk it over with Kistakowsky.

CAPT AURAND: Showing him this memo?

ADM BURKE: No, the book is enough—the book is the same thing, a little longer and more factual data.

CAPT AURAND: One thing on Kisty, the Air Force has sold him these low cost figures on MINUTEMAN and I pointed out to him that they had a lot of stuff in there that they called inherited assets.

ADM BURKE: Ask him this one question: "How is it MINUTEMAN which is essentially a three stage POLARIS with the same type of propellant, but more of it, the same type of material in the framework and body, but more of it, the same type of guidance system, the same type of warhead—costs less than POLARIS?"

CAPT AURAND: He will admit that on a bird-to-bird ratio —

ADM BURKE: But this is their prices—overall prices are based upon about 700,000 dollars for a MINUTEMAN and we are basing ours on a million dollars per POLARIS and all the rest of the costs are the same sort of thing—I mean their costs are about 50% on the known things less than it costs a similar thing in POLARIS.

CAPT AURAND: Well, then they fall back on that you pioneered it for them.

ADM BURKE: Sure—but the research and development—they aren't counting any research and development in that. This is a missile in production and we did do all the pioneering for them—but the missile is in production. In their figures they haven't added one nickel of R&D—not one.

CAPT AURAND: Or security forces.

ADM BURKE: Or security forces or nothing else—and they admit that. I've got to go and make a speech here.

NSC 6019

Washington, November 29, 1960

NOTE BY THE EXECUTIVE SECRETARY
to the
NATIONAL SECURITY COUNCIL
on
EVACUATION AND PROTECTION OF U.S. CITIZENS IN
DANGER AREAS ABROAD

REFERENCES

- A. NSC 106/3
- B. NSC Action No. 2259-b-(1)
- C. Memo for NSC from Acting Executive Secretary, same subject, dated August 8, 1960
- D. Executive Order 10893, dated November 8, 1960
- E. Memo for NSC from Executive Secretary, same subject, dated November 29, 1960

The enclosed draft statement of policy on the subject, prepared by the NSC Planning Board, is transmitted herewith for consideration by the National Security Council at an early meeting.

The enclosed statement of policy, if adopted, is intended to supersede NSC 106/3 and the Record of Action on the subject transmitted by the reference memorandum of November 29, 1960.

It is recommended that, if the Council adopts the enclosed statement of policy, it be submitted to the President with the recommendation that he approve it; and direct its implementation by all appropriate Executive departments and agencies of the U.S. Government under the coordination of the Secretaries of State and Defense.

James S. Lay, Jr.
Executive Secretary

cc: The Secretary of the Treasury
The Director, Bureau of the Budget
The Chairman, Joint Chiefs of Staff
The Director of Central Intelligence

Statement of Policy

EVACUATION AND PROTECTION OF U.S. CITIZENS IN DANGER AREAS ABROAD

GENERAL CONSIDERATIONS

1. Every reasonable effort must be made to protect U.S. citizens abroad in the event of imminent or actual general hostilities, localized hostilities or civil disturbances; including the evacuation of such citizens to relatively safe areas, and provision for their welfare if such evacuation is not possible. Primary factors influencing any decision to implement emergency plans for the protection of U.S. citizens abroad are:

- a.* The imminence of danger.
- b.* The capability and willingness of local authorities to provide adequate protection.
- c.* The effect of an evacuation on the local or international situation.
- d.* The availability of evacuation facilities and relatively safe holding areas.
- e.* The essentiality of reducing the numbers of U.S. noncombatants in probable combat areas in order to:

- (1) Avoid impairment of the combat effectiveness of U.S. and allied military commanders necessitated by their care, and to
- (2) Minimize the hazards of their capture as hostages.

2. It is essential that flexibility be provided in planning for the protection and welfare of U.S. noncombatants in danger areas overseas, since the probability of successful evacuation of such persons to the United States or their movement to relatively safe holding areas could be substantially reduced by:

- a.* Political considerations prior to actual outbreak of hostilities, and
- b.* The disruption of transportation, port and airport facilities incident to a massive attack.

In view of these factors, emergency planning should provide for the disposition and welfare of U.S. citizens overseas within their host countries as well as for evacuation to the United States or movement to relatively safe holding areas. This “standfast” planning is applicable to the eventualities of localized hostilities and civil disturbances as well as general hostilities.

POLICY OBJECTIVES

3. In the event of imminent or actual general hostilities, localized hostilities or civil disturbances:

a. To protect U.S. citizens including, if necessary and feasible, their evacuation to and welfare in relatively safe areas.

b. To reduce to a minimum the number of U.S. citizens subject to the risk of capture as hostages.

c. To reduce to a minimum the number of U.S. citizens in probable combat areas in order not to impair the combat effectiveness of U.S. and allied military commanders.

POLICY GUIDANCE

4. In furtherance of the foregoing policy objectives, the Secretaries of State and Defense shall:

a. Conduct a continuing review of conditions abroad with respect to:

(1) Imminence of general or localized hostilities or civil disturbances which may involve U.S. citizens.

(2) The capability and willingness of local authorities to provide adequate protection.

(3) The numbers and locations of U.S. citizens.

(4) The evacuation and protection capability, including availability of relatively safe holding or survival areas.

b. Make recommendations to the President if required for the timely reduction of the number of U.S. citizens in an area.

c. Maintain plans for: (1) evacuation of U.S. citizens to the United States or their movement to and welfare in other relatively safe areas; and (2) "stand-fast" and welfare of U.S. citizens in the countries where appropriate.

5. Normally, the decision to initiate evacuation shall be made in Washington, taking into consideration the recommendation of the principal U.S. diplomatic or consular representative in the country concerned, or of the appropriate U.S. Military Commander. The following additional considerations apply in initiating evacuations:

a. Evacuation not Involving the Use of U.S. Military Forces and Facilities: When hostilities or disturbances occur with complete surprise or are so imminent as to jeopardize the safety of U.S. citizens and conditions do not permit communication with Washington, the principal U.S. diplomatic or consular representative is authorized to initiate such action as the gravity of the situation warrants.

b. Evacuation Involving the Use of U.S. Military Forces and Facilities: Because of the grave international consequences that may be involved, the President's advance approval for the use of U.S. military forces and facilities is required except:

(1) Where such use would be limited to non-combatant military forces and facilities which are normally assigned to the diplomatic or consular mission concerned or which are used routinely for the

transport of personnel, supplies, and equipment into and out of the country from which evacuation is to take place;² and

(2) In those extreme cases where conditions do not permit either the principal diplomatic or consular representative in the area concerned or the appropriate military commander to obtain Presidential approval in time to initiate effective action.

c. Responsibility for initiating action under the circumstances described in b–(1) and (2) above devolves in the following order:

(1) The principal U.S. diplomatic or consular representative in the country or countries concerned has primary responsibility for making the decision that immediate use of military forces and facilities is necessary for evacuation or protection of U.S. citizens and for requesting assistance from the appropriate military commanders, who will respond to the extent which he considers militarily possible. Responsibility for the execution of such evacuation centered military operations rests wholly with the military commander, coordinating, [illegible in the original] with policies of the principal U.S. diplomatic or consular representative.

(2) If timely communications cannot be established between the principal diplomatic or consular representative in the country concerned and the appropriate military commander, the military commander concerned shall assume the responsibility for undertaking the above actions.

6. In implementing the guidance outlined in 5, the Secretary of State shall have over-all responsibility for the protection and evacuation of U.S. citizens abroad. In certain areas the Secretary of Defense shall have primary responsibility for the protection and evacuation of those U.S. citizens specified jointly by the Secretaries of State and Defense. The Secretary of Defense has supporting responsibility for the evacuation of all other U.S. citizens abroad.

NOTE ON FINANCING

1. The cost of the preparation of evacuation plans and the necessary support thereof, in times of peace, is absorbed by the several Departments concerned out of their regular operating budgets.

2. It is impossible, at this time, to estimate the cost of evacuation in time of emergency, because conditions under which evacuation will occur can not be foreseen.

² As requested, attache aircraft; scheduled MATS flights and MSTs runs which fall within the above criteria. [Footnote is in the original.]

277. Memorandum From Burke to Flag and General Officers¹

Washington, December 4, 1960

TO:

Flag and General Officers

SUBJECT

Special Edition Flag Officers Dope

(This is not to be further distributed, but you may discuss with your more senior officers).

NATIONAL STRATEGIC TARGET LIST
AND
SINGLE INTEGRATED OPERATIONAL PLAN

The Secretary of Defense met with the Joint Chiefs of Staff and the Unified Commanders in Omaha 1–2 December to discuss National Strategic Target List and Single Integrated Operational Plan. The Director of Strategic Target Planning, General Power, and the members of his staff gave a very comprehensive and very smooth presentation pointing out the improvement of this plan over the previous coordinated plan and explained in general how this plan was developed.

There was great pressure to approve this plan even though it was also recognized that there was much improvement that could be made in both NSTL and the Plan itself. However, all Unified Commanders agreed that this plan was better than the previous ones and the improvements that were necessary in the next plan were brought out very clearly during the discussion.

It was also brought out very clearly that this plan was approved based upon the presentation of General Power and without study of SIOP by conferees. The NSTL, as a matter of fact, was not available and will not be available for several days. However, Navy people worked on the plan and based on this, approval of the plan was justified with the understanding that modifications in the directives and procedures for the next plan will be prepared.

The briefings were very long and complex. Nearly all of the questions that were asked at all were asked by Mr. Gates and naval officers.

¹ Source: Burke's comments on the December 1–2 NSTL/SIOP meeting in Omaha with Secretary of Defense, JCS, and CINCs. Secret. 10 pp. Naval Historical Center, Burke Papers, NSTL/SIOP.

The following points were brought out:

The NSTL and SIOP are good first efforts but there are quite a few things which had to be accepted without examination because of the compressed time scale for the development of the NSTL and SIOP. Further examination will be needed in quite a few areas so as to improve the next NSTL and SIOP. Many revisions and refinements will be essential.

a. Minimum NSTL.

The NSTL is probably bigger than necessary. When it is published, which we expect to take place sometime this week, the NSTL will comprise a “minimum NSTL”, additional targets considered to be of major importance, those defense targets which must be destroyed in order for attacking forces to reach their targets, plus those targets which theater commanders must destroy in order to protect their own forces. A great deal of work will be necessary in order to make sure that the NSTL is really minimum because its size to a large extent will determine force levels in the future and also will have a great deal of impact on the types of weapons systems which will be procured.

b. Intelligence.

In general, the intelligence used for the preparation of the intelligence annexes was agreed joint intelligence but owing to the time limitations, the operational intelligence was developed by SAC. There were no significant errors of commission or omission in this intelligence insofar as could be determined in the very short time available for examination.

One of the things that the JCS will have to develop will be how to get really joint intelligence into the plan and NSTL without undue delays. We can't have long delays in arriving at an agreed intelligence solution and at the same time, neither should we permit raw intelligence to be cranked in which may affect the plan significantly without having that intelligence looked at by other people. The evaluation of intelligence data has very significant effects. We want to make sure that our intelligence upon which this plan is based is just as good as it possibly can be. It is for this reason we feel that there should be a joint intelligence center in Washington where all various intelligence agencies can turn to and really crank out good intelligence using all the raw data that is available to anybody.

c. Assurance.

[*text not declassified*] There was great disagreement as to what the maximum assurance should be on any one target. For example, the most important targets should have greater assurance of a weapon arriving at BRL than on lesser targets. However, when you get up into

high assurance levels, the flat part of the curve is reached and it is a question of how high you should go on assurance for the most important targets. [text not declassified] These are things that are going to have to be studied in great detail by the staffs and the JCS will have to write new instructions regarding assurance in the next couple of months. There seemed to be general agreement except for the Air Force people that our assurance criteria are now probably too high or perhaps the assurance on the various types of targets is not proper now. However, this is not a fatal defect in this first plan.

d. Damage Criteria.

Damage criteria [text not declassified] damage criteria. The JCS will also have to examine the damage criteria and the way the damage criteria are applied to various types of targets in order to ensure targets that have to be destroyed are really destroyed once instead of several times. The methods of computing damage will probably have to be reviewed too. It may be that severe and moderate if not the proper way of doing it because the photographs of what moderate damage was, looked to be pretty severe. [text not declassified] As I stated, this is an area in which the JCS will have to lay out in greater detail the damage criteria to be used in the development of the next plan.

e. Follow-on Forces.

The SIOP as developed utilized all of the committed forces which, of course, was entirely within the ground rules which were given to the DSTPS. However, there is considerable question as to whether all of these forces are, in fact, required and whether or not it would be advisable to withhold some forces for contingency operations following the initial attack. This naturally relates back to the size of the NSTL, the assurance of delivery, damage criteria also the survivability of launch bases.

f. Constraints.

The plan was juggled several times in preparation and weight of weapons and types of delivery were adjusted so as to bring the fallout at selected check points down within the levels prescribed in JCS guidance. [text not declassified] This whole problem is urgently in need of attention.

g. Base Survivability.

The problem of survivability of the various types of bases, both fixed and mobile, was only superficially addressed in the preparation of this plan and it is evident that we must develop adequate factors for considering this problem. Base survivability naturally has a marked effect on force levels and types of forces for the future. Base

Survivability can only be determined after thorough war gaming and it is to be expected that this will be a major area in which much detailed work needs to be done by the JCS and the Services.

h. War Gaming.

It was generally agreed that the SIOP should be war gamed by a group in Washington under the direct control of the JCS. This is most important in order to come as close as possible to an unbiased evaluation of this new plan and to develop factors and criteria for use in the succeeding plans. The SIOP also may be war gamed by the JSTPS which, of course, smacks of their inspecting themselves.

i. Points System.

The development of the NSTL was in large measure governed by the use of the SAC ALFA and BRAVO points systems—ALFA points being assigned to military installations and military and governmental control centers. BRAVO points to urban and industrial targets. In coming up with an optimum mix target list, the planners found that the ALFA and BRAVO points were not mathematically compatible and so they were forced to come up with a new type of points which they called OMEGA points. These OMEGA points are an arbitrary judgment based on amalgamation of the ALFA and BRAVO points and have no real mathematical validity. The SAC people are working on developing a new points system. The Navy is also trying to come up with a new points system using the talent and facilities at the David Taylor Model Basin.

j. The Staff and Organization.

The Joint Strategic Target Planning Staff has not up to this time been a truly joint staff. All key positions with the exception of the Deputy Director have been held by Air Force officers. Almost all of these Air Force officers have held concurrent jobs in the SAC Staff organization. We believe that the staff must become a truly joint one with equitable distribution of the key positions within the staff itself and that the officers assigned to the staff should have that as their sole assignment. It has not been possible to persuade the Army to provide as much representation on the JSTPS as we would have liked to see and I am hopeful that they will realize the importance to the Army of the organization in Omaha.

k. Reliability Factors.

The reliability factors used in various weapons systems naturally have a marked effect on assurance and thus relate back in the long run to force levels. It is worth noting that the reliability factors used for missiles results in what appears to be a very high level of programming

of missiles on targets and also the backup of each missile by an aircraft-delivered weapon. The paucity of data on missiles at this time probably makes this a reasonable approach but it is obviously something that we need to correct in the future and this can only be done with more and better data. At the meeting with General Power, it was rather strongly inferred that he intends to probe into the tactics and reliability of weapons other than SAC which are used in the SIOP. I do not know now just how he will go about this but we must be prepared for such examination of our systems.

In summary, there is a tremendous amount of work that must be done soon, primarily by the JCS, in order that the criteria and ground rules that are given to the DSTPS will result in the development of a greatly improved NSTL and SIOP for the next go-round. This SIOP will be made effective on 1 April 1961 and the next plan is due on 1 May 1962.

Arleigh Burke

P.S.

None of the above has anything to do with "Merry Christmas" which I hope you all have.

Arleigh

NSC 6013, PART 1, THE MILITARY PROGRAM

I. OBJECTIVES OF THE MILITARY PROGRAM.

The basic national objective of the United States is to preserve and enhance the security of the United States and its fundamental values and institutions. The basic military threat to fulfillment of this objective stems from an aggressive and deeply hostile International Communism directed by the USSR and/or Communist China, and backed by growing military strength in both nuclear and non-nuclear fields. All elements of the U.S. national power must be resolutely directed toward meeting this communist challenge.

The primary objectives of the U.S. military programs, in support of the basic national objective and in light of the primary threat, are:

To develop and maintain forces of all Services for general war, with sufficient strength to deter general war or to prevail if it should occur.

To develop and maintain as part of its military forces its effective nuclear retaliatory power, and to keep that power secure from neutralization or from a Soviet knockout blow, even by surprise.

To develop and maintain an adequate military capability for defense of the United States and other vital areas of the western hemisphere.

To provide within the total U.S. military forces, highly mobile and suitably deployed ready forces which, in concert with other forces, are adequate to deter or defeat local aggression or fight a limited war in a manner and on a scale best calculated to prevent hostilities from broadening into general war, using all weapons (including nuclear weapons) as required.

To reinforce and support, in appropriate ways, overt and covert political, economic, psychological, technological, and cultural measures in order to achieve national objectives.

II. SUMMARY EVALUATION OF OUR ACTUAL AND POTENTIAL CAPABILITIES TO FULFILL CURRENT MILITARY COMMITMENTS AND BASIC OBJECTIVES AS OUTLINED IN NSC 5906/1.

Overall Evaluation. Between June 1959 and June 1960, there was little change in either the magnitude or character of major U.S. combat forces. Newer weapon systems will be more evident during FY 1961. All Services find it necessary to maintain adequate forces equipped with weapon systems of proven capability to satisfy security requirements and, at the same time, to provide for the development of new systems of yet unproven operational capability. There are two main aspects of this problem.

The complexity of modern weapon systems has resulted in extraordinarily long procurement lead times, and greatly lengthened technical training programs.

Development and procurement of these new weapon systems become more costly each year, and so it has become increasingly difficult to accomplish modernization within available resources.

General War. In evaluating our general war capabilities, the JCS note the requirement for forces capable of both nuclear and conventional operations. While these forces now have a greater capability for delivery of nuclear weapons than ever before, this may not in itself represent a net gain in relative military strength vis-a-vis the Soviet Union. Our deployed forces are subject, with little or no warning, to attack by significant communist forces. Within the near future, the Soviet Union may bring into operational readiness intercontinental ballistic missiles with the capability of attacking our base complex in the United States. The security of our long-range, land-based nuclear retaliatory forces

will be increasingly dependent upon such factors as adequate warning, airborne alert capability, hardening and mobility. During FY 1961, two of our ballistic missile early-warning installations (Thule, Greenland and Clear, Alaska) will be operational. One site has an initial operational capability today. Full coverage is not scheduled for completion until the U.K. Station becomes operational in FY 1963. The latter site is needed to cover missile launchings from sites in southwestern USSR against targets in the eastern U.S. To augment BMEWS, research and development effort increased in FY 1960 on the satellite-borne ICBM attack alarm system MIDAS. Good progress has been made in satellite programs which are essential to our reconnaissance and intelligence activities. We have no active defense against ballistic missiles but development effort on NIKE ZEUS continues at the highest priority. A coordinated Soviet attack against our long-range nuclear retaliatory forces, our deployed land-based forces, our logistical base, and our naval forces at sea would be extremely difficult to execute with complete surprise, and only a coordinated attack with almost complete surprise could endanger our effective retaliatory power.

Limited War. As the Soviet nuclear, ballistic missile and conventional capabilities grow, the element of pressure and threat will probably become more pronounced in Communist dealings with the rest of the world. In their continual probing of the strength and determination of the West they will be more aggressive in their use of political, economic, and perhaps even limited military means. Although the Communists probably would draw back if the Western response were of such vigor as to make clear that further involvement would incur serious risk of general war or political disadvantage, the chances of their miscalculating such risks may increase if they remain convinced that their relative power is growing. Our military capacity to counter a single local aggression supported by the Sino-Soviet Bloc is adequate to meet national security requirements. Dependent upon the location and size of force required, we would be hard pressed to execute limited military operations simultaneously in two or more areas of the world and maintain an acceptable general war posture. In the latter event, national measures providing for a degree of mobilization and augmentation of lift capabilities might well be required. If sizeable forces were involved in such situations, our capabilities for limited war are such that authorization to use nuclear weapons selectively would probably be required. Our capability to conduct non-nuclear war is very substantial and although it has not kept pace with our growing nuclear capability it has increased. Additionally, we must continue to rely, to a considerable extent, upon indigenous forces to cope with guerrilla and jungle warfare.

Cold War. Unified Commanders have formulated plans and are active in assuring increasingly effective utilization of their resources in the cold war. MAAGS, missions, attaches, rotational forces, prestockage of equipment, exchange officers on military staffs and in military schools, weapons demonstrations, show of force, official military visits and assistance in national disasters contribute to the over-all cold war effort. In order to limit the Sino-Soviet initiative in cold war, the United States must develop a broad range of capabilities whereby it may counter Sino-Soviet Bloc and communist activities in many parts of the world. Portions of South America, Southeast Asia, the Middle East, and Africa are areas of particular vulnerability.

Mutual Security. In both limited and general war, a substantial contribution is expected from our allies. Military planning takes cognizance of the limitations and capabilities of indigenous forces. Although our national security is predicated upon the concept of collective security, the United States must continue to develop adequate strength and a strategy for its employment to deter or successfully wage war, survive as a nation capable of controlling its own destiny, and to maintain the leadership of the Free World.

Summary. Statements in previous annual reports and evaluations by the JCS recognized the probable diminishing relative military advantage of the United States vis-a-vis the Soviet Union. From the position we occupied with a great manned bomber fleet supported by a substantial stockpile of nuclear weapons, at a time when the Soviet Union was very limited in long-range bombers and nuclear weapons, it was to be expected that our margin of advantage would certainly decrease. The statements referred to seem less appropriate today, as our over-all military power continues the greatest in the world.

Our task is to maintain our effective retaliatory capability and to improve our ability to defeat or contain local aggressions. The probable strength of the Soviet Union in ballistic missiles calls for major effort on our part to increase the survivability of our retaliatory strike forces. This need has given emphasis in our programs to increase warning, quick reaction, dispersal of bombers, and hardening, mobility and concealment of missiles.

In last year's report it was stated that by the end of FY 1962, with a continuance of present U.S. and Soviet trends and programs, and with no major breakthrough, each side may be expected to possess military strength of potentially decisive proportions. It concluded that in such a situation an advantage, possibly conclusive, could accrue to the side taking the initiative. Although this is possible, the progress made in our programs referred to above, to make certain the survival and readiness of effective retaliatory power, gives reasonable assurance that in

the period ahead no enemy can expect to launch an attack against us without inviting his own destruction.

With respect to limited and local aggression more adequate provision has been made for Army modernization and for airlift. Also, since the end of fiscal 1960 our readiness has been increased by the deployment of an additional attack carrier to the Mediterranean and the Far East, the deployment of the first POLARIS submarine in the Atlantic, and the achievement of a capability to mount a significant airborne alert.

On 2 December 1960 the JCS approved the National Strategic Target List and the Single Integrated Operations Plan to become effective on 1 April 1961. The Plan and the Target List were developed by a Joint Staff composed of members of all four Services and representatives of Unified Commanders contributing forces to the initial attack on targets in the Sino-Soviet Bloc. Targets selected, assurance factors, and damage criteria used were consistent with NSC Study 2009. This action is very significant in that for the first time it integrates effectively and provides for mutual support of aircraft and missiles of all Unified Commands in one attack plan.

As of 7 December 1960 the following missiles were in an immediate response posture: 38 THOR in the United Kingdom; 12 JUPITER in Italy; 13 SNARK at Presque Isle, Maine; 5 ATLAS at Vandenberg AFB, California and Warren AFB, Wyoming; and 16 POLARIS missiles deployed aboard the U.S.S. GEORGE WASHINGTON.

The ICBM site activation program suffered some delay in construction and initial installation and checkout of equipment. Delay in operational readiness occurred at the first five (5) sites. Scheduled target dates will be met from March 1961.

The GAM-77 (HOUND-DOG) is a supersonic air-to-surface missile designed to be used as a primary target weapon or as a penetration aid at a maximum range of 650 n.m., thereby enhancing the striking power range and operational life of its carrier aircraft, the B-52. The first two B-52 squadrons were scheduled to be equipped with operational missiles by December of 1960. However, additional testing is required to improve reliability and some slippage is occurring. The first B-52 squadron with 18 operational missiles is participating in testing at Eglin Air Force Base, Florida. The present program involves 29 B-52 squadrons, all scheduled to become operational by September 1962.

A. PROGRAMS FOR NUCLEAR RETALIATORY FORCES. The first objective of the U.S. Military Program has dictated maintenance of strategic nuclear retaliatory striking forces, tactical nuclear delivery forces, and deployment of forces as appropriate, all acting in concert to deter general war or to prevail in the event general war occurs.

The Strategic Air Command (SAC) has the largest capacity for nuclear retaliation and is charged with primary responsibility for exploiting the

U.S. current superiority in nuclear weapons and long-range delivery systems against selected targets and target systems at the outbreak of general war. Total SAC force has been reduced from 43 (11 heavy, 28 medium and 4 reconn.) wings of bomber and reconnaissance aircraft at end FY 1959 to 40 (12 heavy, 25 medium, 2 reconn. and one strategic missile) wings at end of FY 1960, 2 reconnaissance wings and 3 B-47 medium bomber wings having been inactivated, and one each B-52 and strategic missile wings activated. Programmed changes in FY 1961 will result in inactivation of 4 more B-47 wings and activation of the first B-58 medium bomber wing. This trend of decreasing aircraft wings will continue for the next few years as missiles are introduced into the inventory.

Combat capability of SAC heavy bomber wings increased during FY 1960 as one more B-52 wing was activated, bringing the total to 12 B-52 wings with 34 squadrons equipped² and remaining 2 in process of being equipped. By end FY 1961, 13 wings will be fully converted to B-52s. While combat capability of SAC heavy bombers is improving through introduction of new equipment, the medium bomber fleet, with exception of newly activated B-58 units, is approaching obsolescence. (The first SAC unit became operational with 12 B-58s on 3 August 1960.) The B-47's, which make up the bulk of the bomber force and have now been in service nearly 8 years, have undergone a major safety of flight structural reinforcement to extend their usefulness.

As the Soviet delivery capability increases, so does the vulnerability of SAC retaliatory forces within and outside the United States. To reduce vulnerability, *SAC dispersal and alert programs* have been enhanced as follows:

a. *Heavy bomber dispersal.* Although the present goal is to have no more than one heavy bomber squadron on any one base, 36 sqdns are presently located on 28 bases, i.e., 3 bases each with 3 sqdns, 2 bases each with 2 sqdns, and 23 bases each with one sqdn. Two of the 36 heavy bomber sqdns are in process of receiving B-52 aircraft. By end FY 1961, 37 sqdns are programmed to be dispersed on 29 bases, i.e., 3 bases each with 3 squadrons, 2 bases each with 2 squadrons, and 24 bases each with one squadron.

b. *Medium bomber dispersal.* At present there are 25 wings on 18 bases. Seven bases accommodate 2 wings each and 11 bases accommodate one wing each. At end FY 1961, 23 wings are programmed to be on 19 bases (4 bases each with 2 wings, and 15 bases each with one wing). In extension of this fixed dispersal, SAC has developed plans to reduce vulnerability of the medium bomber force by further dispersal

² Note: An "equipped" unit possesses 50% or more of authorized number of modern aircraft. [Footnote is in the original.]

to non-SAC military airfields and civil airfields during certain emergency situations.

c. *Alert.* On 20 May 1960, SAC reached the readiness posture of 1/3 of its force on continuous 15 minute ground alert. As of 30 June 1960, 448 bombers and 237 supporting aerial tankers are on a 15 minute ground alert status. Also one SM-65 (ATLAS) and four SM-62 (SNARK) missiles were in a war readiness alert posture.

Continued airborne alert training has been conducted throughout the year with the objective of developing the maximum feasible airborne alert capability. Among several specific actions recommended by the Joint Chiefs of Staff to improve the U.S. military posture were those to augment airborne alert capabilities.

During FY 1960 there was some slippage in the *ATLAS ICBM operational site program* for the first 4 squadrons. The first ATLAS complex, (1 of 3 launchers) of first squadron at Vandenberg AFB, became operational in September 1959. A second complex (3 launchers) of the Vandenberg squadron became operational primarily for crew training in FY 1960, but one launcher, temporarily down for retrofitting, will become operational again in August 1960. The second ATLAS squadron (programmed for Warren AFB) is now scheduled to have its 6 launchers fully operational prior to end CY 1960. Programs for deployment of the ICBM force have been revised to provide for increased levels of hardening of the force and increased numbers of missiles for later ATLAS squadrons which will result in a significant increase in over-all effectiveness of ATLAS forces. Research and development programs for TITAN and MINUTEMAN are progressing satisfactorily. The first 2 TITAN squadrons at Lowry AFB are programmed by Air Force to be operational by end CY 1961 and the first MINUTEMAN squadron during FY 1963.

Supplementing SAC retaliatory capabilities are *USAF tactical nuclear strike forces*. In the *Pacific*, these forces consist of 3 wings (9 squadrons) of tactical fighters, one wing (3 squadrons) of tactical bombers and two squadrons of MATADOR tactical missiles. These forces continue in the program during FY 1961. In the *United Kingdom, Europe and the Middle East*, tactical nuclear strike forces consist of 6 tactical fighter wings (18 squadrons) permanently deployed plus 4 squadrons on continuous rotation from the United States, one wing (3 squadrons) of tactical bombers, and 3 squadrons of tactical missiles, consisting of one MATADOR and 2 MACE squadrons. Except for conversion of the MATADOR squadron to MACE missiles the tactical nuclear strike units in these areas are programmed to remain unchanged during FY 1961. Nuclear capable tactical air forces in the *United States*, capable of augmenting forces overseas, consist of 6 tactical fighter wing equivalents (comprised of 24 sqdns, excluding the 4 on rotation to Europe) which continue in the program through FY 1961.

Certain *major U.S. Naval forces* possess a significant nuclear retaliatory strike capability. This capability rests primarily in the attack carrier striking forces and a growing capability in submarine-launched ballistic missiles.

There are 14 *attack carriers* and 16 associated carrier air groups in the fleet. Normally, 4 to 5 attack carriers, with their embarked air groups, are deployed in overseas areas in position to strike assigned targets. Technological advances in aircraft, carrier facilities, electronic equipments and improved operating techniques have materially increased Navy's nuclear weapon delivery capability. The 4 CVA 59 (FORRESTAL) class carriers have increased nuclear striking power, improved operational flexibility and enhanced safety of operation. Action will be taken in FY 1961 to increase the U.S. nuclear retaliatory strike capability by deploying one additional FORRESTAL class carrier in each of the SIXTH and SEVENTH Fleets, loaded with nuclear-capable attack aircraft. KITTY HAWK, another FORRESTAL class carrier, will join the fleet before end FY 1961 and will provide additional nuclear striking power to the U.S. retaliatory capacity and will replace one of the 7 World War II ESSEX class carriers still in the operating inventory.

Present operational capability for guided missile delivery of nuclear warheads from surface ships and submarines is represented by *REGULUS system* for which nuclear warheads are stockpiled. REGULUS is installed in 5 submarines (one of which is nuclear powered) and 2 heavy cruisers, all assigned to Pacific fleet. There are 9 more submarines equipped with REGULUS radar guidance system (TROUNCE) to provide terminal control of a REGULUS missile launched from either a submarine or cruiser. One launching submarine is continuously deployed on station in North Pacific waters with target assigned. The other 4 are available in times of tension.

The first 2 *Fleet Ballistic Missile (FBM) POLARIS submarines* have been commissioned and are conducting pre-deployment tests and will be operational with missiles on board prior to end CY 1960. Seven more FBM submarines are presently under various stages of construction. A total of 6 are scheduled to be operational in CY 1961. Congress authorized 5 additional FBM submarines for a total of 14 and long-lead items funding for 7 more in the FY 1961 Budget. POLARIS missile development has progressed rapidly and all major milestone dates have been met. The missile was successfully fired from a submerged submarine on 20 July 1960.

Included in naval forces are *Fleet Marine Forces* which contribute to the over-all nuclear retaliatory capability. This capability is contained primarily in 3 Marine Aircraft Wings, one of which is maintained in the Pacific. The 3 Marine Divisions, including the division in the Pacific as well as the Battalion Landing Team maintained afloat in

the Mediterranean, also possess nuclear capabilities (8" howitzer and HONEST JOHN).

Nuclear delivery systems organic to deployed *major U.S. Army forces* contribute to the nuclear retaliatory capability. *In Europe*, Army currently maintains 2 REDSTONE missile groups, 8 CORPORAL missile battalions (2 bns in a medium missile command and 6 separate bns), 2 LACROSSE battalions, 5 HONEST JOHN rocket battalions, 5 HONEST JOHN batteries, four 280 mm gun battalions (to be reduced to 2 during FY 1961), nine 8-inch howitzer battalions and five 8-inch howitzer batteries. [text not declassified] New weapons design and missile check-out procedures have appreciably reduced reaction time. Nuclear delivery units *in the United States* capable of augmenting forces overseas include one medium missile command (2 HONEST JOHN and one CORPORAL bns), one air transportable missile command (HONEST JOHN bn), one REDSTONE missile group, 5 LACROSSE battalions, 3 CORPORAL battalions, 2 HONEST JOHN battalions and the nuclear delivery means organic to CONUS divisions. During FY 1961, 4 LITTLE JOHN battalions will be activated. Planned transition from the liquid-fueled REDSTONE and CORPORAL missiles to solid propellant and an all-inertial guidance system for the PERSHING and SERGEANT systems will greatly improve mobility and reaction time. Current developmental progress of the PERSHING missile indicates that it will have an operational capability in FY 1963.

The Soviet Bloc has the following general capabilities for defense against the foregoing U.S. nuclear retaliatory forces:

Present capabilities of the Soviet air defense system would be greatest against penetrations by subsonic bombers in daylight and clear weather at altitudes between about 3,000 and about 45,000 feet. Under such conditions, virtually all types of Bloc air defense weapons could be brought to bear against attacking aircraft. Fighters would retain some effectiveness at altitudes in excess of 50,000 feet, but capabilities of the fighter force would be reduced considerably during periods of darkness or poor visibility. In the increasingly widespread areas defended by surface-to-air missiles, air defense capabilities would be unimpaired by weather conditions and would extend to at least 60,000 feet in altitude.

Despite improvements in the Soviet air defense system, it still has basic weaknesses in coping with a sophisticated air attack. At altitudes below about 3,000 feet, the capabilities of the system would be progressively reduced; below about 1,000 feet, the system would lose most of its effectiveness. Against varied penetration tactics utilizing altitude stacking, diversionary maneuvers, stand-off weapons, decoys and electronic countermeasures, air defense capabilities would be significantly diminished. In addition, the Soviet defense problem would be complicated

by the variety of delivery systems which might be employed, including cruise-type missiles, fighter bombers, supersonic bombers and low altitude attack bombers.

The Soviets have no known operationally effective system for defense against ballistic missiles and artillery by purely defensive means.

B. PROGRAMS FOR HIGHLY MOBILE AND DEPLOYED READY FORCES.

General. United States ready forces deployed throughout the world, together with the highly mobile back-up forces in CONUS and augmentation provided by our allies are considered to be the most significant deterrents to local aggression or limited war. They also contribute to deterrence of general war. Equipped to conduct nuclear or non-nuclear war, these forces are designed to move quickly against local aggression or limited war, where timeliness of force is the key to maintenance of U.S. interests and prevention of general war. Their capabilities for nuclear war have been included, for the most part, in preceding paragraphs. Following paragraphs describe programs for these forces.

The new M-14 (7.62mm standard NATO round) rifle is now being made available to selected *U.S. Army* combat units on a limited scale. A new medium tank (M-60) and armored personnel carrier (M-113) entered the inventory in limited numbers in FY 1960. The new 7.62mm machine gun will be available to some units of the Strategic Army Corps (STRAC) in FY 1961. A high explosive warhead for the HONEST JOHN rocket is now available to overseas and CONUS units. The first dual capable DAVY CROCKETT will be issued to troop units during FY 1961. Army is also scheduled to receive the first models of the new AO-1 MOHAWK combat surveillance airplane and AC-1 CARIBOU 3-ton transport airplane during FY 1961.

U.S. Navy has continued the integration of guided missiles weapons systems into fleet operations. Atlantic Fleet has increased its capability in surface-to-air missiles for anti-air warfare with TERRIER equipped ships. The guided missile cruiser USS GALVESTON is now conducting evaluation of the TALOS shipboard system. In Pacific Fleet, there are 5 submarines and 2 cruisers with REGULUS guided missile capability which are deployed on a rotational basis. Two other cruisers in Pacific Fleet are TERRIER equipped. All carrier fighter aircraft carry either SIDEWINDER or SPARROW III air-to-air missiles for anti-air warfare employment. Some types carry a mixed load of these missiles allowing greater latitude in attack. Light attack aircraft are being configured as fast as procurement will allow, to use BULLPUP, a close-air-support guided missile. Deployed forces in both Atlantic and Pacific Fleets are now equipped with these missiles.

Included in naval forces are *Fleet Marine Force* ground and air units with the capability to employ tactical nuclear and non-nuclear weapons, either surface or air launched. Capabilities for conducting helicopter-borne vertical assault operations continue to improve. Three interim amphibious assault ships (LPH) now serve the fleets. One more antisubmarine warfare carrier (CVS) converted to an LPH will be added during FY 1961 while 2 further LPH, currently under construction, should be available by FY 1963.

In certain areas the capabilities of *U.S. Air Force* tactical forces have continued to improve during FY 1960. Compatibility tests between tactical fighters and KC-135 jet tankers have been successfully completed making it possible to deploy Composite Air Strike Force (CASF) units to overseas locations by use of these jet tankers, if desired. This will not only provide greater reliability for refueling operations, it will also permit more rapid deployment. Modernization of tactical forces with F-105 all-weather tactical fighters began in FY 1960. Tactical Air Command is now equipped with one wing of F-105 aircraft, to be increased to 3 wings by end FY 1964. Equippage of theater based forces will begin in early FY 1962 for Europe and early FY 1963 for Far East. About one wing equivalent of F-100 and all F-105 aircraft will be capable of delivering BULLPUP air-to-surface missiles, which will be coming into the operational inventory in FY 1961. Improved reaction time for MATADOR tactical missile units has resulted in an increased readiness posture for those forces and similar improvement is scheduled for MACE units during FY 1961.

[Omitted here are pages 10–23.]

III. PROGRAMS FOR CONTINENTAL DEFENSE.

ESTIMATED SOVIET THREAT AND CAPABILITIES. As of 30 June 1960, by employing their entire heavy bomber force, many of their medium bombers, their small submarine-launched missile capability, and available ICBMS, the Soviets could mount large-scale initial nuclear attacks against North American targets. Actual weight of attack launched against the United States would depend upon Soviet judgment as to optimum combination of surprise and weight of attack against all areas where U.S. and allied nuclear retaliatory capabilities and other essential targets were located. Soviet leaders probably regard their current long-range attack forces as adequate to deliver a devastating attack on concentrations of population and industry, but incapable of preventing, by military action, the nuclear devastation of the USSR. How long this latter consideration remains valid depends upon the progress made in maintaining an effective U.S. military posture *vis-a-vis* the Soviets.

Because the ICBM offers the Soviets the best prospects of being able to achieve destruction of a substantial portion of U.S. nuclear retaliatory capability prior to launch, future development of Soviet intercontinental attack capabilities will be primarily a function of production and development of ICBMs. However, for some years to come, long-range striking capabilities of the USSR will include both manned bombers and ballistic missiles. The Soviets probably will consider that ballistic missiles can best be employed to neutralize U.S. based retaliatory and other capabilities in an initial blow, relying upon bombers for follow-up attacks. Soviet employment of long-range striking capabilities would continue to face great difficulties of timing and distribution of attack against widely deployed, mobile and ready Western strengths.

It is estimated that the USSR now has a limited capability to launch ballistic missiles from about 12 long range, conventionally-powered submarines, 4 of which probably can accommodate 2 ballistic missiles each. A new class of submarine has been in production since 1958. About 9 of these are now considered operational. Although only fragmentary information is available on this class, it is believed to be designed to accommodate about 6 ballistic missiles. It is believed that these submarines would be capable of a 350 n.m. missile range with a CEP of one to 2 n.m., launching from surface or sail awash condition.

Clandestine attack on the United States by sabotage, biological warfare, and placement of nuclear weapons, could occur against specifically selected targets.

Biological and Chemical Weapons Programs—Comparative Evaluation. Communist China has an extremely limited CW capability and no BW capability. The capabilities of other Bloc countries (not including the USSR) are little better. However, the over-all USSR CW/BW capabilities may be superior to those of the United States and its allies but there is no firm intelligence information to support a precise comparison. The USSR may have more different types of CW agents, greater quantities of each agent and also more delivery means. USSR BW capabilities are not known, but it is certain that their efforts in this field have been most extensive and it is known that they have a very comprehensive R&D CW program.

U.S. BW and CW Programs. Increased funding provided in FY 1960 and projected for incremental increase during next 5 years should do much to reduce present USSR relative advantage. The possibility of qualitative improvement through research and development of both agents and munitions appears to be great. A comprehensive report on current status of Department of Defense biological and chemical weapons research and development programs is included in Section VI, Military Research & Development Program.

[Omitted here is the remainder of the report, sections IV–IX.]

279. Annex to JCS comments, JCSM–553–60 (print Document 130)¹

JCSM–553–60

Washington, December 9, 1960

ANNEX

SPECIFIC JOINT CHIEFS OF STAFF VIEWS ON POSSIBLE
DEFICIENCIES IN THE U.S. POSTURE FOR LIMITED MILITARY
OPERATIONS (C)

1. *a.* Airlift and sealift studies prepared by the Joint Chiefs of Staff in 1959 included the following:

(1) Airlift Requirements and Capabilities under Mobilization and Wartime Conditions (FY 1960–1963).

(2) U.S. Ocean Shipping Requirements and Availability. These studies, based on actual plans and prepared annually, are coordinated within the Joint Chiefs of Staff and with the Services. They provide the basis for joint guidance on transportation planning matters.

b. The above studies used resumption of hostilities in Korea coincident with six months of mobilization as its criterion for limited war capabilities and requirements.

(1) In the airlift study, it was concluded that Military Air Transport Service (MATS) capability for limited war, assuming the Civil Reserve Air Fleet (CRAF) is activated, is adequate for passenger and cargo requirements except for shortages during the first 20 days. Approximately three-fourths of the cargo deficit in this period can be overcome by temporary transfer of capability from the Atlantic area.

(a) Since the airlift study was completed additional passenger capability has been allocated to the Civil Reserve Air Fleet to meet the passenger deficits as indicated by this study.

(b) The cargo capability situation also has been improved since the study by additional Civil Reserve Air Fleet allocations.

(2) The conclusion of the sealift study was that, although there are some shortages of cargo and passenger ships in the first 60 days of a limited war, sealift is adequate. Shortages in cargo ships could be made up from available foreign flag shipping. Passenger ship shortages could be eliminated by “hot bunking” and use of friendly Allied passenger ships.

(3) No airlift or sealift studies have been completed at this time regarding Southeast Asia. New studies on subjects tabulated in paragraph 1 *a* (1) and (2) above, dealing specifically with Southeast Asia, are scheduled for completion by May 1961. The effect of the logistic

¹ Source: “Specific Joint Chiefs of Staff Views on Possible Deficiencies in the U.S. Posture for Limited Military Operations.” Top Secret. 25 pp. Eisenhower Library, Records of the Office of Special Assistant to President for National Security Affairs.

limitations of this area on U.S. transportation capabilities will be considered in these studies.

2. Military Logistics Base plans (Mobilization Base Plans) are formulated by the Military Departments in accordance with the general guidelines established by the Secretary of Defense. The latest guidance is the Secretary of Defense memorandum of 15 March 1960, subject, "Guidance for the Development of FY 61/62 Logistics Programs," which provides for acquisition objectives, production base planning objectives, and materiel retention policies, for both limited and general war planning in the Department of Defense. There has been insufficient time to implement fully this guidance. It is expected that if funding permits implementation of this guidance, our capability to support limited war situations, without degrading our general war readiness posture, should be improved in the near future. However, current budgetary limitations will not enable the Military Departments to meet in all categories the supply and equipment objectives of the logistic guidance. The status of Service mobilization base planning and programs is summarized below:

a. Army. Detailed mobilization plans and programs to support current limited and general war plans are in advanced state of preparation. Major deficiencies, as they relate to limited war operations, are:

(1) Strength, both active and reserve, dependent upon the scope and nature of the conflict.

(2) Planning for the support of limited war is based on the Limited War Plan for the Resumption of Hostilities in Korea. However, its current status of implementation would result in degrading the general war posture in the event a limited war is quickly followed by a general war.

(3) While Army forces are equipped with sufficient materiel to support U.S. forces in limited war operations envisaged in the current time frame, only about one-half would be of the preferred model and the balance would be of an older less effective but acceptable model. Recent allocation of funds will reduce this deficiency to some degree from a qualitative point of view in the time frame under consideration.

b. Navy

(1) The Navy logistics mobilization planning objective is to provide the materiel support to the forces needed to prosecute a limited war with an accompanying selective build-up of forces, while at all times maintaining an adequate general war posture. Planned acquisition requirements to meet this objective are:

(a) Meet the peacetime force materiel requirement.

(b) Complete equipping of selected reserve forces.

(c) Attain a level of war readiness reserve stock not to exceed 180 days combat support for general war for Marine Corps forces deployed

overseas. For all other Naval forces, the general war objective will not exceed 90 days combat support.

(d) Attain an additional level of war readiness reserve stock of those items necessary to sustain in limited war for 180 days designated Naval forces, plus a maximum of 180 days training support for the other Naval forces.

(2) Budgetary limitations have precluded reaching these logistic readiness goals. The most important shortage is modern conventional weapons and ammunition, such as ASW torpedoes, electronic equipment (sonar, radar and ECM), and guided missiles.

c. Air Force. U.S. Air Force wartime planning and programming documents, upon which emergency war plans are formulated, presently reflect the force and war readiness materiel requirements for limited war activity as well as for general war. In order to support the Joint Chiefs of Staff approved contingency plans of the unified commands in consonance with Secretary of Defense memorandum, dated 15 March 1960, the Air Force has segmented the total package authorized for limited war actions and has distributed them on a global basis. Detailed Air Force plans provide for world-wide base prestockage rather than the portrayal of the force and attendant war readiness materiel assets in one location or area to meet limited war threats. The separation of War Readiness Materiel (WRM) for general and limited war will enable the commander to identify readily those items of WRM which are specifically designated for limited war and prevent degradation of general war assets. Additionally, the Air Force has revised its policy on WRM to provide for prestocking and prepositioning materiel in support of approved contingency plans. The concept provides for locating the materiel at or near the point of planned usage.

d. Marine Corps. Mobilization planning is current through the FY 1961 period. These plans provide guidance under conditions of cold, limited or general war, and reflect actual Marine Corps capabilities including provision for assembly of resources available. Mobilization plans are designed to permit incrementally phased activations of units in the event partial mobilization is required. Current actions to improve mobilization capabilities include a reorganization of the Marine Corps Reserve to support more accurately specific mobilization requirements.

3. The general statue of war reserves by Service, is:

a. Army

(1) The status of war reserves, based on the guidance for the development of FY 61/62 Logistics Program, is being computed and analyzed at this time. Therefore, the following information on the general status of war reserves is a qualified estimate, based on available data.

(2) Procurement Equipment Missiles Army (PEMA).

(a) Total assets available for initial issue and war reserves represent a little less than two-thirds of the objectives authorized by the FY 61/62 guidance. Since sufficient assets are not available, the provision of adequate support for a limited war would necessitate the withdrawal of equipment required to meet initial equipment requirements for the balance of the forces authorized by the guidance.

(b) Assuming a six months limited war, up to 24 months would be required after the initiation of procurement to reconstitute that portion of the inventory which would be consumed during the six months period.

(3) Minor secondary items and repair parts.

(a) Mobilization reserve assets and planned acquisition through Fiscal Year 1962 will meet approximately 60 per cent of the requirement.

(b) If mobilization reserves were depleted by a limited war of six months duration, the time required to replace stocks after the initiation of procurement would vary from 6 to 15 months depending on the item.

b. Navy. Navy Mobilization Reserve Stocks (MRS) are stored in CONUS and in reasonably protected sites overseas in locations so as best to support the forces in being and the forces to be mobilized. MRS is maintained, rotated, and modernized to the extent practicable under current financial limitations. The time required to reconstitute the various categories of materiel included in the MRS will vary from three months for certain standard consumables up to 36 months for major electronic equipment.

c. Air Force

(1) The War Readiness Materiel (WRM) requirements for limited war are based on plans approved by the Joint Chiefs of Staff. Air Force supporting plans call for prepositioning such materiel at or near the point of planned usage. Based on the approved strategic concepts reflected in the War Objectives and Basic National Security Policies present stocks are deemed adequate to permit immediate reaction to anticipated (current plans) limited war situations. However, should these concepts change, Air Force WRM requirements would reflect this change. The lack of Base Rights agreements in certain areas of Southeast Asia and the Middle East preclude full implementation of the prepositioning policy. In such case, the required materiel is prepositioned at the nearest United States controlled base. The lack of Base Rights thus causes not only a mal-location of materiel, but also places an additive requirement on transportation resources.

(2) Those WRM assets consumed during war operations will be replaced from materiel in transit; in depots stocks; from stocks in long-supply; diversions from activities with lower priority missions (except that the General War posture will not be degraded); and by expedited deliveries from production and repair facilities.

d. Marine Corps

Sufficient materiel, including repairable unserviceable as well as serviceable assets, is on hand to meet 52% of the M-Day materiel requirement. Time required to reconstitute materiel reserves is estimated to be 18 to 24 months for major items, 10 to 12 months for ammunition, and 9 to 12 months for minor items. This estimate assumes immediate unrestricted availability of funds, and disregards possible delay due to simultaneous maximum demand on industry by all Services. Actions being taken to assume maximum utilization of reserve stocks include regular rotation to obviate deterioration; continuous maintenance in a high degree of readiness of mount-out and resupply stocks; and selective prepositioning of supplies both in WesPac and NELM for contingency requirements.

4. The logistic limitations in Southeast Asia, stemming from the lack of development of communications, port and terminal facilities and transportation means, would severely affect U.S. and friendly indigenous military operations. Furthermore, the existing logistic support facilities are extremely vulnerable to disruption and are inadequate to support sustained operations of U.S. and Allied forces. These limitations would probably affect enemy operations to a lesser degree.

5. Thus, lack of surface LOC's, adequacy of terminal facilities in the area, and the status of strategic communications in Southeast Asia, are recognized as factors which would influence the nature of the operations and the type force to be employed. Military operations for Southeast Asia take into account the geophysical limitations of the area. These limitations establish the *modus operandi* of military operations. Any improvement in facilities would cause changes to plans to utilize the improvements. The lack of facilities is a limitation to be considered in planning.

6. In addition, there are inadequate logistical units in the indigenous forces of Southeast Asia for the support of their own combat forces. Current contingency plans for Southeast Asia include requirements for U.S. logistical units for the support of indigenous combat forces. This limitation in the indigenous force structure is recognized and, as the logistical capability of indigenous forces improves, the contingency plans are revised accordingly.

7. The solution to the problems which pertain to operations in Southeast Asia is not to devote more of our current military assistance to the development of logistic, communication, and support facilities designed specifically for U.S. use. This would have an adverse impact, both political and military, on the host country. Rather, the primary objective of our military assistance program should be the improvement of indigenous capabilities with the eventual goal of adequately trained and equipped indigenous forces which are essential for the conduct of operations in Southeast Asia. In addition, one of the major objectives of

the Military Assistance Program is to provide the host country with a capability to resist Communist aggression by defending its borders and maintaining internal security. Therefore, any program designed specifically for the development of U.S. capabilities to operate in Southeast Asia should be in addition to the existing programs for direct military assistance to the countries of the area.

8. At the time the Limited War Study was being prepared and subsequent thereto, certain actions were being taken to facilitate operations in Southeast Asia. These include:

a. Increased and reoriented military assistance to the countries of Southeast Asia.

b. Deployment of additional Army forces to the Far East, e.g., an airborne battle group and additional Army logistical support forces to Okinawa.

c. CINCPAC Operation Plan for Southeast Asia refined and approved.

d. Additional Marine elements afloat with Seventh Fleet.

e. Continued development of planning and coordination by SEATO forces.

f. Action by Air Force to establish a limited stockpile of conventional munitions in Thailand.

g. Assignment of a third aircraft carrier to the Seventh Fleet on a continuing basis.

h. Increased number of attack aircraft deployed in aircraft carriers with the Seventh Fleet.

i. Programmed modernization of the Airlift Force. (\$33,000,000 is programmed for the development of the so-called SOR aircraft (long-range jet powered cargo aircraft). For interim modernization \$83,900,000 has been apportioned during FY 1961 for the procurement of 16 C-130E aircraft. The FY 1962 program plans procurement of an additional 34 C-130E aircraft, making a total of 50 such aircraft. Consideration is being given to the procurement of 50 of the C-135 type aircraft.)

j. Strategic mobility exercise scheduled for early 1961. (Airlift one Army battle group and deploy Composite Air Strike Force from Continental United States to Far East.)

k. Periodic deployment of Composite Air Strike Force for training purposes.

l. The Department of Defense has officially supported the Department of Commerce in its actions to maintain the National Defense Reserve Fleet at the best practicable degree of modernity and in sufficient strength to fulfill civilian and military requirements in national emergencies.

m. Action by the Army to establish the DA Forward Depot, Pacific, on Okinawa.

9. Actions being taken or that could be taken with regard to obtaining required transit and base rights in Southeast Asia, improving strategic and tactical communications in Southeast Asia, and the improvement of capabilities to conduct over-the-beach supply operations are as follows:

a. Transit and Base Rights in Southeast Asia.

(1) Requirements exist for the following facilities for dispersal, staging and recovery of aircraft and prepositioning and prestockage of materials and supplies as required to support CINCPAC plans.

(a) Vietnam

Tan Son Nhut, Saigon
Tourane
Cap St. Jacques
Nha Trang
Bien Hoa

(b) Laos

Vietiane
Seno

(c) Thailand

Bangkok/Don Muang
Korat Nakhon Ratchasima
Takhl
Chiang Mai
Ubon
Udorn

(NOTE: Current interpretation of the restrictions imposed by the terms of the Geneva Convention have thus far prevented any use of facilities in Laos and Vietnam. Rights have been obtained for limited prestocking in Thailand.)

(2) Transit rights for overflight and for use of bases for peacetime training exercises are obtained on an individual basis.

(3) CINCPAC contingency planning for the area assumes that existing bases, facilities and services will be made available when and as required.

b. Strategic and Tactical Communications.

(1) *Existing Strategic Communications.* Communications to and from Vietiane, Saigon, and Bangkok are provided by the Army Strategic Communications (STARCOM) Station at Clark Air Force Base, Philippine Islands, which interconnects into the world-wide communications system of the Department of Defense. There is, in addition, a communications circuit between Bangkok and Saigon. The Southeast Asian terminals of all these circuits have limited capacity and utilize air-transportable equipment. A high capacity circuit links the British communication system at Singapore with the Naval Communication

System in the Philippines. In addition, the Naval communication facility at San Miguel, Philippines, provides a circuit to inter-connect Naval units afloat with the world-wide communications network.

(2) *Planned Expansion of Southeast Asian Strategic Communications.* During fiscal years 1962–64, the high-frequency circuits which link Clark Air Force Base with the countries of Southeast Asia will be expanded to provide additional reliability and an increased traffic handling capability. This will be accomplished by the utilization of fixed-station types of equipment in place of transportable equipment. The fixed-stations will have increased power and transmitters with a greater circuit capacity. To provide for communications westward from Southeast Asia, the Department of Defense has under consideration a request for an Asian Gateway Communications Station in Karachi which, if authorized, will furnish high capacity communications between Karachi and Bangkok. Within the Southeast Asian countries, an expanded communications circuit is planned between Bangkok and Saigon.

(3) *Contingency Communications.* West of Hawaii, air-transportable equipments which may be used on point-to-point communications circuits are located at Clark Air Force Base, in Okinawa and Japan, and in Seoul. These equipments represent a reasonable additional communications capability to augment existing circuits into Southeast Asia and will be supplemented by improved air-transportable equipments which are under procurement for delivery during the current fiscal year. It should be understood, however, that the technical teams which are necessary for the operation and maintenance of supplementary communications must, except on a very limited basis, be provided from the continental United States.

(4) *Tactical Communications.* The U.S. Military Services do not maintain in being tactical communications systems in Southeast Asia. Each Service provides tactical communications for the control and direction of Service forces within an area of tactical operations. These tactical systems consist of transportable communications equipments which are deployed into an area by tactical forces. Coordination for joint operations is the responsibility of the area commander. Tactical communications systems are, therefore, organic to military units, connect into strategic networks, and are not required prior to the movement of military forces.

(5) *Actions which could be taken to improve Strategic Communications.*

(a) Existing strategic communications connecting into Southeast Asia, together with planned improvements, will provide a minimal capability for limited war operations. Fixed communications systems are dependent upon high frequency circuits designed essentially for teletype operation with only a comparatively few voice circuits available.

(b) If it should be decided to conduct military operations in Southeast Asia, communications planning will have to be revised to reflect operational requirements. The specific nature of such programs will depend upon the concept of operations, the magnitude of forces employed, and the location of controlling and supporting headquarters. Communications for such purposes are not available in the existing system nor contemplated in scheduled improvements. Basically, communications would have to be expanded to include the provision of voice and data transmission between elements of the combat forces and high quality circuits capable of direct extension to command centers in the United States. Included would be measures for increasing the capacity and improving the reliability of the fixed strategic communications system, and for providing extensions from strategic networks into contiguous areas by the use of transportable tactical equipment.

(c) Over-the-Beach Supply Operations.

(1) Army

(a) These operations, which are an important part of the resupply capability of U.S. Army Forces, are periodically tested and improved through the conduct of realistic exercises, and the development and adjustment of doctrine based on lessons learned. One of the most recent exercises was conducted in total darkness with complete success at Fort Story, Virginia, on 17, 18 and 19 October 1960. Another exercise (NODEX-25) was conducted on the coast of France 26–28 October 1960.

(b) Present plans call for a partial shift from landing craft to amphibians as equipment becomes available. For example, four (4) platoons equipped with Barge, Amphibious Resupply Cargo (BARC), will be in operation in CONUS and the Far East (Okinawa) by the end of FY 61, an increase of two over present strength. Also, existing equipment in amphibious truck companies, consisting at present of WW II DUKWs, will be placed in the future with the Lighter, Amphibious Resupply Cargo (LARC-5) thus, greatly increasing the capability of these units.

(c) The present capability to support combat forces in Southeast Asia by over-the-beach resupply operations, if required, is deemed adequate for the forces to be deployed to this area under existing limited war plans.

(2) Navy

(a) The Navy has, under continuous study and development, programs and projects to improve logistic support of landing forces in amphibious operations which include evaluation of various over-the-beach supply support systems. Each system is analyzed with respect to inter-relationship and combined productivity of packaging, materials handling and transportation procedures and techniques. These studies result in continued improvement in the hardware utilized and

techniques employed in over-the-beach supply support operations for amphibious assault.

(b) Private research contractors, the Naval Civil Engineering Laboratory and the U.S. Army Transportation Corps are principal contributors to the Navy Program. Some items now in the evaluation stage are:

i. Landing Craft Retriever (LCR), a vehicle for unloading LC's in one operation, with up to 70 tons cargo lift capability. Tests to date show promise in achieving a through-the-beach capability vice over-the-beach.

ii. Hi-line system of cables from an LST to the beach gives the capability of underway pallet loads from LST's stranded off the beach direct to a truck.

iii. Causeway extensions for unstable beaches ("rush role").

iv. Hose reels for buoyant fuel systems.

v. Transfer line barges.

vi. Deep-water fording kits for tractors used in the surf zone.

vii. 600 GPM ship-to-shore fuel systems.

viii. Inflatable causeways.

ix. Ship-to-shore heavy duty cargo systems.

x. Booster stations for ship-to-shore fuel systems.

xi. Helicopter aerial delivery systems.

xii. Improved high-speed tracked amphibians.

Items recently placed in fleet use are:

i. 21-foot wide end-to-end connected pontoon causeway (replacing 14-foot wide lapped units).

ii. 300 GPM bottom laid ship-to-shore fuel system.

iii. Hi-speed shore party crane.

iv. Controlled pontoon launching from LST's.

v. 100-ton advanced base crane.

11. Subsequent to the preparation of the Limited War Study, a decision was made with regard to use of funds to improve our readiness posture. This funding action will improve our capability to conduct limited military operations. Authorization was granted to increase Army modernization, increase amphibious assault capabilities, provide for additional aircraft carriers on station with the Sixth and Seventh Fleets, and increase air alert status. Subsequent budgetary action may not permit continuation of all of these readiness measures.

- A. NSC 5802/1
- B. NSC Action No. 2151-*f*-(1)
- C. Memo for NSC from Executive Secretary, same subject, dated July 14, 1960
- D. NSC Action No. 2300
- E. NIE 11-8-60; NIE 11-5-59

The enclosed draft statement of policy on the subject, prepared by the NSC Planning Board in accordance with NSC Action No. 2151-*f*-(1), is transmitted herewith for consideration by the National Security Council at its meeting on Thursday, December 22, 1960.

It is recommended that, if the enclosed statement of policy is adopted, it be submitted to the President with the recommendation that he approve it; direct its implementation by all appropriate Executive departments and agencies of the U.S. Government; and direct that the departments and agencies indicated in the table on "Primary Responsibilities for Implementation" (with the exception of the Department of State and the Central Intelligence Agency) report, in a special annex to their respective annual status reports, on progress in implementing the appropriate paragraphs of the approved paper.

The enclosed statement of policy, if adopted and approved, is intended to supersede NSC 5802/1.

Marion W. Boggs
Acting Executive Secretary

17—Research and Development	All appropriate agencies
18—Continuity of Government	OCDM in collaboration with all participating agencies
19—Protection and Dispersal of Federal Facilities	OCDM in collaboration with all participating agencies
20–26—Civil Defense	OCDM
27–32—Internal Security	IIC and ICIS coordination
33—Port Security	Treasury, keeping IIC and ICIS fully informed

DRAFT STATEMENT of
U.S. POLICY ON CONTINENTAL DEFENSE

INTRODUCTION

1. This statement of policy on “Continental Defense” does not encompass all elements of U.S. or allied strength contributing to the defense of North America. Only those U.S. policies are included which are essentially defensive in nature; i.e., which contribute directly to the defense of the North American Continent and to the protection of that element of our retaliatory capability based on the North American Continent.

2. The defense of the United States is an integrated complex of offensive and defensive elements and of military and non-military measures. Each of these has its proper role in deterring an attack or in the defense of the United States should an attack occur. An effective continental defense system will constitute one of the key deterrents to an attack on the North American Continent.

3. Current national intelligence estimates indicate that Soviet delivery systems are changing importantly in character, and imply the following periods:²

a. The period is drawing to an end when the primary element in the threat to the United States is manned bombers.

b. The period of the early 1960's will represent a transition from a largely bomber threat to one mainly composed of ICBM's. In the early 1960's the estimated Soviet ICBM force will present an extremely dangerous threat to SAC bomber bases, unhardened ICBM sites and command installations.

c. In a few years, therefore, the principal element of the threat to the United States will be ICBM's supplemented by BISON heavy bombers and possibly by some refueled or one-way medium bombers, by increased numbers of submarine-launched ballistic missiles, and possibly by cruise-type missiles.

4. The changing character of the Soviet threat and our current assessment of the relative effectiveness of various active and passive defense measures³ have made it necessary that the United States re-examine its military and non-military programs for continental defense. [In particular, national planning must recognize that, barring a technological breakthrough, the development and deployment of an adequate AICBM system during the 1960's is questionable.]⁴

OBJECTIVES

5. *a.* To protect and preserve a retaliatory capability of such force and certainty as to constitute a strong and credible deterrent against attack on the North American Continent.

b. To limit the damage to our civil and military strength which would occur in the event of attack, in order to ensure the survival of

² NIE 11-8-60, July 28, 1960, including relevant revisions to NIE 11-5-59 of May 3, 1960. [Footnote is in the original.]

³ In accordance with accepted practice, the term "active defense" is used in reference to those measures that involve an attempt to physically incapacitate or destroy a threatening object; e.g., interceptor aircraft, surface-to-air missiles, anti-missile missile systems. The term "passive defense" embraces all other means of defense; e.g., airborne and ground alert, warning and response to warning (including the launch of recallable aircraft), dispersal, mobility, hardening, protection against radiation and BW and CW agents. [Footnote is in the original.]

⁴ JCS reserves. [Brackets and footnote are in the original.]

the nation and to pursue the ensuing hostilities to the most favorable possible conclusion.

MAJOR POLICY GUIDANCE

Relative Emphasis

6. Predominant emphasis should continue to be placed upon measures to strengthen and protect our nuclear retaliatory power as a deterrent.

MAJORITY

7. As long as the manned bomber threat continues to be of significant proportions, continue measures to maintain our active defenses against manned aircraft. However, in view of the increasing reliance of the USSR on ballistic missiles for inter-continental attack and the present limitations of achievable active defense measures the U.S. should:

a. While pursuing measures to achieve adequate active defenses, make a particular effort to exploit passive measures that will afford the requisite degree of protection to our retaliatory power and to relate elements, including communications and command.

b. Give increased attention to measures for the passive defense of the U.S. population.

BUDGET-JCS

7. Continued reliance will be placed on a balance of active and passive defense measures consistent with their contribution to the over-all defense posture of the United States, the changing nature of the Soviet threat, and the increasing number of technological options open to the USSR.

7-A. The United States should place predominant emphasis on measures to improve our active defenses, as compared with—but not to the exclusion of—passive defense measures. [Particular emphasis should be accorded those active and passive defense measures essential to the protection of the U.S. capability for prompt nuclear retaliation.]⁵

Time Phasing

8. The time phasing of U.S. “continental defense” measures should take into account the threat posed by the present nuclear attack capability of the USSR and by future improvements in Soviet weapons and delivery capabilities, particularly the achievement in the early 1960’s of a major ICBM capability. This will be a period during which the United States will largely depend on its U.S.-based air retaliatory force. Accordingly, during the early 1960’s special attention should continue to be given to measures for minimizing the vulnerability of

⁵ Budget proposal. JCS would substitute 7-b of the Majority Proposal for this sentence. [Brackets and footnote are in the original.]

the strategic air retaliatory forces to ICBM attack. Effective continental defense requires that the United States be constantly on guard against "technological surprise" and that it continually strive for technological superiority.

International Collaboration and Coordination

9. Continental defense requires continued close collaboration with certain allies. The principle of joint defense of the North American Continent by the United States and Canada, begun in World War II and developed progressively in subsequent years, should be fostered. The highly satisfactory arrangements with Denmark for maintaining defense installations in Greenland should be continued. Efforts should also be made to continue, or to create or improve as necessary, collaboration with other countries concerned with the defense of this continent.

Warning

10. *Strategic.* With the Soviet acquisition of an operational missile capability and the intensification of Soviet efforts to deny warning information to the United States, it has become increasingly important, as well as more difficult, to acquire timely strategic warning of Soviet Bloc attack against the United States. However, barring an extremely fortuitous break, intelligence warning can be expected only to point to a period of sharply heightened risk of hostilities. Therefore, for planning purposes it cannot be concluded that the United States surely will, or surely will not, have strategic warning. Responsible officials must recognize that they may have to accept intelligence warning judgments based on limited, evidence. In this situation it is increasingly important that:

a. The United States have accurate estimates of (1) Soviet military capabilities, (2) their view of their power position in current critical or potential critical situations, (3) their willingness to accept risks, and (4) their progress toward maximum combat readiness. These assessments will also assist in determining requirements for strategic warning and in indicating areas in which new and improved intelligence collection techniques must be developed.

b. It be recognized that, if any reasonable degree of success in obtaining adequate strategic warning is to be achieved, risks are inherent in the execution of high priority collection programs. These risks should be weighed against what may be even graver risks inherent in failure to obtain strategic warning.

c. Vigorous efforts be made to develop improved techniques for the processing, analysis and evaluation of possible indications of hostile enemy intentions.

11. *Tactical.* Every effort should be made to achieve effective tactical warning of aircraft or missile attack to assure adequate time for retaliatory forces to take action, for other military forces including defense

forces to achieve alert readiness, and for initiation of the implementation of civil defense, internal security and other non-military measures. To this end:

a. For warning against attack by aircraft and non-ballistic missiles:

(1) An effective early warning radar net, including its seaward extensions, having a capability for very high and very low-level altitude detection, should continue to be maintained.

(2) Weaknesses in aircraft identification techniques and procedures should be remedied as quickly as feasible.

b. For warning against attack by ballistic missiles: Improvement of the capability to provide early warning of ballistic missile attack should be continued as a matter of the highest national priority.⁶

c. For warning of nuclear detonations: Installation of the currently-programmed bomb alarm and fallout reporting systems for SAC bases should be completed; a national attack surveillance system should be undertaken.

d. For warning against BW and CW attack: Development of a capability for rapid detection and identification of BW and CW agents.

Military Functions

12. *Active Defense.* Active elements of the continental defense system must contend with a mixed threat consisting of manned bombers, non-ballistic missiles, intercontinental, submarine-launched and possibly air-launched ballistic missiles. To this end:

a. Against aircraft and non-ballistic missiles: The United States should continue to make improvements in and to maintain in a high state of readiness, an integrated air-defense system providing defense in depth and capable of destroying enemy aircraft and non-ballistic missiles before they reach vital targets. It is possible that integrated functioning of the air defense system may be compromised by ballistic missile attack. To take care of such an eventuality, the capability of the various weapons elements of the air defense system to act independently should continue to be improved. In addition to the primary air defense forces, all other forces that have an air defense capability and that can be made temporarily available, should, in the event of attack or the threat of immediate attack, be made immediately available and employed as required within this system.

b. Against ballistic missiles: The United States should continue efforts to develop an effective capability against ballistic missiles as a matter of highest national priority.⁷

⁶ Those specific warning systems assigned this priority are set forth in NSC Actions. [Footnote is in the original.]

⁷ Those specific weapons systems assigned this priority are set forth in NSC Actions. [Footnote is in the original.]

MAJORITY

JCS

in an attempt to develop an , and to insure some operational

AICBM capability by the earliest possible date, both for its own value and to offset the practical and psychological disadvantages of possible Soviet claims of success in this field.

c. Against the threat of missiles launched from ocean areas: The United States should strive to achieve and maintain an effective and integrated sea surveillance system that permits detection and tracking of surface ships and submarines operating within missile-launching range of the North American Continent; and should improve its related anti-submarine capability. Until technology permits the deployment of an effective active defense against submarine-launched ballistic missiles, the principal measures of protection should be provided by the capability to attack prior to launch, and, in the case of non-ballistic missiles, by elements of the air defense system.

13. *Passive Defense.* The United States should carry out those passive defense measures that will add significantly to its ability to protect its retaliatory capability and the survival of the other essential military elements of its national power, including with respect to:

a. The retaliatory capability: Measures, such as increase in mobility, dispersal, hardening, reduction of reaction time, the capability to mount an airborne alert of SAC bombers, and protection of essential facilities including command and communications centers.

b. The air defense forces: Similar measures, as appropriate, to reduce the vulnerability of air defense forces.

c. The surviving military forces: Similar measures, as appropriate, to reduce the vulnerability of our other defense forces.

14. *Response to Attack or Attack Warning.* The United States should develop capabilities, procedures and doctrine adequate to provide secure command and control of its retaliatory and defensive forces within the time dimensions of a surprise ballistic missile attack. It is essential to ensure the survival of the decision-making machinery and of reliable means of communication with the surviving retaliatory forces on land, at sea, and in the air. The United States must possess an effective and flexible response that is not necessarily dependent upon the survival of the seat of government and other vital units of the planned system for command and control. At the same time, it is essential to ensure launch and commitment of the counter-offensive forces in response to attack or warning of attack with positive safe-guard against commitment based on equivocal warning or attack information.

15. *Alert Status of Air Defense Forces.* The United States should continue to maintain the alert status of its primary air defense forces, and cooperate in improvement of Canadian primary air defense forces, so as to provide an immediate reaction to warning of an enemy attack.

16. *Emergency Employment of Military Resources in Civil Defense.* The execution of essential military tasks is the primary mission of the military forces. Forces not required in the execution of or capable of executing essential military missions during and immediately following the initial attack should be prepared to assist civil authorities in maintaining law and order and in other essential civilian tasks when civilian capability is inadequate. Additionally, elements of the retaliatory forces and air defense forces should be prepared to assist in the civil defense role when no longer required for their primary role.

Research and Development

17. A vigorous research and development program should be maintained in order to improve the continental defense system and to counter improving Soviet technological capabilities for attack. Of particular importance are the following (without indication of priority):

- a. Early warning capability against enemy aircraft and missiles, by radar and other techniques; and the rapid dissemination of such warning.
- b. Reliable conversion of warning information into prompt decisions and responses.
- c. Effective defenses against ICBM's, submarine-launched ballistic missiles, very high- and very low-altitude aircraft attacks, and aircraft-launched stand-off missiles.
- d. Reduction of vulnerability to electronic countermeasures.
- e. Improved anti-submarine capabilities, to include detection, surveillance, identification and destruction.
- f. The detection, surveillance, identification, and destruction of satellites and space vehicles.⁸
- g. The rapid detection and identification of biological warfare agents.

Civilian Functions

18. *Continuity of Essential Wartime Functions of the Federal Government.*⁹ Plans and relocation facilities needed to ensure the continuity of essential wartime functions of the Federal Government should be completed and maintained in a state of operational readiness at the earliest time practicable.

- a. Plans should provide a ready and certain system of attack warning, reaction and decision-making, with adequate communications and provision for conducting emergency operations.

⁸ Tests involving the destruction of a satellite or space vehicle shall be made only with the specific approval of the President. [Footnote is in the original.]

⁹ Studies having a bearing on this subject are in preparation by OCDM and by the Special Assistant to the President for National Security Affairs (see NSC Actions Nos. 2300-d and -f and 2247-b). This paragraph will be reviewed by the National Security Council following submission of the OCDM study. [Footnote is in the original.]

b. Emergency Federal relocation facilities should be equipped as required to permit immediate activation upon arrival of relocated personnel, and should be continuously staffed as determined by the President.

19. *Protection and Dispersal of Federal Facilities.*¹⁰

a. Except as otherwise determined by proper authority, new Federal facilities and major expansion of existing Federal facilities, important to national security, should not be located in target areas. The location of new or expanded military installations shall be within the sole discretion of the Secretary of Defense [, except that he shall consult with the Director, OCDM, with respect to the location of new fixed retaliatory bases and of major administrative headquarters.]¹¹

b. Fallout shelter should be incorporated in the construction of new Federal civilian buildings of suitable size. Fallout shelter should be incorporated in [all suitable]¹² [selected]¹³ existing Federal buildings.

ALTERNATIVE 1: MAJORITY

20. *Civil Defense.* An essential part of a balanced continental defense posture is an adequate program for the protection of the civilian population from the effects of a nuclear attack, and measures to facilitate recovery and rehabilitation after such attack. [The protection of the population from fallout, together with the questionable prospects for effective active defense in the 1960's against ICBM attack, makes development of an effective civil defense a matter of greatly increased urgency.]¹⁴ An effective civil defense is an important element which a possible aggressor would have to consider in calculating the response of the United States to any threat to our vital national interests, and as such, would contribute to over-all deterrent strength.

21. The key element in an effective civil defense program is a comprehensive system of fallout shelters, since fallout is expected to be a primary hazard to the civilian population. Blast protection is a desirable added feature of shelters under certain conditions. Specific guidance on this subject is contained in a separate NSC policy document.

¹⁰ A study on the passive defense of the population, particularly with regard to fallout shelters, is in preparation by OCDM, in collaboration with State and Defense, pursuant to NSC Action No. 2300-e. [Footnote is in the original.]

¹¹ Defense-JCS propose deletion. [Brackets and footnote are in the original.]

¹² Majority proposal. [Brackets and footnote are in the original.]

¹³ Treasury-Budget proposal. [Brackets and footnote are in the original.]

¹⁴ JCS proposes deletion. [Brackets and footnote are in the original.]

ALTERNATIVE 2: TREASURY

20. *Civil Defense.* Adequate protection of the civilian population would, if it were achievable, both facilitate survival of the nation in the event of general war and contribute to the deterrence of war. Means to provide adequate protection are, however, not now foreseen. Nevertheless, the United States should constantly strive to improve the degree of protection which could be afforded the civilian population in the event of nuclear war. In the light of the limited prospects for effective active defense against ballistic missile attacks, such efforts must rest on an improved and strengthened civil defense program. Increased attention, therefore, should be given to such realistic measures for improving the passive defense of the U.S. population as would offer some contribution to the deterrence of general war without prejudicing the implementation of other measures likely to reduce the risks of war.

21. Fallout shelters constitute the best—although still inadequate—means presently available for reducing the number of casualties in the event of nuclear war. The Federal Government should, therefore, promote construction of such shelters by measures based firmly upon the following fundamental principles:

a. It should be the obligation of each property owner to provide protection on his own premises.

b. The role of the Federal Government should be to provide leadership and example.

c. There should be no elements of compulsion, penalty, or subsidy in Federal programs.

d. Actions must avoid creating alarm, causing Congressional and public reaction prejudicial to higher priority national security programs, presenting the posture of the United States as that of a nation preoccupied with preparations for war, or losing the support of our allies.

ALTERNATIVE 3: BUDGET

20. *Civil Defense.* An essential ingredient of continental defense is improved and strengthened civil defense which seeks, by both preventive and ameliorative measures, to minimize damage from nuclear attack and to contribute to deterring such attack.

21. Measures to carry out the concept of fallout shelter for protection of the civil population against radiation hazard represent a key element in an effective civil defense program. Specific guidance is contained in a separate NSC policy document.

* * * * *

22. In order that Federal, State and local governments may carry out their essential responsibilities during and after nuclear attack or other grave emergency, the capability of State and local governments to function effectively should be strengthened by Federal assistance in the form of guidance, direction and resources. Such assistance should

include pre-attack planning for the full utilization of local resources and for support by available Federal resources, including military forces.

MAJORITY

23. Civil defense will continue to include local planning for the emergency dispersal of populations, not as a substitute for shelter, but as a possible supplement thereto under certain circumstances.

24. Guidance and leadership should be provided to industry essential to [initial]¹⁵ recovery from nuclear attack in the development of plans and programs designed to ensure the continuity of essential production and services.

25. Civilian items essential to survival and [initial]¹⁶ recovery from nuclear attack should be identified, minimum requirements determined,

MAJORITY

and measures developed to meet minimum requirements. Where necessary to this end stockpiling should be undertaken.

26. The United States should continue its present policy of supporting activities which will:

a. Warn the people of impending attack and make possible essential communication before, during and after attack.

b. Give emphasis to the protection (including dispersal where necessary) of essential civilian survival supplies, equipment and facilities.

BUDGET

23. Civil defense policy for protection of the civilian population in case of nuclear attack, while continuing to include local planning for the emergency dispersal of urban populations on attack warning, incorporates the concept of fallout shelter. Specific guidance is contained in a separate NSC policy document.

TREASURY-DEFENSE-BUDGET

and industrial inventories located and related to Government and State stocks. Where total availabilities appear inadequate, measures should be developed to meet minimum requirements with the least disruption of the economy, the least cost to the Government, and maximum encouragement of private participation.

¹⁵ Treasury-Budget proposal. [Brackets and footnote are in the original.]

¹⁶ Treasury-Defense-Budget proposal. [Brackets and footnote are in the original.]

c. Provide for the conduct of research and development on improved measures for the protection of the population, including radiological defense, defense against chemical and biological warfare, mass communications, medical care, and survival requirements.

d. Provide appropriate and adequate information to the public of the nature and extent of the dangers from nuclear attack on the United States now and in the future, and of the measures being taken or which could be taken to alleviate them.

Internal Security

27. The Soviet Bloc should be confronted with internal security measures presenting such risks as will serve as a deterrent to covert attack against the United States.

28. The United States should, to the extent practicable, provide adequate deterrents (a) to clandestine introduction of nuclear weapons by any means such as submarines, small craft, merchant vessels, aircraft, illegal entry of persons and things, and diplomatic channels; and (b) to utilization of such weapons against vital targets. Efforts should be continued to develop improved passive devices for the detection of fissionable material introduced by such means, and to assure their effective use. Efforts should be continued to develop a prototype of an active device.¹⁷ This policy and the programs to implement it will be kept under continuing review in accordance with existing arrangements and in light of all applicable factors, including the growing shift to ICBM's in Soviet strategic attack capabilities against U.S. retaliatory forces.

29. Measures should be taken to protect U.S. aircraft and airports as appropriate, against sabotage, espionage, and other subversive activities, and to provide appropriate safeguards relative to the operations within the continental United States of Soviet Bloc airlines.

30. Selected industrial and governmental facilities of a highly critical nature should, as appropriate, be protected against espionage and clandestine attack by nuclear, chemical, and biological weapons and conventional sabotage.

31. Selective counterintelligence coverage should be maintained of foreign diplomatic and official personnel suspected of engaging in activities beyond the scope of their normal diplomatic assignments.

32. Plans for the detention in the event of emergency of persons potentially dangerous to the United States should be maintained in a high state of readiness.

¹⁷ No decision as to production and use of such a device will be made by the President before completion and testing of a prototype. [Footnote is in the original.]

*Port Security*¹⁸

33. Measures should be taken (a) to protect U.S. ports and vessels therein against sabotage, espionage, and other subversive activities; (b) to supervise and where appropriate deny entry of vessels; and (c) to provide appropriate safeguards relative to the presence in U.S. ports of Sino-Soviet Bloc vessels. Insofar as feasible, having due regard for legal procedures and rights, subversives should be excluded from vessels and waterfront facilities.¹⁹

¹⁸ Certain measures under this heading are supplemental to those contained under the previous heading, "Internal Security". [Footnote is in the original.]

¹⁹ Experience has shown that only a very small percentage of the persons believed to be subversives can be excluded under procedures acceptable to the courts. [Footnote is in the original.]

281. Briefing Note for December 20 NSC Meeting¹

Washington, December 19, 1960

SUBJECT

U.S. Policy on Continental Defense (NSC 5802/1; NSC 5802)

1. The Council had before it a draft statement of revised U.S. Policy on Continental Defense (NSC 6022) which has been proposed by the NSC Planning Board in accordance with [illegible in the original]. In preparing this proposed policy revision the PB had the benefit of discussion which took place in the Council recently, when consideration was given to a preliminary Discussion Paper in which the PB had identified certain questions relating to basic concepts of Continental Defense.

2. The present statement of Continental Defense Policy (NSC 5802/1) was adopted by the Council and approved by the President in February, 1958. The policy review has taken into account two factors which have a particular bearing on the formulation of policy objectives in the area of Continental Defense: First, is the significantly increasing ballistic missile capability which our Intelligence Estimates attribute to the Soviet Union during the period of the 1950's; and second, the limited prospects of the United States' for the development and deployment of an adequate anti-ballistic missile system during the same period.

¹ Source: Continental defense policy. Top Secret. 5 pp. Eisenhower Library, Whitman File, NSC Records.

3. Against this background of an increasing Soviet ballistic missile threat, and the absence of an active defense on our part, some divergent views emerged in the PB with respect to certain elements of the over-all policy. Before taking up these policy issues, perhaps the Council would want to note the following key provisions of the proposed policy on which the PB is in agreement.

a. The policy statement encompasses only those objectives which contribute directly to the defense of the North American Continent and to the protection of that part of our retaliatory capability which is based on the North American Continent.

b. An effective continental defense system is considered to constitute one of the key deterrents to an attack on this country.

c. Intelligence estimates reflect that the period of the 1960's will represent a transition from a largely bomber threat (now drawing to an end) to threat consisting mainly of Soviet ICBM's—with the prospect that in a few years the principal threat to the U.S. will be Soviet ICBM's supplemented by a mix of bombers, submarine-launched ballistic missiles and possibly cruise-type missiles.

d. The achievement of a major Soviet ICBM capability in the early 1960's will take place during a period in which the U.S. will largely depend on its U.S.-based air retaliatory force. Accordingly, during that period special attention should be given to measures for minimizing the vulnerability of our strategic air retaliatory forces to ICBM attack.

e. Recognition is given to the increasing importance—and difficulty—of acquiring timely strategic warning of Soviet attack on the U.S. The paper also includes recognition of the prospect that with the Soviet acquisition of an operational missile capability, U.S. officials may have to accept intelligence warning judgments based on limited evidence—therefore, the risks which are inherent in certain “high priority” intelligence collection programs must be weighed against the even graver risks inherent in failure to obtain strategic warning.

f. A capability for tactical warning against attacks by aircraft, ballistic and non-ballistic missiles, and by CW and BW agents, is singled out for particular effort—along with a requirement for completing the bomb alarm and fallout reporting systems for SAC bases, and the undertaking of a national attack surveillance system.

g. In restating present policy requirements for an integrated air defense system providing defenses in depth against enemy aircraft and non-ballistic missiles, the proposed revision calls for an improved capability of various elements of the system to act independently should integrated functioning of the system be compromised by ballistic missile attack (the objective being to prevent a “free ride” by the enemy over the U.S. in such an eventuality).

h. The proposed policy, as revised, specifically calls for passive defense measures (in addition to *active* defense) to protect our retaliatory capability—including such measures as increases in mobility, dispersal, hardening, reduction of reaction time, the capability to mount an air borne alert of SAC bombers, and the protection of command communications centers.

i. Another agreed policy revision points to the need for developing procedures and doctrine which will provide course command and control of our retaliatory and defensive forces within the time dimensions of a surprise missile attack. The objective is to insure the survival of

the decision-making machinery and a means of communicating with our retaliatory forces on land, at sea, and in the air, in case of such an attack—with recognition of the necessity for an effective and flexible response not necessarily dependent upon survival of the seat of government and other command and control centers.

j. In singling out research and development areas of particular importance, there is included the detection, surveillance, identification and destruction of satellites and space vehicles (with a footnote reflecting existing policy to the effect that tests involving destruction shall be made only with the specific approval of the President.) (Par. 17, p. 13).

k. [illegible in the original] of policy regarding plans and facilities to ensure continuity of essential Government functions are subject to future NSC review upon completion of the pending [illegible in the original] by OCDM and the Special Assistant referred to in the footnote to Par. 18, p. 14.

l. In the area of Internal Security, Par. 28 of the proposed policy calls for certified efforts to provide deterrents against the clandestine introduction of nuclear weapons. As revised, the policy no longer contemplates the use of active devices on the person and pouches of Soviet bloc diplomatic personnel entering the U.S.—because of the State Department position that Bloc officials might detect radiation emanating from the covert device and claim violation of diplomatic immunity (with possible retaliation against U.S. diplomatic pouches and shipments). Such a detection device is under development and a prototype will be completed by AEC and tested early in 1961. As indicated in the footnote on p. 19, production and use of the device would be for Presidential decision at that time.

m. Port Security Policy, stated in Par. 33 was separately considered by the NSC and previously approved by the President on 6/29/60 (NSC Action [illegible in the original]).

POLICY ISSUES

4. The Council may now wish to turn to these paragraphs of the proposed policy statement which reflect divergent views of a policy nature which emerged in the PB:

Par. 4, p. 2, last sentence: The JCS [illegible in the original] its position on this language which questions the U.S. capability to develop and deploy an adequate anti-ICBM system during the 1960's, barring technological breakthrough. It appears that this JCS reservation applies equally to subsequent parts of the paper dealing with Relative Emphasis (Par. 7) and Civil Defense (Par. 20). Accordingly, at this point the Council might hear the comments of JCS concerning its reservation, before moving on to a consideration of succeeding "splits" which involve the same JCS position. (CALL ON: JCS, for comment on the bracketed last sentence of Par. 4).

Par. 7, p. [illegible in the original]: At this point in the paper there appears a split on the question of Relative Emphasis which should be applied as between *active* and *passive* measures to defend our retaliatory capability and our civilian population (a definition of "active" and "passive" defenses appears in the footnote on p. 2). The issue involved here begins with the agreed statement in Par. 6 that *predominant* emphasis should continue to be placed on measures (i.e., whether "active" or

“passive”) to protect our nuclear retaliatory power. Next appears the Majority view in Par. 7 (left hand column) which begins with a specific reference to the increasing ICBM threat and the present limitations on our active defenses. In Par. 7-*a*, while recognizing the need for “active” defenses, a *particular effort* to exploit “passive” measures is called for—and in 7-*b*, the Majority view extends this principle to a requirement for *increased attention* to “passive” defense of the U.S. population. The Minority view of Budget and JCS (right hand column) called for a continued *balance* of “active” and “passive” measures, consistent with the changing nature of the Soviet threat and other factors—with a specific requirement in Par. 7-A for *predominant emphasis* on “active” defenses, and *particular emphasis* on both “active” and “passive” measures to protect our nuclear retaliatory power (but at this point the JCS part company with Budget, and the JCS would call for *increased attention* to “passive” defense of the civilian population). Perhaps the Council would now want to discuss this question, beginning with comment from the Majority and Minority proponents, before discussing a later split on Civil Defense aspects. (*CALL ON*: Defense—and then Budget and JCS).

Par. 20, p. 15: In this paragraph on *Civil Defense*, there is in some respects a continuation of the preceding split on Relative Emphasis. There has been circulated to the NSC a related paper on “Measures for the Passive Defense of the Population with Particular Regard to Fallout Shelters.” The pertinence of the OCDM paper will be apparent from an oral summary of it which the OCDM Director is now prepared to give to the Council. (*CALL ON*: OCDM).

(*After the OCDM Presentation*): The OCDM presentation on Fallout Shelters appears to sharpen the policy issues involved in the alternative views which are set forth in Pars. 20 and 21 of the Continental Defense paper.

Alternative I, the Majority view (p. 15–16) would identify an effective civil defense as providing a deterrent to enemy attack, and a comprehensive system of fallout shelters is described as a key element of civil defense (JCS objected to the second sentence of Par. 20 in which the questionable prospect for an active defense (against ICBM’s in the 1960’s is stated as a reason for the urgent development of an effective civil defense). *CALL ON*: Defense and JCS.

Alternative II, the Treasury view, is stated, on p. 16—and the difference of views appears to relate mainly to the brakes which would be put on Federal financing of a shelter program, admittedly desirable though it may be. (*CALL ON*: Secretary of the Treasury).

Alternative III, (Budget view) on p. 16–A, is a restatement of present Continental Defense policy on Civil Defense (Par. 24 of NSC 5802/1) with a cross reference to existing policy on Fallout Shelter which was stated in NSC 5807/2 (at a time when greater weight was given to the prospects for an adequate active defense against ICBM’s). *CALL ON*: Budget Director.

Par. 23, p. 17: The split here is on the emphasis which should be placed on the dispersal of the population as a civil defense objective, in relation to the fallout shelter program. (*CALL ON*: Budget, for comment on the Minority view.)

Par. 25, p. 17: Raises the issue as to whether the future stockpiling of civil defense items should be confined to requirements for initial recovery from attack, or extended to recovery after attack. Treasury-Defense-Budget hold the Minority view that our policy should be limited to

stockpiling for the initial post-attack period, and limited to measures involving least disruption to the economy, least cost to the Government, and with maximum private participation, as provided in present policy. (CALL ON: OCDM Director, to speak to the Majority view.)

Par. 24, p. 17: Reflects the Minority view of Treasury and Budget that Federal advice and guidance to industry on recovery from attack should be limited to the *initial* post-attack period.

Miscellaneous Issues

5. At other points in the paper appear other split views which the Council may wish to consider:

Par. 12-b, p. 9-10: Here the JCS differed with the Majority on the question of whether U.S. efforts to develop an anti-ICBM capability should proceed to a completed system, or whether in the course of that development there should be provision for some operational capability without waiting for the complete system. A comparative study of U.S. and Soviet programs to develop anti-ballistic missile capabilities was reported to the President in October by the Comparative Evaluation Group—with no recommendation for efforts to demonstrate a kill capability prior to completion of the current NIKE ZEUS program, although the psychological advantage of an early demonstration was recognized. (CALL ON: JCS for comment on the language proposed for Par. 12-b).

Par. 19-a, p. 15: Here, Defense-JCS propose deletion of the final clause which would require that the Secretary of Defense consult with the Director of OCDM before locating new fixed retaliatory bases and major administrative headquarters. (CALL ON: Defense and OCDM)

Par. 19-b, p. 15: There is agreement on the requirement for fallout shelter in the construction of new Federal civilian buildings of suitable size. However, as to *existing* Federal buildings, the majority favor incorporation of fallout shelter in *all* buildings capable of such incorporation, whereas Treasury-Budget feel that fallout shelter should be incorporated into only those existing buildings which may be selected on a basis of relative criticality. (CALL ON: Treasury and Budget).

282. Briefing Note for the December 20 NSC Meeting¹

Washington, December 19, 1960

The first part of the [illegible in the original] item is a report by NASA on its outer space programs.

At the meeting on November 7, 1960, the Council heard a presentation by [illegible in the original] on the outer space programs being

¹ Source: NASA space programs. Confidential. 1 p. Eisenhower Library, Whitman File, NSC Records.

conducted under Defense auspices, [illegible in the original] that meeting that the President requested NASA to present to the Council a report (a) on the outer space programs now being conducted under the auspices of NASA, and (b) on the level of effort the United States should devote to non-military outer space activities in the future.

(CALL ON: DR. [illegible in the original])

The second part of the first item is a presentation by Dr. Kistiakowsky of a report by the Science Advisory Committee on "Man in Space."

(CALL ON: DR. KISTIAKOWSKY)

283. Memorandum of Discussion at the 470th NSC Meeting¹

Washington, December 20, 1960

SUBJECT

Discussion at the 470th Meeting of the National Security Council, December 20, 1960

Present at the 470th meeting were The President of the United States, Presiding; the Secretary of State, the Secretary of Defense; and the Director, Office of Civil and Defense Administration. Also present were Mr. Fred C. Scribner, Jr., for the Secretary of the Treasury; the Director, Bureau of the Budget; the Director, National Science Foundation (Item 1); the Administrator, National Aeronautics and Space Administration (Item 1); the Special Assistant to the President for Science and Technology (Item 1); the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Acting Director, U.S. Information Agency; the Special Assistants to the President for National Security Affairs and for Security Operations Coordination; the White House Staff Secretary; the Deputy Director, OCDM; Mr. Gerard C. Smith and Mr. J. Graham Parsons, Assistant Secretaries of State; the Deputy Administrator, NASA (Item 1); the Associate Administrator, NASA (Item 1); Mr. Franklyn W. Phillips, NASA (Item 1); Mr. Herbert York and Mr. Haydn Williams, Department of Defense; Mr. Douglas R. Lord, Office of the Special Assistant to the President for Science and Technology (Item 1); Mr. Huntington Sheldon, Central Intelligence Agency (Item 1); the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

¹ Source: Agenda item 1: Outer Space Programs Under the Auspices of NASA. Top Secret; Eyes Only. Extracts—7 pp. Eisenhower Library, Whitman File, NSC Records. Drafted on December 21.

1. *OUTER SPACE PROGRAMS UNDER THE AUSPICES OF NASA*
(NSC Action No. 2328)

Mr. Gray introduced Dr. Glennan's presentation on the subject. (A copy of Mr. Gray's briefing note is filed in the minutes of the meeting, and another is attached to this memorandum.

Dr. Glennan said the NASA presentation would fall into two parts: (1) a long-range identification of NASA objectives, which he would discuss; and (2) a more detailed examination of the NASA program now under way or planned for FY 1962, which Dr. Dryden would discuss.

Dr. Glennan began his part of the presentation by noting that a year ago NASA had developed its first long-range plan establishing space objectives for eight to ten years in the future. NASA had just completed a revision of this first long-range plan. Dr. Glennan believed the revised plan, as well as its funding, was more realistic than the first plan. He also noted that the funds required for space activities tended to increase rather than diminish.

Dr. Glennan then displayed a chart indicating that in 1960 NASA had accomplished first launchings of a meteorological satellite, a passive reflector communications satellite, a SCOUT vehicle, a THOR-DELTA vehicle, and an AGENA-B vehicle. A suborbital flight of an astronaut had failed. In addition, a scientific satellite (PIONEER 5) had been launched into a sub orbit to demonstrate long-distance communications.

Dr. Glennan displayed a large chart showing the major target dates for NASA missions from 1961 through 1970. This chart indicated that in 1961 such missions as the following would be attempted: the suborbital flight of an astronaut, an ATLAS-CENTAUR firing, the firing of the first stage of SATURN, and so on. The program would continue with an impact landing of instruments on the moon and a test of the planetary space craft in 1962; the firing of the second and third stages of SATURN and a soft instrument landing on the moon in 1963; the orbiting of an astronomical observer, a MARS-VENUS probe, and the qualification of the C-2 SATURN engine in 1964; the qualification of a very large rocket engine and the testing of a prototype of the main space capsule beyond MERCURY in 1965; the flight test of a nuclear rocket and the landing of mobile instruments on the moon in 1966 or 1967; the sending of a space craft in orbit around another planet in 1968 to 1970; and a man landing on the moon after 1970.

Dr. Glennan said that NASA anticipated 25 to 30 major space flights per year, ranging from JUNO-2, ATLAS-ABLE and THOR-DELTA to NOVA in 1968.

Dr. Glennan then turned to present and projected NASA budgets. He displayed a chart indicating that expenditures for most purposes would continue to rise, on the assumption that projected programs

would continue. He noted that the NASA long-range-plan provided for making decisions at certain specified dates—for example, 1963 would be the time to decide whether to proceed with the expensive NOVA concept. Dr. Glennan said that NASA has now been in business 27 months, and was just beginning to carry out its own program. Up to the present time, most of the program had been inherited from the Military Services. At the end of FY 1959, NASA had had just over 9000 employees; at the end of FY 1961, it had 18,900. Dr. Glennan said that less than 2000 NASA employees were net additions to the Federal payroll; the remainder came to NASA as transfers from the Military Services.

Dr. Dryden then presented the NASA obligational authority as follows: FY 1959, \$338.9 million; FY 1960, \$523.6 million; FY 1961, \$915.0 million; and FY 1952, \$1,159.2 million. Dr. Dryden then displayed a chart breaking the research and development item in the FY 1962 NASA budget into 10 main and 14 subheadings. He then discussed NASA's immediate flight schedule, and commented in greater detail on the MERCURY program. He said that in 1961 two MERCURY flights per month would be made until August. Other flights would be made to check after body heating on the capsule of the type which recently blew up, to carry a chimpanzee into space, to test maximum dynamic pressure, to check re-entry just below satellite speed, and to check the ground system. After that, the first manned flight would be made in a MERCURY vehicle, with a REDSTONE vehicle providing the propulsion. Continued manned flights would follow until in July of 1962 a manned orbital flight would be attempted for the first time. The FY 1966 budget provided \$74 million for the MERCURY man-in-space program.

Dr. Dryden noted that the SATURN program would require \$7 billion over nine years. Major decisions would be necessary before attempting a landing on the moon. Somewhere around the period of 1964 to 1966, the United States would have to decide (1) whether to spend large sums of money to put a man on the moon, and (2) if a manned landing on the moon were to be attempted, what vehicle should be developed for the purpose? Dr. Dryden pointed out that a nuclear rocket having less weight than chemical rockets had been considered, and that there were also possibilities for rendezvous and electronic propulsion systems.

At the conclusion of the presentation, Mr. Gray asked if the members of the Council had any questions. The President said he had a thousand questions. Laymen could understand the curiosity of scientists, but perhaps could not as readily understand the haste with which scientists sought to satisfy their curiosity. In the space field there appeared to be no practical test of the immediate usefulness of a program. The President wondered how to segregate those elements of the program which would be useful from those elements which would not be so useful. He said he did not care whether the man landed on the moon soft or hard. He was

anxious to do whatever was necessary for security, but wished to avoid the development of a SPUTNIK complex. He felt we must be concerned with developing a gauge with which to measure the value of space programs. He noted that the cost of space programs was still rising when Dr. Glennan's chart ended in 1970. He was not prepared to say that he would support a program of \$2.4 billion for space activities in 1970.

Dr. Glennan said he did not disagree fundamentally with the President's views. However, in developing a long-range plan he assumed that programs already started would continue. He had been careful to point out that at various specific dates in the future decisions should be made as to the continuance of various programs. This year had been one point of decision. He had already decided not to embark on a full-scale man-in-space program beyond MERCURY. Dr. Glennan also pointed out that a substantial portion of the funds going into the development of vehicles would result in the ability to launch satellites or to engage in manned space flight.

The President recalled that two years ago \$1 billion was spoken of as the upper limit of the space program. Now it appears that the \$1 billion ceiling will be breached in 1962. The President said he was reluctant to spend sums of this magnitude on space activities. He had no hesitation in supporting vast programs for the security of the country, or programs designed to acquire specific scientific information, or programs which were necessary for psychological reasons; but he believed the \$1.9 billion which he had seen on the chart should be cut back.

Mr. Gray then called on Dr. Kistiakowsky to present a report by a panel of the Science Advisory Committee on "Man in Space". Dr. Kistiakowsky said he wanted to estimate the cost of landing a man on the moon. He assured the Council that what he had to say was very unpleasant, particularly to Mr. Stans' ears. Dr. Kistiakowsky said that to land a man on the moon after 1970, we needed to develop a rocket bigger than the SATURN rocket. A panel of the Science Advisory Committee, consisting of industry men as well as long-haired scientists, had concluded that the man-in-space program cannot now be justified on scientific grounds, but can only be justified on the basis of an emotional urge for exploration such as the urge which motivated Columbus. The President said that, like Isabella, we were hocking our jewels for this purpose. Dr. Kistiakowsky, continuing, said that the man-in-space program could also be justified on the political ground of prestige. He noted that no money could be saved by eliminating instrumented flights and going directly to manned flights because development of the instruments was an essential prerequisite of man's flight into space. After this introduction, Dr. Kistiakowsky displayed charts showing that the total cost, 1961-1975, would be \$3 billion for SATURN, and from \$25.5 to \$53 billion for NOVA. The composite expenditures for SATURN and NOVA, 1961-1975, would be from \$33.5

billion to \$46 billion. Dr. Kistiakowsky concluded by saying he would not attempt to estimate the cost of landing a man on Mars, but he knew it would be several times as great as the cost of a moon landing.

Mr. Scribner asked about the cost of landing a man on the moon versus the cost of bringing him back to earth again. Dr. Kistiakowsky replied that a man could be landed on the moon without a return trip for the cost of SATURN—that is, \$8 to \$9 billion.

Dr. Waterman said he wished to endorse Dr. Kistiakowsky's statements about the general attitude of scientists toward the man-in-space program. He believed scientific observation was important, but thought there was no need to send a man into space if scientific observation could be made by means of instruments alone.

The President raised the question of the rate at which space activities were developing. He said the SPUTNIK complex impelled us to do everything yesterday. He noted that the first time a man was lost in an attempted space flight we would be compelled to start over again and spend twice as much. He agreed with the remarks of Dr. Waterman. He had to think about the country as a whole, the economy, and the other demands on the budget. He believed it might be necessary to establish an annual budgetary ceiling for space activities. Dr. Dryden said the total cost of space activities would not be reduced by spreading the program over a longer period of years. The President agreed, but pointed out that not as great a sum would have to be spent in any one year.

Secretary Gates wondered why it would not be desirable to spend more money on getting scientists to work in laboratories and less on hardware. He believed our space programs, as well as our defense programs, might advance more rapidly if more time was spent thinking and working on the drawing boards instead of building hardware which might not function when it was completed. Dr. Kistiakowsky pointed out that there was a human urge to build a prototype soon after it had been conceived.

Mr. Stans said the NASA budget was the most difficult one on which he had worked, except for the Defense budget. The Bureau of the Budget had worked very closely with Dr. Glennan, and was convinced that the figures presented by Dr. Glennan were about as low as any that could be achieved short of the cancellation of major programs such as SATURN. The figures in the NASA budget were in effect the result of program decisions made some time ago. The President noted that NASA had over 18,000 employees. He wondered whether money couldn't be saved if the number of employees could be reduced to say, 15,000. Dr. Dryden said the really large expenditures in the NASA program would not be reduced by reducing the payroll. The President said he was concerned about the pace of accomplishment. He wondered why a particular flight had to be

made in 1963 instead of in 1965. He felt that our scientific knowledge of space depended on the gradual accumulation of data.

Dr. Kistiakowsky felt that to a large extent the objectives of the space program must be charged to the cold war. The Soviets had succeeded by propaganda in instilling the idea that achievements in space were an accurate over-all measure of a country's scientific and technological potential. Perhaps it was necessary to re-educate people here and abroad to the fact that there are other measures of scientific achievement besides space activities. After such re-education, the space program could be slowed down without adverse political effects. The President believed that he could use \$1 billion to better advantage on some other aspect of the cold war. Secretary Gates thought the cold war argument had been refuted. The President added that \$500 million more spent on our information services might have more effect than the same amount spent on space. Dr. Waterman said that if space exploration could be internationalized the competitive aspects of the space race would disappear.

Secretary Herter noted that at the Tehran and Istanbul meetings last year we had made a presentation to our allies on our space programs. Our allies had been very encouraged by this presentation because up to that time they had been concerned with propaganda about the Soviet achievements. Secretary Herter asked whether the Soviets had not already tried and failed to put a man in space. Mr. Dulles said the Soviets may have made such an attempt.

Mr. Gray said he had the impression that Drs. Glennan and Waterman and Kistiakowsky all took a dim view of the man-in-space program. He had not heretofore realized that this was the feeling of scientists. The President said he was ready to say that he saw no scientific or psychological reason for carrying the man-in-space program beyond the MERCURY program. He thought the idea of a man on the moon was sheer Buck Rogers fiction. Dr. Glennan said his most difficult job was keeping the space program on a sensible basis. He believed that as solid scientific achievements were recorded from earlier space programs, the urge for putting man in space would disappear. The President said we were facing a difficult fiscal problem because our rate of expenditure was increasing faster than our economic growth.

The National Security Council:

a. Noted and discussed a presentation on the subject by the Administrator and Deputy Administrator, National Aeronautics and Space Administration, based primarily on the first annual revision of the NASA long-range plan.

b. Noted and discussed a presentation by the Special Assistant to the President for Science and Technology of a report by a panel of the Science Advisory Committee on "Man in Space".

c. Agreed that further testing and experimentation will be necessary to establish whether there are any valid scientific reasons for extending manned space flight beyond the MERCURY program.

NOTE: The action in *c* above, as approved by the President, subsequently transmitted to the Administrator, NASA.

[Omitted here are pages 7–15.]

Marion W. Boggs

284. Memorandum of Discussion at the 472d NSC Meeting¹

Washington, December 29, 1960

SUBJECT

Discussion at the 472nd Meeting of the National Security Council, Thursday, December 29, 1960

Present at the 472nd NSC Meeting were the President of the United States, presiding; the Acting Secretary of State (Merchant); the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present at the Meeting and participating in the Council actions below were Mr. Julian Paired for the Secretary of the Treasury; the Director, Bureau of the Budget; and the Attorney General (Items 1 and 2). Also attending the Meeting were the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Chairman, Interdepartmental Committee on Internal Security (Items 1 and 2); Mr. Alan H. Belmont for the Chairman, Interdepartmental Intelligence Conference (Items 1 and 2); the Assistant to the President; the Special Assistants to the President for National Security Affairs and for Security Operations Coordination; the Naval Aide to the President (Items 1 and 2); Assistant Secretary of State Gerard C. Smith; Mr. Haydn Williams, Department of Defense; Mr. Huntington Sheldon, Central Intelligence Agency; the White House Staff Secretary; the Assistant White House Staff Secretary; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the Meeting and the main points taken.

¹ Source: Agenda item 1: Attack warning channels and procedures for civilians; Agenda item 4: Evacuation and protection of U.S. citizens in danger areas abroad. Top Secret. Extracts—9 pp. Eisenhower Library, Whitman File, NSC Records.

1. *ATTACK WARNING CHANNELS AND PROCEDURES FOR CIVILIANS*

(NSC 5513/1; NSC Action No. 1565; Memos for NSC, same subject, dated February 20, 1957, December 3, 1959, December 14 and 28, 1960)

Mr. Gray introduced this subject to the Council. (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another is attached to this Memorandum). In the course of his briefing, Mr. Gray called upon Captain Aurand, Chairman of the Special NSC Committee on Attack Warning Channels and Procedures, to summarize briefly the changes which the Committee proposes, with particular attention to revisions considered to be of a policy nature.

Captain Aurand referred to the chart now contained in NSC 5513/1 and to the proposed new chart as circulated to the Council on December 14. He said the Committee proposed two changes in attack warning channels and procedures which involved policy considerations. The first change involved the use of the CINCONAD DEFCONs as triggers for action, replacing strategic warnings, defense emergencies, and air defense readiness. The DEFCON system was a new system established by the Department of Defense and the Joint Chiefs of Staff as a uniform alert mechanism. In the process of adapting the old chart to the DEFCON system, the Committee had noted the DEFCON-3 called by Secretary Gates from Paris last spring. Some of the actions taken by the military as a result of the DEFCON came to the attention of the public and the press and a certain amount of public confusion resulted. The Committee believed that steps should be taken to prevent public confusion or panic when a DEFCON is declared.

The President asked what was meant by the term DEFCON. Captain Aurand replied that DEFCON stood for "defense readiness condition". DEFCON-1 and DEFCON-2 (the most serious DEFCONs) cannot be declared without public knowledge. The DEFCON-3 called from Paris last spring resulted in an excess amount of telephoning in some cities such as Denver with the result that the switchboards were jammed. Captain Aurand then turned to the second policy recommendation by the Committee, namely, a recommendation that the President delegate authority to the Secretary of Defense and the Director, OCDM jointly to make public announcements when DEFCONs are declared in order to avoid public speculation and confusion. DEFCONs would be declared with such speed that the matter would not come to the attention of the President before announcements were made locally.

Mr. Gray said the Planning Board had generally concurred in the recommendations of the Special Committee as summarized by Captain Aurand. However, the Chairman of the Planning Board (Mr.

Gray) did not fully agree with these recommendations. He believed that there should be a clear delegation of authority to make only local, not national, announcements upon the declaration of a DEFCON. He feared that panic might be stimulated by a public announcement made at any level of government lower than that of the President. The President asked what kind of an announcement would be made. Captain Aurand replied that the local OCDM Director would state that the Air Defense Command had declared a state of readiness, that people should continue their normal conduct, that telephones should not be used excessively, and that the public should listen for further announcements on the radio. There would be no reference in the local announcement to the reason for declaring a DEFCON; any such statement of reasons would be reserved for the national announcement by the President. Announcements of this kind would apply to the declaration of DEFCONs 1 and 2 and conditionally as indicated in the chart to the declaration of DEFCON-3.

The President wondered how the Secretary of Defense and the Director, OCDM could coordinate with each other more rapidly than they could consult the President. Captain Aurand said that identical situations would obtain in many DEFCONs so that the proposed public announcements could be planned and “packaged” in advance. Captain Aurand added that there was a conditional [*text not declassified*]. The President asked how the Secretary of Defense and the Director, OCDM would consult regarding the public announcements. Mr. Gray said he presumed the two officials would consult in advance. The President wondered how authority could be given to local officials to make an announcement of the kind contemplated.

Secretary Gates felt that a public announcement would have to be made at the national level quite frequently when DEFCONs were declared. He expected that a DEFCON-3 would be declared every month or so as a drill and he hoped there would not be a public announcement on each such occasion. Captain Aurand said no public announcement would be made in the case of drills. Governor Hoegh added that no public announcement would be made on DEFCON-3 unless the public had already obtained information concerning the alert; and then the announcement would be for the purpose of putting the activity into a lower key. Mr. Hoegh recalled that in the case of last spring’s DEFCON-3, OCDM had announced in Denver that the activity was a test exercise. The President wondered why it could not be announced in most cases that a test exercise was underway. Governor Hoegh thought such an announcement would still require advance coordination. The President thought some of the difficulties in this field would be avoided if we could announce that a drill was

underway. Secretary Gates believed inquiries would still be directed to the Pentagon. Captain Aurand pointed out that the DEFCON-3 called last spring was not a drill. The President said that the DEFCON was really a drill. Captain Aurand said it was not called a drill. Mr. Gray pointed out that the chart proposed by the Special Committee was designed for the actual situation, not for a drill. The President believed there should be some way of calling an alert without frightening everyone.

General Lemnitzer thought that DEFCONs should be called regularly. The appropriate commanders should be informed that these DEFCONs are drills and if the public becomes aware of the DEFCONs, it should be announced publicly that drills are underway. The President agreed that if drills were called frequently, the public would become accustomed to them. Governor Hoegh pointed out that DEFCONs-1 and 2 probably indicated that strategic warning had been received. He felt a great deal of weight should be given to warning under conditions of nuclear war. When DEFCON-1 was called, the people should be warned so that they can help prepare themselves for attack. Secretary Gates said that under DEFCON-1 conditions, all planes would take to the air and the President would make a public announcement. Mr. Gray pointed out that the chart proposed by the Special Committee did not require Presidential participation. The President said the chart did not require Presidential participation but, nevertheless, he said such participation would be desirable.

Mr. Gray then called on Governor Hoegh to indicate the significant non-military actions which would be taken by OCDM in DEFCON situations. Governor Hoegh said that DEFCONs-5, -4 and -3 primarily required only staff action. Under DEFCON-2 OCDM would verify conditions with its Regional Directors, notify the heads of agencies, advise on public information releases, notify the governors, brief the staff, update recommendations regarding the relocation site, recall key officials from leave, inform and notify the White House of the OCDM readiness status. Under DEFCON-1 OCDM would issue a public announcement urging that readiness measures be taken, would recall all officials from leave, would order 50 percent of the pre-designated emergency personnel to occupy the relocation site, would call up the Executive Reserve, would assure the immediate availability of Presidential Action Documents, and would initiate twenty-four hour operations at the relocation site.

The President said that there ought to be among the President's Action Documents a draft of the President's broadcast for use in DEFCON-1. When conditions became this serious, the President had a duty to inform the public right away. He felt a draft Presidential

announcement of about 150 words with some blanks left to be filled in at the last minute was a necessity. Governor Hoegh pointed out that that conditions varied a great deal from one DEFCON situation to another. The President said the thermonuclear bomb did not vary very much and was the bomb which made all these preparations necessary. He believed it was desirable to tell the people what to do. In response to a question from Governor Hoegh, the President said the draft broadcast should be kept secret and would be a part of the Presidential Emergency Documents.

Mr. Gray then pointed out that the Planning Board proposed to amend Footnote No. 3 of the chart to include CINCLANT as one of the commands which can declare DEFCONs outside the continental U.S. He went on to indicate that Dr. Kistiakowsky's representative on the Planning Board had raised the question whether warnings Yellow and Red would be transmitted directly to the White House from CINCONAD instead of being routed through the Joint War Room. The President said extra time was consumed by having additional people transmitting messages. General Lemnitzer said no delay resulted from routing the warning through the Joint War Room. Transmission of the message to the White House was only a matter of pushing the button which caused a prepared tape to be played. Secretary Gates, however, saw no objection to transmitting these warnings directly to the White House if this proved to be feasible. Mr. Gray said he would have this matter looked into.

Mr. Gray then pointed out that Dr. Kistiakowsky's representative in the Planning Board had felt that Warning Yellow as described in the proposed chart should be based on "warning indications" rather than on "intelligence" that hostile aircraft or missiles are suspected of being enroute to the U.S. Secretary Gates felt the word "intelligence" was correctly used in the chart proposed by the Committee.

The President said that every war started under unexpected conditions. Therefore, he wished to place a *caveat* on all delegations of Presidential authority, that the President should be consulted if feasible. Such consultation might require better communications, for example, a telephone line direct from the War Room to the White House. Mr. Gray said he would ask the Committee to examine this matter. The President said he had no serious quarrel with the procedures described in the chart but he believed if the President could be reached, he should be consulted. Secretary Gates pointed out that the President was on the command line. As soon as command conferences are set up, the President would be consulted. General Lemnitzer said the President could be in various places at various time. The important communication was the message from the War Room to the White House Communications Center, which knows where the President is at all times and is able to

get word to him. The President said it might be possible to get through to the President directly without going through intermediaries 80 per cent of the time. Captain Aurand said a direct message to the President would save only two to three seconds. The President said it was not worth initiating some special procedure in order to save that amount of time. General Goodpaster said that any report of such significance as to warrant bringing it to the attention of the President was given to the President without awaiting evaluation and would be accompanied by a statement that it had not been evaluated. The President agreed that any information of great significance coming to the attention of the War Room must be passed on to the President. Mr. Dulles said there was a regular procedure for giving the President important information through intelligence channels. The President said that any warning of any great significance on BMEWS would automatically cause a warning to be flashed on the White House board. He was referring not to the responsibilities of individuals but to an automatic mechanism.

In response to a question from Captain Aurand, Mr. Gray said that the Special Committee would be asked to review the chart in the light of the discussion, including an insertion of language indicating that the announcements called for would be local announcements.

Mr. Stans said January 20 or January 21, from the enemy point of view, would be an ideal date for an attack on the U.S. The President said he had asked representatives of the new Administration to get in touch with Captain Aurand and General Goodpaster. Mr. Stans said he was concerned about civil defense activities since no successor to Governor Hoegh had been designated. The President said he shared the concern expressed by Mr. Stans. For instance, he might have to issue sudden orders to the fleet in view of the explosive situation in Laos. However, he had been unable to get the incoming Administration to realize the importance of this area of activity. General Persons said he was urging Mr. Clifford to have the new Administration put officials in touch with officials of the present Administration in these key fields.

The National Security Council:

a. Discussed the enclosures to the reference memorandum of December 14, 1960; in the light of an oral presentation by the Chairman, NSC Special Committee on Attack Warning Channels and Procedures for Civilians, and of the views of the Joint Chiefs of Staff (transmitted by the reference memorandum of December 28, 1960).

b. Noted the President's view that, in the event of receipt of information which might require the declaration of DEFCON 1, 2, 3 or 4, the President should be immediately advised and consulted if at all feasible, to include specific comment as to whether the information has been evaluated. The President also suggested that consideration be given to preparing in advance a draft of a possible Presidential

announcement in the event of a declaration of DEFCON 1. In addition, the President stated that tests of action to be taken under DEFCON 3, 4 or 5 should be clearly identified as routine drills or exercises to the responsible commanders or officials and, when necessary, to the public.

c. Requested the NSC Special Committee on Attack Warning Channels and Procedures for Civilians to revise the chart enclosed with the reference memorandum of December 14, 1960, in the light of the discussion at this meeting, and submit it for consideration by the Council by Memorandum Action.

NOTE: The action in *b* above, as approved by the President, subsequently transmitted to the Secretary of Defense and the Director, OCDM.

The actions in *b* and *c* above, as approved by the President, subsequently transmitted to the Chairman, NSC Special Committee, for appropriate implementation.

[Omitted here are pages 7–10.]

4. EVACUATION AND PROTECTION OF U.S. CITIZENS IN DANGER AREAS ABROAD

(NSC 106/3; NSC Action No. 2259–*b*–(1); Memo for NSC from Acting Executive Secretary, same subject, dated August 8, 1960; Executive Order 10893, dated November 8, 1960; Memo for NSC from Executive Secretary, same subject, dated November 29, 1960; NSC 6019; Memo for NSC from Executive Secretary, same subject, dated December 15, 1960)

Mr. Gray presented NSC 6019 to the Council. (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another is attached to this Memorandum).

In the course of his briefing, Mr. Gray referred to the three changes in the agreed Planning Board paper proposed by the Joint Chiefs of Staff and called upon General Lemnitzer.

General Lemnitzer said one suggestion offered by the Joint Chiefs of Staff was designed to meet the problem that was always arising in planning, i.e., how to divide military forces between the missions of (1) evacuation and (2) military action. In his view the commander in the field was the only one who could properly decide how to divide his forces to meet competing requirements. Mr. Merchant said the first change proposed by the JCS was acceptable to the State Department.

General Lemnitzer, turning to the second JCS proposal, said he believed the word "coordinating" was preferable to the phrase "acting under the general supervision of the Ambassador." The President said that, in his view, the Department of State should approve the policy of evacuating U.S. citizens from danger areas but from that point on evacuation operations were almost entirely a military matter. It would be wrong to designate the Ambassador as the official in charge

of operations which were approaching a condition of hostilities. Mr. Merchant said that the interim guidance on this subject approved by the President on August 25 contained the phrase "acting under the general supervision of the Ambassador." However, Mr. Merchant believed that the military operation should not be conducted under the general supervision of the Ambassador but that the evacuation operation should be under the Ambassador's supervision. The President believed one difficulty lay in deciding where supervision begins and ends. He had frequently insisted that the Chief of Mission must be the principal U.S. authority in a foreign country. The question was, at what point does our chief diplomatic official cease to have overall authority and responsibility. Of one thing he was sure, namely, that we would need both a good Ambassador and a good military commander in the event evacuation operations were necessary. General Lemnitzer said the JCS were not raising any question as to the overall authority of the Ambassador but they did question the extent to which he should become involved in military operations. The President, with an assist from Mr. Merchant, then proposed the language in Paragraph 5-c-(1) of NSC 6019 which appears in the action below.

The National Security Council:

a. Discussed the draft statement of policy on the subject contained in NSC 6019; in the light of the views of the Joint Chiefs of Staff thereon, transmitted by the reference memorandum of December 15, 1960.

b. Adopted the statement of policy in NSC 6019, subject to the following amendments:

(1) *Pages 5 and 6, subparagraph 5-c-(1):* Add at the end of the first sentence the clause "who will respond to the extent which they consider militarily feasible"; and revise the second sentence to read as follows: "Responsibility for the conduct of such evacuation operations by military forces rests wholly with the military commander, acting in coordination with, and under evacuation policies established by, the principal U.S. diplomatic or consular representative."

(2) *Page 6, paragraph 6:* Revise the first line to read as follows: "6. In implementing this policy, the".

NOTE: NSC 6019, as amended by the action in *b* above, subsequently approved by the President; circulated as NSC 6019/1 for implementation by all appropriate Executive departments and agencies of the U.S. Government under the coordination of the Secretaries of State and Defense.

285. Memorandum From Acting Secretary of State Merchant to the NSC Executive Secretary¹

Washington, December 30, 1960

SUBJECT

Protection Against BW and CW Attack

REFERENCE

Memo for NSC from Executive Secretary, same subject, dated December 15, 1960

As requested, I am indicating below my action with respect to the draft NSC Action on the subject:

Concur: _____✓_____

Do not concur: _____

Comments:

Livingston T. Merchant
Acting Secretary of State

Enclosure

Memorandum From Dorse to Merchant

Washington, December 28, 1960

SUBJECT

Protection against BW and CW Attack

In a memorandum dated October 17, 1960, the Chairman of the Interdepartmental Committee on Internal Security (ICIS), on which State is represented, reported to the NSC that a review of the status of certain biological warfare (BW) and chemical warfare (CW) defense programs under the general cognizance of OCDM showed a deficiency in BW defense programs. The ICIS considers these deficiencies, which involve measures for rapid detection and identification of BW agents, to be a serious internal security shortcoming. The ICIS previously had suggested that OCDM request necessary funds for additional research on which to base development of procedures for rapid detection and

¹Source: Concurrence with draft NSC action on protection against BW and CW attack; includes a memorandum to Merchant recommending a Department of State position. Confidential. 6 pp. NARA, RG 59, S/P–NSC Files: Lot 62 D 1, NSC 5802 and 6022 Series.

identification of BW agents. However, the Director of OCDM had indicated his belief that current research programs of the Department of Defense and the Department of Health, Education and Welfare are related to the problem and concluded that it would be difficult to justify a special request by OCDM for funds for the purpose recommended by ICIS.

It is understood that Defense is not optimistic that its research and development in this field will prove successful and believes there is need for additional research and development. HEW feels that current research will contribute little to a solution of the over-all problem. ICIS, therefore, has urged expansion of research in the BW field to eliminate present shortcomings and feels that OCDM is the appropriate agency for funding such additional research.

The NSC Planning Board recently considered the ICIS memorandum on this subject and requested the President's Special Assistant for Science and Technology to convene a special interdepartmental group to discuss technical questions relating to the problems of BW detection and identification. The group concluded that (a) there are specific research areas in this field which warrant exploration from a scientific point of view; (b) research programs of HEW and Defense will eventually accomplish results necessary for the attainment of departmental missions in this field; and (c) increased efforts in support of the ICIS concern for an early solution to the problem would require either expansion of current research or additional research.

Accordingly, the Planning Board has prepared the attached draft NSC record of action concurring in the ICIS view that research in the field of BW detection and identification is important from the viewpoint of national security and directing the heads of all executive departments and agencies concerned to consider, in collaboration with OCDM, further actions that might be undertaken.

RECOMMENDATION:

That you concur in the draft NSC record of action by initialing the voting slip (Tab A) in the appropriate place.

CONCURRENCE:

S/P—Mr. Furnas

Attachment

Note From Perkins to Ryder

Washington, December 19, 1960

SGA – Mr. Ryder

NSC Vote Slip Action: Protection Against BW and CW Attack

Attached is a copy of a memorandum of December 15 for the NSC from its Executive Secretary enclosing as suggested NSC action on the above subject, together with a copy of a vote slip for action by the Secretary.

You are requested to have prepared a memorandum to the Acting Secretary recommending whether or not he should concur in the adoption of the proposed action by initialing the vote slip accordingly. The original of the vote slip will be retained in S/S and attached to the SCA memorandum when it is received.

The memorandum should be cleared by S/P–Mr. Furnas and should be received in S/S by December 28 (we believe that the Secretary will not be in the Department on that date).

NSC 6027

Washington, December 30, 1960

NOTE BY THE EXECUTIVE SECRETARY
to the
NATIONAL SECURITY COUNCIL
on
CHANNELS FOR TRANSMISSION OF WARNING OF ATTACK

REFERENCES

- A. NSC 116
- B. NSC Action No. 2215-c

The NSC Planning Board on December 6, 1960, reviewed NSC 116, pursuant to NSC Action No. 2215-c, and agreed that revisions of an editorial nature only were required to bring this policy up to date.

Accordingly, the enclosed statement of policy on the subject, incorporating the editorial revisions agreed upon by the Planning Board, is transmitted herewith as NSC 6027 in accordance with NSC Action No. 2215-c, which provides that where NSC policy papers do not require "revision except of a purely editorial nature, the NSC Planning Board should make a written report to that effect to the Council as a matter of record."

In approving paragraphs 4 and 5 of NSC 116 on September 19, 1951, the President directed their implementation by all appropriate Executive departments and agencies of the U.S. Government, as indicated therein. These instructions by the President continue to be applicable to the enclosure.

NSC 6027 supersedes NSC 116.

Enclosure

Statement of Policy

CHANNELS FOR TRANSMISSION OF WARNING OF ATTACK²

1. The Standing Group, in considering the provision of warning of imminent attack, has concluded that there is a clear requirement for certain defined national responsibilities and established secure channels for the transmission of warning of attack.

2. The Standing Group has suggested that the following responsibilities should be recognized by the signatory Powers of the North Atlantic Treaty, and should be included in orders to the Major Commands of the North Atlantic Treaty Organization (NATO):

a. The discoverer of credible information indicating definite preparations for, or movement in initiation of attack against any element of NATO is responsible that the substance of such information be transmitted immediately through the duly established channels for the information of the Major Commands of NATO and the Standing Group.

b. Each Power and each Major Command of NATO is responsible for preventing the transmission in its name of unofficial and/or unvaluated warning of attack. To this end, it should advise the Standing Group and the Major Commands of NATO as to the agencies who are authorized to transmit warning messages.

c. Only in extreme emergency, in which the element of time would prohibit normal complete processing through internal channels, should there be recourse to releasing the information at some lower level.

3. The Standing Group suggested the following channels for transmission of urgent intelligence as being currently appropriate and adequate:

a. From the designated agency of the country or command first receiving AND EVALUATING the information, to the Standing Group via the duly established channels (see subparagraph 2-*b* above) with information copies to the NATO Major Commands.

b. In cases of extreme urgency, when the element of time is vital, any internationally identifiable agency (for example, ambassadors and commanders in chief, as opposed to those specifically designated) should inform the Standing Group by the quickest means available, with copies to Major Commands of NATO.

² This paper was originally a memorandum for the Secretary of Defense from the Joint Chiefs of Staff, dated August 14, 1951. It was concurred in by the National Security Council on September 18, 1951 (NSC Action No. 558) and paragraphs 4 and 5 were approved by the President on September 19, 1951. Pursuant to NSC Action No. 2215-c, the NSC Planning Board editorially revised the paper, to bring it up to date, by amending paragraph 4 and deleting paragraph 6 of the 1951 paper. [Footnote is in the original.]

4. In implementation of subparagraph 3–*a* above, it is considered that advantage should be taken of existing agencies and action channels. At present, intelligence is furnished to the Watch Committee of the United States Intelligence Board by the Department of State, the Central Intelligence Agency, the Military Services, the Federal Bureau of Investigation, and the Atomic Energy Commission. This intelligence is quickly evaluated by the Watch Committee and its conclusions immediately given to the United States Intelligence Board which, in turn, through the Director of Central Intelligence, advises the National Security Council. The personnel and functions of these agencies (Watch Committee, United States Intelligence Board and National Security Council) are so inter-related and organized as to provide for the most expeditious handling of and making recommendations to the President on matters concerning information on the imminence of attack. It may be noted that the Watch Committee is composed of representatives from all agencies dealing with the evaluation of intelligence, with their superiors constituting the United States Intelligence Board, whose superiors in turn are either members of or attend the meetings of the National Security Council. The Chairman of the Joint Chiefs of Staff, who normally attends these meetings, ensures that the U.S. Representative to the Standing Group is kept informed. It is therefore considered that in order to provide both political and military consideration, the President, on the advice of the National Security Council, should authorize the transmittal of warning of attack messages to the Standing Group and Major Commands of NATO. It is further considered that, in view of the communications channels available to them, the Joint Chiefs of Staff should be the U.S. agency to transmit warning of attack messages. In case actual hostilities have commenced, or the Joint Chiefs of Staff consider hostilities too imminent that time is of vital importance, the Joint Chiefs of Staff should be authorized to transmit to NATO such warning of attack messages simultaneously with transmission to the President, the members of the National Security Council and the Director of Central Intelligence.

5. It is considered that, in cases of extreme urgency, when the element of time is vital (reference subparagraph 3–*b* above), information available to the United States of the imminence or actual commencement of hostilities will reach the Standing Group and the Major Commands of NATO through already established intelligence procedures and channels which are internationally identifiable.

**Report Prepared by the Special Assistant to
the President for Disarmament**

Washington, December 27, 1957

REVISION OF U.S. POLICY ON DISARMAMENT

I. GENERAL CONSIDERATIONS

Need for Review of U.S. Disarmament Position

1. Present basic policy states that the United States should "actively seek an international system for the regulation and reduction of armed forces and armaments". (NSC Action No. 1419, June 30, 1955; NSC 5707/8, June 3, 1957)

2. It is clear that the major developments since the last U.S. comprehensive review of detailed positions on disarmament require an essential revision of such detailed positions in order to form a reasonable foundation for actively seeking a sound and safeguarded agreement with the USSR on disarmament.

3. The U.S. net evaluation studies conducted by the General Thomas Committee; the Security Resources Panel Report (Gaither Group); and the U.S. joint intelligence estimates; all point to the high degree of devastation which would result from a modern general war and thus confirm the soundness of the basic U.S. policy to actively seek a sound safeguarded agreement.

4. One feature of the August 29th Western proposals² widely criticized at the recent United Nations General Assembly sessions by Free World nations as well as by the Soviet Bloc countries, has been the "inseparability clause". This clause is contained in Section XI of the August 29th proposals. It states: "This working paper is offered for negotiation on the understanding that its provisions are inseparable."

5. The U.S. Ambassador in Moscow recently has reported: "I continue to believe that the Soviets genuinely seek a first step agreement on disarmament and believe it is this they have chiefly in mind in pressing for high-level talks" (November 23, 1957). However, he considers that the Soviets from their standpoint regard the August 29th proposals as so heavily weighted in the West's favor that the United States should not realistically expect the Soviet Union to accept them, nor should the United States consider the Soviet rejection of them to be a fair test of whether or not the Soviet is genuinely seeking an agreement. (Cable of Ambassador Thompson, September 3, 1957)

6. [text not declassified]

7. The only feasible way to ascertain whether or not the Soviet Union will enter into an inspected and safeguarded agreement which is reasonable and which would be mutually desirable because of a resultant reduction in the dangers of war, is to make an offer of such an agreement.

8. Making such an offer is also the only reliable manner in which the cohesion and support of the peoples of the free nations and of the uncommitted states can be maintained by the United States. This cohesion and support of the peoples of the free nations is vital to the security of the United States.

Separate Test Suspension

9. The United States has consistently held to the position that inspection is necessary for each step in each provision of any disarmament agreement. Thus when the Soviet Union proposed the suspension of nuclear testing, the United States insisted upon the requirement of inspection. In the informal bilateral discussions, carried on with full knowledge of the other Western partners at London, the Soviet Union on June 7, 1957, agreed to inspection stations inside the USSR to monitor the suspension of nuclear testing.

10. The United States has also consistently maintained that a first step should be carefully measured and should guard against a disadvantageous result in the event of violation by the Soviet Union. Thus the United States insisted that a first agreement for test suspension should be of limited duration so that laboratories could be maintained

² See Annex D hereto. [Footnote is in the original.]

in the event of a breach of the agreement. The Soviet Union finally responded in the informal bilateral discussions conducted in London with a counter-proposal of an initial period of two or three years of nuclear test suspension.

11. Leading U.S. atomic scientists state that they could hold their laboratories and scientists together for a two-year period if it was explained as being in the national interest, and they could during this period conduct highly desirable nuclear research without conducting test explosions.

12. [*text not declassified*]

13. At the UN General Assembly session on November 19, 1957, the key vote in the test suspension issue was taken on an Indian resolution which provided for an inspected suspension of tests of nuclear and thermonuclear weapons. The vote was 24 in favor, 34 against, and 20 abstentions. The make-up of this 34 voting with the United States was 27 nations in the NATO and Latin America groups, plus Australia, Nationalist China, Pakistan, Spain, the Philippines, Israel, and New Zealand. New Zealand with its new Government has since changed its position and now favors a test suspension. Six Latin American countries did not follow the U.S. lead—but even more significant was the fact that 24 Asian-African countries did not support the United States. As indicated above, no African countries supported the United States on this vote, and only 4 Asian countries (Nationalist China, the Philippines, Pakistan, and Israel).

14. It is widely recognized that Asia and Africa are principal competitive battlegrounds and may probably swing the decisive weight between the Soviet Bloc and the Free World. The two leaders of two most influential Asian nations—India and Japan—have repeatedly and strongly spoken out in favor of a separate test suspension. Nehru, on December 10, 1957, said: “I feel that suspension of atomic explosives is a valid first step (in disarmament). It is a dramatic step. It would not change the power of any country but would give it a tremendous lead. It would come as a tremendous relief to hundreds of millions all over the world.”

15. The prompt negotiation of an inspected two-year test suspension, because of the time necessary to work out the inspection agreement and obtain Senate approval, could not at best be made effective as a ratified treaty prior to September 1, 1958, and therefore the next series of U.S. tests would be completed before the suspension became effective. [*text not declassified*]

16. A temporary suspension of nuclear weapons tests would bring into being a United Nations supervisory organization which could be the forerunner of an organization to regulate and control armaments and armed forces in the decades ahead.

17. A temporary suspension of nuclear tests would establish a climate conducive to sound successful negotiations on successive steps of armaments regulation and control.

18. A temporary nuclear test suspension would: (a) inhibit the development of more powerful new types of weapons at a time when the United States would have a relative superiority in nuclear weapons; (b) deter the spread of the production of nuclear weapons to other less responsible countries; (c) break the 12-year stalemate in the disarmament negotiations and establish a climate conducive to sound successful negotiations on further steps of armaments regulation and control; (d) carry with it an inspection system which would begin the opening up of the Soviet Union and other Communist areas to international regular observation and would assist in the evolution of the Soviet system toward a more liberal and peaceful form.

Inspection Zones

19. Another consideration resulting from the recent London and New York disarmament discussions is that there is reason to believe that the Soviet might separate out from its proposals and negotiate a reasonable European inspection zone. The USSR would prefer to have a de-nuclearized zone in Central Europe (Bulganin letter of December 10, 1957) but would also consider a European inspection zone as a first step.

20. The latest intelligence estimate on Soviet policies states that the Soviet leaders are "acutely concerned over the potential threat of a revived and nationalistic Germany backed by the United States." The USSR has tended to concentrate on such disarmament proposals as the ban on use of nuclear weapons, liquidation of foreign bases, and troop withdrawals in Europe. According to the intelligence estimate: "Their (Soviet) interest in inducing a U.S. troop withdrawal from Europe would probably lead them to go even further (than inspection for a test ban) in allowing mutual inspection in Europe." (NIE 11-4-57, November 12, 1957)

21. General Norstad has recommended to the NATO Council that it would "enhance the security" of NATO to establish a European inspection zone against surprise attack. Norstad said that the "minimum area" he had in mind was Germany, Poland, and Czechoslovakia.

22. The present Western position (August 29, 1957) states that provided there is agreement by the USSR to either a North America-Soviet Union zone or an Arctic Circle zone that the United States, with the concurrence of its allies, would agree to a European inspection zone including all of Europe to the Ural Mountains (60 degrees East longitude) and in the south to latitude 40 degrees North. If the Soviet reject this zone (which they have), the policy provides that under the same proviso as above a more limited zone of inspection in Europe would be "discussed", but only if a significant part of the Soviet Union, as well as the other countries of Eastern Europe, was included.

23. The Soviet has rejected the August 29th European zone proposals. However, they did evince interest in earlier informal U.S. suggestions based on a 5° E–30° E zone running from a line east of Paris to a line just west of Leningrad-Odessa. In response to this informal U.S. probing, the Soviet on April 30, 1957, responded with a proposal for a zone running from 0 degree (Greenwich) to 25° E (Lvov-Brest-Wilna).

24. The Soviet likewise has rejected the August 29th Arctic Zone and the North American-USSR zone. In response to informal earlier probing by the United States during the London talks, the Soviet on April 30th responded with the suggestion of an Eastern Siberia-Western United States zone running from 108° E to 90° W.

25. The Western European UN Subcommittee members (UK and France), in line with the May 25, 1957 Presidential decision³ that the European zone should be left to the initiative of Western European nations, did take the initiative in advancing in the NATO Council the concept of a 5°–35° European zone. The NATO Council then left to the Western UN Subcommittee members (U.S., UK, France, Canada) the manner in which this zone should be advanced. During the 4-Western Power meetings at the end of July with the Secretary heading the U.S. Delegation, it was decided not to advance 5°–35° European zone but to advance for “discussion” and only under conditions of complete inseparability a small but undefined European zone.

Outer-Space Objects

26. Particularly in view of the recently apparent Soviet strides in satellite-missile technology, it is in the U.S. interest now to make separable from the rest of the package and to agree to the August 29th proposal for the establishment of a technical committee to study the design of an inspection system which would assure the use of outer-space objects for peaceful purposes.

27. The Soviet during the London discussions did not react to the U.S. missile proposal except to indicate that their proposal to eliminate nuclear weapons included all “rockets”.

Armaments Regulation Organization

28. The setting up of an Armaments Regulation Organization under the aegis of the UN Security Council would be in the U.S. interest. Agreement on such an organization by itself would have certain value in breaking the atmosphere of stalemate and thereby improving the chances for agreement on subjects on which the two sides are not now far apart. Such an organization also could begin to make the

³ NSC Action No. 1722. [Footnote is in the original.]

control studies that would be basic to agreements on any additional steps of disarmament.

29. The Soviet have repeatedly indicated their support for some kind of international control organization under the UN Security Council.

Other August 29th Proposals

30. The remaining proposals in the August 29th paper are separable and can be practically implemented in successive steps if agreed upon.

II. POLICY OBJECTIVES

31. Actively to seek a safeguarded disarmament agreement, beginning with a partial agreement and subsequently extending the initial step or steps into a more comprehensive agreement. In negotiation of the foregoing, the United States should seek either individually or in combination measures which would:

a. Break the present deadlock, gain experience in inspection and regulation, and at the same time be careful not to impair the security of the United States in the event that further progress in developing wider disarmament agreements was not forthcoming.

b. Reduce the danger of great surprise attack and thereby give continuing vitality to the nuclear deterrent.

c. Inhibit the spread of nuclear weapons into the hands of "fourth countries".

d. Reduce the probability of weapons systems, particularly missile systems, from developing in a way as to increase the danger of major nuclear conflict being initiated either by accident or by actions of other than the responsible national officials, particularly with regard to the growing problem of dispersion of authority to take action which would initiate world war.

e. Enhance the political position of the United States with regard to its allies and the uncommitted nations.

f. Facilitate within the Soviet Union and the Communist bloc countries the rise of "non-Stalinist" elements and ultimately the evolution of the Soviet Bloc countries into more liberal and democratic societies, including the true independence of the satellite countries.

III. POLICY GUIDANCE

32. The United States, after consultation with the NATO states and other free countries as appropriate, should propose the following separable measures as a basis for an initial agreement:

a. (1) Immediately following ratification of the agreement, the installation of approximately eight to twelve test monitoring inspection stations with appropriate agreed scientific instruments, in the USSR, a like number in the United States, and suitable numbers of such stations in the Pacific Ocean areas, and at other necessary

locations, as agreed by competent scientists and as specified in the agreement. (See attached map, Annex A.) The inspectors to have the right to make prompt on-the-spot observations at any point indicated by their instruments as being a probable site of a nuclear test explosion in violation of the agreement.

(2) Subject to the satisfactory agreement on the inspection stations and on prompt installation of the inspection system, and further subject to the right to end the test suspension before expiration of the 24-month period upon notice of a violation of the agreement upon any important particular; a 24-month suspension of nuclear testing beginning on September 1, 1958, or as soon thereafter as the agreement is effective. This agreement would take effect as soon as ratified by the United States, the USSR, the UK, and any other state, such as Australia, whose territory might require inspection. This agreement would be open to adherence of additional states.

b. Establishment of an initial inspection zone against surprise attack in Western USSR and Central Europe. (See attached map, Annex B.) This zone would be from approximately 3° East longitude to 28° East longitude and from 45° North latitude to the Arctic Circle zone described in *c*.

c. Establishment of an inspection zone in Eastern Siberia, the Arctic, Northwestern United States, and Western Canada. (See attached map, Annex C.) This zone would include all of Siberia east of 108° East longitude and the additional Soviet Arctic Circle territory including the Murmansk area. The West would submit to inspection the Arctic Circle area of Norway, Greenland, Canada, and Alaska, and in addition a sufficient proportion of Northwestern United States and Western Canada so as to approximate the same number of square miles as the Soviet area and to include the same percentage of U.S. and USSR area.

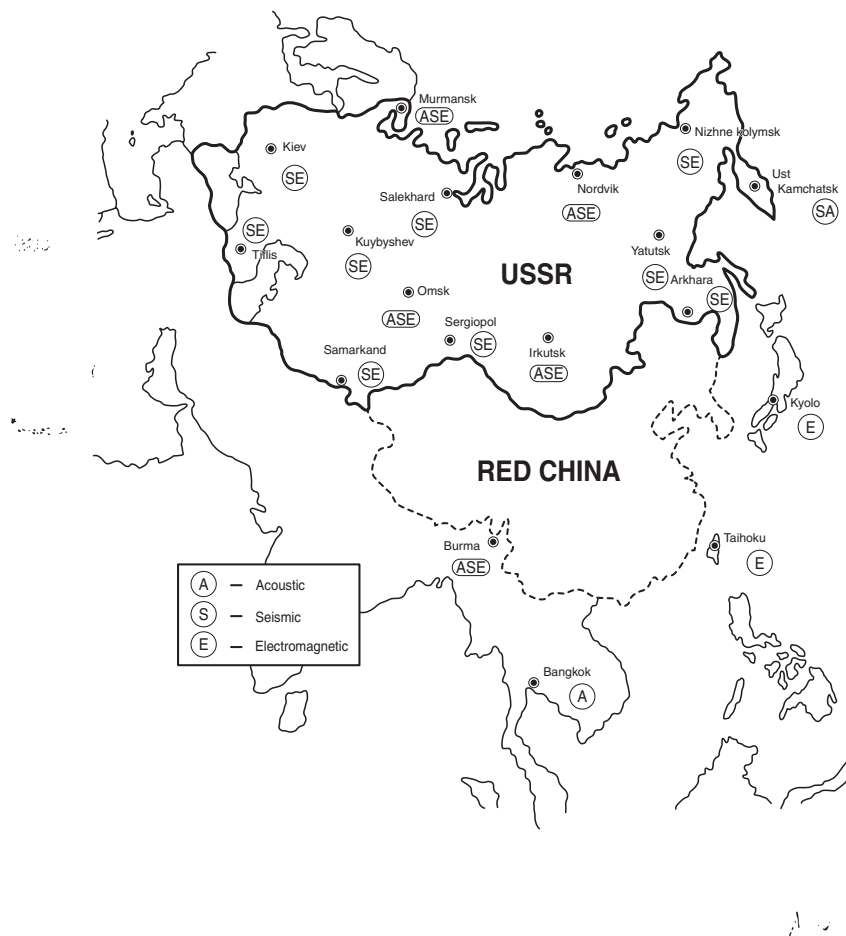

(NOTE: The zones referred to in paragraphs *b* and *c* would have aerial and limited ground inspection of the type proposed in the Four-Power proposal of August 29, 1957.)

d. The establishment of a technical committee to study the inspection requirements of a system to assure that outer-space objects would be used and maintained only for peaceful purposes. This committee would limit its study to the technical problems.

e. The establishment of an Armaments Regulation Organization under the aegis of the Security Council of the United Nations to supervise any of the foregoing measures that are agreed, as well as to prepare for the supervision of future additional agreed measures.

f. An undertaking by all signatory states to make an early and sustained effort, during the initial 24 months of the test suspension, to reach agreement upon, and begin to implement additional steps of, disarmament and arms control, including all of the other measures contained in the August 29, 1957, Western proposals.

Annex B

Annex C

Annex D

Working Paper

Washington, August 29, 1957

UNITED NATIONS DISARMAMENT COMMISSION

SUB-COMMITTEE OF THE DISARMAMENT COMMISSION CANADA, FRANCE, THE UNITED KINGDOM AND THE UNITED STATES OF AMERICA

Working Paper:

Proposals for Partial Measures of Disarmament

I. The Limitation and Reduction of Armed Forces and Armaments

A. Within one year from the entry into force of the convention, the following States will restrict or reduce their armed forces respectively to the maximum limits indicated below:

France	—	750,000
United Kingdom	—	750,000
Soviet Union	—	2,500,000
United States	—	2,500,000

The definition of the armed forces will be annexed to the convention.

B. During this same period, these States will place in storage depots, within their own territories, and under the supervision of an International Control Organization, specific quantities of designated types of armaments to be agreed upon and set forth in lists annexed to the convention.

C. The relation of other States to the convention, including the agreed levels of their armed forces, will be determined later.

D. The States listed in paragraph I–A will be prepared to negotiate on a further limitation of their armed forces and armaments upon condition that:

1. Compliance with the provisions of the convention has been verified to their satisfaction.

2. There has been progress toward the solution of political issues.

3. Other essential States have become parties to the convention and have accepted levels for their armed forces and armaments, fixed in relation to the limits set out in paragraphs A and B above.

E. Upon the conditions cited above, negotiations could be undertaken by France, the Soviet Union, the United Kingdom and the United States on a further limitation of their armed forces which would involve agreed reductions for the United States and the Soviet Union to not less

than 2.1 million men each. The agreed level of forces for France and the United Kingdom, corresponding to this figure, would be 700,000 men each. The levels of other essential States would be specified at the same time through negotiation with them.

F. Thereafter, and subject to the same conditions, negotiations could be undertaken on further limitations to not less than 1.7 million men each for the United States and the Soviet Union. The agreed level corresponding to this figure for France and the United Kingdom would be 650,000 men each. The levels of other essential States would be specified at the same time through negotiation with them.

G. Upon the conditions cited in D above, these States will also be prepared to negotiate on further limitations of armaments. The calculation of any such armament limitations will be in agreed relation to the armed forces determined in paragraphs E and F above and will be completed prior to the application of the further limitations in armed forces. The parties must be satisfied before such further limitations of armaments are undertaken and at all times thereafter that the armaments at the disposal of any party to the convention do not exceed the quantities thus allowed in each category.

H. No measures for the reduction and limitation of armed forces and armaments beyond those provided for in paragraph A and B above will be put into effect until the system of control is appropriately expanded and is able to verify such measures.

II. Military Expenditure

In order to assist in verifying compliance with the provisions of paragraph I, and looking forward to the reduction of military expenditures, France, the Soviet Union, the United Kingdom and the United States agree to make available to the International Control Organization information about their military budgets and expenditures for the year preceding entry of the convention into force and for each year thereafter. The categories of information to be supplied will be agreed in advance and annexed to the convention.

III. Nuclear Weapons

Each party assumes an obligation not to use nuclear weapons if an armed attack has not placed the party in a situation of individual or collective self-defense.

IV. The Control of Fissionable Material

A. The parties to the convention further undertake:

1. That all future production of fissionable materials will be used at home or abroad, under international supervision, exclusively for non-weapons purposes, including stockpiling, beginning one month after

the International Board of Control described in paragraph VIII has certified that the installation of an effective inspection system to verify the commitment has been completed.

2. That they will co-operate in the prompt installation and in the maintenance of such an inspection system.

3. That for the purpose of accomplishing the above undertakings, the five Governments represented on the Sub-Committee will appoint a group of technical experts to meet as soon as possible to design the required inspection system, and to submit a progress report for their approval within the first ten months after the entry into force of the convention.

B. The parties which are producers of fissionable material for weapons purposes at the time of cessation of production for weapons purposes undertake to provide, under international supervision, for equitable transfers, in successive increments, of fissionable materials from previous production to non-weapons purposes, at home or abroad, including stockpiling; and, in this connexion

1. To fix the specific ratios of quantities of fissionable materials of comparable analysis to be transferred by each of them, and

2. To commence such transfers at agreed dates and in agreed quantities at the fixed ratios following the cut-off date for production of fissionable materials for weapons purposes.

C. From the date of the cessation of production of fissionable material for weapons purposes provided in paragraph IV–A–1:

1. Each party undertakes not to transfer out of its control any nuclear weapons, or to accept transfer to it of such weapons, except where, under arrangements between transferor and transferee, their use will be in conformity with paragraph III.

2. Each party undertakes not otherwise to transfer out of its control any fissionable material or to accept transfer to it of such material, except for non-weapons purposes.

V. Nuclear Weapons Testing

A. All parties to the convention undertake to refrain from conducting nuclear test explosions for a period of twelve months from the date of entry into force of the convention, provided that agreement has been reached on the installation and maintenance of the necessary controls, including inspection posts with scientific instruments, located within the territories of the Soviet Union, the United Kingdom, the United States, the area of the Pacific Ocean and at such other places as may be necessary, with the consent of the Governments concerned.

B. A group of technical experts appointed by the five Governments represented on the Sub-Committee will meet as soon as possible to design the inspection system to verify the suspension of testing.

C. Upon termination of the twelve months period, the parties will be free to conduct tests unless they have agreed to continue the suspension for a further period under effective international inspection.

D. If the inspection system referred to in paragraph V-A is operating to the satisfaction of each party concerned and if progress satisfactory to each party concerned is being achieved in the preparation of an inspection system for the cessation of the production of fissionable material for weapons purposes agreed to under paragraph IV-A-1 above, all parties to the convention undertake to refrain from conducting nuclear test explosions for a further period of twelve months. Such an extension will be made only with the understanding that testing may at the discretion of each party be conducted twenty-four months after the entry into force of the convention if the inspection system for the cessation of production for weapons purposes has not been installed to the satisfaction of each party concerned before the end of the twenty-four months and if the cessation of production for weapons purposes has not been put into effect.

E. If tests are resumed, each party undertakes to announce and register in advance the dates of each series and the range of total energy to be released therein; to provide for limited observation of them; and to limit the amount of radioactive material to be released into the atmosphere.

VI. *The Control of Objects Entering Outer Space*

All parties to the convention agree that within three months after the entry into effect of the convention they will co-operate in the establishment of a technical committee to study the design of an inspection system which would make it possible to assure that the sending of objects through outer space will be exclusively for peaceful and scientific purposes.

VII. *Safeguards Against the Possibility of Surprise Attack*

A. From the entry into force of the convention the parties concerned will co-operate in the establishment and maintenance of systems of inspection to safeguard against the possibility of surprise attack.

B. The establishment of such systems will be subject to agreement on the details of its installation, maintenance and operation. It is proposed as a matter of urgency that a working group of experts appointed by the five Governments represented on the Sub-Committee be set up at once to examine the technical problems and to report their conclusions which could form the basis for an annex to the agreement.

C. With regard to inspection in the Western Hemisphere and in the Soviet Union, the Governments of Canada, France, the United Kingdom and the United States propose the following:

1. That all the territory of the continental United States, all Alaska including the Aleutian Islands, all the territory of Canada and all the territory of the Soviet Union will be open to inspection.

2. If the Government of the Soviet Union rejects this broad proposal, to which is related the proposal for inspection in Europe, referred to in paragraph D below, the Governments of Canada, France, the United Kingdom, and the United States (with the consent of the Governments of Denmark and Norway) propose that:

All the territory north of the Arctic Circle of the Soviet Union, Canada, the United States (Alaska), Denmark (Greenland), and Norway; all the territory of Canada, the United States and the Soviet Union west of 140 degrees West longitude, east of 160 degrees East longitude and north of 50 degrees North latitude; all the remainder of Alaska; all the remainder of the Kamchatka peninsula; and all of the Aleutian and Kurile Islands will be open to inspection.

D. With regard to inspection in Europe, provided there is commitment on the part of the Soviet Union to one of the two foregoing proposals, the Governments of Canada, France, the United Kingdom and the United States, with the concurrence in principle of their European allies and in continuing consultation with them, subject to the indispensable consent of the countries concerned and to any mutually agreed exceptions, propose that an area including all of Europe, bounded in the south by latitude 40 degrees North and in the west by 10 degrees West longitude and in the east by 60 degrees East longitude will be open to inspection.

E. If the Government of the Soviet Union rejects this broad proposal, then, under the same proviso expressed above, a more limited zone of inspection in Europe could be discussed but only on the understanding that this would include a significant part of the territory of the Soviet Union, as well as the other countries of Eastern Europe.

F. The system of inspection to guard against surprise attack will include in all cases aerial inspection, with ground observation posts at principal ports, railway junctions, main highways, and important airfields, etc., as agreed. There would also, as agreed, be mobile ground teams with specifically defined authority.

G. Ground posts may be established by agreement at points in the territories of the States concerned without being restricted to the limits of the zones described in paragraphs C–1 and –2, but the areas open to ground inspection will not be less than the areas of aerial inspection. The mobility of ground inspection would be specifically defined in the agreement with in all cases the concurrence of the countries directly concerned. There would also be all necessary means of communication.

H. Within three months of the entry into force of the convention, the parties will provide to the Board of Control inventories of their

fixed military installations, and numbers and locations of their military forces and designated armaments, including the means of delivering nuclear weapons located within an agreed inspection zone or zones, and within such additional area or areas as may be agreed.

I. Any initial system of inspection designed to safeguard against the possibility of surprise attack may be extended by agreement of all concerned to the end that ultimately the system will deal with the danger of surprise attack from anywhere.

VIII. *The International Control Organization*

A. All the obligations contained in the convention will be conditional upon the continued operation of an effective international control and inspection system to verify compliance with its terms by all parties.

B. All the control and inspection services described in the convention and those which may be created in the course of its implementation will be within the framework of an International Control Organization established under the aegis of the Security Council, which will include, as its executive organ, a Board of Control in which the affirmative vote of the representatives of the Governments represented on the Subcommittee and of such other parties as may be agreed will be required for important decisions.

C. All parties to the convention undertake to make available information freely and currently to the Board of Control to assist it in verifying compliance with the obligations of the convention and in categories which will be set forth in an annex to it.

D. The functions of the International Control Organization will be expanded by agreement between the parties concerned as the measures provided for in the convention are progressively applied.

E. Other matters relating to the Organization will be defined in annexes to the convention. These matters will include the duties which the Organization is to carry out, the method by which it shall function, its composition, its relationship to the General Assembly and the Security Council of the United Nations, its voting procedures, its working conditions, jurisdiction, immunities, and prerogatives.

IX. *Movement of Armaments*

In addition to other rights and responsibilities, the Board of Control will have authority to study a system for regulating the export and import of designated armaments.

X. *Suspension of the Convention*

A. Each party will have the right to suspend its obligations, partially or completely, by written notice to the International Control

Organization, in the event of an important violation by another party, or other action by any state which so prejudices the security of the notifying party as to require partial or complete suspension.

B. At its option a party may give advance notice of intention to suspend its obligations, in order to afford opportunity for correction of the violations or prejudicial action.

XI. This working paper is offered for negotiation on the understanding that its provisions are inseparable. Failure to fulfill any of the provisions of the convention would create a situation calling for examination at the request of any party.

288. Memorandum of Conversation Between Stassen and John Foster Dulles¹

Washington, January 2, 1958, 3 p.m.

Governor Stassen said he hoped I would be in a position to support his recommendations coming up at the NSC. I said I was very skeptical as to the recommendations. I said I felt that they would involve a practical abandonment of our proposals dealing with the substance of the matter, i.e., the cut-off of fissionable material for weapons purposes, the supervision against surprise attack, and the use of outer space for peaceful purposes only.

Governor Stassen argued that he felt on the contrary that if we started with suspension of nuclear testing and supervision of such suspension that would make it more likely rather than less likely that we would gain our further objectives.

We discussed the problem of opening up the Four Power Proposals as approved by NATO and the danger that by opening up one point everything else would become unbuttoned. Governor Stassen felt there was no such danger.

Governor Stassen contended broadly speaking that the Four Power Proposals were very heavily weighted against Russia and that they should be moderated in Russia's favor. I asked in what respect he felt they were so weighted and he said it was largely because of the zones for inspection that we had urged. I pointed out that we had

¹Source: Four-power disarmament proposal. Secret. 1 p. Eisenhower Library, Dulles Papers, General Memoranda of Conversation.

agreed to discuss other zones in Europe if the Soviets wanted, and that they had not responded.

Governor Stassen also referred to the 55–45 formula. I agreed that this was probably somewhat weighted in our favour but that in these matters it was necessary to have some ground to give in negotiation and that I did not feel that our position as a negotiating position was unfair and certainly the Russians did not expect it to be our final position.

Enclosure**Memorandum From Twining to McElroy**

Washington, December 31, 1957

SUBJECT

U.S. Policy on Control of Armaments (U)

1. The Joint Chiefs of Staff have reviewed Mr. Stassen's latest disarmament proposal, which is to be submitted for preliminary consideration by the National Security Council on 6 January 1958. They feel that from a military point of view, and also from a political viewpoint, the position they have taken on the Four Power Joint Proposals of 29 August 1957 is still sound. However, they are aware that the political climate has changed to some extent since the submission of those proposals. The best evidence of this change lies in the feelings expressed by several countries at the last meeting of the Heads of Government in Paris that we must continue, especially with our NATO neighbors, to attempt to reach an understanding with the Soviet Union on disarmament, and must not evince an intransigent position.

2. The Joint Chiefs of Staff understand that the most recent disarmament proposal is an effort on the part of Mr. Stassen to meet these aims, and to advance a U.S. position which will lead to the reopening of fruitful discussions on disarmament with the USSR. However, there are three points in the proposal which the Joint Chiefs of Staff believe to be dangerous to the United States.

a. The major change that Mr. Stassen has made to the Four Power Joint Proposals of 29 August 1957 is the abandonment of the provision for inseparability of the individual items of the proposals. From a security viewpoint, there has been no improvement in the international situation since 29 August 1957 to warrant such a critical departure from the joint western position rejected by the Soviets. On the contrary, the apparent advances in Soviet missile technology disclosed since that date, coupled with the boastful and belligerent attitude of the Soviet Union with respect to these events, have aggravated the international situation. In addition, the Soviets have withdrawn from the present UN Disarmament Commission. The inseparability provision of the 29 August Proposals made these proposals barely acceptable to the United States in meeting the minimum requirements for the security of the United States and the other NATO powers. Abandoning this essential provision would present the Soviets with the opportunity of accepting only those proposals compatible with their national interests—for example, the suspension of nuclear testing—to the detriment of the U.S. and NATO interests.

b. The former provision for the control of fissionable material, both for peaceful and weapon purposes, which goes to the heart of the disarmament problem, is no longer a prerequisite. It has been included only for discussion and possible agreement at some future date. It has

not been high-lighted, as it should be, and could be lost entirely in any future negotiations with the Soviets. It is this provision which would assist significantly in diminishing the threat of nuclear warfare. The cessation of nuclear testing, *per se*, need not contribute at all to the effective control of nuclear weapons. This fact was recently emphasized in the Eisenhower cablegram to Nehru, dated 15 December 1957, in which President Eisenhower said, "... however, I do not believe that we can accept a proposal to stop nuclear experiments as an isolated step, unaccompanied by any assurance that measures—which would go to the heart of the problem—would follow."

c. The new inspection zones proposed by Mr. Stassen are weighted heavily in favor of the Soviet Union. The Western USSR-Central Europe zone includes the great majority of NATO installations and troop disposition while it covers only the East European satellites and a small portion of western USSR. The second zone proposed in Eastern Siberia, the Arctic, Northwestern United States, and Western Canada includes a sizable portion of the United States with many important military and industrial installations in exchange for a negligible coverage of comparable Soviet territory and military installations. The Joint Chiefs of Staff do not object to the establishment of inspection zones in the general areas mentioned, but they take serious exception to the inequality in military and industrial significance of the zones proposed by Mr. Stassen.

3. In view of the foregoing, the Joint Chiefs of Staff, while recognizing the desirability of maintaining a reasonable position in the eyes of the world, recommend:

a. Against the adoption of Mr. Stassen's proposal.

b. Adherence to the basic principles of the Four Power Proposals of 29 August 1957, while maintaining flexibility in stating our positions.

For the Joint Chiefs of Staff:

N.F. Twining

Chairman

Joint Chiefs of Staff

290. Letter From Stassen to Eisenhower¹

Washington, February 14, 1958

Dear Mr. President:

On March 19, 1955 you requested that I make the studies and submit the recommendations for the policies of the United States in the

¹ Source: Letter of resignation. No classification marking. 1 p. Eisenhower Library, Whitman File, Administration Series, Stassen, Harold E., 1957.

field of control and regulation of armaments, for consideration by you and by the National Security Council.

With the assistance of an able, experienced, and devoted group of men from without and within the government these studies have now been completed and a comprehensive set of recommendations have been made, some of which have already been adopted as the policy of the United States and the others of which are well understood within the Administration. It has been an honor, inspiration, and privilege to work with you in this task.

It is my highest hope and my fervent prayer that our endeavors in this assignment are confirmed in the years ahead as having made a contribution to a lasting peace with freedom and justice.

It is my belief that I may now make a larger contribution to your objective of a durable peace, which I share, by reentering the active political field in the Pennsylvania Governorship campaign and by discussing with the people of our country the issues and problems of the worldwide competition of ways of life and the tasks of building peace and safeguarding against war.

I write with deep appreciation and commendation for your life time of service to our country, with an especial heartfelt thanks for your leadership as President these five years, and with best wishes for the years ahead.

Sincerely,

Harold E. Stassen

Special Assistant to the President

**291. Record of Telephone Conversation Between John Foster
Dulles and Sherman Adams¹**

February 19, 1958, 3:33 p.m.

The Sec said he had quite a talk with Gruenther re disarmament. The Sec suggested the handling of it should be under the control of State through some regular fellow but that we should have an outside panel of advisers or consultants to guide us. G thought that was a good way and he would be agreeable to serving on such a panel. The Sec thought

¹ Source: Advisory panel on disarmament. No classification marking. 1 p. Eisenhower Library, Dulles Papers, White House Telephone Conversations.

of Bedell Smith and he recommended Professor Wolfers of Yale. Does this commend itself to A? A said yes—he should think so. A said if you get a panel you might as well put it in the newspapers so you might as well get good names. Get whom you want. The Sec said this is largely scenery. It is a public relations job and you are never going to get anywhere with these..... A said to get some practical people who can sit around and talk about it. A asked what about CD? He does not want to help? The Sec indicated such was the case.

292. Record of Telephone Conversation Between John Foster Dulles and Lovett¹

February 20, 1958, 5:09 p.m.

The Sec said he wants L's help on disarmament. The Sec wants to set up a new way to carry on that will be better. It has to be part of State and L agreed. One trouble, said the Sec, with Stassen was he was only interested in disarmament. The Sec needs 2–3 people he can talk with in a general way as to the lines we are following. He wants an informal panel composed of 3—Gruenther, Smith and L—he can talk to them from time to time to get their counsel and advice. He does not think it will take more than a couple of hours a month. It would be an immense service to the Sec if he can do that. L said he has been in the hospital and is leaving to recuperate until April 7 but will be available after that. It is not a formal group but the Sec would like to have it known. The Sec feels the prospects of getting any substantial result are not very good unless and until there are some solutions to political problems. But it is vitally important to keep pressing in this field and it will be disastrous if it is felt we were not interested. L said it would be better if Congress and the papers shut up so trained diplomats can work it out. The Sec referred to the last letter to Bulganin—which L approved of heartily.

293. Memorandum of Conversation Between Eisenhower and John Foster Dulles¹

Washington, February 24, 1958, 3 p.m.

1. I showed the President the proposed statement with reference to organizing the disarmament work. He said he would like to get Jack McCloy on the panel also. I said that I would ask him to serve.

2. I referred to the request of Ambassador Menshikov to see the President and pointed out the embarrassment that would result if ambassadors adopted the habit generally of trying to see the President directly on the affairs of their governments. The President wholly agreed. He suggested that we should tell the Soviet Ambassador that he could, of course, see me at once, but that due to the President's engagements it would not be possible for the Ambassador to see him until toward the end of the week and then I would, of course, be present.

3. We discussed the "Summit" meeting and Macmillan's letter. I said I would attempt to draft a reply which would point out the desirability of having our agenda and positions and participations agreed with our NATO Allies before we started to negotiate with the Soviets and much more so before we attempt to fix a date. The President felt that this was the right line to take.

I showed the President Roscoe Drummond's article on "Summit" talks from the *Herald-Tribune* of February 23.

4. I also showed the President the quotation from the speech of Defense Minister Malinowski criticizing the United States and Britain for delaying the opening of a Second Front.

5. The President referred to a report he had received that Soviet submarines had been sighted off the Atlantic Coast. He said that Admiral Burke was coming to see him about that. The President also expressed his strong reluctance at our Soviet overflights.

I mentioned the Soviet complaint about our "buzzing" Soviet trawlers off the Banks.

6. The President referred to Macmillan's suggestion of participating both in the Citadel and De Pauw events and suggested that it would be best if Macmillan merely came for the De Pauw meeting and then came to Washington the following day, Monday, June 9.

7. We discussed the list of prospective official visits during the latter part of the year. The President said that he was favorable to setting up a meeting for Garcia, but did not think favorably of King Idris,

¹ Source: Disarmament panel; summit meeting; Menshikov meeting; Soviet submarines off U.S. east coast; official visits; Macmillan's visit; youth exchanges with the Soviet Union. Secret. 2 pp. Eisenhower Library, Dulles Papers, Meetings with the President.

President Chiang or Prime Minister Sihanouk. He suggested we should defer on these latter three. In this connection, I showed the President Mr. Herter's memorandum to me of February 20, attached.

8. The President spoke again of his interest in making a proposal for bringing over a large number of Soviet young people to study here, and at our Government's expense. I said we were having this staffed as there were many technical problems involved.

JFD

294. Press Release¹

Washington, February 27, 1958

The Secretary of State has, with the approval of the President, designated Ambassador James J. Wadsworth to act, under the Secretary's direction, as United States representative in future negotiations for an agreement on the limitation of armament. He will also participate in the preparation of positions which the United States will support in disarmament negotiations. Ambassador Wadsworth will, at least for the time being, retain his position as Deputy Representative of the United States to the United Nations.

In addition, the Secretary of State, with the approval of the President, has asked certain qualified private citizens to advise and consult with him informally, from time to time, on the broad policies which should govern the United States in seeking limitation of armament. Alfred M. Gruenther, Robert A. Lovett, John J. McCloy, and Walter Bedell Smith have accepted to serve in this way.

The United States continues to consider it urgent that an international agreement be sought and reached which will effectively limit armaments. The Government of the Soviet Union has since last August, refused to discuss the constructive proposals advanced by the United States, United Kingdom, France and Canada, or to participate in the work of the subcommittee of the United Nations Disarmament Commission. It has also announced that it would not participate in any proceedings of the Disarmament Commission as reconstituted by the recent session of the United Nations General Assembly. It has reacted negatively to the statement by the NATO Heads of Government that they would welcome a meeting at the Foreign Ministers' level to resolve the deadlock.

¹ Source: Wadsworth appointment as disarmament negotiator; advisory panel. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, White House Telephone Conversations.

The United States believes that limitation of armament is so imperative a goal that efforts to reach it should not be interrupted by such procedural obstacles as the Soviet Government has put in the path. We are striving, and will continue to strive, to overcome these procedural difficulties and to find a way to go forward to lift from the shoulders of mankind the dangerous and growing burden of vast and ever more destructive armaments.

**296. Tabs A–E to Memorandum From Farley to John Foster Dulles
(Print Document 142)¹**

Washington, March 18, 1958

Tab A**NUCLEAR TEST SUSPENSION***PROPOSED POLICY*

Nuclear tests to be suspended for a period of three years, beginning January 1, 1959, or as soon thereafter as agreement is reached on the nature and location of control posts to monitor the agreement. The agreement would be automatically extended for an indefinite period at the end of the three years if agreement has been reached on the installation of a control system to ensure that no further fissionable material is produced for weapons purposes.

If such agreement has not been reached, all states would be free to resume testing. The United States would, at the outset, declare its intention to resume nuclear weapons testing in these circumstances, but that all such testing would be conducted underground in order that no further radioactive material be put in the atmosphere.

DISCUSSION

August 29 proposals—A 24-month suspension of testing which would become indefinite when the cut-off is in effect is provided for. However, this measure is conditional upon signing of a treaty covering all other elements of the proposals.

Proposed position

Although a test suspension after the next Pacific series would appear to be in our interests, since it would establish inspection posts behind the Iron Curtain, since it would tend to preserve the further lead in weapons technology we expect to achieve at HARDTACK, and since it would inhibit development of Nth power nuclear weapons capabilities, this proposal should be cast in the terms set forth in the President's 1958 State of the Union Message: "that we will always go the extra mile with anyone on earth if it will bring us nearer a genuine peace."

This proposal would prevent our being faced, in one or two years, with a UN resolution recommending cessation of tests supported by a majority of the membership, an eventuality which seems almost

¹ Source: Nuclear test suspension; cut-off of fissionable material production; establishment of surprise attack zones; preliminary measures relating to missile controls and outer space; reduction of manpower and conventional armaments. Secret. 9 pp. NARA, RG 59, Central Files, 700.5611/3–1858.

inevitable if we continue on the present course. It would also deprive the Soviets of an issue which has been skillfully used by them as a diversionary one in disarmament negotiations, serving, in effect, as a “put up or shut up” proposition.

We do not believe, however, that we should completely abandon the linkage between test suspension and other disarmament measures. Accordingly, we propose making continuation of the test ban beyond three years conditional upon agreement on the cut-off. The advantage of retaining this linkage is that it would put additional pressure on the USSR to accept further disarmament measures, since we anticipate that our position, which would be in line with those expressed by Japan and by Yugoslavia, would gain worldwide support.

The statement that testing, if it is resumed, would take place only underground would help us meet the health hazard argument against testing, since underground testing (which has been proved technically feasible) would not put any further radioactive material into the atmosphere.

Probable reaction of our allies

UK—could be persuaded to support and will view with relief any moves which will make the cut-off less imminent. The U.K. has recently reminded us of our Bermuda agreement to consult with them on any proposed changes in testing policy.

France—would probably oppose privately, but may be persuaded to support rather than be the only testing power. Also possible, in view of the fact that suspension would not take effect until January 1, 1959, that France may have completed its first test by then.

Canada—would support strongly.

Provision should be made in any agreement on testing for continued experimentation with nuclear explosions for peaceful purposes under international auspices.

Tab B

CUT-OFF OF FISSIONABLE MATERIAL PRODUCTION

PROPOSED POLICY

A. Suspension of production of fissionable materials for use in nuclear weapons as soon as an effective inspection system is agreed and installed.

B. Agreement on schedule for transfer of materials from weapons to peaceful uses to go into effect simultaneously with A.

C. Immediate convening of a technical working group to design an inspection system capable of accomplishing this cut-off.

DISCUSSION

August 29 Proposals—Cessation of production of fissionable material for weapons purposes is a key element of this proposal, but implementation was conditional upon acceptance of all other elements.

Proposed position

We believe that suspension of fissionable materials production for weapons purposes would be in our interest as an independent measure. We recognize that there is little likelihood, however, of Soviet acceptance of this proposal in these terms. Accordingly, in Tab E, we set forth the conventional measures we would be willing to undertake if this proposal were accepted.

This proposal should be advanced in two alternative forms (or a combination thereof):

A. Fissionable materials production plants would continue to operate, subject to international inspection to insure that the material produced was used only for peaceful purposes; or

B. Plants now producing fissionable materials would be shut down, thereby drastically simplifying the inspection problem. In the latter case, peaceful uses requirements would be supplied from existing stocks or by dismantling weapons.

Transfers of fissionable materials from previous production to non-weapons purposes would be made in agreed equitable ratios.

Probable reaction of our allies

All except the U.K. would strongly support, and the latter would probably tie acceptance of this proposal to amendment of the Atomic Energy Act and agreement to exchange of weapons information and materials between the U.S.-U.K.

Tab C*ESTABLISHMENT OF SURPRISE ATTACK ZONES**PROPOSED POLICY*

The following measures might be undertaken simultaneously or separately:

(1) The broad U.S.-Canada-USSR zone set forth in the August 29 proposals would be reaffirmed.

(2) A European zone extending from 50–35° east, with the smaller central European zone proposed by General Norstadt (but expressed in terms of geographic coordinates) as a fallback position, with or without an arctic zone similar to that proposed on August 29.

(3) Ground control posts (a la Bulganin) be established on a reciprocal basis at agreed installations (both within the U.S. and USSR and at their foreign bases—e.g., naval and air) with or without the zones described above.

DISCUSSION

August 29 proposals—Provide for the wider aerial inspection zone and a European zone only if the wider or Arctic zones are accepted. Elements were inseparable part of the entire proposal.

Proposed position—We believe that establishment of surprise attack zones apart from any other arms control measures would be in our interest. However, in view of the past Soviet insistence that surprise attack zones be linked to such other measures, we have, in TAB E, indicated what conventional reductions we would be prepared to undertake should the Soviet Union be prepared to accept any of the three inspection proposals described above. If the European NATO members should be unwilling to have a European zone standing by itself, we should propose that it be conditional on Soviet acceptance of either of the other surprise attack inspection measures proposed above.

Probable reaction of our allies—Would probably support.

Tab D

PRELIMINARY MEASURES RELATING TO MISSILE CONTROLS AND OUTER SPACE

PROPOSED POLICY

The following measures may be undertaken simultaneously or separately:

(a) Immediate initiation of an international working group to plan an inspection system to insure that the sending of objects through outer space is for peaceful purposes only.

(b) Joint cooperation in selected outer space projects, such as the development of an outer space platform, an interplanetary rocket and reconnaissance satellites, looking forward to centralization of all outer space activity in an international organization when the program envisioned in (a) goes in to effect.

(c) Advance notification and, if possible, inspection of all vehicles, military or otherwise, entering outer space (or, as a fall-back, all objects to be launched into orbit).

DISCUSSION

August 29 Proposals—Provided only for a technical committee to study the design of an inspection system which would make it possible to assure that the sending of objects through outer space will be exclusively for peaceful and scientific purposes.

Proposed position

The proposal under (a) is a reaffirmation of our suggestion that outer space be used for peaceful purposes only. The decision whether a cessation of missiles production could be implemented separately or whether it should be tied to other elements of disarmament should be left for the future.

We cannot take a final position on a proposal either to ban the production, testing and deployment of intercontinental and intermediate

range missiles or to ban testing of missiles alone, until further technical study of the problem has been made within the U.S. Government. This study should be designed to answer the major question:

Is it possible to devise an effective inspection system to police an agreement banning production and/or deployment of strategic missiles, taking into account present and prospective U.S. and USSR progress in developing and testing operational missiles traversing outer space?

We believe that conclusions as to the military effect of a cut-off of testing could, if our studies are pressed with sufficient vigour, be completed in time to include proposals on the subject in this package before it is discussed with the Soviet Union or our allies. A ban on testing may well prove to be the only feasible and inspectable method of preventing development of operational ICBM capabilities. It may also be found that the problem of missiles must be treated as a whole and that the valid distinction among missiles systems must be based upon range and not upon whether a particular missile is "air-breathing" or ballistic and capable of travelling outside the earth's atmosphere.

Probable reaction of our allies

U.K.—reluctant to accept principle that missiles would be controlled apart from other disarmament measures, but could be persuaded to support proposal cast in above terms which does not prejudice separability pending completion of study. France, Canada and other allies would probably support.

Tab E

*REDUCTION OF MANPOWER AND CONVENTIONAL
ARMAMENTS*

PROPOSED POLICY

(a) Provided any two of the three surprise attack measures proposed in Tab C are accepted;

(1) Reduction of U.S. and Soviet armed forces to the level of 2.2 million men, and to corresponding levels for the U.K. and France;

(2) Placement of designated quantities and types of modern conventional arms capable of serving as nuclear delivery systems (submarines, missiles, aircraft, etc.) in international arms depots.

(b) If the nuclear cut-off and wider inspection zone (U.S.–USSR–Canada–Europe) are accepted:

(1) Reduction to 1.8 million men for the U.S. and USSR, and comparable levels for other states (with a listing of the overseas bases which the U.S. would give up as a consequence of such a reduction).

(2) Placement of such amounts of important conventional armaments in international arms depots that the armaments retained will have a general agreed relationship to the armed forces remaining.

DISCUSSION

August 29 proposal—Present policy provides for a first stage reduction to 2.5 million men, and sets a lower limit of 1.5 on force levels (1.7 in August 29 proposals) ceilings, but makes them conditional on prior political settlements.

Proposed position—The figure of 2.2 million in the first recommendation was selected because it represented the same relation to existing force levels (2.5 million men) that 2.5 million represented at the time it was agreed, i.e., a reduction of 300,000 men. This reduction would probably be accomplished by the United States within the next few years in any event. Current Soviet force levels are estimated as being somewhere around 3.8 million. The establishment of ground control posts in the U.S. and USSR and at their foreign bases plus the mobile ground and aerial inspection of central Europe should ensure that these Soviet forces were substantially reduced, with some concomitant decline in the Soviet capability for limited aggression.

With regard to the second recommendation: the nuclear cut-off would justify us in accepting the more extensive conventional reductions, while the reductions—which would be of sufficient size to affect our overseas posture—might induce the USSR to accept the cut-off. We could not accept the conventional reductions without the nuclear cut-off or either one without adequate inspection, which would involve aerial and mobile ground inspection of the countries concerned.

This proposal no longer attaches political conditions to a more substantial reduction in conventional forces. It is believed that the advantages for the U.S. of a nuclear cut-off and unlimited inspection of the U.S. and USSR against surprise attack warrant agreement to such a reduction, which could have significant advantages in itself.

This proposal would make clear to the USSR under precisely what conditions the U.S. would accept lower force levels and more far-reaching conventional arms cuts in a way that would receive full support by world public opinion.

Probable reaction of our allies

U.K., France and Canada—would probably support.

Germany—may consider the second part of the proposal too drastic without reunification as a pre-condition, but probably could be persuaded to accept, in view of fact that reunification would no doubt be pre-condition to any reductions below 1.8 million and in view of fact that Soviets would probably reject the second proposal.

297. Memorandum for Eisenhower From Cutler¹

Washington, March 21, 1958

In our talk last night relative to the importance to the United States of developing “clean” nuclear weapons, I omitted in my advocacy one very important reason:

The ability to set off “clean” nuclear detonations without contaminating nuclear radioactive fallout would have tremendous significance in the peaceful uses of atomic energy. By using greater explosive force than there has ever been known before, when free from contaminating radioactive fallout, land-locked waters can be channeled to desert areas, rock and earth obstructions to industrial and civil progress can be removed, mines can be more easily opened, oil can be freed from non-porous rock where it is now trapped, safe and deep-draught harbors can be developed, and large canals can be dug even through mountainous areas.

Robert Cutler
Special Assistant

¹ Source: Peaceful uses of “clean” nuclear weapons. Confidential. 1 p. Eisenhower Library, Whitman File, Administrative Series, Cutler, General Robert L., 1958 (3).

298. Record of Telephone Conversation Between Eisenhower and John Foster Dulles¹

March 23, 1958, 1:40 p.m.

TELEPHONE CALL TO THE PRESIDENT (IN AUGUSTA)

Sec said he would like to ask for quite a bit of the Pres’ time tomorrow afternoon. Sec said we have a briefing Cutler set up, but perhaps right after that. Sec said there were two things coming to a crisis. (1) There were considerable reports around with credibility that the Soviets after their present series of intensive tests are making a unilateral announcement of suspension of testing. Sec said he thought Pres should do something comparable e.g. announce that this series next summer will be the last during his Administration. Sec said this would only mean a couple

¹ Source: Possible announcement of nuclear testing; summit preparations. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, White House Telephone Conversations.

of years, you could not bind your successors, and would be dramatic. Sec said it should be announced tomorrow. Sec said he had seen Strauss yesterday and was seeing Strauss and Quarles this afternoon. Sec said if it was not done soon the Soviets would do it first and we would be aping them. Sec said it would be quite dramatic and would not cost much. Sec said McElroy if he was back from Cincinnati, or Quarles, Strauss, the Joint Chiefs and himself should talk to the Pres re this. (2) The Brit are pressing hard to do something on a Summit conference and are more or less prepared to concede in the preparatory talks a 5–5 basis. Sec said he was reluctant to do that. Sec asked Pres what he would think of the possibility of asking the NATO people to ask Macmillan to go to Moscow to explore the possibilities and report back. Sec said it might give Macmillan the prestige he needs; of course there was the risk that he is under great political pressures at home, personally he was the best of the lot. His talks might prove it was not worthwhile to have a Summit conference, although he might be reluctant to come to that conclusion.

Sec said he could not come much before 3 because he was giving a luncheon for Erhard, and then the briefing was at 3, but they could talk about these matters right after it. Sec said if Pres did decide to do this he should call Macmillan on the phone to tell him by 10 p.m. which would be 5 p.m. our time. Sec said he could not come in the morning as he was giving his major presentation on MSP before the Senate Foreign Relations Committee.

299. Memorandum of Conversation with the President¹

Washington, March 24, 1958

PRESENT

Secretary Dulles
General Twining, Chairman, JCS
Deputy Secretary of Defense Quarles
Mr. Allen W. Dulles
Admiral Strauss
General Cutler
General Goodpaster
Secretary McElroy

¹ Source: Proposal to suspend nuclear testing dropped; includes draft Presidential statement. Confidential; Personal and Private. 7 pp. Eisenhower Library, Dulles Papers, Meetings with the President.

We discussed my suggestion that the President, in connection with the opening of the present series of nuclear tests, might state that following this the United States did not intend to have further tests for a period of two years or substantially the duration of his Administration. I pointed out in this connection the estimate of the Intelligence community that Khrushchev might announce a voluntary suspension of testing within the next two or three days and that this would put us in an awkward position *vis-à-vis* world opinion. I pointed out that good world opinion was vital to our cause in the long run and over the broad aspects of the problem which involved more than winning a military war. I expounded the matter along the lines of the annexed draft, although I did not give the President a copy of this. Copies had, however, been given to Messrs. Strauss and Quarles. The proposal was strongly opposed by Strauss, Quarles and Twining and to some extent by McElroy.

The President raised the question as to whether the matter might be handled in a less formal way, indicating a more or less routine administrative announcement. However, there appeared to be difficulties also in that way, and in the end we let the proposal drop.

I was impressed particularly by a suggestion made by General Twining that our allies might feel that we have become frightened. I also felt that without adequate preparation Macmillan and Adenauer might perhaps be embarrassed and feel that we had played into the hands of their political enemies.

Admiral Strauss presented an alternative proposal in the form annexed. I expressed the opinion that this would not have much of a public relations aspect because it seemed to be a repetition of our whole "cut-off" theme. Also whereas it was within our own administrative discretion not to have another series of tests for two years or whatever time we determine we could not alter our agreed disarmament proposals as this would involve action without negotiation with our allies which would make it impossible for us to anticipate the possible Soviet action.

JFD

Attachment

Draft Presidential Statement

After reviewing and confirming plans for nuclear testing in the Pacific this summer, President Eisenhower announced today that he did not intend (for 2 years thereafter) to authorize any additional testing of nuclear weapons. The President believes that this policy is consistent with the security interests of the United States.

The President said that the Free World could take sober satisfaction in the contributions which the next test series will make to the defense

of the Free World and to the development of weapons with greatly reduced radioactive fall-out.

The President said that it has always been his policy only to authorize such nuclear tests as were indispensable to develop United States nuclear weapons systems for the defense of the Free World. With the completion of this summer's tests, very great and flexible nuclear deterrent strength will be available, and the President now sees no early need for further United States nuclear testing.

Research will continue in our laboratories, since there can be no certainty that the long impasse in disarmament negotiations will be ended and in view of the promising applications of nuclear explosions to peaceful uses. It is the President's understanding that if a resumption of U.S. testing is in the interest of the free world, much of any such testing could be conducted underground, so that no radiation would enter the atmosphere.

It is the President's hope that this public announcement of his intentions will improve opportunities for negotiation of an effective safeguarded international agreement to reduce the dangers of surprise attack and to control and reduce military force.

Extensive studies of radiation effects in the United States and other countries continue to support our position that testing adds but an insignificant amount to radiation from other sources and is not dangerous to humanity. The great peril to mankind arises not from nuclear tests but from the growing stockpiles of nuclear weapons and new means for their instant delivery through outer space. Safeguarded agreement to control this peril is a main objective of United States disarmament policy. In connection with such an agreement, the United States of course remains willing to enter into inspected international arrangements covering, among other things, the suspension of nuclear testing.

300. Draft Presidential Statement¹

Washington, March 24, 1958

The President of the United States today stated:

"As the American people well know, the danger to all the people everywhere as the result of a nuclear war has weighed upon my mind and my heart for many years.

¹ Source: Announces upcoming nuclear test at Eniwetok. Confidential. 4 pp. Eisenhower Library, Whitman File.

"These concerns caused me to propose the program of Atoms-for-Peace which has resulted in the establishment of the International Atomic Energy Agency. The endorsement of that proposal by the governments of 80 nations testifies to the universal desire for peace and to find a means to reduce, hopefully to eliminate, the terrible threat of atomic warfare.

"The Government of the United States has maintained that agreements to ban the use of atomic weapons are illusory because such agreements are unenforceable if war should occur. It is also obvious that a suspension of testing of atomic weapons would not mean that stockpiles of weapons of existing types would not continue to increase by continued manufacture. I have pointed out again and again that, with our basic international political issues and difficulties unresolved, it is the existence of atomic arsenals and their enlargement in the possession of three nations, and their inevitable acquisition by other nations, which forces the world to live on a knife-edge of uncertainty as to the maintenance of peace or an atomic holocaust.

"I now propose to the governments having atomic weapons and the means of increasing their numbers, a new approach to peace.

"Let us agree for a trial period of, say, two years to cease all production of the weapons materials. U-235 and plutonium, without which atomic weapons cannot be made. Let us cease to produce these materials for any purpose, military or peaceful. This suspension can be easily inspected since these plants are large, not numerous, and can be kept under U.N. surveillance simply by seeing to it that they are not operated.

"Let us during this period supply the growing demand for fissionable materials to meet the energy needs of a power-hungry world by using our nuclear materials that are in existence,—beginning to use the materials in our weapons stockpiles.

"During the two-year breathing period, let our negotiators seek safe means of resuming production under controlled methods which will foreclose the possibility that any of it will be converted to weapons use.

"Coincident with this more significant agreement a collateral agreement can easily be reached on such subordinate questions as a concurrent suspension of testing, or testing with limited fall-out or testing for peaceful uses only under U.N. supervision or some combination of these."

Attachment

Semi-Final Draft Presidential Statement

Washington, March 24, 1958

SEMI-FINAL DRAFT OF PROPOSED
PRESIDENTIAL STATEMENT

(To Be Released After Reading at Press Conference)

The United States will demonstrate to other nations the progress our scientists have achieved in reducing radioactive fallout from nuclear explosions.

To this end, we are inviting the United Nations to select fifteen qualified scientists to observe at the Eniwetok Proving Grounds in the Pacific this summer a large nuclear explosion better than 90% free of radioactive fallout. We will also invite a representative group of U.S. and foreign news media representatives.

The U.S. has made a long and determined effort to eliminate radioactive fallout from nuclear explosions, in the belief that a breakthrough could be achieved toward basic advances in both the peaceful and military uses of nuclear energy.

Such advances by American scientists could have tremendous significance in the peaceful uses of atomic energy. When man is able to use the stupendous force of a greater radioactive free nuclear explosion, waters can be channeled to desert areas, mineral deposits can be more readily reached, safe and deep-draught harbors can be developed, and level highways and canals built through mountainous areas.

This scientific progress will also make it possible to limit the effect of nuclear weapons to strictly military targets, eliminating the fallout hazard to civilians outside the target area. We can all agree that an explosion of the magnitude which the observers will see at Eniwetok should be used only for peaceful purposes. However, until a safeguarded international agreement is reached to control and reduce nuclear weapons and other armaments, these scientific advances constitute forward steps toward protecting civilian non-combatants from the horrors of modern war.

The United States has always publicly announced its nuclear testing programs. Open shots for official observers and the press, including those from foreign countries, have been held. We hope that other nations will be willing to announce their nuclear tests, and, by opening significant tests to international observation, will reveal their nuclear progress to the peoples of the world.

(Details will be announced later by the responsible departments and agencies of our Government.)

301. Memorandum From Washburn (USIA) to Cutler¹

Washington, March 25, 1958

USIA feels very strongly that unless the President can state that the open shot at Eniwetok will be 90% fallout-free or better—and unless AEC is sure it will be at least that clean—it would be better for the United States *not* to hold the shot.

The President has already publicly used the figure of 96%.

If the 6 megaton shot is 95% clean, it will still yield 300,000 tons of fission contamination—or the equivalent of 15 Hiroshima bombs.

If it is 90% clean, it will still yield as much fallout contamination as 30 Hiroshimas.

Any “cleanliness” less than this, in our judgment, would be far more embarrassing to the President and to the United States than having to find some reason for not holding an open shot at this time.

Abbott Washburn

Acting Director

United States Information Agency

¹ Source: Eniwetok test. Confidential. 1 p. Eisenhower Library, White House Office Files, Project Clean Up, Eniwetok Test, 1958.

302. Memorandum From Melbourne (OCB) to Cutler¹

Washington, March 25, 1958

SUBJECT

Draft Presidential Statement

The special group to revise the draft Presidential statement met at 9:30 today and consisted of Admiral Paul Foster, AEC, Mr. Abbott Washburn, USIA, Mr. George Spiegel, representing Mr. Berding of State, Mr. Bertram Saymon, representing Mr. Snyder of Defense, and Mr. Henry Loomis, representing Dr. Killian.

It was agreed to work from the AEC draft, making revisions, and the first such revision occurred in an amendment of the first sentence of

¹ Source: Discussion of draft Presidential statement. Confidential. 3 pp. Eisenhower Library, White House Office Files, Project Clean Up, Eniwetok Test, 1958.

paragraph 2 which was designed to give time to State to consult informally with Hammarskjöld, who is now in the Soviet Union for a few days, before having too precise a statement on a method of selection of scientists being made. This amendment of State was a completely firm position of that agency, since State considered that it had full responsibility for the method of working out the details of selection of scientists vis-a-vis the UN.

Mr. Washburn raised the point that Press Secretary Hagerty would certainly want to indicate the percentage of reduction in radioactive fallout that the pending test would show. He stated that the whole purpose and origin of the exercise had been to support the President's press statements on July 3 and that the elimination of the figure of 90% or better would not do this and if it were not possible to achieve such a figure in the test, the backfire from world opinion would be too great to justify having it.

Admiral Foster talked with Admiral Strauss and with a technical expert in the AEC. They affirmed doubts as to whether the percentage figure could be guaranteed in the particular test in view of complicated factors from ground radiation and said that while it was hoped this could be done, they felt it unwise to include a precise percentage figure. Admiral Strauss added further, as a clincher for continuing with the test shot, that he considered the President had made a definite decision to go ahead with the test and that the AEC did not wish the percentage figure in the draft.

The sentence included in the composite draft agreed last Saturday was inserted in the AEC draft as the second sentence of paragraph 5. There were other editorial changes which can be noted in the annotated draft attached.

One problem raised in the third sentence of paragraph 5 deserves attention, where the phrase "basic international differences are settled and..." was inserted by the AEC into a sentence contained in the earlier composite draft. AEC insisted that it remain, and, while State had no strong feelings, it concurred with the others that this gave too broad a scope to the context of this concrete announcement, which is simply devoted to nuclear testing. Further, the query was raised whether or not the inclusion of this statement would not give rise to widespread criticism that the U.S. was tending to raise a whole series of unspecified, international differences which had to be settled prior to any action in the nuclear testing field. Defense suggested a possible alternative which would have the sentence read, "Until basic international differences are settled enabling a safeguarded..." I would personally suggest deletion and would suggest that you may wish to try to obtain appropriate assent to its deletion.

It was agreed by all except USIA that in view of the situation described and by AEC standing on its basic text and the fact that the test will not be deferred, that there should not be a question and answer

sheet for background purposes. It was considered by others of the group that the statement would raise questions which would not be seemly for the President to attempt to answer. However, Mr. Washburn did feel that it would be advisable for the President to have some background questions and answers, and in the event you consider it useful, I am attaching a copy of a memorandum sent to me yesterday by USIA, which lists possible questions and answers from a USIA perspective. As a footnote to this aspect of the matter, when Admiral Foster talked with Admiral Strauss, he strongly urged the latter to get in touch with Press Secretary Hagerty and to have him agree that the President would refer questioners to the competent agencies concerned.

Mr. Washburn left before the meeting was over because of another meeting he was obliged to attend and, on leaving, indicated his dissatisfaction with the draft statement as it stood with no percentages indicated for fallout and with the decision that there be no attached question and answer sheet for the President. Earlier I had the occasion to tell him privately and in general terms of what you had given me as the substance of what had been discussed at the special White House meeting yesterday. He indicated that he thought USIA, with its worldwide information responsibilities, might be brought into the chain of developments if it was intended to take substantive policy actions on any crash basis. Mr. Washburn told me on the phone what he had said to you on meeting you after leaving the meeting and your request to him, with which he is complying.

are likely to get scooped. He thinks the Russians will come out unilaterally re suspension of testing and L thinks we should consider saying we will stop after the next test. Why is it being done so far ahead when it is not until August? Also make it definite who the observers are. L thinks it should be the radiation comm. The Sec said Herter is handling it through OCB. L will talk with him. The Sec told re working hard over the weekend with Defense and AEC on suspension but finally they agreed not to do it. The Sec went into a discourse about how in the long run we look militaristic though some isolated cases and their decisions are right. If we just had to win a war that would be easy but it's the diplomatic and economic arenas where we might lose out. Then L, after agreeing, asked if the Sec has thought of asking the Pres to ask to Soviets to agree on an inspection system. L added he is afraid it is going to be bad from a PR standpoint.

Memorandum From Killian to Gray

Washington, March 28, 1958

SUBJECT

Transmittal of Report

In accordance with Action No. 1840 of the National Security Council, as approved by the President on January 9, 1958, I submit herewith a report of the Ad Hoc Working Group devoted to the following three studies in the area of nuclear testing:

“(a) A study of the losses to the United States consequent on a total suspension of nuclear tests at specific future dates.

“(b) A symmetrical study of the losses to the USSR that would accrue from cessation of nuclear testing, using the same hypothetical dates.

“(c) A study of the technical feasibility of monitoring a test suspension, including the outlines of a surveillance and inspection system.”

The Ad Hoc Working Group submitting this report is made up of representatives nominated by the President's Science Advisory Committee, the Department of Defense, the Atomic Energy Commission and the Central Intelligence Agency.

The Ad Hoc Working Group, in preparing this report, limited itself to the technical feasibility of monitoring nuclear tests and to the technical losses that would result to the U.S. and the U. S. S. R. from a cessation of tests. Although the Group considered some of the military implications of these technical losses to the U.S. and the U.S.S.R., a complete evaluation of these military implications would have required extensive studies by the Department of Defense and these are not yet

available. It excluded from its consideration any question of policy with respect to whether there should be a suspension of nuclear tests.

J.R. Killian, Jr.
Chairman

PRESENT AND POTENTIAL CAPABILITIES AND LIMITATIONS
FOR THE DETECTION OF NUCLEAR TESTS*ABSTRACT*

A long range detection system consisting of seismic, acoustic, electromagnetic and air sampling components is presently deployed around the USSR. This system can detect and identify nuclear tests of 10 KT or larger conducted within the USSR and China as shallow sub-surface, surface or air bursts up to 50,000 ft with an estimated reliability of 90–100 per cent. Nuclear tests as small as 3 KT in the same environments can be detected and identified with a reliability of 30 per cent. Underground explosions of 10 KT or larger can be detected with a certainty of 90–100 per cent but cannot be identified as nuclear explosions. Underwater explosions of 20 KT or larger conducted in deep ocean areas of the Northern Hemisphere and some parts of the Southern Hemisphere can be detected with 90–100 per cent certainty and probably identified as an explosion rather than an earthquake. Since the present system was designed to detect tests conducted in the USSR, its capabilities for tests outside the USSR are limited. Nuclear tests as large as a few hundred kilotons and possibly even one megaton might be missed if conducted in areas remote from the present detection network.

A system of improved capability for the detection of nuclear tests possibly conducted on a clandestine basis in the USSR or China is described. This system would consist of about 70 geophysical stations in the USSR and China plus an aerial sampling network involving overflight of critical areas as required to intercept radioactive clouds for the purpose of proving the nuclear nature of the explosion. It is estimated that this system could detect and identify with 90–100 per cent certainty nuclear tests of 1 KT or larger conducted as shallow sub-surface, surface or air bursts up to 50,000 ft within the USSR and China. Underground explosions of 1 KT or larger in the USSR and China could be detected with a certainty of 90–100 per cent but not identified as nuclear in nature. Identification of such underground disturbances may be possible through the use of on-the-spot inspection teams investigating about 300 unidentified sub-surface disturbances of 1 KT or larger per year in the USSR and China. If inspection only of those disturbances of 5 KT or larger is contemplated, only 35 events per year would require investigation.

A system for the detection and identification of nuclear tests in areas of the world remote from the present detection system is described. This system would consist of about 30 geophysical stations located principally in the Southern Hemisphere plus an aerial sampling network necessary to intercept radioactive clouds to prove the nuclear

nature of the explosion. It is estimated that this system could detect and identify with 90–100 per cent certainty nuclear tests of 20 KT or larger conducted as shallow sub-surface, surface or air bursts up to 50,000 ft in remote areas of the world. Underground explosions of 20 KT or larger in remote parts of the world could be detected with a certainty of 90–100 per cent but not identified as nuclear in nature. Identification of such underground disturbances may be possible through the use of inspection teams investigating about 100 suspected test areas per year in remote regions of the world. Underwater explosions of 20 KT or larger anywhere in the world could be reliably detected and probably identified as explosions rather than earthquakes.

PRESENT AND POTENTIAL CAPABILITIES AND LIMITATIONS FOR THE DETECTION OF NUCLEAR TESTS

INTRODUCTION: This report describes the present system for long range detection and identification of nuclear tests in the USSR including an evaluation of its capabilities and limitations. The results of a study of the technical feasibility of monitoring a test suspension is presented, including the outline of a surveillance and inspection system for detecting and identifying, if possible, nuclear tests conducted in the USSR, China and in remote areas of the world.

1. DESCRIPTION OF THE AFOAT-1 LONG RANGE DETECTION SYSTEM:

a. *General.* The present Long Range Detection System is deployed around the USSR and consists of four major components, i.e., acoustic, seismic, electromagnetic and nuclear. The purpose of this system is to determine the fact of an explosion, time, location, height of burst and yield, and finally from the analysis of the nuclear debris to reconstruct, insofar as possible, the detailed characteristics of the nuclear device tested.

Scientific observation posts for each of the four techniques are located as close as possible to the USSR and are operated by units of the Army, Navy and Air Force as appropriate. Preliminary analysis of the radioactive debris is accomplished in field radiochemical laboratories and more comprehensive and detailed analysis of the samples is carried out in a central laboratory in California, all operated by AFOAT-1. In addition, highly specialized measurements are made by laboratories of the Atomic Energy Commission, civilian contractors and university laboratories in the U.S. Collection and preliminary evaluation of data from all these laboratories are effected by AFOAT-1 analysts assisted by special studies at RAND Corporation. Finally, all data and evaluations are reviewed by the Foreign Weapons Evaluation Committee, Professor Hans A. Bethe, Chairman, a committee which is responsible jointly to the Division of Military Application, AEC, and to AFOAT-1.

The final conclusions are reported as intelligence to the Joint Atomic Energy Intelligence Committee, where the information is collated with intelligence from all other sources, and National Intelligence Estimates of Soviet nuclear capability are prepared.

A limited cooperation between AFOAT-1 and the United Kingdom has been in progress for a number of years. Geophysical stations are operated by the British Ministry of Defense. Measurements from these stations are reported by cable directly to headquarters, AFOAT-1. Radiochemical data obtained on samples of Soviet weapon debris are exchanged with the Atomic Energy Research Establishment, Harwell under Sir John Cockroft and the Atomic Weapons Research Establishment, Aldermaston under Sir William Penney.

b. *The Acoustic Component.* The acoustic element of the Long Range Detection System consists of 10 acoustic stations surrounding the USSR as shown in Figure 1. One of these stations is omitted from the figure for security reasons. Eight of these acoustic stations are operated by the U.S. Army Signal Corps from a headquarters at Ft. Monmouth, New Jersey. These stations are located in Japan (2), Philippine Islands, Turkey, Eritrea, Germany, Greenland and Alaska. Two acoustic stations are operated by the United Kingdom. In addition to the permanent net stations, data are frequently obtained from experimental stations in San Diego, Washington, D. C. and Ft. Monmouth, N. J.

Each acoustic station consists of four condenser microphones, one located at each corner of a 6- to 10-mile square. Although only three microphones are necessary to establish the azimuth and apparent velocity of the incoming acoustic wave, four are used to provide a factor of safety for instrument malfunction and to improve the precision of measurement. Time sequence of arrival of the acoustic wave at individual microphones provides a measure of the azimuth and apparent velocity. The microphones are coupled to the atmosphere through a pipe array 1000 ft in length with openings every five feet throughout the length. This coupling device greatly reduces the background noise from wind turbulence (about a factor of 10) and permits identification of acoustic waves having pressure amplitudes as low as 0.1 dyne/cm^2 under favorable conditions. Each microphone is connected by wire lines to a central recording station where variations in atmospheric pressure in the subsonic frequency range from approximately 1.0 to 0.01 cps are amplified and recorded on Esterline-Angus pen recorders. Service personnel, trained especially for the purpose, continuously scan the records on a 24-hour basis. When signal characteristics meet the criteria determined by AFOAT-1 to be indicative of a large explosion, the station personnel itemize the principal signal characteristics in a coded message to the net headquarters at Ft. Monmouth, N. J. There the data are checked, correlated with other acoustic data, and transmitted to

AFOAT-1 for further evaluation and correlation with data from other elements of the Atomic Energy Detection System.

Equipment of the same type has been supplied to the British for their operations. In a similar way they identify significant signals and send the signal characteristics by message through headquarters, AFOAT-1, to the net headquarters at Ft. Monmouth for correlation with U.S. data.

The acoustic data are used to determine the time of burst to about ± 5 to 10 minutes, the location of burst within a radius of about 100 miles, and the yield to about \pm a factor of 2 for small shots and to about ± 15 to 20 per cent on large yield tests.

c. *The Seismic Component.* The seismic component is made up of eight surveillance stations under the operational control of AFOAT-1. These stations are located in Spain, Turkey, Korea, Alaska, Australia and three in the U.S. (See Figure 2.) In addition, one seismic station with similar equipment is operated by the U.K.

Each seismic station is composed of an array of four concrete piers poured on solid rock and deployed when possible at equal spacing along a two-mile line. Each pier accommodates a vertical sesimometer and one of the piers has, in addition, two horizontal instruments oriented at 90° with each other to permit recording of the three components of earth's motion on that pier. In those cases where a linear array is possible, the axis of the array is oriented to favor reception of a signal from the USSR and to discriminate against known sources of microseisms. The individual seismometers are connected through wire lines several miles in length to a central recording station. Seismic waves from a distant source are refracted upward from the mantle to the seismometers at an angle which is nearly vertical. In-phase signals are thus produced on all four seismometers which result in a gain in amplitude proportional to the square root of the number of seismometers. Since microseismic disturbances, in general, travel horizontally from local sources to the station, the response of the seismometers to noise is uncorrelated. Earth motion of about 1–2 millimicrons can be detected under favorable background conditions.

At the central recording station the signals from individual seismometers are amplified and recorded on 35-mm film, together with standard time signals from WWV or WWVH as appropriate. The response characteristics of the seismographs favor the reception of seismic disturbances in the period range of 0.5 to 1.0 seconds where the maximum energy in the earth from atomic explosions is found. Background noise at other frequencies is excluded and as a result the signal-to-noise level at the station is increased.

The film at each of the seismic stations is developed three times during each 24-hour period and scanned by field personnel for evidence

of signal characteristics meeting certain criteria of significance. When, in the opinion of the team personnel, these criteria have been met, the principal characteristics of the signal of interest are transmitted by TWX to AFOAT-1 in Washington, D. C. A central analysis station at Laramie, Wyoming but programmed to be located at headquarters, AFOAT-1, presently receives all of the incoming messages and makes a careful study of the significance of these reports.

From the seismic data AFOAT-1 can ascertain the time of explosion to the nearest $1/2$ second, and estimate to the nearest $1/10$ th second; can determine the location to the nearest 2-5 miles; and can obtain a rough estimate of yield (to an order of magnitude). Yield determinations by seismic methods are very uncertain since the coupling between the explosion and the earth is affected both by height of burst and the geological formations at ground zero. Neither of these factors is known in the case of an explosion in the USSR.

d. *The Electromagnetic Component.* The Long Range Detection System presently contains eight electromagnetic stations located in Minnesota, Washington State, Alaska (2), Japan, Pakistan, Turkey and Germany. Installation of two additional stations is in progress. These stations, located as shown in Figure 3, are under the operational control of AFOAT-1.

The equipment at each station is energized by two antennas: one a vertical whip and the other a pair of crossed loops. The signal from the crossed loops passes through amplifiers and records on a cathode ray oscilloscope. This record permits determination of the azimuth of the incoming signal. The energy from the vertical whip is utilized to remove the 180° ambiguity in determination of azimuth from the crossed loop circuits described above. The vertical whip also energizes the equipment for recording waveform and energy content of the pulse.

The direction finding circuits operate on a frequency of 10 kc with a 2 kc pass band. The equipment for recording waveform and energy content utilizes four channels. The waveform itself is recorded in a wide band from 3 kc to 300 kc and, in addition, three other narrow bands (2 kc) centered on 20 kc, 75 kc and 5 mc are recorded for sampling the spectrum of energy radiated by the explosion. The waveform is recorded on a 500 microsecond sweep which is triggered by the initial signal from the vertical whip and provided with a suitable delay circuit to permit recording of the entire waveform from start to finish.

The channels at 20 kc, 75 kc and 5 mc have been added in the hope that the distribution of energy from the bomb will be different from lightning flashes. The five channels described, together with a WWV channel for timing purposes, are all recorded on 35-mm film on a

24-hour basis. Signal strengths as low as 30 millivolts/meter are detectable under favorable conditions.

The electromagnetic system suffers from a defect of recording millions of lightning flashes which look very similar to the pulse transmitted from a nuclear explosion. Therefore, the individual station cannot, on its own, determine whether the recordings have significance with respect to a suspected nuclear explosion. For that reason the film is transmitted to the analysis center at AFOAT-1 where correlation studies are made to determine the existence of multi-station time and azimuth coincidences. The usual procedure is to search that part of the electromagnetic film covering a time period considered to have been significant from reports of the other geophysical systems or from the date and time established by measurements on fresh debris from the nuclear system.

Signal significance is determined by three methods: coincidence in times of arrival, consistency of intersections of azimuth, and compatibility of recorded signal strength at widely separated stations, assuming a single source and applying known attenuation factors. These methods, however, are applicable only after some method of sorting has been accomplished. At present, this sorting depends upon establishing a time of the explosion by acoustic, seismic or nuclear means.

The electromagnetic system has produced time and azimuth, multi-station coincidences for all of the large Soviet tests as well as several smaller tests, and, of course, it has been checked for accuracy on U.S. tests. The time obtained by electromagnetic data can be determined to 50 milliseconds and estimated to 20 milliseconds. The azimuth can be determined to ± 3 degrees.

Recent experience, on one small Soviet test, indicates the possibility of detection of relatively small tests in the USSR which, if conducted on the surface, produce large electromagnetic signals. If this experience on one Soviet test can be duplicated on all small surface tests, an important detection capability for small tests may be realized. At present, however, the electromagnetic component of the Long Range Detection System does not report independently the detection of a nuclear test in the USSR. It is capable only of response to query.

An important contribution of the electromagnetic time, however, is that when combined with seismic time it is used to determine the height of burst of a nuclear test. The electromagnetic time, of course, corresponds to the exact detonation time of the device and the seismic time gives a reasonably accurate time at which the shock wave from the device strikes the earth. Since there is available a "time-distance curve" on the shock wave transmission through the air from the burst to the ground, it is possible to utilize this curve to determine the height of burst.

e. *The Nuclear Component.* A system for collecting radioactive debris from a test utilizes airborne filters for removing the particulate debris from the air along the flight tracks of the aircraft. Specially designed air filters have been mounted on WB/50 aircraft operated by the Air Weather Service out of bases in Japan, Alaska and Burtonwood, England. WB/50 aircraft fly tracks northeast and southwest out of Japan, north and southwest out of Alaska and to any predesignated point in Europe or the Middle East out of Burtonwood, England. (See Figure 4.) The flight tracks from Japanese and Alaskan bases are planned to cover on a once-each-24-hour basis all air mass trajectories coming out of the USSR between 30° N and 85° N. The aircraft usually fly at 10,000 feet outbound and about from 20,000 to 30,000 feet on the return track so that two altitudes are covered during each flight.

Instantaneous radiation detectors mounted behind the filter papers indicate to the pilot when the filter paper is collecting unusual amounts of radioactive debris. This information is radioed back to the base and used for vectoring special missions to intercept "hot" parts of the atomic cloud and is used as a guide to enable the aircraft to orbit within the cloud while sampling.

The airborne filters are analyzed in a field laboratory (Japan and Alaska) by physical and chemical methods to determine whether or not fresh radioactive debris has been encountered on the flight. Although in most instances early warning by geophysical techniques alerts the air crews to the possibility of intercepting debris, in five cases the initial and only detection of Soviet tests has been by the radiochemical analysis of filter papers. The field laboratories at operational bases in Japan and Alaska also conduct comprehensive radio-chemical analyses of the filters, concentrating mostly on short-lived isotopes for dating and other purposes, and thus provide information which would not be obtainable by the time the filters had been sent back to the central laboratory in Sacramento, California.

Reports of unusual amounts of radioactive debris, or the detection of fresh debris together with the preliminary reports on chemical analysis of short-lived isotopes, are submitted by the field laboratories through priority dispatch to the headquarters, AFOAT-1, Washington, D.C. All significant filter papers are transmitted to the central laboratory at McClellan Air Force Base, where a decision is made with respect to the distribution of samples among the laboratories in the U.S. which contribute to various phases of the analysis program, as well as to the Atomic Weapons Research Establishment at Aldermaston, England. Laboratories participating are the McClellan Central Laboratory, Argonne National Laboratory, Knolls Atomic Power Laboratory, and Tracerlab, Inc. In certain cases, the Los Alamos Scientific

Laboratory, University of California Radiation Laboratory at Livermore and the Naval Radiological Defense Laboratory perform special analyses.

These laboratories make quantitative mass spectrometric studies, alpha pulse analyses, activation studies and chemical identifications of induced activities and isotopes of the transuranium elements and fission products over a period of one to three months after the collection of the debris. All of these data are forwarded by letter report to AFOAT-1 where the final evaluation is carried out. Data received from all of these laboratories are also transmitted to the Foreign Weapons Evaluation Committee and are reviewed at periodic meetings. AFOAT-1 and the Bethe Committee review and discuss conclusions concerning the type of nuclear reactions, materials and geometry utilized by the Soviets in each specific test.

2. EXISTING CAPABILITIES AND LIMITATIONS:

The Long Range Detection System of AFOAT-1 was primarily designed to detect and identify surface bursts or air bursts and sub-surface bursts detonated within the boundaries of the USSR. In considering its capabilities and limitations as a system for monitoring an international agreement on nuclear test limitations, the following four environments for possible test detonations within the USSR have been considered: surface or air bursts below 50,000 feet; sub-surface tests; high altitude tests; and surface or air bursts in remote geographical locations.

a. *Surface or Air Bursts below 50 Kilofeet within the USSR.* To date 44 nuclear tests have been identified within the USSR which are believed to have been between the surface and 50 kft and two which may have been higher than 50 kft. The remaining two Soviet tests were known to be sub-surface, probably underwater. Table I shows the part played by each component of the Long Range Detection System in identifying the 48 Soviet tests. It is noteworthy that five of these tests were picked up by nuclear techniques only. No geophysical response was obtained. Of interest to the study of detection capability, four of the tests did not produce nuclear debris which was detectable. All four of the components of the system seemed to be relatively successful in tests of 500 KT or higher. The absence of electromagnetic detection of some of the tests does not indicate necessarily a low capability but rather that it consisted of only one station overseas and three stations in the U.S. prior to 1957 and no stations prior to 1954. Finally, the table shows a variety of combinations of the techniques which produced successful detection on different Soviet tests, thus demonstrating the value of including all four components in the system.

Table I
AFOAT-1 Identification of USSR Tests

Component	Yield

A – Acoustic

S – Seismic

E – Electromagnetic

N – Nuclear

The *electromagnetic technique* does not contribute, at present, to detection without the assistance of one or more of the other techniques. It does show considerable promise for the detection of surface bursts of relatively low yield, but this promise requires further exploration before any definite statements can be made. Reference to Table I shows a detection capability for tests in the USSR as low as 5 KT. However, in general, it is believed that a lower limit of reliable detection for surface bursts is more like 25 KT at ranges of 4000–5000 kilometers. A reduction in detectability is observed at burst heights of 8000–10,000 feet. Pending completion of developments of machine sorting techniques and a discriminator between bomb pulses and lightning pulses, the electromagnetic system may not contribute greatly to detection of very low yield tests within the USSR.

Except for subsurface tests, the *seismic technique* is applicable principally to surface or low air bursts of 100–150 KT or larger. One surface test of 25 KT in the USSR was detected, but this is the exception and

not the rule. In general, we record about 300 seismic disturbances per year in the USSR above 100 KT, of which about 75% are identified as earthquakes, leaving about 75 disturbances which cannot be identified either as man-made or natural.

The problem of detecting and identifying clandestine tests in the environment (surface to 50 kilofeet in the USSR) under discussion will depend principally upon the success of the combined nuclear and acoustic components of the Long Range Detection System. For the purpose of studying the effect of these two techniques, AFOAT-1 detection data on 25 Soviet tests and 66 U.S. tests in the range of 3.5 to 50 KT were selected. U.S. data are fairly well spread out through all of the seasons. Soviet data does not include many tests in the summer and spring.

Acoustic detection at individual stations has a marked diurnal variation due to the fact that noise levels at night are normally lower by a factor of 2 or more than they are in the daytime. A marked seasonal variation is noted in the detection of acoustic waves, since stratosphere wind patterns in the winter time are most favorable for transmission toward the east and, conversely, stratosphere wind patterns in the summer favor transmission toward the west. Stations to the north or south in general show relatively smaller seasonal effects than do east-west stations. Normally, the stratosphere winds permit longer ranges of detection in summer and winter than in the spring and fall.

Further complicating the acoustic picture is the fact that the amplitude of pressure waves from an explosion varies greatly due to fluctuations in winds and temperatures encountered in the atmosphere at altitudes above the known meteorology. Pressure amplitudes are only very qualitatively related to yield.

In estimating the capabilities of the acoustic net, it has been necessary to rely mainly on actual results obtained from U.S. and Russian nuclear tests. These estimates cannot be precise but they are believed to be as realistic as it is possible to make them at present. Four ranges of detectability were established, as follows: excellent—90 to 100%; good—60 to 90%; fair—30 to 60%; poor—0 to 30%. The result of the study is shown in Table II.

Table II
Acoustic Detection* Capability for Low Yield Air or
Tower Nuclear Tests

Detection Coefficient	Based on USSR Test Results		Based on U.S. Test Results		Overall (KT)
	Winter-Summer (KT)	Spring-Fall (KT)	Winter-Summer (KT)	Spring-Fall (KT)	
Excellent (90 – 100%)	≥15	≥20	≥10	≥15	≥15
Good (60 – 90%)	5–14	10–19	3–9	10–14	10–14
Fair (30 – 60%)	1–4	5–9	1–2	3–9	5–9
Poor (0 – 30%)	<1	<5	<1	<3	<5

* Detection but not identification as nuclear in nature. [Footnote is in the original.]

The last column of Table II shows a conservative overall acoustic detection capability obtained by averaging the winter/summer and spring/fall results obtained from USSR and U.S. tests.

Nuclear debris from relatively small yield low altitude shots within the USSR seems to be readily detectable. Shots of the order of 3–10 KT can be expected to produce substantial clouds of debris if detonated at or near the surface and this debris will not rise much above the 10,000 to 20,000 ft levels routinely patrolled by aircraft out of Japan and Alaska. However, when the yield increases to substantial fractions of a megaton or higher, so much of the debris is deposited in the stratosphere that collections on routine patrols at 10,000 to 20,000 feet are extremely unsatisfactory. From the standpoint of detection of the fact of a nuclear burst, however, it is believed that most very large tests will leave enough debris in the troposphere to permit the fact of fresh debris to be ascertained for the high yield tests.

Clandestine tests of low yield devices conducted at altitudes of 20,000 or 30,000 feet will probably produce debris which will pass over the top of surveillance flights at 20,000 feet. This actually occurred on the U.S. "HA" shot (3 KT) where debris was picked up over Washington at 40,000 feet while no debris was obtained from that same shot on flights between Bermuda and Washington at 10,000 and 20,000 feet. Since altitudes above 20,000 feet are not routinely patrolled but are searched by special high altitude aircraft only upon warning from the geophysical system, it is quite possible that low yield shots fired at

altitudes above 20,000 feet will not be detected by nuclear techniques. Figure 5 is a graphic portrayal of the situation that will occur in the case of low yield tests in the environment under discussion.

Debris collection seems to be at its greatest disadvantage in the summer time. From fall through winter and spring collection activities are at their best. It is, therefore, believed that the air sampling technique will substantially add to the overall system capability but it is difficult to make a quantitative assessment. The overall detection capability for the system under the environment being discussed must, therefore, rely to a certain extent on the judgment as to what size nuclear cloud could escape routine sampling flights from 30° N to 85° N during short periods when interruptions of flight schedules occur and to what extent clouds from small shots would overpass routine flight lines.

Taking everything into consideration, it is believed that for tests in the USSR between the surface and 50,000 feet there will be a substantial contribution to the acoustic component by the nuclear detection component. A combined acoustic and nuclear detection capability, which is believed to be the determining factor in the low yield range, is shown in Table III.

Table III
Overall Detection and Identification Capability for Airbursts
between the Surface and 50,000 feet

Detection Coefficient	Overall Acoustic (KT)	Acoustic plus Nuclear (KT)
Excellent (90–100%)	≥15	≥10
Good (60–90%)	10–14	5–10
Fair (30–60%)	5–9	3–5
Poor (0–30%)	<5	<3

The limited capability for seismic and electromagnetic techniques to contribute in the low yield air burst range does not permit any quantitative evaluation of the small contributions which they may make. Both techniques are limited, however, in any case to small tests conducted on or near the surface as indicated above and to some large yield tests at moderate heights of burst. There is the possibility mentioned in paragraph 1c of some assistance from the electromagnetic component on surface or low air bursts.

b. *Subsurface Tests.* It is assumed that a clandestine subsurface test by the USSR will be conducted in such a way that no radioactive debris will be cast into the atmosphere, that the shot will be sufficiently tamped to prevent any energy appearing in acoustic waves and, of course, that there will be no electromagnetic radiation. The seismic component of the Long Range Detection System will then be the sole component responsible for the detection of such a test.

The seismic system is limited to the determination that a large subsurface disturbance has occurred. There is no unique way of identifying with certainty the signature of an underground nuclear explosion. At long range detection distances the individual characteristics of the source of disturbance are very difficult to detect, since the character of the medium through which the wave is propagated plays a predominant part in determining the character of the recorded signal. The problem is considerably simplified, however, by the existence of several useful, though not unique indicators of earthquakes or blasts.

For example, many large earthquakes persist for many minutes or hours whereas the record from a small underground blast has a maximum duration of a few seconds to a few minutes. Another useful indicator is the fact that all subsurface blasts produce a compressional first wave, while many earthquakes produce alternate compressional and dilational first waves as one proceeds around the source with a seismic detector. Thus, a dilational first wave is an almost certain indicator of an earthquake. The usefulness of this indicator, however, is limited to the large shots where the first wave can be clearly distinguished from the background fluctuations due to microseismic disturbance. In the yield range below 5 KT, it is doubtful if this criterion would be of much use at long ranges. A few earthquakes occur so far below the surface that the seismograms clearly indicate earthquake origin. However, a very large percentage of earthquakes occur at shallow depths (20 kilometers) and do not give any indication that would be useful in separating them from blasts. Most earthquakes produce large clearly identifiable shear waves, whereas most explosions do not produce shear waves. However, there are earthquakes on record where no detectable shear wave was recorded at long range detection distances and there are blasts on record, for example, Rainier, Wigwam and many of the small Nevada shots that have produced noticeable shear waves. Finally, repeated blasts at the same underground location will produce almost identical wave shapes at the same long range detection station. This might be useful in the event that repeated use were made of the same location for clandestine tests. It is concluded, therefore, that the seismic surveillance for underground tests might detect the presence of an underground explosion but would not uniquely identify the source as nuclear in origin.

The ability to detect underground explosions by seismic means has been carefully studied. The limitation in pushing to smaller and smaller yields appears to reside principally in noise generated by storms and man-made disturbances in the vicinity of the stations. A general deterioration of capability for the entire net in the wintertime is observed because of the storm activity in the Northern Hemisphere. There are also short periods of relatively poor capability during summertime windstorms. Natural earthquakes and, occasionally, volcanic activity produce additional background noise which reduces capability for the detection of small yield

underground tests. Large earthquakes produce disturbances which persist for many hours and are often accompanied by aftershocks on several succeeding days which individually persist for many minutes. Natural seismicity of the earth varies considerably from one point to another within the USSR. (See Figure 9.) Natural seismicity is, in general, higher to the south near the Himalayas and along the eastern coast.

The transmission characteristics of the earth for seismic waves varies considerably with the distance between the source and the seismic observatory. (See Figure 6.) It will be noted that a distinct loss of sensitivity occurs at distances between 500 and 1100 miles from the source. A second band of loss in sensitivity occurs between 2000 and 2700 miles from the source. Since all the stations of the existing network are beyond 1000 miles from known Soviet test sites, the seismic detection capability for the existing system is not affected by insensitivity in this range. However, the region of loss in sensitivity at 2000–2700 miles does affect the seismic capability for detecting low yield subsurface shots with the existing network of stations. The reason for the loss in sensitivity in the range of 2000 to 2700 miles is believed to result from a rapid change in the physical characteristics of the mantle at approximately 1200 kilometers depth which results in a dispersion of seismic energy at the surface for this particular range from the source.

The effect of the transmission characteristics of seismic waves as a function of distance on detection by existing stations is shown in a map of the USSR in Figure 7. The areas of poor detection for surface tests resulting from this effect are cross hatched. Subsurface bursts in these areas will also be the most difficult to detect with the present network. A reasonable estimate of yield for subsurface shots which would be detected in these areas is obtained by dividing the yield for surface tests by a factor of 25 for summertime conditions and by 12-1/2 for wintertime. Thus, general statements about seismic detection capability cannot be applied uniformly to the entire Soviet-dominated area. However, for tests within approximately 90–95% of the area some general estimate can be made. Taking all the above factors into consideration, it is believed that the present seismic detection capability is as indicated in Table IV. The capability indicated in Table IV applies to the clear areas in Figure 7. In the cross hatched areas, however, subsurface tests of 10–15 KT might escape detection by the present network.

Table IV

Seismic Detection* Capability for Low Yield Subsurface Nuclear Tests

Detection Coefficient		YIELD (KT)	
		Summer	Winter
Excellent	90–100%	4	8
Good	60–90%	3	6
Fair	30–60%	2	4
Poor	0–30%	1	2

* Detection but not identification as nuclear in nature. [Footnote is in the original.]

c. High Altitude Tests. The Long Range Detection System has no evidence to date that the Soviets have tested a nuclear weapon at extremely high altitudes. U.S. tests conducted so far have been limited to altitudes below 50,000 feet (HA, 37,000 ft). Theoretical investigations of the effects of very high altitude tests (100,000 to 250,000 ft) have been made by Professor Hans A. Bethe and others in recent months. These studies indicate many very interesting and unusual phenomena which will be discussed in detail by Professor Bethe in another paper.

Of the four existing detection techniques, only the acoustic and electromagnetic techniques appear to offer promise for the detection of very high altitude tests and these are debatable in the light of present knowledge. It is believed that adequate detection of high altitude tests will involve development of new or improved detection techniques following experimental high altitude tests at HARDTACK involving new influence fields, i.e., optical, magnetic, etc., as well as possible modification of existing acoustic, seismic and electromagnetic surveillance methods.

d. Nuclear Tests Conducted in Remote Geographical Locations. The AFOAT-1 Long Range Detection System is deployed around the USSR as the primary target. It therefore has very great limitations for shot points in such remote geographical locations as the Antarctic, South Pacific and Indian Ocean areas. It is believed possible that shots of several hundred kilotons and possibly even a megaton could be detonated in these areas far from the present acoustic stations without fear of detection by acoustic means. British tests in Australia at points only 20°–30° S produced no nuclear, no seismic, no electromagnetic and, in six shots out of twelve tests, no acoustic data although advance notification of time and place of the test was provided by the U.K. Six tests did excite one and in two cases two acoustic stations but detection even in these cases was certainly greatly assisted by advance knowledge of U.K. intentions.

The seismic capability suffers very seriously from core shadow for shots detonated in these remote areas. Over 60% of the Southern

Hemisphere would produce very poor capability for shots in the low megaton range. Electromagnetic capability for detection of tests in the Southern Hemisphere is unusually poor because of the high frequency of thunderstorms in the inter-tropical front along the Equator. The ability to collect samples of debris in the Southern Hemisphere is very limited.

e. *Summary of Existing Capabilities and Limitations.*

(1) *Surface or Air Burst 50 kilofeet within the USSR.*

(a) The electromagnetic technique may possibly detect shots within the USSR of 25 KT or greater but requires a determination of time independently by some other geophysical technique to take care of the sorting problem.

(b) The seismic technique is capable of detecting surface or low air bursts of 100 KT or larger.

(c) The acoustic system is capable of detecting tests of 15 KT or larger.

(d) The nuclear technique is capable of detecting tests as small as 3 KT as long as the debris does not rise much above 20,000 feet.

(e) The overall detection capability for the Atomic Energy Detection System is excellent (90–100%) for surface or air burst tests of 10 KT and greater between the surface and 50 kilofeet.

(2) *Subsurface Tests.* The seismic system presently has an excellent capability of detecting subsurface shots of about 10 KT or larger over 90–95% of the area of the USSR. Subsurface tests as large as 10 to 20 KT in the remaining 5–10% of the USSR might escape detection by the present AEDS. It is estimated from Figure 8 that a total of about 140 earthquakes per year of 10 KT or larger occur in the USSR. Identification of about half this number is possible, leaving about 70 events which may be either explosions or earthquakes.

(3) *High Altitude Tests.* It is not possible to evaluate the present capability of the AEDS to detect high altitude tests.

(4) *Nuclear Tests Conducted in Remote Geographical Locations.* Tests in remote areas in the Southern Hemisphere of from several hundred kilotons to a megaton or two might escape detection by the present Atomic Energy Detection System.

Summarizing, the present Long Range Detection System will detect and identify surface or air bursts below 50 kilofeet in the USSR having a yield of 10 KT or larger. It will detect about 140 subsurface events per year (by seismic means) of 10 KT yield or larger of which only 70 will be positively identified as earthquakes leaving 70 subsurface events of unknown origin. The detection capability for very high altitude bursts over the USSR is unknown and for tests in remote geographical locations is limited to the high kiloton or low megaton range.

3. A SYSTEM FOR DETECTION AND IDENTIFICATION OF CLANDESTINE NUCLEAR TESTS WITHIN THE USSR.

This section will discuss a Long Range Detection System within the USSR and China designed to meet the following requirements: (1) The detection and identification of tests as small as 1 KT between the surface and 50 kilofeet, and (2) Detection of underground explosions, and possibly their identification, in a yield range of 1 KT and above.

a. *Seismic Net.* In considering the deployment of seismic stations within the USSR to give 90% capability of detecting tests of 1 KT or larger, three problems of major magnitude appear:

(1) The band of low signal level between 500 and 1100 miles from the source.

(2) The high microseismic noise level expected at stations in average localities.

(3) The frequency of earthquakes of yield equivalent to 1 to 5 KT which because of small signal amplitudes are the most difficult to identify.

As a result of the loss in signal level between 500 and 1100 miles, it is expected that signals from a one kiloton explosion in this distance range will be smaller than the prevailing microseismic noise. It is to be expected that the noise level at a station removed from sources of cultural noise would be as high as .005 microns. An inspection of Figure 6 will show that such a station would be unlikely to detect an explosion at a distance greater than 400 miles. This loss in detectability makes it necessary to use more elaborate techniques than are currently employed at AFOAT-1 stations in order to detect 1 KT without covering the USSR and China with an inordinately large number of stations. It is believed possible to obtain an improvement in detectability of about a factor of four at individual seismic stations by employing arrays of about 20 seismometers at each station. A spacing between the seismometers can be chosen which should result in considerable cancellation of microseismic noise without appreciable degradation of signals of interest. The seismometers would be distributed approximately uniformly over an area of about six square kilometers. With the signal-to-noise improvement of about four to one, it may be seen from Figure 6 that signals of the order of three millimicrons would be detectable between 0 and 500 miles and again between 1100 and 2000 miles.

In addition, it is believed that ultra-long period seismometers (par. 2c(1)) under study may add considerably to the detection of long period surface waves from small subsurface tests. To date, long period surface waves were observed on Wigwam but not on Rainier. However, these instruments would be included in addition to the improved arrays of the present instruments to supplement detection at ranges possibly unfavorable to the present equipment mentioned above if future tests confirm the existence of long period surface waves from small subsurface tests.

Relative to identification of the “detected” events, the annual number of earthquakes within the USSR-dominated area which are larger than a given yield is shown in Figure 8. This relationship is derived from statistical data on world-wide distribution of earthquakes from Gutenberg and Richter, “Seismicity of the Earth,” and AFOAT-1 measurements of seismic wave amplitudes from subsurface explosions. From this curve the number of earthquakes in the USSR and China which produce energy in the earth equal to subsurface explosions of 1–5 KT is found to be 2100. The areas of most frequent occurrence of these earthquakes are shown in Figure 9. The indicators mentioned in par. 2b permit identification of about 85% this number as natural earthquakes provided there are at least three stations within 400 miles of the burst. There remain about 300 earthquakes per year in this yield range which cannot be distinguished from explosions by scientific means.

Considering all of the above factors, it is believed that it will be necessary to install about 43 seismic stations with improved arrays and ultra low frequency seismometers within the USSR and China. Possible locations of such stations are shown in Figure 10. The stations shown are concentrated near seismic regions to obtain the maximum amount of information leading to the diagnosis of natural earthquakes. Any shock originating in the vast aseismic areas of the USSR and China would be strongly suspected of being man-made. It is believed that this network of stations would permit a 3-station fix on a completely tamped subsurface shot as small [*text not declassified*] in about 90–95% of the area of the USSR and China.

It is estimated that about 300 earth shocks in the range of 1–5 KT would occur each year which could not be distinguished from subsurface nuclear tests. It would, therefore, be necessary for inspection teams to investigate most of these sites for the purpose of determining whether or not the seismic indications were from an explosion or from an actual earthquake.

b. *Acoustic Net.* It is estimated that about 30 acoustic stations within the USSR and China (see Figure 11) placed roughly on a 700 nautical mile square grid will provide an excellent (90–100%) capability to detect shallow subsurface, surface, and air bursts with a yield as low as [*text not declassified*] any place in the USSR and China and immediate surrounding water and island areas. This estimate is based on a study of the actual detection results obtained on all U.S. shots (29) in the yield range from .1 to 10 KT. These results indicate a reliable detection range of at least 700 nautical miles for a yield as [*text not declassified*]. This detection range, coupled with the requirement for detection by a least two acoustic stations in order to determine the location and time of explosion, established the grid pattern stated above.

c. *Electromagnetic Net.* Data available on electromagnetic detection of small U.S. surface or tower bursts indicate that a 1000-mile range

would give good assurance of obtaining electromagnetic data on shots as [text not declassified]. Data on U.S. high air bursts is, of necessity, very limited. It does indicate that the electromagnetic signal strengths from high altitude tests are considerably smaller than from surface tests. However, the electromagnetic signals [text not declassified] were obtained at ranges of 1350 miles and 2400 miles, respectively.

It is, therefore, recommended that an installation of about 30 electromagnetic stations co-located either with seismic or acoustic stations (see Figures 10 and 11) would permit taking maximum advantage of the electromagnetic technique. Since the technique does not provide independent detection at the present time, its purpose would be to strengthen acoustic and seismic evidence of a clandestine test. In about one year improved sorting techniques may permit independent detection by the electromagnetic component and correspondingly increase its value.

It should be noted that relatively simple gamma ray shields of lead or water surrounding the bomb will prevent detection at useful ranges by the electromagnetic system. For example, there was a calculated and measured attenuation of the electromagnetic signal by a factor of [text not declassified] for the U.S. test which was shielded by water. [text not declassified] The signal strength, at long range detection distances, would thus be reduced well below the detectable limit.

d. *Nuclear Sampling.* The nuclear sampling network required to detect radioactive clouds from tests of 1 kiloton or larger in the USSR and China introduces a requirement to intercept air masses emanating from tests in this area at all altitudes from the surface to 50,000 ft. The difficulty of this problem arises principally from the fact that clouds from tests in the very low kiloton range have been observed to be no more than a few thousand feet thick. Setting up a picket line to insure interception of all such clouds by sampling aircraft is obviously impractical. It is estimated that a daily air filtering effort along a meridian at 135°E, at altitudes of 10,000, 20,000, 30,000 and 40,000 feet would provide ample coverage of air masses emanating from tests in both the USSR and China. Tests conducted near the east coast of these countries would produce clouds which would still be relatively small in extent as they pass the flight lines and would have the greatest chance of escaping detection. Clouds from tests further inland in Asia would be stretched out to considerably greater lengths and permit a greater chance of detection.

Several months after a moratorium on testing nuclear devices has been in effect the analysis of nuclear debris samples would become considerably more sensitive than they now are for the detection of fresh nuclear debris, since background levels from old debris would be considerably reduced. As a result, smaller samples would still provide significant radiochemical analyses. The number of disintegrations per minute of 2.7-day Mo⁹⁹ at various times after detonation is given in the following table for a sample size of 10⁷ fissions, a rough

average of the intensity of a single particle of nuclear debris. From this table

<i>Days after Zero Time</i>	<i>dpm Mo⁹⁹ in 10⁷ Fissions</i>
2	66
4	40
6	24
8	14.5
10	8.7
12	5.3
14	3.2

it can be seen that even ten days after zero time the Mo⁹⁹ is still detectable even in a very small sample. In general, samples of debris are at least an order of magnitude larger than 10⁷ fissions. Of course, other short-lived activities could be investigated; e.g., 17-hour Zr⁹⁷, 33-hour Pr¹⁴³, 7.5-day Ag¹¹¹, 2.3-day Cd¹¹⁵, and 2.3-day Np²³⁹, to detect the presence of fresh debris.

In general, it is believed that daily aerial filtering at the altitudes and over the flight tracks defined above would provide 90–100 per cent certainty for detection and identification for yields of 3 KT or larger detonated between the surface and about 25,000 feet. Debris from tests as small as 3 KT detonated at altitudes between 25,000 and 50,000 feet will probably be found at altitudes in excess of those recommended for routine patrols. In this case, the air sampling technique will require an assist from the early warning geophysical network in order that high altitude aircraft can be dispatched to altitudes above those routinely filtered for interception of radioactive clouds from such tests.

Radiochemical laboratories should be located at or near flight terminals; in this case, probably Tokyo, Japan and Fairbanks, Alaska. These laboratories would be equipped with the latest techniques for determining the presence of fresh radioactive debris.

It is expected that for small tests deep in Asia, it may be necessary to overfly certain areas of the USSR and China in order to intercept debris which might not come out across the Japanese flight lines. These overflights might require permission to land and refuel at Soviet bases.

e. *Detection of Soviet Concealed Underground Nuclear Tests.*³

"Under a test moratorium, it is possible that the Soviets might endeavor, because of overriding technical considerations, to conduct a limited series of low yield, underground tests on a surreptitious basis. Therefore, the seismic component of the inspection system within the USSR must be capable of detecting signals generated by an underground test, and the moratorium agreement should permit access for on-the-spot ground inspection of suspect areas upon presentation of seismic records that cannot be properly explained as a natural phenomenon.

"Should such evidence of a possible test be obtained from seismic data or other intelligence sources, it must be promptly evaluated in terms of all available information, including the pattern of normal seismic disturbances within the USSR. If the data cannot be discounted as a natural phenomenon, a small mobile inspection team should be dispatched to the area pin-pointed by the information at hand. In the event of underground tests, a mobile inspection team would provide the only capability for confirming the fact of a nuclear explosion, other than that derived inferentially from repeated suspect activity at a given site.

"Such teams must be able to move rapidly into the suspect area before instrumentation and other physical evidences of testing have been removed; conduct low altitude aerial reconnaissance; follow roads and car tracks, and inspect on the ground any unusual activity; and, if justified, interrogate residents in the vicinity and obtain, under extreme conditions, the right to drill for core samples. Such drilling operations are time-consuming and difficult, but provide the only proof that a very low yield deep underground test has been conducted.

"This elaborate inspection system and the concurrent use of all intelligence sources will not guarantee detection of such underground tests, particularly since seismic signals from a low yield underground test cannot be consistently distinguished from normal earthquake signals. However, these elaborate precautions should raise serious doubts in the minds of the Soviets as to whether they should risk such an attempted evasion. We believe it more likely under these circumstances that they would abrogate a test moratorium under some false pretense rather than by surreptitious testing.

"The expansion of the nuclear test detection system to include geophysical stations and mobile inspection teams within the USSR will greatly increase our overt and covert intelligence collection capabilities against a wide range of other Soviet activities. While this does not of itself justify implementing the proposed test moratorium and inspection system, it is a bonus therefrom that would have direct bearing upon military order of battle, early warning and economic intelligence."

³ These opinions of the Central Intelligence Agency were prepared by the Assistant Director of CIA for Scientific Intelligence, Dr. Herbert Scoville, Jr. and are included at this point in the AFOAT-1 report at the request of the Chairman of the Ad Hoc Panel on Nuclear Test Limitation. [Footnote is in the original.]

*f. Contribution of Other Intelligence Sources to the Detection of Clandestine Nuclear Test.*⁴

"In addition to the aforementioned capabilities of the U.S. Atomic Energy Detection System as augmented, it is anticipated that a concurrent expansion of the clandestine collection effort will be attempted. This covert effort will be designed to help detect attempted evasion of a test moratorium via the development of selected informants and the surveillance of activities which may be indicative of such an attempt.

"The routine flow of information from all other intelligence sources should provide assistance in alerting us to possible attempts at evasion within the USSR, but they will not provide any direct evidence that a test in violation of the moratorium has been conducted. The major contribution of such sources would be the detection of preparations for such an evasion and the targeting of the general area involved.

"Conceivably, Soviet clandestine nuclear tests could be staged in remote areas outside the Soviet Bloc such as Antarctica or southern waters. However, all intelligence agencies have agreed that such possibilities would probably be excluded by the Soviets, since various conventional intelligence collection efforts would be almost certain to spot the activities which would be associated with test preparations, if not the test itself. Difficulty would probably be encountered in proving such a test had actually been conducted unless fresh radioactive debris was obtained, and this could be associated in some way with Soviet operations."

g. Security and Classification Problems. It would probably not be advisable to reveal the existing operational network of the AFOAT-1 Long Range Detection System to other nations for the following reasons:

1. Termination of the moratorium would leave the U.S. with the requirement to use a compromised world-wide network of stations.
2. Many small countries presently giving hospitality to AFOAT-1 stations would be compromised by release of the information to the Soviet Union.

The operation of an International Test Monitoring System will presumably be for the purpose of producing scientific proof of a violation by the U.S., the USSR, the U.K., or any other nation. The type of scientific proof will be as follows:

- (1) Seismic, acoustic or electromagnetic records of nuclear tests which permit determinations of time, place, height of burst, and yield.
- (2) Radiochemical data on samples of debris which establish its date of origin, nature of the device (fission or fusion), etc.

⁴ These opinions of the Central Intelligence Agency were prepared by the Assistant Director of CIA for Scientific Intelligence, Dr. Herbert Scoville, Jr. and are included at this point in the AFOAT-1 report at the request of the Chairman of the Ad Hoc Panel on Nuclear Test Limitation. [Footnote is in the original.]

The present Atomic Energy Act of 1954 classifies data in both of these categories for both U.S. and U.K. weapons as well as the samples of debris themselves as Restricted Data because they may reveal "important information on the design and fabrication of nuclear weapons."

Two problems arise, therefore, in the operation of a monitoring system. First, the data in the above categories would have to be cleared for distribution to foreign nationals, and second, some procedure would have to be developed to limit analysis of debris to those measurements necessary to establish the freshness of the debris but to exclude more esoteric measurements which may reveal important information on nuclear devices exploded by either the U.S. or the U.K.

h. Installation Costs of a Long Range Detection System for Clandestine Tests in the USSR. The Long Range Detection System within the USSR discussed above involves 30 acoustic stations of the present type, 43 seismic stations utilizing improved instrumentation at each station, 30 electromagnetic stations utilizing present equipment plus complete aerial filtering coverage of air masses emanating from the USSR and China. The seismic and acoustic stations, because of their mutually incompatible technical site requirements, cannot generally be co-located. The electromagnetic stations, however, are usually found, from a technical standpoint, to be compatible with either seismic or acoustic locations and they therefore may be co-located with one or the other. Therefore, a total of 70 detection stations within the USSR and China would be required.

The time required to install such a system will depend on a number of factors. First, negotiation with the Russians for station locations could turn out to be quite protracted. Technical surveys of possible site locations will have to be made for each of the acoustic, seismic and electromagnetic components installed. Low, flat land remote from electrical disturbances both man-made and natural, as well as from large metal buildings, fences, etc., are the principal requirements for a good electromagnetic station. Level or slightly rolling terrain in areas of relatively low wind velocity provide good acoustic locations. Residential areas of cities are practical since man-made noise does not affect the ultra low frequency acoustic detectors. The geology of the region is critical to satisfactory seismic locations. Of importance also to a good seismic site are areas of low storm activity and areas remote from man-made or natural noise.

The above general statements concerning the requirements for adequate site locations are greatly simplified and presented only to indicate that the survey for the location of all the proposed stations will be a relatively involved and time-consuming operation. Usually it is desirable for the survey team to remain in the area taking background measurements for a period of approximately 1 to 3 months, depending on the technique which is to be used at the site. If several survey teams could operate simultaneously, the time could be reduced.

A conservative estimate indicates that the survey would take of the order of at least six months for all the stations suggested.

The procurement of equipment, which could be initiated concurrently with the surveys, is estimated to take from 6 to 18 months, depending upon the type of equipment. The installation of the equipment, which must take place in series with the surveys, will take from 12 to 18 months, depending on the type of installation. Training of operators, which can start concurrently with the start of the survey, will take from 6 to 12 months, depending on the type of training and upon the procurement of personnel to be trained. This could become relatively involved if utilization of personnel of several nations is planned.

Based upon the above time factors, it is conservatively estimated that two years would be required for the installation. Assuming a minimum of ten months to determine U.S. policy and to negotiate an agreement with the USSR, the system would not be in operation prior to 1 January 1961.

A rough estimate of cost of the installation has been made based upon the assumption that each installation be self-sufficient and independent of the local economy. It was further assumed that all materials and labor would be provided from the U.S. Individual station costs include water supply and filtration, electrical power supply, sewage disposal, access roads, pole lines and vaults, equipment shelters, barracks and latrines, mess hall, vehicle storage and maintenance, fuel storage, technical and support equipment and, most costly of all, a complete communications center. Obviously, depending upon local conditions at each site, the extent of local support in manpower, materials and communications, considerable reduction in cost figures could be effected. These rough estimates indicate that the equipment and installation would cost about \$100,000,000 and operation might run \$30,000,000 per year.

4. A SYSTEM FOR DETECTING NUCLEAR TESTS IN REMOTE AREAS OF THE WORLD.

In Section 3 of this report, a comprehensive detection system has been described which would detect clandestine tests of relatively low yield within the USSR. While this system is by no means fool-proof, principally because of the possibility of evasion by conducting tests underground where detection and identification of all tests is extremely difficult, it would certainly force the Soviets to consider other environments in which clandestine tests might be conducted either with less risk of detection or with greater facility.

It has been pointed out previously in this report that the existing AFOAT-1 Long Range Detection System, as well as the system within the USSR and China described in Section 3, will have a very poor detection and identification capability for tests in areas of the earth remote from those detection systems. The Soviets certainly are aware of this fact and therefore might be strongly tempted to conduct tests in these remote areas using a submarine task force. Tests under these conditions would probably permit limited but adequate diagnostics for the purpose.

One rather disconcerting possibility in this connection would be for a Soviet submarine to deliver a nuclear device to the Marshall Islands and detonate it, fully aware that it would be detected. Such a maneuver would probably be followed up by Soviet propaganda that the U.S. had conducted another test in violation of a moratorium agreement. Proving the national origin of such a test by any scientific means would be extremely difficult.

With possibilities such as these in mind, a system is now described which would permit a greatly increased detection capability in the most remote areas of the world. This system includes acoustic, seismic, electromagnetic and air sampling components designed on the basis of availability of land masses in the Southern Hemisphere and in the large ocean areas of the Northern Hemisphere rather than being designed for a specific detection capability. The system has then been evaluated for its probable detection capability.

a. *Acoustic Net.* It is estimated that about 22 acoustic stations (see Figure 12) would be required to supplement the present long range detection net in order to achieve a capability of 90–100 per cent to detect shallow sub-surface, surface and air bursts with a yield as low as 40 KT anywhere in the world outside the USSR and China. This estimate is based on experience in detecting U.S., U.K and USSR nuclear tests which indicates that explosions as low as 40 KT can be detected with excellent reliability at a range of 2500 nautical miles. The requirement that at least two acoustic stations detect an explosion in order to establish the location and time of the event also influences the choice of stations.

It should be noted that two factors make the capability estimates less reliable for places outside the USSR than for those within the USSR. One is the fact that there have been only 15 nuclear explosions conducted in the Southern Hemisphere, e.g., U.K. tests in Australia, and acoustic data on these are sparse. The other is the fact that a number of island locations for stations had to be chosen in order to cover the Antarctic and remote ocean areas. Noise levels at these locations will probably be considerably higher than at present sites, making detection more difficult.

It is estimated that such a net could detect shallow sub-surface, surface or air bursts with a capability of 90–100 per cent for 40 KT or larger, 60–90 per cent for 10–40 KT, 30–60 per cent for 5–10 KT and 0–30 per cent for less than 5 KT.

b. *Seismic Net.* About 10 seismic stations (see Figure 12) of the type presently used by AFOAT-1 would be required to supplement the present long range detection net in order to achieve a capability of 90–100 per cent to detect underground bursts with a yield as low as 20 KT anywhere in the world. This estimate is based on experience in detecting the Rainier shot and a number of underground high explosive charges. The limited data available indicate that seismic signal amplitudes expected from a 20 KT sub-surface burst would be about twenty times larger than shown in Figure 6. Assuming good station locations could be found with

noise levels of the order of 5 millimicrons, signals should be detectable at all distances out to 6000 nautical miles. A minimum of four detecting stations is required to determine the location, time of occurrence and depth of focus of each shock. Suitable station sites south of the equator are rather limited in number, since the Southern Hemisphere is predominantly oceanic, and island locations are generally found to be extremely noisy. With the addition of stations shown in Figure 12, it is believed that signals could be received at four or more stations from large subsurface shots in all parts of the world. The region of least detection capability is an area of about 1000 miles radius centered near 10° S, 165° W in the South Pacific Ocean. It is estimated that such a worldwide net would have a capability of 90–100 per cent to detect subsurface bursts of 20 KT or larger. Below 10 KT the detection capability deteriorates very rapidly, e.g., at 5 KT there is virtually no possibility of three-station detection.

The identification of those natural earthquakes producing signals of the same size as a 20 KT sub-surface burst is discussed in paragraph 2b. It is estimated that 400 shallow earthquakes per year will be in this class. Of these, about 300 can be identified as earthquakes with reasonable certainty, leaving 100 events per year requiring detailed investigation by inspection teams.

c. *Electromagnetic Net.* Electromagnetic detection of tests in the Southern Hemisphere is favored by the fact that most of the propagation paths will be over water, which will give somewhat less attenuation than over land. However, an unfavorable characteristic of the Southern Hemisphere with respect to detection is that South America, Africa and the East Indies are areas of high thunderstorm activity. Furthermore, the inter-tropical front which encircles the globe approximately at the equator with seasonal shifts from the north to south, constitutes a band of additional thunderstorm activity.

A network of 23 electromagnetic stations has been selected, with the stations made parasitic on the acoustic or seismic locations shown in Figure 12. The detection capability for the network as a whole is estimated to be 90–100 per cent for tests of 100 KT or greater throughout these remote areas of the world.

d. *Air Sampling Net.* In designing a network of air sampling flights for nuclear detection in the remote ocean areas of the world, consideration has been given to the complexity of the wind patterns on a global basis. It is estimated that daily aerial filtering along three meridians with approximately pole-to-pole coverage at each of two altitudes, e.g., 20,000 and 40,000 feet, will provide a detection capability of 90 per cent or greater for tests of about 5 KT detonated between the surface and 25,000 feet. Tests detonated at altitudes higher than 25,000 feet will require special-vectored high altitude sampling flights based on early warning from other components of the detection system.

As is shown in Figure 13, the pole-to-pole coverage is along meridians at approximately 140° E longitude, 50° W longitude and 20° E

longitude. Radiochemical laboratories would be located at Tokyo, Melbourne, Montreal, Buenos Aires, Rome and Capetown. These laboratories would be equipped with the latest devices for the detection of fresh nuclear debris.

e. *Overall Detection Capability.* It is estimated that this system of about 30 geophysical stations plus an air sampling network could detect and identify with 90–100 per cent certainty nuclear tests of 20 KT or larger conducted as shallow sub-surface, surface or air bursts up to 50,000 feet in remote areas of the world. Underground shots of 20 KT or larger in remote parts of the world would be detected with a certainty of 90–100 per cent but not identified as nuclear explosions. Identification of such underground disturbances may be possible through the use of inspection teams investigating about 100 disturbances per year in these remote regions of the world.

The U.S. underwater test (WIGWAM), conducted at a depth of about 2000 feet, produced a unique spectrum of seismic waves at distances of 3000 miles. Ultra-long period seismometers would probably extend this range at least by a factor of two. The existence of these waves suggests that any similar occurrence in remote parts of the world would attract immediate notice on the network of seismic stations described above. It is therefore believed that an underwater explosion of 20 KT or larger anywhere in the world would be reliably detected and probably identified as an explosion rather than an earthquake, because of the marked difference between such signatures and normal earthquake signatures.

Appendix C

CONCEALMENT AND DETECTION OF NUCLEAR TESTS UNDERGROUND

Harold Brown and Hans A. Bethe

I. *General*

Complete containment of a test explosion underground, though devised as a method for making testing easier by eliminating fallout, may also serve as the most effective method of concealing the existence of tests, and may make it very difficult to gather effective proof that such tests have been carried out in violation of a suspension agreement.

Such an explosion provides no electromagnetic signal, and the acoustic signal if it exists at all will be so muffled and distorted that it will not be characteristic even at a distance of a few hundred miles. No activity is released into the atmosphere, so that the only detection method is the seismic. To provide proof by scientific means the residual activity from the explosion must be located underground and sampled.

II. *Results from Rainier Test*

The only such shot carried out in this country which casts any light on such procedures is the Rainier shot of Operation Plumbbob. This was 1.7 KT in yield, and was buried 800 feet from the nearest ground surface, in volcanic tuff. About 1% of the energy appears to have gone into the seismic wave, producing a magnitude 4.2 earthquake indication on seismographs a few hundred miles distant from the shot. Accelerometers indicate that the top of the mesa under which the device was located moved up about a foot and then fell back again. Rocks on top of the mesa were displaced somewhat, and some were rolled down the side, but the appearance of the surroundings after the shot was not inconsistent with the results of a small earthquake; rocks moved by the shot could not be distinguished from those moved by past earth motions, and fissures were present both before and after. Most observers at a distance of 2-1/2 miles felt no earth shock. This is due principally to the absence of hard rock between the source and the observation point. (It is possible that an underground shot will create *less* disturbance above ground than an earthquake of the same seismic magnitude, and that this might be ascertained by examination of the ground around the event and by questioning of the local population, if

any, but extensive experience in the local effects of underground shots would be needed before any such difference could be established.)

One could expect to contain the shot completely without venting by using as little as 500 feet distance to the surface if more disturbance of the surface were allowed; such disturbance would still not be characteristic of an explosion rather than an earthquake. Burial depth required will vary with somewhere between the $1/3$ and $1/4$ power of the yield; a reasonable formula is $400 W^{0.3}$ feet (W in KT).

No activity above background was discernable either above the ground or in the tunnel leading to the explosion chamber, which was blocked off only 200 feet from the shot site. Thus the absence of activity is not merely absence of a radioactive cloud at several hundred miles, but of any radioactivity above ground or in any other region accessible without drilling. The horizontal access tunnel, 1700 feet long from the portal, showed some slabbing and cavein for several hundred feet beyond the point where it was blocked.

Exploration of the region around the zero point by drilling in from the tunnel at a distance of 210 feet has revealed that the solid fission products are contained in a shell a few feet thick at a radius of 55 feet. After four months the peak activity measured along a line at the level of the zero point was 800 mr/hour, while along a line aimed at a point 50 feet below zero from a point 210 feet away horizontally the peak was 40 r/hour. Outside of the shell the activity as measured by a counter was indistinguishable from background. Peak temperature along the horizontal line was 45°C , along the other line it was 65° . Diffusion appears to have carried elevated temperature into the zero point, and some rise above ambient is also noted out to about 70 feet.

Thus a 55-foot radius hole appears to have been established momentarily but then to have collapsed, and the falling in appears to have continued up to a point 400 feet above zero, where a hole 25 feet in radius and 25 feet high was discovered in drilling. This hole contained gaseous fission products at the same concentration as they appear inside the 55-foot radius region around zero, so the entire volume in between appears to be simply connected. This accounts for only a few percent of the gaseous fission products, and it is thought that the remainder were trapped in the resolidification of the molten rock. The region from 55 feet to 130 feet is still impervious but was apparently crushed since the drilling shows water return but no core return. It has not yet been feasible to detect this crushed region by sonic measurements even from inside the tunnel, so that detection by sonic means from above the surface is at least very difficult.

III. *Diagnostic Experiments*

Diagnostic experiments necessary for weapon development can be easily carried out underground. The yield can be measured by shock

arrival time measurements in the rock, analagous to the fireball measurements above ground. This was done on Rainier and appears to be accurate to 10% even without a calibration. The radius of the radioactive debris or the amount of material melted might also be used if the medium is calibrated by a shot of known yield. The prompt diagnostics such as neutron and gamma ray measurements to give time interval or propagation burning data, streak camera work, etc., can be done better below than above ground since the shielding is free and one need only drill holes as desired. Radiochemistry has not been demonstrated to be satisfactory, since fractionation does occur. However, the use of hollow pipes leading into reception chambers from the device may give a substantial fraction of debris unfractionated, and may lead to satisfactory radiochemical diagnostics.

Preliminary estimates indicate that a test operation can be carried out more cheaply underground than on towers and balloons. The diagnostic stations could also be underground for clandestine tests (in fact they probably will be even if the tests are not hidden). Keeping underground tests secret will increase the costs by preventing the use of a single diagnostic bunker for many shots on the basis that more than one in a given vicinity increases suspicion and the possibility of proving a violation. It may mean that each shot must be in a completely different area, but this conclusion may be modified to some extent, because also natural earthquakes have aftershocks. In any event, such extra costs are associated with clandestine tests generally rather than underground tests specifically and are not likely to be more than a few million per shot, which is not a large percentage increase.

IV. Dependence of Seismic Signal on Yield and Medium

On the basis of observations, it is believed that the amplitude of the earth motion from an underground explosion increases as the 1.2-power of the energy released. This scaling law is obtained on the basis of explosions of conventional explosives underground (quarry blasts). The law is somewhat surprising; theoretically one would expect that the seismic amplitude would go as the square root of the energy release. The empirical law has been used in Appendix A to predict the frequency of earthquakes in the USSR which might be confused with subsurface shots of various yields. The empirical law clearly gives more larger results for the seismic signal to be expected from shots of larger yield than Rainier than the "theoretical expectation" would give.

The empirical law indicates that a larger fraction of the energy release goes into seismic waves at higher yield. This effect certainly must stop at some point; at about 100 kilotons the entire energy would be converted into seismic energy if the 1.2-power law held up to that yield. Experiments are urgently needed to establish the actual relation between yield and seismic signal. These should be carried out with

nuclear explosions since conventional explosives may not give the same effect due to the evolution of large amounts of gas.

The seismic signal will depend strongly on the medium in which the test is conducted. The volcanic tuff in which the Rainier test was conducted probably gives a relatively small seismic signal; it is only equivalent to an air shot of about 20 times greater yield. Hard rock would almost certainly give a stronger seismic signal while on the other hand it may contain the radioactive products in an even smaller volume. On the other hand, unconsolidated material which is found in many places near the surface of the earth may well reduce the seismic effects below those observed in the tuff because the signal should decrease with decreasing yield stress, and unconsolidated material may have a yield stress as low as one-tenth of that of tuff (which has about 10,000 psi).

It may also be possible, by excavating a large chamber to begin with, to reduce the energy found at large distances by a factor of 10. One possibility which may reduce the seismic energy is the excavation of large cavities in salt domes. Such cavities may be tens or even hundreds of millions of cubic feet in volume, and need not be spherical. For example, a cavity 150 feet in diameter and 3000 feet long may have nearly the same effect as a spherical one of the same volume. The excavation of such a cavity would be fairly costly, and its use might be limited to a single occasion because it might cave in. To find out to what extent the seismic signal from an underground explosion could be reduced by suitable choice of medium, many tests would be required but most of these could be carried out at low yield.

It is likely that reduction of seismic signal is easier for low-yield shots than for high-yield ones. Unconsolidated material is found only in the top layers of the earth and the required burial depth increases with yield, so that it may be difficult to find such material deep enough to successfully contain a 50-kiloton test. The digging of underground caves large enough to give a substantial reduction of the seismic signal from a 50-kiloton explosion will be very costly and may in fact be impossible, especially since for mechanical stability a cave must be *smaller* at great depth than near the surface. Thus it may well be possible to reduce the signal from a 5-kiloton explosion so that it "looks like" 1/2 kiloton, but more difficult to make 50-kiloton explosion appear like 5 kilotons.

V. Identification

It is shown in Appendix A that the seismic wave from a 1-kiloton sub-surface explosion in surroundings similar to those of the Rainier shot will be detected by the net of seismic stations proposed for the USSR in that appendix. However, there are about 2500 earthquakes per year in the USSR which give signals of similar strength. The most promising feature of seismic signals from underground explosions distinguishing them from earthquakes is that the first pulse from explosions always

corresponds to compression while the first pulse from an earthquake is compressive in two quadrants, while it corresponds to dilatation in the other two. It is estimated in Appendix A that there will be about 300 earthquakes of strength equivalent to 1 kiloton or over which will give signals in the proposed seismic detection net which cannot be distinguished from nuclear explosions and therefore will require further investigation on the spot. If the limit is set at 5 kilotons the number of unidentifiable earthquakes will be about 35.

It should be pointed out that 1 and 5 kilotons refer to the size of the seismic signal, not to the actual yield. By proper choice of the medium as discussed in Section IV, tests of 10 kilotons might be made to look like a normal 1-kiloton explosion, and perhaps, with more difficulty, 50 kilotons to look like 5. According to seismologists, it is unlikely that a nuclear explosion could be so conducted (by proper shaping of the explosion chamber) that the signal is dilatational in some directions.

The seismic signals would locate the source within about 5 miles. Investigation on the spot will then be necessary to decide whether the signal could be due to a test, this is described in Section 3e of Appendix A.

One would presumably try to find the entrance to the tunnel which was used for the test. The experiment could be carried out in a remote area, where there would be no people to give away the game, but then such indicators as roads, unusual human activity, etc., might make the inspection team dispatched on receipt and study of the seismic signal suspicious. They would still have to find the entrance (say a 6 foot hole, since covered up), proceed to the correct part of the tunnel, and drill successfully to get proof. This is made difficult by the small radius of the shell in which the radioactivity is concentrated (55 feet for Rainier). Alternatively one might use an area of substantial human activity, thus producing less unusual change in what is going on, but perhaps requiring more local people to know about what was going on or become suspicious about it.

To summarize:

1. Detection of underground shots depends entirely on a seismic net. Identification depends on local investigation.

2. Adequate proof of violation probably depends on location of the debris, which is confined to a shell whose radius is of the order of $40 W^{1/3}$ feet where W is in KT, and whose depth is of the order of $400 W^{1/3}$ or larger as desired. Within the five mile radius circle of uncertainty identified by the seismic signals, the entrance to the tunnel or hole must be found as a beginning in finding the activity. Broad access is required to have a good chance of locating the debris and thus providing proof.

3. Adequate diagnostic information for weapon development can almost certainly be obtained at no great increase (and perhaps some decrease) in cost by testing underground. It has not been proven that radiochemical detectors can be used, but it appears possible that some

can by appropriate design of underground chambers. Some extra cost may be incurred if it is required to duplicate diagnostic bunkers, etc., in order to avoid testing several devices in one region so as to reduce suspicion; this is characteristic of clandestine rather than of underground shots.

4. Experimental data is lacking or insufficient and should be acquired either prior to or as part of an agreement on the following subjects:

(a) Reducing the seismic energy by choice of medium and design of explosion chamber. Reducing the radius of the radioactive region by choice of medium.

(b) The complete range of radiochemical detectors in diagnostics of underground shots.

(c) Possible distinctive characteristics of underground explosions which will enable them to be told surely from natural earthquakes. This includes the seismograph records at a distance, and earth motions nearby. Possible special chamber design to remove such distinctions if any are found to exist must also be studied.

(d) Use of acoustic sounding from above the surface to detect the disturbed region below the surface. This has not yet proven feasible even from inside the tunnel.

Enclosure

Memorandum From Killian to Gray

Washington, March 28, 1958

SUBJECT

Transmittal of Report

In accordance with Action No. 1840 of the National Security Council, as approved by the President on January 9, 1958, I submit herewith "a study to cover the technical factors involved in monitoring a long-range rocket test agreement to assure that it is carried out for peaceful purposes (such as the launching of scientific reconnaissance vehicles)." This report has been prepared by an Ad Hoc Working Group of the President's Science Advisory Committee and the Central Intelligence Agency. The Deputy Secretary of Defense agreed to the membership of this Working Group and the Department of Defense did not, itself, nominate additional representatives.

The Ad Hoc Working Group did not consider whether a missile test prohibition agreement could be enforced by the inspection of missile production, operational launching sites or the nuclear aspects of the problem. These questions were felt to be outside of the area of competence of the members of the Ad Hoc Working Group.

The Ad Hoc Working Group, in preparing this report, limited itself to the technical factors involved. It excluded from its consideration any question of policy with respect to whether there should be a rocket test agreement. In accord with its directive, it also excluded from its consideration the military implications of a test suspension on the U.S. and the U.S.S.R.

This report is submitted for the consideration of the Council at its meeting on April 3, 1958.

/s/ J.R. Killian, Jr.
Chairman

Attachment

Report Prepared by the NSC Ad Hoc Working Group

Washington, March 26, 1958

REPORT OF THE NSC AD HOC WORKING GROUP ON THE MONITORING OF LONG-RANGE ROCKET TEST AGREEMENT

In response to the action taken by the National Security Council meeting on January 6, 1958, an ad hoc working group of the President's Science Advisory Committee and the Central Intelligence Agency has undertaken a study of "the technical factors involved in monitoring a long-range rocket test agreement to assure that it is carried out for peaceful purposes."

On the basis of technical presentations and discussions at its initial meeting on 13 March 1958, the working group arrived at the conclusions set forth below. For the purpose of this study, the working group considered "long-range" rockets to include the IRBM, ICBM, and vehicles capable of orbiting satellites for either military or peaceful purposes. No attempt was made to establish an exact definition for "peaceful purposes." However, it was assumed that rockets for the delivery of nuclear or other warheads [*text not declassified*] are not for "peaceful purposes."

CONCLUSIONS

1. The remote detection of long-range rockets, which are fired from any point in the Soviet bloc and which leave the atmosphere, could be made almost certain by a monitoring system employing an expansion of the present intelligence detection systems at locations outside the Soviet bloc and new techniques now under development. [*text not declassified*]

2. The detection of long-range rockets, which are fired anywhere in the Soviet bloc from either known or unknown launching sites and which leave the atmosphere, could be further improved by a monitoring system which included suitably placed stations [*text not declassified*] however, such stations may actually not be required to provide certainty of detection.

3. The above mentioned detection techniques may not be capable of discriminating in all cases between "long-range" rockets and other large rockets which leave the atmosphere, such as short-range military ballistic missiles and certain types of AICBM's. For this reason the remainder of the conclusions are stated in terms of "large rockets which leave the atmosphere." It must be recognized that the definition

of “long range” or “large” rockets would have to be very carefully considered in the preparation of any type of agreement in this field.

4. Although an agreement to exchange advance flight schedule information on large rockets leaving the atmosphere could be monitored, it would not be possible to distinguish with any degree of confidence between a large rocket fired as a part of a military program and one fired for “peaceful purposes” [*text not declassified*].

5. In view of the inherent similarity of the technical problems involved in [*text not declassified*].

6. Even though inspectors stationed at authorized launching sites were empowered to undertake an inspection of the assembled rocket prior to the launching as part of an agreement limiting large rocket tests to “peaceful purposes,” it would not be possible to assure that the tests would not contribute most if not all of the essential data for the development of a military ballistic missile program as well as operational experience for military personnel.

7. A complete prohibition of the launching of all large rockets leaving the atmosphere, including those intended for “peaceful use,” could be fully monitored and would freeze the development of ballistic missiles and space vehicles near their present status and would prevent their use for “peaceful purposes.”

8. An agreement, prohibiting *all* national large rocket testing and establishing either an international or joint US-Soviet agency to plan and *execute* all rocket firings for “peaceful uses” of space would still provide the nations participating in the agency with some information pertinent to military missile development. However, such an agreement could probably be designed in a manner which would limit the rate of accumulation of this information to a rather low level.

9. Although an agreement which established an international or joint US-Soviet agency to plan all rocket launchings for “peaceful uses” of space without prohibiting other national tests would not have direct effect on the capability of participating nations to develop military missiles, such an agreement might have desirable features in developing international cooperation and might contribute to a reduction of international rivalry in the missile field. [*text not declassified*] The advantage of such an agreement would be increased if the rocket launchings were carried out by the agency.

10. An agreement to prohibit *all* nationally conducted large rocket tests would not prevent the USSR from building up an operational military missile force, if the USSR had already developed an ICBM capability as of the time of such an agreement. The maintenance and expansion of this capability by the USSR could only be prevented by the prohibition of the retention or manufacture of ballistic missiles or nuclear warheads. The panel did not consider whether, in fact, such a

missile prohibition agreement could be enforced by the inspection of missile production, operational launching sites, and other techniques or the nuclear aspects of the problem. A military missile force built up under these conditions, without the opportunity for quality control tests and military training tests, would deteriorate with time and cease to be instantly available.

Memorandum From Quarles to Cutler

Washington, April 1, 1958

SUBJECT

U.S. Policy on Control of Armaments

REFERENCE

NSC Action No. 1840, 6 January 1958

Pursuant to the above reference designated representatives of the Department of Defense have participated in the discussions and findings of the Ad Hoc Panel on Nuclear Test Cessation, established by the Science Advisory Committee to report on the studies called for in paragraph 1c(1), (a), (b), and (c). In addition, at the request of the Panel, the Department of Defense submitted its views on those aspects of the technical studies related to the military losses to the U.S. and the USSR consequent on a total suspension of nuclear tests at specific future dates. The Department's views are contained in the attached memorandum of March 21, 1958, which also forwarded the views of the Joint Chiefs of Staff as expressed to the Secretary of Defense in the memorandum of March 13, 1958. The Chairman of the Panel now informs me that the views expressed therein relate, in part, to matters outside the scope of the technical studies made by the Panel, and, therefore, that these views have not been considered by the Panel and will not be appended to the report as originally contemplated. Accordingly, it is requested that the attached memorandum be circulated for NSC consideration in connection with the report to be submitted by the Ad Hoc Panel of the Science Advisory Committee.

Attachment**Memorandum From Quarles to the Chairman of the Ad Hoc Panel on Nuclear Test Cessation (Kistiakowsky)**

Washington, March 21, 1958

SUBJECT

The Effects of a Total Suspension or Cessation of Nuclear Testing

Pursuant to NSC Action No. 1840, 6 January 1958, representatives of the Department of Defense have participated in the discussions of your Panel concerning the technical feasibility of monitoring a nuclear weapons tests suspension and the predicted technological status of the United States and the USSR with respect to the development of nuclear weapons, assuming a total suspension of nuclear tests as of 1 September 1958. Documents prepared by the Atomic Energy Commission and the Central Intelligence Agency portraying the predicted position of the United States and the USSR, respectively, have been considered by the Joint Chiefs of Staff and their views relative to the military impact of cessation of testing are transmitted herewith.

The reports of the Atomic Energy Commission and the Central Intelligence Agency are accepted as reasonable and satisfactory estimates of the technological positions of the United States and the USSR, with the understanding that events of the near future may necessitate significant revisions of these estimates. Broadly stated, the estimates indicate that at present and also as of the end of 1958, the United States possesses an advantage in yield versus weight ratios, in flexibility of applications, in the economy of use of special nuclear materials and possibly in knowledge of weapons effects of a specialized nature.

It is reasonable to assume that with the continuation of testing the gap will be narrowed and that both nations may be expected to attain the practicable limits of nuclear weapon development as these limits can be foreseen at this time. It is equally reasonable to assume that in the absence of testing the gap will likewise be narrowed but at a slower rate which will be governed by a number of factors over which the United States can exercise little or no control, such as stepped up espionage, ingenuity in devising partial substitutes for testing, and the extent to which the Soviets may be willing to accept the risks of clandestine testing as well as the risks of a lower probability of achieving desired performance characteristics. The achievement of technological parity as regards the practicable limits of nuclear weapons development as now foreseen with and without continuation of testing appears, therefore, to be a matter of time differential only, with the United States holding an advantage for an indeterminate period in either case.

Concerning developments in the nature of “break-throughs,” that is, beyond presently foreseen practicable limits, both parties will be inhibited by a test cessation and the advantage will lie with the nation which is able to maintain the higher level of effort and interest in nuclear weapon research and development, the security with which it guards its findings, and the risk it is willing to accept in the conduct of clandestine test operations or its attitude toward the abrogation of treaties.

Relative technological status of nuclear weapons development at the moment and for the foreseeable future is not an adequate index of relative military posture. Consequently, an assumption that the future improvement of weapons designs and the knowledge of weapons effects to be gained from nuclear testing is more important to the Soviets than to the United States is untenable. Within the time available for the submission of the Defense Department’s views on the subject matter set forth in NSC 1840, it has not been possible to prepare, on the basis of material submitted by the Atomic Energy Commission and the Central Intelligence Agency a system-by-system comparison which the Panel has indicated to be desirable in order to appraise the relative impact of test cessation on the military postures of the Free World and the Soviet Bloc. With the rapidly changing weapon development scene it is highly questionable whether such an appraisal would be valid even for a brief period.

As pointed out by the Joint Chiefs of Staff, cessation of testing as of the date under consideration will find a number of important U.S. research and development programs aborted or drastically limited:

(a) The study of effects at ultra high altitudes essential to the design of effective anti-ICBM and other systems involving outer space, including the warheads, the delivery means, countermeasures and counter-countermeasures;

(b) Second generations of IRBM’s, ICBM’s and Fleet Ballistic Missiles designed to drastically reduce overall systems costs and reaction times;

(c) Economical designs of warheads for highly mobile systems for the support of battle groups and for air defense;

(d) Clean weapons in the middle and lower range yields;

(e) Weapons which combine absolute nuclear safing with safety from predetonation.

With respect to Items (a) and (b) above, the facts are:

(a) That the USSR possesses a recognized long range missile capability and that following the conclusion of the HARDTACK test program the United States will still not be fully assured of the design of an effective anti-ICBM system to include adequate knowledge of weapon effects at ultra high altitudes and the essential characteristics of the nuclear warheads required.

(b) Since the deterrent capability of U.S. long and medium range missile systems is compromised by the Soviets' ability to adopt the initiative, the retaliatory threat of these systems should be maintained at the highest feasible level through further warhead development, improved readiness and, if necessary, by greater dispersion and larger numbers.

It is the Department's view that until these two requirements are adequately and assuredly met through necessary test programs, the United States should not enter into a test cessation agreement unless it is a part of a broader agreement which offers very large compensating advantages.

In considering the inability of the United States to pursue Items (c), (d) and (e) as listed above, it appears necessary to give adequate weight to political, psychological and economic factors which are certainly not of equal importance to the United States and the USSR. While broadly speaking these factors are outside the area of direct military responsibility, they have a distinct and important bearing on the total Free World military posture. The problems of world wide dispersion of nuclear weapons for potential use by and support of friendly forces and the occupation of foreign bases by U.S. forces possessing a nuclear weapon capability affect not only quantitative requirements but also design features maximizing safety in handling and simplicity of maintenance. On a broader basis, concepts developed in the interests of political solidarity of the Free World which would place restrictions or restraints on the use of nuclear weapons by reason of geographical, psychological or moral considerations, may require the conduct of nuclear operations under conditions which the Department of Defense could not meet without the further developments indicated above. While the Department of Defense does not necessarily indorse limited war concepts which would place restraints on the types of nuclear weapons which may be used and the targets which may be attacked, it is my view that it would be a serious disadvantage for the United States to enter into a test cessation agreement which would block it from further tactical weapon developments of the type indicated by (c) and (d) above.

As regards the inability or time lag attributed to the Soviets in achieving a position equivalent to or approaching that of the United States, it should be obvious that as long as quantitative aspects of nuclear weapons and both quantitative and qualitative aspects of other weapons and delivery systems remain uncontrolled, efforts will be made by both sides to compensate for failures to attain practicable and desirable objectives in nuclear weapons designs by improving delivery systems, maintaining larger forces or by other means. For example: The Soviets' assumed inability by reason of a test suspension to achieve an ICBM warhead of yield equivalent to ours does not deny them the capability of an equally effective ICBM system through the development of

larger payload capacity, improved accuracy of delivery and/or reliance on larger quantities.

It is in the light of the above considerations that I find myself in general agreement with the belief of the Joint Chiefs of Staff that in *its* overall long range effects a test cessation will operate to the distinct disadvantage of the United States. If such a test cessation is a positive and integral part of more comprehensive measures which deal with the stabilization and reduction of nuclear weapons stockpiles, the prevention of surprise attack and the regulation of armaments and armed forces, the military disadvantage of test cessation becomes acceptable in the light of these major objectives. In any case, the United States should not become a party to a test cessation agreement which would prohibit the conduct of tests of yields, in environments and under conditions which the agreed and implemented control system would be unable to monitor satisfactorily as to detection, identification and responsibility.

Donald A. Quarles

Memo for SecDef frm JCS,
13 Mar 58, w/Appendix

308. Record of Telephone Conversation Between Eisenhower and John Foster Dulles¹

April 7, 1958, 8:30 a.m.

The Sec. said he was sending to the President a clean draft of a message to Khrushchev. The Sec. said that after he wrote the Pres. on Sat. we sent a draft to London. Macmillan looked it over and came back with some minor suggestions which are incorporated in the draft the Sec. was sending over. They discussed whether the Sec. would come to the WH this morning and Sec. said he could come over at 10 on his way to the Pentagon.

The Sec. mentioned Jim Hagerty's idea about the possibility of a somewhat different approach to Khrushchev and try to put him behind the propaganda eight ball by saying he suddenly talks one-third of our initial proposal where he said both of us do this and it would be

¹ Source: Message to Khrushchev; cessation of testing. No classification marking. 1 p. Eisenhower Library, Dulles Papers, White House Telephone Conversations.

inspected. Let us say we will go back to the initial program and have a meeting right now of the UK, USSR and us, and possibly France. The Sec. said perhaps we could “beef” it up a little. The Pres. said we could tell Khrushchev that we stand ready in the meantime if he is ready to go ahead on that particular thing. If he would agree to that meeting and that purpose in spite of our plans we would postpone our plans. Perhaps we couldn’t because they are all out in the Pacific. The Pres. said he thought that Hagerty might have something. He said that he and the Sec. were always talking about a new approach and this might be something that would make Khrushchev squirm.

309. Informal Memorandum From Hagerty to Eisenhower¹

Washington, April 7, 1958

SUBJECT

Nuclear Testing and Defense Reorganization

Here are some thoughts on two subjects—Nuclear Testing and Defense Reorganization. These thoughts are admittedly in the propaganda field, but that seems to be the way things are emphasized these days. I don’t know whether they are practical or not; or whether they will give people the jitters—but at least I put them down on paper.

USSR—Nuclear Testing

The Soviets have now made their big propaganda move in the testing field and they apparently are going to play it as hard as they can. Khrushchev has sent you his first note, using this subject to make another propaganda plug. Using his note as a basis, is it possible to answer along these lines?

1. You are glad to see that the Soviets, at long last, have finally started to make some sense on the whole question of disarmament. After maintaining a negative attitude for a long time, the USSR has now come forward with one-part of a proposal that the US and the UN have made for some time—namely that by international agreements nuclear testing and production of weapons can and should be halted. Up to now the USSR has declined to treat this great problem seriously.

¹ Source: Nuclear testing. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, White House Telephone Conversations.

2. Despite past experiences in this field with the Soviets, you are prepared—in the interest of peace—to accept this latest Russian statement at its face value. In effect you say to Khrushchev: “All right, so you now say you are stopping tests and ask the US to do the same. Well, the US will take you up on this since we have been trying to get some agreement about this with you for some time. So—”

3. Let’s try seriously to work out an agreement. Naturally for any such agreement to function in the world successfully, other nuclear powers—the United Kingdom (and probably France)—have to be in accord. Let’s get them to join us in working out such an agreement.

4. To do this, let’s forget for the time being the so-called Summit Conference. Although you have talked about having such a Summit Conference you haven’t even answered the US–UK–French memorandum filed with the Soviet Foreign office a week ago. While we are perfectly willing to have such a Conference with you to discuss other important world matters, we still insist that preparation for such a meeting is elementary to its success.

5. While we should continue to work for such a meeting in order to discuss other world matters, let’s concentrate right now on one single problem—the suspension of testing. Let’s take up that one subject and let’s add to it—in order to make it mean something for humanity—the question of production and inspection. The US has already proposed that in addition to the end of testing, an end should also be reached on the production of nuclear weapons and that a workable system of inspection be instituted to guarantee any agreement we might reach.

6. Let’s have this Nuclear Conference soon—and let’s hold it where all the world can see and hear it. Here is what I proposed to you:

That a Nuclear Conference be held and that the Heads of State of the nuclear powers attend such a meeting. This meeting could be held soon (within a month?). It could be called as a sort of special session of the United Nations, so that all the nations of the world could “sit in” as observers and—in effect—as judges of our sincerity. This meeting could be held at the UN headquarters at Geneva or at New York. At the Conference, the nuclear powers should be able to work out an agreement which would combine an end of testing and production with a suitable and workable inspection system. Then—to make the nuclear powers responsible before the world for living up to that agreement—we could sign this agreement before the representatives of the nations of the world.

7. If you accept this suggestion and join with me in this meeting, I would do one thing more. Even though it might place the US and its allies at a disadvantage—since the USSR has already conducted its tests this year—I would, nevertheless, to show the good faith of the

United States postpone our present Pacific tests while we were working together to see if we could reach a nuclear agreement. This postponement would, of course, be limited to a reasonable period—it could not be expected to last indefinitely.

8. A nuclear agreement between the nuclear powers would be of vast importance in the world and would greatly lessen existing world tensions. In addition, it would make further meeting between us on other world problems much easier to accomplish. As a matter of fact, our diplomatic representatives could begin to discuss preparation for such a meeting at the same time. I see no reason why they could not go ahead in this field with discussions which we have already urged be started this month. Meanwhile we could also go ahead with the Nuclear Conference I have proposed.

310. Record of Telephone Conversation Between Eisenhower and John Foster Dulles¹

April 8, 1958, 10:48 a.m.

The Sec. said one of the questions he may get at his press conference was would we be willing to have technical studies about inspection required for a suspension of testing without also having technical studies of the cut-off supervision? The President said this was not an easy one. The Pres. said we had tried hopefully to put something in our reply. The Sec. read this portion from the letter to Khrushchev. The Pres. said the Sec. could say we would be quite ready to participate in any study—that is technically to find out what can be done. This would bring about a closer understanding and better knowledge. The Pres. said to say we are always ready to study the technical thing. The Sec. said he would try to duck it a little. If we started supervision and control in any field, that is a step forward. The Pres. said that was what he was trying to say.

The President mentioned they might jump him on the word “appreciable”. He said it doesn’t mean “material” but “unnoticeable”. They discussed the definition of the word.

The Pres. said he could not let McElroy go to NATO because of the hearings the Pres. had coming up. If Kilday would agree to a

¹ Source: Possible press questions on suspension of nuclear testing. No classification marking. 1 p. Eisenhower Library, Dulles Papers, White House Telephone Conversations.

postponement, that would be all right. The Secretary said it was not vital that McElroy go to the NATO meeting. There would be no decision taken at the mtg.

Mr. James Goodby

CIA

Mr. Robert Amory

Dr. Killian's Staff

Mr. Spurgeon Keeney

Ambassador Wadsworth welcomed the members to the first meeting of the Special Working Group on Disarmament for Summit Preparations and asked Mr. Farley to explain the terms of reference of the group.

Mr. Farley noted that last week the President had established a Special Cabinet Committee on Summit Preparations to be chaired by the Secretary of State. Other members are the Secretary of Defense, the Chairman of the AEC and the Secretary of the Treasury. At its first

¹Source: Record of the first meeting of the Special Working Group on Disarmament; preparations for summit, suspension of nuclear testing. Secret. 5 pp. NARA, RG 59, Central Files, 611.0012/4-958.

meeting on April 7, the Special Cabinet Committee established a working group on U.S. disarmament policy with members from the Departments of State, Defense, AEC, CIA and Dr. Killian's office. The working group was asked to report by Tuesday, April 15, to the Special Cabinet Committee presenting its initial assessment of (1) the adequacy of present U.S. disarmament policy and (2) the opportunities for new U.S. initiatives in this field.

Mr. Farley reviewed the status of summit preparations within the Department of State, noting that the US, UK and France on March 31 had proposed to the Soviet Union that preparatory talks to pave the way for a possible summit meeting begin in the latter half of April. Therefore, it is a matter of urgency that this government have completed as soon as possible whatever review of its disarmament policy may be necessary.

Mr. Farley noted that while the predominant feeling in the Department of State is that there would be no summit meeting until fall, it is essential that we be ready to begin preparatory talks within the month. He said we recognize that this is a broad field and that probably a great deal of detailed work will be necessary. However, it is desirable at this point for the working group to ask itself (1) if the present U.S. position on disarmament (August 29) is one on which we can stand in detail, (2) if there are possible ideas for change which should be explored, (3) if there are modifications of the present policy which are desirable at this point. He said that probably the prospects of an agreed interagency position by April 15 were slight, but that the working group must by then identify for the principals on the Special Cabinet Committee any lines needing further detailed study. He explained that he considered it the task of the working group to pose the issues, suggest initiatives and assemble the facts so that the principals may be able to make any decisions necessary.

Mr. Farley then explained that the paper distributed to the working group had been prepared by the Department of State in order to put forth the results of our own preliminary re-examination of the broad field of disarmament policy. He noted that it has been approved by the Secretary of State, after discussion with the panel of disarmament advisers, for interagency consideration. He explained that we had considered the present form of the paper as that most useful for comparison with existing policy, that is, an interlinear modification of the June 11, 1957 NSC policy statement on disarmament.

Ambassador Wadsworth said that based on this, he felt the working group should reconvene Monday to receive initial suggestions from its members as to: 1) whether the U.S. should stand firm on its present policy, 2) any new ideas from the various agencies, or 3) any areas which

they felt should be studied further. From this discussion a preliminary report should be prepared for transmission to the President's Special Cabinet Committee.

General Fox said that he thought an aspect of our policy which should be considered very seriously is the question of how it is presented. He said he felt the August 29 proposals were substantively quite sound but had been presented very badly. He thought the working group should pay particular attention to how, in the future our policy may be presented as to be clear and immediately understandable throughout the world.

Mr. Farley agreed, noting that our negotiators had great difficulty presenting our case, and that it is very difficult to separate policy from public impact. However, he noted that this is secondary to the work the group must do. The group must first focus on policy; once that is decided we can consider how it is to be presented. He stressed that the report to the Special Cabinet Committee on next Tuesday should give a consensus of the working group as to whether the August 29 policy should stand, whether it should be changed, studied further, whether detailed technical studies are needed or whether the working group would need immediate Presidential decisions before it could proceed further.

General Fox said that as far as the possible separation of test cessation from the cutoff was concerned, the answer from the military would most certainly be no. However, he said that this might be different if the question were asked relative to the state of our knowledge after HARDTACK has been completed.

Mr. Farley agreed that any decision would clearly be easier given successful completion of the HARDTACK testing program. But he noted that an immediate response to the Soviet demarche might be necessary.

General Fox said that the Defense Department could not recommend such a decision. *Mr. Farley* noted that this was not just a military consideration but that there were extremely important political problems involved.

Admiral Foster said that he was not very sanguine about the possibility that HARDTACK would give the AEC laboratories all the information they want. He said that we would certainly have to predicate our assumptions on what the USSR is doing at the time the U.S. might stop testing. Would they continue their present cessation or would they resume? *Mr. Farley* noted that the Soviet Union by its unilateral cessation of testing has given up considerable freedom of action. What we do with regard to nuclear testing will certainly affect the future Russian position.

Mr. Farley reviewed the extent of separability of the various items in the State Department paper, noting that we propose not only changes

in policy as a whole but also changes in the interdependence of various items. Thus nuclear testing could be agreed to separately subject only to the condition of an agreed inspection system and the stated intention of the U.S. to resume testing at the end of two years unless international agreement on the cut-off of production had been reached. Outer space cooperation could be dealt with separately. Missile control proposals were contingent on further feasibility studies by Dr. Killian's staff. Inspection zones might be accepted independently.

General Fox asked if the target date for agreement—September 1, 1958—assumed Senate ratification. *Mr. Farley* noted that the specific date is, of course, subject to more discussion and at any rate would be stated in terms of a specific date or after ratification of an agreement by all states, whichever was the later. He noted that all the provisions would require a treaty and thus be subject to ratification, although the President could, by executive agreement, stop testing.

Ambassador Wadsworth reviewed our position on the nuclear testing issue in the United Nations. He recalled that many of our friends had felt at the 12th General Assembly that testing should be stopped and that the vote on the issue had been a lot less favorable to us than in the past. Since the 12th General Assembly the feeling among the great majority of the delegations in New York was that the United States should stop testing. Even the SYG had said this publicly. He noted that these people appreciate our need for continued testing, but feel that the unilateral Soviet cessation has changed the situation. He said that there will be a strong movement next fall for a resolution calling for cessation and that while this might not be successful, we certainly will lose many of our former supporters to the abstention list. He noted that this problem had many facets: for instance, a too rigid position by the U.S. may seriously jeopardize public opinion in countries where we have military installations. He reported that the SYG felt on the basis of his Moscow trip that the USSR wants summit talks more than anything else. They object to our DC-SC procedure because they believe it is a trick to prevent a summit meeting. They are also suspicious of the March 31 tripartite note for the same reason, feeling that the proposed preparatory talks would be used as a stratagem to avoid a summit meeting. He reiterated his feeling that the testing question had gone far beyond being a theoretical problem. Even the Norwegians and Danes were becoming increasingly restive. Many nations of the world were hysterical and panic stricken at the thought of possible effects from fallout from nuclear testing. USUN feels we need a broad move at this juncture.

General Fox asked if the Secretary of State would have to tip our hand concerning any proposals we might make during the course of the preparatory talks, or whether we could have a surprise demarche such as the Open Skies proposal, which had a great impact at Geneva.

Would a policy have to be fully coordinated with our allies? *Mr. Farley* noted that there was more of a pattern of cooperation now than there had been in 1955. The experience of last summer had built up a precedent of NATO cooperation which we have continued in coordinating replies to the Bulganin letters. However, he could certainly recognize the value of surprise impact. [*text not declassified*]

Mr. Farley said he thought he should make quite clear that the U.S. will not take much credit from cessation of testing. However, such a move will clear the air as to our general aims in disarmament. We must have more than this to recapture the initiative in world public opinion. He noted that we need during the preparatory talks to show the USSR that the U.S. really wants progress.

General Fox said he felt that the members of the working group were not in a position to make decisions, that they could not judge this issue adequately. *Mr. Farley* agreed but said that the group must examine disarmament policy and, on the basis of their knowledge, make a recommendation to the principals.

Mr. Keeney explained that this is what the Killian panel on nuclear testing had in effect done when it determined the impact on weapons development which would result from cessation of testing, even though it had not discussed military implications. *Mr. Farley* said that the working group is expected to deal with the issues such as test cessation. While the group cannot make final decisions it certainly must recommend courses of action to the Special Cabinet Committee.

General Fox reiterated that on the question of test cessation the Defense Department's answer would clearly be "no". *Mr. Farley* said in that case the group would report differing views and perhaps ask for more studies. *Admiral Foster* said that the group might very well come up with a consensus that test cessation would be unwise from a military point of view but that over-riding political reasons made it wise to stop testing. *Mr. Farley* agreed with this and said it was possible that one or all of the members might take the position either (1) that there should be no decision until HARDTACK had been completed and evaluated or (2) that in preparing for the 13th General Assembly we must have a change in policy.

Admiral Foster noted that it takes about six months properly to evaluate the results of a test series. This would be long past the opening session of the 13th General Assembly.

Mr. Amory said it was quite clear to him that the political deadline of the 13th General Assembly must be met.

General Fox said that from a national security point of view our vital security interest militated against a cessation of testing. *Mr. Spiers*

noted that our political relationships were as much a part of our national security as our military preparedness. *Admiral Foster* said that in view of the shortness of time, he felt that the working group should assume that over-riding political considerations do exist and that a Presidential decision to cease nuclear testing has been taken. The group could then evaluate the result of such a decision. He expressed the personal view that a decision had already been made that the U.S. must have a fall-back to its August 29 policy.

Mr. Farley explained that formerly, during Governor Stassen's tenure, the mechanism for policy change had been for Governor Stassen to make recommendations which were considered by the NSC and sent to the President for final decision. Now Secretary Dulles was the principal disarmament advisor to the President, with Ambassador Wadsworth as chief negotiator and Mr. Farley responsible for policy formulation. He said establishment of this group was an attempt to get interagency development of policy. Thus he felt the group must uncover these problems for eventual decision on a higher level. He noted that there had not yet been any decision on any of the questions on disarmament. It was the task of the working group to propose policy guides for such decisions. It must identify possible advantages of shifts in policy. On the testing question, it may only be able to identify the views of each agency.

Ambassador Wadsworth set 2:30 p.m., Monday, April 14, as the time for the next meeting of the working group.

312. Memorandum From Bethe to Killian¹

Washington, April 17, 1958

SUBJECT

Clean Weapons

[text not declassified]

It has been stated publicly that it would be possible to develop completely clean weapons in the course of five or more years of further testing. In my opinion, complete cleanliness has no significance

¹ Source: Development of clean weapons. Secret; Restricted Data. 2 pp. Eisenhower Library, Records of the President's Science Advisory Committee, Nuclear Weapons.

in military applications of nuclear weapons. The military application mostly contemplated is the use of a clean weapon in a ground burst against a hard enemy target. In such an application, the neutrons coming from the weapon will create radioactivity in the soil next to the weapon. This radioactivity will be carried up with the debris of the weapon itself and will cause fallout in the neighborhood.

It has been estimated that the radioactivity in the ground is at least 1% of the radioactivity which would be produced in a pure fission weapon of the same yield. Since the radioactive materials formed in the ground are different from fission products, the radioactivity will change with time in a different way from that of fission products. However, calculations at Los Alamos indicate that this difference is not very great, and that at any time the radioactivity created in the soil will be of the order of 1% or more of the corresponding fission activity

[*text not declassified*] for sometime to come. It is conceivable that further technical progress and testing may make it possible to return to lead even for the smaller weapons, but this seems quite difficult, quite far in the future, and would undoubtedly be connected with a further loss in yield for a given weight.

For these reasons, and particularly because of the radioactivity necessarily produced in the ground, it does not seem of practical interest to develop clean weapons of a cleanliness of better than 1%. Whether such a development is technically feasible is not known at this time. [*text not declassified*]

According to Dr. Teller, Dr. Brown of the Livermore Laboratory, head of its Theoretical Division, is the person most competent on the development of clean weapons. In a recent conversation with him he was very skeptical whether a completely clean nuclear weapon could be developed.

The only circumstance in which a completely clean thermonuclear device might be of interest would be for peaceful applications. I do not know of any such applications at present. In the case of a deep, underground explosion for peaceful purposes, I believe that there would be other means of protection from the radioactivity than complete cleanliness. Besides, I do not think that the uncertain possibility of some peaceful applications would be a sufficient reason to continue nuclear testing merely for the purpose of developing a completely clean nuclear weapon.

Hans A. Bethe

313. Memorandum From Walmsley (IO) to Herter¹

Washington, April 20, 1958

SUBJECT

United States Position in the Security Council on the Soviet Complaint of April 18, 1958

Present instructions to Ambassador Lodge call for completion of consideration of the Soviet complaint in the Security Council as expeditiously as possible. As yet it is unclear whether the USSR intends to submit a resolution. If not, we continue to believe expeditious disposition of the Soviet item, without any resolution, is the preferable course of action. Submission of a resolution, in the absence of a Soviet resolution, does prolong Council action in circumstances where not too much political mileage will be gained.

Moreover, our submission of a resolution has certain disadvantages: (a) there is a strong risk that the USSR will seek Council endorsement of a summit meeting to deal with this and other outstanding issues among the Great Powers (although the USSR may do this in any event); (b) introduction of a resolution dealing with procedures to cover surprise attack or calling for a meeting of the Disarmament Commission risks opening up the overall disarmament problem, thereby providing an opportunity for the USSR to introduce a resolution calling for an independent test ban, a move that would embarrass us and our friends; (c) even with the Security Council weighted in our favor so that we can prevent adoption of a test ban resolution, Council failure to act on this issue might precipitate a move for a special Assembly session. In particular, the United States would have to oppose a Soviet proposal endorsing the unconditional convening of a summit meeting.

If the USSR submits a resolution, there are three alternatives open to us: (a) to reject outright any Soviet resolution submitted; (b) to amend any Soviet resolution; (c) to press for a resolution of our own. Whether outright rejection of the Soviet proposal is a desired course of action depends specifically upon its content. If, for example, the Soviet text is a clumsy attempt to condemn the United States, the Council members would reject it. However, if the resolution is of a more anodyne character, such as a bland endorsement of the need for peaceful and neighborly relations among states, the Council members might be reluctant to reject it outright. The possibility of amending any Soviet resolution depends upon its character. Even if amended and the USSR still votes for it, it will remain as a Soviet initiative, for which the USSR will claim future credit.

¹ Source: U.S. position on possible Soviet moves in the Security Council on "fail safe" procedures; includes draft Security Council resolutions. Confidential. 5 pp. NARA, RG 59, Central Files, 330/4-2058.

There are, however, advantages to having a resolution, at least on a contingent basis in the event any Soviet proposal is of such a character that its outright defeat would be difficult. In particular, such an alternative resolution would have some or all of the following advantages: (a) to seize the initiative and turn pressure upon the USSR; (b) to maintain a United Nations link with subsequent consideration of the issue of disarmament; (c) to dramatize Soviet intransigence; (d) to maintain the integrity of the Assembly's resolution on disarmament; (e) to broaden the narrow scope of the Soviet complaint and focus attention on the entire complex of disarmament issues.

The attached draft resolution (TAB 1) has been prepared to stress the Secretary's interest in an inspection system for the northern zone, but within the disarmament package of August 29, 1957.

It is assumed that it would not be possible, in the time available, to separate out the aerial inspection proposal without a new decision of the United States Government, consultations with France, the United Kingdom and Canada who are associated with the August 29 package, and discussion with Canada and Denmark whose territory would be involved in any Northern Zone proposal. We have nevertheless prepared a draft resolution (Tab 2) covering this possibility.

To counter a possible Soviet proposal for a summit conference we have prepared a draft resolution (TAB 3) stressing the United States position on the need for preparatory diplomatic exchanges. The substance of this draft resolution could also be used to amend a Soviet proposal if this tactic should be desirable.

Tab 1

Draft Resolution

April 20, 1958

The Security Council

Having considered the complaint of the USSR of 18 April 1958,

Believing that effective steps toward a disarmament agreement at an early date are essential to the achievement of the purposes of the General Assembly's resolution 1236 (XII) entitled "Peaceful and Neighbourly Relations among States",

Recalling General Assembly resolution 1148 (XII) urging states concerned to give priority to reaching a disarmament agreement which, as one of its major elements, provides for: "The progressive establishment of open inspection with ground and aerial components to guard against the possibility of surprise attack",

Noting that the Disarmament Commission has not yet met and that the Subcommittee has been requested to report to the Disarmament Commission by April 30, 1958,

1. *Urges* the Disarmament Commission to meet forthwith and to take immediate steps to implement the recommendations contained in Paragraph 4 of General Assembly Resolution 1148 (XII),

2. *Calls upon* the members of the Disarmament Commission principally concerned to join in technical discussions looking toward the establishment of a northern zone of inspection against surprise attack, as proposed by the United States, United Kingdom, France and Canada to the USSR on August 29, 1957.

Tab 2

Draft Resolution

April 20, 1958

The Security Council

Believing that establishment of zones of aerial and ground inspection would decrease tensions;

Considering the desirability of such confidence-building steps as measures to prevent surprise attacks;

Recalling the General Assembly resolutions 914 (X) and 1148 (XII) which endorse such measures,

Calls upon Canada, France, United Kingdom, the United States, and the USSR to seek early agreement on the establishment of a northern zone of inspection against surprise attack such as proposed by the United States, United Kingdom, France and Canada to the USSR on August 29, 1957;

Requests these parties to join at once in studies of the necessary technical requirements for the establishment of effective inspection in such a zone and to report promptly to the Security Council on the progress of these studies.

Tab 3

Draft Resolution

April 20, 1958

The Security Council

Having considered the complaint of the USSR of April 18, 1958,

Noting that certain members are initiating diplomatic exchanges to discuss matters of mutual interest, including the question of disarmament,

Expresses the hope that such diplomatic exchanges will make possible ultimate agreements on matters of mutual interest, including the question of disarmament.

314. Memorandum of Conversation Between Eisenhower and Herter¹

Washington, April 20, 1958, 5 p.m.

At my request, the President agreed to see me to discuss the projected moves to be taken by Ambassador Lodge at the United Nations on Monday, the 21st, in connection with the Soviet request for a Security Council meeting to consider the question “on taking urgent measures to end the flights of the United States military aircraft carrying atomic and hydrogen bombs towards the frontiers of the Soviet Union.”

I advised the President of the suggestions which the Secretary had sent back to us from his plane trip to Duck Island and stated that these had all been incorporated in the speech prepared for Lodge to deliver. I also told him we had given careful consideration to the filing of a resolution of our own (Tab A) and had prepared two other resolutions (Tabs B and C) in the event the Soviets should file a resolution of their own and it would be necessary to protect our position. I told the President that after we had consultations with Ambassador Lodge and our own staff, I had felt it wiser not to file any resolution of our own if it were possible to dispose of whatever move the Soviets might make in a single session. However, should the Soviets at the last moment file any resolution other than a merely clumsy denunciation of the United States, members of the Security Council would undoubtedly ask for 24 hours delay in which to consider the resolution, and that I would then have an opportunity of consulting with him as to the next move.

The President read the draft speech Ambassador Lodge had sent us, which differed somewhat in arrangement and wording from our suggested draft but which in substance was almost identical. The President read it through carefully and, with the exception of two paragraphs which I had myself questioned, felt it was excellent and agreed that we should proceed along the lines recommended.

¹ Source: U.S. position on Soviet complaints about “fail safe” procedures. Confidential. 2 pp. NARA, RG 59, Central Files, 330/4-2158. Drafted on April 21.

The President then expressed real distress that releases apparently approved by the Department of Defense should have led up to the protest lodged by the Soviets. He called Secretary Quarles expressing his unhappiness with regard to these approved releases, and apparently Secretary Quarles said he would institute a very thorough review as to what had led up to them. I had told the President I did not think there was any security violation involved but that I thought the release of the type of information which had caused the difficulties should be carefully reviewed with the Department of State and the President in the future because of the international implications involved.

I have today sent to General Goodpaster a memorandum, with attachments, which showed that the whole "Fail Safe" concept had been made public as early as November 1957.

Christian A. Herter

Enclosures:

Three draft resolutions.

315. Record of Telephone Conversation Between Lodge and John Foster Dulles¹

April 20, 1958, 12:07 p.m.

The Sec. said he was having a meeting on the Soviet item. He said we are disposed to feel here that we ought to follow this up by positive action of our own which would involve a resolution by the SC calling on the parties to accept the principle of an Arctic zone along the lines of our proposal of last fall and to have the US, the Soviet Union and others involved designate technical people to study how to carry it out. Sec. said it seemed quite obvious that the SU was launching a new major propaganda theme. The Soviets may not have anticipated the rapidity of their defeat but they knew, they were not that stupid, that their resolution would be defeated in the SC. The Sec. said the theme would constantly reappear. It was present in Khrushchev's latest note—how we were sending these planes, etc. The Sec. said they can make big propaganda out of it. The Sec. said we could say surely this is a dangerous situation and the only sensible thing to

¹ Source: Follow-on to defeat of Soviet resolution. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, General Telephone Conversations.

do is to follow the President's "Open Skies" proposal. It was a grave situation caused by the fact that we both have the capacity for massive surprise attack. The Sec. said if we got a resolution along these lines and the Soviets vetoed it, that would permanently spike their propaganda. Lodge asked what the Sec. wanted done about the Disarmament Commission. The Sec. said he wouldn't go there. The Soviets by bringing this case themselves have accepted the jurisdiction of the SC but not the jurisdiction of the Disarmament Commission. Sec. said we should have a meeting of the Disarmament Commission (they agreed any time) but not on this particular item. Lodge said he would arrange a *pro forma* meeting in the DC.

The Sec. said he would see the President today about the proposed resolution and would like to move on this by Monday. The Sec. said we would be having consultation and would be in touch with Lodge.

Lodge said they could do their business in the Security Council on Tuesday rather than Monday. It was difficult to get anyone to work over the week end. The Secretary said let us make Tuesday our target date. The Sec. said that the resolution which had been sent up was on a contingent basis. We would be working on a revised one. Sec. said he wanted to pin the Soviets down.

316. Record of Telephone Conversation Between Quarles and John Foster Dulles¹

April 23, 1958, 3:31 p.m.

The Sec just left the Pres. We were talking about the Soviet move in the SC. We are planning to go back at them with a proposal which in essence would say if you think this Arctic area is so dangerous why don't you agree to establish an inspection zone as we (Def and St etc.) agreed last fall. The Sec said it did not occur to him it would require further clearance because they approved the zone but he wanted to mention it. The Sec is sure the Soviets will veto and that will put us in the position we want to be in. Q said he does not think it will pose a problem but he wants Fox et al. to study it closely and will tell the Sec at NSC. The Sec said he talked with Lodge and they want to launch it Tues and want to speak to the British and French and other friends before.

¹ Source: Proposal to declare the Arctic an inspection zone. No classification marking. 1 p. Eisenhower Library, Dulles Papers, General Telephone Conversations.

317. Record of Telephone Conversation Between Lodge and John Foster Dulles¹

April 24, 1958, 11:43 a.m.

TELEPHONE CALL FROM AMB LODGE (MR WILCOX HEARD
MOST OF IT)

L's over-all feeling is favorable. Some people on his staff think we should never provoke a Soviet veto but L thinks the proposal should be the deciding factor and this has good qualities. The Sec said he is encouraged by the fact Defense went for it and read from their letter. L and the Sec agreed not to present this as a propaganda view.

L said Wadsworth said the Pres may make a nuclear test suspension speech of his own. The Sec never heard of it.

L said the para re the zone of inspection as proposed by us was rubbing their noses a bit. They went into that and mentioned saying as considered. L said he would put this in a telegram and the drafting officer could consider it.

L mentioned putting in something about having a technical group study it for a summit meeting to be held on these points—L thinks they won't want it. The Sec explained why he did not agree on that.

L said in the next-to-last paragraph strike "to settle the technical problems involved" and substitute "to make recommendations for agreement on the technical problems involved to be submitted to a conference of foreign ministers".

L asked re putting in Sweden and Finland. The Sec said a way might be found to include those areas if they agree. They have never been consulted. The Sec mentioned putting them in on a contingent basis. L is putting that in a telegram.

L asked re the speed of it and the Sec said if we have a Foreign Ministers Meeting that aspect would delay it.—The Sec mentioned saying making a report to be considered by the govts concerned through their foreign ministers.

L said now that we are going into the SC we should drop the disarmament comm mtg. The Sec is agreeable to drop it for the time being with the understanding we will have it sometime.

The Sec will restudy the res. L will wait until he hears and then will see the people there. The Sec said he may get Caccia in. L said he would like the changes telephoned to him.

¹ Source: Arctic inspection zone proposal. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, General Telephone Conversations.

318. Record of Telephone Conversation Between Lodge and John Foster Dulles¹

April 24, 1958, 5:49 p.m.

L thinks the first reaction of the three is good and the Canadians were really enthusiastic. The Sec said Robertson seemed quite interested. Murray (#2 man for Canada) had an interesting idea, said L. Have Sweden co-sponsor. There is a lot of merit in asking them—at least they would vote for it. L wishes the Sec would think it over and maybe let him have a word in the a.m. The Sec said he had not given thought to sponsorship. Four powers? L said no. They agreed we have to do it anyway. L said Japan also was mentioned.

L thinks Houghton should speak to Jules Moch in Paris.

The Sec gave a little flavor of his talk this p.m. L said after this he is afraid Alphand will not get it across as the Sec would like him to and repeated re Moch.

L thought he would tell Hammarskjold and the Sec agreed.

L said Sunday he would plan to put out a call for a meeting Tues. He won't be able to sit down to sum up the language until Monday am but that is all right. L hopes for his speech text as soon as possible.

The Sec said he told them we would put it up not in a belligerent spirit but in the spirit of wanting to get something done. He explained it would save much money in view of NSC meeting this a.m. Robertson agreed.

¹ Source: Arctic inspection zone proposal. No classification marking. 1 p. Eisenhower Library, Dulles Papers, General Telephone Conversations.

319. Record of Telephone Conversation Between Barco (USUN) and John Foster Dulles¹

April 25, 1958, 6:39 p.m.

B knows both the Br and Fr have agreed on this move. The Canadians have not been hard [*heard*] from. Barco talked with them and

¹ Source: Arctic inspection zone proposal. No classification marking. 1 p. Eisenhower Library, Dulles Papers, General Telephone Conversations.

told them we would have agreement and he thought it would be helpful to speed up their reaction. They do not as yet know they have agreed as they (the Br) just left. The Sec said he thinks it would be helpful for the Canadians to know. The Sec said the Br had one or two minor suggestions about the phraseology and the French wanted it understood we would not let it open up into a European zone and the Sec assured them of that. They agreed Sweden's sponsorship could not be gone into—we do have time. B agreed. The Sec mentioned its leaking and they agreed it would be a good thing to put out the call tomorrow. Get the Canadian agreement and put out the call and then perfect the text Monday. The Sec said that won't be a great problem. The Br, said B, raised the question of publishing the text fairly soon after the meeting and they agreed this is good. B will call Lodge in Mass. B mentioned a northern zone as a term to use and the Sec said we can't do that because our Defense Dept has approved this in terms of that zone. Caccia suggested to the Sec to redefine it without identifying it. The Sec thinks that would be cumbersome but he will look into it. These were not conditions however.

320. Letter From John Foster Dulles to Eisenhower¹

Washington, April 30, 1958

Dear Mr. President:

I enclose a summary record of the discussion last Saturday with Al Gruenther, Bob Lovett, Jack McCloy and Bedell Smith. I am sending you separately some recommendations about the question of testing.

Faithfully yours

John Foster Dulles

¹ Source: Transmits a record of Dulles' meeting with disarmament advisory panel. Top Secret. 9 pp. Eisenhower Library, Whitman File, Dulles-Herter Series, Disarmament.

Enclosure

Memorandum of Conversation

Washington, April 26, 1958

SUBJECT

Meeting with Disarmament Advisors—April 26, 1958

PARTICIPANTS

Secretary Dulles
General Gruenther
Mr. Robert Lovett
Mr. John McCloy
General Walter B. Smith

Ambassador Wadsworth
Mr. Philip J. Farley
Admiral Lewis L. Strauss
Mr. Donald A. Quarles
Mr. James Killian

The Secretary said that it was urgent that we do something to erase the picture which people abroad hold of the United States as a militaristic nation. This is a false picture which is belied by the facts. But it is difficult for the United States to change this picture in view of the way in which our press selects and publicizes sensational incidents and statements. In this respect the Soviet Union, with its ability to control what is known about it, has an advantage over a free society like that of the United States. This picture of continued military emphasis in the United States hurts us and probably causes us to lose more than we gain from small technical military advances. While our position is understood by the governments of our most important allies like Japan, the United Kingdom and Germany, these governments are in various respects in a precarious position.

It is thus imperative that actions be taken which will make evident the United States interest in peace and in controlling armaments. A review has been underway by the interested United States agencies. The result to date has been to indicate that generally the familiar major areas of arms control must be considered in examining the possibilities for new initiatives. It does appear possible to break up the disarmament package. Already we have separated out the Arctic Zone and are planning an initiative on this April 29 in the Security Council. We have also recently emphasized the possibility of commencing technical studies of inspection of various disarmament measures as a practical way of making a start.

The Secretary then proceeded to review the position on the various elements of the present disarmament package.

1. *Tests*—The President's Science Advisory Committee has recently reached a conclusion that an inspected test suspension at the end of the HARDTACK series would be in the interest of the United States on

military technical grounds. The Atomic Energy Commission and the Department of Defense, however, believe that tests should continue. The United Kingdom not only wishes to complete its planned tests this year, but also does not feel able to give up further testing unless the results of United States weapons tests can be made available to the United Kingdom through amendment of the Atomic Energy Act. Paradoxically, Prime Minister MacMillan says agreement on nuclear test suspension is the only foreseeable result of a summit meeting.

2. *Nuclear Cut-Off*—A suggestion by Admiral Strauss has been given some consideration. This calls for shutting down fissionable material plants in order to ease the inspection problem and require cannibalisation of weapon stockpiles to meet peacetime requirements. However, this was strongly resisted by the United Kingdom which depends on its fissionable material plants for its nuclear electric-power program. Accordingly, no major change in this area is being considered.

3. *Surprise Attack Zones*—We have already decided to separate out the Arctic Zone of inspection against surprise attack. There is a difference of opinion, between General Norstad on the one hand and Chancellor Adenauer and the Defense Department on the other hand, regarding the desirability of accepting European zones of inspection independent of a zone involving North America, and also regarding the possibility of a small European inspection zone covering only Germany, Poland and Czechoslovakia.

4. *Outer Space*—The idea that outer space might be used only for peaceful purposes has been viewed hopefully as a possible major United States initiative. Careful studies by Mr. Killian, however, have raised danger signals. The Soviet Union appears to be significantly ahead of us in ballistic missiles development. If we ceased testing ballistic missiles in the near future, the Soviet Union might have an operational ballistic missile capability, while we would not. As for a broader control of missiles, the inspection requirements for elimination of missiles production and stocks appear to exceed by far any inspection system hitherto contemplated. Accordingly, it appears that this proposal should not be pushed and that the most that can be looked for is some cooperation in peaceful exploration of outer space.

5. *Armed Forces and Armaments*—Some adjustment in our position on this matter will probably be worked out, but the Secretary did not feel that this was an area where we could look for significant or major steps.

The Secretary continued that the inter-agency working group would report shortly. When decisions had been taken, consultations with our allies would then get underway.

He suggested that Admiral Strauss, Mr. Quarles and Mr. Killian expand on the views which he had summarized.

Admiral Strauss said that he thought the nuclear test matter was a false issue. The danger to humanity lies in nuclear war not in nuclear tests. If we were to freeze testing, the Soviet Union would have proven nuclear warheads in sizes up to four megatons, together with offensive delivery systems. The United States would not have defensive systems. And the United States will need clean warheads since defensive missiles would be exploded over the heads of us and our allies.

Mr. Quarles agreed with Admiral Strauss. Even though the United States is ahead qualitatively in warhead development, our needs are different from those of the Soviet Union and there is not a reciprocal situation. So the JCS and the Defense Department after careful study believe it is not to our advantage to stop nuclear tests unless there are important compensating gains in other arms control areas. Admiral Strauss added that he doubted that agreeing to a test suspension would help us significantly with world opinion. He pointed out that even our gains from a positive move like "Atoms for Peace" had been evanescent.

Mr. Killian said that his *ad hoc* panel had looked at the testing question from the technical point of view and had found that the United States would, as Admiral Strauss and Mr. Quarles agreed, have a lead in nuclear warhead development over the Soviet Union at the end of HARDTACK. They had also found that an adequate inspection system to monitor a test suspension agreement could be devised. Another *ad hoc* group had studied the missiles situation and had reached the conclusion summarized by Mr. Dulles.

Mr. Killian continued that the Science Advisory Committee had then studied these matters from a broader military and technical point of view. They had a very great concern over the possibility that the USSR might in the near future call for a unilateral missiles test ban. They had reached the conclusion that, if the United States could act soon on nuclear test suspension, it might be more difficult for the Soviet Union to couple a suspension of both nuclear tests and missiles tests.

His Committee had then looked at the overall defense picture. They had concluded that not only would the United States have a lead in nuclear warheads over a wide range of sizes and types, [text not declassified]. The Committee felt that it was valid to question the need for five more years of testing just in order to make marginal improvements and to clean up these weapons.

Mr. Dulles asked whether further small testing could be done underground. Admiral Strauss said that it could, but that the information obtained would be reduced as a result. He remarked that there would be gaps in the warheads available after HARDTACK; for example, we would have [text not declassified] less than 1600 pounds. Mr. Killian pointed out that we would have the Nike-Zeus warhead. Admiral

Strauss said that this would not be clean and his medical advisors considered too many air bursts would be dangerous. Mr. Killian said that his Committee had studied this question and had found that even if all the warheads of our estimated anti-ICBM requirements were fired, the danger point in radiation would not be reached. He pointed out also that we would have a polaris warhead and thus have warheads for solid fuel missiles.

Mr. Dulles said that in considering these various technical judgments it must be remembered that unless in the next few months we do something to show that we are for reducing arms, we may over the next few years lose Japan, Germany and the United Kingdom. Do we want further refinement of nuclear weapons at the cost of moral isolation of the United States? He pointed out that action on nuclear testing was the only real possibility in the areas that he had reviewed earlier. If there were other new ideas with the appeal of "Atoms for Peace" or "Open Skies" he would welcome them. We can push the surprise attack zones, but there are limits to what these can do for us especially in Europe. The outer space proposal was imaginative, but it appears now that the possible loss to United States national security would be greater than the psychological gains would justify.

Mr. Lovett said that he thought United States agreement to suspend nuclear testing would have a doubtful effect. We want an adequately inspected test agreement. Whatever the Russians may have said, they will not agree to what we consider adequate inspection. We will thus lead into another argument about how much inspection is needed, in which we may well not gain in world opinion, which will think we are putting obstacles. He thought also that the first question was not disarmament but whether there should be a summit meeting. General Smith said that he did not think we could avoid a summit meeting. Mr. Lovett thought that the foreign ministers meeting would be crucial and that the western position on an agenda should be carefully worked out and the intentions of the Soviet Union tested there.

General Gruenther suggested that an authoritative scientific study be obtained establishing conclusively that test fallout was not a danger to health. Admiral Strauss and Mr. Killian pointed out that the National Academy of Sciences and United Kingdom Medical Research Council had already done this. Ambassador Wadsworth said that a report on radiation by the United Nations Scientific Committee would be forthcoming shortly. While it was overwhelmingly reassuring, the one or two sentences about the genetic danger would in his opinion get all the headlines, and be used against us.

Mr. Killian said that he was concerned that the fallout from HARD-TACK, even though not dangerous in itself, will aggravate the situation and will give our opponents a chance to play up the health hazard.

Mr. McCloy said that he was concerned also about reaching a test suspension agreement at the summit. The Soviet Union has made it clear that it will not talk about changing the *status quo* in Germany or Eastern Europe. And test suspension is a Soviet proposal; it would be better to take our action unilaterally rather than merely to say yes to a Soviet proposal. If the only agreement at a summit meeting is nuclear test suspension and Central Europe problems are not discussed, we will effectively have abrogated our position on German reunification and Eastern Europe, despite our protestations.

Mr. Dulles said that he agreed with Mr. McCloy's concern but our allies do not. Chancellor Adenauer wants disarmament as the sole agenda item for the summit. He will not insist on including German reunification for fear he will be charged with using that as an excuse to evade disarmament.

Mr. Lovett said that he was strongly opposed to a summit meeting leading to agreement only on test suspension. If the United States was going to take this step it should be announced now. If some form of agreement is required that should be worked out at a foreign ministers meeting. General Gruenther recalled the difficulties arising from the attitude of the British and French toward nuclear tests and the British and German toward the need for a summit meeting. Mr. Dulles said that his point about German attitudes was to illustrate the popular pressure for disarmament in Germany. He remarked that the United States would insist on raising the question of German reunification even if no Europe ally did.

Mr. Lovett and Mr. McCloy said that our agreement to suspend nuclear tests should be announced unilaterally, and thus taking the steam out of the pressure for a summit meeting. Mr. Dulles observed that this would make sense—it would then be absurd to have a summit meeting just to talk about the control posts and similar technical details. General Smith said that a summit meeting was probably unavoidable, but the danger would be greater if it occurred and led only to a test suspension agreement.

Mr. Quarles said that he was skeptical that the United States would get any cold war gain from stating willingness to agree to test suspension on condition of adequate inspection. He thought that the United States faced a basic dilemma. We cannot escape from our responsibility to maintain adequate devastating striking forces in the face of Soviet power—until a fundamental solution is reached embracing inspection and world order. What we should say at a summit meeting is that we will take any step which will make progress toward such a fundamental solution. Mr. Killian remarked that inspection of a nuclear test suspension would be a step toward such a solution.

General Gruenther commented that the recent United Nations Security Council meeting was a defeat for the Soviet Union. Mr. Dulles said that we handled the meeting well, but that the Soviet Union certainly had expected the result. They took this step as the kick-off of an intensive propaganda campaign. Khrushchev has referred since to the danger of American bombers in his latest letter. Now the satellite governments are sending protest notes.

Mr. Dulles said that it appeared the right course of action would be for the United States to take action now on the nuclear test matter—perhaps by announcing readiness to stop nuclear tests for 12, 18 or 24 months. We would resume testing if an effective inspection system was not operating by the end of the period. He asked the reactions of the advisors.

Mr. Lovett said that he would favor this move if it would reduce the prospects of a summit meeting. Mr. McCloy agreed; he felt that in this way we could avoid jeopardizing our position on Central Europe at a summit meeting. General Gruenther expressed concern at the unilateral element. It would be hard for us to resume testing once we stopped, and accordingly the precise way in which the announcement was put would be very important. Mr. Dulles said that of course the United Kingdom would have to join in such a statement. As for the manner of putting it there could be a call for several stages: an initial agreement on an inspected suspension, a check point after a year on progress in installing the inspection system, and then the full operation of the inspection system. General Gruenther said that this kind of approach would meet his concern.

General Smith said that he favored such a move, but thought that we should not delude ourselves that the Soviet Union will accept adequate inspection. Admiral Strauss said that he foresaw that we will gradually be whittled down from 70 stations to 50 stations then 25, 10 and perhaps less. Mr. McCloy said that he thought even 10 stations would be worthwhile in view of the political gain of Soviet acceptance of inspection.

Mr. Dulles thanked the advisors for joining him and giving him the benefit of their counsel.

321. Memorandum From Twining to McElroy¹

Washington, April 30, 1958

SUBJECT

Nuclear Testing (U)

1. Reference is made to the memorandum by the Joint Chiefs of Staff, dated 13 March 1958, subject as above, and to the memorandum by the Deputy Secretary of Defense for the Ad Hoc Panel on Nuclear Test Cessation, dated 21 March 1958, subject: "The Effects of Total Suspension or Cessation of Nuclear Testing."

2. In these memoranda the effect of a cessation of nuclear testing on the United States relative to the USSR was analyzed. Based on this analysis these memoranda reflected the belief that, unless considered only as a part of a larger disarmament proposal to include suspension in the production of weapons and weapons material and an effective inspection system the over-all long-range effects of a test cessation will be to the distinct disadvantage of the United States. In view of recent increased pressures for the cessation of tests the Joint Chiefs of Staff consider a reiteration and amplification of their views on this subject necessary.

3. The Joint Chiefs of Staff consider that an adequate military position for the United States will not be attained until there is available a complete spectrum of weapons compatible with modern delivery systems, which will make it possible to apply selectively adequate force against any threat. Among the programs of weapon development for which future testing will be essential in order to provide this flexibility are:

a. Small, low-yield, highly mobile weapons for tactical and ASW uses.

b. Modern, light-weight, and instantly ready weapons of sophisticated design for use against hostile aircraft.

c. Warheads for anti-missile use.

d. Deterrent and retaliatory weapons, including warheads for second generation IRBM, ICBM, and FBM missiles.

e. A family of clean weapons.

4. The HARDTACK test series now underway, including the scheduled firing at Johnston Island prior to 1 September, is vital to the defense of the United States. Certain key shots, particularly those essential to the design and operational employment of the anti-missile missile, are crucial in the weapons development program. As past tests bear out, it cannot be presumed that this test series will be a total success or will

¹Source: Views of the JCS on suspension of nuclear testing. Top Secret. 3 pp. Library of Congress, Manuscript Division, Twining Papers, Chairman's Files.

in fact provide all of the much needed answers for presently foreseen military applications. Even if the HARDTACK tests are a complete success, there will be a continuing requirement for additional testing. Cessation of testing by us at any time in the foreseeable future would freeze our weapons research at a point far short of the objectives cited above. Moreover, if the USSR continued testing on a clandestine basis, both offensive and defensive weapons in our stockpile could quickly become obsolete. Further, it is believed that the matter of parity with, or supremacy over, the USSR may have been accorded undue emphasis in past considerations of test cessation. It is fallacious to assume that a present superiority in either numbers or types of atomic weapons would be maintained or that numerical superiority would in itself provide the free world with the capability to cope with all future situations.

5. In light of the above, the Joint Chiefs of Staff wish to emphasize their great concern over the numerous proposals for cessation of weapons tests, especially when this cessation is divorced from a larger disarmament proposal which would provide also for complete suspension of the production of weapons and weapons materials, keyed to an effective system of inspection and verification.

6. The Joint Chiefs of Staff request that you convey these views to the President.

For the Joint Chiefs of Staff:

*/S/ N.F. Twining
Chairman
Joint Chiefs of Staff*

322. Record of Telephone Conversation Between Eisenhower and John Foster Dulles¹

May 1, 1958, 11:47 a.m.

The Pres finished the Sec's memo re Sat and does not see anything stated about the enactment of the law—and there is a part where we start talking about announcements—the Pres is sure the UK will not agree to anything unless we have a law. The Sec is not sure about that. The Sec did not have in mind doing anything for a month or more until we know what

¹ Source: Congressional role in possible suspension of nuclear testing. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, White House Telephone Conversations.

is happening and the Sec thinks we should have a meeting with Strauss and Quarles who do not agree. The Pres is concerned re moral isolation. The Sec said by the end of the tests we will be unless we accompany it with some declaration. Don't think we need do it before June or July. The Pres said if we do anything before Congress acts we will stop them from acting. The Pres said Congress this year is causing more trouble than the previous four. The Sec thinks we can get the legislation through if we agree within 30 days they pass a concurrent resolution opposing it—they would think we won't carry it through then. Everybody is in agreement except the Dept of Justice. This has happened before. If it lies before Congress for 30 days Congress will express its views and it is highly unlikely 30 days.... The Pres said a concurrent resolution is bad—he can veto a joint res. This other takes 2/3s. The Pres thinks it would go through better if Strauss were not so disliked. The Sec does not think we can get it without the concurrent resolution or some control by Congress,—over each specific agreement. The Pres would not care if it were joint—the Sec said they won't take it. We have allowed concurrent resolutions to stop Exec action in several cases. The Sec said it is up to Justice now—he does not know what their final views will be. The Sec said you are asking them to lift a prohibition. The Pres said we don't want to upset the balance to get temporary advantage. But if there has been precedents all right. The Sec said Defense and AEC have agreed they do not see any substantive objection to the procedure. The Pres thinks the AG will say there is nothing unconstitutional but he does not like it. The Pres said then the approval mentioned in the last para is under the assumption the law will be passed. The Sec said that was right—this indicates the trend of our thinking—he does not want approval now but will discuss it further tomorrow.

323. Record of Conversation Between Eisenhower and John Foster Dulles¹

May 2, 1958

S/S:

There follows, for limited distribution, an excerpt from a conversation between the President and the Secretary on May 2:

“I said that I thought that as soon as I returned we should have a meeting and try and shape up our presentation on possible suspension

¹ Source: Possible suspension of nuclear testing. Secret. 1 p. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

of testing of nuclear weapons. The President inquired again about the status of the legislation. I explained the question of allowing agreements to be ineffective if within 30 days there was an adverse concurrent resolution. The President said that he felt while in general there was a duty to prevent any legislative encroachments, he recognized that this was a legitimate case for an exception and authorized Mr. Herter to inform the Attorney General accordingly. I said that the proposal had been concurred in by Defense and AEC."

324. Telegram 1259 From USUN¹

New York, May 2, 1958, 5 p.m.

1259. Re US Position on Fallout.

Suggest Department give consideration to basic change in US public posture re hazards of fallout. As seen from here US policy of always belittling hazards in public pronouncements has made it possible for Soviets to cast US as the apologist for fallout, and thereby to turn exclusively against US world's increasing concern re these hazards. Present situation with Soviets having completed test series and ours just beginning enhances their opportunity promote this development, which might lead to serious anti-American trend world public opinion. In carbon-14 they even have propaganda answer to clean bomb.

Despite combination factors unfavorable to US in present situation, and regardless US position on testing itself, however, believe there would be distinct advantages in courageous change to full and frank exposure fallout hazards consistent with UN Radiation Committee report. Our repeated belittling of fallout hazard appears decreasingly effective with public opinion, and losing US respect of informed people. Convincing posture of candor this issue will reaffirm that America stands for truth and humane consideration.

Moreover, believe we must consider long-range possibility Soviets have not really stopped testing and that time may come when we oppose testing and they continue, taking into account probable relative

¹ Source: U.S. position on fallout. Confidential. 2 pp. NARA, RG 59, Central Files, 700.5611/5-258.

levels and rates of nuclear weapons development (we ahead and they catching up), and fact our policy more responsive to people.

To carry out above suggestion, immediate start could be made by official statements interpreting fully for layman nature and degree genetic and other effects radiation based on reports National Academy Sciences and Radiation Committee. Attitude displayed these statements should deplore any damage caused people of world and future generations, and show desire give balanced interpretation in terms meaningful to average man. Believe dismissal as “negligible” has become counter-productive.

Additional helpful step would be prompt and regular publication worldwide fallout data. Understand US in best position do this. Since widespread irrational fear partly based on lack of factual information, believe putting matter on route basis of common knowledge would dispel honest fear and defeat alarmists.

Believe US can gain much by fully backing up Radiation Committee and scientific conclusions in its report, thereby showing our respect for scientific truth and at same time putting whole issue in reasonable perspective.

Believe timing these steps urgent in view July release report, observation nuclear test, and forthcoming debates radiation, testing, and disarmament issues.

Lodge

325. Memorandum for the Files by Spiegel (S/AE)¹

Washington, May 3, 1958

The following are my comments on USUN 1259:

I realize that we are on a “sticky wicket” with respect to the fallout problem. I do not believe, however, that a “change in public posture” on the hazards is called for. I fail to see how our position can be characterized as being “apologetic” for fallout. I believe that if anyone takes the time to read carefully Dr. Libby’s remarks and reports such as the one issued by the AEC’s Advisory Committee on Biology and Medicine

¹ Source: Comments on U.S. position on fallout. Confidential. 2 pp. NARA, RG 59, Atomic Energy Files: Lot 57 D 688, Fallout.

that he would discover that we have been giving "full and frank exposure" of the fallout hazards.

In all of our official public utterances, we have sought to put radiation emanating from fallout into proper perspective. I fail to see how we could improve our position by agreeing with the dire, unwarranted conclusions of some scientists such as Linus Pauling and Dr. Schweitzer.

USUN has now sent three telegrams dealing with the carbon 14 problem. I recognize that we have been somewhat remiss in not getting an answer back to them. In this connection I would point out that experts in the AEC have been studying now for some two weeks the principal report of concern, namely one submitted by the USSR, sent to the Scientific Committee; however, something should be available next week on this report. In such matters as this, I think it is well to err on the side of caution and not rush into something which might be misleading and inaccurate. Dr. Libby's comments with respect to carbon 14 help to put the carbon 14 matter into proper perspective. The letter in THE NEW YORK TIMES of May 2 by Dr. Kulp and others should help.

The hearings on fallout conducted by the Joint Committee on Atomic Energy last summer offer the best evidence that we withhold nothing on the matter of fallout. A review of the statements made there and since then would show that we are aware of risks from radiation, but that the risks from radiation from fallout are minimal when compared with radiation received from cosmic rays, etc.

Maybe we can find a synonym for "negligible"; however, to me "negligible" is a good word and expresses the situation accurately.

We do publish regularly and as promptly as possible data on the world-wide distribution of fallout. Cumulative totals are now available through June, 1957. Later data on certain areas have been released but as a general rule we are almost a year behind in analyzing samples. When one considers the magnitude of the fallout collection operation and the limited number of people who are qualified and capable of analyzing the samples and the complexities involved in the conduct of the analyses, it is remarkable that we are not more than a year behind. With respect to "complexities", several months efforts were required to develop adequate means of analyzing radio-chemically the samples collected by balloon. In the past good samples of soil and other items have been destroyed through improper analysis. There is the "fly paper" operation and the "steel pot" operation carried out by HASL. There is the balloon program conducted by General Mills on behalf of the AEC and the AFSWP high altitude aircraft monitoring program. Food samples have been collected in various parts of the world as have soil samples, bone samples, etc.

Unless the draft of the UN Scientific Committee's report has been changed radically from the previous drafts, I believe that its release

should not cause us too many difficulties. The facts and conclusions are not dissimilar from those released by the NAS–NRC, and the British Medical Research Council in June, 1956.

To the best of my knowledge, no one has suggested that we not “back up” the Scientific Committee’s report.

CC: UNP—Mr. Owsley (2); and AEC—Adm. Foster (3).

326. Telegram 1283 From USUN¹

New York, May 8, 1958, 4 p.m.

1283. Re: Mytel 1277.

One of principal gains we made from SC debate of Arctic Inspection Zone was way debate dramatized difference between our willingness to open our territory for inspection and flat Soviet refusal.

Making this contrast clear brought out sharply principal reason why we keep our defenses at their present level.

Our defense measures are principal propaganda targets used by communists to undermine our popularity in world. Popularity affects tenure of our bases among other things and therefore is an important military factor.

We must therefore make every effort to make sure non-communist world understands our reasons for continuing to be suspicious of Soviet intentions and thus our reasons for keeping up our defenses.

Experience in SC shows that when our openness is compared with their secrecy, we gain decisively. This is the point we have been trying to make when we insisted on inspected disarmament. But the point is not often made with enough clarity to make the man in the street understand it. We ought to be stating it over and over again because it is a point on which they are fundamentally weak and we are fundamentally strong.

We can build on what we achieved in SC last week by following up with theme of communist secrecy versus our openness.

This is simple yet fundamental idea which should be pressed at every opportunity.

¹ Source: U.S. openness contrasted to Soviet secrecy. Secret. 2 pp. NARA, RG 59, Central Files, 330/5–858.

For example:

1. Whenever the disarmament question comes up we should continue and redouble our emphasis on inspection—on “open sky”, on the idea of “openness”, on the suspicions and dangers of war caused by excessive secrecy.

2. As soon as possible but not later than the 13th GA we should draw together this and other topics—Open Sky, the IGY, the cultural exchange program—into a top-level, long-range proposal for opening the USSR and the US to unrestricted travel by each other’s citizens; unrestricted sale of each other’s newspapers, magazines, books and films; exchange of professors by hundreds and university students by thousands; equal access to each other’s domestic radio and TV networks; and similar steps to build mutual confidence in an open world. There should be no difficulty in making such a proposal so far reaching USSR would undoubtedly reject it but so reasonable that we would earn wide sympathy and USSR would be put on continuing defensive.

327. Telegram 1310 From USUN¹

New York, May 14, 1958, 7 p.m.

1310. Re UN Report on Effects of Atomic Radiation.

1. In our opinion comprehensive report of UN Scientific Committee on effects of atomic radiation likely to give further impetus opposition to nuclear tests on health and medical grounds, generating further political difficulty for US on testing issue.

2. We think this will be case in spite of fact report shows health hazards from testing are statistically only fraction of hazards from medical and natural sources. It seems to us numerous deleterious effects from radiation, which is main subject of the report, will heavily outweigh this fact in public mind and that there will be opposition to any dangers from tests, no matter how small.

3. We recognize few of facts contained are entirely new and that many of them actually stem from report US National Academy of Science. But UN report inevitably does not have qualifications re security

¹ Source: U.N. report on effects of atomic radiation. Secret. 3 pp. NARA, RG 59, Central Files, 700.5611/5-1458.

of West included in academy report. Furthermore UN imprint of new study will give it world-wide attention and sanction, directing official opinion more strongly to problem than before.

4. Examples of material included in report which we think may cause public reaction follow. We are afraid this material will be taken out of context and used without qualifications included in report. It may therefore be given great emphasis by press or, for political reasons, by other countries:

A. Rice eaters (e.g. Asians) may get five times as great a “marrow dose” of radiation than milk drinkers (e.g. Americans and British).

B. Children, foetuses and embryos are probably particularly susceptible to radiation and especially to radiation-produced leukemia and bone tumor.

C. Increased radiation may negatively affect intelligence level and life span.

D. Even smallest amounts of radiation are liable to cause deleterious genetic, and perhaps also somatic effects.

E. Because of delay with which somatic and genetic effects may appear, full extent of damage is not immediately apparent.

F. Even slow rise in environmental radiation could eventually cause appreciable damage to large populations before damage could be identified as due to radiation.

G. Continued tests could result in 2,000–30,000 cases of leukemia, 6,000–170,000 bone tumors and 1,000–120,000 major genetic defects per year under most disadvantageous assumptions made in report (on basis tentative figures in current draft).

5. We understand (Deptel 789) Dept feels Belgian draft para for conclusion (para 54, previously 45) best obtainable under circumstances in committee. We should be prepared, however, for probability that conclusion by saying “cessation of contamination of environment by explosion of nuclear weapons (is one of steps that would) act to benefit of human health” will be regarded in and outside UN as calling for test suspension for medical and health reasons.

6. While understand we would be in position to say we were developing bombs which would not contaminate environment and that committee recognized factors other than health were relevant to decision, net effect undoubtedly be to increase pressures for test suspension. Nor do we think argument that some radiation danger is acceptable cost for Western defense likely make much progress against emotionalism on this issue, especially as we are regarded as more advanced in atomic field and because most military benefits necessarily not revealed to public. Similar comment would apply to argument pointing out tentative and highly uncertain nature of conclusions in report, to which answer would be any error must be on safe side.

7. Comments:

A. If we are making progress toward policy favoring test suspensions, believe it is of overriding importance that we announce this new policy prior to release of report.

B. If we are not we should be prepared with reasonable and constructive response to anticipated reaction which takes fully into account medical and health problems report elucidates.

Lodge

328. Memorandum of Conversation¹

Washington, May 15, 1958

SUBJECT

Reply to Khrushchev letter of May 9 on Technical Talks

PARTICIPANTS

The Secretary of State
Sir Harold Caccia, British Ambassador
Mr. Roper, First Secretary, British Embassy
Mr. Kohler, EUR
Mr. Farley, S/AE

The British Ambassador called at the Secretary's request.

The Secretary handed the Ambassador copies of the proposed US reply to Khrushchev's letter of May 9 agreeing to technical studies of the methods of detecting violations of a possible test cessation agreement.

After reading the draft letter Ambassador Caccia said that his government had two points of interest in the Khrushchev letter. First, they did not want to seem to be dragging their feet and thus give the Soviets a propaganda advantage. On the other hand they wanted to know what we would say and would like to get together with US experts before meeting with the Russians.

The Secretary referred to the discussion he had had on this subject with British Foreign Secretary Selwyn Lloyd at Copenhagen on May 6, 1958. He said that Selwyn Lloyd had thought perhaps a distinction

¹ Source: Possible technical studies of methods of detecting violations of a test cessation agreement. Secret. 3 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

could be made between testing of small bombs and those of a megaton or more. The Secretary had then suggested the possibility that the termination of atomic testing might be approached in two phases. Detection of megaton explosions would be relatively easy. Smaller weapons required more refined and elaborate methods of detection and this might be developed in the second phase. Thus there would be more time for the testing of smaller weapons. The Secretary said he had mentioned this idea to Dr. Killian whose preliminary reaction was that some such gradual approach might be practical.

The Secretary agreed with the Ambassador that we should concert our views on the subject. While a meeting with the Soviets should be definitely scientific and technical in nature, the experts should of course not be left without guidance of experienced political advisers. In this connection he cited the experience of the Japanese trade negotiations with the Chinese Communists in which the Japanese trade experts had innocently agreed that the Chinese Communist trade representatives in Japan should be allowed to fly their flag. This had led to all kinds of complications. The proposed technical talks on methods of detecting tests would be full of political booby traps, e.g., the problem of placing control installations possibly in Communist China or Russian attempts to have such installations placed on Taiwan or in Vietnam. Certainly the head of the delegation should be technical, but must have competent political guidance.

The Secretary then went on to say that he thought it imperative that we should reply quickly, mentioning in this connection that the US draft had been acted upon rapidly following his own return to Washington and had been approved by the President, Defense Secretary McElroy, Atomic Energy Director Strauss, and Dr. Killian. Following British agreement we would propose to advise the French and the Canadians of our plans and then lay the matter before the North Atlantic Council.

Ambassador Caccia said he felt the Canadians would be quite agreeable though he feared that the French would be sensitive on the subject. In this connection he referred to a conversation of UN Secretary General Hammarskjöld with the Russian UN Ambassador. Sobolev had interpreted the Khrushchev letter as meaning bilateral US–UK talks which Mr. Hammarskjöld had said would be completely unacceptable. If the talks were to be convened within three weeks the Ambassador thought US and UK experts should be brought together almost immediately, probably next week. It would be useful, he said, to have an early indication of our thinking. In this connection Mr. Farley said that he would try to get the Killian study on the subject to the British tomorrow and follow up later with a fuller statement.

Ambassador Caccia remarked that action regarding a test suspension from the British point of view would be dependent upon the fate of the amendments to the Atomic Energy Act. The Secretary recognized that while it would be clearly stated that these technical talks were

undertaken without any political commitment, obviously we would be engaged in a course which would inevitably bring us closer to suspension of tests. The Secretary then drew the Ambassador's attention to Mr. Khrushchev's reference to the Arctic as being the shortest route for missiles between the USSR and the USA. He felt this was a foolish slip on the part of the Russians of which we might be able to take advantage.

329. Memorandum of Conversation between John Foster Dulles and Strauss¹

Washington, May 16, 1958

Admiral Strauss discussed with me the question of suspension of testing. He indicated that if we thought it politically important it might be possible to announce before the end of the HARDTACK series that future testing would only be done under conditions which would assure no fallout. He gave me in this connection the report of his General Advisory Committee, copy attached.

I reported on Lloyd's desire to extend the period for the testing of the smaller, e.g., less than one megaton, weapons, and my reply to Lloyd that it might be possible to deal first with detection machinery covering the big explosions with a second phase which would be introduced only later dealing with the smaller tests. Admiral Strauss seemed to think this might be possible.

I spoke of the composition of the experts who might function if this was agreed on with the Soviet Union. He suggested that there should be experts designated as jointly agreed between AEC, Defense, CIA and Dr. Killian. I said I thought we should have a meeting on this subject in the near future and I would try to set it up for next week.

I said we were not clear as to whether the Soviets would accept UK experts or merely wanted U.S. and Soviet experts. Strauss suggested that in the latter case we might keep in touch with the UK and perhaps have the meetings in London.

Admiral Strauss spoke very highly of General Norstad's testimony before the Joint Congressional Committee and suggested I should thank him. Admiral Strauss thought that the amendments could be put

¹ Source: Suspension of testing and reducing fallout from tests; includes report of Strauss' General Advisory Committee. Top Secret; Personal and Private. 5 pp. Eisenhower Library, Dulles Papers, General Memoranda of Conversation.

through, particularly if we would accept the formula for disapproving agreements with other governments by a concurrent resolution. I asked how it would be if we accepted it by a two-third's vote. Admiral Strauss said he thought this might squeeze through and he would talk to Pastore about it if we wished.

I recalled my conversation with the President yesterday, in which the President indicated that there was doubt whether Admiral Strauss would continue to serve beyond his present term. The Admiral expounded on his reasons for this. I said that if he should not continue to serve, I felt that his services should be kept available to the Government and that he might, for example, be a consultant in the State Department with a mention to be a sort of "ambassador-at-large" for atomic peace matters, having in this respect the personal rank of ambassador, if and as he went abroad. Admiral Strauss indicated that something like this would be agreeable to him.

JFD

Attachment

May 7, 1958

The General Advisory Committee feels that the country is approaching a crisis with regard to the continuation of atomic tests on anything like the present scale. While most of the widely disseminated arguments against further tests are exaggerated and unsound, there is widespread uneasiness in the country over the prospect of constantly increasing radioactive fallout, and even many sincere scientists share this feeling. The statements of the President regarding a possible change of policy after the completion of the present series of tests make it important in our unanimous opinion that a statement should be issued before the end of this series, indicating that hereafter we are willing to restrict tests so that future fallout will be deeply reduced.

In our opinion the least concession which the Commission could offer with prospect of winning over a substantial part of the sincere opposition would be to say that hereafter the great bulk of our tests would be carried out underground, with no fallout production, and that tests in the atmosphere would be limited so that the maximum fission yield from the tests of the free nations in any year would not exceed a megaton providing the Russians agreed to a similar limitation. If they did so, and our allies cooperated, we would reduce the addition to potential fallout to between 10 and 20% of the average annual addition resulting from the tests made during the past four years. What is more important, in view of the rate of radioactive decay, etc., we would *actually not increase the total amount of potential radioactive fallout beyond that prevailing this summer.*

Admittedly the policing of this agreement would not be easy but an international inspection agency could be created which could determine compliance fairly accurately for each side. And, as a matter of fact, such a policy would penalize us so little that we might continue it for some time even if Russia did not cooperate. Actually, the only tests of any size and importance which now appear could not be carried out underground, would be in connection with the development of anti-missile missiles and some "plowshare" tests.

While a majority of the Committee recommends that the first proposal be the one made, it would be possible to go still further if necessary and eliminate all above-ground testing for a period of, say, two years. This would make it much harder to develop anti-missile missiles. It would also prevent tests on some peaceful uses such as "ditch-digger" unless special exceptions were made for them, possibly under international inspection. Such an agreement could not be readily policed, especially on small weapons, and would probably be evaded by the Russians unless there were extensive policing inside Russia, but it would practically eliminate any addition to fallout during the period the agreement was effective.

The Committee is unanimously agreed that to go any farther than this in the restriction of testing would seriously endanger the security of the United States.

330. Record of Telephone Conversation Between Eisenhower and John Foster Dulles¹

May 17, 1958, 5:15 p.m.

The Sec. said we had certain complications on the reply to Khrushchev about the experts to be set up to detect testing. The British say, and he is inclined to agree with them, that if we set this up as British, French and the USSR, this will be picked up in France and used by a lot of people there, saying the French were being pushed around, etc. Sec. said you could go back to bilaterals but pick our experts from whatever country, including UK and France, or you could say that in view of the fact that the UK has made explosions and in view of the fact France is

¹ Source: Question of including the U.K. and France in U.S.-Soviet discussions on detecting testing. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, White House Telephone Conversations.

advanced in this field, we think France should be included. Sec. said he had tried to get hold of Dr. Killian in connection with the practical problem of getting experts of other countries. Killian said it would be a lot together but it would be bearable. The Sec. said he had not yet been able to get in touch with Strauss.

The Sec. said he would see the British Ambassador at 4:30 on Sunday to give him his reaction. By that time the Sec. should be able to get in touch with Strauss.

The Sec. said when we had the German problem the Germans did not demand to be there but wanted to be consulted. Sec. thinks the British and French would expect to be consulted. It was far simpler to discuss on a bilateral basis. He thought the Soviets would probably press it on that basis. Then we would be faced with the alternative of doing it bilaterally or break. Sec. said he didn't think the Soviets would accept a lineup of the US, UK and France against the USSR. Sec. thinks they would accept a lineup which says in effect the US and the USSR will pick their experts wherever they choose. We could pick French, Belgians, Japanese. Sec. said he thought there would be no problem of our being chairman of the group.

The Sec. said he would have drafted some formula on this subject and would see the President after church on Sunday. In the meantime the President could be turning this over in his mind.

331. Memorandum of Conversation¹

Washington, May 18, 1958

SUBJECT

Reply to Khrushchev Letter of May 9

PARTICIPANTS

The Secretary of State,
Sir Harold Caccia, British Ambassador
Lord Hood, British Minister

¹ Source: Discussion of response to Khrushchev's letter. Secret. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

John Roper, First Secretary, British Embassy
Foy D. Kohler, EUR
Philip Farley, S/AE

The British Ambassador called at the Secretary's request at his home at 4:30 p.m.

The Secretary handed Sir Harold the revised draft reply to the Khrushchev letter of May 9. After reading the draft, with apparent approval, the Ambassador said he supposed we wanted it submitted to the British Government as rapidly as possible. The Secretary confirmed this, adding that he hoped we could receive their views tomorrow. The Secretary indicated that we were open-minded about including Canada in the draft. The Ambassador suggested that the draft be put up to the Canadians with their names specifically mentioned; they could then indicate what they wanted. In response to the Ambassador's inquiry, the Secretary confirmed that we contemplated putting the letter to the French and the Canadians first, before submitting it to the North Atlantic Council.

The Ambassador observed that the words "at least partially" in the first paragraph met the British Government's first point, and that the new formula removed the danger of affronting the French. In this connection he observed that it looked like it would be deGaulle anyway and that in France it would be said that we pushed the French into it. The Secretary said that in view of developments in France it would be too dangerous to appear to exclude the French at this time.

The Secretary went on to say that we recognize that the new formula involves some risks. We could expect that the Soviets would designate technicians from East Germany, Communist China, Hungary—indeed from practically every objectionable area from our point of view. He said, however, that he had discussed the problem with the President and we were disposed to accept such designations provided the individuals were competent experts.

In conclusion, Sir Harold commented that he thought the new formula was very good psychologically and that it would give us an advantage with public opinion, especially in the U.K. He said he would give the Secretary the British Government's views as soon as possible.

332. Memorandum of Conversation Between Eisenhower and Herter¹

May 30, 1958

The President telephoned me this morning in connection with a letter he had just received from Prime Minister McMillan concerning the exchange of information on atomic weapons which has just been approved in committee on the Hill. He said that any agreement under the bill will have to be laid before Congress for 30 days this year and 60 days thereafter before it can become operative. In that case, we will have to do some fast work.

I said I had talked to Admiral Strauss and we think we can step up our time table very materially. We have a draft reply to McMillan which we will get to the President before he leaves at 12:15 stating, in effect, that we will be in a position to have preliminary discussions with Plowden when he arrives next Wednesday, and shortly thereafter will be in a position to communicate with him about a time for the team of experts to come over. The President said he thought that, instead of aiming at the 1st of July, we should get it done by the 15th of June or we may get in trouble. I told him the only thing we had to be careful of was not to let word get out that we had begun negotiations before Congress has completed action.

The draft reply to McMillan was telephoned to the White House and the President called back at 12:05 p.m. to say it was all right with the exception of the first sentence of the second paragraph, which he suggested be changed to read: “. . . the discussions *by the experts* can in fact progress quickly”

Christian A. Herter

¹ Source: Reply to Macmillan letter on exchange of nuclear weapons information. Confidential. 1 p. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

333. Memorandum of Conversation Between Strauss and Herter¹

Washington, May 30, 1958

I telephoned Admiral Strauss this morning and told him Prime Minister McMillan had just written the President a letter stating that he is most anxious, now that the Congress appears to have approved the exchange of information on atomic weapons, to begin discussions as soon as possible. McMillan wants to send experts over here as soon as he is given the high sign. I told Admiral Strauss I understood June 16th would be the earliest date we would be in a position to talk to the British. We feel that we should have a completed draft of our own before we start discussions with them, but that, if at all possible, we should have such a draft before June 16th. Admiral Strauss said his people are at work on a preliminary draft now, that he would see how it stood and call me back this morning.

Admiral Strauss telephoned me a little later to say that his people have been working on the draft bilateral for some time. There have been some minor differences between them and Defense and they had been allowing time to straighten these out. However, he thinks they are relatively immaterial. Admiral Strauss said we could say to McMillan that we would be in a position to have preliminary discussions with Plowden when he arrives next Wednesday, and shortly thereafter would communicate with him about a time for the British team of experts to come over. Plowden will then have had a chance to review what we have and we will be in a better position to decide on the timing.

Christian A. Herter

334. Memorandum of Conversation¹

Washington, June 6, 1958

SUBJECT

Meeting with U.S. Experts for Geneva Technical Talks on Nuclear Test Detection

PARTICIPANTS

Dr. James B. Fisk
Dr. Ernest O. Lawrence
Dr. Robert Bacher
Mr. Spurgeon Keeny

The Secretary
S/AE—Mr. Farley
S/AE—Mr. Spiers

Dr. Fisk, who called at his request, introduced Drs. Lawrence and Bacher, who had been designated to serve as U.S. experts at the proposed Geneva technical talks on nuclear test detection, and outlined some of the preliminary work that the experts had been doing in preparation for the talks.

The Secretary emphasized to the group the importance which he and the President attached to the work the experts were to do in Geneva. He expressed gratification that men of their caliber were willing to undertake this assignment. He stressed also that he saw the group's mission as being purely technical in character: the purpose of the meeting would not be to reach political conclusions or to determine whether a given system with a specific level of capability would be sufficient. These decisions would be reached in Washington, on a political level, but the work done by the scientists and their views on the technical issues involved would weigh heavily as considerations. We had no idea, of course, whether the USSR would approach the meeting with serious purpose, or whether they would be willing to accept the inspection which we thought, at minimum, was necessary. *The Secretary* did not feel that a technically perfect system would be necessary, and that a lesser system which created an unacceptable risk for the USSR in undertaking violations might be adequate.

Dr. Fisk gave the Secretary a copy of the draft outline of points to be covered in the talks (attached) which he hoped the Department of State would be willing to send to the USSR to put them on notice about

¹ Source: Agenda for talks with Soviet Union. Confidential. 3 pp. NARA, RG 59, Central Files, 700.5611/6-658.

the extent of our preparations and to increase the possibility of having the Soviet experts similarly prepared. In response to the Secretary's questions, *Mr. Farley* said that he thought the suggested procedure was a good one.

Attachment

Draft Outline

June 9, 1958

*Technical Factors Which our Delegation Considers Relevant to a
Discussion of Monitoring a Nuclear Test Suspension*

- I.
 - A. Detection and identification by techniques and procedures, including:
 1. Acoustic
 2. Seismic
 3. Electro-magnetic
 4. Nuclear (air samples, ground samples)
 5. Visible light (high alt.)
 6. Mobile inspection teams
 - B. In physical environments:
 1. On earth's surface and at low altitudes
 2. At very high altitudes
 3. Underground, also underwater
 - C. For yields of:
 1. less than 1 KT
 2. 1 to 10 KT
 3. 10 to 100 KT
 4. above 100 KT
 - D. Carried out in locations including:
 1. USSR
 2. US (continental North America)
 3. Pacific and Australia
 4. Arctic and Antarctic
 5. Far East
 6. Southern Hemisphere oceans
 7. Africa and South America
- II. Some special questions to be considered:
 - A. Are there methods of evasion; e.g. can a 50 KT test (underground) be made to look like to 10 KT? 1 KT?
 - B. Possible interference with detection systems; e.g. introduction of excessive noise in seismic systems;

- C. Need for additional information in such areas as:
 - i. Observed seismic effect vs yield in underground tests;
 - ii. Variations in seismic coupling between a nuclear explosion and various underground environments.
-

335. Memorandum of Conversation¹

Washington, June 6, 1958

SUBJECT

Proposed Nuclear Test Detection Discussions

PARTICIPANTS

Admiral Lewis Strauss, Chairman, Atomic Energy Commission
Dr. James B. Fisk
Dr. Robert F. Bacher
Dr. Ernest O. Lawrence
Mr. Spurgeon Keeny
Mr. Donald R. Morris, S/AE

During the course of a background briefing on the preparations for the proposed Geneva nuclear test detection discussion, *Dr. Lawrence* told Admiral Strauss that they strongly felt the need for some underground shots to gain data on seismic coupling. *Admiral Strauss* noted that preparations for such shots were currently being made at the Ranier site and that he thought these could be speeded up. He would, on the basis of this oral request, undertake to facilitate such shots, but would need a formal letter during the course of the next week from Dr. Fisk. It was generally agreed that several underground shots of varying yields were necessary in order to obtain a picture of the yield versus seismic signal function. In addition, it would be very helpful to have one shot of the same yield as one of the series shots under conditions designed to decouple.

336. Telegram 8917 to London¹

Washington, June 13, 1958, 9:39 p.m.

8917. You should deliver soonest following reply from Secretary to Prime Minister's letter of June 11 (pouched Embassy yesterday):

Dear Harold:

VERBATIM TEXT. June 13. Dear Harold:

Your letter of June 11 raises two points which came up in our discussions in Washington with respect to the nuclear test problem.

On the first, the possible variants in types of explosions which we might agree should be excepted from a suspension of nuclear tests, I agreed that this is one of the questions which should be thoroughly considered in working out our ultimate policy on nuclear test suspension. We hope to be able to approach you shortly on this as well as other disarmament matters, and the question you mention should be one of those discussed. My own view is that we should not reach decisions about this matter before the Geneva technical talks. The information developed there will probably allow us to take a closer look at this problem in the light of the Soviet attitude and in particular the degree of inspection they appear to be willing to accept. It may turn out to be necessary to approach the problem of test suspension in stages as you have proposed.

With respect to the second point, the need to approach the Geneva talks in an exclusively scientific spirit, we are in full agreement. Our respective experts have held preliminary discussions here in Washington and I understand there is a gratifying measure of agreement between us on the approach to be taken. Faithfully yours, Foster. *END VERBATIM TEXT*

337. Memorandum From Lay to the NSC¹

Washington, June 19, 1958

SUBJECT

Peaceful Uses of Atomic Energy

REFERENCE

NSC 5725/1

The enclosed Semiannual Report by the Atomic Energy Commission and the Department of State on the Implementation of NSC 5725/1, for the period December 1957–June 1958, is transmitted herewith for the information of the National Security Council.

The Atomic Energy Commission advises that the enclosure is classified SECRET only because of paragraphs 54 and 55, which were furnished by another agency and were so classified. The remainder of the Report is unclassified.

Discussion of the enclosed Report will be scheduled on the agenda of an early Council meeting.

James S. Lay, Jr.
Executive Secretary

cc: The Secretary of the Treasury
The Director, Bureau of the Budget
The Chairman, Atomic Energy Commission
The Chairman, Joint Chiefs of Staff
The Director of Central Intelligence

Enclosure

Semi-Annual Progress Report

SEMIANNUAL PROGRESS REPORT BY THE ATOMIC ENERGY COMMISSION AND THE DEPARTMENT OF STATE ON THE IMPLEMENTATION OF NSC 5725/1—PEACEFUL USES OF ATOMIC ENERGY

1. This report summarizes significant events during the period December 1957–June 1958 under NSC 5725/1, “Peaceful Uses of Atomic Energy,” dated December 13, 1957. Because many of the items relate to several sections of the policy paper, the information is not keyed to specific paragraphs.

SUMMARY EVALUATION

2. U.S. leadership in peaceful uses of nuclear energy was affirmed during the reporting period when the European Atomic Energy Community (EURATOM) requested U.S. cooperation in considering whether a joint nuclear program might be developed to install within the Community by 1963 sufficient U.S.-type enriched fueled reactors of proven design to supply 1,000,000 kilowatts of electric power. The EURATOM program ranks with the establishment of the International Atomic Energy Agency (IAEA) as one of the most important projects to be undertaken within the framework of the President’s Atoms-for-Peace program. It is presently in the final stages of negotiation.

3. Other significant developments include new offers of assistance to the International Atomic Energy Agency; steady advances in controlled thermonuclear research paralleling those in the United Kingdom; development of an equipment grant program similar to the research reactor grant program; continuing assistance to other nations in the development of national programs; negotiation of a comprehensive power Agreement for Cooperation with Japan, and the increasing scope of U.S. preparations for participation in the Second United Nations Conference on Peaceful Uses of Atomic Energy.

4. Meanwhile, Great Britain has revealed a “stretch-out” in the phasing of its massive nuclear power program, the target date for completion being moved from 1965 to 1966. There are indications of further slippage in the Soviet program. A 40-stage gaseous diffusion isotope separation pilot plant is reported to have begun operation in France in December 1957. Interest in nuclear propulsion for commercial vessels has increased, particularly in Japan, West Germany, Norway, Sweden, and France. U.S. firms maintained their dominant position in the foreign market for research reactors, but neither the U.S. nor any other

country announced any new export sales of nuclear power reactors during the reporting period. U.S. firms, however, are bidding on several projects abroad.

5. The initial five year U.S. power reactor development program has undergone a number of modifications during the past four years. New experimental power reactors have been added to the program; research and development on materials, processes and advanced concepts have been expanded; and cooperative industrial efforts have materialized as an important part of the program. Considerable experience in the design and construction of power reactors has been gained during these four years of concentrated effort and we are beginning to accumulate necessary operating experience. In short, the AEC and United States industry as a whole have gained a considerable degree of sophistication in power reactor technology. This record of accomplishment has kept the United States in a position of world leadership in this field.

6. As the initially defined period of the United States power reactor development program draws to an end, Commission re-evaluation of its objectives and plans, made with particular awareness of the increasing importance abroad of nuclear power, resulted in its determination that the following objectives are desirable and feasible:

a. Achievement of competitive nuclear power in the United States during the next ten years.

b. Achievement of competitive nuclear power in friendly foreign nations during the next five years through a comprehensive program of assistance, clearly defined and vigorously pursued.

c. Fortification of the position of leadership of the United States in the eyes of the world and the peaceful applications of atomic energy, particularly with regard to power.

7. *EURATOM*. The incentives to be offered the Euratom Community under the joint program being developed with the United States (see pars. 35–39) will require consideration as to their adaptability to other areas of the world. On the part of Euratom it will be necessary to obtain full support from the operating utilities within the six member countries, and Euratom also plans to establish a mutually beneficial relationship with the International Agency and with the O.E.E.C. Negotiations will be undertaken upon the request of Euratom to integrate existing U.S. bilateral agreements with member States into a comprehensive agreement with the Community.

8. In the course of negotiations with Euratom a special arrangement was developed for safeguarding materials supplied to Euratom by the U.S. under the proposed joint program. Under this arrangement the U.S. will receive all of the guarantees and assurances required by the Atomic Energy Act that none of these materials shall be used for

other than peaceful purposes. In addition, the principles which will be used in establishing and implementing the Euratom safeguard system must be mutually acceptable, the U.S. will assist Euratom in establishing their system, there will be frequent and continuing consultation to assure that the system is operating effectively under the agreed upon principles, and the U.S. has the right to terminate the cooperative program if the system is not operated in accordance with these principles. These principles also will be compatible with the safeguard provisions of the International Atomic Energy Agency.

9. It is anticipated that this special safeguards arrangement, made with the multi-national organization Euratom, may draw criticism from other nations which have different safeguards provisions in their agreements for cooperation with the United States. Also, Mr. Sterling Cole, Director General of the IAEA, expressed the opinion that the IAEA should have the responsibility for safeguarding the material supplied to Euratom by the U.S. It is the judgment of the Department of State and the Atomic Energy Commission that the special arrangement with Euratom is entirely adequate and will provide the U.S. with assurance that none of the material will be used for any military purpose. The close ties of these countries to the U.S. through NATO and the traditional support of the U.S. for institutions, such as Euratom, which foster European unity justify this special arrangement. Further, it is recognized that inspection of the program by the IAEA is politically infeasible at this time.

10. As a result of the discussions with Mr. Cole, the U.S. has proposed, and Euratom has agreed, that (a) the IAEA shall have the right of first option to purchase any special nuclear material, produced in reactors fueled with materials obtained from the U.S., which is in excess of the need of Euratom for such material for peaceful uses; (b) Euratom is prepared to consult with an exchange experiences with the IAEA with the objective of establishing a safeguards system reasonably compatible with that of the IAEA. In addition, there has been an exchange of letters between the United States and Euratom concerning the language contained in the Memorandum of Understanding on Safeguards and Controls recognizing that such language provides for verification, by mutually approved scientific methods, of the effectiveness of the safeguards and controls system applied to nuclear materials from the other Party and fissionable materials derived therefrom. Further, Euratom has advised the United States that in the event of the establishment of an international safeguards and controls system by the International Atomic Energy Agency, the United States and Euratom will consult regarding assumption by that Agency of the safeguards and control of fissionable material utilized and produced in implementation of the program contemplated by the Memorandum of Understanding.

11. *Safeguards.* Favorable results of the feasibility study of tamper-proof instruments to reduce manpower requirements are expected in June, but the numbers, recruitment, and training of sufficient personnel for a world-wide inspection system remains a formidable problem. No difficulties have been encountered by Commission teams that have inspected the start-up and initial operation of the six U.S.-built reactors now in use abroad, although the over-all question of inspection remains potentially a serious political problem.

12. If the Agency is unable to acquire special nuclear materials on financial terms and conditions more favorable than are available to Members through other sources, principally the United States, the IAEA will have difficulty in competing with bilateral programs. By law, the U.S. can make special nuclear material available to the Agency only on terms comparable to those offered domestic users in the U.S.

13. Although the IAEA is progressing with the tedious tasks of organization, firm U.S. leadership will be required to assure that the Agency moves into its programmatic phase as soon as possible.

14. *Bilateral Agreements.* The United States' bilateral program, inaugurated in 1954, is about complete; and it is not anticipated that many more important bilateral agreements will be negotiated. The emergence of regional groups and the International Agency will require a reassessment and possible modification of the bilateral program in order to be assured that the institutional approach most beneficial to the interests of the United States is given priority. Such a re-assessment will have to take into account the bilateral programs of other nations, such as the U.K. and Canada.

SUMMARY OF ACTIVITIES

15. *United States Domestic Program.* The power reactor development program of the United States has moved ahead on a broad front both from the standpoint of technology developments and industrial participation. Progress has been made in the whole range of effort, from laboratory research on new materials and processes to construction and operation of large-scale commercial nuclear power plants. Particularly important is the continued promise of the boiling water and pressurized water family of power reactors. A new and promising type of power reactor is being developed which uses organic fluids for cooling the fuel elements, avoiding corrosion of fuel elements and the problems of induced radioactivity in the coolant.

16. As of this time there are seven power reactor experiments and one completed prototype power reactor in operational status in the United States. The prototype plant, the Shippingport Atomic Power Station, at its designed rating of 60,000 electrical kilowatts net, is producing more electricity than any other individual reactor in the world.

17. Experimental operation of these plants has, in the main, been very gratifying. Three of the boiling water reactors, EBWR, BORAX-IV, and VBWR (a private project) have performed far above their designed ratings, indicating a potential for capital cost reductions. In addition, successful operation of several of these plants has relieved much of the serious concern once felt about certain operating characteristics. Operation of the Organic Moderated Roaster Experiment, for example, thus far, shows no evidence of fouling of heat transfer surfaces and gives added confidence that the cost of makeup for the organic material can be acceptably low.

18. The civilian power effort has clearly advanced to much firmer ground as a result of this encouraging operating experience and the direction of development required to achieve economic nuclear power can now be charted with more certainty.

19. It has become clear that the achievement of economically competitive nuclear power in the United States will require a continued aggressive program including design, construction, and operation of successive generations of nuclear power plants of the same basic type. Several generations of plants must be built in order to gain the experience which will lead to cost reductions through engineering improvements. The fact that these plants are expected to be economically competitive in other countries (with higher power costs) before this goal is achieved in the United States provides an economic incentive for a certain amount of integration of our domestic development program with our foreign assistance program in the nuclear power field. The building of some "middle generation" plants in other countries can provide progress towards the goal of economic nuclear power in the United States for the lowest government cost. The principal activity in U.S. efforts to facilitate the building of reactors based on U.S. technology in other countries has been the negotiation of an arrangement with Euratom to provide assistance in the building of one million electrical kilowatts of nuclear power to be in operation by 1963 in those countries.

20. It is recognized that power reactor technology which is most advantageous for the United States may have certain limitations or disadvantages when applied to the design of nuclear power plants for other countries. The principal example of this problem is the possible reluctance of other countries to become heavily committed to power reactors which require partially enriched uranium if this fuel is available only from the U.S. This factor is considered in the planning of the U.S. power reactor development program. However, all U.S. studies have continued to show that real advantages of flexibility of design, compactness, higher performance, and resulting lower power costs can be obtained from the use of partially enriched fuel rather than natural uranium. Meanwhile, these advantages are becoming better recognized

by the program planners in other countries. Moreover, the successes experienced by the U.S. in the execution of its experimental reactor program have added confidence to the U.S. approach. Reactor designs requiring partially enriched fuel also are receiving more favorable consideration as a result of U.S. policies on the supply and prices for enriched fuels.

21. It is expected that all of the power reactors being developed by the United States will be suitable for export in varying degrees. The projects include development of fuel cycles based on both source materials (uranium and thorium) and all fissionable materials considered applicable as fuel (U-235, U-223, and plutonium). The "exportability" of most of the designs being developed by the United States will be further improved by development and demonstration of technology for recycling plutonium. Thus, many systems which require partial enrichment of the core might be operated on an initial charge of partially enriched fuel, plus a natural uranium feed stream which is enriched with recycled plutonium. The development of plutonium fuel technology has expanded. Construction of laboratories for further expansion in plutonium fuel development has been initiated. Construction of a Plutonium Recycle Test Reactor also has started at the Commission's Hanford facilities.

22. The power reactor program has continued to explore power reactor designs which could operate on natural uranium. Pursuant to Public Law 85-162, extensive design work was performed on natural uranium gas-cooled, graphite moderated reactors. In addition to use of natural uranium cores, consideration was also given to designs using partially enriched cores. It was concluded that with present technology, there is a significant economic advantage to the use of partially enriched uranium fuel in this type reactor.

23. Development work on heavy water moderated power reactors which would be operable on natural uranium proceeded in accordance with previous plans, but no acceptable proposal was received from industry for carrying out design and construction of a demonstration plant. Design work conducted to date has been inconclusive with respect to the economic promise of this system with natural uranium fuel, although indications are that it would have minimum penalty in ultimate performance and costs compared with partially enriched systems. Additional work, including construction of a Heavy Water Components Test Reactor, is planned. Work on several of the cooperative projects under the Power Demonstration Reactor Program also is pertinent to the evaluation of heavy water moderated reactors which might be operable on natural uranium fuel.

24. The Commission has reiterated its policy of taking the initiative to assure that desirable and necessary power reactor prototypes are built as justified and permitted by the status of pertinent technology, if such projects are not undertaken by industry on its own or through cooperative projects with the Commission. To this end, funds have been requested for construction of an experimental prototype gas-cooled, graphite moderated reactor using slightly enriched uranium and for further design effort on a heavy water moderated reactor of sufficient size and proper design to be operable on natural uranium fuel. It continues to be the policy of the Commission to give industry every opportunity to participate and bear or share the cost of these projects.

25. Contracts have been negotiated for construction of the Sodium Graphite Reactor at Hallam, Nebraska, one contract being with Atomic International for construction of the reactor and one with Consumers Public Power District for other parts of the plant and for operation of the total plant.

26. Design and construction of this plant depend upon data derived from experimental operation of the Sodium Reactor Experiment at Santa Susana, California. Initial difficulties with the SRE having been largely overcome, it now appears that design work on the Consumers plant may proceed. Accordingly, in February, an architect-engineer (Bechtel Corp.) was selected to perform preliminary design.

27. In addition to its positive steps to assure timely completion of plants for which it has assumed primary financial and technical responsibility, such as the PWR and the Hallam Plant, the Commission takes a positive interest in expediting construction of plants being built as cooperative projects or as entirely privately financed plants. In these cases, Commission action must take the form of expediting research and development supporting or pertinent to individual projects, assuring adequate liaison and flow of information, and prompt handling of matters related to the Commission's regulatory and licensing responsibilities.

28. Prior to the advent of nuclear fission, naturally occurring radioisotopes were scientific curiosities whose scarcity and expense limited their usefulness to such things as radium therapy and luminescent watch dials. Today, with the potential availability of tremendous amounts of radioisotopes of all the elements, these materials are rapidly taking their place as one of the more important tools of industry, medicine and agriculture.

29. The strides which have already been made in the utilization of radioisotopes are evidenced by the fact that it is conservatively estimated that industrial uses alone are resulting in annual savings in this country of greater than five hundred million dollars. When this is considered in conjunction with the immeasurable benefits that even now

accrue to millions of people through the diagnostic and therapeutic use of radioisotopes to alleviate human suffering, it is evident that in this modern genei we indeed have one of the most, if not the most, important peacetime benefits of atomic energy.

30. In spite of these accomplishments, we are far from satisfied. The industrial savings mentioned above can be attributed almost exclusively to use of radioisotopes in thickness gauging, flow and level control, and industrial radiography. There are in fact hundreds of other ways in which radioisotopes can bring about benefits and savings equal to or greater than those already realized. Even in such areas as thickness gauging and process control, in which radioisotopes have already proven their worth manifold, the surface has only been scratched. All major industrial effort involving carbon and hydrogen containing materials—and these cover organic chemicals, petroleum products, plastics, rubber, etc.—can expect to use radioactive carbon and hydrogen safely and efficiently in process control techniques that will result in untold savings. To a greater or lesser degree, the same may be said of the use of radioisotopes in almost every other industrial effort.

31. The potential of radioisotopes as a source of power in atomic batteries and luminescent sources has hardly been touched. The life, stability, mobility, and dependability of batteries and light sources using radioisotopes makes their utility almost unlimited.

32. Perhaps the most exciting general industrial application of radioisotopes, and certainly the one which seems to have the greatest potential impact on the entire industrial effort, and on the economy of the nation, is the utilization of massive radiation (million to billions of curies) from these radioisotopes to bring about, on an industrial scale, chemical and physical changes which either cannot be accomplished by other means or which can be accomplished by other means only expensively or inefficiently. Such things as the pasteurization or sterilization of feeds to retard decay, the formation of new linkages in plastics or rubber to bring about desirable changes in properties, the modification of the conditions of petroleum cracking to make that process cheaper and more efficient, the sterilization of drugs and medical supplies, the control of biological and botanical pests, and the development of new and improved strains of plant life, to name but a few, should, within the next few years do much toward making man's life longer, healthier and more enjoyable.

33. In view of the impressive progress which has already been made in the application of radioisotopes and radiation, in recognition of the tremendous potential good which can result from the use of these materials, and with the knowledge that the other major nations of the world—particularly Britain and the U.S.S.R.—are making great strides in this field, the Commission has established an Isotope Development

Program to accelerate these applications. This program, which is budgeted in FY 1959 at 6.6 million dollars, through work in Commission laboratories and through contracts for work in academic and industrial laboratories, will attempt to discover new uses and to make it possible for industry and science to exploit the already known uses of radioisotopes. In addition to its own program in this field, the Commission is working closely with the Quartermaster Corp of the Army in the design and construction of a two megacury Co-60 irradiator for use by the Quartermaster Corp in its program of large scale pilot irradiation of food at its Food Irradiation Center at Stocton, California.

34. Project PLOWSHARE, which has been in progress at the University of California Radiation Laboratory since 1957, investigates potential peaceful uses of nuclear explosives. During this year it will pass from the study phase to that of active experimentation. A survey is now underway to verify the feasibility and desirability of the Alaska Harbor Project announced on June 9, 1956. Cancellation or change in location could be forced by insoluble problems of safety, danger to wild life, lack of material, economic benefit, or engineering infeasibility; but to date no problems appear to be insoluble and it seems that the project will be fired in 1960. Other industrial applications of seemingly great promise are under investigation and it seems probable that one or more specific experiments will be made in 1959. Among these applications are: oil recovery from shales or tarsands, mining, production of aquifers for improvement of water supply or flood control, power production, and scientific experimentation in seismology, geology and special chemical reactions. No one of these applications has yet been proven feasible but all appear to justify further experimentation. The production of useful isotopes has also been the subject of theoretical study, laboratory work, and small-scale field experimentation. This work will continue. The AEC is also taking steps to establish cooperative relationships with industry for the prosecution of some of these experiments. These steps will include requests for legislation where necessary. It appears that the first cooperative venture will be an experiment in petroleum recovery.

*UNITED STATES FOREIGN PROGRAM, REGIONAL
AND INTERNATIONAL ORGANIZATIONS*

35. *EURATOM*. The European Atomic Energy Community (*EURATOM*) came into being on January 1, 1958, and in February the President approved in principle a joint U.S.-*EURATOM* program based upon, the following courses of action:

a. Participation by the U.S. on a lean basis in financing the capital costs of nuclear reactors capable of producing approximately 1 million kilowatts of electricity;

- b. Supplying the necessary special nuclear material to fuel the reactors;
- c. Entering into arrangements with regard to reactor fuel cycles reasonably consistent with those offered in the U.S. domestic program;
- d. Extending the present U.S. direct program of fuel cycle development and testing;
- e. Establishing a 10-year cooperative program of research and development;
- f. Assisting in the establishment of a training program, arranging for the exchange of technical information, and establishing a liaison office at EURATOM headquarters;
- g. Continuation by the U.S. of a strong program of research and development on advance reactor types, basic reactor technology, etc., and providing such information to EURATOM for use in meeting long-term objectives.

36. Within this framework, a Joint U.S.-EURATOM Working Party has held discussions in Europe and in Washington, and has developed a detailed program now under consideration within the Executive Branch prior to submission to the Congress. This program may be outlined in the following manner:

a. The proposed program will have as its objectives, (1) the bringing into operation by 1963, within the Community, of large-scale power plants using nuclear reactors of proven types, on which research and development has been carried to an advanced stage in the United States, having a total installed capacity of approximately one million kilowatts of electricity and under conditions which would approach the competitive range of conventional energy costs in Europe; and (2) the initiation of a joint research and development program centered on these reactors;

b. The total capital cost, exclusive of the fuel inventory of the nuclear power plants, is estimated not to exceed \$350,000,000. These funds would be provided for by the participating EURATOM utilities and other European sources of capital, such financing to be arranged with the appropriate assistance of EURATOM. Up to \$135,000,000 would be provided by the United States Government to EURATOM in the form of a long-term line of credit to cover a portion of the capital costs. These funds would be re-lent by EURATOM for the construction of nuclear power plants covered under the program;

c. In addition, in order to reduce the risks in operating costs to a point where the widespread participation of the European utility industry is assured, the United States, for a ten-year period of operation, would guarantee ceiling costs for the fabrication of the fuel elements required under the program as well as a fixed life for the fuel elements;

d. The proposed joint research and development program, which is for a 10-year period, would be centered on the improvement of the performance of the reactors involved in the program and at a lowering of fuel cycle costs. During the first five (5) years, the financial contribution of the Community and the United States would amount to about \$50,000,000 each, with the sum required for the second five (5) year period to be determined at a later date;

e. Technological and economic data produced in the program would be made available freely to the industries within the Community and the United States and the widespread dissemination of the information would be assured;

f. Under the terms of the program, the United States would sell to the Community, a net quantity of 30,000 kilograms of contained U-235 in uranium to cover the fueling and other requirements of the program over a twenty year period. An initial operating inventory of 9000 kilograms would be sold on a deferred payment basis. The balance would be paid for on a current basis. The International Atomic Energy Agency would have the right of first option to buy, at the announced fuel value price in effect with the United States at the time of purchase, any special nuclear materials produced in reactors fueled with materials obtained from the United States which are excess of the Community's need for such material for peaceful purposes. If IAEA does not exercise this option, the United States would be prepared to purchase such materials on the same terms;

g. The United States and the Community would recognize their mutual interest in assuring that the materials received from the United States, as well as special nuclear material produced therefrom, are used only for peaceful purposes, and an arrangement to accomplish this objective compatible with the provisions of the Statute of the International Atomic Energy Agency would be developed;

h. The United States will process in its own facilities, under the same terms and conditions as are offered to U.S. industry, spent fuel elements from reactors to be included in the program.

37. The Joint Working Party has finished its task, and the EURATOM Commission and Council of Ministers have approved the program. After final approval within the Executive Branch and after Congress has approved an international arrangement between the U.S. and EURATOM, the program will be incorporated in an Agreement for Cooperation under Section 123 of the Atomic Energy Act of 1954. In addition, the following legislative steps will be necessary:

a. Authority to enter into long-term arrangements for the purchase of plutonium and the reprocessing of material;

b. Authorization for the distribution of special nuclear material, for the joint research and development program, and for the fuel cycle.

38. It should also be noted that a Presidential allocation of additional U-235 to cover the requirements of the EURATOM program will be necessary.

39. A total of \$140,000,000 in authorization and funding will be required. Maximum cost of the fuel cycle arrangements is estimated at \$90,000,000 over a 10-year period with the first expenditures probably coming in 1962. The first 5-years of the joint research and development program is estimated to cost the U.S. approximately \$50,000,000 with EURATOM also making available approximately \$50,000,000. In 1959, \$25,000,000 obligational authority is required—\$10,000,000 for fuel cycle funds and \$10,000,000 in research and development money

with \$2,000,000 expenditures in the latter item expected in FY 1959. Other loans and credits in paragraphs 35 and 36 would not require new money authorization.

40. *International Atomic Energy Agency (IAEA)*—Steady progress was made on recruiting a staff for the Agency. Its 1958 calendar year budget is \$4,000,000. The program is expected to expand rapidly in 1959; therefore, the budget will increase. Estimates running as high as \$12,000,000 were discussed at the April Board meeting but the budget to be presented to the IAEA Conference in September is expected to be somewhere between \$6,000,000 and \$9,000,000.

41. The agenda for the second IAEA General Conference scheduled for late September 1958 is now being prepared. Meanwhile, the first program project of the Agency, a survey of nuclear developments and opportunities in Latin America, began in May. The international team selected by the IAEA is headed by Dr. Norman Hilberry, Director, Argonne National Laboratory, and includes representation from the Organization of American States.

42. The Agency has signed an agreement with the United Nations establishing its autonomous relationship with that organization and is negotiating similar agreements with the specialized agencies of the U.N. A draft Agreement for Cooperation with the United States is under negotiation.

43. With the formal offer by member States of special nuclear, source, and other materials, the Agency now has significant materials resources. These include the 5,000 kg contained U-235 offered by the U.S. and the U.S.-matching offers for the 50 kg and 20 kg pre-offered respectively by the Soviet Union and the United Kingdom. Canada, India, Ceylon, South Africa, Norway, and Portugal have made various offers of material to the IAEA.

44. New U.S. offers of assistance were made to the Agency during the reporting period: (a) cost-free services for limited periods of 20–30 expert consultants; (b) matching contributions, up to \$125,000, to a fellowship fund for training abroad; (c) the allocation of 120 fellowships for training in the U.S. at an estimated cost of \$840,000, and (d) two mobile radioisotope laboratories. Additionally, the AEC has requested \$2,000,000 in FY 1959 funds to implement previous offers of a research reactor and radioisotope facilities.

45. *European Nuclear Energy Commission (OEEC)*. The European Nuclear Energy Agency (ENEA), operating under the OEEC Nuclear Steering Committee, came into being February 1, 1958. At ENEA's request, the United States will provide technical and consultative assistance for the \$12 million pilot chemical processing plant to be built at Mol, Belgium. This is a joint project of 12 OEEC Members under a

convention establishing the European Company for the Chemical Processing of Irradiated Fuels (EUROCHEMIC).

46. As a country associated with the work of the OEEC, the United States is following with interest other OEEC programs, such as the security convention now in the process of ratification; the drafting of third party liability legislation, and feasibility studies regarding the use of Iceland's natural steam fields in connection with a heavy water production plant.

47. *Organization of American States (OAS)*. Drafting a statute for the Inter-American Nuclear Energy Commission continues. The first IANEC meeting is planned for early 1959. We believe it would be desirable that a second Inter-American Symposium on the Peaceful Uses of Nuclear Energy be held in late 1959 or 1960 in a South American country under the aegis of the new Commission. The Department of State and the U.S. Atomic Energy Commission have agreed that full participation by the United States should be extended if such a Symposium is held.

48. *Puerto Rico Training Center*. The Puerto Rico Nuclear Center, which is operated by the University of Puerto Rico for the AEC, is intended to serve as a regional nuclear training center for Latin America. Initial operation of the center, in facilities made available by the University, and using some \$300,000 worth of nuclear equipment provided by the AEC, has proceeded successfully. Some 50 students, mostly from Puerto Rico, have now been trained in radioisotopes techniques, and the first course in nuclear engineering is in progress.

49. The principal facilities of the Nuclear Center will consist of a research reactor and associated laboratories, to be located at the Mayaguez Campus. The design of these facilities is in progress and contracts for their construction are expected to be awarded by the end of FY 1958, with completion scheduled in FY 1960. The cost of these facilities is estimated at \$3 million. An additional \$500,000 has been requested in the FY 1959 budget for a medical radioisotopes laboratory to be located at the San Juan Campus.

50. Upon completion, the Puerto Rico Nuclear Center will be able to accommodate upwards of 100 students annually in various phases of nuclear training, plus a number of research associates. Annual operating costs of the Center at that time will be in the vicinity of \$1 million. To serve its regional purpose, the Center must attract qualified students from Latin America. Although the students trained to date have been largely from Puerto Rico, there is encouraging evidence of interest in the Center throughout Latin America, and applications from the Latin American Republics are being received in increasing numbers. This interest was demonstrated by the attitudes and statements of scientists from a number of the Republics who participated in the Symposium on Health Physics in Biology and Medicine held at San Juan

May 26–28 under the joint sponsorship of the University of Puerto Rico School of Medicine and the Commission. Their favorable comments about the Center are considered particularly meaningful in the light of certain other recent political events in South America.

51. *Asian Nuclear Center.* A tentative plan has been prepared for a more modest Asian Nuclear Center involving \$6 million in capital costs and \$4 million in operating expenses for the first three years. This plan is based on the assumption that the Philippine Government will cooperate with the United States in establishing the Center and donate land adjacent to the University of the Philippines in Quezon City for the Center.

52. Plans call for coordination of the proposed Center with the national Philippine nuclear energy program to avoid duplication or overlapping of facilities. Instruction and training would be related to the limited technological resources prevailing in most of the Asian nations which it is anticipated would use the Center, and primary emphasis would be placed on medical agricultural applications of nuclear energy.

MAJOR COUNTRY PROGRAMS

53. *USSR.* Recent reports indicate the USSR nuclear power program is slipping further below the goal announced in February 1956 of installing 2,000 to 2,500 electrical megawatts of nuclear power during the 6th five-year plan ending in 1960. The May 1957 Soviet report to the United Nations outlines a program totaling only 1,400 EMW involving three large and four small experimental nuclear power stations and no target dates were given.

54. Several recent Russian articles mention only one large station under construction in 1957 and, as late as April 1958, U.S. visitors were still being denied visits to the “large Soviet nuclear power stations” on one pretext or another. There is some evidence to show that the Soviets may have only about 700 EMW installed by the end of 1960, this being based on the completion of two pressurized water reactors of 100 EMW each, one 200 EMW graphite moderated water-cooled reactor, and four experimental stations.

55. However, it also is possible that the USSR is building dual-purpose reactors optimized for plutonium production that are not included in its “peaceful purposes” program. The USSR has never identified its atomic energy production sites. Therefore, one should not discount the possibility of the USSR achieving something closer to its announced 1956 goals via the dual-purpose reactors than is indicated in the estimated 700 EMW based on what the Soviet chooses to show Western visitors at this time.

56. *United Kingdom.* A British White Paper issued in April moved the completion date for the U.K. 5–6,000 megawatt nuclear power program from 1965 to 1966. It also indicated that a substantial proportion

of new generating capacity required in the U.K. between now and 1966 would come from coal-fired stations.

57. Significant bilateral activity between the U.S. and U.K. continued. U.S. consultants made available under the U.S.-U.K. agreement for cooperation were responsible for many of the recommendations relating to health and safety standards and procedures contained in the official Fleck Committee Report on the Windscale Accident. U.S.-U.K. study of the properties of graphite under in-pile conditions has been proposed and is under consideration.

58. The technical exchange of information on gas-cooled and fast-breeder reactors has raised the problem of reconciling the different policies relating to the disseminating of information which prevail in the two countries. Under U.K. policy, information developed with public funds is sold; under U.S. policy such information is disseminated without cost to the recipient.

59. The UKAEA has concluded bilateral agreements with several European Countries and is presently negotiating an agreement with Japan. Close U.K. cooperation with Canada and Australia has continued. Three British firms submitted bids on the S.E.N.N. project to be financed by the World Bank in Italy (six U.S. firms also submitted bids). It is expected that the construction of a full-scale nuclear power plant for AGIP-Nucleare, a publicly owned utility in Italy, by a British Consortium, will proceed on schedule, although no firm contract has yet been signed.

60. *France.* The French program has expanded greatly. France has appropriated 235 billion francs for its second five-year program as compared with a total of 148 billion francs spent by the Commissariat à l'Énergie Atomique since its establishment in 1945. The new five-year plan includes: (a) expansion and enlargement of present research facilities and setting up of more research centers; (b) construction of new research reactors and of several prototype reactors for nuclear power and marine propulsion; (c) increased production of natural uranium, plutonium and thorium (the French plutonium separation plant begun in 1955 was reported completed in May 1958); (d) an isotope separation facility either alone or in cooperation with other European countries. A French gaseous diffusion pilot plant went into operation at Saclay the last week in December 1957.

61. *Japan.* Negotiations were completed with Japan on a comprehensive bilateral Agreement for Cooperation which provides for a total net amount of 2,700 kgs. of contained U-235 for use in several research reactors, three experimental power reactors and a full-scale power reactor. The Agreement, which will run for a period of ten years, will supersede and incorporate a research bilateral Agreement for Cooperation which has been in effect with Japan since December 27, 1955. Japan's

first research reactor, built by an American firm, commenced operating in August 1957; a second research reactor is presently under construction under contract with an American firm.

62. The Japanese have stated that the first stationary power reactor to be purchased from the U.S. will be an experimental water-cooled, enriched-uranium-type of 15–20 electrical mw to be completed in 1961. Interest in nuclear marine propulsion has increased rapidly, stemming principally from Japan's position as a leading maritime nation and shipbuilder. There are tentative plans to complete two 40,000-ton tankers (20,000 HP) in 1965 and 1966, but these and other reactor projects were not sufficiently firm to be accepted by the U.S. as part of the 7,000 kgs of U-235 originally requested by the Government of Japan for inclusion in the proposed comprehensive bilateral.

63. Negotiations between the U.K. and Japan are still under way on a bilateral agreement. The Japanese have stated that they intend to purchase a 150 mw Calder Hall-type power reactor from the U.K.

64. *Argentina*. Based on their success in building an Argonaut-type reactor in their own country and fabricating the fuel elements for it, the Argentines have indicated an interest in building this type of reactor for export at a price under \$100,000.

65. *New Fuel Policies*. In March, the Commission authorized the transfer of U-235 enriched up to 90 per cent for both research and materials testing reactors providing individual core loadings do not exceed 8 kg of U-235 and that comprehensive safeguards contained in power bilaterals were in effect or agreed to by the cooperating nations. This action will make more flexible the cooperation with nations desiring to improve their nuclear training and development programs by making their reactors more efficient and economical. U.S. manufacturers experienced considerable difficulty in fabricating sound 20 per cent elements.

66. In May, the Commission granted domestic producers of uranium ores and concentrates the right to make private sales of these materials in the United States and abroad, all sales being subject to Commission licensing. This action enables U.S. industry to compete for the growing foreign and domestic market for nuclear fuel. Adequate safeguards must be in effect for sales of more than 1,000 kg to any one nation. Where such safeguards are not contained in an Agreement for Cooperation, a cumulative limit of 100 kg of normal uranium to a single foreign consignee and a cumulative limit of 1,000 kg for any one country will be in effect. This will enable foreign users of small quantities of uranium to continue to purchase from the U.S. source material needed for basic research, medical, and general industrial application.

67. *Agreements for Cooperation*. During the reporting period, comprehensive agreements with Spain and Italy came into force, superseding previous research bilaterals. Ecuador and Nicaragua ratified their

research agreements. After protracted negotiations, a comprehensive power agreement was concluded with Japan and awaits ratification. It authorizes the transfer of 2,700 kg of U-235 over the 10-year life of the agreement. Ratification of the Venezuelan power agreement has been delayed following the change of government in that country. Sweden has negotiated an amendment to raise the U-235 authorization to 200 kg. Denmark will seek either a power agreement or major amendments to its present research accord. Brazil has requested an amendment to its research agreement to increase the U-235 authorization from 6 to 12 kilograms. Brazil has not ratified its power agreement which is a separate accord from its research bilateral.

68. The United States now has 41 bilateral agreements in effect with 39 nations and the City of West Berlin. (Switzerland has 2 agreements.) Of these, 12 are for power and 29 for research. An Agreement Status Table is attached as the Appendix.

69. *Research Reactors.* The Republic of China, the University of Palermo, Italy, and the University of Geneva, Switzerland, have signed contracts with U.S. manufacturers for research reactors and Brazil's University of Minas Gerais plans to buy a research and training reactor. Twenty-five U.S. commercial research reactors have been or are being built or contracted for in sixteen nations.

70. Eight reactor grants of \$350,000 each were committed during the reporting period to Austria, Belgium, China, Greece, Israel, Italy, West Germany, and Sweden.

71. *Equipment Grant Program.* The Commission has approved a program of equipment grants ranging from "package" research laboratories and subcritical assemblies to relatively minor items of equipment important to many underdeveloped countries. So far in FY '58, \$121,000 has been committed for radioisotope training equipment in Lebanon and Ecuador and for the two IAEA mobile radioisotope laboratories. It is expected that any FY 58 funds remaining after research reactor grant commitments have been completed will be obligated for equipment grants.

72. *Education and Training.* Between February 1949, when foreign nationals were first admitted, and June 1958, the Commission has provided training for 255 foreign nationals in the Oak Ridge Institute of Nuclear Studies Course in Radioisotope Techniques. Due to the excellence of the course and its resultant international reputation, the demand for increased enrollment has been such that the Commission has recently expanded its facilities to accommodate 48 instead of 32 persons per course. The International School of Nuclear Science and Engineering, which was established at Argonne National Laboratory as a part of the Atoms-for-Peace program, has enrolled 328 foreign nationals in the first seven courses. Students for the 8th Session are now being selected.

73. The Equipment Grant and Education and Training programs will contribute directly to extending the impressive benefits of isotope

and radiation applications to the under-developed areas of the world. Under the equipment program, emphasis is being placed on items such as teletherapy units, facilities for growing plants in gamma radiation fields to induce mutations, and isotope research and training laboratories. A special request has been received from the Chairman of the Indian Atomic Energy Commission to provide training and practical experience to a number of qualified Indians in the radiation preservation of food. This request will be accommodated.

74. *Controlled Thermonuclear Research.* The United States and the United Kingdom continue to cooperate closely in pursuing a vigorous research program in the area of controlled thermonuclear reactions. In January, there was a major joint release which embraced practically all data declassified in the field on that date. Both countries are planning major demonstrations of this research at the Geneva Conference in September.

75. *Information.* A workshop for librarians in charge of the gift technical libraries distributed to European and Middle East nations under the Atoms-for-Peace program, held in Geneva in May, was well attended and favorably received. Additional libraries have been donated to the IAEA, Poland, and Honduras. The exchanges of classified information, classified discussions, and the dissemination of unclassified information continued to increase. Visitors from other nations to U.S. installations and U.S. atomic energy industry were averaging about 70 per month.

CONFERENCES, EXHIBITS AND MISSIONS

76. *Geneva Conference.* The United States, as in 1955, plans to make a significant contribution to the second United Nations Conference on Peaceful Uses of Atomic Energy in Geneva, September 1–13, 1958. Approximately 900 abstracts were submitted to the UN Conference Secretary General. It is expected that the U.S. will be allocated about 150 oral presentations at the Conference sessions.

77. Through May 15, 1958, the United Nations reported acceptance of the following number of papers from the countries indicated: USSR—158; United Kingdom—199; France—163; West Germany—65; and India—63.

78. Construction is well advanced on the comprehensive technical exhibit which demonstrates the latest and most significant advances in nuclear science and technology in the United States. It will include the controlled thermonuclear section previously referred to, two operating research reactors, and detailed demonstrations of many other aspects of peaceful research and uses. The Commission also is coordinating and will participate in a trade-fair-type commercial exhibit in down-town Geneva concurrently with the Conference. It is expected that about 45 U.S. firms will be represented at the latter exhibit.

79. The total cost of U.S. participation is estimated at \$4,600,000 of which some \$3,300,000 will be represented in the construction and operation of the exhibits. While the exact total of Conference Representatives and Advisors has not been determined, the total number of people scheduled to be in Geneva officially for the United States is about 600, including a number of guides and clerical help to be hired in Geneva.

80. *Other Conferences and Exhibits.* U.S. scientists will participate at the Fifth International Electronic and Nuclear Exposition and Congress in Rome, Italy, during the latter part of June. There also will be a large U.S. Atoms-for-Peace exhibit there. The Commission provided data and materials, including a small operating training reactor, for nuclear exhibits in the U.S. Pavilion and in the Science Section of the Brussels World Fair.

81. *Missions.* At the request of the nations involved, the Commission sent teams to New Zealand in March and to Australia in June, to hold discussions and seminars with a view to assisting the development and administration of nuclear energy programs in those countries. The New Zealand mission was most favorably received but it reported to the Commission that lack of coordination between the Government and the universities is hampering the progress of the New Zealand program. The Australian Mission is still abroad. There are four U.S. experts on the IAEA International Mission which began a South American survey in May. (See paragraph 41.)

82. *USAEC Scientific Representatives.* In cooperation with the U.S. embassies, the Commission Scientific Representatives in London, Paris, Buenos Aires, Tokyo, and Chalk River, Canada, have continued to render services in connection with the expanding technical cooperation in the areas under their respective jurisdictions. Their work is proving especially useful in evaluating the technical progress in many countries, assisting and participating in the work of the U.S. delegations such as those at the NATO meeting in Paris in December, the EURATOM and OEEC discussions, the Windscale investigation program, and the various Atoms-for-Peace missions.

83. *Foreign Trade.* An interesting development in the foreign trade activities of the U.S. atomic energy industry is the emergence of joint ventures with industrial concerns in other countries, notably in Europe and Japan. These range from cooperative sales arrangements to the formation of separate companies jointly owned by an American and a foreign firm. In some cases, they involve reciprocal licensing rights.

84. These cooperative business arrangements appear to offer U.S. industry a good chance for getting its share of international atomic energy business, particularly if the rapid development of nuclear industry in highly industrialized nations diminishes the prospects of U.S. firms, acting independently, selling appreciable numbers of complete nuclear power plants abroad.

Appendix

340. Letter From John Foster Dulles to Killian¹

Washington, July 3, 1958

Dear Dr. Killian:

One of the most important aspects of disarmament negotiations is the question of measures to detect and discourage surprise attack. This aspect of disarmament is one on which the Soviet Union may be willing to enter into serious negotiations.

Several preliminary studies have been done for the Government in the past three years concerning inspection methods to be applied within any surprise attack zones. None of these, however, has adequately treated the problem of specific inspection and control systems designed to minimize the possibility of surprise attack, nor has any taken into account missiles capabilities. It would therefore be most helpful if the Science Advisory Committee could explore in a preliminary way some of the general facets of the surprise attack problem, with particular reference to its scientific and technical aspects.

What I have in mind is an examination of the ways of obtaining, through an international agreement, significant enhancement of early warning abilities and capability to detect preparations for a major surprise attack, as well as reduce the chances of accidental war, both in the current period and in subsequent years when strategic missiles would have been developed in large numbers. I should think that such study would endeavor to explore the question of just what are the critical areas of the Soviets' military and industrial activities, from the point of view of providing advance warning of a surprise attack, and thus what would be the most important objects and means of inspection and control in any such inspection system.

In making this preliminary analysis you may wish to consider United States capabilities to detect a surprise attack that could be utilized to strengthen reliance on an agreed international inspection system. You may also wish to comment on the extent to which an international inspection system could meet the problems of surprise attack detection which the Science Advisory Committee's Technological Capabilities Panel raised in its February 14, 1955 report to the President, entitled "Meeting the Threat of Surprise Attack".

On the basis of the above, I would hope that you could give a tentative evaluation of the degree of contributions to surprise attack

¹ Source: Request for exploration of surprise attack issues. Secret. 2 pp. Eisenhower Library, Records of the Office of the Special Assistant for Science and Technology Files, Disarmament, Surprise Attack.

protection which the United States would receive from implementation of the various proposals for surprise attack inspection which have been presented in the disarmament negotiations and/or which were discussed in the Second Interim Report of the Working Group on Disarmament Policy, dated April 18, 1958.

If there are other measures which have not been considered in our past proposals, or measures requiring further study, which you conclude might form a basis for international agreement to lessen the chances of a successful surprise attack and/or lessen the danger of accidental war, I would appreciate your including them in your report.

Because of the Soviet proposal of July 2 that a conference of experts be convened to discuss the technical questions concerning surprise attack, and also because of the requirement that the United States be in a position to discuss these matters with our allies in the very near future, it would be most helpful if the preliminary report could be made available by July 31, or earlier if possible.

I am aware that in such a short period of time analysis and conclusions of the Science Advisory Committee might be useful in assuming the validity of some of our present proposals, advancing our preparations for possible technical discussions with the Soviets, and deciding on further studies needed for policy decisions.

Mr. Philip J. Farley and members of his staff will be available to assist you in any way you may wish in formulating and developing such a study.

Sincerely yours,

John Foster Dulles

341. Letter From Killian to John Foster Dulles¹

Washington, July 10, 1958

Dear Mr. Secretary:

In your letter of July 3, you asked whether the President's Science Advisory Committee could explore in a preliminary way some of the general facets of the Surprise Attack problem, with particular reference

¹ Source: Problem of surprise attack not limited to technical or scientific issues. Secret. 3 pp. Eisenhower Library, Records of the Office of the Special Assistant for Science and Technology, Disarmament, Surprise Attack.

to its scientific and technical aspects. Since receiving your letter, I have brought together a group of the Committee and we have engaged in a two-day preliminary discussion as to how the study you propose is to be undertaken. This discussion has resulted in a progress report containing several conclusions which I wish to present to you before we proceed with further study.

We would emphasize first that the Surprise Attack problem is wholly different in kind and in magnitude from the problem of devising an inspection system to monitor a nuclear test cessation agreement. It cannot be dealt with in such specific technical terms, therefore, as we have dealt with the current problems under discussion in Geneva. We also conclude that the examination of existing proposals for inspection zones will require a more general analysis, and in this general analysis some of the following problems will be important.

Our early warning lines and our radar detection systems are designed to provide us with a few hours' warning of approaching hostile aircraft. This time might be extended greatly by aerial inspection of the Soviet territory or by appropriately-stationed observers within the Soviet Union. The problems involved in thus extending our warning time may be more military and political than technical. The use of aerial inspection or ground observers clearly involve difficult military estimates of the result of any specific proposal about limited aerial inspection zones or limited numbers or mobility of ground observers.

In the event that we enter into discussions with the Soviets on the problem of Surprise Attack, it seems highly likely that they will raise the problem of the training flights by our Strategic Air Command bombers, particularly when these bombers are carrying nuclear weapons. If the U.S. delegates are to discuss such a topic, it would seem of great importance that we analyze in advance the present Fail-Safe technique and its possible modifications, the effects of limiting the numbers of aircraft in flight at any time, and of restrictions on their flight paths. These, too, are predominantly military problems.

We must also expect that the proposed discussions with the Soviets will not be limited to present weapons such as manned aircraft, but will encompass also long-range missiles. Their era is rapidly approaching, and consideration of them in the proposed discussions would greatly increase the significance and value of these discussions.

The size of the Soviet satellites leaves no doubt about the early achievement by them of missiles of essentially unlimited range when carrying warheads of thermonuclear size. They can be located anywhere in the USSR and still reach targets in the United States. Since this is true, it is clear that in the missile era geographically limited aerial or ground observer zones in our respective countries can provide no substantial

reduction of the threat of an attack without warning, although they may have other attractive features.

It now appears that unlimited aerial surveillance alone, no matter how elaborately reinforced by scientific devices, can increase warning time only to the limit of the duration of flight of missiles, i.e., to 30 minutes for ICBM's and to 15 minutes for IRBM's. Any further increase in warning time would require quite different kinds of measures and any discussions with the Russians would doubtless have to examine these measures. Examples of these additional means include: (a) Devising of intelligence indicators for providing strategic intelligence; (b) Ground surveillance adequate to cope with dispersed or even mobile missile launchers; (c) Controls on the design, deployment, and numbers of offensive weapons.

Any further increase in warning must be based on the observation, not of hostile acts, but of preparations for hostilities. Examples of the sorts of preparatory acts that might give indication of intention to launch a surprise attack include; (a) Forward deployment of long-range bombers; (b) Fueling and positioning of missiles in preparation for firing. It is an inherent limitation of observations of such action that they cannot give certain indication of the intent to launch hostilities. At best, the observable acts are clear indications of a state of heightened readiness on the part of the observed power. It may turn out, therefore, that no reliable system can be devised to provide dependable advance warning of a surprise attack except in conjunction with agreed limitations on weapons numbers or deployment. Given such agreement, the observation or detection of deployments or weapons production in violation of the agreement might furnish the kind of indicator that would be a reliable warning of attack.

With such considerations as these before us, we early came to the conclusion that discussions with the Soviets cannot long be confined to the strictly technical aspects of surveillance. They will inevitably touch upon the problem of weapons controls, controls of deployment, etc. While there are technical aspects to almost every part of the Surprise Attack problem, it is also clear that the subject of the proposed meeting with the Soviets is of such a nature that technical questions are in inextricably intertwined with political and military considerations.

We suggest that any group making preparatory studies for the conference should recognize the impossibility of separating technical questions from non-technical questions. If the Science Advisory Committee, therefore, is to be effective in conducting the study you request, we must join with competent representatives of the State Department, the Department of Defense, the Central Intelligence Agency and other government agencies.

If it is agreed that we should assemble such a representative group, we are prepared to do so, if the President approves. An Alternative arrangement would be for the Department of Defense to take responsibility for organizing it.

Before we proceed further, therefore, I wanted to place before you these conclusions to make clear our own conviction that a discussion of Surprise Attack involves many elements and that it cannot be studied in a limited technical manner. We believe, further, that the planning for the proposed discussions with the Russians must be undertaken with the assumption that those discussions will certainly lead into non-technical areas. We understand, finally, that the function of this study is not to recommend positions to be taken by the Government, but solely to make an analysis and list the alternatives which might be useful to you in reaching positions and making plans.

Yours sincerely,

J.R. Killian, Jr.

342. Telegram Denuc 103 From Geneva¹

Geneva, July 25, 1958, 4 p.m.

Denuc 103. For Secretary and Killian from Fisk.

I believe that evidence is accumulating rapidly here that the Russians want this conference to succeed, that they want an agreement on nuclear test cessation, that they want it soon, and that they are making and will make concessions to get it.

For example:

1) After first three days of sharp attack involving political issue, namely "purpose" of conference, the subject was dropped and has not been mentioned since.

2) Concessions were made by them on acoustic conclusions.

3) Conclusions on radioactive debris collection contained three significant concessions:

¹ Source: Soviet interest in agreement on nuclear test detection. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/7-2558.

Use of any aircraft,
 Use of aircraft over national territories and
 Acceptance of non-political wording.

4) Recognition and acceptance of “inspection” in seismic conclusions.

5) Lengthy, informal discussion of inspection in connection with proper place in the agenda has committed them farther than we believed they were prepared to go.

6) While there is pressure to complete work, there has been no recent reference to three or four weeks—or any other time limit.

7) General tone of meetings has been better; no further political hassles re communiques, etc.

8) In every important case they have accepted the major elements of our position, moving appreciably from their original position.

9) Their participation, whereas generally emphasizing theory rather than experimental data, has been on a high scientific plane.

We have reported earlier evidence of their concern re 4th power problem. Observations above may be interpreted as related primarily to this problem, but we believe they may have much deeper implications. On the assumption that my estimate is correct and that we do reach satisfactory understandings here with the USSR, the pressures will be intense to make the political decisions on what the next steps will be. I suggest that this issue be carefully thought out in Washington so that the US can take the initiative shortly after conclusion of this conference, which may be only ten days or so away. Soviet propaganda will no doubt make immediate capital out of the fact that Soviet and Western scientists have reached agreement on detection and identification of tests.

The true political implications of this development are not for me to evaluate. It seems clear that there have been important revisions in Fedorov’s instructions during the course of the meeting and he is accepting points which I did not believe at the outset he would accept.

I have discussed these observations with Sir William Penney, who has similar views which he has communicated to the Foreign Office.

Villard

343. Telegram 248 From Moscow¹

Moscow, July 26, 1958, 1 p.m.

248. Geneva experts conference has now proceeded to point where Soviet strategy is becoming fairly obvious. Their aim is to have meeting succeed, and, to this end, they have made number of important concessions which are not altogether in Soviet hard bargaining tradition. They have not, of course, surrendered on any points vitally affecting Soviet internal security and secrecy (nor were they really asked to by west), and conference has yet to discuss desiderata of control system scheme (which may well reveal significant divergences), but real clue to final outcome appears to have been their agreement to limited use of aircraft for flights to collect nuclear debris.

I would now assume that chances of success are sufficiently great to make it incumbent on us to decide where we go from there. Soviets are clearly calculating that final report agreeing to feasibility of control system and giving outline thereof will create irresistible pressure on west to cave in on separate test ban issue. We can be sure that all stops will be pulled from accompanying prolonged propaganda cry and that number of supports for this step in free world will exceed all previous records.

345. Memorandum of Conversation Between McCone and John Foster Dulles¹

Washington, July 30, 1958, 12:50 p.m.

Mr. McCone handed me the attached memorandum on a limited test moratorium and asked my views regarding it. I said that I thought that there should be urgent thinking along the lines of a constructive proposal on suspension of testing as if there were a possible outcome of the Geneva talk of experts, some such action was imperative. I said I thought it would in any event be imperative for the next General Assembly, particularly having regard to certain aspects of the prospective UN report of experts.

¹ Source: Dulles reacts negatively to a paper by Libby and Teller urging testing limitations. Confidential; Personal and Private. 3 pp. Eisenhower Library, Dulles Papers, General Memoranda of Conversation.

Mr. McCone thought it would be very helpful for Murphy if he were stopping in Rome to talk with Cardinal Agagianian who he thinks is better acquainted with problems in Lebanon than anyone else in the world. He is an Armenian and has lived in Lebanon.

Teletype Message to McCone From Libby and Teller

TELETYPE MESSAGE TO JOHN MCCONE FROM
AEC COMMISSIONER WILLARD F. LIBBY AND DR. EDWARD
TELLER, DIRECTOR OF THE LIVERMORE RESEARCH
LABORATORY

A LIMITED TEST MORATORIUM

People everywhere feel a great concern about the possible effects of radioactive fallout from weapon tests. A most powerful objection to continued testing would be removed if radioactive fallout from future tests could be limited or eliminated. One of the following two plans would, therefore, seem reasonable.

We might propose to limit the offsite fission fallout per year to 1 megaton equivalent each year released by the USA and the same amount by the USSR.

An alternative proposal would be to ban completely offsite fallout. This would permit underground testing by everyone.

The task of policing such a moratorium would be simplest in the latter case, but it does seem clear from our knowledge of radioactive fallout from weapons tests that it would be possible to conduct tests on the fallout ration basis.

It is of extreme importance at this time to put forth such a plan of test limitation. It would exploit the amount of agreement already obtained in Geneva. At the same time it would permit us to continue what kind of testing which is necessary to develop our tactical weapons, our clean weapons, and our lightweight warheads for intercontinental ballistic missiles.

Limitation of fallout to 1 megaton a year would, furthermore, permit some effects shots, such as are needed in developing the anti-ICBM system.

If we do not announce our willingness to accept a limitation such as the one given above we may be forced by public opinion into a

complete test cessation. According to the opinion of all reliable authorities small shots below 5 kilotons can be effectively hidden. Methods to hide bigger explosions may well be discovered and such methods may already be available in the Soviet Union.

It is most important for the defense of our country and also for the development of the peaceful uses of nuclear explosives that continued study of nuclear explosions take place. The proposed test limitation would permit continued testing in a calmer and more reasonable atmosphere. We believe, therefore, that it is important to put forward a proposal of this kind in the very near future.

346. Record of Telephone Conversation Between Goodpaster and Herter¹

August 4, 1958, 3:10 p.m.

3:10—General Goodpaster phoned to say that Dr. Killian met with the President today. After the meeting the President asked the General to tell CAH that we should have a statement ready following the present Geneva talks on nuclear testing. The President suggested we say that these negotiations now having been discussed satisfactorily the U.S. is considering what might be done in these areas to promote peace and stability. The President thought it should have the clearance of Defense, AEC, CIA and Gordon Gray. CAH told the General that a paper had been prepared by Mr. Farley on this subject and word was received from the Secretary that he approved it. He said it carried a covering letter to Dr. Killian. It was agreed that at the OCB luncheon on Wednesday CAH would get the clearances of the other Agencies as requested by the President. General Goodpaster said he would inform the President it would be taken up in OCB.

347. Memorandum From Killian to Herter¹

Washington, August 6, 1958

I read with great interest your letter of August 5, together with a staff paper proposing a suggested revision of our policy on nuclear testing. As you know, I have also had from John McCone a description of the proposal under consideration by the Atomic Energy Commission for a limited test moratorium.

First of all, let me note that the recommendation that there be a group brought together, as suggested in your staff paper, to discuss the nuclear provisions of U.S. disarmament policy, is desirable. I would raise this point with respect to what your staff paper suggests: Will it not at some point be necessary to have these proposals formally considered by the National Security Council? Should not the procedure be determined by the President?

I do not feel it possible to reach a conclusion on either the test cessation proposals in the State Department staff paper or in the memorandum from the Atomic Energy Commission without first being clear on certain national policy objectives. I think, in other words, that the specific suggestions in regard to test cessation or a limited test agreement must be appraised in the light of national policy.

If our national policy objective is to ease tensions or if this policy calls for freezing the Soviet nuclear capability at its present level or if our objective is to move in the direction of an agreed cessation of production of nuclear materials, then it seems that we would tend in our conclusions about nuclear test cessation to lean in the direction of the State Department's paper.

If, however, our national policy objectives provide for uninterrupted research and development to achieve every possible military refinement in nuclear weapons, while meeting at least partially the public clamor for reduction of fallout without at the same time stopping tests, then clearly a test moratorium might take the form of that under consideration by the Atomic Energy Commission.

It seems to me, then, that these basic issues must be discussed in order to reach conclusions about a specific form of test moratorium. There are other considerations affecting the selection of a specific plan: One of these is the value to the United States of having an inspection system in operation which would involve a massive penetration of the

¹ Source: Need for basic policy decision before deciding between test cessation or limitation. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/8-658.

Iron Curtain and consequent benefits in intelligence and exchange of information. Another such consideration is whether we want to give the Russians further opportunity to renounce their announced test cessation policy.

Without guidance with respect to these matters, I would personally at this stage find it very difficult to take any position with regard to one plan in contrast with the other.

J.R. Killian, Jr.

348. Letters From Farley to McCone, Quarles, and Allen Dulles¹

Washington, August 7, 1958

Dear Mr. McCone:

At the request of Mr. Herter I am sending herewith a proposed revision of present U.S. Policy on nuclear testing, together with a brief explanation of the arguments which we believe make this proposed policy preferable to the limited test moratorium which is outlined in a memorandum which you recently left with Secretary Dulles.

Mr. Herter's office is now seeking a suitable time for an early meeting to consider the various policy proposals, and how a Presidential decision on nuclear testing policy can best be obtained.

Sincerely yours,

Philip J. Farley

¹ Source: Transmits a proposed revision of U.S. nuclear testing policy. Secret. 7 pp. NARA, RG 59, Central Files, 700.5611/8-758.

Washington, August 7, 1958

Dear Mr. Quarles:

At the request of Mr. Herter I am sending herewith a proposed revision of present U.S. policy on nuclear testing, together with a brief explanation of the arguments which we believe make this proposed policy preferable to the limited test moratorium which has been recently proposed by AEC Chairman McCone.

Mr. Herter's office is now seeking a suitable time for an early meeting to consider the various policy proposals, and how a Presidential decision on nuclear testing policy can best be obtained.

Sincerely yours,

Philip J. Farley

Washington, August 7, 1958

Dear Mr. Dulles:

At the request of Mr. Herter I am sending herewith a proposed revision of present U.S. policy on nuclear testing, together with a brief explanation of the arguments which we believe make this proposed policy preferable to the limited test moratorium which has been recently proposed by AEC Chairman McCone.

Mr. Herter's office is now seeking a suitable time for an early meeting to consider the various policy proposals, and how a Presidential decision on nuclear testing policy can best be obtained.

Sincerely yours,

Philip J. Farley

Enclosure

Proposed Revision of NSC Policy Paper on Disarmament

5. a. All parties will agree, independently of agreement on other provisions of section I,

(1) to refrain, as of the effective date of the agreement, from nuclear testing until 36 months thereafter. (The suspension would not continue beyond a 12-month period unless satisfactory progress was being made in the installation of the inspection system in (2) below.)

(2) to cooperate in setting up during the first 24 months, or earlier if mutually agreeable, an effective international inspection arrangement to monitor tests.

b. The U.S. will announce that it will resume nuclear tests at the end of 36 months if agreement to an adequately inspected cut-off of the procurement of fissionable materials for weapons purposes has not been achieved.

c. The U.S. will announce that it will refrain indefinitely from nuclear tests if the monitoring system referred to in paragraph 5a(2) is operating to the satisfaction of each party concerned and if the inspection system for the cut-off has been put into effect.

d. The U.S. will announce that if tests are resumed, it will give notification in advance of dates and approximate yields of such tests; provide reciprocal limited access to tests; and conduct such tests underground.

e. Provision will be made for the continuation, under international auspices, of any nuclear explosions necessary for the development of peaceful application of such explosions.

Enclosure

Proposed Policy on Nuclear Tests

Discussion:

1. We believe that with the Geneva talks approaching a conclusion, early policy decisions must be taken on the question of nuclear tests. Dr. Fisk, Ambassador Thompson and Embassy London have also expressed this view within the past week. In your letter to Prime Minister Macmillan on June 13 you indicated that we hoped to be able to approach the UK shortly on this matter in the light of information developed in the Geneva talks; and the UK reminded the Department last week of its desire to discuss the question with us upon conclusion

of those talks. The approach of the United Nations General Assembly, the release of the United Nations Radiation Committee [report] scheduled for early August, and the possibility of the question of tests arising indirectly in connection with the proposed Special Security Council Session are additional factors which demand consideration of this question.

2. On July 30 Chairman McCone handed you a message sent to him by Commissioner Libby and Dr. Edward Teller (TAB B). The message suggests that to avoid our being forced by public opinion into a complete test cessation we might propose (1) to limit the offsite fission fallout per year to one megaton equivalent each year released by the U.S. and the same amount by the USSR, or alternately (2) to ban completely offsite fallout and permit underground testing by everyone.

3. While any measures which notably reduced fallout would lessen public concern about the health hazards of continued testing, we believe the AEC proposal is insufficient from the political standpoint and that it has the following specific disadvantages:

(a) It would be viewed as a retreat from previous Western proposals which have called for suspension of tests rather than test limitations, and would seem an illogical sequel to the Geneva talks directed toward methods for enforcement of a possible test suspension.

(b) It would not be accepted and hence would enable the USSR to continue to exploit the testing issue and its own unilateral suspension in world-wide propaganda and to avoid the question of a production cut-off by continuing to hide behind the issue of a test suspension.

(c) By the same token, it would be an easy way for the USSR to avoid the inspection to which it has otherwise become largely committed as a result of the Geneva talks.

(d) It would not inhibit the development of nuclear weapons capabilities by fourth countries, a problem which has been of some concern to the U.S. and one which is of apparently increasing concern to the USSR as well.

(e) It would not have the effect of a test suspension in freezing weapons development of the U.S. and USSR at a time when we retain some important advantages in weapons technology (according to technical studies prepared by the Science Advisory Committee).

(f) A limitation of fallout to a fixed amount would, according to past technical consideration of similar limitation proposals, be difficult to enforce by inspection.

4. The policy recommendations which you discussed in general terms with the panel of disarmament advisors and approved for discussion with other agencies in April, we believe, afford the best basis for decisions at this time. In summary, the nuclear test proposal we have discussed with the other agencies and revised in the light of their comments, is the following: The nuclear provisions of our present proposals (test suspension and cut-off) would be made separable from the

other elements of the package, but testing would remain limited, as far as the U.S. is concerned, to the cut-off which would become a condition subsequent. Nuclear tests would be suspended for three years beginning as of the effective date of the agreement.² The suspension would not continue beyond twelve months unless satisfactory progress was being made in the installation of the inspection system. The U.S. would declare at the outset that testing would be resumed if agreement on an adequately inspected cut-off of production of fissionable materials for weapons purposes had not been reached at the end of three years. Conversely, we would announce that the suspension would be extended for an indefinite period if agreement is reached on the installation of a control system to assure that no further fissionable material is proposed for weapons purposes. The U.S. would announce that, if it became necessary to resume testing, the U.S. would henceforth test only underground.

5. This proposal would, we believe, turn to our advantage each of the factors mentioned in paragraph 3 above which weigh against the AEC proposal. It would be a logical follow-up to the Geneva talks, deprive the Soviets of the propaganda advantages of the testing issue, enable us to begin arms inspection within the USSR, inhibit fourth country programs, and could freeze our present weapons advantage. It would, by removing the test issue, enable us to place more effective emphasis in the nuclear cut-off as the condition subsequent. Most important, it would be evidence of United States willingness to go the "extra mile" to help achieve more meaningful measures of disarmament and thus go far to counter the image which is all too prevalent abroad of an overly militaristic United States.

6. Attached as TAB A is a proposed revision of the paragraph on nuclear tests in present NSC policy which would incorporate the changes recommended above. The other disarmament policy recommendations discussed in the interim report to the Cabinet Committee (TAB B) need not, in our view, be decided until the studies on surprise attack now underway under the leadership of Dr. Killian have been completed.

² A three-year period is a minimum for a meaningful inspected agreement since from 18 to 24 months will be required for installing the inspection system. [Footnote is in the original.]

349. Memorandum of Conversation Between Eisenhower and John Foster Dulles¹

Washington, August 12, 1958, 10 a.m.

1. We discussed the prospective meeting of the General Assembly on the Near East and the President's prospective participation. It was agreed that we would ask that the President should be the first speaker before credentials and like matters might be raised, and that if this could be arranged, the President would plan to speak at the opening, i.e., 10:30, Wednesday morning. It was agreed that after talking with Lodge I would phone the President. He said he would probably come up late in the day possibly for dinner and spend the night at the Waldorf.

With respect to the speech, it was felt that it was still about three pages too long. It was agreed that CD Jackson would attempt the revision and cutting while going to New York with me and that he would phone the revised text down to Mrs. Whitman. I pointed out the desirability of getting a definitive text in time for translation, duplication and circulation.

2. I noted that Bob Murphy would probably come to New York and report to me there en route to Washington.

3. I spoke of the Quemoy-Matsu situation and of the fact that it might be necessary to give a further warning to the Chicoms about this situation. I said that during the past four years the integration of these two islands into the Formosa-Penghu complex had been such that I doubted whether there could be an amputation without fatal consequences to Formosa itself. The President pointed out that this was not true from a military standpoint, and I indicated my agreement with that but did say that the connection from a political and psychological standpoint had become such that I thought now it would be quite dangerous to sit by while the Chicoms took Quemoy and Matsu. I said that I had the feeling that the Communist bloc might now be pushing all around the perimeter to see whether our resolution was weakened by the Soviet possession of nuclear missiles, but I felt confident that if it appeared that we were standing firm, then they would not take action that would risk precipitating a large-scale war.

The President indicated that I might say something along these lines with reference to Quemoy and Matsu at a press conference.

¹ Source: Need to resolve nuclear testing policy; Quemoy and Matsu; U.N. session on Near East. Top Secret; Personal and Private. 2 pp. Eisenhower Library, Dulles Papers, Meetings with the President.

4. I said that another matter that was urgent was the reaching of a policy decision on nuclear testing. It seemed likely that there would be an agreement at Geneva and that coupled with the United Nations Commission Report made it urgent that we arrive at a new policy. I said that State was working actively with Defense and AEC on this subject and that I thought some split would develop which the President would have to resolve. The President said he was thinking in terms of a total suspension except of underground tests. I said I thought that the Defense Department would not like this because in a confined area some characteristics of the explosion could not be accurately estimated. The President said that he did not think that this should be a reason against limiting the test to underground areas.

I suggested to General Goodpaster that he try to arrange a restricted meeting of those directly interested as soon as I could be back in Washington. The President said he had already asked Goodpaster to plan for this.

5. I said I received his note about George Whitney, that he was a good personal friend of mine and I thought highly of him. I observed however that Mrs. Whitman had indicated his age somewhat exceeded the President's estimate. I added however that I was not one who believed incapacity automatically came at 73.

John Foster Dulles

350. Record of Telephone Conversation Between John Foster Dulles and Herter¹

New York, August 13, 1958, 1:14 p.m.

The Sec said on the whole it went well. The atmosphere is less tense than he thought it would be. Fawzi is a slick performer and made a smart conciliatory speech. The Sec said he talked with Gromyko yesterday and for the first time he did not recite boiler-plate stuff and it looked as though he would be interested in getting something. Their res is pretty moderate. If the order were reversed it would not be too bad. This may be the lull before the storm and it may get worse but it is off to a fairly mild start with a reasonable prospect of getting a res most

¹ Source: Cessation of nuclear testing. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, General Telephone Conversations.

would agree on. Probably that is over-optimistic and is due to the Pres' being here.

H said nothing too exciting is going on there. He is going up at 2 on EURATOM. It looks as though they have two reasonable bills if we could get them to report them out.

At 4 there will be another discussion on cessation of atomic tests. The Sec though H could push that along without waiting for him to come back. H said the Sec has to make the decision. Someone notified the man in Geneva re the difference and they have expressed themselves in a telegram which the Sec said he has not seen. H summarized it. It did not come from State—AEC or IAEA. He will try to find out shortly. The Sec is concerned about the French here and notices this formulation talks about parties to the agreement. Who are they? H said so far they are talking in bilateral terms. H replied he assumes it would not include the UK unless they want to join. They agreed they would want to join. The Sec said as you envision it just the UK, US and USSR make an agreement to suspend and the French would be free. H said there has been no real discussion with the French. The Sec said Couve will probably be here Monday and it might be useful to talk then. H will arrange this p.m. to move on it. The Sec said the area would not be limited to the 3 and H said it would be all the world. The Sec said that would require agreements with them. The consent of the others would be second-stage agreements. Agreed. The Sec said you don't know if the French will agree to set it up in the Sahara or the Chinese Communists—that would all be later on. The Sec mentioned our making a unilateral declaration and then will that be a treaty at first? H is not sure of it. The Sec thinks first there would be an Executive Agreement. The Sec mentioned again H's pushing it—if he gets into trouble he could come there for an hour or so if H wanted him to,—at the WH tomorrow or Friday. The Pres said the Columbine would stand by to get him. The Sec said the preliminary thinking along the lines he has indicated should be thought through.

H said at NSC tomorrow Gray has questions for discussion that may bring on discussion re Taiwan. H said he did not see the Sec's memo of conv with the Pres about that. The Sec referred to what he said and added he does not think what the Pres said re a statement before a press conf was his final considered opinion. H said they are drafting something to come here tonight for consideration and will send a copy to the WH. The Sec is reluctant to see it dealt with by a formal decision at NSC and H does not think it can be. The Sec said it is all right the way it stands.

351. Memorandum of Conversation Between Lovett and John Foster Dulles¹

August 14, 1958

Mr. Lovett brought up the continuance of the advisory group on disarmament matters and asked whether it still served any useful purpose. He said that he was perfectly glad to carry on if it did serve a purpose. I said that while events had taken a turn somewhat different from what had been anticipated when the group was appointed in that there seemed no early likelihood of high-level disarmament talks with the Soviet Union, one could never tell what would happen, and I felt that both the President and I felt it a comfort to be able to call on the four individually or collectively and talk matters over. I said I did not want them to serve if they felt they were being in any sense used as a cloak in respect of matters where they were not adequately informed. Mr. Lovett said he had no such concern, and indeed after the first announcement the existence of the group had largely been ignored or forgotten by the press. He said that in view of what I had said he thought the group should continue in being. I expressed satisfaction at this.

He said that Beedle Smith had raised the question with him and that Beedle had felt that the differences exhibited at the meeting with Macmillan were unfortunate. I said they would have been unfortunate with anybody but Macmillan but that he was practically a member of the family. Lovett said he agreed.

We talked about many other matters of a general character.

John Foster Dulles

¹Source: Continuation of the disarmament advisory group. Confidential. 1 p. Eisenhower Library, Dulles Papers, General Memoranda of Conversation.

352. Memorandum From Bromley Smith to Gray¹

Washington, August 14, 1958

SUBJECT

Disarmament Working Group Meeting

The Disarmament Working Group met this morning to review the State and Defense proposals for revision of the U.S. position regarding the suspension of nuclear tests, as stated in para. 8 of the first phase of disarmament.

State presented a draft (copy attached). Defense presented a revision of its earlier draft (copy attached). AEC representatives did not attend because they were engaged in attempting to reach agreement on an AEC draft revision.

The Defense Department has reorganized its proposal in such a way that the Working Group was unable to marry the State and Defense drafts using either brackets or parallel columns. Thus it will be necessary to prepare an additional paper summarizing the policy differences between the two drafts.

In summary, the major differences in the proposed revisions are as follows:

a. State rejects the Defense concept of agreeing to refrain from such nuclear weapons testing as can be monitored by the agreed inspection system. State believes we should refrain from testing if we obtain agreement for the installation of an "*effective* international system of inspection".

b. State rejects the Defense provision (8-a-(3)) which would add as a condition to acceptance of the suspension of testing an agreement to cooperate in the design of an effective international inspection system to monitor the cessation of the *production* of nuclear materials for weapons purposes, and to seek agreement on the installation and operation of such a system. State believes the Defense condition is so close to existing policy that to make an offer to suspend testing on this basis would be inadequate to meet the political situation. State would introduce the concept of arrangements for the cut-off of production of nuclear materials for weapons purposes as one of the conditions to agreement to refrain indefinitely from nuclear tests at the termination of the 24-month period.

c. Defense has deleted from its draft the State provision which would permit the continuation, under international auspices, of nuclear explosions for peaceful purposes.

¹ Source: Record of the Disarmament Working Group meeting. Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.

The Defense representative, General Byers, appeared to agree, during the course of the meeting, to present both State and Defense drafts to the Joint Chiefs formally so that work could be started in the Joint Staff on the JCS views.

The Group discussed the extraordinary complexity of attempting to deal with the question of “peaceful uses” of nuclear dynamite. Dr. Killian’s representative called attention to the fact that the atomic exhibit to be opened in Geneva this summer would include a section on the peaceful uses of atomic energy. He restated the Geneva scientists view that an effort to distinguish between peaceful explosions and weapons tests had not been discussed, and would be practically impossible to accomplish under any kind of a monitoring system.

The discussion also made clear that the system being devised in Geneva will not work if stations are not established in Communist China. If other states will not accept monitoring stations in their territory, the number of stations in the USSR and in the U.S. will have to be greatly increased if the system is to have a significant capability.

As far as I could learn, the State Department has not attempted to list the policy issues involved in a decision to modify existing policy on nuclear testing. There was some feeling expressed by the State representative that Dr. Killian’s points, as summarized during Wednesday’s meeting, were so broad as to involve issues which need not be decided immediately.

Geneva, August 14, 1958, 10 p.m.

Denuc 163. At further three-hour informal session today, para-by-para review of WestDel and SovDel draft conclusions continued and there appeared to be further meeting of minds on most significant points other than number of posts, discussion of which Fedorov obviously postponing until last. Exact degree agreement achieved difficult determine until redrafts based on today’s session prepared and exchanged. At end session, Fedorov gave Fisk redraft organization

¹ Source: Report of meeting with Soviets in Geneva on detection of nuclear explosions. Confidential. 1 p. NARA, RG 59, Central Files, 700.5611/8–1458.

conclusions paper, which appeared on quick reading to omit political issues we had previously claimed inability discuss. (WestDel will transmit text when translation completed.) However, Fedorov made further plea that we explicitly recognize need for "parity" in governing organization in view of important powers it would exercise and stated that no control organ could be set up until this issue settled. He implied he wished us seek instructions this matter, but did not raise it again when Fisk reiterated that we would not under any circumstances be able discuss this matter.

Fisk gave Fedorov WestDel draft final report (Denuc 156) and requested comment.

Group will meet again informally 3:00 PM August 15.

Villard

354. Letter From Kistiakowsky to Killian¹

Washington, August 15, 1958

Dear Dr. Killian:

On July 14 the President sent a memorandum to the Secretary of State suggesting that he join with the Secretary of Defense and yourself in having a careful study made "to further our preparations for possible negotiations on measures to detect and discourage surprise attack." He further directed that this study should be made after appropriate consultation with other government agencies and officials, that the Working Group actually charged with the study be kept quite small, and that it take "full advantage of the analyses and studies of a technical nature bearing on this matter that are being developed within Dr. Killian's scientific and technical group."

The Inter-Agency Group that was brought together in accordance with these instructions to the Secretary of State herewith presents its report with Appendices I to IV attached. In addition there is included a J.C.S. document referred to in the report and a memorandum from the Chairman of the Watch Committee.

¹ Source: Conveys report of Inter-Agency Group on Surprise Attack (not included). Top Secret. 1 p. Eisenhower Library, Records of the Office of the Special Assistant for Science and Technology, Disarmament, Surprise Attack.

The Working Group functioned as individuals, rather than as representatives of their agencies. The Group confined itself to an analysis of the problem and to conclusions about what further studies could most effectively be undertaken in order to prepare adequately in the time available for discussions with the Soviets which may open during the first week in October. The Working Group wishes to stress the fact that it is not making any recommendations in regard to positions which should be taken by the United States in these proposed discussions.

We do venture, however, to add to the conclusions and comments in our report our conviction that the U.S. Government faces a task of great complexity and difficulty in preparing adequately for the discussions, and that the time available is very short.

Yours sincerely,

G.B. Kistiakowsky

Chairman

Inter-Agency Group on Surprise Attack

355. Memorandum From Keeny to Goodpaster¹

Washington, August 15, 1958

Attached for your information are three documents on the Nuclear Test Cessation problem. Dr. Killian thought that you might find them useful as background for the Monday afternoon meeting with the President on this subject.

Paper Prepared in the Office of Science and Technology

POLICY QUESTIONS RAISED BY DISCUSSION OF TEST CESSATION OR LIMITATION

In weighing the pros and cons of some form of test cessation announcement or agreement, it seems desirable first to examine certain questions of basic national policy. The decisions with respect to these matters of national policy may be conclusive in determining whether we depart from our present policy of testing, and if so in what way. Some of the policy questions involved are:

1. If the NSC policy on disarmament seems to be unachievable, is the U.S. prepared to seek some partial solution in an effort to ease world tensions?

a. Should the nuclear provisions of our present disarmament policy (test suspension and cut-off of production of fissionable materials for weapons production) be made separable from the other elements of the disarmament package?

b. Should the suspension of nuclear testing remain linked, as far as the U.S. is concerned, to the cut-off of weapon materials production?

c. Present policy states that the acceptability of any international system for the regulation of armaments depends primarily on the scope and effectiveness of the safeguards against violations and evasions. What degree of reliability of detection is required for a "safeguarded" system for the detection of nuclear tests?

d. What should U.S. policy be toward agreement on suspension *vs.* limitation of nuclear testing: (1) "complete suspension" of nuclear testing (although there would not be a good probability of identifying underground tests of less than 5 kilotons); (2) cessation of all testing except for devices of very few kilotons' yield below the limit specified by the monitoring agreement, such tests to be conducted without radioactive fallout; (3) cessation of such nuclear testing that can be satisfactorily monitored by the agreed system, contingent on progress for the cut-off of production of fissionable materials for weapons; or (4) a restricted testing agreement limiting the amount of annual offsite fission fallout or banning offsite fallout.

2. Would a nuclear test cessation operate to the net disadvantage of the U.S. considering its military, political and economic implications? Is it to U.S. advantage to seek to hold at present levels the nuclear weapons capabilities of the U.S. and the USSR; or should the U.S. strive to achieve every possible military advance and refinement in nuclear weapons while the USSR does the same?

3. Is the U.S. willing to accept political arrangements necessary to extend the nuclear test detection and identification system to Red China?

4. Are we willing to accept an international inspection system in the U.S.? Are there constitutional questions?

5. Is it our conviction that a sound and adequate inspection system would be of advantage to the U.S. by bringing about a massive penetration of the iron curtain and subsequent benefit in intelligence and exchange of information?

6. What should be U.S. policy with respect to the international means required for monitoring a nuclear test cessation agreement, including organization and personnel?

7. Should the U.S. “seek to prevent the development by additional nations of national nuclear weapons capabilities” by means of a nuclear test suspension agreement?

8. Should the U.S. agree to abide by a test ban prior to the installation and operation of an adequate detection system?

9. Should our policy anticipate Soviet acceptance of the inspection concepts agreed at Geneva and seek to make it difficult for the Soviets either to resume nuclear weapons testing or to derive world-wide acclaim for unilaterally practicing a test ban?

10. Is it a national U.S. policy objective to seek now to diminish world-wide fears about the hazards of radioactive fallout and to take action which will reassure those who hold these fears?

Paper Prepared in the Office of Science and Technology

PRINCIPAL ARGUMENTS FOR A TEST CESSATION

1. Military Security of the USA: Relative Position vs. the USSR

Test cessation now or in the near future would be to the military advantage of the U.S. At the conclusion of the Hardtack tests, the U.S. will possess a tested series of nuclear warhead prototypes covering a very wide range of application, and probably with superior performance in all categories compared to the USSR. While it is evident that continued U.S. tests would increase U.S. nuclear weapons strength in an absolute sense, further tests will not increase our *relative* strength, and may even decrease it in the light of rapid Russian advances and the increasing maturity of nuclear weapons technology on both sides.

[*text not declassified*] According to intelligence estimates, USSR does not have a warhead in this weight class and is, therefore, restricted to very much larger ICBM's and may encounter difficulties developing a submarine-launched IRBM.

Similarly, there is no evidence that the Soviets possess tactical weapons of small size and yield comparable to those possessed by the U.S. Evidence on the Soviet test program indicates that it has not followed the most promising avenue for the development of weapons of small size and good yield.

If one looks back over the history of U.S. and Soviet weapons development, one has to conclude that a test cessation at an earlier date would have left the U.S. in a position of much greater relative military advantage. It is likely that the Soviet Union will continue to progress more rapidly than the U.S. and will approach the capability of the U.S. in nuclear warheads if testing is continued.

2. Military Security: Actual Requirements

a. The Hardtack test series has been very successful and has met essentially all important military requirements. [*text not declassified*]

b. In defending the U.S. against attack, particularly a ballistic missile attack, the major technological problems are not in the area of nuclear weapon development, but in the non-nuclear aspects of these defensive weapons—particularly electronics. If we can solve the electronics problems of these weapons systems, we can construct effective systems around nuclear weapons available after the Hardtack tests. In the case of ballistic missiles, while an increase in yields would be useful, we could gain much more by the improvement of guidance and thereby accuracy of delivery.

c. Although we do not now have small-yield “clean” weapons which unquestionably would have tactical applications, there are now available conventional weapons or air-burst fission weapons to accomplish equivalent objectives. It is also significant that radioactivity induced by “clean” weapons in ground burst is substantial and may produce radioactivity equivalent to 20% of fission yield.

3. Detection of Clandestine Nuclear Tests

There appears to be little question that it is technically possible to design a control system to monitor a test cessation agreement. The current Geneva Conference will probably result in agreed-upon conclusions concerning a control system which can effectively detect and identify nuclear explosions of between one and two kilotons and above in the atmosphere and above five kilotons underground and which would have at least deterrent value for lower yields. In addition, recent theoretical calculations have indicated that it is considerably more difficult to hide underground weapons tests by reducing the coupling to seismic waves than had previously been believed.

4. Test Cessation is an Important Step in Disarmament

A test cessation would be an important step in easing world tensions. It would create an atmosphere in which further disarmament missions which are considered more important from our point of view could more easily be negotiated. We must start somewhere seeking

ways to slow down this armaments race and it is unrealistic to expect the early achievement of over-all disarmament agreements. It will be easier to reach agreement on a small problem, like test cessation, than on a large one, like prevention of surprise attack. Unless we reach agreement on this small problem, we cannot expect to be successful in concluding agreements on the larger problems.

The Geneva Conference will probably result in agreement that both control posts and the right of rapid, unimpeded inspection are required in an effective control system. The Soviets have also agreed to limited overflight of the USSR in case there is suspicion of nuclear explosion on its territory. Even though these concepts will require clarification in a political agreement, they constitute a precedent for the acceptance of inspection by the Soviet Union.

5. Nuclear Disarmament

U.S. policy calls for a cut-off of fissionable material production for weapons as a second step in nuclear disarmament. A test cessation agreement could be tied to a future agreement on the cut-off of production. It will be our choice whether we wish to proceed further in nuclear disarmament.

6. International Relations

a. General—The position of the United States in the society of nations will deteriorate if we continue testing. We will increasingly be considered as warlike and as obsessed with aggressive military objectives, while the Soviets will seek to gain support as a nation with peaceful objectives.

We are now engaged in a technical discussion with the Soviets to determine if an agreed-upon system of effective inspection of nuclear explosions can be achieved and the make-up and capability of such a system. If there are agreed-upon conclusions upon the control of test cessation and if the U.S. then fails to seek a test cessation agreement, it may well subject us to world-wide criticism for bad faith, even though we carefully stated before the start of the Geneva talks that such talks did not commit us to any policy with respect to cessation.

b. Fallout—Even though the actual radiation hazards from fallout from nuclear tests may be relatively small, the uncertainties and warnings that have been expressed by scientists on radiation hazards have caused fear and apprehension throughout the world and a strong emotional opposition to testing. We cannot ignore or escape this growing world apprehension and/or escape damage to our position in the world which will result from our disregard of worldwide fears.

7. Peaceful Applications

If peaceful application tests are excluded by the test cessation agreement, it may be possible to re-introduce tests for peaceful application, after the issue of tests has lost its present controversial nature. Such a delay would be acceptable since these applications are of small importance compared with the stopping of the armaments race.

356. Letter From Kistiakowsky to McElroy¹

August 15, 1958

Dear Mr. Secretary:

On July 14 the President sent a memorandum to the Secretary of State suggesting that he join with the Secretary of Defense and Dr. Killian in having a careful study made "to further our preparations for possible negotiations on measures to detect and discourage surprise attack." He further directed that this study should be made after appropriate consultation with other government agencies and officials, that the Working Group actually charged with the study be kept quite small, and that it take "full advantage of the analyses and studies of a technical nature bearing on this matter that are being developed within Dr. Killian's scientific and technical group."

The Inter-Agency Group that was brought together in accordance with these instructions to you herewith presents its report with appendices 1 to 4 attached. In addition there is included a J.C.S. document referred to in the report and a memorandum from the Chairman of the Watch Committee.

The Working Group functioned as individuals, rather than as representatives of their agencies. The Group confined itself to an analysis of the problem and to conclusions about what further studies could most effectively be undertaken in order to prepare adequately in the time available for discussions with the Soviet which may open during the first week in October. The Working Group wishes to stress the fact that it is not making any recommendations in regard to positions which should be taken by the United States in these proposed discussions.

We do venture, however, to add to the conclusions and comments in our report our conviction that the U.S. Government faces a task of great complexity and difficulty in preparing adequately for the discussions, and that the time available is very short.

Yours sincerely,

G.B. Kistiakowsky

Chairman

Inter-Agency Group on Surprise Attack

357. Memorandum From Twining to McElroy¹

Washington, August 15, 1958

SUBJECT

Nuclear Testing (U)

1. Reference is made to your memorandum of 15 August 1958, which enclosed a copy of the Department of State's draft proposal on the revision of the U.S. Position on the First Phase of Disarmament, and an alternate proposal prepared by the Department of Defense.

2. The Joint Chiefs of Staff have examined the two proposals, in the light of their memoranda to you of 13 March 1958 and 30 April 1958. They wish to re-emphasize and reaffirm their views expressed in their previous memoranda to you on this subject, that a nuclear test suspension or cessation should not be agreed to apart from a larger disarmament proposal which would include the termination of the production of nuclear weapons and weapons material. They consider that an essential prerequisite to any agreement to test suspension or cessation is an operational inspection and monitoring system in being. In addition, the Joint Chiefs of Staff desire to point out that, in the foreseeable international political situation, any agreement to suspend nuclear testing would be tantamount to a permanent cessation, and that any escape clause that would seem to permit the resumption of testing would probably be ineffective in the light of world opinions, even if the United States was satisfied that the Soviet Union was not abiding by the agreement.

3. The Joint Chiefs of Staff believe that the present military position of the United States, in the light of recent world developments, fully justifies a continuing requirement for nuclear testing. The results at HARDTACK demonstrate the absolute necessity of testing weapons both from the standpoint of furthering development and also from the standpoint of proof-testing prior to stockpiling. [*text not declassified*] This is but one example of the need for testing in the development of warheads for new applications. In the area of weapon effects, additional data concerning the optimum kill mechanism for AICBM's are required. Also, experiments concerning new and important high altitude phenomena were conducted for the first time at HARDTACK and are only in the exploratory stage. It is increasingly clear that in the national interest nuclear testing must continue. Without testing, the inevitable result must be stagnation in the effectiveness of our present weapons systems. In addition, cessation of testing would preclude the

¹ Source: Conveys negative JCS views on cessation of nuclear testing. Secret; Restricted Data. 2 pp. Eisenhower Library, Whitman File, Nuclear Testing.

introduction of essential new weapon systems requiring new warheads and lead to the stockpiling of unproven weapons.

4. Nothing that has taken place in the recent past has, in the opinion of the Joint Chiefs of Staff, been cause for a basic change in the military factors which influenced the views expressed by the Joint Chiefs of Staff in earlier memoranda. Rather, a strong adherence to the present United States position on the subject of Nuclear Testing seems plainly indicated. Accordingly, the Joint Chiefs of Staff request that you convey the views expressed in this memorandum to the President.

For the Joint Chiefs of Staff:

N.F. Twining
Chairman
Joint Chiefs of Staff

358. Letter From the President's Science Advisory Committee Panel on Surprise Attack to Killian¹

August 15, 1958

Dear Dr. Killian:

We are transmitting herewith a report of a Panel of the President's Science Advisory Committee concerned with the problem of surprise attack. This report is entitled, "Some Technical Aspects of the Problem of Surprise Attack."

Since July 15 when you initiated the work of our Panel, we have given as intensive study to the problem of surprise attack as we were able to give in the time available. Our report discusses some of the technical aspects of this extraordinarily complex subject, and has benefited materially from briefings which were heard jointly with the Inter-Agency Working Group studying this same subject.

We especially wish you to note that our study has indicated several problem areas, both technical and military, that will require further intensive study. Some of these problems could not be carefully considered because of the limits of time. Others, it was felt, went beyond the charter of our activity.

¹ Source: Transmits the Panel's report (not included). Secret. 1 p. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology.

At your request we have forwarded copies of our analysis to the Inter-Agency Working Group studying this problem, and we are prepared to provide any additional assistance that you may deem helpful.

Respectfully,

R. R. Bowie
G. B. Kistiakowsky
E. M. Purcell
I. I. Rabi
J. H. Sides, VAdm., USN
J. B. Wiesner
J. R. Zacharias
Panel Chairman

359. Draft Presidential Statement¹

Washington, August 18, 1958

DRAFT PRESIDENTIAL STATEMENT AT TIME OF RELEASE OF REPORT OF GENEVA MEETING ON NUCLEAR TESTS

We welcome the successful conclusion of the Geneva discussions on technical requirements for monitoring testing agreements. The substantial agreement which has been reached on the technical aspects of this problem is cause for encouragement that disarmament negotiations can be fruitfully resumed. Since effective inspection is an essential element of any meaningful disarmament agreement, progress toward disarmament measures should be facilitated by this agreement of experts as to the technical requirements of a nuclear test monitoring system.

Important questions remain to be resolved before such a test monitoring system can be established. These include the organization of the control system and its relationship to the United Nations and national governments, the implementation of staffing, and on-the-spot inspection, and the participation of the authorities on whose territories control posts should be located. We stand ready to join in negotiations on these questions. We hope that such negotiations can be speedily commenced and carried through to a successful conclusion.

¹ Source: For release after successful conclusion of Geneva talks on detection of nuclear tests. Confidential. 3 pp. Eisenhower Library, Whitman File, Dulles–Herter Series.

We have constantly pointed out during the course of recent disarmament negotiations that a suspension of nuclear tests in itself will not end the present arms build-up or the ability of the nuclear powers to wage devastating war. The heart of the nuclear armament problem is the tremendous destructive power now at the disposal of both sides, together with the means of delivering this destructive power. Unless the production of additional fissionable material for the manufacture of nuclear weapons is halted, and a gradual equitable reduction of present armaments is begun, the threat of mutual nuclear destruction will continue to mount. For these reasons we have urged that action should be taken simultaneously on nuclear testing, nuclear weapons manufacture, and other major arms control steps.

There is the possibility that mutually monitored suspension of tests might be a first step which would make it possible to reach other and more substantial agreements relating to nuclear weapons and their means of delivery and to other essential phases of disarmament. We are encouraged also by the statements of Soviet leaders indicating that a nuclear testing agreement might be an important first step toward halting the arms race and toward agreements in other areas of disarmament.

The United States is prepared to join with the Soviet Union and the United Kingdom, the other nations which have tested nuclear weapons, in negotiating an agreement for an effectively inspected cessation of nuclear tests. There could be drawn in on an *ad hoc* basis others who would assume obligations under the agreement, including those having authority over areas within which control posts are to be established in accordance with phased arrangements. The progress and results of these negotiations might be duly reported to the United Nations and its organs with disarmament responsibilities, through the intermediary of the Secretary General.

For our part we are prepared, unless testing is resumed by the U.S.S.R. or the U.K., to withhold further testing of nuclear weapons for a period up to one year beginning October 1, 1958, while agreement is being reached both as to the terms of the cessation and the detailed arrangements for inspection. Further, if agreement on the terms of an effectively inspected cessation of nuclear tests can be achieved, we are prepared to suspend testing on a year-by-year basis, subject to a determination at the beginning of each year of extension that satisfactory progress is being made (a) in installing and operating the agreed inspection system, and (b) in reaching agreement on and implementing major and substantial arms control measures.

360. Telegram 1913 to London¹

Washington, August 19, 1958

1913. Deliver following message from President to Prime Minister Macmillan soonest. Advise time and date of delivery.

QTE August 19, 1958

Dear Harold:

I have just heard of Foster's talk with Selwyn concerning making a unilateral statement about cessation of testing provided the Protocol at Geneva is signed in a completely satisfactory form. In view of some doubts expressed by Selwyn to Foster, I want to assure you that it is our purpose to be as completely generous with your Government in the matter of passing information as the law will permit. I am sure you will understand the need for something being done promptly in the event that the Geneva Protocol is signed as expected.

With warm regard.

D.E. UNQTE

Herter
Acting

¹ Source: Transmits letter from Eisenhower to Macmillan on public statement on cessation of nuclear testing. Confidential; Presidential Handling; Niact. 1 p. NARA, RG 59, Central Files, 700.5611/8–1958.

361. Record of Telephone Conversation Between Herter and John Foster Dulles¹

New York, August 20, 1958, 8:55 a.m.

H returned the call and The Sec asked if he talked to McCone. H had and also with Killian and they agreed it is desirable to use the same wording as the Russians. McCone's reaction was to have nothing at all rather than giving the Russians veto power. The Sec and H agreed this is all right. The Sec read from a Supreme Soviet decision in the SU

¹ Source: Statement on nuclear testing; offshore islands. No classification marking. 3 pp. Eisenhower Library, Dulles Papers, General Telephone Conversations.

and said he just would say all types of atomic and nuclear weapons and say nothing more about the subject at all. H said they are heading that way. The Sec said it may be possible the way it is worded they intend to do it themselves—the Sec indicated I think we would.

H said he got the telegram re the Sec's talk with de Murville. They agreed it is good. H said they have not heard from Geneva. Macmillan has not sent word to the President.

The Sec said Couve wants to come to Washington and obviously to see the Pres though he did not say so. H will find out the Pres' weekend plans. The Sec told Couve Friday p.m. would probably be better than Saturday a.m.

The Sec said the Pres may get a question re the offshore islands. H read a suggested reply from WSR. The Sec would have thought he could have gone further. H said it has been quieter the last few days. The Sec thought the Pres could say our position remains the same, namely under the Treaty and authority under Public Law 4, the US would act if it seemed that the attack involved Formosa and the Penghus and that during the 4 years since that time there has been increasing integration between Formosa and the offshore islands and that would have to be taken into account. H told of today's Alsop story. If the Pres is asked re the ME he will say it is being actively discussed at the UN and it would be inappropriate to get into it in Washington. The Sec said speeches are supposed to end today and get down to real business tomorrow.

The Sec asked if the plan is to make a statement tomorrow. H said yes—they are signing at 11 in Geneva and he hopes the Pres will get it out about 10. Hagerty may want the Pres to step out of NSC to give to the Press. The Sec complained about all the jargon in the preliminary. H said it is to build up the idea it is only a small part of working towards disarmament. The Sec would suggest cutting down. It is essentially a propaganda exercise and the time it takes hemming and hawing people will wonder what we are up to and what it is. The Sec would think it could be put in more pungent terms though he realizes it is late. H said they can take a try and it would have to go through Defense, AEC etc. and H would hope we won't end up tonight with an indecisive statement. The Sec said if he has time he might make a suggestion later in the day but realizes it is late to do it. H said it can always be looked over again.

H said the French came in and talked to Farley last night. They talked it over and said it sounds as if an ultimatum went to Geneva but we pointed out we have acted as a group. This was about signature—not statement. The position here is mild compared with Geneva.

362. Record of Telephone Conversation Between Herter and John Foster Dulles¹

August 20, 1958, 11:12 p.m.

The Sec said Lloyd was in the other room. The Sec has rewritten the statement somewhat but the principle thing is the US taking account of the Geneva conclusions is prepared to proceed promptly etc. and he read. Lloyd is anxious in order to maintain the integrity of our position to have a requirement that the concept of the putting the experts' report into effect should be accepted in principle by other nations—the SU and UK in our case. H said has it arisen in any way in regard to the French objection to have it submitted to govt—the Sec said no. We have taken the position we will not suspend unless there is a system to supervise—now we say we are going to stop testing for a year—we should insist the Soviets accept in principle there should be supervision and if we do that we have logic and integrity in our position. H thinks it has logic and the Sec thinks it has sense. The Sec said he talked to Farley about this. The Sec said he agreed to “the agreement should also deal with the problem of detonation for peaceful purposes as distinct from weapons tests.” They discussed something briefly I missed and H asked if we are free to continue during it and the Sec said yes, he thinks we are—we just agree to forego weapons tests. H said the logic is clear—the Sec said clear without spelling it out literally which we don't want to do. H liked accept in principle. The Sec said he just got the text of the Pres' letter. H said it was complicated.

363. Memorandum of Conference with the President¹

Washington, August 20, 1958, 11:15 a.m.

OTHERS PRESENT

Secretary Herter
Dr. Killian
General Persons
Mr. Hagerty
General Goodpaster

The meeting was held to discuss the timing of the statement of test suspension, and the timing of notification to the Congress concerning the statement. Secretary Herter said that the timing problems are very difficult, and that much remains to be brought together before the statement is issued. It would be possible, he indicated, to take a calculated gamble that the effect would not be lost by waiting another week until the report of the Geneva negotiations is filed and made public. The special significance of August 21st is the signing of the agreement in Geneva. If we should wait, however, we run the risk that the Soviets would launch some sort of propaganda campaign which would deprive us of the effect we are seeking through our action.

The President asked if we had received any reply from the British as to their agreement with our proposed action, and Secretary Herter said we had not. The President said he understood that the item that is causing a great deal of difficulty in our own government is the ruling out of peaceful detonations during the period while an agreement is being negotiated. He thought a reasonable solution would be to permit these to continue. Secretary Herter said he understood there were some scientific objections to this, in that it would open the way for possible cheating by the Soviets. He said that the period of unilateral suspension could be cut down to nine months and we could negotiate with the Soviets during that period concerning peaceful explosions. The disadvantage to the nine months period is that we would seem to be planning to discontinue simply until we were ready to start another test series the middle of next year.

There was then discussion as to the best means of notifying the Congress, and the President said he thought the best course was to ask Mr. Rayburn and Senator Johnson to get the appropriate leaders together, one group in the House and one group in the Senate.

A.J. Goodpaster
Brigadier General, USA

¹ Source: Statement on cessation of nuclear testing. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on August 25.

364. Telegram Secto 8 From John Foster Dulles at USUN¹

New York, August 20, 1958, 1 p.m.

Secto 8. Personal from Secretary to Acting Secretary. I have again gone over the August 19 draft of Presidential statement to be made at the time of the release of report of Geneva Meeting on Nuclear Testing.

1. I understand that the language on one-year suspension will read “to withhold further testing of atomic and nuclear weapons for a period up to one year beginning October 1, 1958”. This would in my opinion permit of the use of atomic and nuclear power for clearly civilian and peaceful purposes, and do so without loss of world propaganda effect because our statement would be in this respect substantially identical with the decision of the Supreme Soviet of March 31, 1958.

2. While accepting the foregoing draft as a statement of United States policy, I believe that the President’s public statement could with great advantage be substantially simplified. I am adding redraft at end of message to carry out this thought.

Let me emphasize that I am not seeking through this redraft to retract or modify in any way any of the previously agreed language so far as it is a United States policy position. However, since the public statement is primarily designed to influence world opinion and gain good will, I believe that it is desirable to emphasize the positive aspects and avoid expressing publicly some of the difficulties and complexities we foresee and which are inherent in the situation. Following is text of public statement I would suggest:

Begin text: The United States welcomes the successful conclusion of the Geneva discussions on technical requirements for monitoring testing agreements.

Important questions remain to be resolved before a test monitoring system can be established. These include the organization of the control system and its relationship to the United Nations and national governments, the implementation of staffing and on-the-spot inspection, and the participation of the authorities on whose territories control posts should be located.

In an effort to resolve these questions, the United States is prepared to join with the Soviet Union and the United Kingdom, the other nations which have tested nuclear weapons, in negotiating an agreement for an effectively inspected suspension of nuclear tests. Representatives

¹ Source: Draft Presidential statement on cessation of nuclear testing. Confidential. 3 pp. NARA, RG 59, Central Files, 700.5611/8–2058.

of other countries having authority over areas within which control posts should be established would of course be consulted. The progress and results of these negotiations might be duly reported to the United Nations and its organs with disarmament responsibilities, through the intermediary of the Secretary General.

The United States is also prepared, unless testing is resumed by the Soviet Union, to withhold further testing of atomic and nuclear weapons for a period up to one year beginning October 1, 1958, while agreement is being reached both as to the terms of suspension of testing and the detailed arrangements for inspection. Further, if agreement on the terms of an effectively inspected suspension of nuclear tests can be achieved, the United States is prepared to suspend testing on a year-by-year basis, subject to a determination at the beginning of each year of extension that satisfactory progress is being made (a) in installing and operating the agreed inspection system, and (b) in reaching agreement on and implementing major and substantial arms control measures, such as the United States has long sought.

As the United States has frequently made clear, it does not consider that suspension of testing of atomic and nuclear weapons is in itself a measure of disarmament or limitation of armament. The significance of an agreement for a monitored mutual suspension of tests is that it may lead to other and more substantial agreements relating to limitation and reduction of such weapons and to other essential phases of disarmament. This is our hope. End text.

Dulles

365. Record of Telephone Conversation Between Herter and John Foster Dulles¹

New York, August 20, 1958, 1:25 p.m.

Sec. said he gathered peaceful uses is still being batted about. H. said no not at all—President made decision this morning and McCone is very unhappy. Sec. said he thought it was a mistake to put peaceful uses in this statement. Sec. said what this public statement is is an exercise in

¹Source: Statement on cessation of nuclear testing. No classification marking. 1 p. Eisenhower Library, Dulles Papers, General Telephone Conversations.

public relations because we have been slipping so badly. H. said Pres. had gotten into a jam with McCone. H. was asked to go over (WH) before press conference. Sec. said re peaceful uses it is only a matter of interpretation. Killian says in document drafted in Geneva it very carefully covers all explosions. This statm. will have to be cleared today somehow.

H. asked Sec. if he had seen two messages from Macmillan. Sec. said no and H. read one to Sec. Goodpaster has it and will show it to the Pres. Sec. said we can't go all the way with military—if we have to H. and Sec. might as well quit. H. said Pres. is prepared to go ahead on this statm. and get full value. Sec. said he could come down to Washington for meeting. H. will call Sec. back after he talks with Pres.

H. earlier said another way the statm. might be handled would be to take calculated risk on releasing this before report is submitted to UN.

366. Message From Macmillan to Eisenhower¹

London, August 20, 1958

My Dear Friend,

I am greatly obliged to you for your letter of August 19 in which you gave me the assurance that it is your purpose to be as completely generous with us in the matter of passing information "as the law will permit". I gladly accept this assurance and I need hardly say that I have every confidence that you are determined to do your utmost for us.

I am sure you will recognise that in this I have a very heavy responsibility. During the past twelve years, we have made immense efforts to develop the nuclear weapons capacity which would enable us to play an effective part in the defence of the free world. We have made good progress and the tests that we are about to hold will take us a further step towards the solution of the two problems of invulnerability and reduction of weight which we must achieve. If our earlier work is not to be wasted, we must have the answers to these two problems. If you can provide us with the information you already have or will obtain in the future, then I can agree to suspension of tests, which I feel really means abandonment, with a clear conscience. Can I be assured that "the law will permit" you to give us this information if we are prevented from

¹ Source: Seeks assurance on release of nuclear testing information. Top Secret. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Eisenhower.

getting it for ourselves? If you tell me that I am justified in making that assumption, I can rest assured that the essential defence interests of my country are sufficiently safeguarded.

I am sending you a separate message on the political considerations which seem to me to arise on the timing and nature of any public statement on the results of the Geneva conference.

With warm regards,

Yours ever,

(Sgd.) Harold Macmillan

367. Message From Macmillan to Eisenhower¹

London, August 20, 1958

My dear Friend,

My first reaction to your proposed statement was one of grave concern. I will not pretend that I was not influenced to some extent by the technical side of the problem, to which I have referred. My concern on that account has now been dispelled. But I should like to make it plain to you that I was influenced almost as much by the political consideration which I set out in my second message. Two factors, in particular, weighed heavily with me. First, I thought it would be a profound mistake to concede suspension without securing Russian acceptance of an international control system. Secondly, I was seriously apprehensive about de Gaulle's reaction. On both these points I have been reassured by your messages of today. On the first, I think that Foster's new draft is a great improvement. Though, even now, I am not sure whether the Russians will accept a truly international system of control. If they should take the line that each country should man the control posts within its own territory, we shall not have achieved our essential purpose. I hope we shall both keep a careful eye on this. On the second, I would feel happier if I knew what de Gaulle himself was thinking. But I am relieved to know that Couve, at any rate, seems to be taking this quite quietly. I think that I must send the General a personal message about this just before the announcement is made. Perhaps you would consider whether you could do so too.

¹ Source: Agrees to statement on cessation of nuclear testing. Secret. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Eisenhower.

Finally, I note your anxiety about the state of world opinion. I had thought that a statement on the lines originally proposed might seem to be a little precipitate and that there was time for us to proceed in a more deliberate way. This is after all a pretty serious step and it did not seem unreasonable that we should spend a little more time in considering it. But I do understand, especially in view of what you say in the second paragraph of your message, that you think it important to proceed more quickly in order to recover the initiative with world opinion; and, as you will have seen from the separate message which I have sent to Foster, we are prepared to go along with you in this and to make a parallel statement in support of yours.

With warm regards,
As ever,

Harold Macmillan

368. Message From Macmillan to Eisenhower¹

London, August 20, 1958

My dear Friend,

I promised a second message on the political considerations about the statement which you are thinking of making when the report of the Geneva Conference appears.

I fully agree that we must make some public response to that report but I doubt whether it justifies us in going as fast as you propose in the draft statement which Foster gave to Selwyn in New York. It is true that the report will demonstrate the theoretical possibility of controlling a suspension of tests, and we ought to welcome it on that account. But we cannot yet say that we can see our way through the practical difficulties of putting this theoretical system into operation.

There is an enormous prize to win. Both you and I have always felt that through the Geneva Meeting we might move towards the establishment on Soviet territory of some system of international control. Even though that system might be unsatisfactory and inefficient, it would at least have gained us a foothold which we could exploit. If we

¹Source: Urges postponement of statement on cessation of nuclear testing. Top Secret. 3 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Eisenhower.

now suspend all tests, the Russians may well think that they have got substantially what they want without having to pay any price for it. What I mean by this is that they might refuse to agree to any genuine international control, calculating that the West would never be able to resume the tests which they had voluntarily suspended.

If we felt that we must make some forward move on tests at the present time, I would much prefer to see it limited to those tests which we know can be detected by existing national systems—say, everything above 25 kilotons. A proposal on those lines would be consistent with our past insistence on linking suspension to control and would also go a long way to meeting public criticism of tests on grounds of injury to health, since it would eliminate all tests which release fission products into the stratosphere.

A limited suspension of this kind would also make things much easier for the French. I am seriously troubled about their attitude. I feel that after all our difficulties with de Gaulle over recent events, while he is still suspicious of our intentions towards him, it would be a serious mistake to force the French Government into a position of dissociating itself from our proposals. The trouble which we are having with them already at Geneva shows how suspicious they are on this question. We really must consult them fully and give them time to come to a conclusion. But de Gaulle will be in Africa for at least a week from now. I do feel strongly that the whole economic future of Europe, and perhaps its political future too, may be jeopardized if we allow the French to feel isolated or roughly treated over this question.

For myself, I should much prefer that any statement we may agree to make on future policy in relation to nuclear tests should be related, not to the end of the Geneva Conference, but to the opening of the General Assembly. We shall all be under acute pressure there to make some forward move with a view to getting the maximum benefit from it in the Assembly. If we play this card sooner we shall be bound to be asked for more when the Assembly meets.

Finally, I ought to tell you that the test series which we have just announced will not in fact be completed, at earliest, until the middle of October.

May I ask you, my dear Friend, to take these points into account. They seem to me to merit serious consideration. This is a very important decision. I agree with you absolutely as to your purpose, but I am anxious that we should make no mistake as to method and timing.

With warm regards,

Yours ever,

Harold Macmillan

369. Telegram 1969 to London¹

Washington, August 20, 1958, 9:22 p.m.

1969. Please deliver immediately to Prime Minister Macmillan the following message from the President:

QUOTE August 20, 1958. Dear Harold:

This cable replies to your first message, the one referring to certain technical matters. Foster is just now leaving for New York and during the trip will give to Selwyn his conclusions on the political side of the matter for immediate cabling to you. His cable will quote our statement as it has been revised, including such important points as timing.

My personal comment about the political side is merely that the week's experience at the General Assembly clearly shows that much of the world opinion is shifting, if not toward the Soviets, at least away from the West because of our alleged intransigence about all aspects of nuclear testing and so on. I feel that the publication of the report of the technical experts at Geneva may mark an opportunity for us to regain some of this world opinion. If we are to do so, I think we cannot wait for some weeks or days during which time Russian propaganda would make it appear that we are being forced into a position that finally might become untenable.

Now with respect to the two questions of reduction of weight and invulnerability, under the law I am permitted to convey to you any information needed so long as that information will not endanger our security. The law requires that I make a certification to this effect. Since our joint purpose is to make certain that the weapons we both manufacture are for use by the free world in our common defense, there will be no difficulty in my making the necessary certificate for this type of exchange. I understand that British and American technicians are having their first meeting on next Wednesday morning, at which time there will be some agreement as to the kinds of information in which both sides wish to delve. Out of that meeting will come to me further suggestions as to the certificates that I need to make.

Incidentally, we do not see how we could establish and stand by a limit of 25 kilos for bomb testing. The findings of tests are not sufficiently exact to make this a feasible condition.

I think this gives you the technical assurance you need.

¹ Source: Conveys message from Eisenhower to Macmillan on providing technical information and political necessity of making statement on cessation of nuclear testing. Secret; Presidential Handling. 3 pp. NARA, RG 59, Central Files, 700.5611/8–2058.

I want further to say with respect to the whole matter that we are not trying to push you either politically or technically into an isolated or indefensible position. No matter what the exact language of the statement, which I think we will make no later than Saturday morning, we would hope that you could associate yourselves with it if you so desire. But in any event, we will do our best to make certain that our own action does not embarrass you.

When you have both the messages to which I refer, I hope that you will reply as soon as you can because we do believe we are up against one of those moments that we regard as psychologically correct.

With warm regard,

As ever,

Dwight D. Eisenhower UNQUOTE

Herter
Acting

370. Memorandum of Conversation¹

New York, August 20, 1958, 9:45 p.m.

PARTICIPANTS

<i>United States</i>	<i>United Kingdom</i>
The Secretary	Mr. Lloyd
Mr. Reinhardt	Sir William Hayter
Mr. Greene	Mr. A. R. Moore
	Mr. Dennis Lasky

SUBJECT

Statement on Suspension of Nuclear Testing

The Secretary showed Mr. Lloyd the draft of a statement proposed to be made by the President on suspension of nuclear testing. In a lengthy discussion Mr. Lloyd argued that unless there be established in the statement a relationship between our readiness to suspend testing and Soviet willingness to join in negotiations for an agreement to supervise suspension of testing, we would give away to the Soviets

¹ Source: Statement on suspension of nuclear testing. Confidential. 1 p. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

without exacting any price an essential indeed fundamental part of our position.

As a result of this discussion, the Secretary agreed to insert at the beginning of the fourth paragraph the phrase "If this is accepted in principle", so as to establish the link between the two parts of our statement.

371. Letter From Strauss to Eisenhower¹

Washington, August 20, 1958

Dear Mr. President:

The letter from Prime Minister Macmillan is returned herewith.

Where he mentions the "two problems" of "invulnerability" and "reduction of weight", I believe he means, in the first instance, weapons that are safe from pre-initiation. In the second instance, I assume he refers to weapons of large yield where we have succeeded in reducing both size and weight. In both circumstances, the *present law* does permit the transfer of such information as does the present bilateral agreement which became effective on the 3rd of this month. It is not necessary to amend the bilateral to provide for the exchange of further weapons information but, in each case, it will be necessary that we make a finding that the exchange is needed and "will promote and will not constitute an unreasonable risk to the common defense and security".

However, you should be aware that when the Department of Defense and the Commission witnesses testified before the Congressional Committee, they indicated that it was not contemplated that the most sensitive design information would be transferred in the initial exchanges but later when need could be demonstrated and information provided to you that such transfer "would promote and not constitute an unreasonable risk... etc.".

Respectfully,

Lewis

¹Source: Assures Eisenhower U.S. can provide nuclear information sought by Macmillan. Secret. 1 p. Eisenhower Library, Whitman File, Administration Series, Strauss, Adm. Lewis.

372. Telegram Dulte 2 From John Foster Dulles at USUN¹

New York, August 21, 1958, 1 a.m.

Dulte 2. For Acting Secretary for President from Secretary.

Following is text of letter I have handed Selwyn Lloyd for Harold Macmillan: (Revised statement enclosed with letter in separate telegram.)

Dear Harold:

I have just returned from Washington where I went to discuss with the President your two messages of August 20. The message with respect to exchange of information is being handled from Washington. The other message I am answering through Selwyn Lloyd in line with the President's views.

We feel that it is important, as you say, that there be "some public response" to the report of the experts. We believe, however, that unless this public response indicates a significant program, we shall be subjected to a serious propaganda barrage, and if as you suggest we only make our statement on suspension at the opening of the General Assembly, we will then appear to have surrendered to Soviet pressures rather than have taken ourselves an initiative.

Our standing in the world is at a point where there is real danger to us in [illegible in the original] adjudged militaristic. That danger can have consequences as serious as the foregoing of some nuclear weapons knowledge. The United States has already held back on this suspension matter for several months largely in deference to our desire not to confront you with a possible test suspension before we could give you the benefit of our own knowledge in this field. We have through great exertion obtained an amendment of the Atomic Energy Act in your favor and the President has undertaken to act generously under it. We really wonder in the light of this whether you should ask us to take further serious risks in relation to world opinion.

We do not share the fear you express that if we temporarily suspend testing we will never be able to resume, and therefore the Soviets will have gotten something for nothing. Of course this is a risk. But it seems to us that if we made clear that we are suspending only in order to get some constructive progress in the field of disarmament, that will

¹ Source: Transmits for Eisenhower text of letter from Dulles to Macmillan on suspension of nuclear testing. Secret; Eyes Only. 3 pp. NARA, RG 59, Central Files, 700.5611/8-2158.

put the Russians under pressure to do something in this field, as otherwise they will carry the responsibility for the resumption of testing.

That is one reason why we do not want to qualify our suspension in a way which would imply acceptance of the health hazard. If we did that then indeed we might have burned our bridges behind us. Rather we should emphasize that we are suspending only in the hopes that this will prove an opening wedge which will permit of progress in the disarmament field.

As to the French, I wonder if your fears are founded. Last night I showed Couve de Murville the statement we proposed to make. He gave it as his first impression that it was entirely satisfactory and that it would leave the French free to proceed if they so desired because if the Soviets and we stopped testing then there can be no allegation that a small test by the French would be a hazard to world health. Of course that was only a first impression, but during the intervening 24 hours, I have not received anything to the contrary. Certainly a suspension statement in September would be no better from the French standpoint than one made now. For any test that they could make would probably not be until next year.

As to dates, we are willing in view of your preoccupations to indicate October 31st as the date for starting the trial period of test suspension and then on the assumption that the Soviets will by then have initiated with us a serious negotiation.

We have redrawn the proposed statement to reflect somewhat more fully the foregoing views and to make it, we hope, a more effective public document. I enclose a copy of the redraft statement herewith. We will defer making it tomorrow morning, as we had planned, and hold it until Friday or Saturday morning, giving us time to hear further from you.

Faithfully yours,
John Foster Dulles.

Dulles

373. Record of Telephone Conversations Between Eisenhower and Herter and John Foster Dulles¹

August 21, 1958, 8:50 a.m.

TELEPHONE CALL TO THE PRESIDENT (Washington)

Sec. told Pres. he had long talk until Midnight with Lloyd and Sec. thinks that the British are now satisfied with the testing statm. Sec. said he made one change in draft statm. which met their wants (Sec. read statm. to Pres.). Sec. said he also made phrase to meet John McCone's wishes. Sec. now thinks it is in pretty good shape, and thinks Pres. will get approval from Macmillan today. Sec. also showed Lloyd Pres. letter to Macmillan which Sec. thinks will be all right to British. Sec. told Pres. we sent revised statm. to French but we haven't heard from them yet. Pres. said he has Couve de Murville coming down at 5:00 p. m. today.

Pres. said papers show that Arab resolution looks pretty good—Sec. agreed. Sec. said only one thing bad and that is that it will rehabilitate and invigorate Arab League. Pres. said we can't help that. Sec. said Israeli are very unhappy about it. Pres. said he thinks the resolution is all right. Pres. asked Sec. if he had talked to Herter re Congress. Sec. said he had tried to get him but he is at WH for NSC. Pres. said hold on he will get H. 8:56 a. m.

GOVERNOR HERTER

Sec. said he was saying to Pres. that we anticipate British will be happy about testing statm. H. asked Sec. re acceptance does he think we need Congressional action. Sec. said if it were treaty we would have to have Congressional action but merely to suspend testing it requires no action from Congress. Sec. asked H. to what degree of consultation do we have with Congress. H. said McCone is going on Hill today but will not go into substance of statm., however, if asked AEC's view he will have to tell them.

H. asked Sec. re Arab resolution and Sec. told him same as he told Pres.

H. asked Sec. should we make statm. that US is for Arab resolution and Sec. said we would have to hold off on any such announcement for timebeing—maybe later.

H. said he noted from morning papers that at Lloyd's back-grounder with the press last night he announced the British would give enthusiastic support to the Arab resolution.

¹ Source: Statement on suspension of nuclear testing. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, White House Telephone Conversations.

Sec. said he is about to meet with staff and they will discuss any such announcement and will call H. back. H. said he would probably be at NSC a long time—there were a lot of items. Sec. said he would call him out.

374. Memorandum of Conference with the President¹

Washington, August 21, 1958, 10:50 a.m.

OTHERS PRESENT

Dr. Libby
General Goodpaster

Just following NSC, the President met briefly with Dr. Libby, at Mr. McCone's request, to express to Dr. Libby his philosophy regarding exchange of atomic information with the British. The essence of his view is that such exchange should be full and generous; any attempt to do otherwise with true allies is bound to alienate them. The President cited the British assistance to us in World War II through making their intelligence available to us (when we had no intelligence of our own, not having maintained intelligence sections between the wars); he further cited their assistance to us in getting work started on atomic weapons, in providing us information about radar, and information on the design and development of jet engines.

Dr. Libby said that the Atomic Energy Commission has favored a "measured" approach, but he felt Congress is ready to go all the way, in measured fashion, in providing this information to the British. He indicated he thought he understood the President's point of view, and that he was in agreement with it and would seek to carry it out. He recalled to the President that we have pressed the British, on their side, to make available information regarding certain lines of development having commercial significance which they have emphasized.

A.J. Goodpaster
Brigadier General, USA

¹ Source: Eisenhower urges full and generous exchange of information with U.K. Secret. 1 p. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, AEC, Vol. II. Drafted on August 23.

375. Telegram Secto 13 From John Foster Dulles at USUN¹

New York, August 21, 1958, 4 p.m.

Secto 13. For Acting Secretary from Secretary. You may find it useful to have my views on the importance of the inclusion in our proposed draft statement on nuclear testing of the sentence: "The agreement should also deal with the problem of detonations for peaceful purposes, as distinct from weapons tests".

I do not believe that any agreement to suspend the "testing of atomic and hydrogen weapons" should deny to mankind, perhaps forever, the possibility of using this vast new power for human betterment as in creating new harbors and waterways, making available underground sources of water, oil, minerals, etc. To attempt this would be to fly in the face of all human experience.

There may or may not be a mechanistic difference between the devices which are used for military purposes and the devices used for peaceful purposes. Surely there is an immense difference in the motivation. I believe that that difference in motivation justifies a distinction, although I recognize that there may be difficulty in implementing this criterion in a suspension agreement. Nevertheless it must, in my opinion, be attempted. Also I believe that during the period of self-denying and unsupervised suspension, we should be allowed in good faith to exercise our own judgment as to whether the motivation of a nuclear explosion by us is militaristic or peaceful. I believe that the statement referred to is important because it recognizes that there is a distinction between the use of nuclear power for peaceful purposes and for the purpose of testing weapons.

Once a distinction is pointed out and so long as our voluntary denial is limited only to weapons, then I believe that we can in good faith conduct explosions for purposes which are demonstrably peaceful and economic.

I realize that this creates a possible loophole for the Soviets during the one-year period. I understand, however, that it is the judgment of those who work in this field that they would rather take this chance than to forego the peaceful uses, and I, myself, would concur in this conclusion.

I should emphasize again my thought that this whole statement is designed as a public document which we hope will contribute to our prestige and influence in world opinion. It must therefore, in my view,

¹ Source: Transmits Dulles' views on draft statement on suspension of nuclear testing. Confidential. 2 pp. NARA, RG 59, Central Files, 700/5611/8-2158.

be as simple as possible as to what we will and will not do in broad terms: It should not, as a policy document, set out all the complexities and considerations to be taken into account in giving effect to, or in negotiating, our basic position.

Dulles

376. Telegram Dulte 4 From John Foster Dulles at USUN¹

New York, August 21, 1958, 6 p.m.

Dulte 4. Eyes Only for the Ambassador. Following is text of letter to Secretary from Macmillan handed Secretary by Lloyd in New York today:

“August 21, 1958. Dear Foster, thank you for your letter of August 20. I have now received the President’s further message and am most grateful for his clear assurances on the exchange of information. I should like to assure you that my concern in my messages to the President was not simply to protect this country’s nuclear weapons programme. Quite apart from this I felt real doubts as to whether your proposed action was calculated to extract the maximum advantage for the Western countries from the Geneva Conference. I was not thinking so much of world opinion, which I know is not fully with us on this issue, but of the risk of throwing away the prize we hope to gain by making the Russians accept an international control system on their territory.

As to the larger political problem, I welcome the revision of your proposed announcement, which goes a long way to meet my point. I still fear that the Russians may be able to escape paying the price for the suspension of tests, but I recognize the force of your arguments and I agree that the new procedure should reduce that risk. I am also grateful to you for accommodating us on the date from which a suspension of tests should begin. I am therefore ready to join you in the action now proposed. I am sending Selwyn some suggested amendments to your draft announcement which I hope you may feel able to accept.

My intention is to make a parallel announcement at the same time as yours. I am still not sure that we need make these announcements

¹ Source: Repeats telegram to London transmitting letter from Macmillan to Dulles. Secret. 2 pp. NARA, RG 59, Central Files, 700.6511/8–2158.

quite as early as you suggest. May it not seem odd if we make our statements of policy before the world has seen the report of the Geneva Conference on which they are based? If nevertheless you feel it essential to go ahead on Saturday we shall be ready to make our announcement then.

I still feel worried about the French. I wish it had been possible to ascertain De Gaulle's personal views before taking this action. I am however greatly relieved by the news of your talk with Couve de Murville, and I gather Selwyn has had a similarly reassuring reaction from him. Selwyn will continue to keep Couve fully informed of what we are doing, and no doubt you will do the same. With warm regards, As ever, Harold Macmillan."

Lodge

377. Message From Macmillan to Eisenhower¹

London, August 21, 1958

My dear Friend,

I have written directly to Foster about the text and timing of your proposed announcement. But I want, in addition, to reply to your personal message of yesterday.

First, on the technical matters, may I say at once that I am very glad to have your assurance that you can and will give us the information needed, including the two points to which I referred specifically. I am completely satisfied with that assurance and most grateful to you for it. I have never for one moment doubted the sincerity of your desire to help us to play an effective part in maintaining the nuclear deterrent, on which the peace of the world at present depends. But this business has had a long and chequered history, and I know you will understand my anxiety that there should be no possible room for misunderstanding between us at this last stage. As I told you in my message of yesterday, I feel a heavy sense of responsibility over this, and I thought it was

¹ Source: Statement on suspension of nuclear testing. No classification marking. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Eisenhower.

my duty to make sure that there was clear and explicit understanding between us. I am greatly relieved by what you have now said to me.

I am sending you a separate message about the political question as a whole.

With warm regards,

As ever,

(Sgd.) Harold Macmillan

378. Message From Macmillan to John Foster Dulles¹

London, August 21, 1958

Dear Foster,

Thank you for your letter of August 20. I have now received the President's further message and am most grateful for his clear assurances on the exchange of information. I should like to assure you that my concern in my messages to the President was not simply to protect this country's nuclear weapons programme. Quite apart from this I felt real doubts as to whether your proposed action was calculated to extract the maximum advantage for the Western countries from the Geneva Conference. I was not thinking so much of world opinion, which I know is not fully with us on this issue, but of the risk of throwing away the prize we hope to gain by making the Russians accept an international control system on their territory.

As to the larger political problem, I welcome the revision of your proposed announcement, which goes a long way to meet my point. I still fear that the Russians may be able to escape paying the price for the suspension of tests, but I recognise the force of your arguments and I agree that the new procedure should reduce that risk. I am also grateful to you for accommodating us on the date from which a suspension of tests should begin. I am therefore ready to join you in the action now proposed. I am sending Selwyn some suggested amendments to your draft announcement which I hope you may feel able to accept.

My intention is to make a parallel announcement at the same time as yours. I am still not sure that we need make these announcements

¹ Source: Statement on suspension of nuclear testing. Secret. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Dulles, 1955–59.

quite as early as you suggest. May it not seem odd if we make our statements of policy before the world has seen the report of the Geneva Conference on which they are based? If nevertheless you feel it essential to go ahead on Saturday we shall be ready to make our announcement then.

I still feel worried about the French. I wish it had been possible to ascertain de Gaulle's personal views before taking this action. I am however greatly relieved by the news of your talk with Couve de Murville, and I gather Selwyn has had a similarly reassuring reaction from him. Selwyn will continue to keep Couve fully informed of what we are doing, and no doubt you will do the same.

With warm regards,
as ever,

Harold Macmillan

379. Memorandum From Cumming (INR) to John Foster Dulles¹

Washington, August 30, 1958

SUBJECT

Intelligence Note—*Khrushchev Statement on Nuclear Test Suspension*

Khrushchev's "interview" in today's *Pravda* (attached) constitutes the first official Soviet response to the Western proposals of August 22 for negotiations on nuclear test suspension. Presumably a note forwarding Khrushchev's statement, or recapitulating its main points, will shortly be received in formal reply to our note of August 22.

Khrushchev accepts the date of October 31 for the beginning of negotiations and apparently also the participation of only the three powers (United States, Britain, Soviet Union) suggested by the West, although the latter point remains to be clarified. But he stipulates what in the Soviet view must be "the purpose" of the negotiations: the conclusion of an agreement to end "for all time" tests of atomic and hydrogen weapons "of all kinds" and "by all states." References to "all" or "any" kinds of weapons and to "all states" or to a "universal ban" have been standard in Soviet statements since May, when the USSR agreed to

¹ Source: Intelligence Note: Khrushchev Statement on Nuclear Test Suspension. Confidential. 2 pp. NARA, RG 59, Central Files, 711.5611/8-3058.

hold technical talks on controls, and appear designed to cover France. Communist China would presumably also be affected.

Insistence on a cessation “for all time” would represent a change from last year’s Soviet negotiating position which provided for a suspension of “two or three years.” It also implies rejection of the Western view that each yearly extension of a test suspension would depend on the effective operation of an inspection system and satisfactory progress toward major and substantial disarmament measures. Khrushchev states explicitly that “we cannot agree” with these Western “reservations and conditions”, claiming that (1) controls can be easily established and (2) that the West itself has been responsible for failure to agree on disarmament measures and therefore advances the condition of “satisfactory progress” as a means of sabotaging a suspension of tests. (These points had also been made in Soviet propaganda reaction since August 22.)

It remains to be seen whether Moscow will insist on Western acceptance of the Soviet concept of the “purposes” of negotiations as a pre-condition to the actual beginning of negotiations. It will be recalled that Moscow sought Western agreement to a similar set of “purposes” prior to the Geneva technical talks but sent its delegation despite Western failure to comply. At the same time, it has long been the Soviet position that a test ban must be “unconditional” and independent from other disarmament measures and Moscow can be expected to maintain this position in negotiations. Khrushchev’s suggestion in *Pravda* that the USSR will seek United Nations approval of a test ban at the 13th General Assembly and his demand that negotiations last only two or three weeks indicate his intention of generating maximum pressure on the West to agree to a “simple” test ban.

Khrushchev’s other major point was the statement that continued Western testing “relieve the USSR of the obligation it had assumed unilaterally” regarding a suspension of tests. The Supreme Soviet decision of March 31 and several statements by Khrushchev and Gromyko had provided for such a move and strengthen the view that, knowing the United States had scheduled a series of tests during the summer, Moscow was exploiting a normal interval between Soviet tests for political purposes. August and the autumn months have traditionally been a Soviet testing season. Khrushchev did not state explicitly whether the USSR actually intends to resume testing; nor did he indicate whether Moscow would join the United States and Britain in suspending tests for one year once negotiations begin. Khrushchev’s acceptance of the October 31 date for the opening of talks, despite earlier Soviet propaganda complaints that this date was too late, suggests an intention to conduct tests in the interim. In such an eventuality Moscow would apparently calculate that world opinion can be persuaded that the USSR is entitled

to further tests in order not to be left at a disadvantage by intensive Western testing this summer. It may also estimate that popular anxieties concerning the effects of testing would be further stimulated in this way and that hence pressures on the West to accept Soviet terms for immediate and permanent cessation would mount.

Khrushchev did not deal with the question of "peaceful" nuclear explosions. There has been only one Soviet comment since August 22 criticizing the Western position on this point. The reference to ending tests of nuclear *weapons* of all kinds would appear to leave the Soviet position flexible.

In sum, the USSR appears ready to undertake negotiations with the West but appears intent by diplomatic means, through popular pressure and UN action to put the West under maximum pressure to meet Soviet terms in such negotiations.

A similar memorandum has been prepared for the Under Secretary.

380. Letter From Acting AEC Chairman to Eisenhower¹

Washington, September 4, 1958

Dear Mr. President:

On August 19, 1958 a joint letter, which was signed by Deputy Secretary of Defense and by Chairman, Atomic Energy Commission, was sent to you recommending an initial exchange of information with the United Kingdom for the promotion of weapons research, design and fabrication. This exchange was to be effected under the authority of the new Section 144c(1) of the Atomic Energy Act of 1954, as amended, and the new bilateral agreement with the United Kingdom. The letter proposed to you the scope of the information to be exchanged in the initial meetings and requested your determination that the communication of the proposed Restricted Data would promote and would not constitute an unreasonable risk to the common defense and security.

I wish to report to you that the initial exchange meetings with the United Kingdom were held in Washington on August 27, 28 and 29, 1958.

¹Source: Initial U.S.-U.K. information exchanges. Secret; Restricted Data. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Presidential Actions-Atomic.

The information transmitted by the United States was within the scope authorized by you in your letter of August 21, 1958 to the Chairman, Atomic Energy Commission. Certain of the information transmitted to us by the United Kingdom representatives generally paralleled the information which we transmitted to them. They, however, went further and gave us an indication of their general state of weapons development. The United Kingdom representatives also indicated to us their developmental requirements in the atomic weapons fields.

[text not declassified].

Attached for your information is a report on the joint U.S.–U.K. meeting which was signed on August 29, 1958 by the two leading representatives from each country. This report indicates the requirements of the British Government in atomic weapons and it indicates, in general terms, areas of exchange which are desired by both sides at the next joint meeting. Such a joint meeting has been tentatively scheduled to be held in Albuquerque, New Mexico starting September 15, 1958. The Restricted Data which the Commission and the Department of Defense will desire to communicate to the United Kingdom at that meeting is being prepared. Your determination that communication of such Restricted Data will promote and will not constitute an unreasonable risk to the common defense and security will be requested in the near future.

Respectfully yours,

H.S. Vance
Acting Chairman

Enclosure:

Report of Joint U.S.–U.K. Meeting

381. Memorandum From Breithut (S/AE) to John Foster Dulles¹

Washington, September 8, 1958

SUBJECT

Your 4:30 p.m. Meeting with AEC Chairman McCone

We understand that Mr. McCone will raise the two topics discussed below. (Cf. Paris telegram 821, September 6—TAB A).

¹ Source: Briefing for meeting with McCone: IAEA, U.S.-French exchanges. Secret. 2 pp. NARA, RG 59, Atomic Energy Files: Lot 57 D 688, IAEA-General.

REVIEW OF HIS GENEVA TALKS ON THE IAEA

Talks with the U.K., French, Indian and Soviet representatives have reinforced McCone's concern regarding the future of the Agency. The following have been cited as significant problems:

1. *The slow progress of the Agency's program:* Although the Agency's functions embrace the entire field of the peaceful uses of atomic energy, public attention has focused to a significant extent on its role in the development of atomic power particularly in the underdeveloped areas. Expectations and aspirations in this field have greatly exceeded reasonable prospects for early progress. A growing realization that the Agency is unlikely to bring about the swift initiation of atomic power projects in underdeveloped areas has led to some slackening of the earlier ardent interest in the Agency of underdeveloped nations. The trend toward more conservative appraisals of the early prospects for atomic power in underdeveloped areas was reinforced by a number of technical papers at the Geneva Conference. Although the Department does not wish the U.S. to make statements and take positions in the IAEA which will promote extravagant expectations doomed to disappointment, Governor Herter has written Chairman McCone emphasizing the importance of making atomic power a principal theme of the U.S. representative's statement at the Second Geneva Conference (TAB B).

2. *Role of the IAEA and other U.N. organizations:* Mr. McCone is concerned with regard to activities of the U.N. and the specialized agencies which appear to be potentially in conflict with the functions assigned the IAEA by its Charter, and speeches by some of the participants at the Geneva Peaceful Uses Conference have heightened his concern. He may also refer to Secretary General Hammarskjold's report suggesting that the U.N. Radiation Committee might be given operating responsibilities and to resistance to the idea favored by the U.S. of the IAEA's sponsoring future Peaceful Uses Conferences.

We believe that the question of IAEA relationship with the U.N. and the specialized agencies is not a major problem, in spite of certain current frictions. Relationship agreements with ILO, UNESCO, and FAO satisfactory to the IAEA have recently been negotiated and will be submitted to the Second General Conference for approval; and we believe the IAEA can expand its present activities or add new activities in the field of peaceful uses of atomic energy without running into any serious conflict with the specialized agencies. We consider that IAEA should sponsor any future Peaceful Uses Conferences, and that the U.S. should oppose in the Thirteenth General Assembly establishment of operational responsibilities for the U.N. Radiation Committee. IO is prepared to discuss these questions further with Mr. McCone in detail at his convenience after he has talked to you. The basic problem of the IAEA is to develop a significant program of its own. If this is done, the problem of the relationship of the IAEA to the U.N. and the specialized

agencies will be placed in proper perspective and the tension surrounding these problems will tend to disappear.

3. *Level and caliber of national representatives to the Agency:* Many governments are sending medium or low level diplomatic personnel to Board meetings and are showing signs of reducing the caliber of future representation. We are pressing a plan to facilitate future high-caliber participation by holding less frequent and shorter Board meetings in the future and have solicited appropriate capitals for support (TAB C). The level of the U.S. diplomatic and technical delegation is appropriate. The Soviet representative has long been pressing for an advisory committee to the IAEA consisting of scientists of international reputation but the U.S. has resisted the establishment of such a committee as it might jeopardize the role of the Board of Governors and ultimately damage, rather than aid, the Agency.

It might be useful to emphasize the importance of Chairman McCone's presence in Vienna during the opening days of the Second General Conference of the IAEA regardless of the positions the U.S. may find it necessary to take on the issues arising.

HIS TALKS WITH PERRIN, FRENCH HIGH COMMISSIONER FOR ATOMIC ENERGY

McCone reports that Perrin indicates that the French want (a) information on fuel to guide them in building a gaseous diffusion plant, (b) design information, or (c) alternatively, a submarine reactor which they feel was promised them last December. We have made it clear to the French that it is not legally possible for us to provide Restricted Data or a submarine reactor to them until a bilateral agreement has been concluded and has laid before the Joint Committee on Atomic Energy for 60 days. A U.S. team will visit Paris in mid-September to survey French security. A technical team will also have exploratory discussions of the possible scope of a French agreement. However, State and AEC agree that we cannot now answer most of the technical questions submitted to us by the French.

You may wish to emphasize to Chairman McCone the high political importance of the successful completion of a bilateral agreement with the French enabling us to aid them with their nuclear submarine program, assuming security guarantees are adequate. Thus far the AEC and DOD have been fully cooperating with the Department in doing all that can be done to promote progress toward its completion.

382. Memorandum of Conversation¹

Washington, September 8, 1958

SUBJECT

International Atomic Energy Agency

PARTICIPANTS

Mr. McCone, Chairman of the Atomic Energy Commission
Mr. Vance, Commissioner of the Atomic Energy Commission

The Secretary
Assistant Secretary Wilcox, IO
Mr. Breithut, S/AE
Mr. Cargo, UNP

Mr. McCone, who had just returned from the Second Conference of the Peaceful Uses of Atomic Energy at Geneva, said that the American contribution at Geneva was superb. He had heard nothing but favorable comment on it. It was a big operation, however. He thought that if such conferences were held in the future, it might be better to break them down by subject—health aspects in one year, power in another, etc.

The Secretary wondered whether Mr. McCone had the impression that we had surpassed the USSR on atomic matters. Mr. McCone thought that we had in every area. The Soviets showed little advance over their position of three years ago except on the subject of thermonuclear fusion. On this they were working along parallel lines with us. In fact all four of the countries doing major research in this area were working along similar lines.

Mr. McCone said that he wished to report to the Secretary on the results of his discussions in Geneva with atomic leaders of other countries on matters relating to the IAEA. He said that he had talked with Emelyanov and Bhabha, as well as the representatives from Western countries, and they all were concerned about the present position and future prospects of the Agency. Mr. McCone thought that there was legitimate reason for concern. Emelyanov had said that he would propose a scientific council, with Director General Cole as chairman, to devote its time to the establishment of objectives and a program for the Agency, and Mr. McCone told Emelyanov he would support this proposal.

¹ Source: IAEA. Confidential. 3 pp. NARA, RG 59, Atomic Energy Files: Lot 57 D 688, IAEA-General.

Mr. McCone said he had had long talk with Mr. Ralph Bunche. Mr. Bunche said that the Secretary General and the UN Secretariat felt responsible for the Agency and believed that its failure would be a black mark against the UN. Mr. Bunche believed, however, that the organizational structure of the IAEA had the effect of drawing it away from the UN. The Board of Governors was like a little General Assembly. As a result of the political character of the Board of Governors, there was a reluctance on the part of the United Nations and specialized agencies to give the IAEA major responsibilities. For example, Hammarskjöld was reluctant to see the IAEA take over responsibility for further conferences on peaceful uses of atomic energy. He said there would be similar doubts with regard to work in the field of radiation, where the UN Radiation Committee is now active. Mr. Bunche doubted that the IAEA would be given any responsibility in relation to the verification of test suspension.

Mr. McCone added that each specialized agency was carrying out its own role in atomic energy matters. The IAEA did not seem to be serving the UN, whereas it should be a sort of "Atomic Energy Commission" for the UN.

The Secretary observed that this was not the original concept for the Agency and that the position of the Agency described by Mr. McCone was not an accident but was designed. What was sought was to create an atomic energy agency with only a tenuous connection to the UN, something like the International Bank. Mr. Breithut observed that the thought was that a direct connection with the UN might inject irrelevant political considerations into the resolution of IAEA problems.

Mr. Wilcox said that of course the specialized agencies should not jump in and deprive the IAEA of its proper functions. He noted that the Secretary General had a coordinating role in this respect.

Mr. McCone said that he believed that the question he had outlined, the relation of the IAEA to other UN bodies and its position in the UN system, would be the subject of debate in Vienna. He said that he would need guidance on this.

The Secretary remarked that the IAEA did not get off to a good start. The Soviets had stalled in the establishment of the Agency. He recalled his own negotiations with Molotov, who had been evasive and difficult over a long period. The negotiations had in fact taken from 1953 to 1957. Meanwhile, things had not been standing still. There had been bilateral atomic arrangements. EURATOM was conceived. The Geneva conferences were organized. The question was how the IAEA could get back into its hands various matters that it would have undertaken if it had been created earlier. The IAEA, for example, should be organizing the peaceful uses conferences held at Geneva. The Secretary

asked whether the answer to the problem was not to establish specific goals for the Agency and to pursue them.

Mr. McCone said that he was seeking specific objectives for the forthcoming conference but that he had not been able to get very far as yet.

The Secretary remarked that we certainly did not wish to see the IAEA fail. While Mr. McCone had referred to Mr. Hammarskjöld's concern about this, the United States had an even bigger investment of prestige in the Agency. The Agency had been created in response to a proposal of the President. There had been a major battle in the Senate over it. It would be a blow to the United States if the Agency collapsed or withered away.

Commissioner Vance thought that the Agency's purposes, as stated in its Statute, were so broad that they were capable of almost any interpretation. He said that Mr. McKinney and Mr. Cole wanted the Agency to go into the power promotion business. He considered that the Agency did not have a place in this. All the plans that had been advanced implied that the United States would have to come up with very substantial funds to support power development. Commissioner Vance believed that the Agency should be a regulatory body and that it should also carry out some research. In the latter connection, Commissioner Vance believed that research contracts, supported by US funds, could be placed in other countries. He referred particularly to a "pool of talent" in atom research in Western Europe. In an exchange of views with Mr. McCone, Commissioner Vance indicated that we would need to know where these research contracts would be placed. Mr. McCone thought there might be some resistance to this idea by other countries and that the Agency would want to have some voice in how and where such research would be carried out.

Commenting on the possibilities of a nuclear power program, Mr. McCone remarked that there was now a much greater degree of realism about the possibility of nuclear power than heretofore. Commissioner Vance observed that operating costs were very high. He said that he presumed that we should not be so willing to bolster up the IAEA that we would be willing for the United States to go into an extensive nuclear power development program. The Secretary indicated agreement.

At the end of the meeting, Mr. McCone again said that he would need guidance as to whether we wanted the Atomic Energy Agency to continue in a position like the World Bank or whether we would want it tied more closely to the United Nations. He felt that the Agency would be likely to be ineffective unless it were tied more closely with the UN.

383. Memorandum From Minshull to Killian¹

Washington, September 23, 1958

SUBJECT

Policy Decision re Terms of Reference for Surprise Attack Delegation

On Thursday, 25 September 1958, you are tentatively scheduled to attend a meeting with Secretary Dulles and Secretary McElroy to discuss the Terms of Reference for the U.S. delegation to the forthcoming surprise attack discussions in Geneva. The major question to be resolved at this meeting is whether the U.S. delegation will be instructed to discuss only the techniques and value of inspection per se, or whether they will also be allowed to consider limitations on force readiness as well as disposition and level of force as methods to safeguard against surprise attack.

The Joint Chiefs of Staff have taken a formal position on this matter, contending that the discussions must be limited to inspection per se. They argue that limitations or controls on readiness, disposition and level of force are problems of disarmament, a topic not under consideration at these meetings. In this regard it is interesting to note that although Mr. Quarles forwarded the JCS position on this matter to the Secretary of State on August 30th, he did not specifically endorse the JCS views as the position of the Defense Department.

The State Department, on the other hand, has taken the view—as did the Interagency Working Group—that it is also necessary to consider the effect of arms limitation or control in discussing safeguards against surprise attack if the meeting is to yield useful results.

The means for bringing this basic policy difference to the attention of yourself and the two Secretaries is a draft of the proposed Terms of Reference for the November Conference (Attachment A). This document was prepared by the State Department (after informal and private consultation with this office) and was the subject of a meeting of staff personnel from the State Department, the Defense Department, the Atomic Energy Commission, CIA and this office on September 19th. At this meeting the participants came to general agreement on the contents of the draft with one exception: the Defense Department representatives (Lt. Gen. Byers and Col. Rhea of ISA) insisted that Items

¹ Source: Outlines JCS view that readiness, disposition, and level of forces not be included in Surprise Attack talks. Secret. 4 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament, Surprise Attack.

III.C, IV.B.3, and IV.B.4 of the proposed agenda be deleted. (All of these items are on page 5 of the attached document and are starred in red.) However, the State Department representatives (Ambassador Holmes, Phillip Farley and Lawrence Weiler) insisted with equal determination that these items were essential to a productive discussion of the surprise attack problem.

In attempting to resolve this major policy difference, two points are particularly pertinent:

(1) The U.S. National Security Policy² clearly states that this country should seek with particular urgency an international system for inspection and regulation of armed forces and armaments. The NSC policy also states, almost parenthetically, that an inspection system within the Soviet Union assumes, in and of itself, significance to the U.S. security because of its intelligence value. Unfortunately, the JCS would like to recognize only the latter statement of U.S. policy as a basis for the forthcoming Geneva discussions. (Gen. Byers argued persistently during the staff level review of the Terms of Reference to have the entire statement of National Security Policy deleted, and was finally voted down by all others present at the meeting.)

(2) The Report of the Interagency Working Group on Surprise Attack should also be considered in resolving this major policy difference. This report concluded that the Geneva discussions must consider limited arms control in order to deal effectively with the surprise attack problem. Specifically, comments on this matter are contained in paragraphs B 1 and B 2 (pages 6 and 7 of Document No. K-TS-2509) of this report, and it states in part:

"Our examination of the appendices leads us to the view that a major reduction of the threat of massive surprise attack cannot be achieved by observation and reporting alone. Limitations on the disposition and readiness of forces, or on size and type of forces, appears to be necessary to create more effective safeguards against the possibility of massive surprise attack. It is unlikely that the October talks can deal effectively with the threat of surprise attack unless they are extended beyond discussion of inspection and related limited measures. . . ."

This report was prepared by Richard M. Bissell, Phillip J. Farley, John N. Irwin, II, General Curtis E. LeMay, USAF, Gerard C. Smith, J. R. Zacharias, and G. B. Kistiakowsky, Chairman.

Although JCS has not to my knowledge made a formal defense of their position which precludes the discussion of any matter relating to disarmament, there are certain arguments that keep re-appearing in

²NSC 5801/1, Paragraph 40, dated 5 May 1958 and quoted on page 1 of the attached document. [Footnote is in the original.]

private conversations with military personnel on this matter. They run something like this:

This country depends upon great strength in a few types of weapons to deter the over-all more diversified military threat of the Soviet Union. Thus, US-USSR bilateral arms control of a few weapon types (or to be more specific, manned bombers and ICBM's) would leave this country at a severe military disadvantage. Furthermore, if this country discusses controls on individual weapon systems with the Soviets at Geneva, we are likely to be drawn into such an agreement by Soviet propaganda and public opinion. If such an unfavorable agreement were to materialize, the situation would probably become even more serious since Congress, as a result of a false sense of security, would probably reduce military funding.

If one tries to counter such an argument by stating that the forthcoming talks are only technical discussions, and that any actual agreement would be realized in later political negotiations where this country would pursue disarmament on a comprehensive basis, they answer: This is the same story that was given to us on technical test cessation discussions! They continue by noting that our policy prior to the Geneva test cessation talks stated that we would entertain test cessation only as part of a comprehensive program that included a monitoring system, the control of fissionable material and the ultimate abolition of nuclear weapons. They then point out that because of the "technical success" at Geneva and as a result of world opinion and Soviet propaganda, we have now been forced into a test cessation yet we do not even have an inspection system to monitor it.

I feel that the JCS are sufficiently dogmatic in their position on this subject that they are likely to exercise their prerogative to take this basic policy decision to the President. In the light of this possibility, I wonder if it would be advisable to invite Gordon Gray to the meeting on the 25th so that he may be apprised of the situation at the earliest possible date.

Over and above the major policy question that needs to be resolved, there are three other minor points that you may wish to bring up for discussion. The first involves the identification of "space vehicles" as instruments of surprise attack. Inasmuch as this country does not have such an exotic weapon capability, it does not seem reasonable to discuss an inspection system for space vehicles at the Geneva meeting. The technical discussions should point out, however, that modifications of the inspection system may be necessary as weapon technology changes.

The second item involves the wording of the footnote on page 3 of the attached document. I believe the footnote should read: "At this point, it is not essential that agreement be reached among the two

delegations as to the objects of control as long as the ability to discuss the objects of control of interest to both delegations is assured."

The third point is a suggested change in wording for agenda item II.4. I believe it should read: "Acoustic and infra-red detection techniques" rather than "Acoustic and infra-red detection, rocket launchings."

W.H. Minshull, Jr.

384. Memorandum of Conference with the President¹

Washington, September 30, 1958, 9:30 a.m.

OTHERS PRESENT

Dr. Killian
General Goodpaster

Dr. Killian first showed the President draft minutes of the first meeting of the National Aeronautics and Space Council. The President indicated they were satisfactory to him.

Dr. Killian next said that Dr. Glennan will shortly be bringing up the question of the future status of ABMA. With the establishment of NASA, the Redstone group will not have a full mission in the future on military projects. The President said that the proposal to shift ABMA to NASA would seem to be reasonable to him; he anticipated that there would be opposition from the Army, however. Dr. Killian agreed, but said he and his group thought the shift would be a good one. Some provision would have to be made for continuation of Army work by ABMA.

The President said he would like to see a central agency heading up the whole scientific missile operation. He thought the transfer could be made with a "charter" to the Army permitting the Army to keep certain facilities, and have the right to the performance of certain activities when it needs them. The main function of the group would be in the "space" field, but with such a charter provision, since the Army has need for certain applications of the more basic research activity. He said

¹ Source: ABMA move to NASA, Geneva Conference on Atoms for Peace, surprise attack study. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

he would like to see the Secretary of Defense, with the agreement of his subordinates, come up with a recommendation. To do this a combined study would be needed, and the Army should be given an opportunity to state its case.

Dr. Killian referred briefly to the Atoms for Peace meeting in Geneva. He said the U.S. performance and exhibit were first rate. He mentioned that the Russians had top-flight scientists present, who went out of their way to be cordial. He mentioned that their top scientist, named Topchev, invited him to visit Russia next spring. He said he has replied that he does not see his way clear to doing so because of his schedule; he commented that in the present state of difficulties with the Soviet Union such a visit does not seem advisable. The President said he thought that if Dr. Killian had a chance to go, and if relations with the Russians improved, such a trip would be a good thing to do.

Dr. Killian said that the study group is having a very hard time on the Surprise Attack project. It is very difficult to get prepared for the discussions. One key question is as to the scope of the project, i.e., as to what should be monitored, and specifically as to whether limitation of arms and control of size of forces should be among the things being monitored. The President thought the first step is to determine what are the fields or areas wherein by certain actions we could limit or eliminate the danger of surprise attack. Then, what are the means of doing this, i.e., through observation or inspection; then what programs should be carried out to establish these means; then finally in what areas or in what respects could these measures be expected to be effective. Dr. Killian concluded by saying that the President may have to decide, before the matter is resolved, as to whether to include limitation of arms and inspection of such limitation in the Surprise Attack proposal.

A.J. Goodpaster
Brigadier General, USA

385. Memorandum of Conference with the President¹

Washington, October 7, 1958, 9:15 a.m.

OTHERS PRESENT

Chairman McCone
General Goodpaster

Mr. McCone said he wanted to report to the President on a few matters of recent interest in his field of responsibility. The Atoms for Peace meeting at Geneva had gone extremely well. Following this Mr. McCone had visited AEC installations within the United States. He then returned to Vienna for the IAEA discussions. These had gone well until the Soviet representative delivered a diatribe against the United States—apparently entirely for propaganda effect, and to obscure the generous support by the United States for this project, and the total lack of Soviet support. Mr. McCone said the IAEA had experienced growing pains in its first year. In his judgment it should now be drawn much closer to the United Nations. There had been an idea that it could keep free from political overtones by being more independent; this has not, however, proven true. Our representative, Mr. Cole, has had his problems and has been under fire by the Canadians, British and Indians, among others. Also the Deputy, Mr. McKinney, has probably not given as much help as was needed. He is now resigning. The President asked Mr. McCone to work out with State very quickly a successor for McKinney.

Mr. McCone said that the current test series in Nevada is going forward very successfully. He said that some of these tests are showing great potentialities in the field of nuclear explosions for peaceful purposes. The President asked whether the AEC is making preparations for the experimental explosion in the Athabasca oil sands, aimed at releasing the oil now locked in the sands. Mr. McCone said he is trying to see if it can be gotten ready this winter; probably the hole can be drilled this winter, with the explosion more likely in 1960. He stressed the tremendous importance of these oil sands in international affairs—the reserves are apparently equal in magnitude to the total proven reserves in the Middle East. He said he was very anxious that the “plow-share” program go forward, and wants to be sure that the test suspension agreement does not prejudice it.

The President commented that if the heat of these tremendously big explosions could be captured, it was evident that it could bring the oil sands to a very high temperature. Mr. McCone also mentioned the

¹ Source: IAEA problems, Plowshare, uranium requirements. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

heat application to be developed by experiment in one of the Carlsbad salt domes. The President commented that we ought to be quite careful while negotiations are going on. We will reserve the right to conduct these tests. Once the techniques have been proved out he was confident the world would demand that they be utilized, so that civilization could obtain the benefits of this activity.

Mr. McCone said it is clear that we are overcommitted on the purchase of uranium during the period between now and 1962. He would propose to lengthen the term of the commitment, while holding its total unchanged, thus lopping off the “peak” now in prospect. The President commented that if these experiments turn out successfully, and large demands for peaceful uses arise, we could use a lot of uranium. He felt we should keep up long-range interest in providing this product. He would see no objection to going to 1970 in order to bring the procurement into a better schedule.

Mr. McCone concluded by saying that he is working with Mr. Quarles to reach agreement on the problem of long-range requirements for atomic weapons—out of which needs for plutonium and hence for added plutonium capacity can be determined. The President thought this was a good project and hoped that it would forestall a reoccurrence of this year’s situation when the individual Chiefs gave testimony at variance with the over-all Defense position.

A.J. Goodpaster
Brigadier General, USA

386. Note From Gray to Goodpaster¹

Washington, October 11, 1958

GENERAL GOODPASTER:

I thought you might like for your files a copy of the Memorandum of Conversation with Dr. Edward Teller, which has been reworked a little further since you saw it. I have sought to incorporate your

MEMORANDUM OF CONVERSATION WITH
DR. EDWARD TELLER

(in the company of General Goodpaster and Captain Morse)

In accordance with a request made of me by Chairman McCone on Friday morning, October 3, in connection with the NSC-OCB visit to the Nevada Test Site, I arranged for General Goodpaster and me to spend some time with Dr. Teller. This was primarily accomplished by driving with Dr. Teller from Las Vegas to the NTS on Saturday morning, October 4, and by sharing a car with Dr. Teller throughout the day's activities. Captain Morse was in almost constant attendance.

I indicated to Dr. Teller that I was particularly interested, in connection with the question of nuclear test suspension or moratorium, in loopholes, both from the point of view of the "threshold concept" and from the point of view of the reservation of testing for peaceful uses. There follows a summary of various points made by Dr. Teller:

1. Dr. Teller indicated that there was no disagreement as to the facts and that the difference came in interpretations, which he felt in individual cases were largely based on motivation.

2. *Atmospheric tests.* Dr. Teller pointed out that at Geneva there had been no attempt to work out a system of policing these tests under 1 KT. Down to 5 KT the system proposed would present good chances of detection of *atmospheric tests*, but not down to 1 KT. Atmospheric tests are not essential for *development of weapons*, but are important for weapons effects.

3. *Underground Tests.* The chances are not good of detecting an underground shot of the magnitude of 5 KT, and it is virtually impossible to detect an underground shot of 1 KT.

Originally in the Geneva conference we asked for 650 stations (even this number in Dr. Teller's opinion might not be enough to give a high degree of assurance against evasion). We finally agreed upon 160 to 170 stations with the statement that these could detect underground shots down to 5 KT, with some small chance below 5 KT, but not down to 1 KT.

In the course of a year there are approximately 100 natural events which, with present detection systems, would not be distinguishable from a [text not declassified]—20 or 30 of them in the Soviet-Sino bloc.

The Geneva report says that inspection groups investigating a suspected nuclear explosion would be provided with equipment and apparatus “appropriate to its task.” What the report does not say is that such instruments do not now exist. The only way to prove an event to have been of a nuclear character is to locate radioactivity. In such a case the detection machinery would have been effective only with respect to an area 10×10 miles, and a detection been would then have to seek the specific radioactive area and the precise locale of the shot. (Dr. Teller’s estimate is that for an underground shot, drilling would be required and the chances of success on any one drill-hole would be about 1 in 40,000.)

If one is thinking in terms of [text not declassified] the number of such events in the course of a year is about [text not declassified] in the Sino-Soviet bloc. This, from the point of view of sheer members, would present a physical impossibility to inspection teams.

In the matter of underground testing, there is some reason to believe that it is more difficult to detect an underground explosion if it is fired in hard rock, unlike the test conditions at the Nevada Test Site. Also, it is believed that an appropriate structure around the devise could, in effect, decouple the transmission of shock waves to the earth.

Dr. Teller believes that a series of underground tests, [text not declassified] progressively pursued, could enable the development of weapons of increasing yield without the great risk of detection. Thus, Dr. Teller believes that the largest loophole in the test control system developed at the Geneva meeting is the [text not declassified] especially involving experimentation with decoupling. He feels that this loophole is so great as to eliminate fears about loopholes arising from the reservation of explosions for peaceful purposes.

[text not declassified]

4. Generally, *underwater shots* can be detected with effort and if one is willing to spend the sums of money involved for patrol ships, etc. As far as *ocean shots* are concerned, whether atmospheric or underwater, they probably can be detected and indentified but it is very difficult to prove the source. In other words, if there were a test moratorium and if there were an ocean shot, the Soviets could have been responsible but could seek to place responsibility upon the U.S. with very little possibility on our part of disproving the charge. If the shot were under 1 KT it would be very difficult to detect and identify.

5. *High-altitude Tests*. At Geneva it was agreed that no known system can detect and identify shots above 70 miles (the U.S. has now had 25 and 50 mile tests). However, the use of a number of satellites could detect radiation. High-altitude testing was not seriously discussed at Geneva and two methods of evasion of detection are: one, testing

behind an object, such as the moon, and the use of distance. It is possible to go one-third of the way to the sun.

6. The *significance of a violation* involving high-altitudes would be that big weapons could be made lighter and of a *violation underground* that weapons below 1 KT and be below 5 KT (which have been neglected) could be developed; also that "clean" weapons could be developed.

7. Dr. Teller feels that a moratorium would *not* be to our advantage in any case. However, assuming a moratorium, the question is, how best to go about it. He suggests banning all shots that can be policed:

a. Forbid all *atmospheric shots* (thus getting rid of fall-out).

b. Forbid all oceanic shots (this assumes that we will be prepared to put sufficient money into patrol ships, etc.)

c. Forbid all *underground shots above the agreed level of detection*. With respect to this point, Dr. Teller acknowledges the difficulties and suggests two ways in which it could be done, the first being more easily explained, but the second preferable in his opinion.

(1) Prohibit all shots above 5 KT. If one wishes to make a shot, give notification to the international organization and have observers present although not telling them what is inside the device. These observers could detect the yield. This would be a form of international inspection.

(2) Prohibit all shots causing an earthquake equivalent above a certain magnitude—say 4.5. This means that if we make a shot which gives a 4.5 reaction or less, we can announce the shot and no inspection is indicated. However, if the shot produces greater than 4.5 then the inspection teams go into action.

d. *High altitude shots*. If high-altitude shots are to be reserved from the Treaty, it could be provided that they be allowed above 30 miles until a system was devised to detect them down to a certain size. Then if the treaty were to be revised each year it could be progressively tightened.

8. *Explosions for peaceful purposes*. Dr. Teller urges that if there is to be a moratorium, we should *reserve explosions for peaceful uses*. He does not feel that peaceful uses open up any loopholes which are not already in existence because of the "threshold concept." He acknowledges that we might consider opening up peaceful tests completely to international inspection. He also feels that we should make clear that we reserve nuclear experiments that are not tests of weapons, citing specifically nuclear reactions at the level of low yield explosions, or just below.

9. Dr. Teller said that in recent exchanges with the British we found that although they had devoted a fraction of time and money to their program as compared with the U.S. program, their developments substantially parallel our own. Nothing of special significance has escaped the British and on the other hand the British have learned nothing of special significance that we do not know.

Memorandum of Conversation

October 7, 1958

MEMORANDUM OF CONVERSATION WITH DR. BRADBURY

The following points were developed in a conversation with Dr. Bradbury, with General Goodpaster and Mr. Harr present, Sunday morning, October 5:

1. Dr. Bradbury feels it is extremely important to continue *experimentation*. As an example, he alludes to the current work in rocket propulsion (Rover). He believes that this process should continue although in the experimentation there could develop a situation in which a fission action could blow materials out of the nozzle which would appear to have been a nuclear explosion.

2. Dr. Bradbury thinks that it is important to continue high-altitude *activity* primarily for scientific purposes.

3. Dr. Bradbury feels that it is very important to reserve explosions for peaceful uses.

4. It is Dr. Bradbury's view that although it can be said in a technical sense that we are ahead of the Russians in weapons development this actually means nothing. His point is that although we seem to have developed weapons of high yield in smaller packages than the Russians, this is substantially meaningless if one makes certain assumptions about Russian war strategy and accepts the best information one has about delivery systems. Whether the Soviets have weapons of as high a yield as some we have tested is relatively unimportant because we know that they have weapons large enough now to destroy our largest cities. Incidentally, Dr. Bradbury feels that we have erred in insisting upon developing weapons of a precise size, and that there is a margin of error of from 10 to 15 to 20% in any case.

5. With respect to peaceful uses. Dr. Bradbury thinks that we could stand almost any kind of inspection although it would be a considerable nuisance.

6. Dr. Bradbury indicated that we now know that the British have little to learn from us and that we have little to learn from them. This is comforting, he feels, in the sense that their efforts have corroborated the correctness of ours, although disquieting from the point of view that it may be assumed that the Soviets have made equivalent progress.

Memorandum for the Record

October 10, 1958

Memorandum for Record regarding Trip to Nevada Atomic Test site—3–5 October

Discussions regarding the project for suspension of atomic tests brought out that the “equation” can be written in three major terms:

A. Military Security

1. Technically, there is no clear or substantial advantage either to the Soviets or to the United States in suspending.

2. Militarily, although there is some reservation on this point, the suspension is to the considerable disadvantage of U.S. security.

3. Should the Soviets continue in testing under exceptions to the suspension, or in evasion of it, while the United States did not, then (irrespective of whether the U.S. knew of Soviet action or not) extremely serious—possibly even fatal—damage to U.S. security could occur; there is a division of opinion as to the likelihood of such action by the Soviets and the U.S.

B. Foreign Affairs—Defensive Objectives

The Secretary of State has considered that world public opinion regarding testing has come to such a point that the United States diplomacy cannot be satisfactorily conducted without the suspension of tests or a demonstrated effort to nuclear agreement to suspend.

1. World opinion has been successfully brought to a state of alarm by propaganda regarding the genetic effects of nuclear tests.

2. World opinion, as expressed in the efforts and attitudes of several governments, is demanding a suspension of tests as a means of “lessening world tensions,” an objective on which they place a high value; as a corollary they call for agreement with the Russians on any significant subject as a means of lessening such tensions.

3. World opinion in many areas, and particularly those which have undergone heavy serial bombardment in past wars, attaches the horror of atomic warfare to the testing of nuclear weapons.

C. Foreign Affairs—Positive Goals

1. It is possible that agreement on suspension of testing, if achieved and if faithfully carried out, might prove to be a step to more significant measures of disarmament and reduction of the over-hanging armed threat of the Soviet Union to the United States, and vice versa.

2. It is possible that the inspection operations incident to the suspension of testing may “open” the Soviet bloc in such a way as to introduce liberalizing and democratizing effects, which may lessen the threat of use of armed force at totalitarian decision and direction.

D. Influential groups in the United States, both inside and outside the Government, are desirous of test cessation on a variety of grounds, largely represented as moral, humanitarian, etc.

Discussion

Of the considerations listed under A above, it may be said that they represent a substantial, though not fully agreed and not fully evaluated, cost and danger to the United States.

Of the considerations listed under B above, it may be said that the genetic effects are extremely small (most recent scientific findings indicate that the products of testing are below the threshold at which genetic effects would appear) and that the Soviets and those who have helped them have thereby achieved the end of influencing policy through false propaganda; with regard to the lessening of tensions, question exists whether partial suspension, or suspension that can be only partially policed, will achieve this end; also whether in an era of protracted conflict waged by the Communists against the West, in which tension arises from the conflict of Soviet aggressive aims with free world intent to defend and maintain itself, the lessening of tension is an objective that has validity for the free world. These considerations represent a propaganda defeat for the United States, which may well require to be retrieved by concessions at the cost of our security, if our diplomacy is to have satisfactory results.

The considerations listed under C above, to the extent we may have expectation that they will in fact be achieved, represent a true offset to the costs of suspension to our security.

It seems a fair summary that the United States has proposed action which, if taken, balances on the one hand a net cost and risk to U.S. security against, on the other, the necessity for some relief from Soviet propaganda successes, some hope of further disarmament steps and of tendencies toward liberalization in the Soviet bloc, and the satisfaction of the desires and objectives of certain influential groups within the United States.

There is some belief in some quarters that the Soviets may not accept an agreement on cessation of testing which satisfies the minimum terms acceptable to the United States, and that as a result of this whole exercise, the United States will have scored gains in world opinion and in propaganda without security cost to itself. Such gains, arising from a recognition of Soviet intransigence as the cause for failure to reach agreement, would have to be offset by any world opinion that may exist that the United States should have lowered its requirements in order to reach agreement. The danger must be foreseen that the United States, confronted with such later strands in world opinion, might progressively reduce its requirements and thereby incur greater danger of Soviet test evasion and other costs to U.S. security.

Finally, it is probable that the interest of the United States in its own security, in national solidarity, and solidarity with our allies, will require that, whatever the balance of the equation written above, it be represented to the world as a net gain or "triumph" for U.S. policy. At some level in government, however, the truth must be recognized, or the dangers will be compounded.

A.J. Goodpaster
Brigadier General, USA

387. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, October 16, 1958

SUBJECT

Surprise Attack Negotiations and Nuclear Test Suspension Negotiations

PARTICIPANTS

<i>Dept of State</i>	<i>White House</i>	<i>Atomic Energy Commission</i>
Under Secretary Herter	Dr. Killian	Mr. McCone
Mr. William C. Foster	Mr. Gordon Gray	General Starbird
Mr. Farley—S/AE	Mr. Bromley Smith	Dr. Kavanaugh
Mr. Spiers—S/AF	Mr. Keeny	
Mr. Haker—S/AF	Mr. Minshull	<i>Dept of Defense</i>
Mr. Weiler—S/AE		Mr. Quarles
Ambassador	CIA	General Byers
Wadsworth	Mr. Dulles	Mr. Irwin
	Mr. Brent	

Mr. Herter said the issue to be decided regarding the terms of reference paper for U.S. delegation to the Surprise Attack Safeguards Conference was whether the delegation should be completely barred from discussing the question of limitations on armaments as it affects the surprise attack question. He said there was no disposition in the Department of State to discuss limitations in the form of specific numbers.

Mr. Quarles expressed the thought that once we engaged in any discussion of what additional protection might be gained from limitations on armaments, or generally any changes from the present

¹ Source: Terms of reference for surprise attack delegation, nuclear test suspension negotiations. Secret. 8 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

arms situation, we give the Soviets opportunity to discuss all their old proposals such as “ban the bomb”, and this would sow the seeds of destruction of the Conference, as well as place the U.S. at a propaganda disadvantage. He said it was quite true that disarmament measures with inspection would gain greater security for the U.S. but this Conference should not get into such questions. He commented that, in this regard, the language on Page 3 of the terms of reference paper was too broad.

Mr. Herter said the issue centered particularly in the wording to be used for Section III C of the agenda. He had hoped that it would be possible to have developed some specific suggestions from the delegation with respect to limitations that might be discussed but this had not proved possible.

Mr. Foster said he was the servant of whatever the Committee of Three decided, and that the possibility of some fruitful discussion with the Soviets existed even if we did not get beyond Section II of the agenda. However, he said, Sections III A and B are progressive in nature and when you get to qualification discussions, we can assess the value to the surprise attack problem of various types of hypothetical limitations, and this could be of real value to subsequent political negotiations. He said you could discuss variables in general terms or as percentages, or as “minimum cuts” and “substantial cuts”.

Dr. Killian inquired as to views of the delegation on any exclusion of a discussion of limitations, and said that any technical analysis he had seen shows that as far as missiles are concerned, there would be little value in more observation and inspection. He noted the views of the Interagency Working Group which expressed this view.

Mr. Quarles said he did not believe there would not be some value in observation and inspection.

Mr. Foster said we should aim at an assessment of the effectiveness of measures relating to various levels of armaments.

Mr. Quarles said he did not object to the technical discussion having a range of conditions which must be faced, but that this Conference should not get into a discussion of the value of reaching agreements on various disarmament measures.

Mr. McCone said we might start in the discussions at a zero assumption for certain armaments, such as missiles, and work upward rather than back in terms of reductions and limitations.

Mr. Foster commented that he had never liked the word “limitation” for use in the terms of reference paper and perhaps another word could be found.

Mr. Herter said there was always a danger that public opinion would view any technical recommendations of the experts as something that should be adopted by their governments, considering related

political or military factors. However, he said, we have an able delegation and while he would be surprised if the talks ever got beyond Sections I and II, the fact remains that the Soviets have proposed the talks and a mutual interest does exist in reducing the dangers of surprise attack. If we refuse to consider the problem of nuclear weapons, both sides will be faced with it, and if we restrict the delegation in a way that will hamper their exploration of Soviet thinking, we will restrict the potential value of the Conference and will also place ourselves in a disadvantageous propaganda position.

Mr. Foster noted that there was a possibility of fruitful exploratory discussion on methods that might reduce the likelihood of accidental war.

Mr. Quarles said the propaganda victory we had gained at the Geneva technical talks on nuclear testing resulted from our standing firm against Soviet efforts to make the Conference political in nature.

Dr. Killian expressed the view that the delegation should be allowed maneuverability in the talks, and *Mr. Foster* said it must at least have the opportunity during the preparatory work to look at the question of the effects upon the surprise attack problem of limitations and of variables in armaments.

Mr. Quarles said the delegation could study the question of the effects of limitations in their preparatory work, but that discussion of limitations in Geneva should not be undertaken without reference back to Washington. *Mr. Quarles* then proposed that Section II be changed in a manner that would limit discussion to technical problems that would have a range of variables to be concerned about. He said he would not object to the terms of reference paper stating that if the delegation felt that it had to discuss limitations, it should request instructions from the Committee of Three.

There was then some discussion to the effect that perhaps there was a meeting of minds on the issue of what should be discussed. It was agreed that the Department of State would redraft Section III, with appropriate changes in other parts of the terms of reference paper, in an effort to reflect the apparent agreement. The Committee of Three would then review the redraft.

Nuclear Test Suspension Negotiations

The meeting next considered questions relating to the nuclear test suspension negotiations scheduled to begin on October 31 in Geneva. The Third Report of the Working Group on Disarmament Policy (TAB A) served as a basis for the discussion.

Mr. Gray inquired whether there was yet a statement of the U.S. objective in the forthcoming negotiations; was it, for example, to eliminate tests, was it to get off the propaganda hook or was it to eliminate fallout as a potential health hazard.

Mr. Herter said that he considered the U.S. objective was not to eliminate testing *per se* as this was not very important one way or the other. It was instead to test the *bona fides* of the Soviets in following through on the recommendations of the Geneva experts and thus to test their willingness to subject themselves to inspection, which is the *sine qua non* for disarmament. There was, of course, much public sentiment on the basis of possible health hazards but this factor is not basic from the U.S. point of view.

Dr. Killian added that there was of course a public opinion factor to be taken into account.

Mr. Gray asked if agreement could have been reached in Geneva by the experts without a Soviet political decision to reach agreement. If such a decision were taken by the Soviets in August he wondered why their present attitude toward agreement had changed.

It was generally agreed that the Geneva experts' report was based upon a political decision by the Soviet Government that it desired to reach this agreement.

Mr. Farley suggested that one possibility that might account for a change in Soviet position was that our August 22 statement of willingness to proceed to political negotiation took the Soviets by surprise. They may have hoped by reaching agreement at the expert level to increase pressure upon the U.S. position rather than move toward real agreement. Another factor that might be responsible for a change in their attitude could be that the Soviets came to realize in the course of the Geneva discussions that they still had much to learn about nuclear weapons and their effects. This might account for their resuming tests promptly after the Geneva talks.

Mr. Herter raised first for discussion the threshold question. He said he understood the Secretary's position to be that the U.S. would take no stand at the beginning of the Geneva talks on the threshold question but that if the Soviets came to see the disadvantages to them of the extensive inspection required for a full cessation of tests, the alternative of a threshold might be introduced.

Mr. McCone said that he agreed with the Secretary that we let this evolve and begin by discussing the geometric rate at which on-site inspection increases as the threshold is lowered. He understood, for example, that in the case where a hundred inspections would be required for a 5 kt threshold, 1800 would be required at 1 kt level.

Mr. Quarles said he agreed that we should leave the threshold question to be handled in this way. He thought: 1) that we should leave no ambiguity as to what the capabilities and threshold of any agreed system would be; 2) that we should agree to discontinue all tests above the threshold; and 3) that we might unilaterally renounce, subject to certain

conditions, tests below the threshold of reliable detection. Then, if we catch the Soviets testing, we could withdraw our unilateral renunciation.

Dr. Killian said he agreed in general but would raise the question of whether we should in fact renounce even unilaterally tests below the threshold.

Mr. Gray said that the approach the Secretary had suggested and *Mr. Quarles* had emphasized of making clear the limits of any agreed inspection system would have considerable educational value. It would point up the idea not generally understood that the system agreed at Geneva would not reliably monitor all tests.

Mr. McCone said that for purposes of discussion we might separate the problem into two components:

(a) what is the importance of tests below 5 kt and what would we give up by unilaterally renouncing all such tests.

(b) what is the importance of our public posture in the propaganda aspects of the negotiations.

Leaving aside the second field, he had no doubt as to the importance of tests below 5 kt. So long as U.S. military plans anticipate the use of ground forces, small tactical weapons would seem to be required and there is in this area a large field not yet explored.

Dr. Killian said he would be reluctant to forego tests below the threshold, and in this connection, he read the following sections from a staff paper incorporated as ANNEX 3 of the Third Report of the Working Group.

This problem could be resolved directly by permitting continued "safeguarded" testing below 1 kt or 2 kt by all nations. One method of "safeguarding" such testing would be to have Commission representatives make yield determinations of each test to determine that it was in fact below the permitted threshold. If the Commission retained the right of inspection which was not limited to a particular minimum yield, there would be little incentive to conduct clandestine tests below the threshold of the system. The incorporation of this concept in a test cessation agreement would have the following advantages:

1. It would close a significant loophole in the proposed system which could be exploited much more easily in the USSR than the US.

2. It would maintain the concept of fully "inspected" agreements.

3. It would permit the US to continue small-yield weapon developments which are of particular interest to the US for limited war and defense applications. The US is now probably in a period of more rapid development in this field than the USSR.

4. It would tend to establish a differentiation between small-yield nuclear weapons for tactical purposes as opposed to large-yield nuclear weapons for mass destruction.

5. It would make the overall system more workable by greatly reducing the number of inspections required to give an acceptable level of confidence in the capabilities of the system below 5 kt.

Mr. Quarles said he preferred the position mentioned in the staff paper but in his previous comments stated his preference on the basis of the Secretary's proposal as outlined by Mr. Herter. At this point Mr. Herter was called to another meeting.

Mr. Farley said that the Secretary's position was simply that he did not want to go into the negotiations appearing to add to the two conditions in the President's statement of August 22 a third condition as to the size of explosions which would be suspended. This question could better be handled at a later stage of the negotiations on the basis of the extent of inspection the Soviets were willing to accept.

Mr. Farley raised the question of whether an authoritative study had been made on the military value of tests in the various ranges below 5 kt.

Mr. Quarles said he had heard no disagreement on technical grounds to the position that if one side tests below 5 kt and the other side doesn't, a significant military advantage would be lost. He said he believed the first proposition of the U.S. position should be that we should not agree to stop tests we can't monitor, that we would agree to stop those above the threshold of reliable detection. As a second proposition we should say that if the Soviets would stop tests below the threshold on a unilateral basis, we would do likewise.

Mr. Farley said he believed this position was reconcilable with the one he had expressed. We should try to define capabilities of any system under discussion and thus we might find a common interest with the Soviets in eliminating smaller tests than the system could cover within practical limits.

Mr. McCone said we may find that the system can be improved with experience and that the testing limit could then be progressively lowered as the threshold of reliable detection was lowered.

Ambassador Wadsworth said he understood it would be the consensus that we would not go into the negotiations with the threshold as a prominent feature of our position and that we would not have to put a hard and fast threshold into the treaty itself.

Mr. Quarles said we say, depending upon circumstances, want to put the threshold in the treaty.

Ambassador Wadsworth asked how you would write it in since, as Mr. McCone stated, the system might evolve in capabilities. *Mr. Quarles* said one might define the stations and locations and define the capability of the system described, for example, as 90% above 5 kt.

Dr. Killian asked what would then be written in as to tests below 5 kt. *Mr. Quarles* said this might be handled by unilateral statements and kept out of the agreement.

Mr. Farley said we could now attempt to work out a draft position on this point on the basis of the discussion. He suggested that we proceed to the question of how the conditions in the President's August 22 statement might be dealt with in the treaty. He thought there would be no negotiating problem in writing in the first condition, that is, satisfactory installation and operation of the control system. We would need, however, to discuss tactical variations in dealing with the second condition of progress in disarmament.

Mr. Quarles said that an enforceable agreement on testing separate from other disarmament measures in the view of the Department of Defense, would be to our national disadvantage. Defense feels that a minimum condition beyond the test suspension would be satisfactory progress toward limitation of armaments and particularly the production of fissionable materials for weapons purposes. We could from a legal standpoint handle this by an annual renewal clause alone; but failure to renew would carry such an onus from a political standpoint that we would be unlikely to do it. For this reason he would like to see the treaty bear on the face of it a requirement for progress in disarmament, at least as a starting position in negotiations.

Mr. Farley said that he agreed this should be done as a starting position. However, to deal with the Soviet position on a permanent cessation it would probably be necessary to define our requirements for progress on disarmament. The question is only one of not having such rigidity in these requirements as to give the Soviets an advantage.

Mr. Gray said that a treaty which failed to mention the disarmament condition would be a departure from national policy; and would in effect be a separate test agreement.

Mr. McCone said that the more specifics there were in the treaty as to progress required the more defensible our position will be if we find it necessary to walk away from it. Specific conditions would also improve our position with Congress and with many elements of public opinion. Moreover, a tie to disarmament stated in the treaty would facilitate progress in disarmament.

Mr. Farley raised the question of who would decide when progress toward objectives defined in the treaty was substantial: would it be the Control Commission? If not, we would be back to a unilateral determination by each party.

Mr. McCone said that we should search for language that would define necessary progress as far as possible.

Returning to the threshold question, *Mr. Brent* asked if we should go into the negotiations seeking the lowest possible threshold.

Mr. Farley raised the question whether military interests suggest a desirable threshold or whether the threshold should be determined solely on the basis of inspection capabilities of the agreed system.

Mr. McCone said that we could not approach the problem on the basis of what level was to our advantage, since we could not have our cake and eat it on the threshold problem. We would not, however, want to approach it in a way which would give an important advantage to our adversary. If a system could be implemented on a 1 kt level, we should accept it. The area between 1 and 5 kt is of considerable military importance but we should not make an effort in the negotiations to reserve that area, since inspection capabilities can be brought below it.

Mr. Irwin said that he agreed.

General Starbird said that from a technical standpoint there would be a tremendous advantage in having a 1 kt exception, that there would be some additional advantage in an exception up to 5, but it was not a situation in which a 5 kt exception would be twice as good as 2 kt. The exception was progressively of less advantage as you move up the scale.

Mr. Irwin said the threshold should be as low as practicable in order to introduce as much inspection as possible in the Soviet Union.

Dr. Killian agreed, and said this was true also because we have at present a military advantage in the lower ranges.

Mr. Gray asked whether the improvement in the inspection to which *Mr. McCone* had referred would result in opening up the Soviet Union more. *Mr. Keeny* said that improvement in the system would, on the one hand, detect more events which might then be inspected but on the other hand, it would identify more events on the basis of instruments alone and thus reduce the need for on-site inspection.

Mr. Gray asked whether the threshold question applied to tests in outer space or at high altitudes. *Mr. Farley* said that a special study group was at work on this problem.

Mr. Keeny said that preliminary studies indicated that these would be good down to 1 kt at several hundred thousand kilometers and that a detailed report on this subject was scheduled for completion next week.

Mr. Gray emphasized the need for early decisions and it was agreed that the group should reconvene at the earliest possible time.

388. Memorandum From Wilcox (IO) to John Foster Dulles¹

Washington, October 27, 1958

SUBJECT

Telephone Conversation with Ambassador Lodge

Ambassador Lodge has indicated he will call you on Tuesday to discuss: (1) the proposal for an 81-nation Disarmament Commission; (2) resolutions on testing which are pending in the First Committee. The following comments may be useful in your discussion:

1) *81-Nation Committee*

The Department has strongly opposed the establishment of an 81-nation Disarmament Committee since it is believed that such a committee would not serve a constructive purpose. The 81-nation committee would have the same problems that the First Committee has encountered in establishing even a moderately satisfactory negotiating body since such a body would have to be both small and representative. The enlarged Disarmament Commission would constitute in effect a continuing session of the General Assembly in which little of substance could be accomplished. It would supplant the present DC. Meetings of the 81-nation DC would probably deteriorate into a propaganda battle. Such a group would provide an opportunity for constant meddling by a number of countries. Attached (TAB A) is a statement which the Department has previously transmitted to USUN on this point.

On the other hand, it is recognized that acceptance of this proposal by the US would be responsive to the small power interest in maintaining a continued UN role in disarmament and would, as Ambassador Lodge believes "have important psychological value as an overall UN umbrella." Moreover, it is true that at such time as such Commission met it undoubtedly would have to set up sub-groups in order to function. We agree also that it is not possible in the words of Ambassador Lodge "to dream up another truncated Disarmament Commission."

Ambassador Lodge indicated there is "widespread support" for the idea of an 81-nation Disarmament Commission. We have been of the opinion up to now, based on information made available to us by USUN, that this proposal could be defeated if we continued our

¹ Source: Proposal for 81-Nation Disarmament Conference, nuclear testing resolutions in the U.N. General Assembly. Confidential. 3 pp. NARA, RG 59, Central Files, 320.11/10-2758.

opposition and that this could be done without placing us in a seriously untenable position, since part of the onus for denying the UN a role would rest on the USSR for boycotting the 25-nation Disarmament Commission.

On balance, we believe it still is preferable not to support the 81-nation DC proposal. Since USUN has not made a systematic canvass of the strength of this proposal, it would be desirable for you to suggest to Ambassador Lodge that they provide us with a tabulation of the expected vote on this proposal. You might wish to add that if the systematic count confirms his view that there is widespread support for the 81-nation DC proposal, Ambassador Lodge would have discretion to support it.

2) Resolutions on testing

As Ambassador Lodge has indicated, the 17-power resolution (TAB B) with the US as one of the co-sponsors has somewhere between 45–50 votes in favor of it. Ambassador Lodge has not made any recommendations in his letter for further modifications of specific language. In response to Ambassador Lodge's previous recommendations, he has already been authorized to make certain changes in the 17-power resolution, if necessary. The 17-power resolution with such changes is attached (TAB C).

The Indian draft resolution to which Ambassador Lodge refers in his letter has since been superseded by an Indian-Yugoslav resolution (TAB D). We believe this formulation is not acceptable since it still tends to treat the subject of nuclear testing in isolation. However, we have authorized Ambassador Lodge to discuss certain modifications with the Indians and Yugoslavs which would make the resolution acceptable to us (TAB E).

In these circumstances, we believe you should indicate to Ambassador Lodge the following: (a) We would be able to support the Indian-Yugoslav resolution provided they accept the changes we have suggested; otherwise we believe (b) he should stand firm on the 17-power draft resolution with such modifications in it as Ambassador Lodge has already been authorized to accept; and (c) if the modified 17-power resolution does not have the necessary support or it seems desirable for other reasons, we could accept the procedural resolution suggested by the British as the concluding action of the Committee in lieu of any substantive resolution (TAB F).

Tab A**Excerpt From GADEL 61**

2. DELGA 209

Department continues strongly oppose establishment 81-nation disarmament committee. It is unlikely serve useful purpose and in essence it is GA itself, which now debates disarmament annually and which can call special session if it desires. 81-nation committee would have same problems as First Committee in establishing moderately satisfactory negotiating body, and which would have to be small and representative. It would provide opportunity for constant meddling and in effect would constitute more or less a continuous session of GA on disarmament where little of substance could take place and propaganda battle would make serious negotiation more difficult, if not impossible. While we recognize that part of onus for opposing such proposal would be placed on US, we nevertheless believe Soviets would come in for at least equal criticism in view their irresponsible boycott of DC during past year. We doubt that 81-nation DC proposal could be adopted if US and UK continue vigorous opposition.

389. Memorandum of Conversation¹

New York, October 28, 1958, 5:50 p.m.

PARTICIPANTS

The Secretary of State
Thomas E. Murray

The Secretary said he was glad that Mr. Murray would be going to the Geneva conference on nuclear testing. He said he was counting on Mr. Murray's cooperation, stressing that we could not afford a show of division in these very delicate negotiations. He noted that they would

¹ Source: Geneva Conference on Nuclear Testing. Confidential; Personal and Private. 1 p. Eisenhower Library, Dulles Papers, General Memoranda of Conversation.

now be made all the more difficult by the fact that the Soviets appeared to be taking a new look at their position.

Mr. Murray assured the Secretary of his cooperation. He said he would not “speak out” when he disagreed, but would express his viewpoint privately to Senator Gore. He said he had long favored stopping the testing of large weapons, but thought it essential to continue making small yield tests. He thought we could satisfy everyone’s needs, the scientists and military together, by underground tests.

The Secretary pointed out that we needed not only weapons but public good will and the support of our allies as well. He thought therefore that the main question would be one of tactics at the Geneva conference to insure that the blame for any breakdown was laid to the Soviets. We should not ourselves appear militaristic. The Secretary said that if we could work it out without jeopardy to our foreign relations, he would favor small underground testing. He said he did not think the conference would be a success; that the Soviets would continue testing and therefore we would then resume our own testing.

JFD

390. Telegram Supnu 45 From Geneva¹

Geneva, November 11, 1958, noon

Supnu 45. Following summary appraisal first ten days nuclear weapons test conference.

1. Soviet position. Soviet delegation after quickly coming terms on minor points such as private rather than public sessions, and use of “discontinuance” in conference title, immediately assumed rigid position on agenda. Soviet position on agenda has remained consistent that first act of conference be “conclusion” agreement on “cessation” weapons tests. This p.m. informal meeting three delegations proved inconclusive in changing Soviet position. Soviets have indicated wish continue informal discussions on agenda.

In spite of Soviet delegation rigidity on agenda Soviet position in meetings has not been one of complete avoidance substance. They have, of course, focused on their own draft treaty, but from time to time have engaged brief discussions on controls. Soviet challenge to U.S.

¹ Source: Summary of first 10 days of nuclear test conference. Confidential; Priority. 2 pp. NARA, RG 59, Central Files, 700.5611/11–1158.

and U.K. delegations to table own versions draft agreement obviously calculated further center attention conference on first item of Soviet agenda, i.e., conclusion of agreement. Nevertheless may have had some element of attempt get substantive discussion going without formal adoption agenda. Moreover, generally low key at which Soviets have conducted conversations and meetings, even in face of occasional fairly stern lectures from Western delegations seems indicate Soviet delegation interested in prolongation of conference rather than early break, at least prior arrival Kuznetsov, and probably for some time.

2. U.K. position. U.K. delegation reflects preoccupation U.K. Government with securing treaty even if this means corners have to be cut. U.S. delegation gets general impression U.K. delegation will from time to time try to act as "honest broker". However, to date, cooperation of U.K. delegation has been good. Agreed tactics have been carried out with minimum of free-wheeling, and agreed positions maintained. U.K. delegation is noticeably silent in defending link with disarmament leaving this to U.S. delegation but we were on notice as to U.K. attitude before we reached Geneva.

3. U.S. position. Heaviest Soviet attack has been on "year-by-year" element of U.S. position, link with disarmament, and link with effective performance of controls. We expect attack on "year-by-year" and disarmament link to continue without let-up. One element of U.S. position already made public in President's August 22 statement has drawn no fire, namely reference to peaceful uses. Agreement by Soviets that conference should deal "weapons tests" and use of same term in Soviet draft treaty have made it possible consider peaceful uses item as means plugging loophole in commitment stop weapons tests rather than exception. Tactical position on this item therefore improved although U.S. delegation has yet to discuss it.

4. Conclusions. It is far from clear this stage whether Soviets have come under instructions find best propaganda method avoiding treaty and inspection or whether they are under instructions seek some sort of agreement with minimum of controls and these preferably more or less left to wither on vine after agreement actually signed. Actions Soviet delegation thus far seem indicate only that Russians did not come here looking for immediate break. Agenda deadlock does not give completely accurate picture of conference in which there has been some give and take on matters of substance. Our best guess on outlook is for protracted negotiations with or without adoption final agenda and with outcome very much in doubt.

Villard

391. Memorandum of Conversation¹

Washington, November 17, 1958

SUBJECT

Geneva Nuclear Test Negotiations

PARTICIPANTS

Senator Albert Gore, Member, Joint Congressional Committee on Atomic Energy

The Secretary

William B. Macomber, Assistant Secretary—Congressional Relations

Philip J. Farley, Special Assistant for Disarmament and Atomic Energy

The Secretary said that the President had been greatly interested in this discussion with Senator Gore and had suggested that the Secretary talk with the Senator.

Senator Gore outlined his reactions to the negotiations on nuclear test suspension under way at Geneva and his proposal for a U.S. statement calling for agreement on cessation of atmospheric tests and announcing a unilateral three-year U.S. suspension on such tests regardless of the Soviet position. Senator Gore said that he did not think there was much prospect of success in the Geneva negotiations and the move he was proposing would be highly effective since it would offer the prospect of an end to the “anti-social” fallout effects from atmospheric tests.

The Secretary said that Senator Gore’s proposal was very similar to what was being considered as a possible course of action in event the Geneva talks break down. He stressed the importance of a U.S. position, both in pressing the present negotiations and in any unilateral steps which might be taken in the event of a deadlock, which would show the moral and political soundness of the U.S. approach to nuclear testing. The present negotiations with the Russians was in many respects a “poker game” in which we would not want to show our hand too soon. Instead we wanted to expose the real attitude of the Russians toward acceptance of commitments for inspection and control.

Senator Gore spoke favorably of the performance of Ambassador Wadsworth and the U.S. Delegation.

392. Memorandum of Conversation¹

Washington, November 18, 1958

SUBJECT

Geneva Nuclear Tests Negotiations

PARTICIPANTS

The Under Secretary

Mr. Philip J. Farley—S/AE

Mr. Ronald I. Spiers—S/AE

Dr. James Killian—Special Assistant to the President

Dr. Hans Bethe—President's Science Advisory Committee

Dr. Killian explained that he had asked Dr. Bethe to report to the Under Secretary about developments in Geneva and his views on possible next steps. Dr. Bethe said he thought it would be particularly useful for Mr. Herter to have a first-hand account of the atmosphere in the negotiations. He said that the meetings were substantially different from the summer technical sessions and that things were moving quite slowly. He said that until the U.S. had put in its "excellent" treaty outline, there had been no movement on the part of the USSR. At this point the USSR was forced to discuss the control problem to some degree, since they could not let our statements go unchallenged. Consequently, we have received some clarification as to what the USSR does want and does not want. He remarked that the most hopeful point is that both the Russians and the U.S. have emphasized their commitment to the Technical Experts Report, which has now become a "sacred" document. It has become clear that the USSR strongly objects to our concept of organization of a control system and that they want the system organized on a basis of parity. They are particularly opposed to the idea of an administrator "who would be able to tell the U.S. and USSR what to do." Dr. Bethe thought that our best tactic was to continue to put in papers dealing with substantive points and to proceed to talk about them, thus by-passing insofar as possible the agenda issue. The Delegation felt strongly that we should not accept the Russian agenda. The Delegation was unanimous in its opinion that the USSR did not want to break the meetings off, although they might do this ultimately if the breaking issue is favorable to them. He emphasized that we should be willing to give the Delegation flexibility in determining tactics and in dealing with details of the control system, such as the division of the

¹ Source: Bethe's views of nuclear test suspension conference. Secret; Limit Distribution. 3 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

authority between the Commission and the Administrator. A particularly important point for us to insist upon, in his view, is the automaticity of the mobile inspection in response to carefully defined geophysical signals.

Dr. Bethe said that the Delegation had been encouraged at the fact that the Soviet Union had not made a big point out of the peaceful uses testing problem and that their reference throughout the meeting has been to barring “weapons” tests.

The main Soviet fire is focused on our one-year position and our insistence on the link to disarmament, according to Dr. Bethe. The Delegation feels that the Soviet Union is in a strong position on this point and that their opposition would be sustained by public opinion. The Delegation had been happy to see the evidences of Washington flexibility on this point. Dr. Bethe recounted a conversation that he had had with Dr. Feodorov who had agreed, in a private conversation, that governments should be free to withdraw from the treaty if the control system was not installed and operating, although this was not the officially-stated Soviet position. However, the USSR would never agree to a loose provision leaving it to U.S. judgment whether satisfactory progress was being made in disarmament as a basis for treaty termination. He felt that the USSR was firm on this point and that he, himself, felt that it would be “monstrous” to have a treaty dependent upon other treaties not in existence.

Mr. Herter inquired whether it would be in our interest to have an open-ended commitment for cessation of nuclear tests and whether or not, in ten years, we would find that the Soviets had been able to improve their weapons position, even without testing, to such a degree that our security would be jeopardized. Dr. Bethe said that in the absence of testing, the U.S. would be in a far better position to continue nuclear weapons development than the Soviet Union. Our past tests have gone a lot further into diagnostics than we have any evidence to that the Soviet Union has and, consequently, we understand the interior workings of the nuclear weapons much better than they do. Therefore, we are in a better position to make further progress without testing than the Soviet Union. Dr. Killian said that a consideration on the other side is that the Soviet system might be better able to maintain good weapons laboratories in the absence of testing than the U.S. would. Dr. Bethe said that he was not convinced of this point, but that an important factor would be the ability of the USSR to cheat in the face of any system of control.

In this connection, Mr. Herter asked about the validity of the point which is often made about our need to improve our small weapons position, and what the Soviet small weapons capability was. Dr. Bethe said that we have little firm knowledge about Soviet very low-yield tests, but

that what we know about their capabilities in the 10 to 20 kiloton range indicates that they have not highly developed abilities in this area. With respect to our requirements in the small weapons field, Dr. Bethe admitted that there was much that would still be done to improve our position, but that we did have something of "every type in every yield." For us it is not a question of having or not having, but rather a problem of further refinements. Dr. Killian pointed out that you could go on endlessly making weapons refinements and that the Soviet Union could also. In view of our relative position in this field, the Soviet Union would have more to gain by continued testing.

Dr. Bethe said he wished to make two final points. The first was to emphasize that since the Soviet Union has not kept the privacy agreement in the meeting, it would be to the advantage of our Delegation if the "right things" could be said in Washington, particularly in clarification of our position on controls. If we could abandon disarmament link, we would be in a strong position from the propaganda stand-point. Secondly, he wished to say that whereas the UK had been at pains to maintain a united front with the U.S. in the open meetings, their position essentially was quite different and sooner or later this would come out. The British believe that cessation of nuclear tests is inevitable under any circumstances and that any controls we could get from the Soviet Union would be "gravy". Consequently, the UK will, in the last analysis, be willing to settle for substantially less than we will.

393. Telegram Supnu 77 From Geneva¹

Geneva, November 21, 1958, 11 a.m.

Supnu 77. US delegation has been giving close study to problem of how to (A) move negotiations forward into actual discussion controls, or (B) clearly establish Soviet unwillingness to deal seriously with controls and thereby place on Soviet onus for failure make progress towards treaty.

General Soviet position as reflected both inside and outside conference now seems clear. Soviets for present, and we believe for indefinite period, are willing stay on position that there must be some agreement, at least in principle, on QTE cessation UNQTE before Soviets will move

¹ Source: Proposes change in negotiating position in nuclear test conference. Secret; Niact; Limited Distribution. 3 pp. NARA, RG 59, Central Files, 700.5611/11-2158.

to serious discussion, let alone acceptance of, arrangements for control. Delegation appraises Soviet position as firm. We believe firmness stems from probability Soviets believe public attraction their call for agreement in principle cease tests for all time contrasts favorably with US–UK position of conditioning duration of treaty on year-by-year determination not only of satisfactory progress in installing control system but also of progress in the field of disarmament. Given this Soviet position, US delegation does not place much stock in tactical approach such as that proposed by UK (ref Nusup 73) as device for bringing Soviets to grips in discussion of controls. Any tactical approach, whether that proposed by UK or for that matter tactical approach preferred by US delegation itself, such as trying to operate without agenda or trying eventually to reach compromise agreed agenda appears likely fail to bring serious negotiation controls so long as Soviets stand on position agreement in principle cessation tests must first be achieved. This is not to say conference will not be dealing with matters of substance. As delegation has already pointed out, conference, under guise agenda discussion, has already been dealing with central substantive question of whether Soviets willing have treaty which includes effective controls. We believe public acceptance this fact well enough established so that there is little danger imminent break by Soviets occasioned by developments connected with present state negotiations within conference.

US delegation has concluded that most profitable general approach now would lie in sharpening contrast between Soviet and US–UK attitude toward controls and at same time weakening over-all Soviet position on “cessation” by removing vulnerable points in present US position. Vulnerability US–UK position rests on short-term implication of phrase year-by-year determination and in particular on this determination as applied to progress in disarmament, which seems to many people extraneous to problem of assuring end of weapons tests.

In private discussion with UK delegation, US delegation has gained clear impression that move to simplify and bolster public support of US–UK position by making this position rest clearly but solely on inseparability of obligation to cease tests from establishment of effective controls would give UK delegation, and presumably UK Government, confidence for strong negotiating line with Soviets. We believe this would be the best way to remove temptations for UK to adopt tactical approaches which we believe are dangerous and unproductive. UK delegation has from time to time expressed hope that we could meet present situation by simplifying and clarifying US–UK position. UK views on disarmament link are already known to Department. Accordingly, delegation recommends strongly that careful consideration be given to immediate move to make US position on agreement to stop tests rest solely on satisfactory establishment, extension and operation

inspection system. If such US position is adopted, we believe it should be set forth publicly in joint US-UK statement.

Possibility of dealing with disarmament link by mention in a "purposes" article of treaty and further mention in duration clause of treaty has been suggested by Department in Nusup 69.

Delegation has already submitted (Supnu 71) recommendation that disarmament link be dealt with by statement or purpose in preamble only for reasons given in reference message. We believe this position sound and can be explained convincingly in public statement.

US delegation realizes necessity of assuring periodic review of control system and of retaining US unilateral right of determining whether control system being established satisfactorily, coming into effect in satisfactory stages and operating satisfactorily thereafter. We believe such periodic determination can be adequately provided for by negotiating agreed phases within which specific parts of control system should be set up, and agreed standards in accordance with which control system must operate. Position can be publicly presented without short-term implications of "year-by-year" while at same time retaining right of periodic unilateral determination as to effectiveness of system.

In immediately following telegram delegation suggests draft public announcement by US and UK Governments which could give effect to recommended initiative with reference US policy on disarmament link. We believe issuance of such a statement would greatly strengthen relative public position of US-UK as against Soviets, would encourage UK to cooperate fully in probably prolonged and difficult negotiation, and would increase whatever possibilities there may be that Soviets can be brought to serious negotiation of treaty including controls.

US delegation has informed UK delegation of general nature of recommendation made this telegram.

Villard

394. Telegram Supnu 78 From Geneva¹

Geneva, November 21, 1958, 11 a.m.

Supnu 78. Following is suggested draft referred to Supnu 77.

The negotiations at Geneva for a discontinuance of nuclear weapons tests are not making progress. The principal obstacle appears to be Soviet unwillingness to discuss, let alone accept, an effective system of controls to assure that an obligation to stop tests is honored. The Soviets claim that they cannot discuss controls until they have an agreed understanding on an obligation to cease tests. The United States and United Kingdom delegations have repeatedly made clear that as far as their governments are concerned the essential requirement to ensure a lasting agreement to cease tests is an effective system of controls. The Governments of the United States and United Kingdom believe that, if the Soviets will cooperate fully in establishing and operating such a system, an agreement to stop nuclear weapons tests will surely last. Moreover, they believe that the changed attitude toward controls which such Soviet cooperation would signify would remove the greatest single obstacle to progress in agreeing on and implementing measures of real disarmament. Therefore, to make their position crystal clear and to assist the negotiations, President Eisenhower and Prime Minister Macmillan have decided to make the following joint declaration: "The Governments of the United States and the United Kingdom will agree to stop nuclear weapons tests once and for all, provided only that an effective international system of control is agreed, comes into operation by agreed stages, and operates satisfactorily in accordance with agreed standards."

The President and Prime Minister hope that the Soviet Union will accede to this declaration and will instruct its representatives in Geneva to proceed promptly, together with the delegations of the United States and United Kingdom, to negotiate and sign an agreement to stop tests that has proper provisions for effective international control.

Villard

395. Record of Telephone Conversation Between McElroy and John Foster Dulles¹

November 26, 1958, 12:53 p.m.

The Sec told of Nixon's cable. It would involve a change in our basic position. Should the Sec talk to Q or does M want to handle himself. M will be willing to get Q in it but he thinks for us to make that kind of step back should be after a lot of conversation. Our protection against big countries is our atomic strength. If we can't tie it in with restrictions on atomic weapons we are in trouble. M does not get the British point on this and does not think N on a TV program should announce this change. The Sec read the cable. The Sec referred to a message he got last night from Lloyd pressing us to move in this direction. The Sec does not think we should do this over the phone because N wants to have a press conf. M agreed. The Sec agreed it is a serious question and we should take adequate time to thrash it out among ourselves and bring the Pres in. The Sec replied he is not sure he agrees with what M said but is not going to try to rush for a contrary decision because N is having a press conf in London. We should be thinking about this and he suspects our people are because we had what appeared to be a unanimous recommendation from our del that we should accept this change. He believes Fox sent a telegram to Defense. M said maybe that is the way it should come but only after deliberation. The Sec will respond the Pres is in Augusta and it should be discussed among ourselves and him and not all can see him together.

¹ Source: Response to Nixon cable pushing for rapid change in U.S. negotiating position. No classification marking. 1 p. Eisenhower Library, Dulles Papers, General Telephone Conversations.

396. Telegram 5175 to London¹

Washington, November 26, 1958

5175. Personal for Vice President from Secretary. Your 2888. Have discussed this with McElroy. He is strongly of opinion that we should maintain tie-up with QTE major and substantial arms control measures UNQTE as stipulated in President's statement of August 22 and which now constitutes agreed US policy except that we have since agreed to drop the QTE year-by-year UNQTE basis and need for annual determinations.

Under circumstances it is not practical to bring about a new policy before your press conference. McCone is in San Francisco, President is in Augusta, and in view of McElroy's views we could only change our position after a deliberate reexamination by all US elements largely concerned and presentation of views to the President.

It occurs to me that you might say that if adequate controls are accepted and installed for purposes of monitoring agreement to suspend testing, this would of itself go far to pave the way toward broader arms control measures so that the relating of suspension of testing to these other measures would not be apt in practice to constitute a serious qualification. Therefore, the first thing to find out is whether or not the Soviets will agree to an adequate control system. This goes to the heart of all aspects of limitation of armament. This issue they so far evade.

Dulles

¹ Source: Conveys view that there must be full deliberation on proposed change in U.S. position at nuclear test suspension conference. Secret; Priority; Limit Distribution. 2 pp. NARA, RG 59, Central Files, 033.1100–NI/11–2658.

397. Memorandum of Conversation Between John Foster Dulles and Gray¹

Washington, November 26, 1958

On 26 November, I met with Secretary Dulles. For the first portion of the meeting Mr. Philip J. Farley was in attendance.

The first subject for discussion was Senator Gore's memorandum to the President which I had circulated to the Secretary of State and others under date of 26 November. I suggested to the Secretary of State that, with his approval, we might make use of the interdepartmental machinery, which had previously been set up by Mr. Farley, to deal with problems arising out of the Geneva Conferences. I indicated that I had earlier received Mr. Farley's agreement to such a procedure.

The Secretary felt that this was altogether appropriate. He said, however, that inasmuch as the Gore proposal was something timed for an impending breakup of the conference, he felt that there was no great rush because he believed that the conference would not break up very soon.

He indicated, however, that a more pressing problem which the interdepartmental machinery should address itself to was the question of a link with other disarmament measures. He indicated that the British were eager to destroy this link for their own domestic political purposes and that we might have a very difficult time holding them with us. I agreed that this matter should have top priority but that the Gore memorandum should be considered as an auxiliary problem. The Secretary instructed Mr. Farley to proceed.

I had pointed out to Mr. Dulles that Mr. McCone was out of town until December 1 and that Mr. McElroy and Mr. Quarles were immediately unavailable because of Defense budget problems. Mr. Dulles then pointed out to me that he would be absent from Washington from Sunday, November 30th until Friday, December 5th.

At this point Mr. Farley departed the meeting.

I then discussed with Secretary Dulles my concern of not having been involved in the decisions reached at his house on Sunday, November 16. The Secretary assured me that this was an oversight and apologized, saying that he felt that it was more of an operating decision, but agreed with me that high policy had indeed been involved. He then

¹ Source: Use of interdepartmental machinery to deal with issues arising from nuclear test suspension conference. Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up. Drafted December 5.

indicated that he has never invited General Cutler to such meetings at his house but it was his intention to make a change for the future.

We then discussed briefly the forthcoming Defense budget conference at Augusta which was to take place on Friday, November 28. The Secretary expressed a desire that, in his behalf, I report at the meeting his feeling that as long as we maintained an adequate deterrent, our greatest threat in the foreseeable future was not of nuclear war but of local aggression and the requirement for such actions as we have taken recently in Lebanon and in the Taiwan Strait. He therefore asked me to say that from the point of view of his responsibilities in the conduct of foreign policy, he hoped that budget decisions would not impair or cripple our capacity to deal with local situations.

Gordon Gray

Special Assistant to the President

398. Telegram Supnu 121 From Geneva¹

Geneva, December 9, 1958, 10 a.m.

Supnu 121. Following is verbatim text of basic provisions tabled by SovDel at today's meeting. Copies being pouched London, Moscow, Paris for USRO.

Begin verbatim text.

Basic provisions determining the establishment and activities of the control organization for the control over compliance with a treaty on the cessation of nuclear weapons tests

1. A control organization for the control over compliance with a treaty on the cessation of nuclear weapons tests, hereinafter referred to as the Control Organization, shall be established, on the basis of technical methods recommended by the Geneva Conference of Technical Experts, by the initial parties to the treaty, the Union of Soviet Socialist Republics, the United Kingdom of Great Britain and Northern Ireland, and the United States of America, hereinafter referred to as the founder states of the Control Organization.

2. The Control Organization shall consist of a commission for control over compliance with a treaty on the cessation of nuclear weapons

¹Source: Basic provisions text tabled by Soviet Delegation. Official Use Only. 12 pp. NARA, RG 59, Central Files, 700.5611/12-958.

tests, together with the technical system at its disposal (departments, laboratories), necessary for carrying out its functions, hereinafter referred to as the Commission, as well as of ground control posts, control posts on ships, and specially equipped aircraft provided by the founder states of the Control Organization for the collection of radioactive debris over the high seas.

3. The direction of the entire Control Organization shall be vested in the Commission which must direct and coordinate the activities of all the elements of the Control Organization in such a way that it ensures:

(A) The carrying out by ground control posts and ships of continuous and effective observations over possible nuclear explosions, providing for the timely detection of violations of the Treaty on the Cessation of Nuclear Weapons tests.

(B) The carrying out of regular flights over the high seas by specially equipped aircraft provided by the founder states of the Control Organization for the collection of radioactive debris for the same purpose.

(C) The timely processing of documentary data on observations and the information by the governments of the states parties to the treaty concerning violations of this treaty.

(D) The organization and the carrying out of the on-site inspection of unidentified events suspected of being nuclear explosions the composition and functions of the Commission.

4. The Commission shall be established by the founder states of the Control Organization. The Commission shall carry out the following basic functions:

(A) It shall direct the entire activity of the Control Organization, approve instructions and control provisions and types of equipment

(B) It shall review all cases where data provided by the technical system of the Commission give evidence of the existence of events suspected of being nuclear explosions.

(C) It shall adopt decisions on the existence of sufficient ground for suspecting that a nuclear explosion has been carried out in an area.

(D) It shall inform the government of the state on whose territory a nuclear explosion has been suspected of having taken place and shall request its opinion thereon. Upon considering the reply of the said government, it shall adopt a decision as to the necessity or the lack of necessity for carrying out an inspection of the area where the explosion is suspected of having taken place, by despatching a ground or maritime (by ship) inspection team and by organizing an aircraft flight along the routes agreed upon in advance with the government of the state concerned for the purpose of air sampling radioactive debris.

All decisions of the Commission on the above mentioned and other important questions shall be adopted by agreement among the

founder states of the Control Organization. In the event of disputes, the Commission shall inform the governments of the states parties to the treaty and the Security Council of the United Nations.

The technical system of the Commission referred to above in paragraph 2 shall comprise appropriate departments for processing and analyzing data received and for providing the Control Organization with the logistic and technical facilities and personnel. The personnel of the various departments shall be selected and approved by the Commission on the basis of an equal representation of the two sides of founder states of the Control Organization.

5. The technical system of the Commission shall provide, in accordance with instructions from the Commission, for carrying out the following basic functions by the Control Organization:

(A) The carrying out at control posts and on aircraft designated for collecting radioactive debris of continuous and effective observation of events which make it possible to detect nuclear explosions through methods recommended by the Geneva Conference of Technical Experts.

(B) The arranging for the timely analysis and processing of observation data from control posts for the purpose of rapid detection of signs of possible nuclear explosions.

(C) The obtaining if necessary, through requests for observation information, of data from the existing network of seismic and meteorological stations for the identification of natural events which, according to readings at control posts, could be taken for nuclear explosions.

(D) The arranging for, by decision of the Commission, an inspection on the site of a suspected nuclear explosion.

(E) The arranging for the development, testing, and acceptance of measuring instruments and equipment used by the control post network.

(F) The arranging for reliable communications with control posts as well as with the bases from which regular flights by specially designated aircraft for air sampling of radioactive debris are carried out, through the means of communication existing in the territories of the states where control posts are located.

(G) The arranging for trips to and from the control posts for personnel thereof as well as for visits by the Commission personnel to control posts when the latter are considered necessary by the Commission, using the existing means of transportation.

(H) The utilization of results of new scientific achievements for the purpose of raising the effectiveness and the scientific level of the Control Organization.

6. The administrative, logistic and representation expenses of the Control Organization shall be financed with funds allocated by the states parties to the treaty, in accordance with an estimate to be

approved by the Commission. The amount of the contributions by states shall be determined by special agreement.

Ground Control Posts

7. The tasks of the ground control posts shall include the following:

(A) The arranging for a continuous round-the-clock, observation over nuclear explosions by means of technical facilities recommended by the Geneva Conference of technical experts.

(B) Regular, original processing of documentary data obtained by means of all types of equipment of the posts to detect signals characteristic of a nuclear explosion.

(C) Submission, under an established procedure, of reports to the Commission and to the government of the state on whose territory the control post is located on observation data and nuclear explosions.

(D) Timely carrying out of calibration and maintenance work ensuring that all technical equipment of the posts is in continuous operating condition and the maintenance of accurate relative time and of accurate measuring equipment.

8. Each ground control post shall be equipped with seismic and acoustic apparatus, with equipment for registering radiation from nuclear explosions, and instruments for sampling radioactive debris in accordance with the recommendations of the Geneva Conference of technical experts.

Certain coastal posts shall also be equipped with hydro-acoustic equipment. In this connection, the personnel of the control posts may not use measurement instruments which have not been provided for the equipment of such posts.

9. The personnel of a control post shall consist of no more than thirty specialists and of several supporting personnel. With the exception of controllers from either side, the personnel of the control posts shall be selected from among the nationals of the country on whose territory the post is located.

Each post shall include controllers designated by the founder states of the Control Organization on the basis of the two sides, with one or two persons from either side. The post shall be directed by a Chief of Post, a representative of the country on whose territory the post is located, and by a Chief Controller, representing the other side. In countries which are not members of NATO, SEATO and the Warsaw Pact organization, the posts shall have two Chief Controllers, representing both sides.

Foreign controllers shall enjoy diplomatic immunity equal to that of personnel of foreign embassies and missions.

Controllers shall place their seals on all self-recording registering instruments and on means of access to instrument data records, shall

be present when documentary records are removed and processed, and shall supervise proper use of post instruments.

The right of extra-territoriality shall not extend to the territory and the premises of the control posts.

The security personnel of the control post, who shall be subordinate to the Chief of the Post, shall be the responsibility of the local authorities.

Movement of foreign personnel of the posts in the territory of the state must take place on regular terms and conditions in accordance with the procedure existing for foreigners. Any missions of foreign states in the state concerned must not interfere in the work of the control posts.

The provisions of this paragraph as well as those of paragraphs 10 and 11 shall also apply to control posts on ships.

10. Each control post shall maintain a special log-book for the registration of seismic oscillations, radiation, acoustic waves and data on the analysis of radioactive debris samples and, in the event of detection of a PAL which may be suspected as being caused by nuclear explosions, shall submit a report to the commission.

The reports of a control post shall be signed by the Chief of the Post and by the Chief Controller (or both Chief Controllers). In the event that the Chief Controller (or one of the Chief Controllers) does not agree with the conclusions of the Chief of the Post, he must state his dissenting opinion in the report.

Control posts must also submit the results of their observations at the request of the Commission.

In all cases, a copy of the control post's report shall be transmitted to the appropriate government agencies of the state in whose territory the post is located.

All documentary records of the registering instrument and other observation data shall be preserved by the control post for three months, after which they shall be made available to the agencies concerned of the country in whose territory the post is located, to be used for scientific and technical purposes.

11. The communication between the Commission and the control posts, and between the control posts and the Commission, shall be through existing communication channels. Where control posts are located in remote areas, the governments of the states in which these regions are located must arrange for the construction of appropriate means of communication which would ensure a reliable, round-the-clock transmission of data from the control posts. The mail of the control posts shall be carried by airmail via existing airlines.

12. In the event that a state cannot with its own resources organize and staff a control post, the organization and the staffing of the post

shall be carried out by decision of the Commission with the resources of both sides of the initial states parties to the treaty.

Control Posts on Ships

13. Control posts on ships shall be equipped with hydro-acoustic and acoustic instruments, radiation registration instruments, as well as with facilities of a maritime type for collection and analysis of radioactive debris.

14. Each ship control post shall be assigned a specific area of the ocean to cover.

15. The ship control posts shall be staffed by personnel of the state which owns such equipped vessel. The ship shall have on board one or two controllers of the other side (including one controller for navigation).

The Collection of Air Samples of Radioactive Debris

16. For the regular air sampling of radioactive aerosols, weather reconnaissance aircraft shall be used which make regular flights along routes in the open air space over oceans.

The said aircraft must be equipped with special instruments for the purpose of the detection and collection of radioactive aerosols.

At each base of these aircraft there shall be one or two controllers from the other side, whose functions shall include control over collection of samples and over their timely analysis at the radio-chemical laboratory of the base. One of the controllers must be on board the aircraft during air sampling. Air samples, the analysis of which indicates the existence of fresh radioactive debris from a nuclear explosion, shall be sent to the Commission, together with the conclusion on the results of the analysis of such samples as well as with technical documentation obtained on board the aircraft.

Arrangements for On-site Inspection of a Suspected Nuclear Explosion

17. An inspection team shall be despatched to the site of a suspected nuclear explosion by a decision of the Commission to be agreed in each individual case after careful examination of all available data on the identification of natural events. The adoption of a decision concerning the despatch of an inspection team must be preceded by a mandatory study of the data from the existing network of seismic stations and of other data which can contribute to the identification of the events under study.

An inspection team shall be created and supplied with the appropriate equipment in each individual case by decision of the Commission, depending upon the task of the team before it. The size of the group shall also be determined by decision of the Commission.

The supporting and technical personnel of an inspection team, transportation, and equipment shall be provided by the state on whose territory the inspection is to be carried out. In the event that such state is not in a position to provide the necessary equipment and the supporting and technical personnel, the procedure to ensure the inspection shall be determined by the Commission.

An inspection team shall include controllers designated by the founder states of the Control Organization on the basis of two sides. The size of inspection teams must be determined in each individual case in accordance with the FBYB assigned to the respective team.

An inspection team shall be under the Commission, and shall carry out all its instructions.

An inspection team shall submit to the Commission and to the government of the state where inspection is carried out a report on the investigation carried out on site.

18. Flights in the air-space of sovereign states to collect air samples for the purpose of inspection shall be made, with the participation of a representative of the Commission, by decision of the Commission in aircraft of such states along routes determined in advance and agreed upon with the governments of such states.

The Relationship of the Commission with the Governments of the States Participating in the Control Organization

19. In order to ensure day-to-day mutual relations between the Commission and the appropriate authorities of the states on whose territory a control post is located, the government of each such state shall authorize one of its government agencies to have continuing contact with the Commission on matters which are within the competence of the Control Organization.

20. The Commission shall establish mutual relations with such agency on the following matters:

The selection of the location of control posts;

The construction of control posts;

The selection of personnel for the staff of the Commission and control posts;

Transportation and means of communication for the Commission;

Assistance in the carrying out of inspection; and the provision for all other measures relating to the competence of the Commission.

Other Matters

21. The Commission and its technical system should be located in one of the European neutral states.

399. Telegram Supnu 136 From Geneva¹

Geneva, December 15, 1958, noon

Supnu 136. Following text tabled today by US del as draft treaty Articles VI, VII, VIII, and IX. (Which are numbered as VII, VIII, IX, and X in present US draft).

Begin verbatim text

Article VI—Functions of the Commission

1. The Commission shall establish procedures and standards for the installation, operation and improvement of the detection and identification system in conformity with this treaty and its annexes.

2. The Commission shall appoint an administrator for the system, who shall serve for a period of two years and shall be eligible to succeed himself. The Commission shall approve regulations governing the appointment, remuneration and dismissal of the staff of the Control Organization.

3. The Commission shall continuously review the actions of the administrator and the operation of the system under the terms of the treaty and its annexes.

4. The Commission shall approve the locations of control posts, ships, radiochemical laboratories, bases of operation of routine aircraft sampling flights (satellite tracking stations) and regional headquarters.

5. The Commission shall establish procedures and standards for the formation, equipping, maintenance and staffing of inspection groups, for the provision of adequate communications and transport facilities for such inspection groups, and for the expeditious despatch of such groups to the locality of events which could be suspected of being nuclear explosions. The Commission shall approve the number and base location of inspection groups in accordance with the criteria set forth in this treaty and its annexes.

6. The Commission, in establishing procedures for the staffing of the control organization, shall apply the following principles:

(A) No national of a state within which an inspection group is operating or a control post is located shall be included as a member of the inspection group or on the technical and communications staff of the control post.

¹ Source: U.S. text for several treaty articles. Official Use Only. 8 pp. NARA, RG 59, Central Files, 700.5611/12-1558.

(B) The composition of personnel at any component of the detection and identification system shall be such as to minimize the possibility of obstruction to effective operation.

7. The Commission may at any time decide, by a two-third majority of all members, that a particular event qualifying under the terms of this treaty and its annexes for automatic on-site inspection need not be inspected.

8. The Commission shall establish procedures for the despatch of special air missions in accordance with the criteria set forth in this treaty and its annexes.

9. The Commission shall prepare findings in accordance with Article (blank) and shall make recommendations in accordance with that article as to measures to be taken.

10. The Commission may conclude agreements with any state or authority to aid in the carrying out of the provisions of this treaty and its annexes.

11. The Commission shall establish procedures for dissemination of data produced by the control system to nations participating in the system and to interested scientific organization.

12. The Commission shall prepare an annual report to the conference on its activities in carrying out its purpose as defined in Article II and such special reports as it deems necessary on its activities. It shall also prepare for submission to the conference such reports as the Commission may be requested to make to the United Nations. The Commission shall submit these reports, along with the annual reports to the parties to this treaty at least one month before the annual session of the conference following the period covered by the report.

13. The Commission shall establish procedures in accordance with Article (blank) for the surveillance of nuclear devices and observation of nuclear detonations for peaceful purposes.

Article VII—Conference

1. The conference consisting of representatives of parties to this treaty shall meet in regular annual session and in such special sessions as shall be convened by the administrator at the request of the Commission or of a majority of parties to the treaty. The sessions shall take place at the headquarters of the organization unless otherwise determined by the conference.

2. At such sessions, each party to the treaty shall be represented by not more than three delegates who may be accompanied by alternates and advisers. The cost of attendance of any delegation shall be borne by the state concerned.

3. The conference shall elect a president and such other officers as may be required at the beginning of each session. They shall hold office

for the duration of the session. The conference, subject to the provisions of this treaty, shall adopt its own rules of procedure. Each party to the treaty shall have one vote. Decisions on budgetary matters shall be made pursuant to Article (blank) and decisions on amendments pursuant to Article (blank). Decisions on other questions, including the determination of additional questions or categories of questions to be decided by a two-thirds majority, shall be made by a simple majority of the parties to the treaty present and voting.

4. The conference may discuss any questions or any matters within the scope of this treaty or relating to the powers and functions of any organs provided for in this treaty and may make recommendations to the parties or to the Commission or to both on any such questions or matters.

5. The conference shall:

(A) elect states to serve on the Commission in accordance with Article IV;

(B) consider the annual and any special report of the Commission;

(C) approve the budget recommended by the Commission in accordance with paragraph (blank) of Article (blank);

(D) approve reports to be submitted to the United Nations as required by any relationship agreement between the organization and the United Nations; or return them to the Commission with the recommendations of the conference;

(E) approve any agreement or agreements between the organization and the United Nations or other organizations as provided in Article (blank) or return such agreements with its recommendations to the Commission for re-submission to the conference.

(F) approve amendments to this treaty in accordance with Article (blank).

6. The conference shall have the authority:

(A) to take decisions on any matter specifically referred to the conference for this purpose by the Commission;

(B) to propose matters for consideration by the Commission and request from the Commission reports on any matter relating to the functions of the Commission.

Article VIII—Administrator and International Staff

1. The administrator shall be the chief executive officer of the system and shall be responsible to the Commission in the performance of his duties.

2. The administrator shall implement procedures established by the Commission for the installation, operation and improvement of the system.

3. The administrator shall be responsible in accordance with the provisions of Article VI, paragraph 2, for the appointment, organization and functioning of the international staff of the organization. He shall be responsible for including in the staff such qualified scientific, technical and other personnel as may be required to fulfill the purpose of the organization.

4. When the administrator is unable to identify as a natural occurrence an event which has been detected by the system and which could be suspected of being a nuclear explosion in accordance with the terms of this treaty and its annexes, he shall so notify the Commission; and after 24 hours have elapsed he shall proceed forthwith to have an inspection of the locality of the event carried out (unless he is otherwise directed pursuant to Article VI, paragraph 7) in order to determine the actual nature of the event.

5. The administrator shall have authority to order special aircraft missions under procedures approved by the Commission in accordance with the criteria set forth in this treaty and its annexes.

6. The administrator shall determine, subject to the approval of the Commission, specific sites for land control posts, radiochemical laboratories, aircraft sampling stations, (satellite tracking stations), and regional offices and locate ships in accordance with the general principles set forth in this treaty and its annexes. The administrator shall, subject to the approval of the Commission, determine the specific flight patterns for routine sampling flights, and orbits of satellites.

7. The administrator shall determine, subject to the approval of the Commission, the number and base location of inspection groups in accordance with the requirements in this treaty and its annexes.

8. The administrator shall be responsible for undertaking a program to improve the operational capability of the system either by research and development carried out by the staff of the system or by appropriate external contracts. This program may, with the approval of the Commission, include experiments performed by the Control Organization to test the effectiveness of the system, including experiments in connection with nuclear explosions carried under Article (blank).

9. The administrator shall prepare the budget of the Control Organization in accordance with paragraph (blank) of Article (blank).

10. The administrator shall render to the Commission such advice and assistance as may be requested.

Article IX—Detection and Identification System

1. The system shall be established and shall operate in accordance with the provision of this treaty and its annexes.

2. The parties undertake to provide the necessary transportation from the port of entry, or within the territory of the party, to the site

of any element of the system or any area where an on-site inspection has been initiated whenever adequate and expeditious transportation is not available or has been discontinued for any reason.

3. The parties undertake to enter into appropriate arrangements with the Commission for the utilization of national aircraft for the routine collection of air samples when the administrator determines that existing routine meteorological or commercial flights of national aircraft are acceptable for this purpose. In such cases, the administrator shall specify the equipment to be utilized, and one or more observers from the system, none of whom is a national of the state providing the aircraft, shall accompany the flight.

4. The parties undertake to enter into appropriate arrangements with the Commission either to permit flights by system aircraft over their national territory or to have national aircraft immediately available for flights over their own territory when the administrator determines that special aircraft flights are required over national territory in accordance with the criteria in Annex I. In such cases, the administrator shall specify the equipment to be utilized and one or more observers from the nuclear test detection and identification system, none of whom is a national of the state being overflown, shall accompany the flight.

5. The parties undertake to enter into appropriate arrangements with the Commission for the utilization of national vessels for use as elements of the system when the administrator determines that existing weather or geophysical exploration ships are acceptable for this purpose. In such cases, the administrator shall specify the equipment to be utilized and the operating specialists and technical staff.

6. The parties agree to give inspection groups immediate and undisputed access to the locality of any event for which an inspection has been ordered by the administrator. The parties further agree not to interfere with any of the operations undertaken by an inspection group and to assist the personnel of the inspection groups as they may require in the performance of their mission. Inspection groups may be accompanied by representatives of the states concerned provided that the inspection groups shall not thereby be delayed or otherwise impeded in the exercise of their functions.

(Paragraph 7 will be drafted to make provision for high altitude detection after this matter has been further discussed.)

400. Telegram Nusup 118 to Geneva¹

Washington, December 15, 1958, noon

Nusup 118. USDEL authorized table Annex I as contained December 10 draft with following changes:

Article 1: Replace with following text: "The Nuclear Test Detection and Identification System (hereinafter referred to as the "System"), provided for in Article 10 of this Treaty, shall include the features set forth herein which are based upon the Report of the Conference of Experts to Study the Methods of Detecting Violations of a Possible Agreement on the Suspension of Nuclear Tests of 20 August 1958."

Article 2: Insert after "shall" in para 1 words "when completely established and unless otherwise decided in accordance with the provision of this treaty", and replace "a system of satellites" with words "agreed methods for detecting very high altitude nuclear explosions". Replace present text para 2 subpara (f) with "(appropriate techniques as may be decided for detecting very high altitude explosions should be inserted here.)"

Article 3: Delete first sentence para 1. Delete paras 2 and 3.

Article 4: Delete all after word "from" in first sentence para 1 and substitute "elements of the system". Replace present language para 1 sub-para (d) with "To examine continuously the work of the elements of the system to insure the maintenance of a high degree of technical proficiency". Delete paras 2 and 3.

Article 5: Add to first sentence para 1 words "or other elements of the system". Delete paras 2 and 3.

Article 6: In first sentence para 1 after "staff" add "equipment", substitute "direct" for "supervise" and replace all after word "events" with "which cannot be identified as natural events and which could be suspected of being nuclear explosions". Third sentence para 1: after word "responsible" add "at the direction of the Administrator".

Article 7: Substitute "in accordance with the provisions of Article IX of this treaty" for words "subject to etc." in para 1, and insert after word "concludes" words "cannot be identified as a natural event and". Combine para 1 sub-paras (a) and (b) in a new sub-para (a) with last sentence of old (b) changed to read "in addition, any unidentified seismic events with an estimated equivalent yield less than 5 kilotons which the data from the system indicates have an unusually high

¹ Source: Textual changes to delegation's proposal. Confidential; Priority. 4 pp. NARA, RG 59, Central Files, 700.5611/12-1558.

probability of nuclear origin shall be inspected". Renumber sub-para (c) as new sub-para (b). Delete para 2.

Article 8: First sentence para 1 should read "The system shall, when completely established, have about ten regional offices each providing logistic support and administrative supervision to elements of the system operating in its region." Delete paras 2 and 3.

Article 9: Delete all after word "posts" in first sentence para 1 and substitute "uniformly equipped with apparatus satisfying the specifications set forth in the Report of the Geneva Conference of Experts of 20 August 1958." Second sentence para 1 should end before word "however" and should be followed by new sentence reading "The exact number of control posts within the limits indicated above shall be determined as a result of actually distributing them, etc." In para 2 substitute "operation" for word "observation". Delete paras 3 and 4.

Article 10: Delete "and Functions" in title of para 1. Delete paras 2 and 3.

Article 11: Begin first sentence para 1 with word "Daily". Substitute for present text para 2 sub-para (b) "When geophysical data from the control posts indicate that an event has occurred which cannot be identified as a natural event and which could be suspected of being an uncontained nuclear explosion". Correct reference to treaty in last sentence para 2. Delete para 4. Insert first three sentences present para 5 as last two sentences para 2. Final sentence para 5 should be inserted as final sentence present para 3.

Article 12: Add words "by the Central Inspection Office" to para 1 sub-para (h). Delete present para 2. Delete title para 3 and incorporate para 3 as part of para 1.

Article 13: Delete present text. Change title to "High Altitude Detection" and substitute following parenthetical text for this Article: "(appropriate techniques as may be decided for detecting very high altitude explosions should be described here.)"

Article 14: Replace all before word "immediately" in first sentence with words "all elements of the system shall". Third sentence should read: "On request, all elements of the system shall provide additional data to the center." In final sentence first para, substitute "shall" for "will" and delete last four words. Substitute "examined" for word "observed" in first sentence second para.

PART VI: (Time Schedule) Department confirms views expressed para 3 of NUSUP 112 on method of handling this problem.

Herter
Acting

401. Memorandum From Herter to Gray¹

Washington, December 17, 1958

SUBJECT

Evaluation of Test Suspension Proposal by Senator Gore

In response to your memorandum of November 26, to the Secretary of State, the Secretary of Defense, the Chairman of the Atomic Energy Commission, the Director of Central Intelligence and Dr. Killian, there has been prepared by the Interdepartmental Working Group on Disarmament the enclosed "Evaluation of Test Suspension Proposal by Senator Gore". This report has the concurrence of this Department, the Department of Defense, the Central Intelligence Agency and Dr. Killian's office. Chairman McCone has indicated he will transmit the comments of his agency in a separate memorandum.

/S/ Christian A. Herter
Acting Secretary

Enclosure

Memorandum From Gray to Multiple Recipients

Washington, November 26, 1958

MEMORANDUM FOR

Secretary of State
Secretary of Defense
Chairman, Atomic Energy Commission
Director of Central Intelligence
Special Assistant to the President for Science and Technology

There is inclosed a copy of a memorandum prepared for the President at his request, by Senator Albert Gore, which summarizes a suggestion the Senator made to the President orally with respect to current negotiations in Geneva on the suspension of nuclear weapons tests.

The President, in requesting Senator Gore's memorandum, assured him that his suggestion would be given most careful evaluation. I have been directed to obtain for the President a coordinated view to be used in preparing a responsive reply by the President to the Senator.

¹ Source: Response of the Interdepartmental Working Group on Disarmament to a request for an evaluation of a test suspension proposal by Sen. Gore. Confidential. 3 pp. NARA, RG 59, Central Files, 700.5611/11-2658.

In considering the Senator's suggestion it should be borne in mind that the proposal would involve a departure from existing U.S. policy with respect to disarmament, in that it would completely divorce the cessation of testing of nuclear weapons from other disarmament measures.

The Senator advanced his suggestion to the President as one way to meet the situation that would develop were the Soviet Union clearly on the verge of breaking off the current negotiations in Geneva, rather than as a substantive proposal to be made during the course of the negotiations.

The President directs that special note be taken of the fact that the proposal would permit the continuation of both underground tests and tests in outer space, while ceasing only atmospheric tests for a stated period, as for example, three years.

I will be in touch with your respective offices very shortly with a view to determining a satisfactory and expeditious method of meeting the President's requirement.

Gordon Gray

Special Assistant to the President

Enclosure

Memorandum From Gore to Eisenhower

November 19, 1958

In the Geneva Conference on Nuclear Tests, two essentials are involved: (1) the moral and political position of the U.S. and, (2) U.S. military strength vis-a-vis the Soviets.

The U.S. delegation would seem to be negotiating toward an unattainable goal. If so, we must face the prospect of a failure of the conference, for which we would suffer propaganda blame, or an unfavorable agreement.

The Russians plainly seek to pressure the U.S. and the U.K. into agreeing to stop all tests for all time without accepting effective inspection. If they fail in this, they will seek to blame the U.S. for failure of the conference. Soviet success in either respect would be detrimental to U.S. interest.

Mounting fears of radioactive contamination of the air is Russia's most powerful propaganda weapon against us.

The U.S. can strengthen her moral and political position by seizing the initiative to stop radioactive contamination of the world's

atmosphere. This can be done without the establishment of the cumbersome, if not entirely impractical, system of inspection and control proposed by the experts. Presently installed systems have already demonstrated technical efficiency in detection of atmospheric detonations.

It is respectfully suggested, therefore, that the President announce the unconditional and unilateral cessation of all nuclear tests in the earth's atmosphere for a specific period, say three years, ask similar action by other nuclear powers and suggest that the Geneva Conference proceed immediately to negotiate a treaty among the nuclear powers for a permanent stoppage of atmospheric tests.

Thereafter, the conference can proceed to negotiate for the discontinuance of other types of nuclear weapon tests—underground, outer space and sub-oceanic—with an adequate system of inspection and control, making the necessary exceptions for “threshold” and space tests. Technicians have advised that it is possible to develop improved low-yield weapons through underground tests and that it may be possible to conduct tests beyond the earth's atmosphere. The argument for cessation of these types of tests is essentially an argument for disarmament and can be considered as a part of the whole involved problem of disarmament.

The course of action herein recommended has the possibility of bringing three important advantages to the United States: (1) an improvement of the moral and political position of the U.S. in the world; (2) the drawing of a clear distinction between the anti-social contamination of the atmosphere for which the United States is being sorely blamed, on the one hand, and other types of nuclear weapons tests, on the other; (3) possibly laying the groundwork for a successful conference at Geneva, or, at least, mitigating or saving the United States from blame for its failure.

Since the conference evolved from the President's pronouncement of August 22, there is no way that the U.S. can be disassociated from either the success or the failure of the conference. Our prestige and responsibility are involved.

Moreover, one important forward step toward peace and international cooperation might lead to others in our time.

402. Memorandum From Herter to Gray¹

Washington, December 17, 1958

SUBJECT

Evaluation of Test Suspension Proposal by Senator Gore

In response to your memorandum of November 26 to the Secretary of State, the Secretary of Defense, the Chairman of the Atomic Energy Commission, the Director of Central Intelligence and Dr. Killian, there has been prepared by the Interdepartmental Working Group on Disarmament the enclosed "Evaluation of Test Suspension Proposal by Senator Gore". This report has the concurrence of this Department, the Department of Defense, the Central Intelligence Agency and Dr. Killian's office. Chairman McCone has indicated he will transmit the comments of his agency in a separate memorandum.

C.A.H.
Acting Secretary

Enclosure**Report by Interdepartmental Working Group on Disarmament**

December 15, 1958

*EVALUATION OF TEST SUSPENSION PROPOSAL
BY SENATOR GORE*

Report by Interdepartmental Working Group on Disarmament

On November 19, following a call on the President on November 17, Senator Gore submitted a memorandum to the President outlining a proposal for U.S. action on suspension of nuclear weapons tests. This proposal calls for a new U.S. position at the Geneva Conference on the Suspension of Nuclear Weapons Tests consisting of a Presidential announcement of "unconditional and unilateral cessation of all nuclear tests in the earth's atmosphere" for perhaps three years, a call for similar action by other nuclear powers, and a call for the Geneva Conference to proceed immediately with negotiation of a treaty for a permanent stoppage of atmospheric tests.

¹ Source: Transmits an interagency evaluation of a test suspension proposal by Sen. Gore. Confidential. 3 pp. Eisenhower Library, White House Office Files, Project Clean Up, Disarmament.

Senator Gore's proposal is based on the stated assumptions that:

1. Present U.S. goals at the Conference are unattainable.
2. Nuclear testing to date has caused an "antisocial contamination of the atmosphere" which has led to world-wide fear of fall-out which is Russia's most powerful propaganda weapon against the United States.
3. Present detection systems are technically efficient in the detection of atmospheric detonations.

The Working Group considers that the Gore proposal would not be a sound position for the United States to take at this time. Although the assumptions listed above are inaccurate, the proposal has some elements which may be useful in developing a fall-back position in the event that the current negotiations fail.

Comment on Assumptions. There is no reason to believe at this time that U.S. objectives in the Conference are unattainable. The basic U.S. objective is a two-fold one: to obtain an agreement for suspension of nuclear tests under effective international control, or to expose the unwillingness of the Soviet Union to accept international control as the basis for failure to reach agreement if this is the result of the Conference. It is not possible at present to say that an agreement will not be reached despite current unacceptable Soviet positions, since serious negotiation has just commenced and the Soviet Union professes to accept the report of the Geneva Experts on a control system. We remain confident on the basis of discussion so far that, if the Conference breaks down, the blame will clearly rest on the Soviet Union.

While the Soviet Union has used fear of radioactive fallout as a propaganda weapon, world-wide concern with nuclear testing is not confined to this one aspect. The discontinuance of nuclear testing is seen more and more as an important first step toward disarmament. A proposal for anything less than stopping all nuclear weapons tests would evoke an immediate Soviet charge that we were motivated primarily by a desire to evade a suspension, and would not serve as a basis for negotiation with the Soviet Union.

The present nuclear test detection system is not adequate for monitoring atmospheric tests. The Geneva technical conference clearly established the requirement for stations within the Soviet Union if atmospheric bursts down to 1 kiloton are to be detected.

The Gore Proposal as a U.S. Position Now. In view of these considerations it would be undesirable for the United States to advance the Gore proposals at this time. We would give the Soviet Union an excuse to escape from showing its true position on acceptance of international controls and it would be unlikely to have major propaganda value. It would almost certainly lead to a break in negotiations advantageous to the Soviet Union and would thus remove such chance as there is of obtaining international inspection within the Soviet Union. The USSR would accuse the U.S. of walking away from the stated positions in mid-negotiation.

The Gore Proposal as a Fall-Back Position. If the present negotiations do break down, the United States may well wish to announce a policy of moderation in future testing. Such self-imposed moderation may be prudent since, even if the blame for the break lies with the Soviet Union, increased pressure for a cessation of tests can be expected to be directed against the U.S. and the Soviet Union alike and unilateral U.S. action would cut the ground under proposals to this effect.

Further study must be given to the proper course of action. It is not clear at present that underground testing will permit satisfactory diagnostic measurement, including yields, to meet all important future test requirements. Testing in outer space will present even greater and more complex diagnostic problems.

403. Letter From McCone to Gray¹

Washington, December 19, 1958

Dear Mr. Gray:

Attached is a copy of a classified memorandum from the General Manager to me which summarizes the Atomic Energy Commission's views on a number of issues which have arisen at Geneva. This includes item 5, page 2, which reflects the Commission's views on the Gore Proposal.

Also, I am attaching a copy of a TELEX sent to me from Livermore by Commissioner Libby and Dr. Teller on July 25, 1958.

You will note that the TELEX sets forth two alternate plans for reducing weapons test programs by agreement with other nuclear powers. The second of the two plans parallels the Gore proposal. When these two plans were put forth by me it was concluded that since the Geneva Technical Conference was exploring complete suspension, the introduction of the ideas set forth in the TELEX would not be timely.

The Atomic Energy Commission adheres to the validity of either proposal contained in the Libby TELEX, but questions any arrangement of a "unilateral nature". We suggest that a suspension be put into effect only by bilateral or multilateral treaty which provides, among

other things, positive assurances gained through agreed inspection procedures that the agreement will be maintained by all parties.

Sincerely yours,

John A. McCone
Chairman

Memorandum From AEC General Manager to McCone

Washington, December 5, 1958

SUBJECT

Instructions of the Commission Relative to Test Cessation Issues

1. The following paragraphs summarize my understanding of the Commission conclusions reached after a series of Commission and staff deliberations. The information within parentheses is to be used only in discussions among the principals.

2. *Link to Disarmament.* The Commission believes that a decision as to whether or not the linkage with disarmament progress should be dropped is *not* a matter of Commission responsibility. Rather, this is a matter lying within the purview of the State Department. The Commission would point out, however, that cessation without a link to disarmament would mean the continuation of the armament race with an attendant evolutionary development of weapons which could not be fully effective without nuclear testing. It would hope that, if the link were not expressed in an action article of the treaty, the President's objective in this regard as contained in his announcement of August 22 would be incorporated in the treaty preamble. The answer to be made to the British in regard to this issue is a matter also for State to decide. Again, however, the Commission would hope that a way could be found to secure support for incorporation in the preamble.

3. *The Period of Suspension.* An indefinite period of suspension in place of the year-to-year provision would be satisfactory provided:

- (a) Suspension is definitely linked to the detection system, and
- (b) Any party to the Treaty can withdraw if the detection system is not properly installed and satisfactorily operating in the opinion of the complaining party.

Note: The Commission is concerned about engaging in a Treaty in a new area of this type without adequate privileges for reconsideration should basic conditions change. However, this is in the province of the Department of State.

4. *Tie between the Control System and Cessation.* The Commission believes that the Treaty documentation should establish the link between control system and cessation and that link should be definitive, unmistakable, and irrevocable. The Commission would like to see the specific provisions for the control system and the agreement for cessation in a single document. Whether it is necessary that it be in one document or in two lies within the province of the State Department. The Commission would repeat that, even if in two documents, the link must be "definitive, unmistakable, and irrevocable."

5. *The Gore Proposal.* The Commission is in agreement that an immediate unilateral proposal as set forth by Senator Gore would not be desirable. They are in agreement also that, if an announcement along this line is to be made later, it should not be a unilateral declaration but a proposed international agreement, and that the time of making should be at the time of deadlock or breakdown of the current Geneva discussions. (The Commission believes that we should seek a multilateral controlled ban on atmospheric tests as an immediate and practical and enforceable objective. This, as we understand it, is very similar to Senator Gore's proposal.)

6. *Limitation of Test Cessation to Controllable Tests.* The Commission believes that whatever happens at Geneva we must not agree to a ban on tests which cannot be controlled. We must recognize the threshold problem for underground tests and also the outer space detection problem as both involving thresholds of detectability.

Analysis of the underground shots in the HARDTACK II series indicates that the questions of both detectability and identification of subterranean nuclear explosions are substantially more difficult than previously assumed on the basis of the RAINIER shot, the only information available to the Geneva Technical meeting. The increase in difficulty is of a magnitude such as to raise additional substantial questions of the practicality of an inspection system which includes underground shots; the problems of difficulty of staffing; quality of staffing, cooperation by all nations, expense, etc., are compounded by the recent data. It may well be, therefore, that the only practical detection system at this time is one that is restricted to the detection and control of atmospheric nuclear explosions only.

7. The Commission is concerned by the fact that prolonged negotiations during which we continue to suspend all U.S. tests might have the practical effect of making the test ban permanent with no opportunity of establishing controls or other necessary conditions.

On November 7, the President said in part, "If there is not shortly a corresponding renunciation by the Soviet Union, the United States will be obliged to reconsider its position." The Soviet Union has not in the intervening time declared its intention of refraining from further nuclear tests during the discussions at Geneva. A clear statement of our

intentions during the reminder of the negotiation period and during the installation of the control system should be made in the near future. Alternatively, a terminal date for the negotiation should be established.

8. The following two earlier points should be raised by the Chairman at the meeting with the principals:

(a) The advisability of taking this matter out of the staff level and settling between the principals to prevent leakage.

(b) To alleviate the growing concern that U.K. policies in several areas differ from those of the U.S., take positive action with the British to secure an agreed position on the following:

(1) Link to the control system.

(2) Duration (or right to withdraw).

(3) Link (if any) to disarmament.

(4) Geographic areas outside of the boundaries of those countries currently discussing test cessation, such as Red China and North Africa.

Mr. Herter referred to the first item on the agenda for the meeting (Tab A), noting that the U.K. has again pressed the State Department for a decision on the issue of abandoning a link to disarmament in the Geneva nuclear test negotiations. He recalled that this matter had previously been discussed in an Interdepartmental Working Group after receipt of the U.S. Delegation's recommendation that we revise our position as the U.K. suggested, and that all interested agencies but the Department of Defense had agreed with the Delegation's recommendation. He noted that the U.K. had wished to make a major public announcement of the proposed change in position. He inquired whether the Department of Defense had considered this question further and whether a unanimous recommendation might be made to the President on the matter. *Mr. Irwin* said that Secretary McElroy was out of town and he had not been able to discuss the matter with him. However, the joint Chiefs of Staff are strongly opposed to the proposed policy shift. *General Loper* said that he had discussed the question with *Mr. Quarles* who maintained his previous position that the link should not be dropped. *Mr. Herter* said that if this position were confirmed, we should arrange for a meeting with the President to present the varying views as soon as possible.

In response to *Mr. Irwin's* inquiry regarding the pros and cons of the issue, *Ambassador Wadsworth* said that our present position left us very vulnerable to Soviet propaganda and provided a screen behind which the Soviets could always retreat when they wished to evade coming to grips with the issue of control. On the one hand we are seeking to write precise control provisions into the treaty and on the other insisting on the vaguest sort of expression of relationship with disarmament, where it was impossible for us to be specific in response to Soviet probing as to just what we mean. The Delegation felt that there was no real way to fit generalized provisions about disarmament progress into a treaty dealing with another specific issue, test cessation, which we claim is not a disarmament measure. Also our best chance of keeping the British firm on controls is to meet them on the disarmament link point, which they consider academic in nature, and untenable before public opinion.

Mr. McCone said that the Atomic Energy Commission viewed this question as one lying within the responsibility of the Departments of State and Defense. His personal view was that we should not attempt to write the criteria of disarmament progress into an article of the treaty, in view of our inability to be specific, but that some mention should be made of disarmament, as an objective rather than as a condition, in a preamble to the treaty. Lack of disarmament progress should not constitute a reason for dissolving the treaty. He felt that the preamble in the Soviet draft, which dealt only with nuclear disarmament, provided a good entry for similar preamble extended to cover other disarmament aspects in our own draft. *Dr. Killian* said that he agreed with the

position taken by Mr. McCone. *Mr. Irwin* said that he would discuss this matter with the Secretary of Defense and let Mr. Herter know as soon as possible whether Defense was prepared to change its position.

Mr. Herter raised the question whether, if the proposed change in position is made, it should be made with great public fanfare as the British seemed to prefer. *Ambassador Wadsworth*, *Mr. Allen*, and *Mr. Irwin* agreed that the concession should be made as routinely as possible in the course of negotiations and with a minimum of hue and cry which could be taken to imply that the President's August 22 position was wrong. *Mr. Farley* noted that one of our major objectives in the current negotiations was to gain Soviet agreement to an effective control system. Our change in position could be justified on the grounds that Soviet acceptance of the controls sought constitutes a most important step forward which in itself makes future progress in disarmament more possible. Thus it is not a case of our previous position being wrong but simply a recognition that the objective of disarmament progress could in reality best be served by conclusion of an agreement on nuclear tests with firm control provisions. There will be adequate protection for U.S. interest, since it would be possible to withdraw from the treaty if the Soviets obstruct operation of the control system.

General Loper asked whether it would not be possible to postpone a decision on the link until a later stage, since it would not be necessary to discuss the duration article until near the end of the negotiations. *Ambassador Wadsworth* said that he had been giving the question of general tactics in the negotiations further thought over the holidays and felt that our best procedure now would be to move ahead and table all of the remaining articles of our draft treaty, seeking agreement on as many of these as possible, and by-passing for the time-being some of the more difficult issues such as the question of unanimity. We are presently vulnerable to Soviet charges that we have not given a clear idea of the total scope of the treaty we propose. Furthermore, it would be to our advantage to be free to come back at will to some of these difficult issues, such as that of the "veto", at a later stage since these were the issues on which any breakoff would be favorable to the U.S. *Mr. Herter* agreed that the U.S. would be in a far better public relations position if a breakoff in the negotiations occurred on the question of controls than it would if the break were to be on the matter of relationship to disarmament. *Mr. Irwin* said that if the decision were made to break the link, the Department of Defense would prefer to see this policy change played in a low key and with a view to making the most of it as a bargaining counter in the negotiations.

Passing to the second item of the agenda, *Mr. Herter* asked Dr. Kilian to explain the nature and implications of the new data relating to detection and identification of underground tests obtained in the

HARDTACK II test series of October 1958. *Dr. Killian* presented the preliminary report attached as Tab B.

Dr. Fisk, in response to a question from *Mr. Irwin* explained that the new data were considerably more reliable than the Rainier data on which the Experts' Report had been based and which involved only one underground test. However, there is still a large element of uncertainty, and further testing might produce data which could change present calculations either upward or downward. The Rainier data was not presented last summer in a way which would preclude us from reopening the question of underground detection on the basis of the new data. It was agreed that the new data was such that it required the U.S. to reopen the question.

Mr. McCone referred to the letter of December 23 transmitting AEC views on the new data (Tab C) and asked whether the new data indicated that a larger number of smaller underground shots would not be detected than previously thought. *Dr. Fisk* replied that the number would be somewhat larger than before, but noted that the HARDTACK II data does not indicate much change in detectability of underground nuclear explosions. The significant change in capability relates to identification.

Mr. Herter said that from present accounts the Soviet Delegation seems to consider the Geneva Report as definitive and asked Ambassador Wadsworth how he would expect them to react to a reopening of the underground question. *Ambassador Wadsworth* said he thought that they would initially be suspicious of our motives, but that if approached in the proper manner probably accept our data as accurate. An appropriate approach might be to request an informal meeting on Monday, January 5, at which a U.S. scientist could explain the new data and provide the Soviet Delegation with a summary of our findings. He could then propose that the Conference set up a group of experts to deal with this new information, concurrently with the political negotiations.

Mr. McCone expressed concern that this information, which is already known to some newspaper people, might appear publicly prior to its presentation to the Soviet Delegation. *Mr. Gray* added that not only do we have to worry about the newsmen who are aware of the HARDTACK II data but also we must consider our obligation to the U.S. public who consider the Geneva Report as an authoritative treatment of the question of detecting nuclear tests. *Dr. Killian* said he felt an announcement should be made very soon, that any statement should be drafted with great care, should be concurred in by the agencies concerned, and should be drawn so as not to damage our negotiating position. *Mr. Herter* said he felt that the information should not be released publicly prior to its presentation to the Soviet Delegation and that to do so would cast doubt upon our motivations.

Mr. McCone said he felt we should be guided by the advice of the negotiators and take the calculated risk that an approach to the Soviet Delegation on Monday would be possible before the story appears in the American press. He stated that even though there would be considerable concern in several quarters, including the Joint Committee on Atomic Energy, if this information had leaked to the press before it had been made available officially, for the sake of good faith with the Soviets it would be well to take this calculated risk of delaying an announcement of the HARDTACK II data until after an approach to the Soviets on Monday.

It was agreed that (1) Ambassador Wadsworth would seek an informal meeting with the Soviet Delegation on Monday at which Dr. Romney of AFOAT-1 would present the HARDTACK II data. Ambassador Wadsworth would then suggest that the Conference establish a working group of experts in this field to consider the implications of the new data; (2) on Tuesday an announcement would be made in this country setting forth the results of the observations of the HARDTACK II explosions as facts without setting forth any particular conclusions, pointing out that the U.S. Delegation is prepared to discuss the data which supplements the limited data available to the Conference of Experts last summer and also indicating that this data may make it possible to improve upon the capability of the system designed this past summer.

Dr. Killian indicated that he will establish a technical committee here in Washington to study the implications of the HARDTACK II data more carefully. This committee would consist of several senior seismologists, geophysicists and others familiar with the phenomena associated with underground explosions and would also consider alternate seismic techniques for discriminating between earthquakes and nuclear explosions and possibilities for improving the instrumentation of such installations. The Group approved the following terms of reference proposed by Dr. Killian:

“The Panel should determine whether it would be possible within the present state of seismic technology to improve the capabilities of the system recommended by the Geneva Conference of Experts to detect and identify seismic events as either earthquakes or explosions without increasing the number of manned control posts in the system. The Panel’s investigation should include, but need not be limited to, the following:

(a) improvement or augmentation of equipment at control posts in the agreed Geneva system; (b) augmentation of the system with a more closely spaced grid of small, completely automatic seismic detectors; and (c) utilization of criteria other than the first motion of the P wave to identify events as earthquakes (or as explosions).

“The Panel should also recommend a research and test program to evaluate any specific proposals advanced to improve the system as

well as to advance the state of the art in this field. The Panel should indicate the extent to which nuclear tests would be required in this test program."

Mr. Herter asked how airtight a control system was necessary. *Mr. Irwin* replied that we would be fairly well protected by a method of random inspection under which the Soviets would not know when a particular event would be inspected. *Mr. McCone* asked whether the new data would cause any difficulties with Annex 1 which is based on the Report of the Conference of Experts. *Mr. Keeny* replied that Annex 1 on the control system as drafted should cause no difficulties, since there is provision for inspection of all unidentified events above 5 KT regardless of number and 20% of those below this figure. In fact, he thought that when it became apparent to the Soviet Delegation that the number of unidentified events would rise considerably from the figure anticipated in the Geneva Report, they would probably be quite willing to carefully examine possibilities of reducing this number of potential inspections by various techniques including perhaps establishment of a threshold.

In response to a question by *Mr. Herter* as to our tactics should the Soviets reject the new data and maintain the continuing validity of the Experts' Report, *Mr. Farley* said we could then stand fast on the requirements of inspection. He felt, however, that the Soviet politicians would be quick to realize that the implications of the new data would have to be considered now, rather than after they had signed a treaty committing themselves to a large number of inspections.

Mr. Herter noted that since we are committed to monitoring underground tests, we seem to be faced with the necessity of either an increased number of inspections of unidentified events, establishment of a threshold or improvements in instrument techniques or number of control posts. *Ambassador Wadsworth* said the Soviets would surely answer any suggestion for a threshold with heavy propaganda that this showed the U.S. had never been sincere about wanting to stop nuclear tests. *Dr. Killian*, however, suggested that the Soviets themselves might find a higher threshold advantageous. *General Loper* said that Secretary Quarles felt a threshold might be the best solution to the problem.

Mr. McCone said he wished to express the concern of the AEC about the effect on our testing program of overly prolonged negotiations which involve de facto suspension without an agreement. He urged that thought be given to alternatives and to what action we might take should the Soviets resume testing.

Tab A**Agenda**

It is suggested that the meeting scheduled for December 30 consider three items in connection with the Geneva nuclear test negotiations:

1. *The link with disarmament.*

The U.S. Delegation and the U.K. have both strongly urged that the element of the President's August 22 statement tying continuation of test suspension to disarmament progress be abandoned. This question has been considered in the Interdepartmental Working Group on Disarmament, and representatives of all interested agencies other than the Department of Defense have indicated no objection to the recommendations of the U.S. Delegation.

Suggested action: that the Department of State prepare a memorandum to the President seeking his approval of the abandonment of the disarmament link.

2. *Implications of new data on detection and identification of underground tests.*

A working group of seismologists convened by AFOAT-1 has reviewed the seismic data obtained during HARDTACK II and has concluded that the problem of detecting and identifying underground explosions is more difficult than is indicated in the Geneva Conference of Experts Report. Although based on admittedly inadequate data, the Working Group concludes that "statements by the Geneva Conference of Experts concerning the detection and identification of earthquakes equivalent to 5 KT apply more nearly to about 20 KT."

Suggested action: that Dr. Killian undertake to review the Geneva system to study possible modifications to improve system capability, and the Department of State, coordinating with other agencies, prepare instructions to the Delegation to propose a technical working group of the USSR, U.S. and U.K. to review this data with a view to recommending modifications on the system and a program of joint U.S.–U.K.–USSR underground tests to provide further data under varying conditions on this problem.

3. *Fallback Positions.*

The U.S. should develop a plan which could serve as an alternative proposal to a complete breakdown in the Geneva talks. We should consider proposing in this event an immediate end to atmospheric tests with the simple inspection system this would require, and charging the control organ created by such agreement to undertake research and

study with a view to developing a system which would allow the end of high altitude and underground tests as well. Whereas this would not be a negotiable proposition at this time, a proposal cast in these terms might be accepted by the USSR if the only clear alternative is complete breakdown.

Suggested action: as a basis for further consideration of this problem, the Department of Defense's AFOAT-1 should be asked to design a minimum inspection system to monitor an agreement to end all atmospheric tests.

Tab B

Report Prepared by the President's Science Advisory Committee

Washington, undated

POSSIBLE MODIFICATIONS IN THE PRESENT U.S. POSITION AT THE GENEVA CONFERENCE ON THE DISCONTINUANCE OF NUCLEAR TESTS

Alternatives Which Need to be Considered as a Result of Test Results Obtained in October on Underground Nuclear Tests

New Data and Implications

The new seismic data resulting from the Hardtack II series of tests (October 1958) alter the quantitative conclusions relating to underground tests reached by the "Geneva Conference of Experts." While the qualitative basis for seeking the initial technical agreements and for continuing in the present Geneva negotiations appear to be unchanged, detection and identification will be more difficult than had been expected.

The new observations are the following:

1. The maximum amplitude of the seismic signal is approximately 60% of that expected, based on the Rainier data.
2. The "First Motion" of the seismic signal, relative to the seismic signal, is smaller than anticipated (at distances greater than 2,000 KM).
3. The new data are more reliable, being based on observation at more stations and greater distances.

As a result of the new data:

1. The range of detection is decreased for explosions of a given yield.

2. Identification of earthquakes by the method of "First Motion" is less reliable than previously estimated. This result implies a requirement for a considerably larger number of inspections.

Alternatives to be Considered

Since there is clear agreement among informed scientists that significant modifications are necessary in that section of the report of the Geneva Conference of Experts which deals with underground tests, it is important to examine the possible modifications in U.S. policy which these changes in the estimated capabilities of the system will necessitate. The alternatives presented below are all based on the premises that the United States will continue to be firm in insisting on the necessity of proper controls of any test agreement and that we will continue to seek agreement with the Soviets on some form of test discontinuance or limitation.

Alternative No. 1—Discontinue all tests in the atmosphere. The AEC has stated this position in the following way:

"(1) to adhere rigidly to the principle that control of any test cessation agreement is essential and that only those tests which are detectable and identifiable are to be prohibited by treaty. Under no conditions shall the relaxation of the requirements of the control system antecede policy changes regarding the scope of the tests being suspended.

"(2) Negotiate as a first step, beginning at the appropriate time after the resumption of negotiations, a treaty for the cessation of atmospheric tests.

"(3) To postpone for later negotiation a treaty applying to underground and outer space tests after further investigation of the technical problems involved in their detection. The U.S. should be willing to discuss these problems to the extent desired by Russia during current negotiations.

"(4) To propose meanwhile international cooperation (with the Control Commission if established) in this investigation to the extent of conducting for the Commission necessary experiments and in making available to the Commission or other appropriate authority the results of national nuclear experiments whose results bear upon the detection and identification problems at issue.

"(5) To preserve the right to develop non-military applications of nuclear explosives."

This position would initially eliminate the problem of detecting underground tests (as well as tests at great distances from the earth) by permitting such tests. This would answer the worldwide concern about fallout hazard. However, unless subsequent phases were carried out, it would fail to accomplish the other objectives of a test suspension since

by itself it would probably, in the long run, have little effect on weapon development and would not require a control system that would have any significant impact on the Soviet Bloc.

Alternative No. 2—Modify “Geneva” System to Improve Capabilities.

It would be possible to modify the “Geneva” System in a manner which would substantially improve the capabilities of the system. This might be accomplished if one of more of the following steps were adopted:

1. Increase the number of seismographs at each control post in the Geneva System (e.g. An increase in seismographs from 10 to 100 might improve the signal to noise ratio for detection by a factor of 3).
2. Halve the seismic grid spacing by adding unmanned, seismic-only stations using the same number of seismographs as in the main control posts.
3. Augment the agreed-upon grid of manned control posts with a much closer spaced grid (e.g., 100–150 KM) of small, unmanned seismographs which would telemeter information.
4. Increase the number of inspections.
5. Develop other presently promising techniques to identify earthquakes and to discriminate between explosions and earthquakes.

A carefully-engineered modification of the present system, including some combination of the above concepts, could restore or even better the effectiveness of the system proposed at Geneva.

Alternative No. 3—More Effective Use of Inspection in “Geneva” System.

It would be possible to provide at least some level of deterrence down to 1 KT or below with the present “Geneva” system by a more effective use of onsite inspections. This might be accomplished by employing some variation of one or more of the following procedures:

- a) Establish a graduated, decreasing scale for the percentage of unidentified events which would be inspected on a random basis in different yield ranges (e.g., 100% over 20 KT; 25% 20–10 KT; 10% 10–5 KT; 2% 5–1 KT; 1/2% less than 1 KT.)
- b) Establish weighted inspection procedure focused on the nuclear powers and possibly their principal allies (e.g., in areas outside the nuclear powers and possibly their principal allies reduce the percentage of events inspected by a factor of 4 and undertake no inspections on a routine basis below 5 KT).
- c) Increase the number of inspections substantially over the number previously contemplated by simplifying the inspection procedure and only undertaking exhaustive examinations when an initial survey indicated the possibility of suspicious activity.

This position has the advantage of not requiring the reopening of any of the conclusions of the Geneva Conference of Experts; however,

it clearly involves a greater risk that the Soviet Union might attempt clandestine tests than either Alternative No. 1 or No. 2. The extent to which such a system would in fact deter tests is a complex judgment which cannot be made on technical grounds alone.

Alternative No. 4—Permit Underground Testing Below a “Threshold”.

The present “Geneva” system as well as the modification of it suggested in Alternative No. 2 and No. 3 can clearly provide much more secure control of nuclear testing if underground tests are permitted below a “threshold” yield. This procedure would minimize the intangible factor of deterrence upon which a complete prohibition must ultimately rest. There is no unique “threshold” yield to associate with any of these systems. The level of the threshold might vary between 1 and 20 KT and would be set by the objects sought in negotiating an agreement and the amount of risk deemed “acceptable”. A 20 KT threshold would involve relatively little risk of violation but also would permit substantial weapon development and would provide little basis for inspection. A 5 KT threshold would involve greater risk of violation, assuming it was not subject to 100 percent inspection; however, it would permit less weapon development, probably would exclude “n”th power tests, and would provide the basis for extensive inspection. A 1 KT threshold would involve substantially greater risk since clearly only a small fraction of events in 1 to 5 KT range could be inspected; however, such a threshold would permit only limited weapon development in areas probably primarily of interest to U.S., would almost certainly exclude “n”th power tests, and would provide the basis for very extensive inspection.

Alternative No. 5—No Restrictions on Nuclear Tests.

A policy decision to avoid any agreement which would prohibit nuclear testing in any form would permit unrestricted weapon development and would accomplish none of the objectives of a test suspension. It would avoid the risk, considered substantial by some, that underground testing will in fact prove inadequate both for large yields and for diagnostic measurements at all yields.

Tab C

Letter From Vance to Herter

Washington, December 23, 1958

My dear Mr. Under Secretary:

The seismological results from the underground nuclear weapons tests conducted in Nevada during October show that the conclusions of

the Conference of Experts on the possibility of detecting and identifying underground nuclear explosions require re-examination.

In fact, early analysis of these data show that the detection capability of the system for underground explosions probably is much less than was thought to be the case last summer. Therefore, the United States position on controlled test cessation may require reshaping to fit the new facts and the consideration of this possibility is urgent since the treaty Articles and Annex I already tabled by the Western delegations may need serious revision.

Therefore, the Atomic Energy Commission concludes that in the light of:

(1) the seriously limited capability of the control system proposed by the Conference of Experts based on present knowledge as applied to underground and very high altitude nuclear explosions;

(2) the adequacy of the Conference of Experts' proposals for control of atmospheric testing;

(3) the fact that radioactive fallout is caused principally by atmospheric tests—the only type readily controllable at this time;

it should propose to you that the revised U.S. position should be:

(1) to adhere rigidly to the principle that control of any test cessation agreement is essential and that only those tests which are detectable and identifiable are to be prohibited by treaty. Under no conditions shall the relaxation of the requirements of the control system antecede policy changes regarding the scope of the tests being suspended.

(2) Negotiate as a first step, beginning at the appropriate time after the resumption of negotiations, a treaty for the cessation of atmospheric tests.

(3) To postpone for later negotiation a treaty applying to underground and outer space tests after further investigation of the technical problems involved in their detection. The U.S. should be willing to discuss these problems to the extent desired by Russia during current negotiations.

(4) To propose meanwhile international cooperation (with the Control Commission if established) in this investigation to the extent of conducting for the Commission necessary experiments and in making available to the Commission or other appropriate authority the results of national nuclear experiments whose results bear upon the detection and identification problems at issue.

(5) To preserve the right to develop non-military applications of nuclear explosives.

Sincerely yours,

*/s/ H.S. Vance
Acting Chairman*

405. Report of the Panel on Seismic Improvement¹

Washington, January 7, 1959

1. The Panel on Seismic Improvement (PSI), appointed by the Chairman of the President's Science Advisory Committee, met in Washington on January 6 and 7, 1959, to review measures whereby it "would be reasonably feasible within the present state of seismic technology to improve the capabilities of the system recommended by the Geneva Conference of Experts to detect and to identify seismic events as either earthquakes or explosions without increasing the number of manned control posts in the system."

2. The capabilities of the Geneva system with regard to underground tests have recently been reevaluated by another Panel on the basis of new data from the underground tests at HARDTACK II. The PSI did not attempt to evaluate further the specific capability of the Geneva System. The proposals recommended herein would increase the estimated capabilities of the Geneva System. It is noted that the data on nuclear shots used in these estimates was from Rainier and HARDTACK II and thus has all the limitations of that small sample of nuclear test conditions. The PSI has not concerned itself with the possible seismic effects of nuclear tests under different conditions or the possibilities of concealment by decoupling or other techniques.

3. The Geneva System of seismic identification places principal reliance on the assessment of a single phenomenon, i.e. the direction of displacement of the first arrival of the P-wave in a specified network of seismic instruments. The PSI considered a variety of seismic phenomena and techniques which have been suggested to increase the capability of the Geneva System without adding manned control posts, including:

- (a) Evaluation of the first motion of the P-wave with aid of approximate inverse transfer functions.
- (b) Surface wave phenomena using long-period instruments.
- (c) Unmanned, auxiliary seismic stations.
- (d) Larger arrays of seismometers at manned control posts.
- (e) Improvements from increased knowledge of the transmission properties of the earth by experience in operation of the system.
- (f) After shocks as a diagnostic feature.
- (g) Radiation asymmetry at the source.
- (h) Use of computers in data analysis.
- (i) Use of higher frequency seismic signals.

¹ Source: Suggests improvements to detection systems. Confidential. 6 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament.

- (j) Detectors on ocean bottom.
- (k) Detectors in deep hole.
- (l) Diagnostic possibilities of microseisms.
- (m) Focal depth of disturbances.

5. [4.] On the basis of its review of the above techniques, the PSI believes that the following four promising approaches are within the present limits of technology and should be considered:

(a) *Analysis of long-period surface waves.* The capability of the Geneva System for the identification as earthquakes of seismic events equivalent to 5 kilotons or larger by the analysis of long-period surface waves is conservatively estimated at 25% and may be much larger.

(b) *Network of unmanned auxiliary seismic stations.* A triangular network of such unmanned stations is suggested, spaced 170 km apart between the stations of the 1000 km grid proposed in Geneva for the seismic regions of the world. If this network were installed and effectively operated, it would very greatly increase the capability of the Geneva system for identifying as earthquakes those seismic events occurring in interior areas and corresponding in energy to underground tests equivalent to one kiloton or larger.

(c) *Larger arrays of seismometers at manned control posts.* It is reasonably certain that the replacement of 10 distributed seismometers per control post as recommended by the Geneva Conference of Experts with arrays of approximately 100 distributed seismometers would increase the signal to noise ratio by a factor of from 1.5 to 2.5. This would substantially increase the capability of the system to identify small seismic events as natural earthquakes.

(d) *Detectors in deep holes.* A detection method which employs a seismometer in a hole at a depth of several thousand feet is being investigated at the present time. The method offers possibilities for improving the detectability of small signals by a factor of the order of ten, provided that the technological problems of operating instruments at the required depths can be solved. The results to date are incomplete but encouraging. If the factor of ten can in fact be achieved, it would drastically increase the capability of the system to identify small seismic events as natural earthquakes. More definitive results are expected by mid 1959.

The proposals (a), (b), and (c), above, are discussed more fully in the appendix attached.

6. The PSI invites attention to the fact that detection of aftershocks by specially and immediately implaced seismometers can be used by an inspection party as an aid in establishing that an unidentified seismic event was in fact a natural earthquake.

7. The PSI believes that seismic research has not in the past been supported as strongly as many other areas of science. Vigorous research

in seismology is certain to produce many improvements that cannot now be predicted. It is certain that this would lead to an improvement in detection capabilities. The PSI will shortly report its detailed recommendations concerning research in seismology.

8. The PSI urges that sample detection networks be established without delay as representative systems to disclose operational and design problems and provide a firmer basis for the assessment of detection capabilities.

9. The Geneva Conference of Experts recommended supplying new instruments to the existing world network of seismic stations. The PSI believes that this recommendation should be implemented within the next year even if it must be done unilaterally by the U.S.

I. Analysis of Long-Period Surface Waves

Long-period seismograph data (periods greater than 5 seconds) available from HARDTACK II and natural earthquakes suggest additional criteria for the identification of seismic events as natural earthquakes. In the yield range 5KT–23 KT, stations at distances up to at least 3500 km can provide the necessary data, in the absence of microseismic storms. The capability of the Geneva System for the identification as earthquakes of seismic events equivalent to 5 kilotons or larger by the analysis of long period surface waves is conservatively estimated at 25% and may be much larger. Estimates of capabilities are based on observations with instruments not designed for this purpose. The use of specifically designed equipment should further improve the estimates of capabilities.

On the basis of present technology, it is concluded that the following techniques are available:

a) *Love-Rayleigh wave amplitude ratio.* A preliminary study of amplitude ratio of Love waves to Rayleigh waves for periods greater than about 10 sec. from earthquakes and underground explosions has been conducted at the Lamont Geological Observatory at Palisades, New York. The results indicate that in the equivalent magnitude range 5 KT–23 KT a single station at a distance of 3500 km or less can identify about 10% of seismic events as natural earthquakes. Data from stations in appreciable different azimuths are relatively independent and so increase the probability of identification significantly but not above some as yet undetermined limit.

b) *Spectra of surface waves recorded on long period, horizontal component seismographs.* Data from Palisades, Pasadena, and Berkley indicate a systematic difference in the long period spectra of earthquakes and underground nuclear explosions. Although the effect is striking, it is not possible to quote the capability of this method at this time except to estimate that identification of earthquakes from a network of stations is no worse than 10% and the upper limit is open.

The possibility exists that further results can be obtained in the immediate future by additional studies of the amplitude ratio for Love-Rayleigh waves and its aximuthal dependence for earthquakes. This will provide additional data to verify the estimate of 10% identification of earthquakes and examine the possibility of increasing this figure.

II. *Network of Unmanned Auxiliary Seismic Stations*

Interpolation of unmanned automatic seismic stations into the grid of control posts of the Geneva plan gives promise of providing significantly greater information on weak seismic events, corresponding in intensity to one kiloton. A triangular network of such unmanned stations is suggested, spaced 170 km apart between the stations of the 1000 km grid proposed in Geneva for the seismic regions of the world. In such a network, a one kiloton shot coupled seismically to the same degree as Rainier, Logan, and Blanca would give 50 millimicron amplitudes or higher for first motion of P-waves at nine stations on the average. Thus data from single vertical-component seismometers disposed in such a network would suffice to detect first motion with reasonable certainty.

The practical problems of installing such a network may be estimated by noting that the spacings mentioned above imply having 35 auxiliary stations per main station and that the maximum communication distance between a main and auxiliary station is 600 km. Each auxiliary station would require a seismometer, a recording device (for providing a permanent record), a clock, a radio transmitter, a source of electric power, and probably a data storage device which will permit compressed data transmission as required. The cost of the technical

apparatus needed for a single station, when manufactured in large quantities, might be ten to thirty thousand dollars. Access roads (or helicopter pads), installation and related costs may run the total costs up considerably higher, depending on local conditions. Periodic maintenance and record retrieval would probably be required at 30 to 60 day intervals.

The need for this network of auxiliary stations is clearly greatest in the areas of the world where earthquakes occur with high frequency. It might be acceptable to limit application of the network only to these areas, possibly 20% of the land surface of the world. Also one could tailor power and communication arrangements (possibly using wire lines in some places) according to the local facilities available.

If this network could be installed and effectively operated, it would very greatly increase the capability of the Geneva System for identifying those seismic events which are earthquakes, occurring in interior areas and corresponding in intensity to underground one kiloton or larger shots. The practical difficulties of installation, maintenance, and operation of the system, especially in remote areas, should not, however, be underestimated, and the possibilities for occasional spoofing must be recognized.

III. Larger Arrays of Seismometers at Manned Control Posts.

On the basis of present knowledge, replacing 10 distributed seismometers in a 3 km \times 3 km square as recommended for each control post in the Geneva System by 100 distributed seismometers in the same square would affect the signal to noise ratio at frequencies near 1 cycle per second as follows using specifiable techniques:

(1) It is reasonably certain that an improvement at most stations by a factor of between 1.5 to 2.5 will be obtained;

(2) There is reason to hope for improvements in the range from 2.0 to 2.5;

(3) Increases from 10 to 10k stations should provide improvement by a factor from $k^{0.2}$ to $k^{0.4}$ for $k = 10$.

(4) Data which can be obtained within one month will provide a much firmer estimate of what may be expected. The data to be obtained include, most importantly, data on coherence of noise at station separations of 150 to 1500 feet, and secondarily, data on dependence of typical noise levels on wind velocity.

(5) When more is known about noise characteristics, it may well be possible to gain further improvement by applying other analytical techniques to a 100 seismometer array.

406. Record of Telephone Conversation Between Wadsworth and Herter¹

January 9, 1959, 1:55 p.m.

Ambassador Wadsworth telephoned from Geneva, saying his call was in the nature of an S.O.S.—not a panicky one but a considered one. The situation there is now one where the other people came back to focus on duration. The Ambassador has been stalling on duration and in so doing has been piling up unnecessary suspicions at a time when we should be showing movement. He emphasized the fact that they really needed help.

I said we tried to get it settled this week. The President just finished his State of the Union Message. An appointment has been set for 9:00 a.m. Monday morning and we would shoot word to him immediately after. The Ambassador did not think there was any question as to what the answer will be, and I said I didn't think so either. I said we were having a session with the Secretary and Mr. McCone this afternoon and that I thought McCone wanted to discuss the fall-back position which he felt we are likely to be coming to. Ambassador Wadsworth felt it was important to work out something on that basis for possible later use. However, he said they have to have something that will show some movement to hold them another week or so. He added that he knew how things work but that he was really yelling for help; he would appreciate it if I would pass his request on to the people who have to make the final decisions; and that the whole point is we have to strengthen our own situation. I said we could get something to him by telephone on Monday and Wadsworth thought this was a wonderful idea.

I asked how things were otherwise and Wadsworth said that today's session was mild and short. I said I understood that the Killian group had come up with 3 or 4 ways on what we want accomplished without increasing the number of posts too much. It is mostly scientific data. Wadsworth said that would re-establish us as bona fide. They have so much suspicion. I added that it follows pretty much their line that science will show the way, and Wadsworth thought there was something in that.

Wadsworth ended by saying that he just wanted to convey the sense of urgency there; that they can stall but it just does not look good on the record. I said we would do our best.

407. Letter From Eisenhower to Macmillan¹

Washington, January 12, 1959

Dear Harold:

I have now had an opportunity to think about your letter on our position in the Geneva nuclear test negotiations and to discuss it with some of my advisors.

We have considered the course of the negotiations to date as well as the points you set forth and we are prepared to drop our insistence that any agreement we may reach with the Russians have in it an explicit requirement that cessation of nuclear tests depend on disarmament progress. I agree with you that to a certain extent this link is an academic one since, as you point out, the central issue is whether we now have an opportunity to get the Russians to accept a real control system. Certainly, if the Russians were to accept the kind of controls which we both believe are necessary, this very fact would mean that one of the principal bars to future progress in disarmament would have been removed. This is a point we might well make in explaining our attitude on this question.

Although, on the basis of the progress to date, it seems to me that the prospects are not bright that the Russians will accept an effective control organization in the current negotiations, I agree that our public position would be much better if we remove as a point of contention the issue of the link to disarmament, which the Russians may use as a screen to evade accepting responsibility for failure in the negotiations or to evade facing up to the control problem.

I believe that we can propose in the negotiations that we accept as a principle that the ban on weapons tests would be indefinite in duration. The arrangement, we believe, should include schedules for the construction and operation of the control system. Withdrawal from or suspension of the treaty would be possible if on annual review it were found that the control system was not being installed on schedule or not being operated properly. If desirable, we will agree to the first annual review being held two years after the treaty enters into force; thereafter, the review automatically would be on an annual basis.

Obstruction or violation of the agreement itself would, of course, be cause for withdrawal.

¹Source: Agrees to drop linkage of cessation of nuclear testing to progress on disarmament. Secret. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Eisenhower to Macmillan.

I believe that it would be unwise to give this change in position any undue publicity by making it the subject of a public announcement at this time. However, I believe that we should in the negotiations exploit our flexibility on this question every way possible to put pressure on the other side to make concessions.

I have requested Foster to discuss with your people how best to put forward this position in the negotiations.

As ever,

/s/ Dwight D. Eisenhower

408. Memorandum From Gray to Eisenhower¹

Washington, January 13, 1959

SUBJECT

Conference on Discontinuance of Nuclear Testing

The attached memorandum summarizes the views of the Executive Departments and Agencies as to Senator Albert Gore's proposal for a position which the United States might take in the event it appeared that the negotiations were on the verge of a breakdown. However, consideration has also been given to the proposal as one of substance which might be made in the current negotiations.

In summary, Senator Gore suggested an approach to consist of a Presidential announcement of (a) "unconditional and unilateral cessation of all nuclear tests in the earth's atmosphere" for perhaps three years, (b) a call for similar action by other nuclear powers, and (c) a suggestion that the Geneva Conference concentrate on the negotiation of a limited treaty for a permanent stoppage of atmospheric tests.

You will recall that when Senator Gore made his proposal to you orally, you assured him that his suggestion would be given most careful evaluation by the appropriate Government officials. This has been done. The task, however, has been complicated by the fact that the negotiating position of the United States is being continually affected by day-to-day developments in the Russian negotiating position at the Geneva Conference. Even now, it is *not* clear, as Senator Gore believed at the time he

¹ Source: Advises against Gore proposal on nuclear testing at this time. Confidential. 4 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.

spoke with you, that the U.S. Delegation seems to be negotiating toward an unattainable goal, and that therefore the U.S. must face the prospect of failure to obtain our present objectives at the Conference. This seems to me to be especially true in the light of your decision to break the link with other disarmament measures, an action which seemed vital by our delegation to continued successful negotiation.

The officials who advise you with regard to the Geneva Conference agree that the United States should not now advance the Gore proposal. All agree, however, that the Gore suggestion should be considered as one of the alternatives if the time comes when developments in Geneva necessitate consideration of a change in the existing U.S. position summarized in your statement of August 22.

It would be my hope that if you feel it necessary to reply further to Senator Gore, the reply could be handled in such a way as to discourage discussion by public officials of alternatives to our present position at Geneva, at least until the Russian negotiators have made clearer the position which they will take on the proposals we have advanced at the Conference. Senator Gore is being kept currently informed by State Department officials of discussions within the U.S. Government with respect to our Geneva position. He could be assured by you that at such time as it appears to the responsible officials that the Russians are not prepared to agree to a treaty acceptable to us, his suggestion would be considered, along with others, in deciding future U.S. policy toward nuclear testing.

Gordon Gray

Special Assistant to the President

Attachment

EVALUATION OF TEST SUSPENSION PROPOSAL BY SENATOR GORE²

1. The Gore Proposal as a U.S. Position to Take in Geneva Now

a. The U.S. should not advance the Gore proposal at this time because:

(1) It would give the USSR an excuse to escape from revealing its true position on acceptance of international controls on testing.

² The views contained in the first two numbered paragraphs of this memorandum are those of the Departments of State and Defense, the Central Intelligence Agency and the Office of the Special Assistant to the President for Science and Technology. The views of the Chairman of the Atomic Energy Commission are summarized in the final paragraph. [Footnote is in the original.]

(2) It would almost certainly lead to a break in negotiations, thereby destroying such chance as there is of obtaining acceptable international inspection within the USSR. It would permit the USSR to charge the United States with a desire to evade a test suspension and of walking away from stated basic positions in mid-negotiations.

2. The Gore Proposal as a Fallback Position

a. If the present Geneva negotiations break down, the United States may desire to announce a policy of moderation in future testing. Such self-imposed moderation may be prudent because, even if the blame for the break in negotiation lies with the Soviet Union, increased pressure of public opinion for a cessation of tests can be expected to be directed against the U.S. and the USSR. Unilateral U.S. action *limiting* tests would cut the ground under proposals to cease *all* nuclear weapons tests.

b. Further study must be given to the proper course of action. The Gore proposal contains elements which may be useful in developing a fallback position in the event that current negotiations fail.

3. The Position of the AEC on the Gore Proposal

The Atomic Energy Commission agrees with the substance of the arguments made above. However, the Commission believes that the United States should seek as an immediate, practical and enforceable objective, a multilateral controlled ban on atmospheric tests. The Commission opposes a unilateral declaration by the United States to cease all but atmospheric tests. It prefers that a cessation of atmospheric tests come as the result of a multilateral treaty which provides for agreed inspection procedures adequate to insure that the agreement will be observed by all parties.

409. Telegram Nusup 157 to Geneva for Wadsworth¹

Washington, January 16, 1959, 7:21 p.m.

For Wadsworth. In afternoon talk with Mikoyan the Secretary raised matter Geneva talks on cessation nuclear tests. He reiterated US desire achieve agreement. He expressed understanding Mikoyan's misgiving over introduction new data on detection underground tests.

¹Source: Account of Dulles' conversation with Mikoyan on cessation of nuclear testing. Secret; Niact; Limit Distribution. 1 p. NARA, RG 59, Central Files, 700.5611/1-1659.

Secretary also said US could understand Soviet attitude on voting and thought presentation as offered by Soviet delegation of list items they believed should be subject unanimity might well assist resolution this problem but similarly hoped Soviets understood our inability accept any arrangement which would frustrate effective operation control system. He expressed hope Soviets would continue talks and in process find proof their misgivings unfounded. Mikoyan indicated entirely willing continue and commented that agreement if reached on this subject should prove stepping stone to further agreements.

Dulles

410. Memorandum of Conference with the President¹

Washington, January 16, 1959

OTHERS PRESENT

Chairman McCone
General Goodpaster

Mr. McCone said that Sir Edwin Plowden, who had been his host in the United Kingdom in November, is coming to the United States about 1 March for two or three days to visit atomic installations. He asked if the President would be agreeable to attending a luncheon or dinner for him. The President said he would prefer to have a stag luncheon, suggesting the date of March 2, with the British Ambassador also present.

Mr. McCone next reported to the President that the British wished to buy a substantial quantity of refined atomic materials. Defense, State and the Commission agree on the desirability of supplying them. The materials amount to some fourteen tons of plutonium, and in the longer range a contract for a supply of U-235 for the next 10–12 years (thus avoiding British necessity to build a gaseous diffusion plant) with initial acquisitions from us of the order of about fourteen tons. The British would like to pay for the plutonium (to be available in the near future) in cash, and to pay for the U-235 over a longer period with plutonium. The President asked what ratio would be used in

¹Source: U.S.–U.K. nuclear cooperation, Department of Defense plutonium requirements, domestic nuclear power, thermocouples to power satellites, sales of U-235 to IAEA. No classification marking. 5 pp. Eisenhower Library, Whitman File, DDE Diaries.

accepting plutonium for our U-235. Mr. McCone said we are proposing a ratio of 1 to 1, and the British are proposing a ratio of 2½ to 1; he thought we could, and should, settle out for a ratio of 2 to 1. The President asked if this appeared to be a good trade from the standpoint of availability of the two products, and Mr. McCone said it is very definitely so, inasmuch as our needs for plutonium are rising, with small weapons. He added that State and Defense agree on this. The President said the proposition looked generally satisfactory to him. Mr. McCone added that there had been some talk by the British regarding obtaining weapons; this would have involved the need to seek a change in our law, which is better avoided, since problems would then arise with the French and Italians.

Mr. McCone said that, the President having approved this action, he would take it up with the Joint Committee on Atomic Energy. The President raised the question whether the Executive Branch is becoming too subservient to that Committee. Mr. McCone said that so far the relationship is satisfactory. He assured the President that he is not going to let them invade Executive prerogatives and asked the President to have confidence in him that he will not let the Joint Committee push him around. The President indicated agreement on this basis.

Mr. McCone said he would then pursue the matter of exchange with the British. The President asked that, in writing up the agreement, Mr. McCone make sure that State, Defense, Budget and the Attorney General are in concurrence. Mr. McCone said this would be done inasmuch as a change in the bilateral agreement would be necessary.

Mr. McCone next raised the matter of the new production reactor at Hanford; since his last talk with the President Defense has submitted ten-year requirements for atomic weapons. To meet the need it first seemed there would be necessity to build two new reactors in addition to the receipts from the United Kingdom. However, by raising the power level at Hanford, the need will be reduced to one reactor. The President stated strongly that he would not accept these requirements as the basis for any actions until he had seen them. Mr. McCone said that the requirements as submitted by Secretary Quarles, on the scale of 100, corresponded to a figure of 110 recommended by General Twining and between 125 and 200 recommended by the Joint Chiefs of Staff. The President said that the requirements are not authoritative until he had approved them. He challenged the Defense thinking, saying they are trying to get themselves into an incredible position—of having enough to destroy every conceivable target all over the world, plus a three-fold reserve. The patterns of target destruction are fantastic. So many ground bursts are included as to bring certain damage to the United States. He recalled that the determination for many years was that there

were only seventy targets, the destruction of which would bring the Soviet Union to defeat.

Mr. McCone pointed out that we have the authority and the funds for this new reactor as a result of last year's legislative action. The President asked if plutonium is useful for fueling power reactors. Mr. McCone indicated it had a certain usefulness but could not replace U-235. The President said he is more worried about the unrealistic attitude of our top military men than the specific proposal he was considering, and Mr. McCone acknowledged that they talk about megaton explosions as though they are almost nothing. The President asked whether, with more efficient weapons, the trend is toward using less plutonium. Mr. McCone said this trend is offset by the trend towards small and clean weapons which take more plutonium. Finally, the President said he supposed that we have to go ahead with the construction of the reactor. Mr. McCone pointed out that he has not funded the convertible feature; he is trying to get that out of the proposal. He had had this studied by Stone and Webster, and they had recommended against it. The President said he is against the convertible feature. By the time we were ready to make use of that, he was confident that our technology would be advanced so far that we would no longer want to use this particular model. He asked Mr. McCone to try to get this provision out.

Mr. McCone then turned to the subject of power reactors. Four or five big ones are now being built. The electricity being produced by them will run 12–18 mills per kilowatt hours, in cost. In Mr. McCone's view, best progress will be found through testing out a lot of technology in prototypes; he doesn't want to build big plants, but would like to build four or five small ones to prove out and advance the art. At the present time the Government gives R & D assistance and waives fuel costs. The prototypes should be on existing power lines and should be built by power companies. He proposed that we give them some assistance on capital costs on a few prototypes but that we not help on large plants. For our own economy, with but few exceptions, we do not need atomic energy power in the foreseeable future. But to keep the United States in the race industrially and internationally we do need to carry out development, and this would be a good program for the purpose. The President asked what kind of money would be involved. Mr. McCone said he did not know precisely. He is trying to work this out. A prototype producing 50,000 kilowatts, costing about \$8 million, seemed to be in the order of magnitude. He said he was talking only in a preliminary way at this time, but that he had received an excellent report, in which Mr. James Black as well as others had participated. The President said he was a little disturbed over the suggestion, since it seemed to be another venture in the direction of public power, and was fearful that Congress would want to put these power plants into the

TVA and Bonneville systems. Mr. McCone thought that by having this program with the President's support it would be possible to head off this tendency. He said he had talked to Mr. Stans about the matter, and that Mr. Stans had no objection.

Mr. McCone next recalled that the President had pushed the IAEA from the outset, and had offered them 5,000 kg. of U-235. A price had never been set; however, the law provides that it cannot be less than the domestic price. The Soviets, who have made no offer of their own, have been doing a great deal of criticizing on the grounds that we are seeking to make a profit. Mr. Cole wants the price to be no more than the domestic price. Mr. McCone recommended that the matter be settled by fixing the price at the domestic price, which meets the law and also meets Mr. Cole's suggestion. The President said he saw nothing wrong with that.

Mr. McCone next told the President he wanted to demonstrate to him a technical breakthrough in the production of power from atomic sources. At this point he had General Keirn, Colonel Armstrong and Colonel Anderson set up a device for the generation of electricity, by means of thermocouples, from heat provided by an alpha-emitting radioactive isotope (of polonium, although cerium is planned for future models). This device, weighing five pounds, was operating at the level of five watts of power. The output would drop to one-half of this figure in 138 days for a polonium source and approximately 280 days for cerium, these periods being the "half life" of these radioactive elements. While the production of the current model cost \$15,000 for the device, plus approximately \$30,000 for the polonium, the future practical models are expected to decline in cost to approximately \$200 for the device and \$600 for the cerium power source; weight can be reduced from five pounds to approximately three pounds.

The immediate application of this device is as a power source in a satellite. The best possible batteries to provide a similar amount of power over a similar period would weigh 300 times as much as this device. However, one of the most striking features is that these thermocouples, employing different "doped" telluride compounds, have attained an efficiency of 8-10% in converting heat to electric energy with no moving parts. Any other heat source could also be used and small atomic reactors, as little as six inches on a side, are being developed as power sources for future applications.

The President was extremely interested in all of this. After thorough discussion of the matter, photographs were taken, and at the President's request Mr. Hagerty arranged for General Keirn and his associates to meet with the press and explain the device to them.

A.J. Goodpaster
Brigadier General, USA

411. Letter From Herter to Killian¹

Washington, January 16, 1959

Dear Jim:

The first Report of the Panel on Seismic Improvement, transmitted with your memorandum of January 12, is most encouraging. We wish to endorse their continued study of this problem.

It is most important that there be prepared as soon as possible a version of the report suitable for transmission to the Soviet Delegation in Geneva and to the American public. As you know, the Soviets are very suspicious of our motives in tabling the seismic data from Hardtack II. Moreover, world public opinion has tended to view this move by the U.S. as an indication that we are anxious to forestall the successful conclusion of an agreement on nuclear testing. By giving the Soviet delegation these preliminary findings we may be able in some measure to convince them of the sincerity of our concern about the problem of underground detection and of our positive efforts to find solutions.

I understand that the four approaches suggested by the panel are under further study and that the evaluation of their effectiveness expressed in the report is tentative. Pending the results of this study it would be most useful for our tactical planning to have a quantitative analysis of the effect of these four approaches on the capabilities of the Geneva system, as suggested in your memorandum. We therefore urge that AFOAT-1 be requested to undertake such an analysis. It is further urged that any possible research on the applicability of these four techniques be carried out by the appropriate agencies as rapidly as is feasible.

I am aware of the serious concern expressed by many scientists, and reflected in the Panel Report, that the data available from Rainier and Hardtack II constitute a severely limited sample of possible nuclear test conditions. Serious consideration should therefore be given to carrying out further underground explosions, both HE and nuclear, for the purpose of improving our knowledge in this field. Our estimate is that such a program aimed at providing a sounder basis for the detection system to be agreed upon by our negotiators in Geneva would probably be acceptable to international public opinion if we offered to carry it out jointly with the USSR and under international observation. Any

¹ Source: Urges version of seismic improvement report be prepared to present to the Soviet Union, further testing be conducted. Confidential. 2 pp. Eisenhower Library, White House Office Files, Records of the Office of the Special Assistant for Science and Technology, Nuclear Test Suspension, Seismic Data.

Soviet objection that such a proposed program was merely a means for furthering our own weapons development program could be countered by proposing that they supply the nuclear devices for use in underground detonations. Furthermore, I believe the necessity for such a program is sufficiently important that, if the Soviet Union will not agree to participate, the United States should be prepared to proceed alone.

With warmest personal regards,
Most sincerely,

Chris
Under Secretary

412. Letter From McCone to Herter¹

Washington, January 19, 1959

My dear Chris:

I have been thinking a great deal of our talk at the OCB luncheon Wednesday and I am writing you this personal letter so that you will understand my very deep concern over the trend of the Geneva negotiations.

There seems to be complete agreement within scientific circles in this country that the detection system proposed by the technical experts in Geneva is inadequate. However, there is a difference of opinion among reputable and informed scientists as to whether the system can be improved sufficiently by additional, better, and different types of stations and instrumentation so that it can, with assurance, detect and identify nuclear explosions of the proportions indicated in the Geneva technical report. Dr. Teller made a persuasive argument in his testimony before the Joint Committee that the present system can not reliably identify explosions of appreciable size, perhaps not even those as high as 100 kilotons. Furthermore, he explained how nuclear underground explosions could be camouflaged, so that even the 100 kiloton threshold is subject to question.

¹Source: Urges change in negotiating objectives until more reliable detection system developed. Personal. 3 pp. Eisenhower Library, McCone Papers, Khrushchev Exchange.

You may recall that Dr. Teller has from the beginning warned of the difficulty of identifying underground nuclear explosions.

The improvements suggested by the Committee recently appointed by Dr. Killian unquestionably will improve the capability of the system, but many of these proposed improvements are theoretical and untried. However, the proposed array of unmanned stations to be scattered throughout the world would require periodic and frequent maintenance. Unless this is done by international maintenance teams, the stations could be readily tampered with so that they would be of questionable value.

Another very important point which must always be borne in mind is the fact that the Nevada tests, including HARDTACK II, are not conclusive because they were conducted in only one area and in one geological formation. No one knows what would happen in the way of seismic disturbances, for example, if shots were made in granite formation.

I feel that the statements made by competent scientists concerning the inadequacy of the proposed detection system have been and will continue to be accepted as valid by many people within the Government, by responsible members of the House and Senate on both sides of the aisle and by a large segment of the American people.

From evidence now submitted I seriously question that the technology of the detection of underground shots is sufficiently advanced for us to enter, at this time, into arrangements with the Soviets barring such explosions. The keystone of such an arrangement must be strong assurance through effective detection, identification and inspection, that all parties to the agreement will live up to its terms, and this criteria cannot be met unless a very high threshold is agreed upon.

This brings me to the second point; namely, the dangers of proceeding much further with our negotiations on the present basis.

I am deeply sympathetic with your expressed desire that we must determine, by pursuing these negotiations, whether the Soviets will accept an inspection system within their own territory which might lead to further penetration of the Iron Curtain. I agree with you that this is an important point.

I further agree with you that a breakdown of negotiations over the issue of adequate inspection would cause criticism of the Soviets by much of the world. I think the Soviets realize this, and I do not think they will let the negotiations break down on this point.

On the other hand, the Soviets may go the limit to accept inspection stations, possibly even to the point of finding some way around the veto issue. Mikoyan indicated as much to Stassen. In going this route, however, they would insist on the inadequate detection system agreed

to last summer in Geneva. By unexpectedly accepting such a system, the Soviets could place us in the position of either going along with a dangerous agreement or backing away for reasons extremely difficult, if not impossible, to explain to the world.

Our position would then be most awkward. Strong voices would argue convincingly that the system is inadequate and that the criteria of "fool-proof inspection" has not been met. I conclude from the testimony last week on the Hill that almost any agreed threshold would be questioned by the Congress. Certainly, the validity of a 20 kiloton threshold would be vigorously attacked by some very knowledgeable and respected people. I fear, also, that the American public would in time feel they had been misled by our Government.

I therefore feel, Chris, that we are moving along a very dangerous course in this negotiation. While I do not wish to inject myself into "quarter-backing" the negotiation, I urge in all sincerity that you find a way at this time to alter the course of the negotiations along the lines expressed in our letter to you of December 23, 1958.

To summarize our position, we propose taking the initiative at Geneva with a positive two-phase program. First, we would urge an agreement with the nuclear powers to suspend atmospheric tests and to establish an adequate detection system to insure compliance. Such a system would be relatively simple and inexpensive, and would be dependable because of our very extensive experience over a period of years with this type of detection. Moreover, this step would eliminate the fallout issue.

Second, conduct more underground tests as quickly as possible and in diverse geographical and geological environments to seek solid information on identification and detection of underground nuclear explosions. From this information we could determine whether a system could be designed in which we would have sufficient confidence to negotiate for a complete test cessation.

This program of experimentation could be a joint effort by the parties to the treaty, or could be done by the parties individually with international inspection and with all data developed being shared among the participating nations.

Sincerely yours,

John A. McCone

413. Letter From Herter to Killian¹

Washington, January 23, 1959

Dear Jim:

As you know the draft technical annex tabled by our delegation in Geneva on 16 December left open the question of what techniques would be included for the detection of high altitude explosions. Our delegation suggested to the Russians that a technical working group consider the problem of high altitude detection in view of the fact that the conference of experts last summer did not recommend any specific techniques for inclusion in the control system. Our delegation has asked for instructions on how this problem should be handled in the negotiations.

It appears to us that there are two possible approaches to this problem:

1. We could press for inclusion now of specific provisions for detecting high altitude explosions based on such knowledge as we have at present. Responsibility for recommended changes or improvements in the system could be vested in the control commission in the light of further information and experience.

2. We could omit any specific high altitude detection system from the treaty but give the control commission responsibility for developing such a system within a given period of time. In this event the right of withdrawal would have to be protected if the commission were unable to agree on an appropriate high altitude detection system.

The Department of Defense has advised us that they do not favor incorporating provisions for high altitude detection at the present time, and thus apparently would prefer the second alternative. The Soviet delegation in Geneva has generally taken the position that the control commission should bear responsibility for the development of changes in or additions to the system and that for the present we should proceed on the basis of the Experts' report. In order to prepare for a governmental decision on which course to take I would like to request that you convene a suitable panel of experts to consider this question in the light of the relevant technical factors. I believe it would be useful if such a group, in the course of their considerations, could look into the feasibility of conducting usefully instrumented outer space nuclear tests, both on the part of the Soviet Union and ourselves, within the next two four-year periods, the firmness of the information presently available on which to base a high altitude detection system, and the possible implications for

¹Source: Proposes panel of experts to examine detection of high altitude tests. Confidential. 2 pp. NARA, RG 59, Central Files, 700.5611/1-2359.

United States security of a decision to omit specific provisions for high altitude detection from a nuclear test ban agreement for an initial period.

With warmest personal regards,

Most sincerely,

/S/ **Christian A. Herter**
Under Secretary

414. Note From Smith to Gray¹

Washington, January 26, 1959

MR. GRAY

Attached are the pertinent papers and a briefing memorandum covering them for use at the meeting of the principals Monday, January 26, at 2 p.m., in Mr. Herter's office.

It is my understanding that the State Department will not have a paper to discuss, but will use Mr. Herter's reply to Mr. Killian as the basis of its discussion of how to handle the Report of the Panel on Seismic Improvement.

Bromley

Attachment

Memorandum From Smith to Gray

Washington, January 26, 1959

Summarized below are the views of those agencies which have commented on the Report of the Panel on Seismic Improvement:

1. State (Mr. Herter)

a. Publish substance of the Report as soon as possible.

b. Also inform Soviets in Geneva in order to overcome suspicion aroused by presentation of seismic data from Hardtack II.

¹ Source: Transmits papers for meeting on seismic improvement. Confidential. 8 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.

c. Ask AFOAT–1 to make an quantitative analysis of the effect on the capabilities of the Geneva System if the suggested improvements listed in the Report were implemented.

d. Conduct underground explosions, jointly with the Russians or, unilaterally, if they refuse, to learn more about detection of underground expositions.

2. *Defense (Mr. McElroy)*

a. Accept a treaty covering cessation of only such underground tests identifiable by the Geneva System (20KT) without requiring an unworkable number of on-site investigations.

b. Suspension threshold could be lowered (1) if the USSR accepts in a treaty a detection system better than the Geneva System and (2) when improvements in the system resulting from a vigorous development program are installed and operating.

3. *AEC (Mr. McCone)*

a. Geneva System is inadequate.

b. Scientists differ as to effect of Panel's suggested improvements. Further experimentation required to establish the facts.

c. Unless threshold is very high, no system can be relied upon to detect underground tests of a specific yield.

d. U.S. should propose to the Russians now a treaty limited to a suspension of atmospheric tests and a detection system covering such tests.

e. Underground tests should be conducted to obtain information needed to develop a detection system in which all could have confidence.

4. *USIA (Mr. George Allen)*

a. Do not publish Report now because of possibility of confusing the public.

b. There is insufficient scientific basis for negotiating a cessation of underground tests.

c. Propose to the Russians now a cessation of only above-ground tests. When research is more complete, proceed with system to enforce cessation of all tests.

Attached is a summary of a speech made by Senator Humphrey in the Senate on January 20 (pgs. 5–6 of State Department Summary).

Memorandum From Killian to Multiple Recipients

Washington, January 19, 1959

MEMORANDUM FOR

The Honorable Christian A. Herter
The Honorable Donald A. Quarles
The Honorable John A. McCone
The Honorable Allen W. Dulles
The Honorable Gordon Gray
The Honorable George Allen

I am forwarding for your information the attached comments on the first report of the Panel on Seismic Improvement, dated 7 January 1959. As you know, the comments were prepared in response to a request in my letter dated 12 January 1959 transmitting copies of the Panel report. I believe that these comments, together with those I received from you, will provide a useful basis for any future discussion we may have on this report.

Since the report in question must be considered as privileged information, I would suggest that the attached comments be handled on a limited distribution basis.

J.R. Killian, Jr.

Attachment

Letter From Herter to Killian

Washington, January 16, 1959

Dear Jim:

The first Report of the Panel on Seismic Improvement, transmitted with your memorandum of January 12, is most encouraging. We wish to endorse their continued study of this problem.

It is most important that there be prepared as soon as possible a version of the report suitable for transmission to the Soviet Delegation in Geneva and to the American public. As you know, the Soviets are very suspicious of our motives in tabling the seismic data from Hardtack II. Moreover, world public opinion has tended to view this move by the U.S. as an indication that we are anxious to forestall the successful conclusion of an agreement on nuclear testing. By giving the Soviet delegation these preliminary findings we may be able in

some measure to convince them of the sincerity of our concern about the problem of underground detection and of our positive efforts to find solutions.

I understand that the four approaches suggested by the panel are under further study and that the evaluation of their effectiveness expressed in the report is tentative. Pending the results of this study it would be most useful for our tactical planning to have a quantitative analysis of the effect of these four approaches on the capabilities of the Geneva system, as suggested in your memorandum. We therefore urge that AFOAT–1 be requested to undertake such an analysis. It is further urged that any possible research on the applicability of these four techniques be carried out by the appropriate agencies as rapidly as is feasible.

I am aware of the serious concern expressed by many scientists, and reflected in the Panel Report, that the data available from Rainier and Hardtack II constitute a severely limited sample of possible nuclear test conditions. Serious consideration should therefore be given to carrying out further underground explosions, both HE and nuclear, for the purpose of improving our knowledge in this field. Our estimate is that such a program aimed at providing a sounder basis for the detection system to be agreed upon by our negotiators in Geneva would probably be acceptable to international public opinion if we offered to carry it out jointly with the USSR and under international observation. Any Soviet objection that such a proposed program was merely a means for furthering our own weapons development program could be countered by proposing that they supply the nuclear devices for use in underground detonations. Furthermore, I believe the necessity for such a program is sufficiently important that, if the Soviet Union will not agree to participate, the United States should be prepared to proceed alone.

With warmest personal regards,
Most sincerely,

Chris
Under Secretary

Memorandum From McElroy to Killian

Washington, January 16, 1959

SUBJECT

First Report of the Panel on Seismic Improvement

In Secretary Quarles' absence I am replying to your memorandum on the above subject addressed to him on January 12, 1959, in which

you requested his comments on the subject of the report. Inasmuch as the report is strictly technical in nature, prepared by recognized experts in the field, I feel it would be somewhat presumptuous on my part to comment on the technical feasibility of the several measures suggested for improving the capabilities of the Geneva System. I agree that an appropriate next step would be the preparation of a quantitative analysis of the effect of these measures and am prepared to have AFOAT-1 make such an analysis if you so desire.

I believe it worthwhile to note that the estimated effectiveness of the several improvements proposed by the panel is based largely on theoretical considerations and may be subject at this to the same faults as the initial estimates of capabilities of the Geneva system. I am concerned as to the possibility that under the pressures generated by the present Geneva negotiations we may be induced to make commitments or to place unjustified reliance on prospective improvements based on inadequate data. Even if the improvements are subsequently determined to be effective to the degree they may now be estimated, they may be found politically or economically impractical to apply. Thus, it seems most important to me that the United States must not accept an inadequate system on the assumption, that future improvements will make it adequate.

It is quite certain that vigorous research in seismology will produce important improvements; however, I believe it would be very unwise to postulate any specific degree of improvement either in time or as to quality as a basis for committing ourselves to an expanded system calling for a definite level of detection and identification. For that reason it is my view that the following principles which have been previously supported by the Department of Defense should govern our negotiations as regards the suspension of underground tests:

(a) The treaty should provide only for the cessation of such underground tests as we believe to be identifiable by the Geneva System (on the order of 20 KT) without requiring an unreasonable or unworkable number of on-site investigations. Obviously, if the USSR can be induced to accept a better system as an element of the treaty, the threshold would be lowered to accord with our best estimate of the system's capabilities.

(b) The Control Commission should be charged with the conduct of a vigorous development program to improve the system and the suspension threshold should be progressively lowered as the improvements are installed and in operation.

Neil H. McElroy

415. Telegram Supnu 230 From Geneva¹

Geneva, January 27, 1959, 1 p.m.

Supnu 230. Ref Nusup 174. For Herter (S) from Wadsworth.

I fully agree we must concentrate on control issues. I believe our public position on these is excellent. The Brit yesterday took lead in putting forward our ideas on staffing a control organization in a way which showed clearly how effectively this could work in contrast to the Sov position of self-inspection. The Sov delegate was obviously at a loss and floundered for reply. We have started to build our case on workable inspections and should have no trouble in exposing the absurdities of the present Sov position. On the veto also I think we are in a strong spot and can at the proper time further strengthen our position by suggestions of a composition of the control commission which would give some voice to "non-committed" countries.

I am honestly not able to reach a firm conclusion on whether the Soviets will eventually accept the right kind of control organization. Their statements and tactics, particularly since the recess, seem to point the other way, but I am still clinging to the idea that for some reason they want a treaty, perhaps even on respectable terms, and that they may possibly come around to it if our public position is kept strong. Their post-recess tactics may in fact be for any of three purposes: to prepare for a break; to try to bring pressure on West to compromise in order "to save conference"; or to build up to a major "concession" their part.

As far as keeping propaganda advantage goes, and this is essential whether there is eventually to be a treaty or a break, the only hazards I see are the questions of duration and of threshold. The threshold problem need not come up soon, and in any case is not raised by the remainder of our draft treaty. So I will give you my thoughts on this question later. The duration problem is immediate. We have been helped enormously by our dropping of the disarmament link. We can now say quite rightly that duration only hinges on controls. But we still have the weak points, as far as public position goes, of the year-by-year basis and the unilateral right of withdrawal. The Sov line in and outside of the meetings has been to attack these points, particularly the year-by-year, and to demand that we make it clear whether we hold to these positions by tabling a duration article. They have

¹ Source: Urges tabling proposed duration clause of draft nuclear testing cessation treaty. Secret; Niact; Limited Distribution. 5 pp. NARA, RG 59, Central Files, 700.5611/1-2759.

worked to show that delay on our part in tabling an article is a stall and is evidence, together with our introduction of the new data, of our desire to frustrate agreement. They might even have some real suspicion that this is the case.

There are two alternative courses. We can table our presently authorized duration article, along with the other draft articles of our treaty, and get away from the accusations and suspicions of stalling by accepting whatever disadvantages there may be in repeating once again our present position on year-by-year unilateral withdrawal. The other articles give the Soviets no particular issue since the line they have taken on peaceful uses removes this as a major point of argument. Or we can hold up tabling and continue to follow the line which we have been taking for the past three weeks that control issues should be discussed before the question of duration. I believe that it will be easier to keep the focus on controls if we table the article. There is an immediate link back to controls since Tsarapkin has promised the list of items on which the Soviets will want unanimity in the Control Commission (that is, veto) as soon as we table a duration article. And tabling of the article does not rob us of any of the arguments we have been using that the control org should in any case be discussed first. These arguments would be harder to use effectively if we do not table and are open to daily charges of stalling and of obstruction. Too much delay may well cause Tsarapkin to refuse to talk controls.

I have never asked for a change in the duration article which would base the right of withdrawal upon a Commission finding, such as the text which appears in the last para of Nusup 150. I have thought that such an article, which would remove the target of a year-by-year unilateral withdrawal, might be even more difficult in terms of inter-agency feelings and the Congress, than the kind of implicit rather than explicit right of withdrawal which I have supported the UK in asking for. Foster and you are the only ones who can judge whether such a change, to relying on a commission finding, would be either wise or practical. If such a change were possible, it would, I think, make our position on duration publicly unassailable and leave us in a position where the Soviets could not possibly avoid the control issues.

I have not talked of such an article with the Brit because I did not want to raise unnecessary difficulties for you, but they, I am sure, would be delighted. And I should say that whether or not there is any change in the duration article, Ormsby-Gore believes strongly that we should table it immediately since he is [illegible in the original] more convinced than I am that this is the better way to keep the discussions where we want them.

I do not think in considering this last suggestion of a change you should be too much influenced by the possibility that the Soviets

might break if we table our present duration clause. There is, of course, always the chance that they might be looking for a pretext and might take this as an opportunity. And in addition to the recent Sov Govt's statement, the Russians here have been making noises to the Brit and ourselves which are obviously calculated to give us the idea that they may be thinking of winding up the conf. But my personal assessment really is that they probably will not break in the immediate future. My guess is that we will have a few more weeks to go anyway, and I am confident that we can keep the focus on the issues of control.

Villard

416. Telegram Nusup 184 to Geneva¹

Washington, January 28, 1959, 8:24. p.m.

Nasup 184. Department appreciates considerations outlined SUPNU 230 and USDel belief that we may now or soon be more vulnerable if we do not table duration article than if we do, in view fact that our present position is fully on public record and that we are open to charges of stalling and unwillingness show our full position. Accordingly USDel may, in its discretion, table further articles, including duration, in accordance previous approved texts if USDel, in light changing negotiating situation, continues feel that this would be best tactic to preserve most favorable U.S. position in negotiations. Department's concern is that we do not make it easy for Soviets to shift discussion to other issues now that their feet are to the fire on controls as indicated SUPNU 232. Department believes other articles, do not involve any major issues and that peaceful uses article in its present form would be hard for Soviets to attack as providing way for covert evasion weapons test prohibition.

Paragraph 2 of duration article as authorized NUSUP 172 should be amended by substituting "finds" for "considers".

Department believes that before tabling duration article USDel should refuse to be drawn into substantive discussion this question and should make following points:

¹ Source: Approves tabling duration clause. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/1-2759.

1. We expect Soviets give us concurrently promised list issues on which they would wish to have unanimity principle applied (as reported SUPNU 207).

2. Reiterate (along lines Department January 24 statement) that control issue and not matter of duration is key question and that if effective controls can be agreed then duration problem can be readily solved.

3. To undercut possible attack on unilateral withdrawal provision USDel should state in tabling we willing explore at appropriate time any reasonable approaches to problem ineffective operation control system but that we must first know the nature of control system before it would be fruitful to get into details here.

Department will continue to examine here possibility revising present paras 1 and 2 duration article with either U.K. draft or paragraph (F) NUSUP 150.

Dulles

417. Memorandum of Conversation Among John Foster Dulles, Department of State Officials, and Nuclear Advisory Panel Members¹

Washington, January 30, 1959

SUBJECT

[illegible in the original] Arms Control Negotiations and Policy

PARTICIPANTS

Secretary Dulles
Under Secretary Herter
Mr. Holmes—S
Mr. Farley—S/AE
Mr. William Foster

General Gruenther
Mr. Lovett
Mr. McCloy
General Smith

1. Nuclear Test Suspensions Negotiations.

The Secretary said that the Soviet Union was currently taking a rigid line on matters relating to inspection and control, but that U.S. and U.K.

¹ Source: Nuclear test suspension negotiations, surprise attack safeguards. Secret. 5 pp. NARA, RG 59, Central Files, 700.5611/1-3059.

negotiators were holding firm against the veto and self-inspection. The position is awkward because of the new U.S. technical data indicating uncertainties in detection procedures for underground nuclear explosions. If there is a breakdown in the negotiations, however, we want it to come as a result of an unreasonable Soviet attitude toward sound control procedures, not as a result of a shift in the U.S.–U.K. objective of suspending nuclear weapons tests under effective control. If we were to abandon the Geneva experts' report, agreed to this summer after technical discussions held at the initiative of the United States, we would be in a very bad posture.

Mr. Lovett observed that the technical basis on which the U.S. was negotiating appeared to be undermined and it might be desirable to clarify and change the U.S. position rather than rely on our ability to handle the negotiations in a way which would lead to a Soviet break. Mr. Foster said that he understood the U.S. scientists believed that the capabilities of the Geneva control system could be restored. Mr. McCloy said that it appeared to be a case of normal scientific chance and uncertainty rather than error in fact or judgement. The Secretary said that the problem was under active study and that after the scientific restudy is completed any necessary Presidential review of our position would be made.

Mr. Lovett said that he felt there was a growing concern among the sophisticated public that we might be in an untenable and possibly dangerous position and that any control system which could be negotiated might have unacceptable risks and loopholes. Mr. Dulles said that unfortunately this public impression was difficult to deal with since the real answer to it had to be given by explaining our negotiating position and tactics with the Soviet Union, which in turn would prejudice the position of our negotiators as it became public. We are presently in the position of a poker player with someone standing behind him holding up a mirror to show his hand to the opposition. However, our situation is sound and we will play out the negotiation despite the criticism. Mr. Farley pointed out that we were not relying merely on the likely Soviet rejection of effective control and inspection procedures. The Geneva experts' report provides a basic principle which has not been challenged: namely, that seismic events which cannot be recognized as earthquakes through scientific equipment alone must be checked on-the-spot by inspection teams. The only thing that has been questioned is their estimate of the number of seismic events which scientific instruments could identify as earthquakes, an estimate which apparently was too optimistic. However, that factual estimate, which was accurate on the basis of the then available information, has no binding force; the binding principle is that on-the-spot inspection must decide the cases which are unresolved by reading the instrument. Thus we are protected and the Russians if anything are under greater pressure arising from the greater number of on-the-spot inspections.

All four of the advisers strongly endorsed the principle that we must keep the pressure on the Soviet Union to show its basic position on international staffing of control posts, on majority vote in the Control Commission, and similar issues, and that we should not let them escape this pressure by prematurely changing our proposals.

2. Surprise Attack Safeguards.

Mr. Foster said that it was wrong to think that the Geneva discussions on surprise attack safeguards were futile because they failed to reach agreements. He urged study of the key documents published by the United Nations. Among the mains he listed were:

- a. Some useful intelligence on Soviet military thinking;
- b. Exposure of the Soviet thinking on inspection techniques, which was accomplished by their tabling of a proposal for obviously inadequate inspection measures in a zone 800 kilometers on either side of the dividing line in Europe;
- c. The complete unanimity achieved among the five Western states which participated, and the very considerable education of many of the experts from other countries;
- d. The greater appreciation we ourselves achieved of the value of inspection, whether partial or comprehensive.

Mr. Foster said that he thought Soviet attitudes as revealed during the discussions gave us useful information as to what the Soviet Union attaches value to, and thus as to where we may be able to bargain with advantage in future discussions. The Soviets attach great importance to secrecy. This is not just a psychopathic attitude toward the outside world but a very valuable military asset. In effect their ability to keep their missile bases secret is the equivalent of being able to harden them against attack. The Soviet Union also feels very strongly about Germany and the threat a reunified Germany might come to constitute for the Soviet Union and its security.

Also apparent, Mr. Foster said, was a broad acceptance by Soviet experts of the belief that there must be a concentration of ground forces before a major surprise attack is launched. General Gruenther and General Smith were skeptical that this represented the real thinking of Soviet policy makers. It might be the belief of the experts who were chosen to go to the Geneva talks, but it appeared unlikely in view of Soviet missile achievements that this position was taken for any reason other than as an attempt to evade inspection of missiles.

Mr. Foster continued that the Soviets also showed great self-confidence and even arrogance regarding their missile achievements and their economic growth. It was possible in view of this growing strength that the Soviet interest in the surprise attack problem was no more than an effort to keep us talking while they keep gaining. It is also possible that there is some possibility of agreement on mutually advantageous measures. Otherwise the future over the next ten to fifteen years is bleak. Even many of the officers from the Department of Defense who were on

the staff of the U.S. delegation are now interested in exploring possibilities of agreement.

Mr. Dulles said that he had been disappointed that so little progress toward agreement was made in the December talks. He thought that the area of surprise attack safeguards was one which offered some prospects for agreement. He did not expect that there would be substantial reduction of armaments by detailed agreement. There must be confidence before arms can be reduced. Surprise attack safeguards might contribute to mutual assurance that an attack was unlikely, and thus lead indirectly to reduction in the arms burden.

Mr. Foster said that it was a consensus among participants in the discussions that it would be useless to resume the talks on the narrow technical-military basis to which the delegation had been restricted in its instructions. He thought, however, that broader exploration of possible limitations on armaments in conjunction with inspection and observation measures might be fruitful and in the U.S. interest. This might include, for example, analysis of a hypothetical basis of political agreements such as the proposed Rapacki plan. We should be able to show the unsoundness of such schemes, and at the same time make progress toward mutual understanding of the characteristics of sound measures.

Mr. Lovett questioned whether surprise attack talks could be resumed at this time on the broader basis recommended by Mr. Foster. The Berlin and German questions are now crucial ones. He was finding in his contacts with European business people that many of them were looking sympathetically at the Rapacki plan. The Secretary thought that any U.S. studies preparatory to possible resumption of surprise attack talks might take account of and be pointed toward problems of Germany and European security. General Gruenther agreed that studies should be undertaken promptly and said that he assumed such studies were under way in connection with missile negotiations on Berlin and on proposals for "thinning out" in Germany. The Secretary said that there had been studies but only by the Department of Defense and General Norstad rather than by a broader and more flexible group. It was conceivable in present circumstances that some kind of zone in the middle of Europe might be acceptable if that was the price for a reunified Germany.

Mr. Foster pointed out that we might well be thinning out our forces in Europe on economy and if this was the case we ought to consider how we could bargain in such a way as to get something in return. Mr. McCloy pointed out that the study so far of the Draper Committee had not shown any disposition on the part of Norstad or the Department of Defense to reduce force requirements in Europe.

Mr. McCloy, having just returned from a trip to Europe, gave an assessment of his impressions as follows: He found the situation in England uncertain and in some ways reminiscent of the tendency toward compromise so prominent in the days of Neville Chamberlain.

He realized that Macmillan is himself a strong and able man but that he was being strongly influenced at this time with respect to the problems of Europe because of impending elections and his preoccupation with retaining power.

He has looked into the situation in France, and particularly that of NATO, and held a rather pessimistic view of the present effectiveness of the alliance because of the remote and difficult attitude of General de Gaulle. He remarked that Chancellor Adenauer had not recovered as quickly from his recent illness as he had in previous instances in the past, that he was somewhat remote from public opinion in Germany and that the men surrounding him were loath to tell the Chancellor unpleasant things because of the risk of displeasing him and hence lessening the chance of any one of them becoming Dr. Adenauer's heir apparent. Mr. McCloy remarked that there was no government in Italy and that recent shifts in Italian political parties had disrupted the precarious balance which has maintained middle-of-the-road and pro-Western governments for some time. He felt that in the light of this situation the Russian attitude toward Germany, and particularly Berlin, represented a serious and even dangerous situation.

The Secretary expressed general agreement with Mr. McCloy's assessment and posed the question as to whether or not the United States should exert vigorous leadership in order to pull the West together to meet the situation. All of the members of the Advisory Committee and Mr. William Foster emphatically advised in the affirmative.

418. Record of Telephone Conversation Between John Foster Dulles and Farley¹

February 1, 1959, 5:10 p.m.

Sec read proposed cable to Wadsworth to F. F. said he had two comments. (1) the Soviets did table their list of the subjects on which they wanted a vote by unanimity of the 3 powers. There were 6 or 8 items, no real surprises. They wanted it on all major decisions. (2) it was a close thing as to whether Wadsworth's judgment was right, that it might leave them the excuse we were stalling. Sec said he did not know about the Soviet list, does it provide for veto power on all major issues? Sec asked why that had not been played up. F. said it happened the last

¹ Source: Soviet veto proposal in nuclear testing suspension talks. No classification marking. 1 p. Eisenhower Library, Dulles Papers, General Telephone Conversations.

thing on Friday; F. hoped they would hammer on that from now on. Sec said it gave us a good position to force the issue. F. said the only remaining question was the one raised in the Sec's cable—has he made an explicit promise re the duration article. Sec said he would like to be informed about the business of the veto power in the control council. F. said he would get it to him first thing Monday morning. F. said it covered any decision to send in inspection team, find a state in violation, appointment of principal staff. F. said they really have a double veto, because there is also veto by the one who is to be inspected.

419. Telegram 1165 to Geneva¹

Washington, February 1, 1959, 7:15 p.m.

For Wadsworth. Personal from Secretary. Regret that I cannot share your confidence that best way “to clear the decks” for focusing attention on veto and nationality of control staff will be to table remaining draft articles of the treaty. I realize that this is a close question and that from your standpoint there may be advantage in getting rid of accusation of stalling. However it seems to me that the tabling of remaining articles will almost certainly provide Soviets with opportunity to raise new issues and to prevent focusing of attention on key issues of control. Furthermore in view of list of matters where Soviet demands veto power in Control Commission we now have an unassailable position to focus attention on this matter. You will therefore, pending further instructions, abstain from tabling any further articles. Meanwhile please advise me whether you have any explicit agreement with Soviets that you would table draft of article on duration as soon as they tabled their article on veto power in Control Council.

I realize that no control system can be absolutely “fool proof” and that we must count upon the chance of detection being sufficiently great as not to justify gamble of treaty violation. If however Soviet view about the control machinery prevails then even that risk would be minimized. It is apparent that Soviets want the Korean type of inspection system which we know to be futile.

I shall probably be discussing this situation with Macmillan on Wednesday.

420. Letter From McCone to John Foster Dulles¹

Washington, February 2, 1959

Dear Foster:

With further reference to our letter of December 23, 1958, addressed to the Under Secretary of State and signed by Acting Chairman Vance, and to the press release of January 5, 1959, by the President's Science Advisory Committee, and to the report of January 7, 1959, by the Panel on Seismic Improvement chaired by Dr. Lloyd V. Berkner, the Atomic Energy Commission believes that it should convey to you at this time our views with respect to the position of the U.S. in the negotiations now in progress in Geneva.

There seems to be complete agreement within scientific circles in this country that the detection system proposed last summer by the Conference of Experts in Geneva is inadequate in the light of data subsequently developed from the HARDTACK series of tests in Nevada in October. However, there is a difference of opinion among informed scientists as to whether the system can be improved sufficiently by additional, better and different types of stations and instrumentations so that it can with assurance detect and identify nuclear explosions of the proportions indicated by the Geneva Conference of Experts in their Report.

The improvements recently suggested by the Panel on Seismic Improvement unquestionably would improve the capabilities of the system, but many of these proposed improvements are as yet only theoretical. The Panel listed "four promising approaches" that are "within the present limits of technology" and pointed out that vigorous research in seismology is indicated. With respect to one of the recommendations, namely, placing seismometers in holes at depths of several thousand feet, it said:

"The method offers possibilities for improving the detectability of small signals by a factor of the order of ten, *provided that the technological problems of operating instruments at the required depths can be solved.*" (Underscoring supplied).²

Also, the Panel made, inter alia, the following statements:

"It is noted that the data on nuclear Shots used in these estimates was from Rainier and HARDTACK II and thus has all the limitations of that small sample of nuclear test conditions. The PSI has not concerned

¹ Source: U.S. should not agree to cessation of tests that cannot be reliably detected. Secret. 4 pp. NARA, RG 59, Central Files, 700.5611/2-259.

² Printed here as italics.

itself with the possible seismic effects of nuclear tests under different conditions or the possibilities of concealment by decoupling of other techniques."

"The PSI urges that sample detection networks be established without delay as representative systems to disclose operational and design problems and provide a firmer basis for the assessment of detection capabilities."

The Commission hopes that an experimental and testing program to prove or disprove the feasibility of the improvements suggested by the Panel could be conducted and evaluated in less than a year.

Additional reports from further studies by the PSI will further develop the views of experts on the capabilities of the system as improved. However, there are several areas of uncertainty recognized by the PSI in its first report which only additional tests or firings can clear up. An example of great significance is the whole question of the effect of shots in differing geological formations and geographical areas. All tests to date have been in volcanic tuff in the Nevada test site and hence tests in other areas are clearly indicated.

The Atomic Energy Commission has consistently held, as indeed have all Departments of the Government, that the keystone of any acceptable international arrangement must be dependable assurances through effective detection, identification and inspection that all parties to the agreement will live up to its terms. The Commission believes that the technology of detection and identification of underground nuclear explosions is not sufficiently proven at this time for us to enter into arrangements with the Soviets now for the discontinuance of underground test explosions; and the same is true of nuclear test explosions in outer space.

The Commission believes that: first, the U.S. position in the current negotiations in Geneva should be directed so as to prevent a breakdown in the negotiations on minor or purely technical issues and, second, avoidance of our being placed in a position of acceptance of an agreement based upon a seriously inadequate detection system.

To this end we urge your consideration of the following:

First, we would propose that we seek agreement with the nuclear powers to discontinue atmospheric nuclear weapons tests forthwith and to establish promptly an adequate detection and identification system to insure compliance. To consider that such a system could be relatively simple, and acceptably dependable, and its adoption would involve fewer serious issues than are now under debate in Geneva. The discontinuance of atmospheric nuclear weapons tests would eliminate the fallout issue and thereby deprive the Soviets of one of their most effective propaganda themes.

Second, we would propose that we would agree to collaborate in improving the capabilities of the Geneva control system looking toward the inclusion at a later date of underground and outer space tests in the Treaty. In the meantime, nuclear weapons testing in outer space and underground would be permitted without restrictions. Additionally, a

series of special underground tests in diverse geographical and geological environments and a few tests in outer space would be carried out as promptly as possible. These special tests in outer space and underground could be a joint effort by the nuclear powers or they could be carried out unilaterally by the nuclear powers under international inspection; in either case, all data developed should be shared among the nuclear powers.

From such a special test series, together with an intensive program for the improvement of seismic and outer space detection techniques, we could determine the dependability of a detection and identification system in which we would have sufficient confidence to negotiate for a broader test cessation over an indefinite period of time.

My fellow-Commissioners and I feel that we would be remiss in our duties if we failed to inform you of our views as outlined above. In so doing, however, we wish to reaffirm our recognition of the fact that the formulation and direction of the foreign policies of our Government are the responsibility of the Secretary of State.

Sincerely yours,

John
Chairman

421. National Intelligence Estimate¹

NIE 100-5-59

Washington, February 3, 1959

IMPLICATIONS FOR THE FREE WORLD AND THE COMMUNIST BLOC OF GROWING NUCLEAR CAPABILITIES

THE PROBLEM

To estimate the effects of increasing capabilities for nuclear warfare on public attitudes and behavior and on national policies in the Communist Bloc and the Free World.

CONCLUSIONS

1. The impressive developments in nuclear weapons delivery systems over the past year or so have not produced basic changes in popular attitudes in the non-Communist world. These attitudes continue to

¹ Source: "Implications for the Free World and the Communist Bloc of Growing Nuclear Capabilities." Secret. 12 pp. DOS, INR-NIE Files.

reflect a mixture of apathy and fatalistic resignation, fear of the consequences of nuclear war and, particularly in Western Europe, acceptance of nuclear weapons as essential to defense and national status and prestige. In the main, peoples and governments appear to be making a gradual and steady adjustment to the threats inherent in the existence of nuclear weapons and we believe that future developments are not likely to produce any sudden or marked changes in present attitudes and policies. (*Paras. 9–10, 49*)

2. It is possible, however, that the wedding of nuclear explosives with ballistic missiles will produce fundamental shifts in these attitudes and official policies. Such changes could come with little warning in the midst of a crisis situation which served to crystallize the ferment, fears, or newly formulated concepts of the age. (*Para. 56*)

3. Opposition to the testing of nuclear weapons continues strong throughout the world, especially in Japan, India, and in parts of Western Europe. But in most Western countries this opposition is subordinated to the view that nuclear weapons are essential to defense and that a test ban should be made effective by measures of inspection and control. There is great interest in disarmament, including various propositions for disengagement, as a means of reducing tensions and the dangers of war. By-and-large, the public demands caution in situations involving the risk of great power involvement and there is considerable support for UN intervention to observe, control and police areas in which there is a threat to the peace. (*Paras 13–14, 22–24*)

4. Most non-Communist governments display similar attitudes of caution and concern over the nuclear situation. In Asia and the Middle East the nuclear situation continues to reinforce neutralist sentiments which derive from cultural and other factors. The Western European governments are highly sensitive to popular pressures for measures to reduce the dangers of war, and they consider it necessary, and even desirable to explore possibilities for negotiations with the USSR. (*Paras. 35, 38–40*)

5. Nevertheless, Soviet pressures and advances in weapons technology have not caused these governments, and others in the Free World depending on the US deterrent, to alter their posture or alignment. Many governments, including those of the NATO powers, are able to lead the public to accept the proposition that participation in an alliance whose strategy rests on the maintenance of a nuclear deterrent is the best guarantee of security. (*Paras. 32–33*)

6. The rapid pace of technological development will create serious problems for the US and the world. There may be doubts as to who has the lead in modern weapons, and it may become increasingly difficult to convince the peoples and governments of Western Europe—and other parts of the world—that the deterrent is in fact effective. Fears of

a surprise or "pre-emptive" Soviet attack may grow. In those nations which depend upon the US for protection, fears may also increase as to whether the US remains willing to risk general nuclear war in order to defend their vital interests. In view of the foregoing, certain nations might lean toward neutralism in an effort to gain security through accommodation. (*Paras. 50–52*)

7. A period of rapid change in weapons development and of uncertainty as to the relative balance of military power could put an increasing premium on striking the first blow. As the time period required for preparation of a devastating attack diminishes, the problem of interpreting the intent of the other side—particularly during periods of crisis when precautionary military activities had been initiated by both sides—will become even more critical. The relatively greater certainty of retaliation resulting from the development of mobile missile systems or hardened sites would strengthen the operation of the deterrent on either side. Even so, either side might decide that the deterrent effect of the other side's strength or posture was outweighed by the necessity to launch the first strike as the best hope for survival.² (*Paras. 53–54*)

8. Barring an effective disarmament agreement, there will probably be a gradual spread of nuclear capabilities to some additional countries. Nevertheless, we do not foresee any early lessening of the present strong political and psychological restraints on their use. (*Paras. 48, 57*)

DISCUSSION

I. INTRODUCTION

9. The destructive power of nuclear weapons has long been in the public consciousness. However, the advances in delivery capability represented by the satellites and by the missile test programs appear to the world as reflecting a new dimension in the threat. The opinion is widely held that the time is near at hand when hasty action, perhaps as a result of a faulty estimate of the intentions of the opposing side, can unleash a devastating attack with high-yield weapons delivered by ballistic missiles. The world was not prepared for Sputnik and the compound reaction of admiration, shock, and apprehension was profound. The reassessment of national policies touched off by this evidence of Soviet technological capability is still in progress.

10. However, with over a year's perspective since Sputnik it can be said that no great and sudden changes in attitudes or policies have as

² For reservations of the Assistant Chief of Staff for Intelligence, Department of the Army, and the Assistant Chief of Naval Operations for Intelligence, Department of the Navy, regarding this conclusion, see footnote to paragraph 54. [Footnote is in the original.]

yet occurred as a result of the recent demonstrations of growing nuclear capabilities. In fact, the evidence available indicates that peoples and governments are becoming more steady in their reactions to technological advances in the nuclear weapons field. In general, there appears to be a greater degree of fatalism and a greater realization that there are no quick and easy solutions, and that it is necessary to work within the context of familiar institutions and methods for an easing of the nuclear threat.

II. POPULAR REACTIONS AND ATTITUDES

A. The Non-Communist World

11. There is considerable unanimity in world opinion on several general propositions with respect to the implications of growing nuclear capabilities. For example, the popular belief in the non-Communist world is that the testing of nuclear weapons involves some degree of risk to the human race; the general assumption around the world now is that large-scale hostilities between the two great powers would almost certainly mean nuclear war; and practically all people believe that a general nuclear war would be a disaster to mankind. Despite this unanimity on certain general propositions, the revulsion against nuclear weapons is not a dynamic force of even strength throughout the world and there are widely differing views as between regions and even within many individual countries with respect to the measures necessary or possible to deal with the problems of the nuclear age.

12. Broadly speaking, however, it is possible to distinguish between two major trends in popular attitudes toward nuclear weapons. In the Western world and in a few nations in Asia the dominant trend is toward reluctant acceptance of the fact that nuclear weapons are necessary for the common defense. In much of Asia and the Middle East the dominant trend among those who hold any opinions on nuclear weapons is to emphasize the dangers inherent in their existence and to press for their control or outlawing without particular regard to the complicated problems of Free World defense and security.

13. In Western Europe and the Americas there continues to be some opposition to the testing of nuclear weapons on the ground that it constitutes a danger to human life. Nevertheless, this concern has not produced wide-spread and strong pressures for an immediate and unconditional ban on tests. This may be due in part to apathy, but it also reflects a fairly widespread acceptance among informed people of the view that some risks in testing are essential to Western defense and of the proposition that a permanent test ban should be made effective by measures of inspection and control.

14. Attitudes towards other aspects of the nuclear weapons control problem follow a similar pattern in the West. There is great interest in

disarmament, including propositions for "nuclear free zones" and disengagement schemes. There is hope that sincere and prolonged negotiations might bear fruit, reducing the danger of war and the economic burdens of defense. Even in Western Europe important voices demand that the terms for safeguards be scaled down, and some risks and possible loss of military advantage be accepted so that the circle might be broken and real progress made toward controls and disarmament. Nevertheless, Soviet proposals are generally viewed with skepticism and suspicion and there are no strong pressures for large-scale concessions merely to reach agreement.

15. Barring an effective disarmament agreement, the Western public generally sees no alternative to a defense strategy based primarily on the nuclear deterrent. Initially, at least, the public in Western Europe believed that a nuclear defense strategy offered a means of holding down the economic and social costs that would otherwise have been necessary in maintaining large and ready conventional forces. With the Soviet advances in nuclear weapons capabilities has come recognition that the West must not lag behind in weapons technology if the deterrent is to remain effective.

16. Fears that the US might withdraw from Europe at some future date or prove unwilling to risk war in defense of Western European interests also have been elements influencing public opinion in favor of national programs for the development of nuclear weapons. National pride and the desire to gain great power status and to exert greater influence on US policy have been important factors in France and the UK tending to override basic fears of the weapons.

17. The launching of Sputnik I occasioned considerable soul searching in the West. There were fears that the USSR had moved ahead of the US in nuclear delivery capabilities and in this situation neutralism, and even pacifism gained some ground in Western Europe. But confidence in the deterrent strength of the West has been somewhat restored by post Sputnik progress in US missile development. For the most part, the public in the NATO area and in other countries relying on the US deterrent believe that it is still effective, and that alliance or alignment remains the best guarantee of their security.

18. Throughout much of Latin America, Africa, the Middle East, and Asia the people generally lack knowledge concerning nuclear weapons and perceive only dimly their implications. Many of these peoples are fearful of the consequences of nuclear war, concerned over the effects of testing, in favor of nuclear disarmament, and opposed to any stationing of nuclear weapons in their countries.

19. But for the most part they are not faced with concrete issues and tend to be apathetic toward the more general problems. They tend to feel that the nuclear problem is involved in the great power struggle

over which they have no control, or they are so deeply involved in struggles for independence or livelihood that they have little time to reflect on world problems. People in these areas tend to accept and follow, usually passively, the positions taken by their leaders.

20. Informed circles in Latin America have evidenced deep concern over the dangers of nuclear war, and there is much interest throughout the area in disarmament. Nevertheless, while desiring that the US take a more flexible position on disarmament, a majority of the informed persons in Latin America generally recognize the importance to their own security of the US deterrent. Even in Mexico, where one of the highest levels of radioactivity in the world has aroused popular concern, there is no great pressure for a suspension of tests.

21. In the Arab world and much of Southeast Asia, informed circles emphasize the dangers of the nuclear situation, without much regard for the problems of defense in the non-Communist world. They see this situation as part of the great power struggle which could get out of hand with the small nations as probable victims. They hope, by remaining neutral, to escape this threat and they attempt to exert pressures on the great powers to accept controls on testing and nuclear weapons. Their views on the merits of any proposition tend to be colored by a pre-existing distrust of the West, and they are frequently more inclined to accept the seemingly reasonable Soviet proposals than those of the West.

22. India and Japan remain exceptional cases in Asia in the depth of popular concern over the nuclear situation. While the masses in India have only the vaguest notion of nuclear matters, Nehru's warnings have made some impression. The Japanese, the only people to have experienced a nuclear attack, have developed what amounts to a national phobia regarding the use or testing of nuclear weapons. In Japan no one can escape the deluge of comment and exhortation on the subject, at times including daily radio bulletins on the fallout-count. Opposition to testing is vocal and insistent in both countries and there is relatively little concern, except in limited circles in Japan, that a test ban or other controls be backed with adequate safeguards. Neither the Indian nor the Japanese public want their countries to have anything to do with nuclear weapons, although there may be a softening in the Japanese attitude in the future as Japan develops a potential to produce its own weapons, or if there are indications that Communist China possesses nuclear weapons. The peoples of both nations would view the use of nuclear weapons in almost any circumstances as an unmitigated disaster.

23. Nevertheless, even in India and Japan, the public has become a bit more discerning in its evaluation of Bloc propaganda on nuclear issues over the past year. Soviet advances in weapons technology

have had a sobering effect, and the more truculent tone of Soviet and Chinese Communist propaganda—some of it directed at these two countries—has reminded Japan, and to some extent India, that their security is bound up with the fate of the non-Communist world and with the US deterrent. At the same time there is evidence that the press and informed circles recognize that Soviet propaganda on test bans and disarmament does not always correspond to Soviet actions. There was a strong reaction in both countries to the USSR's resumption of tests in 1958. The *Times of India* stated that the USSR prefers "paper agreement and declarations unsupported by actualities" and complained that Khrushchev is more interested in striking attractive poses than in getting on with the difficult task of genuine disarmament. However, these trends toward a more discerning view of the Soviet position have not resulted in greater support for the Western position; the US and West are still criticized for what is generally believed to be excessive rigidity and caution in insisting on inspection and controls.

24. In all regions of the non-Communist world, the fears with respect to the nuclear situation show most clearly during periods of high tension and crises. There is generally very little confidence that any but the smallest wars would be fought without nuclear weapons and little faith that such wars could be contained. Strong pressures are exerted against any nation moving unilaterally in a local situation where its actions could eventually involve other friends or allies. There is considerable support for UN intervention to observe, control, and police areas in which there is a threat to the peace.

25. In popular thinking about local wars little attention has been given to the possible implications of small (under one KT) nuclear weapons. The prevailing view appears to be that there is little difference between large and small weapons in terms of the difficulties involved in limiting the conflict or in the nondesirability of their use. The public is generally not impressed by distinctions between "clean" and "dirty" weapons.

26. Not all believe that small wars involving nuclear weapons would lead inevitably to big wars. There is, for example, a small but vocal group in the UK which has advanced the thesis that the balance of nuclear power among the great powers would serve to enforce caution in any local conflict involving great power interests, whether or not nuclear weapons were used. According to this theory, both sides would appreciate that the costs of total satisfaction in the local conflict might be the progressive raising of the ante to the general war level. Given this appreciation, there would follow a tacit understanding to limit objectives and to restrain the tests of arms and wills to the local area, as in the Korean War.

27. Finally, it should be said that there are various groups in the world, perhaps most articulate in India, who believe that the strategy of deterrence and the piling up of armaments can have only one end—nuclear holocaust. A small group in the UK which holds such views has been actively promoting an old ideal, pacifism, updated for the nuclear age. This group advocates the unilateral scrapping of all Western nuclear armaments, depending on moral strength to deter and overcome Soviet military strength and its materialistic philosophy. To date, however, pacifism has relatively few adherents and has not caught the imagination of youth to the extent that it did in the early 1930's.

B. The Sino-Bloc Bloc

28. There is little positive information available with respect to popular attitudes within the Sino-Soviet Bloc. We believe that the people on the mainland of China know little more than they are told by the regime about nuclear weapons. If this is true, only informed and sophisticated circles would have a realistic understanding of the power of nuclear weapons and of the West, both of which have been derided as "Paper Tigers." While the Chinese Communist leaders have reportedly mentioned in private the possibility of 300,000,000 casualties on the mainland in the event of nuclear warfare, they have publicly emphasized that the Socialist bloc would triumph and that the cause of world communism would be advanced if the imperialists should start a nuclear war. In any event, the regime appears capable of limiting the expression of any fears concerning nuclear war that may exist.

29. The experience of numerous observers in the USSR indicates that there is widespread concern over the chances of war. However, the people appear largely convinced that their government is working sincerely for peace and disarmament.

III. EFFECTS ON GOVERNMENT POLICIES

A. The Non-Communist World

30. The development of nuclear capabilities has exerted a pervasive influence on the foreign policies of practically all nations; on some nations the influence has been profound. Even those governments in areas far removed from the likely centers of possible nuclear conflict are sensitive to the dangers and possible world-wide consequences of nuclear war. The existence of nuclear weapons and the pressure of public opinion have served to make most governments more cautious in the defense of national interests; the dangers of nuclear war have given spur to efforts to negotiate various agreements with the Bloc to reduce tensions and the dangers of war; and nuclear weapons developments have brought forth important changes in defense policies.

31. Nevertheless, it is difficult to isolate and weigh precisely the influence of the nuclear weapons situation, even in the case of defense

policy. National policies reflect the working of other important factors—the basic incompatibility of Communist and Free World objectives, the reduced power position of Western Europe as compared with the US and the USSR, the dependence of much of the non-Communist world on the US for strategic security, and the continuing search of the peoples and governments in the former colonial areas for a solution to insecurity, want, and the problems of modernizing their societies.

32. To date European governments have supported the theory that allied forces must be prepared to maintain and use nuclear weapons as an essential support on which they depend in meeting Soviet pressures. Although Norway and Denmark have declined to accept IRBM sites on their territories, they have joined all the other NATO nations in affirming the strategic necessity for a nuclear defense system. In Italy agreements to install IRBMs were in process of completion when the Fanfani government fell. In France negotiations towards this end were stalled by nationalist trends in French policy which have been intensified by de Gaulle's advent to power and not by any basic opposition on the part of the government to nuclear weapons. Even West Germany, which has been subject to a broad range of Soviet threats, including total devastation if it were to permit nuclear weapons on its territory, has approved in principle the equipping of the Bundeswehr with tactical nuclear weapons. Significantly, however, most of the governments involved have proceeded with the utmost delicacy, and have attempted where possible to minimize publicity or public discussion of the IRBM question.

33. Soviet technological advances have not frightened the Western allies into isolation from the US because by-and-large they recognize their ultimate dependence on US protection. But there has been increased concern on the part of some Europeans for the protection of their own local interests independent of their role in the over-all Western defense system.

34. The UK has pushed ahead with its program of developing some deterrent nuclear forces of its own and France is seeking to join the "nuclear club." While there has been some criticism from the British Labor Party over what is described as excessive investment in the nuclear field, this has caused no fundamental turning away from the principal strategy of nuclear deterrence. Recent British defense ministry thinking may indicate, however, that the government is increasingly concerned that there may be insufficient conventional capabilities for limited war situations. There appears to be a tendency in official circles to divide military problems into those which deal with nuclear armament, and those, usually pertaining to traditional British interests outside the NATO area, which do not.

35. Although the NATO governments are determined to maintain a strong and unified defense (at least to the extent that the economic

costs are politically feasible) most remain sensitive to popular pressures for nuclear controls, for disarmament, and for caution in the defense of national interests. While generally able to lead public opinion on issues considered vital, European governments find it necessary, and even desirable, to explore possibilities for negotiations with the USSR, to examine all Soviet proposals, and to choose carefully the propitious political moment for announcing the adoption of any policy which might be attacked as contributing to an increase in international tensions.

36. Moreover, the European governments themselves are extremely sensitive to the dangers of war and are little inclined to support military actions, or otherwise to take a positive position in situations which do not involve their vital interests. At the same time, they are more than ever concerned that their advice and counsel be heard by the US, so that actions will not be carried out unilaterally having ultimate consequences for all. Particularly in France, there is a strong desire for a greater voice in Western policy.

37. The Canadian Government also fully accepts the implications of reliance on nuclear weapons and of alliance with the US. However, Canada desires that the UN be given a greater role and increased capabilities as a mediator and policeman in local disputes, and that disarmament negotiations be pursued more vigorously. Canada has been particularly sensitive to unilateral UK actions during the Suez crisis and to US actions in the Taiwan Straits.

38. It is particularly difficult to assess the impact of the nuclear weapons situation on the Arab states of the Middle East and North Africa. While fear of involvement in nuclear war has been a factor in Arab attitudes towards Western bases, especially in Morocco, these attitudes are primarily motivated by Arab nationalism and local political considerations. Nasser may believe that a nuclear stalemate exists which provides him greater opportunity to maneuver between East and West and greater latitude in subverting the Arab world. But he is probably also concerned over the prospect of the Middle East being turned into a nuclear battleground through miscalculation on his own part or by the West or the USSR. Moreover, his initiative, or lack thereof, in most situations is almost certainly influenced by a host of other considerations which outweigh thoughts about nuclear weapons.

39. Developments in nuclear capabilities over the past year served to convince the Indian Government even more of the basic wisdom of its neutralist foreign policy, which derives from historical, cultural, and religious factors as well as from an obsession with the consequences of nuclear war. The people provide strong support for the official view that pacts and alliances increase tensions and that the nuclear armaments race only insures a greater catastrophe at some future time when heightened tensions and a fatal miscalculation may result in general

war. The government's concern that disarmament be tackled as a priority world problem has been intensified by the advent of ICBMs. While recognizing that practical security problems are involved in the disarmament issue, the Indian Government exerts every effort to encourage both the US and USSR to make gestures and concessions that might lead in time to substantial disarmament agreements.

40. The Japanese Government continues to rely on US deterrent power for security. Developments in Soviet nuclear capabilities have not weakened its determination to remain allied with the US. At the same time, the strong popular revulsion to nuclear weapons and awareness of Japan's vulnerability to nuclear attack have impelled the government to take measures to minimize the risks of Japan's involvement in nuclear warfare. In pursuit of this objective the government opposes the introduction of nuclear weapons into Japan and seeks revision of the US-Japanese Security Treaty to give Japan a veto over the operational use of US bases. We believe that the Japanese Government would consent to the use of US bases in Japan for the launching of air attacks, nuclear or otherwise, against targets on the mainland of Asia only if Japanese leaders were convinced that Japan itself were directly threatened.³

B. The Sino-Soviet Bloc

41. Soviet thinking and foreign and military policy have been strongly influenced by a growing appreciation of the power of nuclear weapons. The Soviet leaders have made strong efforts to build a substantial nuclear capability of their own, but they have continued to maintain and strengthen a broad range of nonnuclear capabilities.⁴

42. They have also tried to reduce the military and political usefulness of US nuclear capabilities by attempting to make US overseas bases untenable and by increasing the inhibitions attached to any use of nuclear weapons. Recognizing the world-wide fear of nuclear war, the USSR has sought to garb itself with slogans of "peace," to adopt attractive and simplified positions on disarmament, and to emphasize the dangers that go with any association with the US defense effort.

43. The development of nuclear weapons and their potential for devastation in war probably played a major role in the 1956 revision in Communist doctrine, which now holds that military conflict with the capitalist states is no longer "fatally inevitable." This revision was

³ For fuller treatment see NIE 41-58. "Probable Developments in Japan's International Orientation," 23 December 1958. [Footnote is in the original.]

⁴ For a fuller discussion of Soviet strategy see paragraphs 99-117 of NIE 11-4-58, "Main Trends in Soviet Capabilities and Policies, 1958-1963," 23 December 1958. [Footnote is in the original.]

part and parcel of a new emphasis on political means of struggle which became increasingly evident after the death of Stalin.

44. The USSR's activities in its struggle with the West continue to be manifest principally in the political and economic realms. The image of military strength resulting from Soviet advances is, however, an integral part of the setting in which the USSR pursues this struggle. Moscow evidently regards its real and presumed military strength as a significant asset in political warfare. Soviet leaders probably estimate that if they launched a general war at present, even with surprise nuclear attacks, the USSR would suffer unacceptable damage from US nuclear retaliation. On the other hand, they are probably confident that their own nuclear capabilities, even though not as great as those of the US, have grown to the point where they constitute a powerful deterrent to the US. It is therefore probable that in the Soviet view both sides are now militarily deterred from deliberately initiating an all-out nuclear war or from reacting to any crisis in a manner which would gravely risk such a war, unless vital national interests at home or abroad were considered to be in jeopardy. However, we believe the Soviet leaders do not exclude the possibility of nuclear war resulting from accident or miscalculation.

45. While we believe that the Soviet leaders do not at present intend to pursue their objectives by employing their own forces, they will recognize, particularly in consequence of the policies they are pursuing to compel a retraction of Western power by political means, that situations might arise in which the use of force would seem essential to one side or the other. In such situations the Soviets would prefer to provide logistic and other support for local operations in which only non-Soviet forces participated directly. Their objectives in such operations would be limited, and they would seek to avoid direct Soviet involvement, to limit the geographic area of engagement, and to prevent the use of nuclear weapons by either side.

46. Soviet planners probably consider, however, that such limitations might be impossible in some instances, and that encounters between their own and Western forces might result. In this event, they would prefer to minimize the amount of force employed in such situations in order to limit the scale of conflict and the degree of their own involvement as much as possible. For example, they would almost certainly wish to avoid the use of nuclear weapons. In deciding whether to employ their own forces in any particular local situation the Soviets would have to balance the risk of provoking a train of counteractions, possibly leading to general war, against the stakes involved in the area of local conflict. They probably believe that the West's military posture and doctrine rest increasingly upon the use of nuclear weapons, even in limited wars. But they probably also view their own nuclear

deterrent capabilities as already having raised the threshold at which the West would react in such a manner. Thus, they probably believe that the opportunities for pressures against Western positions and for bluff have been enhanced.

47. The Chinese Communist leaders were among the first to proclaim that Sputnik shifted the strategic balance of power decisively in favor of the Bloc and they have been calling for a more assertive policy to exploit this alleged shift. Moreover, their propaganda line has been that a nuclear war would mean only the final defeat of capitalism. Nevertheless, we believe that Chinese Communist conduct in the Taiwan Straits situation is evidence that they are sensitive to the nuclear power of the US.

IV. PROBABLE TRENDS IN ATTITUDES AND POLICIES

48. Barring an effective disarmament agreement, the people and governments of the world will almost certainly be confronted with a continued growth in nuclear weapons capabilities. Technological advances will bring a further diversification of weapons types and some reduction in the costs of production of certain nuclear weapon systems. In this situation there will probably be a gradual spread of nuclear capabilities to "fourth countries."

49. The continuation of the nuclear armaments race and the development of nuclear capabilities by "fourth countries" will occasion fresh outbursts of concern throughout the world. There will almost certainly be, from time to time, renewed and vigorous demands for a cessation of nuclear tests and for measures to control the deployment and use of nuclear weapons. But the dominant trend in public attitudes will probably be one of apathy or resigned acceptance of the existence and development of nuclear capabilities. In the main, peoples and governments are conditioned to living with the threat inherent in the existence of modern nuclear weapons, and we believe that future developments in the nuclear weapons situation are not likely to produce any sudden or marked changes in present attitudes or policies over the next few years.

50. Nevertheless the development of nuclear weapon systems of increasing range, accuracy, and sophistication will continue to influence strongly the conduct of foreign policies. There will probably be a tendency to caution, and if possible to compromise, in disputes which might involve the interests of the great powers and precipitate nuclear war. Neutralism may become increasingly attractive as a means of escaping responsibility for and involvement in the great power struggle between the US and the Sino-Soviet Bloc, although the extent to which this will occur will depend upon a number of contingent developments.

51. Developments in US policies and nuclear capabilities will have great effects on the policies of both those nations committed to the West and the countries which already are neutralist. The entire non-Communist world will watch closely for any sign that the US deterrent is becoming less effective because of technological factors or that US determination to stand beside the exposed and threatened areas of the world is weakening. If members of the Western Alliance came to believe that the US was using technological advances to reduce its military presence overseas it would become increasingly difficult to convince the peoples and governments of Western Europe and Asia that the US remained willing to defend their interests. In this case, a further development of the present trend toward a hard line in Soviet policy leading to increased fears of the changes of general war might cause some members of the Western Alliance to weaken their commitments to the Alliance. Particularly in those countries which might have developed a modest nuclear deterrent of their own, there might be a disposition to flirt with the idea of neutrality. Certain nations around the periphery of the Bloc might lean toward the Bloc in an effort to gain security through accommodation. A belief in the West that the US had fallen behind could contribute to neutralist trends and greatly complicate the problem of maintaining a firm united front against Soviet probes and pressures.

52. If US technological advances and policies lead the Free World to remain confident that the US will defend local interests against Soviet aggression, Soviet efforts to exploit their own growing capabilities could have the opposite effect. Soviet probes and pressures could continue, as in the past, to serve to convince the people of Western Europe that neutralism, unless supported by a formidable indigenous nuclear capability, offered no surcease from Soviet pressures nor a workable substitute for common defense. A similar reaction might develop in Japan, which has generally reacted stoutly to Russian threats. Indian leaders at the national level are already showing increasing concern over the external and internal Communist threat. They probably see in recent criticism of their policies in the Communist press indications of less sympathetic and cordial state relations. We believe that privately, at least, they may adopt a less critical attitude toward Western defense measures and might show greater understanding for Western suspicions of Soviet behavior. Similar tendencies will probably develop in the UAR if the USSR continues to countenance, if not actively to support, serious subversive efforts in Syria and Iraq.

53. At the same time, the development of offensive and defensive weapon systems will complicate the problem of assessing the relative balance of military power and the effectiveness of deterrent forces at any given moment. It is possible that one side or the other will believe itself to possess a temporary and substantial military advantage when it does not, or will believe that it is substantially inferior when it is not.

Such beliefs could have a profound influence on the conduct of national policies and on the world situation. The complexities of this situation and the many unknown factors involved will make for continuing and growing uncertainties.

54. A period of rapid change in weapons development and of uncertainty as to the relative balance of military power could put an increasing premium on striking the first blow. As the time period required for preparation of a devastating attack diminishes, the problem of interpreting the intent of the other side—particularly during periods of crisis when precautionary military activities had been initiated by both sides—will become even more critical. The relatively greater certainty of retaliation resulting from the development of mobile missile systems or hardened sites would strengthen the operation of the deterrent on both sides. Even so, either side might decide that the deterrent effect of the other side's strength or posture was outweighed by the necessity to launch the first strike as the best hope for survival.⁵

55. We are unable to reach any confident judgments on the probable reactions of peoples and governments in the event general war between the US and the USSR appeared imminent. Under some contingencies, there would be no time for public opinion to operate; the actions of the governments would depend on quick judgments.

56. In a situation of a more gradual buildup of tensions, Soviet threats might induce widespread anxiety and consternation. Unless confidence in the ultimate effectiveness of the Western deterrent could be maintained, the USSR might be able to induce several of the less resolute governments in Western Europe, the Middle East, and Asia to proclaim their neutrality and to deny the US access to bases or military facilities in their territories. Fundamental changes in popular attitudes and official policies could come with little warning in the midst of a crisis situation. Such changes might also come about as a result of unexpected demonstrations of the effect of an important technological breakthrough.

⁵ The Assistant Chief of Staff for Intelligence, Department of the Army, and the Assistant Chief of Naval Operations for Intelligence, Department of the Navy, would prefer that this paragraph be deleted but would accept its inclusion if the following language were added:

"In any case, we do not believe that the Soviet leaders are content with the *status quo*, either in the military or political field. They will almost certainly push ahead in their efforts to achieve a clear military superiority over the US. But despite further improvement in Soviet capabilities over the next five years, we believe it unlikely that the USSR will become confident that it can attack the US without receiving unacceptable damage in return. This judgment assumes the maintenance and improvement of US armed strength and the absence of an unforeseen Soviet technological breakthrough of major military significance."

The Director of Intelligence and Research, Department of State, would recommend inclusion of this additional language in the body of the estimate without qualification. [Footnote is in the original.]

57. Although some additional nations will probably obtain nuclear weapons in one way or another, there will almost certainly continue to be strong moral and political inhibitions on their use. Indications are that the people of Western Europe would approve their use in the defense of vital interests, particularly to defend against local or general Communist attacks in the European area. But we believe that fears of the consequences of nuclear war are so deep and profound that no European government would actually accede to the use of nuclear weapons in local conflicts anywhere until efforts at a negotiated settlement had clearly failed or a critical blow to Western security appeared imminent or had actually been struck.

58. It is possible, however, that development of extremely low-yield weapons might bring, in time, a substantial shift in public attitudes so that use of such weapons would be viewed as proper in local conflicts. But we do not foresee an early lessening of the political and psychological restraints on the use of nuclear weapons.

422. Telegram Secto 9 From London¹

London, February 5, 1959, 3 p.m.

Secto 9. Re Secto 7. Secretary this morning discussed with Lloyd and Ormsby-Gore, and subsequently with Macmillan, tactics in nuclear test negotiations. The Secretary noted our “basic charter” on controls matter is as President had expressed it to Macmillan, that central issue is whether Russians will accept a real controls system, and re duration that we can accept in principle that ban on tests would be indefinite, withdrawal from or suspension of treaty being possible if controls system not being installed on schedule or not being operated properly.

Although Ormsby-Gore initially suggested US and UK committed to introducing duration article, and failure to do so might permit Russians to evade discussion on controls, Secretary read Supnu 243 as indicating we are not, repeat not, so committed.

Reviewing language of draft duration article Secretary and Lloyd agreed it questionable whether necessary to specify right of

¹ Source: Account of John Foster Dulles’ discussions with Ormsby-Gore and Lloyd on nuclear test suspension talks. Secret; Niact. 2 pp. NARA, RG 59, Central Files, 700.5611/2-559.

withdrawal, because this an inherent right in any agreement in event of its violation. Secretary said State Department legal experts would study whether Article One, as now agreed in Geneva does not cover point adequately, obviating need for reference to withdrawal in any duration article.

In the end the British agreed that the object of our agreeing to break the link between testing and disarmament had been to focus on control; therefore we will now concentrate on that issue, deferring introduction of duration article until we see whether Soviets will move from their present position on controls and veto; meanwhile on standby basis reexamining between ourselves draft duration article. It was also agreed with the Prime Minister that if conference comes to breaking point on control issue we must find effective ways to dramatize the point, such as taking it to the United Nations or considering letters from Prime Minister and President Eisenhower to Khrushchev.

Regarding the "fall back position" the Secretary mentioned last night re reciprocal forbearance with continuing negotiations on control, it was also agreed that this matter will have the further urgent study that it needs.

Dulles

423. Record of Telephone Conversation Between Dulles and Greene¹

February 11, 1959, 9:55 a.m.

The Secretary said on the phone re the nuclear suspension test talks in Geneva that it made no difference about the composition as long as they had the veto power. The Secretary said he was not sure but what we should call Wadsworth home and advertise the fact what he is coming home about, indicating it is not worthwhile to carry out talks any longer. The Secretary said if you call the talks off you have the question of having to make a counterproposal—one less farreaching in scope or maybe even unilateral. We propose to do this and we hope the Soviets do the same. That has been McCone's idea and also more or

¹ Source: Possibility of breaking off nuclear testing suspension talks. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, General Telephone Conversations.

less Senator Gore's idea. Mr. Greene mentioned whether we would do this in a letter to Khrushchev. The Secretary mentioned the following language:

In view of your position on veto power and all other substantive aspects of control there is, therefore, no alternative but to advise the course of action on the one hand which will not require controls but which, on the other hand, will spare mankind against the growing race of nuclear extermination. Therefore, we propose for the time being, and until further notice, not to have any more explosions and to confine any explosions to underground. We hope you will do the same. If you will do the same, then at least the main concern of mankind will be satisfied. If you don't do it, then we will have to reconsider.

Mr. Greene mentioned this (above) was more or less as the Secretary had explored with Macmillan.

The Secretary said he would imagine Mr. Herter would have some ideas. Mr. Greene said that Mr. Dillon was following this matter closely. The Secretary suggested calling Herter by phone on the matter.

The Secretary said we should consult with some of the Congressional leaders on this thing.

Mr. Greene, to the Secretary's question re Mr. Merchant's apology, said that Mr. Hoghland had addressed himself to this at staff meeting this morning, saying that the *Post* reporters had been inaccurate in their account. Hays was in a very unfortunate frame of mind, etc. Mr. Greene said he had not been able to talk to Macomber about this. Mr. Macomber was tied up elsewhere.

Mr. Greene reported the draft to the Soviets had finally gone to NATO. It would probably be delivered the first part of next week.

424. Letter From Herter to McCone¹

Washington, February 16, 1959

Dear John:

We have carefully considered the views and recommendations set forth in your letter of February 2 to Secretary Dulles concerning the

¹ Source: Rejects AEC position on nuclear testing suspension talks. Secret. 1 p. NARA, RG 59, Central Files, 700.5611/2-259.

current Geneva negotiations on suspension of nuclear weapon tests. This letter confirms the position expressed by Mr. Dulles in his meeting with you on January 30, and by Mr. Dillon during a further discussion on February 12.

We understand and appreciate the difficulties involved in working out an adequate technical system for detecting and identifying certain types of nuclear explosions. We continue to believe, nevertheless, that the over-riding need at the present time is to maintain pressure on the Soviet Union with regard to the key political issues of the organization and functioning of the Control Organization. So long as the Soviets maintain their demands for a veto and for staffing of control posts in the Soviet Union with their own nationals, no technical control system, whatever its capabilities, could be effective.

Your suggestion for an agreement involving atmospheric testing only as an initial step is, as you know, one which we believe should be reserved as a possible full-back position for use in the event the present effort fails.

With warmest personal regards,

Most sincerely,

/S/ **Christian A. Herter**
Acting Secretary

425. Memorandum of Conversation¹

Washington, February 17, 1959

SUBJECT

Geneva Nuclear Test Negotiations

PARTICIPANTS

The Acting Secretary
Mr. Kohler—EUR
Mr. Spiers—S/AE

Sir. Harold Caccia—U.K. Ambassador
Mr. John Roper—U.K. Embassy

Mr. Herter said that he had asked for this meeting to reiterate our view about the necessity of Western firmness on the control issues in the Geneva nuclear test negotiations. There had been no apparent

¹ Source: U.S. firm position on control issues in nuclear testing suspension talks. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/2-1759.

softening in the Russian position on the questions at issue and we felt there should be no softening in our own position. He wanted to emphasize that the U.S. could not consider compromises in its position on the basic control questions, since to do so would run the risk of producing a treaty which the Senate would not consent to ratify. There was also a strong feeling on our part that the inspection provisions which might be adopted in the present negotiations would serve as a precedent for future arms control arrangements and thus bore an importance beyond the immediate situation. He thought it well to re-emphasize this position prior to Mr. Macmillan's visit to Moscow.

Ambassador Caccia said that the subject would undoubtedly be raised by the Soviets with the Prime Minister and that he would transmit Mr. Herter's views, which he thought were sound and represented the approach agreed upon between the Secretary and the Prime Minister during the former's recent visit to London. Sir Harold then raised the question of the Department's reactions to the memorandum which Mr. Roper had delivered to Mr. Farley on February 10 containing U.K. suggestions on how to deal with two of the points in the Soviet veto list. Without getting into the details of the British suggestions, Mr. Herter observed that he felt generally we should not advance proposals for getting around the current impasse but rather should see if the Soviets were prepared to moderate their own position in any respect.

(After the meeting Mr. Herter authorized Mr. Spiers to discuss our detailed comments on the British memorandum with the U.K. Embassy.)

426. Letter From Macmillan to Eisenhower¹

London, February 20, 1959

TEXT OF MESSAGE

My dear Friend,

Before I leave for Moscow, I want to tell you once again how much importance I attach to the conference at Geneva on nuclear tests, and how much I hope it may prove possible for us to reach an agreement on this subject with the Russians.

¹ Source: Extols virtue of agreement on suspension of nuclear testing. Secret. 4 pp. NARA, RG 59, Presidential Correspondence: Lot 64 D 204, Macmillan to Eisenhower.

Any agreement is bound to include certain disadvantages and risks. The main disadvantage, of course, is the handicap an agreement would impose on our ability to improve the nuclear deterrent. The main risk is that the Russians would find some means of evading the agreement, which we could not do. You and I both know how serious this disadvantage and this risk would be. What we have to do, it seems to me, is to judge and balance up whether the advantages an agreement might bring to us would outweigh the disadvantage and risk it would entail.

I will not make any attempt in this message to estimate the disadvantage and the risk. But I do want to tell you that I am very deeply impressed by the advantages which an agreement might bring us. I think it would do three things, each of which would be very important. It would reduce tension. It would hinder the spread of nuclear weapons to other countries. And it would provide a pilot scheme and a precedent for controls in other fields.

How much would all this be worth to us? I want to tell you that I myself sincerely believe it would be worth the extra risk involved in our accepting something less than perfect control. Perfect control is in any case almost impossible in theory and quite impossible in practice. It seems to me that if we can create a control system which involves a sufficient degree of risk to a potential violator that he cannot get away undetected with a violation of the armament, then we shall have done enough to justify our accepting the [illegible in the original] and risks involved. This seemed to be Foster's view when he was with us two weeks ago.

I have the impression the Russians still want an agreement. The most likely explanation seems to me to be that they are concerned about the spread of nuclear weapons to other countries and they dislike the mounting cost of these nuclear programs. So do both of us; and to that extent we have a common interest with the Russians. Whatever be their motive, I feel we still have some prospect of reaching agreement with them, provided they drop some of their present demands and provided we insist only on such a degree of inspection and control as is necessary. While we must certainly press them to go further than they have so far shown themselves ready to go, I think we must remember that they have already come some way toward accepting foreign control, further indeed I think than either you or I would have expected a year ago. The French have a saying that the better is the enemy of the good; I think it applies to our present position in relation to this conference.

Do not think for one moment that I am ready to compromise on essentials. I agree entirely that we cannot accept the present Soviet position under which they would retain a veto over the crucial operations of the control system, in particular the despatch of inspection teams. On this, and on the related question of a veto over findings of a violation

of the agreement, our people put some ideas to your people in Washington last week. They were designed to build into the agreement an automatic right for us (and the Russians) to have inspections. But as clearly neither of us will be physically able to inspect every unidentified event, we felt it would be necessary to agree on some annual upper limit of inspections.

I am sorry to say your people have expressed a good many reservations about this plan. They seem to have thought of it as a concession to the Russians. I regard it as just the opposite, because its purpose is, while protecting all our essential requirements, to nail them down on the veto, and to make their position in asking for a veto still more untenable.

I have no doubt this conference will be mentioned while I am in Moscow. You can rely on me to press Khrushchev hard about the veto.

With warm regards,

As ever,

Harold

427. Memorandum From Eisenhower to Herter¹

Washington, February 21, 1959

I attach a copy of a message have just received from Harold Macmillan. Since he is now in Moscow, I am uncertain as to whether or not he expects an answer, particularly in view of the closing sentence of his message.

The message seems to be ambiguous. Mr. Macmillan speaks of his readiness to accept something less than “perfect control.” Both Foster and I have already indicated that we do not press for an elaboration of the mechanics of an inspectional system so that we could be sure that any nuclear explosion, no matter how small its size nor where exploded, could be detected. But we are insistent that such stations as are agreed upon be allowed to function without interference from the government in those territory the stations are set up. In any agreement to which we would be a party, we cannot countenance a veto

¹ Source: Comments on Macmillan message on nuclear test suspension negotiations. No classification marking. 1 p. Eisenhower Library, Whitman File, Diary Series.

either in the establishment of the detection system or in the carrying out of procedures and examinations authorized by the agreed plan.

We have already agreed that the cessation of tests need not be connected with any feature of disarmament, but we must be quite clear that our arrangements must operate so effectively that they give to each side the assurance that the inspections will be freely and honestly carried out and in accordance with the agreed plan.

If you believe that we should send anything to Macmillan while he is still in Moscow, please let me know.

D.D.E.

428. Memorandum From Herter to Eisenhower¹

Washington, February 22, 1959

SUBJECT

Reply to Prime Minister Macmillan's Message of February 20

I enclose a suggested reply to Prime Minister Macmillan's letter of February 20 to you about our position in the Geneva nuclear test suspension negotiations.

If you approve the response I propose to pass it to the British Embassy on Monday morning for transmission to the Prime Minister in Moscow.

Acting Secretary

¹Source: Transmits proposed reply to Macmillan letter. Secret. 3 pp. NARA, RG 59, Central Files, 700.5611/2-2259.

Enclosure

Suggested Letter From Eisenhower

February 22, 1959

Dear Harold:

I agree with the points you make in your message of February 20 about the importance of the negotiations in Geneva and the advantages which would come to us from a sound agreement. I agree also that perfect control is impossible, both in theory and in practice. However, I am firmly convinced that it would be folly for us now to relax our position in any way; the Soviets are making no signs of movement toward us on the crucial issues.

I concur that an agreement with the USSR on nuclear testing will establish a precedent for controls in other fields. This point concerns me very much. It reinforces the need to continue to press the USSR for a satisfactory agreement on fundamentals before moving to other issues. The important points are the way inspection is organized and the procedures to insure rapid dispatch of inspection teams. We cannot accept any impediments to dispatch of inspection teams. We must be careful that the staffing pattern of the control posts is not such as to interfere with the integrity of the collection and transmission of data. We must be sure that the voting procedures do not legalize obstruction of the operations of the control system. I am sure that you will agree with me that on these points we must be absolutely firm.

Our fear about your proposal for setting an annual upper limit on inspections is that it would get us into negotiations on numbers without agreement on the basic elements of inspection and control. Further, there would be ever-increasing pressure on us, once we accepted the upper limits principle, to go lower and lower until there would no longer be an acceptable level of deterrence. Therefore, I believe we should contemplate no proposals of this type until and unless the important points I have described above are satisfactorily settled.

With warm personal regard,

As ever,

429. Telegram Supnu 294 from Geneva¹

Geneva, February 23, 1959, 2 p.m.

Supnu 294. Following are US del ideas on how a possible recess might be handled and what might be done after a recess:

1. As outlined in Supnu 293 we believe final days of conference should be focused on veto. We would then envisage statement by Western delegations that failure to achieve agreement on central issues of control, namely, veto, staffing, inspections, demonstrated necessity to recess conference and report to individual governments to see what further measures might be devised to assist agreement on these key issues. Statement could include idea that Soviets had obviously not yet been convinced of reasonableness Western position on control by US and UK delegations; therefore desirable to refer issues to wider international forum in order to secure the judgment of world community. Therefore Western delegations expected their governments would call for meeting of UN Disarmament Commission.

2. Letters from President and UK Prime Minister to Khrushchev could be used to dramatize Soviet intransigence on basic issues. If letters sent before planned recess and did not contain specific reference to stopping conference Soviets would have opening for reply which might make it difficult not further prolong negotiations. On other hand it might not be desirable to have call for recess first made by Presidential letter. Accordingly delegation tends believe letter from President should be sent on heels of rather than before recess.

3. In separate message we will outline our ideas on fallback position with regard to tests. In general we think it will be useful if announcement could be made that for some period of time US would forego that kind of tests for which there now exist adequate means of detection without an international control system. This would of course mean atmospheric tests. It would also be helpful if US announced that in addition to underground weapons development tests it was going to undertake underground testing in attempt further to develop knowledge of how effective controls of such tests might best be established and would solicit Soviet cooperation in studies along this line. US could reserve right to test at high altitudes if adequate measures for control this type test not found and agreed. Point elimination of atmospheric tests would remove radioactivity hazard might perhaps not necessarily be made in initial announcement but could of course be used to elicit

¹ Source: U.S. Delegation ideas on handling a recess in nuclear testing suspension talks. Secret. 3 pp. NARA, RG 59, Central Files, 700.5611/2-2359.

favorable response US position. Question of timing announcement of such a fall-back position requires consideration. On balance delegation believes that it would be better to have such announcement made immediately after recess and probably in Presidential letter. It would then have maximum impact in lessening disappointments occasioned by recess of Geneva negotiations. If announcement were deferred until close of Disarmament Commission meeting we would also be exposed to pressures for various different kinds of schemes and would not have advantage of starting out with own proposal.

4. We do not believe a meeting of Disarmament Commission can be avoided in any event and also think it could serve useful purpose from US point of view. Accordingly believe US and UK should take initiative in calling for Disarmament Commission meeting to consider results of negotiation thus far. Believe it might be difficult to get resolution in Disarmament Commission which clearly states acceptable basis for resumption of negotiations. Accordingly tentatively believe type of resolution should be sought which gives general endorsement importance effective international control and suggests that governments concerned attempt to reach agreed basis for further negotiations.

5. We believe some merit in idea appearing to keep negotiations going by some continuing discussion through diplomatic channels. Such discussion might be labelled as devoted to purpose of establishing sound basis for resumption negotiations and in particular for achieving preliminary agreements on basic issue of control adequate to warrant resumption Geneva talks. Call for further negotiations through diplomatic channels might therefore be included in Disarmament Commission resolution.

6. Believe some consideration should be given to utility consideration question resumption of negotiations in proposed Foreign Ministers meeting in German problem. It might be difficult to find good reason for not having discussion this question on the side by three powers concerned at such a meeting if Soviets or members DC proposed such discussion. If it were desired to avoid such discussion at Foreign Minister meeting possibility might be explored having disarmament meeting begin two weeks or so after beginning Foreign Ministers meeting rather than shortly after recess. If on other hand no major objection to discussing question on side at Foreign Ministers meeting this might be used as one response to kind of resolution in Disarmament Commission suggested above.

Villard

430. Letter From Herter to Goodpaster¹

Washington, February 25, 1959

Dear Andy:

I am enclosing herewith a copy of a message from Prime Minister Selwyn Lloyd which I received from the British Embassy this morning at the same time that a copy of the message from the Prime Minister to the President was delivered. I think the President will want to see it because it has some connection with the latter message.

With warmest personal regards,
Most sincerely,

Christian A. Herter
Acting Secretary

Enclosure

Message From Lloyd to Herter

Washington, February 25, 1959

Dear Chris:

Mr. Selwyn Lloyd has asked me to give you the information in the enclosed note on points which have so far arisen in the discussions with the Soviet leaders on disarmament. This note does not cover the topics dealt with in the Prime Minister's message of last night to the President of which I enclose a copy.

Yours ever,

/s/ Sammy

Attachment

Note From the British Embassy

DISARMAMENT

The Russians have responded to all suggestions about control by revealing a positive mania about Western intelligence activities directed against them under cover of proposals for inspection and control.

¹Source: Transmits message from Lloyd to Herter providing a readout of Macmillan's talks in Moscow. Secret. 4 pp. Eisenhower Library, Herter Papers, Miscellaneous Memos.

We have discussed the Nuclear Tests Conference, surprise attack and disarmament in general. On the Nuclear Test Conference it has been made very clear to the Russians that if they maintain their veto proposals in their present form, there will be no agreement. Mr. Khrushchev in return has made it clear that he is not interested in an agreement under which only nuclear tests conducted in the atmosphere would be prohibited.

On the cut-off, Khrushchev has been pressed hard to express some willingness to agree to discuss it. At first he showed extreme reluctance saying that without prohibition of the use of nuclear weapons it would be unacceptable. Later on he went a bit further saying that the matter could be looked into; he would like to exchange views on it and hear more about it, for it was an interesting problem.

On surprise attack, our exchanges have revealed no change in the Soviet position. They have argued pretty effectively against priority for a technical approach in this field. Khrushchev's conclusion was that the positions of the two sides were far apart, and perhaps a start should be made somewhere else. At no time has he pressed for a resumption of the surprise attack conference.

We had a long discussion on the best method of approaching general disarmament talks. Somewhat contrary to our expectations, the Russians have not in any way pressed that such talks should be held, nor hinted that they have new general proposals to put forward.

Khrushchev said he was sceptical of the utility of the 82-member U.N. Disarmament Committee or for that matter of any other committee that might be set up. He would be ready to agree to setting up a sub committee of that committee provided it was on a basis of parity. But he thought that to do so would be a waste of time and a fraud on public opinion. It would produce only a marathon in the field of the talks. He thought that the Heads of Governments must set the ball rolling by agreeing on the principles which the experts could then work out.

Khrushchev has indulged in a lot of general and sweeping statements about his readiness and even anxiety for total disarmament, remarking for instance that the Soviet Union was quite ready to give up armed forces altogether and have only a militia for internal security provided everyone else does likewise. Then everybody could control and inspect everybody else as much as they liked. He has described the objective to be sought as that of discovering "a mutual interest in some system of security which would be to the advantage of both sides."

In fact there has been no real give on the Russian side at all, but Khrushchev's approach has been serious and, from his point of view, realistic.

The use of outer space for peaceful purposes has not so far been mentioned.

431. Memorandum of Conference with the President¹

Washington, February 25, 1959, 9:25 a.m.

OTHERS PRESENT

Dr. Killian
General Goodpaster

The President asked Dr. Killian to talk to Mr. Herter concerning our minimum position on inspection in connection with the negotiations on suspension of atomic testing now under way in Geneva. Specifically, he is to examine the limits of the position which might be acceptable to us.

For example, they should consider the acceptability of a system adequate to give assurance against atmospheric shots and underground shots above a certain size. Under this concept, the suspension of tests would be limited to these particular modes.

Dr. Killian said he would go into the matter with Mr. Herter.

A.J. Goodpaster
Brigadier General, USA

¹ Source: Eisenhower request to Killian to talk to Herter about inspection in connection with nuclear testing suspension talks. Secret. 1 p. Eisenhower Library, Whitman File, Diary Series.

432. Telegram Supnu 310 From Geneva¹

Geneva, March 1, 1959, 1 p.m.

Supnu 310. Eyes only for Herter from Wadsworth.

It is important to our position that we be able to present a draft treaty article on duration. We should do this well before a possible recess. This means that if there is any possibility of an early recess, we should table a draft article this coming week.

There have been various drafts on such an article considered from time to time, and I am well aware of the difficulties you face with other agencies in getting agreement on an article which will help rather than

¹ Source: Desirability of tabling article on duration. Secret; Priority. 3 pp. NARA, RG 59, Central Files, 700.5611/3-159.

hurt our public position. I also thoroughly understand the necessity of not proposing a draft which we could not live with if eventually there is a treaty, but I do think that it is possible to have a draft which is simple and which at the same time fully protects all our interests.

I strongly recommend that we propose a one-sentence article along the following lines:

Begin verbatim text.

This treaty shall remain in force indefinitely, provided the provisions of the treaty and its annexes are being fulfilled and observed.

End verbatim text.

I know there are some who argue that there should be explicit mention of the inherent right to withdraw from a treaty if another party does not observe it. I personally am not persuaded of the merit of these arguments. But if it is necessary to make explicit mention of the right of withdrawal, the language I have suggested could be modified to read as follows:

Begin verbatim text.

This treaty shall remain in force indefinitely subject to the inherent right of a party to be relieved of obligations hereunder if the provisions of the treaty and its annexes (including the timely installation and expective operation of the control system) are not being fulfilled and observed.

End verbatim text.

At first sight I know that my suggested language seems to be a radical departure from the complex versions that we have been thinking about up until now. But I do hope it will be given close study because I sincerely believe that it not only would help our public position but that it would also provide us adequate protection if we were to reach agreement. The phrase about the provisions of the treaty and annexes being “fulfilled and observed” provides a basis for unilateral withdrawal in the contingencies of: violation of the treaty by a weapons test; obstruction of the installation or operation of the Control Organization by a party to the treaty; and also failure of any country such as Communist China to adhere to the treaty by the time such adherence has been specified in any agreed phasing provisions of the treaty.

I realize the text I suggest does not cover the problems of suspending the obligations of the treaty in the event there is failure to achieve revisions of the treaty which may be required in the future if the agreed control system does not operate satisfactorily. The text also does not provide for suspension of obligations or other measures to be taken in the event there is nuclear explosion in the territory of a country which is not a party to the treaty. But neither of these contingencies really needs to be covered in a draft duration article. The appropriate time to

put forward treaty language to take care of these contingencies has not yet arrived and omission of such provisions now does not in any way preclude us from introducing them at a subsequent state if the negotiations either continue or are renewed after a recess. Provisions of this type could be put forward at a later time, possibly in a separate article dealing with how the Control Commission might make reviews of the effectiveness of the control system. Largely because of the unresolved question of just how we are going to handle the problem of threshold, we will not at any time while we are here state that we have tabled all the articles that we propose. We will always say that there may be further articles which we may recommend in the light of further discussions. Accordingly, we will not be precluded from tabling additional articles or additions to our present draft articles later on if necessary.

I hope very much you will agree with my suggestion that we slim down a duration article and put forward as a simple one-sentence text. And I hope that you will be able to secure agreement to such a text from the other agencies concerned. I am sure we would have no difficulties at all in getting the British to go along with such an article.

I believe that Khrushchev's recent speech has made our position here look better than ever. It should also assist us greatly in securing agreement from the British to recess the present negotiations. The one thing we really need to round out our position is a duration article. We need one quickly. I think the kind of article I have suggested would help us immensely.

433. Memorandum From Twining to McElroy¹

JCSM-71-59

Washington, March 2, 1959

SUBJECT

Surprise Attack Study Group (U)

1. Reference is made to a memorandum, dated 23 January 1959, by the Military Advisor to the Assistant Secretary of Defense (ISA), subject as above, which requested that the Joint Chiefs of Staff evaluate and

¹Source: Conveys JCS views on formation of a group to study problems of surprise attack. Secret. 5 pp. Library of Congress, Twining Papers, Chairman's File.

submit comments on a proposal by the Secretary of State concerning the formation of an inter-governmental ad hoc group to prepare a study of the problems of surprise attack and related disarmament proposals.

2. The recent Geneva Conference of Experts on Surprise Attack was suspended with recognition that revised terms of reference were needed before the Conference could reconvene. The State Department proposes that the U.S. approach on the surprise attack problem should be broadened to include arms control measures. The Joint Chiefs of Staff believe that U.S. preparations for a new series of meetings require different terms of reference than those proposed by the Secretary of State.

3. The national security implications of the various arms control measures, that could be considered in a new and less restricted conference on surprise attack, appear to demand, as a first step, a broad U.S. review of disarmament matters from a wider viewpoint than that of surprise attack alone. Such a review would provide a basis for evaluating the surprise attack threat in terms of other threats to U.S. security, and for determining what effect the attainment of safeguards against surprise attack would have upon the over-all U.S. defense posture.

4. The Joint Chiefs of Staff believe that:

a. In view of the actions separating the Arctic Zone proposal, outer space considerations, suspension of nuclear weapons tests, and technical discussions on surprise attack from the August 29, 1957 Four Power disarmament package, there is an urgent need to review existing U.S. disarmament policy for consistency with these actions and national security requirements. The Disarmament Policy Review Working Group, which initiated such a review on 7 April 1958, should complete its action and propose necessary revisions. Within the framework of the revised policy, U.S. positions relative to disarmament measures including safeguards against surprise attack, could be developed by the proposed ad hoc study group. If, however, political considerations preclude completion of an over-all review of our present disarmament policy, by the Disarmament Policy Review Working Group, within the apparent time limitations, it may be necessary to develop U.S. positions relative to disarmament measures within the framework of existing disarmament policy.

b. The objective of the study proposed by the Secretary of State should be limited to the development of recommended U.S. positions on disarmament measures within current U.S. disarmament policy. The surprise attack problem should be considered within this context. The reverse approach would be unwise since the surprise attack problem is but one element of U.S. disarmament policy. Such an approach might lead to conclusions which are unacceptable within the framework of over-all basic national security policy.

c. Current U.S. disarmament policy does not include limitations on combat readiness of U.S. forces and limitations on deployment or operations. The Study Group proposed by the Secretary of State should restrict its considerations of measures which might place limitations on the combat readiness of U.S. forces to the development of

data necessary to counter proposals of this nature that have been or are likely to be made by other parties.

d. The draft terms of reference for a Study Group on Disarmament Measures, attached hereto, should be substituted for the terms of reference for a Study Group on Increasing Protection Against Surprise Attack, proposed by the Secretary of State.

e. In the event that Mr. William C. Foster is not available to direct the Study Group, a senior U.S. Military Officer should be appointed. However, if Mr. William C. Foster, or an individual of similar stature, should assume the responsibility of the Chairman of the Study Group, a senior U.S. Military Officer should be designated as the Director of the Study Group Staff. In any event, the consultants should include at least one military officer.

For the Joint Chiefs of Staff:

/S/ Arleigh Burke
Chief of Naval Operations

Appendix

PROPOSED TERMS OF REFERENCE FOR THE AD HOC STUDY GROUP ON DISARMAMENT MEASURES

1. The objective of the Study Group is to develop detailed proposed U.S. positions relative to disarmament measures for possible use by a U.S. delegation to an international conference.

2. The study group will be guided in its work by the following:

a. U.S. positions relative to disarmament measures will be developed within existing U.S. disarmament policy.

b. U.S. positions on disarmament measures will maintain, as a minimum, the relative U.S. national defense posture vis-a-vis the Soviet Bloc.

c. U.S. positions relative to disarmament measures which might reduce the combat readiness of U.S. forces and their weapons systems will be developed only for the purpose of countering such measures should they be proposed by other nations.

3. Specifically, the Study Group shall accomplish the following tasks:

a. Identify specific and verifiable disarmament measures which might reduce the likelihood of armed conflict, to include reductions of armed forces and armaments. These measures should be applied to each type of weapons system, together with its using organization; first within limited geographic areas where friction exists or is likely to develop, and then to progressively enlarge geographic areas, finally encompassing all militarily significant nations.

b. Design systems for verifying adherence to the measures identified under subparagraph 3 *a* above. Specify the type numbers, and source of verification personnel, their organization for verification

duties, the conditions required to be met in order for verification personnel to be effective, the equipment requirements, and the initial and recurring costs of the verification systems.

c. Evaluate the possible impact of the measures and systems discussed in subparagraphs 3 *a* and *b* above on U.S. national security interests. Assess the effect of such measures and systems on U.S. deterrent and retaliatory capabilities. Identify those measures and systems which are inimical to U.S. national security; those which are conditionally acceptable and the conditions for acceptance; and those which are clearly advantageous to the United States.

d. Identify U.S. unilateral measures which would be required to avoid a reduction in the U.S. national security position relative to Soviet Bloc nations in the event the measures and systems discussed in subparagraphs 3 *a* and *b* above, were incorporated in an international agreement and implemented.

4. The Study Group shall be furnished necessary military and technical data pertinent to this study and shall receive all necessary assistance and cooperation from the Departments and Agencies of the Government.

5. The Director of the Study Group shall submit a final report of the work of the study group to the Interdepartmental Coordinating Group by _____ 1959.

434. Telegram Supnu 319 From Geneva¹

Geneva, March 5, 1959, 3 p.m.

Supnu 319. Eyes only for Herter from Wadsworth.

I am somewhat disturbed by the tenor of certain newspaper stories concerning "Western agreement" with certain elements of the Soviet veto list, particularly as to possible congressional reaction to such stories. Luther Reid has tried hard to inculcate the correspondents here with the difference between the right of veto on the Control Commission and the acceptance of the necessity for unanimity in a few other parts of the treaty. However, the few stories to which I have reference make no distinction in this regard and give the impression that we have yielded to Soviet insistence on a whole series of vetoes in the Control Commission.

¹ Source: Expresses concern with news reports that U.S. and U.K. have agreed to Soviet veto list. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/3-559.

I feel sure that Department is taking adequate measures to reassure certain key people on the Hill as to exactly what we have agreed to, but suggest that before too long it might be appropriate for Phil Farley to hold a background press conference in which these and other points might be made in order to clarify the U.S. position.

As can be seen from verbatims, both U.S. and U.K. delegations have been sparing no pains to make sure that Soviet distortions of the record on this are corrected immediately, and as of yesterday we received Tsarapkin's assurance that he understood our position perfectly. This, of course, will not stop Soviet propagandists from making whatever hay they may wish to in broadcasts and articles emanating from Moscow, but I would like to feel that the appropriate people in Washington know in advance that such propaganda is distorted and that we have not yielded a single principle in this veto business. As you know better than anyone, denial of a charge by a Senator is 100 times harder than obviating the necessity for the charge by giving him the full picture.

435. Telegram Supnu 323 From Geneva¹

Geneva, March 8, 1959, 5 p.m.

Supnu 323. Eyes only for Acting Secretary. On assumption that no firm decision on recess will be agreed with British until after Macmillan's Washington visit we face here a difficult tactical situation. We have been keeping focus on control issues for a long time. And in the course of the past two weeks we have also been filling out the U.S. position by tabling articles. We expect to table the last important articles, duration and review, Monday. There is not much that we can say now about the control issues that does not get us into danger of either erosion of our position or premature discussion of dangerous issues. There are already pressures from the British for compromises on staffing and inspections and for ways around the veto. In connection with inspection we are already skirting the edges of the tricky issues of threshold and phasing. And in all of this we are hampered right now by difficulties in our local relations with our British colleagues. We are clearly at

¹ Source: Seeks advice on tactics in nuclear test suspension talks. Secret. 3 pp. NARA, RG 59, Central Files, 700.5611/3-859.

a point where we must find ways to avoid the dangers to which we are exposed. Essentially it is a problem of how to mark time until the basic decisions are made in Washington and London.

There are three different ways of marking time which we might follow. The simplest would be to call for a recess of two or three weeks with a definite date set for resumption. We could do this on the basis that Macmillan's discussions in Moscow need to be considered in Washington before the conference here can go ahead. I do not think this course would prejudice whatever decision off may be adopted with respect to stopping or going on with the conference.

It is, of course, not probable that the Soviets would agree to such a course without a good deal of propaganda as to why we are suggesting it. It is however pretty clear to the public already that the conference is in fact awaiting decisions which will depend upon the outcome of discussions while Macmillan is in Washington and it might therefore not be too difficult to justify a temporary recess publicly, by frank recognition of this fact.
