The second possibility is to reduce our schedule of meetings over the next three weeks as much as we can. We have in fact already begun to do this. We secured Soviet agreement to having no meeting Friday and we can do this from time to time in the coming fortnight. Even if the Soviets refused to cancel particular meetings, this tactic still has an advantage since their refusal puts the responsibility of talking on them. However this course gives the Soviets the choice of what we talk about and to that extent is disadvantageous. Even with a reduced schedule we might be faced with eight to ten meetings during the next three weeks in which Western initiative and control would be difficult to maintain.

Finally we could relax somewhat our present sharp focus on control issues and begin talking about the minor things involved in the draft treaty articles that we have already tabled. This would help to avoid the danger of getting prematurely into too detailed discussions on control but would at the same time relax pressures on the Soviets on the key control issues. It would also involve the risk that the Soviets might agree to some of the minor articles which could create a misleading impression of progress in the negotiations and create some awkwardness if our decision is to end up soon.

On balance I believe that from our point of view here a recess of two or three weeks would be the least disadvantageous course of action. I realize that of course you have to take into consideration factors broader than those which influence our thinking here.

Whatever course of action we follow there is one difficulty which I hope we can resolve just as soon as possible. We have of course been careful not to say anything to our British colleagues here about the possibility of a wind-up of this conference. I believe, however, they clearly

sense the fact that we in the past two weeks have not been able to talk with them as frankly as we previously have. We have the impression that as a natural consequence the British delegation here is holding out some of their thinking and not telling us everything that is going on. In spite of some differences of approach we have, during these negotiations, enjoyed the advantage of full and frank cooperation with our British opposite numbers. The fact that we cannot be completely frank with them at this juncture is hurting us now. I hope that in the next day or so we can be authorized to tell them something which will enable them to understand why we must wait for further decisions before we get into some of the questions which they are eager to discuss. I should think it would be at least possible for me to say that we cannot really do anything at all here until after Macmillan's Washington visit. I would hope it would also be possible for me to tell them that there is serious consideration going on in Washington as to whether it is worthwhile to continue the conference at this stage.

Villard

436. Telegram Supnu 325 From Geneva¹

Geneva, March 9, 1959, 7 p.m.

Supnu 325. Eyes only for Herter from Wadsworth. Reference: Supnu 323.

The Sovs today gave what was evidently intended to be an indication of interest in either reducing the number of our scheduled meetings or of having an early recess.

After the regular meeting members of SovDel buttonholed difference members of USDel informally. They all asked whether we thought regular daily meetings were useful since there was obviously so little to talk about now. Tsarapkin asked US staff member what we thought about cutting down meetings to one or two a week and to another member of USDel question was asked what about two meetings a month. Usachev asked Stelle and me what our thinking was about time off for Easter, expressed opinion "US would need perhaps a month to find out where it was going".

¹ Source: Suggests a recess in nuclear testing suspension talks. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/3-959.

Significance of these Sov questions may of course be primarily along lines of trying to find out what we are going to do and specifically whether early break by US in prospect. But it is difficult to interpret questions as not also indicating possible sov receptivity to idea of recess for period of Macmillan's talks and Easter.

Accordingly we feel today that it might be easier than we had assumed yesterday to secure Sov agreement to a recess of three weeks or so after the next few days.

Since Easter comes on the 29th of month it would seem easy to justify a recess until at least a few days after that date.

As a matter of fact if there is any possibility that the UK position in Washington talks is such that we find it necessary to continue these negotiations for considerable period a recess which lasted for some time after the end of Macmillan visit would be highly opportune. In that event we would need through consultation and decisions as to how we were going to proceed. I feel justified by the Russian questions today and by the possible contingency that there might be a decision for further negotiations to put more strongly the recommendation for an immediate recess with a resumption date which I put forward in my yesterday's message.

Villard

437. Telegram Supnu 328 From Geneva¹

Geneva, March 10, 1959, 6 p.m.

Supnu 328. Eyes only for Herter from Wadsworth.

Attitude of SovDel continues be most friendly and inclined be confidential. In three separate conversations this afternoon after plenary session following points raised and indications made.

1. Tsarapkin approached me and brought up subject of headquarters staffing in most friendly and cooperative way, after which he inquired concerning US plans for tabling further articles and virtually admitted he had no instructions for definite action. Also welcomed idea

¹ Source: Further indications Soviets would agree to a recess. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/3-1059.

no meeting tomorrow, although I carefully did not bring up subject in form of US proposal. He admitted to both Sir Michael Wright and me that about all he was prepared to do in immediate future was to "sit and listen".

2. Vorontsov approached Stelle and indicated same general lack of instructions for constructive activity; jocularly suggested that US and UK get together and resolve their differences; gave indication Sov Del appreciated and sympathized US Del would have to await Macmillan trip Washington before major issues could be decided.

3. Akalovsky overheard Usachev (Sov Del) approach Narayanan (Secretariat) with question re "Easter vacation" plans. Narayanan replied that of course usual procedure Secretariat would be to take off Good Friday and Easter Monday, whereupon Usachev said something about starting Easter vacation on or about the 20th March. Narayanan then noted that this would give Secretariat chance to catch up fully on final version verbatims prior to return after recess.

These additional straws in wind reinforce US Del's conviction that Sov Del definitely stalling for time and would not be averse either drastic reduction in number of plenary meetings or outright recess of considerable length over Easter. They are obviously just "going through motions" and asking questions in order kill time during sessions.

Villard

438. Memorandum From Beckler to Killian¹

Washington, March 11, 1959

SUBJECT

Thoughts on Geneva Follow-Up

1. The conclusions of the Panel on Seismic Improvement with respect to the possibility of concealing underground nuclear tests have fundamentally altered the U.S. position in the Geneva conference. For it now appears that even if the Soviets were to accept our conditions for the monitoring of nuclear testing, there is insufficient technical basis for assuming that a reasonable detection network can be devised to assure high confidence in the detection of clandestine tests. One possible exception to this is the fact that automatic detectors in sufficient density in seismic areas might give high probability of detecting intentionally concealed nuclear tests. Although this possibility needs further investigation and study, it is not clear that we would be prepared to seriously advance this system without actual tests of its reliability and non-jammability. Further, such a system may be unacceptable to the Soviets because of the number of inspections required of the detector sites to assure continuous operation of the stations.

Because the conclusion on concealment fundamentally alters the U.S. position at Geneva, it might be well to reinforce the technical conclusion with further examination by other experts. There were only a few members of the Panel who could professionally participate in the conclusion. It would also be well to involve British experts, such as Penney, not only because of his technical competence but because the conclusion on concealment would undermine the British position in Geneva. It may not be possible to improve the technical basis of the conclusion because the imperfectness of the medium involved, i.e. the earth, will undoubtedly require testing under actual environments to check out the theory.

2. This new development seriously weakens the psychological advantage of the U.S. that might otherwise accrue if we were to break on the basis of the veto issue. It can no longer be maintained that the U.S. would be willing to continue the discussions if the Soviets were to capitulate on the veto issue. Hence, the Soviets would have a good chance of convincing world opinion that U.S. distrust of Soviet motives coupled with an insecure technical position prompted the U.S. to break.

¹ Source: Mitigating effects of withdrawal from nuclear testing suspension talks. Secret. 3 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Nuclear Policy.

3. Nonetheless, it would seem inevitable that the U.S. must now withdraw or recess from further discussions leading to acceptance of a specific control system until further technical information is at hand that will permit definition of capability of the system in the face of possible concealment through underground and outer space testing. Whether the withdrawal is in the form of a break or recess depends upon the political advantages of dwelling on the veto issue as opposed to leaving a grain of hope that the U.S. has not abandoned the possibility of agreement of an adequate safeguarded inspection plan.

4. Despite the negativeness of a withdrawal of the Geneva discussions, I believe that it is possible to counteract this impression to some extent by working toward a positive program:

a. Propose an agreement (possibly through the U.N.) that all nuclear powers restrict future testing of nuclear weapons in such a way as to avoid further build-up of radioactive contamination in the atmosphere, i.e. underground or at a sufficient distance from the earth.

Because of the unresolved differences of technical opinion between Los Alamos and Livermore on the ability to get adequate diagnostic information from underground testing, it would appear desirable to have an early technical examination of this problem before proposing agreement on underground testing.

b. Consideration should be given to proposing a cooperative research and development program, including U.S., U.K., and USSR, which is designed to further determine effects of nuclear weapons under different geophysical environments and the development of improved equipments for detection of nuclear detonations in such environments. There may be military security aspects that would limit such cooperation, i.e. the need to reveal design information in order to determine detectability, but it is believed that there will be adequate opportunity for a cooperative program without serious compromise of security information. If such a cooperative program were to be seriously considered, it would have to be developed in some detail before final decision on such a proposal.

5. I feel that withdrawal from Geneva coupled with the two positive approaches indicated above will avert a good deal of the pessimism that would attend the failure of the Geneva conference. It could be pointed out that although more work needs to be done to establish the capabilities of detection systems, the U.S. would not be willing regardless of the outcome of such tests to accept a veto by the USSR over the right of inspection of unidentified events. However, it could be pointed out that the U.S. believes that some of the Soviet concerns over inspection could be mitigated by improvement of the detection system to reduce the number of on-site inspections required to identify events as natural or artificial. Through a cooperative research and development program it may be possible for the U.S., U.K., and USSR to draw closer together in defining a system that the Soviets would have sufficient confidence in as to overcome their insistence on the right of veto.

439. Note From Caccia to Herter¹

Washington, March 13, 1959

Dear Chris,

I enclose for your personal information a copy of a letter from the Prime Minister which I have delivered to the President.

Your sincerely

Harold Caccia

Enclosure

Message From Macmillan to Eisenhower

March 13, 1959

TEXT OF MESSAGE

Dear Friend,

I promised to send you an answer as soon as possible to your message of March 9 about the Nuclear Tests Conference.

I have thought over your suggestion carefully. While I would prefer the Conference to carry on with its work, I am prepared to agree that it might recess for a while. I entirely support your view that it must not be a sharp or complete break, and in arranging for any recess, I feel we must take great care to ensure that it is not misinterpreted by the public (and is incapable of being misrepresented by the Russians) as revealing a desire on the part of our two Governments to break off negotiations. I think we both feel that if we can get agreement with the Russians at Geneva on acceptable conditions it would be of real advantage to us all.

I think that in order to prevent our purposes from being misunderstood the recess should occur at a time when it would seem natural. Easter would provide such an occasion, and this suggests a break from March 26. However, I would like to suggest instead that we should aim at a recess from March 20. This would not strain too much the use of Easter as the occasion, but would have the advantage that I should not yet be back from my visit to you. Thus the Russians would have no

¹ Source: Transmits a copy of a letter from Macmillan to Eisenhower agreeing to a recess of nuclear testing suspension talks. Secret. 6 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Eisenhower.

reason to expect before the recess a formal proposal on the lines of the idea which as I told you in my message of February 24 I had discussed very tentatively and non-committally with Khrushchev, for they must know that I shall want to discuss it with you. A recess beginning only just before Easter and after I am back from Washington would be more awkward.

I suggest therefore that we plan for a recess of three weeks starting from March 20. I think it is most important that at the time of recess we should announce the date of re-assembly, although we might have it in mind to considerably reduce the tempo of the negotiations when they start again. The case would then be an exact parallel to the Christmas recess, when as you remember no anxiety was expressed in any quarter that we might be working for a break.

No doubt you are aware of articles now appearing in the press and suggesting that the Western powers do not want an agreement at Geneva. If we were to recess without a date for re-assembly this speculation would inevitably increase, and we should find ourselves in a bad public position. We do not want people to draw a parallel with the Surprise Attack Conference, which recessed before Christmas without setting a time for its re-assembly; I think the public concludes that the Conference has not died.

Your delegation in Geneva has no doubt reported to you that the Russians there have been making tentative enquiries about the possibilities of a recess. So far our delegation has not had similar enquiries. But I conclude that it might be possible for a recess to be arranged by the three delegations at Geneva. I think this would be a better way to arrange it than by our writing to Khrushchev, because I fear that if we did so he would seize the opportunity to publish a propaganda reply misrepresenting our proposal.

I agree with you that we could profit by a recess to make plain to the world at large the principle which is essential to a sound and acceptable agreement: "an effective international control system not subject to veto or obstruction", as you rightly put it. But I doubt whether it would be wise to have the status of the negotiations discussed in the United Nations Disarmament Commission. As our Embassy has told your officials, we are not sure that neutral nations will be so easily convinced of the rightness of the whole of our present position as it stands on the record of the Conference. At any rate, even if we were to secure a favourable verdict in the Disarmament Commission I do not see how, that would help us at Geneva. I think it would on the contrary be likely to make the Russians more difficult and obstinate.

Finally, I must mention a point in your letter with which I do not altogether agree. I do not think that the tentative suggestions which I made to Khrushchev have led the Russians at Geneva to show any

sign that they think we are weakening on the idea of the veto or on the question of controls. I made it clear that we could not accept a veto on the despatch of inspection teams, and that my ideas were designed to do away with the veto on inspection. We attach the utmost importance to control in disarmament matters, and I think that the suggestions I made on inspections do not in any way compromise the principles for further disarmament agreements.

I agree that our suspension of testing should be maintained during the recess. But perhaps the point need not be made to the Russians unless they ask.

I look forward to having your comments soon. If we are to secure a recess from March 20 we shall need to send instructions to our delegations in Geneva promptly.

With warm regards,
As ever,

Harold

Attachment

Message From Eisenhower to Macmillan

March 11, 1959

Dear Harold:

Thank you very much for your informative note after your Paris meeting. The only disagreement that I would have with your description as Eighteenth Century is that I place the period in the "Early Nineteenth."

From what you said I feel there must be some hope of getting a little better expression of intention with respect to De Gaulle's participation in NATO and the use of his Fleet.

I am eagerly looking forward to your arrival, and I only wish that I could take you to a sunny climate rather than to ask you to endure some more of the winter weather that you have encountered during your many travels.

With warm regard,
As ever,

IKE

440. Memorandum of Conference with the President¹

Washington, March 13, 1959

OTHERS PRESENT

Dr. Killian
General Goodpaster

Dr. Killian said that further study had disclosed possible ways of decoupling a seismic signal from an atomic explosion. The use of large cavities would be a way of doing this. For each kiloton of yield a cavity of about 100,000 cubic meters (i.e., about 100 feet in radius) would be required. From the standpoint of monitoring, this presents a very real loophole, in that it becomes difficult to set any kind of a threshold for detectable tests. Accordingly, agreements to suspend testing in the atmosphere, and to limit testing to explosions outside the atmosphere, would seem to be indicated.

It is also technically possible to conduct weapons tests in outer space out to about 180 million miles. Conceivably a satellite detection system could be established that would be capable of detecting unshielded tests out to that distance, but this could be countered by shielding of weapons with lead shields that would prevent detection of tests up to several hundreds of kilotons.

In summary, a system with a low threshold cannot be guaranteed.

The President said he may want to have a session of a couple of hours' duration with Macmillan here next week. He would want Dr. Killian to come up by helicopter.

The President added that he takes with some seriousness Khrushchev's statement that the Soviets are not testing small weapons. He added that this is being carefully studied at his request.

Dr. Killian said that if the Geneva talks should be recessed for political reasons, there are technical reasons supporting a decision to leave open the possibility of exploring techniques of monitoring and inspection, and in particular to see if agreement can be reached on conducting some tests to observe their effects and detectability.

A.J. Goodpaster
Brigadier General, USA

¹ Source: Technical aspects of detecting nuclear testing. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on March 17.

441. Memorandum of Conference with the President¹

Washington, March 17, 1959

OTHERS PRESENT

Secretary Herter
General Goodpaster

The President said there seems to be growing evidence that testing is having bad physiological effects. He referred to recent articles about contamination by strontium 90. He is coming to the conclusion that our position should be that we will not test in the atmosphere. We will leave the underground and outer space tests out of any treaty. His thinking was that we should go for a system which both sides agree would work. To do so we would have to agree that small weapons could be tested under ground and in outer space. In his mind the biggest gain to be derived from such an agreement is the establishment of a system that could operate without veto, on a basis in which both sides could have confidence.

The President said he thought the scientists will in due time come to the position that the large-scale use of nuclear weapons in the northern hemisphere is an impossible solution to military problems. He thinks we must come to a test ban not as extensive as initially planned. Governor Herter said we are studying many combinations. He thought that perhaps we should take out of the treaty any coverage of the underground tests and refer that matter to the United Nations, simply agreeing to atmospheric testing. He thought, however, the Soviets would disagree to this proposal since they are more interested in sweeping pronunciamientos than in tightly designed systems. The President said if we don't try to get an agreement that gives the right of inspection, we really have nothing.

The President next asked as to the status of the Surprise Attack negotiations. Mr. Herter said that he felt that some further studies should be made on the basis of which the negotiations could then go forward. Defense, however, is resisting this proposal at least to the extent that they do not wish studies made by the same group that was in Geneva, but rather by the established agencies. The President asked Mr. Herter for a memorandum on this matter.

The President next suggested that Mr. Herter ask Ambassador Caccia what the British want to take up while they are at Camp David, and

¹ Source: Nuclear testing suspension talks, surprise attack negotiations. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on March 20.

Mr. Herter said he would do so. The President pointed out that we can bring additional people up by helicopter while the meetings are going on, but that he felt that the large staffs should be held in Washington.

In concluding, the President said that what would be of value in our negotiations with the Russians is to get anything on which the two sides will agree to in which each has the right to inspect and satisfy itself regarding the performance of the other, even if it is a tiny thing like withdrawal from a twenty-mile zone. If either side has a complaint, it could then bring the matter right out into the open.

A.J. Goodpaster
Brigadier General, USA

442. Memorandum of Conversation¹

Washington, March 22, 1959, 5:20–5:55 p.m.

PARTICIPANTS

The President
The Secretary
Governor Herter

Prime Minister Macmillan
Mr. Selwyn Lloyd

Our conversation was somewhat rambling and some of it purely anecdotal. The following matters of substance, however, were covered.

I remarked rather jocularly that the press seems to be playing the outcome of the Camp David talks as a “triumph” for the Prime Minister. He and the President both said there is no basis in fact for any such inference.

We discussed the next steps in connection with our reply to the Soviet note of March 2. The President attached importance to getting this reply cleared with the other NATO Governments in Paris and delivered and published prior to his press conference on Wednesday; the Prime Minister shared this view as he expected to have to make a statement in Parliament the same day. I said that I thought it not unlikely the French Government would raise some objection, resulting in delay, primarily to demonstrate their independence of the British and Americans.

¹ Source: German peace treaty; Egyptian-Iraqi relations; nuclear test suspension talks. Secret; Personal and Private. 3 pp. Eisenhower Library, Dulles Papers, Meetings with the President.

We discussed the question of composition of prospective meetings with the Soviets, and Mr. Herter recalled that on the question of the German peace treaty, the Soviets had suggested 26 nations be participants. I said, however, that the Soviets had said that if there was an agreement on the full conference that they would then be willing to have a preliminary Four Power conference on this subject, eliminating all other participation in the preliminary meeting.

The President said that over the week end the group had discussed the whole gamut of Soviet probings for weak spots in the free world position. He and the Prime Minister then recounted some of the discussion about the Middle East.

It was the view of Macmillan and Lloyd that Nasser by attempting to array the Arab world against Kassem was forcing him into the hands of the Communists. Actually he was not pro-Communist and had not done anything to intensify his links with Communism during the past few months. The British felt that some one intermediary should be sought who would try to mediate a *modus vivendi* between Nasser and Kassem, whereby both states would exist within the Arab world, without the UAR attempting to dominate or absorb Iraq. I said Italy would perhaps like to play some such role. Lloyd said the Lebanese were, he thought, making this attempt.

I said I felt it was somewhat ominous that we know nothing about what the Soviets were doing in relation to Iraq and Iran. It seemed to me that it was inevitable that they were doing something and that they had momentous plans, and that our lack of any knowledge should not be taken as proof that nothing was going on, but rather should make us more alert.

On the Geneva test suspension negotiations, the President and the Prime Minister noted that the latter attached importance to finding some way to keep these negotiations going after they resume on April 13. He hoped that they could spin out at least until a Foreign Ministers meeting with the Soviets. The President indicated his readiness to conclude an agreement suspending atmospheric tests; he recounted some of the briefing Dr. Killian had given the group at Camp David. This had led him to conclude that any explosion greater than 10 kilotons could be detected; he thought that it might be possible to get Soviet agreement on unmanned instrument detection stations. The reported Soviet "agreement" to our Duration Article makes it appear possible that the Soviets might make further concessions.

I recalled that we have made provision for effective mobile controls the *sine qua non* of any agreement.

The Prime Minister noted that our most recent scientific information suggests that there is a risk of disadvantage to us if the Soviets suddenly give in on the veto issue. Nevertheless, he thought that our gain

would so outweigh any such disadvantage that we ought to assume the risk. The President said that he thought even an agreement limited to atmospheric tests, and including as few as three or four control posts, would be better than no agreement at all. I said that I thought that while our scientists can advise us on the size, composition and nature of controls, they are not in a position to make the required judgment as to the overall value to us of the establishment of mobile control personnel behind the Iron Curtain.

The President said that while he thought there was a clear understanding on both sides as to the different points of view and matters of agreement, the officials would attempt to work out an agreed statement embodying the conclusions. I remarked it would be at this point that the trouble would begin. Macmillan said that what they had in mind was not so much a substantive paper as a procedural paper to cover who was to do what and where. The President said he planned to get together with Macmillan at 4 o'clock Monday afternoon to clear up any final ambiguities, and that the Prime Minister was leaving at 8:30 Tuesday morning.

I referred briefly to my own plans to return to the hospital for a couple of days and the prospect that I might be discharged on Wednesday.

John Foster Dulles

443. Memorandum for the File by McCone¹

Washington, March 23, 1959

Discussion with Foreign Secretary Selwyn Lloyd
at Luncheon on March 23, 1959
at British Embassy

After reviewing the March 21st meeting at Camp David on the Geneva Conference, Mr. Lloyd stated he hoped that we would support their proposal for a limited number of on-site inspections as a logical means of solving the impasse on the inspection and veto issue. In answer to a question, Lloyd stated that he felt that 50 inspections per year would be a good number and, in his opinion, about all that the scientists would wish to undertake.

¹ Source: Discussion with Lloyd on nuclear testing suspension talks. Secret. 3 pp. Eisenhower Library, McCone Papers, Sealed File No. 5.

I stated that we did not look with favor on the plan because it would inevitably bring up the issue of the number of inspections with the Soviets unquestionably proposing a very low number, and with our side suggesting a number adequate for reasonable safeguard assurances. I further stated that because of the possibilities of “decoupling effects” together with the general inadequacies of the Geneva system, for reasons explained by Dr. Killian, the number of on-site inspections would necessarily have to be very high to satisfy us. I pointed out that the original Geneva report indicated over one hundred unidentifiable events, later data revised this to about one thousand, and the “decoupling” might raise the figure much higher. Additionally, it seemed to me that an argument over the number of inspections might place us in a bad posture in public opinion.

Lloyd then discussed the possibilities of agreeing to suspension of atmospheric shots only with a very simple and “veto-proof” detection system coupled with a decision to study the underground and high altitude problems for a time, and come to an agreement in these areas when technology is further advanced. I supported this idea stating that I felt Macmillan’s suggestion to me at the conclusion of Saturday’s meeting, that such a proposal might be withheld until the Summit Conference, was an appealing idea. Lloyd said that he had proposed to Macmillan that the Geneva negotiators draft a memorandum setting forth the areas of agreement and the areas of disagreement (the veto being the most important one) and refer the disagreements to the Summit Conference because the Geneva negotiators could not come to agreement. Lloyd left me with the impression he would press for this as a desirable procedure to be followed.

I then asked Lloyd to clarify remarks he made Saturday afternoon concerning the “threshold”. He stated that the British felt that we were negotiating a *complete suspension* and in doing so recognized the detection system *would not be absolute* and that tests in the very low yields *could not be detected* but, nevertheless, they *would* be suspended under the agreement. Lloyd stated that it was his impression and conviction that if the Soviets on April 13 decide they will accept our proposal then we would be foreclosed from any underground testing for the duration of the treaty. He thought that we could not now bring up the “threshold.” I stated his remarks on Saturday had led me to the conclusion that he felt this way, but that *it did not represent our* viewpoint as we felt the threshold problem *was still* to be discussed and concluded.

I think this represents a very important difference of viewpoint between the United States and the British which should be resolved promptly.

444. Memorandum From Berkner to Killian¹

March 24, 1959

SUBJECT

Concealment of Underground Explosions

The Panel on Seismic Improvement, appointed by the Chairman of the President's Science Advisory Committee, considered the general problem of the concealment of underground nuclear tests at its meeting on 5 and 6 March 1959. The Panel reviewed various proposed methods of concealing underground nuclear tests. The Panel concluded that, on the basis of present knowledge, the most promising approach was the method of reducing the distant seismic signal from an underground explosion by suitable design of the shot chamber. The Panel, therefore, examined this proposal in detail.

The enclosed report by the Panel, "Certain Aspects of the Concealment of Underground Explosions," summarizes the preliminary theoretical analysis of this particular method as well as the possible limitations and deficiencies of the theory. On the basis of this preliminary theoretical analysis, available experimental information, and other practical considerations, the Panel arrived at the following general conclusion on concealment which was included as paragraph 4 (f) in the summary report of the Panel's findings, "Report of the Panel on Seismic Improvement," dated March 16, 1959:

"In considering the problem of concealment, the PSI has examined the possibilities of reducing the magnitude of the seismic signal from a nuclear explosion by means of suitable design of the shot chamber. The PSI concludes that it would be possible by this technique to reduce the seismic signal by a factor of ten or more. The seismic signal from one Hardtack II shot (Evans) was ten times less than that from another shot (Tamalpais) of approximately the same yield although no attempt was made to reduce the signal. Moreover, preliminary theoretical studies have shown that it is possible in principle by this technique to reduce the seismic signal from a given yield by a much greater factor than this. In view of the many complexities involved, it is necessary that this theory be tested with appropriately designed experiments to determine how large a decoupling factor can actually be realized in practice. While many of these tests can be carried out with high explosives, complete evaluation of the theory probably cannot be made without nuclear explosions. All possible seismic instrumentation should be employed in connection with such

¹ Source: Transmits report on concealment of underground explosions. Secret. 7 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Nuclear Policy.

tests to assure that adequate data is obtained to assess the phenomena involved and possibly to discover some characteristics which might allow long range detection of such decoupled tests."

(signed)

Lloyd V. Berkner

Chairman, Panel on Seismic Improvement

Enclosure

Report Prepared by the Panel on Seismic Improvement

March 24, 1959

Certain Aspects of the Concealment of Underground Explosions

1. *Method.* It is proposed to reduce the seismic signal from an underground explosion by setting the explosion off in an underground cavity of such size that the pressure on the wall of the cavity never exceeds the plastic yield stress of the surrounding medium. To reduce the pressure on the wall, it is proposed to fill the cavity with gas in such a manner that the explosive force is transmitted by radiation rather than by a gas shock. This requires a light gas such as hydrogen, or reduced gas pressure, or both.

2. *Estimate of Seismic Signal.* The seismic signal generated in the medium has been estimated by applying the theory of elasticity to the medium. This is justified, as the medium never suffers a non-elastic deformation. Elastic theory permits us to calculate the energy per unit frequency $E(\nu)$ for which we find

$$\sqrt{E(\nu)} = \frac{3}{\sqrt{2\pi} \delta^{1/2} c^{5/2}} W(\gamma - 1) \omega \quad (1)$$

where δ is the density of the medium, c its sound velocity, W the energy released in the explosion, γ refers to the equation of the state of the gas and ω is the circular frequency.

It will be noted that (1) is independent of the radius of the hole; once the hole is big enough to insure elasticity of the medium, it no longer matters how big it is chosen. It is further seen that the amplitude of the elastic wave which is proportional to (1) is directly proportional to the energy released and is also proportional to the frequency. The latter dependence will hold as long as the frequency is less than the characteristic frequency of the hole, c/R , where R is

the radius of the hole; the dependence on ω insures small amplitude for low frequency.

We have compared the result (1) with the empirical result from the Rainier experiment. It can be shown again from elastic theory that

$$\sqrt{E(v)} = \sqrt{\frac{\kappa \pi \delta}{c}} r^2 D \omega. \quad (2)$$

where D is the total displacement of the rock measured at a distance r from the explosion. It has been assumed that ω is less than the critical frequency of the wave generated by the explosion, which in the case of Rainier was about $\omega \times = 25 \text{ sec}^{-1}$. In the Rainier experiment, D was observed to be 15 cm. at $r = 110 \text{ m}$. Using this information and the theoretical equation (1) and assuming the medium in which the hole is made to be hard rock of $\delta = 2$, $c = 5 \text{ km/sec}$, we find that the signal (1) is about 700 times smaller than the signal (2).

3. *Detectability.* In the Geneva net of stations one has to rely on receiving signals at distances more than 2000 km. At such distances only frequencies of less than 1 cps can be easily received. If we apply the theoretical factor of 700 and if we assume that the Geneva net can detect explosions of 5 kt and above, then explosions in a cavity could be concealed up to yields of 3.5 megatons. There are other limitations which make it very difficult to use this method of concealment for such large explosions, particularly the size and cost of the required hole which will be discussed below.

If there were a net of auxiliary stations of spacing 170 km, it is expected such a net could detect first motion from 1 kt explosions. Moreover, such a group of stations respond to high frequencies of the order of 10 cps. In this case, the frequency is higher than the critical frequency of an unconcealed 1 kt explosion. Generally in Rainier surroundings the critical frequency is about

$$\omega_x = 5 W^{-1/3} \text{ cps} \quad (3)$$

where W is in kilotons. If $v > v_x$, the concealment factor is reduced to

$$700 \frac{v_x}{v} \quad (4)$$

and therefore at 1 kt to 350. In this case an explosion of 350 kt can be made to look like 1 kt and will therefore be just detectable.

4. *Limitations of the Method.*

a. *Radiation wave.* It seems important to avoid an appreciable material shock wave in the cavity, and thus to use gas at reduced density as described above.

b. *Temperature at wall.* In a cavity designed to have 50 atmospheres static pressure and air at 1/100 normal density, the temperature will

be 10 ev. Such a high temperature may remove solid material from the cavity surface which would come off with appreciable momentum and thus might give a recoil to the wall, which would increase the seismic wave. Estimates indicate that this ablation of the wall is probably not important. If it should turn out to be appreciable, it could be minimized by providing thin foils inside the cavity to absorb some of the heat.

c. *Plastic deformation.* It is important that the wall suffer no appreciable plastic deformation. The elastic behavior of rock is not known to us sufficiently to assess the limitation which this puts on the pressure in the cavity. Experiments would be important.

d. *Cracks in rock.* If the rock wall has cracks that are likely to open on application of internal pressure, this would eliminate the hoop stresses around the cavity and would permit very much larger expansion of the cavity radius. This would increase the signal transmitted to a distance in proportion to the expansion. We are entirely ignorant on the occurrence of cracks in rock, and here again only experiment can determine the limitations from this cause. We believe that it should be permissible in any case to apply a pressure equal to the lithostatic ambient pressure which is about 1 atmosphere per 5 meters depth. It is suggested that salt may be particularly free of cracks, especially if it is leached out by water.

5. *Maximum permissible pressure.* We do not know the maximum pressure in the cavity which is permissible to insure elastic behaviour of the rock. It is important to know this pressure because the cavity volume is inversely proportional to the pressure, and the cost of excavating the cavity will be approximately proportional to its volume. If we assume that 50 atmospheres is a permissible pressure, the required radius will be 33 meters for 1 kt which corresponds to a volume of 150,000 cubic meters.

6. *Deficiencies in the theory.* The following deficiencies in the theory are known to us which can probably be removed by further theoretical work:

a. The generation of surface waves, in particular of a long period, has not been investigated. These waves may be important for detection.

b. The ablation of the surface of the cavity due to high temperature must be determined, in order to assess whether it is necessary to provide foils.

c. A calculation should be made of the effect of shocks in the gas in the cavity. Also, the impulse carried by the expanding bomb material should be considered.

d. It is somewhat remarkable that the shock predicted by our theory is about 30 times less than earth shock observed from air explosions of the same yield. This paradox should be cleared up.

7. *Construction of Cavity.* A hole of one million cubic meters would be required to contain an explosion of about 7 kilotons at 50 atmospheres pressure. One method of obtaining a hole of this size, which has been looked into in a preliminary manner, is to wash it out in a large salt dome. Salt is believed to have the required properties of high strength and freedom from cracks. In addition, there is some experience with excavating large holes in salt by dissolving out the solid material. The principal problem is to locate a salt dome near an adequate supply of water. (This can be sea water.)

An estimate of the cost of excavating such a cavity on an urgent time scale was made in another connection. It was estimated that it would require 6 months to a year to do the excavation and would cost between 4 and 7 million dollars so that the cost is about a million dollars per kiloton if the pressure has to be held to 50 atmospheres. It is probably possible to reduce the cost by increasing the time required, and a much more thorough investigation should be made to establish more accurate costs.

It may be possible to use ice instead of salt for the containing media. This possibility should be investigated since it would increase the availability of sites and may decrease the cost.

8. *Test Requirements.* Because of the potential effect on the capability of a detection system, the Panel recommends an immediate experimental and theoretical program to evaluate quantitatively the possible decoupling by means of a properly designed cavity. The program should include an extensive series of HE tests leading up to full-scale nuclear shots. The HE tests should be closely coordinated with theoretical predictions to provide valuable information for the design of a nuclear test. Final verification that all of the conditions for decoupling are satisfied will undoubtedly require full-scale nuclear shots.

9. *Other Methods.* The Panel has briefly considered a variety of additional concealment methods. These included: the use of noise cover from large earthquakes, from after shock sequences, from artificial explosions, from volcanic explosion, and from local meteorological conditions; the location of test sites to take advantage of such noise cover and to minimize the effectiveness of the control net; the introduction of confusing signals into the network by an explosion pattern; the effect of geologic structures on wave propagation; the possible effects of the surface reflection from flat and curved surfaces

on the initial P wave at distant stations; the possibility of decreasing the initial compression and accentuating the subsequent rarefaction by an array of explosion points; the possibility of producing an initial rarefaction wave by venting a large cavity of high pressure gas in the vicinity of the nuclear explosion; the possibility of venting an underground explosion chamber into tunnels. A quantitative evaluation of these methods requires an extensive experimental and theoretical program. The preliminary examination suggests that many of these methods will make detection and identification substantially more difficult than tests under Rainier conditions. In general, the methods seem to have somewhat compensating disadvantages. Of the many possibilities, the Panel recommends special emphasis in the immediate future be given to the study of the effect of the surface on underground explosions and the possibility of venting the explosion chamber into underground tunnels.

445. Memorandum for Killian¹

Washington, March 26, 1959

SUBJECT

Recommendations by Panels on High Altitude Detection and Seismic Improvement

The following recommendations were made by the Panel on High Altitude Detection:

1. We recommend that direct responsibility be assigned for continuing detailed engineering study of the nuclear space test detection system including laboratory development of instrumentation. We should like to emphasize that this need is independent of any pending decisions on the status of the nuclear test program.

2. We recommend that more detailed measurements of space radiations should be incorporated in the satellite and space-probe schedule than are now planned.

3. We recommend that a study be undertaken to consider the detection system (including satellites) required to obtain information on Soviet space tests for intelligence purposes if such tests are legal.

4. We recommend that a brief study be initiated immediately to analyze the compatibility of the missiles and pay-loads considered in this report.

The following principal recommendations are drawn from the reports of the Panel on Seismic Improvement:

1. Steps should be taken to initiate a research program in seismology directed toward the fundamental problems involved in the detection and identification of underground tests. While this program should make use of existing private, university, and government laboratories, it should be viewed as a single package, centrally directed and funded and reviewed by an appropriate advisory committee of scientists.

2. Steps should be taken to initiate a "system development" program, including development of new equipment, actual field trials of significant elements of the system and the planning of operational procedures. Responsibility for "system development" should be assigned to a single, central laboratory.

3. An experimental test program should be undertaken immediately to obtain data under different environmental conditions and to test theories on the possibilities of concealment. While many of these tests can be carried out with HE, complete evaluation probably cannot be made without nuclear explosions.

446. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, March 26, 1959

SUBJECT

Geneva Nuclear Test Negotiations

PARTICIPANTS

<i>Dept. of State</i>	<i>White House</i>	<i>CIA</i>
Mr. Herter	Dr. Killian	Mr. Dulles
Ambassador Wadsworth	Mr. Gray	Mr. Brent
Mr. Farley—S/AE	Mr. Keeny	
Mr. Spiers—S/AE		<i>Dept. of Defense</i>
Mr. Baker—S/AE	AEC	Mr. Quarles
	Mr. McCone	
	Mr. Foster	

Mr. Herter said that the purpose of the meeting was to consider our approach at the April 13 resumption of the Geneva negotiations, in the light particularly of the Macmillan-Eisenhower talks and of the recent technical studies completed by Mr. Killian at State Department request. *Mr. Herter* said that there had been considerable discussion during the Macmillan visit of the nuclear test negotiations and that this seemed to be, next to the Summit meeting, the problem of greatest interest to the U.K. Macmillan attaches the greatest importance to reaching some agreement on nuclear tests with the Soviet Union, although he appears to be firm with respect to our position on the veto. *Mr. Herter* said that both Macmillan and Selwyn Lloyd had attempted to get our agreement to the idea Macmillan had put to Khrushchev for a ceiling on inspections as a way around the veto problem. Selwyn Lloyd had suggested to Herter the number of 100 inspections per year. However, the U.S. representatives had resisted this suggestion, since adoption of this approach would throw us directly into discussion of the technical issues which would have to be solved before any sound number could be agreed. The second Macmillan suggestion had been that if it proved impossible to get the Soviets to change their position on the veto, the conference would recess after adoption of an agreed report to Governments outlining the areas of agreement and disagreement, with the thought that this subject would be discussed at a Summit conference. Since the U.S. would not accept the idea of an automatic Summit conference, this suggestion has little appeal for us. Accordingly, the

only agreement reached was that there would be further scientific and diplomatic discussions prior to the April 13 resumption. Sir William Penny and Sir Edward Bullard would arrive in Washington on April 2 for the scientific discussions on the Berkner and Panofsky reports. We have a stiff deadline which will require early decisions within the U.S. Government on the approach to be taken on April 13. It was agreed that Dr. Killian would bear the responsibility for conducting the scientific discussions with the British representatives and that the Departments of State and Defense and the AEC would have representatives at these discussions.

Mr. Herter then described the views of the Secretary and the President on the future course of the negotiations. The President feels that any detection system that could be devised would be imperfect and that even if there were no agreed threshold, we should be prepared to reach agreement with the Soviets if they give in on the veto. The President feels that we need to be sure only that there is a reasonable level of deterrence. *Mr. Herter* then read from a memorandum prepared by Mr. Dulles on a subsequent meeting with the President and the Prime Minister, in which Mr. Dulles said that effective mobile inspection would be a sine quo non of agreement. This would be of great political importance. Whereas our scientists can advise us on the size, composition and nature of controls, they are not in a position to make the required judgment as to the over-all value to us of the establishment of mobile control personnel behind the Iron Curtain. Both the President and the Secretary consider this element of the Geneva negotiations of extreme importance for future progress in disarmament. *Dr. Killian* and *Mr. McCone* agreed with this and *Dr. Killian* observed that the problem is how the objective could be accomplished, and what imperfections would be acceptable.

Mr. Herter said that there were two contingencies which must be considered. The first was to consider our position in the event that the Russians stick on the veto. In this case we must decide what our fall-back position would be and when it might be presented. The second contingency would arise in the event that the Soviet Union gave in on the veto. In this case we would have to face the question of how much imperfection we could accept and whether it would be necessary to press for a threshold. *Dr. Killian* said that the British suggestion on the ceiling on inspections would represent a possible approach if it were coupled with a threshold. He said also that we would have to have experimentation in order to test the practical possibilities of concealment by decoupling which were now only theoretical. *Mr. Quarles* said that we should not drop the possibility of a threshold, although he recognized the validity of the tactics of not taking the initiative in proposing it.

Mr. McCone said that he was disturbed by the idea of “deterrence” and thought that this was a new concept which had not been previously discussed. *Ambassador Wadsworth* said that this had been an integral part of our approach from the beginning. *Mr. Farley* said that it had become apparent in his appearances before the Joint Committee and the Humphrey Subcommittee that the inability to achieve 100 percent perfection was recognized. He described the approach presently set forth in the U.S. Annex to the Treaty which involved inspection of only 20% of the unidentified events below five kilotons. The question was not whether the principle of deterrence was acceptable, but what constituted adequate deterrence. *Mr. Herter* said that a decision on the degree of deterrence which we could accept would need to be made only in the event of a change in the Soviet position on the veto. *Ambassador Wadsworth* said that such a change was a distinct possibility in view of the adoption by the conference of a duration article which made withdrawal easy.

Referring to the two contingencies he had described, *Mr. Herter* said that in the event of Soviet sticking on the veto he would prefer to have President Eisenhower and Prime Minister Macmillan propose by letter an agreement limited initially to atmospheric tests. He did not personally believe this should be proposed during the course of the present negotiations, but that it should be done immediately after a recess in the negotiations. *Ambassador Wadsworth* said it might be possible after the return of the Delegation to Geneva, when it became apparent that the Soviet position had not changed, to recess the negotiations for this purpose. In any event he did not believe that we should seek an abrupt break in the negotiations, since it would be easy for the Soviets to make it appear that we were responsible for such a break.

Mr. Herter then raised the question of whether we should move to a unilateral cessation of atmospheric tests if the Soviets turned this proposal down. *Dr. Killian* said that this would mean giving up the chance to make a beginning step in arms control. He felt this point was of overwhelming importance since new technological developments in the weapons field will increase the uncertainties and instabilities of the present world situation, and with it the hazards of war. The only way out of this dangerous situation was through some monitored armaments accommodation with the Soviets, and we should not give up this important objective lightly. *Mr. Quarles* said that he agreed with this view. *Dr. Killian* went on to say that the changing situation with regard to the technical aspects of detection and the possibilities of evading detection created a situation which perhaps led to the desirability of seeking an agreement on atmospheric tests first. This initial step could be done, he felt, without giving up the ultimate objective of an

agreement with the Soviet Union to end all tests. This loss might be the consequence of moving to a unilateral proposal. *Mr. Herter* agreed that we could propose to continue negotiations towards the ending of all tests, along with an offer to stop atmospheric tests as the first part of a package. *Dr. Killian* felt that we should not let insistence on mobile inspection hold up whatever progress was possible on limited measures where it was not required. We should do whatever we could on the basis of what was now feasible and should seek an evolutionary development of an inspection system which would extend to cover all tests. *Mr. McCone* said that the AEC would support such an approach. *Ambassador Wadsworth* suggested that the objective should be to seek cessation of all tests as agreement was reached on the appropriate inspection provisions. As part of this approach we could suggest collaboration on a program of underground tests to test improvements in the detection system.

Dr. Killian said that we should arrange for an urgent analysis of whether underground tests would really be useful to the U.S. or to anybody. There was a serious difference of opinion in the scientific community on this point. Another technical problem in connection with ending atmospheric tests was to obtain a definition of where the atmosphere ended, since fallout could result from tests at very high altitudes. *Mr. McCone* said that the AEC was looking into this latter question urgently at State Department request.

After a discussion of whether mobile inspection, even on a very limited basis, would be needed as a part of an atmospheric test agreement, *Dr. Killian* said that the uncertainties without mobile inspection would be minor, and that we should not let the genuine USSR fear of inspection as an instrument of espionage prevent us from getting agreement on atmospheric testing. *Mr. Herter* said that we would be right back where we started if we insisted on mobile inspection in this connection.

The meeting concluded with a discussion about whether the information in the Berkner and Panofsky panel reports should be made public or available to the Congress. It was agreed that the information would be kept classified and that it would be preferable to make available the Panofsky report, which contained Restricted Data, only to the Joint Committee. Consideration should be given to making available the Berkner report and the non-Restricted Data parts of the Panofsky report to the Humphrey Subcommittee on a private basis.

447. Letter From Quarles to Herter¹

Washington, March 26, 1959

Dear Mr. Secretary:

Reference is made to the 26 February meeting of principals of the Interdepartmental Coordinating Group on Disarmament, at which it was agreed that a Working Group from our staffs would proceed to develop a fall-back position for guidance of the U.S. Delegation and for use in the event of failure to reach agreement at the current Geneva Conference on the Discontinuance of Nuclear Weapon Tests.

It is the view of the Department of Defense that an important first step in developing a fall-back position in the present situation should be the clarification of our basic policy on nuclear weapons test suspension. Then, within the concepts of that policy, the various possible fall-back positions would be explored.

As discussed at the last meeting of the principals, it was understood by the Department of Defense that the following concepts were accepted as a basis for future U.S. policy on nuclear weapon tests in these circumstances:

1. As a result of the Soviet Government conducting a series of nuclear weapons tests 1–3 November 1958 the United States was released from the voluntary suspension announced by the President on 22 August 1958. Nevertheless, the United States should continue to abide by its voluntary suspension until 31 October 1959, with the possible exception of some underground tests to gain data for improving the proposed detection and identification system. (If the USSR should resume testing during this period, our policy should be reviewed in light of the circumstances at that time.)

2. After 31 October 1959, the U.S. should reserve the right to test as we deem necessary, until such time as there is an agreement to discontinue specific types of tests under effective control.

3. The U.S. should take no further unilateral action to deny to ourselves the right to test.

4. The U.S. should enter into no further arrangements whereby we would agree to suspend any types of tests, even though the USSR would do likewise, in the absence of agreement on an effective control system.

¹ Source: U.S. position at resumed nuclear test suspension talks. Secret. 2 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Nuclear Policy.

5. The U.S. should continue to support agreement to discontinue any types of tests which can and will be controlled effectively by an agreed control system.

6. Any fall-back position:

- a. should be consistent with the foregoing concepts, and
- b. should not be characterized as a change in present policy, but rather as an effort within the context of our present policy to seek agreement for discontinuance of any tests which can be effectively controlled.

It is now understood that agreement on the above concepts, as presented in the Working Group by Department of Defense representatives, is not reflected in the Working Group's evaluation of possible fall-back positions. If the Department of Defense is correct in understanding that these concepts were accepted by the principals at the 26 February meeting, it is considered that the Working Group should be so informed. If that assumption by the Department of Defense is incorrect, then it is recommended that the principals meet at an early date to determine policy concepts for guidance of the Working Group in their consideration of possible fall-back positions.

It is also recommended that our fall-back position be resolved before the end of the present recess on 13 April, in view of possible termination of the Geneva Conference soon thereafter.

Sincerely yours,

SIGNED

Donald A. Quarles

448. Memorandum From Killian to the Department of State¹

March 31, 1959

SUBJECT

Modification in the Memorandum of Conversation, dated March 26, 1959, on the subject of "Geneva Nuclear Test Negotiations"

In the statement attributed to me at the bottom of page 3, I would suggest that the wording be modified as follows:

"Dr. Killian suggested that we should seek a better understanding of the extent to which underground tests would be practical in terms of increased cost, extended development times and yield limitations. There is some difference of technical opinion at the present time about the problems involved in conducting underground tests."

J.R. Killian, Jr.
*Special Assistant to the President
for Science and Technology*

449. Memorandum From Killian to Eisenhower¹

Washington, March 31, 1959

SUBJECT

Technical Factors Relating to Arms Limitation and to the Geneva Conference on Nuclear Test Cessation

In the attached memorandum I have outlined the principal technical factors which may have a bearing on policy decisions affecting nuclear test negotiations.

On the chance that you may find this summary statement of some help as background material, I send it along but I hasten to point out

¹ Source: Technical factors relating to arms limitation and to the Geneva conference on nuclear test cessation. Secret. 11 pp. Eisenhower Library, Whitman File, Administrative Series, Killian, James R., 1957.

that the views expressed have not been coordinated with the Departments of State or Defense nor with the Atomic Energy Commission.

J.R. Killian, Jr.

Attachment

Memorandum by Killian

March 30, 1959

MEMORANDUM ON SOME TECHNICAL FACTORS INVOLVED IN POLICY DECISIONS ON ARMS LIMITATIONS AND SPECIFICALLY ON THE LIMITATION OF NUCLEAR TESTING

The recess of the Geneva Conference on the Discontinuance of Nuclear Tests with a stated date (April 13) for reconvening, requires the United States Government to re-examine its policy positions with respect to these negotiations.

This memorandum deals with my personal summary of the technical considerations which have a bearing on these policy questions. In discussing the technical factors, I recognize that they probably are of secondary importance to political and policy objectives.

Trends in Military Technology

Let me first point out how current trends in military technology emphasize the urgent importance of arms limitation of some kind. While deeply convinced that we must be unremittingly alert to keep ahead in our military technology, I also must conclude, in the light of factors mentioned below, that I see little opportunity to simplify the complexity of our military technology, to reduce the burden of defense, or to achieve a stable condition by means of military technology alone. On the contrary, the trend of technological measures and countermeasures will steadily complicate our defense, augment instability, and increase the cost of maintaining the relative strength we need.

We see this trend clearly revealed in our needs to make our strategic striking power, both aircraft and missiles, less vulnerable to surprise by dispersal, hardening, and shorter reaction times (including ground alert and possibly some degree of air alert). We see it clearly in the changing requirements of air and missile defense as typified by the problems associated with the Sage system and Bomarc, with Nike-Zeus, ballistic missile early warning systems, antisubmarine warfare systems, and with requirements for more comprehensive communications systems.

We see further evidence in the effort to improve the yield-to-weight ratio of atomic weapons, and in the developing program for using space and space vehicles for military purposes. The possibilities for military technology in modifying the geophysical environment of the earth are illustrated in the possibilities (remote) now envisaged for weather modification and by the results of Argus and other high-altitude experiments.

As military technology moves toward more systems operating on a global scale, and as it begins to make use of extraterrestrial space and effects, and as the time-scale becomes more condensed, we face the requirement for weapons systems, offensive and defensive, of increasing performance and complexity. Because of rapid technological change, we see the new systems overlapping with quickly obsolescing older ones and we see the consequent possibilities of systems being piled upon systems.

As complexity increases, the chances for error or aberrations on the part of humans and machines grow greater, and the consequences of such errors and aberrations (e.g., accidental war) become enormous. The shortened time-scale also reduces the opportunity for careful judgment by increasing the rewards for spontaneous response.

The overriding technological fact, however, is the continued build-up of improved high-performance nuclear weapons on both sides to make possible catastrophic effects if they are used in massive attacks.

Another technical factor involving uncertainties is the problem of fallout. The biological effects of radiation involve uncertainties, particularly in the genetic area, and we may possibly face a growing body of sober scientific judgment that the fallout hazard is greater than we now believe.

The profound over-all effect of these trends points to the great urgency and importance of our diligently and creatively seeking methods of arms limitation—limitation which will not weaken our position relative to the Soviets.

Some Technical Aspects of Arms Limitation

If progress is to be made in *any* kind of arms limitation (such as reducing the hazard of surprise attack or limiting the production of fissionable material or any other form of limitation), the agreements for such limitation will have to be accompanied by some form of monitoring to assure both sides that agreements are being carried out. We have so far held steadfastly to the principle that arms limitations agreements must be monitored. If we are to achieve such agreements and preserve this principle, then we will certainly be faced with the design of monitoring and inspection systems that will have to fulfill technical, military and political requirements.

While the discontinuance or limitation of nuclear tests are not, except in a limited way, disarmament measures, they do have a special importance in establishing the principle and techniques and practice of monitoring agreements. On the technical side, and perhaps on the military and political sides too, we have given more study and thought to monitoring and inspection systems for the control of nuclear tests than we have for any aspect of arms limitation. We probably have a better chance for arriving at some acceptable arrangement for monitoring and inspection of nuclear tests than we have for any other form of arms limitation. This was illustrated by the difficulties encountered in the Geneva Conference on Surprise Attack. A monitoring and *inspection* system for nuclear tests is likely to be simpler and more achievable than a monitoring and inspection system for surprise attack. We are not only further advanced in the technical aspects of the problem, but we have large pressures of world opinion favoring the achievement of such an agreement.

What Do We Do About the Geneva Negotiations?

Let me now turn specifically to the problems associated with our negotiations on the limitation or discontinuance of nuclear tests. We must recognize that new data secured in the Hardtack II tests, together with conclusions reached in recent studies on underground testing and on testing in outer space, leave us in a position where the system agreed to last summer at the Conference of Experts involves more substantial and significant uncertainties than believed at the time. While the Panel on Seismic Improvement has concluded that the Geneva system can be substantially restored to its originally-conceived capability, they also concluded that by deliberate concealment it would be possible to reduce the signal from an underground explosion by a factor of 10 or more and that, in theory at least, the signal might be reduced by a much larger factor than this. It is, therefore, impossible—without further tests—to give any firm estimate of the capability of the Geneva system for underground tests. This does not mean that such a firm estimate may not be achievable in the foreseeable future.

The Panel on High Altitude Detection indicated the technical feasibility of testing in outer space, as well as the technical feasibility of a system to detect these tests. Such a system would have a detection threshold which would be as high as a few hundred kilotons if the violator of the agreement resorted to very expensive measures to try to achieve concealment.

The reports of these two panels represent as good a discussion of the technical possibilities as could be achieved in the time available. They emphasize that continuing studies and experiments on a reasonable scale are needed for the further understanding of test detection and for the

understanding of concealment possibilities. It was clear from the findings of both panels that attempts to conceal tests, either underground or in outer space, would be very costly.

The Concept of Probability or Calculated Risk

In our policy-making, we should recognize that no technological system is going to be perfect or absolute in its performance. We must consider the effect of such technological inspection systems in terms of probability and consider their restraining value on the basis of an estimated probability to detect within stipulated limits.

In a world of rapidly-changing technology, it may be impossible to devise fool-proof monitoring systems—either for nuclear test cessation or for other forms of agreed arms limitation. The most that these systems may accomplish will be to make evasion very costly and very uncertain. These may be the principal functions of monitoring systems. Hence, if they are to be of maximum use to us, they would have to be supplemented by highly-developed intelligence systems of our own and with appropriate military measures.

Political-Technical Factors in Geneva Negotiations

The current Geneva negotiations indicate that there are very great difficulties in reaching a satisfactory agreement with the Soviets on the critical questions of voting, staffing, and inspection. The present Soviet position on these questions is clearly unacceptable since it would eliminate even the deterrent effect of the Geneva System. We should not seek to find our way out of the present impasse in Geneva by relaxing our requirements on the critical political aspects of the control organization.

It would, therefore, seem desirable at this stage to draw back from our original efforts to achieve a system as comprehensive as that discussed by the Geneva Conference of Experts last summer and to settle for some more limited form of test agreement that would simplify both the technical and political requirements of the control organization. The most obvious possible alternative approach would be to seek an agreement which would provide for no testing in the atmosphere but would permit testing underground and at high altitudes. The timing and method of introducing this alternative is not dealt with here.

It would seem important that if we seek to agree to exclude atmospheric testing that we propose doing so by formal agreement (rather than by unilateral action) which involves some system of monitoring and which thus preserves the principle of monitoring and, perhaps, inspection and provides experience with such a system.

Such an agreement might include specific provisions for a phased, evolutionary extension of the test ban to include coverage of testing

underground and at high altitudes when controls adequate to detect such tests become technically available. Research to develop this more extensive control organization might well be made a responsibility of the control organization itself.

If our decision is to proceed in this direction, it is important that we make an early technical analysis to determine what we mean by the "atmosphere." In view of the present discussion about fallout from the stratosphere, it seems clear that a system to limit testing to the troposphere will neither solve the fallout problem nor alleviate public concern about this problem. Some radioactivity will return to earth from tests conducted out to a distance of many thousands of miles. The limit of the "atmosphere" will probably be difficult to establish.

It is also possible that an agreement not to test in the atmosphere might be accompanied by an agreement to conduct explosions in outer space only under internationally-supervised conditions, or alternatively, it is possible to define somewhat sharply the outer limits of the atmosphere and assume that unilaterally-planned testing will take place beyond that altitude. There are other kinds of technical problems that would need to be resolved, such as the conduct of explosions lightly covered with earth, or explosions under water.

It is reasonably certain, however, that these technical matters can be satisfactorily resolved from the U.S. point of view and that it would be possible to suggest a monitoring system that would be relatively simple and that would greatly reduce, if not eliminate, the requirement for inspection teams and the fear that they would be used for purposes of espionage.

However, before proposing such an agreement, I believe we should know, more clearly than we do now, the effect of this type of agreement on our own weapons program. Specifically, estimates should be made as to the additional costs involved and the usefulness of data obtained if our test program were to continue at its present rate and all tests were conducted either underground or in outer space. In addition, we should examine carefully the effect of an atmosphere test ban on our anti-intercontinental ballistic missile weapon system testing.

Sustained Disarmament Studies

The complexities inherent in understanding the monitoring of arms limitation agreements and the great importance of our achieving a thorough understanding of what is to our advantage or disadvantage suggest the importance to the United States of undertaking systematic and sustained studies of the technical, military, and political aspects of arms limitation. Our experience in the Geneva Conference on Reducing the Hazards of Surprise Attack pointed up the deficiencies of ad hoc and hurried preparation for such negotiations.

Even though an agreement for limited nuclear test cessation remains our first goal, we should look beyond this. We might well direct our studies and planning toward a possible reduction in the advanced means or *delivery* of nuclear weapons. This may be a more practical objective than control of nuclear weapons stockpiles and production.

A small but important beginning was made in this direction by the Geneva Conference on Surprise Attack. The failure of this conference should not deter further efforts. It seems especially urgent that we proceed with further studies of ways to reduce the hazards of surprise attack.

We must also undertake studies and experiments to improve our capacity to detect tests other than in the atmosphere (as, for example, in outer space), even if we achieve no agreements. The research and experiments recommended by the Panel on Seismic Improvement and the Panel on High Altitude Detection should be carefully considered and followed up as a part of our long-term effort to advance the technology of detection.

Summary

The trends in military technology, together with the threat of catastrophic war, in the continuing development of nuclear weapons systems emphasize the overwhelming importance of seeking sound ways of limiting armaments. The possibilities of uncertainties in scientific estimates of biological effects of radiation hazards should be kept in mind in formulating policy.

Since any kind of arms limitation will probably have to be accompanied by a monitoring system, it is important to establish the principle of monitoring and inspection and to achieve an agreement which will give us experience in monitoring. The monitoring of nuclear tests has received more study and is more thoroughly understood than any other arms limitation monitoring. This is an added reason for seeking an agreement for the limitation of atomic tests.

It would seem technically feasible to achieve a sound agreement that would involve the stoppage of tests in the atmosphere, this stoppage to be subject to monitoring through an agreement. Such an agreement might provide for the evolutionary development of improved detection systems for underground and outer-space testing. If we are to seek this kind of modified test limitation agreement, we should at once clarify the technical premises for such an agreement.

We also need to organize and pursue on a sustained basis creative efforts to understand the technical, military, and political aspects of arms limitation of other kinds than nuclear tests cessation.

D.E.

450. Memorandum of Conversation¹

USDel/MC/12

Washington, April 4, 1959, 3 p.m.

SUBJECT

Geneva Nuclear Test Negotiations

PARTICIPANTS

United Kingdom:
Mr. Selwyn Lloyd
Sir Harold Caccia
Sir William Penney
Mr. John Roper

Department of State:
Mr. Christian Herter
Amb. James J. Wadsworth
Mr. Philip J. Farley—S/AE
Mr. Ronald I. Spiers

Mr. Lloyd suggested that the discussion begin with a consideration of our position when the Geneva nuclear test negotiations resume April 13. *Mr. Herter* asked Sir William Penney to report on his impressions of the technical position he found in his discussion with U.S. scientists this week. *Sir William* said that the most important issue related to the possibilities of decoupling or concealment. He said that he had carefully reviewed the theoretical treatment of the U.S. scientists which he found accurate and "almost certainly right". However, there were many uncertainties in geophysics and it was impossible to tell whether what was theoretically possible would be possible in practice. He strongly supported the idea of a testing program to check on the theoretical possibilities of decoupling as well as on improvements in instrumentation worked out by Berkner and his panel. He did not know whether nuclear tests should be part of this program or whether high explosive detonations would be sufficient. This was a question with many political implications.

Mr. Lloyd said that, as he understood it, it now appeared that there would be no certainty of detecting underground tests under 50 kilotons or more. *Mr. Herter* said that this brought us to the problem of what our position would be if the Soviets dropped their veto demands, and whether there would be a sufficient deterrent to violation to make it possible for us to accept the agreement. *Mr. Herter* said that we had this afternoon despatched a letter from the President to Prime Minister Macmillan regarding our position on April 13, a copy of which he handed to Mr. Lloyd. After reading the letter *Mr. Lloyd* asked whether the following sentence in the draft letter to Khrushchev was not somewhat disingenuous: "If you are prepared

¹ Source: Nuclear test suspension negotiations. Secret; Limit Distribution. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

to change your present position on the veto, on procedures for on-site inspection, and on early discussion of concrete measures for high altitude detection, we can of course proceed promptly to conclude negotiation of a comprehensive agreement for suspension of nuclear weapons tests." *Mr. Herter* said that if the USSR were to change its position on the points cited, the U.S. would be willing to negotiate an agreement on the cessation of all tests. We had never thought a fool-proof agreement possible. What we were seeking to create was a level of risk for the potential violator sufficient to deter him from violating. He pointed out that we were now, under the terms of the Annex we had proposed in Geneva, prepared to accept inspection of 20 per cent of the underground tests below 5 kilotons. This was a concrete example of the approach of deterrence. *Mr. Lloyd* said that he considered this a quite adequate level for deterrence. *Mr. William Penney* and *Amb. Caccia* thought the general approach presented in the letter to Macmillan was excellent.

Mr. Herter then handed *Mr. Lloyd* copies of a draft statement to be made by *Amb. Wadsworth* at the opening meeting. He explained that this statement had not been fully cleared within the U.S. Government, but that it would be useful to the British in understanding the approach we suggest.

Sir William Penney said that in his view the basic question to be answered if this approach were taken was whether we would resume underground testing. If this was the case the position might be difficult to put across, since it would be pictured as a stratagem intended to permit continued weapons testing. *Mr. Herter* said that we would certainly not resume underground testing before October 31. *Sir William* suggested that the Soviets would also claim that there needed to be no further controls than those already in existence if the agreement were limited to atmospheric tests. A final technical question which would need to be resolved would be the definition of the upper limit of the atmosphere. He was satisfied with the American position of using the 50 kilometer figure set forth in the Genova experts' report, but felt it would be necessary also to state that we would do no extra-atmospheric testing while we were working out the control schemes.

Mr. Lloyd stated that the British would give careful study to the American suggestions and respond promptly.

451. Memorandum From Herter to Eisenhower¹

Washington, April 4, 1959

SUBJECT

Geneva Nuclear Test Negotiations

I am enclosing for your consideration a draft letter to Prime Minister Macmillan suggesting the position we should take when the Geneva nuclear test negotiations resume on April 13th.

This letter proposes that on the day the negotiations resume we state our willingness, if the Soviets continue to be unready to abandon their position on the veto over mobile inspection, to agree to put the test ban into effect in stages. The first step would be a ban on tests in the earth's atmosphere under simple controls, and underground and outer space tests would be suspended also when agreement is reached in these negotiations or in the control commission on the required control measures for these tests. At the same time we would reaffirm our readiness to reach agreement on a full test ban, if the USSR is ready to abandon its position on the veto and its refusal to consider the relevant technical problems of underground and outer space test detection.

You have already approved the atmospheric test ban proposal as a fallback position. The proposed letter sets forth the reasons for which we believe the proposal should be made on the first day of the Conference.

If you approve this letter, I will discuss this matter with Selwyn Lloyd on Saturday, April 4th.

Christian A. Herter
Acting Secretary of State

Enclosure**Draft Letter From Eisenhower and Macmillan to Khrushchev**

April 4, 1959

Dear Mr. Chairman:

Today the Geneva negotiations for the discontinuance of nuclear weapons tests are resuming. During the recess I have considered where

¹ Source: Transmits a draft letter to Macmillan suggesting a position to take in nuclear test suspension negotiations. Secret. 7 pp. Eisenhower Library, Whitman File, Dulles-Herter Series, April 1959.

we stand in these negotiations and what the prospects are for the successful conclusion which I earnestly desire. I have also talked with Prime Minister Macmillan, who reported to me on his frank discussions of this matter with you.

The United States strongly seeks a lasting agreement for the discontinuance of nuclear weapons tests. We believe that this would be an important step toward reduction of international tensions and would open the way to further agreement on substantial measures of disarmament.

[Illegible in the original] Such an agreement must, however, be subject to fully effective safeguards to insure the security interests of all parties, and we believe that present proposals of the Soviet Union fall short of providing assurance of the type of effective control in which all parties can have confidence. Therefore no basis for agreement is now in sight.

In my view these negotiations must not be permitted completely to fail. If indeed the Soviet Union insists on the veto on the fact-finding activities of the control system with regard to possible underground detonations, I believe that there is a way in which we can hold fast to the progress already made in these negotiations and no longer delay in putting into effect the initial agreements which are within our grasp. Could we not, Mr. Chairman, put the agreement into effect in phases beginning with a prohibition of nuclear weapons tests in the atmosphere? This would require a simplified control system not involving the mobile on-site inspection which has created the major stumbling block in the negotiations so far.

My representative is putting forward this suggestion in Geneva today. I urge your serious consideration of this possible course of action. If you are prepared to change your present position on the veto, on procedures for on-site inspection and on early discussion of concrete measures for high altitude detection, we can of course proceed promptly to conclude negotiations of a comprehensive agreement for suspension of nuclear weapons tests. If you are not yet ready to go this far, then I propose that we take the first and readily attainable step while the political and technical problems associated with control of underground and outer space tests are being resolved. If we could agree to such initial implementation of the first phase of a test suspension agreement, our negotiators could continue to explore with new hope the political and technical problems involved in extending the agreement as quickly as possible to cover all nuclear weapons tests. In the meanwhile, the world would have assurance that nuclear weapons tests in the atmosphere with their attendant addition to levels of radio-activity had been discontinued, and we would be gaining practical experience and confidence in the operation of an international control system.

I trust that one of these paths to agreement will commend itself to you and permit the resuming negotiations to make at least an initial response to the hopes of mankind.

End message to Mr. K.

Enclosure

Draft Letter From Eisenhower to Macmillan

Dear Harold:

One of the most heartening aspects of our talks here was the accord we found in our strong convictions as to the importance of the negotiations in Geneva for the controlled suspension of nuclear weapons tests. These talks offer the one early possibility for a first step toward enforceable disarmament and toward control over the future development and spread of modern means of destruction.

I have been giving further thought to what we might do to revitalize these negotiations. I believe it is important to give a note of hope to the talks. We cannot achieve this merely by resuming interminable wranglings over the veto and the composition of inspection teams. If that is what faces our negotiators, then I think there will be increasing discouragement in our own countries and throughout the world.

What we might do is make clear immediately that these important differences in approach need not be a bar to putting into effect promptly the elements of a control system which are not in dispute—control posts and agreed aircraft flights, together with the banning of the atmospheric tests which these elements can adequately monitor. As fast as the political and technical problems of monitoring underground and outer space tests are worked out, an initial agreement would, of course, be broadened to include these also.

What I propose is the very opposite of an ultimatum. We would make clear by our statements and actions that we are prepared and determined to continue negotiating a comprehensive test suspension agreement. We would simply be offering a way to get started promptly in a limited area of agreement, if the Soviets remain adamant on the veto. Indeed, between us, I think that advancing such a reasonable alternative course of action may be the only effective way to test the real Soviet position on the veto.

The Soviets are no doubt considering their own moves. We should act when talks resume on April 13th if we are to retain leadership and to take action to restore a sense of purpose and hope in the negotiations.

Our representatives might make carefully prepared statements at the opening session in Geneva on April 13th, recapitulating the progress and difficulties in the negotiations, and pointing out the possibility of action to capitalize immediately on the areas of agreement already reached or in prospect.

Simultaneously letters from you and me to Premier Khrushchev, perhaps along the lines of the enclosed draft, might be delivered in Moscow endorsing the approach. In order that our suggestion might not seem to be advanced as a propagandistic gesture, it might be made privately and released publicly only after sufficient time for a Soviet response—unless, of course, a premature leak forces our hand.

These thoughts are being discussed here with Selwyn and your Embassy. Because I believe we have an opportunity to give a new and sounder impulse to these negotiations, I wanted to bring them to your attention directly and to hear your views.

With warm regard

As ever,

Herter
Acting

453. Letter From McCone to Herter¹

Washington, April 4, 1959

Dear Chris:

I have noted your letter of March 28 to the President reporting on our meeting of the previous day during which we discussed the Geneva negotiations.

I agree with points 1 and 2 as stated in your letter. With respect to point 3, the final sentence in the paragraph concerns me. This sentence states, "A limited program for underground testing, perhaps under international participation, might be undertaken as part of this effort to see whether the problem of detecting underground tests might be simplified." While we agree completely with the idea of international participation in a program to prove underground detection methods, we feel that during this period when investigations are being made and improved monitoring systems developed and installed, we must be free to carry out essential weapons tests which are not forbidden by treaty and which do not contribute to atmospheric fallout.

To do otherwise would permit the Soviets unrestricted latitude for weapons development through underground, and possibly higher altitude, testing during a period when we would be deprived by our own injunction of opportunity to advance our own weapons program. I

¹ Source: Believes U.S. should test during interim period; U.S. should not accept a detection system that only deters testing. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/4-459.

thought all in the meeting were agreed on this point. However, the wording of the sentence of your letter as noted above gives me concern that some might feel that the testing during the period of experimentation would be limited to shots made solely and exclusively for the purpose of developing the detection system. Mr. Farley tells me this was not the intent of this sentence in paragraph 3 but, nevertheless, I felt you should be advised of the AEC position which we feel must be maintained by our negotiators because of the very important weapons developments that will accrue to either side from tests during the two or three year period set aside for experimentation and research.

Your item 4 at the top of page 2 concerns us. It seems to establish the principle of accepting a very inadequate monitoring system on the theory that, because the system may detect a forbidden explosion, a party to the treaty will be deterred from violation. If you will recall, I said at the meeting, and several others agreed, that it seemed to me it would be a major departure if we were to accept a system having just sufficient capability to act as merely a “deterrent” in lieu of an effective monitoring and inspection system. This idea departs from authoritative statements, all of which have supported the idea that we shall accept the suspension of such tests as can be policed by an effective monitoring system that would have a high probability of proving any violation. If we are now to accept the “deterrent” theory, we are talking about something very different which will call for a change in our public position as well as our representation to Congress.

The Commission feels that such a move would be a serious mistake and we urge that our negotiators in Geneva be instructed not to accept an arrangement based on the theory of “deterrence” rather than adequate policing.

Our notes on the meeting listed as inconclusive discussions covering the following topics: a treaty based upon “an effective inspection system” as compared to one that was deemed to be “an effective deterrent”. — From these notes you can see that we did not feel there was agreement in the meeting on the so-called “deterrent theory”.

We consider these two matters I have discussed above to be of the utmost importance. We recommend, therefore, that your letter to the President of March 28 be supplemented to reflect these points.

Sincerely,

John A. McCone

454. Memorandum From Killian to Gray¹

Washington, April 7, 1959

SUBJECT

Limitation and Control of Armaments

At its meeting on 16 and 17 March 1959, the President's Science Advisory Committee considered the need for developing a more thorough understanding of the military and technical aspects of international agreements aimed at the limitation and control of armaments. The Committee was deeply concerned by the fact that at present no organization within the United States Government is conducting systematic and continuing studies on this problem, which the Committee recognized as one of great importance and complexity.

The Committee was impressed by the requirements for technical studies on the limitation and control of armaments, not only to understand the effectiveness of available technical means for carrying out possible inspection and control concepts but also to understand the implications of the objectives desired and the effects on national security of the various measures that might be proposed to attain these objectives. The Committee concluded that in considering these problems it is necessary not only to cover existing military forces and inspection techniques but also to lay great stress on the effect of changing technology on military forces and operations and on the techniques of monitoring agreements.

The Geneva Conferences on Surprise Attack and the Discontinuance of Nuclear Weapon Tests have demonstrated the great importance of adequate preparation for discussion of these complex problems at international conferences. The various departments of government and the scientific community cooperated exceedingly well in the technical studies undertaken immediately prior to these conferences. It is clear, however, that it is not possible either to understand specific proposals and alternatives adequately or to develop an integrated national policy on the limitation and control of armaments by means of such periodic ad hoc studies conducted under the pressure of impending negotiations.

An effective study program on this problem should not be limited to purely theoretical considerations but should include the conduct of research and experimentation in order to permit the development and evaluation of technical means for control and inspection. As a specific example, the recommendations in the recent reports by the Panel on

¹ Source: Recommends systematic study on military and technical aspects of arms control. Confidential. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.

Seismic Improvement and the Panel on High Altitude Detection clearly demonstrate the need for a program of creative research and experimentation if the capabilities and limitations of systems designed to detect and identify nuclear explosions are to be adequately understood.

While the Committee's immediate concern is with the scientific and technical aspects of this problem, it recognizes that the understanding of this problem from the point of view of national security requires the integrated study of a combination of military, technical, and political factors. It seems clear that there is no single department in government with the combination of technical, military, and political resources to study all of these factors in depth or arrive at fully integrated judgments on the entire problem. The resulting organizational problems must be successfully resolved in order for studies in this area to be really responsive to the needs of policy decisions on questions of the limitation and control of armaments.

The President's Science Advisory Committee recommends that steps be taken to initiate a sustained program of systematic study, including appropriate research and experimentation, on the military and technical aspects of possible international agreements concerned with the limitation and control of armaments and that consideration be given to the manner in which this program can be most effectively organized and conducted.

J.R. Killian, Jr.

455. Memorandum of Conversation¹

Washington, April 7, 1959

SUBJECT

Surprise Attack Study

PARTICIPANTS

Mr. Herter, Acting Secretary of State
Mr. Quarles, Deputy Secretary of Defense
Mr. Irwin, Assistant Secretary of Defense (ISA)
Mr. Farley, S/AE

Mr. Quarles outlined the thinking of the Department of Defense regarding the proposed surprise attack study, as presented in his letter

¹ Source: Discussion of proposed surprise attack study. Confidential. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

of March 10 to the Secretary of State. He emphasized particularly the way in which the proposed terms of reference for the surprise attack study broadened out into basic disarmament issues and the need for a review of present U.S. disarmament policy. He stressed also the special interest of the Departments of State and Defense in disarmament matters.

Mr. Herter said that he personally had come to the conclusion that it was important to have a review of U.S. disarmament policy. A very practical problem was that it was difficult for the State Department to release the type of officer needed for such a fundamental policy review in view of the existing demands on the personnel of the Department and the limitations of funds. For this reason, among others, the Department had been eager to take advantage of the interest shown by Mr. William Foster in pursuing the avenues of study opened up during the surprise attack conference with the Soviet Union and the preceding period of preparation. Mr. Farley pointed out that the Department's proposal for a study specifically directed at the surprise attack problem was motivated by the considerations that the surprise attack talks with the Soviet Union were formally in recess rather than broken off and that we needed to be prepared in event there was occasion to resume them; in addition, the study would be useful since it bore on many of the problems now being considered in connection with the European security aspects of forthcoming negotiations.

Mr. Quarles expressed appreciation for the staffing problem for any broad disarmament review. He thought that the Department of Defense might be able to help in finding the funds for outside consultants or participants and that studies which the State Department desired might be placed with such organizations as the Rand Corporation if State Department funds for this purpose were not available. With regard to Mr. Farley's point, he raised the possibility that, in the broad disarmament policy review, special early attention might be given to the surprise attack aspects.

Mr. Herter suggested that as a next steps a draft terms of reference be drawn up for a broad disarmament policy review.

456. Memorandum of Conversation¹

Washington, April 7, 1959

SUBJECT

Geneva Nuclear Test Negotiations

PARTICIPANTS

Mr. Herter, Acting Secretary of State
Mr. Quarles, Deputy Secretary of Defense
Mr. Irwin, Assistant Secretary of Defense (ISA)
Mr. Farley, S/AE

Mr. Quarles read through the letter of April 4 from the President to Prime Minister Macmillan, enclosing a draft letter to Khrushchev on the Geneva nuclear test negotiations. Mr. Quarles said that, as Mr. Herter and Mr. Farley were aware, he personally had reservations regarding the proposed tactics of suggesting the possibility of a controlled agreement for suspension of atmospheric tests. He thought that our present public posture was excellent and that introducing this modified proposal would enable the Soviet Union to “shift the monkey to our backs” and place the blame for failure to reach a comprehensive test suspension on us. Mr. Herter said that he felt, with increased concern about fallout and the Soviet obstinacy on the veto, the Soviet Union would be placed in a very difficult position if we made this modified proposal.

Mr. Herter summarized for Mr. Quarles his conversation with the President regarding the philosophy of “deterrence” with regard to an adequate control system for a nuclear test suspension.

¹ Source: Letter to Macmillan; concept of deterrence. Secret; Limited Distribution. 1 p. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

457. Letter From Herter to McCone¹

Washington, April 8, 1959

Dear John:

I appreciate your bringing to my attention the points in your letter of April 4, which are very important ones in our thinking about the next steps in the Geneva negotiations.

You ask the intent of the sentence in my letter to the President of March 28 which states "A limited program for underground testing, perhaps under international participation, might be undertaken as part of this effort to see whether the problem of detecting underground tests might be simplified." This sentence was included in order to record the principle that, in event of an atmospheric test ban, there should be underground nuclear experiments in order to learn more about the detection problem. There was absolutely no intention to imply that we had agreed tests would be conducted for no other purpose. If there were to be a limited agreement for suspension of atmospheric tests, the United States would of course retain freedom of action to conduct any underground tests which we found necessary.

Your second point, which relates to the question of what constitutes an adequate policing system for a test suspension agreement, appears to reflect some misunderstanding of our view. Certainly we do not support what you refer to as the "principle of accepting a very inadequate monitoring system", nor do we believe that "deterrence" is different from "adequate policing." Any acceptable agreement must provide for an adequate and effective monitoring and inspection system. In devising an "adequate" monitoring system, however, we believe that we cannot aim for an unachievable 100% fool-proof system but rather for an effective system which will deter any other nation from attempting violation by the knowledge that there is a high probability that the system would detect any effort to violate.

Having learned of your concern on this point, I took the occasion of my call on the President on the morning of April 6 to tell him about it. You will be reassured to know that he too considers an adequate and effective monitoring system to be one which has a high enough probability of detecting any attempted violation that it deters a potential violator.

With warmest personal regards,

Most sincerely,

Chris
Acting Secretary

Enclosure

Memorandum From Gray to Goodpaster

Washington, April 9, 1959

You no doubt have copies of this further exchange of correspondence. However, please note Mr. Herter's statement about having informed the President.

Do you think that the President is sufficiently informed about the potential serious difference of view in this matter? I agree with Mr. McCone that there may be a great difference between a system of "deterrents" and a system providing adequate inspection and control.

Gordon Gray

Special Assistant to the President

Enclosure

Memorandum From Calhoun to Gray

Washington, April 8, 1959

There are enclosed for your information copies of AEC Chairman McCone's letter of April 4 to the Acting Secretary of State and of the latter's reply of April 8 concerning nuclear test suspension. A copy of the Acting Secretary's letter of March 28 to the President is also enclosed.

458. Record of Telephone Conversations Between Herter and Goodpaster and Eisenhower and Herter¹

April 10, 1959

5:30—*Gen. Goodpaster* telephoned and said he had explained to the President as best he could what position our friend is taking and he is at a loss to understand why they are doing this. The President

¹ Source: Discussion of Macmillan proposal on nuclear testing. No classification marking. 1 p. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.

thinks he is thinking of this additional provision because he anticipates Khrushchev will turn down the President's proposal. Then, if he does turn it down, evidently due to our friend's home situation and the election coming up, he does not feel he can let the thing break up. In any event, the President is very concerned about it and does not think they are on sound ground. Goodpaster said the President had questioned whether there was an agreement on the 50 kilometers. CAH said we did agree on that. (2) Goodpaster said the President will be in early tomorrow, around 7:30, and if we have our draft reply ready for his consideration he had told Arch Calhoun to send it over and Goodpaster will make communications arrangements for it. CAH said we hope to have the draft within about half an hour. (3) Discussed Macmillan's statement that he would be willing to send a brief message. CAH said Macmillan is not reserving the right to veto the thing, merely to talk to us again about it.

5:55—*The President* telephoned. Said that this statement of Macmillan's position is different from the previous one, and he doesn't think we can object too much to this because he says "three powers". Also doesn't think our people can object too much if there is no atmospheric pollution. CAH said his understanding is that Macmillan would like to come back and go over the thing again in the event of their being a refusal to agree on the atmospheric. President reiterated he is now of the disposition it would not hurt us too much; looks with favor on the proposal as now laid before us. CAH said we hope to have a draft reply ready shortly; thinks we should say that if they do refuse to do anything on the atmospheric tests, we would consider again Macmillan's suggestion.

Washington, April 15, 1959

SUBJECT

Geneva Nuclear Test Negotiations

¹ Source: Macmillan proposal to offer unilateral moratorium on underground and outer space testing while negotiations on those issues are underway. Secret; Limit Distribution. 3 pp. NARA, RG 59, Central Files, 700.5611/4-1559.

PARTICIPANTS

<i>Department of State</i>	<i>The White House</i>	<i>Atomic Energy Commission</i>
G—Mr. Murphy	Mr. Gray	Mr. McCone
EUR—Mr. Kohler	Dr. Killian	Mr. Gardner
S/AE—Mr. Farley	Mr. Beckler	
Mr. Baker		<i>Central Intelligence Agency</i>
Mr. Morris	<i>Department of Defense</i>	Mr. Dulles
S/S—Mr. Berg	Mr. Quarles	Dr. Scoville
	General Fox	

In Mr. Herter's absence *Mr. Farley* explained that during the course of consultations with the U.K. last week regarding the phased approach to a test cessation agreement presented by Amb. Wadsworth in Geneva on Monday, Prime Minister Macmillan had proposed to President Eisenhower that we supplement our proposal for a first step inspected agreement on the cessation of atmospheric tests by offering a unilateral moratorium on testing underground and in outer space for a finite period while further negotiations on extension of the agreement to these areas are in progress. The State Department felt that such a move at this time would not be wise from a negotiating point of view and Mr. Herter had so recommended to the President. The President accepted Mr. Herter's recommendation but noted agreement with Prime Minister Macmillan that such a course of action might have to be reconsidered at some point. The President had therefore directed that the British proposal receive urgent and objective consideration within the US Government.

Mr. Farley said that staff personnel of the agencies concerned had attempted to identify the considerations bearing on this question as reflected in the paper which had been distributed to each of the principals as a guide for this morning's discussion.

Mr. Quarles said that, speaking for the Department of Defense, he found the considerations outlined in the staff paper appropriate but felt that the conclusions reflected an overly sympathetic attitude toward the British proposal. *Mr. McCone* said that the AEC would have considerable concern about any such proposal which would stop our testing underground or in outer space in the absence of adequate assurance that the Soviet Union was likewise refraining from such tests. He explained that the effect on the weapons laboratories of any *temporary* one or two-year suspension of nuclear tests would be quite far-reaching. Whereas if a permanent cessation of tests came into effect, new missions could be assigned and the staffs could be reorganized, temporary cessation would make such reorganization extremely difficult. It would be almost impossible to retain the teams presently working together at the laboratories in the absence of firm goals for their work. Once these groups had dispersed it would be extremely difficult to reassemble them.

Mr. McCone noted that the proposed Humphrey-Fulbright joint resolution concerning the negotiations had been discussed at an

executive session of the Joint Committee on Atomic Energy yesterday. Some members of the Committee had felt that the language of the resolution and particularly that of the preamble seemed to give the impression that the U.S. was headed toward nuclear disarmament rather than overall disarmament including conventional forces. Some members also had felt that it would be highly unwise for the U.S. to stop underground and high altitude testing until our present needs for weapons development in the anti-missile and small-weapons fields had been satisfied and that therefore we should agree now only to a cessation of atmospheric testing. *Mr. McCone* said that he had notified Senator Fulbright, and had so informed the Joint Committee, that the AEC supports the proposed joint resolution but felt that the specific language should be reviewed carefully in order to avoid any wrong impressions. He said he mentioned this matter at the present time to indicate that the Macmillan proposal would probably meet resistance among some members of Congress.

Mr. Farley suggested that it might be more forthright if the staff paper could quote AEC and possibly DOD judgement as to the relevant factors pertaining to problems with the laboratories, necessary research and desired weapons tests in relation to the Macmillan proposal. It was agreed that the AEC and the DOD would undertake to prepare suitable language for inclusion in the paper.

Mr. Quarles said he felt the tactical situation with regard to any unilateral action such as proposed by the U.K. should be considered before any firm conclusions as to its desirability were drawn. He felt that the U.S. should not join with the Soviet Union in any suspension of nuclear testing for which no control is planned. He would suggest that the U.S. adopt the position that as long as the negotiators are continuing to seek controls for a total agreement we will continue to abstain from all nuclear testing until the October 31, 1959 date previously announced by the President, and that we will examine our course of action at that time in the light of the situation which then exists. He believed that this would be as far as the U.S. should move without risking damage to its own overall security position.

Dr. Killian suggested that urgent consideration be given to the question of what would be our policy toward future tests in the atmosphere in the event we do not reach agreement with the Soviet Union at the present negotiations to ban such tests.

Mr. Farley noted that we had not pressed for any firm understanding within the Government on this question because we felt that the Soviet reaction to the April 13 proposal and the course of these negotiations as well as the Foreign Ministers meeting during the next month or two would have considerable bearing on any decision we might make.

Mr. Quarles said that he felt that we should continue our unilateral abstention until October 31 and then if no progress toward agreement is evident we might announce that we will abstain unilaterally from atmospheric testing indefinitely but that we consider ourselves free to conduct such non-contaminating tests as our security interests may require. Such a move would seem to be the best combination of cold war tactics and technical requisites. It would undoubtedly be more expensive to do all our testing in the underground and outer space environments, but he felt it would be better to bear such expense than to continue to bear the onus of contaminating the atmosphere. If such a policy were too difficult in terms of development requirements it might be modified by limiting atmospheric tests to a certain amount of radiation. *Mr. Quarles* said that in any event he felt we should reserve any such announcement until October 31.

Dr. Killian said he wished to emphasize the importance of obtaining better and more solid factual information on the usefulness of underground tests. He noted that there was considerable difference of opinion between Los Alamos and Livermore on this question and that AFSWP was skeptical of the usefulness of tests in this environment. Similar attention should be given, he felt, to the question of testing beyond the 50 kilometer altitude limit now being discussed for our atmospheric proposal since there seems to be a real problem of fallout from explosions beyond this altitude. *Mr. McCone* and *Mr. Quarles* agreed that these questions should be urgently studied and that the mechanics for such study would be discussed further with *Dr. Killian*. Similarly, the problem of further exploratory programs to further our knowledge of detection of underground and outer space tests would be coordinated with *Dr. Killian*.

Mr. McCone noted that he was often asked whether a total cessation of nuclear tests would not involve foreclosing the possibility of development of an anti-missile missile system.

Mr. Quarles said that “foreclose” was perhaps too strong a word but that he felt that if we could make no further nuclear tests we would seriously prejudice the possibility of developing an effective anti-missile missile system. *Dr. Killian* pointed out, however, and *Mr. Quarles* agreed, that the primary technical problems now standing in the way of an anti-missile missile system were engineering rather than nuclear and that we do now have a warhead which could be used with such a system.

Mr. McCone said that if the U.S. depends to a large extent for its security on defense against incoming missiles he wondered how we could justify any stoppage of nuclear tests in the high altitude area. He thought that the public had been convinced of the need for protection against attacking aircraft and that an anti-missile system would be looked at in the same light.

460. Letter From Killian to Herter¹

April 18, 1959

Dear Mr. Secretary:

I have transmitted to Gordon Gray the attached recommendation of the President's Science Advisory Committee. The view it expresses is essentially what I have discussed with you on several occasions.

The Committee did not suggest how these studies should be organized or what their terms of reference should be, but it is strong in its conviction, based upon experience we have had in providing technical studies to support the Geneva negotiations on test suspension and surprise attack, that we need to achieve better preparation and deeper understanding of some of the technical problems involved in the whole arms limitation area.

Yours sincerely,

J.R. Killian, Jr.

**Memorandum Prepared by the President's Science
Advisory Committee**

March 16, 1959

ARMS LIMITATION FOLLOW-UP STUDIES

This memo has been prepared to stimulate the interest of the PSAC in taking an active role in the initiation and in support of sustained activities dealing with the military-technical aspects of international agreements aimed at reducing the threat of war. It is an aim of our national policy to preserve and enhance the security of United States through agreements whose objectives are the reduction of international tension, the reduction of the threat of war and the reduction of the burdens of the arms race.

This memo is concerned with the ways to improve the efforts for implementation of this policy through agreements for inspection and monitoring of armed forces, for arms limitations and for arms

¹ Source: Transmits President's Science Advisory Committee's recommendation for arms control studies. Confidential. 10 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Surprise Attack, Miscellaneous.

reductions. The two recent conferences in Geneva have demonstrated anew the extreme importance of preparation prior to such conferences, i.e, the need of acquisition of a clear understanding of the objectives desired and of the actual effects of various measures that might be proposed to attain the objectives. The need for a continuing development effort to provide the technical means for support of inspection and controls has also been clearly demonstrated. The most obvious demonstration of this need is, of course, the detection of underground nuclear tests.

To achieve the needed understanding it is not sufficient to consider the existing military forces and to devise means for reducing their threat to peace, while preserving the military security of United States. Rather, one has to look into the future and anticipate the effects of changing technology on military forces and operations; one must consider the effects of changing technology on the feasibility and on techniques of the monitoring of military forces, as well as on the usefulness of an early warning of an impending attack; further, one must devise detailed integrated patterns and time tables for agreements (somewhat like weapon systems are designed from component parts), whose objective should be the enhancement of the security of United States in the sense defined above by the national policy. That sense we interpret more broadly than simple enhancement of our military power because though the reduction of the threat of war may be brought about by an enhancement of our military power, it can certainly be assisted by other factors as well.

While the emphasis in the preceding paragraph was on military-technical matters, it is essential to recognize that the ultimate objectives of the agreements we seek are political and that political considerations are of the greatest importance in finding mutually acceptable patterns of agreement. Thus it is clear that the preparation for future international conferences must include the study of military, technological and political factors. It is a task which is best carried out by an inter-departmental or non-departmental body rather than a necessarily slanted single department.

Agreements which in principle might reduce the threat of war and reduce the armaments race are of several types. Starting with the least ambitious they may be classified as:

I. Agreements for partial inspection of armed forces. The partiality of inspection may arise from the geographic limitations of the zones to which inspection is limited or from deliberately incomplete but world-wide inspection. The incompleteness itself may be of two kinds. For instance inspection may apply to only one kind of military activities (e.g. nuclear weapons tests) or only one type of inspection mechanism may be agreed to (e.g. the "Open Skies" proposal of the President). The objectives of such agreements may be to provide "strategic" warring

of the other side's activities (which certainly applies to the nuclear tests) or to provide timely warning of preparations and launching of an attack (which could have been the effect of the "Open Skies" agreement if the attack were to be launched by conventional ground or sea forces). Neither objective may be attainable with rather limited agreements, but they may still be valuable for political reasons, e.g., the building of mutual confidence, the experimentation with inspection in essentially unfriendly countries, etc.

II. Agreements for comprehensive monitoring of armed forces. The word comprehensive implies here that no geographic limits are set on the inspection apparatus. As regards the thoroughness of inspection, however, some limits must be set, as their absence would imply a virtually complete surrender of sovereignty by contracting parties, not a likely event. The immediate objectives of such inspection schemes are strategic information and possibly "early" warning in a tactical sense; the ultimate objectives are reduction of tensions and of the arms race.

III. Partial arms limitation agreements. It is our national policy not to accept any such agreements unless the compliance is monitored. The nature of the monitoring, however, should vary greatly depending on what is the nature of the limitations (e.g. that of the improved nuclear weapons in the test cessation proposal). There may be other factors which should influence our choice of the severity of monitoring. For instance, agreements where the agreed-to monitoring apparatus is the sole mechanism for detecting non-compliance and where the non-compliance can lead to drastic changes in the balance of power before detection, call for especially strict monitoring, etc.

IV. Comprehensive arms reduction, i.e. disarmament, agreements. The world we live in is such that ambitious disarmament proposals seem much less realistic than even the more modest steps indicated above, but some understanding of the comprehensive plans should be acquired, in order to insure that the more modest plans could be molded so as not to conflict with the comprehensive plans.

Any one of the agreements broadly indicated above contains many inputs, of military, technical and political nature. In the following we shall indicate some of them, insofar as we have become aware of them in preparing for and then participating in the Geneva conference on the prevention of surprise attacks.

Effective inspection and monitoring of military forces inevitably provides the inspecting side with strategically important information on the disposition, state of readiness, etc. of the inspected forces. If suitably designed, it may also supply the inspecting side with early warning of the impending attack. However, as the speed of the attack increases with changing military technology (e. g. the trend from ground forces to long range fast bombers and then to ballistic missiles) the

advance warning of an attack gives the defender ever less time to make the attack ineffective. Since the probability of circumstances in which the United States would carry out a surprise attack is extremely remote, we must be concerned, lest an inspection scheme provide our potential enemies with such strategic information as to make their attack more effective, without giving us sufficient additional warning to counteract the effects of previous disclosure of information regarding our forces. This point requires careful study, whether one considers the inspection schemes alone or adds to them arms limitation measures.

In the schemes involving inspection alone, it appears preferable to focus the monitoring on operational forces and weapon systems, but as the schemes are expanded to include arms limitation agreements, monitoring may also include manufacturing and/or development activities, or even may be limited to one or both of them. These are complex problems, certainly not well understood at present.

Involved in all inspection schemes are a host of military-technical problems. To mention but a few: (a) the development and evaluation of various monitoring techniques as applied to particular weapon systems (e.g. the effectiveness of aerial photography in detecting operational missile sites); (b) the "rights and privileges" and the freedom of access of the inspectors. Surely some limits must be set on them as otherwise the schemes would not be acceptable even to us, not to mention the USSR, but these limits must be so chosen as to introduce the least interference with the objectives of the plan; (c) communications from inspectors to data evaluation centers become a serious problem when hours or minutes become decisive and also the problem of authentication of these messages needs study; (d) the handling of the data at the centers and their transmission to decision centers have not been worked out; these are not trivial problems already because of the danger of false alarms and the consequent possible increase of tensions, the reverse of what the scheme is designed to achieve; (e) especially in comprehensive inspection systems the inspecting staffs, with logistic support, seem to run to tens of thousands; these are expensive schemes even if the best use is made of technical aids. This consideration alone suggests a consideration of a change from the concept of the complete inspection of all forces to that of random sampling, a principle which has been effectively used in many industrial situations; (f) distinction in the degree of monitoring is probably required between strictly offensive and largely or wholly defensive forces and weapon systems; (g) an even more difficult problem is the devising of monitoring schemes which, even in the case of a failure of the built-in early warning, tend to protect retaliatory forces of the attacked side and thus stabilize peace by mutual deterrents.

These are some of the problems in which the technical inputs are especially strong. Many other problems have stronger military and political emphasis, although still involving technical considerations. For instance, the choice of geographic zones for "trial" inspection schemes involves not only the political, and strategic considerations, but also those of ever changing military technology and of technical aspects of inspection. The USSR delegates in Geneva emphasized their unalterable opposition to even the discussion of any schemes involving monitoring alone, without arms limitation measures. It would appear desirable to determine whether, from the point of view of the USSR, with its emphasis on military secrecy, the inspection schemes alone are indeed as disadvantageous as their delegates implied. If that is the case, it needs to be determined whether it is to our political advantage to propose nonetheless such schemes in conferences or to abandon them. In the latter case the technical work indicated in the preceding may take a somewhat different slant.

The discussion of the last few pages, we hope, justifies our conviction that the study of the whole area must be done by a staff that represents not only the military but also the technical and political competence. We hope also that this discussion gave some indication of the variety and complexity of the problems involved. It is our belief that the complexity is so great that to rely on ad hoc study groups preparing each particular conference is to our national disadvantage. What is needed, we believe, is a sustained effort on a significant level, in order to have available the required information and technology when a suitable opportunity for an agreement is in prospect and also to have on hand a competent staff trained in the problems involved, so as to have the best possible on-the-spot advice when conferences do take place. This certainly would be needed in the eventuality that the USSR seriously enters the discussions of some agreements and comes forth with proposals of its own.

It is not the purpose of the present memo to present a detailed organizational plan for a continuing study of the problems outlined above. However, certain features of a desirable organization can now be indicated. We deem it desirable to have this organization set up on a non-departmental basis. The organization itself might consist of a full time director with a modest administrative and technical staff and a board of consultants, whose advice would be seriously weighed in planning activities and whose opinion would add weight to the conclusions reached. It goes without saying that a budget must be provided, to support activities outside of the director's office, as well as this office itself. These activities, which are the essence of the concept being proposed, fall into three categories:

(a) Studies and development under contract by private institutions and corporations on specific aspects of the broad area encompassed. Examples of possible contractors might be the RAND Corp., Lincoln Lab, STL, JPL, ORO, ITEC, Russian Research Center at Harvard, etc.

(b) Studies and development on request of the suggested organization and possibly with the transfer of funds, by several departments which have active interests in the problems, e.g. studies by groups setup in the State Dept, Defense Dept or in AEC.

(c) Conferences of limited duration (but perhaps as long as the entire academic summer vacation) in which competent people from government departments concerned (e.g. Defense and State), from groups engaged in continuing studies under (a) and competent “outsiders” take part. The main purpose of such conferences would be the integration of data obtained under (a) and (b) and the planning of future work.

461. Memorandum From Herter to Eisenhower¹

Washington, April 20, 1959

SUBJECT

Voluntary Temporary Moratorium on Underground and High Altitude Tests

On April 11 you directed that the interested agencies give urgent consideration to Prime Minister Macmillan’s proposal that we offer to accompany a controlled agreement for suspension of atmospheric tests with a temporary moratorium on other nuclear weapons tests provided the Soviet Union did likewise.

This question has been carefully examined with the Secretary of Defense, Chairman, Atomic Energy Commission, Director of Central Intelligence Agency, and the Special Assistant to the President for Science and Technology. We have concluded that proposing an extended uncontrolled moratorium on outer space and underground tests, even if the Soviets agree to negotiate controlled suspension of atmospheric tests, is an undesirable course of action at the present time. Such a proposal would undercut our basic principle of effective control, and would be unlikely to increase Soviet interest in serious negotiations.

¹ Source: Recommends against Macmillan proposal for moratorium on underground and space nuclear testing. Secret. 5 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Nuclear Policy.

Consideration of this question has served to draw attention to the urgent need for decisions on United States nuclear testing policy in the event negotiations are unsuccessful or reach agreement only on controlled suspension of nuclear weapons tests in the atmosphere. We have agreed that studies looking toward such decisions should be initiated promptly and should embrace future requirements for nuclear weapons testing, improvement of methods of detection, fall-out considerations, and factors of cost and practicability involved in testing underground and in outer space. Arrangements for these studies are being worked out by the Department of Defense, the Atomic Energy Commission, and the Special Assistant to the President for Science and Technology.

Acting Secretary

Proposal

Washington, April 17, 1959

VOLUNTARY TEMPORARY MORATORIUM ON UNDERGROUND AND HIGH ALTITUDE TESTS

PROBLEM

To consider whether it would be in the U.S. interest to offer to accompany a controlled suspension of atmospheric nuclear weapons tests with a voluntary one to two year moratorium on underground and high altitude nuclear weapons tests, provided the Soviet Union does the same.

BACKGROUND

During preparation of the proposal put forward on April 13 at Geneva by the U.S. and U.N. delegations, a possible additional feature was considered. While this additional element was not included in the April 13 proposal, it was agreed that it would be given further urgent study by the U.S. against the possibility that the Soviet reaction to the April 13 proposal might be such as to justify reconsideration of the decision not to include it.

The additional proposal was put forward in the following terms. The Russians will probably be very disinclined to reach any agreement falling short of a complete ban on all tests. They will argue for a complete ban on grounds of general principle and say that anything short of it will be unsatisfactory and unfair. The U.S. and the U.K. might meet this objection by announcing that they would be prepared, provided the Soviets are likewise to refrain for a period from the entry into force of the initial agreement from conducting tests underground and above 50 kilometers. This moratorium would be a voluntary arrangement outside any formal agreement—thus preserving the important

principle that the agreement itself should only commit us to steps which we know can be controlled. The U.S.–U.N. hope would be that during this moratorium period scientific advances would [illegible in the original] agreement with the President on a ban extended to cover further explosions. The moratorium should not exclude the possibility of conducting experimental nuclear explosions underground jointly with the Russians or under international control, so obtain necessary data for developing a control system. There is presumably a reasonable prospect that scientific advances will enable us to move further before long. The period of moratorium should thus be either one or two years.

It might of course be argued that during this period of one or two years the U.S. and U.K. would be bound by their voluntary abstention, while the Russians might carry out experiments undetected. Against that, the U.K. suggests, the points can be made first, that we do not know whether the Russians are in fact doing underground tests; and, second, even if we got a comprehensive test suspension it would take well over a year to install the control system, during all of which time the Russians could cheat if they wished to; and third, this risk is inherent in the present moratorium which has been in force since the Geneva conference began. Thus it is suggested that we would not lose very much and we might make a considerable impact upon public opinion.

DISCUSSION:

1. *Effect upon public opinion.* Such a move would be viewed favorably by that segment of public opinion which welcomes any move toward the cessation of nuclear weapons tests. It would provide an effective answer to Soviet charges that we have proposed an atmospheric test ban because we never really intended to stop all tests. On the other hand, it could create the impression that effective international controls are not really necessary and to this extent weaken public support for the U.S. position on controls.

Since the U.S. and U.K. have suspended tests for the time being—without the Soviet Union having felt it necessary to make a similar explicit renunciation—our public posture is not now vulnerable. If challenged as to long range testing plans, the U.S. and U.K. can point out that they are not now testing and that it is up to the Soviet Union to demonstrate its intentions in serious negotiation for an atmospheric test ban rather than for the U.S. and U.K., without any *quid pro quo*, to answer for the indefinite future.

2. *Effect upon negotiations.* While such a move might increase the chance of Soviet acceptance of an atmospheric test ban, it would weaken our position seriously in negotiation for a complete test cessation under effective control. Once we were committed to a complete suspension, the pressure would be on us to withhold testing even if there were no progress in negotiations for extending the control system. Yet what the U.S. and U.K. want is to put pressure on the Soviets to extend controls in order to get other tests brought to a halt. This can best be done if the U.S.

and U.K. do not reduce their bargaining power voluntarily. Moreover, any appearance of acquiescence in the Soviet view that an agreed suspension of tests can be undertaken without controls would correspondingly weaken our bargaining position in insisting upon such controls.

3. *U.S. Requirements for Nuclear Weapons Tests.* The U.S. has important needs for further nuclear weapons tests: to improve existing design (particularly in the small warheads field); to develop new or improved designs (particularly in the ballistic and anti-ballistic missile field) to improve the safety of certain designs; and to examine further the phenomena revealed by the Johnson Island and ARGUS firings.

4. *Relative ability of the U.S. and USSR to carry out weapons improvement (or [illegible in the original]) tests under the proposed arrangement.* If the proposed arrangement was adopted, it would not be possible for the United States to conduct nuclear weapons tests. The USSR might not be inhibited to the same degree and could undertake [illegible in the original] they believed undetectable. It would be difficult for us to carry out nuclear tests for improvement of the detection system (or for peaceful purposes) that would not carry with them the possibility that the Soviets would conduct nuclear weapons tests under these guises.

5. *U.S. Congressional and public reaction.* Public and Congressional support for moves which might advance the objective of first step agreements toward an inspected test cessation should be weighed against distrust in these quarters of any arrangement with the USSR which does not embody effective controls.

6. *Effect on laboratories and developmental programs.* In the judgment of the Atomic Energy Commission and Department of Defense, while the potential of the weapons laboratories has been affected only slightly up to now, it is probable that deterioration will proceed rapidly if the U.S. should commit itself to the proposed further one or two year moratorium. Although current programs which are in advanced stages of development and which are based to large degree on devices already tested will proceed relatively unaffected, it is most probable that a one or two year voluntary suspension of this type will greatly accelerate the trend of scientific personnel away from the long-range weapons development programs. Once these people are dispersed, their reassembly into an effective scientific organization [illegible in the original] virtually impossible in absence of extreme emergency.

It will be extremely difficult for the laboratories to plan new development [illegible in the original] without knowing, at an early date, in what environment, if any, testing would be permitted. A development program without testing is, of course, in itself a most difficult undertaking. The voluntary ban would further delay any decision as to the basis on which weapons development is to proceed. Also, there might be difficulties in securing adequate appropriations for continuation of weapons research or resuming a weapons testing program after a prolonged voluntary suspension.

7. *Need for further studies.* The following matters relating to the conduct of future nuclear tests should be studied as early as possible so that an early decision on future nuclear testing policy can be reached well in advance of the expiration of the present one-year voluntary withholding of nuclear testing:

- a. Requirements for additional nuclear weapons testing.
- b. The feasibility and practicability of underground testing including the cost and timing of test programs.
- c. The problems of testing in the earth's atmosphere above the detection limits of the Geneva System including the problems of radioactive fallout and the definition of the upper limits of the atmosphere in relation to the fallout problem.
- d. The organization and test program needed to explore the problems of underground test concealment, improvement of seismic detection, and system studies for detection of tests in the upper atmosphere and outer space.

CONCLUSIONS

On the basis of these factors it is suggested:

1. That proposing an extended uncontrolled moratorium on outer space and underground tests represents an undesirable course of action at the present time, and that the United States should adhere to the policy set forth in the August 29 and November 7 White House announcement concerning a voluntary nuclear test suspension.

2. That studies relating to future requirements for nuclear testing, the improvement of methods of detection of nuclear tests, the fallout problem, and factors of cost and practicability involved in testing underground and in outer space should be undertaken promptly so that decisions can be reached on future nuclear testing policy as soon as possible and well in advance of the expiration of the present one-year voluntary withholding of nuclear testing.

462. Telegram Supnu 382 From Geneva¹

Geneva, April 22, 1959, 3 p.m.

Supnu 382. For Herter from Wadsworth. Reference: Nusup 307.

I think your message covers very well what we should do in response to various approaches the Russians might take. I personally think that what is most likely is that Russians will not give clear acceptance or

¹ Source: Negotiating tactics at nuclear testing suspension talks. Secret; Niact; Limited Distribution. 3 pp. NARA, RG 59, Central Files, 700.5611/4-2259.

rejection of either of alternatives suggestions we have made and that they will not make any major new proposals on basic issues in next few days. So line of action that we will probably have to follow is the one you have laid out in next to last paragraph of your telegram.

We may meet Soviet objections to idea of formal recess before Foreign Ministers meeting but I do not think they will press these objections and, in any case, we will be in a strong position just to say that time terms of resumed negotiations should be set by our Foreign Ministers. The fact that no one can accurately foretell how long the Foreign Ministers meeting will last will in itself help us avoid setting a date for re-opening our conference at the time that we recess.

The only point on which I differ, and I think this is a very important point, is on question on how we handle staffing issue. I agree completely that we should try to play down the staffing issue and have it not appear as equal in importance to inspection and the veto. But I sincerely believe the only way we can do this, in present situation, is to make a limited movement from our present position. I think all we really have to do is to say that since the Soviets have now agreed that the business of control is really carried out by actual technical staff, and since they have abandoned their previous idea of controllers, we have decided to accept the idea of having a strictly limited number of host country nationals in the control posts. The number should be strictly limited so as to guard against any obstruction of the control function. But the presence of a limited number of host country nationals could be justified on grounds that host country also has an interest in seeing that control posts operate properly.

I would not expect that we would expose ourselves to any detailed negotiations on the staffing issue. And I would not put forward any specific formula on staffing. But I think some movement off our present staffing position is required to give plausibility to our claim that this issue can be resolved and to clearly remove it as one of the decisive issues. If we continue to stand pat on staffing I am afraid any talks at Foreign Minister level will be cluttered up by Soviet challenges on this point. Some slight modification of our previous position will avert the risk of Gromyko emphasizing this issue and thus cutting into efforts you have in mind to focus attention sharply on Soviet intransigence on basic control issues of veto and inspection.

Otherwise I agree that we are in first rate position to put our proposition squarely to the Russians and put on them the onus for any breakdown or lack of progress in negotiations.

As I have said, I think the tactics you have outlined are sound and if I am authorized to make the kind of statement on staffing that I have suggested, I am sure we can handle the situation so that you will have a strong and clear position to field when you meet with the other Foreign Ministers.

I am sending a separate message on the details of tactics we would like to follow over the next two weeks.

463. Telegram Supnu 383 From Geneva¹

Geneva, April 22, 1959, 3 p.m.

Supnu 383. Believe Soviets will probably continue their line of hinting willingness to make compromises as part of the continuing negotiations but without actually making any substantive changes in position. They will claim the possibility of significant progress in the negotiations has been proved by the Soviet shift on staffing and the adoption of a number of articles and that in view of this there is no real reason to consider a shift in direction.

We have been thinking about how best to maneuver the Soviets into more of a yes or no position in next two weeks on the alternatives we have presented. We believe that the best tactic is for us to let the Soviets exhaust the supply of non-controversial articles, most of which apply to either of our alternatives, periodically emphasizing that these are all really peripheral matters. By letting them do this, we commit them more and more to our basic framework. This will inevitably focus attention more sharply on the issues at the heart of our treaty, e.g., voting procedures and on-site inspection. While this process is going on we will begin to fill out the details of our staged alternative, first in a general descriptive statement, and then when the Department's views on Supnu 365 are received, perhaps by tabling as a single document a treaty draft for the staged approach. We will then have two alternative documents on the table, each of which will include a good number of articles which have been agreed. This will let us play up in more concrete terms the choice we are putting to the Soviets, and just what is involved in each. At this point it will be difficult for the Soviets to maintain any [garble] sense of movement in the negotiations, and the real issues to be solved can be spotlighted with little risk of anything else getting in the way.

We believe these tactics in line with those outlined Nusup 307.

With respect to question release modified version Berkner report, the view would depend on how problem of para 4 (f) treated since we would wish avoid situation where Soviets could misinterpret any move for recess as being motivated by desire to break off negotiations and that our revelation further technical difficulties demonstrated true nature our intentions. Would prefer have any specific treatment question new data or theories re decoupling postponed until Soviets accept our proposal for technical discussion.

Villard

464. Telegram Supnu 401 From Geneva¹

Geneva, April 29, 1959, noon

Supnu 401. Paris for the Secretary. On basis Tsarapkin performance yesterday, it appears that Soviets will probably move quickly to reply to questions we have posed on Khrushchev-Macmillan proposal and that their answers may be clear and to the point. They have already stated flatly that in context of quota agreement they are prepared to drop veto and requirement for commission decision on dispatch inspection teams. They have indicated that agreement on criteria which would qualify events for inspection will not present major problem. They have bought concept of permanent inspection teams. They will probably be prepared negotiate on composite inspection teams. They have opposed idea that quota should have relationship to number of unidentified events and have stated clearly that they thought size of quota was a political decision. They might, however, make point that if we feel so inclined there is nothing to prevent us from basing our "political" position on size of quota on "technical" factors of number of unidentified events and capabilities of system. In sum it begins to look as if Soviets will shortly demonstrate that they have really adopted Macmillan plan and will be in position to stress this in their propaganda. Accordingly we are quickly approaching point where we will have to decide what US position on Macmillan approach is to be.

In considering Macmillan approach Department may wish give thought possibility of adding to quota suggestion provision for periodic revision quota number. In first two years of actual operation of treaty time taken to construct control posts and to bring them into operation will mean that there will be relatively few events in any case which would justify inspection under criteria as presently contained Annex I. For the first two years of treaty size of quota is therefore not of major practical importance. If there were provision for periodic review of quota number and agreement on annual quota for succeeding year, and if moreover this provision were so phrased as to provide basis for withdrawal from treaty if agreement not reached USDel believes Macmillan approach might be more palatable. In separate telegram USDel is sending illustrative draft of type of review provision which might be considered.

¹ Source: Soviets seem to adopt Macmillan quota proposals. Secret; Priority; Limit Distribution. 2 pp. NARA, RG 59, Central Files, 700.5611/4-2959.

If Washington decides that we should go along with Macmillan approach we will need to know what kind of initial quota would be acceptable. Recommend thinking on this point be urgently undertaken.

Villard

465. Memorandum From Panofsky to Killian¹

Washington, May 1, 1959

SUBJECT

Preliminary Findings of the Working Group of the Panel on High Altitude Detection

At a meeting on 1 May 1959, a Working Group of the Panel on High Altitude Detection considered the problem of identifying nuclear explosions in the region between 50 and 100,000 kilometers. This region was chosen since it was believed this would eliminate the problems of both fallout and communications disturbances.

The Working Group came to the following preliminary conclusions:

1) *Detection* of unshielded bombs of low yield at distances of 100,000 kilometers is possible with high confidence from terrestrial stations by means of both direct emission of light and fluorescence of the upper atmosphere induced by bomb x-rays. Cloud cover will probably not reduce this capability substantially.

2) *Identification* should involve signals arising from some other effect than thermal radiation alone. Of the various possibilities, radar backscatter may be particularly significant since it does not necessarily depend on the thermal x-rays emitted from the bomb as do most of the other effects. Other identification aids are: a) magnetic field perturbations, b) modification of the Van Allen radiation as measured in a satellite, c) ionospheric perturbations, and d) direct radio signal.

3) Special problems exist in the very low altitude range (50–200 kilometers) where only one ground station might “see” (line of sight) the explosion. Consideration will be given to this problem.

4) Current judgment is that concealment of direct light emission is difficult but that concealment of the x-rays which give fluorescence radiation and ionospheric disturbances could be effective.

¹Source: Preliminary findings of the working group on high altitude detection. Secret. 2 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Nuclear-Hi-Alt-Misc.

Individual members of the Working Group will prepare detailed papers on each of these methods which will be submitted to the Chairman within two weeks. These papers will present estimates of the capabilities, and, if possible, the availability and costs of each of these systems. A final meeting of the Working Group will be held within a month to prepare a general report covering the detailed conclusions on this problem.

Wolfgang K.H. Panofsky
*Chairman, Panel on High
Altitude Detection*

466. Memorandum for the Record¹

Washington, May 5, 1959

Gordon Gray gave me several comments concerning Secretary Herter's memorandum of April 27th on disarmament policy review, indicating that they had been discussed with Dr. Killian, who seemed to be at least in general agreement with them:

There is a question of bringing into the study personnel outside the established governmental departments. Dr. Killian thinks this is very much needed: it is doubtful that State has been thinking in these terms.

The terms of reference seem rather long and comprehensive. Questions No. 2 and 5 in particular seem to be rather far-reaching and not susceptible of definite treatment.

If such a study is to be conducted with any great promise of success, it should have the President's support and commitment. In addition, there would be no point in going into it unless Defense, not only at top level but at military level, were quite serious about it.

It is worth considering whether this should not be initiated with an NSC action. Perhaps the terms of reference should bear the stamp of the NSC. If this were done, a NSC meeting with the JCS and the Service Secretaries present might be a desirable way to start the project off.

A.J. Goodpaster
Brigadier General, USA

467. Telegram Supnu 433 From Geneva¹

Geneva, May 14, 1959, 7 p.m.

Supnu 433. Following is text memorandum worked out ad referendum at US–UK staff level after Gromyko–Herter–Lloyd meeting reported separately.

“The Foreign Ministers of the USSR, UK, and USA have exchanged views on the position reached in the Conf for the Discontinuance of Nuclear Weapons Tests. The three FonMins recognised that technical aspects of questions outstanding at the conf require further study. The three FonMins agreed that their technical representatives should meet in Geneva on June 1, 1959 to consider, in the light of the most recent scientific and technical information available:

I. Recommendations for techniques for detecting nuclear explosions at altitudes above 50 kilometres and in outer space;

II. Recommendations for improving methods of distinguishing between underground explosions and earthquakes;

III. Recommendations for specific technical criteria which must be satisfied by data from the control system before an inspection can be undertaken.

The three FonMins agreed that their technical representatives should be requested to report to the Conf for the Discontinuance of Nuclear Weapon Tests at the earliest possible date, and in any case to make an interim report to the Conf when it resumes its meetings on June 8 1959.”

Since USDel technical staff other than Northrup has left, request Dept comments on suggested terms of reference in time to allow transmittal above text to Sov Del tomorrow.

Above has not yet been seen by Secretary.

468. Telegram Secto 67 From Herter at Geneva¹

Geneva, May 18, 1959, 9 p.m.

Secto 67. Secretary met with Lloyd (U.K.) today re Soviet refusal technical discussions capabilities detection and identification seismic events and technical criteria for inspections. Following is approved summary conversation: Lloyd mentioned three points: (1) Whether we should continue to press Gromyko on acceptance technical talks as requested in discussion with him; (2) whether we should agree to technical discussions on high altitude alone, and (3) extent of further discussions nuclear testing at Foreign Minister level during this conference.

Secretary stated Gromyko owes us an explanation because in discussion on May 14, he seemed to go quite far toward accepting wide-range technical talks.

With respect to high altitude alone, Secretary stated he did not think we should accept at this time. Secretary and Lloyd agreed that there should be no extensive talks with Gromyko on nuclear testing during Foreign Minister's conference. Secretary pointed out that it could be Gromyko's intention to use minor concessions on testing during Foreign Minister conference as basis necessary progress for summit.

Lloyd briefly discussed status U.S.-U.K. positions outstanding issues. It was agreed much work remains to be done by both U.S.-U.K. staffs in developing respective positions and in developing jointly-agreed positions outstanding issues. It was agreed Secretary would approach Gromyko for meeting at noon May 19 to again seek agreement for technical talks high altitude, capabilities detection and identification seismic events and technical criteria for inspections. It was agreed that if Gromyko accepts, U.S.-U.K. scientists should meet London or Washington several days before technical talks with U.S.S.R.

469. Memorandum of Conference with the President¹

Washington, May 19, 1959, 11 a.m.

OTHERS PRESENT

Dr. Killian, Dr. Bacher, Dr. Baker
Dr. Bethe, Dr. Bronk, Dr. Chance
Dr. Fisk, Dr. Kistiakowsky, Dr. Land
Dr. Piore, Dr. Purcell, Dr. Rabi
Dr. Seaborg, Dr. Smith, Dr. Weiss
Dr. Wiesner, Dr. Dryden, Dr. Hill
Dr. Scoville, Dr. Waterman, Dr. York
Mr. Beckler, Major Eisenhower
General Goodpaster

The President welcomed the group. Dr. Killian asked if he had any points he wanted to bring to the attention of the group, which had not met with him for some months. The President said he did not. He hoped they would continue their study of means of simplifying and making more effective the control of governmental research activities, and eliminating duplication. He referred to a troublesome amendment by Senator Russell to the Military Construction Bill, under which Congress would authorize on an annual basis programs for specific aircraft and missiles. Dr. Killian mentioned that the Congress is doing this in relation to the space program, and the result is to delay these programs considerably. Dr. Dryden confirmed this.

Dr. Killian said the group had two matters they wanted to bring to the President's attention. As to the first, they were impressed by the great and growing complexity of our military technology, by the reduction in the time scale, both of possible conflict and of weapons development, by the rapid obsolescence of weapons types, and by the overlapping of different systems. All this seems to mean an increase in the cost of weapons, and a lack of stability in military relations between nations. On the point of obsolescence, the President commented that once we have an effective standardized item, we should proceed by gradually replacing it, but not by scrapping such items as soon as an improved type of item is available. Dr. Killian agreed with this philosophy. He added that dispersal programs, quickened response and improved alarm and alert systems add to the same tendency. The group was much impressed with this point and wanted to propose to the President that they think the United States should tackle the arms control problem anew. From the standpoint of the group, what they want is a

¹ Source: Technical basis of disarmament; international exchange of scientific information. Secret. 5 pp. Eisenhower Library, Whitman File, DDE Diaries.

systematic and rigorous feeding in of technical factors involved in arms control. The President asked if Dr. Killian felt that any additional charter or directive from him was needed to carry this out, expressing agreement with the principle. He added that, just as military men succeed as they work themselves out of a job, the scientists should be working themselves out of the job of devoting their talents to military weapons systems.

At Dr. Killian's request, Dr. Land carried forward the discussion of the subject. He said first that he was grateful for the President's support of scientific activity since the group first met with him about a year and a half ago. The whole attitude of the country has been turned around in the few months, and the President's personal part in this has been the decisive factor.

(At this point a note was brought in which the President read aloud to the group, indicating that Admiral Strauss' nomination had been reported favorably out of committee by a margin of one vote; there was no generally shared reaction from the scientists.)

Dr. Land went on to say that the problem is, while using science for military ends, also to recognize in a practical way the obligation of science to bring about abundance, well-being, a better life, etc. He therefore asks whether something could be done to dramatize scientific efforts in behalf of arms control. He said that if scientists talk to our military people about arms control, they are immediately suspect as being soft or indifferent to security—even if they are the very scientists who have made great contributions to military technology. There is every reason why the United States should take initiative on arms control, and scientists should be permitted to contribute all ideas they can—as to how to control armaments and make a better life for everyone. His specific request is for the President to work with the scientists to advance and foster arms control. The President said that if the scientists can help to show concrete ways to make progress on arms control, he will be most grateful and glad to join in the process.

Dr. Wiesner next spoke, pointing out that this is a very large problem, some aspects of which caused him great concern while he was at Geneva. Our national effort in such fields as the disarmament field seems to be characterized by too slow decisions, too many conflicting objectives, and inadequate management and study of the problem. He is convinced that arms control needs study in detail. For example, he felt that U.S. policy makers, prior to the U.S. commitment last year to suspend testing, were woefully uninformed on the problem, at least in respect to any degree of detail. He said the inevitable consequence is overconservatism in negotiation. He said there is no continuing development of technical background and studies for disarmament. Accordingly, our group went to Geneva with quite inadequate technical and

political preparation. He felt that until we have such studies we cannot go into this subject seriously.

The President recalled that beginning three or four years ago he had the idea of stopping atmospheric tests. He encountered enormous resistance and found very little support initially. The lesson is that the great task is to bring thinking along, since in a democracy public opinion weighs so heavily. He did not think that we need big bodies studying these questions. Rather the need is for a few basic, good ideas. He thought that a small sub-committee may usefully be set up to develop the technical basis for disarmament. Dr. Killian commented that this effort would tie in very closely with the terms of reference submitted to the President by Mr. Herter in relation to the whole question of disarmament.

Dr. Killian said the second item the group had in mind to discuss with the President had been the subject of a study of a panel under Dr. Bronk. The idea is one of greatly enlarged international exchange of scientific information. Dr. Bronk said that the scientists think they are especially well positioned to build international understanding. He thought that they could contribute to a better understanding of the U.S. by foreign countries as a country devoted to freedom and well-being of its people. As an example, he suggested exploring the possibility of encouraging young people to give several years of their lives to service abroad in technical and scientific fields, including the teaching of science and technical subjects. He thought there is need for an overhauling of the concept of exchange of scientific information between the United States and countries abroad. For example, he thought the "quid pro quo principle" applying to the exchange of people is too restrictive to guide the exchange of scientific information.

The President said he certainly agreed in principle but would ask how the group considered that thinking should be organized on this matter so as to get qualified people working on it. In other words, what is the next step. That is what he would like to hear.

Dr. Rabi, at Dr. Killian's request, reported that he had visited in Russia for six days. He had been well received and relationships were excellent. He said he had visited a large nuclear accelerator at Dubna (?) of about one-half mile diameter. This is being run as an international laboratory with personnel from many of the satellite nations working together as a team. He thought that perhaps the United States is failing to use some of its facilities in a way that would promote better international relations. What he had in mind was the possibility of making the Brookhaven Laboratory or the Lawrence Laboratory a "Pan-American" facility. He said that the NATO Science Committee, after a slow start, is beginning to see the light. It is necessary for the U.S. to keep up the

pressure and the initiative with a flow of new ideas and provision of a large fraction of the funds.

The President repeated that as to the principle, he was in accord. He felt he could do something to help if the project is shaped up in a concrete way. Dr. Rabi pointed out that other nations participating should pay for part of the operation. This would add to their self-respect. Dr. Piore said that a radio-astronomy laboratory just now coming into operation might be a very useful place to apply this. The South Americans, for example, have no facilities in this field. The President said he simply asked that the group work up a concrete plan.

He then spoke on what he termed the basic truth to which he always comes back. He said we have got to find an answer to cooperating closely with other countries, "or else." He did not think we could carry forward the heavy burdens for armaments that we are now supporting. Inevitably we would have to go to controls throughout our society, or at the least to bureaucratic domination. He thought that all of the suggestions made indicated promising ways for progress, and challenged the scientists to show ways to go forward beyond what our military and political leaders are able to conceive. The crux, however, is to organize these efforts. He said he does not believe that the Soviets want war, but pointed out that Khrushchev is quite ready to engage in military bluffs to advance Soviet foreign policy. Dr. Rabi pointed out that he thinks neither country is seriously thinking about going to war, commenting on rows of apartments being built that he saw in Russia.

The President said he is ready to do anything he could to join in such an activity. Dr. Wiesner referred to the great lack of public understanding of the issues. The public, he said, thinks of test suspension as being dangerous to our well-being (which he considers to be an incorrect judgment). The President picked up this point, saying that his greatest obsession is just this problem. He thinks the most important thing for people today is to get the American people to understand the basic factors of international and domestic issues. Such an understanding is the indispensable firm base from which governmental action can be undertaken. This is a terribly difficult task, however—not to be accomplished simply by saying it needs to be done. He mentioned many of the efforts that he makes to form and lead public opinion.

As the group dispersed, the President asked how the proposal for the linear accelerator is progressing. Dr. Killian said the paper work is in good shape and AEC is at the point of putting the proposal to the Congress.

A.J. Goodpaster
Brigadier General, USA

470. Telegram Tosec 144 to Herter at Geneva¹

Washington, May 29, 1959, 8:57 p.m.

Tosec 144. For Herter from Dillon: From Acting Secretary. Next following telegram is draft tactics paper for resumption nuclear test negotiations June 8 which was developed by interagency working group and which I have authorized as basis initiating consultations with UK.

Objective proposed tactics is to follow-up probing Soviet position technical aspects and veto requirements for inspection as initiated by Wadsworth just before recess and in particular to resume pressure on Soviets for discussion technical issues identified in conversations you and Lloyd had with Gromyko.

We anticipate Soviets will continue to be unwilling to engage in discussion underground detection and our tactics contemplate exerting pressure by tabling at outset conclusions Berkner Panel studies outer space detection and supporting study documents. To avoid appearance of raising new obstacles to agreement we would table these technical findings to demonstrate value US-UK proposal in present draft Annex I for inspection of all unidentified events of 5 kt and above, and 20 percent of those under 5 kt. This would have advantage of not REPEAT NOT appearing retreat from past treaty proposals and yet supporting our position on need for substantial number of inspections and for building some flexibility into treaty in view of uncertainties present knowledge and likelihood improvement in system.

Important consideration in planning introduce technical studies immediately on resumption negotiations is increasing pressure here from Congress and the press for publication studies on underground and outer space testing and detection. Pressure arises from both those alleging State Department hiding information showing detection such tests impractical and those believing studies lead to conclusions simplifying detection problem. Much of substance of studies is coming out in garbled form in view of access of large number panel members as well as key Congressional committees. We believe that introduction into negotiations and subsequent release will give us best chance of putting proper interpretation on results these studies. Still unresolved is question whether concept of "perfect hole" for concealment underground explosions should be tabled and published. While we are reluctant to reveal this concept in view possible usefulness to Soviets,

¹ Source: Negotiating tactics for resumption of nuclear test ban talks. Secret; Limited Distribution. 2 pp. NARA, RG 59, Central Files, 700.5611/5-2959.

only way cope with allegations this concept is proven one which vitiates test suspension agreement may be to reveal all its difficulties and uncertainties.

High altitude study nearing completion and will be passed UK for study as soon as available. At that time will make arrangements for appropriate consultation US and UK scientists in advance of any discussion with Soviets this matter.

Dillon
Acting

471. Telegram Tosec 145 to Herter at Geneva¹

Washington, May 29, 1959, 8:57 p.m.

Draft Tactics Paper for Nuclear Test Negotiations

Upon resumption nuclear test negotiations June 8 Department believes USDEL should pursue tactics along following lines, incorporating substance of following in comprehensive opening statement in order maintain control debate.

(1) USDEL should establish continuity by recalling Wadsworth statement May 8. Should continue place focus on questions needing solution if effective control to be achieved continuing tactics along lines outlined NUSUP 337 in defining issues and eliciting SOV response to questions bearing on technical and organizational elements effective control.

(2) In this connection delegation should welcome Soviet readiness to discuss high altitude detection and should propose establishment technical working group this subject to convene Geneva June 15. US will suggest Term of Reference for this study. Make clear that we consider this to be only one of the three technical areas essential to clarify the problems associated with the establishment of effective control system and our willingness to discuss high altitude problem should not be interpreted as abandonment efforts to explore other technical aspects control system identified by Lloyd and Secretary. Objectives of technical discussion should be to recommend specific

¹Source: Transmits draft tactics paper for nuclear test ban negotiations. Secret; Limited Distribution. 5 pp. NARA, RG 59, Central Files, 700.5611/5-2959.

instrumentation and spacing requirements for ground based elements of high altitude detection and identification system for tests above 50 kilometers to be installed in control posts established in first phase and to make recommendations as specifically as possible re satellite detection system to be developed and installed at later date. USDEL may undertake to provide names of US panel members in advance of meeting and should propose report to conference within one week of date group convened.

(3) USDEL should indicate disappointment that Soviet delegation has thus far been unwilling enter into technical discussion on assessment of capabilities for detection and identification seismic events and recommendations of methods for improving these capabilities. Should express hope that upon clarification US–UK proposals as to purpose and task such group SOVDEL will reconsider its position.

(4) USDEL should state that US has, as indicated January 5, continued its studies of implications of new seismic data for control provisions to be incorporated in treaty. US scientists have considered in light of all pertinent data concerning the capability of detection and identification system (1) certain improvements to detection and identification system that might be achieved within range of existing technology, (2) potential of further improvement through program of seismic research and (3) question of decoupling as it relates to capabilities for detection and identification of underground tests. USDEL should table for consideration revised declassified version Berkner Report of Panel on Seismic improvement together with annex on concealment. Should also table detailed studies covering major possibilities for improvements and possibilities for advancement of science of seismology in fields directly related to detection problem. Should point out that contrary to SOV charges study of these reports and recommendations will demonstrate their constructive purpose. They do not recommend additional control posts; implementation of these recommendations would increase the capacity of the system to identify seismic events and in this respect serve to limit the number of inspections required for effective control. If these recommendations for improved instrumentation are considered and agreed in light of latest technical data, it would not be necessary to reach any precisely agreed reassessment of capabilities of system as such. This unnecessary in light US formula for determining number of on-site inspections contained Annex I which takes into account changing capabilities of system. Because formula is based on percentage relationship to unidentified events, it is self-adjusting according to number such events that develop in practice. USDEL should renew proposal technical consideration capabilities for detection and

identification seismic events and recommendation of methods for improving these capabilities. Should point out US in such talks would answer any inquiries from other Dels re data submitted and would expect receive and consider any comparable data furnished by other Dels as background for recommendations. Purpose of talks would be reach agreed recommendations for improvements in instrumentation initial system. Effect of these improvements would clearly be in interest all parties concerned since they would serve to limit need for on-site inspection.

(5) The question of recommendations for specific technical criteria which must be satisfied by data from control system before an inspection can be undertaken, USDEL should table working paper outlining US ideas of criteria that would be used in connection formula set forth US Annex I. Should state if USSR finds ideas expressed in working paper acceptable we see no necessity for technical working group. If not, however, would propose discuss and seek resolve any differences in technical working group.

(6) USDEL should point out technical data present both uncertainties as to detection capabilities that remain to be resolved and potentialities for significant improvement in the system. Uncertainties and potentialities point equally to fact that program of research and development and provisions for results of such development to be incorporated in system are of real importance. In this connection US welcomes statements of SOVDEL indicating willingness consider results of future scientific research in Control Commission. US will further elaborate views this question in subsequent meetings.

(7) Referring to US undertaking to consider carefully SOV proposal for quota inspections USDEL should state that while such consideration cannot be carried very far until clarification received on questions posed earlier meetings USDEL observes, however, that US-UK proposal in Annex I wherein number inspections governed by number unidentified events deals far more realistically with existing uncertainties and potentialities for improvement than does Soviet proposal. US-UK formula is self-adjusting on basis experience, provides clear incentive for improvement of detection capabilities. Because of self-adjusting feature which percentage basis affords results of program of joint research and experimentation such as US proposal April 13 would be readily reflected in reduced level of inspections, which would not be case in quota approach.

(8) USDEL should indicate that as a part of its review of questions before conference it has prepared revisions of draft Articles VI and IX which will be tabled in short time. Redrafts attempt define more clearly relationship between Commission and administrator, involve new

wording re staffing which takes into account US position stated May 8 and contain clearer definition role of Commission and Administrator with respect to research, review and improvement of System.

(9) USDel should again refer to questions raised in meeting of May 8 and recall President Eisenhower's letter of May 5 in which he indicated that if Soviet position had not in fact changed on basic issues he would urge renewed consideration phased approach beginning with agreement discontinue atmospheric tests.

(NOTE: Above draft tactics paper furnished for background information USDEL here in event initiation consultations with UK here leads to questions from Lloyd or others on UKDEL.)

472. Memorandum From Irwin to Herter¹

Geneva, June 8, 1959

SUBJECT

Mr. Wilcox's Memorandum of June 1, 1959,
Subject: Resumption of General Disarmament Talks

Mr. Wilcox's memorandum raises several points of interest to the Defense Department. In discussing possible negotiations within the enlarged UN Disarmament Commission, he speaks of the possibility of establishing "various sub-groups on certain aspects of our original package and, in particular, surprise attack". Again referring to the possibility of talks outside the framework of the UN, he suggests that "talks on, for example, surprise attack, could be undertaken in a political framework rather than the past technical approach".

As you know, the Defense Department has opposed separating specific disarmament subjects out from the original 1957 Disarmament Package. Certain subjects, such as, Tests Suspension, Surprise Attack, Outer Space, have been discussed apart from general disarmament negotiations. The Defense Department hopes no other topics will be

¹ Source: Department of Defense reservations on resumption of general disarmament talks. Confidential. 2 pp. NARA, RG 59, IO Files: Lot 61 D 91, Disarmament.

separated out from the 1957 Package unless the proposed State-Defense Disarmament Policy Review should determine that such could safely be undertaken. With respect to surprise attack, the Defense Department has no objection to a renewal of the technical discussions that were suspended but would be concerned over separate policy talks on surprise attack.

With respect to the forum for general disarmament negotiations, the present enlarged UN Disarmament Commission, composed of 32 members, seems most unwieldy. While we concur in the value of holding general disarmament talks under the aegis of the UN, we would be concerned that talks in the large Disarmament Commission might result in the establishment of a sub-group, whose members, other than certain NATO nations and the Soviet group, would be incompetent to deal with this complex subject and whose participation might be disadvantageous to us. If it were possible to ensure satisfactory composition of sub-groups, our concern would be largely met.

Central Intelligence Agency
Mr. Allen Dulles
Dr. Scoville

Mr. Dillon suggested that before getting to the major problem before the meeting, i.e. the level of inspection which the U.S. would require in connection with a nuclear test cessation treaty, *Dr. Killian* report on the status of preparations for the high altitude technical discussions scheduled to begin in Geneva on Monday, June 22nd. *Dr. Killian* said that the panel, which will be headed by *Dr. Panofsky* of Stanford University, has been assembled and held a preliminary meeting in California on June 15. He asked *Mr. Keeny* to report on the work accomplished and the problems faced.

Mr. Keeny identified the members of the panel and described the general approach which the group would use in discussion with the Soviets. The group planned to use the summer experts' report as a take-off point, first reviewing knowledge which had been obtained since that time. The group would cover both satellite and ground-based techniques and would avoid either minimizing or stressing the problem of concealment, attempting rather to lay out frankly the limitations and capabilities of all of the possible techniques. A plan of work has been developed and responsibility for preparation of papers has been assigned to members of the delegation. With respect to the matter of classification, AEC feels that the Restricted Data problem will present

¹ Source: High-altitude technical talks, inspections of nuclear test ban. Secret; Limit Distribution. 4 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

no difficulty. Defense information is a more difficult problem and the Department of Defense was presently conducting a review of the second Panofsky report. *Mr. Dillon* asked *Mr. Gates* to do what he could to expedite this review.

Mr. Dillon asked about the status of consultations with the U.K. *Mr. Farley* said that the U.K. has been given the reports and that he had explored with the British Embassy the possibility of Sir William Penny chairing the British experts in view of his experience in this kind of meeting.

Mr. Keeny, continuing, said that a summary of the Panofsky reports had been prepared for public release but that the panel members were unanimous in regarding such a release as undesirable. These reports were basically different from the Berkner study in making a specific system recommendation and got into a discussion of costs. Publication of a summary would entail laying out our position in toto at the beginning of the discussion with the Soviets. There was no intention to table the reports as a whole in Geneva, and the objective was to move slowly into the problem as the U.S. experts did in last summer's meeting. Publication of a summary would be at cross purposes with this objective.

Mr. Dillon observed that there appeared to be no real public demand for the release of these reports and *Dr. Killian* and *Mr. McCone* agreed that they should not be released, in view of the circumstances described by *Mr. Keeny*, until it was clear release would not adversely affect the technical discussions.

Mr. Dillon then suggested the group turn to the inspection problem, and said that the "question to be explored was the best approach to deciding what kind of a quota the U.S. would require, and what would be the best means of making a decision under either a quota or percentage approach that a given event should be inspected. He asked *Mr. Dulles* to outline the contribution which could be made by intelligence in this process. *Mr. Dulles* said that intelligence could make a considerable contribution. Any Soviet attempt at violation would inevitably involve a large number of Soviet nationals. [text not declassified] The Soviet uncertainty about this would serve to keep them off balance. *Mr. Dulles* then reviewed a number of special ways in which the information available [text not declassified] could be applied to increase the effectiveness with which the U.S. would use any given number of inspections. After reviewing these methods *Mr. Dulles* concluded that it was possible to do enough by intelligence to make violations uncertain and dangerous, especially any violation which involved digging holes, since earth moving was easy to spot by various means. There was, of course, no guarantee that intelligence techniques would detect violations, but it must be considered an important adjunct to the system. *Mr. Dillon* asked whether the techniques described by *Mr. Dulles* could

be used without compromising our sources. *Mr. Dulles* replied that this would be the case only if the U.S. were able to select itself the events to be inspected. *Mr. Scoville* said that *Mr. Dulles'* observations pointed up the relevance of *Prof. Tukey's* thoughts on maximizing the effectiveness of a choice of inspections, and it showed how intelligence could help in assigning weights under the *Tukey* systems. *Mr. Gates* observed that a control system permitting on-site inspection in the Soviet Union would be of substantial intelligence value in itself. However, he reported that some of his people felt that there were some concealment techniques which were so simple that they would create no substantial indications which intelligence sources could pick up. The problem may be so great that intelligence will not be a help.

Dr. Killian suggested bringing a working group together to review the whole problem of inspection and the various approaches to it, as well as to study precisely what the risk would be for the U.S. if it were possible for the Soviet Union to conduct a small number of tests clandestinely. Such a group would, of course, look at the *Tukey* approach as well as at the effectiveness of the intelligence contribution. The objective would be to get a true overall picture of that problem rather than isolated bits and pieces, which are all we presently have. *Mr. McCone* agreed that such a study would be highly desirable and *Mr. Dillon* asked that *Dr. Killian* take responsibility for getting it started.

Dr. Killian observed that the Soviet proposal for selection by each side of events for inspection looks better and better the more he thought about it, and that he did not understand why the Soviets made it. He felt that if we had a budget of 100 inspections per year to use there would be a high probability of catching any violation. He felt that it was possible to reduce this number and still have a high probability, but that 100 was a reasonable figure to start with. He said he felt that any figure as smaller as 25 would not be acceptable to us. *Mr. McCone* observed that 100 inspections would allow inspection of all events above 5 kilotons and about 5 per cent of those under that figure. *Gen. Loper* said that the advantages of allowing the "other side" to choose the event to be inspected would not necessarily argue in favor of the quota approach, since it was equally applicable to making choices within a percentage. *Mr. McCone* said that the probabilities of detecting a violation appeared to be greatly improved if each side was able to choose the events to be inspected. He suggested that the *Killian* group might take various assumed numbers of allowed inspections a year, and, taking everything into account, see how effective it would be and what risks it would mean for the U.S. *Mr. Dillon* said that it was vital to have informed conclusions on these questions before we make up our minds on what to do in the negotiations. Every indication is that the Soviets will not be willing to talk about technical matters such as these but that we ourselves should still have this information as a basis for determining our own objectives.

Mr. Dillon asked *Mr. McCone* to report on his visit to Geneva. *Mr. McCone* said that he had been graciously received by Tsarapkin who then turned around and told the press that he had come to scuttle the agreement. He said that *Amb. Wadsworth* was doing a superb job, displaying great skill and patience. *Amb. Wadsworth* was troubled, however, by the degree of turnover on the delegation staff, as well as by the problem of communications, which was no doubt a temporary one caused by the heavy traffic of the Foreign Ministers meeting. *Amb. Wadsworth* continues to believe that the Soviets do want an agreement and was troubled by the message sent by the Secretary regarding the possibility of a change in direction in three or four weeks. *Mr. McCone* thought that the delegation itself felt that agreement on the April 13 proposal was, all things considered, the most desirable end result of the negotiations. The Joint Committee apparently shared this view. *Mr. McCone* said he believed, in the long run, the Soviets will be willing to discuss technical aspects of the underground problem.

Mr. McCone said he wished to raise one final point that was occasioned by an inquiry from the Joint Committee as to how often the principals meet to consider the course of negotiations. He felt that these meetings should be held quite frequently. *Mr. Dillon* agreed that they should be convened whenever there was a concrete need. *Dr. Killian* said that one of the next problems that would need discussion related to just how much of a high altitude system we will be prepared to press for, in view of the great costs involved and the conflict with other high priority satellite and missile objectives. He suggested that there should be an early meeting to discuss this problem after the staff had been able to lay out the relevant considerations.

474. Terms of Reference for Disarmament Policy Review¹

June 23, 1959

TERMS OF REFERENCE FOR DISARMAMENT POLICY REVIEW

An urgent study should be undertaken jointly by the Departments of State and Defense to review and make recommendations regarding United States disarmament policy.

¹ Source: Terms of reference for disarmament policy review. Secret. 2 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Disarmament.

The basic question to be considered is whether there are comprehensive or partial measures of arms control and reduction which would contribute to the achievement of our national security objectives.

In considering this question, existing detailed United States disarmament policy and positions should be reviewed. These positions were last systematically formulated in 1957 and only relatively minor modifications have been made since that time. The last proposals for comprehensive disarmament were advanced by the United States in 1955.

In reviewing existing policy and making recommendations, such questions as the following should be considered:

1. The extent to which specific measures of arms control and reduction might contribute to our national security objectives.

2. What comprehensive arms reduction arrangements might be in the interest of the United States and the possibilities (including the technical feasibility) of achieving such a comprehensive arrangement through single or multiphased agreements.

3. What limited or partial arms control or reduction measures (including regional measures) might be in the interest of the United States, the timing and technical feasibility of such measures, and their interrelationship with each other and with a comprehensive arrangement.

4. The technical and organizational aspects of enforcement. Full attention should be given to the need for technical and military studies which would be required to have an understanding of the problem of detection, monitoring and inspection essential to any arms limitation agreement.

5. The possible role of the United Nations and appropriate U.N. organs in enforcement of disarmament agreements (particularly agreements involving radical reduction of national military establishments).

The review will take into account estimated Soviet attitudes toward various measures of arms control and reduction.

Conclusions and recommendations should be submitted by April (?), 1960.

Negotiations are currently under way with regard to nuclear test suspension, and discussions of aspects of disarmament may be anticipated in the near future in a possible Summit meeting or in competent organs of the United Nations. The results of any such negotiations and discussions should, of course, be taken into consideration during the study. The head of the study will not be expected to advise on day-to-day problems concerning international discussions which may be in process. However, his advice may be requested from time to time as matters of interest to the study arise. Priority attention should be given, within the framework of the general study, to consideration of various types of international agreements consistent with United States security interests which might reduce the danger of surprise attack, or unintentional war.

The head of the study shall be directly responsible to the Secretary of State. Government personnel and consultants selected to work on the study will be assigned to the head of the study and will be responsible to him. Organizations under contract to work on the study will also take guidance from and report their findings to the head of the study. The head of the study, in consultation with the appropriate departments and agencies, shall select the staff. He may also obtain the services of civilian consultants, and organizations such, as RAND and ORO, as he deems appropriate. The full support and assistance of appropriate departments and agencies will be provided including the assignments of qualified personnel, and all necessary data including both military and technical pertinent to the study will be made available.

475. Letter From Herter to Taylor¹

Washington, July 1, 1959

Dear General Taylor:

This is to confirm our telephone conversation of today regarding the review of U.S. disarmament policy. In accordance with our conversation, I am sending herewith a copy of the terms of reference which the President has approved.

As I told you, this study is of the utmost importance to us, as we will most certainly be involved in one way or another in arms control and limitations negotiations with the Russians in the not too distant future. Such negotiations would, of course, be in addition to the current negotiations in Geneva on the suspension of nuclear testing.

I cannot express too strongly the hope that you will find it possible to undertake the undertaken the general direction of this important review of our disarmament policy and devote such time to it as your commitments will permit.

Most sincerely,

Christian A. Herter

TESTS OF REFERENCE FOR DISARMAMENT POLICY REVIEW

An urgent study should be undertaken jointly by the Departments of State and Defense to review and make recommendations regarding United States disarmament policy.

The basic question to be considered is whether there are comprehensive or partial measures of arms control and reduction which would contribute to the achievement of our national security objectives.

In considering this question, existing detailed United States disarmament policy and positions should be reviewed. These positions were last systematically formulated in 1957 and only relatively minor modifications have been made since that time. The last proposals for comprehensive disarmament were advanced by the United States in 1955.

In reviewing existing policy and making recommendations, such questions as the following should be considered:

1. The extent to which specific measures of arms control and reduction might contribute to our national security objectives.
2. What comprehensive arms reduction arrangements might be in the interest of the United States and the possibilities (including the technical feasibility) of achieving such a comprehensive arrangement through single or multiphased agreements.
3. What limited or partial arms control or reduction measures (including regional measures) might be in the interest of the United States, the timing and technical feasibility of such measures, and their interrelationship with each other and with a comprehensive arrangement.
4. The technical and organizational aspects of enforcement. Full attention should be given to the need for technical and military studies which would be required to have an understanding of the problem of detection, monitoring and inspection essential to any arms limitation agreement.
5. The possible role of the United Nations and appropriate U.N. organs, in enforcement of disarmament agreements (particularly agreements involving radical reduction of national military establishments).

The review will take into account estimated Soviet attitudes toward various measures of arms control and reduction.

Conclusions and recommendations should be submitted by January 1, 1960.

Negotiations are currently under way with regard to nuclear test suspension, and discussions of aspects of disarmament may be anticipated in the near future in a possible Summit meeting or in competent organs of the United Nations. The results of any such negotiations and discussions should, of course, be taken into consideration during the

study. The head of the study will not be expected to advise on day-to-day problems concerning international discussions which may be in process. However, his advice may be requested from time to time as matters of interest to the study arise. Priority attention should be given, within the framework of the general study, to consideration of various types of international agreements consistent with United States security interests which might, reduce the danger of surprise attack or unintentional war.

The head of the study shall be directly responsible to the Secretary of State. Government personnel and consultants selected to work on the study will be assigned to the head of the study and will also take guidance from and report their findings to the head of the study. The head of the study, in consultation with the appropriate departments and agencies, shall select the staff. He may also obtain the services of civilian consultants, and organizations such as RAND and ORO, as he deems appropriate. The full support and assistance of appropriate departments and agencies will be provided including the assignments of qualified personnel, and all necessary data including both military and technical pertinent to the study will be made available.

476. Memorandum of Conversation¹

Washington, July 8, 1959

SUBJECT

Visit of Congressional Group to Geneva to Observe Nuclear Test Suspension
Negotiations

PARTICIPANTS

State:

The Secretary
Mr. Macomber, H
Mr. Farley, S/AE

AEC:

Mr. McCone

Senators Gore and Hickenlooper

Representatives Holifield and Van Zandt

The Secretary expressed interest in the reactions of the Congressional group during their recent trip to Geneva to observe the nuclear test

¹ Source: Congressional observer group's views on nuclear test ban talks. Secret. 3 pp. NARA, RG 59, Central Files, 033.1100/7-859.

suspension negotiations. All agreed that it had been very useful and informative.

The Secretary observed that he had never become reconciled to the fantastic elaborateness of the control system which the United States is proposing. In addition to its complexity and cost, much of its operation would involve unproductive activities which would make it extremely frustrating for the personnel engaged. From the point of view of simplicity as an initial step, he would be pleased if an initial agreement could be worked out for suspension of atmospheric tests. However, it was firm U.S. policy to exhaust all possibilities of reaching agreement on an effectively safeguarded suspension of all weapons tests.

Senator Hickenlooper said that the Congressional advisers were acquainted with Mr. McCone's letter of July 7 to the Secretary, and that they agreed in general with the report and recommendations in that letter. He commented particularly on the fact that the British were eager for any kind of agreement. The Soviet Union, while it talks of the concessions it has made, has actually not agreed to a thing of any substance in the months of negotiations to date.

In response to the Secretary's inquiry regarding Soviet attitudes, Mr. Holifield said that he had explored the inspection quota proposal with Mr. Tsarapkin. When Tsarapkin was unwilling to say what quota he proposed, Mr. Holifield had asked him whether he would accept 100 (?), 50 (?), 25 (?), 15 (?)—at which point Tsarapkin had broken in to say "not 25, not 15, but a few". Mr. Holifield observed that he generally agreed with Mr. McCone's July 7 letter. He said that he had urged Dr. Fedorov to join in nuclear detonations to test out the possibilities for detection of underground explosions, and had received an evasive but negative response.

Mr. Van Zandt said that Tsarapkin had said repeatedly to him that the Soviet Union did not trust the U.S. approach to these negotiations and considered our introduction of new data as an effort to prevent agreement. Mr. Holifield said that he had asked Usachev how the participation of Red China might be arranged, as was essential if the agreement was to be enforceable, and Usachev had stated that this was the problem of the United States. Mr. Holifield said that he recommended that in the "white paper" proposed by Mr. McCone the problem of Red China be fully treated.

The Secretary said that he believed one very important concession had been made by the Soviet Union in agreeing to the U.S.-proposed duration article which was our principal safeguard in the agreement. Senator Gore observed that even in this case the United States made the major concession by giving up the year-to-year condition it had originally stipulated.

Senator Hickenlooper said that he wished particularly to endorse Mr. McCone's proposal for a responsible, objective re-examination of

U.S. objectives in these negotiations and our continuation of them by people not previously involved. He thought that the negotiations should be recessed while this re-examination was under way and while the Foreign Ministers Conference continued. The Soviet Union clearly knew where it was going, and the U.S. could not afford to continue without a clearer definition of its own objectives and minimum requirements. He was confident that the Soviet Union would not in the end agree to a sound and effective control system and urged that we begin to bring to the fore the substantive questions which at present were not being discussed, in order to expose the true Soviet position.

The Secretary observed that it was clear the Soviet Union recognized the great military advantage the present secrecy of the Soviet regime constituted. They could not be expected to give up this secrecy for any less than a very high price.

Senator Hickenlooper said that he doubted that it was technically possible to police underground tests. Fortunately, there was a way out of a comprehensive agreement which the United States might take: This would be a voluntary stoppage of tests in the atmosphere. The Secretary said that he was reluctant to give the Soviet Union anything unilaterally. He recognized that there was a widespread concern, whether soundly based or not, regarding fallout. Mr. Holifield said that his Committee had looked very carefully into all the facts concerning the danger from fallout from nuclear tests, and these facts showed that there was no present global danger.

Messrs. Hickenlooper, Holifield, and Van Zandt all commented that of course the United States should not walk out of the negotiations and thus take the crushing propaganda loss that would result for the country that broke off the negotiations. It is a familiar Russian tactic to try to outlast us and wear us down. We must be prepared to continue negotiating, but without being trapped into an unpoliced, indefinite suspension of all nuclear weapons tests.

Mr. McCone commented that one obvious Soviet objective was to try to get us to agree in principle to the inspection quota idea, so that we would then be in the unfavorable position of haggling about numbers.

Senator Gore said that he was not unsympathetic with the over-all problem of the State Department in proceeding with these negotiations in the larger context of the Foreign Ministers meeting, our relations with allies, and our efforts to make a start on disarmament. He felt, however, that there was real danger in protracted negotiations on nuclear test suspension. He referred particularly to the risks of continuing the negotiations during an election in the U.K. The Soviet Union is also gaining propaganda advantage by playing up its pretended concessions. He urged a high-level reassessment leading to establishment of firm objectives and time schedules, and an abandonment of the present drift in the U.S. approach to the negotiations. He commented that he believed

there was value to unilateral action to end atmospheric tests and thus to separate out the fallout problem from disarmament negotiations.

Senator Hickenlooper said that he wished to disagree with Mr. Hollifield's comment regarding discussion of the China problem in any "white paper" on the test suspension negotiations. He believed there should be no mention of Red China in view of the implied admission of the advantages of recognition of Red China, and in view also of his belief that a three-power agreement, the only possible first step, would be a three-power test suspension agreement among the U.S., the U.K., and the USSR.

The Secretary expressed his appreciation to the Congressional group for making the trip to Geneva and giving him the benefit of their frank views.

477. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, July 9, 1959

SUBJECT

Geneva Nuclear Test Negotiations—Meeting of the Principals

PARTICIPANTS

<i>State</i>	<i>White House</i>	<i>DOD</i>	<i>AEC</i>
Mr. Dillon	Dr. Killian	Mr. Gates	Mr. McCone
Mr. Farley—S/AE	Dr. Kistiakowsky	General Loper	Dr. English
Mr. Spiers—S/AE	Dr. Bacher	Mr. Irwin	
Mr. Morris—S/AE	Mr. Keeny	<i>CIA</i>	
Mr. Toon—EE	Mr. Skolnikoff	Mr. Dulles	
Mr. Borg—SS	Mr. Gray	Dr. Scoville	

Mr. Gray said he thought it important that we consider how we obtain public understanding of the U.S. position and goals at the negotiations. *Mr. McCone* agreed, saying he felt strongly that there is not a good public understanding of the aims of our Government at the nuclear test negotiations. Two things have served to obscure the issue in the public

¹ Source: Public opinion; possibility of concealment of nuclear tests. Secret; Limit Distribution. 5 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Nuclear Policy.

mind: the Soviets have taken great pains to create the impression that they have made substantial and important concessions at the negotiations; at the same time, the U.K. has repeatedly, and most recently in a Macmillan statement last week, given the impression that agreement is just around the corner. In his opinion there remain many substantial problems to be solved before an agreement can be reached. For this reason he had suggested in his letter of July 7 to Secretary Herter that a "white paper" on the U.S. position be prepared. *Mr. Dillon* said that he felt the public was fully aware of the primary U.S. objective, which is to attain agreement on a fully safeguarded, inspected suspension of nuclear weapons tests. As far as the negotiations are concerned, we should proceed rapidly to set out our views of the technical problems. For instance, we are currently preparing a working paper setting forth our concept of the technical criteria which would have to be met before an event would be identified as natural. We believe that such a course will do a great deal to clarify the technical issues with regard to underground test monitoring and would serve to "smoke out" the Soviet position.

He had discussed with Secretary Herter the question of tactics during the immediate future when the Foreign Ministers Conference will be in session. They both felt that we should not seek a recess during the Foreign Ministers Conference. This period could be used to detail our views concerning the large numbers of unidentified seismic events which would have to be dealt with—emphasizing the need to deal realistically with the inspection problem, especially as far as events below 5 kilotons are concerned—and to seek resolution of such remaining procedural and organizational problems as we can. Thus, while he felt the timing of release of such a "white paper" as *Mr. McCone* had suggested should be deferred, he agreed that we should begin preparation of such a document.

Mr. Dillon then called on *Dr. Robert F. Bacher*, Chairman of the ad hoc committee on on-site inspection, to report on the findings of his group.

Dr. Bacher reviewed the history of the underground test detection problem, touching on the considerations of the Conference of Experts last summer, the complicating data resulting from the HARDTACK II underground explosions and the recommendations of the Berkner Panel on Seismic Improvement. He emphasized that the science of seismology was largely in its infancy and, at the present state of the art, full of uncertainties. With regard to the question of concealment, he noted that decoupling theories, which had been thought to be relatively insignificant at the time of the Experts' Conference, now held forth possibilities which could change the underground detection situation completely. He emphasized, however, that the decoupling technique developed by *Dr. Albert Latter* was a very complicated and uncertain matter. This large-hole method would require an approximately 1 million-cubic-meters hole for a 10 kiloton explosion at a cost of from 2 to 4 dollars

per cubic meter, i.e., 2 to 4 million dollars. He pointed out that there is essentially no experimental information to support this theory; however, the theory has stood up against severe theoretical scrutiny. It is expected that the HE experiments scheduled to begin in the near future by the AEC ought to be able to shed considerable light on the validity of the theory. There will remain, of course, other problems since no one knows whether a hole of the size suggested could hold together or whether there would be physical deviations from the experience with experiments in salt mines when dealing with a homogeneous medium such as would be used for an actual clandestine test.

Our thinking since last summer has been that inspection of a certain percentage of unidentified events should take place. Recently, however, the concept of an annual quota of on-site inspections has been introduced, first by British Prime Minister Macmillan and subsequently by Soviet Premier Khrushchev. His group, which met July 1–2, had been called upon to study the problems in inspection bearing on determination of a percentage or quota for inspection and to estimate the likelihood of detection which could be achieved by various percentages or quotas. Obviously after only such a short time he could not present a complete and detailed report on this complicated problem, but could merely sketch out the preliminary conclusions reached by the group. He noted that although there remained differences of opinion among the members of the Panel, he felt it was possible at this time to report some reasonably firm conclusions.

He noted that in dealing with the over-all underground problem, there were three major variables: (1) the ability to identify an underground event as natural on the basis of instrument readings; (2) the number of annual inspections which would be available in a quota; and (3) the probability of finding and proving a violation by on-site inspection. A factor of improvement in any of these variables would improve the over-all situation by the same factor. Actually, the bulk of events above 5 kiloton equivalent would be identified by the Experts' system. It was only when one dipped below the 5 kiloton range that large problems arose.

He explained that the Panel had taken three equivalent seismic yield ranges—0.5 to 2 KT, 2 to 5 KT and greater than 5 KT. In each area they had assumed three different kinds of coupling: (a) the Rainier coupling; (b) decoupling by a factor of 4; and (c) decoupling by a factor of 10. (Because of the uncertainty of the Latter method, which theoretically could give larger decoupling factors, this was not considered.) Applied to these figures were a factor of delimitation of areas of concern derived from intelligence considerations, a factor stating, the percentage of events which would be inspected, a factor indicating the probability of proof that a violation had occurred and finally a factor indicating the increased probability of detection which would result from a test series rather than an individual clandestine test. The resulting numbers

gave a probability that a given violation would be caught. He noted particularly that the most difficult of these several factors was the probability-of-proof factor of which our knowledge was deficient. This was extremely important since the final result of detection probability is directly proportional to this probability-of-proof factor.

Dr. Bacher summarized the following conclusions indicated by the panel's discussion:

1. If large decoupling factors prove to be possible using the Latter technique, we will then be driven back essentially to reliance on intelligence, since the network will have very little capability of detecting such events, much less identifying them. However, he personally felt that the possibility of constructing holes for tests larger than 10 KT was extremely speculative.

2. The probability of being caught in a violation in the low-yield ranges is most heavily dependent on the effectiveness of the actual on-site inspection procedure since the other factors have less influence than in the higher yield ranges.

3. Urgent study of the following problems is needed: (a) experimental testing of the Latter decoupling theory; (b) operational study of effective inspection techniques; (c) a hard look at the possibility of using unmanned seismic stations on a 150 to 170 kilometer network. This could be the main solution to the decoupling problem. If such a network were used rather than the Geneva system, the identification capability would be improved greatly since the network would reach down to the 50-ton range. He noted that the use of such stations is common in seismology; of course, in a control system such units would require telemetry capability and would be difficult to make tamper-proof.

Dr. Killian said he felt that the results of this quick study made clear that underground detection problem is very difficult. He emphasized, however, that these analyses were very much on the conservative side and that the situation might in actuality be very much better.

Mr. Dillon said he was impressed with the fact that the real problem existed in the lower yields and that in the higher yield range we seemed to be much better off. *Mr. McCone* noted that this fact raised again the question of whether we should propose a yield threshold for the agreement. *Mr. Keeny* pointed out that the Experts' Report had itself estimated a capability for underground events of only 5 kilotons and above and had not claimed to have such capabilities in the smaller yield range.

Mr. Gates asked whether experimentation on weapons development in size below 5 kilotons was not very expensive. *McCone* agreed that it was quite expensive in terms of fissionable materials.

Referring to his recent trip to Geneva, *Mr. McCone* said that the Soviet Delegate, Ambassador Tsarapkin, had told him that his country

could never accept the concept of unmanned seismic stations so closely spaced because of the large numbers involved and the need for servicing. *Dr. Bacher* pointed out that although a large number of such slave stations would be required, they would almost entirely do away with the inspection problem since such a network would identify almost all earthquakes without such inspection.

Mr. Dillon asked what we might do to improve the state of our knowledge of on-site inspection techniques. *Dr. Scoville* replied that a great deal of work had been done last fall and that there was no question but that there were possible technical and detective methods to find underground nuclear explosions. He felt that it would be most useful if the AEC could prepare a study on ways in which tests could be hidden and minimum amount of diagnostic instrumentation which would be needed. Then, the “detectives” could pit their wits against the “hidlers”. *Dr. Bacher* agreed that the HARDTACK II events had been very easy to find. However, no particular effort was made to conceal these shots.

In response to *Mr. Irwin’s* question as to whether the Berkner recommendations for 100 seismometers at each control post would be practical, *Dr. Bacher* explained that it was common in the oil industry to use arrays of 1,000 such units, *Dr. Killian* stressed that in general the Berkner estimates had deliberately been very conservative.

Mr. Dillon asked whether *Dr. Killian* thought we had enough information to set forth for the President in lay language the present state of the problem. *Dr. Killian* said he thought that we can certainly give him a reasonable estimate of the implications of this latest study on our overall position. It was agreed that *Dr. Killian* would undertake to prepare such a paper.

Dr. Killian said he would like to suggest a possible over-all conclusion based on *Dr. Bacher’s* report. He said that it would seem, on the basis of the existing state of knowledge and without further experiments, that the soundest course for us would be to accept an atmospheric test cessation alone until we get further data on the underground problem. He said that he would be willing to suggest that this ought to be our position. *Mr. Farley* said that he understood *Dr. Killian* to be suggesting that we adopt such a position ourselves as the only realistic approach, but in our tactics at the negotiations and with regard to the public, we must be careful to prepare a logical and detailed case supporting such a course. *Dr. Killian* and *Mr. McCone* agreed.

Mr. Dillon called the attention of the group to the cost estimates previously circulated by the State Department and asked that the principals look carefully at the implications of such large costs.

In response to a suggestion by *Mr. McCone* that it might be advisable to recess the negotiations, *Mr. Dillon* said Secretary Herter wished to avoid any consideration of the test cessation issue in the Foreign Ministers Meeting and for this reason had decided that it would be wisest

not to recess the negotiations while the Foreign Ministers are in Geneva. *Mr. Irwin* said he thought that it would be wisest if the Conference would recess in order to save the ammunition provided by the various issues, such as numbers of unidentified events, etc., for use in presenting any solution such as the threshold approach or the atmospheric-cessation-only-approach. *Mr. Dillon* said that in the light of the discussion at the meeting today, he and the Secretary would reconsider this point.

After *Dr. Killian* had reminded the group that when the Latter concealment theory is proven to be feasible or infeasible, we would again be faced with a new set of circumstances on underground testing, *Mr. McCone* said that the AEC expected to finish the HE experiments designed to test out the theory by the beginning of September.

Mr. Keeny then gave a brief review of the proceedings at the technical discussions on high altitude detection held in Geneva the last two weeks. He said that essentially the Soviet Union has agreed to our entire position on a system for monitoring the high altitude environment, including our assessment on shielding. The only area in which he felt they would not agree was the use of ground-based back scatter radar, since they maintained this equipment had dangerous potential for intelligence gathering on their missile program.

478. Memorandum of Conversation¹

Washington, July 10, 1959

SUBJECT

Nuclear Test Suspension Talks

PARTICIPANTS

Sir Harold Caccia, British Ambassador
The Viscount Hood, British Minister
The Secretary
Livingston T. Merchant, Asst. Secretary, EUR

During the course of a call on the Secretary on another matter, the British Ambassador inquired whether there was any new development which he should report to Selwyn Lloyd concerning the nuclear test suspension negotiations.

¹ Source: Nuclear test ban talks. Secret. 1 p. NARA, RG 59, Central Files, 700.5611/7-1059. Drafted on July 22.

The Secretary replied that he would like to run up a warning flag in connection with the underground tests. The Scientific Committee had met yesterday and reviewed recently developed technical information on the detection of underground tests. The report was very discouraging. It made clear, however, that more underground tests must be carried out in order to reach any firm conclusion as to the detection possibilities of any existent system. The Secretary said he had not yet had the opportunity himself of going over the report but that he would be discussing it in Geneva with Mr. Lloyd.

On the matter of high altitude testing, the Secretary said that the experts' talks on this subject in Geneva seemed to be going well. He said his tentative conclusion was that it may be necessary to settle for an agreement limited to atmospheric tests while continuing negotiation on those underground. He said he had very much in mind the problem of securing approval by the Senate of any control system which had so low detection capability as to raise doubts as to its effectiveness even as a deterrent.

479. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, July 16, 1959

SUBJECT

Geneva Nuclear Test Negotiations—Meeting of the Principals

PARTICIPANTS

<i>State</i>	<i>White House</i>	<i>D.O.D.</i>	<i>A.E.C.</i>
Mr. Dillon	Mr. Gray	Gen. Loper	Mr. McCone
Mr. Kohler—EUR	Dr. Kistiakowsky	Gen. Fox	Mr. English
Mr. Farley—S/AE	Mr. Keeny	Mr. Knight	Col. Sherrill
Mr. Spiers—S/AE			
Mr. Blanchet—S/AE		<i>CIA</i>	
Mr. Fessenden—S/AE		Mr. Dulles	
Mr. Borg—S/S		Mr. Brent	

Mr. Dillon explained that the meeting had been called to follow up the discussion on July 9 and was concerned with two problems: the

¹ Source: Technical aspects of nuclear test suspension talks. Secret; Limit Distribution. 8 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy.

presentation to the President of a simplified version of the report made by Dr. Bacher at the July 9 meeting; and secondly, recommendations as to what action should be taken in the light of the technical situation. He then asked Dr. Kistiakowsky what the status of the preparations for the submission to the President was and whether the report contemplated departed appreciably from Dr. Bacher's comments last week.

Dr. Kistiakowsky replied the paper would be ready for presentation early next week. He said that it would not depart appreciably from Dr. Bacher's remarks except in the avoidance of detail and the addition of visual aids. There had been no further meetings of the Panel. It was apparent that some of the findings reported by Dr. Bacher were technically supported while others were necessarily guesswork. He particularly noted the "P factor", i.e., the estimated probability that an inspection party could actually determine the nature of a suspicious event. On this point there was great disagreement among the Panel members and agreement only on the point that there was no basis for reaching a firm estimate. *Mr. Dillon* interjected that this appeared to lend weight to the view that there was a need for additional experimentation. *Dr. Kistiakowsky* explained that experimentation would not contribute to a more precise evaluation of this factor since it involved unpredictable considerations like the skill of the investigators, how much information we might have of the area concerned from intelligence, etc. *Mr. Dulles* remarked that the conversation on July 9 had been largely confined to technical considerations and had not considered the psychological factors. It had not gone into how the Soviets would assess the risk of attempting evasion.

Mr. Dillon referred to the draft course of action (attached) circulated at the outset of the meeting. He commented that we should not alter our public position regarding our ultimate objective of a safeguarded test suspension, during a period in which we would ascertain whether we could, in fact, devise adequate safeguards for a discontinuance of tests. *Mr. McCone* said it was his impression on reading the paper that we were drifting away from the position of requiring adequate safeguards. *Mr. Dillon* replied that this was not our intention. *Mr. Dillon* then reviewed each of the recommendations of the paper in turn, calling particular attention to paragraph d concerning a U.S. declaration of willingness to withhold nuclear tests underground while an experimental program to clear up present uncertainties was being conducted.

Mr. McCone and General Loper noted that the estimate in the paper in paragraph c-5 that such a program could be conducted in two to three years was out of line with Dr. Northrup's estimate of three to five years. *Mr. Dillon* said that this number would of course be changed to whatever the actual estimate was. *General Loper* then took exception to the statement of the problem at the outset of the paper which placed too

great weight on the problem of the concealment of underground nuclear explosions. If this problem were solved there would still be the matter of detection of underground testing in the lower yield ranges where the deterrence factor was very small. He also questioned the recommendation in paragraph d that we should agree not to test underground, suggesting that the language should be changed to "refrain from testing in the atmosphere" so that there would be no contamination from radioactive fallout. He maintained that this had been the President's idea all along. *Mr. Dillon* suggested that this paragraph be bracketed for the President's decision and said that the statement of the problem would be generalized to take care of General Loper's objection.

Dr. Kistiakowsky then gave a further account of the technical presentation that would be made to the President. He explained that there had been two key assumptions in *Dr. Bacher's* presentation of July 9: that decoupling by a factor of 10 would be feasible and that probability of success in on-site inspections was very low. If these assumptions were set aside, the picture was very much as it was at the end of the experts' discussions in 1958, provided that the improved instruments recommended by the Berkner Panel were incorporated into the system. The weight of these two assumptions would be brought out in a series of charts in which, by means of bar graphs, probability of detection would be plotted against detonations of different yield under varying assumptions as to the number of on-site inspections which could be carried out. One chart also showed the situation which would occur if decoupling should be feasible to the extent of reducing amplitude by a factor of 200.

At the request of *Mr. Dillon* *General Loper* then reported on a joint AEC–DOD study on what action should be taken to follow up the main recommendations of the Berkner Panel. He said that the Air Force Technical Applications Center (AFTAC) had recommended that there should be applied research on the evolution of early improvements on the detection of underground tests and secondly that there should in addition be fundamental research in seismology. New projects in both fields had been recommended, and the recommendations had been submitted to *Dr. York* for review. A panel had been selected to examine the projects recommended and subsequently to advise AFTAC on the carrying out of these projects. AFTAC has already begun to accumulate Soviet periodicals on seismology and to establish contacts with U.S. laboratories working on allied fields. He said that the funding had not been settled but that the expenses had been estimated at \$22.8 million for the first year and \$30 million for the second year. *General Loper* noted parenthetically that AEC could look for assistance from the Department of Defense in the amount of \$375,000 for work on the salt dome and granite experiments. *McCone* at this point inquired

whether the Panel believed that it could make a real contribution to solving the problem—whether it could come up with recommendations which would make a real difference in the system. He suggested that the Panel's recommendations would require very close examination, citing again Dr. Northrup's opinion that three to five years would be necessary and that even under these circumstances there might not be successful results. *General Loper* said that this was why AFTAC had emphasized the need for fundamental advances in seismology. He explained that AFTAC had under consideration the establishment of a model station to test the deep-hole equipment, long-period equipment and other improved equipment.

In response to Mr. Dillon's request, *Mr. McCone* then reported on a study of the AEC and DOD on the requirement for additional weapons tests, including the feasibility and cost of conducting them underground. McCone said that it had been prepared by a committee composed of a representative of the Division of Military Applications in the U.S. Air Force; the Assistant to the Secretary of Defense for Atomic Energy; the Manager of the AEC installation at Albuquerque; the Directors of the Los Alamos and Livermore Laboratories; and the Vice President of the Sandia Corporation. He said that the report set out various areas in which improvements, some of them of a dramatic nature, could be made in both low and high yields, in the refinement of the Polaris warhead and in the development of the Minute Man warhead. It projected a series of desirable underground tests extending into Fiscal Year 1960 and costing \$50 million. It also projected other tests in the upper atmosphere which would cost \$500 million to \$775 million. *Mr. Dillon* asked what, in general, were the assumptions as to what could be done underground. *Colonel Sherrill* said they had arbitrarily limited the underground testing in the first instance to 50 KT. It might be possible to go higher than this but this would be impossible to determine without the benefit of further underground testing. They had programmed two tests which could go up to 130 KT if preliminary testing in lower yields should prove it feasible to go this high. *Mr. McCone* then read the conclusions of the report that further testing was necessary to develop "new concepts"; to explore the possibility of warheads for mobile ICBMs and effects tests for the study of high altitude defense; to develop high assurance and predictability in various weapons and to contribute to the further development of the anti-ICBMs warhead and anti-submarine weapons, as well as weapons with improved characteristics for use over land surfaces. *Mr. McCone* said that there was a supplementary statement by Dr. Teller as well as an amplification by the Department of Defense. This report pointed up the seriousness of the question before the present group.

Mr. Dillon asked whether all the principals would be available next week for the meeting with the President. *Mr. McCone* said that he would be away on Monday, Tuesday and Wednesday, but that someone else could represent him if there were reasons for going ahead with the meeting. *Mr. Dillon* indicated the meeting would be postponed until *Mr. McCone's* return.

General Loper then raised the question of proposed instructions to the U.S. Delegation in Geneva concerning staffing. He said that he recognized that the position which the delegation was instructed to take was fundamentally sound, but he questioned on tactical grounds the wisdom of taking this position at this stage of the negotiations. *Mr. Dillon* and *Mr. Farley* outlined the reasons for going ahead on the discussion of staffing. *Mr. McCone* expressed the view that from his observation of the situation in Geneva it would be bad to try to stop further discussion on the staffing problem. He suggested that we might, however, in putting forth our position on staffing make clear that this was a peripheral issue in the negotiations and that the central issue lay elsewhere. It was agreed that *Mr. Knight* would discuss the matter with *Mr. McElroy* and call back in the evening.

Mr. McCone then stated that he did not think that the Tab A of the paper under discussion should go forward to the President, since the points included were matters of dispute. *Mr. Dillon* said that they had been attached as a tab for the information of the meeting participants rather than the President.

Attachment

Draft Course of Action

Problem. To outline a specific course of action in the event of a Presidential decision that the newly-developed theoretical techniques for concealment of underground nuclear explosions invalidate the Geneva Experts' system to such a degree that agreement on a comprehensive nuclear test ban would, on balance, involve an unacceptable security risk for the U.S., at least prior to conduct and assessment of further research and experimentation.

Possible Course of Action. The following course of action, which is proposed for discussion with the U.K. after Presidential approval, would do most to minimize adverse reaction and accord with the considerations and basic objectives outlined in Tab A.

a) The Secretary to inform Lloyd of our present views, and offer an immediate visit by a U.S. technical team headed by Dr. Bacher to the U.K. to satisfy U.K. questions. (We should be prepared for a U.K. conclusion that the political advantages to be gained from agreement far outweigh the technical uncertainties involved. In addition the U.K. is

likely to resist a change in position while the Foreign Ministers Conference is under way and so long as a Summit Conference is a possibility.)

b) Secretary Herter and Lloyd to advise Gromyko in Geneva that we are seriously concerned about Soviet unwillingness to join in reconsidering the effectiveness of the Geneva system for dealing with underground tests in the low yield ranges and that, in spite of the progress which the negotiators have made, we will be unable to agree to a comprehensive ban until there is a solution of this problem. Gromyko should be made to understand that our public and Congressional opinion will not accept an agreement which is not technically sound, and that we cannot longer defer facing up to this problem. Secretary Herter to offer that Dr. Bacher visit Geneva or Moscow to review the technical considerations with Dr. Feodorov or other Soviet scientists.

c) If, as is to be expected, the Soviet Union refuses to agree to the proposed technical reassessment despite this demarche, Wadsworth should be instructed to state in the meeting that the United States, short of finding ways of overcoming the technical uncertainties, no longer believes it possible to agree to a full test ban.

1) This would be preceded by a presentation in the meeting, by Dr. Bacher, of our full analysis of the technical situation.

2) This action would be coordinated with a message from Eisenhower to Khrushchev designed to authenticate this position.

3) If the USSR under this pressure, agrees to the proposed reassessment, the conclusions of the Bacher Panel and the Latter theory will stand up under Soviet technical criticism, and thus will provide even stronger justification for our action. If the USSR continues to refuse, it will bear the onus of ignoring the difficulties we have described in specific terms.

4) In either event we should introduce a draft treaty for a phased approach similar to that developed subsequent to the April 13 proposal, preserving as many as possible of the now agreed elements of the control system but extending to high altitude tests on the basis of the recent agreement in this area.

5) Concurrently, we should propose a concrete program of research and experimentation, to be conducted cooperatively over a definite period (2-3 years), designed to answer the present uncertainties about underground detection capabilities. The treaty would include provision for extending the ban to underground tests, perhaps in stages, as soon as effective control is proven possible by further study and experimentation. The initial stage might be to prohibit underground tests creating a seismic signal larger than 10-20 KT if this is deemed feasible.

d) In order to emphasize that the objective of the U.S. is to develop a sound system and not to find a pretext to resume testing, the U.S. should declare readiness for its part to withhold nuclear weapons tests underground while the experimental program is being conducted, provided the USSR agreed to this approach, to cooperate in the research program, and undertook a similar declaration on its own part. (We anticipate that without this provision it will probably not be possible to obtain U.K. concurrence to the outlined course of action.)

e) If the USSR does not accept this proposal, the President should issue a statement recalling the U.S. delegation temporarily, announcing

the intention to undertake the experimental program unilaterally (or jointly with the U.K.) and proposing resumption of negotiations as soon as the program produces results sufficient to warrant this action. In this event we should refrain from conducting any tests in the atmosphere and limit ourselves to a modest and restricted program of underground weapons tests conducted with an absolute minimum of publicity. (We must anticipate Soviet and U.K. declarations of intent not to conduct any testing.)

Considerations. Any plan of action for a change in U.S. position with respect to the Geneva negotiations must be developed with the following considerations in mind:

a) The need to minimize the impression that the U.S. is seeking to evade agreement with the USSR now that it has become more of a practical possibility, or that the U.S. is seeking a pretext for resumption of nuclear weapons testing.

b) The necessity for full, candid and effective exposition of the reasons for our position.

c) The importance of holding on to such advances in Soviet willingness to accept international control and inspection as have been made during the course of these negotiations.

d) The importance of not prejudicing the possibilities of success in, or even the meaningful conduct of further disarmament negotiations.

e) The importance of avoiding a major policy split with the U.K., in which there is extreme internal pressure to obtain a successful result in the current negotiations.

f) The danger of unilateral Soviet forswearing of all nuclear weapons tests as a likely response to a U.S. shift in position, and the consequent propaganda gain for the USSR.

g) The implications which a change in the prospects for an agreement on testing could have on other current or prospective negotiations with the USSR.

Basic Objectives. The U.S. initially decided to seek an agreement on suspension of nuclear tests for a number of reasons, which remain cogent:

a) A desire to combat the image of the U.S. as a military-minded nation, indifferent to world fears about nuclear war and world hopes that some means might be found to cope with the threat of modern arms.

b) To attack the 4th country problem, limiting the development of independent nuclear weapons production capabilities.

c) To break the 12-year disarmament impasse by taking an immediately practical first step that might make subsequent steps come easier.

d) To penetrate the Iron Curtain and force Soviet acceptance of the idea of international control.

e) To demonstrate to the world as well as to the Soviet Union U.S. willingness to seek sound agreements with the USSR and to probe the sincerity of Soviet professions of a desire for relaxation of tensions.

f) To freeze the status of Soviet nuclear weapons technology, insofar as possible, while it is still behind ours.

g) To counter a successful Soviet propaganda drive which enabled it to pose as champion of peace on this issue, and to forestall an unequivocal UN call for test cessation with or without controls.

h) In achieving these objectives, at the same time to dispose of the "fallout" issue which was stigmatizing the nuclear weapons on which we relied.

It is necessary to insure that any course of action adopted does not mean a reversal of the U.S. position or adoption of an obviously unnegotiable one which would mean a setback to the chance of achieving these objectives. If through a change in our position we convince others we are no longer interested in an agreement on nuclear tests there could be a serious impact on the confidence of our allies and of uncommitted countries in the U.S. as a responsible power which seeks an alternative to an arms race.

In view of these considerations and the history of the negotiations so far, the U.S. must be prepared to deal frankly and fully with the technical factors which we believe justify a change in our objectives. It would be unwise to base such a change on Soviet recalcitrance in the negotiations, since the gap between the Soviet and Western positions at present, though substantial, may well be bridgeable by further persistent effort. The Soviets have made substantial changes in position during the negotiations and have moved closer to our concept of international control than ever before in the long history of disarmament negotiations. There is no longer a clear, dramatic difference between the Soviet and Western positions on key issues. Initially the Soviets maintained that controls were unnecessary and, finally, during the 1958 Experts' Conference accepted in toto the U.S. position on the full range of control methods which we deemed technically necessary. This Soviet acceptance of our proposals was duplicated during the recently concluded high altitude technical discussions. Accordingly, we believe that in order to be plausible we must clearly base any change in position on technical difficulties not foreseen last summer, which we must try jointly to overcome before we can be confident that a comprehensive test ban is in fact enforceable. We must be prepared, in particular, to explain the Latter concealment theory and its implications. This is the major new development justifying reassessment, since it was recognized as far back as the Experts' Conference that underground events in the low yield ranges would be difficult to identify and that below some point (which now appears to be about .7 KT) some would go undetected. This level of risk has been considered acceptable, given the limited motivation for cheating in these ranges.

480. Memorandum From Killian to Kistiakowsky¹

Washington, July 20, 1959

I wish to put into this memorandum the suggestion that I made to you verbally for modifying the position paper for the Geneva Test Cessation Conference which you showed to me on Sunday and which was presented by the Department of State at the meeting of principals on Thursday.

My suggestion is this: that as a first step in a plan to propose a phased and evolutionary test ban, we seek to introduce into the Geneva discussions the whole problem of the Latter Hole. In doing this we would first of all make a complete disclosure of the concept and theory with a complete discussion of the uncertainties that we feel this introduces into the monitoring of underground tests. Next we should propose an agreement to conduct test experiments to gain solid evidence about the effects of the Latter Hole. These should include nuclear tests. Without nuclear tests, I doubt very much whether any experimentation is going to be convincing as to whether the theory is right or wrong or partially right.

A first step such as the one I propose would seem to put us in a more advantageous position. If the Soviets accepted the proposal for such tests, there could be a clear possibility of gaining more solid experimental evidence to proceed with further discussions of a monitoring system, in a manner which would make it clear to the world that we were troubled by the uncertainty which has been introduced by this new concept and that also we were anxious to get the facts and let them fall as they may.

If the Soviets refuse to agree to such a proposal, our position would seem to me to be much stronger before the world in that we have sincerely sought to make an effort to meet the technical uncertainties head on with information fully available to both sides.

If such a program of testing and experimentation to find the facts about the Latter Hole do proceed, we would then be in a much more solid position to determine what our next step should be. If, for example, the experiments support the theory of the Latter Hole and indicated very large decoupling factors, we might have to conclude that a second phase involving detection of underground tests might have to be drastically modified or even dropped. If, however, the tests showed

¹ Source: Proposes discussing Latter Hole in nuclear test suspension talks. Top Secret. 2 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy.

that the decoupling factors are much smaller than those which theory indicates might be possible, we would have a solid technical base for looking at systems for detection of underground tests.

The step which I propose and describe is included in the State Department proposed position paper, but my plan puts it in a somewhat different setting and changes the timing. We would make such a proposal as I describe first, and then defer our decisions as to whether we propose an atmospheric ban as the first phase of an evolutionary plan.

One question that will have to be met in appraising my proposal is the time required to conduct such nuclear tests and the effect of the time required on our own planning. If it was agreed that we were to make such a proposal and if consequently the proposal were accepted, I think that we would be operating under a sense of urgency to make such a test and get the facts as soon as possible. I would hope that this could be a matter of two years rather than three to five years.

Whatever we now decide to do, I hope very much that we will cling to our policy of seeking to establish the principle of monitoring. We now know that monitoring systems are more complex than originally supposed, but I am not convinced that this additional complexity invalidates the concept of monitoring. I am convinced that the principle of monitoring is so important for any progressive development of arms limitation policies and procedures that we ought to pursue the effort to design and get agreement on monitoring systems with great determination. We have gone deeply into the technical aspects of nuclear test monitoring and inspection, and it may well be that we have a greater opportunity to reach sound agreements about this particular kind of monitoring system than we could expect in the future to reach with any other aspect of arms limitation.

More fundamental even than this is the importance in my view of making headway, however slight, in the development of methods of arms limitation which still provides adequately for the security of the United States. Despite all of the difficulties and frustrations that are inherent in the current negotiations, I still believe that these negotiations are worth continuing and warrant our being persistent and patient in seeking to achieve progress and further results.

J.R. Killian, Jr.

481. Memorandum of Conversation¹

US/MC/164

Geneva, July 29, 1959, 1:15 p.m.

PARTICIPANTS

United States
The Secretary

U.S.S.R
Mr. Gromyko

SUBJECT

Disarmament Negotiations

After the discussion on Geneva Conference matters following lunch today, the Secretary raised with Gromyko the questions of renewing disarmament negotiations. He said that he was prepared now to discuss with Gromyko his ideas on a suitable form for carrying on negotiations which are now in suspension. The Secretary's view would be the negotiating group should be small, and he had understood from Gromyko's conversation with Secretary General Hammarskjold that he shared this view. It was clear to the Secretary that if the negotiating group is to be a workable organ, membership in it should be restricted to parties with a high degree of technical competence and with a real sense of responsibility with regard to the disarmament problem. The Secretary would prefer therefore that the negotiating body not include neutral countries since, for the most part, they are lacking in the requisite technical competence and their presence therefore would probably [illegible in the original] the discussions. The Secretary [illegible in the original] the United States, the United Kingdom [illegible in the original] the Soviet Union, Poland and Czechoslovakia [illegible in the original] which to consider the Secretary [illegible in the original] could lunch with him Friday or Saturday [illegible in the original] to carry on their discussion of the problem.

482. Memorandum of Conference with the President¹

Washington, July 29, 1959

OTHERS PRESENT

Acting Secretary Dillon
Mr. Charles Coolidge
General Goodpaster

Mr. Dillon said he was there to introduce Mr. Coolidge to the President in a new capacity, that of Director of the study of Disarmament which the President had recently approved. The President expressed his gratification that Mr. Coolidge was bringing his extended experience in security affairs back to the government to lead this study.

Mr. Coolidge said his ideas on disarmament are still pretty meager. It seemed to be something that everyone is for but for which it is very hard to find specific effective things to do. He said he did not intend to establish any big task forces, but thought he would take advantage of what has already been done. His staff he expected to include four from Defense, four from State, two or three from the scientific community, one from CIA and one from AEC, at least initially. The President supported this approach, commenting that our normal experience is that these projects are over-organized, to the extent that they become bureaucratic. His thought is that the key is a few people with good ideas and imagination. Mr. Coolidge said he had talked with Dr. Kistiakowsky, Dr. Killian and Mr. Allen Dulles to get their thinking, and would certainly be searching for ideas wherever they could be found.

The President said that one of the difficulties is that it is hard to get timely response even where we see some action possibilities. He recalled that he had thought some two years ago that it would have been a good idea to discontinue atmospheric testing. The Soviets probably would not have agreed, since they have insisted on banning all types of testing, but we would have improved our situation greatly without ruling out tests that were really essential. In the long run, he said he feels we cannot go beyond the ban on atmospheric testing since inspection against ground testing is too uncertain, and inspection against high altitude testing will probably be too costly. He felt that there is great value to be gained through the elimination of certain types of arms from certain areas. The virtue is that we thereby establish inspection systems, and it is from these that he expects progress in the international field to be achieved. After further discussion of the difficulties involved in the disarmament approach, Mr. Coolidge and the President agreed that the only thing to do is to stay with it and do the best we can.

¹ Source: Disarmament study. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

The President again thanked Mr. Coolidge for taking on this assignment. At this point Mr. Coolidge left the President's office.

The President then cleared a proposed message to Prime Minister Macmillan and gave it to Mr. Dillon for final editing and dispatch. He followed this with a message to Khrushchev with the same instructions. Mr. Dillon suggested delivering the message to Macmillan through Lord Hood and the one to Khrushchev through Ambassador Menshikov here in Washington, and the President agreed.

Mr. Dillon recommended for the President's approval the designation of Mr. Dowling as Assistant Secretary for European Affairs in the State Department. He mentioned that the international organization for the support of NATO is planning to designate a new head, and asked if the President would see any objection to Mr. Harriman's taking that post, which is an entirely private position. The President said he did not think this was a matter which needed to be brought to him, and would therefore have no objection.

A.J. Goodpaster
Brigadier General, USA

483. Telegram Cahto 188 From Herter at Geneva¹

Geneva, July 31, 1959, 10 p.m.

Cahto 188. Re Tocah 211, following are Wadsworth views on recess.

1. While recess until conclusion of Killian talks would be highly desirable from many standpoints. USdel is rather at loss to find reasonable justification for requesting one which will wash with Russians and world opinion. Soviets are already deeply suspicious re United States attitude toward treaty. They have made this quite clear in their repeated probing for United States answer to their quota proposal. Unless desirability of recess can be very clearly demonstrated, any attempt to obtain one likely be met by Soviet allegations re United States intentions and refusal go along on agreed basis.

Alternative of spacing out meetings and slowing down tempo of work seems to us preferable. Recently conference has averaged only three meetings per week. If United Kingdom agreed we could move ahead at

¹ Source: Wadsworth's views on recess of nuclear test ban talks. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/7-3159.

about this rate or slower on number of uncompleted matters, all of which would have to be negotiated in any event, even for limited treaty.

3. Believe following tactics would permit United States to maintain reasonable posture for about two weeks:

A) Continue as during last five weeks to limit meeting schedule on basis ad hoc arrangements to three or less per week.

B) Continue staffing discussion, dealing with thirds proposal, question of nationality of head of post, and United States views re exclusion host country nationals from inspection groups.

C) Continue discussion preparatory commission, Annex III, seeking clarification of Soviet position and definition of any issues of disagreement.

D) Table Annex II on privileges and immunities for discussion if this can be agreed with United Kingdom.

E) Table if possible amendments to treaty to incorporate high altitude provisions as recommended Supnu 563.

F) Continue discussion of veto, especially as regards budgetary, administrative and logistic questions.

G) Deal with minor matters which are still pending such as depositary government, disposition of records of Experts' discussions re high altitude detection, and amendments relating to choice of Vienna as headquarters.

H) Consider definitions and disputes articles when agreement reached with United Kingdom these matters.

Foregoing assumes high altitude provisions and Annex II can be readied for presentation within week. In any case it would of course be most helpful to Wadsworth if conversations with British could be started and carried through as quickly as possible.

Herter

484. Telegram Cahto 201 From Herter at Geneva¹

Geneva, August 3, 1959, 7 p.m.

Cahto 201. For the Acting Secretary. Wadsworth and I met with Lloyd, Wright, Laskey and Morgan of UKdel August 1 and informed the group about latest schedule of Killian and his group re coming

¹ Source: Discussions with U.K. on nuclear test ban talks. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/8-359.

to London. Lloyd indicated this was acceptable to them, not knowing at the moment where Penney was. He thought that if their scientists agreed with the latest U.S. findings and with a two to three year research and experimentation program that the UK might agree that we cannot accept disarmament agreements which cannot be controlled; i.e., we could not yet sign treaty banning underground tests.

Lloyd expressed considerable concern about impact of present US plan on the General Assembly. He pointed out that unless the US–UK did something about continuing the moratorium on tests other than experimentation for the detection system, we stood a good chance of receiving a resounding defeat in the Assembly. He thought that world opinion would be “aghast” if the West resumed testing, that the Irish res presented certain difficulties and that a res calling for a moratorium might even be passed. He further thought that the West’s strongest point was the Russian refusal to discuss the new seismic data and that we should play the hand on that.

I replied that I felt this would not be as serious as Lloyd thought, since most of the world objected to tests because of fall-out and the results thereof.

Lloyd pointed out that although this was true, the Soviets would be sure to make a great deal of mileage with an argument to the effect that this proved that we never had wished to have a comprehensive test ban and that the “anti-treaty forces” in Washington had won the day.

All of the above predicated on assumption that Sovs would not agree to the negotiation of a limited treaty.

On further procedural matters it was agreed that Killian-Penney group should come to Geneva from London as soon as they had reached agreement. It was thought doubtful that Federov (USSR) would return to Geneva from Moscow, but it was agreed that Western scientific position should be placed upon record by Penney and Killian. It was also agreed that Western dels should table the alternative limited treaty covering atmospheric, high altitude and underwater explosions together with an undertaking to carry out the research needed, with Russian cooperation.

Considerable conversation then ensued about the advisability of making an announcement that when, as and if research and experimentation had resulted in a detection system in which we could have confidence, the US would accept the quota idea in principle. It was generally agreed that this might be a good tactical move and that it might lead the Sovs closer to agreement to join with the West in the experimentation program.

It was agreed that we would wait until completion of London talks between Killian and Penney before setting up any rigid timetable for the future. In any event, Killian and Penney should first agree on the scientific position. We could drag out the conference until they could come to Geneva and present their data. We might then suggest a recess to allow the Russians to consider the new package. Lloyd thought we should keep the

test conf in existence and try to delay a GA rpt GA disarmament debate at least until November with the conf still in progress to that time. It was also pointed out that there is a lot of hard work to be done on the alternative draft treaty and that it would be important to receive US Govt's decision on the high altitude report which, according to UK group, had been accepted by the UK as an "acceptance as correct technical assessment."

Herter

485. Letter From McElroy to Eisenhower¹

Washington, August 5, 1959

Dear Mr. President:

In keeping with your announcement on August 22, 1958, of a one-year's suspension of nuclear weapons testing, I issued certain instructions concerning preparations to be made by the Department of Defense for the resumption of testing after expiration of the suspension period. Specifically, I directed that preparations be made for conducting a limited test series not earlier than February 1960 and a more comprehensive series involving overseas operations by the middle of the Calendar Year 1960. These periods were selected with due regard to the preparatory time required and on the assumption that by the middle of 1959 we would be able to make a fair evaluation of the chances of success or failure of the test cessation negotiations.

On the basis of these instructions two test series were planned; first, a single underground shot to simulate certain effects of explosions at very high altitude, as an important consideration in the design of anti-ICBM systems; second, a comprehensive overseas series to thoroughly investigate the effects of very altitude explosions on communications, radar, materiel and personnel; to further investigate safe delivery and kill distances for anti-submarine weapons and to determine the necessary characteristics of fully hardened ICBM launching sites.

No substantial expenditures for the proposed *underground test* are required at this time.

¹ Source: Plans to resume testing. Secret. 4 pp. Eisenhower Library, Whitman File, Administration Series, McElroy, Neil, 1959.

However, we have now reached a point when considerable sums must be expended in preparations for the more comprehensive program if it to be conducted as scheduled during Calendar Year 1960. It is estimated that between the present date and the end of October 1959 from \$30 to \$40 million would have to be committed in preparations for this test series if the presently placed operational date is to be met.

The Joint Chiefs of Staff and the Director, Defense Research and Engineering, have advised me that the data to be obtained from these tests are of great importance to the design and operational employment of the several weapons systems to which they apply. The very high altitude tests, in particular, are designed to obtain information on interruptions or blackouts of communications and other effects of nuclear explosions in a hitherto relatively unexplored environment which may be of vital importance to our future defensive posture. These high altitude explosions would also serve as a partial test of the effectiveness of the detection system recently agreed upon at the Geneva Conference.

I recognize, however, that there are many factors which may make it impracticable to arrive at a firm decision at this time concerning the resumption of testing both as to timing and as to scope. While I am extremely reluctant to foreclose the possibility of obtaining, at the earliest possible date, the much needed data to be derived from the planned test series, I have concluded that it would be unwise to embark upon the expensive preparations required until the outcome of the Geneva negotiations and its effect on future U.S. policy can be determined. Accordingly, I am issuing instructions to the effect that within the Department of Defense modest preparations for one or more underground tests in Calendar Year 1960 will continue and that preparations for the more extensive series, including underwater and high altitude tests, will be limited to maintaining test plans in a current status and to the procurement of very long lead time items only. These instructions will mean, in effect, that subject to a determination of policy *by the end of this year*, limited underground testing could be conducted in the Spring of 1960 and that a comprehensive series involving overseas operations could be conducted in the Spring of 1961.

I am aware that the Atomic Energy Commission, in response to specific weapons development requests placed by the Department of Defense and in pursuit of advances in the state of the art, has also tentatively planned a number of tests involving both underground and high altitude explosions. These development tests are of equal or greater importance to the Department of Defense than the weapons effects tests referred to above. Inasmuch as the need for these tests is being studied at your direction by Dr. Kistiakowsky, it would not appear appropriate for me to comment on the Commission's plans at this time.

With great respect, I am

Faithfully yours,

Neil McElroy

Attachment**Memorandum From John Eisenhower to Goodpaster**

Washington, August 13, 1959

In connection with the attached memorandum, Dr. Kistiakowsky asked me to check with the President whether the study referred to in the last paragraph should be expedited in order to provide a preliminary briefing to the President before departure for Europe. The President said this was not necessary, and I so informed Dr. Kistiakowsky's office.

JSDE

P.S. Dr. Kistiakowsky called after he had taken the action above. Mr. Gates is much concerned over the actions recommended herein and may feel it necessary to reclama to the President. In view of this, Dr. Kistiakowsky had decided to blitz his study anyway. I so informed the President.

¹Source: "Large Hole;" satellite detection systems. Secret. 5 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament, Nuclear Policy. Drafted on September 3.

The joint group of British and American technical delegates has reviewed the technical aspects of detecting nuclear weapons tests in the light of new information which has become available since the report of the Geneva Conference of Experts and has reached the following conclusions:

(1) The group accepted for joint use by the U.S. and the U.K. the table, a copy of which is given in the appendix to this report, entitled "Estimated Capability of Control System for Detecting and Identifying Seismic Disturbances in the U.S.S.R."

(2) The concept of the "large hole" has introduced a new kind of uncertainty which requires a re-examination of the control system agreed upon by the Geneva Conference of Experts. The "large hole" technique may provide a method of concealing underground explosions which cannot be detected by the system recommended by the Geneva Conference of Experts. This conclusion seems inevitable unless future tests contravene the theory as developed for the "large hole".

(3) In view of the large cost and unknown feasibility of the "large hole" it is agreed that a program of engineering analysis and experimentation is desirable and necessary. The group therefore urges the prosecution and completion of high explosive tests as already planned both for the U.S. and the U.K. It further recommends that both the U.K. and the U.S. undertake engineering studies of the practicality and cost of constructing large holes and that these studies should be of such thoroughness as to give confidence in their conclusions. It is further agreed that there also should be consideration of the problems of radiation transport, of the effects of X-rays and of neutrons produced by a nuclear explosion in a large cavity.

It is a conclusion of this group that planning, (and if politically unobjectionable, execution) should proceed for a series of "large hole" tests, including complete plans for a nuclear test. This planning should include the choice of sites, the instrumentation, the method of measuring yield, the time required and the cost.

(4) Consideration should also be given to the degree of decoupling achievable in "small holes", and to alternative kinds of large cavities including the possibility of cavities including the possibility of cavities in ice and containers under water.

(5) The group notes that it is very unlikely that the engineering feasibility of decoupling by use of a "large hole" can be conclusively proven or disproven within a time shorter than a year, although high explosive tests will yield partial information within 4–6 months. Even after several years' work the question may be unresolved. Any agreement within the next few years which bans underground tests runs some risk that decoupling schemes may be able to circumvent the

experts system unless that system can be augmented in its capability by means beyond improvement of instrumentation.

(6) The group accepts the findings and recommendations of the Berkner Panel report and urges their rapid implementation. It recommends in addition that on-site inspections of selected earthquakes be undertaken as quickly as possible after these earthquakes have occurred. It is noted that such field work could appropriately be undertaken in New Zealand and California. Whenever appropriate, advantage should be taken of those underground explosions which might yield useful information for developing on-site inspection techniques.

(7) The group concluded that the only technical norms now known for the detection of explosions in large cavities would be unmanned stations of the kind discussed in the Berkner Panel report. It urges a careful technical study of the design of unmanned stations including their feasibility and associated communications and safeguarding problems. In making this comment the group emphasizes that it is not recommending at this time a political decision that unmanned stations be introduced into the Geneva discussions, since this might undermine the present proposals for manned stations.

(8) The group stresses the importance of continuing study and research for the purpose of determining new techniques for decoupling and concealment and for detection and inspection.

(9) The group recognized that there were substantial uncertainties in signal strength as a result of variations in medium, geographical and geological formations, depth of burial, etc., which in some cases could reduce the coupling below that of the Rainier event. It also recognized the difficulty of evaluating the probability that an on site inspection in the region of a concealed underground nuclear explosion would result in identification. The risk of detection may be increased by a substantial but unknown amount by the use of intelligence information in selecting the events to be inspected. The combination of all these factors makes an estimate of the capability of the system, even excluding the possible use of large holes for decoupling, very difficult below the yield level of about 20 kts. Experimentation, much of it with high explosives, could reduce some of these uncertainties. The group considers that when all the technical problems mentioned above have been fully investigated it may not be possible to offer a system which has a reliability equal to that estimated by the Geneva Conference of Experts.

(10) Although it is not possible to make a quantitative evaluation of the contribution of intelligence, it can be expected to supply assistance in determining the degree of suspiciousness of seismic events and thereby in selecting which of these events should be inspected. This assistance can be expected to be much more effective in detecting large scale unusual operations such as may be required in the construction

of a “large hole”. However, intelligence by itself cannot provide a case for carrying out an inspection. Finally intelligence will introduce an element of uncertainty into any Soviet planning for a concealed nuclear test and thereby provide a deterrent to such Soviet activities.

(11) The group noted that the satellite system and ground station equipment recommended at Geneva (10 July 1959) for the detection and identification of high altitude nuclear explosions was evaluated in that Report as incapable of detecting nuclear explosions of hundred of kts. yield which are shielded against emission of X-ray radiation at a distance of more than a few tens of millions of kilometers. Such tests are a feasible means of obtaining the necessary diagnostic data on new weapons designs and might therefore, when the relative costs of conducting them are evaluated, be preferred to the large hole by a potential violator as a method of evading the control system. If one adopts the solar satellite system which is discussed but not explicitly recommended in the Report of the Technical Working Group, the capability of the systems could be improved so as to require a violator to go several times as far.

487. Letter From McElroy to Eisenhower¹

Washington, August 14, 1959

Dear Mr. President:

It is my understanding that in pursuing the course of action regarding test cessation negotiations which you approved on 23 July 1959, questions have arisen concerning what action should be taken with respect to an extension of the U.S. test moratorium beyond 31 October 1959. I felt it desirable to ask the views of the Joint Chiefs of Staff on this matter. Their views are inclosed herewith.

I recognize that there are many difficult and complex political problems involved in a decision on the part of the United States to resume testing in the near future. As I wrote you on 5 August 1959, the Department of Defense, in recognition of the nature of the problems, has cut back the level of preparations for future test programs which have been developed to advance our knowledge in several important areas.

The one-point safety matter discussed by the Joint Chiefs of Staff in the attached memorandum presents a situation quite apart from the area of general or specific advancements in the design and application of nuclear weapons. I agree with the Joint Chiefs of Staff that failure to resolve this matter with a minimum delay could have military-political consequences far more serious than those which might arise from conducting the limited testing which would appear necessary to its resolution.

With great respect, I am

Faithfully yours,

Neil McElroy

Enclosure**Memorandum for McElroy**

JCSM-332-59

Washington, August 14, 1959

SUBJECT

Extension of the Current Nuclear Weapons Test Moratorium (TS)

1. In accordance with your verbal request the Joint Chiefs of Staff have examined the effects of a possible extension of the current

¹ Source: Conveys JCS concerns about extension of nuclear test moratorium, safety of nuclear weapons. Top Secret; Restricted Data. 4 pp. Eisenhower Library, Whitman File, Administration Series, McElroy, 1959.

suspension of nuclear weapons testing beyond the termination date of 31 October 1959 established by the President on 22 August 1958. The Joint Chiefs of Staff have noted that the conditions prescribed by the President at that time as a basis for further extension have not been met. They assume, therefore, that an extension beyond the initially prescribed one year period is a matter for decision by the United States and is not dictated by any existing international commitment.

2. On a number of occasions the Joint Chiefs of Staff have expressed their firm conviction that it is contrary to the interests of the United States to impose restrictions on the development of its armaments in the absence of firm and enforceable agreements which impose equivalent or compensating restrictions on the Communist Bloc. The continuation of test suspension is such a restriction.

3. As applied to the broad area of nuclear weapons testing for the purpose of developing new weapons concepts or exploring nuclear weapons effects in unusual environments, the Joint Chiefs of Staff do not hold that a short term extension of the test moratorium beyond 31 October 1959 is a matter of vital consequence. However, there is a serious problem with respect to the production, deployment, and employment of a large segment of the present and early future stockpile of nuclear weapons which demands the earliest possible solution. This is the problem of a possible nuclear contribution in the event of an accidental detonation. It is the understanding of the Joint Chiefs of Staff that this question can be answered only by actual tests and that it may be possible to conduct such tests without nuclear detonation.

4. For the following reasons the Joint Chiefs of Staff consider it imperative that nuclear weapons testing to the extent necessary to resolve the one-point safety question as regards weapons currently stockpiled and weapons under development for early stockpiling be initiated and completed as soon after 31 October 1959 as technically possible:

a. As a result of recent calculations of the probabilities and consequences involved, the Atomic Energy Commission has cut back production of the weapons in question and the Joint Chiefs of Staff have placed certain restrictions on deployment and movement of these weapons which degrade the state of readiness of both strategic and tactical forces.

b. There is a real danger that information as to the questionable nuclear safety of certain U.S. weapons will become widely known through inadvertent disclosure. The longer the present uncertainty obtains the higher the probability of such a disclosure. The U.S. public and our Allies have been repeatedly assured that our weapons are one-point safe. A rumor to the contrary could have a catastrophic effect on our ability to maintain overseas storage bases, to maintain strip alerts of air defense and retaliatory forces, to continue air alert exercises, and to continue logistic movements.

c. In the event that safety tests should have positive results, the earliest possible appraisal of the consequences of such a finding on our entire nuclear weapons posture will be essential. Involved in such an appraisal will be the need for redevelopment and refabrication programs which, in turn, may require further tests for confirmation of the results.

5. The Joint Chiefs of Staff request that the Secretary of Defense make known to the President their views as to the seriousness of this problem and their concern as to its earliest possible solution.

For the Joint Chiefs of Staff:

N.F. Twining
Chairman
Joint Chiefs of Staff

488. Letter From McElroy to Eisenhower¹

Washington, August 20, 1959

Dear Mr. President:

The Joint Chiefs of Staff have forwarded to me a memorandum dated August 13, 1959, on the subject of phased approach to agreement for the cessation of nuclear weapons tests. A copy of this memorandum is attached for your information.

In their memorandum the Joint Chiefs of Staff question the capability of a control system with existing techniques to detect and identify underwater nuclear explosions. Mr. Gates has forwarded this memorandum to Under Secretary of State Dillon and requested that an assessment of the technical matters raised by the Joint Chiefs of Staff be made as a matter of urgency by Dr. Kistiakowsky. Mr. Dillon has requested Dr. Kistiakowsky to undertake this study.

While I agree that a study of this problem should be made, I do not agree with the views of the Joint Chiefs of Staff as contained in paragraph 4 c of the attached memorandum. Because of the political and psychological implications incident to underwater testing, I do not feel that the Defense Department should support the views that such tests should be grouped with underground tests in any agreements that we might be a party to.

I am sending a copy of this letter to the Secretary of State and to the Joint Chiefs of Staff for their information.

With great respect, I am

Faithfully yours,

Neil McElroy

Attachment

Memorandum From Twining to McElroy

JCSM-326-59

Washington, August 13, 1959

SUBJECT

Phased Approach to Agreement for the Cessation of Nuclear Weapons Tests (C)

1. The Joint Chiefs of Staff understand that pursuant to a decision by the President, the United States is preparing to adopt a policy of seeking a phased approach to an international agreement for the controlled suspension of nuclear weapons tests. This approach will exclude from the tests cessation agreement any ban on nuclear weapons tests underground or under the surface of inland waters which do not emit radioactivity in amounts detectable by the agreed control system. Tests underwater in the open sea or waters open to the sea such as the United States has conducted in the past would be prohibited.

2. The decision to withdraw underground nuclear weapons tests from any controlled tests cessation agreement is believed to be based on a searching inquiry into the state of the art of seismology which has cast serious doubts on our ability to detect and identify underground nuclear explosions, particularly in the lower yield ranges. New data has indicated that there are techniques available which will allow concealment of such tests from seismographic detection.

3. A review of the findings of the Berkner Panel on Seismic Improvement and other papers prepared by the panel has not indicated an equal concern for our ability to detect and identify the nuclear characteristics of underwater explosions. The techniques of detection and identification for underwater explosions using seismic signals are similar to those for underground. A brief inquiry in this area has indicated that techniques for concealing underwater explosions are feasible and perhaps more readily implemented than those for concealing underground tests. Since seismic methods play a significant role in underwater detection and identification, any doubts as to the capabilities of seismic systems for underground detection should cast doubts also on the capabilities for underwater detection by these means. Hydro-acoustic methods for detection of underwater explosions are available. However, identification of the nuclear origin of an explosion is by collection of a sample of radioactive waste. For underwater explosions this is extremely difficult due to the large expanses of ocean areas even though an approximate location by seismic and hydroacoustic methods is determined.

4. With respect to this new policy, the opinions of the Joint Chiefs of Staff are as follows:

a. The state of our knowledge of underwater detection is such that any assumptions as to our capability to differentiate a nuclear explosion from other artificial seismic disturbances may result in an adverse military security position parallel to that we find ourselves in with regard to underground detection. The Soviets may be able to make underwater tests unknown to us and thus make advances in weapon technology and knowledge of weapons effects which we will deny to ourselves.

b. The United States, because of non availability of suitable deep water lakes and inland seas, might be placed at a disadvantage with respect to the Soviet Union if tests under the surface of inland waters are included in the same category as underground tests.

c. That underwater tests in general should be grouped with underground tests until such time as thorough inquiry into underwater detection techniques has confirmed a high probability of underwater detection and identification even in the event of determined efforts toward concealment.

5. The Joint Chiefs of Staff request that you convey the views expressed in this memorandum, as appropriate, to the President and to the Secretary of State.

For the Joint Chiefs of Staff:

N. F. Twining,
Chairman
Joint Chiefs of Staff

489. Memorandum From Twining to McElroy¹

JCSM-337-59

Washington, August 21, 1959

SUBJECT

Study on Nuclear Tests (U)

1. Reference is made to a memorandum by the Deputy Secretary of Defense for the Chairman, Joint Chiefs of Staff and the Director of Defense Research and Engineering, dated 23 July 1959.

2. The Joint Chiefs of Staff consider the resumption of nuclear testing to be so vital to the security of the United States that a reiteration of past

¹ Source: JCS views on necessity of nuclear testing. Secret. 3 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Nuclear Testing.

positions is timely in view of the study now under preparation by Dr. Kistiakowsky. In this connection, the Joint Chiefs of Staff consider that:

a. An adequate military posture for the United States will not be attained until there is available a complete spectrum of weapons compatible with modern delivery systems, which will make it possible to apply selectively adequate force against any threat.

b. To attain an adequate military posture, further testing is essential in the following development programs:

(1) Small, low-yield, highly mobile weapons for tactical and ASW uses.

(2) Modern, light-weight, and instantly ready weapons of sophisticated design for use against hostile aircraft.

(3) Warheads for anti-missile uses.

(4) Deterrent and retaliatory weapons, including warheads for second generation IRBM's, ICBM's and FBM's.

(5) A family of clean weapons.

c. The investigation of weapons effects through testing is also extremely important because effects information is essential to weapon design and employment. Weapons effects information is particularly needed in the following fields:

(1) Anti-Submarine Warfare

(2) Surface War at Sea

(3) Coastal Defense Against Large Yield Weapons Burst at Sea

(4) Ballistic Missile Defense

(5) Communications and Radar Systems

(6) Air Defense

(7) Structural Design of Military Installations

(8) Tactical Land Warfare

d. Without nuclear testing, the inevitable result must be stagnation in the effectiveness of our present weapons systems and the building of a stockpile of weapons of questionable reliability and confidence. Stagnation will become evident as improved strategic missiles must be fitted with older warheads at a cost in missile performance in order to insure reliability. Weapons of untested effectiveness, particularly small tactical weapons, will have to be manufactured in greater numbers as a substitute for assured effects and performance.

e. The over-all long-range effects of a test cessation will be to the distinct disadvantage of the United States. Of equal and more immediate disadvantage would be suspension of the production of weapons and weapons material with the resultant progressive physical deterioration of the stockpile.

3. In the referenced memorandum, the Deputy Secretary of Defense advised that Dr. Kistiakowsky would work with the Department of Defense and the Atomic Energy Commission in coordinating a study to review the priority, validity and timing of weapons tests. In view of the potential impact of this study on the future effectiveness of U.S. military forces, the Joint Chiefs of Staff have a most vital interest and should be kept informed of all aspects of the study. In order to insure adequate consideration of the military aspects involved, the

Joint Chiefs of Staff offer the service of their representatives to assist in preparation of this study.

4. The Joint Chiefs of Staff recommend that you forward this memorandum to the President.

For the Joint Chiefs of Staff:

N.F. Twining
Chairman
Joint Chiefs of Staff

490. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, August 26, 1959

SUBJECT

Geneva Nuclear Test Negotiations—Meeting of Principals

PARTICIPANTS

State:	Defense:	AEC:
Mr. Dillon	Mr. McElroy	Mr. McCone
Mr. Sullivan, S/AE	General Loper	
Mr. Spiers, S/AE	Mr. Knight	White House:
Mr. Morris, S/AE	CIA:	Mr. Gray
	Mr. Dulles	Dr. Kistiakowsky
	Dr. Scoville	Dr. Killian
		Mr. Keeny

Mr. Dillon said that he had called today's meeting to provide an opportunity for Dr. Kistiakowsky to brief the principals on the report of the Ad Hoc Panel on Nuclear Test Requirements and for Dr. Killian to report on the meeting of the Joint Group of British and American Scientists in London.

Dr. Kistiakowsky explained that the Ad Hoc Panel on Nuclear Test Requirements had been convened in accordance with Action No. 2108 b(1) of the National Security Council, as approved by the President on July 20, 1959. The President had further instructed that the

¹ Source: Kistiakowsky report on nuclear test requirements. Top Secret; Restricted Data. 7 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.

Panel not engage in an assessment of the relative position of the United States vis-a-vis the Soviet Union. Therefore, the report deals only with United States military technology and leaves open the question of our nuclear strength relative to the Soviet Union. This report should thus be considered but one input into our consideration of the over-all question of resumption of nuclear weapons tests. The following members of the Panel participated as individuals and not as representatives of their specific organizations and were selected to represent as broad an area of expertise as possible:

Dr. James W. McRae, Chairman	Honorable Herbert B. Loper
Dr. Hans A. Bethe	Dr. Carson Mark
Dr. Arthur T. Biehl	Rear Admiral Edward N. Parker
Dr. Norris E. Bradbury	Dr. Edward M. Purcell
Dr. Harold Brown	Vice Admiral John H. Sides
Dr. G. A. Fowler	Brigadier General Alfred D. Starbird
Dr. Marshall G. Holloway	Dr. Edward Teller
Dr. Richard Latter	Dr. Jerome B. Wiesner

Dr. Kistiakowsky then read the following *General Conclusions of the Ad Hoc Panel*.

"1. Certain proposed nuclear tests would appreciably increase the effectiveness of key programmed weapon systems and guarantee against the possibility of gross error in design. However, aside from the weapon safety problem, the development or military use of no presently programmed weapon system is clearly contingent on the outcome of the proposed nuclear tests."

Dr. Kistiakowsky explained that whereas the AEC laboratories feel that various programmed warheads may have been amply proven out by past developmental testing, the Department of Defense would like proof tests of the finished weapons. The laboratories further believe that with additional testing it will be possible to double the yields of many of our missile warheads of a given weight. They are prepared to guarantee improvements on warhead yields on the basis of mock-up tests which would probably involve from 20 to 100 kilotons nuclear yield and which could be conducted underground. The Department of Defense, however, believes that full-scale proof tests of such improved devices would be necessary. Such large tests, of course, could not be conducted underground although they could be carried out in outer space.

Mr. McElroy asked whether the scientists indeed believe they could obtain adequate diagnostics on space tests for megaton range weapons. Dr. Kistiakowsky replied that it is necessary to differentiate between the "high altitude" region which would extend out roughly to 20,000 kilometers and the "outer space" region beyond that distance. High altitude tests would be relatively easy to conduct. Our experience at Johnson Island indicated that there would be no problem in getting very extensive diagnostics even though the tests would produce highly spectacular "fireworks". To go to outer space powerful boosters will

be required. These tests will be hard to instrument since it will not be possible to send up special follower rockets containing instrumentation as was done at Johnson Island. On the other hand, the Panel felt that it would be possible to measure the yields of such tests which, after all, is what is desired from proof tests.

"2. Questions have arisen concerning the safety of certain designs in stockpile and production against the possibility of a very low yield nuclear explosion in case of accident. Highest priority in testing should be given to the experimentation involving very low yield or zero yield 'safety' shots intended to establish whether a problem really exists. It is not possible now to determine whether a satisfactory solution to the problem, if it exists, can be found in all cases without nuclear tests."

Dr. Kistiakowsky explained that the questions with regard to the one-point safety of our very important weapons have arisen from calculations done recently at Los Alamos. There are three possible courses of action to resolve this problem:

(1) Safety tests of stockpile primaries could be conducted underground in a relatively brief time. If the primaries prove safe there would, of course be no nuclear yield. [text not declassified]

(2) One could use cores of stockpile design containing reduced amounts of plutonium and carry out carefully instrumented tests designed so as to preclude a nuclear explosion in excess of a predetermined yield, such as one pound TNT equivalent. This type of experiment would take more time than the first alternative but would probably result in more detailed information on the safety of present designs.

(3) One could rely on the more detailed calculations which Los Alamos is now doing and not carry out any tests. The majority of the Panel, however, felt that tests were essential. Others, mainly from LASL, felt that tests would not resolve the situation any better than carefully planned calculations. Dr. Kistiakowsky pointed out that in any event no test can definitely *prove* that a given device is absolutely safe.

Dr. Kistiakowsky explained that the results of further experimentation could be:

a. That LASL's concern is unfounded and the devices are in fact one-point safe.

b. That the devices prove to be only slightly unsafe and could be modified by the laboratories without significant further nuclear tests.

c. That the devices prove to be unsafe and thus will require complete retesting. In this case, however, one could decide to use for the devices in question a primary which is known to be one-point safe.

Dr. Kistiakowsky noted that LASL's recalculations should be completed very soon and that preliminary results seemed to be more reassuring than their previous calculations.

Mr. Dillon asked how long the second alternative for testing the safety of the questionable devices would take. General Loper thought such tests could probably be started in about two weeks from go-ahead. Dr. Kistiakowsky said that one problem would be that [text not declassified] plutonium would be scattered around by the tests. Since this is

a very toxic substance the tests would have to be conducted underground, presumably at the Nevada Testing Grounds. *Mr. McCone* said that plans for such tests presented a real problem since the press representatives closely watch the activities at the Nevada Proving Grounds, General Starbird has said he did not think it would be possible to provide a successful cover for such an operation. *Dr. Kistiakowsky* said he thought that it would be possible to conduct these tests at Los Alamos in the classified areas. One would only need tunnels around 30 to 40 feet deep, which could be dug in the canyons where there is complete privacy. The shots could be billed as just more HE explosions of which dozens are set off at LASL everyday.

Mr. Dillon said he did not see any particular reason why it would not be possible to proceed with such tests at Los Alamos. They would not represent a violation of our unilateral suspension since they were not really nuclear tests. However, this would be a matter for the President to decide upon when there is an opportunity to present the issue to him.

"3. Certain proposed nuclear tests would explore new ideas which point to new applications and which, by advancing the state of the art, will also almost certainly lead to new, and presently unpredicted concepts in weapon systems and doctrine."

Dr. Kistiakowsky said that the Panel had been generally unanimous in the opinion that, on the basis of past experience in weapons development, further research tests would lead to new applications. It was, of course, impossible to predict what new ideas and new information might flow from the tests now proposed. *Dr. Teller*, for one, is very enthusiastic about the possibilities.

"4. Although there is no immediate information required for specific military systems, the proposed high altitude effects tests might yield unexpected information of great technical importance."

Dr. Kistiakowsky explained that our high altitude tests in 1958 [*text not declassified*]. It is clear that high frequency radio is unreliable in time of war. Further high altitude effects tests might discover new phenomena of importance.

Mr. McCone asked whether the Defense Department did not feel that immediate additional information was necessary considering the dramatic effects of high altitude shots on radar and radio. *General Loper* said that the evidence pointing to a severe disruption of high frequency communications leads to a redesign of communications system rather than to an urgent need for more information on the disruptive effect. As for the AICBM system, the other facets of this system are far less certain than the effects of the AICBM warhead on an incoming weapon.

"5. The proposed effects tests in the sea and at low altitudes would provide militarily valuable information but their results would not affect any decisions to use or not to use a proposed military capability."

Dr. Kistiakowsky explained that these would be tests of devices such as the anti-submarine depth bomb, where the Department of Defense requires more information on the radiation hazards to the launching

destroyer or of the effect of water waves on coastal cities. Similarly, they are concerned about the earth shocks which would result from surface explosions and their effect on hardened missile bases. The Defense Department is, however, proceeding with their plans for the use of these weapons regardless of further effects tests. *General Loper* said that although the results of such tests would not affect any decisions to use or not to use a certain weapon they would vitally affect decisions on *how to use* and *when to use it*.

"6. Aside from tests incident to the safety problem, there is not a strong technical requirement for the conduct of any single proposed test in the immediate future. Failure to reach a decision now to conduct proposed nuclear tests within a year and to proceed with plans and preparations on this basis would postpone the achievement of anticipated improvements in weapon system effectiveness and the evolution of new ideas."

Mr. McElroy noted that some of the proposed testing could have a major effect on the reduction of costs of our nuclear arsenal.

"7. The major objectives of the proposed nuclear tests could be achieved by contained underground shots except for certain high yield development tests and the weapon effects test program. The high yield development tests could be conducted at altitudes of 500–1000 kilometers in 1961 and in space (beyond 100,000 kilometers) at considerable cost in the period from 1961 to 1965, the date for each test depending on the weight of the device."

Dr. Kistiakowsky explained that one could be reasonably certain that there would be no fallout on the earth from tests conducted beyond 100,000 kilometers in space. However at, for instance, 1,000 kilometers one would have to concede that explosion products would eventually drift into the atmosphere even though this process might take a very long time.

General Discussion

General Loper said that it was not the position of the Department of Defense that everything must be proof-tested before being acceptable to the military. Rather they believe that full-scale tests of weapons are necessary in cases where the extrapolation from proven designs is quite broad. The laboratories never guarantee the performance of a device, but only indicate a degree of confidence. Thus, even in the minds of the designers there exists a possibility of gross error in weapon performance. Dr. Kistiakowsky commented that such was the situation with some of the key warheads in our stockpile.

Mr. McElroy said that he believed the development of nuclear weapons to be of far more importance to the United States than to nations with large numbers of people. Our nuclear arsenal is what permits us to be a military power. This power would be much inferior if we were reduced to reliance on our manpower armed with conventional

weapons. *Dr. Kistiakowsky* suggested that it was probably not so much a question of population as the unwillingness of Westerners to be used as canon-fodder. After all, the combined manpower of the United States and the NATO countries is greater than that of the USSR and its satellites. *Mr. Dulles* said he believed that never again would we fight with millions of soldiers in the field of battle.

Mr. McCone said that he was personally very much concerned with the moderate tone in which the general conclusions of the Ad Hoc Panel were expressed. This did not seem to accord with the very important examples of testing needs set forth in the report. He thought it very important that the principals realize that further testing could dramatically increase the yields of some of our warheads. These improvements might be extremely important to the defensive position of the United States. With regard to the one-point safety problem, he noted that if further experimentation discloses that a redesign of primaries is necessary to provide adequate safety it might be necessary to test new primaries [*text not declassified*].

Dr. Kistiakowsky commented that the Panel had seriously questioned this latter possibility because it assumed a significant decrease in the weight of guidance components.

Mr. Dillon said that if the position of the AEC laboratories that improvement in large yield weapons will be possible by underground tests of relatively low yield mock-ups is true, the United States would be in rather good shape if we agree to a ban which excluded underground tests. *Mr. McElroy* said he thought that from the Defense point of view the United States would get along all right if they were able to conduct underground tests. He believed that a limited agreement, as approved on July 23, would be reasonable in terms of the present international atmosphere. The Defense Department, however, would be deeply concerned if the present unilateral withholding of testing continued much longer.

Dr. Killian asked whether the Panel had discussed the relative value of increasing the accuracy of missile guidance and booster power as opposed to seeking to increase the warhead yields as a solution to improving the effectiveness of our ballistic missiles. This is, of course, a complex problem. The increase yield is only one factor in the equation. *Dr. Kistiakowsky* said that only a few members of the Panel felt that a factor of two gain in warhead yield was a life or death matter. However, if there were no further testing, one would be left with only the yields now available.

Dr. Killian said that in considering what we might gain from continued testing he thought it very important to evaluate what improvements would be possible for the Soviet Union also.

Mr. McElroy said that under conditions of no testing there develops a progressively decreasing confidence in their weapons on the part of the military.

Mr. Dillon said he thought that since large yield and even megaton weapons could be developed by means of underground testing of low yield mock-ups, it would seem that an underground ban would be dangerous. *Dr. Kistiakowsky* said that this would only be true if the Latter Hole theory proves workable. Even mock-up tests would involve yields [*text not declassified*]. Such yields could readily be detected by the improved Geneva system. However, although there seems to be general agreement that the Latter Hole is a sound theory, there is no experimental evidence to support the theory. It is unknown whether the large holes required could be built.

* * *

REPORT OF LONDON MEETING OF THE JOINT GROUP OF US-UK SCIENTISTS

Dr. Killian explained that the London meeting had been convened, by agreement between Secretary Herter and British Foreign Secretary Lloyd, to provide for joint US-UK review of the underground detection problem and to permit our people to present to UK scientists the considerations developed by the US technical panel under the chairmanship of *Dr. Bacher*. He said that the aim of the group had been to reach agreement on the technical factors bearing on the underground detection problem so that the responsible policy officials in both the US and UK would be able to proceed on the basis of the same technical information.

(*Dr. Killian* then read to the principals the report of the Joint Group which is attached as Appendix A to this memorandum.)

Dr. Killian said it was clear that the UK scientists were persuaded of the theoretical validity of the Latter Hole idea. However, they had real doubts as to the practical possibilities of constructing such a hole and considered urgent study of the engineering problems involved to be necessary. They were not prepared to accept the judgments of the *Bacher* group on the probability factors of actually finding evidence of an underground violation through on-site inspection nor to accept the *Bacher* group's assessment of the usefulness of intelligence. They clearly felt that it would be unwise to present the *Bacher* report to the Soviets since the judgments expressed therein could be challenged on technical grounds.

Dr. Killian said that the Latter Hole possibility for concealing underground explosions remains the most significant problem in the underground picture. Until we obtain more factual information we will remain in a state of uncertainty which cannot be resolved. It will be necessary to proceed with the recommended high energy experiments

and probably with nuclear tests, unless the high energy tests indicate a very serious defect in the theory.

In discussing the several recommendations for further research in the report of the Joint Group the principals agreed that Dr. Kistiakowsky should consult with the Department of Defense and the AEC with regard to an engineering study of the Latter Hole theory, and that the CIA should proceed with the inspection study of earthquakes and underground explosions.

Appendix A

491. Letter From Dillon to McElroy¹

Washington, August 28, 1959

Dear Neil:

In his letter of August 14, 1959, Deputy Secretary Gates forwarded to me a memorandum dated August 13, 1959 to you from the Joint Chiefs of Staff questioning the capability of a control system to detect and identify underwater nuclear explosions. As requested by Mr. Gates, I suggested to Dr. Kistiakowsky that his office undertake a technical assessment of this problem.

In his reply, a copy of which is enclosed, Dr. Kistiakowsky raises some questions with respect to the concern of the Joint Chiefs and suggests that the matter be reviewed within the Department of Defense.

With best wishes,

Sincerely,

*/s/ Douglas
Acting Secretary*

¹ Source: Transmits letter from Kistiakowsky stating Geneva experts concluded that underwater tests could be detected. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/8-2559.

Enclosure**Memorandum From Kistiakowsky to Dillon**

Washington, August 25, 1959

Dear Secretary Dillon:

Thank you for your letter, dated August 18, 1959, suggesting that this office undertake an assessment of the problem of detecting underwater nuclear explosions. On the basis of the information at present available to me, I do not believe that it would be feasible for my office to undertake such an assessment at this time.

As indicated in Secretary Gates' letter of 14 August to you, the Report of the Geneva Conference of Experts concluded that there was a "good probability of detecting nuclear explosions of one kiloton yield set off deep in the open ocean," and that "the on-site inspection carried out by the international control organ...would be able to identify with good probability underwater nuclear explosions with a yield of one kiloton and above." It is not clear from the memorandum for the Secretary of Defense from the Joint Chiefs of Staff, forwarded to you by Secretary Gates, what new information is available to question these conclusions. This capability is apparently questioned, at least in part, on the basis of limitations in the seismic method; however, it should be noted that the detection and identification of underwater tests would be based primarily upon the hydroacoustic method and the subsequent collection of radioactive debris. Although it is stated that techniques for the concealment of underwater explosions are feasible, there is no indication as to how this might be accomplished or the possible magnitude of the concealment.

If there is concern about this matter on behalf of the Department of Defense, it might be useful, as a first step, for an appropriate technical group within the Defense Department, such as AFTAC, to undertake a careful examination of those aspects of this problem which are raised by the Joint Chiefs of Staff. On the basis of such a technical study, it would be possible to determine whether there are reasons for questioning the conclusions of the Geneva Conference of Experts.

Sincerely,

G.B. Kistiakowsky

SUBJECT

Disarmament

Mr. Lloyd referred to the preliminary reactions of Gromyko on August 26 when the UK, US, and French ambassadors in Moscow presented to him a draft communique on establishment of a 10-nation disarmament negotiating group. Mr. Lloyd said that he was concerned that Gromyko had said it would be “a few days” before he submitted written comments. Mr. Lloyd pointed out that it was important to settle this matter well in advance of convening of the General Assembly. He agreed with Hammarskjöld’s comment that it would be well to have the UN Disarmament Commission meet about September 8, before the General Assembly meets, so that the discussion would be handled by UN permanent representatives rather than foreign ministers. If Gromyko raises any objections in his written comments, we will, of course, have to consult among the five of us on the Western side. Time is thus very short and everything possible should be done to get an early reply from Gromyko.

The Secretary said that Khrushchev is out of Moscow and it takes a while to get a formal Soviet response in these circumstances. He commented that he attached particular importance to avoiding establishment of a new smaller Disarmament Commission or a negotiating subcommittee. He thought the best course would be continuation of the present 82-nation Disarmament Commission with the reports of the 10-nation group going direct to the large Disarmament Commission rather than to any smaller subcommittee thereof.

¹ Source: Disarmament machinery, cut-off of production of fissionable material, disarmament policy. Secret; Limit Distribution. 3 pp. NARA, RG 59, Conference Files: Lot 64 D 560, CF 1449.

Mr. Lloyd said that he agreed heartily and was relieved that the United States was not advancing the proposal for a 24-nation disarmament commission which had been informally discussed in Washington. However, if the 10-nation group is not formally constituted in advance of the meeting of the present Disarmament Commission, the uncertainties will be taken advantage of and we can anticipate some such move as addition of 2 seats from each of the geographic blocs.

The Secretary and Mr. Lloyd agreed that the US and UK chargés in Moscow would be instructed to inquire as to the Soviet reply on the proposed communique during the first part of the following week.

Mr. Lloyd said that he thought we should resume study of the possibility of a cut-off in production of fissionable materials for weapons purposes. Sir William Penney was going to the United States in the latter part of September and would be prepared to talk with US experts on this problem. Sir Richard Powell remarked that the UK was interested in the inspection problem and the question whether it was technically feasible to monitor an agreement to cease fissionable materials production for other than peaceful purposes. Sir Patrick Dean said that UK studies indicated that the inspection problem would be very difficult and the opportunities for diversion would be considerable.

Mr. Lloyd commented that it had become clear several years ago that policing any agreement for elimination of existing stocks of nuclear weapons was technically impossible. Up to 18 months ago, however, he had thought that it was technically feasible to monitor current production of fissionable materials. Since he did not believe that there was any real chance that the Soviet Union would accept a cut-off in production of fissionable materials for weapons purposes, this appeared to be a good proposal to press for political effect. The Secretary said that, if there were technical uncertainties as to inspection of any such agreement, we would not want to get trapped again by advancing the proposal and have the Soviets agree to enter into negotiations only to find that our scientific base was unfirm. Accordingly he welcomed the suggestion that preliminary technical discussions of the inspection problem be initiated during the forthcoming visit of Sir William Penney, who was very highly regarded in the United States.

Mr. Lloyd asked about the current United States views on the substance of disarmament policy. The Secretary said that the President had just approved a basic review of disarmament policy under the direction of Mr. Charles Coolidge. These studies will be complete about the end of the year at which time we will be in a position to commence consultations. It was this schedule that caused us to urge that the new 10-nation negotiating group not meet until February or March. Mr. Lloyd said that, from the point of view of the cold war, this was very awkward timing. It may be possible to spin out discussions inconclusively in the

interim but we must anticipate frightful pressures to get substantive discussions under way. The Secretary said that this was not an easy subject and there were complex interrelations between disarmament policy and future military requirements and plans which must be taken into account.

Mr. Lloyd agreed that our basic security problems must be carefully considered. He urged, however, that we not forget the public opinion battle, particularly in the minds of the uncommitted countries, and that we not be too perfectionist. He remarked that the 1954 Anglo-French plan had been excellent from this point of view—though the Soviet Union pretended to accept the essentials of this plan in 1955, they did not really agree to its crucial features.

Mr. Herter said that, as one example, if we gave up nuclear weapons we would be virtually helpless against the hordes of Asiatic manpower. Mr. Lloyd said that he agreed and for that reason his Government had always insisted that nuclear and conventional forces must be cut back *pari passu*. He thought that we had not pressed the Soviet Union vigorously enough on the reduction of manpower and conventional armaments such as submarines. Mr. Herter remarked that such considerations were related to the possibility which had been touched on recently of the UK concentrating on its conventional forces and thus better complementing the US military posture.

Mr. Lloyd said that it appeared we would have to continue on the basis of the 1957 agreed Four-Power position in any disarmament discussions in the forthcoming General Assembly. The Secretary said that in any case the disarmament problem in the General Assembly was principally an emotional one.

SUBJECT

Nuclear Test Negotiations

There was discussion of current technical assessments of our present and future ability to monitor nuclear test suspension. It was noted that the theoretical possibility of decoupling the signal from underground nuclear tests by a factor of hundreds had been called to the Soviets' attention at Geneva, but that the "large hole" technique for achieving this decoupling, and the implications as to the feasibility of a ban on underground tests, had not been presented.

Mr. Herter referred to the urgency of underground experiments to resolve questions of "one point safety" of United States weapons. Necessary tests might be conducted with only a high explosive detonation, but a small nuclear yield might be produced in some cases. Should they result in a detectable atomic explosion, the public explanation could attribute this occurrence to "an accident".

Both the Prime Minister and Foreign Secretary Lloyd expressed the belief that the United States would be fully justified in conducting safety tests. The President indicated his acquiescence in making the underground safety tests. The talks left unresolved the question as to whether the necessary preparations at the testing site might arouse public suspicion and what might be said publicly.

SUBJECT

Nuclear Testing

Nuclear Testing

Mr. Herter suggested that Mr. Farley might summarize the proposed tactics when the Geneva nuclear test negotiations resume on October 12. Mr. Farley said that, as Mr. Herter had mentioned to Mr. Lloyd just before the conclusion of the Geneva Foreign Ministers meeting, the United States, felt that we should face up to the serious implications of the most recent technical evaluations of our ability to detect underground tests. We should therefore state to the Soviet Union the implications of the "large hole" technique and propose both joint research and experimentation to resolve the uncertainties in monitoring techniques for a suspension of underground tests, and a limited initial agreement covering atmospheric and high altitude tests.

Mr. Lloyd recalled that the U.S. and U.K. scientists under the leadership of Dr. Killian and Dr. Penney, while agreeing that there were substantial uncertainties in the detection of underground tests and that a program of research should go ahead, had cautioned that it was doubtful that there would be any early solution of these technical uncertainties. Mr. Herter said that the only alternative tactic which we saw was to push ahead with the discussion of the inspection issue, accepting the inspection quota in principle but proposing and justifying a number of inspections so high that the Soviet Union would reject it.

Mr. Lloyd revised the recommendations of Dr. Killian and Dr. Penney for a joint U.S.–U.K. research and experimentation program on

¹ Source: Tactics for nuclear test ban talks, joint research. Secret; Limit Distribution. 2 pp. NARA, RG 59, Conference Files: Lot 64 D, CF 1449.

detection of underground tests, reading a summary list of nine items to be pursued. Mr. Farley said that a number of these actions were already in various stages of planning or execution. Mr. Herter asked whether the Soviet Union had shown any interest in participating in this activity. Mr. Farley recalled that at the time of tabling of the report of the Berkner Panel, the U.S. had suggested the possibility of joint research and experiment to resolve difficulties in underground detection but the Soviet Union had not been willing to discuss the new seismic data and thus had not reacted to the proposal for joint research.

Following a mention by Mr. Farley of preliminary AEC planning for possible eventual conduct of underground nuclear explosions to test the "large hole" theory, Mr. Lloyd said that the U.K. Embassy in Washington had just sent in the text of a proposed U.S. AEC-DOD press release on this program. He questioned whether more than the first general sentences were needed. Mr. Herter and Mr. Farley said that the later sections of the draft release were useful to put the program in the proper context, since they made clear that the explosions would not be for weapons development purposes, would only be conducted if a subsequent Government decision to do so was made, and were for the constructive purpose of improving knowledge of detection and identification techniques. Mr. Lloyd pointed out that the relationship to the Geneva negotiations was not spelled out, and Mr. Gates said that he thought an announcement on underground nuclear testing for this particular purpose ought to be held up until our general policy on underground nuclear weapons testing had been established. Mr. Herter said that further thought should be given to a possible offer of a joint research program with the Soviets. He said that he would see that if possible the release would be held up for future consideration.

There was then further discussion of the safety tests which the U.S. was considering. Mr. Lloyd said that it was the view of the U.K. that these tests were very important and the United States would be justified going ahead with them.

Enclosure

Annual Progress Report by the Atomic Energy Commission

*ANNUAL PROGRESS REPORT BY THE ATOMIC ENERGY
COMMISSION AND THE DEPARTMENT OF STATE ON THE
IMPLEMENTATION OF NSC 5725/1—PEACEFUL USES
OF ATOMIC ENERGY*

1. This report summarizes major developments during the period of July 1, 1958 to June 30, 1959 under NSC 5725/1, "Peaceful Uses of Atomic Energy", dated December 13, 1957. Many of the items relate to several sections of the policy paper; the information therefore is not keyed to specific paragraphs in the policy paper.

2. The U.S. continues to lead other nations in assisting the development of the peaceful uses of atomic energy in other countries. During the reporting period the dominant position of the United States was strengthened in a number of areas. Of particular note was the approval and initiation by the United States and EURATOM of the joint nuclear

¹ Source: Transmits report on the implementation of NSC 5725/1, for the period July, 1958-June 30, 1959. Secret. 46 pp. NARA, S/S-NSC Files: Lot 63 D 351, NSC 5725.

power program designed to install approximately 1,000,000 electrical kilowatts of nuclear power within the EURATOM area by 1963–1965.

3. The current coal surplus in EURATOM countries and discovery of new energy reserves has lessened the urgency for developing nuclear reactors to meet the Community's immediate energy requirements. However, EURATOM is convinced that a large scale nuclear power program will be needed to meet long term needs and regards the joint effort as an important means of acquiring the experience essential to such a program.

4. Also, the United States announced in February a program for making enriched uranium fuel available for a limited number of power reactor projects on a deferred-payment basis. This program, while more modest than the EURATOM joint program, should help reduce the initial high costs of operating power reactors and should encourage the early construction abroad of reactors of U.S. design. Recent requests, however, from India and Spain indicate there will be continuing pressures from non-EURATOM countries for the United States to provide additional special incentives to stimulate the development of power reactor projects or to develop cooperative programs comparable to the EURATOM arrangements.

5. The EURATOM and deferred-payment programs, combined with the relatively advanced stage of U.S. technology and attractive guarantees that are being provided by U.S. manufacturers, have put the United States in the forefront of the expected limited market for selling power or power demonstration reactors to foreign countries. In the past year a pre-existing contract for the sale of a large-scale reactor to the SELNI electricity group in Italy was put on a firmer footing and a letter contract for an additional large scale reactor also was awarded to a U.S. company by the Italian SENN group. It is expected that these will be supplemented by other sales of large reactors as proposals are reviewed and approved under the EURATOM program. The award of the SENN project to a U.S. firm was particularly significant in that it was made as a consequence of competition with a number of proposals submitted by manufacturers in the United States, the United Kingdom, France, and Canada.

6. During the year, firms in the United Kingdom contracted to sell two large reactors, one to Italy and the other to Japan.

7. During the reporting period, the Atomic Energy Commission revised its domestic nuclear power development program and presented to the Congress a series of objectives which, in addition to accelerating the U.S. civilian power program, is also geared to providing the maximum support for continued U.S. leadership in this field abroad.

8. The Second United Nations Conference on Peaceful Uses of Atomic Energy, held in Geneva in September, 1958, was highly

successful. The United States held a dominant role generally through the quality and number of its technical papers and impressive technical exhibits. The latter was regarded as the finest scientific exhibition ever assembled. The U.S. representative at the Second Geneva Conference proposed that a third conference of the same general character be held in another three-year period.

9. The International Atomic Energy Agency made modest progress in the past year in a number of areas. Further work needs to be done, however, to strengthen its organization, technical staff, programs and financial resources, and to increase the level of support from member countries. The expectation that the Agency will play an important role in safeguarding and distributing materials so as to assure and promote their peaceful uses still holds even though a number of states now appear adverse to submitting to Agency safeguards or working through the agency.

10. The Agency has established for itself a significant role in the exchange of atomic information and as a forum for dealing with problems of an international character, notably in the fields of health and safety.

11. During the past year, the United States continued to provide comprehensive support to the IAEA. Examples are the offer to fund the costs associated with building the Agency's analytical laboratory in Vienna; financing half of the Agency's operating budget; continuous advice on all Agency operations; furnishing top flight experts for various Agency symposia and advisory panels, and assisting in the planning of the Agency's future program at the Second General Conference held in the fall of 1958.

12. Some concern has been expressed that the continued use of bilateral agreement system adopted by the member states most advanced technologically to channel and promote cooperation in peaceful use of nuclear energy, undercuts the role of the Agency. The bilaterals generally were in use before the IAEA was established and have been effective in the Atoms for Peace program. It does not appear that there will be major changes in this system in the immediate future. However, it is hoped that as the Agency gains stature, experience, and more support from its membership that a re-evaluation of the bilateral systems will result in the Agency taking over larger areas of cooperation.

13. Agency operations continue to be handicapped by the present unrealistic statutory relationship between the Board of Governors and the Secretariat which results in routine administrative matters, often of a minor nature, being brought to the Board for decision. The more complex problems that would be raised in any attempt at this time to revise the Agency Statute and Rules of Procedure have made it inadvisable to press for a remedy.

14. Agency safeguards were considered formally for the first time at the June Board meeting. Debate centered on general principles, and, as in the past, the opposition to safeguards was ably led by the Indian Governor. Action was deferred until the September meeting. The Soviet Union did not participate actively.

15. During the reporting period, progress was made in formulating a U.S. position for implementing the safeguards provisions in the U.S. bilateral agreements for cooperation and on IAEA safeguards proposals. This position is being developed in consultation with Western suppliers of materials and progress has been made toward achieving a common approach. To maintain an effective international safeguard system it is essential that this common front be achieved and held, particularly with respect to the sale of natural uranium which is now in world-wide surplus. [All the major uranium producers in the Free World, except France, have indicated a willingness (although commitments have not yet been made) to join in a common front if all the others do so. These same countries, including France, have joined with the United States in developing a common position regarding the specific type of safeguard procedures the International Atomic Energy Agency should develop in the near future. The agreed-upon procedures are concerned with immediate requirements and will be expanded as larger and more complex facilities materialize. The Soviet Union position, particularly with respect to applying safeguards to underdeveloped countries, is not known at this time although the USSR has claimed a "no strings attached" policy in supplying material to the Soviet Bloc.]² (Bracketed portion Conf.-DI)

16. Most of the bilateral negotiations now involve amendments to extend or modify the terms of existing agreements, which now cover most of the countries having an interest in cooperating with the United States. The cooperation provided for in these agreements is being effectively carried out, and consists mainly of exchanging or training personnel, disseminating reports, transferring materials, and exporting reactors manufactured by U.S. industry.

17. The emergence of the IAEA and various regional groups has initiated a reassessment of the bilateral program to determine whether relatively greater emphasis should be put on these multilateral institutions. The United States hopes to negotiate a general agreement with EURATOM and its member states that, insofar as possible, would transfer from the member states to EURATOM rights and obligations now contained in the individual bilateral agreements between the member states and the U.S. In addition present areas of US-EURATOM cooperation would be expanded wherever desirable.

² Brackets are in the original.

18. Other aspects of the Atoms for Peace Program include continued leadership of U.S. firms in exporting research reactors; steady increase in special nuclear materials transferred to friendly nations (see Appendix "E") and further expansion and specialization of training facilities available to foreign nationals (see Appendix "B"). Seventeen research reactors manufactured by U.S. firms are now in operation overseas and 16 more are under construction. In addition, five contracts or letters of intent involving foreign sale by U.S. firms of power or small-scale power demonstration reactors were executed. A total of 286 kilograms of contained U-235 has been distributed overseas for peaceful purposes and as of June 30, 1959, 238 foreign nationals were working or receiving individual training experience at AEC installations.

19. The United Kingdom atomic power program is either on or ahead of schedule and is expected to achieve the goal of 5000–6000 MW by 1966. There is the possibility that in the next year or two a new or extended program will be formulated. [Current information available on the U.S.S.R. program confirms earlier estimates that there has been slippage in the power program but Soviet capabilities in the power reactor field are advancing steadily. Although the U.S.S.R., on the basis of its over-all nuclear technology, is believed capable of building nuclear power submarines, the only verified nuclear propulsion project is the icebreaker "Lenin", reportedly essentially complete but not yet in operation.³ The French program is developing rapidly with two gaseous diffusion pilot plants for U-235 and a plutonium separation chemical reprocessing plant now in operation. The first full-scale nuclear power plant is scheduled to come in late in 1959 or early in 1960.]⁴ (Bracketed portion Secret DI) Additionally, the French have shown interest in the centrifuge method of isotope separation, particularly its development in West Germany, and have offered to buy the German-made centrifuges—presumably for use in the French weapons program. (The centrifuge method makes U-235 production possible with a smaller capital outlay.) While German financial interests reportedly favor the sale, other German opinion is hopeful of assurance that the gas centrifuges will be used only for peaceful purposes. CONF. DI.

20. The attached Annex describes the progress made in the Atoms-for-Peace program and identifies a number of other problems that will require further study. However, the Atomic Energy Commission and the Department of State do not believe any revision to the NSC 5725/1 policy paper is required at this time.

³ On July 11, 1959, First Deputy Premier F.R. Koslov when at Shippingport, told Admiral Rickover that the Soviets were building nuclear powered submarines. During Rickover's subsequent visit to the U.S.S.R. in August 1959, this subject was not mentioned, and no further Information was obtained. SECRET DI. [Footnote is in the original.]

*ANNEX TO ANNUAL REPORT BY THE ATOMIC ENERGY
COMMISSION AND THE DEPARTMENT OF STATE ON THE
IMPLEMENTATION OF NSC 5725/1—PEACEFUL
USES OF ATOMIC ENERGY*

*I. UNITED STATES FOREIGN PROGRAM: REGIONAL AND
INTERNATIONAL ORGANIZATIONS AND BILATERAL
ARRANGEMENTS*

1. *International Atomic Energy Agency (IAEA).* Establishment of the IAEA was an outgrowth of President Eisenhower’s address before the United Nations Assembly on December 8, 1953. Agency progress to date has been primarily due to the interest and support of the United States. Its ultimate success will depend on its ability to acquire fuller support from other members through competence and effectiveness in its sphere of activities. There has been some encouraging progress in this direction during the reporting period.

2. On May 11, 1959, the Agency signed its Agreement for Cooperation with the United States permitting it to draw on the approximately 5,000 kilograms of U-235 offered by President Eisenhower in 1956. Supply agreements with the USSR (for 50 kilograms) and the U.K. (20 kilograms) were signed on the same date. Canada has donated three tons of natural uranium to the IAEA for use in the first project (a 10 MW Japanese research reactor) involving transfer of reactor fuel under Agency safeguards.

3. The Agency also decided to defer construction of a research reactor in view of the plans of Austria to make its own reactor facilities available to the Agency. Accordingly, the major share of funds involved in the previous U.S. offer to support an Agency reactor project was reallocated and will be applied to constructing and equipping the Agency’s central analytical laboratory. This laboratory is to be used to support the Agency’s statutory functions, primarily in the health and safeguards field.

4. At the Second General Conference of the IAEA, held in the fall of 1958, the Chairman of the U.S. delegation indicated that the U.S., as

time and experience progressed and consistent with its existing obligations, would look to the Agency as the major institutional channel through which its international peaceful use programs would be carried forward. Chairman McCone also suggested that the Agency:

a. Inaugurate a major program of training, research, and application in the field of radioisotopes;

b. Intensify its efforts to develop international standards, codes, and regulations for the safe transportation, handling, and use of radioactive materials and the disposal of radioactive wastes; press forward with safety codes relating to reactor operation, reactor siting, and the protection of atomic energy workers; and, devote its attention to the problem of third-party liability;

c. Serve as a central coordinating body for training personnel;

d. Initiate an intensive survey of existing power reactor types and the criteria for introducing them into new areas, including the means by which the Agency could accelerate the availability of nuclear power within reasonable economic dimensions;

e. Continue to develop into a major center for the acquisition, collection, and the distribution of scientific information on the peaceful uses of atomic energy. (In this regard, the U.S. suggested that future Geneva Conferences be held under Agency auspices, and that the Agency serve as the medium for freely exchanging information on controlled fusion research.)

5. The U.S. also indicated its intention to explore with the Agency the development of a program whereby specific research projects for the U.S. could be assigned to the Agency which, in turn, would develop contracts with institutions throughout the world.

6. Progress was made in these and other areas over the past year. The most notable accomplishments have been in the field of training. The Agency's program of providing fellowships for study in the peaceful applications of atomic energy has been well received. Roughly 300 applications for Agency fellowships have been received from individuals in about 30 countries. Most of these have indicated a preference for study in the United States. The Atomic Energy Commission is intensively studying the problems associated with meeting its responsibilities in this area, including the security aspects associated with receiving Soviet Bloc applicants in Commission installations.

7. Other areas of important work and progress in IAEA activities include: stimulating radioisotope uses by providing courses and advisory missions to member states and sponsoring conferences on radioisotope applications; identifying and resolving, through expert panels and conferences, some major international problems involved in transport and handling of materials, waste disposal, and assuring adequate treatment of third-party liability, and developing a proposed system for assuring that materials used under Agency auspices are applied only to peaceful purposes.

8. It is particularly notable that at the Second General Conference, the Government of Japan announced that it was willing to have the safeguards provisions of its Agreement for Cooperation with the United States administered by the Agency when the latter can undertake this service. It is hoped that other nations will make similar declarations.

9. *EURATOM*. During the last year, the U.S.–*EURATOM* joint nuclear power program was approved and initiated, and an appropriate U.S.–*EURATOM* Agreement for Cooperation covering the needs of the program came into effect in February of 1959. This program is regarded as a major contribution towards the strengthening of European unity and development of close ties between representatives of European and American nuclear science and technology in advancing peaceful uses of atomic energy.

10. The major objective of the joint program is the installation, within the next four to six years in the *EURATOM* area, of approximately one million kilowatts of nuclear generating capacity using reactor types carried to an advanced stage of development within the United States. The current goal is to have these projects completed by December 31, 1963, except that completion of the projects may be deferred to 1965 to allow for the incorporation of reactors of a more improved and advanced design. The reactor program is to be accompanied by a ten-year joint research and development effort which will be aimed at improving the performance of the reactors involved and in realizing savings and improvements in the associated fuel cycle.

11. The research and development program, which will be carried out in both the Community and the U.S., will be financed by equal contributions from the AEC and *EURATOM* and is expected to cost \$100 million for the first five years.

12. Invitations for the Research and Development and reactor phases of the program were issued in December of 1958 and in April of 1959, respectively. Approximately 200 proposals and letters of intent covering research or development projects have been received. These are now being reviewed by a joint U.S.–*EURATOM* Research and Development Board which has been constituted in Brussels to select the proposals and coordinate the administration of this phase of the program.

13. Reactor proposals are to be received by October 20, 1959. This will allow sufficient time for review and selection to permit the necessary authorizations to be obtained during the next session of Congress. It is expected that these projects initially will be screened by a Joint Reactor Board which will prepare suitable recommendations for the *EURATOM* Commission and the USAEC. As of May 11, five European utility groups indicated their intention to submit proposals for projects to be completed by 1963, and two concerns expressed intention

to submit proposals for projects to be completed by 1965. If acceptable, these proposals should permit the goal of one million kilowatts to be realized.

14. Reactor projects selected will be eligible to receive the following special incentives which are designed to minimize the major uncertainties associated with operating nuclear power plants today:

a. AEC guarantees (for a 10-year operating period) designed to limit financial risks arising from the cost of fabricating fuel elements and from failure of the elements to meet a predetermined life;

b. A long-term assurance of an adequate nuclear fuel supply available under deferred-payment at prices offered U.S. industry;

c. An assurance for a 10-year period of a defined market for the plutonium recovered from the reactors;

d. Long-term, capital loans to cover a portion of the plant construction costs, and

e. A long-term assurance by the United States that chemical reprocessing services will be available under terms comparable to those offered U.S. reactor operators.

15. Over the past year it became apparent that the joint program, as well as other nuclear power programs in Western Europe, face a problem not anticipated a year ago. This is due to an acute over-supply of coal in Western Europe; an apparent easing of the tensions in the Middle East; discovery of new oil reserves throughout the world, discovery of sizeable natural gas reserves in the Sahara and some slowing of economic growth with consequent lowering of energy requirements. These developments have tended to temper the long-term estimates as to amount of nuclear power that will be required to meet the over-all energy deficit in Europe and to lessen the enthusiasm in some quarters for proceeding with the joint U.S.-EURATOM program on a "crash" basis.

16. The long term effect on the planning for future European energy requirements of these factors, (referred to in Paragraph 15) especially new oil and gas reserves, is difficult to appraise at the present time. Much will depend on the potential of nuclear power development to reduce power costs and on the political stability of North Africa and the Middle East. The joint U.S.-EURATOM program is regarded as an important first step to provide experience for only large-scale effect that may follow.

17. The Community made progress in other areas over the past year. Basic regulations have been published for safeguards and health physics; a draft third-party liability convention has been prepared; negotiations are under way to establish several joint research centers. The EURATOM supply agency, which will be accountable under the Treaty for all special nuclear materials, is being organized and, probably will begin operations in October 1959. Internationally, EURATOM has executed agreements

with the U.S. and the United Kingdom. Negotiations are under way with Canada and Brazil. None of these agreements envision a program of cooperation as extensive as that with the United States.

18. In the months ahead, EURATOM will concentrate most of its activities on the joint program. The EURATOM Treaty, however, as well as the agreements in effect between the United States and the Community, and the U.S. and the member states of EURATOM, contemplate that there will be renegotiations to expand the areas of cooperation with EURATOM and to effect appropriate transfer of the rights and obligations in the individual agreements of the member states to EURATOM. These negotiations are expected to be initiated shortly, and to be completed during 1960. Some of the member states, notably France, have expressed misgivings about the renegotiations and have made it clear that a transfer of responsibilities that would necessitate their having to channel all of their individual cooperative activities with the United States through the EURATOM organization would be opposed. It has been explained to these States that they still will be free to deal directly with the U.S. on matters pertaining to the technical direction of their national programs and that the renegotiation is designed to take into account the responsibilities vested in EURATOM by its Treaty.

19. In anticipation of their increased responsibilities in dealing with EURATOM, the USAEC and the Department of State are augmenting the staff of the United States Mission, seven professional-level AEC staff, plus two State Department officers and an Export-Import Bank representative under the direction of a "Deputy for EURATOM Affairs" who will be a senior AEC official.

Other Multilateral or Regional Activities

20. *Inter-American Nuclear Energy Commission (IANEC)*. On April 22, the Organization of American States approved the statute of the Inter-American Nuclear Energy Commission. The IANEC will serve as a center of consultation for the OAS member states and to facilitate cooperation among them in promoting the peaceful application of nuclear energy. Its major responsibilities include: Assisting member republics in coordinated planning for research and training; furthering the exchange of scientific and technical information; organizing conferences and other meetings; recommending measures to promote the training of scientists and technicians; recommending public health safeguards; requesting, when deemed advisable, the cooperation of public and private institutions in contributing to nuclear development programs in OAS countries and undertaking studies within its sphere of responsibility.

21. *Asian Nuclear Center*. In accordance with paragraph 38 of NSC 5725/1, the Department of State and the USAEC previously developed

a plan for construction of a less costly Asian Nuclear Center, possibly to be associated with the Colombo Plan and the IAEA. A review of present conditions has indicated that the establishment of even a less costly Asian Nuclear Center is not justified at the present time. As reported previously, the Asian countries are not prepared to give such an institution sufficient financial support. Continued study will be directed toward determining whether an alternate regional scheme is technically and politically desirable. (Conf.-DI)

22. It should be noted that the Philippines hope to develop a national program which will have regional appeal. The experience with the Asian Nuclear Center has demonstrated that the successful formulation of a regional center is almost entirely dependent upon the vigor and enthusiasm with which the idea is supported by the member states involved.

23. *Organization for European Economic Cooperation (OEEC)*. The European Nuclear Energy Agency of the OEEC continued to make progress on a number of joint projects. The design of the "Eurochemic" joint processing plant to be built at Mol, Belgium, is proceeding with substantial technical advice from the United States. In addition, in March, 12 European countries, under OEEC auspices, signed an agreement to cooperate in the U.K. "Dragon Project", a high-temperature, gas-cooled reactor to be constructed at Winfrith Heath at an approximate cost of \$38 million.

24. The OEEC also has made important progress in drafting a convention to cover third-party liability. (See paragraph 36.)

25. *Puerto Rico Nuclear Center*. The Puerto Rico Nuclear Center was established in cooperation with the University of Puerto Rico for the purpose of offering nuclear training in the Spanish language to students from Latin American countries. Of the 182 enrollees at the Center since it began, 42 were from 18 Latin American countries. Most of those took short-term courses. Students in the full-length Nuclear Technology Courses increased from two completing the 1958-59 session to eight in the 1959-60 session now under way. It is assumed that, as more specialized nuclear facilities become available and as the Center acquires more technical stature, it will attract more students from the region. Continued study is being devoted to the question of how the United States can accelerate this process.

26. *Bilateral Arrangements*. The extent of U.S. participation in the Atoms-for-Peace program abroad indicated by the fact that 43 bilateral agreements are in effect with 41 countries, and the City of West Berlin. (Switzerland has two agreements.) Of these, 13 are for power and 30 for research. This is in addition to the special agreements that have been signed with EURATOM and the IAEA. An Agreement Status Table is attached as Appendix "A".

27. It is not anticipated that a significant number of additional countries will enter bilateral agreements with the United States. The trend is to amend current research agreements to increase the amounts and enrichment of special nuclear material made available or to replace research agreements with more comprehensive power bilaterals.

II. OTHER ASPECTS OF U.S. PROGRAM OF INTERNATIONAL COOPERATION

28. *New Fuel Policies.* In the past year, the United States developed a program for making enriched power reactor fuel available on a deferred-payment basis to individual countries, multilateral groups and the IAEA. This plan will serve to reduce the initial heavy costs for nuclear power plants and was designed primarily for non-EURATOM countries. It will be restricted to projects with a combined generating capacity of up to 500,000 kilowatts. To be eligible, reactor plants must be completed before June 30, 1964. In addition, the AEC will permit the lease of heavy water for use in domestic or foreign research, medical or testing reactors (previously transferred only on a sale basis), and lease of enriched uranium for foreign subcritical assemblies, exponential assemblies, and reactor experiments. These actions should contribute to foreign research and development programs.

29. *Safeguards to Prevent Diversion of Materials to Military Uses.* During the reporting period, the United States participated in several meetings for developing agreement among the western supplier countries on the application of safeguards to exports, to bilateral agreements, and for use by the Western Powers when these matters are considered in the International Atomic Energy Agency. Major uranium producers, without final commitment, have indicated they are prepared to apply agreed-upon safeguards if other suppliers do so. The French are reserving on the question of applying safeguards to their bilateral activities although they have joined with the other powers in endorsing the type of system to be applied by the IAEA. ([illegible in the original] portion Secret DI—Remainder Conf. DI)

30. The U.S. policy is that safeguard procedures should be developed on an evolutionary basis (rather than in detail for all anticipated cases beforehand) with attention first devoted to the immediate (and also simpler) cases. Later procedures will be developed for the larger and more complex facilities. This approach is designed to enhance the political acceptability of necessary safeguards actions and to take full advantage of technological developments which may ease the burden of applying an adequate system to the more complex and different cases.

31. It is improbable that facilities coming into operation during the next year or two will require more than periodic visits and audits. As it looks now, the safeguard system may require resident inspectors

at complex installations such as chemical processing plants. General procedures have been developed and inspections are being made for reactors up to 100 MWT.

32. The U.S. has encouraged development of a safeguards system by the International Atomic Energy Agency and has assisted the Agency by supplying comments for use in the preparation of the IAEA safeguards manual. At the suggestion of the Western Powers the proposed IAEA safeguards are being revised to assure that they conform to the "evolutionary approach."

33. In all these discussions, we have emphasized our interest in transferring to the IAEA, wherever practicable, the administration of the safeguards rights provided by our existing bilateral agreements. Also, we are assisting EURATOM in the development of its regional safeguard system and there is a mutual interest in making it compatible with IAEA procedures.

34. Certain materials, principally uranium, are achieving the status of common articles of commerce whose supply has exceeded demand. This makes the development of a common position favoring the continued imposition of safeguards to such materials increasingly difficult. (See Paragraph 15 in Report).

35. *Third-Party Liability.* One of the major problems facing the Atoms-for-Peace program relates to the necessity of reaching an effective international understanding concerning (1) the extent of liability which is to apply to those who supply nuclear facilities, the operation of which can have a harmful effect on persons and property, and (2) the protection provided the general public from nuclear hazards. U.S. manufacturers wish to be assured that their risks in exporting nuclear equipment overseas will be kept as nearly as possible within reasonable levels. Lack of effective resolution of this problem could materially interfere with U.S. efforts to sell nuclear power equipment abroad and could affect adversely the U.S. participation in the Joint EURATOM-AEC program.

36. During the past year, there has been a notable increase in work on this problem. The Organization for European Economic Cooperation (OEEC), has prepared a draft convention for submission to its member states. Under this convention, the operator of a nuclear facility would be held absolutely liable if a nuclear accident damaging third parties occurred, but the liability would be limited to [illegible in the original] million. However, a member state could increase the liability or decrease it to a minimum of \$5 million as to installations in its territory.

37. The EURATOM Commission has recommended to its Council of Ministers a convention supplementing that of the OEEC, which would raise the level of operator liability to \$100 million unless a higher amount is established by a member country. There is a provision for state indemnification of the operator for liability incurred beyond a

certain level of insurable risk. Provision is also made for the states of the EURATOM Community jointly to assume responsibility for compensation in cases where the damage exceeds state indemnification, by some means not yet developed.

38. *Training.* Training of foreign nationals in nuclear science and technology has been one of the outstanding contributions of the Atoms-for-Peace program. Since the lack of suitably trained personnel could be a major impediment to advances, in the nuclear field, the U.S. has continued and expanded an aggressive program to meet foreign requirements.

39. In addition to the increasing opportunities provided by U.S. colleges and universities, the United States encourages nuclear training of foreign nationals through AEC-sponsored formal courses of instruction, by providing individual training programs at Commission-sponsored installations, and by supplying U.S. scientists and engineers to teach and work in foreign countries.

40. Ten formal courses or arrangements for training, with a total capacity of 424, are now open under AEC auspices to nationals of other countries (see Appendix "B"). One thousand and twenty-one foreign nationals have taken advantage of these opportunities. In addition, since 1956, the AEC has helped arrange individual programs for over 800 foreign nationals. As of June 1959, [illegible in the original] foreign nationals were working and receiving individual training experience within AEC installations.

41. There is a growing need for more specialized individual training. To avoid duplicating the type of instruction available at universities and to raise the level and degree of highly specialized training offered by the AEC, the program at the International School at Argonne will be reoriented in 1960.

42. *Research Reactor and Equipment Grants.* The program for making grants to foreign countries for research reactor projects has made steady progress. Nineteen \$350,000 grants have been awarded to date. The number of requests for reactor grants are diminishing as more countries come under the program.

43. An additional grant program for the acquisition of various types of nuclear laboratory and related equipment was initiated last year. Fifteen grants totaling \$1,363,000 were approved for 12 countries. This program potentially could be of great use to the underdeveloped countries since it is flexible and can cover a variety of less costly items that may be individually tailored to country needs.

Conferences

44. *Geneva Conference.* The Second United Nations Conference on the Peaceful Uses of Atomic Energy, held in Geneva, Switzerland in September 1958, was the largest scientific gathering of its kind ever convened.

45. More than a third of the 2,135 papers submitted came from the United States; and of the 722 papers selected by the U.N. for oral presentation, [illegible in the original] were from the U.S. This was more than twice as many as presented by the U.S.S.R. (99) or the United Kingdom ([illegible in the original]) and three times as many as presented by France (58). The United States was the only nation to be represented by at least one speaker in every session on the agenda.

46. The United States Technical Exhibit was an outstanding attraction and was attended by slightly over 100,000 people. The impressive array of full-sized laboratories, reactors, and thermonuclear devices operated by the scientists who built them, captured the attention of both delegates and the general public.

47. The U.S. film program excelled those of other nations in technical content and compared favorably with all others in quality of presentation. Of the 51 technical films presented by the U.N., 17 were furnished by the U.S. Additionally, in the exhibit the U.S. displayed 26 short films on specialized subjects in four language to more than 15,000 persons.

48. A Commercial Exhibit also was held in downtown Geneva during the Geneva Conference. More than 50 private U.S. companies participated with the AEC in organizing an impressive display of commercial activity in the U.S. in the atomic energy field. Of the 13 countries represented in this exhibit, the U.S. Exhibit was exceeded in size only by those of Great Britain and France and compared favorably in quality with those of all other nations.

49. At news conferences, the U.S. Delegation went on record at Geneva as favoring another large conference in 1961 and suggesting that it be held under IAEA auspices. The reaction was not favorable and in its official report, the U.S. Delegation recommended that the matter of size and sponsorship be studied further by the Department of State in cooperation with appropriate authorities. The U.S. Delegation to the Second IAEA General Conference at Vienna in September, 1958, took the position that any future conferences on nuclear science and technology of the type held at Geneva should be under IAEA sponsorship. In December 1958, the United Nations General Assembly directed the UN Secretary General and his Scientific Advisory Committee to evaluate the Second Conference with respect to the need, nature and timing of similar conferences in this field.

50. *Rome Conference and Exhibit.* The United States mounted an exhibit at the 1958 Rome Exposition and Congress on Nuclear Energy which included an operating low power research reactor. The display, well received by participants and public, was awarded first prize by the Congress.

51. *Second Inter-American Symposium.* Following the favorable response to the Inter-American Symposium on peaceful uses of nuclear energy at Brookhaven, in May of 1957, the Organization of American States, supported by a grant from Mutual Security Funds, sponsored a Second Inter-American Symposium, June 1–5, at Buenos Aires with the Argentine Atomic Energy Commission as co-host. Applications of nuclear energy to the life sciences featured the agenda and 26 of the 38 papers were presented by scientists from Latin American countries. Seventeen of the 21 OAS member states were represented among the more than 200 participants and observers.

52. *Tokyo Exhibit.* The USAEC presented a nuclear energy exhibit at the Tokyo, Japan, International Trade Fair, May 5–22, 1959. It featured an operating training and research reactor and an operating SNAP III thermoelectric generator.

53. *Other Conferences.* During the period July 1, 1958–June 30, 1959, the U.S. sponsored or participated in eight other international scientific congresses, conferences, or symposia dealing with the Atoms-for-Peace program.

III. U.S. DOMESTIC PROGRAM

54. *Power Reactors.* In October of 1958, the Chairman of the AEC appointed a special Ad Hoc Committee to perform an intensive evaluation of the Commission's reactor development program. This committee permitted its report in January 1959 and set forth a number of recommendations dealing with the technical program as well as general policy. The Commission has utilized these recommendations, along with those contained in other industrial and governmental surveys, in the formulation of an updated series of objectives for its civilian power program. These objectives, as outlined by Chairman McCone in recent Congressional hearings, are:

a. To reduce the cost of nuclear power to levels competitive with power from fossil fuels in high energy cost areas of this country within 10 years;

b. To assist friendly nations now having high energy costs to achieve competitive levels in about 5 years. This assistance is to be extended mainly through clearly defined programs of cooperation;

c. To maintain the U.S. position of leadership in the technology of nuclear power for civilian use;

d. To achieve a further reduction in the cost of nuclear power in order to increase the economic benefits and extend these benefits to wider areas, and

e. To develop breeder-type reactors to make full use of the nuclear energy latent in both uranium and thorium, recognizing that U-235 alone may not be sufficiently plentiful to meet all needs over the long range.

55. In the course of civilian power reactor development, there has emerged a program under which the many reactor concepts are separable into four categories on the basis of their potential to achieve economically competitive nuclear power.

56. First category: Reactor concepts which at this time seem to offer the greatest possibility of early achievement of nuclear power costs competitive with costs from fossil-fueled plants, at least in high power cost areas of the United States and abroad. Included are pressurized-water, boiling-water, organic-cooled, and certain gas-cooled reactors. Generally, these are the systems which have evoked the greatest interest in Europe and Japan.

57. Second category: Reactor concepts which probably will not produce low-cost power in the near future, but which have potential advantages which may ultimately overcome the early lead of those of the first category. Included here are reactors which use heavy water as a moderator-coolant or as a moderator alone, the liquid-metal-cooled reactors, and some of the more advanced gas-cooled reactors.

58. Third category: Reactor types which seem at this time to offer very great potential advantages but which require extensive additional technical development before these advantages can be demonstrated or disproved. These include the more long range reactor types, such as the pebble-bed and fluidized-bed concepts.

59. Fourth category: Reactor concepts whose basic objectives and major promise lie in their potential ability to produce more fissionable material than they burn and to do so at a rate sufficiently great to allow this country's nuclear fuel resources to keep up with the projected growth of its nuclear power demands. Such concepts would embrace the sodium-cooled, fast-breeder reactor, for the U-Pu system; and the thermal-breeder reactor for the Thorium-U-233 system.

60. Major emphasis in the immediate future will be placed on bringing the concepts in the first category above to a point where they become established as the basis of a nuclear power industry both in the United States and abroad. As the developmental and prototype program proceeds to the point where this objective is being realized, the emphasis will shift to concepts in the succeeding categories, always with the idea of placing major emphasis on those concepts which offer the greatest promise of early and outstanding success.

61. We recently reached a point in reactor development where we can be more selective in deciding which reactor concepts to carry forward into intensive and expensive hardware development, which reactors to continue under research and development, and which concepts to lay aside.

62. Thus, each major development effort in the AEC power reactor program has been analyzed or re-examined with the over-all program objectives in mind. As a result, two projects involving insufficiently developed concepts were dropped from the Power Demonstration Reactor Program during the past year and additional effort was being placed behind more promising reactor types. One of these is the heavy water moderated concept. Although not well advanced in this country, this particular reactor system is of special interest abroad because such reactors can use natural uranium and do not have to rely on expensive uranium-enriching plants. With this in mind, the AEC is working towards a more extensive cooperative program with Canada which has two heavy-water-moderated experimental reactors in operation. These reactors have provided extensive irradiation services for some of the U.S. heavy-water program activities.

63. The special interest of other countries in natural-uranium-type reactors has brought participation of other groups in the U.S. program. Representatives of Sweden, EURATOM, and the OEEC were among those taking part in a recent heavy-water design study.

64. U.S. development of the gas-cooled reactor concept, certain aspects of which has been greatly advanced by the British, is also being accelerated. Two gas-cooled power reactor projects are included in the FY 1960 program rather than one. In addition, the proposed FY 1960 program includes an advanced boiling-water prototype reactor, an experimental organic-cooled reactor, a low-temperature process heat reactor, and a small-sized power reactor suitable for use by public utilities and for the export market. The Commission feels that small power plants of 5 to 40 electrical megawatts, if proven economic, would fulfill important power requirements associated with underdeveloped foreign areas as well as supply power to isolated high-cost fuel areas within the U.S.

65. *Maritime Reactor Program.* Of great interest abroad and closely related to the civilian power effort is the joint AEC-Maritime Administration program for development of nuclear propulsion for merchant ships. This program centers around the design and construction of the N.S. *Savannah*, a nuclear-powered merchant ship now under construction at the Camden, New Jersey, yard of the New York Shipbuilding Corporation. The vessel's pressurized-water nuclear propulsion plant is being designed and fabricated by Babcock and Wilcox Co. It is to be launched on July 21 and initial operation is scheduled for the early part of 1960.

66. The *Savannah* is being constructed not only to acquire actual experience in the design, construction, and operation of nuclear merchant vessels, but to provide a means of identifying and resolving the many international legal and regulatory problems associated with

placing such a vessel into world commerce. Third-party liability studies now in progress are directed in part toward facilitating the movement of nuclear-propelled ships.

67. Associated with the *Savannah* project are supporting activities such as crew training, health, safety, and environment studies, and the development and construction of servicing and repair facilities.

68. The joint AEC-MA program also includes research, development, and preliminary design work for a 60,000 deadweight-ton tanker using a boiling-water reactor plant. A longer range program to develop a marine nuclear plant consisting of a high-temperature gas-cooled reactor coupled with a closed-cycle gas turbine has been stated. This program could lead to the started construction and operation of a land-based prototype by 1963. Also under way are technical and economic studies of other reactor systems showing promise for marine use; investigations into advanced vessel designs; and development of more efficient and economic methods for constructing nuclear ships.

69. Interest in nuclear ship propulsion is strong among countries who traditionally have major shipbuilding operations. [As of this time, the only known application of nuclear propulsion in the U.S.S.R. is in the icebreaker "Lenin".]⁵ (Bracketed portion Secret-DI)

70. *Plowshare Program.* The program for applying nuclear explosions to peaceful purposes is still in an early stage of development. A number of applications under study could make significant contribution to the Atoms-for-Peace program although further experimentation is required before this is an assurance. It is expected that there will be ample experimentation in the United States prior to application overseas.

71. The more promising possible peaceful uses of nuclear explosives are: civil engineering or excavation applications, recovery of natural resources (such as oil and minerals), industrial uses (such as production of power and isotopes), and in basic research investigations. Projects now underway or under such serious consideration are the following: *Chariot*, to get data on excavation applications; *Oxcart*, to obtain data on fundamental principles such as the relation between depth of burial, and physical effects such as containment of fallout; oil shales to determine the feasibility of using nuclear explosives in recovering oil from oil shales (several American oil companies have expressed a desire to participate in and contribute to this experiment); tar sands to determine the feasibility of using nuclear explosives in recovering oil from the Athabaska tar sands in Alberta, Canada (Richfield Oil Company has offered to pay for this experiment but AEC participation is contingent

⁵ Brackets are in the original.

upon Canadian Government approval); and *Gnome* to obtain basic data on power and isotope production.

IV. SELECTED COUNTRY SUMMARIES

72. *Canada.* The Canadian program for developing natural uranium, heavy-water, power reactors has expanded and future plans have been put on a firmer footing. Construction of the 20 MWE nuclear power demonstration reactor (NPD) scheduled for operation in 1961 near Chalk River has progressed satisfactorily. Atomic Energy of Canada, Ltd., has proposed to the Canadian Government that it proceed with the detailed design and construction of a large (200 MWE) reactor similar in design to NPD. The plant is to be built and operated by 1964 in the Ontario public utility system.

73. The Canadians also have become very interested in natural uranium, heavy-water-moderated reactors cooled either by organic fluids or heavy-water steam. A feasibility study on the organic-cooled-type has been initiated. The close U.S.-Canadian cooperation has continued and an increased cooperative heavy-water reactor program is planned.

74. *France.* Except for the Soviet Union, and the United Kingdom, France has the largest and most diversified atomic energy program in Western Europe today. The notable advances during the past year were: (Secret-DI)

a. *Plutonium Production.* A plutonium separation chemical reprocessing plant, has been in continuous operation at Marcoule since January 1959 after experiencing considerable difficulties. The French G-1 reactor, in operation since January 1956, produces 12 kilograms of Pu per year at design level of 40 MW thermal. The French G-2 reactor at Marcoule, which went critical in July 1958, produces 40 kgs of plutonium per year at design level of 150 MW thermal. A third production reactor identical to G-2 reached criticality early in June 1959. (Secret-DI)

b. *U-235 Production Capacity.* Two pilot plants each with 12 active stages are now in operation. In January 1959 construction of a full-scale separation plant at Pierrelatte was initiated. This plant will have an estimated production capacity of 4 kgs of U-235 per day in 1962 and 10 kgs per day of U-235 in 1965. (Secret-DI)

c. *Reactors.* Electricite de France, the French National Power Company, is scheduled to complete EDP-1, the first full-scale (63 MWE) power reactor in France, late in 1959 or early in 1960. The United States has furnished fuel for several French research reactors and the French materials testing reactor during the past year.

75. *India.* Heavy emphasis is being put on achieving national self-sufficiency in personnel and materials. A 1,000 kw pool-type research reactor, designed and built in India and fueled by enriched uranium supplied by the United Kingdom, has been in operation 35 months. Work on India's second reactor, a 30 MWT NRX-type test reactor, is scheduled

for completion in 1959. Canada is providing technical assistance for the construction and the U.S. has provided the heavy water. (OUO)

76. While no power plants are in operation, it is planned to have a million KWE generating capacity available by 1966 from reactors using natural uranium provided by domestic sources. The Indian Atomic Energy Commission also has recently made overtures concerning a joint Indian-U.S. cooperative program involving reactors using U.S.-enriched uranium. The United States is prepared to explore this further. (OUO)

77. *Japan*. A 10-year comprehensive U.S.-Japanese Agreement for Cooperation came into effect during December of 1958. The Japanese also entered into a power agreement with the U.K. Japan has selected the General Electric Company as builder of a 10-MWE-type power demonstration reactor. British General Electric has been chosen as contractor for the first full-scaled power reactor (a 150 MWE advanced Calder Hall reactor).

78. *United Kingdom Nuclear Energy Program*. The U.K. nuclear energy program has been established on a broad basis and is one of the three most highly advanced programs in the world. Over the past year there has been substantial progress in all areas of the program with notable emphasis on the field of nuclear power. The U.K. heads all other countries in domestic nuclear power construction with approximately 300 MWE to be installed by the end of 1959; and about 1400 MWE under construction, with an additional 500 MWE station authorized for Wales with construction to begin sometime this year.

79. The official nuclear power program is either on or ahead of schedule and is expected to realize the national goal of 5000-6000 MW by 1966. There is a possibility that within the next year or two a new (or extended) program will have been formulated. Decision in this respect will be affected by (a) experience gained with the generation of reactors now operating or under construction, (b) progress made with the advanced gas-cooled reactor and other concepts under study, and (3) a further evaluation of domestic economic needs.

80. In June 1958, the U.K. Nuclear Power Plant Company, one of the UKAEA industrial consortia members, signed an agreement with the Italian Company, Agip Nucleare, for collaboration in the construction of a Calder-Hall-type 200 MW station in Italy. Another consortia member, General Electric Company-Simmons Carves Group, has contracted to build a gas-cooled power reactor plant in Japan. The UKAEA will supply fuel for these stations. Thus far, these are the only two power plants sold by the U.K., and it is becoming somewhat apparent that the commercial exploitation of nuclear power by U.K. industry overseas is beginning to be adversely affected by the lack of a reactor with a greater commercial potential than the gas-cooled type.

81. This is further aggravated by the recent programs that have been initiated by the U.S. to provide special incentives to reactors using U.S. design. The rapid commercial development of an atomic energy industry in the U.S., coupled with the liberal technological information policy of the U.S., is precipitating a considerable turning of U.K. nuclear industry to U.S. firms for commercial arrangements which will enable them to expand their export marketing output beyond that afforded by the present and foreseeable U.K. AEC program.

82. These factors have combined to bring some tensions at the political level between the United States and the United Kingdom since the British have felt that the EURATOM and deferred-payment programs have put them at an unfair disadvantage. The British have stressed the mutual interest of the U.K. and the U.S. in avoiding any subsidy race in competition in the international nuclear power market. However, it has not affected the close and varied U.S.–U.K. cooperation at the technical level. (Conf.-DI)

83. Paragraph 51 of last year's report noted that there was a U.S.–U.K. problem in reconciling the different policies relating to the dissemination of information prevailing in the two countries. The United Kingdom has not found it possible to provide freely to the United States information of commercial sensitivity which is developed with public funds since such data normally are sold in the United Kingdom. The extent of this problem is not as great as was thought originally since the amount of data in this category is substantially less than was originally contemplated.

84. *U.S.S.R.* The U.S.S.R.'s capabilities in the power reactor fields are advancing rapidly, and a considerable amount of original and interesting work on reactor and reactor component development has been performed; however, no Soviet breakthroughs have occurred. Their rate of reactor construction confirms our earlier estimate that this program has slipped substantially below its original goals announced in 1956 of 2000–2500 MWE by 1960. The latest over-all estimate is that, as now projected, the U.S.S.R. will have a capacity of about 2000 MWE by 1963. Information given Admiral Hyman G. Rickover on his August 1959 trip to the Soviet Union confirmed the considerable slippage in the original goal. For example, Admiral Rickover reported that only two of the four 100 MWE boiling water reactors are under construction at Belloyarsh with operation expected in 1961. He also was told the two 210 MWE pressurized water reactors (presumably at the Voronezh station) are due for completion in 1961.

85. The nuclear power programs of the United States and the U.S.S.R. involved the same general reactor types. As in the U.S., the first large power stations will be cooled with ordinary water. The Soviets also are developing experimental power reactors up to about 50 MWE,

using various coolants. However, the U.S.S.R. is concentrating on the construction of large power stations employing a limited number of reactor designs, with a much smaller effort in purely experimental reactors; while the U.S. is building smaller stations which will use a greater variety of reactor types.

86. The only firmly identified U.S.S.R. application of nuclear energy for propulsion (see Koslov statement to Rickover—footnote to paragraph 19 of Report on Page 7) is the icebreaker “Lenin” which is essentially complete. Admiral Rickover was told on his aforementioned visits that the Soviets expected the “Lenin” test to be completed by the end of 1959. With respect to the Koslov statement, it is believed that the U.S.S.R. on the basis of its over-all nuclear technology, has been capable for several years of building nuclear submarines, but no such construction has been verified. (SECRET DI)

87. A major effort is being made to increase the size, number, and variety of devices for controlled thermonuclear research. The status of Soviet work in this field is roughly comparable to that of the U.S. and the U.K.

88. In 1955, the U.S.S.R. announced a program of atomic aid to the satellites. Research reactors, cyclotrons, and equipment for research with radioisotopes are sold to the satellite countries and technical training is provided. Rumania, Czechoslovakia, East Germany, Poland, and Hungary have received 2,000 kilowatt research reactors and Communist China has received a 6,500–10,000 kilowatt reactor. All Sino-Soviet Bloc countries have membership in the Joint Nuclear Research Institute in Dubna and they may send scientists to study and work in its laboratory, which employs some of the most advanced nuclear research equipment in the U.S.S.R. (UNC)

89. The most significant programs of assistance outside the Soviet Bloc have been directed to Yugoslavia where the U.S.S.R. has assisted in the construction of a research reactor, and Egypt where a research reactor and supporting equipment have been provided. (UNC)

90. Soviet offers of technical assistance, including in some cases nuclear equipment and training have been made to numerous other non-Bloc countries including Norway, Japan, Lebanon, Australia, Chile, Burma, Indonesia, Iran, Thailand, Syria, Greece, Mexico, Afghanistan, and most recently, Iraq. (UNC) Iraq has recently been offered a reactor and is hoping to obtain the machine as a gift. (Secret-DI)

91. The training and research institutes at which the U.S.S.R. will accept trainees sponsored by the IAEA have been specified. These include leading universities and research institutes. None of these installations is directly connected with the Soviet Atomic Energy Program. (Secret-DI)

496. Special National Intelligence Estimate¹

SNIE 11-9A-59

Washington, September 8, 1959

**PROBABLE SOVIET POSITION ON NUCLEAR
WEAPONS TESTING²****THE PROBLEM**

To assess the relative weight of weapons requirements and other considerations in determining the Soviet position on further nuclear testing, and to estimate the Soviet attitudes toward complete discontinuance of nuclear weapons testing and toward limited discontinuance.³

THE ESTIMATE

1. Broadly speaking, the considerations which lie behind the Soviet position on further nuclear testing are of three kinds: technical, strategic, and political. Technical considerations have to do with the stage of research and development in which the Soviets find themselves with respect to nuclear weapons—how urgent do they consider the necessity of further testing in order to round out their arsenal of nuclear weapons, to improve the economy or efficiency of those they have, or to realize the potential of new devices? Strategic considerations relate to the effect of further testing on the world balance of military power—how far do the Soviets believe they would derive advantage or disadvantage in this respect from either a resumption or a discontinuance of nuclear testing? Political considerations have to do with the advantages which the Soviets might see for themselves in a continuance of their strong propagandists stand against further testing, and with the longer-range benefits which they might hope for if an agreed discontinuance of nuclear testing could be established as the first step towards other agreements. We propose to discuss each of these considerations briefly, and to estimate how the Soviets weigh them against each other in arriving at their position.

2. The Soviets now have available a wide spectrum of fission and thermonuclear weapon types. Their test series have shown that they

¹ Source: "Probable Soviet Position on Nuclear Weapons Testing." Secret; Restricted Data. 11 pp. DOS, INR Files.

² See NIE 11-6-58. "The Soviet Attitude Toward Disarmament," dated 24 June 1958 (Secret), for a fuller discussion of the arguments which are summarized in the present paper. [Footnote is in the original.]

³ Limited discontinuance would ban for an indefinite period any testing in the atmosphere and outer space, on the earth's surface, and underwater; only contained underground tests would be sanctioned. [Footnote is in the original.]

could obtain yields ranging from less than three KT from fission devices to eight MT from thermonuclear devices. They thus can produce weapons suitable for tactical ground force use and naval employment as well as for a wide range of aircraft and missile delivery systems. This capability probably included efficient use of nuclear materials in air defense warheads. Significant improvements in stockpiled weapons are certainly being made as a direct result of the tests completed in 1958.

3. An analysis of Soviet nuclear weapons progress does indicate that there are several areas in which the USSR might desire to conduct further tests. These areas include: (a) high altitude or space tests related to AICBM effects or proof tests; (b) tests of low-yield, light, tactical devices; (c) tests directed toward materially increasing fissionable material economy; (d) tests of “clean” devices; and (e) tests of thermonuclear weapons with yields above eight MT. In addition, refinement of existing designs would be desirable in any test series.

4. Almost certainly there are pressures in the Soviet Union, on both technical and military grounds, for continued nuclear testing in some or all of these fields. Over the long-run the Soviet nuclear weapon design and development capabilities could only be marginally improved without further tests. However, the available spectrum of nuclear weapons is probably adequate to meet their basic military requirements. On balance, we believe that the Soviets currently estimate that the technical potentialities for weapons improvement would make further testing desirable, but do not provide an overriding requirement for the resumption of tests at this time.⁴

5. From the strategic point of view, the Soviets probably believe that a continuation of nuclear testing by both sides would be unlikely to alter the relationship of military power between the US and the USSR in any decisive way. In any case, they are almost certainly unable to estimate with confidence that a continuance of nuclear testing would operate to their advantage rather than to that of the US. They may believe that, despite certain US superiorities in weapons technology, a stabilization of nuclear weapons technology at present levels of development would serve Soviet military interests better than would a continuance of testing by both sides. On these grounds, therefore, we think that the Soviets almost certainly are willing, though not necessarily anxious, to have both sides cease testing.

6. From a political point of view, total discontinuance of nuclear weapons testing would mark a major step in the Soviet effort to single out nuclear weapons as different from and more repugnant than other weapons. It would crown with success the long public Soviet demand

⁴ For further discussion of the technical aspects see the Annex to this estimate. [Footnote is in the original.]

for a test ban and raise the prestige of the USSR. It would thus serve long-range strategic and political aims by providing a springboard for intensified agitation against further deployment of nuclear weapons abroad, against initiating the use of nuclear weapons in any situation, and even for a complete ban. Even though the Soviet leaders would probably see little prospect of involving the West in negotiations on these issues and still less prospect of getting agreement, they would calculate that by focusing renewed attention on them, they could generate political problems within the free world and inhibit Western defense activities. Any resulting relaxation of Western defense efforts, any divisions within NATO and any progress toward a climate inhibiting Western use of nuclear weapons would be viewed by the Soviets as important gains.

7. A total discontinuance of nuclear weapons testing would inhibit other countries, including Communist China, from persisting in efforts to develop their own nuclear weapons. The Soviets would welcome the fact that the problem created within the Western Alliance by French desires to pursue a weapons development program would be intensified. While Communist China would probably press for acquisition of a nuclear capability, the Soviets presumably believe that they could meet this pressure by promising to provide appropriate nuclear support to China, and by arguing that as a next step they would work toward the withdrawal of US nuclear weapons from Eurasia.⁵

8. In sum, then, we believe that the Soviets see no overriding current technical requirement for continued nuclear weapons tests, and no assurance that they would improve their relative military position by such tests (assuming, of course, that tests were resumed by both sides). Accordingly, we believe that the major factor now determining the Soviet position on further nuclear testing is their evaluation of the political and propaganda gains to be expected from a discontinuance of tests. We believe that in their opinion these gains would be considerable, and in the long run would contribute substantially to their strategic objective of weakening the US both militarily and politically, outweighing any immediate technical and military advantages to be derived from a resumption of testing.

9. It follows from the above conclusion that the Soviets would prefer a total discontinuance and would be cool to a limited one. However, they could calculate that a surface, atmospheric and space test ban would still permit them to stigmatize nuclear weapons to a degree, and thus to gain some of the advantages of the complete ban. A limited restriction on nuclear testing which permitted underground tests would allow the

⁵ For further discussion of Chinese nuclear capabilities and Sino-Soviet nuclear arrangements, see NIE 13-59, "Communist China," paragraphs 74 and 83 through 86, dated 28 July (Secret). [Footnote is in the original.]

USSR to realize some of the potentialities for further weapons development, though with greater expense and difficulty than under conditions of unrestricted testing. (Such an agreement would, of course, also permit the US and UK to improve their weapons, and in time would allow other nations to develop nuclear weapons.) While it is therefore possible that the Soviets would agree to a limited discontinuance with controls—especially if the alternative were a rupture in negotiations—we believe it highly unlikely. The chances are better that they would settle for a limited discontinuance without international controls.

10. We believe it most probable that the USSR will continue to press for a total discontinuance of nuclear weapons tests, capitalizing upon the approval which this course of action receives in many parts of the world. We think, moreover, that the Soviets will agree to a total ban on weapons tests, with international controls, provided that they succeed in holding inspection monitoring to what they regard as an acceptable limit in terms of their stringent requirements for state security. Pending such an agreement they will continue their propaganda against tests. We do not believe that, for the time being, the Soviets will resume testing (in the absence of an agreed ban) unless and until the US does so; in effect, therefore, they would have a continued moratorium without controls.

11. With the alternatives open to them, we believe that the Soviets would prefer not to risk entering into an internationally controlled agreement with the prior intention to evade it by illicit weapons tests. If they regarded the need for testing as so great, they would instead probably defer an agreement or agree to a limited ban. If conditions changed subsequent to an agreement, so that they believed that significant gains could be realized from renewed testing, they would have to weigh these potential gains against the likelihood and consequences of detection. It is unlikely that the Soviets would risk what they regarded as an appreciable chance of detection and disclosure of illicit tests. However, if they came to believe that an overriding necessity for testing had arisen, they would probably renew testing, employing some gambit such as accusing a Western power of breaking the agreement, seeking to justify their renewed testing as retaliatory action to meet new and legitimate defensive requirements. If Communist China were not covered by the agreement, the Soviets might resort to testing on Chinese Communist territory.

12. If a considerable period elapses without an agreed nuclear test ban, the willingness of the Soviets to forego testing may change. The evolution of military requirements for new advanced weapons systems, or the recognized possibility of a technical breakthrough in the laboratories, might create in the USSR much stronger pressures for resumption of tests than we believe now exist there. These pressures could persuade the Soviet leaders that an agreed test ban was no longer

to the advantage of the USSR, or possibly that a limited discontinuance of tests, rather than a total ban, was desirable.

Annex

SOVIET TECHNICAL MOTIVATIONS TO RESUME NUCLEAR WEAPONS TESTING

SUMMARY

1. With the completion of their 1958 test series, the Soviets have available a wide spectrum of fission and thermonuclear weapons which are probably adequate to meet their basic military requirements. This spectrum includes devices suitable for ground force and naval employment as well as for a wide range of aircraft and missile delivery systems. This capability also probably includes efficient air defense warheads, pre-initiation proof primaries for some thermonuclear weapons, and thermonuclear warheads yielding from 200 KT to 8 MT.

2. Based upon the nuclear weapon development and test capabilities evidenced by the Soviets to date, we estimate that with resumed unlimited testing they could increase their thermonuclear yields, improve yield-to-weight ratios and economy of fissionable materials in their weapons, and overcome any lack of knowledge of high altitude effects. They could also develop new weapons to satisfy future military requirements for advanced weapons systems.

3. Under an atmospheric and outer space test ban, the Soviets are capable of a major development effort but the advances would be somewhat slower and they would be unable to close any gap that might exist between the US and Soviet knowledge of high altitude effects. We have no evidence that the Soviets have conducted deep underground nuclear tests, and we estimate that they have not done so. However, the conduct of such tests to include the collection of adequate diagnostic information is fully within their technical capabilities.

4. If no further nuclear testing occurs, their over-all nuclear weapon development capabilities could only be marginally improved.

5. The Soviets are technically capable of conducting clandestine underground tests in violation of a complete nuclear test ban and at present have a unique missile capability for clandestine nuclear test attempts in outer space. Some significant design progress could be achieved if several limited test series were conducted, particularly in very low yield weapons and in over-all fissionable material economy.

6. An analysis of Soviet nuclear weapons progress indicates that there are several areas in which reasonably adequate tests may not have been conducted to date and which probably create technical pressures within the USSR for the resumption of nuclear tests. These include:

(1) high altitude or space tests related to AICBM effects or proof tests; (2) tests of low-yield, light, tactical devices; (3) tests directed toward materially increasing fissionable material economy; (4) tests of “clean” devices; and (5) tests of thermonuclear weapons with yields above 8 MT. We estimate that at present these areas do not provide, either individually or collectively, an overriding technical motivation to resume testing. On the other hand, the evolution of military requirements for new advanced weapons systems or a possible technical break-through in the nuclear weapons laboratories could create in any or all of these technical areas much stronger pressures for the resumption of nuclear tests.

7. Resumption of nuclear testing by the US would intensify technical motivations for the Soviets to resume testing.

DISCUSSION

INTRODUCTION

1. An assessment of Soviet technical motivations to resume nuclear testing, whether or not a test cessation agreement is negotiated, must consider the present state of Soviet weapon art, current and future Soviet requirements for improvement in their nuclear weapons, and likely Soviet assessment of the technical capabilities of existing and proposed test detection and identification systems. Soviet capabilities for undetected evasion of a test ban will be considered in this discussion in light of two assumptions: first, that only contained sub-surface tests will be allowed—i.e., those in which no venting into the atmosphere occurs; and second, that a complete test ban with the necessary inspection components will be in effect.

CAPABILITIES OF DETECTION SYSTEMS

*[text not declassified]*⁶

METHODS OF EVADING DETECTION

5. The effectiveness of all the detection systems given above are dependent upon Soviet knowledge of and ability to employ the technical means of decreasing the likelihood of detection. These means

⁶Decoupling is a test technique for underground explosions which is designed to reduce the amount of energy going into the seismic signal. Decoupling may theoretically be accomplished by detonating the device in a large underground cavity or hole, the dimensions and shape of which are dependent upon the anticipated yield. [Footnote is in the original.]

include such possible techniques as decoupling of subsurface explosions to reduce the seismic signal produced, shielding of space detonations to reduce the radiations emitted by the nuclear explosion, and positioning the explosion either at extremely large distances in outer space or behind planetary bodies for concealment. Such techniques have been made known to the Soviets, and it is within their capability to exploit them.

6. All of the methods above will increase the time and expenditure required for testing and decrease the amount, or at least make difficult the attainment, of diagnostic information desired from each test. Nevertheless, should the Soviets choose to risk detection and exposure, technical information could be gained by testing under these conditions permitting further progress in nuclear weapons development.

PRESENT STATE OF SOVIET NUCLEAR WEAPON DEVELOPMENT

7. Since the preparation of SNIE 11-7-57, *Feasibility and Likelihood of Soviet Evasion of a Nuclear Test Moratorium*, dated 10 December 1957, the Soviets have conducted two extensive series of nuclear tests. These series include a total of 32 tests which were detected between 28 December 1957 and 3 November 1958.⁷

8. These two test series included devices yielding from less than 3 KT to nearly 8 MT. [text not declassified]^{8 9 10}

9. Estimates of present and future Soviet thermonuclear weapon stockpiling capacities are summarized in FIGURE I.¹¹

SOVIET REQUIREMENTS FOR FUTURE TESTS

10. Future Soviet requirements for nuclear tests are dependent upon military requirements on which adequate intelligence does not exist. However, the characteristics of the varied nuclear test devices that have been detected clearly indicate that the Soviet military planners have a wide spectrum of modern nuclear weapon designs available to them for all of the weapons systems we estimate that they possess. Furthermore, we estimate that with the possible exception of non-spherical implosion systems there is virtually no major principle of weapon design which the US exclusively holds. However, members of the Soviet Delegation

⁹ The use of thermonuclear fuels to increase the neutron environment of fissionable materials to provide a significant increase in fission yield. [Footnote is in the original.]

¹⁰ Warheads capable of producing the design yield despite the presence of a strong, steady neutron flux. [Footnote is in the original.]

¹¹ Based on NIE 11-2-58, *The Soviet Atomic Energy Program*, 16 June 1958. [Footnote is in the original.]

to the current Geneva Conference on the Discontinuation of Nuclear Weapons Tests have admitted informally that there is military pressure within the USSR for the resumption of nuclear tests.

11. There are five discernible areas wherein adequate tests may not have been conducted to date which must be evaluated both collectively and singly:

a. *Tests related to AICBM effects or proof tests at altitudes well above the tropopause (higher than approximately 30,000 feet) or in space.* [text not declassified] a large volume of information has been published on US high altitude tests, which may reduce Soviet requirements for high altitude effects data.

b. *Tests of low-yield, light, tactical devices weighing less than 100 pounds, including non-spherical implosion systems.* The Soviets have conducted at least 15 tests with yields of about 5 KT or less, including some which were not detected by the USAEDS. However, none of these tests are believed to involve devices weighing less than about 200 pounds. Therefore, we believe that they seriously lag behind US capabilities, particularly in fractional KT weapons and non-spherical implosion system.

c. *Tests directed toward materially increasing the economy of missile materials, particularly in the larger TN devices.* Soviet nuclear weapons in the higher yield ranges consume large amounts of fissionable materials, and it is well within Soviet capability to achieve substantial economics by further testing.

d. *Clean Devices.* We have detected only one Soviet full-scale clean experiment (JOE 68, 20 October 1968). Additional tests will be required if the Soviets desire clean weapons in any yield range.

e. *Thermonuclear Weapon with yields above 8 MT.* The highest yield Soviet tests detected to date have been 6.1 and 7.5 MT. They are capable of scaling this device up to at least 12 MT at a considerable cost in weight and fissionable materials. Any requirement for such very high yield devices would probably necessitate testing in the 10–20 MT yield range.

12. In addition, the refinement of existing designs should be included as a desirable requirement in any test series.

POSSIBLE TEST PROGRAMS

13. Table I presents our estimate of Soviet technical potentialities for nuclear weapons development under three conditions; (a) continued unlimited testing, (b) a partial test ban, and (c) a complete test ban. (Detailed related cost estimates are impracticable in light of the scant knowledge available on the expense of evasion techniques, thus we have only attempted to indicate relative magnitudes.)

POSSIBLE GAINS WITHOUT TESTING

14. One should not conclude that the Soviet nuclear weapons program will be immobilized if no tests are conducted. Significant improvements in stockpiled weapons are certainly being made as a direct result of the test series completed in 1958. Future laboratory studies of nuclear materials in contained environments and in amounts not

sufficient to produce a significant nuclear yield can also contribute to some advancement of the weapon art, particularly for small, low-yield devices. Improvement in delivery hardware and techniques can materially increase the military effectiveness of the present Soviet nuclear stockpile. Redesign based on theoretical studies may be made to a limited extent, but we believe the Soviets would hesitate to stockpile new designs without proof-testing them. Successful espionage against the West might permit isolated advances in the Soviet program.

TECHNICAL MOTIVATIONS TO RESUME TESTING

15. We believe that the five areas requiring further tests, as listed in paragraph 11, create technical pressures within the USSR for the resumption of nuclear tests. However, we do not believe these areas currently provide an overriding technical motivation to resume testing. Under a nuclear test ban the Soviets will continue to pursue the development of improved weapons systems and the study of improved nuclear weapons technology. Over a period of a few years the evolution of military requirements for new advanced weapons systems and improved nuclear devices could create in any or all of these technical areas much stronger pressures for the resumption of nuclear tests.

16. There is always a possibility that as a result of laboratory research which is beyond our capacity to predict, the Soviets may foresee a technical breakthrough leading to a major improvement in nuclear weapons design. This possibility appears remote; however, should it occur, it could produce with the passage of time a very strong technical motivation for the Soviets to resume testing.

17. Resumption of nuclear testing by the US would intensify technical motivations for the Soviets to resume testing.

18. If the US resumes underground nuclear tests for the specific purpose of acquiring further technical information on seismic effects pertinent to the control of a complete test ban, this probably will also promote demands within the Soviet Union for resumption of testing. However, the Soviets would probably refrain from testing until they have made capital of any potential propaganda advantage. If the Soviets, in time, conduct similar tests, we believe they would certainly exploit them for weapons development information.

TABLE 1
POSSIBLE SOVIET NUCLEAR TEST PROGRAMS

	UNLIMITED TESTING			ATMOSPHERIC AND OUTER SPACE TEST BAN			COMPLETE TEST BAN			
Possible Technical Gain	Increase in economy for large TN weapons and some increase in yield-to-weight ratios for all classes of weapons. Additional effects data in all environments. Proof tests of all devices intended for stockpile. Development of small, fractional-KT weapons.			Increase in economy for large TN weapons and some increase in yield-to-weight ratios for all classes of weapons. Proof tests of devices yielding less than about ½ MT. Clandestine outer space tests would allow limited numbers of proof tests of devices yielding more than ½ MT.			Progress somewhat slower but relatively unhampered in the less than 1 KT category. In higher yield range, progress much slower and limited by risk and cost to a few critical developments. Progress in TN development very limited.			
Detection Possibility	AIR & SURFACE	SUBSURFACE	UHA ¹ & SPACE	AIR & SURFACE	SUB-SURFACE	UHA ¹ & SPACE	AIR & SURFACE	SUBSURFACE	UHA ¹ & SPACE	
USAEADS	Good to Excel- lent for > 5 KT	Poor to none	Poor to none	Same as for unlimited testing			Same as for unlimited testing			
USAEADS & STDS ²	Good to Excel- lent for > 5 KT	Poor to none	Fair to good	Same as for unlimited testing			Same as for unlimited testing			
Geneva Experts Control System ³				ATMOSPHERIC	UHA & SPACE		YIELD	SUBSURFACE	SUBSURFACE DECOUPLED	UHA AND SPACE
				Good to Excellent	Fair to good		<1 KT	Poor	None	Poor
							1-25 KT	Poor to fair	None to poor	Fair to poor
							>25 KT	Good to excellent	None to poor	Poor to good
Increase in Test Cost	None over present			Large for High-yield Moderate for Low-yield			Moderate for <1 KT Moderate to extremely large for 1-25 KT Extremely large for >25 KT

² STDS: Space Test Detection System (3 to 8 years to become operational). [Footnote is in the original.]

³ Operational 3 to 8 years after treaty. [Footnote is in the original.]

FIGURE 1
ESTIMATED SOVIET THERMONUCLEAR WEAPON STOCKPILING POTENTIAL
(BASED ON UNLIMITED TESTING)

497. Letter From McElroy to Eisenhower¹

Washington, September 14, 1959

Dear Mr. President:

In response to the specific request of the Joint Chiefs of Staff, I am attaching the memorandum of the Joint Chiefs in which they reiterate their past positions on the importance of nuclear tests.

In the light of world opinion and public concern over the hazards of atmospheric testing. I cannot support a position in favor of the resumption of relatively unlimited testing. I do, however, want to express to you my own view that a continued development of nuclear weapons is of such far-reaching importance to this country that I feel that we should (a) adopt a negotiating position with respect to a possible agreement on the suspension of testing under which underground testing would be permissible, and (b) resume underground testing after December 31st, 1959, unless by that time a comprehensive test suspension agreement had been concluded.

If we proceed as I have proposed above, I believe that our position can be kept consistent with world opinion that further atmospheric contamination is unacceptable and at the same time permit our scientists to exercise the full range of their ingenuity in the use of underground testing for weapons development.

In connection with the matter of test resumption, I refer to my letter to you of August 14th, 1959, in which I pointed out a particular problem dealing with the safety of certain important weapons now in stockpile and scheduled for continued production in relatively large numbers. It is my understanding that it is highly probable a number of tests will be required before the need for design changes can be determined and that if rectification is required, some low yield proof tests may be necessary. As a critical matter now affecting our state of readiness and apart from the longer range developments referred to by the Joint Chiefs of Staff, this problem merits special consideration in establishing our course of action for the immediate future.

With great respect, I am

Faithfully yours,

Memorandum From Goodpaster to McElroy

Washington, September 14, 1959

The President has read your letter of September fourteenth on the subject of nuclear testing, as well as the Joint Chief of Staff memorandum of August twenty-first on the same subject, which was enclosed.

He asked me to advise you that he has asked that the views in these documents be made available to the "Committee of Principles" which is considering questions relating to any resumption of nuclear testing, to be borne in mind in their further consideration of the subject, and to receive specific attention in further reports to or meetings with the President on this matter.

A.J. Goodpaster
Brigadier General, USA
Staff Secretary

**Memorandum From Gray to Dillon, Gates, McCone, Allen
Dulles, and Kistiakowsky**

Washington, September 16, 1959

Please note the attached documents which should be considered in the next meeting of the principals.

Gordon Gray
Special Assistant to the President

498. Memorandum of Conference with the President¹

Washington, September 22, 1959

OTHERS PRESENT

Secretary Dillon, Mr. Farley, Mr. Allen Dulles, Secretary Gates, Admiral Burke, Mr. McCone, Dr. Kistiakowsky, Mr. Gordon Gray, General Persons, General Goodpaster

Dr. Kistiakowsky began by presenting to the President the results of the work of the panel appointed to consider nuclear test requirements from the standpoint of the progress of our own military technology. He stressed that it was not a study of the comparative positions and needs of the United States and the Soviets. He said that the panel was drawn from representatives of interested agencies. He then read the conclusions of the panel's work, accompanying this with a commentary of his own views.

In scope, the study covered weapons improvement and proof firing, one point safety considerations, questions of new concepts and new devices, high altitude effect shots, and effects of low altitude and undersea shots. The ensuing discussion focused on the one point safety questions.

Mr. Gates said in this regard that Defense would like to see a decision to proceed with one point safety experimentation by the "creep" method. Initial firings would involve no nuclear reaction. Subsequent firings would increase the likelihood of nuclear reaction and permit it to occur up to a determined point, such as a yield equivalent to that of an explosion of one pound of TNT. Mr. McCone said he was not certain that the control could be quite that accurate but thought it could be held to a few pounds. Mr. Gates commented that this could be a series of high explosive experiments, involving an accidental one-pound nuclear yield at the very end.

Mr. Dillon commented on two points. First, public reaction in the UK might be very difficult if it were to become publicly known that we were worried regarding the safety of our weapons. The second question is the effect on our statement that we will not conduct nuclear weapons tests before the first of the year. If we can make it stick that these are experiments rather than tests, he saw no problem. Also, if they are conducted at Los Alamos he saw no problem, whereas if they are conducted at Nevada, they seemed likely to become weapons tests. The Soviets would then charge bad faith. We must not call them safety tests,

¹ Source: One-point safety testing; nuclear reactor for Dutch submarine; exchange of reactor information with the Soviet Union. Top Secret. 7 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted September 24.

since this name would alarm world opinion. He was aware that there are technical questions regarding preparations and the speed of conducting the firings that are of importance.

Mr. McCone said he thought that a certain amount of attention will be attracted to the firings at either place. At Los Alamos there is one point of concern. We will be putting a sizeable number of kilograms of plutonium into the ground. It is conceivable that a fissure might occur such that a leaching of plutonium into the water table would introduce a degree of poison over a large area. This is not true in Nevada, since the sub-surface water is trapped there. He said the AEC could start quickly at either place. If a decision were made to wait for the first firing until after the first of the year, he would want to go ahead with advance preparations now. He agreed on the "creep" method, commenting that 25-30 experiments will be required. He thought there would be less publicity from use of Los Alamos than from use of Nevada. It has, however, the one possible bad feature that he mentioned. There is one further possible source of difficulty—involving a special kind of ignition in the pit, but he felt that could be dealt with by precautionary measures.

The President said the question in his mind is whether we are making laboratory experiments or are testing. If the former is the case, this goes along all the time and he saw no need to make a big fuss about it. It was clear to him that the nuclear effect, if any, would be so extremely slight that we should avoid the use of the word "tests" at all. Mr. Dillon added that we should avoid any reference to "weapons" in any press release. Mr. Gates thought that the firings could be very clearly justified on the basis of experimental research. Dr. Kistiakowsky concurred that it would be intellectually honest to do so, providing there is a strong injunction to design the experiments so as to avoid any possibility of explosion. Mr. Dillon thought that if this is too fine a line we should make preparations now and conduct the firings after January first. The President thought that it is not too difficult to make the distinction Dr. Kistiakowsky was speaking of. Mr. Gates pointed out that we could conduct the first few firings since these would have no chance whatsoever of any nuclear contribution. Admiral Burke added that by having a few of these now, we are not making an abrupt change after January first. The President said that the words "weapons" and "tests" should be avoided. Dr. Kistiakowsky said that it seemed desirable not to have a public statement. The President said that these experiments are going on all the time, and he saw no need for a public statement. He did not believe that the experiments should be conducted in Nevada. Mr. Gates said that most of the AEC people seemed unconcerned about the remote possibility of contaminating the water table.

The President said he is convinced of one thing and that is that no free country can go back to atmospheric testing. World opinion—the adverse effect of alienating free world countries—would stop it. However, he could not see why we could not conduct experiments underground for

safety purposes. He recognized that firing large weapons out 500 miles or more would be a different question from atmospheric testing.

Dr. Kistiakowsky asked if these HE firings could be conducted in the big steel ball that he understands is at Los Alamos. Mr. McCone said too many shots are required, and too much time is needed between shots to decontaminate the ball. The President thought that, with each shot, we should find out a good deal more about the probability of any accidental explosion. Mr. Dillon observed that even if we start now to prepare for and conduct the experiments, none involving nuclear release would occur until after January first.

Mr. Dillon said that the next subject the group wished to take up had to do with the application of the Netherlands for an agreement for atomic cooperation involving a nuclear submarine. They wished to purchase the nuclear elements thereof. This question started with the Heads of Government meeting in Paris in December 1957. Secretary Dulles and Admiral Strauss made the statement that the U.S. would seek legislation to make possible such cooperation. Subsequently, we got the legislation, and the Dutch asked for this cooperation on two submarines they are building for SACLANT's anti-submarine force. We have checked the Dutch fund estimates, and technical proficiency, and their security system, and they are qualified on all counts. We have stalled on this, but feel that we are really committed. Defense, State and SACLANT support the proposal, but the AEC does not want to extend cooperation in nuclear submarines to anyone beyond the United Kingdom and Canada. It appears that Admiral Strauss did not have Commission approval to offer cooperation, and now the AEC does not want to recommend it. The President said the controlling point is that we said we would seek to arrange for such cooperation, and subsequently obtain the necessary legislation.

Mr. McCone said that the AEC must certify to the President that the proposed cooperation will promote and not constitute a risk to the common defense. He doubts whether the Dutch proposal would promote the common defense, but recognizes this is a problem for Defense to determine. The real point in his mind is that the more widely we extend this information, the wider is the risk of its compromise. Admiral Rickover, on his recent trip to Russia, concluded that the Soviets will not have a successful submarine for some time to come. The AEC feels that the best interest of the United States would be served by keeping this information close. They feel that if the Dutch obtain it, other countries will approach us for it—other countries where security is not so tight.

The President said that the North Atlantic countries are a coalition trying to develop weapon systems and doctrine for common defense. Indeed it is hard to ask the Dutch to put their effort into building anti-submarine forces on an outmoded type. He asked whether we are going to do everything that is technically advanced and further whether we are going to break up the alliance. These are the choices, he feels. The real

question is what is the importance of secrecy in relation to the importance of our alliance. The only argument that has weight in his opinion is that other countries will press us in ways we find hard to resist and that we have less confidence in the security of these other countries.

Mr. Dillon said that each country must be considered by itself. The French, Italians and Germans have asked for this cooperation. The French, whose atomic activity is penetrated by Communists, now say they will transfer this project to their Navy, which is secure. However, their lack of cooperation in NATO affairs led us to inform them that we could not go ahead on this project—that the Congress would not approve. As to Germany, they can build only 350-ton submarines under the Brussels Treaty, so the question does not arise for the present. The Italians have asked for preliminary talks but they do not have an appreciation of costs and technical operating requirements. They are not thinking of paying for a submarine and since we do not intend to give them one, we have a good “out.”

Mr. McCone recalled that we have given enriched uranium to the French for a land-based prototype. Perhaps a year from now the Russians will have a nuclear submarine system. At present we have an apparent lead. The President recalled that Khrushchev had said he is stopping the building of cruisers while continuing the construction of submarines and mine sweepers. Admiral Burke added that they are building destroyers and PT boats also.

Mr. Dillon recalled that Foreign Minister Luns of the Netherlands is here now. He saw Mr. McElroy a few days ago and will see Mr. Herter shortly. He is making a big point of the nuclear submarine. Mr. Dillon feels we cannot go back on our previous statements. Admiral Burke said that the Dutch will assign this ship to SACLANT once it is built. He said they are very desirous of keeping up a good Navy.

The President said that personally he thought we should do what the Dutch ask. He didn't know about the AEC view, but thought that Mr. McCone should talk to his colleagues. If we have allies we must treat them like allies. He recalled how the U.S. broke faith with the British on atomic agreements after we got what they had to offer. Mr. McCone recognized that, in the final analysis, the determination is the President's to make. AEC simply recommends. The President said that he recognized that there is risk, but pointed out that there is risk in everything we do. He did not think the risk in giving secrets to the Dutch is very great. Mr. Allen Dulles confirmed that Dutch security is as good as any in Europe. Admiral Burke said that a nuclear submarine costs twice as much to build as a conventional ship and requires an extra year of construction. The President asked Mr. McCone to see the AEC people and tell them his views. We do not want nuclear submarines spread all over the world, but we talked this matter over in NATO and took our decision very deliberately. The President said he doubted the Dutch

would get all of the secrets right away in any event. Mr. McCone said we could tell them we would build a submarine for them. However, he realized that the Dutch would like to build as much themselves as they can in order to hold the cost down.

Finally, Mr. Dillon said he wanted to mention the matter of the proposal for exchange of atomic reactor information with the Soviets. The President asked whether this type of exchange is not what the IAEA was created for. Mr. McCone said there was need for guidance for himself and others participating in the discussions, both as to the exchange of information and as to exchange of visits. Yemel'yanov has asked Mr. McCone to visit the Soviet Union, and Yemel'yanov would then want to return the visit, inspecting our "peaceful use" reactors and our fusion experiments. Mr. McCone agreed that the exchanges should be under the aegis of the IAEA and said that he thought Mr. Yemel'yanov shared this view. Mr. Yemel'yanov has stressed how expensive the Soviets are finding the use of atomic energy for power, and has also stated that neither country can afford wasteful duplication of the other's efforts in this field. Mr. Yemel'yanov also apparently proposed to Dr. Teller the building of a joint scientific facility—probably a nuclear laboratory in Vienna. With regard to thermonuclear fusion experiments, Yemel'yanov's suggestion was that the Russians put twenty to thirty scientists in our laboratories and we put twenty to thirty in theirs. The whole area of high energy physics is a promising one for such joint inquiry.

The President asked if we had this kind of cooperation with the British. Mr. McCone said we have a complete exchange of information with them in these fields. The President suggested that our participants in these discussions should chiefly do a lot of listening. Mr. Dillon asked that the discussions be kept within the framework of the IAEA or the Lacy-Zarubin agreement. The President said he saw no reason why this cannot be done through the IAEA. At the same time he thought we should take a close look at what information we make available. The Russian scientist wants to see our plants, and have us see his. The President wondered whether the Russians could hold out their more advanced activities. Mr. McCone said that they could, in contrast to us, since our program is public knowledge. He had no doubt they would hold out anything that we have not achieved. Mr. McCone stated that we of course would give them only unclassified information, although they would see some advances in materials which they have not yet achieved.

The President asked whether the people in the AEC think this type of exchange is a good thing. Mr. McCone said that they did, more so in fact than he did. Mr. Dillon commented that whatever we see is a gain.

Mr. Allen Dulles said that the Soviets have shown some embarrassment over their program, since it has been cut back so drastically from their earlier, unrealistic goals. Admiral Burke commented that we should not fraternize too closely with them. Our allies will think we are weakening with regard to the Communist threat.

Summing up, the President said he saw no objection to our talking with the Russians and getting a clearer idea of just what they have in mind. He was not sure Khrushchev would want to talk about this question at Camp David. The President said he is afraid that Khrushchev will occupy the time at Camp David in unproductive haranguing. He is more likely to do so in a large group. The President would like to limit the group to Khrushchev and Gromyko in addition to Herter and himself, but supposed this would not be possible. He would like to exclude Menshikov, who seems to be "bad news" and is untrustworthy. He thought we must bring out that the Russian itinerary, and schedule of events, were worked up strictly by the Russians, and they have the responsibility for what was on or not on the schedule during his travels around the country.

A.J. Goodpaster
Brigadier General, USA

499. Memorandum From Coolidge to Herter¹

September 29, 1959

Pursuant to the terms of reference establishing the Joint *Disarmament* Study, you have requested my advice on the merits of the proposal that nuclear weapons be completely eliminated.

A. The proposal has impressive merits:

(1) It has an enormous emotional and, therefore, political appeal. The threat of annihilation by nuclear warfare is removed, not only for the people of the United States but for the people of many other nations.

(2) The proposal practically eliminates the dangers of surprise intercontinental attack and of accidental war. These dangers are bad enough at the present and will get worse as ICBMs replace bombers.

(3) The proposal would mean that the homeland of the United States would be comparatively safe, so the great productive superiority of the United States over the Soviet Union could be brought to bear to win World War III as it did in World Wars I and II.

(4) The proposal has considerable logic. The Soviets have been ahead right along in the conventional arms race. They are on the point of catching up and for a time will probably be ahead of us in the nuclear race, as they get ICBMs in quantity before we do. It makes no sense to

¹ Source: Elimination of nuclear weapons. Secret. 4 pp. Eisenhower Library, Whitman File, Administration Series, Coolidge, Charles A.

insist on being behind in two races. Rather it is logical to call off one race and to concentrate on at least drawing even in the other race. We can draw even in the conventional race by building up our conventional capability and that of our Allies to equal the Soviet capability, or by equalizing conventional capability by agreement with or without a UN police force. In this connection it should be noted that an equal number of men for the Soviet Bloc and NATO would give the Soviets a great advantage because of their geographical situation, their spartan standards and their tighter command.

(5) The elimination of nuclear weapons might well stimulate our NATO Allies to increase their efforts in conventional forces, commensurate with the improvement in their economic situation which has occurred since the early days of NATO, though it is possible that NATO might collapse once the umbrella of our nuclear capability is removed.

(6) The elimination of nuclear weapons accompanied by the limitation of other arms would meet the Soviet condition of total disarmament, when they have said there will be no block to complete freedom to inspect within the Soviet Union.

(7) The proposal would force us to give up our reliance on tactical nuclear weapons, which is becoming an increasingly ineffective deterrent to local wars.

(8) Obviously, much money would be saved in the discontinuance of the expensive production, research and development of nuclear weapons and the expense of accomplishing the necessary hardening, dispersal, mobility, etc. of our nuclear retaliatory force to meet the Soviet ICBM threat. But this saving might prove non-existent for a period, in view of the necessary changes in our armed forces outlined in B 3) below.

(9) The proposal is broad and comparatively simple in concept and is thus less likely to become bogged down than are minor measures.

B. In spite of its impressive advantages, this proposal has a number of serious disadvantages:

1) Such technical information as is available to me is to the effect that, while it is possible to devise a system which will detect the diversion of significant amounts of nuclear material produced in the future from peaceful purposes to weapons, it is not possible to devise a system which will monitor the liquidation of the existing stockpiles of nuclear weapons or materials with sufficient reliability to prevent the concealment of a sufficient number of nuclear weapons to be decisive in the outcome of a major war. Perhaps a new study could develop an adequate system, but considering the vast wastes of Russia and its Satellites (let alone Red China), the probability does not look bright. Considering the continued production of plutonium by "Atoms for Peace" reactors and the continued production of delivery vehicles in the Outer Space program, the problems these two inspection systems must overcome are indeed formidable. Incidentally these factors mean that the

elimination of nuclear weapons by the "have" nations would have only a marginal effect in preventing the spread of such a capability to the "have not" nations, unless all nations similarly agreed.

2) Unless inspection is essentially airtight, the risk to the security of the United States is great, because even 100 clandestine ICBMs of high yield would be a most serious threat. Theoretically this could be offset by depositing with the UN a substantial quantity of nuclear weapons for release on the discovery of the existence of clandestine missiles in the hands of the Soviets. But realistically the time necessary to obtain the release of the UN missiles might be fatal to us and the UN missiles would probably be the first target of the Soviets' missiles. Further if such a deposit was made for release to us, a similar deposit would have to be made for release to the Soviets and there would be danger that the Soviets would seize and fire that deposit, so that they would not even need clandestine missiles.

3) The abolition of nuclear weapons would require replacing most of our air force and navy, and the rearming of our ground forces, since our planes, vessels and ground force armaments are all designed for nuclear weapons and would be highly inefficient without them. This would produce a serious gap in our defense posture and would probably cost so much as to more than offset the saving outlined in A(8) above.

4) With the nuclear deterrent removed, the size of small wars might well tend to increase. Also the tendency to start a large war would be greater.

5) Once a large war started, all bets would be off, and with the material and vehicles at hand, it would not take the Soviets or ourselves long to manufacture a substantial number of nuclear ICBMs, so that all our efforts to eliminate nuclear weapons would have been largely in vain.

6) The loss of nuclear capability by us would create a serious danger in the Far East. Conventional air attacks by Red China on Formosa would be difficult to prevent. Even if the Red Chinese could be confined to the mainland, it would be most difficult to stop them from taking over all of South East Asia.

7) An airtight inspection of us might be unacceptable from the point of view of domestic politics and security.

8) In view of the improbability of technical experts being able to come up with an inspection system which would satisfy us, to make this proposal the core of the United States position on disarmament would expose us to the accusation that we were merely making a play for publicity and had no intention of going through with it. This in the long run would do us more harm than letting the Soviets get away with their present favorable publicity.

C. Is the proposal "jumping out the window for fear of falling out", as one military man has put it, or is it a wise and major step forward—assuming of course a favorable report by the experts? It depends on whether the risks to the United States security are substantially greater under the proposal than if we rely on mutual deterrence with such

minor disarmament measures, if any, as are possible to attain. Unless the risks are substantially greater, we should obviously adopt the proposal in view of its many desirable features.

I cannot pose as an expert in balancing these risks, but it seems to me that the risks of the proposal are substantially greater. Perhaps, if the Soviets alone were involved, it might be wise to go ahead with the proposal, but with Red China in the picture there are just too many possibilities of a slip up through sabotage or otherwise, in the complicated international machinery we would have to setup to police both nuclear and conventional arms control, for me to bring myself to believe that it is wise to surrender all our nuclear capability at this time. Attempting to set the clock back is fraught with too many uncertainties. It seems to me the best we can do is to put it up to the Soviets to devise an adequate inspection system for detecting breaches of an agreement to eliminate nuclear weapons and indicate an open mind on the possibility of their ultimate elimination.

While I have consulted my staff on the general proposition of eliminating nuclear weapons and believe that the consensus of their opinions does not differ materially from the foregoing, this memorandum expresses my own personal views.

Charles A. Coolidge

500. Record of Telephone Conversation Between Dillon and Kistiakowsky¹

October 6, 1959, 6:25 p.m.

Regarding nuclear tests suspension, CDD said that before we can change our basic position from the one we had in earlier discussions it would be necessary to have further experimentation before we could be certain about what would be an effective control system. He said if the Russians agree to 200 teams and inspections a year, the necessary staffing, and to abandoning veto on budget that would be fine—but that would be so unexpected that we really don't think we have to take it into account. Dr. K. said he was not enthusiastic about a meeting of experts because if people who go there are honest and not biased, they will not be able to defend defeatism that situation is dramatically different than in 1958. Dr. K. said that although a figure of \$5 million for

¹ Source: Control system for suspension of nuclear testing. Confidential. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

2 kilotons is indicated, this does not include any instrumentation or anything else and that since the whole thing is purely theoretical concept, it would be ridiculous to base our policy on such a figure.

CDD said he feels that after the technical details are settled we will then have to decide whether we need a substantial number of inspection teams—he said someone told him there are only 2 or 3 places in the Soviet Union where they had seismic disturbances and in this case many teams would be a strong deterrent. Dr. K. said he doesn't know how many we would need—that this would depend on a political and not a technical decision. CDD said he agreed with Amb. Wadsworth when he said we should have effective control, sufficient to deter them from holding tests to any great extent (they might make one test, but controls would keep them from holding a series of tests). Dr K. said the people in Defense do not agree with our thinking and CDD said this is because they have been led to believe that there is no possibility of any sort of reasonable control and that the situation is quite different than in 1958. Dr. K. said that technically the situation is not different, but that a new factor is being considered, i.e. What is the chance of getting there and not finding an event that actually did happen? He said that factor is not technical—it is a guess and can't be brought up at Geneva.

Dr. K. said he thinks one of the primary jobs for Charlie Coolidge is to try to find out what we mean by adequate inspection—this question should be brought up to the President. CDD said he thinks there would be a difference of opinion between us and the people at the Pentagon if, for instance, it were decided that 125 inspections were necessary—they would say no and we might say yes. He said he thinks it is best to go ahead with the technical details now and later decide how many inspections would be necessary.

501. Memorandum From Keeny to Kistiakowsky¹

Washington, October 15, 1959

SUBJECT

Suggested Course of Action for U.S. Delegation in Nuclear Test Negotiations

Attached is a copy of the instructions for the U.S. Delegation to the forthcoming continuation of the Nuclear Test Negotiations as approved by Dillon and a copy of a letter from Gates to Dillon commenting on these instructions. Dillon has informed Gates that his suggested change in the “objective” will not be incorporated in the instructions. I learned privately that the original letter from Defense as prepared by Irwin was considerably stronger and that Gates has toned it down before signing.

With regard to the instructions, I consider them acceptable in view of present policy decision. However, the delegation can probably count on some real trouble since it cannot state any quota that would be acceptable to U.S. If pressed on this by Soviets as it probably will be, the Delegation will have problem in maintaining illusion that we would accept comprehensive treaty if Soviets were only reasonable on inspections.

Instructions for the U.S. Delegation

Washington, October 14, 1959

Suggested Course of Action for U.S. Delegation
In Nuclear Test Negotiations

Objective

Upon resumption of the nuclear test negotiations in Geneva, the objective of the U.S. Delegation will be to direct the negotiations so as to place the United States, by December 1, in a favorable position to table a phased treaty in accordance with the Presidential decision of July 23. Without exposing our hand at present, the U.S. Delegation should seek

¹ Source: Comment on instructions to U.S. delegation to nuclear test ban negotiations. Secret. 3 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy 59.

to demonstrate in a decisive way the Soviet attitude toward the technical and political requirements of effective international control.

Tactics

In order to accomplish this objective, the delegation should demonstrate clearly the uncertainties, the unresolved problems, and the specific requirements of effective control (particularly as regards underground detection in the light of new technical data) and Soviet unwillingness to meet even minimal essentials of control. For this purpose it is necessary to discuss the requirements of effective control in terms of technical data from seismic measurements (and their interpretation), relating to detection and identification of underground disturbances; the effectiveness of various levels of inspection; uncertainties to be resolved; and the possibilities and uncertainties of system improvements. While principal emphasis should be put on the new technical data and the underground test detection and identification problem, unacceptable Soviet positions on the veto, on staffing, on freedom of access, and possibly on phasing, should also be highlighted in order that the technical issue will not be the sole basis for subsequent U.S. action and in order not to forewarn the Soviets of our intentions.

Timing

Timing is of the utmost importance if we are to put ourselves in a position to make a definitive move and avoid further indefinite inconclusive negotiations. The program on resumption might take generally the following lines:

(a) Recall Soviet unwillingness to face up to the implications of the new data and again propose technical discussion of these data.

(b) Even if this is not accepted, the delegation should immediately embark upon a full exposition of our own analysis of the new data and the problem of on-site inspection. While we could not use the full Bacher panel type of quantitative analysis, in view of the necessity to omit the intelligence factor and the arbitrariness of the numerical probabilities assigned to the success of on-site inspection, the general assessment of the number of unidentified events even with Berkner improvements and the level and freedom of inspection required to have any substantial chance of identification could be extensively presented. The technical presentations should be sufficiently of [illegible in the original] raw data and descriptions of instrumentation employed to discredit completely any future Soviet efforts to sustain allegations that the United States has not supplied sufficient information to permit full evaluation and discussion of the new seismic data. The presentation should include a discussion of decoupling possibilities, including the theory of the Latter hole technique. It should also include a technical justification for whatever treaty language we provide on high altitude detection. The approach would be not to present or defend a specific U.S. number of inspections, but to expose the unreasonableness of the Soviet claim to favor effective inspection while at the same time accepting only "a few" annual

on-site inspections. We should highlight the Soviet refusal to discuss the relationship of level of inspection to technical facts: accept improvements required to restore even in part the estimated capabilities of the system designed by the Geneva Experts in 1958; discuss the latest available instrumentation and supply data or join in experimental efforts to improve detection capabilities.

Our line on the Soviet proposal for a predetermined number of annual inspections [illegible in the original] would be (as in the President's May 5 letter to Khrushchev) that the principle of not inspecting every unidentified event is not an issue in view of our similar original position in our draft Annex I limiting inspection to a percentage of unidentified events. Our objection is to the Soviet view that the number of inspections is based entirely on political and not on technical considerations.

(c) We would follow or intersperse our presentation on the detection problem with summary speeches on the veto, on staffing (in this case particularly a "signing off" speech in view of the line already taken by Ambassador Wadsworth that we have reached our final position on this matter); and freedom of access of inspectors (preferably accompanying this by introduction of Annex II on Privileges and Immunities).

502. Memorandum of Conversation¹

Washington, October 20, 1959

SUBJECT

Geneva Nuclear Test Negotiations

PARTICIPANTS

State Department

Secretary Herter

Amb. Wadsworth

Mr. Charles A. Sullivan—S/AE

Mr. Ronald I. Spiers—S/AE

United Kingdom

Mr. David Ormsby-Gore—Minister of State
for Foreign Affairs

Amb. Caccia—British Embassy

Mr. Charles Wiggin—British Embassy

The Secretary said that he understood that Mr. Ormsby-Gore asked for this meeting to discuss the U.S. position paper for the October 27 resumption of nuclear test negotiations. *Mr. Ormsby-Gore* said that the U.K. felt that the tactics in the paper were "exactly right" but that the British had reservations about our ability to continue with these tactics

¹ Source: Tabling a limited treaty in nuclear test negotiations. Secret; Limit Distribution. 5 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

until December 1 without weakening rather than strengthening our position. The British felt that we should aim for an earlier tabling of a phased agreement and a statement that our basic position is that effective control over underground testing is not possible at the present time. The British felt that there was some danger in creating the impression that if only the USSR were reasonable, e.g., if it would agree to a sufficient number of inspections, the problem would be solved. We should state frankly that our present knowledge permits us only to accept a ban on atmospheric, underwater, and high altitude tests. The U.K. furthermore felt that the limited treaty should be tabled in about two or three weeks after resumption of negotiations. We have already effectively pinned the Russians down on the questions of veto and staffing and there is little to be gained by further discussion of these issues. If we go back to the negotiations in the way the U.S. suggests, we will be accused of dragging them out unduly, and as the present Dec. 31 deadline on the U.S. testing moratorium is neared, there will be increasing pressure on the U.S. to declare its intentions about future testing.

Secretary Herter said that the Dec. 1 date was an outside limit. Our feeling was that we should get the technical data on the record whether or not the Soviets agree to discuss it. We do not have a definite date in mind for tabling the limited treaty, but do feel that we should call on the USSR once more to evaluate the data. We must take pains to make clear that we are not being frivolous or trying to back away from an underground test ban, but simply that we cannot run the risk of having the U.S. Senate reject the treaty because our scientists will not testify that it provides for adequate controls over underground testing. The Secretary inquired as to the status of the phased treaty. *Mr. Sullivan* and *Mr. Spiers* reported that a copy of one of the latest drafts had been given to the U.K. in Geneva but that there were several unresolved issues within the U.S. Government in connection with it. Also there were several articles, including the Annex on privileges and immunities, which were applicable to the limited treaty but which had not yet been worked out with the U.K. in connection with the comprehensive treaty. The present treaty draft included all of the controls, except on-site inspection, which would be required in the comprehensive treaty. *The Secretary* asked whether it would not be possible to provide only for a very limited control system in the phased treaty. *Mr. Spiers* explained that the theory had been that the treaty would look forward to the installation of the complete system in phases and that seismic instrumentation would be included for the purpose of facilitating research on underground detection. He pointed out that the initial phase would amount to a simple control system and that the Commission would have authority to postpone, substitute for, or not install the subsequent phases. The ban would apply to underground tests only when the Commission, with

the concurrence of the permanent members, agreed that the controls were adequate.

Mr. Ormsby-Gore said the British position was that when the limited treaty was tabled we should propose a specific joint research program on underground detection. If the USSR accepted the phased treaty approach and the research program, we would declare our intention not to resume underground tests pending the carrying out of the agreed research. *The Secretary* said that the latter point would give the U.S. real trouble since our feeling was that this would give the Soviet Union a de facto comprehensive test ban without adequate underground controls or provision for on-site inspection. *Mr. Ormsby-Gore* said that if there were no such moratorium the USSR would not accept the phased treaty. *Amb. Caccia* said that the U.S. would not need to declare this moratorium but could in practice simply refrain from conducting underground tests. Since the USSR has stated that they would not be the first to resume testing, there would therefore be a de facto moratorium.

Speaking of the matters which could be discussed by the delegations upon resumption of negotiations, *the Secretary* inquired as to the status of the peaceful uses explosion issue and wondered whether we should not press the Soviet Union further on this point. *Mr. Ormsby-Gore* said that this question had been agreed in principle with the USSR and there was little reason to press the Soviet Union on details at this point. He recalled that the remaining issues involved parity in the number of explosions which could take place and the "black box" concept. *Amb. Wadsworth* recalled that *Mr. McCone* had indicated that we could probably drop the "black box" idea and that, if so, we could agree to drop this in return for Soviet abandonment of the parity idea. *The Secretary* estimated that we could easily clear this matter up within the U.S. Government if this were the only issue remaining.

Returning to the question of the voluntary moratorium, *Mr. Ormsby-Gore* observed that the U.S. would be in a bad position to resume testing if the limited treaty were proposed, and that the U.N. would put pressure on the U.S. to refrain from further testing while negotiations on a limited treaty proceeded. *The Secretary* said that this would be a problem for the U.S. to deal with. *Mr. Sullivan* asked whether the British would be inclined to declare their intention not to conduct further tests if the U.S. were not able to do likewise. *Mr. Ormsby-Gore* said that the U.K. would have to consider this situation very carefully but that he did not believe resumption of testing by the U.K. was a practical possibility. He said that the U.K. was strongly convinced that the Soviet Union would not accept a limited treaty unless all tests were ended. The Russians have made an impressive number

of concessions in the course of the current negotiations in order to stop fourth-country weapons developments. They would not be willing to agree to the level of international control to which they now appear to be committed if underground nuclear testing were to be permitted. Thus the West would be giving up the possibility of achieving agreement with the Soviet Union on even a limited measure of international control, with all that this implies for future progress in disarmament and for the improvement of East-West relations. *The Secretary* observed that the longer the moratorium continued the more difficult it would be ever to resume testing. It was necessary for the U.S. to retain its freedom of action in this respect. *Amb. Wadsworth* wondered whether it would not be better to accept the present system with all of its uncertainties but with on-site inspection than to give up this provision and to refrain from testing anyhow.

Mr. Ormsby-Gore said that that would weaken our position on the fundamental principle of the necessity for effective control which will be of overwhelming importance in future disarmament negotiations. What we should now say is that in certain environments effective control is possible, but that through no fault of any of the parties in the negotiations it now appears that this is not the case with respect to underground tests. We should therefore pursue joint research in this area; while we are working together in such a research program we would mutually refrain from conducting any tests. He said that he felt that even under the present system the USSR would not in fact conduct tests in violation of the agreement and that there would be a severe deterrent to such testing. However, it was impossible to prove scientifically that a violator would be caught. Therefore we must operate in the light of present uncertainties. *Mr. Spiers* pointed out that under the present treaty we would be accepting a substantial period during which controls would not be in actual operation but during which the obligation not to test would apply. *Mr. Ormsby-Gore* said that a voluntary moratorium during the research program period would not be a substantial departure from our present position.

Mr. Ormsby-Gore said that the U.K. was concerned about the position we would be in if the Soviet Union made further concessions on the control system. We would then have to decide whether, after these concessions were made, we could then declare an underground ban unacceptable or whether we would have to insist on a figure for on-site inspections which was far beyond anything we could practically undertake. The position could be an embarrassing one.

The Secretary said that we should hasten our preparations for the tabling of a limited treaty so that we would be in a position to decide to do so within the next two or three weeks. He suggested that this

might be discussed with the U.K. at the working level and that an inter-departmental meeting be held in the near future to iron out the remaining policy differences within the U.S. Government. *Mr. Ormsby-Gore* then reverted to the question of the terms of the accompanying offer on a voluntary moratorium. He said that it was perhaps not necessary from a tactical point of view to make this offer precisely at the time of tabling the treaty. However, we should have a prior decision that this offer would be made if the USSR, as it probably would, rejects the idea of a limited treaty, rather than run the risk of losing the first chance we have had since the war to get a practical arms control agreement. *The Secretary* said that he could not be pinned down on this matter at the present time.

Mr. Ormsby-Gore then inquired as to how the problem of high altitude tests would be dealt with in the limited treaty. *Mr. Sullivan* said that in the present draft the ban would extend to all tests except those underground and that provision is made for high altitude controls. He said that the technical agencies in the Government regarded outer space testing as too expensive to be practical and that he therefore did not see any great problem in dealing with this issue within the Government. *Mr. Spiers* pointed out that the uncertainties and imperfections in the high altitude detection system were no more far-fetched than those obtaining in the case of underground tests. There were possibilities for conducting shielded tests behind the moon and the sun, and whereas such tests might be prohibitively expensive, so might the construction of the "Latter hole". Accordingly, some of our people felt that it would be illogical to accept these uncertainties in connection with high altitude testing at the same time that we were unwilling to accept equal uncertainties underground.

503. Memorandum From Starbird to McCone¹

Washington, October 26, 1959

SUBJECT

AEC POSITION RELATIVE TO TESTING

I am extremely disturbed over the effect that the current position of the Commission may have on our long range weapon program and on the treaty negotiations. Specifically, I make reference to the Commission's current position to the effect that we should place ourselves in a position by 1 January where the U.S. is free to resume underground testing, but without the U.S. Government's taking immediately any decision to so test (or making announcement of intent). I realize that I am focused on our weapons problems but I have tried to be balanced in my outlook and to support completely Commission decisions and desires without further argument. However, I believe I would be remiss if I did not point out what I believe is a wrong course. I believe the Commission should advocate that the U.S. should:

- a. Take a decision now to resume underground testing as soon as practical after 1 January.
- b. When the President (or other U.S. spokesman) informs Khrushchev that we can only consider now an atmospheric treaty, he similarly announce we are making preparations to resume underground testing as of some early future date.
- c. We take strong and positive action now with the British to gain support for this approach, using as tactfully as possible our weapon (and submarine) cooperation as a pry.

¹ Source: Recommends U.S. resumption of underground testing. Secret; Personal. 5 pp. Eisenhower Library, McCone Papers, Sealed File No. 3.

The steps taken in the last 1½ years by the U.S. in test cessation negotiations have been without complete agreement internally within the U.S. as to our plan and long range objectives, and without agreement with the British as to objective. They have been taken generally in the hope of securing some transitory propaganda advantage or in a scramble to avoid immediate propaganda loss (or direct conflict with the British). Because of a lack of objective and plan, we have gradually weakened our flexibility and ability to outlaw only that which can be controlled. Unfortunately, too, we have placed ourselves in a most difficult position relative to resuming an activity we need and which we know is not monitorable,—underground testing. To recall some of these steps:

May–August 1958—We initiated and carried out technical discussions of test monitoring as a separate disarmament issue. Our agreed objective was to test the Soviets’ willingness to reach realistic technical agreement on disarmament issues. (The U.S. belief was that they would not proceed reasonably, would break off the Conference, and we would gain propaganda advantage therefrom.) Though the Soviets were not reasonable, publicly they appeared reasonable enough so we could not break off the Conference. As a result:

August 1958—We believed world opinion thought the technical agreement indicated progress was possible in test cessation and this was a step toward disarmament. We had to do something. Therefore, we announced a one-year moratorium and willingness to negotiate. Our real objective was to get out of a jam, but translated it was to: test willingness of Soviets to “open up” to realistic inspection; or to show the world they wouldn’t. [We knew lower yield, useful, underground tests were unmonitorable, so we planned to retreat to a threshold concept if the Soviets proved reasonable.]²

August 1958–January 1959—We realized from new data that underground monitoring was most difficult, if not impossible. We presented data in hope that this would help our case but without firm plan of how. We realized, too, that U.K. was less firm than we, but did not press to get agreed plan or objective.

February–March 1959—Macmillan suggested to Soviets quota plan. I believe (though am not sure) we had some warning of his new approach. We did not block it, probably to avoid discrediting Macmillan.

April 1959—We finally proposed the atmospheric only treaty but were quickly countered by the “quota” and “a few.” We dropped further negotiations on this because: we could not discredit Macmillan; but must continue to show progress. The world thought we were making progress.

² All brackets are in the original.

May–July 1959—From the Bacher study all U.S. Principals finally realized a quota system would be ineffective, and the President approved this conclusion. In July (as in April) the U.S. decided again our objective must be to negotiate limited treaty and revert to underground testing until controllable. We avoided announcing (or implying) this intent because: we could not secure U.K. agreement; did not want to discredit Macmillan; but must continue to avoid break in negotiations. The world thought further progress was being made in negotiating an agreement.

September 1959—We announced extension of moratorium to 31 December to let Lodge escort Khrushchev and give time for further negotiation. All U.S. Principals at meeting when this extension was announced stated that objective had not changed from July 23rd, i.e., to negotiate limited treaty and revert to the unmonitored underground testing, and to set the stage for accomplishing this as soon as possible.

Now—We are returning to Geneva without agreement on what we are really trying to achieve. The U.S. and U.K. are pulling in opposite directions. Within the U.S., staff representatives of agencies are fighting to gain their agencies' separate ends. [For examples: State to show progress in disarmament negotiations without tangling with USSR or U.K. no matter the effect on weapon preparedness; CIA to get inspection teams into Russia even though this necessitates a comprehensive treaty; DoD to retain the possibility of a wide range of testing; and AEC to retain the possibility of underground test only.]

The key issue which needs resolution, if our negotiations are to proceed without aimless wandering, depends in the answer to one question. We know now (and all agencies and apparently U.K. agree) that we cannot monitor effectively all useful underground testing. Faced by this fact this question is: "Should our objective be to revert as soon as possible to underground testing; or are the political dangers of reverting so great as to be unacceptable?"

a. Until this question is answered, we cannot draft our public presentations to show: that we are only proceeding as the world public desires most (cessation of all tests); or that we must proceed somewhat against international desires (underground testing and why).

b. Until it is answered, our people of different agencies (as well as the U.K.) will continue to pull in opposite directions. Through plan or inadvertence, more and more small events will occur which reduce our ability to adopt one course or the other.

c. Passage of time will force us more and more into a position where we must accept the moratorium,—where the world expects us to find a solution under which there will be no more testing.

There are some arguments put forth to show that there is danger to announcing and reverting to underground testing. These are:

a. This could provide the Soviets with opportunity to break off negotiations of a first agreement, accusing us of bad faith. It might if the Soviet objective is to proceed as rapidly as possible to a "banning of the bomb." It should not if their objective is a first step toward monitored disarmament. We should be able to show this.

b. If we revert to underground testing, the Soviets may start unrestricted testing again accusing us as the provocateurs. This is a possibility, but world opinion (if it really fears fallout, as it apparently does) would probably attack them much more than the U.S.

c. The Soviets would gain more than we through any form of limited but legalized testing (particularly if they cheat a little). This depends entirely on the energy and effort we would put on the testing we can do, as compared with what the Soviets would be willing to do.

There are, in my opinion, much greater dangers in not announcing that we intend to proceed with such tests:

a. As already stated, our opportunity to resume testing becomes less and less as time passes, and events compromise our flexibility. With the passage of sufficient time we shall be in a position where we must accept perpetual cessation without any realistic control.

b. As long as we avoid announcement that we "intend to resume," we shall avoid a showdown with the U.K. (and some of our own agencies) on this issue. Unfortunately, this will lead the U.K. (and some U.S. members) to continue to hunt for reasons why decision must be pushed further back. More unfortunately (and in view of fact negotiations must proceed), it will permit them to put forth steps which further compromise our freedom of action.

c. Unfortunately, too, our defense planning (and the defensive systems in development) are proceeding on the basis of warheads which should be tested. Without test we are being forced to compromise,—in some cases on yield, but in other cases on schedules of stockpile entry, reliability and safety. It is the latter that bothers one most, and it is happening.

d. We know there are many warhead advances which we could make with underground test, but which we cannot without. Some of these could give us new systems of defense which we lack now. People will disagree now as to the importance of these future developments (as they did in 1946 when we strove to improve atomic weapons and in 1952 to develop TN). Yet, to me these are definite possibilities which if we lose we may be very sorry about later. The McRae Committee met to determine whether there was need for further test. It has been stated that it concluded we need not test again immediately. This is just not what the Committee found. In brief, it found: no defense system in development would go without a warhead because of lack of test (this was a foregone conclusion, for none are placed in development until we can promise a warhead); systems in development could be appreciably increased in effectiveness by test; other warheads were possible with test (but not without) which should lead "almost certainly" to new concepts in weapon systems and doctrine; decision must be taken immediately that U.S. will resume test, and test be resumed within a year (and report was in early August), if we were not to suffer postponement of achieving new capabilities. It should be remembered that

this was a subcommittee of the PSAC and that the PSAC has advocated for over two years (and tried to justify) complete cessation.

In summary, if we, in truth, really desire to retain a freedom to test underground as required, we must announce that we are proceeding with preparations to resume as of a particular date. As long as we do not, the various opponents to resumption (and particularly the British) will attempt to: delay the decision; develop all possible reasons why we should not resume; take steps (knowingly or inadvertently) which would further tie our hands; and to decrease thereby our flexibility until that flexibility disappears entirely. It is for these reasons I respectfully recommend the Commission reconsider its position taken two weeks ago.

Alfred D. Starbird

Brigadier General, USA

Director of Military Application

504. Memorandum of Conference with the President¹

Washington, October 27, 1959

OTHERS PRESENT

Mr. McCone, General Goodpaster

Mr. McCone said that he had spent nine days in the Soviet Union on the inspection of their peaceful atomic activities. The Soviets had kept him going constantly. He had five top AEC scientists with him. Mrs. McCone also accompanied him.

He said he had visited the ice breaker *Lenin* and had been taken out for a five-hour trip on it. The President asked what the scientists said about its power plant, recalling that Admiral Rickover, on his return, had said that it is not very advanced and advised the JCAE that we should therefore hold back on giving submarine information to our allies, lest it leak to the Russians. Mr. McCone said that the scientists told him that the *Lenin* power plant was excellent. The ship is splendidly

¹ Source: McCone's visit to the Soviet Union; Yemelyanov visit to U.S.; Dutch request for nuclear submarine; discussion with Macmillan on nuclear testing negotiations; U.K. purchase of U-235. Secret; Restricted Data. 5 pp. Eisenhower Library, Whitman File, DDE Diaries.

built in every detail. He said there is some indication the Soviets are not doing so well with the power plants on their submarines.

Mr. McCone then said that he was taken through six atomic institutes or laboratories. Generally their power program appears to be behind ours, and has been cut back markedly from their own schedules. He was told that they have slowed down in order to see how the first few plants do, and take advantage of what they can learn from them. He said their work on controlled thermonuclear fusion is very good and that they have acted very fast in this field whenever decisions are taken. They are essentially following our course, and characteristically building on a larger scale the things we are building first on a smaller scale. In the area of high energy physics, they are showing a lot of activity. This is a very expensive field, and he found opinion among them that the nations of the world could advantageously get together on this in order to save costly duplication.

He said their level of competence in nuclear matters is quite high, their scientists are good, and started work quite early in this field. Their work began in the late twenties and early thirties and has carried on since. It is quite clear that their accomplishments are by no means attributable to "stealing our secrets," although they may have gained marginal advantage from time to time on specific details in this way.

The Soviets treat their scientists extremely well, giving them various incentives, and various special things such as houses, added income, etc. The scientists have direct access to Khrushchev when required. Their plan of organization in the scientific field is very good. It is built around their Academy of Science, which has shown itself able to do things very fast and to focus attention on selected objects. At the present time top quality scientists are in atomic and missile activities, and their very best scientists are in the field of space. Repeatedly they have shown that they can do things in a fraction of the time we take—one-fifth to one-third is by no means unusual.

Mr. McCone said that he noticed that they are using some Red Army soldiers on construction work. He was told that where they do this they pay these individuals the difference between soldiers' pay and the pay of construction people. He said their instrumentation and electronics are very good. He did not see their computers or have a chance to observe their computer techniques directly, but they must be quite excellent in view of the results they are achieving.

He said he looked for any evidence relating to a nuclear-powered aircraft, and could only conclude that they are carrying it at the level of a research rather than a development or prototype program.

In summarizing regarding peaceful uses of atomic energy, he said he thought their level of effort is roughly comparable to ours. They are

not as far advanced as we are in any area. He sees no sign of any "break through" unless it might be in a highly secret aircraft project.

He said he is laying out a comparable schedule for Dr. Yemelyanov when he comes to the United States. He said that Yemelyanov wants to go further in the exchange of information than we have yet gone. Mr. McCone said that he had had Mr. Garthoff of CIA in his party and was confident he had obtained a great deal of information. He said the party went to the Ukraine, to Krivoi Rog. He was told he was the first American that had ever been there. He visited a uranium ore mine there. Also, he was taken into a mill where metal is extracted from the ore. He was told that he was the first foreigner that had ever been there. No visitor even from the satellites had previously been permitted in. Mr. McCone said that he asked for statistical information concerning their output. This was not available but Yemelyanov said he would bring it to him when he comes to the United States.

Mr. McCone then talked about the possible next phase in this field of activity. He thought that there could be exchange visits of our scientists to their non-secret installations and vice versa. The President suggested putting a few scientists in each other's plants to work there for up to a year or so. Mr. McCone thought a year might be rather long but that six months might be feasible. He commented that there are some places where we could not have them for more than a visit, because they would be in too close association with our people who are in secret activities. In addition, the President thought we could jointly build some new facilities—such as those involved in high energy physics. Mr. McCone said the Russians have indicated they desire to do this as a possible third step. The President said this whole project looked good to him and asked Mr. McCone to talk to the State Department about it. He thought such facilities could perhaps be built in Vienna near the IAEA.

Mr. McCone said he did not, on his visit, see anyone outside of scientific or atomic figures. The President asked him to talk to the State Department with the thought of bringing Yemelyanov in to see him, so that the President could question him as to what he thought he had learned or accomplished through the visit. Perhaps the fact that this is an action which does not simply reciprocate what Mr. McCone did in Russia will have some impact.

The President said he understood the Dutch feel that we are dragging our feet regarding their request for information and assistance in building a nuclear submarine. He said there is no finer group than the Dutch in NATO. Mr. McCone said the problem is that the French will demand this when we have given it to the Dutch. The President said that he didn't mind this, since we could make clear to the French that the reason we are not giving them the same information and assistance

is that their cooperation in NATO has not justified it. Mr. McCone said that if the Dutch would purchase the submarine, or even the power plant, rather than obtaining the information and building it themselves, the problem would not be too difficult. It would help us if they would wait a while for the information. He said he would try to work the matter out with State, adding that his fellow Commissioners and the JCAE are very tough on this question.

Mr. McCone said he had also stopped in Great Britain and that Lord Plowden will be here next month. The President asked Mr. McCone to be sure to bring him in. Mr. McCone said he had talked with Mr. Macmillan regarding the problem of testing. Mr. Macmillan said he was ready to have an agreement limited to the banning of atmospheric testing, provided there was a gentleman's understanding that underground testing would also be stopped unilaterally. The President said he wants very much to stop testing, but he cannot see how unilateral cessation would be acceptable. He did not know how he could gain the assurance that he thinks we would need.

Mr. McCone said that in the mine in the Ukraine that he visited there were a dozen places where a one to two kiloton weapon could be set off without our ever knowing it. Through such tests they could move into a "death ray" type of weapon. The President expressed his interest about this type of weapon, asking as to its range of effectiveness. Mr. McCone said that it is effective over a radius of 1500–2000 yards. Blast effect is so localized as to be almost negligible. High-energy radiation would kill anyone within that radius. There would be no fall-out under one design and very limited fall-out under the other. I told the President we had some information on this and would get it to him.

Mr. McCone said the British would like to work out a long-range plan for the purchase of U-235 from us. Their plant is very expensive and they would like to close it down. Regarding atomic power plants, the President said he thought the best course would be to build no more plants for a while, to wait for improvements to come along through research, and to gain experience. Mr. McCone said we are studying various future lines of possible development. To follow any single line will cost in the order of \$350 to \$500 million to bring it to a stage of producing competitive power. This is a most important study, now well advanced, and he expects it to cut down on the number of alternative concepts under consideration and development. The President said one trouble is that the scientists get many ideas and then tend to want to carry them all along much too far. It is desirable to cut down unpromising lines of effort earlier.

Mr. McCone said that he was taught a lesson by the Soviet Academy of Science. They move their people around very readily, and thereby

channel energies and shorten times of development. He thought the Soviets would be ahead of us, for example, when we get to a one and one-half million pound thrust space vehicle. The President said we are trying to do many things at once, scattering our effort and spreading contracts all over rather than having someone giving direction and setting priorities.

Mr. McCone said that, following this trip, he has for the first time been thinking that it may be desirable to put the President's Science Advisory Committee, the AEC, the NASA and certain other laboratories into one national scientific organization.

Mr. McCone finally commented that he found EURATOM disappointing in some respects. The thinking of the people is good but Europe now has a surplus rather than a shortage of conventional fuels—oil and coal—and the atomic power development is going slow. He had the impression that the EURATOM people do not consider it to be so urgent, and in this he agrees.

A.J. Goodpaster
Brigadier General, USA

505. Letter From Gates to Dillon¹

Washington, October 28, 1959

Dear Douglas:

You will recall that in the letter of September 29, 1959, the Department of Defense recommended that the U.S. seek at Geneva a phased treaty providing in the initial phase for a ban only on nuclear weapon tests in the earth's accessible atmosphere. In connection with high altitude nuclear explosions, it was noted that the detection system recommended by the experts at Geneva in July 1959 is based primarily on theory, and the Department of Defense is concerned that the United States may accede prematurely to a system which subsequent experimentation may prove to be inadequate for its purpose. It was

¹ Source: Question of a lack of effective system to detect high-altitude tests; includes summary of engineering studies. Secret. 8 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy 59.

considered that the uncertainties warrant further exploration before the United States undertakes an international commitment to ban tests in this environment.

On June 26, 1959, the Special Assistant to the Secretary of State (AE) requested the Director, Defense Research and Engineering, to conduct studies of a system for the detection and identification of high altitude explosions for the purpose of providing guidance to the U.S. Delegation in Geneva. Engineering studies are being conducted under the direction of the Advanced Research Projects Agency; a preliminary summary of their findings and conclusions to date is attached hereto. Of particular pertinence is the statement: "Theoretical estimates of detection capability are sufficiently promising to justify a comprehensive and time consuming research and development program. They are not sufficient to permit at this time any firm estimate of capabilities upon which to base national policy in the decision of whether or not nuclear tests in space can be reliably controlled." The attached engineering study was based on the assumption that all facilities, costs and manpower required were in addition to any existing U.S. capabilities.

Consideration of the summary of these studies has reinforced the view of the Department of Defense that the United States should not, at this time, agree to a ban on very high altitude tests which would depend for its enforcement upon a detection system of uncertain capabilities. There is a further consideration that, before these capabilities could be proved out, an extensive and extremely costly program of experimentation would be required.

In view of the work now in progress in formulating the U.S. draft of a phased treaty, which will require a final determination as to what the United States should propose in such a treaty in the initial phase, it is recommended that the principals of the members of the Interdepartmental Working Group on Disarmament meet at an early date with a view to arriving at a decision with respect to this problem.

Representatives of the Department of Defense would be prepared to present a short oral briefing to the principals, setting forth the salient aspects of the studies which have been made.

Sincerely yours,

Thomas S. Gates
Deputy

Paper Prepared in the Department of Defense

Capabilities and Limitations of a System of Ground Stations and
Satellite Based Detectors for the Detection and Identification of
Nuclear Explosions at High Altitude and in Space

1. The Technical Working Group on the detection of high altitude nuclear explosions on 15 July 1959 reported its findings to the Conference on Discontinuance of Nuclear Weapon Tests in terms of an assessment of capabilities and limitations of possible techniques for the detection and identification of nuclear explosions at high altitudes above the earth and recommendation of techniques and instrumentation for consideration by the Conference for inclusion in the detection and identification system. Based on recommendations by Dr. Panofsky, head of the US representatives to the Technical Working Group, the Department of State requested the Department of Defense to conduct an engineering study of a system for the detection and identification of high altitude nuclear explosions for the purpose of providing guidance to the US Delegation upon its return to Geneva in October 1959.

2. The Advanced Research Projects Agency issued work orders to the Army Ballistics Missile Agency and to the Ballistic Missile Division of the AF and Space Technology Laboratory to conduct such studies.

3. On 15 October, ARPA invited the AFTAC to join with ARPA in listening to the reports of ABMA and BMD/STL and to jointly evaluate the capabilities and limitations of the proposed system for detecting and identifying high altitude nuclear explosions.

4. The problem of providing guidance to the State Department divides itself naturally into two major areas:

a. Determination of the engineering feasibility, costs, manpower and time factors involved in establishing a high altitude detection system including ground and satellite systems.

b. A scientific study of each of the detection techniques recommended at Geneva to evaluate their capability to detect nuclear explosions in various ranges of space as a function of distance, and yield of the explosion.

5. In the short time available to conduct this study, it was not considered possible to second guess the Experts' theoretical estimates of range capabilities of the independent techniques. A final reliable determination of the potential detection ranges depends upon the sensitivity which might be achieved by the detectors, the character of radiation from nuclear explosions as a function of range, and the natural radiation background which may exist throughout the orbits contemplated for detection satellites. It is relatively straightforward theoretically to calculate the intensity of X-rays, neutrons and gammas from nuclear explosions as a function of distance from the explosion in space. It is not possible, however, to say what the background radiation will be without an extensive and time consuming research, nor is it possible to state at this time what types of detection instruments may be practical for use in satellites and exactly what their detection sensitivity will be since this is intimately associated with the level of background radiation in the space environment and in some cases with the detailed characteristics of the detectors themselves which will not be determined except through careful research and development.

6. The principal contribution of this preliminary study, therefore, has been in 4.a. above, namely, the engineering problems associated with establishing the satellite and ground platforms at which instruments for detection recommended by the technical group would be established.

7. This report, therefore, will present a summary of those engineering studies as well as an evaluation of system capability on the assumption that the ranges of the detection theoretically estimated or assumed by the Technical Working Group at Geneva are confirmed by subsequent comprehensive research programs.

8. Systems of satellites considered were those recommended by the Panofsky Working Group at Geneva. They include the Argus Satellite System of two satellites at an orbit radius of approximately 1,000 kilometers for detecting electrons trapped in the earth's magnetic field. A near earth satellite system was considered to include 8 to 10 satellites in circular orbits of about 700 kilometers in radius. A far earth satellite system was considered with 6 satellites equally spaced around circular orbits of 50,000 kilometers or larger. Finally, a system of 4 solar

satellites in orbits approximating that of the earth around the sun was considered.

9. Eight to ten satellites in near earth orbits will not provide complete coverage of the entire surface of the earth. The far earth satellite system can be made operational at almost the same time as a near earth system. The combination of poor coverage by the near earth system and evidence that a far earth system could be installed in about the same length of time prompts the decision that no effort should be wasted on establishing a system of near earth satellites.

10. The overall satellite system considered practical from an engineering standpoint only consists of the Argus Satellite System, the Far Earth Satellite System, and the Solar Satellite System. The engineering studies conducted at ABMA and STL indicate that the Argus system could be operational in the third year from "go ahead"; the far earth system could be operational at the end of the fourth year or beginning of the fifth year, and the solar satellite system could be operational about the middle of the fifth year from "go ahead".

11. The total cost of the three satellite systems would be approximately \$1,200,000,000. The annual operational cost was estimated to be \$100 million dollars per year. Limitations and capability of the solar satellite system will be presented in following paragraphs. Because of those limitations, the following cost figures are presented for the Argus and far earth satellite systems only. For this limited system the total cost would be about \$650,000,000 and the annual operating cost would be approximately \$60,000,000 per year.

12. Manpower requirements for launching teams, tracking stations, and control and analysis of the satellite systems would be of the order of 1200 people.

13. The engineering study included estimates of cost, manpower, and time factors for detection equipment to be placed at the 170 control posts of the Geneva Experts' system. The cost included two optical detectors, backscatter radar, and cosmic noise receivers, but excludes cost of building control posts. The total cost for the terrestrial system at control posts is estimated at about \$120,000,000 with an annual operating cost of about \$30,000,000. A total of over 2100 personnel would be required to operate the high altitude detection techniques at control posts.

14. In evaluating just how the various ground detectors and satellite based detectors would be integrated into an effective control system, we have applied one basic principal which has guided the United States throughout its experience with detection system design over the past eleven years. Briefly, this principal is that reliable detection and identification of nuclear explosions requires recordings from a

minimum of two independent physical techniques and preferably three or more independent measurements. Reference to the chart of capabilities of high altitude detection techniques attached to this report makes possible the following conclusions concerning possible capability of the high altitude detection system assuming that present theoretical estimates of detection range are confirmed by research program estimated to take a minimum of three years to accomplish.

a. A system including the recommended techniques at 170 control posts plus the Argus and far earth satellite system may possibly provide a reliable detection capability for nuclear explosions of 1 megaton or larger at distances of 10^5 and possibly 10^6 kilometers from the earth.

b. For explosions as small as 1 kiloton, this system could provide reliable detection by several independent techniques to distances of only 10^4 kilometers from the earth.

c. At all distances beyond 10^5 to 10^6 kilometers (approximately the orbit of the moon), only a single technique possesses the theoretical range to detect nuclear explosions at these vast distances from the earth. This technique based on X-radiation from the device is highly vulnerable to shielding considered feasible by our scientists. Its maximum range is estimated as about 100,000,000 kilometers for a shielded 1 megaton nuclear device. The solar satellite system suggested by the Panofsky high altitude working group, therefore, could be instrumented only for X-ray detection. Since the radius of the orbit of the earth around the sun is about 150,000,000 kilometers, the X-ray technique, having a range of only 100,000,000 kilometers for shielded 1 megaton devices would not be able to detect explosions behind the sun or behind the moon even if one were willing to accept the result of a single pulse of X-rays unsupported by any additional measurement as an adequate detection capability. It can only be concluded at this time that a system of solar satellites does not serve the purpose of providing reliable detection of nuclear explosions which might be detonated in the earth's orbit beyond the range of the near earth satellite system (approximately the distance of the moon).

15. Theoretical estimates of detection capability are sufficiently promising to justify a comprehensive and time consuming research and development program. They are not sufficient to permit at this time any firm estimate of capabilities upon which to base national policy in the decision of whether or not nuclear tests in space can be reliably controlled.

16. SUMMARY. It is not possible at this time to state with confidence the capabilities of a system for detecting nuclear explosions in space. It appears probable that given a minimum of three years of research and development that a reliable system for detecting shielded nuclear explosions in space out to about the moon may be possible in about five years at a cost of about three-quarters of a billion dollars for installation and about 90 million dollars a year

for operation. If theoretical prediction that the short pulse of X-rays expected from nuclear explosions is unique to such a source and is not present as a result of natural causes, and if convincing evidence that pulses of X-rays from solar activity could not be used by a violator to detonate a nuclear device and thus screen the resulting short pulse of X-rays by the longer duration pulses of X-rays from natural sources, and if such evidence could be considered sufficient without independent confirmation by other techniques such as gamma rays or neutrons, it is possible that in about five years confidence might be established that a solar satellite system could be relied upon to detect nuclear explosions in space roughly circumscribed by the earth's orbit around the sun.

17. *CONCLUSIONS*: The engineering studies indicate

a. At least three years of research are required to establish the feasibility of a system to detect nuclear explosions in space.

b. Adequate redundancy of recordings to insure reliability of detection can be obtained only for shielded explosions of 1 megaton out about as far as the moon.

c. A system to detect 1 megaton shielded nuclear explosions between the earth and the moon if proved feasible by a comprehensive research program can be installed in about five years at a cost of about three-quarters of a billion dollars.

d. Detection of nuclear explosions in space beyond the moon will depend upon whether or not research proves that a single short pulse of X-rays is unique to a nuclear explosion and cannot be concealed in some way by a violator.

e. If proved feasible a solar satellite system instrumented for measuring X-rays only for detecting unshielded explosions of 1 megaton in space roughly circumscribed by the earth's orbit could be installed for about one half a billion dollars additional to the cost of the system described in 17.c.

CAPABILITIES OF HIGH ALTITUDE DETECTION TECHNIQUES

506. Memorandum of Conversation¹

Washington, November 3, 1959

SUBJECT

Meeting of the Secretary's Disarmament Advisers

PARTICIPANTS

Department of State

Secretary Herter

Mr. Philip Farley—S/AE

Mr. Ronald Spiers—S/AE

Joint Disarmament Study

Mr. Charles Coolidge

Panel of Advisers

Mr. Robert Lovett

Mr. John McCloy

Mr. Alfred Gruenther

Mr. William Foster

Dr. James Killian

D.O.D.

Mr. Irwin

Secretary Herter expressed his appreciation that the Panel was willing to continue to give him the benefit of the advice which Secretary Dulles had found useful. He stated that there were several recent developments in the disarmament field which made it particularly appropriate to hold a further meeting of the group at this point.

Secretary Herter said that we would soon be engaged in substantive disarmament negotiations, and explained the origins of the ten-nation disarmament committee which had been agreed with the Russians at Geneva and which was scheduled to meet early in 1960. The fact that the U.N. yesterday referred the proposals which it had before it to this group for consideration assured that these negotiations would be the center of attention. Another early problem in disarmament would be the Summit meeting. As the Panel was aware, Adenauer held that disarmament was the most important subject for consideration at such a meeting and that all agreed disarmament would have to be discussed. The Secretary himself felt that it would be best not to have the ten-nation committee meet before the Summit, but rather that its commencement should be scheduled so it would receive its directives from the Summit. In preparation for these meetings Mr. Coolidge had been asked by the President and the Secretary to coordinate a joint Department of Defense-Department of State study and come up with policy recommendations. Finally there was the matter of the nuclear test negotiations which had been going on for a year. There was the problem of the U.K. moving ahead of us in our position in these negotiations, as well as newly discovered technical difficulties in detecting underground tests. Generally, we are faced with the feeling on the part of

¹ Source: Nuclear test negotiations, stability of deterrence requires greater conventional force. Secret; Limit Distribution. 6 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

most nations that we are moving into an era when progress in disarmament is essential. Although there are varying degrees of skepticism about the possibilities of such progress, there is a very real fear of the continuation of the present arms race. The Soviet proposal on complete and general disarmament makes it more important that we have positive proposals of our own to present.

The Secretary suggested that the group first be briefed by Mr. Farley on the nuclear test negotiations, after which Mr. Coolidge could present his own thinking on the broader disarmament problem.

Mr. Farley stated that we faced an unpleasant dilemma in the test negotiations, which began their second year yesterday. There has been a general rapprochement of the public positions of both sides. Although numerous differences remain to be worked out, those differences are no longer sharply defined in the public mind. The Macmillan proposal for a quota of inspections has let the Soviet Union obscure the differences between us in this key area.

A central problem relates to monitoring of underground tests. This problem assumed new dimensions with the difficulties disclosed by the new data we obtained during our last test series. Thus we face a situation where as many as 200 annual inspections might be required to obtain adequate deterrence, even if the effectiveness of concealment methods does not prove out. The U.K. agrees with us that the problem of policing underground tests is a difficult one. They also agree that the most desirable outcome for the negotiations at this stage would be a phased agreement beginning with a prohibition of the contaminating tests which are easiest to police, e.g., atmospheric and under water. However, the U.K. believes that the only way to get the USSR to agree to a limited approach is to couple it with a three-year voluntary suspension of underground tests while we do further research on the control problem. This difference of view between us and the U.K. is now reaching a crucial stage. In the meantime it has become apparent to the Soviets that we are setting the stage for a shift in position by unilaterally setting forth our own technical analysis of the problem. *The Secretary* explained that the 1958 Experts' report conclusions were based on one underground nuclear test. Unhappily, our own further tests put us in the very difficult position of having to back away from the agreed report. The USSR, on the other hand, insists on sticking with the 1958 technical conclusions. We made this mistake in perfectly good faith. Our fear is that if we agreed to what we now believe amounts to inadequate control the Senate would reject the agreement. Mr. Farley said that we believed that it was important to finish presenting our technical conclusions. Then we will be face to face with the question of whether we are going ahead with a proposal for a limited treaty and either resume tests or declare our freedom of action with respect to further testing. If this

is the route we take, our problem will be to bring the U.K. along with us and to accept the adverse impact of world opinion, which has been taking a more optimistic view of these negotiations and the prospects of disarmament in general. The dilemma we face is a difficult one. We either accept what is perhaps less than adequate policing or incur the political liabilities consequent upon a change in position.

In response to a query by Mr. Coolidge on how Communist China would fit into an agreement, *Mr. Farley* explained that the treaty would last so long as the system it provided for was being installed on schedule and that the schedule called for installation of control positions in China in the second phase. Accordingly, if it proved impossible to extend the treaty to China there would be a basis for U.S. withdrawal.

General Gruenther referred to the strength of feeling he had encountered in his own experience on the subject of nuclear testing. He felt that we had not succeeded in explaining our position on this issue both at home and abroad. He referred to the public position taken by Senators Humphrey and Kennedy in favor of a comprehensive test ban. The opposition to testing has become increasingly more apparent in the Red Cross for a long time. We are losing the battle of public opinion abroad, and particularly in Oriental countries where the problem of strontium 90 is felt more acutely because of the predominance of cereal foods. Whereas we scored a technical victory in the vote on this issue at the New Delhi Conference, it was clearly apparent that the mass of opinion was against us. The world premiere of the motion picture "On the Beach", scheduled for December 17, would increase our problems even more; it is an effective and well-done anti-nuclear war plea that would have a great impact on public opinion. He has spoken to many people at home who feel that our emphasis on the difficulties of underground detection is nothing more than a device to get out of the negotiations (e.g., George McGee and Senator Anderson). If our own people do not believe in the honesty of our intentions, we cannot blame the British. We have not been able even remotely to convince the *Washington Post* that our position is an honest one. Our present difficulties are compounded by our own previous inability to get through to the public. Our opinion at home is not united and world opinion is fast moving against us on this issue.

The Secretary asked Dr. Killian to explain the technical situation with respect to underground tests. *Dr. Killian* described the Latter hole, indicating that whereas it was at present only a theoretical possibility it represented a real uncertainty in our ability to cope with underground tests. Although it is enormously expensive and complicated and no one will know whether it will be feasible from an engineering standpoint until appropriate tests have been performed, it could undermine the whole control system if it works. The U.K. feels

that this is the major factor which has changed since the 1958 Experts' report. Furthermore, the new data from Hardtack II may not be conclusive and further experimentation is needed. The Berkner Panel felt that it was possible to restore the effectiveness of the Geneva system to compensate for the new data, but not for the Latter hole. *Mr. Gruen-ther* agreed that the large hole was a new element, adding that we in effect know about the other uncertainties before we decided to negotiate at Geneva, even though there may have been some shift in the efficiency of detection since then. *Mr. Lovett* agreed with the strength of public feeling on this issue, stating that after Gov. Rockefeller made his recent radio statement on underground tests the broadcasting company's switchboards "lit up like a Christmas tree" with callers protesting the Governor's position.

Mr. McCloy said that it appeared to him from Dr. Killian's descriptions that the difficulties of constructing the big hole were almost insurmountable and asked whether we really believed that this was a feasible evasion method for the Soviets to use. *Mr. Farley* noted that the unit of measurement for the Latter hole was football fields.

The Secretary described the instructions under which the U.S. delegation was currently operating and said that the delegation was charged with laying out the scientific material as part of the record preparatory to tabling a limited treaty. It is difficult to foresee whether we will be able to resolve our problems with the U.K., and he personally thought it might be better to have a poor inspection system for underground tests than a de facto suspension by moratorium with nothing in return. *Mr. McCloy* asked for the assessment of U.K. motivations. *The Secretary* said that the British attached a great deal of importance to achieving inspection in the USSR and felt that this would represent a break-through on the whole disarmament problem. In addition to this, Macmillan keenly feels the strength of British public opinion on this issue and is, above all, aware of U.K. vulnerability to nuclear weapons. *Mr. Farley* said that, in sum, the British felt that the technical uncertainties of the situation did not outweigh the political advantages to be obtained. *The Secretary* said that it would be difficult for us to proceed on our present course of action if the British would not go along with us. In addition, Khrushchev has said that he does not care anything about developing small nuclear weapons. The USSR is interested in stopping further refinement of U.S. stockpiles and there is every indication that they would refuse a partial treaty. He observed that on the basis of the McRae report it was hard for a layman to see any urgency in the resumption of testing, although he recognized that Defense and AEC did not share this view. *Dr. Killian* stated that it was important to get the large-hole theory to the public as quickly as possible.

Turning to the problems of broader disarmament, *the Secretary* explained the possibility of the U.S. having to withdraw some of its troops from Europe because of the balance of payments deficit, and that he had asked Mr. Coolidge to determine how this possible need might be turned into a disarmament quid pro quo.

Mr. Coolidge said that he had several general points he wished to make first. We are now faced with a broad and dramatic Soviet proposal and he felt that if our only answer consisted of proposals for small steps we would look bad in world opinion. In addition to such small-step proposals, therefore, he felt that it was sound for the U.S. to develop a long-range goal with which we could associate ourselves. He suggested the following formulation:

- "1. No nuclear weapons should remain in the control of any nation.
- "2. An adequate international peace force should be established to operate under effective international law with increased jurisdiction in the World Court.
- "3. National military establishments should be reduced to the point where no single nation can effectively oppose the international peace force."

Mr. Lovett stated that he felt it would be a fatal error to go forward with a program such as this on the basis only of mutual trust. Mr. Coolidge said that he was not proposing this and that these three points should simply be regarded as a statement of an ultimate goal. Mr. McCloy agreed that we should have such a goal and that it was a necessity if we were to get public opinion moving in our direction. The only alternative to complete disarmament may be total destruction. Dr. Killian said that he believed this was a persuasive statement, although he questioned making nuclear weapons elimination the first point. Mr. Foster agreed and suggested that point No. 2 be stressed. *The Secretary* recalled that our problem with point No. 1 was that no one had been able to find a means of detecting hidden nuclear weapons. He said that our general problem in this field is to find a starting point where we can test out Soviet *bona fides*. In this connection he mentioned the Norstad plan as a possibility. The French and Germans have always objected to the idea of small inspection zones in Europe, but the Secretary felt that this was the simplest test he could conceive. Such a zone might be combined with reductions on the part of both sides. Mr. Foster agreed with the idea of trading troop redeployments for a lifting of the Iron Curtain. *The Secretary* said that the President was disturbed that we have not been able to do anything to liquidate our "temporary" forces in Europe and that there was a general impatience with the rigidity of the Germans particularly, who wished to maintain the status quo. Mr. Lovett said that something along the lines that Mr. Coolidge proposed would serve a very useful purpose.

Mr. Coolidge said that another problem with which his group was concerned was the situation we might face after a few years when both

the U.S. and USSR will have ICBMs in quantity. Our key problem is what we can do to insure stability in the missile age. He had seen no alternative to mutual deterrence, but effort must be made to insure stability of this deterrence. In such a situation he felt that we would have to have stronger conventional forces or we could be nibbled away by the USSR while each side was paralyzed by the thought of counter-destruction if missiles were used. *Mr. Foster* agreed with this statement of the problem and said that our trading position was growing progressively weaker. The foundation for a stable deterrent was a more intensive defense effort on our own part. It is necessary to have a secure deterrent at all levels and this would require a build-up in our ability to fight conventional wars. *Dr. Killian* said that he was coming to the conclusion that the initial step toward arms reduction was creation of a better balanced and more adequate U.S. defense establishment. *Mr. Gruenther* agreed, saying that in order to proceed with disarmament we will have to increase our defense expenditures.

Mr. McCloy said that withdrawal of any U.S. troops from European forces before a Summit meeting would be the worst possible move we could make. *Mr. Gruenther* agreed, adding that because of the possibility of press leaks, which would be inevitable after such a decision, it would be almost impossible to secure a quid for the quo of troop reductions. *The Secretary* said he understood that the pressure to do this before the Western Summit was now off. *Mr. Irwin* emphasized that there had been no decision on this matter and that it had been raised merely as a warning signal.

The Secretary suggested that the advisers meet again early in December prior to the President's trip to Europe and stated that Mr. Farley would make arrangements for a specific date.

507. Memorandum for the Record by Haskins¹

November 30, 1959

SUBJECT

Planning Board Meeting with Charles A. Coolidge

On Tuesday, November 10, the Planning Board met with Mr. Charles A. Coolidge, who has been appointed by the President to

¹ Source: Planning Board meeting with Coolidge. Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Disarmament, General.

head a joint review on behalf of the Departments of State and Defense of U.S. disarmament policy, and two members of his staff, Mr. Guido Perera and Admiral Davis. The purpose of the meeting was to hear from Mr. Coolidge a reflection of the preliminary thinking which he had gone through and to solicit any ideas which members of the Planning Board as individuals might have.

Mr. Coolidge began by saying that the U.S. must make some general far-reaching proposals and place them in an attractive setting; it is useless, he said, to put forward picayune measures. He said that we should declare what we ultimately hope to get and suggested the following four general objectives:

- (1) No nuclear weapons in the control of any individual nation
- (2) An international police force equipped with nuclear weapons
- (3) A World Court with increased jurisdiction
- (4) Reduction of national forces to a point where no nation could oppose the international police force (Robert Amory later suggested that the fourth objective should refer not only to "no nation," but also "no likely combination of nations;" Mr. Coolidge agreed).

Mr. Coolidge said that of course these objectives represented a piece of "pie in the sky" today, but that he was thinking of an ultimate goals statement as something to vie with the Soviet "pie in the sky" proposal.

He suggested that we try to build on what we have got; that is, for example, that we use the United Nations. He did observe that the existing UN police force was badly mixed up.

He spoke in general terms of a codification of existing procedures as being a desirable early step, pointing out that it would not raise inspection problems. He said that a group at the Harvard Law School was studying the matter.

In discussing Soviet capabilities, he referred to the "missile gap." He said that the Soviets would have ICBMs in quantity before the U.S. and that then the DEW line will be no good at all. He said that the information he had was that the Soviets in their strategic missiles concept are relying more on mobility than upon base hardening.

He then spoke of the theory of a balance of mutual deterrence. Under this theory, there would be a sufficient number of defensive missiles remaining after an attack (as a result of base hardening or mobility or a combination of both) to permit a counter-attack upon the Soviet Union. He said that achieving such mutual deterrence would accelerate the arms race for a while, but that once we get the required number of missiles, a plateau would be reached and then defense expenditures could be reduced.

He touched briefly on the possibility of a partial disengagement of ground forces in Europe, whereby there might be a thinning out of

Communist forces in East Germany, Poland and Czechoslovakia and a concomitant thinning out of NATO forces.

He also referred to the so-called “nth” country problem and said that an excellent working paper on it had been prepared for the JCS.

He readily admitted that we cannot get to the goals unless and until there is a method of detecting clandestine nuclear detonations. He said that even the Russians had now admitted that there were insufficient means of detecting underground nuclear explosions.

Mr. McCone

Joint Disarmament Study

Mr. Coolidge

The Secretary said that several important developments had taken place since the group had met last on November 3, 1959 in connection with both the nuclear test talks and our general preparations for further disarmament negotiations in 1960. He introduced Mr. Frederick Eaton whose appointment as U.S. representative to the ten-nation disarmament committee would be announced by the White House on Thursday. He asked Mr. Farley first to report on the most recent developments in the nuclear test talks.

Mr. Farley said that since the group last met the most important development had been Soviet acceptance of the technical discussions

¹ Source: Developments in nuclear test talks, Coolidge report, troop withdrawals from Europe, Norstad plan. Secret; Limit Distribution. 7 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

on underground test detection for which we had been pressing since last January. Agreement was finally reached after considerable negotiation on terms of reference for the technical talks and the meeting began on November 25 in Geneva. So far no important developments had taken place in these talks, which have consisted to date mainly of a presentation and defense of the new seismic data by the U.S. representative, Dr. Fisk. The Soviets have hinted that they also possess new data. At the end of these talks we will have the problem of determining how the conclusions reached will affect our future course of action. Our prior decision was we had no alternative but to press for a phased treaty in view of Soviet refusal to consider the implications of the new data. As a result of Soviet willingness to undertake these talks we have reaffirmed our objective of reaching a comprehensive agreement provided that the risks involved are acceptable. Consequently it will not be known until the returns are in from Geneva whether we will have to revert to a phased proposal or can proceed to a full test ban. In response to a question by *Mr. Coolidge* about our position on high altitude testing, *Mr. Farley* described the capabilities and limitations of the system worked out by the technical group which met in Geneva earlier in the year. Our final position on inclusion of a high-altitude ban in the treaty will also have to await the outcome of the present technical talks. If we have to go back to a phased approach omitting underground tests from the initial ban it may be decided that it is illogical to accept the uncertainties in our capabilities with respect to outer space tests while we are unwilling to accept them with respect to underground tests. If we determine that the risks involved in proscribing underground tests are acceptable we would probably reach the same conclusions with respect to high altitude testing.

Mr. Coolidge asked whether if peaceful use of outer space were to be a major U.S. objective in the new disarmament talks this would have an impact on our ability to police outer space tests. *Mr. Farley* said that if a system were agreed upon to monitor all objects leaving the earth's atmosphere and to permit pre-inspection of these objects we would not have to set up a separate outer space detection system.

Mr. Coolidge said that he thought any proposal he made with respect to peaceful use of outer space should initially be limited to orbiting vehicles and not include missiles. In these circumstances no contribution could be made to the policing of an outer space test ban.

Secretary Herter reported that in the NSC discussion this morning Dr. Kistiakowsky recalled the conclusions that had been reached in a study two years ago that a ban on missiles testing would be contrary to U.S. interests at the time. He felt that enough had happened in the intervening time to warrant a restudy of this problem. *Dr. Killian* agreed that such a restudy was needed. With respect to orbiting vehicles he felt that

there was little practical military use for such objects in the foreseeable future. The key problem was missiles.

Reverting to the weapons test negotiation *Secretary Herter* said that his feeling about the strength of public opinion on this issue had been re-enforced by a discussion with Amb. Phleger who was our representative in the Antarctica treaty negotiations which concluded today. Amb. Phleger had said that it would not have been possible to conclude the treaty unless we had agreed on a ban on nuclear weapons and nuclear testing in the area. The Latin Americans, the New Zealanders, Australians and others had strong feelings on this question and felt that domestic public opinion regarded this as the most important issue today.

At Secretary Herter's request *Mr. McCone* reported on his conversations with Emelyanov on his recent trip to the Soviet Union and subsequently during Emelyanov's trip here. Emelyanov apparently took quite seriously Mr. McCone's statement that the U.S. could not accept a weapons test ban treaty unless the USSR agreed to technical talks and Mr. McCone estimated that this may have had something to do with the reversal of the Soviet position on this question. Emelyanov had discoursed at length on the developments in the USSR since Stalin's death. He took the position that there had been great changes in Soviet objectives and methods since that time and that Khrushchev was strongly motivated by three basic premises: that the victory of Communism would come about by popular choice and not by force, that war is to be avoided at all costs, and the need for the fastest possible economic development of the USSR. Emelyanov believed that Khrushchev was sincere and genuine in his desire to reach agreements with the U.S. such as in the nuclear testing field, although he was still having difficulty with the remainder of the old apparatus inherited from Stalin, among whom he named Tsarapkin and Sobolev. Mr. McCone told Emelyanov that we would have to have assurances from our scientists on the adequacy of control and that we would agree to ban tests only in those areas in which control was adequate. We will agree to end any tests that are within range of detection, whether this includes the whole range of testing or only down to a specified level. The main objectives are controls corresponding to the measures to be taken, relief of public concern over radiation hazards, and to make a start which can be built upon for further disarmament. Emelyanov said that he agreed in general with this approach and that he would take it up with his government. Emelyanov also stated that after talking with Drs. Teller and Weinberg about Project Plowshare he was less suspicious than he had been about our intentions in pressing the idea of peaceful uses explosions. Emelyanov had also stated that some people in the USSR had favored agreeing to a ban on atmospheric tests on the grounds that the U.S. would not go

along. On the general subject of disarmament Emelyanov had agreed completely that control and disarmament had to go together and that neither could be contemplated without the other. After disarmament was complete the Soviet Union was prepared to allow anyone to go any place in the USSR. This might be easier for the USSR than for the U.S. to accept, since they did not have commercial secrets to protect. He had said also that the USSR had conducted no underground tests and that they did not intend to. Khrushchev had decided not to develop tactical nuclear weapons even though the Soviet military was opposed to this position. Mr. McCone said that he was convinced that in the final analysis the Soviet Union would accept the phased approach if we pressed it.

At the Secretary's request *Mr. Farley* explained our position with regard to continuation of the voluntary suspension. The convening of the technical meeting made it less likely that we would reach a crucial point in the negotiations by the end of the year. The way has been paved, by a statement made by Amb. Lodge on November 19 at the General Assembly, for a further continuation of the moratorium on a short-term basis. Lodge had emphasized that controlled suspension was our objective and that we did not intend to fall into the trap of an indefinite uncontrolled moratorium which would reduce our bargaining power vis-a-vis the Soviet Union. *Secretary Herter* stated that he did not believe it would be necessary to show our hand on this question or to make any final decisions until the very last minute. *Mr. McCone* agreed and said that he supported the position expressed by the Secretary at a recent press conference that the moratorium should be continued on a week-to-week basis.

Secretary Herter then asked Mr. Coolidge to present to the group the review of his thinking that he had outlined in the morning to the NSC.

Mr. Coolidge recalled that at the previous meeting he had stated his conviction that the U.S. should offer a long-range disarmament goal and should put forward also specific immediate steps which would provide a test of Soviet intentions and present the fewest possible of the complications involved in "package" approaches. He distributed the following statement as an expression of the long-term goal:

"The present policy of the United States on arms control matters should be to favor verifiable arms control measures which tend toward establishing world peace under law; namely, a world in which:

1. Rules of international law prohibiting armed conflict between nations shall be in effect, backed by adequate jurisdiction in a world court and by an adequate international peace force.

2. National military establishments shall have been reduced to the point where no single nation or group of nations can effectively oppose the international peace force, and no weapons of mass destruction shall be in the control of any nation."

Secretary Herter reported that the President was generally favorable to this type of a statement.

Mr. Coolidge continued by outlining the immediate steps which we might propose which he characterized as constituting "2½" measures. The half measure consisted of pursuing the present Geneva negotiations to a successful conclusion. The others would be, first, to propose a system to insure that all vehicles entering orbit were used for peaceful purposes only. The second would be the Norstad plan, involving the establishment of an inspection zone with joint air and ground inspection teams and overlapping radar in an area covering Holland, Belgium, Denmark, Germany, Czechoslovakia and Poland. This would be combined with a freeze on non-indigenous forces at their present levels. When the system was installed and working we would propose a thinning out of troops in the area. This proposal would be presented as a disarmament plan which would give us working experience in inspection techniques. This proposal would also take advantage of our probable need to withdraw two or three divisions from Europe due to our balance of payments difficulties. He recognized, on the other hand, that this proposal would create great difficulties with deGaulle and Adenauer. *Mr. Foster* supported the European zone idea and stated that he had informally sounded out Jules Moch on the Norstad plan. Moch had told him that he personally favored this approach although his government did not. He thought that a proposal along these lines would be negotiable with the USSR. *Secretary Herter* said that he supported this kind of proposal because he believed that it was the best way to test whether the Soviets really meant business in disarmament.

Secretary Gates said that his concern about this suggestion stemmed from its similarity to the disengagement proposals which had been put forth by Mr. Kennan and which had frightened the Germans terribly. *Mr. McCloy* said that he would be extremely worried about putting forward a proposal such as Mr. Coolidge had outlined. *Secretary Herter* pointed out that a less specific version of this proposal had been incorporated in the Western Peace Plan and had been accepted by our allies in this context. He recognized that a substantial difference was made by the fact that then it was connected with reunification of Germany and that there will be great difficulties with Adenauer in taking it out of this context. *Mr. Coolidge* observed that Norstad was more strongly in favor than ever of his inspection zone ideas but felt that they should not be combined initially with a thinning out proposal. *Secretary Herter* said that Norstad would be willing to agree that IRBMs not be stationed in the zone but that he wanted no other restrictions on deployment of weapons or men.

Secretary Gates said that we were faced with the choice of either reducing our manpower or having a bigger defense budget. We were

presently spending \$22½ billion for Personnel and Maintenance and Operation and this was entirely out of balance with other expenditures. This factor was considerably more important than the balance of payments problem. It would be impossible to reduce our overall forces without withdrawing some troops from Europe. *Mr. Foster* said that the Norstad plan would allow us to get started on establishing inspection and control, which was of extreme importance. *Secretary Gates* said that we could proceed on the present basis for another fiscal year only. He acknowledged that the President feels strongly on this subject, believing that our troops were sent to Europe for emergency purposes only and the situation had now become frozen. He himself believed that it was a misuse of forces to keep so many men in Europe. *Mr. McCloy* said that the Germans would take this as an abandonment by the U.S. and that it would be a very bad tactical error to pull out forces prior to the Summit. *Secretary Gates* said that there was now no intention to reduce European forces during the next calendar year.

Dr. Killian inquired whether the Coolidge group had looked into the problem of achieving stable deterrence. *Mr. Coolidge* said that his conclusion was that one of our overwhelmingly important objectives was to work for an invulnerable retaliatory force. *Secretary Gates* said that studies recently completed in the Department of Defense show that between now and 1963 neither side could win a war without striking first. The importance of pre-emptive attack would grow continuously between now and this period. This projection held good even taking into consideration our plans for base hardening, development of Polaris, increasing mobility and the use of storable liquid and solid fuels. *Dr. Killian* said that he had reached the conclusion that we will be in the best stance to achieve progress in disarmament when we have gotten ourselves into a position where we can take risks that we cannot now accept because any surprise attack would leave us unable to retaliate. We can only accomplish this by increasing our defense expenditures. *Secretary Gates* said that he expected to spend a good part of the next year before the Congress justifying our present defense budget.

Returning to the preliminary conclusions of his review of disarmament policy *Mr. Coolidge* said that the possibilities of developing an international police force appeared to be quite barren given the attitude of the majority of U.N. members. Thus he felt the only immediate steps which could be taken towards Part I of the general goal he had outlined would be (a) to regularize U.N. procedure for appointing a U.N. "presence" in troubled areas and adding the power in U.N. teams to mediate disputes; (b) reviving and pressing for codification and development of international law; (c) repealing the Connally amendment and agreeing that disputes on the interpretation of the language in treaties must be submitted to the World Court.

Secretary Herter explained the timing requirements for development of our disarmament position. He would like to be able to deal with some specifics such as the Norstad plan at the Western Summit meeting December 19. It is not yet decided when the ten-nation committee will meet since we prefer to have it begin in May, after the Summit, whereas our allies prefer to have it start before the Summit. We are prepared, if they press the point, to agree to convening March 15, although we believe the group could do nothing but “putter” until after the Summit. *Secretary Herter* said he was very disturbed at our lack of specific ideas on disarmament. The Russians have a position, the British and French both have specific ideas, although the first stages of the British plan seem to be restricted to “study groups” and the French plan starts out with “good faith declarations”. The smaller nations of NATO look to us to take the lead in this field and we cannot fail them.

Mr. McCloy said that he was still disturbed about the Norstad Plan. It was not a small step. Politically it had the greatest implications of just about anything we could propose. It is not a question of numbers of men, but of the concept of disengagement. It would mark the beginning of the collapse of our whole forward strategy. *Secretary Herter* said that we must have concrete suggestions to present. He was impatient with the Germans and their generally negative attitude. They continuously stress the importance and the priority of disarmament but have never presented a single useful idea. With respect to the Norstad plan he thought it was primarily a question of presentation. It must be put forward in a way that does not appear to the Germans as the beginning of their neutralization. *Mr. Foster* repeated that in his view there was a great deal of logic behind the Norstad idea. He agreed that we could not afford to keep the same number of troops in Europe as we have today. *General Gruenther* said that he thought we could sell the idea of reducing U.S. forces. The Norstad plan would have some military advantages but he was afraid of its psychological impact on our allies.

Secretary Herter said that there were limits to the numbers of men we could pull out from Europe, both for the reason *Gen. Gruenther* had stated and because the only substitute for our troops would be new German divisions so long as French forces were occupied with the Algerian conflict. We would soon reach a point where many of our allies would be nervous about the number of Germans under arms. It was clear to him that the Russians also were genuinely afraid of a strongly armed Germany. *Mr. Foster* strongly endorsed the last remark.

Dr. Killian reiterated his conviction that *Mr. Coolidge* should look closely at the advantages and disadvantages of controlling missile testing. It is quite possible that if we made such a proposal now it would come into effect only after we have had a chance to better our capabilities vis-a-vis the Soviet Union but before we had reached a point of no

return on missile control and before weapons such as the small mobile Minuteman were developed. *Secretary Gates* said that he thought it might be as much as five years before we were in this position and that Defense would oppose such a ban. *Dr. Killian* said that he thought the American public was not aware and should be made aware that the U.S. can never again have a supremacy deterrent as it did when it had the monopoly on nuclear weapons. The best we can get is a system of mutual deterrence and it is illusory to think we have a capability for keeping military supremacy. Our major and most crucial problem in the years ahead is to make sure that this system of mutual deterrence was a stable one both through arms control measures and unilateral action to increase the invulnerability of our retaliatory power.

509. Record of Cabinet Meeting by Starbird¹

Washington, December 11, 1959

RECORD OF CABINET MEETING, 11 DECEMBER 1959 *CONSIDERATION OF TEST MORATORIUM NEGOTIATIONS*

1. Those in attendance included: the Vice President; Secretary Herter; Mr. Gordon Gray; Mr. Dulles; Mr. Allen; Attorney General Rogers; Mr. McCone; General Persons; Mr. Farley; Dr. English; General Loper; General Fox; and General Starbird.

2. Mr. Gordon Gray and Secretary Herter introduced the meeting. They stated that consideration of the subject at this meeting was informational in nature and not intended to make decision. The primary reason for the consideration at this time was the fact that the announced moratorium expires on 31 December; a decision must be taken by the President immediately after his return as to what would be the U.S. announced policy to apply thereafter.

3. Secretary Herter then gave a summary account of the negotiations to date. Somewhat to our surprise the Soviets agreed in August 1958 in the Conference of Experts to a system for the monitoring of testing. With regard to monitoring underground tests, the system's capabilities had to be evaluated largely on the basis of only one underground nuclear shot. Later in HARDTACK II (in October 1958) several underground shots

¹Source: Nuclear testing suspension talks. Secret; Restricted Data. 4 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing. Drafted on December 14.

were fired. These revealed that the capability of the Geneva Conference of Experts' system was less than had been earlier thought. The President proposed an "atmospheric only" ban but this the Soviets refused. Our officially announced period of moratorium for negotiation was for one year—through October 31, 1959, but was extended later to December 31. When we realized from the HARDTACK II data that the system had a lesser capability than originally thought we insisted that there must be joint technical discussions of this new data. If satisfactory technical discussions could not be carried through, we might have reverted to a limited treaty. The Soviets resisted this strongly. However, finally they "caved in" and there is now underway at Geneva a technical discussion of the underground problem. We are receiving detailed reports on the Technical Conference. They are of such complex nature that it is hard for a layman to understand them. It does appear that we have presented all of our new data and that the detailed elements are now being discussed. There is some pessimism as to what may emerge from these discussions. Secretary Herter then asked Chairman McCone if he desired to add any comments to this summary.

4. Mr. McCone stated that he thought it was too early to tell whether or not any agreements would come from the present technical discussions. The Soviets had obviously been caught off balance by our presentation on decoupling. Our people are apparently doing a good job of presenting their data. In the earlier high altitude conference, the Soviets had held back from any agreement initially but had finally reached agreement on many elements of the high altitude detection report. Mr. McCone then explained that there were three serious questions with regard to underground testing.

a. What could the Geneva Conference of Experts' system (even with improvements) actually detect and identify and what would be the number and procedures of inspection for those events detected but not identified?

b. Could decoupling by a major factor be accomplished? If this could be done, quite large shots could be made to look so small that they would not be noticed.

c. Third and finally, how effective could be a system of on-site inspection in actually proving that a nuclear event had occurred? There was a great deal of difference of opinion in this regard.

5. Thereafter a rather general discussion occurred on various aspects of the problem. The more significant items that were brought out are as follows:

a. As to necessity for the U.S. testing, Secretary Gates spoke at length: both on the necessity for conducting certain safety experiments right away; and on the long-range benefit to our military position from devices we could develop but would have to test. With regard to the former, he brought out that certain restrictions apply to certain of our

weapons. The experiment to answer certain questions in this regard had been approved by the President but we did not know how to handle the public relations aspects without serious propaganda danger during the presently announced moratorium period. He felt these experiments should go forward as quickly as possible after 1 January. With regard to the later and broader aspect, he pointed out the dependence of our military posture on nuclear warheads. He illustrated gains by explaining that the so-called [*text not declassified*] systems that might be developed.

b. The Vice President stated that he knew there were differences of opinion among the scientists as to what we could gain from testing. He asked Dr. Kistiakowsky's opinion. Dr. Kistiakowsky stated that a Panel covering only possible U.S. gains from testing had concluded: the greatest and most urgent problem was that of answering the safety questions; that there was no necessity for immediate testing to meet the requirements of systems currently in development.²

c. Mr. Dulles commented in answer to a question that we had no indication that the Soviets were currently testing.

d. Secretary Herter explained that one thing that handicapped us in knowing what to do was the general lack of clear and consistent scientific indication as to exactly what were the capabilities of the monitoring system,—that opinions differed. Dr. Kistiakowsky stated that the scientists could advise that shots above a few kilotons should be detectable and identifiable (if decoupling were not considered). He stated further that below a few kilotons they would advise that the system would not be fully reliable; also that if decoupling worked much greater shots could be concealed but decoupling was expensive. He mentioned that there had been already certain improvements in the instrumentation which would improve the system. When Secretary Gates indicated that a very extensive program (Vela) was necessary to prove out the detection system, Dr. Kistiakowsky indicated that this was not the purpose of the project. The main purpose was that of improvement of system instrumentation already existent to permit a system of improved capabilities. Beyond describing the capabilities in the manner shown the scientist could not go. It was up to those concerned with policy to decide what should be the nature of the agreement considering the capabilities and limitations of the system.

e. Mr. Allen commented to the effect that perhaps we should take a system of the 20 control posts only, and without on-site inspection. After all, if the control posts detected questionable events and these were revealed publicly perhaps this would deter violations. All Principals connected that they believed that this would not be adequate deterrence but without discussing in full. Mr. Herter believed this would give up an advantage for which we were bargaining (presumably some real inspection in Russia).

f. Mr. McCone explained that perhaps a logical answer to our situation was to propose a threshold system. In explanation, if the detection scheme were capable with its on-site inspection of effectively monitoring, for example, blasts of 10 KT and above, then we would agree to

² Note: This was only a part of the Panel's finding, of course. The total finding went on to the general effect that warheads for systems in development could be improved significantly through testing and that other systems of great promise should be possible if testing were permitted. [Footnote is in the original.]

forego such blasts but not forego those that were of yield less than 10 KT. Decoupling introduced somewhat of a problem but this might not be insurmountable. He brought out that it was the original intent of the U.S. at the time the negotiations began in October of last year to introduce at the appropriate time the threshold concept. Such introduction had not yet occurred. Mr. McCone also read what he believed should be the announcement made by the President just before 31 December. A copy of this is enclosed.

g. Later Mr. McCone said he wished that there was a way that the U.S. could take the initiative. He suggested that we announce we would forego all atmospheric tests but would consider ourselves free to revert at any time to underground testing should it be required. Secretary Herter doubted the Soviets would accept this. In answer to query, he mentioned the British continually indicated they would be prepared to accept a more limited system than the U.S. desired. In answer to a specific query of the Vice President as to whether Mr. McCone believed that we could work out with the Soviets an agreement permitting underground testing, Mr. McCone replied in the negative.

6. The Vice President commented to the following effect during the general discussion. It appeared to him that there were three possible courses and that there were strong supporters of the three. Those courses were: to revert in the near future to underground testing; to forego for an extended period (whether it be stated as on a “week-to-week” basis or otherwise) all testing and without any inspection system; or to take whatever inspection system could be negotiated in return for a comprehensive system. He believed this would be the way the President would look at the matter when he returns. As to the first of these approaches (revert in the near future to underground testing) he felt that the President would be in a most difficult position to announce this, at least in the early future immediately after his present good-will trip. He and others mentioned successive events of the future which might dictate again and again against an announcement at that time that we were reverting to testing,—the Summit Conference, the President’s trip to Russia, and the U.S. election. We might in actuality then find ourselves in a position where we had only one of the other two choices.

7. The Vice President pointed out that the President on his return would have many things that would have to be done in a short time. He asked Mr. Gordon Gray to complete a memorandum for record which could be given to the President, or used in connection with informing the President of these discussions.

Alfred D. Starbird

Brigadier General, USA

Director of Military Application

Enclosure

Announcement

510. Memorandum of Meeting¹

Washington, December 11, 1959, 10 a.m.

SUBJECT

Moratorium on Nuclear Testing

Present: The Vice President, General Persons, Secretary Herter, Mr. Farley, Secretary Gates, Deputy Secretary Douglas, General Loper, General Fox, Secretary Anderson, Attorney General Rogers, Chairman McCone, General Starbird, Dr. English, Director Dulles, Dr. Scoville, Director Allen, Dr. Kistiakowsky and Gordon Gray

Mr. Gray opened the meeting by indicating that the Vice President had wanted to have a discussion of the moratorium on nuclear testing. Mr. Gray suggested that the Secretary of State might give a general summary of the situation and that Mr. McCone might follow up in more detail, particularly with respect to the technical discussions now in progress in Geneva.

The Vice President made it clear that the purpose of the meeting was not to arrive at any decisions but perhaps to help in arriving at recommendations to be made to the President upon his return. He was concerned about timing and about the necessity which would confront the President immediately after his return to decide as to what would be the U.S. announced policy to apply after the expiration of the moratorium on 31 December.

Mr. Herter said that of course the principal problem was with respect to a decision as to what we do after the first of the year. The question is whether we extend the moratorium.

Mr. Herter then gave a summary account of negotiations to date. Somewhat to our surprise the Soviets agreed in August 1958 in the Conference of Experts to a system for the monitoring of testing. With regard to monitoring underground tests, the system's capabilities had to be evaluated largely on the basis of only one underground nuclear shot.

Later in HARDTACK II (in October 1958) several underground shots were fired. These revealed that the capability of the Geneva Conference of Experts' system was less than had been earlier thought. The President proposed an "atmospheric only" ban but this the Soviets refused. Our officially announced period of moratorium for negotiation was initially for one year—through October 31, 1959, but was extended later to December 31. When we realized from the HARDTACK II

¹ Source: Moratorium on nuclear testing. Top Secret. 9 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.

data that the system had a lesser capability than originally thought we insisted that there must be joint technical discussions of this new data. If satisfactory technical discussions could not be carried through, we might have reverted to a limited treaty. The Soviets resisted this strongly. However, finally they “caved in” and there is now underway at Geneva a technical discussion of the underground problem. We are receiving detailed reports on the Technical Conference. They are of such a complex nature that it is hard for a layman to understand them and Secretary Herter confessed that he could not ascertain from the cables whether we are or are not making progress in the discussions.

Mr. McCone then spoke, suggesting that there are essentially three serious problems with regard to underground testing:

1. The question of the adequacy of a detection system. For example, what could the Geneva Conference of Experts’ system, even with improvements, actually detect and identify and what would be the number and procedures of inspection of those events detected but not identified?

2. The problem of on-site inspection. This problem itself contains two questions: first, one of criteria for inspection (in which the Soviet effort seems to be to establish criteria which in effect will prevent inspection) and second, a question of what we can do when we get to the site.

3. The problem of decoupling. For example, could decoupling by major factor be accomplished? If this could be done, quite large shots could be made to look so small that they would not be noticed.

Mr. McCone said that he did not think we could now draw conclusions as to the outcome of the technical discussions but he doesn’t now see any real prospect of a common approach. The Soviets had obviously been caught off-balance by our presentation on decoupling. Our people are apparently doing a good job of presenting their data. However, Mr. McCone said that one could never be sure that agreement could not be reached. He recalled in the earlier high altitude conference the Soviets had held back from any agreement initially but had finally reached agreement on many elements of the high altitude detection report.

Mr. Herter then spoke again to the question of timing. He pointed out that it was probable that somewhere between the 18th and 21st there would begin a recess until January 4. This has not been definitely agreed but seems to be the consensus of all parties.

Secretary Herter stated that if it turns out that we just cannot agree with the USSR, we are prepared to lay on the table a phased agreement which would immediately ban atmospheric tests alone. However, in any event, we are faced with the question of what to recommend to the President concerning the moratorium which expires on December 31.

Mr. Herter expressed the view that we should make no commitment as to any definite time for the further withholding of underground tests and that in our own minds we should really think in terms of continuing the moratorium on a week-to-week basis. However, he felt that we should publicly say that we have no present intention of resuming testing but reserve the right to do so.

At this point the Vice President said that on the basis of conversations that he had had with many people, he felt that there were three main points of view. He said that there are first those who want to begin underground testing now; second, there are those who feel that we should never resume tests; and third, there are those who feel we should not resume if we get what he described as a foolproof agreement.

To the Vice President the real question was this: Do we resume testing if the Soviets make an offer which is inadequate from our point of view but which may seem plausible to the world?

The Vice President expressed a reservation in his mind about the week-to-week principle pointing out that this might by reason of negotiations and other world developments in effect mean an indefinite moratorium.

Mr. Gates at this point pointed out that our whole defense rests on nuclear weapons. He also said that we must be able to experiment with weapons for safety purposes and we have a problem of definition within a definition. Is, he asked, the release of nuclear energy tantamount to weapons testing? He pointed out that we had been long prepared to engage in experimentation for safety purposes which would perhaps result in a release of nuclear energy but that there had always been some reason to postpone this experimentation, such as the Khrushchev visit and the Eisenhower trip. There might continue to be reason to avoid announcing resumption of tests by reason of the Western Summit Meeting, the East-West Summit meeting, the Eisenhower visit to the Soviet Union, U.S. elections, etc.

The Vice President then pointed out that the President will soon return as a sort of international "prince of peace" and the realities of the situation lead him to believe that the President simply cannot within say, sixty days, order tests on any basis including underground unless in the meantime the Soviets do something egregious. He pointed out that public opinion hangs over us all the time and he would want to raise this question: If we should by reason of public relations have a moratorium in effect, do we then take the best inspection system we can settle for?

Mr. McCone then referred to the safety problem. He acknowledged that the percentage of danger is small but it is there nevertheless and it is imperative that we have experimentation which unfortunately will result in the release of some nuclear energy.

Mr. McCone then pointed out that he had discussed the threshold theory with Mr. Vasily Emelyanov and that Mr. Emelyanov did not seem to object. Indeed, he said that Mr. Emelyanov had told him that at one time the Soviets were prepared to propose a ban on atmospheric testing alone on the basis that the U.S. would reject it and propaganda advantage would result. Later they had been afraid that we would accept it and hence did not propose it. Mr. Emelyanov promised to consult his Government with respect to the threshold principle but there had been no further word.

Mr. McCone expressed the view that perhaps the logical answer to our situation was to propose a threshold system. In explanation, if the detection system were capable, with its on-site inspection, of effectively monitoring, for example, blasts of 10 KT and above then we would agree to forego such blasts but not forego those that were of a yield of less than 10 KT. Decoupling introduced something of a problem but this might not be insurmountable. In any event, Mr. McCone expressed the hope that the Technical Conference would bring in the threshold theory or develop so as to permit us to bring it in.

Mr. McCone then asked if we could agree that we would extend the moratorium on a week-to-week basis. Mr. Herter said it would be better to put it on a basis of no present intention to resume testing. The week-to-week concept would be our own private approach.

At this point then Mr. McCone read a proposed announcement a copy of which is attached. No copies were circulated and the announcement was not discussed in detail.

The Vice President said that he knew there were differences of opinion among scientists with respect to the military necessity of early resumption of tests and suggested that Dr. Kistiakowsky speak to this point. Dr. Kistiakowsky described the McRae Panel report and its conclusion that the greatest and most urgent problem was answering the safety questions and there was no necessity for immediate testing to meet the requirements of systems currently in development. However, he acknowledged that this was not a net evaluation and did not take into account the state of the art in the Soviet Union.

The Vice President then asked about such developments as the neutron weapons and asked whether these could be developed without further testing. It was agreed that they could not be. Mr. Gates then observed that these weapons, including the development of clean small weapons [*text not declassified*], were of considerable importance to the national security. Dr. Kistiakowsky described more in detail what the neutron weapon is.

The Attorney General asked if we had any evidence that the Soviets were now or had been engaged in underground testing. Mr. Allen Dulles replied that there was no evidence whatsoever. The Attorney

General then asked whether, if we did not continue testing and the Soviets did, would this put us at a military disadvantage. The consensus was that we would be so disadvantaged. The Attorney General then observed that history would judge the policy makers rather harshly if it ultimately developed that we were withholding testing and the Soviets were not and we had thereby suffered a military disadvantage.

Mr. Herter then adverted to the seeming paradox of the fact that the uncertainty which runs like a thread through this whole matter might redound to our advantage. He pointed out that as the discussion in the meeting had indicated, there was no absolutely foolproof system. In view of the fact that one cannot be sure of avoiding detection, this uncertainty may act in a sense more as a deterrent than would absolute certainty at certain levels because the Soviets would not know exactly what could be detected and identified.

At this point, Mr. Gates pointed out that although this was not a budget discussion we must bear in mind that the kind of an inspection system we were discussing would cost large sums of money and would take a long period of time to install. When Secretary Gates indicated that a very extensive program (VELA) was necessary to prove out the detection system and develop instrumentation, Dr. Kistiakowsky indicated that this was not the purpose of the project. Instrumentation is available. The main purpose is that of improvement of system instrumentation already existent to permit a system of improved capabilities.

Mr. McCone repeated that it would take several years to install the system and in the meantime there would be a deterioration of the atomic stockpile and of the laboratories. He wished also, he said, to raise two other issues: first the question of Communist China and second the Ormsby-Gore talk. With respect to Communist China he pointed out that here was a vast land area where underground testing could be conducted at will without adequate detection and inspection. He said that his reference to the Ormsby-Gore talk was the Department of State cable dated December 9 from Wadsworth, outlining what Mr. McCone described as a very ominous and disturbing conversation with Mr. Ormsby-Gore of the UK, in effect suggesting that we might have to depart from our traditional position of "no disarmament without thoroughly effective control." (Cable attached)

Mr. McCone wondered whether we were getting ourselves into a position of policy control by the UK. He invited Mr. Herter to comment on these points.

Mr. Herter replied that from the beginning it was apparent that the UK wishes to reach an agreement. This was true before their recent elections and continues to be true. The UK, he said, was prepared to make many concessions which we have not been prepared to make. Indeed, they want us to declare another moratorium. Mr. Herter said

that the British would probably do this on their own part and there was nothing we could do to stop them. With respect to Communist China, Mr. Herter pointed out that we have a treaty article which would seek to include Communist China. However, there was no point in tabling that until the three powers agree among themselves.

Mr. McCone pointed out that by reason of information the British are getting from us, they do not need to continue their own test program.

At this point there was a discussion of the state of the art of seismology.

Secretary Herter commented that one thing that handicapped us in knowing what to do was the general lack of clear and consistent scientific indication as to exactly what were the capabilities of the monitoring system. He said there were differing opinions. Dr. Kistiakowsky replied that the scientists could advise that shots above a few kilotons should be detectable and identifiable. He said further that below a few kilotons they could advise that the system would not be fully reliable. Also, if decoupling worked, much greater shots could be concealed. He indicated that there had already been certain improvements in the instrumentation which would improve the system. However, Dr. Kistiakowsky said that beyond describing the capabilities of the system, the scientists could not go. It was up to those concerned with policy to decide the nature of the agreement, considering the capabilities and limitations of the system. With particular reference to decoupling, Dr. Kistiakowsky pointed out that if we accept the notion of decoupling then regardless of what the experts agree in their present discussions, we will not have an adequate system. The question is, he thought, whether we really believe the Soviets will undertake this costly and difficult operation for evasion purposes. He indicated the range of costs of a big hole of \$20–50 million. To underscore his point, he said that it was possible to conduct a test behind the moon in the outer atmosphere but raised the question of whether it was realistic to suppose that anyone would really attempt it.

Mr. Allen expressed the view that perhaps we should take a system of the 20 control posts only and without on-site inspection. After all, he said, if the control post detected questionable events and these were revealed publicly perhaps this would deter violations. There seemed to be no agreement on this point.

Mr. McCone then asked if we could not work out of the dilemma by taking the initiative; why don't we come out and say that we won't test in the atmosphere—period. Mr. Herter expressed his view that this would not be wise because he feels that we should get something for such a declaration in the way of an inspection system.

Mr. McCone then reported on the meeting he had had with some members of the Joint Committee on the preceding day. He said that

probably an 80% majority of the Committee wish us to resume testing right after January 1st.

Mr. Gray then said that he wished to point out that we were really perhaps talking about two different problems—one was the experimentation for safety tests which might release some nuclear energy but which could be treated as experimentation for safety purposes and not as the resumption of weapons testing—second, was the question of the resumption of nuclear testing. Mr. Gray said that it seemed to him that there was a consensus that as long as the negotiations are going on and indeed in any event for the foreseeable future the political problems confronting the State Department would prevent the President from announcing a resumption of nuclear testing. However, if the safety problem was as great as those responsible for defense said it was then in the interest of national security the President might feel it essential to go ahead with the experimentation.

Mr. Herter then said that the State Department had been ready and willing for these experiments to be undertaken. He said that Dr. Kistiakowsky felt that they could be described as experiments and not testing. However, said Mr. Herter, the Defense Department had resisted this; he thought perhaps because it could be used as a lever for an agreement to resume testing. Mr. Gates denied this as a Defense Department position but Mr. Herter reiterated that he had understood this rather clearly from Mr. Irwin.

At this point, Mr. McCone broke in to say that it was not the Defense Department which was resisting proceeding with the experiments under the presently announced moratorium, but the AEC. He said that if this work were done at the laboratories where there was a sophisticated press it would be impossible to avoid headline stories which would describe the experiments as nuclear weapons testing. This, he pointed out, would be for the Soviets, propaganda-wise, the equivalent of an actual resumption of testing. He therefore was opposed to proceeding under the current moratorium with these experiments because no way could be found to conduct them without the release at some point of nuclear energy.

Mr. Gray said there appears to him to be one major question which we weren't facing up to and that was this: Would the continuing international political situation be such that in fact we would never resume testing? Mr. Herter observed that the State Department was not recommending such a position. Mr. Gray responded that he did not suggest that anyone was recommending such a position but as a practical matter was this not a possibility? If so, we would have an uncontrolled moratorium and if this were to be inevitable (and he expressed the hope that it would not be) then would not we want to face the decision

of taking the best system we could negotiate even if it turned out to have only primarily intelligence values?

The Vice President said that what all of this suggested to him is that perhaps some decisions which one might think could be indefinitely postponed might have to be made rather early upon the President's return. He asked Mr. Gray to complete a memorandum for record which could be given to the President, or used in connection with informing the President of these discussions.

Gordon Gray

Special Assistant to the President

511. Telegram From Harold Brown to McCone¹

Washington, December 26, 1959

A. I would summarize the happenings and results of technical working group No. 2 as follows:

1. The Soviets accepted the suggested instrumental changes and ideas for future improvements. They rejected the HARDTACK II results and other conclusions about seismic detection and identification. They also refused to accept the U.S. Delegation formulation of criteria for eligibility of seismic events for inspection, which stretched the technical situation as far as we felt we could go in the direction of optimism without allowing most or all small nuclear explosions underground to be mistakenly identified as earthquakes by the criteria. There was thus no agreement nor any narrowing of the gap between US and USSR on any technical item of substance. The UK, though strongly wanting some kind of agreed report, was substantially in accord technically with the final US report.

2. The contrast between the honesty of the US Delegation and the subordination of technical evaluation to political requirements on the part of the Soviets was very evident. For example, while agreeing to the correctness of the very large decoupling factor of the large hole in private, they denied it at the formal sessions. They made an extremely dishonest presentation to the question of magnitudes, purporting to show that there were only a fifth as many earthquakes of size equivalent to a given

¹ Source: Results of technical working group no. 2: foolproof detection impossible, U.S. should resume testing. Secret. 6 pp. Eisenhower Library, McCone: Papers, Test File, Dec. 1959.

nuclear explosion as believed by the Conference of Experts, but offered to leave things as they were in 1958, showing that they did not take their own purportedly scientific position seriously. Most important of all, they made it clear that they would accept a set of criteria only if these criteria eliminated almost all earthquakes from eligibility from inspection, whether or not this was justified by the technical situation. The U.S. Delegation, when it found that it could change its criteria so as to eliminate more natural events without too much risk of misidentification of explosions, did so. The Soviets presented, and stuck to, criteria which would certainly have identified all the underground HARDTACK explosions as earthquakes and made them ineligible for inspection. This kind of behavior indicates that inspection by technical agreement in the international control organization would never occur under the proposed treaty, and is one of most discouraging things about the negotiations to date.

3. It is clear from the work of the US technical group during the past five weeks that the system capability is considerably less than believed even a few months ago.

a. The criteria, which were as liberal as we felt could be agreed, leave almost all seismic events equivalent to 5 KT with RAINIER coupling unidentified, and even at some tens of KT a large fraction will be unidentified and, therefore, eligible for inspection. Though the aids of selection are expected to improve this situation considerably, no one can guarantee this, or say how much. This can be found out only through several years of research, and at the end of this time there is a good chance that as many new questions will have been raised as old ones answered.

b. On the other hand, preliminary calculations by Bethe and others, as well as by the Soviets, indicate that a decoupling factor of several (perhaps even five) can be achieved by choosing a different medium, (e.g. granite, which is everywhere) instead of the RAINIER tuff, or a greater burial depth, or a different geography. Though we have no exact calculations and therefore made only a reference to "considerable variation of amplitude" in the report this could mean that instead of for 5 KT, the statement that almost no equivalent earthquakes are identified by their seismic signals applies to 15 or 20 KT. That is, magnitude 4.4 may mean 15 or 20 KT instead of 5 KT.

c. On-site inspection is now agreed by the US technical people to be very difficult, that is, its probability of success may be very small. The failure of geophysical techniques "forces us to place very much greater reliance on aerial, ground, and underground visual and photographic surveys directed toward the observation and detection both of geologic and terrain disturbances as well as those of unusual human activity. Both of these kinds of evidence may be greatly diminished or possibly even completely eliminated in some cases by careful planning on the part of a potential violator."

The Soviets maintain that the experts' report says that on-site inspection has a hundred percent chance of success. They persisted in this with the statement that drilling would always find debris even after Bethe pointed out that the area to be inspected was so much larger than the dimensions of the radioactive region from an explosion that it

would take fifty thousand years to find by that method. No statement about inspection appears in our final report, because it was felt that the subject is non-quantitative, and the statements about it in the experts' report cannot be contradicted. However, it is clear that Soviet and US interpretations are very far apart.

It developed that the probable area of location of a seismic event is more nearly 2,000 square kilometers than the 200 given (though qualified) in the experts' report. The U.S. Delegation tried to allow in its criteria for 500 square kilometers where necessary. The Soviets wanted to consider everything not located to within 200 square kilometers ineligible for inspection, which would eliminate almost every event. If the inspection area is only a fraction of that within which the event is actually located, this situation alone reduces the probability of success to at most 10 or 20 percent, independent of efforts to conceal the evidence.

d. The large hole decoupling proved to be, by the evidence of engineers who have washed out large holes by solution mining, much easier than had been thought. Multiple pump operation could produce a 75 kiloton hole in as little as two years for less than \$20,000,000. In connection with the use of intelligence to find such activities, it is of interest that during most of the construction period only a two man crew would be required.

B. My own ideas on the procedure to pursue now are as follows:

1. We have been negotiating for some time on a comprehensive ban with the idea that the difficulties of policing underground (and deep space) tests would lead the Soviets to suggest or at least acquiesce easily to a threshold idea. It is obvious that they will not do so without great pressure from us. The disagreed conclusions of technical working group No. 2 provide the US with the best opportunity we may ever have to make clear to the world that the proposed control system does not in fact control underground (or space) explosions at all, below some yield (or beyond some distance). This has never been made clear to the world or US public, nor has the fact that no radioactive hazard exists from such explosions. Both of these ideas must be given wide publicity, no matter what our policy on testing may be, simply because they are true and important.

2. If world public opinion (or our opinion of what world public opinion is) makes all testing impossible for the US even though the Soviet Union may test clandestinely, then it is better to withhold testing unilaterally and not have the control system, because the presence of the inadequate control system would:

a. Lead to a false sense of reassurance. The public would not realize that the Soviets might very well be testing, while without the system they would realize it.

b. Serve as a "first step" toward other inadequate control systems to monitor real disarmament agreements which would place the US in very grave peril by depending on Soviet good intentions for our continued existence.

c. Generate extreme tension between the U.S. and the Soviet Union by channeling inspections into the most sensitive areas and efforts of the Soviets, the system must rely on intelligence and intelligence will

invariably point to the most sensitive areas, without knowing whether they contain nuclear test activities or something else.

3. The U.S. should propose a ban covering the atmosphere, space out to 100,000 kilometers, and underground for yields higher than about 100 or 150 kilotons. The underground situation could be handled by setting a magnitude of about 5.5, which the explosions could not exceed. A big hole to handle much more than 100 to 150 kilotons is still considered very expensive and time consuming, and so developments necessitating such yields would be made very much harder, if it is felt important to inhibit them. A few inspections a year would be enough for events above magnitude 5.5 (I estimate there are only a few tens of such events per year in the Soviet Union), and smaller events would be ineligible for inspection.

4. To avoid Soviet stalling on such a proposal, the U.S. should announce that it now reserves the right to carry out such explosions at any time, and will do so whenever it is ready and its defense needs demand. The actual execution could await an educational plan of the kind described in *B.1* above which should be accomplished in a few months. If an actual military development shot is considered too embarrassing at the moment, the DITCHDICGER experiment might be carried out with the statement that in the absence of an agreement and a detection system, everything is completely a matter of trust, and that the world can trust us when we say that this shot has only peaceful aims. The Soviets have hitherto been able to deflect U.S. attempts at a limited treaty merely by ignoring them, and letting the U.K. put pressure on us to continue negotiating on a comprehensive ban which we know to be technically incapable of being monitored. Another eighteen months of this kind of activity must be avoided, and the announcement that we are no longer bound to refrain from testing would help avoid it. Even more effective would be an early resumption of low-yield underground tests following an educational campaign, which would put real pressure on the Soviets to reach an agreement consistent with the capabilities of the control system.

5. It may be that the U.S. would lose more in allied and neutral opinion by resuming tests than it stands to lose by a gradual weakening of our military strength. However, one should remember that this deterioration could well make us unable to defend either ourselves from a massive attack by denying us the ability to retaliate with mobile missiles which could survive, or to defend our allied and the neutrals with effective weapons of limited war. I find it hard to believe that we cannot explain our case to the rest of the world well enough to reduce to acceptable proportions the propaganda losses following upon a refusal to accept a comprehensive treaty which is not accompanied by a comprehensive control system.

I think we can make our case. To do so, however, we must take a strong line insisting on a threshold or a limited treaty, corresponding

to the capabilities of the system. We must stick to that line. We must let the U.K. know that we mean it and that we expect them to support us in what they know to be technically justified. Finally, we must let the Soviets know that this is our final offer, and that we do not intend to continue the present uncontrolled ban. We can best do this by resuming tests which are allowed under the arrangement we propose without waiting for the conference to act on it, otherwise the Soviets will inevitably decide we are bluffing. The disagreed conclusions of technical working group two, particularly on criteria, provide a logical public justification for such a policy on the part of the U.S. The justification has existed for some time within the Government, where the facts have been known, but we are unlikely to have again as good a peg for a strong and positive policy as has been provided by the results of the technical discussions during the past month in Geneva.

The Secretary said that a number of significant things had occurred in connection with the Geneva negotiations since the last meeting of principals. The technical working group had resulted in a largely disagreed report. The Secretary asked Dr. Fisk to describe the impasse that had been reached and to give his appraisal of the technical situation. *Dr. Fisk* reviewed the course of the meeting, describing the position that the U.S. had taken on the new Hardtack data, the "big hole" decoupling possibilities, system improvements and technical criteria establishing eligibility for on-site inspection. Dr. Fisk said that it was obvious from the outset of the meetings that the Soviet delegation was operating under strict political instructions and it proved extremely difficult to center the arguments on strictly technical considerations. The Soviets never consented to informal meetings until the end of the talks and even then their representatives were under severe constraints. This was unlike the situation that prevailed in the summer of 1958 where informal sessions proved most useful. The meeting ended without any agreement on the US data or its implications. Whereas the Soviets accepted the "big hole" theory they challenged its feasibility and the lack of experimental foundation. Dr. Fisk interpolated that his own first reaction to the big hole had been that it was a bizarre idea. He now felt that it looked more feasible than he had first thought, if constructed in salt domes. The Soviets agreed with all of the improvements we suggested and in general with anything which was optimistic. There was no agreement on criteria, although at some points the Soviet and US drafts coincided. Under the terms of our criteria a large majority of seismic events would be eligible for inspection. The Soviet approach would allow inspection only of highly suspicious events, such as those occurring in aseismic areas. Our delegation took the position that it was impossible to assign degrees of suspiciousness. Dr. Fisk said that he found it significant that the Soviet Annex to the final report does not contain the Soviet criteria proposals and that this must mean they themselves recognize that their position is absurd and that it would fall apart when subjected to objective technical scrutiny. Dr. Fisk continued that despite the failure to reach agreement the meeting had resulted in a far broader understanding on the part of all participants of the technical problems involved in underground detection. All of the US data is now on the record. He referred to the fact that Federov had blasted the US presentation at the last meeting and that he, Dr. Fisk, had tried to answer him on the spot. The effectiveness of our response could no doubt be improved. In general Dr. Fisk felt there was little doubt that the USSR genuinely wanted a treaty but they would not admit anything which makes the problem of detection look more difficult than it did in 1958. Sir William Penney of the UK delegation was in almost total agreement with the US position. The UK annex to the report was only slightly different in its emphasis on minor points.

The Secretary said that the Soviet annex was a nasty document and reflected on the integrity of our scientific team. He felt consideration should be given to how we might most effectively answer the Soviet attack. He said that we were now confronted with the problem of where we go from here and referred to the decision which had been made when the Soviets accepted the technical talks that we would review our position in the light of the conclusions of the technical meetings. Under the US criteria 90 per cent of the events which were detected would be inspectable and this would amount to a very large number. There would be thousands of events of 1 kiloton and above and the problem would be immense. *Dr. Fisk* agreed but stated that auxiliary information, when used by experts, could reduce by a factor of two or more the events which might have to be subject to inspection. However, this still left a very large number.

The Secretary said that there were several different ways of proceeding. First, we could press the Soviets further to accept our criteria. The second would be to get agreement on a quota of inspections sufficiently high to provide an adequate deterrent. *Amb. Wadsworth* felt that the Soviets might take our criteria but that they would not go very high on the numbers. *The Secretary* was concerned by our lack of a sound basis to defend before the Senate an agreement which provided practically no deterrence to violations in lower yield underground tests. We were confronted with two questions in connection with tomorrow's meeting with the President. First, what should we recommend to the President with respect to the extension of the moratorium which expires December 31. Second, what direction should the negotiations take upon reconvening January 12. He recalled that there had been a prior decision to table a limited treaty and that this had been reversed when the Soviets accepted the technical talks. Given this background he felt that there were two courses open. The first was to give up any attempt to control underground testing altogether. The second was to reconcile ourselves to accepting less than adequate. A third approach which had been suggested appealed to him more than either of these alternatives, namely, to propose a threshold (expressed in terms of seismic magnitude rather than kiloton yield) above which underground tests would be banned. He asked *Dr. Fisk* to comment on the feasibility of this approach. *Dr. Fisk* said that there is a difference in view between ourselves and the Russians on the correlation between yield of an explosion and seismic amplitude, but there appeared to be general agreement among seismologists on the relationship between signal amplitude and seismic intensity. *Mr. McCone* said he thought that the approach was a feasible one.

Secretary Gates suggested that one way to combine our objectives of establishing a new direction and rebutting the Soviet attack on our scientists would be to draft and despatch a Presidential letter deploring

the attack, referring to the lack of technical agreement and suggesting reversion to a phased treaty such as had been put forward on April 13. *The Secretary* said that he saw two practical dangers that had to be balanced in deciding what to do in the present negotiations. The first is that we should avoid concluding a treaty that does not hold water. On the other hand we must recognize that we live in a world that does not like nuclear testing and our procedure will have to take this reality into account. This is why he felt that the threshold idea offers the best possibility. The world wants us to exert all possible efforts to reach an agreement and the threshold principle, which would ban underground tests in the highest yield ranges, would be supportable in public opinion. We would take the position that the arbitrary position of the Soviets and their refusal to engage in objective technical discussions left us no alternative but this approach. At the same time we would propose a joint research program and express the hope that further work would allow us gradually to achieve the objective of pushing the threshold down. If the Russians reject this suggestion the onus for failure will be on them and we will be in a much better position vis-a-vis world public opinion with respect to resumption of our own testing. *General Cabell* said that the Soviets have played the technical talks break down in a low key and that their propaganda had emphasized the areas of agreement which had been reached and de-emphasized the areas of disagreement. *The Secretary* said that this confirmed his view that they genuinely want to reach an agreement and that we should take advantage of this desire.

Mr. McCone said that he was disturbed about leaving unanswered the Soviet attack on our scientific presentation which he felt should be brought into public perspective promptly. *Dr. Fisk* said that he hoped we would avoid having this degenerate into a name-calling contest and felt that it would be more effective to play this quietly. *Mr. Farley* said that we might emphasize that the Soviet name-calling was an indication that they had been unable to counter our technical arguments and that we should put out again the technical facts which had led us to the conclusions we had reached.

The Secretary said that he liked Secretary Gates' idea of a letter from the President. *Mr. McCone* agreed and said that he also felt that threshold suggestion would have appeal if it were technically practical. *Secretary Gates* felt that the threshold idea could be mentioned in the letter but that it did not need to be made as a proposal. *Dr. Fisk* said that there were some technical problems with the threshold proposal, such as our ability to set out a procedure to determine an average magnitude value when confronted with scattered seismograms, each of which had a slightly different amplitude. *Dr. Kistiakowsky* said that he felt it would be practical to put forward the threshold proposal as long as the threshold were tied to magnitude, as the Secretary had suggested,

rather than to yield. *Dr. Fisk* said that it is hard to avoid the conclusion that if it is difficult to write criteria for on-site inspection, it will be even more difficult to establish the criteria in terms of instrument reading for a threshold. If this were the direction decided upon early and careful study would be required.

Dr. Kistiakowsky said that the threshold proposal could be sweetened by proposing advance notification of any underground tests conducted below the threshold, and if provision were made to use these tests as part of a research program to advance the art of seismology which could lead to a gradual reduction in the threshold. *Secretary Gates* said that this proposal made good sense.

In connection with the drafting of a Presidential letter *Dr. Kistiakowsky* observed that it would be best to avoid going deeply into technical considerations and that it would be best to issue a factual statement to which the President could refer. *Mr. Farley* suggested that the President might say he had instructed the scientists to go to Geneva to conduct a free and objective scientific inquiry and that thereafter his attention had been drawn to *Federov's* intemperate attack. He had then asked the scientists to report to him on this matter and he was transmitting the report to *Khrushchev* under cover of the latter. This approach would get far more public attention for our position than the Soviet attack had received. *Mr. McCone* reiterated that we should take early initiative with a factual statement which *Dr. Fisk* and his group might prepare.

The Secretary asked *Dr. Fisk* how long it would take to get a scientific study of the feasibility of the threshold. *Dr. Fisk* said that he thought a week would suffice once the appropriate seismologists and staticians had been assembled. *The Secretary* asked that such a study be made as a matter of priority. If the study concluded that it was not feasible to suggest a threshold we would have to re-examine the position we would take in the negotiations. *Secretary Gates* suggested again that it would be better not to propose a threshold but to suggest only that this possibility be jointly studied. *The Secretary* disagreed, stating that it was far better to make a firm proposal. This would provide a basis for demanding a modest number of inspections. In any case it would be better to take what we can get in terms of a ban on underground tests than to abandon the objective entirely.

The Secretary referred to the need to make a public announcement regarding our future testing policy. He preferred a statement to the effect that we had no plans to resume testing, that we were presently studying the documents from the technical discussions, and that we would state our position on the question in the future. *Mr. Gray* suggested that we should announce that we would not engage in atmospheric testing but that we would reserve the right to resume underground tests. *The Secretary* said that this would reduce *Amb. Wadsworth's* bargaining

power in Geneva to the vanishing point if it became necessary to propose a phased treaty. *Secretary Gates* agreed. *Ambassador Wadsworth* said that he would prefer continuation of the week-to-week extension to Mr. Gray's proposal.

The Secretary said that there was a further alternative course of action which had not been considered and that was to take up the Tsarapkin suggestion that the full system be installed and a temporary ban on underground tests be put into effect for a two or three year period. He was personally not keen on this alternative although it may have to be considered in view of the British position. It is clear that the U.K. will split with us when it comes to actual resumption of testing. *Mr. McCone* observed that the British could afford this position only because they get weapons data from us. *The Secretary* said that the question of resumption of testing had to be considered in the light of the importance for us of further underground testing. Whereas this is essentially a political decision we need to have the technical facts available. He recognized that it was difficult to answer the point that you never know what further testing may produce and that important technical break-throughs, presently unforeseen, may materialize. *General Twining* said that the Joint Chiefs of Staff, although they were now prepared to accept an adequately controlled cessation of tests, had always thought that any cessation was a big mistake. The Chiefs felt that once tests were stopped we would never be able to resume them. He was convinced that they were right in this assessment. *Mr. McCone* said that the AEC was not prepared to comment on the need for further U.S. testing but could state that a nation which was free to conduct underground tests could make significant technological advances in a period of three years.

The Secretary said that he would like to stick with the threshold proposal. This had tremendous political advantages for us in showing that we were willing to go as far as we possibly could even in the face of the obstinacy displayed by the Soviets in the technical talks. This would be far better for us publicly than an immediate resumption of testing. *Mr. McCone* agreed. He stated that a group of scientists were scheduled soon to meet at Pasadena and that this might offer an opportunity to get a quick assessment of the feasibility of a threshold. He added that Dr. Brown of Livermore had supported the threshold idea. *Dr. Kistiakowsky* said that he felt that the difficulties to which Dr. Fisk had alluded could be minimized if the treaty were drafted to say that no tests would be conducted which would produce a signal larger than magnitude, say, 5.0. At the same time we would state unilaterally that we would not test above a certain yield, say, 20 kilotons, that would allow us a sufficient margin of error. *Dr. Fisk* agreed that with a "guard band" concept of this type many of the difficulties would be reduced. *Dr. Kistiakowsky* stated

also that our first proposal did not need to spell out all of the details but could be made in fairly general terms. *Under Secretary Dillon* said that we did not have to have a firm proposal by January 12, although we should work out the technical details as quickly as possible. *Ambassador Wadsworth* said that we should prepare our position during the recess on other outstanding points which would give us momentum in the meetings in case there was a delay in presenting our new position. We should aim at presenting a counter “package” proposal of our own on these issues.

The Secretary then reviewed the order of presentation for the meeting with the President tomorrow, observing that there appeared to be general agreement on the course of action we should follow.

513. Memorandum From McCone to the AEC General Manager¹

December 29, 1959

On Monday, December 23, Secretaries Herter, Gates, Dillon, General Twining, General Cabell (representing Mr. Dulles) and the writer met with Dr. Fisk for the purpose of reviewing the results of the technical conference at Geneva and also determining recommendations to be made to the President concerning (a) the handling of the test moratorium after December 31, and (b) guidelines to be followed by Ambassador Wadsworth when the Geneva conference resumes on January 12.

On Tuesday, December 23, the some group met with the President at Augusta to discuss the above subjects and to receive the President's directive concerning the policies to be followed.

It was decided:

1. The United States policy with respect to test moratorium which expires December 31, should be as outlined in the attached press release made by the President at Augusta this morning.

2. It is our desire to genuinely seek agreement on test suspension under satisfactory conditions of inspection and control.

3. Since it appears impractical to arrange proper safeguards for small underground explosions, Dr. Fisk's scientific group are to

¹ Source: Details decision made by the President on U.S. position in nuclear testing ban talks. Secret; Personal. 2 pp. Eisenhower Library, McCone Papers, Test File, March 1960.

immediately explore and report the feasibility of establishing a threshold (which might be relatively high) and possibly would be expressed in terms of seismograph readings.

4. If it is possible to deal with the question of the threshold in this way or otherwise then the delegation will be instructed to seek a treaty which would ban atmospheric testing and underground testing above the agreed threshold with no prohibition on testing below the agreed threshold level. It is recognized that there is the risk of "cheating" by decoupling, but it was felt that this might be an acceptable risk if all conditions would be satisfactorily met which would include, among other things, the installation of adequate number of properly instrumented detection stations and an agreement on a reasonable number of unrestricted on-site inspections.

Note: Further discussion of the risks inherent in decoupling are not necessarily foreclosed.

5. If the Fisk scientific group report that the establishment of a threshold is not feasible then Ambassador Wadsworth will be instructed to seek an atmospheric treaty with no prohibition whatsoever on underground testing.

6. Under both 4 and 5 above it would be agreed that when and as technological improvements permit extending the area of suspension then the treaty will be amended to include such expanded areas. Special emphasis will be placed on the intention of the United States to continue research and to perfect detection methods for the purpose of expanding the agreed areas of suspension.

7. Throughout both meetings indignation was expressed by all parties over the intemperance of the Soviet scientists' comments at the conclusion of the Geneva technical conference. These statements are to be refuted by Dr. Fisk through public release of the verbatim transcripts of pertinent parts of the conference. Furthermore, the intemperate conduct of the Soviet scientists will be forcefully brought to the attention of the Soviet government through appropriate channels.

John A. McCone

Press Release

514. Telegram 5162 to London¹

Washington, January 7, 1960, 12:28 p.m.

5162. VERBATIM TEXT. Deliver immediately to Foreign Secretary Lloyd following message from Acting Secretary. Advise date and time of delivery.

QUOTE.

January 6, 1960

Dear Selwyn:

Since the adjournment on December 19 of the Nuclear Test Cessation negotiations in Geneva, we have been devoting much thought to the situation created by the Soviet refusal to acknowledge the technical facts regarding the problem of underground detection and identification. This refusal and the discourteous manner in which our scientists were treated have given us a good deal of concern. I am enclosing for your personal information a copy of a letter which Chris sent to Gromyko just before he left town for a short vacation. Gromyko was informed on delivery of the letter that we have no present intention of making it public. So far we have had no response.

Both the British and American scientific delegations were in accord that the capabilities of the control system recommended by the experts in 1958 are not as great as previously believed. As long as the Soviet Union refuses to concur in this evaluation of our difficulties, we find ourselves without any basis for attempting to reach agreement in the political conference on the provisions of a comprehensive treaty which, while taking the problems fully into account, would, at the same time, seek to overcome them.

In these circumstances, we feel that upon the resumption of the talks on January 12, we should press the Soviet delegation to accommodate itself to the scientific facts as we see them. In particular, we should stress that it is both logically and practically impossible to proceed with negotiations for a comprehensive test ban treaty without a set of agreed criteria and without established procedures for initiating and carrying out on-site inspections. We are opposed to any reconvening of the technical working group; any necessary technical questions might

¹ Source: Transmits letter from Dillon to Lloyd outlining U.S. position in resumed nuclear test suspension talks. Confidential; Limit Distribution. 4 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, UK Officials Correspondence with Secretary Herter.

be discussed either at the political conference itself, or in such *ad hoc* sub-groups as it may prove desirable to set up.

We cannot, of course, now predict how the Soviet delegation will react to such an approach, but their reaction should indicate the area of agreement now possible between the two sides. If the Soviets do not prove to be forthcoming within a week or two, we feel that there is no alternative but to revert to some sort of phased treaty. We naturally have very much in mind our proposal of last April that we negotiate a phased treaty to be applicable initially to atmospheric tests, with a correspondingly simplified control system. At the same time, we believe that if it should prove technically feasible, it might be advantageous for the Western position, before proceeding to this scheme, to advocate a treaty including a limited underground ban above a prescribed threshold.

Our specialists in this matter are now studying whether it would be technically feasible to define a threshold in terms of seismic magnitude. By putting the threshold in magnitude instead of kiloton values, we would avoid disputes with the Soviets both about the proper scale for converting explosion yields into seismograph readings and about large cavity decoupling. The Soviet objective of keeping the number of inspections to a minimum would mean that they would bear part of the burden for whatever threshold might be adopted. As you remember we have always maintained that there is a direct relationship between the number of unidentified events and the level of inspection required. As soon as our study is completed we will be in touch with you about our specific ideas.

We believe that a threshold approach would be an earnest of our wish to accept obligations under the treaty up to the very limit of what it is scientifically possible to control at the present time. It would be understood that, as advances were made in detection and identification techniques and agreements reached for their effective use, we would be willing progressively to lower the threshold. In addition, we might well at the outset propose a jointly agreed program of research with the USSR to speed up progress in seismology. I think you will agree that this proposal would have the additional merit, as compared with the April suggestion for a limited treaty, of providing justification for the installation and operation of a full-scale control system on the territories of the three original parties.

In the light of the major problems which remain unresolved in the technical area, we do not now consider it fruitful to push to immediate decisions on political-organizational issues. We are not now willing to deal with the Soviet "package" proposal as such, but we understand that it is sensible to continue discussions on such questions as would have to be settled in any type of treaty. The U.S. Delegation, therefore,

expects to have several new suggestions for dealing with matters such as the powers of the Commission and the Administrator. It plans to discuss these as well as the general position outlined in this letter with the U.K. Delegation in Geneva within the next few days.

With best wishes,

Sincerely,

Douglas Dillon
Acting Secretary

The Right Honorable
Selwyn Lloyd, C.B.E., T.D., Q.C., M.P.,
Secretary of State for Foreign Affairs,
London.
END QUOTE.

Mr. Dillon referred to his letter of January 7 to Foreign Secretary Lloyd outlining in general terms the course of action to be pursued

¹ Source: Discussion of appropriate threshold for underground testing. Secret. 8 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

upon resumption of the Geneva negotiations January 12th and noted that the main element to be filled in was the question of the threshold. He called upon Dr. Kistiakowsky to present recommendations based upon the work of a group of advisers which had met on Wednesday to consider this question.

Dr. Kistiakowsky said the group of scientists which had worked both in California and here, had concluded it is technically possible to define a threshold in terms of the magnitude of seismic events detected by the control system. He distributed copies of a definition of magnitude based upon straightforward measurements which, apart from minor quibbles, would probably be acceptable from a technical standpoint even to Soviet scientists. He said that the technical group had concluded that above a magnitude of 4.25 the definition he had distributed could be readily applied. Above magnitude 4.5 it would be possible to test safely up to about half the corresponding kiloton yield since the magnitude would be uncertain by some 0.1 to 0.2 magnitude units and the yield of a device can not be predicted in advance with complete accuracy. He said the one minor point on which they had not reached complete agreement was merely a matter of choice, namely how far out you should go with the instruments used to measure the critical magnitude. He distributed a table indicating the number of events that would be located and unidentified at various magnitudes if the U.S. definition and criteria were applied. The table is attached. He said that the group had decided to recommend, although it did not represent a purely technical judgment, that a magnitude of 4.75 would be a useful point at which to define the threshold. This magnitude corresponds to the Blanca shot in the Hardtack series, so we have a definite fix on instrument readings for this magnitude. If the Soviets stick to their own interpretation of the Hardtack data they would, under that threshold, not be able to test more than two kiloton devices. The U.S. on the basis of its interpretation would feel free to test devices up to and possibly above 10 kilotons, without the use of decoupling, in a medium comparable to that of the Rainier shot. The level of the threshold to be chosen, however, is flexible. If it is higher there is less justification for a substantial monitoring system and the U.S. position becomes correspondingly less defensible. If it is lower the number of inspections becomes quite large if a substantial deterrent is to be maintained. The incentive to undertake concealment by use of decoupling also becomes greater. He noted that it was considered technically feasible at a cost of some £25 million to construct a hole large enough to contain a 70 kiloton explosion which was not substantially larger for test purposes than the legal tests at 4.75 magnitude. Thus the 4.75 level suggested represents a compromise between these conflicting considerations. In response to questions as to what magnitude scale the 4.75 magnitude represented, Dr. Kistiakowsky said that it was based on the Gutenberg and Richter

scale as developed in 1956. The numbers of unidentified events in the table were calculated by the rigorous standards of U.S. criteria set forth at the recent technical conference. Opinion differs as to how much further a good seismologist could narrow down the choice. Estimates vary from 30 per cent to a factor of 10. A fair guess is that the unidentified shown on the table would be reduced by a factor of 2. If seismic research continues, this factor can be improved. One point on which delegation scientists were sensitive in recent technical discussions was the Soviet reminder that little had been done for improvement of the system by U.S. scientists since 1958.

He said that the group had also made non-scientific estimates of the number of inspections that might be suggested to the principals for consideration. This could be either a percentage quota or a numerical quota. The pluses and minuses of the two alternative methods of calculation include the following factors:

A percentage basis (1) affords protection against yearly variations in the number of earthquakes and existing uncertainties in our estimates, and

(2) if based only on the number of unidentified events, presents a much greater incentive to the Soviet Union to participate in improvements of the technical capabilities of the system because such improvements would reduce the number of unidentified events; and gives the Soviets an incentive to install stations in Communist China in order to reduce the number of unidentified events eligible for inspection.

A numerical basis (1) Would presumably be easier to negotiate since it accepts the quota proposal and makes the exact level of inspection clear in advance.

(2) Avoids the need for criteria on which there was no meeting of minds among Soviet-U.S. experts.

(3) Is easier to apply in practice.

(4) Is simple and understandable from the standpoint of public relations.

There are several alternative means of expressing the level of inspection.

(1) We could say 10 per cent of all located seismic events above the magnitude of 4.75 were to be inspected. This method would by-pass the criteria problem but would provide little incentive to improve the system unless the treaty also called for reductions in the number of inspections in connection with improvements.

(2) We could call for inspection of 20 per cent of all located seismic events deemed eligible for inspection by the criteria the U.S. has proposed. This proposal would be based on the proposal we have already tabled that inspection of 20 per cent of events below 5 kilotons

be inspected. If this basis for calculation were proposed, the percentage would apply to the number of events unidentified without stations in Red China until such stations would be installed.

(3) The third alternative would be to simply say that there would be 10 inspections per year.

Mr. Dillon said it makes little difference what exact level is selected within the general range *Dr. Kistiakowsky* recommends. The question depends not only on technical factors but may involve specific military needs of the Department of Defense and AEC. If, for example, from a technical standpoint we could accept a 10 kiloton threshold, and DOD had strong needs for tests in the 15 or 20 kiloton range, this factor could be taken into account. *Dr. Kistiakowsky* said the group of scientists had not explicitly considered the question of U.S. testing needs in its recommendation, but that *Dr. Harold Brown* of Livermore had joined in the recommendations. He is thoroughly familiar with our testing needs and presumably took this factor into account. *Mr. Gates* said these technical questions relating to testing needs were mostly for AEC to decide. He noted that after all these complex calculations we had arrived back at the *Lloyd* proposal for 10 inspections. *Mr. Dillon* commented that *Lloyd's* 10 inspections had applied to a comprehensive ban whereas the present suggestion was for 10 inspections applied to events above approximately 20 kilotons. *General Loper* stressed that all unidentified events should be eligible for inspection. *Mr. Gates* said that just as military needs are usually over-estimated in the first instance as a margin of safety, we should play it safe in our initial proposal regarding the level of inspection. *Mr. Dillon* said that we might, in fact, need a higher deterrent factor than 20 per cent and recalled our previous proposal that all events above 5 kilotons be inspected.

Dr. Kistiakowsky said the figure of 10 would include all events we thought really suspicious after our seismologist had intelligently applied diagnostic criteria to the unidentified events.

Mr. Dillon reverted to the relationship of military needs to a threshold and commented that, if you needed a 30 kiloton shot for weapons development, this could be legitimately conducted by the use of decoupling. That would not be cheating since the size of the signal rather than the size of the explosion would be the criterion of legality. *Mr. Gray* asked whether there was any point in thinking in terms of a control system including Communist China. *Dr. Kistiakowsky* said that in this estimate he was looking at the column of figures calculated without stations in Communist China. He said that there might be substantial advantage stipulating that testing allowable under the threshold be accompanied by advance notification of the time and place of the tests. We could argue that this builds into the proposal a mechanism for improvement of the system. *Mr. Dillon* asked what were the prospects for progressing

to lower thresholds. He noted that Dr. Kistiakowsky said it was difficult to apply the definition below 4.25. He asked whether, for example, a threshold of 4.6 would be feasible. *Dr. Kistiakowsky* said we could go even further down than 4.6 if the auxiliary criteria could be codified. He mentioned that Dr. Oliver already speaks of a factor of 10 reduction in unidentified events by unilateral application of the auxiliary criteria.

Mr. Dillon said it was important from a public relations standpoint to emphasize that one threshold would not apply forever. We should emphasize our willingness, as better methods of development are to be put into effect, to lower the threshold progressively. This could also be done by increasing the number of on-site inspections. *Mr. Gates* questioned the idea of stressing “we could do better later”, since it implies the U.S. threshold quota we now propose is too high. *Mr. McCone* said it could also be argued by the Soviets that we should call off all tests below a threshold unilaterally from the beginning.

Dr. Kistiakowsky said we still have on the books a proposal to ban all tests in outer space. There is a well established fact of gaps in detection of capabilities at great distances, even though testing at such distances would cost a great deal and could not be conducted on a large scale for some years. Our policy with respect to such a ban is, however, primarily a political rather than a technical problem. *Mr. Dillon* suggested that we might go up to 100,000 kilometers on the basis of ground based instruments instead of proposing the total ban based upon very expensive satellite systems. *Mr. McCone* said he felt the same way.

Mr. Gates said he felt he must reflect the very strong JCS concern about including an underwater ban. Political difficulties with underwater tests are much the same as with those in the atmosphere. We should not, however, propose to include such a ban at an early stage. A very real military problem is involved. Without further experimentation we simply don’t yet know how to kill a submarine with nuclear weapons without endangering the crew of the destroyer delivering the weapon. We would have to give in on the ban of underwater tests in the last analysis, but it would be unwise to begin by doing so. *Dr. Kistiakowsky* asked whether bubbles from an underwater shot could contaminate the atmosphere. *Mr. Gates* said this was not known. In addition there was the difficulty of possible decoupling of underwater shots too if you are willing to spend enough. He believed the political factors were equal to the military factors in the case of underwater explosions, but believed it was good not to start with the full offer.

Mr. Dillon noted that the JCS also wants to test in the atmosphere. *Mr. Gates* agreed but said the underwater question was somewhat different and would involve not weapons development but learning to use weapons already in our stockpile. It is a safety problem to be resolved. We don’t want to use weapons that would kill our own people.

Dr. Kistiakowsky said that a 10 kt underwater shot could be conducted provided one million tons of concrete were used, were made in a structure the size of the Empire State Building, and were placed two kilometers deep in the ocean and when, of course, the Department of Defense is rich enough to do this.

Mr. Dillon said we should all go home and study the figures that had been presented and should get additional figures from *Dr. Kistiakowsky* for the intermediate ranges between 4.75 and 5. There would be no great difference to us between 4.75 and 4.85, for example, and we would need the advice of the DOD and AEC in making a choice.

Mr. McCone asked whether this was a question of adequate safeguards or if the elbow room we needed for military requirements is a legitimate consideration. *Mr. Dillon* said we could move the threshold somewhat on the latter basis. The problem with the threshold of 5 is that it may not provide sufficient justification for control systems in the Soviet Union. We have little feeling about the precise level so long as it provides adequate justification for the system we propose. The Soviet criteria would have identified events only above the Blanca range. In this sense the Soviets too were admitting a threshold of about this level, so that it would not be in a position to object too effectively to our proposal. *Dr. Kistiakowsky* noted by way of clarification that a statement that the technical situation was difficult below 4.25 applies only if we assume the Geneva system. We could go lower if the system were modified as regards either spacing or instrumentation.

Mr. McCone said that while further study is required he was in a position to make some comment even now on the threshold problem. He said that this would seem to be an extremely complicated type of negotiation; that it has many pitfalls from the negotiating point of view and that it gives *Tsarapkin* considerable room to maneuver us into an uncomfortable position. He said we should think carefully as to whether we want to start down this road at all. We should decide in advance with the UK just what kind of a treaty we are negotiating, that is, whether our aim is a comprehensive ban or whether it is our intention to stop testing only in the areas where effective safeguards can be accomplished. If the latter is agreed, both with the UK and Russians, we may safely go this way.

Mr. Dillon said he agreed that we should not get into specific numbers in the Geneva negotiations unless the Russians agreed in principle to the threshold approach. As to the level of threshold, *Mr. McCone* said that recognizing the political factors the AEC would prefer the threshold of 5 but could live with a threshold of 4.75.

Mr. Gates asked whether it is realistic to expect that, if you can test legally below a threshold, it would be politically possible to conduct an extensive test program below it—for example, 10 tests a year. *Mr. Dillon*

said he didn't think the question of whether you have a threshold would make any difference in the political reaction to a test program. [illegible in the original] would be equally concerned about underground testing whether it was permitted by a treaty with the Soviets or not. Testing would be easier with the threshold to the extent the threshold would permit us to say that we would in the future ban all tests that were controllable. The initial agreement would show our willingness and good intentions. *Mr. Farley* added that in addition, the kind of a treaty we were discussing would dispose of the pollution problem.

Mr. McCone said we now know that the threshold is technically feasible; the next question is whether it is good. *Mr. Dillon* said that he thinks it is a good approach. He believed we should say we want a phased treaty covering the atmosphere (leaving the underwater question aside for now) and underground tests above a given threshold. We should point out this approach by-passes the criteria disagreement with Soviet scientists. We should say we do not want to go into detail on the proposal until it is agreed in principle. We should not get into the outer space question unless the Soviets agree on the underground part of our proposal. Then we could say once the principle of threshold was accepted, that a comparable principle should apply in outer space. We should tell the U.K. as soon as possible what our ideas are on a specific threshold. *Mr. Gray* asked what the U.K.'s attitude would be. *Mr. Dillon* said that they may very well accept the threshold proposal. They could be expected to proclaim a moratorium on tests below the threshold and would want the U.S. to do the same. *Mr. Gray* commented that we might ask the U.K. in this case whether they would want the information from our own "immoral" tests.

Mr. Allen Dulles noted that the higher you put the threshold the fewer on-site inspection you get. *Mr. Dillon* said you wouldn't get many any way.

Mr. McCone said that a high threshold reduces the incentive for decoupling. The Soviets, he believed, would discuss a number more readily than a percentage. The Soviets might also propose that we keep the same number of inspections and move the threshold down. He said the AEC believed the simplest method would be to base inspections upon a percentage of all events located. We can couple this with a statement of willingness to renegotiate the level as detection and identification capabilities improve. We would want a higher percentage depending on whether Red China was included in the control system. In response to a question, *Mr. Keeny* said Red China was relatively more important than other areas of Asia because it was not only adjacent to the Soviet Union but adjacent to highly seismic areas within the Soviet Union.

Dr. Kistiakowsky commented on the project Vela. So far little money has been made available and little work had been done. Defense has quite recently made available \$8 million for the project. In addition to this project, however, there are two other research needs: (1) research on instrumentation for ground-based detection in outer space, and (2) research on satellite instrumentation for detection. *General Starbird* said the AEC was spending \$2 million in development of outer space instruments and another million in construction of a hole for underground tests. *General Loper* said the original memorandum of agreement last April did not appear to call for such an expensive program as called for by the more far-reaching objective stated for Project Vela which ARPA had designed.

Dr. Kistiakowsky said we needed research programs in all three fields, seismic, ground stations for high altitude detection, and satellite instrumentation. *Mr. McCone* said the AEC was making preparations for the decoupling shots but the announcement of these preparations had been delayed since November, first because of the U.N. debate and then because of the technical talks in Geneva. We could not make the announcement as easily after January 12 as now because it might result in some embarrassment to the resumed Geneva discussions. Since now seems to be the best time he proposed the text already cleared interdepartmentally should be released. *Mr. Farley* confirmed that we had no objection to the text and added this would seem to be a suitable time. *Mr. Dillon* agreed but believed the President should see it, because of his personal interest in these matters. *Mr. Gray* agreed the President should see it. *General Starbird* said that failure to make the announcement had not prevented preparations so far. They had proceeded at the Nevada test grounds under the general implication that we were merely keeping the test grounds in order. There have been no leaks so far but it would be difficult to seek sites for additional tests in Louisiana if we were unable to state our purpose.

Mr. McCone asked for discussion of the question of whether we should make the announcement at all. *Mr. Dillon* commented that the President's attitude is often "why say something if we don't have to". *Mr. Gates* said it is not a problem of DOD concern. *Mr. Dillon* said we need to go ahead and get the sites we need for additional tests, and the desirability of the announcement would seem to depend on whether the announcement was necessary in order to proceed with site selection. *Mr. McCone* said he is willing to take the risk of proceeding without announcement, but it should be taken in the recognition that at some point we will have to make the announcement after the fact. It was agreed to defer the announcement and to proceed with the selection of sites.

Mr. Dillon said the group should meet again next week after it had considered the threshold proposal advanced by *Dr. Kistiakowsky*. He said that *Mr. Merchant* would represent the Department at the meeting. In the meantime instructions to the Delegation now would be along lines of the January 6 letter to *Selwyn Lloyd*, pertinent paragraphs of which he read to the meeting.

Washington, January 15, 1960

SUBJECT

DOD Position Paper on Threshold for Underground Tests

1. At the Principals' meeting on January 12, Secretary Gates presented a staff paper setting forth the DOD position on the threshold for

¹ Source: Comments on Department of Defense staff paper (attached) on the threshold for underground tests. Secret. 18 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament, NT, Threshold.

underground nuclear tests. This paper specifically criticizes the threshold proposals, which Dr. Kistiakowsky presented at the Principals' meeting on January 8 at the request of Secretary Herter and Mr. McCone, as being deficient in that "the number of inspections would be determined arbitrarily (at a comparatively low figure) without appropriate relationship to the scientific facts and the capabilities of the detection system." The proposals presented by Dr. Kistiakowsky were developed by a representative group (including Drs. H. Brown, S. English, J. Oliver, W. Panofsky, C. Romney, J. Tukey, and General A. Starbird) which considered the proposals to represent a balanced judgment properly related to the scientific facts and system capabilities.

2. The alternate threshold proposals contained in the DOD position paper essentially call for the inspection of all unidentified events above magnitude 5 (i.e., 100 per cent of all unidentified events or 50 per cent of all detected seismic events). The implication contained in the DOD position paper that this proposal is uniquely in accord with scientific facts and the capabilities of the detection system is not correct since it does not take the following factors into account:

a. An effective deterrence does not require 100 per cent coverage of all possible violations. This is particularly true in the case of nuclear tests where a series of violations rather than a single clandestine test would be required to constitute a real security threat.

b. Among the events which are not positively identified as earthquakes (by U.S. criteria), it would be possible to establish the relative degree of suspicion of various events by means of the following information:

(1) Utilization of auxiliary seismological information. There is a large amount of seismic data which, although not at present sufficiently definitive to be codified as criteria, would provide information indicative of whether an event was either an earthquake or possible explosion. This type of information would be particularly valuable in the case of the larger seismic events considered in the various threshold proposals. Although there is no agreed estimate as to the cumulative value of this auxiliary information, it would probably reduce the number of events worthy of suspicion by at least a factor of 2 (and possibly much more) and would probably focus particular attention on a relatively small number of events in the yield ranges above 4.75.

(2) Utilization of covert and overt intelligence. As long as the choice of events to be inspected in the USSR is made by the U.S., we can make use of all sources of covert intelligence as well as common sense based on geographic and geological considerations in picking the seismic events to be inspected. Since the extent of our intelligence capabilities are presumably not known by the USSR with certainty, the unpredictable aspect of this factor would in itself probably constitute a significant deterrent.

3. The DOD position paper directly criticizes the approach to inspection which would require "the East and West to act unilaterally in selecting the events to be inspected in the host countries' territory,"

on the grounds that this would degrade the authority of the International Control organization. It is precisely this ability to chose events for inspection that will provide the maximum deterrent effect since it would permit the unrestricted use of all of the information discussed above (i.e., auxiliary seismic information as well as overt and covert intelligence) and would remove debate on the validity of individual inspection operations from the international organization. The original U.S. proposals on inspection procedures were based on "random" selection since the concept of selection by the other country or side was not considered negotiable. However, this concept of selection has now been advanced by the Soviets themselves.

4. The threshold concept is presumably being considered by the Principals with the hope of discovering a formula which might have some chance of being negotiable with the USSR (reasonable deterrence coupled with low level of inspection), and at the same time, would establish clearly in world opinion that the U.S. is attempting to extend the test ban as far as technical considerations will permit. It must be recognized that any threshold proposal that we advance will probably be attacked by the Soviets as an attempt on our part to continue testing. The DOD proposal, however, would appear to give the Soviets particular opportunity to question our motives since it couples a relatively high threshold with the highest possible level of inspection. The question should, therefore, be asked whether the threshold proposal in this form would actually serve the basic purpose for advancing the threshold concept in connection with the present Geneva Negotiations.

Paper Prepared in the Department of Defense

DOD Staff Paper Presented at the January 12 Principals' Meeting

PROPOSED POSITION OF THE UNDERGROUND THRESHOLD

1. With regard to an agreement on the discontinuance of nuclear weapons testing, the United States Government has taken the position that the level of inspections must bear an appropriate relationship to the scientific facts and the detection capabilities of the Control System. The USSR representatives, on the other hand, have insisted that the number of inspections must be small, despite the scientific data which indicates that the unidentified events will be numerous. The failure of the recent Technical Conference to achieve agreement on the U.S. criteria which would establish eligibility for inspection also prevented

agreement as to the number of unidentified events which might occur. Without agreement on criteria, some other basis for initiating an inspection would have to be devised. Dr. Kistiakowsky has set forth three alternatives, two of which would seem to require agreement on criteria and the third susceptible of application without such agreement. All of the alternatives have one deficiency in common—the number of inspections would be determined arbitrarily (at a comparatively low figure) without appropriate relationship to the scientific facts and the capabilities of the detection system.

2. Upon review of the threshold concept as applied to underground test ban prepared under Dr. Kistiakowsky's direction, the DOD is of the opinion that it would be to the best interests of the U.S. to withhold the introduction of this concept until or unless it had been clearly demonstrated that the USSR (and possibly the U.K.) will not agree on the inspection criteria established by the U.S. technical group or accept a treaty confined to atmospheric tests. The following reasons are cited: Under the threshold concept, one of two procedures is possible, i.e., to select events to be inspected on the basis of the "characteristics" of instrument readings (criteria), or on the basis of a percentage of the total events. If the Soviets refuse to accept the U.S. criteria, we will be led into a compromise of our best scientific data and thus establish a bad precedent for future disarmament negotiations as well as invite the prospects of adverse Congressional and public reaction. If we suggest a percentage of the total events in order to eliminate the criteria problem, we will introduce a very undesirable factor, namely, the necessity for the East and West to act unilaterally in selecting the events to be inspected in the host countries' territory, thus degrading the authority of the International Control organization. Obviously, if there is no agreement on inspection criteria, there would be no agreement on which events should be eliminated as natural occurrences.

3. The Department of Defense believes that the threshold concept in terms of the magnitude of the seismic events contains uncertainties and ambiguities which detract from its desirability for immediate application without further validation. Further, recognizing the uncertainties in natural and possible artificial decoupling, the proposal does not seek to regulate underground testing to any specific maximum yield but only to make it incumbent upon the signators to the treaty to conduct their operations in such a way as to avoid an instrumental response exceeding the agreed magnitude.

4. If, however, it is decided to be in our over-all interest to advance this concept as a proposal, it is considered that the threshold should be set to meet the following objectives:

a. The threshold should be high enough to require only the number of inspections which would be feasible within the practical limitations

of the numbers of inspection groups and their operations which can be supported by the System.

b. The number of inspections must bear an appropriate relationship to the scientific facts, taking into account the best scientific data bearing on the problem; and

c. The threshold should be high enough to permit certain developmental tests should the United States at some time decide to undertake such tests.

5. The question, therefore, is what threshold in terms of the magnitude of the seismic waves generated by an earthquake should be adapted to assure that the foregoing objectives would be attained. Accepting the following tabulation as representing the best U.S. estimates of the data shown and adopting the assumption that Communist China will not accept stations on its territories, it is apparent from the fourth column that a magnitude of 5.00 is about the minimum that could be adopted taking account of the considerations stated above.

Nu *Number of unidentified events in the USSR of magnitude greater than M*

Nu* *Number of unidentified events if stations are limited to USSR and US*

YR Yield equivalent in KT for Rainer coupling

6. In the light of the foregoing, it is recommended that the following position be established with respect to the inclusion of a threshold for underground tests in a phased treaty:

a. There shall be agreement with the inspection criteria proposed by the U.S. and this criteria shall be written into the treaty.

b. In the first phase of the treaty, no signator nation shall conduct underground tests above a threshold which shall be defined in terms of the magnitude of seismic waves recorded at the locations and in manners specified in the treaty.

c. The initial threshold shall be magnitude of 5.00 as calculated by the Gutenberg and Richter 1956 formula.

d. All events of magnitude greater than 5.00 shall be analyzed in accordance with the agreed inspection criteria and *all* those events not thus identified as natural events shall be eligible for inspection.

7. In the event that the Soviets refuse to accept the U.S. inspection criteria as presented by Dr. Fisk and his Technical Group, the following modifications of the above should be introduced:

a. Same as Paragraph 6(b) above.

b. Same as Paragraph 6(c) above.

c. 50% of all detected events of magnitude of 5.00 shall be subject to inspection. For those events occurring in the U.S. or in territories under the control of the U.S. or U.K., the USSR shall have the option of designating the events to be inspected; and for events occurring in the USSR the selection shall rest with the U.S.-U.K.

8. In either of the above propositions the further condition should be added that the Control Commission will maintain a continuing study and analysis of the feasibility of improving the quality of the detection system and shall from time to time report to the signator nations its recommendations as to improvements to be installed and the corresponding threshold to be adopted. The installation of improvements and the adoption of thresholds below or above those specified in the initial agreement shall be subject to the unanimous agreement of the signator nations.

9. If the Soviets do not agree to any of the foregoing proposals involving a threshold, a phased treaty confined initially to atmospheric tests should be proposed.

Paper Prepared by Kistiakowsky

Washington, January 8, 1960

THRESHOLD FOR UNDERGROUND NUCLEAR EXPLOSIONS

I. *Definition of Threshold*

It is technically possible to define a "threshold" for underground nuclear explosions in terms of the magnitudes of the seismic events detected by the Control System. There are several ways in which magnitude might be defined for this purpose. A detailed definition of magnitude based on the use of short period P waves has been prepared (see attachment). This definition could be used operationally in a straightforward manner to define magnitude above about 4.25. Above about magnitude 4.5, the apparent magnitude by this definition corresponding to a

given explosion under fixed coupling conditions could vary between ± 0.1 and ± 0.2 magnitude units. This corresponds to about a ± 25 per cent variation in equivalent yield. It would, therefore, probably be possible to test with confidence nuclear explosions with at least 50 per cent of the yield permitted by the threshold in particular coupling conditions. To avoid accidentally exceeding the threshold, a tester could “creep up” to this 50 per cent level of the threshold by means of a series of smaller explosions. It is to be emphasized that it is difficult to assign a kiloton equivalent to a particular magnitude since, (quite aside from the very large decoupling factors possible in large cavities), this value could vary by a factor of two or more depending on particular medium coupling conditions. In addition, it should be noted that the Soviet report to Technical Working Group 2 differs substantially from that of the U.S. in evaluating the seismic magnitude of specific U.S. nuclear tests.

II. *Quantitative Analysis of Thresholds*

Estimates of the total number of seismic events and the number of unidentified seismic events above various magnitudes in the USSR, based on the earthquake statistics and criteria in the U.S. report to Technical Working Group 2, are summarized in the following Table. (The estimates used are preliminary calculations by the Livermore Laboratory reduced uniformly by 25 per cent in order to conform with previous AFTAC assumptions as to the percentage of world-wide earthquakes which would occur in the USSR.)

TABLE

m	N	N_u	N_u^*	Y_R
5.25	32	3	8	110
5.00	59	8	27	43
4.75	105	25	70	19
4.50	185	95	150	8
4.25	335	245	300	3.3
4.00	580	490	545	1.45

m	Magnitude
N	Total number of earthquakes in the USSR of magnitude greater than M
N_u	Number of unidentified events in the USSR of magnitude greater than M
N_u^*	Number of unidentified events if stations are limited to the USSR and US
Y_R	Yield equivalent in KT for Rainier coupling

In considering this Table, the following points should be noted:

1. The average annual number of earthquakes becomes increasingly uncertain with decreasing magnitude and in the lower magnitude ranges is probably uncertain by a factor of two.

2. The estimates represent the *average* number of annual events and there are actually significant variations in the number of annual events.

3. The ability of the system to identify events within the USSR is dependent upon the extent to which the Control System is installed outside the USSR and would be significantly reduced if stations were not installed elsewhere in Asia.

4. Soviet and U.S. scientists disagree significantly on the values for the equivalent yield with Rainier coupling (Y_R). [*text not declassified*]

III. *Level of Threshold*

The establishment of a particular magnitude level as a test threshold presents a difficult problem which is not primarily technical in nature. A judgment on this problem must be based on consideration of such factors as the following:

1. If, on the one hand, the threshold is established on too high a level:

(a) Higher yield underground explosions which could probably be controlled with reasonable effectiveness would be legalized.

(b) There would be little or no justification for inspection.

(c) Support of U.S. position on test control issue in world opinion would presumably be weakened.

2. If, on the other hand, the threshold is established at too low a level:

(a) Number of inspections would either be too large or effectiveness of control would be reduced.

(b) System would have little or no capability of reducing number or eligible events in lower range of permitted magnitudes.

(c) The incentive to undertake concealment by large cavity decoupling would be increased.

In balance, it is concluded that magnitude 4.75 constitutes the best compromise among the above factors. In addition, it should be noted that we have direct measurements from the Blanca explosion corresponding to this magnitude under Rainier coupling conditions.

IV. *Number vs. Percentage Quota*

The eligibility of events for inspection under any magnitude threshold can be determined on either a numerical quota or percentage quota basis. The comparative advantages of these two methods are as follows:

1. *Percentage Quota*

a. Covers uncertainties in estimates and yearly fluctuations in number of seismic events.

b. If based on unidentified events:

- (1) Presents much greater incentive than numerical quota for Soviets to improve technical capabilities of system;
- (2) Presents stronger incentive to Soviets to include China in system in order to reduce number of eligible events in USSR;
- (3) Eliminates possible Soviet argument that there are too few unidentified events for a particular numerical quota; and
- (4) Same percentage can apply to different thresholds.

2. *Number Quota*

- a. Easier to negotiate since essentially accepts Soviet quota concept and indicates clearly level of inspection to be conducted.
- b. Independent of changes in criteria of eligibility for inspection or could be applied against all events independent of criteria.
- c. Somewhat easier to apply.
- d. Possibly more effective from point of view of public relations as representing simple, understandable proposal.

V. *Suggested Position*

Technically, there appear to be three reasonable approaches to a threshold proposal based on magnitude 4.75 seismic events:

1. Require inspection of 10 per cent of all located seismic events with magnitude above 4.75. Since the number of located seismic events of this size in the Soviet Union is 105, this would result on the average in approximately 10 on-site inspections per year. This proposal could bypass the lack of agreement on the criteria for eligibility of inspection.

2. If the Soviets are willing to accept the U.S. criteria for determining the eligibility of seismic events for inspection, require inspection of 20% of all located seismic events with magnitude above 4.75 which are deemed eligible for inspection. Since the number of unidentified seismic events above magnitude 4.75 is estimated to be between 25 and 70, depending on the extent of installation of the system on a world-wide basis, this proposal would result in an average annual level of inspection between 5 and 14.

3. Establish a quota of 10 inspections per year which could be applied against either the total number of located seismic events or the number of unidentified events with magnitudes greater than 4.75.

Technically, the proposals based on the use of percentages, particularly the first proposal (i.e., 10 per cent of all located seismic events above magnitude 4.75), appear to be the safer course in view of the uncertainties in the estimates of the number of seismic events. However, the quota proposal would probably give the same general level of deterrence and might have advantages from the point of view of negotiability and public relations.

Attachment

SUGGESTED THRESHOLD DEFINITION

1. A seismic event shall qualify for consideration by the Control System if its seismic waves are as large as, or larger than, the seismic waves recorded from an earthquake of magnitude 4.75 as determined by the procedure given in paragraph 2 below.

2. The method for determining magnitude is as follows:

a. From the seismograms of each control post which detects signals from the event in question for which A is measurable as defined below and for which the epicentral distance is greater than 16° and less than 36° to 90°², determine whether or not the magnitude m, according to:

$$m = \log \frac{A^{1.5}}{GT} \quad (\text{Gutenberg \& Richler, 1956})$$

is greater than 4.75

In the above formula, the symbols are defined as follows:

A = half of the maximum peak positive to negative amplitude (displacement), measured in microns, in the first three cycles of the P waves, as recorded by a vertical seismograph of the type described in paragraph 3 below. For the purpose of this computation, signals are considered to be detectable and measurable to sufficient accuracy if A is 3 times the peak noise amplitude during the preceding few minutes.

T = the time, measured in seconds, between the peak displacement (used in determining A) and the next following peak.

G = the steady-state magnification of the seismograph at period T. Q is given as a function of distance in Table 1.

b. If the apparent magnitude exceeds 4.75 at half, or more than half, of the control posts specified in 2a above, the event is judged to have a magnitude of 4.75 or more.

3. The vertical seismograph used for measuring A, as defined in paragraph 2a above, shall be a short period seismograph with characteristics which will permit operation of single seismographs at quiet stations with magnification greater than 10⁶ at the frequency of peak response. It may, in particular, conform to the specifications in GEN/DNT/TWG. 2/9, Annex IV, page 12.

²(The most desirable cut-off distance for data to be used in determining magnitude under this definition is still under consideration.) [Footnote is in the original.]

¹Source: Preparations for ten-nation disarmament talks. Secret. 6 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

The Secretary said that the purpose of the present meeting was to give some direction to the meeting of disarmament representatives which would convene next Monday. The present group should be regarded as a steering committee unrelated to any of the others set up for Summit preparations. The group would continue in existence after the disarmament talks begin to assess the progress which takes place between now and the Summit in order to discuss and decide on what problems relating to disarmament might be raised at the Summit. He did not foresee the need to decide on any more meetings of the present group at this time. Generally the disarmament experts could work directly on their own, reporting as appropriate to their governments and directly to NAC on the progress of their work. *Ambassador Brosio* agreed and suggested that the meeting of the group of Ambassadors could be reconvened at the end of February, at which time they would make a general assessment of the progress made by the experts. *Ambassador Heeney* said that he had not thought of this as a formal group but simply as an ad hoc meeting. He hesitated to accept the idea of the Ambassadors "assessing" the work of the disarmament group. He would prefer that arrangements be kept informal and flexible. *The Secretary* agreed and suggested that it might be useful to meet occasionally when the Geneva negotiations had begun. He suggested that the primary task was to determine in most general form what the disarmament representatives could most usefully discuss. First, there was the question of Western objectives in the negotiation. He said that the U.S. would have a draft objectives paper to submit at the opening meeting on the 25th. *Ambassador Caccia* agreed that this should be the first item. He had been instructed to put forward a proposal in this connection, i.e., that our objective should be to present a comprehensive plan as an alternative to Mr. Khrushchev's and, with it, specific suggestions for limited steps which would constitute a first phase. He was instructed to distribute such a paper at the present meeting (Tab A). The purpose of the limited first steps was to counter the idea that nothing could be done unless everything was done. *The Secretary* agreed with this thought, observing that we must test Soviet good faith by simple measures which would be characterized as leading to specifically identified goals. *Ambassador Alphant* said that this was in line with French views and that they would themselves submit a more elaborate working paper on the 25th. *Ambassador Brosio* said that the Italian Government was also working on a paper which accorded with the views which have been expressed and that they hoped to have it ready for the working meetings.

Secretary Herter said that since the Soviets will try to have discussion based on their own proposal, we should be prepared with a coordinated position on the Soviet plan. The first step might be to exchange analyses of Khrushchev's proposal. *Ambassador Caccia* said that one of our major objectives should be to prepare an agreed critique of this proposal.

Ambassador Caccia suggested three additional items for consideration by the disarmament representatives: (1) the working methods which the delegations would follow during the Geneva sessions; (2) the opening tactics for the meetings on March 15; (3) procedure on consultation with NAC during the preparatory work and the ten-power meetings. *Secretary Herter* agreed with these items, noting that there might be some discussion of the third point here.

Ambassador Alphand said that techniques and general political questions should be discussed at the Ambassadorial level and not on the "technical level". *Ambassador Heeney* said that he thought the meeting on the 25th should not be characterized as a meeting of "experts". *Ambassador Caccia* said that Under Secretary O'Neill would represent the U.K. at the preliminary meetings and suggested that the date of February 8th be set for a meeting of heads of delegation to review the work of the deputies. Mr. Ormsby-Gore would be prepared to come to Washington at that time. The heads of delegation should also plan to meet in Geneva a few days before the actual convening of the Ten-Nation session. *Secretary Herter* said that we should aim for February 8th for the heads of delegation meeting with the proviso that it could be changed if necessary to the 15th. The earlier the target date the more pressure there would be to complete our work. *Ambassador Brosio* concurred, noting that Ambassador Cavalletti would initially head the Italian delegation and that Mr. Martino would be prepared to come to Washington on February 8th. *Ambassador Heeney* said that General Burns would be here on the 25th and would head the Canadian delegation throughout the meeting. *Secretary Herter* said that he was not prepared to get into a discussion of substance at the present time and wished to note that the U.S. wanted to avoid presenting a completely frozen comprehensive package plan. He wished to have separable first step measures which we could suggest and he reserved judgment on the desirability of presenting a program in which there is a fixed commitment to move ahead all the way to the end. *Ambassador Caccia* agreed that the group should have the task of drawing up a comprehensive plan with separable first steps.

Secretary Herter suggested that the U.S. provide Ambassador Durgess with a resume of today's session to use as a basis for reporting to NAC. *Ambassador Caccia* agreed, but stated that the committee of disarmament representatives should decide on their own procedures for consulting and reporting to NAC. He raised the question of the press line that should be used at the conclusion of today's session. It was agreed that no formal communique would be issued and that each delegation would state that the Ambassadors and the Secretary reviewed procedural arrangements for next Monday's meeting.

Ambassador Brosio suggested that the disarmament representatives should also discuss the implication of Khrushchev's Supreme Soviet

speech and how the West should react to it. Consideration should be given to the possibility of counteracting the Soviet move with unilateral measures of our own. *Ambassador Heeney* said that Canada felt some helpful work could be done by the NATO international staff which could be fed into the working group. The Canadians were considering making such a suggestion in Paris next Wednesday.

Tab A

Revised United Kingdom Comprehensive Plan

FIRST STAGE

(i) The endorsement of any agreement which might be reached by the Geneva Conference on the Discontinuance of Nuclear Weapons Tests.

(ii) Study and initial establishment of an international disarmament organization.

(iii) Collection of information by the international disarmament organization on present levels of forces, including conventional armaments possessed by various powers, followed by restriction or first stage reduction of armed forces of the United Kingdom and the United States, USSR, and France to agreed maximum limits. The collection of information would be based on declarations (to be completed in the first stage) by States according to predetermined and mutually agreed criteria. The information would cover existing conventional equipment and armaments, pertaining to land, sea, and air forces.

(iv) Consequent upon such reduction, placing by these States in storage depots within their territories and under the supervision of the disarmament organization, of specific quantities of designated types of armaments to be agreed upon and set forth in lists annexed to the agreement.

(v) Prior notification to the disarmament organization of launching programmes for missiles according to certain predetermined and mutually agreed criteria, and reports on launching operations, including information on the location of launching sites. Notification of flight plans of satellites, international arrangements for tracking and for exchange of resultant information.

(vi) A technical conference on the possibility of controlling the stopping of production of fissile material for weapons purposes and on the possibility of the transfer, under control, of existing stocks of such fissile material (whether fabricated into weapons or not) to non-weapon uses.

(vii) A conference on measures to prevent the launching of surprise attack. This conference would consider the political as well as the technical aspects of measures against surprise attack.

(viii) A technical conference to study a system to ensure the use of outer space for peaceful purpose only.

(ix) Study of the arrangements required for the international authority which will have to be set up in order to preserve world peace as purely national armaments diminish.

The first stage shall be completed, if possible, within one year; the second stage shall then start.

SECOND STAGE

(i) A world conference shall be convened to determine the levels to which all States shall reduce their forces and armaments in the final stage.

(ii) Progressive establishment of international disarmament organization.

(iii) Progressive reduction of existing conventional armaments and military man-power through adequately safeguarded arrangements for international control (levels to be agreed) and collection of information relating to manufacture of conventional armaments and equipment of all kinds.

(iv) All states producing fissile material to make full declarations on all plants producing it and their capacity. Introduction of the “cut-off” of production of fissile material for weapons purposes, conditional upon specified progress on conventional disarmament.

(v) Reduction of stocks of nuclear weapons by successive transfers, under international supervision, of existing military stocks of fissile material (whether fabricated into weapons or not) to non-weapon uses.

(vi) Missile launchings to be subject to prior notification and on-the-spot control. International tracking system to be installed.

(vii) Progressive establishment of inspection against surprise attack.

(viii) Agreement on the establishment of a system to ensure the use of outer space for peaceful purposes only.

(ix) Joint study of the control of a ban on the manufacture of biological and chemical weapons and other weapons of mass destruction.

(x) First stages in the establishment of the international authority required to preserve world peace.

The timing of the start of the final stage shall be decided by agreement among the States concerned.

FINAL STAGE

Comprehensive disarmament by all powers under effective international control including:

(i) A ban on the manufacture of nuclear, chemical, biological, or other weapons of mass destruction.

(ii) A ban on the use of outer space for military purposes.

(iii) A ban on the use of nuclear, chemical, biological and other weapons of mass destruction.

(iv) Destruction of all military missiles. Control over manufacture of rockets and satellites.

(v) Establishment of effective international control over military budgets.

(vi) Completion of the establishment of the international authority to preserve world peace.

(vii) Measures, in the light of the latest scientific knowledge, to control existing stocks of nuclear, chemical, biological and other weapons of mass destruction with a view to their elimination.

(viii) As progress is made on such control and elimination, final reduction of conventional armaments and military man-power to the levels required for internal security purposes and the fulfilment of the

obligation of signatory States under the terms of the United Nations Charter. Destruction of surplus armaments.

(ix) Control over manufacture of all types of armaments to ensure that production is limited to that required for (viii) only.

Covering Letter From Head to Merchant

Washington, January 15, 1960

My dear Livie

I have received the enclosed message for Mr. Herter from Mr. Lloyd in reply to Mr. Dillon's letter of January 6 about the Nuclear Tests Conference.

As I know that the Secretary is still away I am sending the message to you so that you can give it preliminary consideration in anticipation of his return,

Yours [illegible in the original]

Sammy

Enclosure

Letter From Lloyd to Herter

January 14, 1960

TEXT OF MESSAGE

Dear Chris,

I was most grateful for Doug Dillon's letter of January 6 outlining your ideas on how we should proceed in the Nuclear Test Conference. I am sending this reply to you as he is now in Paris.

To deal with a lesser point first, I agree that no useful purpose would be served by attempting to reconvene the technical working group at present.

On the major point, I also agree with you that if we have not succeeded in getting the Russians to budge from the position they took up in the technical conference before Christmas, we have little chance of securing a treaty under which a ban on all tests would be effectively policed from the outset. Clearly a limited treaty which goes beyond what you contemplated last April by banning at least certain underground tests is an advance on what you then had in mind, and to that extent we welcome your idea. As a result of the agreed technical report of last summer I imagine you would also be prepared to include a ban on high-altitude tests. Furthermore your proposal to define a threshold in terms of seismic magnitude rather than in kiloton yield strikes me as ingenious. It will, as you say, eliminate a lot of argument and should I think put the Russians in a somewhat difficult position. After their argument that a seismic magnitude of 4.75 represents the equivalent of a yield of 1.7 kt, the acceptance of your proposal, if you should choose the figure of 4.75, will mean that the Russians are being offered what on their own figures they should admit is nearly a comprehensive treaty, whatever our own reservations on this particular magnitude.

Nevertheless, I am firmly convinced that the Russians (who are quite capable of instructing their scientists to make a *volte face* to agree with you that a seismic magnitude of 4.75 is, after all, the equivalent to a yield of 20 kt) will not look at any proposal that does not ban all tests, at least temporarily. If we were to insist on a treaty which left open the possibility of underground testing below a specified magnitude, I think the Russians would break off negotiations. What is more, they

would proclaim vociferously that they had broken on a Western proposal which they would represent as showing the West to be insincere in its protestations of a desire to stop all tests. They would say that they were being asked to accept a considerable measure of control on Russian territory at great cost, while the Western Powers continued to develop their nuclear weapon potential by underground testing. I am afraid that the odium for failure to reach an agreement would thus fall on the West. Unjust though this would be, I do not think that in the present state of world opinion, particularly as manifested in the last session of the General Assembly, we can afford to allow this to happen. I know full well that the underground tests which under your proposal would still be permissible contribute nothing to fallout, but I am afraid this argument carries little weight with the large numbers who believe all nuclear tests should now cease.

There is a further consideration. The Russians have declared that they will not be the first to resume tests. If, however, some underground testing remained permissible and the Western Powers decided to resume tests, then it is certain that the Russians would follow suit, and I doubt whether they would confine themselves to underground tests. I have explained to you before now my fear that even in that case much of the odium would fall on whatever power had been the first to resume tests of any kind. But quite apart from that: are we really sure that it is we rather than the Russians who stand to gain more in military terms from a further round of testing? The indications are that, for us the improvement to be derived from further testing may be marginal. If, as we believe, we are at present ahead of the Russians, would they not be likely to diminish our lead if we gave them the chance to resume testing? These considerations, together with others familiar to you, persuade me that it is much in our interest, in spite of all the scientific difficulties, to come to some arrangement with the Russians under which all tests should cease.

As you know, when the President first advanced your proposal for a limited treaty last April, the Prime Minister told him that he thought it would be necessary to offer a moratorium on underground tests for one or two years. The President did not feel able to accept such a suggestion then, but the Prime Minister said he might have to revert to the proposal. Under the terms of your new suggestion it would be appropriate to change the Prime Minister's original suggestion to one for a moratorium for a limited period on underground tests below the nominated threshold. I assume that all tests in other environments would be completely banned, provided the treaty obligations were

being fulfilled. We would maintain the important distinction of principle that the permanent ban would apply only where we could be assured of effective control; while there would be no more than a temporary suspension where such control was not yet possible.

I am convinced that such a suggestion for a moratorium will in the end have to be added to your proposal, and would ask you most earnestly to consider whether you could not accept it at the outset; we have after all now had a totally uncontrolled moratorium for some fourteen months; and even if there had been no scientific reassessment and we had proceeded to an agreement entirely on the basis of the experts' report of 1958, we should have had to contemplate a period of two or three years, while control posts were built and the control system was being organised, when there would have been a virtually uncontrolled moratorium. I do not believe we should lose very much by voluntarily subscribing to a moratorium for underground tests below the threshold if we could get agreement to your new proposal. We could then, as Dillon in his letter says you contemplate, propose a joint programme of research with the Russians to speed up progress in seismology.

As I have said above, I believe that, if we do not proceed on these lines, we shall get no treaty. I think such a result would be disastrous. Not only should we lose the opportunity to get for the first time international controls operating in the Soviet Union, thus serving as a precedent for subsequent disarmament controls, but also, I fear, the prospects of success at the Ten Power Disarmament Conference would be very gravely prejudiced.

I apologise for the length of this letter.

With best wishes,

Yours sincerely,

Selwyn

519. Tabs A and B to Memorandum of Conversation Among Principals of Geneva Test Group¹**Tab A**

Washington, January 19, 1960

*AGENDA**Meeting of Principals of Disarmament Working Group**Tuesday, January 19, 1960 5:00 PM Room 5104 New State*

1. Should the US advance a proposal based on a signal strength threshold in the Geneva nuclear test negotiations? If so,
2. What should be the level of the threshold?
3. What should be the level or number of inspections?
4. Should a specific threshold level and a specific level of inspection be proposed at Geneva now?

Tab B*DRAFT INSTRUCTION*

Within the general framework course of action stated by Dillon letter of January 6 to Foreign Secretary Lloyd USDel may after coordination with UK explore in general terms with USSR following approach based upon a signal strength threshold for underground tests. In presenting proposal USDel should from outset reaffirm and make clearly understood US position that it will agree to cessation of nuclear weapons test explosions only in environments where adequate safeguards can be applied. In discussion with UK USDel should draw as required on technical paper provided at the meeting of principals January 8. Unless SOVS show interest in agreement on basis principles outlined USDel should not enter into detailed technical discussion with USSR on methods of calculating magnitudes, kiloton equivalents of various magnitudes, exact criteria to be employed in locating events, or number of unidentified events at various levels which would result from application US criteria for identification except insofar as specified in para 6 below. If SOVS show such interest USDel should seek further instructions on presentation these technical considerations.

In presenting proposal USDel should point out that in absence technical basis for establishment and operation control system covering all

¹ Source: Agenda of Working Group meeting and draft instruction on threshold to U.S. delegation to nuclear test talks. Memorandum of Conversation is Print Document 240. Confidential. 4 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

underground nuclear explosions, US nevertheless desires consolidate in treaty existing areas of agreement on cessation of nuclear weapons test explosions in environments to which adequate and agreed controls can now be extended. Proposal should be advanced as constructive approach to impasse in which we find ourselves as result continuing wide areas technical disagreement reflected report Technical Working Group II. Proposal for threshold approach represents (a) evidence US willingness seek test cessation in areas that can be adequately monitored (b) way to bypass existing disagreements between US and Soviet scientists on criteria for identification of underground events by basing inspections on events located by system (c) way to achieve a workable agreement despite existing disagreement and limitations as to detection and identification capabilities in lower yield ranges and disagreements on equivalent kiloton yields of events of given seismic magnitudes (d) way to move by phased approach as rapidly as technically feasible toward more comprehensive ban through lowering [or eliminating]² threshold as methods of detection and identification were improved by research.

USDel should outline key elements of proposal as including following:

1. US proposes phased treaty including in its first phase ban on underground nuclear explosions above a lower limit or threshold defined in term of magnitudes of seismic events detected by control system.

2. Proposal would be carried out under arrangements whereby number of inspections would be directly related to number of events above agreed threshold. Thus within the limits of technical capabilities, selection of appropriate threshold would depend in part upon level of inspection acceptable to USSR.

3. Treaty should provide for lowering threshold as system capabilities are improved through utilization of improved techniques, instrumentation and criteria or higher level of inspection. Program of joint research, including nuclear detonations as required, to improve detection and identification capabilities of system and develop improved criteria should be instituted as rapidly as it can be agreed; it could be continued by control commission when it is established. If USSR does not agree to join us, US feels obligated to proceed unilaterally in development of improved detection systems making use of nuclear detonations as required.

4. US believes agreement on criteria proposed by its technical experts in TWG II for use in at least initial phase would help meet SCV concerns as to wide range of events against which agreed level of inspection could be applied, since it would narrow number of events

² AEC recommends deletion. [Footnote and brackets are in the original.]

eligible for inspection as far as technically feasible at present time. If these criteria employed, US would propose agreed level of inspection apply only to events remaining unidentified by control organization after application these criteria. If, however, agreement cannot now be reached on criteria for identification, US would propose as way around this difficulty that agreed level of inspection apply to all events located by system.

5. US proposes that level of inspection be expressed as percentage of events above agreed threshold magnitude that remain unidentified after control commission has applied criteria proposed by US scientists at TWG II. This would reduce number of events eligible for inspection to lowest figure consistent with existing scientific information. It is, moreover, a formula which will automatically reduce the number of inspections as improvements in techniques and criteria are developed. If agreement on criteria for identification is not yet possible, however, US proposes that pending such agreement the level of inspection be expressed as percentage of total events above agreed threshold magnitude which are located by the system. USDel should recall US has also made clear in past that whether level of inspection should be expressed as percentage quota or numerical quota is of secondary importance in comparison to basic requirement that level of inspection should bear appropriate relationship to scientific facts and detection capabilities. Accordingly US would also be willing, if USSR prefers, to express the level of inspection in numerical terms based on a calculation of an agreed percentage in relation to the latest scientific estimates of numbers of located events or unidentified events it has presented to the conference. Since this would tend to re-open existing scientific disagreement which might otherwise be avoided, however, we would propose not to enter into a complex technical negotiation upon this basis unless a broad understanding in principle on the proposed approach can be agreed.

6. As a specific example of the application of the proposed approach, the US should propose a threshold of magnitude 4.75. Above this threshold 20% of all events unidentified by US criteria or alternatively 10% of all events located by the system would be subject to inspection. Depending upon whether agreement on criteria can be reached, all located events or all unidentified events would be eligible for inspection. On the basis of our best estimates this basis for inspection would result in from 10 to 20 inspections per year in the Soviet Union.

7. In answer to questions which will arise concerning certain matters our position would be as follows: you should, in your private coordination with the UK representative ahead of presentation, point out these:

a. Relative to our accepting a moratorium on weapon testing below the threshold, the US will not accept such a moratorium and would be free to resume such testing when its national security so dictated.

b. Relative to high altitude testing we would plan on “an agreed suspension of nuclear weapons tests in the atmosphere up to the greatest height to which effective controls can under present circumstances be extended.” If ground stations only were agreed, no higher than 100,000 KM. If Argus and far earth satellite systems are installed, no more than 300,000 KM.

520. Letter From Gates to Herter¹

Washington, January 19, 1960

Dear Mr. Secretary:

The report of the Joint State Department-Defense Department Study on Disarmament, prepared under the direction of Charles A. Coolidge, has been received. This report will be referred to the Assistant Secretary of Defense for International Security Affairs and to the Joint Chiefs of Staff for their information and study.

Since recommendations (1) and (2) involve our own defense posture, it seems appropriate that I comment on those recommendations at this time. These subjects have been under intensive review over the past several months within the Defense Department concurrently with the studies undertaken by the committee under Mr. Coolidge’s direction.

The current defense program is consistent with the recommendations made by Mr. Coolidge concerning our overall defense posture. Our strategic delivery capability is substantially in excess of that of the Soviet Union and we are taking all practicable steps to further increase the invulnerability of our strategic delivery forces. Our program relies on a whole complex of related resources, each of which in various degrees contributes to the establishment and maintenance of an assured retaliatory capability.

We are not now operating an airborne alert of any significance because we do not believe it necessary. The Air Force is planning a more extensive alert capability for the heavy bomber force and we are purchasing extra engines and spare parts to expand this program, as well as training the heavy bomber wings in the conduct of an airborne alert. This capability could be exercised if needed.

¹ Source: Transmits joint State Department-Defense Department study on disarmament prepared under Coolidge’s direction. Secret. 73 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Disarmament.

At the same time, the Department of Defense is taking steps to improve the modernization of the conventional capability of both our armed forces and those of our allies—the latter, of course, through the assistance rendered by the Foreign Aid Program. We are confident that we are in a position to deal effectively with limited wars which our strategic capabilities might not deter. We do not, of course, envisage any situation short of general war in which significant numbers of our forces would be directly involved in any conflict with those of the USSR.

I will forward to you in the near future the Defense Department comments on those aspects of the Coolidge report not concerned with our defense posture, after we have had further time to study the recommendations contained in the report.

Sincerely,

Thomas S. Gates

Draft Statement by a State Department press spokesman

The State Department has received the report of the Joint Disarmament Study headed by Mr. Charles A. Coolidge. This report was prepared by Mr. Coolidge for submission jointly to the Secretaries of State and Defense as a working paper to aid them in preparing a recommended disarmament policy prior to the forthcoming ten power conference at Geneva about March 15th. Final formulation of U.S. disarmament policy will of course be the responsibility of the President with the advice of the National Security Council. The State Department does not intend any release regarding the substance of the report and its recommendations, which are now under study.

BRIEF SUMMARY OF REPORT

The United States must strengthen its overall defense posture before significant arms control measures can be successfully negotiated with the Soviets, and should proceed to do so, even if it will require a substantial increase in defense expenditures.

In particular, the United States should strengthen its conventional capability, and should make its strategic retaliatory force highly invulnerable in order to establish and maintain a stable balance of deterrence against intercontinental nuclear war. Until a stable balance of deterrence is established, the United States should not negotiate measures which limit its strategic nuclear capability. Therefore, however, the United States might find it advantageous to negotiate agreements which would enhance this stability and permit a levelling off of the arms race.

Comprehensive proposals calling for disarmament in phased stages, with an obligation to move from one stage to another, should be avoided. Instead, the U.S. should establish a broad ultimate goal for disarmament, namely, world peace under enforceable law, and should prepare for immediate negotiations only modest steps toward that goal, in order to test the intentions of the Soviets and actually to accomplish at least something.

Specially, the U.S. should take the following actions:—

Measures to Limit National Capabilities

1. Completion of the current negotiations on the production of nuclear tests, preferably excluding underground tests from the prohibition.

2. Propose a limited inspection zone against surprise ground attack in Europe, in aid of NATO's mission.

3. Propose the prohibition of vehicles capable of mass destruction from being placed in orbit or maintained in outer space.

Measures to Increase International Capabilities

4. Re-energizing the development and codification of international law by the United Nations.

5. Increasing the jurisdiction and enhancing the prestige of the International Court of Justice.

6. Improving the machinery for the use of a U.N. "presence" in areas of international disputes and adding the function of mediation.

The merits of additional arms control measures are analyzed. Annexes to the report contain comments on proposals made by the Soviets and our principal Allies and, further, contain more detailed consideration of important matters dealt with in the report itself.

Dear Mr. Secretary:

Pursuant to the terms of reference establishing the Joint Disarmament Study by the two Departments of State and Defense, I submit to you the conclusions and recommendations resulting from the study.

The terms of reference and a list of my principal assistants and of the able and devoted staff who struggled with the difficult problems presented by arms control, together with data indicating the assistance received from others, the method of operation followed and the scope of the work are attached as Annex "A."

This report is a group product in the sense that the information and ideas it contains are the result of the labors of all concerned. No effort has, however, been made to reach unanimity. While the report necessarily requires a consideration of the defense posture of the United States, a conscious effect has been made to confine the scope of the report to arms control matters, and to avoid trespassing on allied fields such as military planning, civil defense and political and economic problems.

I. BACKGROUND OF ARMS CONTROL

A. *Our Posture for Negotiating Arms Control Measures Must be Strengthened*

It is possible that current Soviet propaganda efforts in favor of peace and disarmament may reflect the beginning of a fundamental change in their thinking which could lead to reduction of the communist military threat to the Free World. It would, however, be foolish to base our policy approach to arms control upon that possibility for at least two reasons.

First, it is equally possible and far more likely that the Soviet current peace campaign is designed to lure the Free World into reducing or eliminating its military capability, so that the Soviets can pursue their

continuously reaffirmed aim of world domination without fear of a nuclear war. In a disarmed world, they could, through sheer manpower and economic measures, infiltrate, subvert, upset, dominate, and finally take over the control of Europe, the Middle East, Africa, and with Red China, the remainder of Asia—leaving one or both of the Americas to die on the vine. And there would be nothing that the Free World could do about it, except to re-arm frantically after it was probably too late. Even if the Soviets are not successful in persuading the Free World to disarm completely, any progress they can make in reducing the military capability of the Free World is so much to the good from their point of view. Until the Soviets have unmistakably demonstrated sincerity by deeds as well as words, [illegible in the original] prudence dictates that we strengthen our guard against communist aggression rather than relax it.

Second, even if the Soviets have honest motives in proposing disarmament measures, they are tough realists. Should our posture and that of our allies deteriorate relative to the Soviet's posture during the extended process of negotiations which lie ahead, this would lower any real incentives which [illegible in the original] for the Soviets to accept meaningful arms controls with proper safeguards. As realists, they tend to regard agreements as confirmations of existing facts, not as promises to do something which goes further than facts. Hence, when the facts change for the worse from our point of view, so will the agreements we are likely to get out of the Soviets.

[illegible in the original] that the basic premise of our approach to arms control must be to address the Soviets from a position in which our defense posture is strong and our capacity for effective political action is unimpaired. And this should be so whether we take the gloomy view of stressing the difficulties involved in arms control negotiations with the Soviets, or take the brighter view of explaining the hopeful possibilities of [illegible in the original] useful agreements.

A glance at the [illegible in the original] indicates that our situation for negotiating meaningful arms control measures is deteriorating. Our relative defense posture during the early sixties—the period with which the coming disarmament talks will be most concerned—will be less favorable than it has been since World War II. At the risk of over-simplification, weaknesses in our defense posture present three major problems:

1. *Intercontinental War*—While the U.S. had a monopoly in nuclear weapons, there was little danger of intercontinental war. The Soviets had no chance of [illegible in the original]. Even after the Soviets acquired nuclear bombs in quantity, the danger of a nuclear war was limited by our large stockpile and our superior delivery systems, in the form of the numbers and quality of the manned bombers of SAC (Strategic Air Command) and their ability to strike from, or recover

to [illegible in the original] bases. The enormous advantage to the Soviets of surprise attack was [illegible in the original] by working from the DEW Line (Distant Early Warning Line). Thus, while the danger was much greater than when the U.S. had a nuclear monopoly, the nuclear capability of the U.S. which could survive a surprise attack appeared sufficient to inflict such severe damage on the Soviets as to deter them from starting an intercontinental war.

The development by the Soviets of intercontinental ballistic missiles has changed this situation very much for the worse. While the Soviets probably have not at the moment many ICBM's, within the next two years or so they may have a sufficient number to knock out most of SAC and destroy our principal cities in a surprise attack. And we may receive little or no warning. Even when BMEWS (Ballistic Missile Early Warning System) is completed, and even if it functions as effectively as its designers expect, the amount of warning it will give will be measured in minutes. Further, there is as yet no known defense against ICBM's, and the technical problems involved in creating a reliable defense against them seem enormously difficult. And the threat of shorter range missiles launched from Soviet submarines may be almost as serious.

This Soviet capability will exist even after the U.S. has acquired ICBM's in quantity. But in the interim, assuming that the Soviets have them in quantity and we have not, the situation will be grave. This interim period is frequently referred to as "the missile gap." Our military leaders are fully aware of the situation and are endeavoring to counter it by such measures as keeping a part of FEC continuously in the air.

Ultimately we would [illegible in the original] greatly if we could persuade the Soviets to [illegible in the original] agreement to give up missiles entirely. For the time being, however, we can neither expect them to give up their strong card, nor does reliable inspection of an agreement to do so presently appear feasible. Therefore, this report envisages that we will press forward with unilateral measures to shorten the duration of the missile gap, rather than counting upon arms controls to do so, and addresses itself primarily to the situation when both the Soviets and ourselves have ICBM's in quantity.

2. *Limited War*—The Soviets have been superior to the U.S. in conventional forces since we unilaterally reduced ours immediately after World War II. We are endeavoring to affect this superiority by various measures, including regional alliances, military aid programs, maintenance of some mobile forces and arming with tactical nuclear weapons. We are supplying certain of our NATO allies with the vehicles of nuclear weapons under arrangements whereby the U.S. retains control of the warheads. Our best information is that the Soviets are probably equipping their own forces with tactical nuclear weapons, but not as yet their satellites or Red China.

The superiority of the Soviets and Red China in conventional and para-military forces, combined with their geographic position, results in a situation unfavorable to us in terms of dealing with aggression when for various reasons we might be unwilling to use our nuclear weapons.

It seems clear that, in addition to regional alliances and military aid programs designed to strengthen indigenous forces in areas where limited wars might occur, we must be able to back up our allies with conventional forces to a degree which will make our willingness to intervene in limited wars credible both to our allies and to our enemies, whether or not we use nuclear weapons. While it is beyond the scope of this report to recommend the level and armament of forces required for this purpose, it is readily apparent that our conventional capability must be increased if we are to be able to deal effectively with limited wars which our strategic capabilities are not expected to deter, and if we are to be in a sound position to negotiate meaningful arms control measures with the Soviets.

3. *Economic*—As distinguished from our military posture outlined above, the U.S. has had, and still has, impressive superiority over the Soviets on the economic side. Its productive capacity and wealth are still much greater than the Soviets. This can be used to advantage in arms control matters—by enabling us if the Soviets drive us too hard, to spend more money on defense than they can.

However, rapid technological development plus rising costs are increasing the cost of our weapons at a disconcerting rate. It therefore appears necessary to increase the military budget substantially, until the defects in our defense posture are cured. This is a political rather than an economic problem, but it should be faced.

For the first time, a strictly economic problem has recently appeared, namely, an unfavorable balance of international payments. This could subject us to heavy pressures to reduce our overseas military establishments and foreign aid, which in turn might have a material adverse effect on arms control negotiations. It is not clear at the moment how serious this problem may prove to be.

Conclusion—In weighing the factors outlined above in connection with intercontinental war, limited war and economic problems, the conclusion seems inescapable that defects in our defense posture will result in our negotiating arms control measures with the Soviets from an unfavorable position, and that we are not likely to achieve significant results from such negotiations unless and until our posture is improved or there is a fundamental change in the world situation.

Accordingly, it is recommended:

Recommendation No. 1

Irrespective of the nature of arms control proposals made at the coming negotiations, the United States should increase its effort to close

the missile gap and otherwise promptly to remedy defects in its overall defense posture.

B. The Rational of Arms Control

The fundamental difficulty with arms control agreements is that war is the ultimate method of settling international disputes, when settlement in countries with law or agreements has failed. And war recognizes no contractual restraints. In a sense, therefore, war is a negation of the entire concept of a binding agreement. Hence, agreements to forbid war or to limit war making capabilities, though made in the time of peace, border on the field where agreements are wholly ineffective. This may account for the dismal history of past arms control agreements. Logically, therefore, it can be argued that disarmament agreements are not worth attempting—ever. Even if that gloomy view is not adopted, the considerations outlined in the preceding section seem to indicate that now's not the time for such an attempt on our part.

But the short answer is that as a political matter we cannot avoid making the attempt and making it at this time. And if we make the attempt, it must be an honest one. It, therefore, seems desirable to examine the rationale underlying arms control.

Up until now, the pressure for arms control has been largely emotional and economic—that is, political. Reduction in the risk of being subjected to the horrors of nuclear war has had, and has, a world-wide human appeal. Exploitation of this continent by the Soviets, if not countered effectively by us, could result in serious political gains for communism. Relief from the [illegible in the original] burden of defensive arms competition also has had, and has a potent economic appeal. But now, for the first time, our future in an unrestricted arms race is not a bright one from a strictly military point of view. In the age of nuclear missiles, we will not be able to buy the security we have known in the past, no matter how much money we spend. Hence, we should use our best efforts to reach arms control agreements which will slow down the race by limiting the capability of the Soviets in a manner which is conducive to our own security. Therefore, arms control should have a significant role in our military planning, and even if efforts to slow the arms race by arms control agreements do not look very promising, they should nevertheless be made from a [illegible in the original] military point of view.

But the great drive behind arms control today remains the dread of intercontinental nuclear war. The feeling is widespread that somehow a way must be found to curtail or abolish nuclear weapons. This is not primarily the result of Soviet propaganda, but rather because of widespread realization that nuclear weapons have added a danger of wholly new dimensions—the possible annihilation of a nation and destruction of its homeland.

II. NUCLEAR WEAPONS

Since nuclear weapons constituted the great urge behind disarmament today, sympathetic and intense consideration has been given to the possibility that the United States might agree to measures which would lead to their elimination. This conclusion has been reluctantly reached that the United States cannot afford in the immediate future to agree to eliminate or drastically reduce its nuclear capability.

In the first place, an agreement by the Soviets to eliminate nuclear weapons could not be relied upon, because there is at present no known way of detecting hidden nuclear warheads, and less that 100 nuclear missiles with high yield warheads would put us at the mercy of the Soviets if we had surrendered ours. This problem is particularly acute with ICBMs. They consist of the nuclear warhead and the rocket vehicle. The "Atoms for Peace" program results in enriched uranium going into peaceful reactors, and plutonium—the major element of warheads—coming out. Similarly, the "Peaceful Use of Outer Space" program will result in the production and improvement of rockets of a type admirably suited for use as the vehicle for ICBM's. So two important peaceful programs greatly complicate the problem of controlling ICBMs.

In the second place, even if we could be sure that the Soviets retained no nuclear weapons, the overwhelming manpower of the Soviets and Red China requires us to retain a nuclear capability unless and until there is created a world authority capable of enforcing international law. If we now surrendered our nuclear capability, the uneasy balance of power which now exists between the Free World and the Sino-Soviet bloc would be upset, because the elimination of the risk of a major nuclear exchange would encourage the Soviets and Red China to step up their military efforts to attain their goal of Communist domination of the world.

Does all this mean that the nuclear arms race must go on unabated? Not necessarily. It seems probable that the Soviets share our desire to reduce the risk of a major nuclear war. At the moment, they apparently prefer other means for achieving world domination. But whatever their recourse, it appears [illegible in the original] for us to explore and build on this mutual desire. And there is a concept which might put a limit to the nuclear arms race, namely, the concept of a stable balance of nuclear deterrence.

III. STABLE BALANCE OF DETERRENCE

A. *Intercontinental Nuclear War*

The word "deterrence" describes a situation in which a party has the power to take action but voluntarily refrains from doing so for fear of the consequences. In the context of intercontinental war, it is usually

thought that for one nation to deter another it is necessary for the first nation to be able to defeat the other—to have military superiority. And that is indeed the most potent form of deterrence. We had that kind of deterrence when we had a nuclear monopoly. There was then, however, no balance of deterrence. Deterrence was one-sided. It prevented nuclear war because we abstained from starting such a war, not because we were deterred by the Soviets' military power.

Deterrence, however, may also exist when there is a stalemate—that is, where there is roughly a parity of nuclear power between two nations. The present situation between ourselves and the Soviets is often referred to as a “nuclear stalemate.” In such cases, deterrence is not one-sided; each deters to the other, so there is a balance of deterrence—some call it “[illegible in the original] deterrence.” But if parity must be retained in order to preserve a balance of deterrence, it will not be very stable. One side is apt to draw ahead of the other, either by making more weapons or more effective weapons.

It follows that if it is not essential to maintain parity, it will no longer be necessary for each side to keep up with the other; as the balance of deterrence will begin to acquire an element of stability. And close analysis indicates that parity is not essential. The test of deterrence is the damage which the attacker will receive, and deterrence can exist even when the defender has a lesser capability than the attacker. If the attacker will be severely damaged, he is not likely to attack even if he could destroy the defender. It is not necessary “to be there fastest with the mostest.”

The foregoing analysis of both parity and less-than-parity omits to consider the destabilizing effect of a first strike. On first thought, the advantage of striking first seems so great that there can be no stability unless the defender has a much greater force than the attacker, because the defender will have available only the weapons which survive a devastating nuclear missile attack.

On further thought, however, it is apparent that if the retaliatory force of the defender is sufficiently invulnerable so that it will take from three to five of the attacker's missiles to knock out each of the defender's missiles, then the attacker must have three to five times as many missiles before the defender's retaliatory force is completely destroyed. On a 3-to-1 basis, if the attacker has 1,800 missiles and the defender only 1,000, then the 1,800 missiles of the attacker would destroy only 600 of the defender's 1,000. The defender would be left with 400, which could inflict frightful damage on the attacker's governmental and industrial centers.

Therefore, if both sides are aware of this [illegible in the original] and make their retaliatory force sufficiently invaluable to [illegible in the original], say, a 3-to-1 ratio, through mobility, concealment, dispersal, hardening and the like, then neither will be likely to attack. A stable balance of deterrence will have been created. Once such a situation has

been created, neither side is apt to incur the enormous expense of building enough missiles to overcome the handicap of such a ratio as 3-to-1. Hence, the nuclear arms race is likely to level off at a sensible point. Just where that point should be is a matter of military-scientific judgment, but there clearly is a point where “enough is enough.”

Of course, the situation between us and the Soviets at any given moment of time will lend itself to a mathematical competition such as that outlined above. The differences in types of missiles, their accuracy and yield, the degree of their invulnerability and so on, preclude the use of mathematics. Further, the stability of the deterrence can be upset by technological advances producing greater accuracy or larger yield, or by anything else which would reduce the number of attacker’s missiles required to knock out each of the defender’s missiles. The situation, therefore, must be kept under continuous review. There is, however, no immediate problem on this score. When we have attained a high degree of invulnerability for our retaliatory force, it will be time enough to worry about the point at which we can level off.

It is concluded that the concept of a stable balance of deterrence has sufficient validity to warrant its adoption. Insofar as it works, it is a way, though admittedly an expensive one, of “banning the bomb”—not by eliminating the capability to use it, but by eliminating the willingness to use it.

It is therefore recommended:

Recommendation No. 2

The United States should urgently increase the invulnerability of its strategic retaliatory force to the point where a substantial part of that force will survive any attack the Soviets will be able to deliver.

This foregoing recommendation, like Recommendation No. 1, is not dependent on any arms control negotiations. We should attain the requisite invulnerability unilaterally. But arms control measures could at some point be helpful in understanding a subtle balance of deterrence. It is obvious that we will not be in a position to negotiate meaningful measures of arms control affecting this concept unless and until we can convince the Soviets of the merits of the concept from both their and our point of view. It is doubtful if we can to that before Recommendation No. 2 has been carried out. Nevertheless, sooner or later arms control agreements could be helpful in the following ways:

1. They could help to determine the level at which the balance of deterrence is initially established and might later reduce that level. It should however, be noted that the lower the level, the more effective the inspection system must be. At a high level, a few clandestine missiles may not be dangerous, but at a low level they might be very dangerous.

2. Technological improvements which tend to upset stability could be slowed or halted through monitored agreements to control the testing of missiles, thus enhancing stability and saving money.

Even though the occasion for fruitful negotiation with the Soviets on such arms control measures may be sometime away, the concept should underlie our thinking on disarmament measures.

According, it is recommended:—

Recommendation No. 3

The United States should accept the concept of a stable balance of deterrence as a basic principle underlying arms control measures affecting intercontinental war.

B. The Concept of Stable Balance of Deterrence Appears to Have No Significant Applicability to Limited Wars

The foregoing discussion has been addressed solely to the problem of intercontinental nuclear war. Smaller wars present a different problem. The spectrum of possible limited wars is so broad, and the number of possible participants so varied, that it is difficult to conceive of constructing an adequate system of balanced deterrence which could be stabilized, with or without arms control. Though limitations on force levels and armaments would reduce the forces available to fight limited wars, to equalize these reductions in such a way that there would be a deterrent balance in such relevant geographic area appears out of the question. And there is no such ratio between defensive and offensive weapons in limited wars as underlies the concept in intercontinental war. It is purely a question of who has the stronger forces.

Thus the concept of a stabilized balance of deterrence has little applicability to limited war. While our nuclear strategic capability has tended to hold down the size and possibly the number of limited wars, creating a stable balance of deterrence for intercontinental war does not add anything to that. Indeed, the more stable this balance, the more destabilizing may be its effect on limited war, since a potential aggressor is apt to think that both sides will try to prevent a local war from escalating into a general war, and so press limited war further than he otherwise would. On balance, it seems that the concept has no significant effect on limited wars.

A more detailed discussion of the concept of a stable balance of deterrence is continued in Annex "B."

IV. DISARMAMENT GOAL

Before turning to specific arms control measures, it seems important to determine the general direction in which we hope arms control measures will take us. It is obviously beyond the scope of this report to suggest an over-all national policy which would correspond to the

policy of world domination ascribed to the Soviets, within which arms control constitutes only one of many means of implementation, along with political, economic, ideological, and, in the Soviet case, subversive activities. But it is important that, for the field of arms control itself, an objective should be clearly stated. We should state what we ultimately hope to attain by means of arms control in order to provide a basis for our own decisions and to make our aims and motives clear to others. Further, such a statement would place in perspective initial measures of arms control which might otherwise look insignificant.

A comprehensive phased package of arms control measures is no substitute for an arms control objective. If the phases extend far enough to reach the ultimate objective, the package mixes the specific with the general, and confuses the presently attainable with the ultimate, to such an extent that the package cannot be clearly understood by the many, many people who must understand arms control measures if these measure are to be adopted. It founders on the multitude of the issues it raises. It is, under existing negotiating conditions, "biting off more than we can chew."

These considerations are of particular importance at the moment, because of the revival by the Soviets of their long-standing proposal to eliminate nuclear weapons entirely, to which they have added elimination of all standing military forces. The simplicity and sweep of these proposals require special effort on our part to place our own proposals for arms control in a setting of comparable breadth and simplicity.

Yet, the statement of our goal cannot be so broad that it loses meaning. Some specificity is required. It is too broad to state simply that the security of the United States is the goal which governs our position on arms control measures. We must be more specific and state quite precisely what it is we desire to accomplish in the long run through arms control measures. Otherwise we are in much the same position as if we had no goal; the rest of the world will be uncertain of our aims and we ourselves may hesitate and vacillate when faced with proposals by others.

The President and others have stated a simple and sweeping goal, namely, "world peace under law." Not only is this simple and sweeping, it is wholly consistent with our national tradition—the rule of law and not of men. It is, however, subject to the above objection of being too broad to be meaningful. Accordingly, it is recommended that, while adopting the goal of "world peace under law," we should spell out its main elements, as we conceive them.

Recommendation No. 4

The United States should establish the goal which it desires ultimately to reach through arms control measures and toward which it will make progress as fast as in its judgment the world situation permits.

Recommendation No. 5

The United States should favor arms control measures which tend toward establishing world peace under law, namely, a world in which:

1. There shall be universally recognized rules of international law, which if followed will prevent all nations from initiating armed conflict with (or from aiding civil disturbances within) other nations, backed by adequate jurisdiction in a world court and by effective means of enforcement.

2. Through safeguarded international agreements, national military establishments shall have been reduced to the point where no single nation or group of nations can effectively oppose enforcement of international law, and no weapons of mass destruction shall be within the control of any nation.

The establishment of a long-range goal in accordance with Recommendation No. 4 is fundamental. Whether Recommendation No. 5 sets forth the most declarable form of long-range goal may be open to argument. But if changes are made, they should not substantially reduce the breadth and sweep of the goal.

The above statement of the goal does not, and should not, spell out the means by which it is to be achieved. Nothing is said as to whether the rules of international law are to be adopted by multilateral treaty or are to be enacted by a supra-national legislature. Nor is it stated whether effective enforcement is to be provided by collective security agreements, by creating the type of international peace force contemplated by the present UN Charter or by creating a frankly supra-national police force; and if the latter, what its size should be and how it is to be raised, maintained, commanded and financed. Nor is it stated whether discarded nuclear weapons should be placed under international control, used to arm a peace force or destroyed. There is even no indication as to whether the United Nations or the International Court of Justice should be used, or new organizations should be created.

The omission of these matters is not to deny that they involve many and difficult problems. Rather, the omission is but an essential characteristic of any statement of principle which is expected to remain operative for a long period of time. If means are specified in the goal, the principle is apt to fade when the means are overtaken by events or lose their realism. No one can now foresee what means can be worked out. Measures which now seem wholly unworkable may, through technological developments or changes in the world situation, gradually or even suddenly prove workable. Conversely, measures which at the moment seem workable may prove to be unnegotiable. The important thing is that the ultimate principle be kept alive and bright through all the vicissitudes of lengthy multilateral negotiations on many specific proposals.

That the problems in the way of reaching the long-range goal are many and difficult is wholly obvious. They are so many and so difficult that the goal may never be reached. That, however, should be no drawback to its adoption now. For almost two centuries, we have been working to reach the goals set forth in the United States Constitution, and we have not succeeded yet. But few would say that therefore the Constitution should not have included those goals. Progress toward the goal should be made as fast, but only as fast, as the security of the United States permits, in the light of the military capability of our probable enemies, our commitments to our allies, unsettled political problems, technological considerations and the like. The test in each case should be to adopt only those arms control measures which are compatible with the goal and which involve less risk to the security of the United States than not adopting them.

V. ARMS CONTROL MEASURES FOR IMMEDIATE NEGOTIATION

As indicated in the preceding section, the main purpose of establishing a long-range goal is to relieve us of the necessity of presenting for negotiation a comprehensive phased package of arms control measures. Not only is such a package confusing but creates such a multiplicity of issues that negotiations bog down. Further, it commits us presently to take actions in the future which when the time comes we may not wish to take. We should be free at all times to agree only to such proposals as we are sure at the time we are willing to carry out. As applied to the existing situation, the years of fruitless negotiations suggest that it would be advisable to concentrate our efforts on comparatively few measures. Our goal calls for two types of action, one limiting national capabilities and the other building up international capability. The suggestion to concentrate on a few measures applies to both types.

Accordingly, it is recommended:—

Recommendation No. 6

The United States should take the following actions designed to limit national military capabilities:

1. Endeavour to complete the current negotiations on nuclear testing, preferably excluding underground tests from the agreement.
2. Propose at the Ten Power Conference a European zone of inspection against surprise ground attack, in aid of NATO's mission.
3. Propose at the Ten Power Conference a prohibition of vehicles capable of mass destruction from being placed in orbit or stationed in outer space.

Recommendation No. 7

The United States should take the following actions designed to increase international capability:

4. Propose action by the United Nations to intensify the effort to develop and codify international law.

5. Repeal the so-called "Connally Amendment," and seek multilateral agreements giving the International Court of Justice, the full jurisdiction set forth in Para 2 of Article 36 of its statute.

6. Propose motion by the United Nations to improve the procedures governing the cessation of a U.N. "presence" in areas where disputes exist.

The reasons for suggesting only six measures—of which only two (the European [illegible in the original] Outer Space) would be negotiated at the coming Ten Power Conference, might appear to be based solely on negotiating tactics, which are not a part of the responsibility of this study. And in a sense this is true. But it is thought to be a part of the responsibility of this study to devise ways and means of breaking the dismal history of years of futile negotiations. The same reason which is behind the recommendation that an ultimate goal be established, in lieu of a comprehensive phased package proposal, is behind this recommendation that we confine ourselves to relatively few and simple matters. It is to see if we cannot for the first time actually accomplish something. Specifically:—

(a) Concentration on a few points brings all the prestige and power of the United States behind a few relatively simple measures. If we were to announce publicly our long-range goal objectives, the goal should act as a magnifying glass and focus heat on a few measures.² If no real progress can be made on these measures, it will reveal to us and to the world that the present peace offensive of the Soviets is no more than propaganda.

(b) Concentrating on a few points tends to confine negotiations to limits within which there is little scope for the distracting diversions at which the Soviets are so adept.

(c) Concentration is facilitated by the fact that the measures affected are not dependant on each other. They have not the interconnection which many arms control measures have—for example, the connection force levels and armaments have with each other and with military budgets.

(d) By endeavoring to achieve a few limited objectives which can be relatively easily inspected, we might achieve agreement on inspection procedures which could be helpful in later more important measures. In this connection, it should be noted that none of the selected measures involve Red China, except for inspection of underground nuclear tests.

It is realized that several of our allies have made far more ambitious proposals. In particular, the United Kingdom has proposed a series of phased stops starting principally with studies and ending with the possible abolition of nuclear weapons (see Annex "H"). In

²To emphasize this concentration, it might be desirable to "wipe the slate clean" by withdrawing all proposals we have previously made. [Footnote is in the original.]

concentrating on a few matters, we should not indicate hostility to such more ambitious proposals or indeed to some of the Soviet proposals. On the contrary, we should express interest in considering them, but only after the few measures which we have advanced have been acted upon. Otherwise, our effort to accomplish something this time is apt to meet the same fate as our prior efforts. It will founder on the diversionary tactics of the Soviets

Nevertheless, it is recognized that the very large “gap” between our long-range goal and the few measures recommended above does create a problem. Desirable as it may be to retain freedom as to how, and how fast, that gap should be filled, we may well be forced to say something about it. With that in mind, this report suggests measures which could be added to those recommended above for present negotiations. It further comments on other measures, including those currently proposed by our principal allies and by the Soviets. These comments in many cases indicate what conditions should be met before the particular proposals are adopted.

VI. FULLER CONSIDERATION OF FOREGOING AND OTHER MEASURES TO LIMIT NATIONAL CAPABILITY

A. Above Measures Recommended for Immediate Negotiation

1. Completion of Current Negotiations to Cease Nuclear Testing.

Our hand is already set to the plow in the current negotiations for an agreement to cease all nuclear testing. If that were not so, much could be said for excluding underground tests from the agreement; and it is recommended that if our commitments in these negotiations permit, the agreement should not include underground tests. In this connection, it should be noted that the inspection called for by the proposal to prohibit satellites capable of mass destruction (Proposal #3 in Recommendation No. 6. above) could be made to cover the monitoring of nuclear tests in outer space. But irrespective of what the agreement should cover, the negotiations should be pressed to a conclusion, for the success or failure of these negotiations will be an important omen as to the possibility of progress in other matters. Under the circumstances, a detailed recommendation in this report covering these negotiations seems hardly in order.

2. European Zone of Inspection Against Surprise Attack.

There should be disclosure and verification by the U.S., the United Kingdom, France, and the Soviets, of the size, composition, and locations of their forces in an area described by terrain features and encompassing most of the territory of the Low Countries, Germany, Denmark, Poland, Czechoslovakia and Hungary, in which there is a concentration

of NATO and Warsaw Pact forces. The area is defined in terms of terrain features insofar as practicable, rather than national boundaries, in an effort to avoid suggesting U.S. acceptance of either the existing division of Germany or the Soviet-imposed post-World War II boundaries of Poland and Czechoslovakia.

Restricting the application of the measure to the military forces of the above-named nations within the area should make it easier to avoid negotiating with the Pankow regime in East Germany.

Verification would consist of joint inspection teams—backed by aerial inspection and radar.

The proposal is described in greater detail in Annex “D.”

The reasons for selecting this proposal for immediate negotiations are:—

(a) It would lessen the possibility of a surprise ground attack in Europe and would thus aid NATO in its primary mission of defending against a European ground attack. This is an important area of the world and the area where the consequences of a surprise ground attack is the most serious.

(b) The zone is relatively small and should serve as a valuable laboratory in which to develop inspection techniques.

(c) If the information disclosed by the Soviets is found to be reliable, it would engender mutual confidence. If it is proved unreliable, we would be warned against agreeing to more serious steps.

(d) The proposal is in the same general field as the first of the five “partial” measures Khrushchev has proposed, and so indicates we have not wholly ignored his proposals.

(e) The zone does not include Soviet territory proper, and so stands a better chance of being acceptable to them, even though it is less desirable from our point of view.

(f) Anticipated objections by our allies, particularly West Germany, should be answered by the inclusion of the territory of the other NATO countries, which negates “discrimination” against Germany, and by describing the zone by terrain features rather than national boundaries. (A description by coordinates appears impracticable). The real point is that under the proposal the zone is not neutralized, not denuclearized, nor is West Germany prevented from building up its twelve divisions, nor is it required to withdraw from NATO, nor are force levels affected.

(g) While force levels are unaffected, nevertheless, if the inspection provides the anticipated increase in the security of NATO forces, a thinning out of non-indigenous forces in the zone should be practicable from a military point of view. At that time, therefore, we might be in a position to consult with our allies and jointly propose to the Soviets some thinning out.

If it should develop that adding zones in other parts of the world would make this proposal more acceptable to our allies or the Soviets, there would be no objection to doing so, provided the other zones make sense by themselves. The main purpose of aiding NATO’s mission would, however, become obscured.

3. Prohibition of Vehicles Capable of Mass Destruction from Being Placed in Orbit or Stationed in Outer Space.

The principal reason for suggesting this measure is a simple one. Twice in the past, an opportunity to control revolutionary weapons at a time when they were controllable has been missed. The first was when we had a monopoly on atomic weapons and the Soviets refused the "Baruch Plan." The second was when ICBM's were in their infancy and no agreement was reached to halt their development. Now we have an opportunity to prevent space vehicles from becoming weapons of mass destruction. We should not "miss the boat" a third time. It is highly important to forestall the extension of the nuclear arms race into outer space.

It is to be noted that the proposal is confined to space vehicles carrying weapons of mass destruction. It does not include communications or reconnaissance vehicles. These are extremely important to our country. They will provide many types of information for verification of arms control agreements. Our ability to use them must not be compromised, in spite of the probable opposition of the Soviets to permitting them.

The essential first step is to obtain early agreement to the prohibition of the launching of mass destruction weapons designed to sustain themselves in space. This would not include ballistic missiles since they do not sustain themselves in space. This could be achieved through an agreement that no weapons of mass destruction would be placed in orbit or projected into sustained space flight; disclosure by registration of flight plans of all satellite sustained space flights reaching over 100 kilometers (60 miles); verification of satellite and sustained space flights, through international inspection of payloads prior to launching and inspection for undisclosed satellites and monitoring of sustained space flights above 100 kilometers through a space surveillance and tracking system.

A specific height above the earth is suggested so as to avoid running into unsettled questions of law and fact, such as the definition of "space," the limitation of national sovereignty in the areas above national terrestrial boundaries and the use of national airspace and outer space for peaceful purposes. The figure of 100 kilometers (60 miles) falls between the theoretical upper limit of continuous flight of winged aircraft based on aerodynamic force (approximately 55 miles) and the lower theoretical limit at which a satellite can exist in orbit (about 70 miles).

In the interest of speed, and because only two nations are launching space and satellite vehicles, it is probably desirable that the agreement be negotiated bilaterally between the U.S. and the Soviets as a subcommittee of the Ten Power Conference. The agreement should provide that other nations might join and if, subsequent to its execution,

any nation engaged in a space program failed to do so, the parties to the agreement might withdraw.

While seeking to obtain the proposed agreement, the United States should undertake to establish its leadership in space matters unilaterally and by participation in existing international programs. To do so, emphasis might be placed on utilitarian programs, such as improved weather forecasting, communications and geophysical reconnaissance. There are areas in which the United States presently excels. This is not to imply, however, that efforts to develop more powerful propulsion systems should not be pressed. While this is being done, it might well be desirable to endeavor also to set up certain programs jointly with the Soviet Union.

The questions of law and fact, some of which are outlined above, which in the past have plagued consideration of space matters, should be set apart from arms control negotiations. They might in due course be referred to either the UN or to some other international body for resolution.

B. Other Measures Which Could Be Presently Negotiated.

As previously suggested, it is recognized that the recommendation to concentrate our efforts on the few measures recommended above may not be accepted or the attempt to do so may not be successful and that in any event it will be necessary to discuss, with our Allies at least, what we are willing to talk about next. We will have to say something about the great gap between our initial proposals and our ultimate goal.

Accordingly, this report considers measures which could be presently [illegible in the original] danger to the security of the United States.

1. Mechanics for Lessening Likelihood of War by Accident.

In the missile age the defender against an intercontinental attack may receive little or no warning. Hence the time for deciding to launch a retaliatory attack is dangerously reduced for, once launched, missiles cannot be recalled in the same manner as bombers. Under these circumstances, there is great danger of war starting from an accidental nuclear explosion or from the isolated act of an irresponsible individual or from some other ambiguous event.

It would, therefore, seem that both the Soviets and ourselves should [illegible in the original] some means of lessening that danger and that the Soviets would be willing to explore jointly with us ways of lessening the danger.

It is not clear what form the means should take. Hence, prior to discussions with the Soviets, it is hardly profitable to do more than suggest a possibility for joint exploration. This might consist of stationing in the capital of each country high ranking officers, with direct communications to their own capital, who could personally verify [illegible in the

original] ambiguous incident, such as an accidental nuclear explosion. [illegible in the original] the last country would be most anxious to aid [illegible in the original] verify the true character of the incident, so the problems [illegible in the original] by ordinary foreign [illegible in the original] in the Soviet Union would not [illegible in the original].

The ultimate might be a “purple telephone” directly connecting the Soviet Premier and the President of the United States.

The idea here suggested would be particularly important in times of heightened tension between us and the Soviets. Obviously, the time to establish the mechanics is before tension arises. It is possible that other nations would wish to participate. There appears to be no objection to a few additional participants. But the number should be kept small so that the mechanics do not become too cumbersome to be effective.

2. Preparatory Steps for Limiting Force Levels.

It clearly would be to our advantage to bring about a reduction in the conventional capability of the Soviets through a reduction in their force level. We have already unilaterally reduced our own forces to 2.5 million, and in the present state of the world it appears unsound for the U.S. to reduce its force level further. This is not so much because the Soviet's level is over 4 million as it is because of the unsolved political problems, particularly their impact on us through our commitments to other nations, and because of the menace of Red China.

Nevertheless, if the Soviets should come down to our level we might be willing to agree to a modest reduction. It seems apparent, however, that for us to propose to the Soviets that they come down to 2.5 million, while we remain stationary, is too one sided to propose. The best we can do is to say to them that if they will come down to 2.5 million, and that is verified, we will be willing to discuss with them some further reductions.

If the Soviets indicated interest in that proposition, it is not too soon to begin to study mechanics for the verification of force levels, as the British suggest. Presumably those mechanics would include furnishing the UN with inventories on force levels (and perhaps conventional arms), and the development of the technique of effective inspection by an international inspection organ, possibly using a random system of spot checks. It is a complicated matter, even though it involves but a small part of what total disarmament would involve.

While care should be taken to make it clear that we are not interested in talking force levels until the Soviets come down to a verified 2.5 million, and that even then our idea of a reduction in force levels is not large, there seems no harm in attempting presently to develop plans for verification and for the creation of an international inspection organ.

C. Measures Which, for Various Reasons Should Not be Presently Negotiated.

1. Limitation on Conventional Arms.

What has been said above about force levels applies to conventional armaments. The two go hand-in-hand. While theoretically a limitation on weapons is more effective than a limitation on men, because an unarmed man is not much of a [illegible in the original], yet the only sensible method of limiting conventional arms appears to be to tie the number of permitted weapons to the number of permitted men. Therefore, limitation of conventional arms should wait until a limit on force levels is agreed upon. The possibility of depositing arms in depots is considered separately below.

2. Limitation on Nuclear Weapons.

As previously indicated, intense thought has been given to ways and means of eliminating the principal reason behind the current world interest in disarmament, namely the dread of intercontinental nuclear weapons; the best which seems practicable is the levelling off of international nuclear capability once a stable balance of deterrence has been achieved. Neither their elimination nor other measures of control appear at this time to be consistent with the Security of the United States. Accordingly, none of the following proposals on nuclear weapons should be negotiated at this time:

a. *Elimination of Nuclear Weapons.* At the risk of repeating what has previously been said, we must retain a nuclear capability as an effect to the overwhelming manpower of the Sino-Soviet Bloc. This capability must be retained unless and until effective machinery for enforcing international law is in operation. Additionally, even the Soviets admit that there is no way of detecting clandestine warheads and if we were to surrender our nuclear weapons, even 100 clandestine nuclear weapons of high yield would place us at the mercy of the Soviets. Nor is it feasible to eliminate the most dangerous type of vehicle — the missile. The "Atoms for Peace" and "Peaceful Use of Outer Space" programs seriously complicate the inspection problem. Even if an agreement for elimination could be inspected, the Soviets would certainly not agree to go back to manned bombers in which we clearly have the advantage, while we retain any nuclear capability. There therefore is nothing to negotiate on this score.

b. Limitation on Numbers of Nuclear Weapons

For the reasons given in connection with the discussion of the concept of a stable balance of nuclear deterrence, no negotiations should be undertaken on limiting the number of strategic nuclear weapons until that balance is established, and then only if an adequate inspection system can be devised. Limitation of numbers, as used here, includes cut-off of production of missiles, which is an indirect way of freezing numbers.

Nor should negotiations be undertaken on limiting tactical nuclear weapons. Certainly not unless and until the conventional capability of

the Free World equals that of the Sino-Soviet Bloc, and maybe not even then in view of the overwhelming manpower of the Bloc.

c. Cut-off or Reduction of the Production of Nuclear Materials for Weapons.

The inspection of a cut-off of the production of nuclear materials to weapons purposes in disclosed plants appears at the moment to be practicable only if the Soviets would permit the inspectors to share in the management of the plant. Further study may devise a simpler method for effective inspection of disclosed plants without such participation in management. However, clandestine plants are not impossible, especially in view of a new German improvement in the centrifugal process. In addition, diversions of plutonium produced by electric power reactors could create a significant number of warheads, if the Soviets should embark on a sizeable atomic electric power program. These problems are more fully considered in the attached Annex E. Additionally, from our point of view it would be difficult to negotiate a cut-off and still preserve the right to continue to manufacture a certain fusible material without which a large part of our nuclear stockpile would shortly deteriorate.

Irrespective of these considerations, the controlling reason why there should at this time be no negotiations looking toward a cessation or reduction of the production of nuclear material is that we may well need our full production for the next few years in order to attain a stable balance of deterrence and for tactical weapons. The existing programs of the Department of Defense call for practically full production until 1968. This, however, is not conclusive since these programs are not necessarily designed to attain a stable balance of deterrence. The problem is accordingly complicated, involving a detailed knowledge of existing and future weapons systems, military plans and Soviet capabilities—all addressed to the rather nebulous concept of a stable balance of deterrence. The conclusion here is that no negotiations for a cut-off or reduction should be undertaken until an exhaustive study demonstrates that on balance it would be to our advantage. This study should be undertaken promptly since the proposal to reduce or cut-off nuclear production for weapons appears to be the most promising of all proposals to limit nuclear weapons.

d. Testing Intercontinental Missiles.

Study has been given, and is currently being renewed, on the desirability of seeking a cessation of the testing of missiles. The theory in favor of cessation is that by the time an agreement to cease missile testing can be negotiated and put into effect, the U.S. will have done all the testing it requires for all the missiles it needs, and hence a cut-off of testing might leave the Soviets with much the same cumbersome and relatively inaccurate early generation missiles as they now have. But, unless the renewed study discovers new considerations, the danger that delays in the development of our own missiles will leave us at the time of cut-off with "soft" and unsatisfactory missiles (so that balanced deterrence would be difficult to achieve) outweighs the possibility that the Soviets may by testing reduce the size and increase the accuracy of their missiles. The conclusion is that once we establish stable balanced deterrence, with an adequate number of relatively invulnerable

missiles, it may well be worthwhile to negotiate for a cut-off of missile testing, although study should be proven as to whether the knowledge to be gained in the development of space vehicles may not render such a cut-off largely meaningless. But until satisfactory invulnerability is attached we should not agree to a cessation of missile tests.

e. *The "Nth Country"*.

Should the U.S. presently negotiate an agreement that we will not aid any other country in obtaining a capability to manufacture nuclear weapons nor transfer nuclear weapons to it? Both are presently prohibited by the Atomic Energy Act. Presently, selected allies are training in the use of certain nuclear weapons and are furnished with the vehicles, but the nuclear warheads are stockpiled under U.S. control. The object of this arrangement is of course to offset the great Soviet superiority over NATO in conventional forces. There are those who advocate seeking an amendment to the Atomic Energy Act permitting the US to transfer nuclear weapons to selected allies or assist them in manufacturing their own nuclear weapons, and our present national policy envisages that as possibly a desirable step. On the other hand, there are many who believe that the more nations who have nuclear weapons, the greater the danger that a major nuclear war will be irresponsibly started, and the less chance there is that effective controls over nuclear weapons will ever be established. The 1957 Western Proposals included a partial limitation on the transfer of nuclear weapons after production of nuclear material for weapons purposes has ceased. Also a resolution adopted by the UN General Assembly on November 30, 1959, suggests that nations producing nuclear weapons agree not to hand over the control of such weapons to other nations.

If the Act should be amended and selected Allies should make their own nuclear weapons, it might well increase the stability of balanced deterrence between the Free World and the Soviets, and it should save considerable money. Also there are a number of nations who may well acquire a nuclear capability without our help, and if we should help them we might retain some participation in the decision of when to use them. On the other hand we would be faced with a great deal of unfavorable world opinion and, incidentally, we would lose the veto on their use which our present control over the warheads now gives us.

If we went the other way and negotiated with the Soviets an agreement not to help other nations to manufacture nuclear weapons, we would inevitably become involved in an agreement not to transfer nuclear weapons to them, in which case it would be exceedingly difficult to preserve our present practice of transferring the vehicles and retaining control of the warheads. Of course, if such an agreement were effective, it would present the Soviets from giving Red China a nuclear capability. But it seems likely that the Soviets will not do that for reasons of their own, unless they are badly threatened by the West, in which case they would do it anyway.

On balance it seems that in the present state of the world the existing situation is reasonably satisfactory, and that until there is a change in the world situation we should refuse to negotiate on proposals to prohibit the transfer to other nations either of the capability to manufacture nuclear weapons or the weapons themselves.

A summary of an analysis of this problem by the Rand Corporation is attached as Annex F.

3. *Foreign Bases.* The overseas bases of the U.S. which so bother the Soviets vary widely in the type. Some are SAC bases from which an attack can be launched. Others are merely for SAC recovery, after an attack. Some are only staging bases. Others support IRBMs. Still others are naval bases. And there are a number of other types besides. In fact what is a "base" as distinguished from merely a U.S. military contingent is often difficult to say.

Also, the relationships with the host countries vary widely. In some cases the host country is extremely anxious to keep our base, either for military or economic reasons, or both. In other cases the host country is reluctant and may even impose overflight or other conditions which substantially reduce the value of the base to us.

It seems probable that in the course of time we will voluntarily or otherwise abandon some of our bases. It is conceivable that our balance of payments problem might force us to abandon more than we otherwise would, for our overseas bases constitute an unfavorable item in that balance. This suggests that we should use such abandonments as ammunition with which to obtain some concessions from the Soviets in arms control negotiations.

The problem, however, is not a simple one. In so far as the abandonment of these bases would hurt our nuclear retaliatory power, they should not be abandoned. Nor should bases which are useful to support limited war operations be given up. Our supply problem for such operations, as compared with the Soviets, is bad enough even with these bases. Further, there is an important political problem: an indiscriminate surrender of our overseas bases will raise the ghost of "Fortress America". And lastly, while we may surrender some of our present bases, we may well need additional ones for new weapons systems which will strengthen our retaliatory capability.

All these considerations lead to the conclusion that no agreement should be negotiated with the Soviets which calls for any substantial or indiscriminate reduction in our overseas bases until there is a sufficient change in the situation so that the above considerations will have lost their force.

4. *Budget Controls.* There can be considerable advantage to the U.S. in obtaining budget information from the Soviets—more than they will get from receiving such information from us. But the difficulty of checking the accuracy of Soviet information means that an agreement to limit military expenditures should be regarded only as supplementing other more reliable measures of control. It would be valuable when combined with other intelligence data, but not reliable by itself. The measures here recommended for immediate

negotiation are so few and of such character that they need no such supplementing. Irrespective of that, however, we should not negotiate an agreement to limit our own military expenditures until the defects in our defense posture have been cured as recommended in Recommendation No. 1.

5. *Chemical, Biological, and Radiological Warfare "CBR"*.

Not all CBR weapons are capable of mass destruction. For instance our police arsenals include several types of gas used merely to disable civilians temporarily. Tear gas is a common example. But insofar as CBR elements are capable of mass destruction, they should be classed for arms control purposes in the same category as nuclear weapons. Ultimately, therefore, no CBR capability should remain in national control. However, the problems of monitoring of an agreement to limit or abolish CBR when the time comes are not at all the same as monitoring limitations on nuclear weapons, nor are they the same for the different elements of CBR. In particular, the biological element requires very little in the way of plant, equipment and materials. Since this report recommends no limitations on nuclear weapons in the immediate future, these problems of CBR need not be faced at this time.

D. *Other Measures in the 1957 Western Proposals.*

The forgoing comments have covered most of the important measures contained in the Western proposals of August 29, 1947. Comments on the remainder follow:

1. *Deposit of Arms in Depots*—There is no objection in principle to the 1957 proposal (originated by the U.S.) for placing conventional arms in storage depots within the national territories of signatory states, under the supervision of an international control organization, as the levels of the forces which would use those arms are reduced. But there is a real question whether it is worth the effort to try to negotiate with the Soviets either on the principle or on the lists of armaments to be deposited. Since the arms would be deposited in national armories and either obsolete or quickly available in the event of hostilities or of violation of any other agreement limiting arms or armed forces, the proposal is largely of symbolic value and seems scarcely worth pursuing.

2. *International Control Organization* — As indicated earlier, the measures recommended for immediate negotiation do not require the creation of an over-all international control organization. They call for limited, specialized inspection mechanics, adapted to the particular measures they are to control. It may therefore be premature to negotiate the establishment of an over-all control organization. However, planning for reduction in force levels, which could be started presently (see D.2., above), might well indicate *planning* for such an international control organization. But the establishment of such an organization

involves many difficult political problems, such as the relationship of the organizations to the Security Council, its composition in the light of Soviet insistence on parity, and its voting procedure in the light of the Soviet preference for unanimity. These problems are at issue in the Geneva Nuclear Test negotiations and even though the inspection there involved is of a specialized nature, until the negotiations have terminated, it may be well to fight the battle there rather than begin it anew in a parallel form. If they result in the establishment of a Nuclear Test Organization, it may be desirable to use that organization as a nucleus for a control apparatus of wider responsibilities.

3. *Political Problems* — It is obvious that such political problems as Berlin German unification and Formosa have an important bearing on the amount of disarmament the U.S. can safely accept. No specific tie-in between arms control measures and political problems is, however, recommended. The 1957 Western proposals conditioned future steps on progress in solving political problems, and that did not prove to be a fruitful approach. In this report, the only connection between arms control measures and political problems is that political problems constitute an important element in references to the “present world situation” and the like.

4. *Movement of Armaments*—A related aspect of the 1957 Western proposals which has not yet been mentioned is the proposal that there be a study of a system for regulating the export and import of designated armaments. While there may be some justification for considering arms export controls applicable to specific areas (for example, the Middle East and Africa), the general concept of control of arms traffic has serious implications for our foreign military aid program and it is better not to raise the issue at all.

5. *Suspension of the Convention*—Provision for modifying or suspending an arms control agreement should be incorporated in the agreement itself. Since future political and technological changes may render an agreement obsolete, mechanics for keeping it up to date are highly desirable. Suspension should be provided in order to protect signatories in the event of violation by one of the parties. Such provisions should be formulated in the light of the measures included in each agreement and, therefore, are not discussed in detail in this report.

E. *Comments on Current Soviet and Allied Proposals.*

To avoid repetition here, comments on the current proposals of the Soviets and our principal Allies are contained in Annex G.

F. *Red China.*

In our past disarmament proposals Red China has been mentioned by name progressively less often. She has merely been included in

general references to "other essential states". It is not suggested that Red China has been forgotten, but there is some evidence of a tendency to assume that if we can reach agreement with the Soviets our troubles are over. This tendency should be discouraged. While Red China presently appears to have no more than about 2.8 million men in her armed forces, she apparently is building up their effectiveness, and her violently aggressive and hostile attitude toward the Free World in general and the United States in particular, make it clear that we should agree to no arms control measure without careful consideration of how it leaves us with respect to Red China. This is particularly true of measures which would limit our nuclear capability. Red China must also be considered in connection with verification and inspection, whether or not she is a party to the particular arms control agreement. Otherwise the Soviets might well evade an agreement by carrying on forbidden activities in Chinese territory.

Whether or not Red China will join in any agreements which the Soviets are willing to sign is not known. The political and diplomatic problems of how negotiations with Red China should be handled are beyond the scope of this report. The point here stressed is that Red China should never be forgotten in connection with arms control agreements.

G. *Inspection.*

The all-important problem of inspection is involved in some of the measures recommended for immediate negotiation and is certain to come up frequently in connection with other measures. It deserves careful analysis.

For reasons which need no repetition here, adequate verification of compliance is a *sine qua non* to acceptable arms control agreement with the Soviets. Measures which otherwise might be acceptable cannot be accepted if performance cannot be adequately verified. On the other hand, 100% foolproof verification is rarely, if ever, possible because of technical problems, expense and acceptability to both sides. Further, the degree of accuracy necessary for verification is not the same for all arms control measures; some need less than others. It is therefore important to see if there are not some guidelines which will be helpful in determining the type of verification which particular arms control require.

It should be noted at the outset that *verification* is not the same thing as *enforcement*. Verification merely spots whether or not there has been performance of an agreement. What should be done if verification discloses a breach of the agreement is very important, but it is an entirely separate problem. The action required to offset a breach has nothing to do with the action required to detect one. Adequate verification does not make an agreement "self-enforcing".

Verification is commonly thought of as being synonymous with *inspection*. That is not strictly true, because there are arms control measures which can be verified without inspection. A large nuclear explosion in the atmosphere would be an example. Of course, if verification of a particular measure can be had without inspection it is an advantage in favor of that measure.

Nevertheless, *inspection* is the most important single method of verification, because it applies to so many important arms control measures and presents such difficult problems.

To date efforts to establish any inspection system at all have been fruitless. Some progress has recently been made in the current negotiations on the cessation of nuclear tests. But it is not yet clear that a satisfactory system will emerge.

The principal difficulty is the Soviet reluctance to let foreigners invade their military secrecy. While we think they are almost pathological on that score, they have been so since the days of the Czar; and it is true that this secrecy gives them a distinct military advantage. They claim our inspection proposals are merely for the purpose of "espionage". Of course, that is not the purpose, but there is no doubt that we would gather valuable intelligence from inspection tours and our present national policy recognizes that fact. Efforts should be made to weaken the Soviet position, but it will not be easy.

This situation is aggravated by the fact that our earlier proposals for the inspection of force levels and arms limitations, called for such a large number of personnel and so much transportation and communications, and were so expensive, as to be impracticable. Incidentally, they probably would not have been acceptable to our own country.

A fresh look at the problem suggests that arms control measures fall into two distinguishable categories. The first deals with the readiness of forces, such as the destruction of operational training flights, presence of warheads with delivery vehicles, and the like. These are matters of great concern in connection with surprise intercontinental attack. They require that accurate information be quickly available if the other side is to take action to offset a breach of agreement. The second category deals with more static matters, such as composition of forces, numbers and types of conventional weapons, military budgets, and the like. On such matters, information can be less precise, and time is not of the essence.

Inspection systems adapted to deal with matters in the first category pose complicated requirements in terms of numbers of inspectors, fullness of access, speedy and reliable communications, and so on. Such systems are likely to prove unacceptable to the Soviets and in arms [illegible in the original] perhaps to us also. Above all, the consequences of failure could be serious.

On the other hand, inspection may be workable and effective when applied to the second category of matters, where timelines and margin of error are not so critical. Less cumbersome inspection machinery, the use of sampling techniques supplemented by unilateral intelligence, might make such systems acceptable.

As a general criterion it would, therefore, appear that arms control measures which require elaborate inspection and in which even small scale violations could be serious, should be avoided.

It is entirely possible that further studies will devise new technologies which will simplify the inspection problem. For instance, industry uses the sampling technique of random spot checks, which with inventories and the like produces a very high probability of complete accuracy. That technique might greatly simplify inspection of arms control measures. Also technology might be able to invent helpful devices. Such studies cannot, however, be profitably pursued in a vacuum, so the terms of reference for the studies must state with some precision the particular arms control measure to be inspected.

It is also essential to take full advantage of our own unilateral intelligence capability in designing inspection systems.

Finally, a consideration which has a bearing on the negotiability of arms control proposals requiring inspection is whether or not inspection can be accomplished adequately from outside the Soviet Union. Measures which involve only inspection in the satellite countries, for example, will probably have a higher probability of Soviet acceptance.

A more detailed consideration of the problem of inspection is contained in Annex H to this report.

H. Surprise Attack and Unintentional War

The terms of reference of the Joint Study direct that priority attention be given to types of international agreements which might reduce the danger of surprise attack or unintentional war. These subjects do not lend themselves readily to separate negotiations apart from substantive arms control measures. Since they largely involve the use of weapons, they cut across many arms control measures. The unsuccessful effort of a year ago to discuss the technical aspects of surprise attack as a separate matter illustrates the difficulty of separate treatment. Nevertheless, these two priority subjects have been kept consistently in mind and some of the measures recommended in the report are helpful either directly or indirectly.

1. *Surprise Attack.* The recommended inspection zone in Europe (page 25) is specifically designed to lessen the possibility of a surprise ground attack against NATO forces in Europe. While lessening the likelihood of surprise ground attack does not compare in importance with

preventing an intercontinental nuclear attack, Europe is clearly the most important area for preventing a surprise ground attack.

On the all important problem of preventing a surprise intercontinental nuclear attack, it is difficult to envisage any presently practicable agreement which can prevent a surprise attack in the age of ICBMs. The danger of it has increased, and so has the difficulty of preventing it. However, the creation of a stable balance of deterrence (Recommendation No. 2) will discourage a nuclear attack. Since any attack by ICBMs will presumably be a surprise attack, the deterrence against any nuclear attack is deterrence against surprise attack. Further, the use of photographing and other types of satellites should be of some help in detecting preparation for a nuclear attack. Additionally, the more inspection of other measures which can be put into effect, the greater is the chance that information indicating preparations for a surprise attack may be detected.

2. *Unintentional War*. The only recommended measure directed specifically to the prevention of accidental war is the proposed mechanics outlined on page 31. However, the creation of a high degree of invulnerability in retaliatory forces as a part of establishing a stable balance of deterrence may mean that retaliatory forces will not have to be set in motion right away. Time may be available to determine the real meaning of an ambiguous incident which will lessen the likelihood of an accidental war.

It is probable that if and as other arms control proposals than those recommended in this report came under negotiation, further measures can be worked into them which will be helpful in preventing surprise attack and unintentional war. This should be borne in mind.

It may appear that in the foregoing analysis of specific arms control measures a great deal of attention has been given to the limitations these measures would have on our own activities and that very little attention has been given to the benefits we would receive from the limitations these measures would impose on Soviet activities. Insofar as that is true, it is not because the latter has been ignored. One reason is that the problem of inspecting a number of the most important measures remain unsolved. The primary reason, however, is that we cannot afford to freeze the situation as it will exist a few years from now. We must get stronger before we can agree to measures which reduce the capabilities of ourselves and the Soviets equally; otherwise an imbalance of power in favor of the Soviets will be made permanent through arms control measures. Of course, if the Soviets should agree to verified measures which limit them more than us, then the field might open up considerably. But, at the moment, the likelihood of that does not seem great.

VII. FULLER CONSIDERATION OF MEASURES TO
INCREASE INTERNATIONAL CAPABILITY OUTLINED
IN RECOMMENDATION NO. 6 (P. ?)

A great deal of material has intervened in this report since measures to increase international capability were outlined in Recommendation No. 6. That is because the forum for these measures will be the UN, whereas the forum for the measures discussed in the interval will be the coming Ten Power Conference. It seems desirable to group in one place in this report the measures which will come up in the latter forum.

The thought behind the recommended measures designed to increase international capability is to build on what we have, namely the United Nations, rather than to attempt a great leap forward by making a drastic revision of the UN Charter or by creating a new organization. The steps proposed represent very modest progress toward the ultimate goal of peace under international law, backed by adequate jurisdiction in a world court and by effective means of enforcement. But they appear to be as far as can go at the moment.

While in this area we do not face the recurrent Soviet objection to inspection teams as "sabotage", there are at least as formidable difficulties in the way. One such is that to attain the ultimate goal will require either drastic changes in the Charter of the United Nations or a new world organization. Nevertheless, there is still scope under the present United Nations Charter for considerable progress before the question of making drastic changes must be faced. It seems well worthwhile to attempt to exhaust that scope, before deciding whether to advocate a drastic change.

A. Development and Codification of International Law

It is assumed by many that before any rules attain the status of international law, they must be enacted by a supra-national legislative body. This is true only in the sense that to be as effective as domestic law (in that an offender goes to jail) international law must apply to individuals and must be enforceable. To accomplish that, there must not only be a supra-national legislative body but there must be a supra-national court and, most important, a supra-national police force to seize individuals and put them in jail against the will of their government.

However, rules of conduct adopted by treaty are properly called "law", and though no one will go to jail for a violation, a court may determine whether or not the rules have been violated, and world opinion can be relied upon as an increasingly potent enforcement mechanism to induce compliance by nations. Even if progress can never be made beyond that point, it seems well worthwhile to attempt to reach it.

And there is ample room for progress under the United Nations Charter as it exists today. Article 13 calls for the development and codification of international law. Little progress on that score has been made to date, because efforts have been largely confined to codifying rules which we generally recognized as presently constituting “international law”. Little or no effort has been devoted to the development of rules which, if adopted by nation members, would restrain actions leading to armed conflict. Specifically, progress has bogged down on the definition of “aggression”. It would seem that this obstacle might be overcome by defining most if not all of the specific acts which together or singly constitute aggression, without attempting to define the conclusion represented by the word “aggression”. Domestic law generally does this by defining numerous acts which together or singly constitute a “breach of the peace”, without formulating a definition of “breach of the peace”.

However that may be, it seems well worthwhile to revive and intensify the effort to develop and codify international law. This appears of sufficient importance not only to entrust the task to the highest legal talent member nations can produce, but also to provide adequate staff assistance and to devise [illegible in the original] to ensure that progress is periodically checked and validated by periodic diplomatic conferences.

It should be noted that a valuable by-product of such an endeavor would be to increase the area of common understanding between nations which would tend to lessen tensions and perhaps provide a broad basis for real international cooperation.

Accordingly, it is recommended:

Recommendation No. 8

The United States should introduce in the General Assembly a resolution which will:

a. Establish a new organ composed of outstanding jurists, who would be required to devote full time to their duties, would be cleared for appointment by high courts, law schools, and academics, as provided in Article 6 of the Statute of the International Court of Justice, would be well-compensated well-staffed, and would be charged with the following duties:

(i) To codify existing principles of international law, giving priority to those principles which will make armed conflict between nations, and aiding civil disturbances within another nation, less likely.

(ii) To prepare rules not presently within the scope of international law but which, if adopted by member nations, would make armed conflict between nations, and aiding civil disturbances within another nation, less likely.

(iii) To submit the results of their work from time to time to the international diplomatic conferences described below.

(iv) To recommend the establishment of periodic diplomatic conferences of representatives of member nations to review the work of the new organ.

(v) To recommend procedures whereby the results of the work of the new organ will have the force of treaty provisions. Perhaps agreement could be presumed if no objections were made within a specific period.

A draft of such a resolution is attached as Annex J.

B. Increasing the Jurisdiction and Prestige of the World Court

Again there appears to be considerable scope within the United Nations Charter for progress. To date the International Court of Justice has had far too few cases for it to become the important instrument for the peaceful settlement of international disputes which the Charter envisages. This is not only because, as noted above, little progress has been made in developing or codifying international law, but because its jurisdiction under paragraph 2 of Article 36 of the Court's Statute to pass upon the four important matters there enumerated³ is not firm. The so-called "Connally Amendment," which reserves to the United States the right to decide when a dispute involves domestic matters, set a precedent beclouding our declaration conferring jurisdiction on the Court which many other nations have followed.

Lastly, the Court's prestige should be increased by making sure that all members of the Court represent the highest judicial talent in each of the nations supplying members.

Accordingly, it is recommended:

Recommendation No. 9

The Connally Amendment should be repealed. International agreement should be sought for unqualified declarations under paragraph 2 of Article 36 of the Statute of the International Court of Justice. The member of the Court appointed by the United States should at all times be of outstanding judicial ability.

It has been suggested that jurisdiction of the Court be extended to individuals, and that a system of regional inferior or "trial" courts are necessary in order to establish the facts on which the World Court may act on appeal, and also to meet the convenience of litigants. The suggestions have merit, but they would require a Charter amendment and it seems desirable to concentrate on making the present Charter work before seeking to amend it. It should be noted that a special Committee

³ Namely, interpretations of treaties, questions of international law, the existence of facts constituting a breach of agreement, and reparation for breach of agreement. [Footnote is in the original.]

of the American Bar Association is working constructively on this and related fields.

C. Progress Toward Effective Enforcement of International Law

Leaving aside fulfilling the ultimate goal by an international police force large enough to cope with the armed forces of any nation or group of nations as being too far in the future for present consideration, it seems clear that if there could be created a small mobile, well-equipped force analogous to our Marine Corps, under effective UN control, it would be of real help in the prevention of limited war and armed aggression.

It is equally clear, however, that no such force is presently practicable. Not only is the Soviet Union opposed but so are a substantial number of small nations, principally for fear of their forces becoming involved in a struggle between the two major powers. Also the problems of the recruiting, financing, supplying and commanding of even a small force are presently insoluble. Further, the UN Charter provides only for earmarking of units by member nations and even that has broken down in the face of the unrealistic composition of the Security Council and the vast differences in political concepts between nations, particularly between the Free World and the Soviets. In general, the Soviet veto in the Security Council has blockade the functioning of the UN's peace machinery.

The best that can be expected in the near future is that some UN members will continue to supply small armed forces on an *ad hoc* basis under the Uniting for Peace Resolution which by-passes the Security Council when the Council fails to act. Incidentally, it should be noted that small *ad hoc* forces have the great advantage over standing forces in being selected from nations not involved in the particular dispute.

This is a discouraging outlook for establishing effective enforcement of international law. Nevertheless impressive results have been accomplished by UN observer teams and by UN semi-military forces charged with policing borders and the like. It therefore seems worthwhile to endeavor to formalize the procedures by which such groups are brought into being, and to add to them a mediation function. If successful, this might well establish a basis of confidence which would permit further progress. Further discussion of the problems of international law enforcement is contained in Annex I.

Accordingly, it is recommended:

Recommendation No. 10

The United States should introduce in the General Assembly a resolution requesting the Disarmament Commission to develop measures, for adoption by the General Assembly, which would establish a corps of observers nominated by member nations from which the Secretary

General, when authorized by the Security Council or the General Assembly, would appoint teams charged with any one or more of the following functions, subject to the consent of one or both of the parties involved as at present: (1) to determine and report the facts involved in any situation involving an actual or threatened breach of international peace; (2) to recommend measures to terminate or avoid such hostilities; (3) to act as mediators to settle such disputes; (4) to supervise the cessation of such hostilities or the measures adopted to avoid them; and (5) to assist in the administration of disputed territories.

A draft of such a resolution is attached as Annex K.

VIII. MATTERS NOT THE SUBJECT OF RECOMMENDATION

There are various matters which have a distinct bearing on the subject matter of this report, but which are beyond its scope. While no recommendations are therefore made on these matters, a few brief comments upon them may be helpful.

A. *Civil Defense.*

The only aspect of Civil Defense considered here is its effect on a stable balance of deterrence. On that it is arguable that if we and the Soviets had fallout shelters, the stability of balanced deterrence would be enhanced, since an attack would have to be more massive to give the same results as without shelters. On the other hand, the attacker would suffer less damage from retaliation and so might be more likely to attack. The result appears to be a standoff.

B. *Opening Up Soviet Society.*

In view of the Soviet's unswerving goal of world domination, any measures which tend to open up Soviet society, and eventually even alter their goal, will in the long run have a beneficial effect on disarmament, indeed may be a prerequisite to the accomplishment of significant arms control. Thus exchanges of civilians in all walks of life, cooperation on scientific projects, and the like, should be helpful to this end. Similarly, arms controls and related inspection measures might in themselves help to open up Soviet Society.

C. *Negotiations.*

There are at least two matters which seem to deserve consideration by those charged with the coming negotiations:

1. *Negotiating Margin.*

It appears that in past negotiations we have sometimes tabled proposals which reflect our ultimate position, and the recommendations in this report naturally state an ultimate position. If, however, we table proposals for negotiation in that form, we have no margin for

trading. We have no basis for the give and take which is the essence of the negotiating process. Hence the measures actually tabled at the coming negotiations should, where appropriate, ask for more or offer less than our ultimate positions or in some other manner provide the required margin.

2. Joint East West Studies.

Joint studies on technical problems may seem innocuous and desirable, not only as evidencing activity but also as an aid to assessing the merits of a particular proposal. But they carry with them a strong implication that, if the Western and Soviet experts solve the technical problems, we will agree to the proposal itself. The current negotiations on the cessation of nuclear testing is an example of this. Irrespective of the merits of this particular example, it is a dangerous practice. We should be sure we are willing to go through with a proposal before we agree that experts should be convened to study the technical problems it involves.

D. Publicity.

A number of knowledgeable individuals have expressed the conviction that in the past we have been too interested in the public reaction of other nations and have neglected our own public. They maintain that the best way to obtain the understanding support of world opinion is through educating the United States public. In that connection it is suggested that we should publicize our long range goal, explain why we cannot take bigger steps toward it under present world conditions, explain the concept of stable balanced deterrence, and hammer mercilessly on the fact that deeds speak louder than words and that the United States record as a non-aggressive nation is incomparably better than that of the Soviets. For example, a comparison of our actions in liberating Cuba and the Philippines with the Soviets' actions in Hungary and the fact that we committed no aggression while we had a nuclear monopoly, make their epithet of "fear mongering" utterly absurd. Mobilizing special publicity talent for the coming negotiations would seem highly desirable.

IX. FURTHER ARMS CONTROL STUDIES

While a number of outside organizations (see Annex A) have rendered valuable help to this study, this has proved insufficient for the identification and detailed study of all issues involved. Certain issues have however been identified, work statements for their study are in the final stages of preparation for recommendation to the Departments of State and Defense is in process. These studies are described in Annex I, which also includes suggestions for additional fields for studies.

It seems clear that the successor organization to this Joint Study should be authorized to contract for substantial outside assistance if it is to cope adequately with the continuing problems of disarmament.

* * * *

While the Annexes to this report have been reviewed for consistency with this report, in case any inconsistencies remain, this report, and not the Annexes, is to govern.

The cooperation by all agencies of the Government consulted in the course of this Joint Study has been outstanding, at all levels, and is gratefully acknowledged.

Respectfully,

Charles A. Coolidge
Director

521. Telegram 5562 to London¹

Washington, January 23, 1960, 3:57 p.m.

5562. Please deliver following to Selwyn Lloyd from the Secretary. Advise date time delivery.

QUOTE January 23, 1960

Dear Selwyn:

As Mr. Dillon mentioned to you in his letter of January 6, we have been exploring possibilities for advancing in the current Geneva negotiations on nuclear tests a threshold proposal based on seismic magnitudes. We have now completed our study of this approach from a technical standpoint, and our delegation in Geneva has been authorized to discuss some specific ideas and proposals with your people there.

I was glad to note from your letter of January 14 that you welcome the threshold idea at least to the extent that it permits us to go beyond an atmospheric treaty and to ban at least certain underground tests. I am glad, too, that you have no objection to a threshold set at the level of 4.75 since that is the level we have now chosen for consideration on the basis of our technical studies.

¹ Source: Transmits letter from Herter to Lloyd on threshold proposal at nuclear test talks. Confidential. 6 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.

We, too, have been giving serious thought to the question of possible Soviet reactions to a threshold proposal. I believe, as you do, that they may well seek to extract maximum political advantage by charges that the West is seeking to put a costly inspection system in the Soviet Union for intelligence purposes and at the same time to continue a program of nuclear weapons development. Against this possibility, however, we have weighed the clear advantages of a move which represents an advance over our earlier proposal for an atmospheric treaty, which gives evidence of our willingness to agree to a test cessation in all areas that can be adequately monitored, and which offers a constructive way to by-pass existing disagreements between US and Soviet scientists on criteria and detection capabilities.

From the standpoint of world opinion, I think this new approach will point up more effectively than our earlier atmospheric proposal the idea that our purpose is not a limited treaty but a phased approach to a comprehensive treaty. I think if we emphasize the idea of progressively lowering the threshold through joint research we will be able to make this goal and the road by which we propose to achieve it somewhat clearer than we were able to do last April. Moreover, on purely technical grounds I think we are in a better public position to press for a phased treaty than we have been in the past. Both the report of the technical working group and Khrushchev's recent admission before the Supreme Soviet that modern technical equipment cannot provide absolute certainty that all underground nuclear explosions can be detected should be helpful in this regard.

On the basis of such factors as these I have come to the conclusion that the Soviets would be unlikely to use the proposal as the pretext for a break, and even less likely that it would prove advantageous to them if they should do so. The idea of the phased treaty, beginning on an even more limited basis, has already been advanced, and the idea that we could not agree to any cessation of tests which could not be effectively controlled has been a cardinal point of our public position from the outset. If a new proposal combined these elements with constructive new suggestions for getting around present technical disagreements, I doubt the Soviets could readily turn this new phased treaty proposal to their advantage. The effect of our earlier phased treaty proposal was in fact to put pressure upon the Soviets to move in a constructive direction.

I have given earnest consideration to your suggestion that the proposal be accompanied by a moratorium for a limited period of underground tests below the threshold. Despite certain public relations advantages, I believe we would have something to lose by such an uncontrolled moratorium in terms of maintaining the principle that international undertakings in the field of disarmament must be adequately controlled. We might lose militarily as well, of course, since

the Soviets would be able to test below the threshold in confidence that signal strengths would not permit inspection whatever warnings we might obtain by intelligence means.

You refer to the fact that we have already had an uncontrolled moratorium for over a year, and that two or three more years would under our present proposals be required before a control system can become fully operative. It is just this fact, that we have already been perhaps overly generous in conceding a test moratorium without effective control, that makes me feel further extensions or relaxations of our requirements for a moratorium would serve to weaken the essential principle of controlled agreements.

You refer to the question of a Soviet resumption of atmospheric testing in response to any resumption of underground tests by the western powers. I am inclined to think that this is unlikely, and that if the Soviets resumed atmospheric tests they would, whatever their excuses, bear the odium for pollution of the atmosphere. In any case the threshold proposal would not carry with it any announcement of resumption of underground tests. It would merely, in the spirit of the President's announcement of December 28, involve a statement in response to Soviet inquiries that, in accordance with the principle that we cannot agree to a cessation of tests in environments which cannot be controlled, the U.S. would be free to resume testing below the threshold when its national security interests so dictated. I have discussed this matter with the President and find that he shares this view as to the way the matter should be handled.

You mention that as a result of the agreed technical report of last summer we probably would be prepared to include a ban on high altitude tests. I think our position there should be consistent with what we say about the underground ban, and with the proposal of the President last April. At that time we suggested an agreed suspension of nuclear weapons tests up to the greatest height to which effective controls can under present circumstances be extended. This formula would leave for discussion, in connection with treaty language on high altitude, the question of the extent of controls and corresponding obligations we would want to include in the initial phase.

I hope that we will be able to reach agreement on this course of action in the near future, since a new western initiative at Geneva would, I think, be particularly useful at this time. I should be glad to know your reaction to the threshold proposal in light of the specifics Ambassador Wadsworth will be presenting to Sir Michael.

With warmest personal regards,

Most sincerely,

522. Memoranda of Conversation Between Eisenhower and Herter¹

Washington, January 23, 1960, 8:30 a.m.

In a conversation with the President this morning, I discussed with him at some length procedures with respect to instructions for our negotiating group headed by Mr. Eaton, who meet on Monday with representatives of the other four nations involved in an effort to reach a common position before the March 15 conference with the Soviet Bloc countries in Geneva. I told him that I felt it would be a long and difficult process to achieve agreement with the Defense Department on a detailed program and that, from the point of view of proceeding, it would be best if Mr. Eaton could isolate in the discussions with our Allies points on which he or a representative of Defense who would be sitting with him, felt there might be real objections on the part of Defense. I added that, of course, when unresolved specific points came up we, together with Defense, would bring them to him for resolution.

He agreed with this procedure. He likewise agreed that we should try to work out some proposal which we could make to the Russians which would have a good public relations impact but that for the initial stages we should confine ourselves to trying to reach agreement on such matters as might be quickly implemented, and that no commitments should be made in so-called “package” form of specific steps leading from the first initial stages to the final disarmament.

Memorandum of Conversation Between Eisenhower and Herter

Washington, January 23, 1960, 8:30 a.m.

The President this morning approved the draft of a disarmament objectives paper. Although we discussed at some length the question of an international police force, it was finally agreed that it would be best not to try to spell out any details and to leave the language as it stood, subject, of course, to revision in consultation with the Five-Power disarmament group. I likewise told him I would send to General Goodpaster our own communication to the Department of Defense containing some of our ideas, as well as the British specific disarmament proposals

523. Message From Ormsby-Gore to Herter²

January 29, 1960

Text of Message to Mr. Herter from Secretary of State

Thank you for your letter of January 23 about the Nuclear Tests Conference. Sir Michael Wright has now sent me the gist of your instructions to Ambassador Wadsworth.

I feel bound to tell you that we seem to differ considerably in our assessment of the situation.

To begin with, we believe that any proposal to the Russians which would permit the holding of tests below a given threshold would be totally unacceptable to them. If we insisted on this solution we think it might lead them to break off the negotiations. You take a different view. It has of course been a cardinal point of our public position from the outset that we could not agree to any cessation of tests which could not be effectively controlled. But Tsarapkin has repeatedly told us in Geneva that the Russians are not interested in a negotiation which will

² Source: Disagrees with threshold proposal for nuclear test talks. Confidential. 4 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.

not bring about the end of all tests. Khrushchev too has emphasized this repeatedly and I believe he means it.

Now, as I understand it, the guidance which you have sent to Ambassador Wadsworth on what he should say about tests below the threshold and at high altitude does not go beyond what you say in your letter to me. On past form I think it all too likely that the Russians will concentrate their attack on these apparent gaps in your proposals. I confess that we are not at all clear here about what precisely you have in mind on high altitude tests and tests in deep space. I am sure you will be asked at a very early stage whether you intend to start testing above a certain height, or whether you accept the report of the first technical working group, and its implications for the Treaty. On tests below the threshold you appear to rest on a statement on the lines of that which the President made on December 28 last. I am sure that this will be twisted by the Russians to imply that you have never paid more than lip service to the goal of the cessation of all tests. In short, I greatly fear that by concentrating on what you do not say and ignoring the specific proposals you put forward, the Russians will make great propaganda capital of the new move you suggest, whether or not they decide to break off negotiations altogether. They will be the better able to do this since your new proposals do not carry with them the alternative attached to the President's proposals of last April that we would still be willing to try to negotiate a comprehensive Treaty to cover all tests.

You say further that if the West should quite legitimately resume underground tests below the nominated threshold, and if the Russians were then to follow with atmospheric tests, as in my view they almost certainly would, you consider the odium would attach only to the Russians. I wish I could agree. However unpleasant the fact it would, I am sure, be generally held that the West had given the Russians the pretext for resuming and I am convinced that world opinion at large, which gets quickly agitated about fallout, would place the blame on the West. However clear it was that the Russians were causing the fallout, it would nevertheless be generally represented and believed that it was Western action that had brought this about.

You may be under the impression that my suggestion of a temporary moratorium on tests below the threshold represents a retreat from our insistence that any cessation of tests should be effectively controlled. This is not the case. What I had in mind was not a cessation of tests below the threshold but only a suspension of specified duration. We would aim during that period, as you suggest, at a programme of joint research with the Russians to lower the threshold. My suggestion does not imply an indefinite suspension of tests below whatever lower threshold we might in the meantime have achieved. This I think would preserve the principle. I also had it in mind that in proposing

a moratorium we should ask the Russians to accept some degree of inspection of events below the threshold. I do not think the Russians could reject this out of hand. Even partial control on this kind of basis would improve our position.

In commenting on my suggestion that we should incorporate a moratorium you say you think that we have perhaps been overly generous already. I do not think we need reproach ourselves with excessive generosity over the moratorium that has existed so far. After all, we accepted a time lag of this kind in good faith and with our eyes open when we took the decision to enter into negotiations in October 1958. And if we assume, as all the indications suggest, that the Russians have held no further tests since November 1958, I do not think our generosity has cost us much.

As you know, we believe that this negotiation over nuclear tests will vitally affect the future course of events in the whole field of disarmament measures. If we fail to get agreement with the Russians in the Nuclear Tests Conference I think the prospects of reaching any form of agreement with them in the Ten Power Disarmament Committee are negligible.

There is a further point. We are as worried as you over the possibility of the spread of nuclear weapons to other countries. A number of countries are certainly contemplating a nuclear weapons programme, and I am sure the only hope of restraining them is an agreement, to which they themselves could subscribe, which will persuade them that no one beyond the present nuclear powers in which I would now include France is going to be able to develop weapons. Development entails testing and therefore agreement on the controlled cessation of tests seems to us the quickest and most effective way of discouraging any other powers from starting on this vast enterprise.

I am extremely doubtful, as I have said before, whether we shall get agreement with the Russians unless they are convinced that we are not going to continue any form of tests. It seems to me to be well worth giving an undertaking of limited duration to suspend those tests we cannot yet control and then using that time to devise controls that will be effective over the whole spectrum. If we succeed in this, we shall have won a tremendous prize for we shall have got the Russians for the first time to accept international control on their own soil.

I ask you therefore most earnestly to consider whether you can add to the instructions you have already sent to Ambassador Wadsworth a proposal that there should be a suspension of tests of limited duration in the uncontrolled environments. These would then be progressively reduced until we have comprehensive controlled cessation.

524. Telegram 5847 to London³

Washington, February 2, 1960, 8:33 p.m.

5847. Please deliver following to Selwyn Lloyd from the Secretary. Advise date time delivery.

QUOTE February 2, 1960

Dear Selwyn:

It was good of you to give me your assessment of the situation in the nuclear tests conference and your reaction to the threshold proposal that Jerry Wadsworth has been discussing with Sir Michael Wright.

I am sorry that our views are still at variance on one or two important aspects of the proposal. I am hopeful, nevertheless, that we will be able to develop an agreed basis for proceeding in the near future.

I share fully, of course, your assessment of the significance of a test cessation for restraining the spread of nuclear weapons and of the importance of getting the Soviets to actually accept the international controls to which they are now largely committed before world opinion.

On the matter of high altitude tests, our own position does not at present go beyond the general principle I mentioned in my letter of January 23. In essence it is simply that our obligations in the initial phase should be commensurate with the controls we agree to install. I think if we accepted any commitments beyond this it would serve to undercut the principle upon which the threshold proposal is based and which it is our purpose to maintain. We have in mind, for example, cessation of tests up to a height of not more than 100,000 kilometers if installation of adequate ground based controls is agreed, and up to greater heights if installation of satellite controls is agreed. The problem is partly the practical one of weighing the costs and technological problems of control against technological capabilities for outer space during testing the first phase of the treaty. The obligations we can agree upon for underground testing also have a bearing, since it would be hard to justify the costs of, for example, a solar satellite system to prevent tests at very great distances in space during a phase of the treaty in which underground tests were not prohibited by the treaty. Accordingly, we had thought it would be best from the tactical standpoint to continue our efforts to resolve the current deadlock on the underground environment before going ahead to treaty language on outer space.

³ Source: Reply from Herter to Lloyd acknowledging differences, proposing interim steps at nuclear test talks. Confidential; Priority; Limit Distribution. 5 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.

I have given further serious thought to the question of the acceptability of the threshold proposal to the Soviets, and the course of action we should pursue if it is rejected. I continue to believe that the other side could not with advantage take so immediate and drastic a step as to break off the negotiations and resume atmospheric testing, particularly in the absence of any specific announcement of our intention to resume testing. I doubt they could profit from this kind of response to a carefully considered Western proposal for circumventing technical disagreements, consolidating the broadest possible existing area of agreement, and working constructively toward extending that area of agreement. On the other hand I do agree that in the light of past positions of the Soviet Union against the holding of any tests this proposal is not likely to find ready acceptance. The issue, however, seems to me to be one of principle, namely that we should not agree to any arms control measure to which adequate controls cannot be extended. It is a principle understandable from the standpoint of world opinion, and one which I consider to be equally essential from the standpoint of this agreement and of broader future agreements in the field of disarmament. I recognize the connection between this negotiation and the ten-power disarmament negotiation. But to compromise such a principle would start the ten-power talks under poor auspices. Thus, while I share of course your doubts as to any immediate acceptability of the proposal, I consider it an essential negotiating move to narrow down and bring to a focus both the principle involved and the area of technical problems for which a resolution must be found before we can proceed to a comprehensive treaty. As you know, our purpose in entering into the technical talks in November was to seek to determine whether a sound technical basis could be found for proceeding to a comprehensive treaty. The Soviets have been far from helpful in their response, both in the technical discussions and in their more recent reiteration of the politically motivated positions taken by their scientists. I think what is needed at this stage is a proposal which poses again as clearly as possible these inescapable issues, and which confronts the Soviets with the consequences of their failure to agree to reasonable criteria or to face in a realistic way the technical problems that must be resolved. In this negotiating context I continue to feel that a moratorium proposal going beyond the limits of effective control might serve to reduce the clarity of the issues involved, to relax somewhat the pressures we need to exert upon Soviet positions and most importantly, of course, to reduce the clarity and force of the principle that agreement must be commensurate with effective controls.

I recognize fully that the position you propose draws a clear and important distinction between temporary undertakings in fields not yet subject to effective controls, and a cessation of indefinite duration in areas on which adequate controls can now be agreed. This, however,

is a somewhat different distinction from that involved in the principle of agreement to cease tests only in areas where effective controls can be provided. It is the latter principle that is the basis of U.S. policy. In addition to the soundness of this principle, it is one which cannot be compromised if Senate consent to ratification is to be achieved.

The difference between us here appears, I regret to say, to be an important one. I think it is particularly unfortunate not only that unauthorized leaks to the press during the past few weeks, which have obviously come from American sources, have occurred prior to our reaching agreement between us, but also that they have tended to point up the aspects of the proposal which will be least attractive from a public and negotiating standpoint. I hope, nevertheless, that we will be able to agree on a course of action in the near future. Since your objections do not seem to go to the threshold proposal as such but only to the question of an accompanying moratorium, perhaps we can agree that the U.S. delegation should be authorized to proceed with the proposal on the basis I have outlined. On the moratorium question perhaps we could agree to take the line that the treaty would itself contain no provision regarding tests below the threshold.

I know that this solution is far from satisfactory in its potential for Soviet maneuver to exploit any apparent difference. There have been certain differences in the past, however, in our respective unilateral statements regarding a moratorium, and they have thus far proved manageable by our respective delegations. Since there is in my view a strong need for a new Western move at Geneva at this time, I hope that with the arrival of David Ormsby-Gore we will be able to work out an agreed basis for proceeding.

Incidentally, in connection with our efforts to facilitate progress toward a comprehensive treaty I think you will be glad to learn that our existing program on underground test detection was recently augmented by an additional allocation of some seven million dollars for this fiscal year. This augmented program has already been planned in considerable detail and is getting under way at the present time.

With warmest personal regards,

Most sincerely,

Christian A. Herter UNQUOTE

525. Memorandum of Conversation¹

Washington, February 3, 1960

SUBJECT

Geneva Nuclear Test Negotiations

PARTICIPANTS

Sir Harold Caccia, British Ambassador
The Secretary of State
Mr. Wiggin, First Secretary, British Embassy
Mr. Merchant, Under Secretary of State for Political Affairs
Mr. Farley, S/AE

The Secretary gave the British Ambassador a copy of his letter delivered earlier in the day in London to Selwyn Lloyd, regarding future proposals in the Geneva nuclear test negotiations. After reading through the letter *Sir Harold* commented that he understood the United States was eager to put forward the threshold proposal as soon as possible but did not plan to do so until after discussions with David Ormsby-Gore early in the following week. *The Secretary* confirmed this and said that we thought it most important to have a clear agreed understanding as to how we would handle the proposal and the questions which would be raised by the Soviets.

Sir Harold said that, speaking personally, he thought that perhaps a distinction might be made between the types of testing which could be detected and controlled, and the types which could not at the present time. Wadsworth and Sir Michael Wright might propose that tests in the former category be covered by a cessation agreement to be negotiated promptly by them with Tsarapkin; tests in the undetectable category raised a political problem which was beyond their competence and which would have to be referred to the highest level, presumably at the forthcoming summit meeting. *The Secretary* said that there appeared to be no problem regarding the tests which could be detected and identified. We were, of course, ready to enter into a safeguarded agreement now ending such tests. We were also determined to pursue the test suspension further as rapidly as the technical uncertainties could be resolved. He referred to the work now under way, to the extent of seven million dollars, to resolve the technical problem of underground test detection. We were prepared to join in a coordinated research program in areas under any threshold. *Mr. Merchant* observed that *Sir Harold's* suggestion might appear to derogate from the authority of

¹ Source: Attempt to coordinate positions for nuclear test talks. Confidential. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

our negotiators, whose instructions could be as broad as their governments chose. More importantly, we should not appear to compromise the principle of entering into disarmament agreements only when they could be adequately controlled, as would be done in implying a possible political resolution of what was essentially a control problem.

It was agreed that the Secretary would meet with the British Ambassador and Mr. Ormsby-Gore on Monday, February 8, to discuss the matter further.

526. Memorandum of Telephone Conversation Between Herter and McCone¹

Washington, February 3, 1960, 10:40 a.m.

Mr. McCone telephoned to say he had about 45 minutes with the President this morning, and that their talk had run along the lines of the Secretary's talk with the President yesterday. Mr. McCone said the President expressed considerable concern over the British opposition, and volunteered his recognition that if this British opposition ever got on the Hill we would have troubles on the bilaterals. The Secretary said Mr. Merchant had already run into difficulties on this yesterday. Mr. McCone said it was the Republicans who were causing the difficulties, principally Hickenlooper and Hosmer, who were probing this so-called "undue extension of Presidential authority".

The Secretary said he is going to talk very frankly to Caccia this afternoon. McCone said he mentioned the Ormsby-Gore threat to the President, and the Secretary said we had sent information on this to Goodpaster to pass along to the President. McCone said Goodpaster did report to the President and that the President had asked Goodpaster to call the Secretary to be sure we fully understood the implications of this from the standpoint of the bilaterals. The Secretary said he is going to have to see Ormsby-Gore when he arrives on Monday, and that it is a question of how far to go with him and still try to keep the confidence of the person who told us. McCone said he thinks the Secretary will just have to smoke him out by telling him this is what we are going to do and asking him what they are going to do in light of this. McCone said the President is right along with us all the way.

¹ Source: Ormsby-Gore visit. No classification marking. 2 pp. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.

McCone said on the Emylanov matter, the President seemed to think it was worth exploring. McCone said he was now talking with Dr. Rabi and John Hall, and that Mr. Hall will be meeting a little later with Mr. Bohlen. McCone said they will then phone Emylanov and, if that is productive, Hall will go over there and, if that is productive, McCone will go.

McCone said he and the President had an interesting talk on the idea McCone had talked to the Secretary about, i.e., taking a plant and matching it with another plant on the cut off, with a second phase of an open sky search for another plant. McCone said he would like to see us staff this out a little with Eaton and others. The Secretary said Eaton has to be given guidance on our line of approach; what, at the present time, Eaton is still doing is trying to talk about matters of substance rather than technique on the major issues to see where we are at but, at the same time, it is a question of how this particular thing is approached. McCone said he thinks this might be something that could be done. The Secretary said it was a question in his mind whether this is leading to a complete cutoff, with this being a method of doing it bit by bit, and this being a part of the method of ascertaining whether there are any more plants or not—a part of the inspection, so to speak. McCone said this might lead to a complete cutoff and reveal all the plants, and the open skies would lead to a lot of other things, including the missile problem. The Secretary said this is where we run into problems in that they will say we want to find the launching pads instead of the plants. McCone said he would tell them that of course we want to find the pads if we are going to discuss disarmament. The Secretary said that, of course, this is the crucial thing we are driving at, but that this is the great military advantage the Soviets have and it is a question of what they may ask as a quid pro quo for their giving up this military advantage. McCone said they offered complete disarmament without any quid pro quo. The Secretary said he thinks all the way through we are up against the same fundamental difficulty, i.e. adequate inspection. The Secretary said there he thought the question of inspection ought to be considered case by case on what we are trying to handle. McCone said his theory is that our posture will be better on the 15th of March if we offer something significant and tangible; but not complete, rather than just offering to study something, and that is why he suggests this course. McCone said all we may get is one padlocked plant here and one there but it will make headlines three inches high. The Secretary said we want to give very careful study to actually laying it on the line and asking them to do the same in having so much fissionable material neutralized which is something we can afford better than they can. McCone said he had a few brief notes on this, which he could personally show the Secretary. Agreed McCone would meet the Secretary at 1:50 today and ride over to lunch with him.

527. Working Paper¹

February 8, 1960

UNITED STATES VIEWS ON CERTAIN
DISARMAMENT MEASURES

I. Ultimate Arms Limitation Goal

The objective in disarmament negotiations is to contribute, by balanced, phased, and safeguarded arms control agreements, to the achievement of a secure and politically ordered world in which:—

1. There shall be universally recognized rules of international law, which, if followed, will prevent all nations from initiating armed conflict with other nations, backed by adequate jurisdiction in a world court and by effective means of enforcement.

2. Through safeguarded international agreements, national military establishments shall have been reduced to the point where no single nation or group of nations can effectively oppose enforcement of international law.

3. An international control organization adequate to verify compliance with agreed measures of disarmament is established and operating effectively.

4. An open world, including the institution of aerial and ground inspection adequate to detect any build-up for surprise attack, large or small, has been achieved.

II. The Following Areas to Be Negotiated at This Time by the Ten Nations

1. A joint study of the composition, control, financing, etc., of an International Disarmament Control Organization, and recommendations with respect thereto.

2. Agreement to establish the International Disarmament Control Organization in the light of recommendations of the joint study group.

3. A joint study of present force levels of the various powers, including criteria for defining force level ceilings and the manner of verification thereof; and recommendations with respect thereto.

4. Agreement to establish an initial force level ceiling, in the light of the recommendations of the joint study group and upon establishment of effective verification procedures.

5. A joint study of the present levels of conventional equipment and armaments pertaining to land, sea and air forces, including criteria

¹ Source: U.S. Views on Certain Disarmament Measures. Secret. 3 pp. Eisenhower Library, Whitman File, DDE Diaries.

for defining the same and the manner of verification thereof; and recommendations with respect thereto.

6. Agreement to place in storage depots, within their own territories and under the supervision of the Control Organization, specific quantities of designated types of conventional armaments, in the light of the recommendations of the joint study group and upon the establishment of effective verification procedures.

7. A joint study of an appropriate inspection zone or zones in which there would be established one or more of the following in order to give participating States greater protection against surprise attack, including the exchange of information concerning military forces (subject to effective verification procedures, including aerial inspection, ground observers at agreed points, and mobile ground teams—all with specifically defined rights and authority); overlapping radar; reporting of flights for all aircraft; and establishment of appropriate communications facilities and arrangements.

8. Agreement to establish within the agreed zone or zones appropriate measures to give participating States greater protection against surprise attack, in the light of the recommendations of the joint study group.

9. A joint study of measures to be taken to assure that no nation shall place in orbit or station in outer space weapons of mass destruction—including prior notification of launching and launch site inspection.

10. Joint studies of means for preserving world peace as national armaments diminish, through the further development, or creation, of international organizations; and recommendations with respect thereto.

11. Agreement to aid in the development of the means for preserving world peace through the further development, or creation, of international organizations, in the light of the recommendations of the joint study group.

(Additional items may be added under this category.)

III. Future Action Which the Ten Nations Agree Must be Taken to Attain the Ultimate Arms Limitation Goal and Which Will be Negotiated after the Completion of the Various Measures and Studies Set Forth Above

(The United States will present at an early date items for inclusion in this category.)

528. Memorandum for the File by Herter¹

Washington, February 11, 1960

SUBJECT

Disarmament

The Secretary accompanied by Mr. Farley had lunch February 11 with Secretary Gates who was accompanied by Mr. Douglas and Mr. Irwin.

Nuclear Test Detection Improvements

The Secretary said that Dr. Kistiakowsky had reported to him on the planning underway for improving seismic and high altitude detection instruments and techniques. A good deal of work is now being undertaken by Defense and AEC; Mr. Herter expressed appreciation in particular for the study which Defense is supporting on the unmanned auxiliary seismic stations. It appears however that some more money may be needed this fiscal year. In addition sizeable amounts of the order of 40 or 50 million dollars might be needed in FY 1961 particularly if development of satellite detection systems is to go ahead. Mr. Herter remarked that he was somewhat skeptical of the desirability of putting this amount of money in satellite detection methods in view of the unlikelihood of outer space testing; Mr. Douglas expressed agreement. Mr. Herter said that he expected a further report from Dr. Kistiakowsky, after which consultation might be necessary regarding possible sources of additional funds.

Mr. Gates said that Defense wanted to be helpful and could possibly find 1 to 2 million dollars more if needed. Larger amounts however would have to be released by the Bureau of the Budget.

Nuclear Cut-Off

Mr. Herter said that the policy decisions on such major elements of our disarmament position as the nuclear cut-off would have to be made very soon in view of the approach of the March Ten-Nation Disarmament Talks and the fact that we are already consulting with our allies. We need to know whether we will propose the cut-off and if it is not in our interests any longer then we need to have persuasive reasons why it cannot be advanced. He went on to say that he hoped it would be possible to continue to propose the cut-off and in addition to challenge

¹ Source: Record of discussion among Herter, Farley, Gates, Douglas, and Irwin on test detection improvements, cut-off in production of fissionable material. Secret. 2 pp. NARA, RG 59, Central Files, 600.0012/2-1160.

the Russians to match us in contributing a large number of megatons from existing stockpiles to international custody (perhaps the custody of the International Atomic Energy Agency), along the lines suggested by former AEC Commissioner Murray. Mr. Herter said that the information he had been given regarding our stockpile and the Soviet stockpile indicated that we could advantageously make such proposals. That would be the kind of dramatic move that would be highly effective. He had little expectation that the Soviet Union would go along with such proposals but if they were acceptable from the military point of view then he saw every advantage to putting them forward.

Mr. Gates and Mr. Douglas raised questions regarding the propaganda impact in view of the fact that it would presumably be well known that whatever megatonnage we proposed to contribute to international custody would be only a fraction of our stockpile and would still leave a tremendous destructive capability. They also questioned whether we could make such an initial proposal without being drawn into rapid nuclear disarmament which would leave us defenseless.

Further discussion dealt largely with tactical weapons requirements, in which both Secretary Herter and Mr. Douglas expressed real skepticism in regard to the proliferation of weapons, as indicated in the projection to 1968 given by General Loper in his briefing. Returning to the matter of a possible cut-off proposal on the production of fissionable material, Secretary Gates stated that the matter was before the Joint Chiefs and he was hurrying their report as much as possible.

C.A.H.

529. Memorandum From Twining to Gates¹

JCSM-51-60

Washington, February 12, 1960

SUBJECT

U.S. Disarmament Policy (U)

1. Reference is made to the memorandum by the Assistant Secretary of Defense (ISA), dated 4 February 1960, subject as above.

¹ Source: JCS views on U.S. disarmament policy. Secret. 18 pp. Eisenhower Library, White House Office Files, Project Clean Up, NSC Special Meetings.

2. The Joint Chiefs of Staff have reviewed the Department of State draft of a recommended U.S. Disarmament Policy which was submitted on 4 February 1960 for Department of Defense views. The Joint Chiefs of Staff have also reviewed the Department of Defense comments upon a recommended disarmament "position" previously submitted by the Department of State staff. It is apparent from a comparison of the two papers that the major objections and suggestions submitted by the Department of Defense in connection with the earlier "position" paper were not incorporated in the present "policy" paper. To the contrary, the papers are substantially identical.

3. The Joint Chiefs of Staff endorse the comments made by the Department of Defense. They feel that it would be unproductive to reiterate and to attempt expansion of those views in order to comment item-by-item upon the present "policy" recommendation. As an overall view, the Joint Chiefs of Staff regard this present Department of State draft as unsatisfactory in its substantive content; also, in their view, it is not a proper expression of arms control policy. It is, rather, a negotiating POSITION paper both in content and format and should not be accorded the stature of a policy statement. The views of the Joint Chiefs of Staff as to an appropriate U.S. arms control policy are contained in Appendix "A" hereto.

4. The necessity for formulating a U.S. negotiating position for forthcoming 10-Nation talks, with attendant pressures, may require National Security Council decisions in the very near future. Therefore, it is considered desirable to also state the views of the Joint Chiefs of Staff relative to a U.S. negotiating position—a position in keeping with their concept of an appropriate arms control policy. These views are contained in Appendix "B" hereto.

5. The Joint Chiefs of Staff disagree with the fundamental philosophy underlying the current approach to the arms control problem reflected in the paper submitted by the Department of State staff. Basically, this philosophy seems to regard the prime test of arms control proposals to be their negotiability, political appeal and responsiveness to the vagaries of world public opinion, rather than their tangible effects on the welfare and security of the United States. Underlying this placement of emphasis seems to be the view that arms control, per se, will facilitate the resolution of political conflict, rather than vice-versa, and that the risks of serious military disadvantage vis-a-vis the Soviet Bloc are intrinsically less dangerous to U.S. security than the political risks of leaving arms control negotiating initiatives in Soviet hands.

6. Concrete examples of unsound commitments to which a negotiation-oriented approach leads are to be found in measures advocated in the Department of State staff papers for immediate negotiation to: (1) reduce present force levels (without any reference to any agreed

appreciation of how this would affect U.S. security or NATO policy); (2) cease production of nuclear materials for weapons purposes (without reference to its long-range effect on U.S. military posture); and (3) cease the testing of long-range missiles (without an agreed intergovernmental appreciation of its effort on over-all security of the United States and its allies). The Joint State-Defense Study on Disarmament rejected all three of these proposals as matters for immediate negotiation because of their unfavorable impact on U.S. security. On 8 February 1960, the Joint Chiefs of Staff, in a memorandum to the Secretary of Defense, supported these views.

7. In the view of the Joint Chiefs of Staff, the above examples point in the dangerous direction to which our arms control policy will almost certainly lead if it continues to be founded on the sacrifice of substantial security considerations to negotiating expediency.

8. It is recommended that the comments and proposals contained in this memorandum and its attachments form the basis for your reply to the Secretary of State; for use by the National Security Council in the development of a U.S. arms control policy; and as a position for negotiations at the 10-Nation Conference.

For the Joint Chiefs of Staff:

/s/ N.F. Twining
Chairman
Joint Chiefs of Staff

Appendix A

U.S. POLICY ON ARMS CONTROL

A. General Philosophy Underlying Arms Control Policy

1. Arms control is essentially a matter of national security in the broadest sense and, as such, it is susceptible to resolution only at the highest levels of government. Most certainly, any decisions with respect to arms control can be made only after careful consideration of international relationships, national security and the effect on our broad national strategy. However, our military strategy and our force structure must inevitably be affected by any steps towards arms control. Therefore, arms control should have a significant role in our military planning, and negotiations attendant thereto should be made from an over-all security, and not political, point of view.

2. The United States should continue to conduct negotiations with the USSR, on any issue and through any appropriate channel, whenever it appears that over-all U.S. interests will be served by such negotiations. Negotiations with the USSR should be designed to help maintain Free World initiative and cohesion, to probe the intentions and expose

the meaning of Soviet policies, and to resolve specific differences on terms advantageous to the United States. All such negotiations should also be directed ultimately, toward the peaceful resolution of the basic Communist threat; but the United States should recognize that there is little prospect that the process of negotiation will eliminate this threat during the foreseeable future, and also that useful agreements on specific issues may be possible even in the absence of a general settlement. The United States and its major allies should be prepared to sponsor mutual concessions between the Free World and the Sino-Soviet Bloc which will afford net advantages to the United States and which will leave unimpaired the over-all security position of the Free World. The United States should not, however, make concessions in advance of similar action by the Soviets in the hope of inspiring Soviet concessions. Agreement actually reached with the USSR should be dependent upon a balance of advantages and not upon implied good will or trust in written agreements. Agreements affecting strength and deployment of military forces should include provisions for effective safeguards against violations and evasions.

3. It is the policy of the United States to place main, but not sole, reliance on nuclear weapons and the capability to deliver such weapons.

4. A central aim of U.S. policy must be to deter the Communists from use of their military power, remaining prepared to fight and prevail in general war, should one be forced upon the United States. This stress on deterrence is dictated by the disastrous character of general nuclear war, a danger of local conflicts developing into general war, and the serious effect of further Communist aggression. Hence the Communist rulers must be convinced that aggression will not serve their interests; that it will not pay.

5. In carrying out the central aim of deterring general war, the United States must develop and maintain as part of its military forces its effective nuclear retaliatory power, and must keep that power secure from neutralization or from a Soviet knock-out blow, even by surprise. The United States must also develop and maintain adequate military and non-military programs for continental defense. So long as the Soviet leaders are uncertain of their ability to neutralize the U.S. nuclear retaliatory power, there is little reason to expect them deliberately to initiate general war or actions which they believe would carry appreciable risk of general war, and thereby endanger the regime and the security of the USSR.

6. Military planning of U.S. forces to oppose local aggression will be based on a flexible and selective capability, including nuclear capability for use in cases authorized by the President. Within the total U.S. military forces there must be included ready forces which, in conjunction with indigenous forces and with such help as may realistically be expected from allied forces, are adequate (a) to present a deterrent to

any resort to local aggression, and (b) to defeat such aggression, or to hold it pending the application of such additional U.S. and allied power as may be required to defeat it quickly. Such ready forces must be highly mobile and suitably deployed, recognizing that some degree of maldeployment from the viewpoint of general war must be accepted. When the use of U.S. forces is required to oppose local aggression, force should be promptly and resolutely applied in a degree necessary to defeat such local aggression. Force should be applied in a manner and on a scale best calculated to prevent hostilities broadening into general war.

B. Basic Objective of Arms Control Policy

The broad ultimate goal of U.S. policy of arms control is to achieve world peace under enforceable law.

C. Specific Principles of Arms Controls Policy

1. The United States will engage in arms reduction agreements after the study, testing, proving and adoption of a reliable system of inspection, reporting and control.

2. The regulation of nuclear weapons and their means of delivery will be avoided except as part of the final and ultimate portion of any arms control arrangement.

3. To be acceptable to the United States any proposal for arms control should incorporate provisions to enable the United States to retain its nuclear stockpile and delivery advantage until the Communists are unable to wage war successfully against the United States and its allies because of:

a. The significant reduction of the Communist conventional forces; and

b. Major reductions of the Soviet nuclear stockpile and delivery capability; or until

c. The preservation of U.S. security can be trusted to an effective international peace enforcement arrangement.

4. Our position must be such that our Allies do not become alienated by reason of:

a. Fear that we would not lend them adequate military support in time of need; or

b. Unreasonable fear that our actions will involve them against their will in a nuclear war. (The word "unreasonable" is inserted where it is to emphasize the fact that the willingness of the United States unilaterally to go to war is essential, if the United States is to maintain its position as the leading world power. To illustrate, the United States has a variety of bilateral commitments with other nations of the world which have force, and indeed deterrent effect, only if it is clear that the United States intends to abide by these commitments without regard for the attitude of other nations).

5. In framing or accepting arms control proposals, public opinion should not of itself be considered a determinant of policy. No action should be proposed unless such action, if taken, and its foreseeable consequences, are clearly either in the interest of the United States or in no sense contrary to the interest of the United States.

6. In assessing the value and enforceability of an arms control proposal, the Soviets should be considered undeterred by adverse public opinion.

7. Unhampered research and development looms ever larger as the basis for U.S. military strength and its ability to stay ahead in the race for technical superiority. Every arms control proposal offered or accepted by the United States shall preclude the possibility of its resulting in stigmatizing the development or use of weapons systems essential to the security of the United States.

8. Any arms control proposal offered or accepted by the United States will be carefully evaluated to insure that no sacrifices of moral principle on the part of the United States are involved.

9. In seeking to achieve the objective of favorable world public opinion, the United States will place primary emphasis on the achievement of lasting rather than transient public support and will stand ready to endure immediate adverse reaction to this end.

10. No arms reduction or control proposals should be made solely for the purpose of increasing intelligence capabilities.

11. For the purpose of evaluating proposed arms restraints upon the Communist countries, the conventional and the nuclear capabilities of the Soviet Union, its satellites, and Communist China shall be treated as one.

12. Any Russian undertakings with respect to the performance of Red China must be backed by adequate means for the United States, on a current basis, to obtain proof of compliance.

13. We must correlate every arms control proposal in any particular negotiation with related areas of concern in other pending or programmed negotiations, with a view to assuring that the effect upon the U.S. security interest in all negotiations is beneficial and that our position is mutually consistent and logically sustainable in all negotiations.

14. In arms control negotiations the firm intention of the United States to be the world leader shall be maintained in the eyes of both friend and foe. Recent history has demonstrated that the Soviets react promptly to signs of weakness. To appear irresolute, uncertain, or fearful, is to invite aggressive probing. Not only is such probing intrinsically unacceptable, it is likely to be accompanied by Russian over-confidence that could precipitate general war. Accordingly:

a. Each proposal made by the United States shall be such as to preclude any inference that it is fearful of Soviet strength or of its own ability to be successful in any conflict within the foreseeable future.

b. Proposals postponing negotiations to a time when it is foreseeable that the United States will have less bargaining strength are unacceptable.

15. Prior to entering into joint international studies or negotiations in any particular field or facet of arms control, the necessary unilateral U.S. studies and interdepartmental consideration must be achieved so that there is a firm U.S. position which protects our security and national interest as well as a determination that the matters in question are desirable subjects for negotiation. We should subject all proposals to this criterion to preclude being committed to negotiations, the ultimate outcome of which could not or would not be in our interest. For example, negotiations aimed at a suspension of missile testing or the cessation of the production of nuclear weapons would not be proper subject for negotiations.

16. We should make clear to the world that armaments result from international political tensions and that the only lasting method of reducing armaments is to reduce the causes of political tension. The resolution of major international issues must therefore precede substantive reduction of the U.S. Military Posture.

17. Comprehensive proposals calling for arms control in phased stages, with an obligation to move from one stage to another, should be avoided. Instead, the United States should establish a broad ultimate goal for arms control, namely, world peace under enforceable law, and should propose for immediate negotiations only modest steps toward that goal, in order to test the intentions of the Soviet Union and actually to accomplish at least some progress. Concentration on a few points will bring all the prestige and power of the United States behind a few relatively simple measures, confine negotiations to manageable limitation, permit agreement on one or more points in isolation, and facilitate understanding by even unsophisticated peoples.

18. Until the Soviet Union has unmistakably demonstrated sincerity by deeds as well as words, elementary prudence dictates that we strengthen our guard against the Sino-Soviet military threat rather than relax it. Any deterioration of the United States or Western military posture relative to the Sino-Soviet posture during the extended process of negotiations which lie ahead should be avoided since this would lower any real incentives which may exist for the Soviet Union to accept meaningful arms reductions and controls with proper safeguards.

19. A secure nuclear deterrent to general war must be maintained as a first priority matter. The U.S. strategy is designed to achieve the basic objective of deterring or being prepared successfully to wage general or limited war. The United States must always be able to back up its Allies with forces to a degree which will make our willingness to fight credible both to our Allies and to our enemies, recognizing that

the United States will use nuclear weapons when required to meet the nation's war objectives.

20. Progress toward the arms reduction and control goal should be made as fast, but only as fast, as the security of the United States permits, in the light of the military capability of our probable enemies, our commitments to our Allies, unsettled political problems, technological considerations and the like. The test in each case should be to adopt only those arms control measures which are compatible with the goal and which involve less risk to the security of the United States than not adopting them.

Appendix B

U.S. POSITION ON DISARMAMENT

I. Our Ultimate Arms Limitation Goal.

This U.S. objective in disarmament negotiations is to contribute, by balanced, phased, and safeguarded arms control agreements, to the achievement of a secure and politically ordered world in which:

(1) There shall be universally recognized rules of international law, which, if followed, will prevent all nations from initiating armed conflict with other nations, backed by adequate jurisdiction in a world court and by effective means of enforcement.

(2) Through safeguarded international agreements, national military establishments shall have been reduced to the point where no single nation or group of nations can effectively oppose enforcement of international law.

(3) An international control organ adequate to verify compliance with agreed measures of disarmament is established and operating effectively.

(4) An open world, including the institution of aerial and ground inspection adequate to detect any build up for surprise attack, large or small, has been achieved.

II. Steps which we are presently Prepared to Take and With Respect to which we are Presently Prepared to Negotiate and Reach Agreement.

1. Discussion of the nature and functions of the international authorities and arrangements which will be needed to preserve world peace as purely national armaments diminish. The specific objectives of the discussion should be to develop recommendations on the following matters:

- a.* Development and codification of international law.
- b.* Strengthening the jurisdiction of the International Court of Justice.
- c.* Improvement of procedures governing the creation of a United Nations presence in areas where disputes exist.

2. An agreement to take into account, for possible application to other measures, any international control arrangements which may be established by the Geneva Conference on the Discontinuance of Nuclear Weapons Tests.

3. A joint study of an international arms control organization, followed by an agreement for the progressive establishment of this organization.

4. Collection of information by the international arms control organization on present levels of forces, including information on conventional equipment and armaments pertaining to land, sea and air forces possessed by the various powers. This would be followed by the establishment of agreed initial force level ceilings, which shall be subject to initial and continuing verification by the control organization. The collection of information would be based on declarations by States according to predetermined and mutually agreed criteria.

a. Prior to establishment of initial force level ceilings there would be a mutually agreed definition of the term active military forces.

b. Initial force level ceilings for the U.S., USSR, and Communist China shall be set at 2.5 million each for active military forces. (NOTE: This figure subject to change if agree definition is not in accord with views of the Joint Chiefs of Staff as stated in their memorandum for the Secretary of Defense, dated 3 September 1957, subject: "Disarmament Planning".)

c. Initial force level ceilings for the other Western nations, party to the negotiations, shall be set at:²

Canada _____

France _____

Italy _____

U.K. _____

d. Initial force level ceilings for Poland, Bulgaria, Rumania, and Czechoslovakia shall be set according to criteria mutually agreed to by the Ten-Nations.

e. Further U.S. force reductions should not be negotiated until:

(1) The USSR and Communist China have each in fact, reduced to 2.5 million in their active forces and this has been adequately verified by international inspection and control.

(2) The initial force levels for other states with significant military forces have been agreed and reduction to these levels adequately verified by international inspection and control.

5. Consequent upon the establishment and verification of initial force level ceilings, negotiations should be initiated with the objective of placing by these States in storage depots within their territories and under the supervision of the arms control organization, of specific quantities of designated types of armaments to be agreed upon and set forth in lists annexed to the agreement.

² To be determined during the course of Western preparations for the Ten-Nation Conference. [Footnote is in the original.]

6. Establishment of a European inspection zone (including all or an agreed part of the territory covered by Germany, Poland, Hungary, Czechoslovakia, Bulgaria, Rumania, Benelux and Denmark). Within this zone there would be an exchange of information concerning military forces, verified by aerial inspection, ground observers at agreed points, and mobile ground teams, all with specifically defined rights and authority, and overlapping radar.

7. If necessary to gain Western acceptance of the European inspection zone proposed in 6 above, then agree to the establishment of a zone in the USSR, a small zone in the Eastern Siberia-Alaska-Canada area, or a zone of aerial inspection in the Arctic area north of the Arctic Circle, together with appropriate arrangements for reporting flights of all aircraft within this area.

8. Prior notification to the disarmament control organization of launching programs for long range missiles according to certain predetermined and mutually agreed criteria, and reports on launching operations, including information on the location of launching sites.

9. Notification of anticipated launchings of satellites, international arrangements for tracking, and exchange of resultant scientific information. Subject to a determination of the feasibility of the necessary inspection and control measures, and their implementation, an agreement to prohibit vehicles capable of mass destruction from being placed in orbit or stationed in outer space.

10. Determination of timing and manner of extending an arms control agreement to include other States having significant military capabilities.

III. *Future Steps Required to Reach our Ultimate Goal Expressed in Some Detail which we are Prepared to Set Down at the Present Time, but as to which we are not at the Present Time Prepared to Negotiate, or Agree Nor to Place in Any Time Phase.*

(Note: The achievement of the ultimate goal can only be anticipated as the world moves concurrently toward greater stability and order and this presupposes the resolution of important East-West political conflicts, which, among others, includes the reunification of Germany as a prerequisite to the withdrawal of non-indigenous forces.)

1. Progressive extension of the international control organization in the light of accession to the arms control agreement by other States and in accordance with the expansion of inspection and control requirements.

2. Continue to completion the establishment of the international authority to preserve world peace.

3. Progressive, safeguarded reduction of national military establishments to the point where no single nation or group of nations can

effectively oppose enforcement of international law; such reductions to be phased to coincide with the build-up of international law enforcement capability to preserve world peace.

4. Collection and verification of information relating to manufacture of armaments and equipment of all kinds.

5. All states producing fissionable materials to make full declaration on all plants producing it and their capacity.

6. A joint study on (a) the possibility of the transfer, under control, of fissionable materials from national stockpiles into IAEA custody, and (b) the possibility of accounting for past production of nuclear weapons.

7. Cessation of production of fissionable materials for weapons purposes, conditional upon specified progress on other arms control measures.

8. Further measures for reducing the threat of great surprise attack, including on-the-spot control and prior notification of missile launching, and the installation of an international tracking system. Extension of the inspection system to detect possible preparations for surprise attack.

9. Progressive extension of international control arrangements to ensure the use of outer space for peaceful purposes only.

10. A ban on the initiation of the use of nuclear, chemical, biological and other weapons of mass destruction.

11. Progressive disposition of surplus armaments in phase with the reduction of national military establishments.

12. Control over manufacture of all type of armaments to ensure that production is limited to that required to achieve the objective stated in the ultimate U.S. goal.

IV. Joint Studies Which We Are Presently Prepared to Make With Respect to Certain Steps Referred to in Section II.

1. A study of the means of verification and control to insure that initial force level ceilings are not exceeded.

2. A study of the means of developing international authorities and arrangements for preserving world peace, including effective means of enforcement.

3. A study of the feasibility of the necessary inspection and control measures to prohibit vehicles capable of mass destruction from being placed in orbit or stationed in outer space.

(Note: The question of the cessation of production of fissionable materials for weapon uses is one which our allies will probably urge as a subject for joint study at this time. The U.S. should not agree to a joint international study of this problem unless or until it has been studied within our government and a firm U.S. position established after weighing all the implications. This would also apply with regard to a study on the cut-off or limitation of long-range missile testing or production.

530. Record of Telephone Conversations Between Herter and Eaton, Gates, and Farley¹

February 13, 1960, 9:50 a.m.

Mr. Eaton called and said that the Chiefs had acted and filed their report. They have a negative answer both on studying and stopping the cut-off. The Secretary said the question of study had come up. Mr. Eaton said that on the cut-off they won't even entertain the idea of a study but they will on space. Mr. Eaton said they were taking quite a beating over there. On the grounds that we don't have anything more constructive, they saw no reason for having another meeting unless we have a position to suggest. Mr. Eaton said the report was being prepared in Mr. Irwin's office and would be sent to Gates. They will agree, Mr. Eaton said, to a level of 2.5 without any verification but they will not agree to reducing it even with verification. In the missile field they won't even discuss it. The Secretary said he didn't have the report in yet. Mr. Eaton said Dr. Kistiakowsky said it would be the end of the month but Mr. Farley thinks it will be the end of next week. The Secretary said he didn't think it would prove anything one way or the other. Mr. Eaton said he had sent a questionnaire, with four questions, to Farley and Defense and had received the answers. The Secretary asked Mr. Eaton if he would dictate a memo on where he stood on these talks since he was seeing the President Monday morning. Mr. Eaton said he would have it ready tomorrow morning. Mr. Eaton suggested he come to tomorrow's meeting ahead of Mr. Gates tomorrow. The Secretary said this would be fine.

9:55 a.m. The Secretary telephoned Secretary Gates and said he understood the Joint Chiefs had a report ready for him on nuclear cut-off and force levels. Mr. Gates said he had a paper on disarmament. The Secretary said that Mr. Eaton was at the end of his tether since the other nations were saying they could not go on unless we make our position clear. He said he was seeing the President at ten on Monday and that Eaton was preparing a memo for him. They arranged a conference at the Secretary's house at 11:30 tomorrow morning. Gates suggested bringing Twining and one or two others. The Secretary said he couldn't seat very many people but that would be allright.

10:20 a.m. The Secretary telephoned Mr. Farley and reviewed briefly the two conversations with Messrs. Eaton and Gates. He told him about the meeting tomorrow and asked if he could be at his house

¹ Source: U.S. position for ten-nation disarmament talks. No classification marking. 1 p. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.

at 11:00 a.m. Mr. Farley said he would be there. Mr. Farley mentioned the French shot which had been fired this morning.

531. Record of Telephone Conversation Between Herter and Gates¹

Washington, February 15, 1960, 4:05 p.m.

The Secretary telephoned Mr. Gates to say he had spoken to the President this morning about nuclear production cut-off and the conversation the Secretary and Mr. Gates had on this subject yesterday. The Secretary said the President wanted to decide the matter right then, but that the Secretary had asked the President not to do this since Defense and the JCS were not present. The President agreed to defer his decision, but said he wanted to have a meeting on this following the NSC on Thursday, although the Secretary said he had just had word the meeting was arranged for 9:00 a.m. Thursday to be followed by NSC at 10:00 a.m. The Secretary said the participants would be Defense, JCS, State, AEC and Allen Dulles. The Secretary said he told the President Thursday morning might be too soon for Defense, but the President wanted to go ahead and the Secretary told Mr. Gates it might be well to see where we stand at the meeting. The Secretary said the issue, as he put it to the President, was very simply is it or is it not in our interests to move on this. The Secretary said because of the prior positions taken by the U.S. Government, including past statements by the President, that if we now decide we are not going ahead we have to have a strong negative position. The Secretary said he thought it would be well before the meeting on Thursday to have a preliminary meeting at the staff level, and that Mr. Farley would be getting in touch with Defense. The Secretary said he thought what we will probably do is distribute in advance a piece of paper on which we want approval or disapproval so we can get squared away. The Secretary said he couldn't feel that more study is going to solve this problem because the JCS will be against it anyway, but the Secretary said he felt that unless this is really opposed to our national interest, we will have to be for it.

Mr. Gates said as far as he knew neither the JCS nor himself have sufficient facts to reach sound conclusions. The Secretary referred to the figures which General Loper must have and Mr. McCone's information

¹ Source: Cut-off of production of fissionable material. No classification marking. 1 p. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.

on reworkability of fissionable material. Gates reiterated his feeling that we don't have sufficient data to make an intelligent appraisal. After further discussion as to available information, Mr. Gates said perhaps he had not been informed by his own people as to what they had available, and he would look into it immediately. The Secretary said he thought Mr. Gates would find we had the essential facts.

532. Memorandum From Kistiakowsky to Eisenhower¹

February 18, 1960

SUBJECT

Government Organization for the Development of Arms Limitation and Control Policies

Last fall, following an earlier request from you to your Science Advisory Committee, its Panel on Arms Limitation and Control, chaired by Dr. Killian, prepared a recommendation regarding the preferred organization for the development of an arms limitation policy, which was then endorsed by the full Committee.

In essence our recommendation is to create an office within the Executive Office, with a director responsible to you, to be charged with the development of arms control policies. At the same time the State Department should be strengthened in this area, since it alone should have negotiating responsibility.

Having learned that you had instructed Secretary of State Herter to make to you a proposal for the required organization. I forwarded to him the attached recommendation of your Committee, which describes in detail the proposed organization and its relation to the State Department.

Recently, Secretary Herter told me that he decided not to accept our suggestion and will instead propose an organization on the staff level in the State Department. This I reported to your Science Advisory Committee, and the latter now have instructed me to bring to your attention our recommendation.

¹ Source: Government organization for the development of arms limitation and control policies. Confidential. 2 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-Organization.

I am aware that you look with disfavor upon adding new functions to the Executive Office. On the other hand, the following are among the reasons in favor of this proposal:

1. *Development of policy transcends departmental responsibilities.* Development of national policy in this area involves the complex interaction of military, political, and technical factors. These factors clearly involve the responsibilities and capabilities of several agencies of Government. Responsibility for arriving at a balanced judgment on these problems does *not* fit into the mission of any single agency of Government. Specifically, the State Department does not appear to be in a position to evaluate our present and future defense posture problems or to determine the technical requirements for adequate control of agreements.

2. *Public relations.* The formation of a special office next to the President will create a much stronger image of U.S. interest in disarmament in both world and domestic public opinion than the formation of a new staff activity in the State Department.

3. *Quality of organization.* Location in the Executive Office of the President would permit recruitment of much higher-level leadership and staff for the office than would be possible in a staff organization within the State Department. Problems involved are so complex that proper staffing is of utmost importance.

4. *Interagency support.* Location in the Executive Office of the President would greatly facilitate the process of obtaining coordinated support from the various agencies which must supply information relevant to the development of policy (e.g., Defense Department, State Department, AEC, and CIA).

5. *Direct support for the President.* The President could look to an office located within his Office for direct support in his decision-making process in this vital area of national policy.

6. *Supporting studies by Government contractors.* Development of policy will require some supporting studies best performed by Government contractors. This could be accomplished more easily and effectively by an office in the Executive Office than by an office in the State Department which has historically not used this approach and which might face Congressional opposition to such use of funds.

7. *Coordination of research and development on monitoring techniques.* It would be easier for an office located in the Executive Office, than for an office in the State Department, to coordinate the substantial research and development activities on monitoring techniques which will have to be carried out by various agencies, such as Department of Defense or the AEC.

G.B. Kistiakowsky

533. Memorandum From Farley to Merchant¹

Washington, February 19, 1960

SUBJECT

Disarmament

Five Power Talks

On February 15 the U.S. Representative submitted a paper entitled "Views on Disarmament" (TAB A). The Canadian, French, Italian and U.K. delegations took the position that a very limited one-phase disarmament program, such as the U.S. delegation paper contained was not acceptable. These four delegations favored a comprehensive plan, similar to Mr. Selwyn Lloyd's U.N. proposals, setting forth the general staging of measures leading to the goal of general disarmament.

As a result of discussions during the week of February 15, several revisions were made in the U.S. paper to make it conform more closely to the general outlines of the U.K. plan. The latest revision of this paper is attached as TAB B.

The principals for France, Italy, and the U.K. are leaving Washington this weekend, and have agreed that it probably will be necessary to meet again in Paris on March 2 for further discussions of the Western position. Working groups of experts from the five delegations have met daily to discuss problems in several major areas of disarmament; they will continue to meet next week.

The German Ambassador in Washington, Mr. Grewe, appeared at his request before the five representatives on February 16. Mr. Grewe commented briefly on a disarmament paper which his government had circulated to the five delegations. Mr. Grewe said that his government expected to have its views on disarmament taken into account as the Western position is formulated and that, furthermore, it expected to be invited to participate in any Five Power discussions of zones affecting German territory.

U.S. Policy

A special meeting of the NCS was held on Thursday, February 18, to discuss the cut-off of production of fissionable material for weapons purposes. The President decided at this meeting that the U.S. would agree to negative cut-off immediately, subject only to

¹ Source: Five-power disarmament talks; cut-off of production of fissionable material; disarmament policy. Secret. 2 pp. NARA, RG 59, Central Files, 600.0012/2-1960.

agreement and effective installation of appropriate inspection and control measures.

The Secretary of Defense, by letter dated February 17, has transmitted to the Secretary the views of the JCS on the State Department's proposed disarmament position paper. The Secretary of Defense and the JCS take issue with most proposals in the Department's paper and recommend that the Coolidge Report be submitted to the NSC for consideration as a basis for initial actions in the disarmament area.

There will be a meeting to discuss general disarmament matters at 10:30 AM on Sunday, February 21 at the Secretary's residence. Messrs. Dillon, Merchant, Eaton and Farley have been asked to attend.

534. Memorandum of Conversation¹

Washington, February 21, 1960, 10:30 a.m.-2 p.m.

SUBJECT

Disarmament

PARTICIPANTS

Secretary Herter
Mr. Dillon
Mr. Merchant
Mr. Kohler
Mr. Eaton
Mr. Stelle
Mr. Farley

In a meeting at the Secretary's house certain questions identified by Mr. Eaton (Tab A) as well as a number of other policy and negotiating issues were discussed at length. The following general conclusions were reached:

a. *French Views.* Mr. Eaton said that M. Moch had warned him that the French Government could not be expected to concur in the nuclear "cut-off" unless assured of U.S. nuclear materials or weapons. He asked whether steps could be taken to bring the French around. Consideration was given to whether we might give any specific or

¹ Source: French view on cut-off; five-power working paper; negotiating tactics for ten-power talks; military force levels. Secret; Limit Distribution. 7 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

general assurances. It was recognized that this subject was quite highly charged politically in the U.S. and that any commitments without Congressional blessing would be of little value and also risky if word of them got back to Congress. Perhaps a determined effort by the Executive to bring Congress around would at least establish our good intentions toward the French; but it had to be recognized that such an effort ran the risk not only of bitter public controversy but even of a flat Congressional bar. It was also noted that even if we satisfied the French on the cut-off, we might still find ourselves at odds with them on the issues of force levels and strategic missiles controls. The best hope appeared to be an attempt to get the French to avoid taking issue openly with us, in view of the doubt that the Soviets would accept the cut-off and the time lag in any case which might permit French fissionable materials production to go ahead and possibly a gradual change in U.S. Congressional attitudes. If the French take the attitude predicted by Moch, then Mr. Merchant, accompanied by Mr. Eaton, might have to go to Paris in an effort to bring the French around. Before embarking on this course of action (which might be done under the cover of general summit consultations), it was necessary to ascertain the basic French position. (A telegram alerting our Embassy in Paris to the problem was decided on and subsequently despatched.)

b. *Status of 5-power Working Paper.* Mr. Eaton reported that a 5-power working paper (5P/WP/15(Corr.4) 2/19/60) had been approved February 19 for referral to governments. Two principal issues were whether the "ultimate goal" should be identified as "general disarmament" or "general and complete disarmament." Our allies had tended to favor the latter formula but so far had accepted our brief version which we introduced as more realistic.

In the discussion it was agreed that the phrase "general disarmament" was more accurate and realistic and would usefully serve to distinguish in part our approach from the Soviet approach. On the other hand, the Soviet phrase was in the Camp David communique and the United Nations disarmament resolution and if our allies raised the point again we could not finally refuse. Furthermore, if the Soviets asked for the longer phrase as an agenda item—e.g., "the question of complete and general disarmament"—it would be fruitless to engage in controversy in view of the past history.

Mr. Eaton said that another question was whether the West should put up a comprehensive plan. The allies favored this, feeling that in the struggle for world opinion we had to match the Soviets in the scope of our approach. They felt that ample safeguards and check points were built into the U.K. plan, for example. The Secretary said that he had always believed we had to set forth a goal of disarmament which was as imaginative and radical as the Soviets. He doubted, however, that it was desirable to compete with the Soviets in devising elaborate

plans for every future step toward that goal. Instead he preferred to concentrate on a few simple, practical disarmament steps which might be taken now and challenge the Soviets to agree to these with adequate inspection as a way to get started and build confidence.

c. *Negotiating Approach.* Mr. Eaton said that he did not want to get into an interminable negotiation which never got to the crucial point of agreement, like the 16-month old nuclear test negotiations. He proposed to make it clear to the Soviets from the outset that the key to substantial progress was their willingness to accept adequate verification and that if they were unwilling to do business on this point he did not propose to be drawn into interminable and fruitless discussion. He wanted to be clear that this was a reasonable line and that he would not be expected for other reasons, such as the summit, to continue talking at the conference table irrespective of progress. The Secretary said that he agreed wholeheartedly with this approach, but that we must take a positive position advancing concrete measures of disarmament, and care should be exerted not to be in the position of appearing to ask for "inspection without disarmament." Mr. Eaton said that he recognized that this was a delicate hand of play, but that it was his intention to agree in general to disarmament measures which would be the subject of inspection, but to insist on a fairly detailed agreement on inspection measures before negotiating the details of the disarmament measure. Mr. Dillon said that no specific guarantee could be given in advance regarding acceptability of a break off in negotiations—particularly one before the summit. Mr. Eaton said that he fully understood this, but that the negotiating position which he would take might well require an early decision on our willingness to break off negotiations, although he would be careful not to put us in any position where we would be embarrassed by not breaking off without coming back for instructions.

d. *Force Levels.* Mr. Farley said that the most urgent policy issue remaining unresolved between State and Defense was possible reductions in military force levels. We wanted to put pressure on the Soviets to agree to mutual inspection and to use the argument that without inspection no one could know whether they indeed reduced their forces by 1.2 million. However, we could not effectively challenge them to accept inspection unless we were willing to say that acceptance of inspection by the Soviets would lead to reductions below levels presently scheduled by us and the Soviets. Furthermore, this had to be a direct challenge not complicated if possible by other conditions such as involvement of Communist China. Mr. Herter said that in his past discussions with Secretary Gates it appeared possible that Defense would agree to reductions below the 2.5 million ceiling accepted by the JCS. After a good deal of discussion of past U.S. and Western positions, Mr. Dillon asked Mr. Farley to prepare a talking paper for him which he could use in raising with Mr. Gates the question whether we could accept reductions to a level

of about 2.1 million, independent of Communist Chinese participation, provided only there was adequate inspection.

e. *NATO Consultation*. Mr. Eaton raised the question of timing of consultation with NATO. It was agreed that:

(1) The basic disarmament working paper should be submitted to the Council members by Friday, March 4. This would enable the members and governments to study the positions for some days prior to discussion in NAC on March 9. Special additional meetings could of course be held on the succeeding days, i.e., 10th, 11th, etc., if desired.

(2) There should be at least one representative of the disarmament group present and authorized to reply to questions and enter into the discussion. This might well be Mr. Eaton, who had chaired the five-power group here.

f. *Policy Questions Raised by Mr. Eaton. (Tab A)*.

(1) We will use all possible ways (Canadian good offices in NATO, Norstad approaches to de Gaulle and Adenauer, talks with Adenauer during his visit here in March) to get French and German agreement to the Norstad plan. However, if persuasion fails and particularly if Adenauer is adamant and suspicious of our motives, we will not press the plan over such opposition.

(2) We do not at present have any specific consideration we can give in return for Soviet acceptance of the Norstad inspection zone proposal. The “no nuclear arms to indigenous forces in Germany” example again involves the question of Adenauer. Moreover, this represents an important objective for the Soviets, who are not likely to give nuclear arms to the Poles and Czechs anyway.

(3) We are already barred by our domestic legislation from transferring nuclear weapons to other countries. We should not undertake a commitment with the Soviets in this regard—since they are not likely to trust other bloc members sufficiently in any case to make such transfers—except as a consequence to agreement on the nuclear cut-off.

(4) There was no conclusive position reached on IRBMs since the question of European combined production of second generation IRBMs is currently under active study. It was noted that in the past the President has been willing to envisage agreement not to station IRBMs in Germany, where there is no NATO need for weapons of this range.

(5) There was little interest in negotiating withdrawal from U.S. bases, in view of the importance of these to our strategic deterrent and the lack of symmetry between the U.S. and Soviet strategic positions which made base withdrawal difficult to match with a corresponding Soviet *quid pro quo*.

(6) There was little interest in non-aggression pacts, both because they are paper pledges and because the UN Charter already provides the necessary commitment. Such pacts also had undesirable overtones of parity. The suggestion was made that we might counter any future Soviet proposal by saying we could accept a non-aggression clause as part of an agreement for open skies inspection which would really do something to safeguard against chances of surprise aggression.

(7) Little prospects were seen of Soviet agreements on limitation on the use of nuclear weapons. On the contrary, it seems likely the Soviets

will seek to frustrate any use of tactical nuclear weapons by refusing to accept any distinctions. Hence this is clearly not a field for initiatives.

(8) U.S. troop withdrawal from Europe is unthinkable if we are to maintain our alliances. We have no reservation about the desirability of having Soviet troops withdrawn from Eastern Europe, but in view of the proximity of the USSR this is not worth much in the way of concessions.

(9) Agreements for limitations on arms traffic are primarily political measures and are under consideration with regard to the summit in the East-West relations working group in Paris.

(10) Elimination of strategic trade controls is really not an important bargaining card nor very relevant.

(11) Any world police force would have to be related to the UN in view of the responsibilities of the UN under the United Nations Charter. While we should not disown the UN or its role here, preliminary discussion might relate to the composition, functions, etc., leaving aside the question of relationship to the UN for the time being.

(12) The proposal gestures were more relevant to the summit than to the 10-nation talks. Publicity attending the 10-nation meeting should in fact focus on disarmament questions.

(13) Not discussed.

(14) Not discussed.

(15) See *a* above.

Tab A

Policy Questions Proposed by Eaton

POINTS FOR POSSIBLE EXPLORATION WITH TOP POLICY MAKERS

1. If deGaulle and Adenauer, even after careful softening-up tactics, should oppose the Norstad Plan, do we consider it a dead issue? Are there other weapons of persuasion at our command? If not, are we prepared to press it against their combined opposition or against the opposition of Adenauer alone?

2. If the Soviets should indicate willingness to accept the Norstad proposal if linked to some measure of disarmament, do we have any latitude? Can we, for example, promise troop reductions within specified time period—say, one year—if inspection is working satisfactorily? Can we promise to accept under similar conditions (or accept) a Rapacki first stage (i.e., no nuclear arms to indigenous forces in Germany, Poland, and Czechoslovakia).

3. What are the conditions under which we would be prepared to enter into commitment with the Soviets not to transfer nuclear weapons—to all other nations? to specified allies? to countries on Soviet bloc periphery? to Germany?

4. The same question with regard to IRBMs? Also, what are our present plans for IRBM installations in Europe?

5. Are we prepared to negotiate elimination of certain bases on Soviet periphery—for example, IRBM bases in Italy, air and naval bases in Turkey? If so, what should be our price?

6. Under what conditions would we agree to a non-aggression pact between NATO and Warsaw Pact? between U.S. and USSR?

7. Are there any commitments on the use of nuclear weapons which we would be prepared to negotiate with the Soviets? For example, upper KT limit on weapons in a limited war? Ban on use of nuclear weapons against population centers in a limited war? Ban on use of any but short-range missiles in a limited war?

8. Have we a price for U.S. troop withdrawal from Europe? Do we in fact want complete Soviet withdrawal from Central and Eastern Europe, bearing in mind the possibility of another Hungary and its implications for the West?

9. Are we prepared to enter into commitment not to traffic in arms? in the Middle East, in Africa, in Latin America?

10. Are we prepared to use elimination of strategic trade controls as a bargaining tool? If so, what is the range of prices?

11. Re a police force, do we favor one under UN auspices or separate from the UN, perhaps linked with Disarmament Control Organization, as at one time suggested by the British?

12. Should U.S. make some sort of well-publicized gesture on eve of talks to put Soviets on defensive, such as:

a. Announcement of unilateral lifting of closed travel areas in the U.S.?

b. Invitation to high-ranking Soviet military to “tour” selected U.S. defense installations to “see for themselves” that U.S. military posture is “strong,” but not “threatening to attack anyone?”

13. Are there any political implications of the Berlin and German issue which tie in with the work of the Ten Nation group? What posture should we take prior to May Summit Meeting?

14. What specific political solutions are required before we enter advanced stage of disarmament?

15. What positions should we take on the French position that they cannot accept our position on the cut-off of production of fissionable material for weapon purposes unless their allies can supply them with fissionable material for weapons purposes?

535. Letter From Khrushchev to Eisenhower¹

March 3, 1960

Dear Mr. President:

I should like by way of the frank and friendly correspondence, which has been established between us and which has already acquitted itself in many instances, to exchange views with you on a question which in our opinion is of very great importance.

I could not but note your statements at the press conference on February 3 on the question of the possibility of the United States turning over to its allies secret information on nuclear weapons, nor could I fail to note the world reaction subsequent to those statements.

To be honest, at first I was hesitating as to whether I should make this matter the subject of my correspondence with you at this time. The final decision to address you with this letter was arrived at after I had convinced myself that your statements at the press conferences on February 3 and 17, as well as Secretary of State Herter's statement on February 8, were rather broadly interpreted in various countries, including these in the West, in a quite definite sense, i.e., as an expression of the intention of the United States to equip with American nuclear weapons, within the framework of NATO in particular, those of its allies who do not have such weapons.

The question touched upon by you is of such great importance that I believe it necessary even now to share with you certain considerations.

It is a well known fact that from the time when nuclear weapons were invented the secret of their production has been acquired by the USA, the USSR Great Britain, and now to a certain extent by France. Other states so far possess neither the secrets of production of nuclear weapons nor the weapons themselves. We are in agreement as to the necessity of freeing humanity from the frightful threat of a nuclear war and of working toward the complete elimination of nuclear weapons. It is on this crucial problem that you and I reached complete mutual understanding during the memorable conversations at Camp David. It is for this very purpose that negotiations are being conducted by the USA, Great Britain, and the USSR on the prohibition of nuclear weapons tests, and soon there will begin a discussion of general and complete disarmament in the Ten-Nation Committee.

¹ Source: U.S. plans to share nuclear weapons with NATO. No classification marking; Presidential Handling. 5 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Khrushchev-Eisenhower.

Of course, it is very important that none of the nuclear powers take any steps that could complicate the solution of the problem of complete elimination of nuclear weapons throughout the world.

The question arises as to what consequences would result from increasing the number of states having access to nuclear weapons. What would the result be in such a case?

It is hardly necessary, Mr. President, to seek to prove to you, an outstanding military leader and statesman made rich in wisdom by life's experiences, that the cause of consolidating peace and eliminating the threat of a nuclear war would suffer serious loss as a result. It would enormously impede the solution of the problem of general and complete disarmament, which would of course provide for cessation of the manufacture of nuclear weapons and the liquidation of the stock piles thereof. It is obvious that the greater the number of states possessing atomic and hydrogen weapons the more difficult it would be to take the measures necessary for the complete destruction of this weapon under effective control. Indeed, let us suppose that the allies of the USA—individually or within the framework of NATO—actually have a nuclear weapon placed at their disposal, and that the circle of nuclear powers in the West is thus expanded. In such a case there would arise an absolutely new situation, in which the solution of the problem of eliminating nuclear weapons would be considerably complicated. In such a case we would also have every justification to hand over this weapon to friendly countries that might turn to us with a corresponding request for purposes of ensuring their security and defense.

Let us look at another aspect of the problem. Let us suppose that the secret of the production of the nuclear weapons or the weapons themselves are handed over to the Federal Republic of Germany. Is it a secret that at the present time in the FRG there have again appeared many reckless people who cherish the hope of *revanche* for the Second World War? It is sufficient to recall only a recent statement by Mr. Adenauer to the effect that the German people are charged with a "special mission."

However Mr. Adenauer may have interpreted this "special mission," the fact must not be disregarded that if he were to have the nuclear weapon placed at his disposal he would be tempted to use it to fulfill this "mission." And can it be hoped that Mr. Adenauer's successors in the post of chancellor would be more peace-loving? With the present trend in the course of events in the FRG, the answer of course is no.

I consider it appropriate to point out that neither the Soviet Union nor the states allied with us experience any fear, of course, in connection with the belligerent statements of the German "revanchists." You realize that from the standpoint of our security we have no fear of the

German “revanchists,” even though they may be armed with nuclear weapons.

But it would be a great mistake if we, bearing a great responsibility for the fate of all humanity, should gamble on the readiness of our countries for any war with the most modern weapons. The Soviet Government considers it the main purpose of its policy to prevent the unleashing of any new world war, and to bring about the prohibition and destruction of nuclear weapons and every kind of weapon in general. A widening of the circle of nuclear powers would create new obstacles on the road to disarmament and of course would immeasurably intensify the threat of humanity’s sliding into the abyss of general nuclear war.

However, I continue to believe, Mr. President, considering your statements that the course of events will run, not in the direction of increasing the number of states possessing nuclear weapons but in the direction of general and complete disarmament and, consequently, in the direction of eliminating the danger of nuclear war. Therefore, I hope that you will correctly understand the motives that have prompted me to appeal to you with this message.

For my part, I should like very much to have your views concerning the matters to which I have referred.

With sincere respect,

N. Khrushchev

536. Telegram 6676 to London¹

Washington, March 5, 1960, 3:11 p.m.

6676. EYES ONLY AMBASSADOR AND EATON.

Please deliver following to Selwyn Lloyd:

QTE March 5, 1960 Dear Selwyn:

I have just returned from South America and have had an opportunity of checking on the conversations which have taken place between Doug Dillon, Fred Eaton and Caccia here since I received the personal message from you which was delivered to me in Argentina.

¹ Source: Transmits letter for Lloyd from Herter on ten-nation disarmament talks. Secret; Niact. 3 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, UK Officials Correspondence with Secretary Herter.

As you know, we feel that there is no great substantive matter of difference between us and are convinced that language satisfactory to both of us can be worked out between Ormsby-Gore and Eaton when they meet in Paris. From a purely practical point of view, I am sure you realize that, in the course of the negotiations, we feel that the items involved in Stages 1 and 2 should be agreed upon before we get involved in negotiations on the items in Stage 3, and certainly, again from a practical point of view, even though we should be successful in negotiating with respect to Stage 3, I am sure that you agree that the items in 1 and 2 should be implemented before we can implement those in 3. From reading your message I take it that you feel that this is essentially the line of all your thinking but that you do not wish to make any advance statement which would indicate that any phase of disarmament could not be discussed during the Geneva talks.

In this we of course agree since the tabling of our plan will inevitably involve discussion of the items in Stage 3. I realize that there is a narrow line between discussion and negotiation and this is the reason we continue to feel that our differences may be more of form than of substance. What we feel we must avoid at all cost is being drawn into negotiations on such items as banning the bomb before we have achieved agreement on items in Stages 1 and 2. We have considered this problem very carefully, and I must tell you in all candor that I can see no prospect of any change in our position on this matter. This, of course, does not rpt not involve waiting for the actual implementation of Stages 1 and 2 before commencing negotiations on Stage 3.

If when Eaton and Ormsby-Gore meet, there should still remain any differences in language, I should be most grateful if you would advise me when I could reach you by phone since I feel certain that we can work this matter out and feel very deeply that it is important for us to maintain a united front both with respect to our allies and when the talks begin in Geneva.

With warmest personal regards,
Most sincerely,
Chris UNQTE

FYI Copy has been delivered to Caccia here.

Herter

537. Note From Caccia to Herter¹

Washington, March 7, 1960

Dear Chris,

I have been asked to pass to you the attached personal message from the Foreign Secretary.

Yours sincerely

Harold Caccia

Message From Lloyd to Herter

TEXT OF MESSAGE

Dear Chris,

Thank you for your letter of March 5. I am glad that you have got safely back to Washington. I hope that you are not too tired by what must have been a very arduous but well worth while journey.

I am glad that we have reached a compromise agreement on the language of the link between Stages 2 and 3. I am grateful to you and your colleagues for their willingness to try to meet our point of view. I do not think that our solution is ideal, but we too tried to find something that you could live with.

The problem in my mind has been one of presentation. Our preoccupation has been to prevent Mr. Khrushchev getting off with an undeserved halo as the man who is for complete disarmament. To start with, the Western plan must look good enough and far reaching enough, subject to the accepted reservations about effective control. If our plan does not look good enough, we shall have given Khrushchev a big propaganda advantage which he will particularly exploit at the Summit.

Ormsby-Gore is going this evening to Paris. I hope that Eaton and he will succeed in bringing the French along. It would be a great pity if they are out of step on disarmament. It will be another damaging blow to N.A.T.O.

With my best wishes,

Selwyn

538. Memorandum for the Record by Goodpaster¹

Washington, March 8, 1960

Mr. Herter met briefly with the President on February 28th. He reported to the President that Governor Potter, in the Canal Zone, had decided to fly American and Panamanian flags, crossed, on March first, and that he felt this was a helpful forward step.

Mr. Herter next said that he had received a long letter on disarmament from Selwyn Lloyd. The President read through this letter. He stated that he agrees with Lloyd on one point—that if we are to condition everything on elimination of nuclear weapons, we will never make any progress, because they could be hidden so easily as to make policing impossible. The President said he thought we should not take the position that we will not negotiate on “stage three” items until “stage two” items have been completely implemented. We can say, however, that we will not sign an agreement on stage three items until the earlier stages are completely in effect. Mr. Herter said this is exactly the problem with Defense. They do not want to discuss or negotiate on stage three items—for example, limitation on missiles, reduction in weapons and forces, etc.—until stage two is in effect. He thought it should be possible to find some kind of language that would accommodate our own and the British positions, on the basis of what the President said. The President said what he had in mind is that implementation should follow a certain order. Study of disarmament measures should desirably follow the same order, but it would be possible to start some of these studies earlier if there is a specific need—even while holding strictly to the sequence of implementation.

The President said he found it difficult to understand the thinking of Defense in this matter. I explained to him as did Secretary Herter that Defense is fearful that we will start talking about stage three items and then, because of the pressure of world opinion, be unwilling to adhere to our requirement that the implementation of these be delayed until after stage two is in effect.

A.J. Goodpaster
Brigadier General, USA

539. Memorandum of Conversation¹

Washington, March 8, 1960, 2:30 p.m.

PARTICIPANTS

The President

Amb. Menshikov, Soviet Ambassador

Mr. Richard H. Davis, Deputy Assistant Secretary for European Affairs

Ambassador Menshikov began by saying he had been instructed by Mr. Khrushchev to see the President and to hand over a personal message. The Ambassador then read from his own English translation the text of Mr. Khrushchev's letter dated March 3.

The President said he would have the message translated and would study it. He added that he would like to express the following preliminary thoughts which the Ambassador should transmit to Khrushchev. First, the President appreciated this personal message and Mr. Khrushchev's thought in sending it. Secondly, the President said he shared the uneasiness, if not dismay, if such a situation should arise as Mr. Khrushchev described in his message. But he would like to recall that at a time when the United States had a monopoly on atomic weapons it had tried in 1947 to give it to the United Nations. United States policy had never changed. Now we know, the President continued, that the Soviet Union has great nuclear power. We do not know what distribution the Soviet Union may have made of its nuclear power nor do we know how the members of the Warsaw Pact are armed. The President expressed readiness to study the message and to reply in due time. As he had repeatedly stated, he was ready to do anything to make a better, more peaceful world. Now we have four nations which dispose of nuclear weapons. It was easier to make them now and knowledge of how to do so was getting to be a common thing. We don't know when other nations may develop nuclear weapons.

The President expressed agreement that we must move rapidly on this problem and, as he had said at his Camp David talks with Chairman Khrushchev, the most important thing was agreement on reliable controlled disarmament. This was a very serious matter and while we agree on general principles, we must find the means to carry them out.

Ambassador Menshikov expressed the hope that progress would be made at the ten-nation disarmament committee level and at the forthcoming Summit.

¹ Source: Menshikov delivers Khrushchev's letter on nuclear arms for NATO. Secret; Presidential Handling. 2 pp. NARA, RG 59, Central Files, 600.0012/3-860.

The President replied he was ready for any practical forward step which would take the uneasiness out of the minds of mankind, that he would continue to strive for this goal.

Ambassador Menshikov asked what he might say to the correspondents who were waiting outside, to which the President observed that there was always this problem when he delivered a message in person to the White House. Ambassador Menshikov said it was the same at the State Department and suggested he might merely say that he had delivered a personal message from Chairman Khrushchev. Ambassador Menshikov said he was not instructed whether the letter was to be published.

The President in agreeing to Ambassador Menshikov's suggestion said that if the letter were not published he would merely reply to any press inquiries that he never revealed his personal correspondence with Chiefs of State without their concurrence. If the Soviet Government decided to publish the letter, the President requested prior notification.

NOTE: General Goodpaster informed Mr. Davis after Ambassador Menshikov departed that the President had instructed him to inform the Department that the contents of Mr. Khrushchev's message should be held closely on a need-to-know basis.

540. Memorandum of Conference with the President¹

Washington, March 10, 1960, 8:35 a.m.

OTHERS PRESENT

Secretary Dillon
Mr. McCone
Major Eisenhower

Mr. McCone opened by informing the President that plans are going forward for Project Gnome, part of Operation Plowshare. This experiment would require a full year of preparation. Since the extensive construction work will require obtaining contractors and letting bids, an announcement will be necessary in the near future.

¹ Source: Operation Plowshare. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

The President said the only difficulty was that this almost serves notice to the world that we have given up obtaining an overall nuclear test ban agreement within a year. Mr. Dillon said that the principle of peaceful use of atomic energy has been agreed on with the Soviets.

The President said he had no objection, but that the announcement should include that we would welcome observers from the U.N. or from any member nation of the U.N. which has an interest in the project. He further desired that the idea that the principle has been approved between the U.S. and the Soviets be added to the announcement.

Mr. McCone said it would be useful to prod the Soviets on the test ban matter anyway. The Soviets have no intention of agreeing with any of our proposals at Geneva. Only yesterday they informed our negotiators in Geneva by direct telegraph from Moscow that they cannot fulfill their obligation to the IAEA on safeguarding nuclear reactors unless agreement on a nuclear test suspension has been reached. This linking of totally unrelated matters indicates they have no desire to make real progress.

The President said he wanted one more item added, which would be that final authorization for the actual detonation would be reserved for action by the President. He directed Mr. Dillon to inform the British Ambassador of our intention to go on with this project, but warned him not to afford the British a veto.

As a sidelight, Mr. McCone pointed out that the Canadians had a similar project in the Athabaska Tar Sands ready to go. They are holding up simply because they do not wish to be the first to fire a device. Mr. McCone pointed out the increased difficulties we are having in holding our laboratories together, stressing Livermore which has considerable interest in Plowshare.

The President, as another sidelight, said he wished that we could eliminate nuclear weapons entirely from the world. This is, of course, impossible, but many people think it can be done. Therefore, the only qualm he has on an operation such as this is that it might unnecessarily worry people who are scared enough anyway.

* * *

Finally, Mr. Dillon told the President that our disarmament plan has been presented to NATO by Mr. Eaton. It was well received and another meeting on this subject is scheduled for Saturday. Indications are that this can be made public on Monday.

John S.D. Eisenhower

541. Letter From Eisenhower to Khrushchev¹

Washington, March 12, 1960

Dear Mr. Chairman:

I am grateful for your consideration in sending your letter of March third in which you share with me your views on matters which are indeed of great importance. As indicated in your letter, we were in full agreement at Camp David, as was mentioned in the communique covering those discussions, that the question of general disarmament is the most important one facing the world today and that the Governments of the Union of Soviet Socialist Republics and the United States will make every effort to achieve a constructive solution of this problem. To this I cannot fail to give my wholehearted and continued support.

In reply to the thoughts expressed in your letter, and in the same spirit of frank exchange of views I welcome this opportunity, as you requested, to set forth considerations which I think important.

First of all, while I do not wish to make extended comment on your remarks about the Federal Republic of Germany, I do consider that these reflect a misunderstanding of the nature of the post-war German state. An impartial appraisal would, I believe, show that the leaders of the Federal Republic, as well as the overwhelming sentiment of the population which elected these leaders to office, want peace as much as any of us and do not present an aggressive threat to any country. I can assure you from personal knowledge that this is the case, recognizing that, while memories of the past may justify caution, they should not blind us to the realities of the present.

Now, with regard to the basic questions raised in your letter, I should note that, as you yourself say, certain of the observations you make are based on interpretations arrived at in various parts of the world of the meaning of comments that Secretary Herter and I made in the course of press conferences during the month of February. If the interpretations of our comments to which you refer led you to believe that a change had taken place or was in progress in the policy of the United States as regards the transfer of nuclear weapons or information on the design and manufacture of nuclear weapons, they were in error. Neither Secretary Herter nor I had any intention of implying the existence of or plans for any such change; and upon re-reading carefully

¹ Source: No change in U.S. policy against transferring nuclear weapons to other countries. Confidential; Presidential Handling, 6 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Eisenhower-Khrushchev.

the transcript of our remarks I do not feel that an interpretation in this sense would be justifiable.

Your letter therefore, based as it seems to be on misinterpretation of remarks which I have made, seems to reflect fundamental misunderstanding regarding the policy of the United States Government. At the risk of being repetitious I should like to review this policy for you.

It is our policy to avoid the widening of the circle of nuclear powers. This policy is implemented in the actions of the United States and is reflected in our basic laws, in particular the Atomic Energy Act of 1954 as amended. The United States does not transfer nuclear weapons to the custody of its allies in time of peace and we do not (with the exception of the United Kingdom which is already a nuclear power) provide to our allies or to others information on the design and manufacture of nuclear weapons. Our policy has been public knowledge since its inception and any change would become immediately known. On the other hand, we do not know whether or not the USSR places nuclear weapons at the disposal of the members of the Warsaw Pact or others of its allies.

It must be recognized that states with a major industrial capability in the present world cannot be expected to be satisfied indefinitely with a situation in which nuclear weapons are uncontrolled and they themselves do not have nuclear weapons for their own defense. As for our allies in NATO, it must further be recognized that they have a legitimate desire to defend themselves with the most modern weapons available. This desire is easily understood when it is realized that they must provide for defense against forces which, as you yourself have made very clear on numerous occasions, already possess the most modern and destructive armaments. It is to help meet the legitimate need of our allies for their own defense that we have established the NATO atomic stockpile system. Under this system, custody of atomic warheads remains in the United States alone as provided by law and they can be used only in defense against aggression. The circle of nuclear powers is not widened thereby. The legitimate needs of our allies for modern weapons to be used in self-defense are satisfied, but in a manner which does not require them to produce such weapons themselves.

You and I must recognize, however, that the secrets of the production of nuclear weapons to which you refer cannot long remain hidden from many of the states in the modern world which have advanced scientific and industrial resources. If the proliferation of nuclear weapons is to be prevented we cannot longer delay a start on the agreed international control of nuclear energy and a beginning on meaningful disarmament agreements covering both conventional and nuclear arms under verifiable conditions.

It is generally agreed that technical means are not now available for assuring the elimination of past and present stocks of nuclear weapons. This situation was officially recognized by the Soviet Government in its disarmament proposals of May 10, 1955 and reconfirmed in its declaration submitted to the General Assembly of the United Nations on September 18, 1959. I believe you also acknowledged it in a speech made at Moscow on May 24, 1958.

Nonetheless there are things which can be done now and I urge that we take the opportunities which are before us to agree to the measures which would bring to a halt immediately the possibility of the emergence of new nuclear powers.

What we can now do are the following three things:

1. We can, in the Geneva negotiations for discontinuance of nuclear weapons tests, stop all nuclear weapons tests which can now be effectively controlled. That done, we could through joint research move, as quickly as additional control measures could be proven and agreed, to the cessation of all weapons tests. The response of your representative to the proposals of the United States representative on February eleventh for immediate agreement on the presently achievable steps has thus far been negative. But surely it is in the interests of our two countries and of the whole world to conclude now an agreement in all areas for which the problems of essential inspection have been resolved.

2. We can support, in the April meeting of the Board of Governors of the International Atomic Energy Agency, the adoption of safeguards procedures which will ensure that the future expansion of nuclear power production does not itself become the source for fissionable material for production of nuclear weapons. Both the United States and the Soviet Union are taking significant strides in the development of nuclear power and in the making available of this new energy resource for the benefit of other nations. Surely we have a common interest, as reflected in our adherence to the principles of the statute of the International Atomic Energy Agency, in seeing that the nuclear power reactors which are built in the future in many nations do not become the source of material for manufacture of weapons by new nuclear powers.

3. We can, in the disarmament negotiations beginning March fifteenth in Geneva, agree to stop the production of fissionable material for use in nuclear weapons—thus stopping the accumulation of nuclear weapons stocks—as soon as effective inspection measures are agreed and operating. Simultaneously we could begin to transfer fissionable materials now in weapons stocks to peaceful purposes with a view to the eventual elimination of these weapons from national arsenals. This practical and important step is one which I have urged repeatedly since my letter of March 1956 to Premier Bulganin. The arguments which you

bring forward in your letter of March third seem to me to reinforce the cogent reasons for proceeding promptly with this significant measure.

I think we are agreed that the surest method of dealing with the situation which concerns you, as indeed it does me, is to make progress toward effective disarmament measures. I think you will agree that there is little prospect of achieving much in this field at the summit unless we can base ourselves on solid progress already achieved in the Geneva negotiations. I hope that you will instruct your representatives, as I have done mine, to make every effort to eliminate differences to the point where we will have something real to deal with at Paris in May.

I hope that this frank statement will clarify the policy and objectives of my Government and remove the misapprehensions of our purpose. Particularly I again assure you that my public statements, to which you refer, implied no change whatsoever in this nation's policies or their application. I appreciate your expression of the concerns which you feel. For my part, I express the hope that you will join with us in the negotiations to which I have referred, in undertaking now the concrete and effective measures which will make vast progress in dealing with the nuclear threat.

Sincerely,

542. Telegram Didel 32 to Geneva¹

Washington, March 16, 1960, 8:41 p.m.

Didel 32. Secretary has approved position paper on Chinese Communist problem and US disarmament policy. Paper being pouched. Summary follows:

I. Problem: General problem is to handle disarmament negotiations in such manner that Communists not permitted use negotiations for political or propaganda gains with respect ChiCom issue while avoiding commitment on meaningful disarmament program including effective inspection arrangements.

II. Anticipated Communist Position: Communist side may try inject ChiCom issue either by direct initiative or by exploiting any

¹ Source: Summary of approved position paper on Communist China and U.S. disarmament policy. Secret. 4 pp. NARA, RG 59, Central Files, 396.1-GE/3-1660.

opportunities which free world proposals may offer. Communist objectives would be:

A) To use this controversial political issue to divert public attention from inadequacies of Communist disarmament position.

B) To reap political propaganda gains at free world expense without accepting disarmament obligations.

C) To confer prestige on ChiCom regime which Communists would exploit throughout Asia and Africa as well as in connection Chinese representation issue at next UNGA.

III. Manner in Which Issue Might Arise at Conference: Possibilities include:

A) Direct Communist Proposal: USSR may propose ChiComs be invited participate conference Geneva either as member Communist side or as observer or in some other manner. ChiComs for their part may send message demanding invitation to participate.

Participation by ChiComs in any manner whatsoever should be firmly rejected by free world side. Composition negotiating group has been agreed upon. ChiComs have no standing of any sort before group. Injection ChiCom issue would be political maneuver which could only be designed obstruct serious disarmament talks. Group should proceed at once with assigned task without interruptions by political moves.

B) Initial Force Level Ceilings: Any suggestion that force level ceilings are to be considered for ChiComs will almost inevitably lead to immediate Communist demand for ChiCom participation. In connection 2.5 million ceiling for US and USSR, and appropriate levels for certain other states, it has been agreed that Communist China should not be included but that QUOTE escape clause UNQUOTE might be required.

C) QUOTE Escape Clause UNQUOTE in Connection 2.5 Million Ceiling: In order minimize opportunity Communists use QUOTE escape clause UNQUOTE as basis for injecting ChiCom participation issue into discussions, escape clause should be phrased generalized language without specific mention ChiComs.

D) Second Stage Force Levels: If discussion this stage should be reached Communist side would be likely raise issue ChiCom participation. Phrasing of any proposals touching on this issue under stage two and timing their discussion are accordingly very significant matters.

E) World Disarmament Conference: Question of invitations to possible world disarmament conference of militarily significant powers or any studies relating to such conference would involve political issues which Communists might seek exploit. Handling of invitation issue or any study relating to conference is complex and politically delicate matter especially in forum such as Geneva talks. Separate paper dealing this matter will be prepared. As all studies contemplated first stage cannot be undertaken at once delegation should seek avoid getting into any discussion re world disarmament conference until substantial progress has been made with USSR on other aspects disarmament program.

IV. U.S. Position:

A) In view sensitivity of political problems involved, delegation should maintain close contact with Department on handling of any issues involving problem directly or indirectly. In particular delegation should consult Department on phrasing of any proposals bearing on this matter so that wording may be worked out by mutual agreement between Department and delegation.

B) Delegation should be guided by general principle that until there is evidence USSR is prepared accept meaningful commitments including effective control system, question of how Communist China will be brought into relationship with proposed arrangement should not be broached by US delegation. Discussion of best means handling ChiCom issue can be made later in light Soviet attitude as disclosed first stages negotiations. This issue should be decided by US Government during negotiations and after Soviet intentions re acceptance effective commitments including controls in their own territory have been clarified.

V. Discussion: Discussion section of position paper contains background information including following position given Department by Chinese Ambassador: QUOTE I realize that it would not make sense to leave the whole of the Chinese mainland out of any disarmament scheme, but at the present stage the question of disarmament is largely one of cold war. As such, we must face up to the danger of increasing Chinese Communist prestige and giving additional ammunition to those who are advocating the admission of Communist China to the UN and the recognition of it by the United States. In other words, we may not achieve any actual disarmament for some time to come, but we may find ourselves having lost another round of psychological warfare. UNQUOTE

Herter

543. Record of Telephone Conversation Between Herter and Kistiakowsky¹

Washington, March 21, 1960

11:20—Telephoned Dr. Kistiakowsky 1) Secy said with regard to suggestions Dr. K had made on organization, Department had also

¹ Source: Disarmament organization; military planning; developments in test talks; moratorium on testing. No classification marking. 2 pp. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.

prepared organizational set up in connection with disarmament which was a part of our presentation on the Hill on appropriations. Secy suggested Dr. K get in touch with Mr. Farley to see how the two might be dove-tailed, and Dr. K said he would call Mr. Farley. The Secy said he was still bothered as to whether the individual in charge of Dr. K's setup in the White House would be the fellow who was the top policy man or whether he would be an objective adviser to the President, which the Secy felt should be talked out a little more. Dr. K said he had hoped that by the fact that policy decisions would be made by the committee chaired by the Secretary of State, this would take care of it. Secy said, however, there was another section which stated that the White House man would be the principle policy formulator. Secy and Dr. K agreed that it was important that the various roles and functions be very clear right from the start. 2) Discussed unreliability of information being given Gates and, in turn, those responsible for policy formulation with regard to our missile programs, etc. Discussed Polaris and Navy's misrepresentation in order to concentrate on their submarine before people were distracted to the Polaris; discussed Air Force over-optimism on Sky Bolt. Dr. K said real trouble with our military planning is that the planners take the idealistic view of what they want and when instead of the realistic view of what they can have by when. 3) Secy referred to new Russian offer in Geneva and the fact that he had talked briefly to the President about it and additional fact that British will be very insistent on this. Secy said he had our legal people looking into what the President can and cannot do. Secy said, for instance, on a moratorium which wouldn't begin until ratification of the treaty which ratification is undoubtedly out of the question for this year, whether the President can commit himself to a moratorium which goes beyond his term of office?; what can be done by Executive action as opposed to a Treaty? Dr. K said he was worried about calling the principals meeting so quickly because both Gates and McCone will take a negative attitude. Secy said Gates is away and Douglas will be attending; that Douglas is pretty realistic on this. Secy said McCone had told him confidentially—Dr. K said McCone had also told him—that he feels there will be no more testing during this Administration, and Secy said whether McCone will be complete negative on a treaty he just didn't know. Secy said the British are inclined to feel real progress has been made and the Secy said he shared that feeling. Dr. K said he also felt progress had been made and that both he and Dr. Killian feel it would be very unfortunate if we reject this out of hand without countering with constructive suggestions of our own. Dr. K said we just have to accept the fact that there will be no more nuclear tests or else the whole cold war will get hotter. Dr. K said he had a feeling at the root of the difficulty is lack of understanding by our legislators and the electorate on what a monitoring system can do; we can't have a foolproof inspection

system. Secy said it was also a question of whether the Soviets will keep their word; whether they will cheat on a ban within the letter of the law or whether, with their current preoccupation with world opinion, they will respect the ban for fear of being caught cheating with its resulting effect on world opinion. Secy said as regards the meeting of principals tomorrow that the Secy felt we have to get this out on the table as soon as possible since we will have to go to the President on the unresolved factors. Dr. K said since this is largely a political rather than a technical decision now, that he will have to take a secondary role in the meeting. Dr. K said there was one item which would undoubtedly be tossed at the Secy tomorrow, which Dr. K thought Secy should be forewarned about. Dr. K said it had been thought with regard to small underground explosions that there was a sharp limit as to size—if the explosion was too big it would collapse and a signal would go out—but Dr. K said it now appears that if you make it too big you don't get the full effect but you still get a partial effect and, therefore, the risk of doing it clandestinely is very much reduced. Dr. K said he is sure this will be mentioned tomorrow by the people who will argue against going ahead.

2:12—General Goodpaster telephoned (see separate memo)

2:30—The President telephoned (see separate memo)

3:30—Returned Mr. Kendall's earlier call, but Mr. Kendall had seen Secy at the White House and taken care of whatever the matter was.

4:05—Mr. Kohler telephoned to say the Soviet Ambassador wants to see the President again. The Secretary said the answer was no. Mr. Kohler said we always have to balance this a little against Thompson getting in to see Khrushchev, but agreed the Soviets should tell us the subject matter and then we could decide. Secy said he would call Gen. Goodpaster about this.

544. Memorandum From Lay to the NSC¹

Washington, March 21, 1960

SUBJECT

The Feasibility and National Security Implications of a Monitored Agreement to Stop or Limit Ballistic Missile Testing and/or Production

REFERENCES

A. NSC Action No. 1840-c

B. Memo for NSC from Executive Secretary, subject; "Monitoring a Long-Range Rocket Test Agreement", dated March 28, 1958

C. NSC Action No. 2161-b

The enclosed report on the subject by the Special Assistant to the President for Science and Technology is transmitted herewith for discussion by the National Security Council at its meeting on Thursday, March 24, 1960.

Also enclosed for discussion by the Council in connection with the above-mentioned report are two memoranda containing the views of the Joint Chiefs of Staff on the subject. The request in paragraph 7 of the first of these memoranda ("U.S. Disarmament Policy", March 2, 1960) that the JCS be afforded an opportunity to comment on the study by the Special Assistant to the President for Science and Technology prior to its referral to the NSC, has been complied with; and the second memorandum ("Study Entitled 'The Feasibility and National Security Implications of a Monitored Agreement to Stop or Limit Ballistic Missile Testing and/or Production'", March 18, 1960) contains the views of the Joint Chiefs of Staff on the report by the Special Assistant to the President for Science and Technology.

The enclosures, one of which contains RESTRICTED DATA, are being given a special limited distribution, and the contents should be subject to special security precautions, with access thereto limited to those individuals having a strict "need to know" in the performance of their official duties.

Report Prepared by Kistiakowsky

March 14, 1960

*The Feasibility and National Security Implications of a Monitored
Agreement to Stop or Limit Ballistic Missile Testing and/or Production*

Scope, Limitations and Assumptions

1. The study is divided as follows: investigation of (a) the feasibility and monitoring requirements for a ballistic missile flight test ban or limitation, (b) the feasibility and monitoring requirements for a ballistic missile production ban or limitation, and (c) the national security implications of any such agreements. The relationships of the above questions to the operations of national space programs has also been considered under the assumption that space programs will be continued subject to inspection and some control.

2. There are a number of other interrelationships which merit serious study, but which it has not been possible to consider in this analysis. The conclusions to this study must be read with these limitations in mind. In particular, the study does not adequately consider:

2.1 The implications of abrogation of any of the possible agreements that might be reached;

2.2 The relationship of the arms control measures discussed here to others, including general disarmament;

2.3 The implications of inhibiting the attainment of nuclear delivery capabilities by nations, other than the U.S., U.K., and USSR;

2.4 The dissymmetries between the U.S. and the USSR in the problems of maintaining production and/or test facilities, and competence when limitations on their utilization are in force.

2.5 The detailed inspection team requirements and cost for monitoring a production ban;

2.6 Specific limitations and controls that might be imposed on space programs and the organization of a possible international authority to carry out space programs;

2.7 The implications of increased emphasis on other delivery systems that might flow from agreements limiting missile tests or production.

2.8 The violation of a production ban or limitation by the importation of long-range ballistic missiles from a non-signatory country.

On the basis of this study, and particularly in view of its limitations, it has not been possible to determine whether or not a test ban in

1963, or at any later date, would be to the net advantage or disadvantage of the U.S.

3. The conclusions that follow are based on the present NIE of Soviet stockpile growth and on U.S. missile program schedules as approved, or proposed for approval, that appear to be reasonably attainable if adequately supported. In the event of any agreement, it would be necessary to be certain that the applicable U.S. schedules were indeed met, if not actually accelerated, prior to the implementation of the agreements.

Summary of Conclusions

Missile Test Monitoring

4. Detection of ballistic missile flights with high confidence can be accomplished by means of radars that are currently in development. The siting of some radars within the Sino-Soviet Bloc and within the U.S. would be required. Such a detection system would probably take about two-and-a-half years to develop and install. About 15 radars would be needed to detect with certainty missiles from within the Bloc whose trajectory rose 75 n.m. or more above the surface of the earth. Of these, at least 4 or 5 would have to be located within the Bloc; the remainder could be located in friendly countries around the periphery. On normal ballistic flights, an apogee of 75 n.m. corresponds to a ground range of 300 n.m. However, it would be possible to fire missiles on non-optimal very flat trajectories out to perhaps 3,000 n.m. without their apogee exceeding the 75 n.m. limit. Radar monitoring could not detect static or tethered firings, nor assure detection of short-range firings of long-range ballistic missiles, or flights by aerodynamic vehicles. Therefore, such tests should not be excluded by any agreement unless there were some other detection means agreed to by which they could be monitored.

5. A world-wide high confidence system for detecting missiles, the apogee of which exceeds 75 n.m. is feasible, but would require a large number (about 100) of radars. It is possible, though by no means certain, that alternative less expensive flight detection systems could be operational by about 1963.

Relationship of a Missile Test Ban to Space Programs

6. For a test ban to be effective in limiting missile development, it would be necessary that space programs, both civilian and military, be abandoned, subjected to rigid inspection and some controls, or internationalized.

7. Short of abandoning space efforts altogether, some feed-through from space programs into possible missile development programs is inevitable. Though more detailed study is required, a cursory look

suggests that limitations or controls consistent with valid national space programs could slow, but would not stop, the effects of this feed-through. The inspection teams would, however, be in a position to assess the degree of danger represented by the applicability of space techniques to possible military developments.

8. Inspection would include advance disclosure of all space firings, right to inspect all space vehicles in advance of firing, together with their components and associated equipment, and access on the part of both sides to all results.

9. Internationalization of the space effort could reduce the effects of feed-through to a minimal level, and could also lower the risks associated with the possibility of technological surprise.

Implications of a Missile Flight Test Ban

10. A missile flight test ban would represent a considerable risk for the U.S. if implemented as early as January 1961. A test ban so dated as to preclude the confident operational development of the mobile Minuteman and the 1500 n.m. Polar's would be disadvantageous to the U.S. On the basis of the programs indicated in Figs. 1 *a* and 2 *a*, early 1963 would represent the earliest possible date for such a ban. With respect to other considerations and on the basis of present knowledge and expectations, there do not appear to be decisive reasons for believing that the risk to the U.S. (or the USSR) would be either greater or less if there were a missile test ban in 1963 than if there were no such ban.

11. Any test ban which is dependent on radar coverage for monitoring the Bloc should provide sufficient lead time so that construction of radar sites can begin two years before the effective date of the ban. Alternative monitoring systems may or may not involve comparable lead times.

Monitoring of a Missile Production Ban or Limitation

12. A missile production ban or limitation can be monitored if, and only if, the following conditions can be met.

12.1 The agreement guarantees a right to unrestricted and self-initiated access by the inspection teams to any point in any area of the Sino-Soviet Bloc.

12.2 The inspection directorate has the right to valid aerial photography of the entire Bloc on a periodic basis.

A prior inventory of Bloc missile stockpiles and selected industrial facilities would probably be required for monitoring production, and in any case would be needed to insure that the stockpile is not greatly different than estimated in the NIE.

13. Given the foregoing conditions, if a quota were desired, a sufficiently large quota could probably be set on the permitted number of

inspections without seriously degrading the confidence of the monitoring system.² However, in the event of a production limitation or in the event of a continuing national space program, continuous inspection of certain key facilities, such as missile and space production installations, would be required.

14. The inspection teams would be concerned not only with the production of the missiles themselves, but also with the production of the support equipment necessary to give the missiles an operational status. Although it is not within the terms of reference of this study and has not been investigated here, it seems probable that inspection of launchers and launch sites would be of great use; it is possible that further study would reveal it to be as important, or perhaps more important, than inspection of missile production.

15. U.S. intelligence data could provide valuable support to the activities of inspection teams.

16. Despite inspection of the sort envisaged here, there will remain the possibility of a small flow of clandestinely produced missiles. The order of one or two missiles a month might represent a relatively low risk of detection, while five or more a month would probably represent a high-risk situation to the USSR.

Implications of a Missile Production Ban

17. An absolute ban on production would be dangerous to the U.S. if implemented as early as 1961. With delay, the danger would diminish. On the basis of the estimates in the tables, by January 1963 there might still be significant risk, but by January 1964 (or possibly earlier if U.S. production were accelerated), the risk should be small.³

Implications of a Limitation on Missile Production

18. If implemented as early as 1961, a limitation which permitted production of at least several times the estimated clandestine production capability could improve the U.S. position. This conclusion is contingent on the USSR not already having an overwhelming initial attack force which would make it necessary to accelerate presently-planned U.S. missile production. With the passage of time, the advantage of a limitation over an absolute ban would diminish in importance. In the event of an agreement to limit production, a continuation of flight testing would seem advantageous up until early 1963, in that continued testing would contribute to stability by permitting the attainment of

² The Department of Defense is opposed to agreements on quotas, on principle. [Footnote is in the original.]

³ The DOD representatives would prefer that this read “smaller” rather than “small.” [Footnote is in the original.]

hardening and mobility by both sides. After 1963, continued flight testing might be disadvantageous in that such testing would permit further improvements in the guidance accuracies of both sides (particularly that of the USSR).

INTRODUCTION

19. The purpose of the study is to determine the feasibility and the implications to U.S. national security of a monitored multilateral agreement to ban or delimit the flight testing and/or production of long-range ballistic missiles. The precise terms of reference of the study are set forth in Annex A.

20. The definition of long-range involves a certain arbitrariness, particularly since radar detection system requirements are more directly tied to missile apogee than to range, and since for a given apogee the variation in range may be considerable. A limit of about 75 n.m. on apogee would certainly exclude all full-range ICBM firings, and would also exclude firings in the IRBM range except on trajectories so flat as to impose constraints on design substantially more severe than are required for minimum energy trajectories in the same range. A 75 n.m. apogee would seem to be a reasonable limit, though it should be pointed out that a lower limit would be required if it were desired to preclude tests of all ballistic missiles in the ranges that might be important for launch from submarines or aircraft.

21. Questions of national military policy and posture affect the emphasis in the study. With the advent of the Soviet missile force, probably movable, or possibly mobile, and in any event sited in locations unknown to the U.S. (and at least some of which will probably remain unknown for some time), there is a basic dissymmetry in the U.S. and Soviet positions. Thus, even if U.S. policy would permit a first strike by us, it could not be expected to seriously impair Soviet missile strike capability. Consequently, the emphasis of the study has been on the preservation of a U.S. retaliatory capability in the event of a possible Soviet surprise attack.

22. This dissymmetry will, to a significant extent, be weakened by the eventual U.S. possession of a mobile missile force—first Polaris, later the mobile Minuteman, and possibly eventually the ALBM when airborne.

23. The conditions requisite to a satisfactory implementation of a production ban or limitation would presumably reduce this asymmetry, since these conditions involve unlimited inspection and access to valid air reconnaissance data.

24. While emphasis in the study has been on the preservation of a secure U.S. retaliatory capability, it has also seemed important to consider the problem of stability more generally. Even though the U.S. (or the USSR) might have a substantial retaliatory capability, the USSR (or perhaps less likely the U.S.) might make a pre-emptive strike in a

situation when war seemed very probable or inevitable in the hope of minimizing damage to itself. To the degree that such a course may seem desirable, the situation may be characterized as unstable. On the other hand, if the U.S. force posture were such that nearly all the U.S. force would survive a Soviet attack, and if nearly all the Soviet force could be expected to survive a U.S. attack, a situation of great stability would ensue, for there would then be little incentive for either side to strike first, even in the event of what it might regard as extreme provocation. Hardening of missiles can help bring about such a situation by increasing the exchange ratio, i.e., the number of missiles required in an attack to achieve some high probability of destroying one of an adversary's missiles. It is also important, of course, that the force sizes not be so disparate that an attacker may have the capability of overwhelming the opponent's force even though it is hardened. As the exchange ratio approaches unity with improving accuracy and reliability, or if the U.S. is unable to estimate Soviet force size with any confidence, mobility will be a preferable method of insuring stability.

25. There are certain key considerations which dominate and interpenetrate all discussions of the present problem. It is desirable to isolate these clearly at the very outset so that they can be kept explicitly in mind during the ensuing discussion. For convenience they are tabulated here:

25.1 There is a fundamental difficulty in monitoring a missile test ban in that there need be no residue or evidence at the site of a launching which will persist for a sufficient period of time so that an inspections team could verify a suspected firing by visiting the site. (This is particularly obvious in the case of missiles fired from submarines.) Disturbances in the atmosphere and ionosphere may persist long enough so that evidence of a firing may be adduced minutes or hours after the event; however, the techniques for doing this are still under development. For the present at least, because of the impossibility of verification after the fact, missile detection systems for monitoring a test ban must therefore be such that there is negligible probability that other events will be mistaken for missile tests. It is not necessary that the system be able to detect all missile tests. If it is able to detect a substantial fraction of possible tests, and if the conditions when detection will not be made are unpredictable by the other side, then it would seem reasonable to assume that any agreement would not be violated in the hope or expectation of avoiding detection.

25.2 By agreeing to stop missile flight tests, particularly if it is done within the next few years, there will be pressures exerted which will tend to prevent, or at least defer, the development of ballistic missiles by countries other than the U.S., USSR and UK. Clearly, this effect may be of very great importance. However, consideration of whether the net effect will be desirable or undesirable is beyond the scope of this study.

25.3 The problems of warning, decision making and reaction time for the U.S. are critical. In the near future it must be assumed that virtually all of the aircraft or missiles would be destroyed on any U.S. base against which a Soviet ICBM was delivered, provided the Soviets were able to achieve a high degree of surprise and simultaneity of attack.

The degree to which they can do this remains somewhat uncertain, but what evidence there is suggests that they can probably do reasonably well. Later, hardening will enhance the survival probability of many missiles. However, warning will continue to be very important. As BMEWS becomes operational (the first station late this year), about 15 minutes of warning will be available. Although BMEWS may be very helpful in providing warning for SAC aircraft, there may be serious problems in communications and decision-making that must be solved if use is to be made of such warning for launch of U.S. missiles. There is probably a very real question as to whether a decision to actually launch missiles would ever be made solely on the basis of BMEWS warning. The first BMEWS station will provide warning of ICBM attack against most, but not all, U.S. bases; however, it should be noted that even with all three BMEWS stations operational, there will still be a gap in warning of attack by missiles launched from submarines. Moreover, there are conceivable trajectories for Soviet ICBM's against which the BMEWS would not be effective. There is no provision for providing IRBM's and aircraft stationed on overseas bases that are around the periphery of the Bloc with BMEWS type of warning against ballistic missile attack, and even warning against aircraft attack may be questionable. In view of the Soviet 700 and 1100 n.m. ballistic missile and light bomber capabilities, and the softness of the IRBM's (and aircraft), they must for the most part be discounted completely as retaliatory weapons after surprise attack. They may, however, contribute to the complexity of a possible Soviet attack.

25.4 Considerations not only of production rates but of national missile stockpile levels are fundamental to the study. The analysis from which the conclusion of this study derives is based on the NIEs⁴ of Soviet development, production and deployment, and on U.S. schedules that have been approved or proposed for approval, and which are believed attainable. If, within the next three years, the Soviets should substantially accelerate production, or if there should be major slippages in U.S. programs, the U.S. position could be very adversely affected, and some of the conclusions of this study would require alteration. Figures 1 through 6 show the anticipated performances, characteristics, and operational capabilities on which the analysis is based. Figure 7 shows graphically the growth in effective ICBM's for both sides and the size Soviet force that would be required in order to have a 90% probability of producing at least a specified overpressure at each aim point in the U.S. Included as aim points are SAC operational air bases, ICBM sites, naval bases, and command and control installations. The assumptions are, for the most part, based on NIE 11-8-59 and are summarized on the figure.

25.5 Questions of attainable guidance accuracy turn out to be central to the discussion. Insofar as the dissymmetry discussed in 21 obtains, Soviet accuracy is far more important than U.S. accuracy, since their missile sites are not currently among our aim points, whereas our fixed missile sites undoubtedly figure prominently in theirs. Thus, the Soviet CEP emerges as probably the most sensitive parameter of the

⁴ NIE 11-5-59 Soviet Capabilities in Guided Missiles and Space Vehicles, 3 Nov. 1959 (TOP SECRET); NIE 11-8-59 Soviet Capabilities for Strategic Attack Through Mid-1964, 9 Feb. 1960 (TOP SECRET). [Footnote is in the original.]

study. This is basically because CEP is more or less directly translatable into missiles, via the notion of the “exchange ratio.” This ratio is the number of Soviet missiles required to destroy (at a certain level of confidence) a U.S. missile installation. Thus, each such installation can in a sense “claim” so many Soviet missiles. The exchange ratio for hardened sites is extremely sensitive to CEP, varying about as the square of this quantity. Consequently, a two to one improvement in Soviet CEP means approximately a four to one effective amplification in that part of the Soviet missile force earmarked for attack on our hard sites. In view of the extreme sensitivity of this parameter, variations from the NIE of Soviet CEP have explicitly been considered. In particular, an alternative set of Soviet CEP’s has been used for exploratory purposes, which corresponds to the accuracies believed, on the basis of U.S. R & D flights, to be attainable with radio-inertial guidance systems.

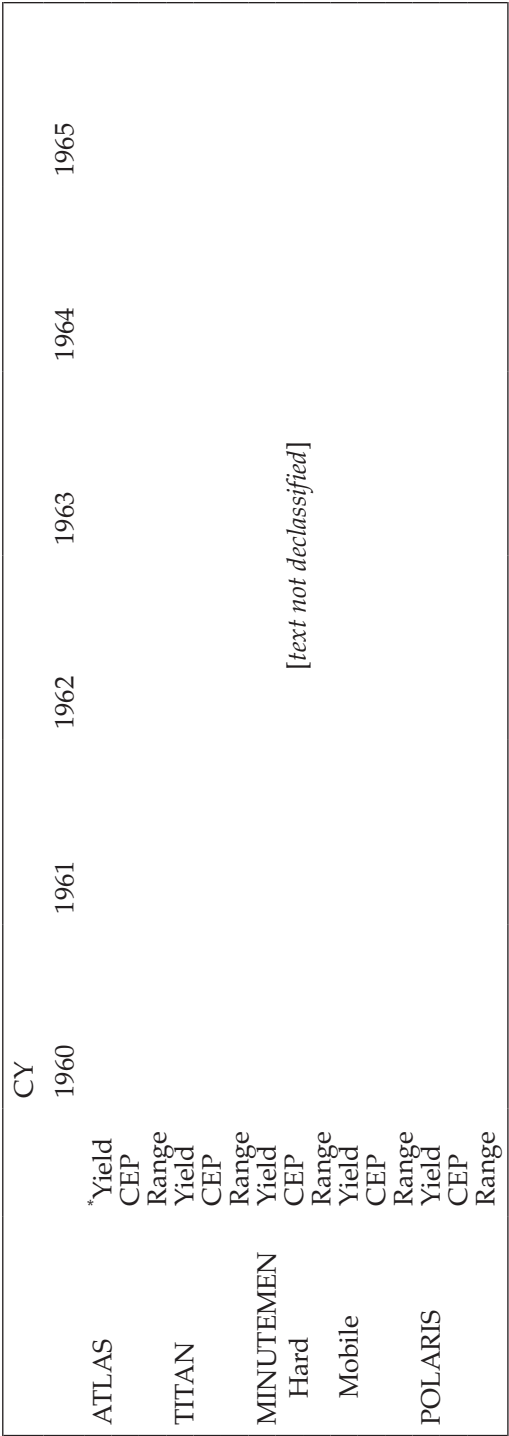

25.6 It has been necessary to consider carefully the destabilizing effects that a variety of measures might have on the balance that the agreements in question are intended to foster. Some of these measures are quite obvious, e.g., the effects of possible clandestine production under a ban. Others, no less important, are not quite so obvious, namely the effects of ASM measures and of possible active defense measures against ballistic missiles. The relevance of ASM to the efficacy of Polaris as a deterrent is clear. With respect to AICBM or AIRBM measures, the reasoning goes something like this. While cost effectiveness arguments may militate against AICBM defense when there are no constraints on missile production and when heavy decoying and a high degree of simultaneity of arrival are possible, ballistic missile defense may be much more attractive when these conditions cannot be met. Thus, in the event of a production ban or limitation, there would be added incentive for both sides to develop such defenses. Also, if a test ban were negotiated which would lead to heavy emphasis by the U.S. on Polaris (which has little decoy capacity and would not be capable of delivery of weapons with high simultaneity of arrival), then, the possibility that the USSR might develop—via crash and haywire—a modest but worrisome AIRBM capability would accordingly have to be taken into account. (The same applies in part to Minuteman, in that this missile will probably have a minimal decoying capability.)

26. The points discussed above are not the only ones that could be adduced, but they are the most essential ones and will probably suffice to clarify the discussion.

27. The spectrum of time over which the agreements might be implemented runs roughly from the present era into the 1964 period. Two dates have been singled out for detailed analysis: 1 January 1961 and 1 January 1963. It turns out that these dates enjoy a certain adventitious naturalness in that they represent key dates in the structure of the U.S. missile force (1961 operational Polaris capability and Atlas capability; 1963 hard and mobile Minuteman potentially).

28. Finally, the study group recognizes that the problem of the study is only a part of a much larger problem—that of armament control generally. It has not concerned itself directly with questions of the negotiability of any of the agreements considered.

*Topical Discussion**I. Items relating to the feasibility of monitoring a long-range missile flight test ban.*

30. Ballistic missile flights originating within the Sino-Soviet Bloc could be detected with high confidence utilizing a system of radars, at least some of which must be deployed throughout the Bloc. The numbers (and to some degree the characteristics) of the radars required will depend on the minimum apogee and range against which the system is to be effective. Table I illustrates this.

a) Column a is the minimum apogee against which the system is to be effective.

b) Column b is the range of a missile on a minimum energy trajectory which will have the apogee given in column a.

c) Column c is what is believed to be a reasonable upper limit on range for the apogee given in column a. It should be noted that attainment of such extremely flat trajectories as implied in column c would require heavier nose cones to withstand the great heating and also probably some terminal guidance.

d) Column d is the number of radars required for world coverage against missiles with the apogees given in a and the range given in b.

e) Column e is the number of radars required for world coverage against missiles with the apogees given in a and the range given in c.

Table I

Apogee (nm)	Missile Range (nm)		Radars for World Coverage	
(a)	(b)	(c)	(d)	(e)
100	400	10,000	125	70
75	300	3,000	170	115
50	200	1,000	250	240
30	120	200	415	415

From the table it can be seen that an apogee limitation of about 75 n.m. would exclude ICBM test firings. If it were desired to exclude IRBM's as well, a limit of slightly over 50 n.m. is indicated, though even with the 75 n.m. limit IRBM testing would have to be on far from minimum-energy trajectories. With a 75 n.m. limit, world coverage requirements are seen to be about 115 radars. Actually, of course many areas would not require coverage so that number of radars needed might be more like 100. Because of the great expense of a world wide radar system and in view of other possibilities discussed below, it might be desirable to use radar monitoring only for missile flights originating in the Bloc (and the U.S.). The numbers required are somewhat sensitive to location, i.e. whether it is necessary, and possible, to install radars in

countries around the periphery over which Soviet missile might be fired. If it is assumed that this is to be done, then about 15 radars would be required to detect firings of missiles the apogee of which exceeded 75 n.m. As many as 10 or 11 of these could be located in countries along the periphery of the Bloc. The rest would have to be sited within the Bloc. The system would probably take about two and a half years to install, and the initial cost would be of the order of 300 million dollars. A staff of 30 to 50 technicians (plus housekeeping) would be needed at each site. Mobility for the staff would not be a severe requirement.

31. With a radar detection system as described above, a substantial amount of missile development could continue since the radar system described above would not detect static, tethered and very short-range firings of long-range ballistic missiles, firings in which the missile is destroyed shortly after take-off, and any firings of aerodynamic missiles. Therefore, such tests should not be excluded by any agreement unless there were some other detection means agreed to by which they could be monitored. It is assumed that both sides would conduct such tests. If this were to prove not to be the case, there would be a serious dissymmetry which is not considered in this study.

32. Certain current developments—particularly acoustic and radio backscatter systems—offer the possibility, if used cooperatively, of a satisfactory and relatively inexpensive detection system—one that could even be deployed peripherally to the Bloc countries. It is not possible at the present time to specify the confidence level to be attached to such a mutually supporting system, either with respect to certainty of detection or with respect to immunity to false alarms.

33. In the event of a Soviet self-imposed moratorium on missile flight tests, these techniques—in conjunction with others now being used to monitor Soviet missile firings—might suffice at least for a while to keep track of Soviet activities. However, the present techniques are subject to circumvention if the Soviets take certain rather costly and time-consuming measures.

34. The testing of IRBM's and small ICBM's at sea is a possible operation. A world-wide radar system to detect such launchings would have an initial cost of the order of 2 billion dollars. Alternatively, cooperative use of acoustic and backscatter techniques might constitute a relatively inexpensive world-wide detection system which might be satisfactory for the detection of the inherently high-risk operation of launch by the Soviets (or others) on the open seas. Another alternative system to monitor tests at sea would involve the use of inspection teams to examine ships, shipyards, ports and coastline. The monitor teams would require rights of access and of aerial photography comparable with those delineated in Item IV, 50. as necessary for a production ban.

35. The MIDAS infra-red satellite system, which may be implemented in any event as a measure of early warning, has the potentialities of a world-wide flight detection system. It is not possible at present to determine whether such a system would by itself satisfy the requirements, nor to determine with certainty the date by which it could be operational.

36. Of the various detection systems discussed above, only the radar system would have any capability of distinguishing between a missile firing and a space flight. None would have any capability at all for determining whether a space flight was being used primarily to further missile development. Consequently, it would be necessary to establish in all the countries involved monitor teams having broad powers of inspection of space vehicles and payloads, both civil and military, including direct access to the firing site, the vehicle and its check-out equipment, to the internals of the payload components, and to the tracking and telemetry data.

II. Items relating to the effect of a space program on the effectiveness of a missile flight test ban.

37. In the event of a test ban, space experimentation could provide a "feed through" to the advantage of missile capability. Certain of this feed-through would be quite difficult to circumvent, for example:

- a) Increase missile reliability through continuing experience in the handling and firing of large rocket engines.
- b) Improvements in guidance accuracy.

Such improvements are by no means contingent on the existence of a space program, but they would certainly be accelerated by it.

38. A cursory examination suggests that limitations or controls on a national space program, such as would be at all consistent with the vigor and scientific validity of such a program, could slow, but would not stop, the effect of feed-through. The requirements for such controls, and the degree to which they would slow down feed-through, have not been studied in detail. It would be necessary to study in detail the question of whether new configurations (e.g., solid propellant boosters) or new sub-systems (e.g., all-inertial guidance) developed and tested in the course of space operations might find their way into the Soviet missile stockpile. Such developments would enjoy greatly reduced confidence in the presence of a test ban, but the lack of confidence would not necessarily constitute complete unacceptability.

39. The supervision of space effort (including military space programs, if they were to be continued) by an international authority could result in a minimal degree of feed-through into the military missile efforts. It would, in addition, greatly reduce the dangers inherent in the possibility of technological surprise.

III. *Items relating to the national security implications of a missile flight test ban.*

40. If a test ban were implemented in January 1961, the only ICBM that could be deployed in which the U.S. would have high confidence would be the soft, radio-inertial Atlas. An operational Polaris force, with 1200 n.m. missiles only, would be possible; confidence in it would be less than in the case of the soft Atlas. A hard all-inertial Atlas capability could be developed, but confidence in it would be even less than in Polaris. The operational deployment of the Titan would be precluded; this would probably imply a smaller (as well as qualitatively different) U.S. ICBM force for the period beginning in the latter half of 1961 than would be the case in the absence of a ban.

41. A January 1961 test ban would reduce but not stop the rate of improvement in accuracy of Soviet missiles. Insofar as the ability of these missiles to strike soft U.S. targets is concerned, Soviet accuracy will almost certainly be good enough by January 1961 so that any further improvements may be quite unimportant.

42. In summary, a test ban dated January 1961 would involve considerable risk for the U.S., since it could lead to a situation a few years hence wherein the U.S. would have an inadequate retaliatory capability. Soft missiles (and any aircraft caught on the ground) could be easily destroyed by a surprise Soviet strike-first. The Polaris force would not have certain desirable characteristics which further testing would provide, and in addition, confidence in the system would be lower than in the case of continued testing. Any aircraft that may be on air alert will find penetration of Soviet air defenses increasingly difficult with the passage of time. Finally, any hard ICBM capability which might be developed would be one in which there could be little confidence.

43. A test ban implemented in January 1963 would permit the operational deployment of the 100 psi all-inertial Atlas, Titan and Minuteman, of the mobile Minuteman and of the 1500 n.m. Polaris, assuming adherence to present schedules. A test ban implemented six months earlier would probably not preclude development of any of these systems, though confidence in the mobile Minuteman and the non-cryogenic all-inertial Titan would probably be significantly lowered.

44. A January 1963 test ban could not be counted on to preclude the development of a second-generation Soviet ICBM, possibly smaller and employing non-cryogenic fuel.

45. By January 1963, Soviet guidance will probably have improved substantially. A 1963 test ban would reduce, but not stop, the rate of improvement subsequently. It is possible that by January 1963 accuracies and reliabilities of Soviet missiles may already be good enough so

that the exchange ratio against 100 psi U.S. targets may be approaching dangerous levels.

46. In summary, a January 1963 test ban (would not appear to be particularly dangerous for the U.S., since it)⁵ would permit development of all U.S. missiles for which there are now firm programs, with the probable exception of the ALBM. At this time there do not appear to be any others in prospect that would offer the possibility of greatly improving our retaliatory posture. It would seem important that the test ban not be so early as to preclude development of the mobile Minuteman and the 1500 n.m. Polaris in view of the inevitable improvements in Soviet CEP's.

47. Technological, military or political developments as yet unforeseen could invalidate or modify these conclusions. There does not appear to be any basis for determining at the present time whether such developments will make a test ban less desirable or more so.

48. Certain possible developments do not alter the conclusions but are distinctly related to the problem. Thus, it seems unlikely that in the next few years, the USSR could develop ASW or ballistic missile defense capabilities which could seriously modify the deterrent effect of the Polaris missiles. However, in the farther future, the possible effects of such countermeasures might be important. In particular, the unilateral deployment of an AICBM defense could seriously alter the balance of force.

49. As a second example, a test ban, particularly an early test ban, could lead to a strong resurgence of interest in aerodynamic missiles, particularly very low altitude varieties. Thus a ban could create strong side effects whose ultimate consequences are difficult to predict, but which might be as serious as those which this ban sought to preclude.

IV. Items relating to the feasibility of a ban or limitation on missile production.

50. A qualifiedly⁶ effective system for delimiting Sino-Soviet production of missiles could be implemented if, and only if, the following conditions could be met:

50.1 The agreement guarantees a right to unrestricted and self-initiated access by the inspection teams to any point in any area of the Sino-Soviet Bloc.

50.2 The inspection directorate has the right to valid aerial photography of the entire Bloc on a periodic basis.

⁵ The DOD representatives would prefer that words in parenthesis be deleted. [Footnote is in the original.]

⁶ The major qualification is treated in Item 55 below. [Footnote is in the original.]

A prior inventory of Bloc missile stockpiles and selected industrial facilities would probably be required for monitoring production, and in any case would be needed to insure that the stockpile is not greatly different than estimated in the NIE.

51. Given the conditions outlined above, a limitation on allowed rates of inspection could probably be set. However, existence of a space program or of limited missile production would make necessary continuous inspection of certain key facilities, such as missile and space installations.

52. The activity of the inspection teams would be concerned not only with the production of the missiles themselves, but also with the production of the support equipment necessary to give the missiles an operational status. Although it is not within the terms of reference of this study and has not been investigated here, it seems probable that inspection of launchers and launch sites would be of great use; it is possible that further study would reveal it to be as important, or perhaps more important, than inspection of missile production.

53. U.S. intelligence could support the work of the inspection teams by providing relevant information beyond that derived from the overt inspection.

54. A much more extensive study will be required to determine the proper organization and manpower requirements of the inspection teams and the intensity of level of inspection, including limitations on inspection frequency. A cursory first look indicates that for monitoring the Sino-Soviet Bloc, a minimum of 1000 qualified people, exclusive of logistic support, would have to be engaged in this activity.

55. Despite inspection of the sort envisaged here, there will remain the possibility of a small flow of illicitly produced missiles. A clandestine rate of one or two missiles per month might involve relatively low risk of detection, while five or more per month would probably represent a high-risk situation.

The risk of detection and exposure has to be related to the possible advantage to be gained by incurring the risk. In the event of a total ban on production, for example, the advantage to be gained might be very large compared with the probability of, and the likely consequences of, exposure. In the event of a reasonable limitation on production, the advantages might seem considerably less persuasive.

V. Items relating to the national security implications of a ban or limitation on ballistic missile production.

56. A production ban as early as January 1961 would leave the U.S. with a very few soft fixed missiles, two Polaris submarines, and a bomber force whose capability of penetration (particularly in a retaliatory role) will diminish in time as Soviet defenses continue to

be buttressed. The Soviet ICBM force relative to the number of U.S. aim points could be such that only sure warning and great speed of response on the part of the U.S. bomber force could offer any hope of survival of any significant U.S. retaliatory capability in the face of near-simultaneous surprise attack. In addition, the generally low levels of inventory on both sides would lead to a danger from small levels of clandestine production.

57. If implemented as early as 1961, a limitation which permitted production of at least several times the estimated clandestine production capability of the Bloc would lead to a situation a few years hence where the missile inventories of the two sides would be in a proportion such that neither side's force would be sufficient to destroy the bulk of the adversary's force. (This conclusion is predicated on the assumption that at the time of the ban the Soviet operational missile stockpile would not be so unexpectedly large as to make it necessary to accelerate presently-planned U.S. missile production). The allowed production rate should be made sufficiently high that an approximate parity would be achieved before the U.S. bomber force could be rendered ineffective by Soviet air defense.

58. The detailed tailoring of the negotiations would have to include consideration of the problems of some continued testing, replacement and disposal of obsolescent missiles, and manufacture of spare parts.

59. In the event of an early production limitation, both sides might wish to do limited testing in order to prevent diminution in confidence, to improve accuracy and to prove out modifications of the missile force—particularly improved mobility and hardening. Such modifications would probably, in the near future, increase exchange ratios—and hence promote stability of deterrence—faster than improvements in accuracy could diminish them. With a limitation production, continuation of testing would seem, therefore, to be advantageous to both sides. At some later date (possibly in early 1963) when both sides had sufficiently exploited mobility and hardness, the desirability of continued testing might be questionable. Further tests might result in reduced exchange ratios as improvements in guidance became more significant than further improvements in hardening. Moreover, a discontinuance of testing at that time might prevent or delay the attainment of missile capabilities by powers other than the U.S., U.K., and USSR. Whether or not this would be desirable is not considered in this study.

60. If current schedules are met, a January 1963 production ban would leave the U.S. with about 200 ICBM's and 9 Polaris submarines operational. Actually, additional missiles might be produced prior to 1963 and added to the operational inventory later as more bases and/or submarines were completed. If Soviet CEP's and force levels were about as estimated in the NIE, a very substantial fraction of the U.S. ICBM's would survive a Soviet first-strike. The Polaris force, plus even

a small residue of the ICBM and bomber force, would pose a very substantial threat to the USSR.

61. Thus, U.S. capabilities would seem sufficient so that the Soviets would not attack in the expectation of delivering a knockout blow with small damage to themselves. However, if they should, for any reason, arrive at the conclusion that war was inevitable or highly probable, there would be great incentive for them to deliver a pre-emptive strike since by doing so they could destroy a very large fraction of the U.S. force and so reduce damage to themselves very materially below what would be expected in the event that war should develop in such a way that the whole of the U.S. force could be used against them. The possible advantage to them of such a pre-emptive strike in the event of crisis or uncertainty would then be contributory to instability. This, coupled with uncertainties regarding Soviet future capabilities, would seem to make a 1963 production ban somewhat risky, though probably not out of the question.

62. With deferral of the ban until about January 1964, the U.S. Minuteman forces, both fixed and mobile, are scheduled to grow so substantially that a situation of more stable mutual deterrence should have been reached, since a pre-emptive Soviet strike could be expected to destroy a much smaller fraction of the total U.S. capability. Thus, on the basis of current estimates and schedules, there would appear to be little danger in a ban at that date.

63. By 1963 the stockpiles of both sides will be large enough so that the advantages of a production limitation over a ban would be far less significant than in 1961. The conclusions with respect to the desirability of a ban in 1963 or 1964 are then, for the most part, appropriate to a limitation in production as well. A limitation would, however, seem slightly preferable, in that it would minimize the desirability of possible clandestine production.

64. The arguments presented earlier with respect to a prohibition on testing when there is also a limitation on production seem applicable for 1963 or later.

65. In the event of a ban or a limitation on production, the development of an AICBM defense would probably receive increased emphasis on both sides. The unilateral development and deployment of such a capability by either nation could seriously modify the stability of an established mutual deterrence.

Annex A

Proposed Terms of Reference, NSC Study (per NSC Action 2161–b)

The purpose of this study is to determine the technical feasibility and national security implications of a monitored ban on flight testing and/or on production of long-range ballistic missiles.

The study shall consider the major problems and implications of a ban on the testing of long-range ballistic missiles with emphasis on the technical feasibility of monitoring an agreement. The study will evaluate the importance of the changes that have taken place since the NSC study of March 28, 1958, with particular reference to the evolving status of missile capabilities in the U.S. and USSR.

A similar study will be made of the technical problems and implications of an agreement to stop missile production.

The relationship between the two types of restriction shall be considered, to determine their interdependence and, where appropriate, the relationship of missile test and production bans to other closely related arms control measures will be considered.

The relationship between any missile test or production ban and outer space programs will be a part of the study.

This study could consider an assumed situation existing on January 1, 1961, and alternatively, January 1, 1963. The study will be completed between February 15 and March 1, 1960.

Memorandum From the Joint Chiefs of Staff to Gates

JCSM 74-60

Washington, March 2, 1960

SUBJECT

U.S. Disarmament Policy (U)

1. Reference is made to the memorandum by the Secretary of Defense, dated 24 February 1960, concerning a possible international agreement to ban or limit the testing, production, and the numbers and/or deployment of long-range missiles.

2. The Joint Chiefs of Staff have reviewed the proposed disarmament measures and the accompanying question encompassed in your memorandum which stated:

“Cessation of all further flight testing of IRBMs and ICBMs and immediately upon the installation of an agreed control system to verify this measure. All further peaceful uses testing of rockets would be conducted only as part of an internationally agreed program. Upon the installation of appropriate inspection measures, agreed limitations would be imposed upon the numbers and the production and/or deployment of long-range missiles and of other long-range delivery systems such as aircraft and submarines. Subsequently agreed reductions would take place.

“Question. What would be the effect on the relative military posture of the United States and her Allies vis-a-vis the Soviet Bloc including Communist China of the adoption of an international agreement along the lines of the above measure, effective in January 1962; 1963; 1965?”

3. The Joint Chiefs of Staff feel that these disarmament proposals entail critical implications for the future security of the United States. This is particularly so if considered for any of the proposed time periods whether with or without regard to other disarmament measures. Current U.S. long-range missile programs are far from complete. For example, the MINUTEMAN program, including research and development on missile components, is actually just well underway. Although hardened MINUTEMAN testing is programmed to be practically complete in 1963, the mobile configuration would still be in the testing stage. (All of this presupposes no slippage or detrimental test results along the way.) The current POLARIS research and development program is less than 40 per cent complete. Although plans indicate completion of development of the 1500 mile missile by 1962, development of the subsequent model (2500 miles) will not be possible if a cut-off date of 1963 is established. TITAN research and development flight test programs are just beginning (of the 98 R&D flights programmed, 7 have been accomplished). The various improvements in this program are dependent upon SUCCESSFUL test completion.

4. There are many serious technical difficulties in our missile program that can be overcome only by extensive R&D testing over the next three or four years, followed by actual military crew firings under field conditions. Examples of more serious problems are: the all inertial ICBM guidance systems have not been flight tested to date; the development of a reliable large grain, solid propellant is in its infancy; and non-cryogenic fueled ICBM's have not proceeded past the static engine test phase. To commit the United States to a missile flight test ban, as of the proposed dates, based upon anticipated major technical advances and their successful incorporation into our missile programs, could be dangerous to the security of the United States.

5. Failure to successfully complete the flight test phase of any of these systems, or major system components thereof, would not permit the United States to produce a reliable missile weapons system to match the estimated current and anticipated missile technical advances of the USSR. Of equal importance, when viewed in the light of unit operational readiness, training of combat crews would be reduced to “dry runs”. This, of course, would result in questionable confidence in the whole weapons system.

6. Consideration of the foregoing, plus an examination of the implications thereof leads to the following conclusions:

a. Any agreement to ban flight testing of IRBM's, effective prior to 1965, would be disadvantageous to the United States because of the impact upon our weapons systems development programs.

b. The lack of firm data on U.S. programs as well as those of the Soviet Bloc makes the period 1965 one of great uncertainty. The anticipated continuing accelerated advances in weapons technology dictates that judgments as to the relative posture of the Soviet Bloc and the Free World by 1965 cannot be more than questionable at this time.

c. Any consideration of production limitations must include consideration of relative effectiveness of existing inventories of operational missiles as of the cut-off date. Measures which both the Soviet Bloc and the Free World would take to accelerate their ballistic missile programs, PRIOR TO THE CUT-OFF DATE, cannot be determined, but such could materially change current inventory forecasts, to include types of missiles. Furthermore, judgments as to relative advantage accruing therefrom would be contingent, to large extent, on the degree to which either or both sides possess an effective active defense against such a missile posture. Therefore, any judgments as to the advantages or disadvantages which would accrue from a national commitment to cease or limit production as of a given future date must be approached with extreme caution. The Joint Chiefs of Staff believe that a decision relative to the date at which a production ban would be advantageous to the United States cannot be made at this time.

d. An examination of our strategic dependence upon extensive deployment of U.S. and Allied strike forces, as compared to the more monolithic character of the military posture of the Soviet Bloc, indicates that it would be to our national disadvantage to negotiate agreement which would limit deployment of long-range delivery systems.

e. With regard to agreements on reduction of the long-range delivery systems, the Joint Chiefs of Staff consider that specific measures cannot be considered except as related to other disarmament measures.

7. Recommendation: Inasmuch as it is understood that the study being conducted under direction of the Special Assistant to the President for Science and Technology encompasses, in addition to an investigation of the feasibility of an inspection system, an assessment of the implications of such proposals as are related to our national security, it is recommended that the foregoing be utilized by the Defense representatives in the development of this study. Furthermore, in view of the military implications involved, it is recommended that the Joint Chiefs of Staff be afforded an opportunity to review and comment on this study prior to its referral to the National Security Council.

For the Joint Chiefs of Staff:

SIGNED
Arleigh Burke
Chief of Naval Operations

Memorandum From the Joint Chiefs of Staff to Gates

Washington, March 18, 1960

SUBJECT

Study Entitled "The Feasibility and National Security Implications of a Monitored Agreement to Stop or Limit Ballistic Missile Testing and/or Production" (U)

1. Reference is made to a memorandum by the Assistant Secretary of Defense (ISA), dated 14 March 1960, which requested that the comments of the Joint Chiefs of Staff with regard to the subject study be forwarded to the Secretary of Defense by 18 March 1960.

2. It is the understanding of the Joint Chiefs of Staff that when this study was requested by the National Security Council on 10 December 1959, it was contemplated that all major aspects of the problem of control of long range ballistic missiles would be considered and their implications fully assessed in order to establish a sound basis for a policy decision by the President. The terms of reference furnished to the study group were sufficiently comprehensive to permit accomplishment of this objective. However, the study report sets forth, in paragraph 2 thereof, seven interrelated areas of major concern which were not adequately considered.

3. These limitations of the study should be fully recognized in order to preclude a premature decision on this matter. In its over-all effect, the report is unduly optimistic with regard to the prospects for an early U.S. proposal for, or agreement to, a missile test or production limitation.

4. In view of its limitations, the study does not provide an adequate basis for the formulation of a broad policy with regard to the control of missiles. It does afford a sufficient basis, when construed in the light of the comments contained in the Appendix hereto, to conclude that the United States should not at this time propose any limitation on the testing or production of missiles to become effective at any foreseeable date in the future.

5. It is to be expected that proposals of this nature will be advanced by other nations in such a manner as to require their consideration by the United States. For this reason, it is recommended that the United States expeditiously complete a study of all major aspects of the problem in order to provide its negotiators with adequate policy guidance.

For the Joint Chiefs of Staff:

(SIGNED)

Thomas D. White

Chief of Staff, United States Air Force

Appendix

COMMENTS ON STUDY ENTITLED "THE FEASIBILITY AND NATIONAL SECURITY IMPLICATIONS OF A MONITORED AGREEMENT TO STOP OR LIMIT BALLISTIC MISSILE TESTING AND/OR PRODUCTION"

1. *Paragraphs 2, 10, 18 and 46* (pages 1, 4, 6 and 33). These paragraphs imply that a flight test ban beginning in early 1963 would contain no risk, or only slight risk, to the United States. The date 1963 is considered to be within the period where potential disadvantages of a test ban, with regard to possible slippages, unforeseeable technical/operational difficulties, and the desirability of sophisticating our programmed weapons system, can be identified. Moreover, the possibility that Soviet technical advances could provide them with a significant technical superiority prior to the effective date of a test ban should not be overlooked. The Joint Chiefs of Staff consider that uncertainty appears in the period 1965 and beyond.

2. *Paragraph 3* (page 2). With regard to the last sentence, it should be recognized that such certainty is a practical impossibility.

3. *Paragraphs 4 and 31* (pages 2 and 28). A radar monitoring system may not provide enough coverage to ensure detection of short-range missile firings or of ALL flights by aerodynamic missiles. However, it would be incorrect to imply that even a minimal system could not detect some of those flights within its radar envelope.

4. *Paragraph 6* (page 4). It should be recognized that consideration of the implications of these measures was beyond the scope of the study, and that, because of the indicated relationship, such implications must be considered before test or production limitations are proposed.

5. *Paragraph 8* (page 4). It is considered unnecessary for the limited purpose of the inspection system contemplated here, that ALL information be disclosed. However, it must be recognized that if this proposal were eventually implemented in conjunction with other disarmament proposals (such as measures to preclude surprise attack) there would be inevitable pressure for the complete disclosure of all information obtained through the use of space vehicles. This consideration should be given full weight in any initial decision as to whether the United States should propose or agree to, any restriction on testing or production of missiles.

6. *Paragraph 9* (page 4). The second conclusion of this paragraph (following after the comma in the second line) should not be interpreted as implying the internationalization of our space program would be to our advantage.

7. *Paragraph 10* (page 4). The indecisiveness of the last sentence (and of the last sentence of paragraph 2, page 1) supports the view that a determination cannot be made at this time that a missile test ban effective at any foreseeable date would be to our advantage.

8. *Paragraph 11* (page 4). The lead time indicated, and the emphasis on radar, are relevant only if credence is given to an effective date of 1963.

9. *Paragraph 12* (page 4). The Joint Chiefs of Staff concur in the conclusions of this paragraph. It should be noted, however, that the study fails to point out, in this paragraph, or elsewhere, the very significant problem involved in the determination of whether the United States would be willing to submit to such extensive inspection.

10. *Paragraph 13* (page 5).

a. The Joint Chiefs of Staff consider that the United States should not agree to a predetermined, fixed number of annual inspections (quota). Instead, the level of inspections should bear an appropriate relationship to scientific facts and detection capabilities. This principle would seem to require the right to inspect all declared production facilities and any suspected undeclared facilities. The level of inspection should, therefore, have an appropriate relationship to the number of declared facilities and to the numbers of undeclared facilities and suspected activities qualifying for inspection on the basis of agreed criteria.

b. The language of the first sentence indicates that in order not to seriously degrade the confidence of the monitoring system, a large quota would have to be set on the permitted number of inspections. The likelihood of obtaining USSR agreement to a "large quota" is completely negated by past experience.

c. The last sentence implies that continuous inspection of "certain key facilities" would be adequate in the event of a production limitation or a continuing national space program. Such limited inspection would disregard clandestine production.

11. *Paragraph 17* (page 6).

a. It is possible that the danger of a production ban would diminish with time, but, recognizing the limitations of this study, there is no justification for concluding that the risk will be small by January 1964. It is equally true that a production ban would become progressively less meaningful with time. The over-all assessment of risk vs gain should include comprehensive assessment of many facets, not considered in this study, before a conclusion as to "small risk" can be justified.

b. This paragraph mentions only acceleration of United States missile production. It would be extremely dangerous to assume that the Soviets would not also immediately accelerate their production in the event that an international proposal for limitation of production at some future date were to be presently taken under consideration.

12. *Paragraph 18* (page 6). Recognition should be given to the possibility of development, before 1963, of terminal guidance methods to improve missile accuracy. Tests to refine such terminal methods might

be continued, even after establishment of a test ban, by test launchings from aircraft remaining below the floor of the radar detection system.

13. *Paragraph 23* (page 8).

a. The meaning of this paragraph is not clear.

b. Paragraphs 13 and 23 appear to be inconsistent in the following respect: The latter contemplates unlimited ground and air inspection of a limited production ban; the former envisages a type of limited inspection both with regard to number of inspections (quota) and situs of inspections ("certain key facilities").

14. *Paragraph 25* (pages 9–14). Current U.S. long-range missile programs are far from complete. For example, the MINUTEMAN program, including research and development on missile components, is actually just well underway. Although hardened MINUTEMAN testing is programmed to be practically complete in 1963, the mobile configuration would still be in the testing stage. (All of this presupposes no slippage or detrimental test results along the way). The current POLARIS research and development program is less than 40 per cent complete. Although plans indicate completion of development of the 1500 mile missile by 1962, development of the subsequent model (2500 miles) will not be possible if a cut-off date of 1963 is established. TITAN research and development flight test programs are just beginning (of the 98 R&D flights programmed, 10 have been accomplished). The various improvements in this program are dependent upon SUCCESSFUL test completion.

There are many serious technical difficulties in our missile program that can be overcome only by extensive R&D testing over the next three or four years, followed by actual military crew firings under field conditions. Examples of more serious problems are: the all inertial ICBM guidance system have not been flight tested to date; the development of a reliable large grain, solid propellant is in its infancy; and non-cryogenic fueled ICBM's have not proceeded past the static engine test phase. To commit the United States to a missile flight test ban, as of the proposed dates, based upon anticipated major technical advances and their successful incorporation into our missile programs, could be dangerous to the security of the United States.

Failure to successfully complete the flight test phase of any of these systems, or major system components thereof, would not permit the United States to produce a reliable missile weapons system to match the estimated current and anticipated missile technical advances of the USSR. Of equal importance, when viewed in the light of unit operational readiness, training of combat crews would be reduced to "dry runs". This, of course, would result in questionable confidence in the whole weapons system.

15. *Paragraph 25.6* (page 13).

a. The first sentence implies that “the agreements in question”, i.e., proposed agreements on limitation of testing or production of missiles, are intended to foster “balance”. The achievement of a balance of power is not a purpose of, nor could it be achieved by, disarmament agreements except pursuant to proposals whereby the stronger side accepts greater limitations or reductions. This would be an unrealistic expectation.

b. In considering the last six lines of this paragraph (page 14), recognition should be given to current efforts leading toward development of decoy capability for both POLARIS and MINUTEMAN.

16. *Figures 1 thru 3* (pages 16–21). These figures relating to U.S.–U.K. missile data do not indicate their source and cannot be reconciled in detail.

17. *Figure 5* (page 24). Does not indicate source.

18. *Figure 7* (page 25). The data upon which “SOVIET REQUIREMENT” was plotted do not correspond to data for any of the cases discussed in Table A, Annex A, to NIE 11–8–59. It would be undesirable to have before the policy makers two estimates of Soviet missile requirements (this study and NIE 11–8–59) which differ considerably, without a very clear explanation of the reasons for the difference.

19. *Paragraph 30* (page 27). The conclusion that about 15 radars would suffice under the assumption stated fails to recognize the possibility of testing on the high seas.

20. *Paragraphs 62–63* (page 38). Any consideration of production limitations must include consideration of relative effectiveness of existing inventories of operational missiles as of the cut-off date. Measures which both the Soviet Bloc and the Free World would take to accelerate their ballistic missile programs, PRIOR TO THE CUT-OFF DATE, cannot be determined, but such could materially change current inventory forecasts, to include types of missiles. Furthermore, judgments as to relative advantage accruing therefrom would be contingent, to large extent, on the degree of which either or both sides possess an effective active defense against such a missile posture. Therefore, any judgments as to the advantages or disadvantages which would accrue from a national commitment to cease or limit production as of a given future date must be approached with extreme caution. The Joint Chiefs of Staff believe that a decision relative to the date at which a production ban would be advantageous to the United States cannot be made at this time.

545. Letter From Eaton to Herter¹

Geneva, March 22, 1960

Dear Chris:

We have finished a week here and are now on into the first day of the second week. It is very difficult to tell how the Soviets intend to proceed.

They seem quite relaxed. But, although there has been virtually no difficult language used as yet, they are trying very hard to establish the words "general and complete disarmament" as applicable to their own plan. In other words, the Soviets feel they have a patent on the expression and will permit no infringement.

So far as I am concerned, this is not particularly disturbing except as it is wasteful of time. However, it would be my guess that in these first days it is inevitable that time should be wasted in some way, and this is the least harmful I can think of.

The Soviets speak of the nuclear test talks each day, and I frankly believe that it is in this area that they are concentrating at the moment, permitting our own discussions to go in a rather desultory fashion. But, as I said earlier, it is really too early to guess.

Each day last week I made some comment solely for the purpose of establishing ourselves in the conference. I have now determined, at least for the moment, that I will not enter further into discussions while they remain in the upper atmosphere (where they have been all week) but save my fire until, hopefully, we get down to more mundane measures.

In this connection, while shaking hands with Zorin this morning, I told him that I hoped he would get in touch with me directly when he felt there was some specific matter for discussion which would advance the objective of our conference. He seemed quite grateful and uttered "khorosho, khorosho". After the day's meeting, at which he had talked for perhaps thirty minutes in not a destructive manner, I sent a private word along to him that I thought his statements had, in general, been helpful. I believe that this may be fruitful of some results later on when he believes the time is ripe to talk specific matters.

By the foregoing, however, I do not intend to indicate that we should sit by and wait for Russian moves as a general rule, but at this particular time I am convinced that this is the best tactic.

¹ Source: Report on first week of ten-nation conference on disarmament. Secret; Eyes Only. 4 pp. NARA, RG 59, Central Files, 396.12-GE/3-2260.

Also, I am of the impression that the Russians feel that the British are our Achilles heel. Zorin has sent word that he wishes to talk with Ormsby-Gore. It may be that he will wish to play us off against the British or vice-versa. Again, this is but a feeling and is based on no creditable evidence. But, I rather sense that the British are not too unhappy about the nuclear test talk as presented by the Russians on Saturday. Why should they be? If I am correct, the presentation reads very much like a play-back of a record cut in London.

In this connection I spoke to Michael Wright on Friday evening and told him that I had heard the Russians were coming in with the “threshold” accompanied by a moratorium. He said, “Yes, this could be very troublesome.” I replied that it certainly would be troublesome for us. I rather felt that he was a bit embarrassed by my comment. Therefore, I did not elaborate on it further.

In line with your suggestion, I broached the subject of recessing for the Summit in my talk with Dr. Protitch on the second day of the meeting. From the feeling in Washington, I gather there is talk of a Western Summit and some talk of a meeting in Istanbul. In light of all of this, I indicated that Dr. Protitch might want to suggest, on his own, that we recess the last Friday in April and sit down again shortly after the first of June. This would give us ample time to bring you up to date on what has transpired here, as well as time after the Summit to prepare the papers necessary to carry out any instructions which may emanate therefrom.

Dr. Protitch raised the question with the Russians, and they indicated that they thought recessing during the month of May would be consonant with their own plans. This is not agreed as yet since we want to be sure that it is agreeable to all of our colleagues and if possible avoid any chance of the onus for an early recess being placed upon us.

The foregoing about covers the report of the week.

I have two specific matters:

a. I think it would be well if I made an occasional report to the Chairman of the Foreign Relations Committee of the Senate and the Sub-Committee on Disarmament, i.e., Senator Fulbright and Senator Humphrey. I am enclosing a letter to each of them together with my first report.

The decision on whether to forward these communications rests entirely with you. However, I hope that if you decide that they should go forward that they do so promptly in order that they will be contemporary rather than historical documents. I will not expand on this as I hope the enclosures will be self-evident in this respect.

b. The other matter is the question of instructions from you. On the morning of the opening of our conference (when it was much too late

to have any discussions with our allies and only the briefest with our own staff), I received very specific instructions together with language to be included in remarks which I was to make on the opening day. These related to our relations with the United Nations. I could not follow these instructions without requesting a change in the Allied Paper which had been cleared in all five capitals and with NATO. Specifically, it was requested that a United Nations study be substituted for the Joint Study referred to in the Plan (which I may say had been in the Plan for weeks and reference to the U.N. included in the last days to cover point).

Further, this matter had been thrashed out and agreed between Mr. Wilcox and Mr. Dillon on the last day of my stay in Washington.

I was therefore, put in the embarrassing position of failing to follow your instructions or of causing a very real explosion among our allies.

I determined that I would endeavor to make the minimum changes in your suggested language (which being in quotation marks and in the context of the telegram I had to assume you had approved, word for word). I hope the result did not do violence too much to either your instructions or the agreement with our allies. I left it in such a way that we are free now to go back to our allies and change the earlier arrangement if that seems to be desirable.

I have set this forth at some length, as base on this experience, I hope that you will realize our predicament when matters of this kind arise in the future.

We begin preparations here after lunch with a meeting of our four allies for presentation to the full conference on the following morning at 10:30 A.M. Therefore, any communication which I receive after lunch I will not have time thoughtfully to consider, discuss with our staff and with our allies until the following day.

I recognize that there may well arise a critical or emergency situation which may require more immediate action.

I am enclosing copies of all this material which you may wish to send to Doug and Phil Farley and copies of letters to Senator Fulbright and Senator Humphrey which you may wish to send to Mr. Macomber.

Forgive the length of this letter but I felt that it would be helpful to give you some of the flavor of things here at this early date.

Kindest regards and gratitude for the help which I have received from you.

Sincerely,

Fredrick M. Eaton

546. Note From Caccia to Herter¹

Washington, March 22, 1960

Dear Chris,

The Foreign Secretary has asked me to send you the attached strictly personal message about nuclear tests.

When you have had time to consider it and the problems involved, he greatly hopes that you may give me a further opportunity of talking over this question with you before you send him any reply.

Yours sincerely,

Harold Caccia

Attachment

Message From Lloyd to Herter

TEXT OF MESSAGE

Dear Chris,

Harold Caccia has reported to me the conversation which he had with you on Sunday about the proposals put forward by the Russians at the Nuclear Tests Conference last Saturday. I understand that you will be giving further consideration to them in the course of this week, and I therefore hope you will not mind if I inflict upon you another letter setting out our attitude.

We regard these proposals as a most hopeful development. Of course we must go into the detail of them with great care and get precise clarification of what Tsarapkin really is proposing. He seems to have left some important points open for detailed negotiation. We must of course make sure that these points are settled in the way we want and I think it would be worth trying had to see whether this can be done.

I do not want now to rehearse at length all the arguments I put to you in my two messages of January 14 and 27. I hope you will look once again at those messages; but I would like in this one to set out as a series of headings the arguments I then used. These were:

¹ Source: Transmits letter to Herter from Lloyd on nuclear test conference. Secret; Personal. 5 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.

(i) that the Russians would only accept an agreement which would suspend all tests;

(ii) that if we now fail to reach an agreement the odium for this failure is likely to fall on the West;

(iii) that similarly if we fail and tests are resumed, and even if Russian tests were atmospheric while yours were underground, the main odium for this resumption of testing would likewise fall on the West;

(iv) that it is possible and indeed likely that from the military point of view the Russians stand to lose more than the West if tests are not resumed;

(v) that we have in any case had a completely uncontrolled moratorium on all tests since the negotiations began nearly seventeen months ago;

(vi) that even the best possible agreement would, as we have always realised, involve a virtually uncontrolled moratorium on all underground tests at least for a period of two or three years during the installation of the system; acceptance of the principle of the present Soviet proposal would in effect scarcely add to that period;

(vii) that if we fail to get an agreement then

(a) we lose the first opportunity of installing controls on Soviet territory and hence a vital precedent for future disarmament agreements;

(b) we gravely prejudice the prospects of progress in the Ten Power Disarmament Conference;

(c) we lose the best prospect now open to us of checking the spread of nuclear weapons to other powers.

There is also the important argument which I did not use in my two messages of January 14 and 27 but which I have used with you before. Supposing we fail to get an agreement, we shall be in a period in respect of which the Russians have announced that they will not be the first to resume tests. If, when it came to the point, the United States were to decide that it would not resume tests either, then we shall have thrown away all the advantages which an agreement might have brought us and shall have, in fact, an uncontrolled suspension.

But the most important argument of all is that at long last there may be a chance of making an agreement with the Soviet Union on fairly reasonable terms which would involve the setting up of a control system in the Soviet Union. If achieved in the way we want, it would be the first piece of controlled disarmament that the world has really ever seen and could change the outlook both for the Disarmament Conference and for the Summit.

I will not examine the technical considerations here; but I am convinced that, if a satisfactory moratorium proposal were accepted, we could by inspection exercise some real degree of deterrence against the possibility of Soviet violations below as well as above the proposed threshold.

I know that you will reflect carefully on these arguments and on all the remaining factors which suggest that agreement on the basis the

Russians have now proposed may be negotiable in a manner which would, on balance, be to the advantage of the West.

With best wishes,

Yours ever,

Selwyn

547. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, March 22, 1960

SUBJECT

Geneva Nuclear Test Negotiations: Meeting of Principals

PARTICIPANTS

Department of State
Secretary Herter
Under Secretary Dillon
Under Secretary
Merchant

General Dabney
White House
Mr. Gordon Gray
Dr. Kistiakowsky
Mr. Keeny

Atomic Energy Commission
Mr. McCone
General Starbird
Central Intelligence Agency
Mr. Dulles
Dr. Scoville

Secretary Herter explained that the purpose of the meeting was to discuss the nature of our reply to the Soviet counterproposal of March 19 in which they offer to conclude a treaty on the cessation of all tests except underground tests below a magnitude of 4.75, on condition that all parties agree at the same time not to test below that magnitude during a period of joint research. It is necessary to take legal and political factors into consideration. *The Secretary* has been informed by the legal adviser that the President cannot bind this country to a moratorium on testing going beyond his term of office, unless such a moratorium is approved by the Congress. Another legal point is that the Immigration

¹ Source: Discussion of reply to Soviet proposal on testing moratorium. Secret. 5 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

law waiver which would allow Soviet scientists to come to the United States as participants in a joint research project also would not extend beyond the term of this Administration. A further legal consideration: Since there appears to be no chance for agreement on a treaty in time to allow ratification by the Senate at this session, the treaty, if submitted late in this session, will probably just be held over for consideration during the term of the next Administration or, perhaps, to the period next January when the new Congress will be in session, but the new President will not yet have been inaugurated. These are legal limitations to keep in mind. The political factor consists of the strong feeling of the U.K. that the Soviet counterproposal represents an important breakthrough in the negotiations; the U.K. wants favorable action on it—and soon. This is a political reality. *The Secretary* then discussed the counterproposal, in light of information presently available, which is not complete. It appears that the Soviets envision a moratorium of 4 to 5 years duration. It is not clear what is to happen after that time, if joint research work has not produced a detection system satisfactory for discovery of all tests. Only chemical explosives would be used in research work. There is nothing new as to inspection quotas; they are still to be politically determined, and to have no relation to the number of events discovered. The only change in the Soviet position seems to be the provision for joint research. Nevertheless, some consideration must be given to this tricky counterproposal. So much propaganda has been made with it already that even the U.S. public thinks it involved a big concession. The burden is on us to prove that it is a bad proposal and how it could be made better. So the possibilities as to future action on which we must decide are: 1) Rejection of a moratorium and a resumption of testing; 2) continuing negotiation; and 3) Establishing direct connection with the Ten Nation general disarmament talks. *The Secretary* referred to the Bell Laboratory report on unmanned seismic stations, due in three weeks, as an additional factor. Another factor, and a great worry, is that we are now in a de facto moratorium, but there is no benefit for the U.S. in such a moratorium since we can conduct no on-site inspections at all.

Mr. McCone strongly urged that the Soviet counterproposal be rejected. He advocated remaining firmly attached to the principle, enunciated at the meeting with the President on July 23, 1959, that we should not commit ourselves to end tests which cannot be controlled. This principle was reiterated at the December meeting in Augusta. The Bell Laboratory studios are important, but they will not make the detection problem appreciably easier. Also, joint research using chemical explosives does not have the same value as research using nuclear explosives. Mr. McCone emphasized the dangers of continuing the moratorium: If we remain exposed to a long period of nuclear test suspension, while the Soviets are not, we shall become a second

class nuclear power. At present, and if we accept the Soviet counter-proposal, the possibility exists that the Soviets will continue testing. Meanwhile, our own weapons development possibilities, which would be greatly increased by a modest testing program, are not being taken advantage of. Mr. McCone expressed great disappointment with the British attitude. He disagreed with the idea expressed by Ambassador Wadsworth that progress could be made in Geneva on organizational issues; there is only one issue at Geneva and that is: Controls. If we accept suspension without controls, the security of the United States is threatened.

Mr. Douglas said that Mr. McCone has well expressed the inclinations of the Department of Defense. A period of two to three years during which the Soviets may test, and we will not, involves a real risk. He suggested that a program of joint research be initiated, but without a commitment not to test.

Mr. Dulles answering a question by *Secretary Herter*, stated that there is a chance of obtaining some additional information about Soviet testing, by means other than scientific detection and subsequent inspection.

Dr. Kistiakowsky, answering a question by Secretary Herter, stated he is unable to estimate the likelihood of the Soviets being able to conduct so many clandestine tests during a period of moratorium of 4 to 5 years as to be dangerous to U.S. security.

Secretary Herter announced that he must leave to greet the Foreign Minister of Spain, but wished to reiterate that there are political questions of the first magnitude involved here. The international state of mind is one of opposition to nuclear tests. These advocating a special General Assembly session to consider the French tests are only five votes short. The votes needed to summon such a session will possibly be forthcoming after another French test.

Dr. Kistiakowsky praised the value of the Bell Laboratory test studies on unmanned seismic stations. Stationed at 200 to 300 mile intervals, these stations could undoubtedly detect and identify events of a strength far below the threshold. But the cost and complexity of the operation would be enormous. Thousands of stations would be required. This is a serious limiting factor. Perhaps it would be a useful compromise to install such unmanned stations near known salt domes. Perhaps also the treaty could provide that the stations would be movable at the discretion of the organization.

Mr. McCone reiterated opposition to a moratorium, pertaining to the fact that the President had announced from the beginning that a moratorium was dependent on significant progress on the disarmament issue. Perhaps it is time to transfer the nuclear test suspension negotiations to the Ten Nation general disarmament conference.

Mr. Merchant pointed out that such a move would result in the test suspension issue being fitted in with some 20 others on which the ten nations are just beginning deliberations. Alternatively, a special sub-committee would deal with test suspension. Both alternatives seem undesirable. In the meantime, the political and scientific problems of the moratorium would remain with us. It is quite likely that a General Assembly session will be devoted to the "evils" of testing, a factor to be considered when we consider resumption. On the other hand, if negotiations continue for two more years with a de facto moratorium, we would be better off with a treaty, containing a moratorium, which would allow us to inspect in the Soviet Union.

Mr. McCone expressed regret that it was not made sufficiently clear at the outset of these negotiations that we would not consider a treaty without complete controls, under any circumstances. What has happened should serve as a lesson to Ambassador Eaton. Even a General Assembly condemnation by a vote of 80 to 10 is preferable to abandonment of the key principle of controls. Answering a question by *Mr. Douglas*, he stated that AEC preparations for eventual resumption of underground testing will be completed by midsummer. We can then test within 45 to 60 days thereafter. Any delay in testing after that time involves a delay in improving the efficiency of our weapons.

Mr. Douglas said that a delay of eight to ten months would perhaps not make much difference.

Dr. Kistiakowsky, answering a question by *Mr. Merchant*, stated that a vigorous three year program, employing largely technical talent available in the United States, would result in major progress on the detection and identification program. But there is no guarantee that the whole problem will be solved by then.

Mr. McCone quoted *Dr. Romney* and *Mr. Northrup* as saying that 3 to 5 years would be required, barring a crash program. However, no one can be sure that the program will yield practical results. Though the "Cowboy" serious has not been fully evaluated, results already show that decoupling through underground testing in salt is practical and that a considerable reduction in signal can be obtained even by a system of decoupling which is partially, not completely, successful.

Mr. Dulles, answering a question of *Mr. Gordon Gray*, said there is no evidence to show that the Soviets are conducting tests.

Mr. Gray commented that the present situation will subject the Government to criticism by the press and the American people. In effect, there has been a moratorium for 17 months. If these negotiations are combined with the Ten Nation talks there is likely to be an additional de facto moratorium period. If the Government continues the moratorium while there is a feeling that testing is important, criticism

is sure to follow. Another angle to consider is that of the effect which a relaxation of the principle that adequate controls must safeguard a suspension of testing agreement will have on the general disarmament negotiations. Mr. Gray felt the group should prepare an agreed position, or alternate recommendations clearly stated, for submission to the President. He recommended that the group be consistent in its statements to the press.

Mr. Merchant, after answering a question of *Mr. Dulles* by stating that the Soviets appear to want all test suspension treaty issues, except the inspection quota, settled before the Summit, suggested that all press inquiries be referred to Secretary Herter. He expressed belief that the President's chief advisers should talk in definitive terms about our reply to the counterproposal only after the President has decided on it. Even though the proposal may be patently unacceptable and our answer may be clear, there should be no out-of-hand rejection.

Mr. McCone said that he would be unable to refuse to answer all questions of the press, since he has always been on record in opposing an agreement containing inadequate control provision, so his position on this proposal must be clear. As a basic matter of principle, we should reject it. He quoted Senator Andersen, in a speech of today, as favoring rejection. *Mr. Irwin* supported Mr. McCone.

Dr. Kistiakowsky commented that the Soviet proposal is unacceptable, for technical reasons. Assuming there will be only 20 stations in the Soviet Union, there is no hope of detecting all events, including decoupled explosion. For political considerations, however, a counterproposal should perhaps be evolved.

Mr. Dillon (*who entered the meeting at this point*) and *Mr. Merchant* said that the strong feelings of the U.K. on this proposal must be taken into consideration in the opinion of Secretary Herter. However, we could not let the U.K. determine our own course of action.

Mr. Dillon pointed out the advisability of arriving at a decision as soon as possible, so that a program may be submitted to the President. The U.K. is exerting pressure for favorable consideration of the Soviet proposal. We all believe that it is not a good proposal, but the decision we must make is as to desirability of a counterproposal. He suggested another meeting of the Principals for the next day, March 23.

548. Telegram 4663 From London¹

London, March 24, 1960, 4 p.m.

Sent Department 4663, repeated information Geneva 127.

Embtel 4581. Nuclear Test Negotiations.

While we presume Department has been receiving British views on Geneva nuclear test negotiations from both British delegation and UK Embassy Washington, we believe we would be remiss if we failed to emphasize apparent strength and breadth of British attitudes toward March 19 Soviet proposal.

Government and other informed British elements are undoubtedly aware of dangers of accepting disarmament limitations or obligations that do not involve adequate controls. At same time public and political pressures are such in Britain today that we judge it would be extremely difficult, if not impossible, for government to resume nuclear testing, even small underground explosions below threshold proposed by us at Geneva. It seems clear therefore not only that British Government is under heavy pressure to accept latest proposal for moratorium on tests below threshold, In order to gain over-all test agreement, but also that there will be very little understanding or support in this country for us if we refuse negotiate on this basis.

In last few days many indications of British attitudes on this matter have been given me and various members of Embassy staff. These have included comments from government ministers and officials, members of Parliament, etc.

Parliamentary attitudes appear quite uniform, extending across board through Conservatives, Liberals and Labour Parties. And press comments have been likewise uniform.

Whitney

¹ Source: U.K. views on Soviet proposal for test moratorium. Secret. 2 pp. Eisenhower Library, Whitman File, Dulles-Herter Series.

549. Draft Paper with Eisenhower's Revisions¹

March 23, 1960

The United States should be prepared to accept the following three point program in the Geneva nuclear test negotiations:

(1) Conclusion of threshold treaty along lines proposed by the U.S. on February 11, with satisfactory settlement of the outstanding technical and political issues required for an effective control system, including the level or quota of inspections (to be applied both above and below the threshold), remaining aspects of the staffing and voting problems, composition of the Control Commission, arrangements for detonations for peaceful purposes, and the phased extension of the controls necessary to assure a world-wide cessation of nuclear weapons tests.

(2) Undertaking of a coordinated research program, to be commenced as soon as possible, for the purpose of progressively improving control methods for events below the threshold. Such a research program should explicitly make provision for the conduct of nuclear explosions (to be carried out under safeguards similar to those for detonations for peaceful purposes) necessary for improving and testing detection capabilities.

(3) Simultaneous unilateral declarations by the three powers at the time of signature of the treaty that they would refrain from conducting nuclear weapons tests explosions not prohibited by the treaty for an agreed period² dependent on (a) active pursuit of the agreed coordinated research program and (b) absence of any indication that the other countries are testing.

¹ Source: Outlines a U.S. position on nuclear test suspension. Confidential. 1 p. Eisenhower Library, Whitman File, Dulles–Herter Series.

² The President would make it clear in the basic agreement that so far as he is concerned this period could not extend beyond January 20, 1961, and that subsequent determination would necessarily be by his successor. [Footnote is in the original.]

550. Telegram Deldi 39 From Geneva¹

Geneva, March 26, 1960, 1 p.m.

Deldi 39. Eyes Only Secretary. From Eaton. I should like to make the following points with respect to the forthcoming visit of Macmillan. The following are my impressions and not based upon any solid evidence. (1) The French delegation here quite apparently does not wish to reach any kind of agreement that can be blessed at the summit, the reasons being that the possible areas of agreement that they see are troop reductions, a test ban or, less likely, nuclear cut-off without substantial weapons destruction. They are opposed to all of these. They, therefore, are keeping things in the air to the extent that they can and avoiding any solid discussion. In my effort yesterday to pin the Russians down with a question on control in terms of manpower and conventional armaments, the French did everything they could to run away from it not because they did not agree on control but because they were fearful that conventional reductions might become an isolated measure that DeGaulle could not accept at the summit. (2) The British are rather on the other side of the fence and would appear to be eager to reach some agreement for blessing at the summit.

I asked Ormsby-Gore yesterday whether he knew if Macmillan planned to discuss with the President any particular point in the field of disarmament other than nuclear tests. He said he did not think there was any particular point but certainly discussion disarmament would very likely take place.

In our view, the British are playing a somewhat cagy game. They try hard not to antagonize the French but while with us in general at the same time they are not completely in our camp. This may be because of Ormsby-Gore's concern that by my taking a fairly firm position at this point on controls it will become increasingly difficult for any measure to reach a point where it is susceptible of having holy water sprinkled on it at the summit. I have impression from British here that they may be overly anxious for agreement on either some particular measure or on broad and fuzzy general principles to take to summit. (3) I believe we have far more chance of getting an eventual agreement which would be acceptable to us by not being too eager in the coming days than by appearing over-anxious with the Russians. I have taken a fairly firm line in all public gatherings but have on two occasions communicated to the Russians that any time they wish to talk about some specific measure I would like to talk to them.

¹ Source: Disarmament and the Macmillan visit. Secret. 3 pp. NARA, RG 59, Central Files, 396.12-GE/3-2660.

The only result was a luncheon yesterday at which Zorin suggested that we accept the Khrushchev plan, failing that, we should agree on all the measures of disarmament, place them in stages, and in time sequence, adopting a goal which was their goal, not ours immediately. My only response to this was that if at any time he had any practical suggestions, he should let me know because I was only too glad to talk with him about them. I specifically asked them to give me any paper which they indicated they had in mind for submission to the summit. They ducked this.

(4) Most important I would hope that we would make abundantly clear to Macmillan that we are not prepared to have any agreement on any specific disarmament measure without first discussing the details of the inspection which would be permitted to verify the particular measure and pinning the Sovs down to agreement with respect to these inspection provisions.

(5) With respect to the summit, I believe it follows that the greatest care must be exercised against agreeing with the Russians in general terms that we will accept any measure which is subject to adequate verification because the Russians would seize on the substance of the agreement and walk away from the control.

From the impressions we now have, after two weeks here, I do not believe that any particular measures or set of general principles have reached a stage where it would be productive to seek agreement on them at the summit.

The foregoing does not repeat not in any way mean that between now and the summit discussions there may not develop here specific measures or general principles which might be introduced for endorsement and we will continue our efforts to see what can be developed. At this stage, however, we see nothing which we can presently suggest.

I do not think that forcing the pace here in the interest of securing something to agree at the summit would be useful for the longer range prospects of disarmament negotiations.

The foregoing comments on the summit, I submit in recognition that other factors of which I may not be aware may have an important bearing on strategy.

Villard

551. Memorandum of Conversation¹

Washington, March 26, 1960, 10 a.m.

SUBJECT

Nuclear Test Suspension

PARTICIPANTS

Ambassador Caccia
Lord Hood
The Secretary
Mr. Kohler
Mr. Farley

The Secretary said that the United States had formulated its tentative views on the recent Soviet proposal at Geneva. He gave the U.K. Ambassador a paper summarizing these views, in anticipation of discussions with the Prime Minister the following week. He said that the substance of the paper had been transmitted to Ambassador Whitney to give to Selwyn Lloyd.

After looking through the paper (which was substantially the same as the position paper on "Nuclear Testing" for the Macmillan visit) the U.K. Ambassador said that he did not understand the relationship of the proposal for a moratorium "from one to two years" and the statement that the President could only commit himself until January 20, 1961, which would be less than one year. The Secretary explained the legal problem involved. Mr. Kohler remarked that the Soviets, to judge by a recent piece in *Tass*, were aware of this problem and were citing it as evidence of their willingness to meet us more than half way in their proposal.

The U.K. Ambassador asked what our conception was of a "coordinated research program". Mr. Farley said that we use the term "coordinated" rather than "joint" research to indicate that we wanted to go ahead actively with our national research without holding it up until agreement was reached. As a matter of fact, what emerged would be for the most part discussion of national research activities in this field, some sharing of tasks, and exchange and comparison of results. This would undoubtedly be most efficient. In addition it would probably be desirable to have some actual joint effort with scientists of the three countries working together on individual projects. The Secretary suggested that advantage should be taken of the presence of Sir William Penney to hold informal discussions with Dr. Kistiakowsky,

¹ Source: U.S. position on Soviet proposal for a test moratorium in advance of Macmillan visit. Secret. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

Mr. McCone and others on the United States side. This might be done Monday afternoon, March 28, if the schedule at Camp David did not demand the presence of the proper participants. Mr. Farley agreed to set up tentative arrangements for such a session.

The Secretary said that he thought there was not too much difference between the United States approach and the U.K. approach as reflected in the points which Lord Hood had transmitted to Mr. Farley a day or two earlier. The U.K. Ambassador agreed, but observed that the U.K. might feel that a more positive Anglo-American approach was desirable rather than the exploratory approach reflected in the U.S. paper. The Secretary observed that there were a number of important issues still to be resolved and we should not give away prematurely our readiness to agree to a moratorium and thus weaken our bargaining power on these other issues. The U.K. Ambassador said that if other questions arose when the U.K. group examined the U.S. paper, they might call Mr. Farley in the period before the meeting at the Embassy on Monday morning.

¹Source: Coordinating the U.S.–U.K. position in nuclear test talks. Secret; Limit Distribution. 5 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

The *Prime Minister* expressed his appreciation of the tremendous and sincere effort which had gone into preparation of the United States paper which Mr. Herter had given the British Ambassador on March 26. There were manifold political, technical, and even spiritual matters which were involved in trying to find a common position which would respond to the expectations of the world. Having studied the U.S. paper he was aware that the positions of the United States and the United Kingdom were so close together that he could only express his estimate of the situation by addressing to himself the familiar wartime admonition: "is your journey really necessary?". He did think it was helpful to have a full understanding of the possibilities and the course of action which would be agreed. It might also make it easier for our highly competent negotiators to know that the people who are giving them instructions have gotten together and concerted their views.

The *Secretary* said that the United States side had examined the points transmitted to Mr. Farley by the British Ambassador and also felt for their part that there were no real differences.

The *Prime Minister* asked what the United States meant by referring to "coordinated research." *Sir William Penney* said that he could perhaps comment on this since he had already held some informal discussions on the previous day with U.S. technical people; there were to be further technical talks later in the day. The concept is that national research programs should be worked out and that the technical people from the three countries should keep in close touch while they are being carried out. It was not contemplated that a U.S.-U.K.-USSR directorate should be set up to develop and conduct a single program. He observed that this concept of exchange of views and information was a familiar one in international cooperation among scientists. He observed that one point which needed further discussion was the question of use of nuclear detonations in the research program. Such detonations would have a great advantage but raised political difficulties.

Mr. McCone said that the United States had looked into the latter question carefully and concluded that nuclear explosions were needed if anything meaningful was to be done. The *Prime Minister* asked whether this was because the waves from chemical and nuclear explosions are different. *Sir William* said that nuclear detonations were proposed in order to check that point. The *Secretary* commented that the United States wanted to be sure that definitive results were obtained in a research program. We do not want to get again in a position where we find that we have entered an agreement and then find that our technical facts are inadequate. *Mr. McCone* commented that *coordinated* rather than *joint* research was important if results were to be obtained in a one

to two year period. We could not hold up our own research while we were attempting to get agreement on a joint program.

The Prime Minister speculated that the Soviet Union will argue that the objective is to stop all tests rather than to find additional reasons for conducting nuclear explosions. *The Secretary* said that we would expect to conduct any nuclear detonations in accordance with procedures agreed on for nuclear detonations for application to peaceful purposes. It was important that our negotiators proceed to get agreement on the pertinent treaty article covering such procedures. *Sir William Penney* said that he thought from his discussions with Soviet representatives that the Soviets would be willing to agree to such procedures if they believe that weapons improvements will be barred. *Mr. McCone* said that there were several ways of accomplishing this. Examination of a nuclear device might be possible, at least by the Soviets, who presumably would not benefit as would potential Nth powers from study of the design of some of our weapons. However, it would be difficult to expose the design of some of our advanced reduced radiation devices to the Soviets, even though these are the devices which may be preferred for certain peaceful applications.

The Secretary said that for us the real justification of a moratorium on underground tests is the hope of progress in the research program. We must have simple and clear research objectives. The timing of commencement on the research program was a problem. We had to recognize that negotiations on the treaty might well be protracted for another six to twelve months on such issues as staffing and accession of other countries.

The Prime Minister said that, while there are many issues remaining, we should acknowledge that much of the past delay has been due to stalling on both sides. Given a common approach, we should be able to work through most of the remaining issues fairly quickly, although the inspection quota and perhaps one or two others will probably have to be resolved at the highest level. If the quota can be agreed at the Summit, he would anticipate signature of a treaty this summer. Ratification, of course, would depend on respective constitutional processes.

The Secretary said that he envisaged the possibility that we might need to have simultaneous unilateral declarations of a moratorium on testing before signature of the treaty. We now have no moratorium, as the President made clear last December 29, which puts us in an anomalous situation. If negotiation on the treaty is protracted, we might wish to seek agreement on the research program and agree to the research program and unilateral moratorium simultaneously with a clause

providing that the moratorium would end after a specified and brief period if the treaty is not signed.

Mr. McCone commented on the research work under way or planned by the United States. A station of the kind agreed to at Geneva is under construction in Oklahoma for completion in early fall. Also 20 smaller stations, without the full seismic array, are being built throughout the United States. By September or October we should be ready to make 5 kt detonations in granite and tuff, both nuclear and chemical, to test detection and decoupling. Tentative plans are under way for putting up five more stations in the United States and possibly Canada in 1960 and 1961. He commented that each experiment of course raises many new questions in addition to such answers as it gives to previous questions. Finally, about 15 unmanned stations are being built on a grid.

The Prime Minister said that apparently more thought needed to be given to the timing of the moratorium and research program. He had thought that we contemplated declaration of the moratorium and initiation of the research program simultaneously with signature of the treaty, as indicated in the U.S. paper. *Mr. O'Neill* said that the negotiating tactics might be quite different in the two approaches. He had thought that we wanted to hold out promise of the moratorium as an inducement to get favorable settlement of the remaining treaty issues. He saw that we could protect ourselves, and perhaps retain some bargaining power, by an escape clause in an agreement covering coordinated research and a moratorium, but doubted that this would be equally effective.

The Prime Minister said that there was a more fundamental negotiating problem. If this were a business negotiation we would simply continue negotiating out the remaining issues without saying much about the Soviet proposal and our position. Unfortunately our full position is in the press before we have finally agreed on it among ourselves and instructed our negotiators. He would like, if possible, to make a virtue out of this situation and thought perhaps this might be done by putting forward our position as an offer of a positive nature.

The Secretary said that he tended to favor an approach which focused on the remaining issues and threw back at the Soviets their statement that the remaining items are inconsequential. We should say that if these issues are indeed small, then here are solutions which are acceptable to us on which we can readily reach agreement. *Mr. Douglas* said that while he agreed with the approach to a coordinated

research program outlined earlier by Sir William Penney, he thought there was virtue in some cases to having Soviet scientists actually participating in some of the work so that they can see and evaluate for themselves the results achieved. This was generally agreed. In response to a question by Mr. Herter, *Sir William* said that the Soviets can undoubtedly contribute significantly to such a research program, though he was certain that they would need to develop plans and find money, seismometers and people just as he would. *Mr. McCone* said that the program he had outlined would cost the United States 18 to 20 million dollars a year which would have to be found. *Mr. Herter* said a further technical meeting was scheduled later in the day which could look further into these problems and report back to the principals the following day.

The Prime Minister asked whether there were any other major points which should be identified. *Mr. Douglas* said that he thought it important any agreed inspection quota apply both above and below the threshold. *Mr. O'Neill* said that he understood the Soviets were prepared to agree to this. *Mr. Farley* said that this was the position Tsarapkin had taken, but in the context of a moratorium which was a treaty obligation.

The Prime Minister and *the Secretary* returned to the question of what our public posture should be. *The Prime Minister* said that we would have to point out at the outset that, because of our ratification processes, the moratorium would have to be outside the treaty. As for timing, there were two possibilities—a moratorium declared simultaneous with signature of the treaty, or a moratorium declared immediately with a proviso that it would lapse if the treaty is not signed soon. *The Secretary* said that a related question was whether we put our position as a counter-proposal or as an acceptance of the Soviet proposal. After some further discussion he agreed with the Prime Minister that a third possibility would be to avoid either accepting or rejecting the Soviet proposal, but instead to proceed with a negotiation designed to marry the February 11 Western proposal with the Soviet March 19 position.

The meeting broke up at 11:30 a.m. with agreement that further discussion would have to be devoted to the tactical line and to the question of communique.

553. Paper¹

March 28, 1960

The Need for Nuclear Detonations in a Seismic Research Program

While it appears that educated guesses, based on the best relevant theoretical considerations, indicate that the difference between HE and nuclear explosions in terms of amplitude of seismic signal might be within the range of factors of 2–5, it is believed that a program of nuclear detonations is necessary, for the following reasons:

(1) At the present time there is no experimental data to connect the seismic signals from deep, contained HE and nuclear detonations.

(2) There is no generally accepted theory connecting seismic signals with the details of the source. Speculations as to the behavior of nuclear detonations, unsupported by actual evidence, should be tested. Data is needed on which to base conclusions, or better inferences, as to: spectrum of frequencies of shocks generated, effect of environment (gas & water content, etc.), and the state and behavior of the vaporized material.

(3) The effect of different media must be further known. To date deep underground nuclear detonations have only been conducted in Nevada tuff. Even with contained experiments with H.E. in this medium, extrapolation of effects to other media could be very misleading.

(4) The effect of different crustal environments between source and receiver can be important in determining the characteristics of signals received by a seismic station. Again, nuclear detonations are needed in other locations, as well as in other media, to obtain definite information on this.

(5) For proper evaluation of the capabilities of Geneva stations it is essential to have data at larger ranges. There are yield limitations on the use of HE, in that the volume of HE alone for 5 KT requires a spherical cavity of 60–75 feet diameter. Larger yields than 5 KT are highly desirable for the experimental program.

(6) There have been no nuclear “big hole” decoupled shots. The differences between HE and nuclear detonations should be further examined experimentally since there is expected to be a difference in the shock phenomenology occurring.

(7) It is important to keep in mind that if there is a now unknown characteristic of the seismic wave which would prove to be more useful

¹ Source: “The Need for Nuclear Detonations in a Seismic Research Program.” Confidential. 1 p. Eisenhower Library, Whitman File, Miscellaneous Series, Macmillan, Vol. II.

for detection and identification than any now known, it can be discovered only by experiments with nuclear sources.

554. Talking Paper¹

undated

*TALKING PAPER ON THE SUBJECT OF A COORDINATED EFFORT
IN THE SEISMIC IMPROVEMENT PROGRAM*

I. General Principles

1. The program will involve a major research, development and test effort whose objectives would be:

- a. To secure maximum improvement in seismic detection and identification capabilities (for both the short and long term).
- b. To determine the capabilities and limitations of any system which may be adopted.

2. Although coordinated effort by the three parties is desirable, each party must conduct such program activities as it believes essential to the program. There should be early initial coordination among the parties, so that:

- a. Each may adjust its program to gain better over-all coverage, and to avoid undesirable duplication;
- b. Agreement can be reached on the observation of, and cooperation in, the activities of the others.

3. It is propose that:

- a. Each party will keep the others informed as to its planned research, development, and field test activities, including locations and times of tests and locations and types of seismic recording stations.
- b. Each party will facilitate to the extent reasonably practical, the installation on its own soil of instruments useful to the others' program.
- c. Each party will announce well in advance any additional, significant, man-made, seismic disturbance which may be useful to another's program.
- d. Each party will provide expeditiously to the others, any basic information, results of analysis, or findings which may be useful in furthering the program.

¹ Source: Coordinated effort in the seismic improvement program. Confidential. 5 pp. Eisenhower Library, Whitman File, Miscellaneous Series, Macmillan, Vol. II.

4. Test detonations including nuclear detonations (See Appendix "A") will be necessary to investigate seismic signals and system behavior, with firings both in coupled and decoupled emplacement, and in various geographic and geologic environments.

5. All parties will commit themselves, for any nuclear devices they may fire in connection with this program, to use only devices whose design is already proven and not to use the firings concerned to advance weapon design. To assist in assuring others of their fulfillment of this commitment, they will comply with the following provisions: allow the other parties to observe all features of device emplacement, instrumentation, and firings, except for the internal design of devices themselves; install only such minimum instrumentation as is necessary to assure safe firing and measuring of yield, and deposit immediately under general surveillance of the others the devices it will use for the purpose.

II. *United States Effort*

1. The United States is initiating an extensive program of research and development designed to further the possible methods of improvement described in the Berkner Panel Report and in the Report of Geneva Technical Working Group II for the improvement of the control system. This program includes the following:

a. Study of the seismicity of the earth by world-wide standardized seismic instruments, study of the generation and propagation of seismic waves of all types and frequencies from earthquakes and explosions in various media and geographical locations, investigate the frequency characteristics and directional spectrum of microseisms, investigate the transfer functions of typical crustal structures, conduct model studies of radiation around simulated faulting and explosive sources, investigate cross-correlation techniques for determining direction of first motion of P waves from earthquakes and explosions, investigate extensively crustal structure by refraction shooting, study inverse transforms for long period waves.

b. Study microseismic noise on the ocean bottom and in deep wells, develop improved long period detectors, develop digitalized recording techniques, study deep hole seismometers, design and test large arrays and other improved seismometers.

c. Design, construct and test a complete Geneva-type seismic station and include as appropriate improvements to such station. Develop detailed specifications for a world-wide system to control underground nuclear tests.

d. Conduct such nuclear and HE tests as are needed to obtain fundamental seismic data which are needed to develop more sophisticated techniques for detection and identification and to test performance of system components and the final Geneva system.

e. Investigate the feasibility and reliability of unmanned stations.

f. Determine the relationship between magnitude and equivalent yield of seismic events.

2. Initial U.S. field installations which can be ready by September 1, 1960, to further the research and development program described above will include one Geneva-type station, and twenty simpler stations at various locations in the U.S. (Each containing one three-component, one second period seismometer and one three-component, 25-second period seismometer and some containing 1–10 second seismometers and 2 to 2½ second seismometers).

3. As soon as the above are ready we would propose to fire at NTS three test explosions of equal yield (5 Kt), one nuclear in hard rock, one nuclear in tuff, and one HE in tuff. From these, very useful (though recognizably incomplete) information should result relative to: behavior of a single Geneva station; the contrast in behavior of HE and nuclear detonations in one rock; and behavior of equal nuclear detonations in two different rocks. These experiments will provide at an early date basic data essential to the planning and execution of the more complicated analytical studies described above. These studies hopefully could result in significant technological progress toward improvement of the system by providing knowledge of possible characteristic difference between signals from explosions and earthquakes.

4. The U.S. is considering the installation of five additional Geneva-type stations and some 10–15 of the simpler stations. These would come available progressively over the period 6–18 months from now. The U.S. would intend to operate continuously the Geneva stations and some of the simpler stations, to acquire information on background and on signals from natural events. This information is intended to improve our basic knowledge required for detecting and identifying seismic events, so as to make possible improved system capabilities.

5. The U.S. is also considering the installation of 15 unmanned seismic stations in a grid of 100–200 kilometers in a region of high earthquake activity to study the behavior of natural events and smaller HE shots.

6. In addition, when the network mentioned above has been installed, further high explosive and nuclear detonations will be required to confirm the more sophisticated techniques which should be available at that time and to obtain a test of the improved instrumentation and system response of the six Geneva stations, as well as to determine the effect of different locations and/or conditions of firing. An estimated 5 nuclear detonations, together with several large HE detonations, probably would be needed and timed to be fired at the end of the 18 month period referred to in paragraph 4 above. The earlier Plowshare experiment, GNOME, and any other Plowshare experiments should be beneficial in this regard.

III. Results Possibly To Be Achieved Through This Effort

It is certain that an 18–24 months program along the lines of that described, with the United Kingdom and Soviet programs, will give

a more definite indication of the capability of a Geneva-type system. It should provide us with much basic information on possible seismic detection and identification techniques and equipment not now known. This should enable the efforts at improvement to be directed in realistic and effective avenues. It should lead to useful developments which will improve the detection and identification capability of the Geneva or improved Geneva system. It, however, may show added difficulties or limitations not now recognized or properly evaluated. It is not now possible, therefore, to estimate whether the overall effect would be that of showing the system to be more reliable than now believed.

Appendix A

THE NEED FOR NUCLEAR DETONATIONS IN A SEISMIC RESEARCH PROGRAM

A limited number of nuclear detonations is considered an essential element of a vigorous seismic research program for the following reasons:

(1) There exists a substantial uncertainty as to the relative amplitude of seismic signals from nominally equivalent (e.g. 5 KT nuclear and 5000 ton HE) detonations.

(2) There exists a strong possibility that the frequency spectra of seismic signals from nuclear and HE explosions are different and there may be other differences as yet unknown.

(3) The decoupling of explosions by carrying them out in large cavities may be substantially different for HE and nuclear charges and lead to different signals.

A comparison of new HE shots with the already existing seismic data from the Rainier shot and other underground nuclear tests of the Hardtack II series would not meet the requirements of the research program because of the limited seismic instrumentation which was previously used.

An additional consideration is the very high cost of and substantial transportation and hazard problems that will be involved in carrying out HE shots involving thousands of tons which are considered essential to obtain strong signals in the second zone. For instance, a 5 KT shot would require placing underground 200,000 cases of TNT.

Thus, the use of HE explosions alone will inhibit the research program and will prevent the realization of full capabilities of the advanced seismic detection systems which could be developed if detailed information on seismic signals from nuclear explosions were obtained.

555. Supplementary Memorandum of Meeting¹

Washington, March 29, 1960, 3:30 p.m.

Supplementary Memorandum—Meeting of the President with Prime Minister Macmillan on March 29, 1960 at Camp David, 3:30 PM.

Secretary Herter brought in a draft of instructions to the US and UK delegations at the test suspension negotiations in Geneva. The President said he had looked at these and thought they were satisfactory.

Prime Minister Macmillan commented that he saw two reasons against trying to incorporate the provisions for a moratorium on testing below the threshold into the treaty. First, we have always said that we would not sign an agreement unless there were fully effective inspection. The second point is that the moratorium then would not go into effect until the treaty is ratified. This would mean that we would have to wait at least until next February, which is apparently the earliest time that a treaty could be expected to be ratified.

Mr. Herter raised the point as to whether there should be a moratorium on tests above the threshold while we await ratification. He said that it has always been generally assumed that there would be such a moratorium, and general agreement with this position was indicated.

A.J. Goodpaster
Brigadier General, USA

556. Memorandum of Conference with the President¹

March 30, 1960, 2:45 p.m.

OTHER PRESENT

Dr. Kistiakowsky
General Persons
General Goodpaster

Dr. Kistiakowsky said that Chairman McCone, Secretary Herter and Acting Secretary Douglas had asked him to assume the task of preparing a plan for the coordinated conduct of research in the seismic field in connection with nuclear testing. He said that, if the President approved, he would be agreeable to doing so. In response to a question by the President, he said his role would be one of preparing a plan, not conducting operations. On this basis the President approved his doing so.

Dr. Kistiakowsky next said that the concept of giving assurance against clandestine testing through technical monitoring is showing some signs of getting out of hand. The techniques become so elaborate and complex as to be impractical. He thought we must be careful of working ourselves into a position where we are proposing things that cannot practically be carried out. He suggested that an alternative approach might be to concentrate on the fact that the Soviet operate behind an iron curtain; perhaps our efforts should go into breaking that down, and obtaining information through that route.

Dr. Kistiakowsky mentioned that he and Dr. Killian had talked further with Secretary Herter on the subject of an organization within the Executive Branch for arms limitation activities. Mr. Herter agreed that a staff level organization within the State Department is not good enough. The President commented that one virtue of his First Secretary concept is that such an organization could be put directly under him.

Dr. Kistiakowsky next brought up for discussion the question of setting out a definite program for technical research relating to arms limitations. He asked the President what kind of time objectives the President thought should be established. He also asked if this work could be assigned high priority by the President. The President thought that study would show that the research effort would fall naturally into distinct steps. The essential point is to give it a high priority, and he approved the assignment of high priority to the project. Dr. Kistiakowsky said that Dr. York believes he can get together two-thirds of the money needed (in the order of \$20 million), but would need help on

¹Source: Research in seismic detection, radioactive strontium in wheat. Secret. 3 pp. Eisenhower Library, Whitman File, Diary Series. Drafted April 4.

getting the last \$10 million. The President thought that the planning phase of this activity should not cost very much, and that this might be supported out of his emergency fund. He asked Dr. Kistiakowsky to check with the Bureau of the Budget on the whole matter, however. He stated he would be willing to send up a supplemental to cover what is needed in this field, inasmuch as the need arises on the basis of new, more hopeful developments related to limitation of armaments.

Dr. Kistiakowsky said that there has been discussion within his group and the AEC concerning the continuation of small hydrodynamic nuclear experiments. These do not of course constitute weapons tests. There was some thought that this should be discussed with the Joint Committee on Atomic Energy, and that a standby statement should be prepared to explain what these are, in order to avoid any confusion of these with the question of weapons testing. The President expressed great worry about the Joint Committee on Atomic Energy, because of its failures to safeguard the security of secret information given to it. He also had great doubts about making a statement to explain this matter. Dr. Kistiakowsky stressed that the statement was intended to be prepared for standby only, and that it would be worked out with all the interested agencies. The President agreed that this experimentation could go ahead. He offered no objection to the secret preparation of a standby statement. Dr. Kistiakowsky then suggested that there might be some reason for the President to discuss with Khrushchev what constitutes a weapons test. The President was very dubious about this.

The next subject raised by Dr. Kistiakowsky was a report on carcinogens in food, including specific reference to the cranberry problem last fall. He said it is an excellent report, which he plans to show to Secretary Flemming and Secretary Benson. The President agreed with his doing so and stated the Administration could then decide whether to release the report. Dr. Kistiakowsky then referred to a related problem of great seriousness which has developed. Analysis of wheat and wheat products shows, in some nine States, a high concentration of radioactive strontium, particularly in the bran. There seems to be no immediate hazard to health in this, but the concentrations are within the range that warrants concern. The information is not public as yet, but could be presented in a highly sensational fashion. The President asked about the source of this radioactive strontium, and commented that it really means there should be no more large fission explosions in the atmosphere. Dr. Kistiakowsky said that there are dangers in the situation of large-scale dislocation of the economy, extending over a number of major farming States. The President asked General Persons to give personal attention to shaping up action on this matter.

Dr. Kistiakowsky next reported briefly to the President as to what is done with radioactive wastes, in response to a question some time

ago by the President. Most is held in huge underground concrete tanks, but is kept for a few years until the radioactivity has greatly declined. The residues are then disposed of in rivers, deep wells, or at sea, in the latter case quite frequently in sealed containers. The President commented about the terrible consequences that have arisen out of the discovery of nuclear fission, endangering the whole future of civilization. He recalled a statement he had made in 1953—which had been greatly challenged, although he has continued to believe it—that if the world could be completely free of these weapons, the U.S. would be better off. It is because of these weapons that, for the first time in our history, we have reason to fear for the safety of our country.

The President reverted to the question of radioactivity in wheat, and asked Dr. Kistiakowsky to arrange to obtain the results of samples taken in Argentina and Australia.

Dr. Kistiakowsky concluded the meeting with a report on the DISCOVERER project. The design is good and the engineering is good. However, the management (Lockheed) is extremely poor and the Air Force is taking steps to try to tighten it and strengthen it. A great number of stupid mistakes have been made (for example, using foam rubber in one apparatus which, in a vacuum, swelled up to fill the entire instrument and preventing its functioning).

A.J. Goodpaster
Brigadier General, USA

557. Letter From Herter to Gray¹

Washington, April 11, 1960

Dear Gordon:

I have your memorandum of April 7, 1960.

I am not sure that you are aware that last October the President wrote to me suggesting that permanent status be given to a unit of Government dealing with disarmament and that this be in the State Department, and that I responded in November concurring in the President's

¹ Source: Organization for disarmament. No classification marking, but responds to a Personal and Confidential memorandum from Gray (included). 4 pp. Eisenhower Library, White House Office Files, Project Clean Up, Disarmament-General.

judgment. Subsequently I have received from Dr. Kistiakowsky and others recommendations that the disarmament organization be established in the White House. I have given very extended and careful consideration to the merits of these proposals, but have concluded again that the permanent disarmament organization which the President had in mind should be established within the Department of State. In any event, I would consider the assignment of the disarmament responsibility to a subcommittee of the National Security Council as being inappropriate.

Last week Dr. Kistiakowsky and Dr. Killian were informed of this decision and they have promised to do their best to support it. With the assured cooperation of the President's Science Advisory Committee and the cooperation I expect to receive from the Department of Defense and the Atomic Energy Commission, I am quite confident that the State Department organization arrangement will prove successful. Furthermore, I am convinced that it is important that this project be advanced without any further delay.

I expect to submit a progress report to the President on this matter shortly.

With warmest personal regards,
Most sincerely,

Christian A. Herter

Attachment

Memorandum From Gray to Herter and Gates

April 7, 1960

I have very informally and tentatively explored with the President a notion I have had with respect to continuing studies regarding reduction and control of armaments. It was largely prompted by the discussion following George Kistiakowsky's presentation at the Council meeting on March 24. You will recall that Secretary Rostow, Admiral Burke and Dr. Kistiakowsky all indicated the need for continuing studies, but the President did not make any specific decision regarding such studies.

Also, I am prompted by recalling that we have perhaps had a rather spotty and uneven record of studying the reduction and control of armaments problem and in preparing for international conferences which have been concerned with this matter. We have had big

projects like the [illegible in the original] project and smaller ones like the Coolidge project, and others generally on an ad hoc basis.

My thought is to establish a procedure which would, for example, provide for (a) continuing and integrated evaluations of the technical feasibility and implications for the national security of proposals for the reduction and control of armaments; and (b) a continual watch for changes which would significantly alter such evaluations.

In order to provide continuity within an established organizational structure which is directly responsible to the President, I think this procedure could best be accomplished by establishing a small subcommittee of the National Security Council. The subcommittee could consist of the Secretary of State (Chairman) and the Secretary of Defense, with the Chairman of the Atomic Energy Commission participating when matters of concern to him were before the Committee. Advisors to the Committee might be the Chairman of the Joint Chiefs of Staff; the Director of Central Intelligence; the Special Assistant to the President for Science and Technology; and the Special Assistant to the President for National Security Affairs. Provision would be made for a small staff, headed by a full time staff director, to be approved by the President. The staff could be composed, as the Committee might determine, both of representatives detailed from the interested departments and agencies and of individuals from outside of government, either on a part-time or a full-time basis.

This procedure should not disturb, but would instead [illegible in the original] and supplement, organizational arrangements which you would have in the State Department and in the Defense Department.

The President has asked me to explore this matter personally with the Secretary of State and the Secretary of Defense and I shall shortly be in touch with both of you. In the meantime, this is simply to acquaint you with the notion in general terms so that you may give the matter some thought before we meet to discuss it, and I suggest that this not be given any general distribution in your department. The President would of course not proceed except upon your recommendation.

Gordon Gray

Special Assistant to the President

558. Statement Agreed to at a Meeting of Five Western Foreign Ministers¹

April 13, 1960

Tab C

The Foreign Ministers of Canada, France, Italy, the United Kingdom and the United States reviewed and approved a report from their representatives in Geneva on the course of the disarmament negotiations now in progress within the 10-Nation Disarmament Conference in relation to the forthcoming meeting of the Chiefs of State and Heads of Government in Paris. They recalled the unanimous resolution of the United Nations General Assembly of November 20, 1959, which expressed the hope that measures leading toward the goal of general and complete disarmament under effective international control will be worked out in detail and agreed upon in the shortest possible time.

The Foreign Ministers consider that the approach reflected in the Western proposals represents the surest and most effective way of moving toward the ultimate goal of a secure, free and peaceful world in which there shall be disarmament under effective international control.

The Foreign Ministers expressed the hope that agreement would be reached as soon as possible in these negotiations on measures of disarmament to be attained by balanced, phased and safeguarded agreements which must be observed and verified by an appropriate international organization within the framework of the United Nations. At the same time they agreed that their representatives should give thorough consideration to any practical disarmament proposal which would preserve the security of all the nations concerned and which would pave the way for further progressive measures leading toward the ultimate objective. In this connection the Foreign Ministers are requesting their representatives in Geneva to continue their efforts to achieve the early identification and consideration of areas of possible agreement.

The Foreign Ministers noted that the negotiations will be pursued within the 10-Nation Disarmament Conference until April 29, at which time the formal sessions will be recessed until June 7. During this period of recess the representative of the Five Western Powers will review the course of the negotiations and advise the Foreign Ministers in preparation for the May meeting of the Chiefs of State and Heads of Government.

559. Memorandum of Conversation¹

US/MC/50

Washington, April 14, 1960, 2:15 p.m.

SUBJECT

Problem of Nuclear Test Suspension

PARTICIPANTS

Howard C. Green, Secretary of State for External Affairs, Canada
Norman A. Robertson, Under Secretary of State for External Affairs
Arnold Heeney, Canadian Ambassador to U.S.
Christian A. Herter, Secretary of State
Livingston T. Merchant, Under Secretary for Political Affairs
Foy D. Kohler, Assistant Secretary, EUR
Ivan B. White, Deputy Assistant Secretary, EUR
Delmar R. Carlson, BNA

Mr. Robertson inquired as to whether the United States was looking beyond an agreement suspending nuclear tests by the three powers and considering the question of accession to the agreement by other powers. The Secretary replied that much work, including considerable detailed preparations, had been done regarding this problem.

The Secretary explained that even if agreement were obtained among the three powers and by any others, a considerable number of problems of implementation would have to be solved. He pointed out that an enormous, expensive, and complicated system would be required for a worldwide inspection network. Such a system, he said, would require, according to the scientists, 180 stations with about 30 persons located at each station, together with very sophisticated equipment. He observed, however, that if the Soviets were to accept a comprehensive system of that sort, 20 of the stations were to be in the Soviet Union and therefore Soviet acceptance would be a great step forward.

Regarding accession, the Secretary emphasized that we would strongly desire other powers to adhere to any agreement and to share in the responsibility for the maintenance of the system. He mentioned that the agreement would provide for signatories to the agreement to leave the system after two years if they concluded that it was not working. Mr. Green inquired as to whether the matter of accession had been discussed with the Soviets. The Secretary replied in the affirmative and

¹ Source: Accession to nuclear test ban agreement, Chinese nuclear capability, commercial nuclear work in Europe. Secret. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

added that we had already drafted some of the articles necessary to cover accession in an agreement.

In answer to a question by Mr. Robertson regarding China, the Secretary confirmed that there had been rumors that China might explode a nuclear device, but that we had no confirmation of this. The Secretary also mentioned the reported possibility of commercial firms in West Germany and the Netherlands being able to produce nuclear materials. Such a development would be particularly worrying because it indicated a proliferation of the most deadly knowledge.

560. Memorandum of Conversation¹

Washington, April 21, 1960, 1–3 p.m.

SUBJECT

Disarmament

PARTICIPANTS

Secretary Herter
Under Secretary Dillon
Mr. Dwinell
Mr. Farley
Mr. Foster
General Gruenther
Mr. McCloy

1. *Disarmament Organization*

The Secretary said that a good deal of thought had been given in the Executive Branch, both in the White House and the State Department, to the question of organization for disarmament policy development and negotiations. He had discussed the question with the President and also with Mr. Gates, Mr. McCone, Dr. Kistiakowsky, and other interested officials. The arguments for centering disarmament efforts in the White House and in the Department of State had been carefully examined and compared. The President has now authorized an expanded and up-graded disarmament effort in the Department of State reporting

¹ Source: Coordinating center for U.S. disarmament efforts. Confidential. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

directly to the Secretary. At the Secretary's request *Governor Dwinell* reviewed State Department plans for an expanded effort and the status of administrative actions to put these plans in motion.

There was extended discussion of the proper location of the coordinating center for U.S. disarmament efforts. *Mr. Foster* said that he applauded the decision to undertake such coordination and an expanded planning and studies activity. He had himself long supported such a move. Though he felt it should be in the White House, he recognized the arguments for locating the effort in the Department of State and was quite willing to see whether that solution could be made to work.

General Gruenther and *Mr. McCloy* also welcomed the move and emphasized the importance of obtaining an experienced individual of recognized stature to head the program. They also emphasized the importance of centralizing all State Department disarmament activities under such an individual. There was some discussion of possible candidates for such a position.

2. Geneva negotiations

The Secretary and *Mr. Farley* reviewed briefly the status of the Geneva ten-power disarmament negotiations and the nuclear test suspension negotiations and prospects for discussion of disarmament and nuclear testing at the Summit.

561. Memorandum of Discussion Between Eisenhower and McCone¹

Washington, April 22, 1960, 11:15 a.m.

MEMORANDUM OF DISCUSSION WITH THE PRESIDENT AT 11:15 AM, APRIL 22, 1960

I met with the President for fifteen minutes this morning and reviewed the content of my discussions with President de Gaulle as outlined in my cable to Secretary Herter; reviewed the details of my visits to the French production plants, laboratories, etc. and my discussions

¹ Source: McCone's visit to France; nuclear testing. Confidential; Eyes Only. 1 p. Eisenhower Library, McCone Papers, Sealed File No. 5.

with the Commissariat and members of the foreign office as outlined in my memoranda to the files, dated April 18, 1960.

The President expressed himself as feeling our present laws are forcing other countries to develop a weapons capability; that we might stop this if we would develop a somewhat different approach to the plan of handing weapons in conjunction with other countries, but under appropriate controls. I agreed.

The President expressed himself as becoming increasingly alarmed over atmospheric testing, stating he felt our scientists and others had been overly optimistic in minimizing the dangers from fallout. I said I concurred and that, as I had told him many times in the past, I would not in my present position recommend a resumption of atmospheric tests.

I pointed out underground testing was another thing as there was no danger from fallout. He concurred.

I told the President that our monitoring stations had picked up the radioactivity resulting from the French tests.

John A. McCone

Ten-Power Disarmament Talks

PARTICIPANTS

France

Mr. Couve de Murville
Ambassador Alphand
Mr. Pellen

United States

Secretary Herter
Under Secretary Dillon
Mr. Farley
Mr. McBride

Mr. Couve de Murville said that there was apparently disagreement among the Western delegations in Geneva regarding the nature of the counter proposal to be tabled before the April 29 recess. The United

¹ Source: Tactics for ten-power disarmament talks. Confidential. 3 pp. NARA, RG 59, Central Files, 396.12-GE/4-2460.

States, generally supported by the U.K., Canada and Italy, wishes to table a paper combining a statement on principles and a call for specific initial disarmament measures. The French prefer to table simply a statement of principle. On tactical grounds, the French delegate believes the specific measures will be effectively attacked by the Soviets as not new, and as very limited, and as emphasizing control more than arms reduction. On grounds of substance, the French find great difficulty in the focus on the cut-off in production of fissionable materials for weapons purposes. This measure is for the French, in effect, a renunciation of nuclear weapons, since they are just about to begin production. The proposed specific-measures papers, either in the U.S. version or in the longer version worked out in Geneva, added to French difficulties by presenting the cut-off as a first-stage rather than second-stage measure. The French also have difficulty with troop ceilings or reductions in the near future, though this problem is less serious. In view of the French nuclear situation, they must insist on measures of substantial reconversion of nuclear weapons in order to equalize the position of the present nuclear powers with theirs.

The Secretary recalled the great concern in the United States, especially in military circles, with any early time scale for elimination of the nuclear threat in view of technical inspection limitations and the Western reliance on the nuclear deterrent. *Couve* said that, of course, the French insisted on balanced nuclear and conventional reductions and maintenance of an adequate military posture.

Mr. Farley said that the U.S. was apprehensive of a separate Western principles statement which would shift the debate to Soviet ground and pose the issue as how one proceeds toward general and complete disarmament as matter of principle, rather than as what practical measures can be taken to make a beginning and to test Soviet professions of willingness to accept effective controls. *Couve* said that he saw the problem as one of public relations. The West must counter the recent Zorin statement on disarmament principles with something of the same scope and nature but with greater realism. *Mr. Farley* said that, in addition to the difficulty the U.S. had as a matter of pre-Summit tactics with engaging in a debate on principles, we believe that the principal impression given publicly by the proposed Western principles statement would be one of "realism". Public relations-wise, the Western document would appear cold and negative and delaying with its references to phasing, balance, and prior effective controls. The U.S. specific measures paper, while fully consistent with the Western five-power plan, was an effort to take out and high-light concrete steps which would emphasize once again the specific actions the West were willing to take. *Mr. Dillon* observed that the difference appeared to be that *Couve* considered the Western

measures “mouselike”, whereas the U.S. considered them to be concrete and to some extent publicly appealing.

Couve suggested that the U.S. paper might be tabled by the U.S. simply as a U.S. approach. *Mr. Farley* suggested that the principles statement, of which the text was now agreed among the five Western delegations, might be introduced in the same way, by one of the other Western delegations, as a counter to the Zorin statement.

The Secretary said that the steps might be done in sequence, with first the principles paper introduced and then, subsequently, the U.S. specific measures paper. This might best be done toward the end of the week, in order to leave the Soviets as little time as possible to tear the two papers into bits. *Couve* agreed generally but observed that the timing would have to be left to the delegations in order to take into account their problems of filling up the week. It was agreed that the principles paper might be introduced as a common five-power Western paper and that the U.S. paper would simply be supported by such other Western delegations as were able to, with any others remaining quiet.

The Secretary said that we had just learned Hammarskjöld wished, not only to attend a ten-power meeting next week, but also to exercise his “unquestioned right” to speak to the ten-nation meeting. *Couve* said that he understood this possibility had been discussed among the Geneva delegations, who did not welcome such an appearance. It was agreed however that, under the circumstances, it would be necessary to hear what the Secretary General had to say.

The meeting adjourned at 11:40 a.m.

563. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, May 5, 1960

SUBJECT

Nuclear Test Negotiations—Meeting of Principals

PARTICIPANTS

<i>State</i>	<i>AEC</i>	<i>DOD</i>
Under Secretary Dillon	Mr. McCone, Chairman	Secretary Gates
Mr. Sullivan—S/AE	Brig. Gen. Starbird	Mr. Knight
Mr. Spiers—S/AE	Dr. English	Mr. Lanier
Mr. Dubs—SOV		Gen. Betts—ARPA
Mr. Baker—S/AE	<i>White House</i>	Mr. Beyer—ARPA
Mr. Gotzlinger—S/AE	Dr. Kistiakowsky	Col. Brundage—USMC
Mr. Mau—S/S	Dr. Gray	Maj. Poulson—USAF
	Mr. Keeny	Mr. Northrup—AFTAC
<i>CIA</i>		Dr. Leonard
Mr. Dulles		Dr. Cmdr. Chandler
Dr. Scoville		

General Betts introduced members of his staff who would brief the group on present capabilities of detection of high altitude explosions, possibilities of circumventing such detection and possibilities of improvement in the capabilities of detection.

Dr. Leonard explained that detection in outer space can be effected by use of the open-photo multiplier-type x-ray, and neutron and gamma-ray techniques. Neutron and gamma-ray equipment is now ready for use, but the x-ray equipment, which in theory has much greater capabilities, will require extensive research and development work. Furthermore, x-ray techniques can be confounded by a violator's shielding of the weapon which he explodes. The vehicle requirements of a potential violator of course depends on the effectiveness of the detection system. If there is none, he is free to test a few hundred miles above the earth, using quite simple rockets. If there is a deterrent, he is forced to use multi-stage rockets. As the deterrent improves in effectiveness, the violator is forced farther into space, perhaps to tens of millions of miles.

¹ Source: ARPA briefing on detection of high-altitude explosions; inspection of underground events above the threshold. Secret. 9 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy, 1960.

ARPA's approach to this problem, Dr. Leonard continued, was based on study of the capabilities and limitations of:

1. the Argus Detection System;
2. A Far Earth Satellite System; and
3. An Advanced Satellite System, containing advanced x-ray equipment.

The Argus System, based on the use of two satellites, could be operational within nine to twelve months at a cost of 100 million dollars. However, the U.S. now has the capability of launching a nuclear device for testing which would not be detected by the Argus. The Argus is effective for detection anywhere up to 15,000 miles, but it has lesser capacity for detecting devices exploded over the polar regions.

The Far Earth System would be composed of six satellites stationed at a distance of 60,000 miles from the earth. It requires no further research and development and can be made operational within 18 months, at a cost of about 200 million dollars. It would be capable of coverage extending to a few million miles, but its effectiveness would vary with the size of the nuclear device being tested. When the U.S. completes the Atlas-Centaur project, the resulting missile could serve as a test vehicle for testing without detection by the Far Earth System.

The Advanced System would be composed of a number of solar and earth satellites containing advanced x-ray, neutron and gamma-ray equipment. Four years of research and development would be necessary plus one additional year before the operational stage is reached. The cost of the System, including the first three or four years of operational capacity, would be 1.1 billion dollars. The capability of the Advanced System cannot be clearly defined; it may be confounded to some degree by shielding of the nuclear device and by unexpected radiation in space. It is a good guess that a determined violator could avoid even this System by going tens of millions of miles into space.

If the foregoing program were carried out, therefore, a violator would not be restricted at all in the first year; in the next six months, he would not be able to test within the earth's magnetic fields; thereafter, he would have to go out to a distance of a million miles or more until establishment of the advanced system, when he would need vehicles with a range of tens of millions of miles as well as shielding against x-ray detection. The total cost of all systems would be in excess of 1.3 billion dollars.

Major Poulson presented recommendations of the Department of Defense as follows: That the treaty agreement be limited to a controlled ban on tests within the sensible atmosphere (30–50 KM); that control posts be equipped in accordance with the recommendations of the 1958 experts; that a research and development program be instituted to develop increased high altitude detection capabilities and to define a high

altitude "threshold"; and that the Treaty can be progressively expanded, based on research and development program results. Defense recommends immediate initiation of a research and development program to expedite achievement of expanded coverage and definition of a high altitude "threshold", and consideration as to unilateral establishment of a satellite-based detection system at the earliest time, so as to deter a potential violator and provide at least limited intelligence as to any clandestine tests, in case a moratorium on high altitude testing is agreed to.

In answer to *Mr. Dillon's* question *Dr. Leonard* stated that a violator could be quite certain of testing with impunity if his vehicle reaches a height beyond the effective range of the detection system in use at the particular time. *Dr. Kistiakowsky* replied that the violator takes an automatic chance since he hardly can be absolutely certain that the vehicle will perform as planned. In answer to *Mr. Dulles*, question, *Dr. Kistiakowsky* stated that a violator could gain intelligence as to yield alone from a test ten million in space. *Mr. McCone* expressed belief that diagnostic instruments in the future could pick up more information.

A discussion as to cost of possible clandestine nuclear tests in space ensued. There was agreement that a test, sufficient to escape detection by the Argus System, would cost about 20 million dollars.

Dr. Leonard commented that ground based equipment at 180 stations, as planned by the 1958 Experts, would be capable of picking up a half megaton device detonated at a distance of 600,000 miles. *Mr. McCone* defined what he believed to be the question before the group: Whether to withdraw from an attempt to negotiate an agreement covering tests above the sensible atmosphere by citing the position expressed in the President's letter to Khrushchev in April 1959 that we will agree to suspend testing only in those environments where effective controls can be agreed.

Mr. Dillon suggested that the question not be decided before some evaluation of the alternative high altitude plan, which relies on inspection of orbital and sustained space flight missile launchings and radar detection. *Mr. McCone* commented that this alternative plan, which would appear comparatively simple to the public, should certainly be explored. However, we must keep in mind its effect on our missile testing program and on the ten nation general disarmament negotiations in Geneva. *Mr. Dillon* pointed out that we had presented this proposal already in the 10-Nation meeting.

It was agreed that a principals meeting be held, Tuesday, May 10, to further discuss our position on high altitude testing in view of the Defense presentation.

Proceeding to a discussion of the proposed agreement on a moratorium on underground testing below the threshold, *Mr. Dillon* commented that our position had been decided at Camp David as being one to two years. According to *Mr. Northrup*, AFTAC believes that the Berkner

Panel objectives for improvement in the capabilities of the detection system can be attained in three years. But there will be some significant progress within six to twelve months. *Mr. Dillon* compared the Soviet proposal of a moratorium lasting 4–5 years with the 1–2 year moratorium proposed by the US and UK. He pointed out that British at Camp David had indicated readiness to accept a three year term and said that we must be prepared for British support of three years as a practical compromise. *Mr. Gates* and *Mr. McCone* said they saw no reason for anything more than a unilateral declaration as to voluntary suspension of tests until such time as research programs on improved detection methods would show significant results. No definite time should be set. *Mr. McCone* thought some conclusive results would be obtained from three scheduled firings this year. *Mr. Gates* expressed belief that the program would take four to five years. He proposed that each of the participating nations make a unilateral declaration as to the length of time of the moratorium it will abide by. *Mr. McCone* distributed three Atomic Energy Commission papers concerning the proposed research program, “U.S. Position Relative to our Course of Action at the End of the Coordinated Research and Development Program” (TAB A), “Primary U.S. Position on Safeguards Concerning Use of Nuclear Explosions in the Seismic Improvement Program” (TAB B), and “Fallback U.S. Position” (TAB C). He urged that the United States clearly state its objectives in regard to the research program. There had been an unfortunate failure in the past in this regard. At the 1958 Experts meeting, we agreed that complete suspension of tests was feasible based upon 90% identification capability at the 5KT yield equivalent level. Secretary Dulles and Secretary Quarles, however, believed that the Soviets would not accept a sufficient number of on-site inspections, and that a threshold, under which tests under the threshold would be permitted, would result. This belief was not quite borne out, however. Therefore we should very clearly state that the purpose of the coordinated research program will be improvement of detection capabilities and a determination whether or not a threshold will continue to be necessary. Khrushchev and Tsarapkin seem to presuppose that a system having complete capability can be devised. We must make sure that the stated objectives of the research program take into account the possibility of a conclusion that a threshold will continue to be necessary. *Mr. Sullivan* asked for an estimate as to time necessary to make significant progress in detection of underground events. *Mr. Northrup* replied, 3 to 5 years. But some very important information can be developed this year and some more next year, at least to the extent of guidelines as to what will be eventually possible.

Mr. Knight raised the question of inspections below the threshold. *Mr. McCone* distributed an Atomic Energy Commission paper, “U.S. Position on the Quota” (TAB D). He stressed that the number below the threshold must be based on a political determination. The number of 50 has been suggested, because the total annual number of natural

events in the Soviet Union below 4.75 magnitude is estimate at 500. However, AEC would not hold to this number. *Dr. Scoville* raised the possibility of one interchangeable quota covering all events above and below the threshold. *Mr. Gates* expressed opposition to this approach since it would serve to negate our established principle against formal agreement in environments where there are no adequate safeguards. Until three years of research and development is completed, we will not know whether we can adequately detect events below the threshold. Therefore, there should be no connection between the agreement to ban tests above 4.75 and the unilateral voluntary moratorium on tests below. *Mr. Northrup* stressed the difficulty of exact determination of magnitude, and stated his belief that a degree of interchangeability would result from this. He expressed hope that the seismic system would not be assigned the task of determining exact magnitude. *Mr. McCone* advised that the quotas above and below the threshold be kept strictly separate in negotiation; in practice cases might arise where an event slightly below the threshold is inspected out of the quota for events above. *Mr. Dillon* commented that we should make it plain that the quota below the threshold is not tied to a technical determination. Otherwise, when a technical determination can finally be made, parties might argue against an adjustment. *Mr. Gates* suggested that we either require no inspections at all below the threshold or settle for a small token number that would be only part of the research program. *Mr. McCone* cited the Rand study to the effect that an increase of control posts in the Soviet Union from 21 to 30 and a relocation to more favorable sites could materially increase detection capabilities. He suggested that any US-UK compromise in regard to the quota for inspections above the threshold be accompanied by an agreement to effect the changes suggested by the study. He went on to stress the need for consideration of a temporary detection system which will quickly afford some capability after signing of a treaty. Such a system should permit immediate use of our inspection quota. *Mr. Dillon* asked for comments on the Peaceful Uses paper. (TAB B). *Mr. Gates* and *Mr. McCone* stated that they do not agree with any plan involving disclosure of devices. *Mr. McCone* expressed concern about the legal problem involved and about the problem of disclosure to Nth powers.

Mr. Gates returning to the subject of development of detection capabilities, commented that this program could afford opportunity for weapons development. Two underground tests and one high altitude test could result in an improvement of 6 to 1 in the effectiveness of the Minuteman. There would also be a significant reduction in the need for nuclear materials. *Mr. McCone* stressed the dramatic improvements in nuclear weaponry which both the Soviets and ourselves are capable of making by engaging in a relatively small number of tests. He promised to bring a chart to the meeting of May 10 to illustrate this point. There are estimates to the effect that the Soviets could ensure a

25 to 1 improvement in efficiency of their 50 megaton nuclear weapons by engaging in just two high altitude tests and one underground test. Smaller weapons are also capable of dramatic improvement in yield and flexibility with just a few underground tests.

Tab A

Paper Prepared in the Atomic Energy Commission

*U.S. POSITION RELATIVE TO OUR COURSE OF ACTION AT
THE END OF THE COORDINATED RESEARCH AND
DEVELOPMENT PROGRAM*

1. The United States should insist that, as a result of a coordinated research and development program, it will determine: whether the Geneva system, improved as appears feasible, can provide a reliable monitoring arrangement for all underground testing; and if not the modifications that are practical to permit greater effectiveness, and, hence, a lowering of the threshold. In reaching its conclusions it will consider both normal firings and decoupled firings. Thereafter the United States would agree to revise the treaty to preclude all testing which can be adequately monitored by the control system incorporating such modifications as have been revealed necessary and are agreed. The United States would feel free to resume the conduct of tests which the monitoring system cannot effectively control.

2. Naturally, should either of the other two nuclear powers resume nuclear weapons testing during the period of the unilateral moratorium, the United States would feel it necessary to take similar action.

Tab B

Paper Prepared in the Atomic Energy Commission

*PRIMARY U.S. POSITION ON SAFEGUARDS CONCERNING USE
OF NUCLEAR EXPLOSIONS IN THE SEISMIC
IMPROVEMENT PROGRAM*

It is necessary to avoid a situation where the Soviets could use the seismic improvement program as a means of carrying out continuous weapon development, or a situation where our own intentions could be misunderstood. After weighing all courses, we believe the best way to meet this problem is for the U.S. and U.K. to propose at the earliest possible time that the three powers agree that any devices used by them for this program will be deposited as black boxes within an agreed very short

period of time, and that these, and only these, devices will be used for this program. Specifically we believe that the U.S.-U.K. proposal should call for agreement by the three powers on the following restrictions:

a. The parties to announce they will use only proven designs for the program;

b. The black boxes will be deposited by each party, within the shortest possible time (say by August 15) in storage within its own territory but under such surveillance by the others (or by an international group) as is required to prevent modification or substitution;

c. Observation of all aspects of the firing and its instrumentation, except the internals of the devices, will be permitted to the other parties;

d. No diagnostic instrumentation will be permitted at the zero point.

Tab C

Paper Prepared in the Atomic Energy Commission

U.S. FALLBACK POSITION ON SAFEGUARDS CONCERNING USE OF NUCLEAR EXPLOSIONS IN THE SEISMIC IMPROVEMENT PROGRAM

If the Soviets will not declare their agreement to conduct any nuclear portion of their program under the procedures outlined in the U.S. primary position (black box deposits, observation of firings, etc.), the U.S. and U.K. should announce that we intend to proceed with our programs and under the conditions stated. Simultaneously, the U.S.-U.K. should declare that, if the USSR later, either announces nuclear firings or if detonations are detected, we must assume that these are firings for weapon development, and we shall consider ourselves free to undertake such firings as we believe as we believe are necessary to avoid possible loss in relative nuclear position.

Tab D

Paper Prepared in the Atomic Energy Commission

U.S. POSITION ON THE QUOTA

1. With regard to events of over 4.75 the United States should hold to the annual level of inspections already proposed, namely, 20% of all events located or 30% of all events unidentified by U.S. criteria, either of which is estimated to be about 20 inspections a year in the USSR. The treaty should make clear that both the initial and the periodically revised annual number of inspections are a *technical* determination and will bear an agreed relationship to scientific facts and the capability of the system.

2. The allowable number of inspections for events under the 4.75 quota must be a number politically taken. We believe that the United States should insist on approximately 50 if the Geneva network is that to be installed. Based on recent estimates this would approximate 10% of the annual number of natural events under 4.75 which occur annually in the USSR.

3. As a matter of principle if there is to be a lesser number of inspections accepted by the United States it should be only upon reaching an agreement that comparable improvement of the system initially called for is agreed by the Soviets. This gain could come through:

a. Increasing somewhat the number of stations above the 21 now contemplated by the US–UK for the USSR, and

b. Permitting the US–UK to make locations in the most favorable areas.

4. So that the system can be most effective even in the short term, we should insist also on the following:

a. The right of the US–UK to install as quickly as possible temporary stations in the USSR with the USSR having comparable rights for territory we control.

b. The US–UK to have the right to inspect any event detected by the temporary system until such time as the permanent system has such capability as to allow the permanent criteria to apply.

564. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, May 10, 1960

SUBJECT

Nuclear Test Negotiations—Meeting of Principals

PARTICIPANTS

See attached list (Tab A)

Secretary Herter began with a discussion of the Atomic Energy Commission paper, as amended, on safeguards concerning use of nuclear explosions in the seismic improvement program, which had been

¹ Source: Detection of nuclear tests and missile launches, inspections. Secret. 8 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

distributed at the Meeting of Principals of May 5 (Tab B). The "black box" principal is a controversial one, but there are arguments in favor of it, the Secretary said. It will assure that the research program is not used by the original parties as a means of carrying out weapons development. It will obviate the necessity of declassifying devices which might have served to increase the nuclear capability of other States. *Mr. McCone* pointed out that the devices which we might be free to declassify would be uneconomic ones requiring tremendous amounts of material. Furthermore, a coordinated program involving detonation of devices previously deposited in "black boxes" would get around legal problems. Under present law, for example, any nuclear device transported into the United States automatically becomes the property of the United States and receives a "restricted classification". These provisions of law would also be likely to preclude a possible exchange with the Soviets of devices contained in "black boxes", as requested by *Mr. Herter*. Transportation and handling within the United States of foreign devices of unknown design would also involve an unconscionable safety risk.

Mr. Herter requested suggestions on making the "black box" approach more acceptable to the Soviets. *Dr. Kistiakowsky* reported that Sir William Penney had told him about some ancient U.K. devices which perhaps might be declassified for use in the research program. He asked about any legal problems which import of such devices into the United States could cause. *Mr. McCone* replied that, under the law, the devices will become the property of the United States. He offered to initiate immediate consultation or to use of the U.S. devices between General Starbird, now in London, and the British. *Mr. Herter* expressed approval of this idea. It was agreed that the AEC position on safeguards be adopted.

Turning to the problem of high altitude detection, *Mr. Herter* briefly reviewed the report on capabilities which had been presented by ARPA at the May 5th Meeting of Principals. *Mr. Gates* commented that the report showed a violator would find it increasingly difficult to test, as successive components of the 1.3 billion dollar system are installed, but that he might, with sufficient expenditure, have the capability for doing so, even with all components in operation. He would be able to obtain valuable information on yield even from a distance of many millions of miles in space. *Mr. Herter* asked whether the Midas satellite would contain equipment useful for detection. *Mr. Gates* replied that that Midas could not be expected to do the work of ten or more satellites as envisioned in the ARPA report. *Dr. Kistiakowsky* referred to the Report of the High Altitude Experts of July 1959 which found that it is technically feasible by means of a system of optical detectors installed at ground control posts to detect a one-kiloton explosion up to 100,000 KM during the day, and 300,000 KM at night. Use of fluorescence, electromagnetic and radiation equipment installed in ground posts, supplemented by the Argus satellite,

would afford capability up to 100,000 KM. We have the knowledge to set up a system effective to 100,000 KM now. Above that, a more collaborate system would, of course, be needed. But the Department of Defense position that we cannot now provide a reliable system of control above the sensible atmosphere is to be questioned. *Mr. Dillon* commented that, in view of the ability of a ground-based system to detect events in the 50,000 to 100,000 mile range, we might be able to suggest a high altitude detection system effective to that range, combined with a plan for pre-launch inspection of orbital and sustained space flight missiles. Radar would be employed for detecting any clandestine launching. If a party has launched a missile above a prescribed altitude without having subjected it to inspection, it would be assumed that a weapons test has been conducted. *Mr. Herter* expressed concern that the Soviets would state that introduction of an alternate concept is a repudiation of the high altitude experts report. *Mr. Dillon* replied that the tremendous costs, which still would fail to produce a completely reliable system, constitute a good argument for seeking an alternative. *Dr. Kistiakowsky* reaffirmed that the full network of 180 control posts equipped in accordance the experts' agreement would give coverage up to 100,000 KM.

Dr. Northrup commented that, in connection with project Vela, he had received a time and cost estimate from United Electrodynamics Corporation for installation of the 22 control posts in the area of the Soviet Union. If there are 100 arrays at each station, the time estimate is five years; the estimated cost, one to five billion dollars. *The group* expressed astonishment at these estimates. *Mr. McCone* quoted *Dr. Bethe* as estimating the cost of 600 unmanned augmenting stations as only sixty million dollars. *Dr. Northrup* replied that no realistic estimate had yet been made as to cost of unmanned stations. He recommended a study of costs and of problems involved in installing element arrays at remote stations. The "housekeeping" costs after establishment of a control post are also a large factor. *Mr. Gates* suggested that the U.S. Delegation stress all those uncertainties and mention the need for a year of joint and unilateral research on the problems of time and cost of installations and on imperfections. He stressed the need for expert advice on costs. *Mr. Herter* agreed that research is badly needed.

Dr. Northrup replied that an engineering study of the proposed 22 stations in the USSR has laid the groundwork for a more careful estimate than the one he had cited. It would be possible to extrapolate the results to the 180 stations planned all over the world. *Mr. McCone* suggested that a paper be prepared for the President. *Gen. Roderhauser* stated that decision to have 30 arrays at each station rather than 100 would cause a revision in the cost estimates. An estimate as to savings and as to changes in capability resulting from such a decision could be given to the President. He stressed the expense of connecting up arrays. *Dr. Northrup* promised a more realistic estimate than "one to

five billion dollars" within two days. *Mr. Gates* commented that a more exact estimate as to time is just as necessary. *Dr. Northrup* described "five years" as a "thumb sketch" estimate. The problems of constructing, for example, air fields in the Arctic should not be underestimated. A better estimate will be ready soon. *Mr. McCone* raised the possibility of the organization's requiring a private communications system. *Dr. Northrup* commented that the cost of such a system has not been specifically estimated, but it was taken into consideration when the total estimate was made.

Returning to the specific subject of high altitude, *Mr. Gates* suggested we could talk about a goal: no further tests which might cause fall-out. That would be well within 100,000 KM. *General Potts* estimated the necessary distance at 15,000 KM. He pointed out a problem in connection with a high altitude threshold; the uncertainty in determination of distance of a missile firing. It would, for instance, be difficult to prove that a ban on tests up to 25,000 KM had or had not been violated by a missile which travelled to 24,000 or 26,000 KM. *Mr. McCone* recommended that, in view of so many uncertainties, main reliance must be placed on a system of pre-launch inspection of missiles. Even though there are problems in connection with Soviet inspection of our missiles on our territory, he could see no better way of dealing with the high altitude problem. *Dr. Kistiakowsky* and *Mr. McCone* assured *Mr. Herter* that it would be possible to inspect adequately a missile to determine whether it contains fissionable materials. *Mr. Irwin* pointed out the other problem: to detect a clandestine missile launching. *Mr. Sullivan* stated that technical discussion would probably have to follow a United States proposal of an alternate high altitude detection system. *Mr. Dillon* restated the two principal problems: (1) how to conduct a pre-launch inspection of missiles; and (2) how to ensure, by means of a Midas satellite or radar, or other means, that any clandestine launching is discovered. *Mr. Irwin* expressed the belief that the Midas satellite would be able to detect a missile launching anywhere in the world. Defense is now spending a considerable amount to attempt to assure the success of the Midas. *Mr. McCone* promised an immediate AEC study of the problem of pre-launch inspection. *Mr. Sullivan* urged that the alternate high altitude proposal be tabled as soon as possible, if it is to be offered. Since a departure from the experts report is involved, it is up to the United States to make the move. *The group* agreed that, pending completion of necessary studies, the United States position remains simply as stated in the threshold proposal of February 11, i.e., that all tests up to the greatest heights to which effective controls can now be agreed, should be banned.

Turning to the subject of quotas, *Mr. Herter* reviewed the paper presented by AEC at the Meeting of Principals of May 5. (Tab C) *Mr. McCone* proposed that we continue to insist on 20 or 21 annual inspections of

events above 4.75 magnitude, based on a technical determination. As for events below the threshold, there should be 50 inspections based on a political determination. The figure 50 just happens to be ten percent of estimated events. In view of the number of years which will elapse before a complete system is installed—perhaps 5½ years—there is a real problem involved in applying the quota during the interim period. Perhaps some seismic stations can quickly be set up; perhaps the AFTAC complex of stations can give notice of suspicious events. *Mr. Dillon* also stressed the importance of making it plain that the quota above the threshold and that below the threshold are based on entirely different considerations. *Mr. Herter* suggested no inspections take place below the threshold. If there are such, it might prejudice the cut-off on the moratorium after two years, since everyone will have become accustomed to the prescribed inspection arrangement as constituting adequate controls over events below the threshold. *Mr. McCone* expressed preference for having some inspections. At the end of two years of research, he said it will be possible to exercise better judgment as to whether it may be possible to control a comprehensive treaty or whether the threshold can be reduced to, say 4.25 or whether, in view of decoupling possibilities, the present threshold is the minimum which can effectively be controlled. *Mr. Irwin* asked whether seismologists ever expect to be able to identify a nuclear event positively. *Dr. Northrup* answered in the negative; the best that can be expected is a substantial reduction in unidentified events. At this time, it is also not possible to distinguish a nuclear explosion from a chemical explosion. *Mr. Irwin* advocated taking a firm position on what still remains to be done to improve the detection and identification system as far as feasible. We should agree to a moratorium of two years. At the end of that, a threshold should be set at a magnitude which is then considered subject to effective control. *Mr. McCone* agreed. He recalled that at the 1958 beginning of the negotiations we had agreed to a comprehensive test ban based on an expected report which only envisioned 90 percent identification capability at the 5 KT level. He had agreed to this only upon being persuaded that the Soviets would prefer a threshold to a comprehensive ban, when the great number of on-site inspections necessary to control the comprehensive ban would be revealed. But matters had turned out differently. *Mr. Herter* pointed out that the threshold now proposed is at the 20 KT level. It might be said that our attitude has stiffened, rather than wondered. *Mr. McCone* urged that we notify the U.K. and our delegation that the moratorium and concurrent research program are aimed at making a final choice as to a threshold. He stated his impression that the Soviets and the U.K. have a different concept, neither envisioning that there will be any further tests under any circumstances. He wanted it understood that, if there are no improvements in detection capabilities, the threshold will be 4.75. *Mr. Herter* expressed belief that everyone agrees to this. If research does

not lead to improvements within two years, the Government would certainly not submit to the Senate a treaty providing for a comprehensive ban. *Mr. McCone* asked whether Selwyn Lloyd understands our approach. *Mr. Irwin* stated the belief that Selwyn Lloyd understands, but does not agree. *Mr. Dillon* commented that the U.K. perhaps hopes to persuade us to its viewpoint. *Mr. Irwin* urged that, on remaining issues of substance, no more concessions be offered to the Soviets just for the sake of a successful conclusion to the negotiations. *Mr. Herter* remarked that our discussions with the U.K. have never departed from the principles expressed by this group.

Dr. Latter then briefed the group on the Rand study of possibilities for increasing the effectiveness of control posts in identifying seismic events. About 100 earthquakes above 4.75 magnitude occur annually in the Soviet Union, *Dr. Latter* said. All of them can be detected by the net of 21 control posts as now arranged to be established on the land territory of the Soviet Union. Through a study of the nature of the first motion and unofficially based upon identification of four clearly recorded first motions, the Geneva experts believed it possible to identify 48 earthquakes, leaving 60 which could be suspected of being nuclear events.

In the course of the Rand study, it was first of all discovered that the criteria of the Geneva experts could not be fully justified. Fuzzy signals, emanating from a distance of 2500 to 3500 KM, might result in identification of a nuclear explosion as an earthquake. It was then discovered that relocation of control posts, so as to supply some concentration in that 5 percent of the land area of the Soviet Union in which 80 to 90 percent of earthquakes occur, would not only remove the [illegible in the original] mentioned above but would substantially increase the effectiveness of the system in identifying earthquakes. If the number of control posts set by the experts—21—were to be redistributed so that it would not be likely to be necessary to consider data emanating from a distance of more than 1100 KM, all but 12 to 15 percent of earthquakes could be positively identified as such. It will be necessary to identify only two motions instead of four. Of course, such a redistribution might result in losses of detection capability for methods of detection other than the seismic. The Rand study also encompassed the probable effects of adding stations to the Geneva set. An addition of four stations, placed near seismic areas, would result in identification of all but 20 percent of detected earthquakes; an addition of nine stations would result in identification of all but 10 percent.

The Rand Study also encompassed earthquakes exceeding magnitude 4.4 (5 kilotons Rainier coupling). There are 220 of these annually in the Soviet Union, of which 150 would remain unidentified after application of present criteria. Relocation of 21 control posts would result in identification of all but 45 earthquakes. Addition of four control posts would result in identification of all but 75; addition of 9 stations, all

but 35. The principal earthquake areas in the Soviet Union are the Pumir Mountains, Kamchatska, Sakhalin and the Urals. *Dr. Latter* concluded that the principle of unrestricted location and relocation of control posts is a very important one.

In answer to *Mr. Herter's* question, *Dr. Latter* replied that it would be possible to determine the size of an event. He also explained that the study was based on the Nevada-type nuclear detonation in tuff. In his best judgment, an explosion in salt produces a signal reduced by a factor of two or three. *Mr. Herter* said, nevertheless, this study points to possibilities for tremendous advances in identification. *Mr. McCone* remarked that it points to possibilities for bargaining a reduction in onsite inspections against an increase and/or free relocation of control posts. *Dr. Northrup* commented that the proposed Rand system would also result in location of an event within a smaller area than the 50 to 200 square miles on which the Geneva experts based their recommendations.

Tab A

List of Participants

Participants of Meeting of Principals on Nuclear Test Negotiations on May 10, 1960

Department of State:

Secretary Herter
Under Secretary Dillon
S/AE—Mr. Farley, Mr. Sullivan, Mr. Spiers, Mr. Baker, Mr. Gotzlinger
S/S—Mr. Lau
SOV—Mr. Dubs

White House:

Dr. Kistiakowsky, Mr. Gray, Mr. Sochler

AEC:

Mr. McCone, Dr. English

CIA:

Mr. Dulles, Dr. Scoville

DOD:

Secretary Gates
Mr. Irwin, Gen. Dabnoy, Gen. Potts, Gen. Roderhauser, Dr. Northrup, Mr. Ranier,
Col. Brundage, Dr. Latter, Dr. Karzac, Lcdr. Chandler

Tab B**Paper Prepared in the Atomic Energy Commission***Primary U.S. Position on Safeguards or Concerning Use of Nuclear Explosions in the Seismic Improvement Program*

It is necessary to avoid a situation where the Soviets could use the seismic improvement program as a means of carrying out continuous weapon development or a situation where our own intentions could be misunderstood. After weighing all courses, we believe the best way to meet this problem is for the U.S. and the U.K. to propose at the earliest possible time that the three powers agree that any devices used by them for this program will be deposited as "black boxes" within an agreed very short period of time, and that these and only these devices will be used for this program. Specifically, we believe that the U.S.-U.K. proposal should call for agreement by the three powers on the following restrictions:

- a. The parties to announce they will use only proven designs for the program;
- b. The "black boxes" will be deposited by each party, within the shortest possible time (say by August 15) in storage within its own territory but under such surveillance by the others (or by an international group) as is required to prevent modification or substitution;
- c. Observation of all aspects of the firing and its instrumentation, except the internals of the devices, will be permitted to the other parties; and
- d. No diagnostic instrumentation will be permitted at the zero point, except specified yield measurements.

Tab C**Paper Prepared in the Atomic Energy Agency***U.S. Position on the Quota*

1. With regard to events of over 4.75, the U.S. should hold to the annual level of inspections already proposed, namely 20 percent of all events located or 30 percent of all events unidentified by U.S. criteria, either of which is estimated to be about 20 inspections a year in the USSR. The Treaty should make clear that both the initial and the periodically revised annual number of interventions are a *technical* determination and will bear an agreed relationship to scientific facts and the capability of the system.

2. The allowable number of inspections for events under the 4.75 quota must be a number politically taken. We believe that the U.S.

should insist on approximately 50 if the Geneva network is that to be installed. Based on recent estimates, this would approximate 10 percent of the annual number of natural events under 4.75 which occur annually in the USSR.

3. As a matter of principle, if there is to be a lesser number of inspections accepted by the U.S., it should be only upon reaching an agreement that comparable improvement of the system initially called for is agreed by the Soviets. This gain could come through:

a. Increasing somewhat the number of stations above the 21 to 30 now contemplated by the U.S.–U.K. for the USSR; and

b. Permitting the U.S.–U.K. to make locations in the most favorable areas.

4. So that the system can be most effective, even in the short term, we should insist also on the following:

a. The right of the U.S.–U.K. to install, as quickly as possible, temporary stations in the USSR with the USSR having comparable rights for territory we control; and

b. The U.S.–U.K. to have the right to inspect, within the quota, any event detected by the temporary system until such time as the permanent system has such capability as to allow the permanent criteria to apply.

565. Memorandum for the Record by Kistiakowsky¹

June 6, 1960

SUBJECT

Geneva Nuclear Test Negotiations

As I shall be accompanying the President on his Far Eastern trip, I have prepared the following comments on several technical aspects of the Nuclear Weapons Test Cessation problem as guidance to Mr. Keeny of my office in the event that he attends a Principals meeting as an observer during my absence.

¹Source: Comments on technical aspects of nuclear weapons tests cessation. Secret; Eyes Only. 4 pp. Eisenhower Library, White House Office Files, Additional Records of the Special Assistant for Science and Technology.

I. The Underground Detection Problem.

The Soviet delegates in Geneva have refused to agree with our plans to include decoupled explosions as well as small (below about 1 KT) tamped nuclear explosions in the seismic research program, claiming that these do not contribute to the improvement of the system and/or are a subterfuge aimed at the resumption of development of small tactical weapons.

While I strongly feel that we should continue with a seismic improvement program, if necessary on a unilateral basis, I have misgivings about proceeding on a unilateral basis with the present Vela program, particularly with safeguards based on the "black box" approach. My reasons for this misgiving are that the nuclear tests in the Vela program discussed in paragraphs (a) to (c) below are technically not all indispensable and could be modified to meet some of the Soviet criticisms without damaging seriously our program. Therefore, if we proceed on this program with "black box" safeguards, we may invite world-wide criticism that we are using a subterfuge in order to resume weapons tests. This possibility should certainly be taken into account before deciding to proceed with the present Vela program of nuclear explosions.

In considering this problem, it should be noted that the Ad Hoc Panel which reviewed the Vela program, presented by us at Geneva, was not instructed to reduce the number of nuclear explosions to the technically indispensable minimum and therefore accepted AEC-DOD plans for twelve nuclear explosions as contributing technically to the program. Several component issues are involved here, which I will consider separately below.

(a) Tamped explosions. The program to study the effect of environment and yield on tamped nuclear explosions includes shots of 1 KT and $\frac{1}{4}$ KT yield. I discussed the matter with three members of the above mentioned Ad Hoc Panel; they feel that these shots could be done chemically or even eliminated without seriously impairing the program, but emphasize that some other members of the panel might well take a different view. It is an issue on which no technical unanimity is likely to be achieved.

A special problem is presented by the earliest scheduled shot, "Lollipop," (5 KT) to be fired in September. It has come to my attention that the Department of Defense is constructing extensive underground installations in close proximity to the locus of this explosion for "weapons-effects tests," (i.e. to determine the effects on different types of construction for hardened missile sites). Whether this use of the seismic improvement program would be accepted by world opinion, I do not care to estimate, but am sure that the existence or intent of the installations could not be kept secret, especially if UN or USSR observers are present there.

(b) Decoupled explosions. In addition to one large (10 to 20 KT) partially decoupled explosion, the program includes 0.1 KT, 0.5 KT and 2.0 KT decoupled or partially decoupled explosions as well as a [illegible in the original] KT tamped calibration explosion. The principal reasons for the small yields chosen are that smaller underground holes can be used, reducing construction time and cost. However, the explosions are so small that they might yield only incomplete technical information relating to possible methods of detecting and identifying decoupled explosions. It should be emphasized that the Geneva system, even after substantial improvements and some expansion, cannot be expected to detect such small decoupled explosions. Therefore, unfriendly minds could denounce them as a program for developing techniques for evasion of monitoring. The panel members with whom I discussed the issue feel that, for instance, a single, fully decoupled 5 KT shot would be more instructive as far as possible improvements are concerned than the present program, but they emphasize that this will entail a significant delay and that such a modified program will probably be objected to by some members of the Panel. It is probable that the Panel would be unanimous in insisting from the technical point of view that, as a minimum, one or two decoupled shots of perhaps 5 KT be included in the program, as otherwise no information on means of detection of decoupled explosions will be forthcoming because chemical explosives cannot be used for *this* purpose.

(c) Safeguards for nuclear explosions present a serious problem because of the flat rejection of the "black box" plan by the Soviets. If our program is reoriented to include only explosions of a size of a few KT and larger, it should be possible, technically and I believe legally, to resort, if a compromise is sought, to one of the following schemes: (i) to use UK weapons which were developed prior to the US–UK bilateral agreement. These could be inspected by US and USSR on UK soil, then sealed into "black boxes" and imported into USA. (ii) to use devices based on the old US "gun type" design, which could be inspected by the USSR and UK after declassification. As this design requires a large amount of U-235 and is extremely inefficient, its declassification would be of only very limited value to any nation attempting to join "the club." The cost to us of these devices will be small compared to the total costs of the Vela program, although larger than in the case of implosion weapons. Whether the political problems involved in either of these proposals can be resolved, I do not know.

(d) The estimate of the cost of the monitoring system in the USSR was mentioned at the Joint Committee hearing and at the Principals meeting as \$1–5 billion. I have not been able to discover any foundation for this figure. The relevant report of United Electrodynamics to

AFTAC gives only the figure of \$75 to \$128 million for the installation of arrays of seismometers at 22 stations in the USSR. It does not include other costs, such as logistic support system, other equipment, housing and communications to the World Control Center at Vienna. I understand that United Electroynamics has recently unofficially estimated the total cost for USSR at \$750 million (which included allowance for nuclear testing of system). This figure is much in doubt and is much higher than the corresponding figure given in the estimate prepared by AFTAC.

II. The High Altitude Detection Problem.

As you may recall, the experts in Geneva agreed on the feasibility of monitoring high altitude weapons tests through a fantastically complex system, including ground-based instruments, low-altitude satellites, high-altitude satellites and solar satellites. The DOD briefing given to the Principals presented an especially pessimistic (and not wholly correct) assessment of some features of this plan. I understand that certain of the pessimistic conclusions on the time of availability of X-ray detection are now being modified as a result of a review by the OSD Ad Hoc Committee on High Altitude Detection. More significantly, however it now appears that the cost of a satellite high altitude detection system may be greatly reduced as a result of work by Lockheed Corporation. This idea makes use of the fact that fission fragments from explosions relatively close to the earth would be mechanically trapped in the upper atmosphere and would radiate gamma rays for an appreciable time. This would permit the substitution of four low-altitude (500 km) satellites for a larger number of high-altitude satellites. Satellites of this type with somewhat simplified X-ray equipment for deep space detection could probably be available in two or three years. When more sophisticated X-ray equipment becomes available, this system would have essentially the same capabilities as the high-altitude satellite system described by the DOD. The cost for this type system would be in the \$100 million class rather than in the \$1 billion class. A definitive analysis of this plan should be available by mid-June, but it looks most promising. I might add that low-altitude satellites were a part of the Geneva plan and the new scheme merely makes the rest of the plan unnecessary, unless one wants to go to the so-called "solar satellites" to monitor nuclear explosions behind the sun and to force a violator to more complicated shielding devices. My guess is that one could have a moratorium on such tests in deep space for quite a few years without fear of evasion, because of the great costs and difficulties of carrying out such weapons tests.

566. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, June 9, 1960

SUBJECT

Geneva Nuclear Test Negotiations—Meeting of Principals

PARTICIPANTS

See attached list. (Page 13)

Secretary Herter suggested that the discussion be based on the memorandum, subject: “Course of Action in Nuclear Test Negotiations”, dated June 7, 1960 (TAB A). Particular attention might be paid to the problem of safeguarding nuclear explosions used in the research program to ensure against their use for weapons development, and to the problem of high altitude detection. He expressed regret at the fact that the Soviets have seen fit to disavow the statements of their scientists at the recent meetings of the Seismic Research Program Advisory Groups by denying plans to take part in any coordinated research program for the purpose of verifying or revising the recommendations of the 1958 Geneva Conference of Experts. Since any declared moratorium is conditioned on agreement as to a coordinated research program, the moratorium concept is endangered.

Mr. Farley summarized Soviet objections to the United States-suggested co-ordinated research program as follows: Too large a number of nuclear tests, especially small yield tests; study of decoupling which is unnecessary and undesirable; lack of sufficient safeguards, such as internal inspection, for ensuring that devices are not being exploded for the purpose of weapons development.

Mr. Herter remarked that these objections are much like Soviet objections to our “Plowshare” program of nuclear tests for peaceful purposes. He called on *Mr. McCone* to present results of his study as to legal means by which satisfactory safeguards for ensuring against weapons development might be offered.

Mr. McCone responded that the devising of a satisfactory plan presented considerable difficulties. While it is necessary to operate a sophisticated array of instruments in order to secure really useful weapons information, any explosion will give at least a “go-no go”

¹ Source: Safeguarding seismic research explosions, high altitude detection. Secret; Restricted Data. 13 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, RD-Test Ban Question.

result and might to that extent supply some information of value for weapons development. Therefore, he continued, the possibility of opening the devices for internal inspection has been considered. To do so, in accordance with the Atomic Energy Act, the AEC must declassify the needed devices. Such declassification might make the device available to countries other than the three nuclear powers, and would thus defeat one of the major purposes of a treaty; i.e., the prevention of dissemination of nuclear weapons information. The use of U.K. and Soviet devices has also been considered. But the AEC would find it most difficult, under this alternative, to fulfill its statutory responsibility for safety of atomic devices. *Mr. Herter* suggested that UK devices be examined internally in the UK and, then, in transport to the U.S. and thereafter, be handled as are our devices. *Mr. McCone* remarked that this would involve quite a cumbersome disassembling and reassembling procedure. Besides, it is doubtful whether the U.K. is in possession of devices which could be so used with a range of yields necessary for the research program.

Dr. Kistiakowsky suggested that we declassify some old gun-type devices of our own; such devices as would not be likely to assist another country in achieving nuclear capability. *Mr. McCone* wondered whether such a device would supply the range of yields necessary for the research program. *Dr. English* stated that there might be old gun-type devices which could be specially altered for the purpose of giving the required yield, but that such alteration would be a difficult task. They could not be fabricated to yield less than one kiloton. *Mr. McCone* said that the Kistiakowsky suggestion could be considered. *Dr. Kistiakowsky* expressed his belief that use of old gun-type devices, though perhaps not as ideal for the research program as use of sophisticated small devices, might be adequate and would be easier to defend from the political standpoint, since there could hardly be suspicion of use for weapons development purposes. *Mr. Herter* asked whether the number and size of shots planned for the VELA program was a fixed determination from which there should be no departure. *Dr. Kistiakowsky* replied that the Panofsky Panel had been under no instructions to determine a minimum number and had, therefore, selected 12 as a desirable number for an adequate program. He quoted *Dr. Panofsky* as saying that the panel would not be unanimous as to a minimum number and minimum range of yield. *Mr. McCone* defined the objective of declassification: To make available old gun-type devices, developed so as to be of use for a sufficient number of shots (perhaps a few less than planned for VELA) and not likely to be of assistance to any powers seeking to develop a nuclear capability. He expressed doubt that any nation without considerable nuclear material resources would be able to make

use of the comparatively elaborate and extravagant device using large quantities of U-235 which could be developed. He agreed that the very small nuclear explosions were not essential, although omitting them would require some reorientation of the program. *Mr. Herter* stressed the importance of obtaining scientific advice within the shortest possible time as to the possibilities of effective use in the research program of declassifiable devices, and on the minimum number of nuclear tests necessary.

Mr. Northrup announced a meeting to take place next week of the Panofsky Panel. It is expected that the Latter brothers and other seismologists will also attend. They are to consider the best distribution of yields for nuclear devices to be used in the research program. This group can consider the question raised by the Principals. *Dr. Kistiakowsky* defined the question as: The number and yield of devices which need to be detonated in order to make worthwhile the research program on improvement of detection and identification methods. Part of the issue would be the essentiality of detonation of very small devices, and whether these could perhaps be replaced. He also suggested that everyone connected with the planning for Project VELA be included in the group. *Mr. Northrup* agreed and proposed also the addition of *Dr. Harold Brown*. He expressed confidence that an answer could be supplied within a week. *Mr. Herter* asked *Mr. McCone* whether he would be prepared to accept the guidelines and conclusions of the group of scientists. *Mr. McCone* indicated that he would accept, pointing out that he had accepted the recommendations as to Project VELA.

Mr. Northrup reported an inclination toward tests with a yield range from one kiloton to 50 kilotons, rather than yield ranges beginning at a fraction of a kiloton, as suggested by the United States at the meetings of the Seismic Research Program Advisory Group. However, he expressed belief that the need for experimental shots to determine the effectiveness of decoupling will be reinforced by the panel of scientists. *Mr. McCone* and *Mr. Irwin* reaffirmed the importance of including decoupling in the research program. The study of decoupling is still in the theoretical stage. *Mr. McCone* said that the negotiations would be at an impasse if the Soviets do not accept the need for this.

Mr. McCone promised to inform the panel of scientists as to the type of devices which can be made available for modification and declassification.

Mr. Farley remarked that the problem of dissemination of information to nth countries could be resolved by getting Congressional relief so that certain devices could be released for the program without being declassified and disseminated. He said that we would be

very vulnerable vis-a-vis the Congress if we throw the blame for our inability to use open devices on the limitations imposed by domestic law, without having first consulted with Congress. *Mr. McCone* stated that the suggestion was worth considering, and that he would discuss the matter with the Joint Committee. As to the use of open devices in peaceful uses projects, it might be possible for Project Gnome and for the Athabasca oil project, but not for the harbor and canal projects, since these require devices based on very advanced technology.

Mr. McCone suggested that we dismiss the idea of using U.K. or Soviet devices and, instead, attempt to satisfy Soviet objections by declassification or legal action. *Mr. Herter* expressed belief that, when a program of seismic improvement is being carried out earnestly and in good faith, the scientific group in charge might well decide that a number of detonations, additional to the minimum agreed number, might serve a useful purpose. Therefore, the program should be as flexible as possible, and it should be agreed on as soon as possible.

Mr. Farley referred to two other issues on which we hope to obtain agreement soon: the parties article and the quota provisions. The former is designed to ensure, as far as possible, the accession of Red China. The U.K. has promised comment on our proposed language for both articles. *Mr. Herter* recalled that, based on the report of the 1958 Conference of Experts, we have put forward a proposal calling for 20 on-site inspections in the Soviet Union for events of magnitude 4.75 or above. The Rand Report, summarized at the last meeting of principals on May 10, has however held out the hope of a reduction in unidentified events, based on redistribution and possible addition of control posts.

Mr. Northrup commented that the Rand Report should only be considered as offering an interesting direction for further research. It is merely a theoretical indication of progress which might be made in a research program. He quoted Dr. Richard Latter, who was principally responsible for it, as stating that no proposal to reduce the quota should be based on this report until a research program establishes the correctness of its conclusions. *Mr. McCone* advocated that the Rand Report not be considered in any way at this time as a basis for policy changes. *Mr. Herter* expressed disappointment that there had been briefings and much publicity about this report. *Mr. Farley* said he understood the Rand Report conclusions are no less certain than the conclusions on which we based the proposal for 20 inspections on the territory of the Soviet Union. *Mr. Irwin* replied that he understood the Rand Report to indicate there might be many more seismic events in the Soviet Union than the 100 estimate contained in it. *Mr. Northrup* reported an AFTAC study as determining there are about 120 annual seismic events. He pointed out that the efficiency of the system advocated in the Rand

Report would be lessened by the use of 30 element arrays instead of 100 element arrays. A study has indicated the impracticability of using 100 element arrays in the Soviet Union. *Mr. McCone* advocated that we not base policy on theory not yet supported by experience, and that we base our stand on previous determinations while insisting on a seismic improvement program, the results of which may lead to adjustment of the quota.

In reply to *Mr. Irwin's* question as to the status of the formula by which we arrive at our quota of 20, *Mr. Herter* replied that the number we adopt would bear a relationship to probable number of events even though the relationship might not be explicitly agreed. *Mr. Farley* said that we planned to write a specific number into the treaty, but that this would be subject to revision at the end of two years and periodically thereafter on the basis of recalculation of number of events and other factors.

Dr. Kistiakowsky advocated that the Rand Corporation be requested to supply an explanation as to the reliability of the conclusions in their report. His suggestion was supported by *Mr. Herter* and *Mr. Gates*. *Dr. Romney* suggested that an independent evaluation of the Rand Report be made by a capable group. *Mr. Herter* replied that he would prefer to have Rand's own evaluation first. *Mr. McCone* repeated that the Rand Report should not be considered in any way. He expressed regret that it had received so much publicity before the Joint Committee and in private conversations with the British. *Mr. Herter* stated what he believed to be the conclusion of the group: That we await an evaluation from Rand Corporation before giving any more consideration to possible use of the figures in the report as a basis for negotiations.

Mr. Herter recalled the cost estimate of one to five billion dollars for installation of 22 control posts in the Soviet Union, mentioned by *Mr. Northrup* at the May 10th meeting of principals. *Mr. Northrup* said that this estimate had been presented by United Electrodynamics Corporation at the Joint Committee hearings in April. The corporation has since made a brief restudy and now estimates that installation on the territory of the Soviet Union will cost 750 million dollars, and the entire 1958 Geneva system, exclusive of high altitude, up to 3½ billion dollars. The corporation is now undertaking a careful 90-day study and will present a final estimate in July or August. The AFTAC cost study of last year, which arrived at a figure of 1½ billion dollars for installation, is now believed to have been an underestimation. *Mr. Gates* stressed the necessity of securing careful cost estimates.

Mr. Herter, *Mr. Gates* and *Mr. McCone* agreed that the time has come to make a determination whether the Geneva negotiations are in range of agreement. Such a determination is inherent in the National Security Council directive, *Mr. McCone* said. It would be wrong to launch

a seismic improvement program, costing 75 to 100 million dollars, if its results were to be rejected or to have no practical use. He advocated that the principals meet again by the end of the month in order to decide on alternative courses proposed in Section III of the memorandum (TAB A) in light of the Soviet attitude.

Mr. Irwin reported that the study on possible alternatives to the high altitude system proposed by the Geneva experts has been completed but, pending review by a working group, it is not yet ready for the principals. Dr. Kistiakowsky remarked that, while the Rand Report may have been a bit too optimistic about improvements in the system, the report on high altitude delivered by the Department of Defense specialists, at the meeting of principals on May 5, may be too pessimistic. An ad hoc study group reporting to General Betts has concluded that a simplified x-ray system for use in satellites, having a capability up to 100 million kilometers, might be available much sooner than a system having capability up to 1 billion kilometers. Also, a preliminary study by Lockheed Corporation appears to indicate the feasibility of replacing satellites at 60,000 km as recommended by the Geneva experts with low altitude satellites (perhaps at 300 km) having a capability from 50 km out to distance of capability of the x-ray system. The significance of these developments are a substantial reduction of costs and saving in time, deriving from elimination of a sophisticated system of satellites in far space, and, possibly, elimination of ground-based equipment for detection of events occurring at high altitude. He suggested that the decision of the principals as to high altitude alternatives be delayed a week or so, in order that it may be based on consideration of all studies. Mr. Herter recommended that another meeting of principals be held within two weeks.

Mr. McCone recommended certain revisions to the memorandum concerning courses of action, and these were approved. Agreed revisions are contained in TAB B.

Tab A

Paper Prepared for Principals of Geneva Test Group Meeting

Course of Action in Nuclear Test Negotiations

The meeting of Principals Thursday at 10:15 AM will consider the course of action to be pursued in the nuclear test negotiations, considering specifically (a) the current status of negotiations, (b) US tactics in the period immediately ahead, and (c) the course of action to be followed pursuant to last week's NSC decision, namely that we should make clear these negotiations and the US moratorium cannot go on indefinitely without a decision, and that the US should determine at what time or at what stage it should seek to place a time limit on its duration.

I. Current status of negotiations.

A chronology of major developments in the negotiations during the past six months is attached. At present, the focal point of Conference discussion is an effort by the US and UK Delegations to seek clarification of the Soviet position on the coordinated research program. Although the Soviet Delegation has reaffirmed the May 3 declaration, accepting the idea of a strictly limited number of nuclear detonations for research purposes, their statement that they will not conduct the chemical explosions discussed by their scientists nor begin coordinated research until signing of the treaty leaves important ambiguities in their position which should be clarified to assist us in determining the prospects for any meaningful coordinated program. For example, we do not know whether the Soviet position is (a) that national research programs should begin now and their coordination begin when the treaty is signed; or (b) that coordinated research should begin now insofar as it involves Soviet observation of US tests and programs but should not involve US observation in the USSR until treaty signature. Moreover, we do not know whether they have cancelled the entire Soviet component of the research program or only the four or five chemical explosions in it.

II. Objectives and Tactics in negotiations during current month.

The following course of action is recommended as a basis for discussions at the meeting. It sets forth certain steps and objectives to be carried out during the month of June to lay the basis for decisive action, and suggests alternative courses that might be pursued at the end of the month.

In general, the objective during the current month should be to lay the basis both for governmental determination and public acceptance of a course of action that will achieve the purpose defined by the NSC decision to, in effect, place a time limit on the duration of the US test moratorium.

The following steps are recommended:

A. The U.S. Delegation should be instructed to stress that the US position as set forth in the White House announcement of March 29 and subsequently in the conference is that a moratorium on testing below an agreed treaty threshold is conditioned upon prior agreement on a coordinated research program. The U.S. Delegation should also stress the corollary of this position, namely that if no agreement can be reached at an early date on treaty and on a coordinated program of research, there can be no such moratorium.

B. The U.S. Delegation should press urgently for clarification of the Soviet position on the coordinated research program.

C. The US should seek to deprive the Soviets of any argument that Project VELA explosions might involve weapons development and to lay the basis in public opinion for the conduct of such explosions. Two alternative possibilities for accomplishing this purpose might be (a) if a fuller technical justification for the present US position on safeguards to demonstrate conclusively that it would not permit weapons development cannot be found, to find methods consistent with the Atomic Energy Act for constructing devices that might be opened to inspection or opening existing devices, and indicating willingness to have observation by qualified scientists on a world-wide basis, or (b) to state US willingness to employ UK devices which would be open to inspection by the three parties before their importation into the US. We understand from the AEC that there are various legal, practical and safety factors which would make the latter course extremely difficult.

D. The U.S. Delegation should seek to ascertain promptly whether the harder Soviet line regarding research has affected the prospects of early agreement on other issues before the conference. In this connection, we should press, in particular, for Soviet responses to the various proposals we have tabled prior to the summit, i.e., quota, staffing, criteria, definition of magnitudes, flight routes, observers and phasing. In order to increase pressure on the Soviets to be specific about the quota, the US might indicate that if the Soviets are unwilling to discuss quota apart from the question of duration of a moratorium, we are prepared to consider these questions simultaneously.

E. In order to assess and demonstrate decisively whether agreement within a reasonable length of time is possible, the US should seek to define and bring to public attention, as quickly as possible, the full range of remaining issues which would have to be resolved if agreement is to be achieved. Specifically, the questions of high altitude and parties should be brought to the fore by the tabling of US proposals. We should also, within the month, in order to complete the process of bringing the negotiations to a decisive focus, fill in all significant gaps in the Western position by tabling the quota article, the definition of nuclear detonations and the revision of Annex I.

III. Alternative courses of action at the end of June.

On the basis of the issues and Soviet attitudes defined by the foregoing tactics, the US should, at the end of the current month, decide upon one or more of the following steps which serve to define with varying degrees of exactness a time limit on the US moratorium.

A. In the absence of substantial agreement in the coordinated research program, the US should (a) announce specific dates for several shots in the VELA series, (b) indicate that we are still hopeful that agreement on safeguards and coordination can be reached before these

dates, but the conduct of the explosions will not be dependent upon such agreement, and (c) reaffirm the December 29 position on nuclear weapons tests. This US may also wish to announce one or more Plowshare shots at this time since these, like VELA shots, are unrelated to the moratorium.

B. Depending upon the Soviet attitude and prospects of agreement defined by the tactics outlined above, the US may also wish to announce at the same time or as a subsequent move the indefinite suspension of atmospheric tests on a unilateral basis and either (a) state that in the absence of substantial progress toward agreement, underground weapons tests will also begin at an early date or (b) announce specific weapons tests which would take place after the initial VELA and Plowshare shots.

Recommendations

1. That a decision be reached as to US tactics in the immediate future.
2. That an early meeting of Principals be set to consider the position to be taken on high altitude.
3. That a meeting be scheduled before the end of the month to review the status of negotiations and determine a further course of action.
4. That Defense be requested to expedite its assessment of the Rand report as a basis for determining its relationship to discussion of the quota.

Attachment

CHRONOLOGY OF NUCLEAR TEST SUSPENSION NEGOTIATIONS

December 18, 1959—Technical Working Group 2 concluded with agreement on possible improvements in the Geneva control system, but with disagreement on the capabilities of the control system, and on criteria for identification of underground seismic events.

December 29, 1959—Augusta statement by the President that United States will be free to resume nuclear weapons tests on expiration of its voluntary moratorium on December 31, but will not do so without advance announcement.

February 11, 1960—US proposal for:

(1) Threshold treaty which would end, upon signature, atmospheric and underwater tests, high altitude tests as far as effective controls are agreed, and underground tests above 4.75 seismic magnitude reading.

(2) Joint research and experimentation to improve detection of small underground tests and permit extension of the ban.

February 16, 1960—Soviet position on criteria for identification of underground events shifts almost to the US-UK position in Technical Working Group 2.

March 19, 1960—Soviets propose conclusion of a threshold treaty as proposed on February 11, but covering all outer space tests and with the joint research program accompanied by an obligation not to conduct underground weapons tests below the threshold.

March 29, 1960—Eisenhower-Macmillan Camp David communique declares negotiation on remaining issues leading to a threshold treaty should be speeded up and completed. As soon as a threshold treaty is signed and arrangements are made for a coordinated research program, a voluntary unilaterally declared moratorium could be instituted for an agreed duration on nuclear weapons tests below the threshold.

April to mid May, 1960—US and UK introduce proposals on several major elements of a threshold treaty including staffing and extension of the control system; Soviet Union marks time.

May 3, 1960—Soviet Union agrees to proceed with working out a joint research program which would include a strictly limited number of joint underground nuclear explosions. Soviets agree that the moratorium should be unilaterally declared but propose a four to five year duration co-extensive with the program of joint research.

May 7, 1960—White House announces Project VELA expansion to a level of \$66 million for FY 61, including such nuclear explosions as are necessary.

May 11, 1960—Experts meet in Geneva to discuss the seismic research program. The Soviets describe a program of fairly extensive seismic research including a number of chemical explosions.

May 17, 1960—Scheduled Summit meeting does not occur.

May 30, 1960—Geneva Experts adjourn with Soviets opposing US plans for studies of decoupling and for a number of nuclear explosions, and expressing view that research program should begin only with signature of treaty.

June 2 and 3, 1960—Tsarapkin rejects US proposals for safeguards to insure that nuclear explosions do not advance weapons development. Disclaims research necessary except as US condition for moratorium; insists on four to five year moratorium duration. States research should be joint, with full Soviet examination of internals of nuclear devices used.

Tab B

Revisions to Memorandum at Tab A

*REVISIONS TO MEMORANDUM, "COURSE OF ACTION IN
NUCLEAR TEST NEGOTIATIONS"*

1. In paragraph I, insert the following after the third sentence:

Their recent statements are particularly confusing in that they apparently renounce the statement of intentions made by the Soviet scientists in the Seismic Research Advisory Committee meetings.

2. In paragraph II, delete the third sentence.

3. In paragraph II, subparagraph A should read as follows:

A. The U.S. Delegation should be instructed to stress that the U.S. position, as set forth in the White House announcement of March 29, and subsequently in the Conference, is that a moratorium on testing below an agreed treaty threshold is conditioned upon: (a) prior agreement on a coordinated research program; and (b) prior satisfactory agreement on the other issues outstanding, such as on-site inspections, control commission, control post and inspection team staffing, voting matters and peaceful use detonations (also the issues of length of moratorium, schedule for installation of temporary and permanent stations and high altitude monitoring). The U.S. Delegation should also stress the corollary of this position; namely, that, if no agreement can be reached at an early date on all of these treaty issues and on a coordinated program of research, there can be no such moratorium.

4. In paragraph II, the following second sentence should be added to subparagraph B:

However, in so pressing, it should avoid as far as possible any implication that it is the U.S. which will gain by Soviet acceptance (and, hence, the U.S. would be expected to compromise on other essential issues).

5. In paragraph II, subparagraph C should be deleted and the following subparagraph C and D should be substituted:

C. The U.S. should seek to deprive the Soviets of any argument that Project VELA explosions might involve weapons development and to lay the basis in public opinion for the conduct of such explosions. Note: Due to the technical, legal, safety, and other problems involved, the alternate possibilities of using USSR or U.K. devices for Project VELA nuclear shots are deemed an unworkable solution. Other possible alternatives for accomplishing this purpose might be: (a) to develop and fabricate suitable U.S. gun-type designs, and in the necessary yields, which might be declassified; and (b) to secure necessary legislation or Congressional sanction to reveal to the U.K. and the USSR the internal design of the classified device presently planned for the VELA

program. (It should be noted that an amendment to the Atomic Energy Act or Congressional sanction to permit the U.S. to reveal the internal design of the classified device to the U.K. and the USSR would present serious difficulties with respect to certain U.S. Allies, particularly France.) The AEC believes that one of the above two alternatives may be possible and has agreed to further examine these two possibilities as a matter of urgency in order to determine if either is practical. Consequently, the AEC will promptly prepare a study which will outline the legal, technical and other considerations which would have to be resolved. The AEC position will be determined after such studies have been carried out and further considered.

D. The U.S. should emphasize publicly and in the Conference the facts that: (a) the proposed safeguards are adequate to give assurance to the Soviets that no significant weapon progress will be made. This is possible if the proposed U.S. safeguards are carried out by both sides or by an international team; and (b) under existing U.S. law, it is impossible to open our devices to the Soviets without declassifying them and, hence, making weapons information available to all countries.

6. In paragraph II, subparagraph D should be deleted and the following subparagraph E should be substituted:

E. The U.S. Delegation should seek to ascertain promptly whether the harder Soviet line regarding research has affected the prospects of early agreement on other issues before the Conference. In this connection, we should press immediately, in particular, for Soviet responses to the various proposals we have tabled prior to the Summit; i.e., quota (and the procedures under which its inspections can be used), staffing criteria, definition of magnitudes, flight routes, observers and phasing. In order to increase pressure on the Soviets to be specific about the quota, the U.S. might indicate that, if the Soviets are unwilling to discuss quota apart from the question of duration of a moratorium, we are prepared to consider these questions simultaneously, but it must be understood that agreement to a moratorium is dependent on a resolution of all other unresolved issues.

7. In paragraph II, old subparagraph E becomes now subparagraph F.

8. In paragraph III, subparagraph A, the words "and other outstanding issues" should be inserted after "coordinated research program" on the second line.

9. Add the following recommendations, numbered 5 and 6, to the section entitled "Recommendations":

5. U.S. Government spokesmen both here and abroad should make every effort to explain publicly the meaning and importance of the issues which must be resolved, and the necessity for prompt resolution.

6. That more attention be given to realistic cost estimates for installation and operation of the system, and that the U.S. Delegation in Geneva raise these matters in the negotiations when we are prepared to give our considered estimates.

567. Memorandum From Twining to Gates¹

JCSM–250–60

Washington, June 10, 1960

SUBJECT

Soviet Disarmament Proposal of 2 June 1960 (U)

1. Pursuant to the request of the Assistant Secretary of Defense (ISA), dated 8 June 1960, the Joint Chiefs of Staff have reviewed the Soviet disarmament proposal of 2 June 1960. If adopted, this proposal

¹ Source: Conveys JCS views on a June 2 Soviet disarmament proposal. Secret. 2 pp. Library of Congress, Twining Papers, Chairman's File.

would dismantle the U.S. nuclear capability, including the foreign base structure essential to our forward strategy, before any controlled reduction of Sino-Soviet conventional capability had been accomplished. Further, since control functions throughout the disarmament process would, under the Soviet proposal, be carried on essentially only at declared plants and sites with no inspection for clandestine activities, there would be no assurance that even the nuclear capability of the Soviets had been equally nullified.

2. Enough has been said by the West about the necessity for a balanced, phased, and safeguarded arms control arrangement that the Soviets undoubtedly know this proposal is completely unacceptable to the West. Indeed, in his letter which transmitted the proposal, Mr. Khrushchev asserted that the West is "not ready to implement it". Though he cleverly attributed the proposal for immediate nuclear disarmament to French insistence on early restrictions on nuclear delivery systems, the Soviet proposal goes much further than anything which has been suggested by the French.

3. Thus, this proposal appears to constitute but another effort in furtherance of the Sino-Soviet objective to disrupt Free World alliances, disintegrate our collective defenses, and frustrate the United States forward strategy. There has never yet been any reason to regard apparent Soviet willingness to negotiate disarmament measures as other than diversionary tactics, and there is no basis for regarding the present proposal in any different light.

4. For the above reason and also because of its failure to remedy the shortcomings of past Soviet proposals in such areas as control, preliminary studies, phasing and post-disarmament peacekeeping, it is the view of the Joint Chiefs of Staff that the proposal is completely unacceptable. In any examination of the Soviet proposal at the Ten Nation Disarmament Conference, we should adhere firmly to the principles, conditions and time-phasing set forth in the Western disarmament plan of 16 March 1960. In this connection, it is observed that Mr. Eaton, in his cable to the Secretary of State of 7 June 1960, anticipates heavy pressure from all four of our Allies to make substantial amendments to the Western plan. The Joint Chiefs of Staff have already rejected in JCSM-203-60, dated 12 May 1960, the French proposal for control of means of delivery for nuclear weapons. Without prejudging any other proposed modification of a specific Western proposal, the Joint Chiefs of Staff regard it as imperative that the United States insist strongly upon Allied unity in the future, remembering that it was an instance of disunity which provided the Soviets the opportunity for concealing the true purpose of their present proposal.

5. In addition, it is important that our governmental departments and agencies, and our negotiators, bear constantly in mind the

fundamental principle which underlies any disarmament measure as well as a dangerous tendency which constantly asserts itself to lead us astray from the principle. We rely upon armaments for national security. With disarmament, there must be a *quid pro quo*—an adequate substitute if our security is to remain unimpaired. The exchange must be simultaneous with no hiatus. Traditionally, we have regarded the substitute to be an adequate system of inspection and control to assure initial and continuing compliance, since good faith, alone, has been demonstrably proven inadequate. The tendency, which too often achieves headway, is toward the erosion, during the negotiating process, of the control system originally deemed necessary. This result is readily apparent in the nuclear test cessation negotiations, where, through the medium of the moratorium, the United States has, in effect, acceded to the Soviet demand for a cessation of nuclear testing without any assurance that the Soviets are not, themselves, testing. This undesirable precedent must not be permitted to influence the outcome of the Ten Nation negotiations.

For the Joint Chiefs of Staff:

N.F. Twining
Chairman
Joint Chiefs of Staff

568. Memorandum From Twining to Gates¹

JCSM-236-60

Washington, June 13, 1960

SUBJECT

Draft Treaty on the Discontinuance of Nuclear Weapons Tests (U)

1. The Joint Chiefs of Staff have examined the draft treaty on the discontinuance of nuclear weapons tests in accordance with your memorandum, dated 26 January 1960. Cognizance has also been taken of recent events such as the THRESHOLD proposal, made by the United States during February, and subsequent related actions.

¹ Source: Conveys JCS views on test ban treaty. Secret. 7 pp. Library of Congress, Twining Papers, Chairman's File.

2. Specific comments on the treaty itself, to include inspection and control aspects and the estimated installation and operating costs of the control system, are contained in the Appendix hereto.

3. The Joint Chiefs of Staff stated their views on 21 August 1959, in a memorandum for the Secretary of Defense, that an adequate military posture for the United States will not be attained until there is available a complete spectrum of weapons compatible with modern delivery systems which will make it possible to apply selectively adequate force against any threat. It is recognized that if an enforceable test ban agreement is concluded and implemented the United States will not achieve such a spectrum of weapons. However, a nuclear test ban treaty which would guarantee a cessation of testing by the Sino-Soviets as well as the United States could theoretically be to the relative U.S. military advantage. The present estimated preponderance of the U.S. stockpile relative to that of the Sino-Soviet Bloc and the current U.S. lead in sophistication of nuclear weapon systems are factors which, if taken in isolation, could justify U.S. acceptance of an enforceable test ban from a security standpoint. Unless a test ban treaty could guarantee a cessation of testing in the Sino-Soviet Bloc, with its resultant effect on Soviet weapons and stockpile development, further U.S. testing for sophistication of the components of various existing weapon systems as well as basic development of new weapons is deemed vital. The anti-missile missile is not the least of this latter category.

4. The recent trend of the Geneva test ban negotiations offers little [illegible in the original] for a treaty that would ensure a cessation of testing in the closed society of the Sino-Soviet Bloc. An inadequately safeguarded treaty, however, would be self-enforcing in the open societies of the West. The introduction of the U.S. THRESHOLD proposal with its attendant moratorium and inadequate detection, inspection and control system justifies reiteration and re-emphasis of the dangers of such an unsafeguarded agreement to the security of the United States.

5. The conclusion of a treaty on discontinuance of nuclear weapons tests without adequate safeguards would set a dangerous precedent for the Ten Nation negotiations, particularly in respect to the proposal for cut-off of production of fissionable material for weapons purposes, phased reduction of nuclear weapons stockpiles and eventual elimination of the use of nuclear weapons. For the past decade, the Soviets have pressed for a ban on the use of nuclear weapons, consequently, there will be a tendency to equate a nuclear weapons test ban with a ban on their use. This point the Sino-Soviet Bloc would undoubtedly pursue to the maximum in an effort to offset our present nuclear advantage.

6. Acceptance of the presently proposed test ban treaty, the provisions of which do not provide for adequate safeguards, would establish a dangerous precedent for the Ten Nation negotiations and would

make it increasingly difficult to insist on adequate control for the above mentioned nuclear disarmament measures which have already been tabled. The historical U.S. position of insistence upon adequate safeguards (required by Basic National Security Policy) appears to be deteriorating rapidly in the interest of arriving at agreement. Although the decision to announce a unilateral moratorium below the THRESHOLD has already been made public, the Joint Chiefs of Staff believe that a technical analysis and experimental verification of the effectiveness of the proposed control and inspection system should be made and the results evaluated before any moratorium is actually implemented. The fact that prominent and patriotic U.S. scientists insist that adequate inspection and control is impossible due to difficulties in the high altitude and underground environment is, in itself, good reason to require that such an analysis be made. The decision on a unilateral moratorium below the THRESHOLD was based primarily on political considerations which in no way removes technical difficulties involved in developing an effective control and inspection system in high altitude and underground environments.

7. As previously stated, the Joint Chiefs of Staff believe it essential to the maintenance of our nuclear deterrent to periodically detonate weapons to test systems and techniques for the employment of nuclear weapons to ensure operational reliability, and to further sophisticate weapon systems. Unless a safeguarded treaty could ensure a cessation of testing by the closed society of the Sino-Soviet Bloc, these requirements must be fulfilled continuously in order to provide for the security of the United States. The most important matter of concern now, however, is the apparent movement of the United States away from a safeguarded treaty to one of "good faith" which has always been the Soviet approach. A prolonged moratorium without satisfactory development of a reliable control system achieves essentially the same results for the Soviets as an agreed and ratified treaty. Any test cessation agreement accepted on faith alone gives the Sino-Soviet Bloc, with its closed society, an advantage in altering the present military posture ratio. As such it would be militarily undesirable to the United States. The frustration of the U.N. truce team in Korea is an example of the danger of accepting the principle of agreement on good faith with the hope of working out the details of control during the implementation of an agreement.

For the Joint Chiefs of Staff:

N.F. Twining
Chairman
Joint Chiefs of Staff

Appendix

SPECIFIC COMMENTS ON THE PROPOSED TREATY FOR DISCONTINUANCE OF NUCLEAR WEAPONS TESTS (U)

1. Comments on Basic Treaty Proposals.

a. Despite agreement reached thus far on the preamble, 17 articles and one annex to the treaty, the most significant issues are still unresolved. The parts agreed deal principally with broad statements of objectives and with procedural and administrative matters relating to implementation of the treaty. Moreover much of that which has been agreed is actually subject to terms and provisions of the treaty not yet agreed.

b. Obviously there is a fundamental difference between the U.S. and USSR positions to date. The United States insists upon the development of an adequate detection identification and control system first, with signing of the treaty to follow. The Soviets desire a treaty first with vague reference to later development of adequate controls. The Joint Chiefs of Staff note that the U.S. position in this matter reflects Basic National Security Policy of the United States.

c. U.S. efforts during February to break the negotiation stalemate by proposing the THRESHOLD² approach appear to have opened the door to deterioration of U.S. position of insistence upon adequate treaty safeguards. The moratorium below the THRESHOLD insisted upon by the Soviets and agreed upon by the United States, is a departure from adequate safeguards. However, more serious is the possibility of retreating further to include the moratorium as a part of the treaty itself and including below the "THRESHOLD" in the inspection quotas agreed upon.

2. Inspection and Control Aspects.

The technical aspects of the inspection and control system are contained in Annex I, Detection and Identification System (DIS). There are, however, important decision making and overall control type measures included in those treaty articles not yet agreed. Because of limited success in reaching agreement in both of these areas, the United States in February tabled the THRESHOLD proposal.³ This proposal presumes adequate capability now to detect nuclear explosions above seismic magnitudes of 4.75. Scientists are not in agreement that such detection is presently feasible. This was highlighted during

² Department of State message to American Consul, Geneva (NUSUP), circular 1002, dated 10 February 1960 (DA IN 283394). [Footnote is in the original.]

³ Department of State message to the American Consul, Geneva (NUSUP), circular 1002, dated 10 February 1960 (DA IN 283394). [Footnote is in the original.]

the conference of experts held during August 1958 and later during Technical Working Group Two meetings held during November and December of 1959. The final report of the latter group reflects that there are areas of disagreement regarding the interpretation of the new data from the HARDTACK experiments and regarding the question of de-coupling. More recently, Dr. Edward Teller's testimony before a congressional committee on 20 April 1960 indicated several different methods by which nuclear explosions can go undetected. He further testified that an adequate control system would not be feasible for at least a decade. Even Hans Bethe, a leading scientific advocate of a ban on tests, was in regretful agreement to the inadequacy of the Geneva detection system. These and other considerations indicate that technology has not yet provided a reliable system for detecting and identifying all types and magnitudes of nuclear detonations within the earth's atmosphere, much less in outer space. The detection inspection and control system as envisioned within the treaty should be critically and carefully re-examined formally by scientific experts, both nationally and internationally, to determine the adequacy of this system.

3. *Comments on Estimated Installation and Operating Costs of the Control System.*

a. The Air Force Technical Application Center (AFTAC) estimate on the cost of the control system recommended by the Geneva Conference of experts was examined and found to be a reasonable estimate of dollar expenditure for that system. However, the addition of an outer space satellite capability for detecting high altitude explosions and the requirements which would be imposed in developing a lower THRESHOLD would raise the system cost to an amount greatly in excess of the AFTAC estimate. For example, the cost figure arrived at by AFTAC to install the Geneva system and operate it for one year is \$1,643,545,756. If the number of control posts were increased by a factor of five, as has been suggested by some to insure acceptable reliability of even the Geneva system, this figure is raised to over \$8,000,000,000.

b. Consideration of the additional control posts as unmanned stations may be expected to reduce the costs of installations and operation. The reliability of such installations, however, is open to serious doubt. For example recorded data is of no value until analyzed and evaluated. Transmitting such data to manned stations would have to be automatic. Also, back-up equipment with "fail safe" automatic cut-in capability would have to be provided to assure no breakdown. Stations would have to be protected against sabotage, thievery and vandalism. All of these and other problems will be aggravated because of the remote siting of unmanned posts. Failure to adequately safeguard the equipment could result in a low confidence factor for the whole system. Because of the undetermined number of unmanned stations that would be acceptable, and other variables, cost

estimates cannot be made. It is believed, however, that savings in personnel and their attendant logistical support will not be in direct proportion to actual costs. The additional sophistication of the equipment, safeguarding the site, and base-to-site logistical support are expensive considerations.

c. Since a satellite detection capability is presently under study by ODDR & E, the cost of that system could not be considered at this time.

569. Letter From Lloyd to Herter¹

June 15, 1960

Dear Chris,

I am concerned at the way in which the negotiations in the Nuclear Tests Conference have been stagnating recently. The immediate reason is the Russian attitude towards seismic research. But while we must press them on this I think it is important, if we are to maintain the momentum of the Conference and our public position, that we should take what opportunities are open on other questions. When we had our useful discussion on June 1 during my visit to Washington, I understood that, despite what had happened in Paris, United States policy in these negotiations was to press ahead as fast as the changed circumstances allowed.

To make progress in the negotiations, we shall sooner or later have to tackle the major issues which we had hoped to solve during the Summit. These were the size of the quota, the composition of the Control Commission, and the length of the moratorium. Time is getting on, and I wonder if you are yet able to give me any indication as to how you propose we should handle these issues at Geneva. Unless we take some initiative soon, there seems to be a risk of a deadlock developing in which neither side will speak first. Indeed, Tsarapkin has just dropped a hint that he will not discuss the various texts we have tabled until the West has come out with some proposal on the length of the moratorium and the composition of the Control Commission. Now that the Conference discussions are a matter of public record it might be difficult

¹ Source: Status of U.S. positions at test ban negotiations. Secret. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.

effectively to charge the Russians with deliberate procrastination so long as it is open to them to argue that we have held back on key issues.

I am sure that you have also been giving thought to the situation that has developed and will, as I am, be concerned with the need not only to keep the negotiations moving but to maintain a good public position vis-a-vis the Russians on the broad issues of the Conference. It would be very helpful to me to have an indication of how you think we ought now to proceed.

Yours ever,

Selwyn

570. Memorandum of Conversation¹

Washington, June 17, 1960

SUBJECT

Disarmament

PARTICIPANTS

State

Mr. Sullivan—S/AE

Mr. Spiers

UK Embassy

Lord Hood

Mr. Wiggin

Lord Hood called under instructions to present UK views on future Western activities in the Ten Nation Disarmament Conference. He reported that the Foreign Office feels that it will be increasingly difficult to hold to our present position in Geneva, that it is disadvantageous to the West to let the Soviet plan hold the field, and that it is not enough for us simply to probe and criticize while standing pat on our present position. The UK felt it was necessary to think up a new way of proceeding and suggests that we adopt the tactic of pressing the Soviets to discuss particular subjects in working groups. If the Soviets declined, we should then proceed to discuss these measures in plenary sessions. The particular items which the UK had in mind were: (1) the Irish resolution, which we are committed to discuss, (2) control of orbiting

¹ Source: Tactics for ten-nation disarmament conference. Confidential. 3 pp. NARA, RG 59, Central Files, 396.12-GE/6-1760.

vehicles, (3) nuclear cut-off, (4) constitution, functions, and powers of the control organ, and (5) control over nuclear delivery systems. The UK felt that we should start with the items on which it would not be difficult to reach Five Power agreement.

Mr. Sullivan said that our own tentative approach was not greatly different from that which Lord Hood had outlined. We do not want to make a substantial departure from the present Western position but agree in principle to expanding or modifying the Western plan while staying within its present framework. He said that we had been considering tabling the terms of reference which are being coordinated among the five Western delegations and that this idea would have the same effect as that proposed by Lord Hood. He asked whether the British were thinking also of proposing studies of Third Stage measures such as elimination of nuclear weapons and nuclear delivery systems. *Mr. Wiggin* said that the British did not have the same hesitation about this as the US had previously demonstrated. Such discussion of the controls for these measures would conclusively demonstrate that they belonged in the Third Stage. Furthermore, the UK had never felt that there was implied in such study proposals a moral commitment to move directly to the implementation of the measures studied at the conclusion of the particular study. *Mr. Sullivan* said that we were reviewing these questions ourselves and did not rule out the possibility of our agreeing with this position. With respect to the delivery system problem with the French, our primary concern was over the French idea for prohibition against mating warheads and carriers in an earlier stage. This would have a dangerous and profound impact on our readiness of forces and thus on our entire deterrent posture.

Mr. Sullivan and Mr. Spiers reviewed the other points which we had been considering, emphasizing that they did not at this point represent firm US decisions, as follows: (1) exchange of military observers at agreed military bases as an initial confidence building measure; this function would in due course be taken by IDO. *Mr. Wiggin* observed that this would be characterized by the Soviets as control without disarmament. (2) a US-USSR surprise attack zone; we would not contemplate proposing a European zone at this time in view of the probable French reaction. (3) introduction of 1.7 million as the first level of reduction in Stage III of the Western plan; and (4) incorporation of reference to gradual elimination of military bases in Stage III of the Western plan. *Mr. Sullivan* said that we were not sure yet whether we would, if these ideas are accepted, wish to issue a revision of the Western plan or to table separate papers expanding on various parts of the Western plan. Two other ideas which are under consideration are to provide in the Western plan that transfer between stages would depend upon a Security Council decision that the prior stage had been implemented and

for which the concurring votes of the permanent members would be required. *Mr. Spiers* noted that this was a reversion to previous Western positions which had normally provided for such a role for the Security Council and which would protect the West against the unacceptable automatic movement from stage to stage provided for in the Soviet plan. A further idea was to expand our proposals on transfer of fissionable material to peaceful uses by indicating a proposed specific amount for to be transferred. *Mr. Sullivan* pointed out that the timing on this entire matter was of great importance since it was necessary to move rapidly if the Western powers were to be effective. We hope to have our own views by Tuesday and to be in a position then to discuss them with our Allies.

Lord Hood asked whether we had anything we could say at this point about the nuclear test negotiations in the light of Selwyn Lloyd's letter to Mr. Herter. He assumed that it would be possible to arrange a meeting between Ambassador Caccia and Mr. Herter early next week. *Mr. Sullivan and Mr. Spiers* said that the main issue at the moment was the safeguards we would propose for the nuclear detonations in the seismic research program. Various alternative possibilities to the "black box" are now under review. *Mr. Wiggin* said that the Western powers would be in an impossible position vis-a-vis public opinion unless we could abandon the "black box" idea, since we were asking the Soviets to accept a type of control relying on good faith declarations and that this was a radical reversal of our own previous position in all disarmament talks. If we did not revise our position, we would be hoist our own petard. *Mr. Sullivan* said that we were keenly aware of these vulnerabilities and were quite confident we would find some way of proceeding with open devices. *Mr. Wiggin* inquired about our attitude on the composition of the Control Commission. *Mr. Spiers* said that while we were prepared to accept parity on the Control Commission we would continue to believe, as Mr. Herter had indicated to Mr. Lloyd in Paris, that we should not make this concession at this point before other potentially difficult issues such as high attitude treaty provisions had been identified so that all our bargaining leverage was not used up too quickly. He believed that we would soon be prepared to discuss the problem of the length of the moratorium if the Russians were prepared at the same time to be concrete on the size of the quota.

571. Letter From Caccia to Herter¹

Washington, June 22, 1960

Dear Chris,

Selwyn has asked me to send you the enclosed personal note about disarmament.

I think that it speaks for itself. But he has asked me particularly to say that the last thing he wants to do is to throw any monkey wrench into any works that may be in hand. Hence the very personal form of his letter.

At the same time he does feel strongly that we shall need to play this hand with great care as this is the area in which we and the Communist bloc still have business dealings, and unlike last year there will not be the same prospect of a Summit meeting as there was when the Assembly met in 1959. From long experience he knows, as you do, that it is not possible to set the stage for disarmament discussions at short notice. It is for this reason, amongst others, that he would value your views on how this problem should be handled with the object of our having a good position and the initiative when the Assembly meets.

I have an appointment to see you tomorrow and shall be most grateful if you can give me at least some preliminary reaction at that time.

Yours sincerely,

Harold Caccia

Enclosure

Message From Lloyd to Herter

TEXT OF MESSAGE

My dear Chris,

It seems to me that over the next nine months or so the struggle between East and West for world opinion may well be concentrated in the field of disarmament. This is the one area in which the free world and the Communist bloc are now seriously in contact and discussion,

¹ Source: Transmits a message from Lloyd to Herter on Western position in disarmament talks. Personal and Secret. 8 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.

and the way in which each side conducts itself will be watched with the closest attention all over the world and especially in the uncommitted countries. As you know, I have always argued that we need to conduct our disarmament discussions with two main objectives in mind. First, to achieve some concrete progress by the implementation of some specific measure or measures which would increase confidence and open the road to further progress. Nuclear tests come in this category. Secondly, to retain or win the support of world opinion for our standpoint on disarmament. This seems to me best done by demonstrating that we are absolutely genuine in our desire to bring about substantial and far-reaching disarmament, provided always we can assure ourselves with regard to our own security through a system of international control and verification together with the establishment of effective peace-keeping machinery. Under these conditions we at least are prepared to go to the end of the road. If the way seems blocked, it must be clearly seen to be because the Communists refuse to accept these reasonable and necessary conditions and not because of any reluctance of the part of the West.

I have always felt that this is the posture that we must constantly try to maintain and it is in this context that I wished to let you have my private thoughts on the present state of play in the disarmament discussions.

Since we last talked together, the Russians have come forward with their new proposals. They are for obvious reasons quite unacceptable. It was also perhaps fortunate that Mr. Khrushchev put up such a deplorable exhibition in the press conference at which he introduced them, so that it was widely interpreted as indicating that the Russians were not very serious about them. Nevertheless, the proposals do contain, for the most part in quite the wrong sequence, virtually every measure put forward in the Western Plan. In addition Zorin has been saying that he is fully prepared to consider any suggestions and amendments that the West cares to propose. This superficially flexible and reasonable approach is, I am afraid, bound to make an increasingly favorable impression and will gain them much undeserved support outside and in the United Nations. This impression will be reinforced if the West after three months of negotiations are unable to point to any move that they have made since tabling their plan in March. In these circumstances the Russians having by their new proposals gained the initiative, will succeed in exploiting it to our disadvantage. I regard this as a serious and major danger to the overall Western position at this stage in East-West relations.

How are we to prevent this? The alternatives seem to me to be the following:

(A) We stand by our existing plan and make no move; we restate its advantages and do our best to discredit the new Russian proposals.

This would be a rational course but I think our position would steadily deteriorate the longer the talks in Geneva continued and when we came to the United Nations we might find our position more vulnerable. We would be thoroughly on the defensive.

(B) We could try and refurbish the Western plan and submit it to the conference as a new Five-Power proposal. The trouble is that this might prove quite a lengthy proceeding and indeed once we re-opened the whole discussion between the five Western Powers, and presumably in NATO, it is by no means certain that we could reach unanimous agreement in time to be of any use. On the other hand, we might be able to do this in time for the Assembly.

(C) One or two of the Western partners might introduce another set of proposals perhaps in outline rather than in detailed form. This would, of course, be worked out with the full knowledge of your people, if in the end you preferred not to be one of the authors. It would be in such a form that you could give it a general welcome and promise it the most sympathetic consideration, but you would not be committed to it. I have in mind the same sort of procedure we adopted over the Anglo-French plans of 1954 and 1956 and over our plan at last year's Assembly. In each case you made sympathetic noises but were not committed. I think that the last exercise at the United Nations served as quite a useful counterweight to Mr. Khrushchev's much publicised plan put forward the following day.

Weighing up the alternatives I see some advantages in course C and I would very much like to hear how it strikes you. If you felt that it had some merits it would then be important to decide on the timing. Here there would seem to be two alternatives:—

(A) For us to work out the proposals as quickly as possible with a view to submitting them in the Ten-Power Committee in Geneva. The ideal target date might be about the middle of July on the assumption that the conference is likely to have to adjourn at the end of July in order that a report can be prepared for the Disarmament Commission and that all concerned can have some break before the General Assembly. The objective would be to regain the initiative from the Russians before the recess.

(B) To take a little more time to work out the new proposals with a view to introducing them in the United Nations forum in September. Again the objective would be to regain the initiative for the West before the United Nations began its debates on disarmament. At the same time a drawback to this alternative might be that we would appear to be leaving ourselves in a bad posture throughout the Geneva talks and it would almost certainly be necessary therefore to agree to take some smaller initiatives in the committee in order to indicate that the West was not entirely rigid and inflexible. I have in mind minor amendments to the Western plan and proposals for joint studies of those measures on which both sides agree.

I have been turning these matters over in my mind and in the absence of an opportunity to talk them over with you personally, I thought I should send you my private thoughts in strictest confidence. None of our partners knows anything of this. Please let me know frankly what you think of all this.

In the meantime, we are putting together some ideas for an initiative such as that suggested in paragraph 4(C) above.

With warm regards,

As ever,

Selwyn

572. Memorandum of Conversation¹

Washington, June 23, 1960

SUBJECT

Disarmament and Nuclear Testing

PARTICIPANTS

U.S.

Secretary Herter

Under Secretary Dillon

Mr. Kohler—EUR

Mr. Sullivan—S/AE

Mr. Spiers—S/AE

U.K.

Ambassador Caccia

Lord Hood

Mr. Wiggin

The Secretary apologized for his delay in answering Selwyn Lloyd's letter on the nuclear tests negotiations and explained that we had been concentrating our attention on solving the "black box" problem in connection with the seismic research program. He said that we had drafted a joint congressional resolution which had now been approved within the Government and which is being put before the Congress. He read the operative paragraph of the draft resolution. *The Secretary* observed that this move, if successful, should eliminate the present sticking points with the Soviets. If the Russians insist on more than we are willing to provide, so long as we are able to let them inspect the inside of the device, we are disposed to reject such further demands. Of course if we could not go ahead with the coordinated program on this basis the question of a moratorium on underground tests would be out of the window since the two issues were connected in the Eisenhower-Macmillan communique of March 29. *Ambassador Caccia* said that the resolution seemed to him a very fair offer and that he could not

¹ Source: Positions in negotiations on disarmament and test ban. Secret. 3 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

see any justification, speaking as a non-scientist, for giving the Soviets blue prints of the device, since we contemplated allowing full inspection of its internals. *Mr. Dillon* said there was to be a secret hearing at 10 o'clock June 24 on this subject before the Joint Atomic Energy Committee. Preliminary soundings indicate that the resolution should go through without difficulty.

The Secretary said that with respect to moving ahead on other matters he was in general agreement with the points made in Selwyn Lloyd's letter. The only difference seemed to be on the question of tactics, with respect to making a concession on the composition of the control commission. We are fully prepared to accept parity but would not feel we should go ahead with this concession right now. We are prepared however to discuss the question of the length of the moratorium together with the quota number. The only issue on which our position is not yet in good shape is on the problem of high altitude controls. *Ambassador Caccia* said he would get these points to Mr. Lloyd right away and that he was sure there was no need for a formal reply to the letter.

Turning to the question of disarmament *the Secretary* said that we had also been thinking along the lines set out by Lloyd in his more recent message on the subject of general disarmament. He gave *Ambassador Caccia* the new U.S. revised Western Plan and referred to the paragraph providing for study of missile delivery systems, observing that this met the essence of the French position. *Ambassador Caccia* asked if we envisaged a series of subcommittees being established to deal with various aspects in the plan. *Mr. Dillon* said this was a possibility. *The Secretary* referred also to the paragraph in the proposal providing for a Security Council decision regarding transition from stage to stage, noting that this also met a French suggestion.

Mr. Dillon said it was our view that the revised plan would have a great deal of public opinion impact. *The Secretary* said there were not many changes in substance. He did wish to mention, on a confidential basis, that by the time the plan was presented, Mr. Eaton might be in a position to propose a substantial transfer of enriched uranium to peaceful uses after the cutoff.

The Secretary said that we are trying to make arrangements for Mr. Eaton to see Mr. Lloyd on Saturday morning (June 25) and to see Couve de Murville on Saturday afternoon (June 25). We hope it would be possible to have a meeting of the Five Western Disarmament Representatives in Paris on Sunday, June 26. If agreement is reached on the text it would be possible to give the plan to NAC on Tuesday, June 28. *Mr. Dillon* said that the plan has been forwarded to our Embassies in London, Paris, Rome and Ottawa with instructions that it be delivered to the Foreign Office the first thing tomorrow morning. *The Secretary* said that this plan

could be characterized as meeting many of the Soviet positions. Where Soviet language was acceptable, we had actually adopted it.

Mr. Kohler informed Ambassador Caccia of our recent discussions with the French, who gave us a copy of their own paper the day before yesterday. Ambassador Alphand had called today indicating his unhappiness that we were going ahead with a revised proposal without commenting on the specific French suggestions. We had advised the French that their suggestions were essentially tactical and were not inconsistent with the paper we had prepared. We had made a great attempt to meet their point of view and we are prepared to discuss their ideas further in Paris. *Mr. Dillon* said that the French proposal was based on the assumption that the U.S. would not be able to make a significant policy move at this point. Since this assumption had proved incorrect the framework in which the French ideas had been suggested was changed and subject to re-examination.

Ambassador Caccia asked whether we still considered the Norstad plan a possibility, particularly in connection with the General Assembly. *The Secretary* referred to the language in the US paper providing for establishment of an inspection zone “including the US and USSR” as preserving the possibility of a zone in Europe. *Mr. Dillon* said that this might create some difficulty in Paris. In that case we were prepared to take out the word “including”. He said he was certain that the eagle eyes of the French would pick up this point.

573. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, June 23, 1960

SUBJECT

Meeting of Principals on Disarmament and Nuclear Testing Conference

PARTICIPANTS

See attached list

Secretary Herter opened the meeting by asking whether there were any comments on the latest draft of the “Program for General and

¹Source: Disarmament and nuclear test conferences. Confidential. 6 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy, '60.

Complete Disarmament under Effective International Control". *The Secretary* said he understood the paper had been fairly well staffed out. He felt there might be a problem with some of our Allies as to the provision for establishment of zones of inspection but felt this provision should be left in the paper; it might prove to be a good trading point.

Mr. Gray felt that the U.S. might be making a mistake in adopting certain Soviet phraseology for inclusion in the revised disarmament plan and mentioned, as an example, the phrase "security of citizens". He felt that we should be careful not to include in the new plan concepts which are alien to U.S. traditions.

Ambassador Eaton agreed that some language from the Soviet papers had been incorporated in the new draft where it was acceptable to us. He noted that the Soviets use the term "security forces" while the term "security of citizens" was U.S. phraseology. *Ambassador Eaton* felt that we should not be obdurate and refuse to accept any Soviet terminology, even when acceptable to us.

Secretary Gates stated that he had an opinion from the Joint Chiefs of Staff concerning the latest draft plan, the substance of which was that the plan was acceptable militarily. The Joint Chiefs of Staff had also pointed out that the U.S. would be under pressure to modify the new plan and that the U.S. should stand firm with this plan. *Secretary Gates* added that Defense thought the sentence in the new plan referring to "blank number" of kilograms of fissionable material for the transfer from past production to peaceful uses should be deleted. At a later date, after Defense, the Joint Chiefs and the AEC had studied this matter further, a specific number could be transmitted to *Ambassador Eaton* for his use in explaining the plan. It was preferable, *Secretary Gates* commented, for *Ambassador Eaton* to specify the quantity of kilograms in a speech rather than to include this number in the plan itself. *Mr. Allen* said he felt it would be well to have a definite figure in the plan when it is presented in Geneva. *Secretary Gates* thought it would be possible to arrive at a definite figure by the middle of the following week, but he would prefer that the sentence not appear in the draft given to the Allies. The Principals agreed that the sentence in question would be deleted.

Chairman McCone mentioned that the term "fissionable materials" involved both uranium 235 and plutonium. The U.S. could transfer uranium, but because of the military needs for plutonium, we could not agree to transfer that material. He had, therefore, suggested to *Ambassador Eaton* that the term "weapons grade highly-enriched uranium" be used in the draft plan in place of the term "fissionable materials". *Chairman McCone* recalled that *Ambassador Eaton* had not wished to change the terminology which had been used for some time. *Ambassador Eaton* replied that, if a sentence referring to specific quantities of fissionable material to be transferred were, at a later date, inserted in

the draft plan the AEC wording might then be used. *Mr. Smith* suggested that it might be desirable to use the singular form of the term “fissionable materials” when referring to transfers but to make the term plural when referring to the cut-off, since the cut-off would include all fissionable materials. *Chairman McCone* thought this might be one way of handling the problem. *Secretary Gates* remarked that, if his suggestion were followed, the sentence regarding quantities to be transferred would not appear in the plan at all, but would appear in a speech to be made by Ambassador Eaton.

Secretary Herter stated that, while there might be difficulties with our Allies on the plan, a paper reflecting the lowest common denominator would not be worth having. He felt that the U.S. should move. *The Secretary* noted that a copy of the plan had been sent to the President, as a draft which was to be considered by the Principals. There had been no reaction as yet from the President. Pending that, *The Secretary* concluded that he understood the Principals were now in agreement on the text of the plan and that Ambassador Eaton could proceed to consultations with the Allies on the basis of the revised plan (TAB A).

Secretary Herter then turned to the question of a resolution to be presented to Congress requesting relief from the Atomic Energy Act of 1954 (TAB B). The resolution would permit the inspection of the interior of a nuclear device by representatives of the three original parties to the proposed treaty on the discontinuance of nuclear weapons tests. *Chairman McCone* reported that he had undertaken consultations with Congressional leaders and, while he could not guarantee favorable Congressional action, the reaction of the people he had consulted had been encouraging. He recommended that the draft resolution be sent at once to the President if the Principals agreed with the text.

Chairman McCone then stated that this resolution involved the question of the conduct of the negotiations on testing from this point on. He felt that, if the Soviets rejected an offer by the U.S. to open certain nuclear devices to inspection in connection with the seismic research program, it would clearly indicate that the Soviets were following a policy of placing one impediment after another in the path of negotiations. *Secretary Herter* agreed that, if Congress acted favorably on this resolution and the Soviets did not accept the proposal, it would seem virtually impossible to reach an understanding with them on a research program. *Chairman McCone* said he felt the U.S. should break off the negotiations on testing if the Soviets turned down this proposal. *The Secretary* remarked that certainly the justification we had given for a moratorium would break down if the Soviets refused to join with us in a coordinated research program to improve underground detection of nuclear tests.

Secretary Gates felt that the resolution also might create problems with our Allies, since information is withheld from them on the type

of device we propose to disclose to the Soviets. Furthermore, *Secretary Gates* said, if the precedent of disclosing the interior of a nuclear device were extended to the Plowshare program, the U.S. would be in difficulties for the reason that in the Plowshare program it is proposed to use very sophisticated types of nuclear weapons. He felt strongly that, if we agreed to open the "black boxes" to be used in the research program, and if the proposal is still not accepted by the Soviet Union, the U.S. should walk out of the test talks.

Chairman McCone felt that our position with respect to our NATO Allies could be defended. However, as regards opening up the "black boxes" the staffs of both the Defense Department and the AEC were quite worried, because of the possibility of opening nuclear devices in the Plowshare program. For example, the theory of the "Ditch-digger", a device which might be used to dig canals, would have to be tested in Nevada. This was such an advanced theory that the interior of this device could, perhaps, not even be exposed to the U.K. (*Chairman McCone* noted, in passing, that the Vice President had told *Secretary Gates* and himself on the preceding day that the Plowshare program should go forward without delay.)

Chairman McCone then stated that, with respect to the resolution, its provisions fell short of what *Tsarapkin* was requesting. *Tsarapkin* was insisting on the right to sample materials that went into the assembly of the nuclear devices and also wanted to have the blueprints, *Chairman McCone* felt this was a ridiculous request.

Secretary Gates reiterated that he felt we would be under pressure from our Allies after making this offer of opening a nuclear device for the Soviet Union. *Mr. Smith* felt that the French would not try to get information through the medium of the test talks, since they wanted to have nothing to do with the talks.

Chairman McCone asked whether the Principals were agreed that the negotiations on testing were finished if the Soviets did not accept the offer which the passage of the resolution by the Congress would make possible. *The Secretary* remarked we seemed pretty close to the end of the negotiations even now, and that we had no obligation at the present time not to test. *Mr. Smith* referred to the resolution and asked whether it was necessary to use the word "representatives", which implied many people would be looking into the nuclear devices. He felt the wording should be a "qualified representatives." This would strictly limit the number of people who would be participating in the exercise. After some discussion, it was agreed that the word "representatives" might be modified by the addition of the words "limited" or "qualified". *Chairman McCone* felt that the number of representatives could be controlled.

Chairman McCone added that he felt the conversations with Congress should be kept in the closest confidence. If the resolution were not

acceptable to Congress. This fact could be used against us by the Soviet Union. *Mr. Gray* agreed and thought everyone in the room should be cautioned to be very careful about discussing this matter.

The Secretary asked *Mr. Keeny* what progress had been made by the panel of scientists working on the problem of the minimum number of nuclear explosions to be conducted in the seismic research program. *Mr. Keeny* replied that there had been no agreement on what a minimum program of nuclear shots should be, due in part to the unclarity as to what was meant by the term “minimum” and due, also, to some technical problems. He thought it was significant that not too much disarmament had appeared with regard to the general program as it had previously been drawn up. Everyone had agreed that the decoupling phase of the program should be included, but there had not been agreement on the exact number of the shots to be conducted. *The Secretary* inquired whether the committee would be definitive as to the number of shots required. *Secretary Gates* answered that the exact number of explosions needed would not be definitely known until the program had gotten underway. *The Secretary* expressed the hope that the scientific community would reach unanimity on this problem.

Mr. Keeny said that the committee had not been certain whether the time required for the conducting of the seismic research program should be considered as 18–24 months or three years. With larger yield shots and a three-year period of research, fewer nuclear explosions would be required. *Mr. Keeny* and *General Starbird* pointed out that with larger shots, problems of a technical and engineering nature arose, such as the problem of larger excavations, which would prolong the period of research to three years.

Chairman McCone brought up another matter—that of Soviet insistence that the research program be agreed among the three parties in the negotiations. *Chairman McCone* felt an “agreed” program was nonsense; it should rather be carried out in a “coordinated” manner.

Secretary Gates asked if the record of this meeting of Principals would show that the Principals were agreed that if the Congress passed the resolution being presented to it, and if the Soviets did not accept the U.S. offer made possible by the passage of the resolution, the negotiations on discontinuance of nuclear tests would be broken off.

The Secretary repeated that the justification for a moratorium on nuclear testing would be lost if the seismic research program did not go forward; the final decision on such a step as a break-off of the negotiations would, of course, be up to the President.

Mr. Gray said that, if the program offered to the Soviets were rejected out of hand, the U.S. should then be in a position immediately to carry out the steps necessary to give us the type of posture we want globally. Since an outright rejection of the program by the Soviet Union was at least a possibility, we should make advance preparations as to

what steps we would take. *Mr. Dillon* said the most likely outcome was a fuzzy reply by the Soviets which would be neither outright rejection nor acceptance. In this case, the Principals would have to meet again to settle the problem.

Both *Secretary Gates* and *Chairman McCone* wanted it made clear as to what would happen if the Soviets did not accept the research program proposed to them by the U.S. *Chairman McCone* added that everyone he would be consulting in Congress would want to know whether the negotiations will be broken off, if Congress passed the resolution and the Soviets rejected the program. *The Secretary* replied that he would think they would be; he thought the President would think so too. An outright Soviet rejection would give us good grounds to break off negotiations.

574. Memorandum of Telephone Conversations Between Herter and Eaton¹

June 27, 1960

9:15 a.m.—Mr. Eaton telephoned to report on the break-up of the conference. Mr. Eaton said he had spoken to Zorin before the meeting and told him that Eaton would be prepared to table a new proposal within a very few days. Eaton said Zorin's response was that the discussions had been going badly. Eaton said the meeting then came to order with the Pole in the chair and the Pole recognized Zorin who read his statement. Eaton said Zorin's statement was then paralleled by one of the satellites and they walked out while everybody on our side insisted the conference go on. Eaton said the next chairman in alphabetical order was Ormsby-Gore who took the chair and said the conference was continuing. Eaton said he then made a statement, which will be coming over the open wires to us, and Eaton said he filed the plan exactly as it came out of Washington. Eaton said this was then followed by a statement on the part of all the other Western delegations endorsing the plan. Eaton said Moch then raised a point of order that this conference had been convened by the Four Foreign Ministers and that it could not be broken up by any one of them unilaterally. Eaton said the conference was then adjourned until tomorrow which will give us a chance to determine what should be done. Eaton said they can either convene in the morning and do something or they can announce termination or whatever is decided. Eaton said the Western delegates were meeting at 5:00 p.m. Geneva time (12:00 noon Washington time) and following that meeting Eaton said he would get a communication to the Secy on any suggestion by the Western delegates. The Secy said he was assuming the statement Eaton made was in order and Eaton said it was fine—one of the most classical statements ever made. Eaton said he had been asked to have a press conference but he didn't think he would. Eaton said they called the press into the conference after the Soviets walked out so they heard the Western statements, but Eaton said he thinks he will go very briefly on radio and TV. Eaton said the Soviets are in a very, very difficult position because the press knew we had a plan and were going to present it. Eaton said he told the press he had had a private talk with Zorin so they knew that he had told Zorin we were prepared to do this. Eaton said they had just heard about the President making a speech and they will have in Washington a text of what Eaton said for the President's possible use. Eaton asked if the President had received a letter from Khrushchev and the Secretary asked what

¹ Source: Breakup of ten-nation disarmament talks. No classification marking. 2 pp. Eisenhower Library, Herter Papers, Telephone Calls.

letter he referred to. Eaton said Khrushchev has presumably written to each of the heads of the Western powers according to Zorin's statement and Mr. Eaton then read the rough translation of Zorin's remarks (copy attached). Mr. Eaton said the significant part was, of course, their taking this to the UN.

3:00 p.m.—Mr. Eaton telephoned from Geneva after having met with the other Four Western representatives. Mr. Eaton said the Soviets will not come back; that they will meet tomorrow and the conference will adjourn after tomorrow. The Secretary said he was then in a session discussing the question of going to the U.N. Disarmament Committee with a view to passing a resolution urging the Soviets to continue disarmament discussions. Eaton said this is good. Eaton said they were going to recommend the Secy consider making a statement calling an immediate meeting of the Security Council to ask that an emergency session of the General Assembly be called. The Secretary said they have a Disarmament Committee of 82 which would seem to us the better and more logical forum. Eaton said the Soviets have said they would go to a regular meeting of the GA and it might appear we were trying to avoid that by going to the Disarmament Committee. Eaton said by going directly to the GA this would indicate we could take a positive approach quickly by putting it before the U.N. Eaton said their alternative recommendation was to go to the Disarmament Committee but everyone there would favor calling a emergency session which can be done by seven members of the SC. Eaton said the only thing would be to be sure the emergency session would be limited to disarmament matters, but regardless of that, Eaton said it was the strong view of everyone with the possible exception of the French, that it would be good better to go before the GA to make clear we were going to the forum the world recognizes. Eaton said the suggestion on the part of all the Five delegations was that coordination of the Western position take place in Washington where the time difference problem is less. Eaton said he expressed the personal view the Secy might want to take a position and take it immediately to indicate we can take decisions without delay and the other delegations are fully conscious of this and would go along with the exception of wanting to be certain their Foreign Ministers are advised. Eaton said he would be available by phone at any time and was sending the Secy by most rapid communication a fuller text of what Eaton had said to the Secy.

575. Memorandum for the Files by McCone¹

Washington, June 28, 1960

During my discussion with the President on Monday, June 27, he stated:

- a. No moratorium on testing now exists (December 29, 1959, Augusta statement),
- b. Why shouldn't we proceed with unannounced tests.

In discussions with the Joint Committee on June 27, concerning the proposed "Joint Resolution" the following questions were raised:

- a. Can the seismic improvement program be carried on with older gun type devices (thereby eliminating the use of the Mark 7),
- b. Would gun type devices now in stockpile be used or would modifications be necessary and, if so, would these modifications be construed as "weapon developments."

With reference to the President's statements:

- a. Technically, no moratorium exists at the present time, for on December 29, 1959, he stated: "..... In the meantime, the voluntary moratorium on testing will expire on December 31. (1959)"

"Although we consider ourselves free to resume nuclear weapons testing, we shall not resume nuclear weapons tests without announcing our intention in advance....."

I agreed with the President that no moratorium existed based on the December 29 statement but, nevertheless, no testing had taken place and, furthermore, the Eisenhower-Macmillan declaration of March 29, offering to conduct a seismic improvement program extended the moratorium for a period during which a limited treaty would be negotiated and signed and a coordinated seismic program completed.

Therefore, for all practical purposes, a moratorium does exist by directive of the President.

- b. With reference to the conducting of nuclear tests for weapons development or seismic improvement in secrecy, my investigation indicates this is possible at the Nevada test site because of the vastness of the installation and the diverse activities taking place there. However, there is a very high probability that the activity would become known to the press and, through them, to the public because of the number of people involved and the familiarity on the part of the press with various activities such as safety precautions, unusual instrumentation, and laboratory technicians all of which is unique to a weapons test undertaking.

¹ Source: Record of McCone's conversation with Eisenhower on considerations for resumed testing. Top Secret; Restricted Data; Eyes Only. 3 pp. Eisenhower Library, McCone Papers, Sealed File No. 5.

Therefore, it can be concluded that one or two tests can be conducted without the fact becoming known, but a series (and a series would be required for meaningful results) would, in all probability, become known to the public.

The President's position caused me to review requirements for immediate tests. It is indicated that testing should be undertaken promptly on the Minute Man, Polaris and the first step on a small Queen weapon. These tests are justified on the basis of safety and dependability.

With regard to the points of the Joint Committee:

a. The seismic program outlined under project Vela calls for use of both the gun type weapons and the Mark 7. Seismologists and the AEC staff consider these as "proven designs", however, neither the Mark 7 nor the gun type devices *now in stockpile* will give the exact yields called for under project Vela. The yields are obtained by increasing or decreasing the special nuclear materials in the "proven devices".

If the program is restricted to existing devices in the stockpile on the theory that only such devices are acceptable as "proven", then project Vela must be modified considerably. *[text not declassified]*

It is debatable whether an increase or decrease of the special nuclear material in a proven device could or should be construed as a "weapon development."

b. If the program is restricted to gun type devices then project Vela, as now laid out, cannot be accomplished. For yields of *[text not declassified]* a modified program can be developed.

However, for yields above 25 KT and, more particularly for yields under 1 KT (of which 4 are indicated, ranging from *[text not declassified]*), we must extrapolate from knowledge gained from the present gun type devices for these particular yields are both above and below yields yet attained by us in devices of this type.

It is quite possible that actual yields so extrapolated would vary from the theoretical yields by as much as 30%, plus or minus, and it is also possible that yields of the lower range *[text not declassified]* might fail entirely. Such extrapolation might very readily be considered as the development of new and heretofore untried weapons as yield of the magnitude anticipated has not been produced heretofore.

[text not declassified] of the Mark 7 device. These devices would always be used because of the economy of the special nuclear material. However, it is important to note that under an arrangement of where the gun type device would be declassified (even on a limited basis), or the Soviets were permitted visual and manual inspection (as provided in the Joint Resolution), and as a result that completed the weapon development, for the reason mentioned above *we could not* explain that this is not the case because we had alternate devices which are better and more economical (Mark 7's in stockpile) and such information is classified as Top Secret, Restricted Data.

John A. McCone

576. Record of Telephone Conversations Between Herter and Lodge and Lyndon Johnson¹

June 28, 1960

6:10 p.m.

Lodge telephoned that the resolution in the Disarmament Commission requests the Russians to go back to the 10-nation group. Lodge said he didn't think this would get as many votes as a resolution to negotiate in the Disarmament Commission. The Secretary asked if he had reference to negotiating with a group of 82 and Lodge said that was what the Disarmament Commission was made up of and that he didn't think we had to be afraid of this at all. The Secretary said it was impossible to negotiate in such a large body and Lodge insisted that if it could be done with 10 it could be done with 82. Actually, he said, it would boil down to the Russians and us; that we could bring the British and French in for private talks. Lodge said this was all academic because they would refuse. He said he was afraid we wouldn't get a strong vote to go back to the 10-nation group. Lodge said he had suggested we go into the Disarmament Commission with the proposal on disarmament which he thinks would be best of all. The Secretary asked if he hadn't received what Eaton had tabled. Lodge said they had been told that this wasn't sufficiently far along. The Sec. said the draft letter to Hammarskjold would have our proposal as an attachment asking that it be circulated. He said that Eaton didn't have time to clear the proposal with our allies. Lodge said that the meeting would be on July 6; that would be time to clear it with our allies. The Secretary said it would still be in the process of clearance. Lodge said the best thing to do would be to start negotiating on disarmament in the Commission; the next best was to urge the Russians to come into the Commission. The worst thing would be to come back into the 10-nation group. The Secretary said to try to do it in the 82-nation was just as bad; that this was a terribly complicated and difficult thing. Lodge said he didn't think the fact that there were 82 added anything to the complexity of the situation. It meant that we, the Russians, the British and French would sit down in private. The Secretary mentioned wording it in such a way as to ask the Russians to return or in such form as the Disarmament Commission would select. Lodge said then all the neutrals would get in, i.e., Communist China. The Sec. said he wouldn't mind Communist China being in and Lodge said not in an election year. The Sec. said he could not see it being done in the 82-nation group. Lodge suggested the

¹ Source: Tactics for U.N. resolution on resuming disarmament talks; State Department appropriations bill. No classification marking. 2 pp. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.

Secretary get in the disarmament experts and mull it over. Lodge said the point was to force the Russians to say yes or no to negotiations now. Lodge said he planned to meet with our allies tomorrow to sign the letter and the Sec. asked if they were ready to sign. Lodge said he didn't think they were. The Sec. said the British wanted time to think it over. Lodge asked the Secretary to think it over and to let him know.

6:43 p.m.

Telephoned Lyndon Johnson that he was worried about the State Department Appropriations Bill. The Secretary said that as Mr. Macomber had told him, we would do our best on the money going into the University. Sec said he hoped that as far as salaries and expenses were concerned the Senator would give us a good break. Senator Johnson said he would certainly be considerate. He realized the burden the Secretary carried and that he would try to be as understanding as if their positions were reversed. He said he would get on it in the morning. The Secretary expressed his appreciation.

577. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, June 30, 1960, 10:15 a.m.

SUBJECT

Geneva Nuclear Test Negotiations (Meeting of Principals)

PARTICIPANTS

<i>State Dept.</i>	<i>DOD</i>	<i>AEC</i>	<i>White House</i>
The Secretary	Mr. Gates	Mr. McCone	Dr. Kistiakowsky
Mr. Dillon	Mr. Irwin	Dr. English	Mr. Gordon Gray
Mr. Farley	Gen. Dabney	Col. Sherrill	Gen. Persons
	Mr. Lanier	Col. Anderson	Mr. Keeney
<i>CIA</i>			
Gen. Cabell			
Dr. Scoville			

Mr. Herter reviewed the Geneva discussions of a coordinated research program and the arrangements for use of nuclear devices in

¹ Source: Use of nuclear explosions in seismic research. Secret. 4 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

seismic research. In view of the Soviet shift in position regarding seismic research and Soviet unwillingness to use nuclear devices of their own, the United States is faced with the problem whether to go ahead on its own. If we do go ahead, the “black box” approach permits suspicion that we are doing something of possible weapons advantage. To avoid this situation, Mr. McCone explored with Congressional leaders the possibility of a congressional resolution permitting us to open certain devices for U.K. and Soviet examination. The eventual congressional reaction was that this should only be done if there was a reciprocal opening of Soviet devices. AEC also explored declassification possibilities. General declassification was impractical since it would result in the information being made available to Nth countries. Limited declassification restricting dissemination of the information on the specific devices involved also appeared undesirable.

Mr. McCone said that limited declassification would be objectionable to the Joint Committee since it would establish a precedent whereby the Congress would lose control over restricted data. For example, the Executive Branch would be able to handle transmission of nuclear weapons or nuclear submarine information to selected allies by this procedure without having to submit an agreement for cooperation for Congressional review. *Mr. Gray* said that perhaps the Joint Committee wouldn’t like it, but limited declassification apparently was feasible under the law. *Mr. McCone* said that the congressional objections would be bipartisan and would probably lead to legislative action shutting off this course of action.

Mr. Herter said that we had to find an answer. As things now stand, the Geneva talks are likely to end not because of Soviet obduracy but because of United States unwillingness to remove a valid basis for suspicion of our nuclear explosions under the seismic research program.

Mr. McCone said that he thought a possibility would be for us to reemphasize the necessity for seismic research and use of nuclear explosions for this purpose, emphasize that we were going ahead with this program, and propose that we and the Soviets each put in 4 to 6 nuclear devices for use in the program and open them up for examination. Congress would buy this reciprocal approach in his judgment. The Soviets would probably turn such an offer down. We could then invite UN observers to check our use of “black boxes”. *Mr. Herter* asked if this meant we would go ahead with Vela even if the Geneva negotiations collapse. *Mr. McCone* said a modified version of Vela would be desirable. He thought that there would be a controlled underground test ban someday and we do not know enough now without further research to design the requisite controls. He did not dispute *Mr. Herter’s* belief that the “black box” approach was not persuasive enough to world opinion, though it would satisfy objective scientists like Nils Bohr.

Mr. Herter asked whether AEC had concluded firmly that Soviet devices could be brought into the United States and used in the research program. He recalled that such a proposal had been vigorously rejected on a previous occasion. *Mr. McCone* said that he needed to discuss the practical aspects with his laboratories and that this idea had come to him just on the preceding evening.

Dr. Kistiakowsky said that continuing discussions among the U.S. technical people had developed a new list of nuclear explosions for Vela cutting out two shots below 1 kiloton. Of course, any initial list would be subject to review in the light of actual results from early shots.

Mr. Dillon said that another possible course would be for the President to take the initiative and offer the Soviets the opportunity to examine the U.S. nuclear devices used in Vela upon condition of Congressional approval. If accepted, the President could send this to Congress in August. The Presidential lead would somewhat protect the Congressmen from the political dangers they feared by shifting responsibility to him, and they would be hard put to refuse the President the authorization he asked. There was considerable discussion of the sensitivity of information on gun-type devices and its possible value to the Soviets or to the French.

Mr. Herter stressed the importance of proceeding without delay. *Mr. McCone* emphasized his view that the limited declassification approach would draw Congressional counter-action promptly in August and that we should avoid facing the Congress with a fait accompli if possible. He believed he could get an answer as to the technical and safety aspects of his reciprocal proposal by noon, July 1. *Mr. Gates* urged that any such conditional proposal be accompanied by the statement that the United States will go ahead on August 15 if the Soviets do not accept. *Dr. Kistiakowsky* said that such a statement, while it would bring the issue to a head, was not necessary on technical grounds since Vela could proceed for awhile using chemical explosions and the first nuclear test would not be ready much before October 1. *Mr. Dillon* pointed out that if Congress convenes August 8, then the August 15 deadline would be too close. *Mr. Gates* said that he believed the earliest possible date should be set and he did not see why, if a decision was made, we could not be ready to act August 15.

Mr. Gray asked whether, if we go ahead unilaterally, UN observers would accept an invitation to observe our "black box" detonations; he referred to past invitations to UN observers which showed their reluctance. *Mr. Dillon* said that probably they would not come, but the offer would be worth something as evidence of our good intentions.

Mr. Dillon said that when we came to make a decision we should face the fact that the requirements for reciprocal Soviet participation will not appear reasonable and the Soviets will simply reiterate that

they do not believe nuclear detonations are needed and will not contribute any. The simplest and most direct course would be opening U.S. devices for examination. *Mr. Herter* and *Mr. McCone* thought that these objections were at least partially met by past instances of Soviet admission of detection limitations and the need for research.

Mr. McCone said that, in a frank talk on the previous evening, Ambassador Caccia had told him that he thought the Soviets would shortly walk out of the Geneva negotiations, attempting to throw the blame on the U.S., and declaring that they would not conduct nuclear tests unless the United States held nuclear explosions (of any kind, including Vela or Plowshare) in which case they would consider themselves free to conduct whatever tests they felt necessary.

It was agreed that, while *Mr. McCone* was checking out the technical and safety problems of bringing Soviet devices into the United States, the staffs of the interested agencies would draft on a contingency basis instructions to Ambassador Wadsworth to put forward a proposal of the kind suggested by *Mr. McCone*.

578. Memorandum of Conversation¹

Washington, June 30, 1960

SUBJECT

Nuclear Testing

PARTICIPANTS

U.K.—Sir Harold Caccia, The British Ambassador
The Viscount Hood, Minister, The British Embassy
Mr. Charles Wiggin, First Secretary, The British Embassy

U.S.—Christian A. Herter, Secretary of State
Foy D. Kohler, Assistant Secretary for European Affairs
James D. Swihart, OIC, U.K., Ireland and B.I Affairs

The Ambassador inquired as to our latest thinking about the Nuclear Testing Conference developments. The Secretary responded that we presently had under discussion some of the complicated legal aspects. He understood the Ambassador had recently had a conversation

¹ Source: Seismic testing. Secret. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

with Mr. McCone regarding some of the problems. At the moment, we were working on alternative proposals that would be more acceptable to the Congressional leaders concerned. He would probably have no objections if something along a reciprocal basis could be worked out. There would remain some technical questions, such as whether the Atomic Energy Commission could shoot off someone else's device. The Ambassador observed that even under our new thinking, we would have still the difficulty that the Soviets have gone on record that they are opposed to inspection. The Secretary remarked that if the Soviets were to turn us down, then the moratorium would be out the window. The Ambassador felt that it was a pity that our first proposals were not practical from a U.S. domestic political standpoint. The Secretary observed this was a question involving the inspection problem. Lord Hood asked whether it was correct to state that our new idea would mean the Soviets could inspect our explosions here and that we, theirs in the Soviet Union? The Secretary said that this was not correct. Under our proposal, we would all exchange a certain number of devices and then test each others. Lord Hood wondered whether this would not raise legal complications from our standpoint. The Secretary replied we are trying to see how we can get around these difficulties including the problems of how to declassify, which, in turn, might raise difficulties here and with our Allies. Lord Hood felt one of the hazards might be that the Soviets would not turn down our proposal completely. The Secretary said that our position would be to fall back on the 1958 scientific experts' report. He commented further that in putting forward any such proposals, we may have to state they are subject to subsequent legislative approval. The Ambassador remarked that in the event we decide to go down this road, he would like to warn his own people as soon as possible. The Secretary said that we should know where we're going by tomorrow and would let the British know as quickly as possible. The Ambassador inquired whether we had given any further thought about the Tsarapkin package. The Secretary said we have, but unless some of the other problems are settled the moratorium will be over. He remarked that the quota and the moratorium were two separate issues. The Ambassador agreed, but pointed out that during the moratorium period we could inspect. The Secretary said this was so in theory, but as a practical matter, the appropriate instrumentation may not be ready during the two-year moratorium period. The Ambassador summarized that it would appear we felt this problem should be taken step by step; i.e., inspection first, quota second, and finally, moratorium.

579. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, July 6, 1960

SUBJECT

Geneva Nuclear Test Negotiations—Meeting of Principals

PARTICIPANTS

See attached list

Mr. Dillon expressed his appreciation to *Mr. McCone* for returning from California to be present at this meeting. The purpose of the discussion would be consideration of how we proceed regarding opening to inspection older-type nuclear devices to be detonated in connection with the research program. The proposal to open the devices for inspection on condition that an approximately equal number be made available by the U.S., the U.K. and the USSR, (as forwarded to the delegation in NUSUP 919) caused great consternation in the British Government. Lord Hood had told the Department that this alternative was unlikely to be accepted and represented a step backward from the move which Secretary Herter had mentioned to Ambassador Caccia (i.e., obtaining Congressional authority to open old devices to inspection, without condition of reciprocity), and that the “ultimatum” aspect might force the Soviets to break off the talks under conditions highly unfavorable to the Western powers. In view of the firm U.K. stand, it is likely that we will be on our own if we persist in the approach set out in NUSUP 919. *Secretary Gates* asked why the U.K. could accept the approach calling for “quid pro quo” on inspection of devices if they believe it to be unacceptable to the Soviets. *Mr. Dillon* replied that they believe such an approach would not be vulnerable, from a world public opinion standpoint, if not coupled with the statement of intention to go ahead on our own even though it were rejected. *Mr. Farley* commented that the U.K. desire for continuation of the negotiations is the key to their reactions.

Mr. Dillon expressed belief that a U.S. decision to go ahead with our own research program after a maximum effort by the U.S. to find an answer to the safeguards problem would have a good chance of acceptance by public opinion, but that otherwise we would be very vulnerable.

¹ Source: Opening nuclear weapons for seismic research program to inspection. Secret. 5 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy, 1960.

Mr. Gray reported that, in a telephone conversation, General Persons had expressed concern about our putting forward at Geneva, in the face of present Congressional views and without indication of Congressional support, any safeguards proposal which would require some Congressional authorization.

Mr. McCone reviewed the discussions which had taken place with members of Congress in regard to a joint resolution, prepared by the Department of State and the AEC, authorizing the revealing of a number of older-type devices in connection with the research program. During the week beginning June 20, he had talked to Senators Johnson and Anderson and Representatives Rayburn, McCormack, Holifield and Halleck, and had met with unanimously favorable response. He was advised that the Joint Committee on Atomic Energy should report out the resolution. At a closed hearing on June 24, the Committee appeared prepared to endorse the resolution, on condition that the text would limit inspection to "visual and manual examination", and would contain a proviso that each of the other nations would accord similar rights of examination to devices it might use in the program. On the succeeding Monday, June 27, however, perhaps as a result of informal Congressional discussions over the weekend, the atmosphere had changed. It was obvious that the Committee would not approve the original resolution because of fear that political opponents of members running in the coming elections would charge them with having given away nuclear weapons information to the Soviets without any return. Thereupon we had developed our "pool" proposal. *Mr. McCone* had not, however, told these members of the plan to state that, in case of rejection by the Soviet Government, we would go ahead on our own. The Atomic Energy Commission also had reconsidered declassification of devices but arrived at a negative conclusion as before.

In light of this background information, *Mr. McCone* recommended that the delegation be instructed to advance the alternative proposal, calling for the pooling arrangement and omitting the language objectionable to the U.K. Government. He warned against advancing the original proposal, at this time since the Joint Committee opposed it. He quoted Senator Hickenlooper as still favoring the original resolution but as warning him against proceeding on it without support of the other committee members. If this proposal were advanced, and accepted by Soviets, we might be in serious trouble with the Committee, perhaps made vindictive by the political climate. *Mr. Dillon* commented that the progress in the negotiations which would ensue from finding an answer to the safeguards problem might spur popular demand for Congress to pass the needed resolution. He stated that the addition of the "ultimatum" represented a departure from the proposal the Joint Committee was considering and might affect the Joint Committee's

attitude towards it. *Secretary Gates* commented that the words “We would face strong compulsion to” hardly constituted an ultimatum.

After further discussion, *Mr. Dillon* agreed that the alternative proposal be advanced, as suggested by *Mr. McCone*. If it is turned down by the Soviets, the Administration might then be in a stronger position to go back to the Congress for authorization as required under the original proposal. *Secretary Gates* expressed concern at elimination of the language announcing our intentions to proceed unilaterally with the research program, including nuclear experiments, if the Soviets do not accept the alternative proposal. He called for a clear decision that there will be nuclear detonations for purposes of improving the underground detection system, during the term of this Administration, and recommended that this decision be clearly communicated to the other parties to this treaty. He urged that further long negotiation, under a *de facto* moratorium, be avoided. *Mr. Dillon* replied that such a communication should be connected to a plan which world opinion would consider to be good, such as an offer to open the devices which will be used. Attaching such a communication to the alternative proposal, with its compulsory “*quid pro quo*” features, would be likely to lead to the collapse of the talks under circumstances very unfavorable for us. *Secretary Gates* urged that the Principals recommend to the President that the nuclear aspects of the research program go forward, if the Soviets do not accept our proposal. *Mr. Dillon* said that the statement of our intention to go ahead with the testing program might be attached to our “fall-back position” offer. He re-emphasized his view that the U.K. would consider this a reasonable approach. *Secretary Gates* and *Mr. McCone* stated it appears that the U.K. basic objectives in these negotiations are different from ours. They even appear to be agreeable to a comprehensive treaty without adequate controls. *Secretary Gates* agreed that the caveat might be left out, as long as the Administration has a clear position on its own objective.

After a discussion, it was decided not to make an informal approach to the Joint Committee at this time as to either of the alternatives. *Secretary Gates* and *Mr. McCone* recommended that the proposal be advanced in Geneva as soon as possible, in order to avoid a Soviet walk-out accompanied by an announcement that “We’ll never test again.”

Mr. Dillon proposed that we first advance the alternative proposal now, devote our best efforts to obtaining its acceptance, and second, if this fails, go back to the Joint Committee in August with a request for a joint resolution enabling us to put forward the original proposal, together with a caveat about intention to go ahead on our own. *Mr. Sullivan* suggested that the House Foreign Affairs Committee also be consulted. *Mr. McCone* expressed belief that it would be preferable

to make the second move without seeking Congressional authority, because of the possibility that some of the members of the Committee might remain away from Washington and that those who come back might again refuse to give favorable consideration. *Mr. Dillon* suggested that the second move, if necessary, might be made before the August session begins. *Mr. McCone* conceded that there is an element of chance in the second move; but he urged that, in view of the danger of leaks to the press, we go ahead as rapidly as possible. He cautioned against expanding the inspection concept beyond the permissible limits set by the Joint Committee. He recalled that the Joint Committee had been unusually concerned about showing drawings or blueprints to the Soviets.

Mr. McCone expressed his understanding that, in the event the original proposal is eventually advanced, it will be accompanied by a caveat phrased as originally proposed by Secretary Gates. *Mr. Dillon* suggested that extensive thought be given to the domestic political implications before setting a nuclear detonation date for inclusion in the caveat. *Secretary Gates* said that the President and Vice President must certainly be consulted as to this question, but if they do not consider the move unwise, we should include a very strong statement. *Mr. Dillon* replied that consideration should even then be given to the form of presentation of the proposal. Inserting a date might give the Soviets the opportunity to break up the Conference with a big propaganda blast. *Mr. Kohler* agreed that inclusion of a date would ensure an adverse reaction.

Secretary Gates reiterated that there would be no question of considering that an ultimatum or a threat is involved here. We are merely trying to go ahead with explosions for research proposes, to improve the capabilities of the system. *Mr. Dillon* pointed out that there seemed to be some experimentation for military purposes involved. *Mr. McCone* denied this. The tunnel linings which had been constructed would have the purpose of providing information useful for civil defense. It has nothing to do with weapons development. *Mr. Dillon* pointed out that military application could be made of the results. *Secretary Gates* and *Mr. McCone* insisted that, at a time when the Soviets are firing rockets into the Pacific, no one should object to that. *Mr. Dillon* said that the problem was not so great if the results of all the experimentation were made generally available. *Secretary Gates* said this would be the case. *Mr. McCone* noted that the tunnel could simply be filled in if the problems this experiment would create were too great.

In answer to a question by *Mr. McCone*, *Mr. Farley* mentioned that Sir Michael Wright had suggested that, in order to make the pooling proposal more palatable to the Soviets, the pool might be used for both research devices and peaceful uses devices, so that the Soviets could

have a rationale for agreeing to contribute to it. *Mr. McCone* expressed opposition to this since some Plowshare devices are of such sophisticated design that they cannot even be shared with the U.K.

The Principals agreed to pass their recommendations to the President on July 7.

580. Telegram 219 to London¹

Washington, July 9, 1960, 2:45 p.m.

219. Please deliver following message from President to Prime Minister. Advise date and time delivery.

QUOTE: July 9, 1960

Dear Harold:

I have been giving considerable thought to the handling of the nuclear detonations in the seismic research program. This program is essential if we are to reach an agreement on the cessation of nuclear testing of the kind you and I proposed on March 29, and if the moratorium which we are prepared to agree to is to provide us answers on the underground detection problem.

We have explored here, and with your people, various ways of dealing with the safeguards for these nuclear detonations. One possibility is a pool approach whereby devices of the U.K., the U.S., and the USSR would be used on a reciprocal basis. Another approach would be an offer by the United States to open its seismic research devices to inspection by representatives of the U.K. and the USSR. Either approach would, as you know, require Congressional authorization.

With respect to the first proposal it is probable that the Soviets will reject it inasmuch as they have already stated that they have no intention of using nuclear explosions in seismic research. In spite of this I feel it is important that we put the pool idea forward as a proposal. It will be another evidence of our desire to find a cooperative solution. A further reason that I believe it is desirable to put this forward is the strong feeling expressed by certain members of the Congress that a safeguards arrangement should be reciprocal. Having made this proposal, we would then be in a better position to obtain Congressional support for the second course of action. I have concluded that we should not put forward this proposal accompanied by any sort of warning of possible unilateral action in the event of Soviet rejection.

If the Soviets reject the pool proposal in spite of our best persuasion, we plan to offer to open devices used in the United States seismic research program for examination by the United Kingdom and the USSR. This proposal would also be put forward without a warning of possible unilateral action in event of Soviet rejection. Implementation of this proposal would of course be subject to Congressional action

¹ Source: Transmits letter to Macmillan from Eisenhower on opening nuclear weapons for seismic research to inspection. Secret; Presidential Handling. 4 pp. NARA, RG 59, Central Files, 711.5611/7-960.

which I could request in August if the Soviets show any likelihood of accepting.

However, should the Soviets reject this reasonable proposal or should they delay their response for an unreasonable period it would be our intention to announce that we are proceeding with the U.S. seismic research program and that we intend to invite United Nations or other international observation of these experiments. If this proposal does not satisfy the Soviets I doubt that there is anything we can devise which would, and under those circumstances I believe our action in going ahead would be widely understood and supported.

As for timing, it is our objective to put forward these proposals and be prepared in the event of Soviet rejection or undue delay to make the above mentioned announcement sometime during August.

To protect our negotiating position we are limiting knowledge of the second proposal and our future intentions to the smallest possible group.

With warm personal regard,

As ever,

Dwight D. Eisenhower UNQUOTE

Washington, July 14, 1960

SUBJECT

Plowshare Study Proposal

When the Science Advisory Committee met with the President on July 11th there was discussion of the Plowshare program, particularly with respect to the matter of radioactivity and its economic consequences. The Committee recommended that a critical study of the problem be undertaken by the National Academy of Sciences.

Attached is a general description of what is intended to be included in the proposed study. The description is based on a discussion with Dr.

¹ Source: Transmits description of Plowshare study proposal. Confidential. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Dr. Kistiakowsky.

Kistiakowsky immediately prior to his departure for Europe, but he has not had an opportunity to see the final language.

D.Z. Beckler

Enclosure

Proposed Study

K-C-10334

July 14, 1960

*Proposed Study on
Radioactivity Associated with Project Plowshare*

It is proposed that, on behalf of the President, the Special Assistant for Science and Technology request the National Academy of Sciences/ National Research Council to undertake a classified study of the radioactivity associated with use of nuclear explosions for peaceful purposes (Project Plowshare). The purpose of this study would be to provide a basis for government planning concerning Project Plowshare.

The study would be focused on the critical evaluations of the world-wide and local fallout and the ground contamination involved in specific applications of nuclear explosions proposed in Project Plowshare. The study would also make general estimates of the direct and indirect economic effects resulting from precautions against radioactivity contamination. In addition, the study would estimate the duration and magnitude of the research and development effort required to reduce the radioactive contamination involved in various applications.

The study would not attempt to evaluate either the overall comparative economic worth of the proposed applications of Project Plowshare or the psychological aspects of the problem resulting from either the favorable reaction to U.S. technological strength or the unfavorable reaction to fear of radioactivity contamination and the association of the project with nuclear weapons development.

The study would be completed by September 10, 1960 in a form suitable for a briefing for the President. (It must be recognized, however, that the late starting date and the problem of obtaining the services of competent people during August make this completion date uncertain.) The cost of conducting such a study is estimated at some \$25,000 to \$50,000.

582. Memorandum From Henderson (IO) to Merchant¹

Washington, July 19, 1960

SUBJECT

Background for Your Meeting with Lord Hood on Disarmament

The Acting Secretary and Ambassador Lodge, in a meeting with the President agreed in principle that we take steps to convene a meeting of the Disarmament Commission about the middle of August—preferably earlier rather than later. We had hoped to have a meeting of the Disarmament Commission shortly after the Soviet walkout from the 10-nation Committee on Disarmament meetings in Geneva which would have been limited to a call on the USSR to resume negotiations. We had not envisaged that the Commission would become involved in the details of the substance of disarmament, nor would it concern itself with the transfer of the disarmament negotiations to a forum other than the 10-nation group. The passage of time has changed the situation, and the limited kind of DC meeting we had in mind no longer appears profitable.

It has been our expectation and that of our allies that there would be at least one meeting of the Disarmament Commission before the next General Assembly. The primary issue among our allies is whether or not the meeting should be immediately before the Assembly convenes and *pro forma* in nature or whether it should be called earlier and a more substantive discussion of the issues be allowed to take place. On July 15 Mr. Wilcox called the British, Canadian, Italian and French representatives in and informed them that we now believe a meeting by mid-August of the Disarmament Commission was most desirable. We have now had responses to our proposal. The Canadians feel that the earlier a meeting of the DC is convened the better; the Italians are willing to go along with a mid-August meeting but do not appear to feel strongly about the date; the British feel that the disadvantages of a mid-August meeting outweigh the advantages and prefer a later meeting which, at one point, they described as possibly late August or early September; the French prefer to hold no meeting of the Disarmament Commission and are adamantly opposed to a meeting prior to September 15.

While there are advantages and disadvantages which are cited below for a mid-August meeting, we believe the advantages outweigh

¹ Source: Background briefing for Merchant's meeting with Hood on position on timing of a meeting of the U.N. Disarmament Commission. Confidential. 2 pp. NARA, RG 59, Central Files, 600.12/7-1960.

the disadvantages and that we should make further efforts to persuade the French and British to our point of view.

Briefly stated, the advantages of a meeting by mid-August are as follows:

1. By that time the Soviet Government may have responded to our note of July 2 concerning the Communist bloc walkout from the 10-nation meeting in Geneva and again made clear that they do not intend to resume negotiations in that forum in the near future.

2. There is an obligation to report to the Disarmament Commission on the 10-nation Conference and it is likely that some members of the Commission would resent what they might consider a deliberate effort to avoid meaningful discussion and action if the meeting is called just prior to convening the General Assembly. In addition, a late session of the Commission would interfere with the preparations which each delegation must make prior to convening the General Assembly session and might for this reason alone be resented.

3. Finally, fixing a precise and early date for convening the Disarmament Commission might place some pressure on the French to move toward agreement with us on a revised disarmament plan. Such agreement would, of course, give us a much stronger position in a substantive discussion in the Disarmament Commission and the General Assembly, a position much less possible of exploitation for divisive purposes by the USSR.

On the other hand, there are serious difficulties. The principal one is a possibility that agreement will not be reached on a revised disarmament plan and we will thus be susceptible to Soviet divisive efforts. In addition, the question of the usefulness of the 10-nation Committee probably will be challenged by the Soviet Union and its associates, and the difficult question of the composition of another group may be raised (we have raised the question of composition with our allies but we have not as yet received their views as to how to handle this issue should it be raised).

We are doubtful that the French or even the British can be persuaded of the advantages of a meeting of the Disarmament Commission by mid-August but in view of the agreement in principle on such a meeting between the Acting Secretary, Ambassador Lodge and the President, we believe we should make one more effort at your level before reconsidering this course of action. We had urged our allies to respond favorably to our proposal well before July 20 so that our request for a meeting of the Disarmament Commission could be made coincidental with the withdrawal of the bulk of our negotiating mission in Geneva which will begin on that date.

583. Letter From Herter to McCone¹

Washington, July 20, 1960

Dear John:

At the President's request, I am sending you herewith a copy of a presentation entitled "Nuclear Test Ban Negotiations" recently made to the President by his Science Advisory Committee.

With warmest personal regards,

Most sincerely,

Christian A. Herter

Enclosure

Presentation Prepared by the Science Advisory Board

Washington, July 12, 1960

Nuclear Test Ban Negotiations

Mr. President, we are concerned over the possibility that the nuclear test ban negotiations will end in failure under circumstances which may cause a substantial portion of world opinion to place the blame for the failure on the United States. We would, therefore, like to discuss two technical problems which could endanger our position before world opinion if these negotiations fail. These problems are the use of nuclear explosions for seismic research (Project Vela) and for peaceful purposes (Project Plowshare).

There are many important unsettled issues in the Geneva negotiations. On some of these issues both sides have presented positions which are being actively debated; on other issues one side or the other has not yet taken a position (The United States for example has not presented a position on the length of moratorium or the high altitude coverage of the Treaty). *The technical issue concerning the use of nuclear explosions in the seismic research program to improve the control system is not in itself sufficiently critical that it should control the outcome of the negotiations.*

¹ Source: Conveys copy of presentation by the Science Advisory Board entitled "Nuclear Test Ban Negotiations." Confidential. 7 pp. Eisenhower Library, McCone Papers, Testing.

We believe that the program for improving means of seismic detection of nuclear explosions which is now being pursued vigorously in this country is most desirable. Nevertheless, one must anticipate that the technical results of this *program will not change the nature of the political decision* which will have to be faced by the U.S. Government after a two year period. The technical basis for such decisions will, of course, be stronger. There will, however, *still be a threshold* yield of nuclear explosions, probably smaller than at present, below which it will not be possible to distinguish explosions from earthquakes. The United States will have to make a purely political *decision whether to accept the possibility of evasion of a test ban under this threshold, or whether to press for a more extensive control system, or whether to resume testing of small weapons.* In addition, *methods of concealment will still exist, and even more powerful ones may have been conceived.* The United States will still have to *weigh these factors against the risks and costs to a potential violator, against the net military significance of continued nuclear weapons progress, and especially against the broad significance of achieving a first step toward more important measures of arms control and toward opening up the USSR.*

A seismic research program using only conventional chemical explosives would contribute a great deal to seismic detection methods, but would fall far short of the objectives of the presently planned research program, particularly in the area of concealment by decoupling. Therefore, *we recommend that every effort be made to propose at Geneva a safeguarding procedure involving the open inspection of obsolete U.S. devices whose design is already known to the USSR.*

We believe that it is imperative that any nuclear explosions in the seismic research program be conducted solely for useful seismic experiments, so that our motives in conducting them cannot be subject to question. We are concerned, therefore, both by the possibility that such an early date will be picked for the first nuclear explosion that its scientific value will be drastically reduced and by present plans for the use of the so called LOLLIPOP site which has extensive and obvious military weapons effects tests built into tunnels in the immediate vicinity of the shot point.

Should attempts to arrive at a mutually agreed upon safeguarding procedure fail, we do not consider that the promise of the seismic research program toward clarifying the political issues is sufficient to warrant unilateral use of nuclear explosions. Under such circumstances, we recommend that the seismic research program be restricted at this time to chemical explosions. *We believe that should the U.S. resume unilateral nuclear explosions, it should be only for valid military reasons.* It would be unfortunate if weapons testing were resumed as a result of a program which itself was conceived to remove obstacles from the treaty to cease such tests.

The use of nuclear explosions for peaceful purposes (Project Plowshare) presents a less immediate but more difficult problem than their use for seismic research. Although some exploratory work can be done in this field with both chemical explosives and obsolete nuclear devices, ultimate economic utilization of nuclear explosions for peaceful uses depends on the most advanced thermonuclear weapon design. The question of safeguarding procedures for these nuclear explosions will have to be faced both in drafting treaty provisions and in preparing for Plowshare nuclear explosions planned for next year. On the one hand, we cannot subject advanced devices to Soviet inspection in the foreseeable future; and, on the other hand, we cannot insist that the treaty be drawn to permit this project to proceed in an unrestricted fashion without creating an almost unlimited means of evading a ban on nuclear weapon development.

The Plowshare projects have several common features:

- (a) they aim to accomplish, at a hoped for large economic advantage, objectives most of which could be achieved by ordinary means.
- (b) they are long range, requiring further studies and test explosions before the actual tasks can be begun.
- (c) they involve many new safety considerations which affect the engineering and economics of the projects.

We have no doubt concerning the soundness of the basic underlying physical principles. On the other hand, *a realistic evaluation of the economic balance between nuclear and ordinary accomplishment of the projects has not been made.* Such an analysis cannot be made until the economic significance of the radioactivity controls required in Plowshare undertakings is understood. Even if technically radioactivity proves controllable, a serious public relations problem remains. There does not appear to be any economic or scientific reason why such a program should be pursued in haste. We are concerned, therefore, that the proponents of this project may be overly optimistic over its immediate prospects, and that this project could be oversold by them in much the same manner as were fusion reactors and aircraft nuclear propulsion. A critical review by an unbiased competent group is essential before decision to push this program is taken.

While a soundly prosecuted Plowshare program might be of value to U.S. prestige, we are concerned with the probable adverse public reaction to potential radiation exposures, however small, and also with the inevitably widespread doubt concerning U.S. motives. We note in this connection that Mr. Vishinsky in November 1949, when announcing the first successful Russian nuclear tests to the United Nations, explained the explosions as having been carried out for just such peaceful economic purposes as are envisaged under the Plowshare program.

Under these circumstances, the United States may have difficulty justifying to world opinion, or to our own people, either unilateral initiation of nuclear explosions for peaceful purposes or insistence on treaty provisions which would appear to permit nuclear weapon development, if these courses of action were to result in the breakdown of the Geneva negotiations and (or) in the resumption of nuclear weapons testing.

We conclude reluctantly that an effectively controlled nuclear weapons test ban will necessarily involve some restrictions to an optimum program of nuclear explosions for peaceful purposes, unless such a program can be conducted openly.

584. Letter From Wadsworth to Herter¹

Geneva, July 21, 1960

Dear Chris:

Many thanks for your nice letter of July 16. You are quite right that things have picked up considerably, but our information from Washington is that there are still a few important things which are stalled.

I agree with you that if things looked as though we were close to agreement in early August, the Conference should probably keep driving ahead. However, given the existing rigid position of the Soviet Union on all matters over the last several weeks, I am sure that this will not happen.

Cabot and I have had some conversation on the subject of your second paragraph, and Doug Dillon and I also skirted around the subject delicately while he was here. Although I would, of course, like to carry this negotiation to a successful conclusion for all kinds of reasons, I still think that I would prefer to come back to New York in the event that Cabot goes on the ticket. This, of itself, is a question of necessary timing, which I wish we could discuss quietly together. Perhaps after the Convention we can work out some kind of an arrangement of

¹ Source: Exchange of three letters on state of negotiations and possibility that Wadsworth will replace Lodge. Personal and Confidential. 5 pp. Eisenhower Library, Herter Papers, Letters-1960.

communication between you and Cabot, on the one hand, and Geneva on the other.

As to personal and health considerations, there is no doubt but that, if I have to come back to New York, we will have to have a very definite rest period before plunging into preparations for the General Assembly. This might mean that mid-August could turn out to be a little late for departure from Geneva.

Thanks again for your warm understanding—I appreciate it more than I can say.

Sincerely yours,

James J. Wadsworth

Letter From Herter to Wadsworth

Washington, July 16, 1960

Dear Jerry:

It seems for some reason that our personal correspondence by mail becomes outdated by the rapidity with which events are moving. When you wrote me on July 1, you were obviously very discouraged as to the turn the negotiations had taken, but I gather from recent wires that things have picked up considerably. However, I have the feeling that we are not out of the woods as yet.

I do hope that the negotiations will be recessed in the middle of August, unless it looks as though you were very close to completing an agreement. A new factor has entered the picture insofar as you yourself are concerned in that Cabot Lodge may very possibly be nominated for Vice President on the Republican ticket, in which case we might well feel that you should take over in New York with the beginning of the September session. I will, of course, be in very close touch with you on this just as soon as our information is a little clearer.

In the meanwhile, take care of yourself and feel free to keep on sending me your own personal views.

Best to you both,

As always,

Christian A. Herter

Attachment**Letter From Wadsworth to Herter**

Geneva, July 1, 1960

Dear Chris:

Thanks so much for your nice letter of June 28. In one way, it makes me feel much better; in another way, quite apprehensive. I am wondering if people other than yourself who are struggling with this question realize what the inevitable steps will be if we cannot come up with a reasonable safeguard provision for these Project Vela explosions. Perhaps they don't care, but I would be surprised if this is the case.

One thing is sure: If we fail to come up with reasonable safeguards, and if we fail to come up with positions on the various other things like moratorium, composition of the Control Commission, etc., we will not have the same kind of finale as the Disarmament talks.

On the contrary, it will be the United States which will be in the position of not being able to defend itself before public opinion. I agree with the British that the major saving factor in the ten-nation debacle was the fact that Fred Eaton had a piece of paper ready to put on the table. If we don't put all of our pieces of paper on the table, we will not have that advantage. In addition to this, I am quite sure that public opinion would side with the Russians in their insistence that adequate safeguards be placed around research explosions in order to demonstrate that we are not seeking weapons development material.

This is a frightful dilemma, and I don't envy you people who have to make the decision. If it comes to a "finale" for this Conference, you have (1) no Conference, (2) no coordinated research program, (3) no moratorium, (4) no treaty, (5) no control, and (6) the \$64,000 question as to resuming tests. If tests are resumed, even for research, you face the inevitability of world-wide development of weapons. You have the Soviet declaration that they would test in all elements, thus leading to more public outcry which will be blamed on us because we were the first to test. What would this sequence of events do to us in the United Nations and the Western Alliance? Against this is the national security argument.

As I indicated above, I know you are thoroughly aware of all of these things, but I am just wondering if the other people who might oppose executive declassification fully realize where this would inevitably lead.

In the meantime I will be awaiting more cheerful news with as much patience as I can muster.

Harty joins me in best to you and Mac.

Sincerely yours,

James J. Wadsworth

585. Record of Telephone Conversation Between Eisenhower and Herter¹

July 21, 1960, 5:30 p.m.

5:30—the President telephoned from Newport with regard to his proposed press statement on disarmament. *The President* said he was bothered about this failure to have the British and French go along. THE SECRETARY said we have been working on it very hard for the last ten days. THE PRESIDENT said what he was getting at was if we go ahead and if we don't get their support, then what? THE SECRETARY what happens is that Lodge files the letter requesting the meeting with the SYG and the SYG then has to poll the entire membership of the UN and has to get 42 members supporting the call of the Disarmament Commission, and the Secy said he thinks when it is actually put on the table the British will go along but they won't go along to co-sponsor the call for the meeting at this time. THE PRESIDENT said the Secretary better send a message to the British and French to the general effect we are very sorry they couldn't co-sponsor but we felt it was necessary to put it on and see what the majority of the UN would feel. THE PRESIDENT said what worries him is if we get something of vital importance and we have ignored the British and French view on this—The President said as he understood it the difference was just a matter of timing—then when we want something that is really important, they say to the hell with us. THE SECRETARY said we have had at least four separate sessions with them on this; that the Canadians are keen and so are the Italians; but rather than split the Five Western Powers in the sponsorship of this, we felt it was better the U.S. call for the meeting since we could not have the co-sponsorship of all the other Four. THE PRESIDENT said if the Secretary feels this is important he will approve it, but said he thinks the Secretary should say to the British and French that we thought it was necessary to go ahead because of “special considerations” but we are sorry they couldn't see their way clear to cosponsor. THE PRESIDENT said he takes it, however, they are not opposed, except to the question of timing. THE SECRETARY said he has a feeling when the chips are down they may go along. THE PRESIDENT said he had doubts they would, and said we haven't many good friends in the world and when we slap them in the face it is bad, so the President said he would be careful to explain it. THE PRESIDENT said he would not spell out the “special considerations” but they

¹ Source: U.S. request to UN Secretary-General to convene the Disarmament Commission. No classification marking. 1 p. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.

could guess them. THE PRESIDENT said he would tell Jim Hagerty to put this statement out in half an hour to give the Secy time to send cables to the British and French.

586. Letter From Eaton to Herter¹

Geneva, July 25, 1960

Dear Chris:

I have submitted separately for the record a classified report on the Geneva disarmament talks but since it runs to some 14 pages, I want to sum up here more briefly comments and recommendations on what strike me as the essential points emerging from the Conference.

1. It's clear that we never got down to the stage of concrete and business-like negotiations on disarmament with the Soviet side. From our own point of view, the Conference was more a matter of continuing, backstage negotiation with our Allies, particularly France, on how far the United States was willing to alter its basic disarmament position to counter Soviet initiatives in this field.

2. We made an honest effort to find some genuine negotiating ground with the Soviets. However, the Soviet break on June 27 confirmed what had become obvious almost from the start, namely—that the Soviets came to Geneva with an all-or-nothing program they knew could not be negotiated with the West. At no time in Geneva was there any indication that the Soviets were prepared to discuss any disarmament matters which had a possible chance of acceptability to us. They knew this, and therefore at no time did they contemplate a serious negotiation.

3. I am not prepared to speculate at length about the conditions under which the Soviets might have been willing to talk seriously in Geneva, or whether they came here in March with the primary intention of using the Conference for Communist propaganda and political warfare against the West. Regardless of their intentions, however, every statement and act in and out of the Conference appeared designed for propaganda and to win world opinion. I am not at all sure they succeeded in this, particularly in view of the poor timing of their break.

¹ Source: Sums up ten-nation disarmament conference. Secret. 4 pp. NARA, RG 59, Central Files, 396.12-GE/7-2560.

Nothing short of major substantive concessions from us of a character damaging to Free World security would have been likely to change the Soviets' basic propaganda approach to the Conference.

4. Fruitful discussion of disarmament with the Soviets will only take place in bilateral talks. There must be fullest consultation with our Allies giving consideration to their views, their national interests and aspirations, but the decision must rest with us. Use might be made of NAC to facilitate this process. While bilateral negotiation will be politically difficult now, it will become far more difficult and perhaps impossible as time goes on.

5. One of the biggest problems facing us on the Allied side is how to resolve our basic differences with the French on disarmament, which ran through the whole Conference. The French position on early control and elimination of delivery vehicles is intended primarily as pressure on us. It counters our proposal to stop fissionable production before the French have really started, and serves notice that we should not expect to retain the bulk of our nuclear weapons and delivery means while the bulk of our nuclear weapons and delivery means while the French have none. By appealing to world opinion as a plausible avenue to disarmament, the French delivery vehicle proposal is intended to soften the difficult position in which the French would find themselves if they should refuse to go along with any agreement we might make with the Soviets in the nuclear field. It is probable that the only way out of our difficulty with the French would be to assure them that we will find a way to support their efforts to become a nuclear power. Failing this, French acquiescence to a common Western Plan will be obtained, if at all, only by the prospect of the tabling by the other four powers of a common paper before some public session, as in the UN.

6. A related major problem concerns the position and tactics we should adopt to handle the disarmament issue during the next phase in the UN. I feel strongly that, if any paper is to be tabled in the UN, we should seek flexibility by tabling a US Plan which the NATO governments would welcome and generally endorse without being committed—either our June 27 plan or better yet its modified version, US/WP/09 (Rev. 5). This would give us a better opportunity to move into possible bilateral discussions in the future than if we were committed to either a Five-Power or Four-Power Plan from which we could not vary without the consent of our partners. My guess is that the British, Canadians, and Italians would prefer our tabling a plan unilaterally to isolating the French publicly. Furthermore, if we should do this, the French might not feel impelled to air their differences with us publicly by tabling their own markedly different proposals.

7. As far as the Soviets are concerned, we can expect them to make renewed efforts to get UN approval of their approach to general and complete disarmament in order to set the framework for any new round of negotiations. They will probably seek to enlarge the composition of the Ten-Nation Committee perhaps by the inclusion of Communist China and India. The outcome of maneuvering in the UN during the next few months will be important, and we certainly must do our best to forestall Soviet moves which could have crippling effects on the future Western negotiating position.

8. If serious negotiation is to be undertaken in the future, it is important that the US not state a public position in detail until after the negotiations have commenced and it becomes apparent that the Communists are prepared for serious talk. The public position we will constantly be called upon to declare must be in general terms, sufficiently specific to be serious but sufficiently flexible and consonant with our basic security needs to permit detailed negotiation when such becomes feasible. Although this is difficult, the latest US proposal, in good measure, meets the requirement.

9. In view of Soviet disarmament initiatives designed for wide mass appeal, there may understandably arise pressures for US response in kind. The US should never design a disarmament proposal or plan with an eye to propaganda. Once the elements of the plan are determined, however, it should be put in clear and forceful language to enhance its public appeal. In the long run we will be best served before world opinion by straightforward espousal of reasonable and practical measures which we ourselves are fully prepared to carry out. Any US proposal must be consonant with US security. This does not mean that US security may not well require important controls, reductions and perhaps eventual elimination of national armaments and forces, but the proposal must require that the first measures to be taken shall be reasonably verified before we are committed to further obligations which, if not honored by other states, would endanger our security.

10. In formulating a disarmament position, there is a natural tendency to focus on our present security and political posture. This is understandable, since we can not predict with assurance what the future will hold. However, we can be sure that during the several years time it would take to work out and put into effect any substantial disarmament measures, there will be important changes in the present situation. For example, our weapons systems may call for a quite different deployment from that of today. It may not be necessary to maintain substantial forces on the European continent or elsewhere abroad. Furthermore, as their own situation changes, our Allies may not welcome our presence to the extent they do today. I do not mean to suggest that

this will necessarily be the case, but such considerations should be taken into account in designing the future disarmament proposals.

Sincerely,

Frederick M. Eaton

587. Official Report of the U.S. Delegation to the Conference of the Ten-Nation Committee on Disarmament¹

Geneva, March 15–June 28, 1960

OFFICIAL REPORT OF THE UNITED STATES DELEGATION TO
THE CONFERENCE OF THE TEN-NATION COMMITTEE ON
DISARMAMENT

I. BACKGROUND

The Conference of the Ten-Nation Committee on Disarmament held 48 sessions in Geneva between March 15, 1960 and June 28, 1960. The committee recessed between April 29 and June 7.

The committee originated as a result of an initiative of France, the United Kingdom, the United States and USSR. The Foreign Ministers of these countries, in a communique of September 7, 1959, declared that:

“As was announced on August 5, 1959, prior to the closing of the Foreign Ministers’ Conference in Geneva, the Foreign Ministers of the United States of America, France, the United Kingdom, and the Union of Soviet Socialist Republics discussed possibilities by which further negotiations on the question of disarmament could be most effectively advanced. Agreement has now been reached among the Governments of the United States of America, France, the United Kingdom, and the Union of Soviet Socialist Republics to set up a committee to consider disarmament matters. Understanding has also been reached that the participants in the disarmament committee will be the United States of America, France, the United Kingdom, the Union of Soviet Socialist Republics, Bulgaria, Canada, Czechoslovakia, Italy, Poland, and Rumania, subject to the agreement of all the named states.

“The United Nations Charter recognizes that disarmament matters are of world-wide interest and concern. Accordingly ultimate responsibility for general disarmament measures rests with the United Nations.

¹ Source: No classification marking. 14 pp. NARA, RG 59, Central Files, 396.12–GE/7–2660.

The setting up of the disarmament committee in no way diminishes or encroaches upon the United Nations' responsibilities in this field. In setting up the committee the special responsibility resting on the great powers to find a basis for agreement is taken into account.

"The four governments conceive of this committee as a useful means of exploring through mutual consultations avenues of possible progress toward such agreements and recommendations on the limitation and reduction of all types of armaments and armed forces under effective international control as may, in the first instance, be of particular relevance to the countries participating in these deliberations. Furthermore, it is the hope of the four governments that the results achieved in these deliberations will provide a useful basis for the consideration of disarmament in the United Nations.

"It is the intention of the four governments that United Nations Disarmament Commission will be kept appropriately informed of the progress of the deliberations of the committee. For this purpose the four governments have agreed that the committee will present reports on its work to the United Nations Disarmament Commission and through it to the United Nations General Assembly and the Security Council. As a first step in this direction, they have requested the Secretary General, in accordance with Resolution 1252-D (XIII), to convene the Disarmament Commission during September 1959 if feasible, in order that the members may be fully informed of the nature and purpose of the disarmament committee.

"The four governments will consult with the United Nations Secretary General with respect to providing appropriate facilities to the newly established committee. They expect that the committee will begin its work early in 1960 in Geneva."

The General Assembly on November 20, 1959, adopted Resolution 1378 (XIV), in which it called upon governments to make every effort to achieve a constructive solution of the problem of general and complete disarmament. The same resolution requested the Secretary General to make available to the ten-nation committee for thorough consideration the U.K. declaration of September 17, 1959, the Soviet declaration of September 18, 1959 and other proposals or suggestions made, as well as the records of the plenary meetings and the meetings of the First Committee at which the question of general and complete disarmament was discussed. The General Assembly also expressed the hope in this Resolution that "measures leading towards the goal of general and complete disarmament under effective international control will be worked out in detail and agreed upon in the shortest possible time."

II. THE WORK OF THE COMMITTEE

A. *Before the Recess of April 29*

At the opening session of the conference on March 15th the Soviet bloc renewed its support of the plan presented by Chairman Khrushchev to the United Nations General Assembly on September 17, 1959.

The plan called for complete and general disarmament to be carried out, within a four-year period, in three stages. Stage one proposed significant reductions in the field of conventional armaments and armed forces. The second stage called for the complete disbandment of all remaining armed forces and the elimination of all foreign military bases. The final stage proposed the total elimination and/or destruction of all means of waging war, including abolition of all military institutions, courses and organizations.

The Allied plan was formally submitted at the second session of the Conference. As an ultimate goal the preamble of the plan looked toward a secure, free and peaceful world disarmed under effective international control where disputes would be settled in accordance with the principles of the United Nations Charter. To attain this objective the plan proposed three stages. The first and second stages detailed specific measures of disarmament which, in the first instance, would serve to stabilize the existing military environment. These two stages set forth basic measures to: guard against surprise attack or accidental war; halt future production of fissionable material for weapons purposes; reduce existing nuclear weapons stockpiles; bring about beginning balanced reductions in conventional arms and armed forces and initiate steps toward assuring the peaceful use of outer space. The third or final stage outlined far-reaching measures of disarmament. These aimed at the elimination of armaments to levels required only for internal security purposes and the build-up of an international enforcement system backed by universally accepted rules of law.

During the first three weeks of the negotiations each side probed the position of the other side.

The Soviet bloc, in asking the Allied powers to elaborate on their program, argued that the Allied plan did not provide for the total elimination of all means of warfare and did not embody concrete measures which, within a fixed time period, would lead to general and complete disarmament. They claimed that it was not responsive to Resolution 1378 (XIV) of the United Nations General Assembly.

The Allies, in turn, noted that the Soviet bloc, while having stated its willingness to embark upon a program of complete and general disarmament, omitted any reference to specific measures by which this objective could be reached; its plan had unrealistic time limits and avoided control measures in the early stages. In particular, the Allies cited the fact that it detailed no specific measures which would lead to the first essential requirement—that of halting the arms race and securing a generally stable military situation.

Midway through the conference's first round, it became apparent that neither side was prepared materially to change its basic position.

At this juncture, the Soviet bloc took a new tack. On April 11, the Soviet representative tabled, ostensibly to find a way out of the apparent stalemate, a document entitled "Basic Principles of General and Complete Disarmament". This stated that general and complete disarmament should: include the disbanding of all armaments and armed forces; be achieved in a sequence of three stages within four years; be implemented under international control; result in states having only internal security forces of an agreed size; and not be interrupted by any condition not covered in the treaty. In addition, a so-called "concrete measure" was proposed. To back up an agreement on principles by a deed, the bloc suggested that states possessing nuclear weapons should "solemnly declare" that they would not be the first to use them.

The Soviet bloc's "General principles" document was a step backward rather than a step forward. It was nothing more than a rephrased version of objectives contained in the Khrushchev plan. As to the proposed measure of renouncing first use of nuclear weapons, the West's view was that uncontrolled paper proclamations of intent which in no way would assure world stability or security were unacceptable.

At this point, the conference seemed to be stymied. In an effort to break the apparent deadlock, the Allies, on April 26, presented to the conference a "statement on conditions" for disarmament. It was hoped that such a statement would overcome the intransigence on the Communist side and permit negotiations to proceed on specific measures.

The statement declared that the disarmament process and any agreement finally reached must fulfill the following conditions: disarmament must be carried out in stages and as rapidly as possible, but with no fixed timetable; nuclear and conventional measures must be balanced in the interest of equal security for all countries; disarmament measures must be effectively controlled to ensure full compliance; and disarmament measures must be negotiated progressively according to the possibility of their early implementation and effective control. The statement concluded that the final goal of a program of general and complete disarmament under effective international control must be to achieve the elimination of weapons of mass destruction and their means of delivery, and the reduction and limitation of all types of forces and weapons to levels required only for internal security and the fulfillment of obligations under the U.N. Charter.

While the Communist countries did not specifically reject the Western paper, their reaction offered no encouragement to the Allied hope that the conference could turn toward a discussion of specific measures.

The conference recessed on April 29 in anticipation of the meeting of Heads of Government.

At the last session the Soviet bloc reiterated its determination to seek, as the first prerequisite of the conference, agreement on general principles for complete and total disarmament.

For its part, the West made it quite clear that unless and until the Soviet bloc was prepared to negotiate and agree on a number of specific disarmament measures, the conference's prospects for success were dim.

The Allies had hoped that through general probing this first round would indicate possible areas of common interest for negotiation. This unfortunately was not the case.

B. After the Conference Reconvened on June 7

Upon the resumption of the conference on June 7, the Soviet Delegation submitted the paper, Basic Clauses of a Treaty on General and Complete Disarmament, which had been transmitted by the Soviet Union to the Western governments on June 2, as well as to some 80 odd additional nations, and which revised the earlier Soviet proposals of September 18, 1959. The Soviet Delegation maintained that these new proposals represented an attempt to meet some of the views expressed by the Western Delegation prior to the recess.

The Soviet Delegation was told that the Western Delegations and their governments would carefully study the Soviet proposals in the hope that they might represent a serious desire to negotiate.

The work of the conference thereafter consisted primarily of two endeavors, first a renewed effort by the Western Delegations to have the Soviet and other Eastern European delegations discuss the concrete measures of disarmament as set forth in the Western proposals of March 16, and secondly attempts by the Western delegations to obtain clarifications regarding the new Soviet paper, in order to facilitate study of these proposals by Western governments.

Our efforts to get the Soviet delegation to discuss specific practical measures of disarmament that would enable the world to make a start toward the goal of general and complete disarmament were unsuccessful. In spite of the fact that we invited the Soviet Delegation to choose any one of the measures in the March 16 paper as a basis for initial discussion, the Soviet Delegation persisted in refusing to discuss these proposals or the inspection requirements for each. The excuse used was to charge that the March 16 proposals were essentially proposals for control without significant measures of disarmament.

The Western effort to obtain clarification of the Soviet proposals of June 2 was made by a series of questions which were put to the Soviet Delegation. Only some of these questions were answered during the course of the discussions and the answers were unsatisfactory. The questions on control which were submitted by the French Delegation were answered evasively. The Soviet and other Eastern European delegations spent most of their time making propaganda speeches charging that the Western delegations were avoiding substantive responses to the new Soviet proposals and were displaying a negative and inflexible attitude.

In spite of the evasiveness of many Soviet answers to questions, it became clear that the new Soviet paper was primarily a change in format from the earlier September 18 proposals, and that most of the unrealistic and unacceptable concepts of that earlier document remained. Various changes which the Soviet Delegation maintained had been made in the September 18 paper in order to meet Western views proved in fact to be illusory or tied to impossible conditions.

Thus, for example, the Soviet Delegation maintained that moving a proposal for elimination of nuclear delivery vehicles from the last to the first stage of a disarmament program was in response to views expressed by the French Delegation, whereas in fact the Soviet proposal would have required the free world to commit itself as a first step to destroy within a matter of months its essential means of collective self-defense.

Similarly, the discussions showed that Soviet indication of a possible willingness to abandon its previous insistence on a four-year time table for complete disarmament was merely the abandonment of this particular figure but not of the impractical principle upon which it is based, that a fixed time table for the entire complex disarmament process must be agreed on before any steps can be taken to halt the arms race. As a corollary position the Soviet Union continued to insist that a time table for complex and radical disarmament measures be agreed to without the benefit of any joint studies to determine the problems or even feasibility of implementing each measure.

With regard to the critical question of control and inspection, there appeared to be little change in the Soviet position even though the Soviet paper of June 2 devoted more space to the subject than did the Soviet paper of September 18. The discussions showed that the Soviet Delegation was unwilling to accept even in principle that international inspectors would have the right to determine if clandestine installations existed in excess of agreed amounts; the Soviet position would limit the inspectors merely to counting these particular installations or forces that a government declared it was eliminating.

Finally, the responses made by the Soviet Delegation to some of the questions put to it made it apparent that a fundamental difference between positions remained. The position expressed by the Soviet Delegation was that the whole range of general and complete disarmament must be negotiated in detail in the Ten Nation Conference and then submitted to a world conference where all the nations of the world would have to approve a complex world-wide treaty before any actual measures to halt the arms race could be instituted. This approach would, of course, foredoom the world to endless discussion and no action could be taken to get the disarmament program started while negotiations were continuing on later stages.

The U.S. Delegation indicated to the Soviet Delegation the general nature of our concerns about the above indicated Soviet positions. The U.S. Delegation had also indicated in earlier meetings those elements of the June 2 paper which appeared to represent some slight movement toward a more rational approach to disarmament, such as the Soviet recognition, at least in principle, of the need to develop improved peace-keeping arrangements within the United Nations to assure the security of nations as national forces are progressively reduced, and the apparent recognition of the need to study at an early stage the arrangements necessary for the cessation of production of fissionable material for use in weapons.

Notwithstanding the serious and fundamental faults in the Soviet paper which the discussions in the conference had revealed, and despite the fact that the Soviet Delegation had refused to discuss the allied proposals of March 16, the U.S. Representative returned to Washington for consultations during the week of June 19. The Soviet Representative, Mr. Zorin, was informed by the U.S. Representative that he was returning to Washington to discuss the various views that had been presented during the discussions since the recess. During these Washington consultations a revised U.S. proposal was prepared. This new paper was based on the same sound basic principle of that of the Western proposals of March 16, namely, that we should proceed with earlier measures of disarmament and then discuss the details of later and more difficult stages of general and complete disarmament. The new U.S. paper did, however, clarify and amplify certain of the proposals put forth in the Western delegations on March 16 and it contained modifications which reflected views expressed by our allies and certain of those expressed by the Soviet Union. Thus, its purpose was to provide a fresh basis for advancing the negotiations.

The U.S. Representative informed Mr. Zorin before the meeting of June 27 that discussions in Washington had been fruitful and that the U.S. Delegation would table a new paper within the next few days, following consultations with allied delegations.

In the light of these facts, the subsequent action of the Soviet and other Eastern European delegations during the meeting of June 27 in withdrawing from the conference clearly demonstrated that their governments were not interested in serious negotiations but rather were concerned only with propaganda.

The action of the Polish Representative who was acting as Chairman of the meeting was unprecedented in the annals of international conferences. The Polish Representative refused to permit Western representatives who had been inscribed to speak the opportunity to make statements, recognizing only communist representatives. He then attempted the illegal procedure of declaring the meeting and conference ended. His departure from the room required the United Kingdom

Representative to take the chair for the remainder of the meeting. The U.S. Delegation, in view of the actions by the communist delegations, tabled the new U.S. paper (TNCD/7). It was not possible, of course, to present the paper as a Five Power document, since none of the Allied delegations had had time fully to consult with their governments.

The Conference held one subsequent meeting on June 28 in order to give the communist delegations an opportunity to reconsider their arbitrary withdrawal. The communist delegations, however, did not attend the June 28 meeting. The Conference adopted the following communique at the end of the meeting:

"The forty-eighth meeting of the Conference of the Ten-Nation Committee on Disarmament was held in the Palais des Nations, Geneva, on 28 June 1960, under the chairmanship of the representative of the United Kingdom.

"The Conference requested the United Nations Secretariat to forward all records of the Conference to the United Nations Disarmament Commission, and, through it, to the General Assembly and the Security Council.

"The Conference decided that the verbatim record of the forty-eighth meeting should be made public as soon as possible.

"The Conference adjourned at 11:10 AM."

The United States Delegation, together with the delegations of Canada, France, Italy and the United Kingdom remained on in Geneva in order to be available in the event the governments of the communist delegations reconsidered their actions and decided to resume negotiations. The failure of the communist governments to return their delegations to the Ten Nation Conference, however, created a situation in which further useful work by the Conference was impossible.

The United States Delegation expresses its regret that the communist governments have, by their actions, prevented successful negotiations on disarmament. The importance to the world of the task of halting the arms race and of achieved balanced and staged disarmament remains unchanged by recent communist actions in the Conference.

It is important that the United States continue its efforts to seek safeguarded disarmament agreements that will reduce the danger of war and permit the devotion of a greater portion of man's creative capacity to the construction of a better world for all peoples. It remains, however, for the communist governments, and particularly the Soviet Union, to decide that they are more interested in serious practical negotiation than in propaganda before this hope can be realized.

III. CONFERENCE ORGANIZATION

A. Secretariat

As a result of consultations with the Secretary General of the United Nations, all facilities and services for the conference were

provided by the United Nations Secretariat under the direction of Dr. Draga N. Protitch, who was present as the personal representative of the Secretary General.

B. Rules of Procedure

Prior to the first private meeting of the conference, agreement was reached on the following document (TNCD/INF. 1):

“Agreement on Procedural Arrangements

Agreement has been reached by the representatives of the ten Nations on the following matters. Modifications may be made by agreement of the ten Nations.

1. Nature of Meetings

All meetings will be private, except when agreed otherwise by the ten Nations.

2. Time of Meetings

There will normally be one meeting per day at 10:30 AM Mondays through Fridays. If experience proves that this time creates difficulties for any Delegation the matter may be raised again for further discussion.

3. Publicity and Communique

Publicity by or on behalf of the conference will be limited to the communique following each meeting. The draft communique will be prepared by the Chairman of the day and approved by the ten Nations. It will normally refer to the chairmanship of the meeting, any new documents tabled, agreements reached and the time of the next meeting. Delegations reserve the right to brief the press as regards their own positions.

4. Languages and Records

The languages of the conference will be English, French and Russian and there will be simultaneous interpretation into each of these languages. The right is reserved for delegations to request consecutive interpretation, but wherever possible advance notice of the request should be given to the Secretariat. Verbatim records will be furnished in the three languages.

5. Seating and Chairmanship

Delegations will be seated in English alphabetical order and chair will be taken in rotation by the ten Delegations in English alphabetical order.”

C. Agenda of the Conference

No formal agenda was proposed or agreed upon. In addition to the documents transmitted to the committee by General Assembly Resolution 1378 (XIV), the committee had before it the following documents tabled during its deliberations:

Message of greetings from the Chairman of the Council of Ministers of the USSR, N.S. Khrushchev, to the Ten-Nation Committee on Disarmament. (TNCD/1 of 15 March 1960)

A message by President Eisenhower to Ambassador Eaton for the Conference of the Ten-Nation Committee on Disarmament. (TNCD/2 of 15 March 1960)

A Plan for General and Comprehensive Disarmament in a Free and Peaceful World submitted by Canada, France, Italy, the United Kingdom of Great Britain and Northern Ireland, and the United States of America on 16 March 1960. (TNCD/3 of 16 March 1960)

Proposal by the Delegations of the People's Republic of Bulgaria, the Polish People's Republic, the Rumanian People's Republic, the Union of Soviet Socialist Republics and the Republic of Czechoslovakia, submitted to the Ten-Nation Committee on Disarmament on 8 April 1960 (TNCD/4 of 8 April 1960)

Proposal by the delegations of Canada, France, Italy, the United Kingdom of Great Britain and Northern Ireland and the United States of America, concerning principles and conditions for general and complete disarmament under effective international control, submitted to the Ten Nation Committee on Disarmament on 26 April 1960. (TNCD/5 of 26 April 1960)

Proposals by the Soviet Government submitted to the Ten Nation Committee on Disarmament on 7 June 1960 (TNCD/6/Rev. 1 of 8 June 1960)

Program for General and Complete Disarmament under Effective International Control submitted by the delegation of the United States of America to the Ten Nation Committee on Disarmament on 27 June 1960 (TNCD/7 of 27 June 1960)

IV. UNITED STATES PARTICIPATION IN THE CONFERENCE

United States Delegation:

Ambassador Fredrick M. Eaton, Chairman, U.S. Representative
Mr. Charles C. Stelle, Minister, Deputy U.S. Representative

ADVISERS

Mr. Alexander Akalovsky, Department of State

Mr. N. Spencer Barnes, Department of State

Mr. Jeremy Blanchet, Department of State

Rear Admiral Paul D. Dudley, U.S.N. Senior Military Advisor,
Department of Defense

Mr. F. Richards Ford, III, Department of Defense

Mr. G. McMurtrie Godley, Department of State

Mr. Robert E. Matteson, Department of State

Mr. Alan G. Mencher, Department of State

Captain Willard deL. Michael, U.S.N., Department of Defense

Mr. D. F. Musser, Atomic Energy Commission
Mr. John M. Stuart, Jr., Public Affairs Officer, American Consulate
General, Geneva
Mr. Robert G. Sturgill, Department of State
Lt. Colonel Harry E. Taber, U.S. Army, Department of Defense
Mr. Malcolm Toon, Department of State
Mr. Henry S. Villard, Minister, U.S. Representative at the European
Office of the United Nations
Mr. Lawrence D. Weiler, Department of State
Colonel Thomas W. Wolfe, U.S.A.F., Department of Defense

SECRETARY OF THE DELEGATION

Mr. Virgil L. Moore, U.S. Resident Delegation and Consulate General, Geneva

V. OTHER DELEGATIONS PARTICIPATING IN THE CONFERENCE

1. Delegation of the People's Republic of Bulgaria... (4 members)
2. Delegation of Canada... (5 members)
3. Delegation of the Czechoslovak Republic... (11 members)
4. Delegation of France... (19 members)
5. Delegation of Italy... (10 members)
6. Delegation of Polish People's Republic... (8 members)
7. Delegation of Rumanian People's Republic... (9 members)
8. Delegation of the Union of Soviet Socialist Republics...
(17 members)
9. Delegation of the United Kingdom of Great Britain and North-
ern Ireland... (20 members)

588. Memorandum of Conversation Among Principals of Geneva Test Group¹

Washington, August 2, 1960

SUBJECT

Geneva Nuclear Test Negotiations

PARTICIPANTS

See attached list

The Secretary opened the meeting by reading Under Secretary Dillon's memorandum of conversation of the last meeting of the Principals with the President on July 7.

Chairman McCone stated that, as agreed at the July 6 meeting, AEC had consulted members of the Joint Committee to inform them of the alternative fallback position which was under consideration and to informally ascertain their views. Mr. Dwight Ink, who handles legislative liaison, had consulted five or six key members of the Joint Committee during a recent trip on which he had accompanied them. Without exception they opposed the fallback position violently. Mr. Ink's appraisal was that if the fallback position was presented to Congress through normal channels, there would not be a single vote for the proposal on either side of the aisle in either House. If the President should use the device of securing prior endorsement by both presidential candidates and by the leadership of both political parties, the chances of passage would still not be greater than 50-50. Chairman McCone said that he recognized that our job is to reach sound policy decisions and seek to influence Congress rather than to second-guess them. He realized also there was danger in basing an appraisal upon Congressional reaction to a hypothetical question rather than one actually before them for decision. Nevertheless, he thought Congressional reaction was a legitimate factor to consider in policy decisions and wanted to emphasize the negative effect upon that reaction which the Soviet proposal of 3 inspections had produced. There was much feeling that such a ridiculous proposal in the face of the scientific facts was an indication of lack of seriousness about the negotiations as a whole. *Under Secretary Douglas* commented that the question of 3 inspections is not directly related to the main question of safeguards.

¹ Source: Instructions to U.S. delegation to test ban negotiations. Secret. 7 pp. Eisenhower Library, White House Office Files Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy, 1960.

The Secretary, in reviewing other action that had been taken pursuant to the July 7 decision, recalled that the President had informed Prime Minister Macmillan of the course of action we had then contemplated, including the fallback position. There had been no official response from the Soviets to the proposal which was advanced in the conference on July 12. Tsarapkin had made a strong speech outside the conference condemning the proposal and using stock propaganda phrases, but he had not yet stated an official position. Meanwhile, he had put forth a proposal for 3 inspections to be applied above and below the threshold. He has pressed us for a declaration on a length of the moratorium. He may be seeking tactically to link the quota and moratorium questions. The Secretary recalled that the initial moratorium proposal of March 29 had been linked not to the quota but to two preconditions, namely, the conclusion of threshold treaty and agreement upon a coordinated research program. The Secretary was not sure that his view was fully shared by Under Secretary Dillon, but he personally considered that the original preconditions should be met before a moratorium would get us off on a tangent, and he did not see why we should agree on a moratorium before agreeing on the action to be taken by way of research during the moratorium. Both the U.S. and UK Delegations in Geneva had proposed that we get our positions on the table in the near future. The Secretary indicated that he had questions about this procedure. He would be reluctant to go to Congress on the fallback position until the Soviets had responded to our proposal, but he agreed that we could not let the Soviets delay a response indefinitely.

There was one aspect of the research program which he would like to see clarified, mainly that of the LOLLIPOP event. The Secretary read the letter of July 22 from Secretary Gates and raised the question of how urgent and important the proposed effects tests were considered to be. *General Loper* said that we had never had tests of underground pressures generated by close-in bursts. In building silos for underground missiles, in particular, we had to rely on extrapolation in the absence of such data. LOLLIPOP would be the first and perhaps the only shot we would conduct in granite, so we wanted to use it for this purpose. *The Secretary* asked whether we would be conducting the VELA program today except for the hope of achieving a test agreement through such a program. *Chairman McCone* said that we would, even if the negotiations break down, seek improvement of our knowledge of detection capabilities, although probably by using different devices in a somewhat different series of explosions. Even if there were no negotiations in progress, we would at least instrument our Plowshare and weapons tests to give us seismic data as well. *Under Secretary Douglas*, addressing himself to the Secretary's question as to the urgency of the tunnel lining tests, said it would be hard to maintain such tests are urgent to a matter of weeks or months. Our construction program for hardened bases is

already far down the road. It is true, however, that it is proceeding on the basis of limited experience. *The Secretary* observed that this then is not a controlling factor on the speed of moving ahead. *Under Secretary Douglas* said such information would be reassuring, but we have proceeded so far without any great question as to this aspect of the problem. *General Loper* said the designs for basic construction would not be affected, but the tunnel tests would give us better estimates as to their vulnerability. The same would be true of our evaluation of the effects of various weapons on Soviet bases in relation to differing with varying CEP's. *The Secretary* asked whether we would make all the information derived from such tests public. *Under Secretary Douglas* said yes. *Chairman McCone* said that Secretary Gates, in the meeting of July 7, had affirmed this, stating that all the information was of a fundamental scientific nature useful for both military and civil defense purposes. *The Secretary* asked how much information this would give the Russians. *General Loper* said it was hard to hold this kind of information classified, as Civil Defense people need this information badly, for example, in evaluating the use of subway tunnels for emergency transportation or shelter areas. *Under Secretary Douglas* said that since the LOLLIPOP event would be in granite, results would not be directly applicable to any missile site construction that is contemplated. *General Loper* said it would, however, add to our general knowledge of the question.

The Secretary said there was the immediate question of instructions to send Ambassador Wadsworth. In this connection, he failed to see the reason for making a recess proposal now. *Under Secretary Dillon* said it was simply a matter of the three delegations being exhausted. *Mr. Farley* said that our delegation had been instructed not to agree to either the beginning or the duration of a recess. The consensus was that it would probably be for about a month. *Chairman McCone* recalled that the March 29 announcement regarding our willingness to have a moratorium had been based on two preconditions and agreement had not been reached on either. It hardly seemed appropriate to recall the delegation or to agree to a recess under these circumstances. *The Secretary* said the principal unresolved issues include moratorium, quota and composition of the Control Commission. He felt the quota and the Control Commissions questions should be resolved first, but he would have no objection to putting in a statement that we intended a moratorium of a year or eighteen months, provided it was made clear that the matter would not be discussed further unless agreement had been reached on other matters. We should also send instructions that there should be no recess until the Soviets had responded to our safeguards proposal, and we in turn had had an opportunity to respond with our counter-proposal. We should send instructions that the moratorium question should not be negotiated while these matters were outstanding.

Chairman McCone referred to the telegram reporting on Narayanan's conversation with Tsarapkin and noted that in the process Narayanan had, in effect, revealed our fallback position. He read the telegram to the group and noted that if we advanced the fallback position, we might find ourselves confronted by a situation that would give us problems on the Hill. *The Secretary* said it made no sense to conduct these experiments for seismic improvement if the negotiations had blown up. The Soviets say that they would be free to test anywhere. Accordingly, we should not confine ourselves to seismic improvement shots if the negotiations end. *Under Secretary Dillon* said the first question was what we would tell Wadsworth. We should press for a reply before granting any recess. We should decide what to do if the Soviets come back with an answer along the lines of the Narayanan telegram. Presumably, we should go to the fallback, but we cannot go to Congress unless either the Soviets have accepted our July 12 proposal, which is impossible, or we are able to tell Congress of our fallback position and that we need this authority in order to conduct an essential program and that we will fire the first shot at a specified time. There was not a chance of the Soviets accepting our fallback proposal before an August recess. *Chairman McCone* said this amounted to saying that the whole matter must go over to the next Administration. *Under Secretary Dillon* said we must either do that or be prepared to announce, we are going to make a shot. He considered it best, from the standpoint of dealing with the Soviets, to state a fallback position and set a date on which the program would begin, but this might not prove feasible since the President did not seem very keen about issuing such an ultimatum. The alternative is to let things drag on until after the elections. *The Secretary* said we should put the alternatives to the President. If we are to break the negotiations at our own initiative, we must issue an ultimatum and announce a date for the first shot. He had no enthusiasm for talking about the moratorium until this matter was settled. *Chairman McCone* said the quota of 3 against all the scientific background we have presented is so ridiculous as to raise the question of whether the Soviets have any sincerity at all. *The Secretary* said that the present self-imposed moratorium, of course, is in the Soviets' interest, and accordingly is in their interest to drag out the talks. *Under Secretary Dillon* said we should recall that if we break off this time of the year, we get a debate in the General Assembly and possibly a resolution asking us not to proceed with the nuclear detonations. *Under Secretary Douglas* asked whether anybody had thought of our taking our own initiative in the UN with a resolution banning atmospheric tests. *Under Secretary Dillon* said he didn't think that would work. The resolution would promptly be amended to include all tests. Testing is an emotional rather than a rational issue on which the UN would be marshalled against us. If we decide to act against UN sentiment, we should take action first and let the UN deplore it rather

than announcing action, being confronted by a UN resolution and then acting in defiance of it.

The Secretary said he was planning to instruct Wadsworth that there should be no reference to the moratorium until the safeguards issue was settled. *Under Secretary Douglas* said he would approve such an instruction. *Under Secretary Dillon* asked what we would do when the Soviet answer comes. Should we decide now or have another meeting. It was generally agreed that we should decide later. *Chairman McCone* recalled, returning to the question of instructing Ambassador Wadsworth, that the March 29 moratorium proposal had two conditions: agreement upon a threshold treaty and upon a coordinated research program. We should not agree to a recess until these matters are agreed, but we should indicate that we would sit for only so long. We might state that the moratorium would go with a two year program to be announced as beginning on a given date. *Under Secretary Dillon* said he was not sure whether all of this would be satisfactory from a domestic standpoint. He welcomed *Chairman McCone's* idea, however, that we should not tie the ultimatum to one shot but to the VELA program as a whole, since this would be a better public relations posture. *The Secretary* said we should draft immediate instructions to Wadsworth that no recess should be agreed until the safeguards matter was cleared up; then in a separate paper we should put the alternative courses of action regarding safeguards to the President. *Chairman McCone* agreed we should not recess until the research question is resolved. The VELA program is being undertaken in the light of our hopes for agreement. If there is no such hope, we should change our plans and employ different devices in order to get maximum benefit from the shots.

Turning to the question of high altitude controls, *The Secretary* thought the alternatives were whether to lay a proposal on the table for a complete control ban or for the threshold in outer space. He did not wish to pursue a technical briefing on a proposed control system, however, unless he could be assured the recommendations were scientifically sound and generally agreed. *Under Secretary Dillon* said he wondered whether we need take a position on outer space at all in Geneva, since technical certainty is not possible in this rapidly evolving field. Any position we take now could only embarrass us three years hence. Tabling a position would just put a new question before the conference which could open months of debate. The chances for getting an agreement on the underground aspects of control were so slim that we need not open the outer space question. *The Secretary* added that the outer space component would add hundreds of millions of dollars to the cost of the system. *Chairman McCone* said that in the high altitude area we would again be taking very inconclusive scientific evidence as a basis for national policy and repeating the mistake of 1958 if we

reached a decision now. *Dr. Kistiakowsky* said that from a political standpoint Under Secretary Dillon's comment seemed entirely reasonable. From a strictly scientific standpoint, the uncertainties of the underground situation were much greater than the uncertainties of a high altitude detection system. We know very little about the transmission of the signals through the complex structures of the earth, but we know a great deal about the transmission of such signals through empty space and about the instruments for recording them. As regards high altitude, there are only two uncertainties: first, that of background radiation and secondly, those of engineering the detection satellites now under construction in which we had a reasonable degree of confidence. There is a much more solid basis for confidence in the high altitude components of the system than in the underground. *The Secretary* asked what is the danger of the Soviets getting valuable information from tests at millions of kilometers as compared to the danger of their getting such information by testing below the threshold or by underground concealment. *Under Secretary Douglas* said that for our part we have no interest in tests at such great distances. *Dr. Kistiakowsky* said such a test would give information as to whether a device actually went off, but other diagnostics would be much more difficult in outer space than underground. *The Secretary* asked if the high altitude question isn't something better left to the Control Commission in view of present technical uncertainties. *Chairman McCone* said there is a good technical reason for deferring decisions on it since it would require at least two years of development to know much about it. *The Secretary* commented that he was still attached to the pre-launch inspection approach. *Mr. Irwin* noted there were serious technical difficulties in this approach as well. *Dr. Kistiakowsky* observed that some of these difficulties related to our reluctance to permit close inspection of vehicles to be launched. He said there was still another alternative: that we could speak of a threshold in outer space not as a ceiling in terms of altitude but in terms of signal strength which was the way we had defined the underground threshold. Detection capabilities of the system recommended by the experts a year ago would be a megaton at at least a hundred million miles and a kiloton at shorter distances. *The Secretary* raised the question of what language could be used in the treaty to describe these various alternatives. *Mr. Irwin* said we could devise language for either of the three alternatives: 1) an altitude ceiling, 2) a threshold in terms of signal strength, or 3) a complete ban in which we would accept whatever uncertainties are involved. There was general agreement that the question should not be decided at the present time, that an immediate instruction should be sent to Geneva regarding the recess and silence as to the duration of the moratorium along lines already discussed, and that a further paper

should be drafted for Presidential consideration of alternative courses of action on the safeguards problem.

589. Letter From McCone to Goodpaster¹

Washington, August 2, 1960

Dear Andy:

Attached please find a statement prepared by the General Advisory Committee to the Atomic Energy Commission on the subject of "USSR Capability in Weapons Development During the Test Moratorium". This statement was prepared as a result of this statutory committee's discussion of the subject at their meeting in Washington on July 26–28, 1960.

¹ Source: Transmits statement by the General Advisory Committee to the Atomic Energy Commission on "U.S.S.R. Capability in Weapons Development During the Test Moratorium." No classification marking. 2 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, AEC, Vol. II.

The reports of the several briefings mentioned in the statement, including Dr. Bethe's memorandum, will be made available to you should you desire to have copies of them.

For your information, I am also furnishing a copy of the GAC statement to the following: Secretary Herter, Secretary Gates, Mr. Dulles, Dr. Kistiakowsky, and Mr. Gray.

Sincerely yours,

John A. McCone

Statement Prepared by the General Advisory Committee to the AEC

Washington, July 29, 1960

**USSR CAPABILITY IN WEAPONS DEVELOPMENT
DURING THE TEST MORATORIUM**

The Committee continued to examine the problem presented at its May meeting on USSR Capability in Weapons Development During the Test Moratorium. Representatives of the Division of Military Application, the Los Alamos Scientific Laboratory, the Livermore Laboratory, and the Central Intelligence Agency presented excellent briefings on the numerous aspects of the general problem. At the request of the Committee, Dr. H. A. Bethe provided a memorandum entitled "Estimate of USSR and USA Capabilities of Weapons Development". The Committee greatly appreciates Dr. Bethe's efforts in the preparation of this carefully considered statement. As a result of these briefings, Dr. Bethe's memorandum, and accompanying discussions, the Committee submits the following comments.

The General Advisory Committee is convinced that it is technically possible for the USSR to conduct, without serious risk of detection, significant weapons tests under the current test moratorium. We are fearful that under these circumstances the USSR may be able to surpass the United States in nuclear weapons performance. The Commission should recognize that continuation of the current situation increases the risk that the United States advantage will be overcome. We must take vigorous action to break the current deadlock either by securing a test-ban agreement with adequate inspection safeguards or by resuming testing under such conditions as not to contaminate the biosphere.

590. Memorandum of Conversation Among Principals of the Geneva Test Group¹

Washington, August 11, 1960

SUBJECT

Geneva Nuclear Test Negotiations

PARTICIPANTS

See list on page 6

The Secretary stated that the purpose of the meeting is consideration of the proposed course of action, and certain alternatives presented therein (*Attached*). In connection therewith, it would be advisable to discuss the Congressional aspects of our fallback position on safeguards. The Secretary expressed particular concern about the fact that the House of Representatives is expected to be in session only two weeks. In order that restrictions against opening devices for inspection may be lifted, both Houses would have to act on a joint resolution.

In answer to the Secretary's question, *Mr. McCone* explained the mechanics of committee procedure in connection with such a resolution. In view of the jurisdiction of the Joint Committee on Atomic Energy over matters involving restricted data, it may be expected that a new resolution, just as the resolution of last month, would be assigned by the leadership to the Joint Committee. *Secretary Gates* commented that at best the Committee will decide to take no action on a new Administration request. *The Secretary* said, his information indicates that favorable action can be expected only after a major effort. *Mr. McCone* recommended that, before proposing the fallback position as outlined in the course of action, we should work it out with Congress, consulting both the Joint Committee and the House Foreign Relations Committee. Informal contacts with Congress have resulted in an appraisal of a 50% chance that desired action may be obtained, provided there is vigorous Administration support. It is difficult to predict, however, how Congress would act when the time comes. *Secretary Gates* commented that the White House is now most reluctant to approach Congress on any new matter since, it is believed, Congress will be most likely to take no action, and thus embarrass the Administration. He expressed belief that this attitude will be reflected in the decision on the course of action. *The Secretary* asked about possible alternatives. *Mr. McCone* responded that the Commissioners of the AEC, who have responsibility under law, have voted against declassification.

¹ Source: Discussion of resumption of testing. Secret. 8 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

The Secretary inquired as to the possibility of limited declassification. He recalled the President's reluctance to submit matters to the Joint Committee, and wondered if Executive declassification, followed by reclassification, would provide a feasible answer. *Mr. McCone* asked that limited declassification, under executive order of the President, would extend only to the end of the President's term.

Mr. McCone stated that, in giving second thought to the matter, he has serious reservations about advancing the fallback position in Geneva. He expressed belief that the President and the Vice President, who are very much concerned about making possible the Plowshare peaceful user program, will hesitate to advance a position which will greatly endanger that program. Plowshare devices are too sophisticated to be opened; a demand to open them may follow from our fallback position on research devices. He also expressed anxiety about increasing obstacles to progress in the Russian position. He recalled an informal conversation of June 23 between Tsarapkin and Wadsworth in which the former adamantly opposed the commencement of a research program before the treaty is signed. He also criticized the Soviet proposal calling for three annual inspections, and the remark allegedly made to a New York Times reporter that this proposal is not negotiable. He doubted Soviet sincerity in seeking agreement. *The Secretary* recalled that, at the Camp David discussions, President Eisenhower and Prime Minister Macmillan envisaged that the start of the research program would not be long delayed, and that the moratorium would be in at the same time as the research program. *Mr. Farley* explained that, while the Soviets may not participate in a research program by conducting programs of their own before signing of a treaty, they do not object to our carrying on such a program earlier as long as they are consulted about it and permitted to join in it.

The Secretary stated that a decision to withdraw from the plan to advance the fallback position would have to be communicated to the British Government right away since we are committed to it. Of course, the President must make the final decision. *The Secretary* agreed that, in view of the Congressional situation, an approach to them on the fallback position now appears impractical. It is clear, he said, that a political decision must now be made on the future of these talks, which have dragged on endlessly. He expressed support for the setting of a deadline, after which the United States seismic research program would get underway. We should not subject ourselves to a protracted delay while the Russians consider any safeguards proposal we may make.

The Secretary asked whether Congressional reaction would be more favorable if our proposal included a requirement that the Russians open any alleged large high explosive detonations to our inspection to ascertain that nuclear devices are not used. *Mr. McCone* replied that such inspection would give us needed assurance that explosions up to 50 KT which are announced or which we detect and cannot identify are

not nuclear explosions. This would certainly serve as a reassurance to Congress. However, the two principal elements of concern to Congress are: 1) the unilateral character of our commitment to open devices, giving the appearance that we are giving in to Soviet demands; and 2) the effect on our allies of such a move. The French, for example, are not permitted to inspect devices in the NATO stockpile, which are like the devices to be opened for inspection to the Russians. Rep. McConmack especially may be expected to express concern over this.

Secretary Gates remarked that it was time to say that we are now going ahead with the UK on a seismic research program. *Mr. McCone* suggested that, if there is no prospect of an agreement emerging from the research program proposal, we should go ahead with a program of underground shots providing information of use for seismic research, but also for Plowshare and for weapons purposes. A change in devices making possible the accomplishment of these added purposes would be practicable.

The Secretary raised the problems involved in withdrawing from our commitment to Macmillan to advance the fallback position, in devising an effective way of presenting a cut-off date, and in conducting explosions so as to minimize difficulties in the United Nations. *Mr. Allen* commented that our public posture would be better if the UK joined us in testing after any break. *Mr. Farley* commented the UK would probably show understanding for the US need to test, but would not join us unless the Soviets resume testing.

Secretary Gates remarked that, if we cannot find an adroit way to get out of this situation, any program would in effect be delayed till next year. *The Secretary* referred to the possibility that the President may simply decide there will be no nuclear explosions while he is in office. He referred the participants to the alternative approach at Geneva and in Congress mentioned in Para 3 of the proposed Course of Action, and commented that this approach might keep the matter out of the political arena. He suggested laying out the alternatives clearly for the President. He should decide on the date on which the research program will get underway.

Responding to the Secretary's question, *Mr. McCone* said that AEC would be ready for a detonation on October 1 which will produce significant, but not optimum, results. A delay to November 15 would not be a good idea since intense technical preparations at the test site would have to be made during the week of the election, which might be seized upon as the cause for various demonstrations by those opposing the shot, and because a shot scheduled for a post-election date might produce another "voice" seeking to be heard on this matter. He responded to *Mr. Gray's* question by stating that three explosions are planned up to the end of the year, but it is not sure that all will actually take place within that time period. *Gen. Starbird* expressed belief that at least two explosions can be made ready. *Mr. Gray* commented

that the President has made clear that he alone will be responsible for decisions till January 20 next. If he believes that significant results could be accomplished, he may well feel differently about permitting these shots. *Secretary Gates* remarked that the technical people believe a better job can be done in November, except for the political factor. *Mr. McCone* agreed, but pointed out that there has never been a shot for which the scientists did not want more time.

Mr. McCone described the first device scheduled for explosion. [text not declassified] Its location is at the bottom of a well, 950 feet deep and 36 inches in diameter. A tunnel has been dug from a location 1000 feet away from the device to a location 250 feet away, with numerous branch tunnels. All tunnels contained lining and instrumentation to test the shock resistance of the lining material. Total cost of the installation is four to five million dollars. The results to be obtained will be useful for design of hardened bases, for civil defense shelters, and for the mining industry. When the information is published, it will prove very valuable even to the Soviets. We should take the position that this installation has nothing to do with weapons development. Nor will there be any fallout. *Mr. Allen* commented that results would be made available to the Soviets whether they attend the explosion or not. *Mr. McCone* said that he would supply to the President full particulars regarding the planned explosion.

Secretary Gates, recalling the President's statement of July 7, expressed belief that the President would select the alternative proposal in Para 3 of the proposed Course of Action. *Mr. McCone* replied that the statement as to a date contained in the proposal hardly qualifies as an ultimatum in the sense that the President found objectionable.

Mr. Allen asked about the time required for the final preparations for the shot. *Gen. Starbird* replied that scientists must be summoned 30 days before the expected date, and practice radio countdowns begin two weeks before. *Mr. Allen* commented that a short lead time is of advantage since it minimized the problem of possible [illegible in the original] and demonstrations against the planned explosion. *The Secretary* said that the recent Presidential statement assuring that there would be no tests that would contaminate the atmosphere during his Presidency would be helpful.

The Secretary remarked that the issues seem to be clearly drawn for Presidential determination in the Course of Action paper. *Mr. McCone* suggested the alternative of pressing the pooling proposal once more. He referred again to Soviet adamance on a number of issues, and wondered whether we should not be equally adamant and press for resolution of other issues on our terms. He pointed out that, at the end of the two year research program, we still face a two or three year period of installation. *Mr. Farley* remarked that the only way to be adamant is to make plausible a threat to resume testing. If we actually resume nuclear detonations for

research proposes, we lend plausibility to such a threat. *Secretary Gates* expressed the suspicion that the Soviets may be testing nuclear weapons. It does not seem plausible that they are developing Polaris warheads without such tests, he said. *Mr. Dulles* remarked that we have no indications that such tests are going on.

Mr. McCone suggested that the Course of Action paper be changed by transferring to paragraph 2(a) the provision, now contained in 2(b), that our detonations will proceed on schedule and that prompt Soviet reply will be necessary if they are to leave themselves enough time to arrange for observation.

It was agreed that the Course of Action would be presented for consideration at the meeting of the National Security Council, Friday morning, August 12.

Attachment

Paper Prepared for the Principals of the Geneva Test Group

COURSE OF ACTION

1. Adopt a planning date of *November 15* (October 1)² for the first nuclear detonation in the seismic research program.

2. Authorize Wadsworth to state that, on studying the Soviet response to the pool proposals, the United States has decided, subject to Congressional authorization, to open its devices for U.K.-Soviet examination and thus end the debate regarding arrangements for the necessary nuclear detonations. The U.S. seismic research program of about

² Defense and AEC alternative to underlined words. [Footnote is in the original. Underlined words are printed here in italics.]

two years substantially as outlined by our scientists in May at Geneva, is scheduled to get under way on *November 15* (October 1)³.

(a) In so stating he would attach the condition that the Soviet Union agree that any devices employed for seismic research on its own territory will be opened on a reciprocal basis. He would also *recall our previous proposal* (attach the further condition)³ that any alleged large high explosive detonations for either industrial or seismic research purposes be opened to U.K. and U.S. observers to ascertain that nuclear devices are not used. He would also state that the devices would be open for visual and manual observation by the U.K. and USSR, that U.K. and Soviet scientists can be present when the device is detonated, *that U.K. and Soviet seismic instrumentation as necessary and agreed can be installed* (that Soviet and U.K. scientists can observe all U.S. instruments)³, and that all data obtained will be made available to the U.K. and Soviets; this forthcoming approach if well publicized should make it difficult for the Soviets to make major issues of the details of these arrangements, on which they have insisted on prior agreement;

(b) Wadsworth will make clear that our detonations will proceed on schedule and that prompt Soviet reply will be necessary if they are to leave themselves enough time to arrange for their observation and installation of necessary and agreed seismic instrumentation that they may propose.

(c) Wadsworth will continue to press for resolution of outstanding issues as called for in the March 29 Eisenhower-Macmillan communique, including an adequate quota of on-site inspections, the composition of the control commission, control post staffing, voting matters, and arrangements for the use of nuclear detonations for peaceful purposes. In this connection the U.S. would continue to make it emphatically clear that the Soviet offer of 3 inspections is totally inadequate and unacceptable, and should restate its position that the level of inspections must bear an appropriate relationship to the number of unidentified events and to the capabilities of the system.

(d) Provided the coordinated research program goes ahead as scheduled on *November 15* (October 1) and remaining issues are solved and a treaty signed, the U.S. would agree to a moratorium on nuclear weapons tests below the threshold from date of signature of the treaty for the remaining portion of the two-year research program we have outlined.

3. A joint resolution would be submitted to Congress during the August session, preferably after receipt of evidence of intent on the part of the Soviets to reach agreement, but if necessary before receiving a Soviet reply.

If statement of a specific date in 2 above has an undesirable appearance of ultimatum, which the President on July 7 wished to avoid, Wadsworth might modify his approach slightly by saying simply that we were proceeding with our preparations urgently without mentioning a specific date until a Soviet reaction was received; but we would advise

³ Defense and AEC alternative to underlined words. [Footnote is in the original. Underlined words are printed here in italics.]

Congress privately that we were determined to go ahead regardless of the Soviet answer and were making our preparations accordingly.

Upon Presidential approval of the above course of action, Congressional consultations should be undertaken promptly and should include Congressional leadership and Foreign Affairs and Foreign Relations Committees in addition to the Joint Committee on Atomic Energy. (After Congressional consultations, and only if they indicate that favorable Congressional action on the fallback proposal is probable,)⁴ it would also be necessary immediately to send a letter to Prime Minister Macmillan, who expressed reservations regarding any unilateral U.S. action and will have to be persuaded of the necessity for such a decisive course of action. If necessary because of serious objections from the Congress of Macmillan, the above course of action would be reconsidered with the President.

⁴ Defense and AEC proposed addition. [Footnote is in the original. Underlined words are printed here in italics.]

591. Position Paper Used by Herter at 455th NSC Meeting¹

August 12, 1960

PROPOSED COURSE OF ACTION IN GENEVA NEGOTIATIONS ON NUCLEAR STRATEGY

1. Adopt a planning date of _____ for the first nuclear detonation in the seismic research program.

2. Authorize the U.S. Representative to state that, on studying the Soviet response to our pool proposal, the United States has decided, subject to Congressional authorization, to open its devices for U.K.-Soviet examination and thus end the debate regarding arrangements for the necessary nuclear detonations. The U.S. seismic research program of about two years substantially as outlined by our scientists in May at Geneva, is scheduled to get under way on _____.

(a) We would attach the condition that the Soviet Union agree that any devices employed for seismic research on its own territory will be

opened on a reciprocal basis. We would also state that the devices would be open for visual and manual observation by the U.K. and USSR, that U.K. and Soviet scientists can be present when the device is detonated, that U.K. and Soviet seismic instrumentation as necessary and agreed can be installed (we will make clear that our detonations will proceed on schedule and that prompt Soviet reply will be necessary if they are to leave themselves enough time to arrange for their observation and installation of agreed instrumentation), and that all data obtained will be made available to the U.K. and Soviets. This forthcoming approach, if well publicized, should make it difficult for the Soviets to make major issues of the details of these arrangements, on which they have insisted on prior agreement;

(b) We will continue to press for resolution of outstanding issues as called for in the March 29 Eisenhower-Macmillan communique, including an adequate quota of on-site inspections, the composition of the control commission, control post staffing, voting matters, and arrangements for the use of nuclear detonations for peaceful purposes. In this connection the U.S. would continue to make it emphatically clear that the Soviet offer of 3 inspections is totally inadequate and unacceptable, and should restate its position that the level of inspections must bear an appropriate relationship to the number of unidentified events and to the capabilities of the system.

(c) Provided the coordinated research program goes ahead as scheduled on _____ and remaining issues are solved and a treaty signed, the U.S. would agree to a moratorium on nuclear weapons tests below the threshold from date of signature of the treaty for the remaining portion of the two-year research program we have outlined.

3. A joint resolution would be submitted to Congress during the August session, preferably after receipt of evidence of intent on the part of the Soviets to reach agreement, but if necessary before receiving a Soviet reply.

(If statement of a specific date in 2 above has an undesirable appearance of ultimatum, which the President on July 7 wished to avoid, our approach might be modified slightly by saying simply that we are proceeding with our preparations urgently without mentioning a specific date until a Soviet reaction was received; but we would advise Congress privately that we were determined to go ahead regardless of the Soviet answer and were making our preparations accordingly.)

Upon Presidential decision as to a course of action, there should be prompt Congressional consultations as appropriate and communication with Prime Minister Macmillan, who was advised of our intention of going to a fallback position but expressed reservations regarding any unilateral U.S. action to commence nuclear detonations.

592. Memorandum From Farley to Dillon¹

Washington, August 12, 1960

SUBJECT

Recent Developments in the Negotiations for the Discontinuance of Nuclear Weapons Testing

Safeguards in Connection with Seismic Research Program

On August 2, the Soviet delegation declared that the United States proposal on inspection of the interior of nuclear devices opens up the possibility of working out a mutually acceptable formulation of safeguards provisions, but rejected the concept of tripartite pooling of devices. The Soviets reiterated their proposal of June 15, calling for examination of internal and external construction and of drawings of devices used in any research explosions carried out by the U.S. or the U.K. (*Tab A*)

On August 11, the Principals gave consideration to a Course of Action paper dealing with authorization to advance the fallback position, and recommended its submission, in revised form, to the National Security Council on the following day. (*Tabs B and C*)

The matter was discussed with the President at a meeting of the National Security Council on August 12.

Package Proposal on Organizational Matters

We instructed our delegation to explore informally with the other delegations a possible package settlement of organizational issues. In the context of such a package, the United States would be prepared to accept a Control Commission based on parity between the West and the Soviet bloc, consisting of four representatives from each of these, and three representatives of uncommitted states. Except as now otherwise specified in the treaty, the Commission would decide all organization matters by majority vote. Chiefs of control posts, and personnel of inspection teams in the territories of original parties would be selected by the Administrator from nationals of the other side. Chiefs of control posts, and personnel of inspection teams in the territories of other parties would be selected from members of the staff able to function

¹ Source: Update on test ban negotiations. Secret. 4 pp. NARA, RG 59, Central Files, 700.5611/8-1260.

with full objectivity in the state concerned. Observers on special aircraft flights would not be nationals of any country in whose territory the event under investigation may have occurred and, where such an event may have occurred on territory of an original party, the observers would be nationals of the other side. In accordance with the general parity concept, the budget would be set by equal contributions from the Soviet Union on one hand, and the United States and United Kingdom on the other. The United States would be prepared to agree to requirement for adoption of the budget as a whole, by unanimous agreement of the three original parties.

After obtaining U.K. concurrence, Ambassador Wadsworth presented the package proposal at an informal meeting of August 10. In the course of discussion, Mr. Tsarapkin expressed the personal opinion that a 4–4–3 Control Commission is reasonable, but saw some difficulty in the provisions on staffing and budget contributions.

Sir Michael Wright has pressed our Delegation strongly to table the package proposal, in order to complete the formal introduction of the western position. He has also urged consideration of a fallback position concerning inspection teams, observers and deputies. We have instructed our Delegation not to accede to the British request since tabling is expected to make it easier for Tsarapkin to pick and choose parts of the package he will accept and parts he will reject.

Moratorium on Testing Below the Threshold

Since the Camp David announcement of United States and United Kingdom willingness to institute a voluntary moratorium of agreed length on tests below the threshold, provided that a treaty is signed and a coordinated research program arranged, the Soviet delegation has, at ten plenary meetings and a number of informal meetings, pressed the Western delegations to state the moratorium duration they envisage. Ambassador Wadsworth has urged that he be authorized to state an initial position, citing tactical advantages which would be derived therefrom. We have instructed the Ambassador to withhold such a proposal at this time on the ground that it might enable the Soviets to divert the focus of discussion from the research program and remaining treaty issues.

On August 10, Sir Michael Wright pressed our delegation strongly on the desirability of tabling a proposal, in order to complete the formal introduction of the western position.

Annex I, "Detection and Identification System"

The U.S. Delegation has tabled a revised draft of Annex I, containing a description of components, operations and criteria to be employed in detecting and identifying events which could be suspected of being

nuclear explosions, and an installation schedule. We are awaiting Soviet response.

The revised draft does not include provisions for the installation of a high altitude detection system. At a meeting of Principals of May 2, it was decided to make no decision at this time as to the alternative proposals on such a system, viz., a complete test ban in outer space based on controls recommended by the Experts' Conference of 1958; a treaty ban up to 50 KM, with or without a moratorium on tests above that altitude.

On August 11, after criticizing the United States' installation schedule for "not preserving the equality of the sides in each stage of installation", the Soviets presented their own text, differing principally in that it sets 15 control posts on the territory of the Soviet Union, instead of 21, as contained in the U.S.-U.K. version, and in that it seeks to establish a number of control posts in such southern hemisphere locations as Australia and Oceanic Islands in the first phase of installation, rather than in later phases. This phase would be extended from three years, as proposed by the U.S.-U.K., to four.

Parties Article

On July 26, the United States delegation tabled a revised draft article on parties to the treaty containing provisions for adherence or accession of other states or authorities. (*Tab D*) In their response of August 4, the Soviets objected (1) to the use of the term "states or authorities", and expressed strong preference for the term "states"; (2) to the distinction between states invited to join by the Commission, and those whose accession the Commission finds to contribute to the achievement of the purposes of the treaty; and (3) to the necessity for Commission action on accession of parties. They charged that these provisions are unprecedented in treaty usage and would discriminate against certain parties.

Recess

The U.K. delegation has informally urged a recess, and the Soviet delegation has indicated approval. At a meeting of Principals of August 2, it was decided that the United States should not agree to a recess until the matter of safeguards in connection with the research program is cleared up. Following a meeting of the National Security Council on August 12, the delegation was instructed to seek to arrange for a recess of 3 to 4 weeks beginning soonest.

Quota of On-Site Inspections

On July 26, the Soviet delegation presented a proposal calling for a quota of up to three annual inspections on the territory of each original party, for events above or below the threshold. (*Tab E*) Ambassador

Wadsworth responded that the Soviet figure falls short of meeting the minimum requirements for effective deterrence.

593. Memorandum of Conference with the President¹

Washington, August 15, 1960

OTHERS PRESENT

Chairman McCone, General Goodpaster

Mr. McCone noted that he would be leaving for the discussions with Macmillan and the British on test suspension negotiations later the same day. Mr. McCone said that checks that had been made with the Joint Committee on Atomic Energy made it clear that a shift to our “fall-back position” regarding Soviet inspection of nuclear devices used in our seismic experimentation program would cause a great deal of trouble in the Congress. The President said he understood from Macmillan’s latest letter that he would like to see us go to our fall-back position.

Mr. McCone said that the Soviets evidently knew about our fall-back position at the time we put forward our proposal regarding reciprocal inspection arrangements. He didn’t know who had passed this information to them, but noted that it must have been our negotiators in Geneva, or the British, who had been informed about it. In any case, they turned down the reciprocal system and demanded what amounted to unilateral concession by the United States.

The President told Mr. McCone that he thought he and Under Secretary Merchant should simply tell the British that we have so many

¹ Source: Preparation for McCone’s discussions with Macmillan. Secret. 2 pp. Eisenhower Library, Whitman File, Diary Series. Drafted on August 19.

political problems in regard to this matter during the next 2½ months that he did not feel it is possible to prepare the way for the proposal now. He did not, however, want to be in the position of breaking up the negotiations. He commented that this would be a shock to world opinion, adding that world opinion can be held quite strong along lines to which people are accustomed, but can become unstable and "shattered" under the shock of surprise, as for example the U-2 affair. The President added that he did not want Macmillan to think that we are playing fast and loose with him in having mentioned a fall-back position in July and then not putting it forward now.

Mr. McCone recalled that the check made with the Congress indicated that they would not clear the fall-back position. The President thought that after the election, an incoming President might have a good chance to get something like this through. He added that he considers the Atomic Energy Act unconstitutional in the powers it accords to the JCAE. He thought perhaps he would put forward the proposal and let Congress turn it down—and added that he might conceivably, in those circumstances, go ahead and do what he proposed and defy Congress to take action against him.

Mr. McCone said there is one point he intends to stress to Macmillan and that is that there is a tremendous difference between the United States and the USSR at Geneva, and that any talk of having narrowed these differences to something quite small is entirely erroneous. The President commented that he would be glad to take any treaty reducing military weapons if there is a proper quid pro quo and if adequate inspection to verify performance is provided. Mr. McCone recalled that the Soviets have offered three inspections a year and that practically speaking this is equivalent to none at all. He said Dr. Killian has held that a number in the order of seventy-five is a minimum.

Mr. McCone next commented that he had agreed that Ambassador Lodge, in making his speech on disarmament, should suggest that we and the Russians each put 30,000 kgs. of U-235 into escrow under inspection. He referred to planning a few years ago on the subject of atomic weapons and noted that our annual production today is many times what was estimated to be the total requirement just a few years ago.

The President asked that Mr. McCone extend his personal regards to Prime Minister Macmillan when he saw him.

A.J. Goodpaster
Brigadier General, USA

594. Memorandum From Dillon to Eisenhower¹

Washington, August 22, 1960

SUBJECT

Disarmament Reorganization within the Department of State

You will recall that last fall you initiated steps to strengthen the organization of the U.S. Government for dealing with disarmament matters. You decided that it was logical to place the responsibility for leadership of this new effort in the Department of State. On April 22, Secretary Herter reported to you orally that we would move ahead with the establishment of a focal point for disarmament activities, in a new organization reporting directly to him but with relative autonomy and staffed in part with personnel from other agencies. Since then, with the assistance of the White House Staff, we have been actively seeking an outstanding public figure to head the organization. In the meanwhile we have been proceeding with our plans.

On or about September 1, the Department of State plans to establish formally a United States Disarmament Administration. In addition to an intensified program of study and research, the new administration will be responsible for formulating policies with respect to the limitation and control, by international agreement, of armed forces and weapons of all kinds and will progressively assume responsibility for the direction and support of international negotiations in this field. A more complete statement of the functions of the Administration is enclosed.

Secretary Herter has kept the Secretary of Defense, the Chairman of the Atomic Energy Commission, the Director of the Central Intelligence Agency, and your Scientific Advisor informed of these developments and he is confident of their understanding and support. Nevertheless, given the importance of this move and realizing your great interest in the subject, Secretary Herter thinks it would be most helpful if you could express your views on the new project in a letter to him and to these key officials. I am enclosing suggested letters for your possible use.

It might also be useful for our international relations if you or the White House were to make a public announcement in connection with the establishment of this organization. The exact form of the announcement would, of course, be reviewed in the light of circumstances existing

¹ Source: Establishment of U.S. Disarmament Administration within the Department of State. No classification marking. 6 pp. NARA, RG 59, Central Files, 600.0012/8–2260.

at the time of its release. It could take the form of (or include) release of the letter which you would send to Secretary Herter.

With the establishment of the United States Disarmament Administration and at the time Mr. James J. Wadsworth enters on duty as United States Representative to the United Nations, it would be appropriate to terminate his designation as United States Representative on Disarmament. The designation was made by letter from Secretary Dulles with your approval on February 27, 1956. With your approval, Secretary Herter will take the appropriate formal steps, in the next few weeks. You may at that time wish to express appreciation of Mr. Wadsworth's significant services in his former capacities.

/S/ Douglas Dillon
Acting Secretary

Enclosure 1

Paper Prepared in the Department of State

Functions of the New United States Disarmament Administration

The mission of the Administration will be to assist the Secretary of State in leading and coordinating the effort of the United States government in formulating, negotiating and implementing policies in the field of control and limitation, by international agreement, of armed forces and weapons of all kinds, including agreements to safeguard against surprise attack and to lessen the danger of war by miscalculation. This mission, which will be carried out with the cooperation of the other interested parts of the government and with the assistance, where necessary, of experts and consultants under contract will include, *inter alia*, the following functions in the arms control field:

A. Development, review, analysis, evaluation and coordination of plans, policies and programs, and research in connection therewith, where necessary;

B. Coordination, and where appropriate, commissioning or assisting in the conduct of research and development activities in such matters as systems of limitation, inspection and control;

C. Formulation and coordination of U.S. positions for use in negotiation at international conferences, including analysis of the proposals of other countries; preparation of instructions to delegations, taking account of established procedures and responsibilities for U.S. participation in the U.N; provision, where appropriate, of members of U.S. delegations; and maintenance of contact with representatives of foreign governments;

D. Stimulation, coordination with and, where appropriate, financial support of such U.S. activity as is carried on by non-governmental agencies;

E. Planning, cooperation with, and assistance in public information programs designed to keep foreign and domestic public opinion accurately informed of U.S. policies;

F. Planning and coordination of U.S. participation in such arrangements for monitoring and inspection as may be required under international agreements to which the United States may be a party.

Enclosure 2

Suggested Letter from the President to the Secretary

Dear Mr. Secretary:

I have read and approved your memorandum concerning the steps you are taking, pursuant to plans I initiated last fall, to create a United States Disarmament Administration to strengthen leadership and coordination of the manifold activities of the United States government in the field of arms limitation and control.

I agree that this Administration should be staffed with personnel drawn from other agencies and from outside government as well as from the Department of State, thus assuring the blending of skills essential to the highly complex work in which it will be engaged. I expect that, as in the past, you will continue to coordinate the participation of the other agencies in this program.

In addition to coordinating or conducting an intensified program of study and research, the new organization will be responsible for formulating policies with respect to disarmament, including the limitation and control, by international agreement, of armed forces and weapons of all kinds and for direction and support of international negotiations on these subjects.

The Disarmament Administration will permit the United States to marshal the best available political, technical and scientific skills in a continuing campaign to discover practical means for easing the burden of armaments, lessening the dangers of war by miscalculation, and winning a just and durable peace.

I am requesting the heads of all other interested agencies to give you full and continued support in developing an effective organization and in building a strong and imaginative policy.

My own devotion to this endeavor is deep and abiding. The well-being and safety of our country and of the world may be significantly advanced by your efforts. I shall support you in every way I can.

I am sending letters related to this one to the Secretary of Defense, the Chairman of the Atomic Energy Commission, the Director of CIA, and to my Special Assistant for Science and Technology.

Enclosure 3

Suggested Letter From Eisenhower to Multiple Recipients

Suggested Letter from the President to:

The Secretary of Defense
The Chairman of the Atomic Energy Commission
The Director of the Central Intelligence Agency
The Special Assistant to the President for Science and Technology

Pursuant to the plans which I initiated last fall, the Secretary of State has established the United States Disarmament Administration to strengthen leadership and coordination of the manifold activities of the United States Government in the field of arms limitation and control.

This Administration will be responsible to the Secretary of State and will be staffed with personnel drawn from other agencies and from outside government as well as from the Department of State, thus assuring the blending of skills essential to the highly complex work in which it will be engaged.

In addition to coordinating or conducting an intensified program of study and research, the new organization will be responsible for formulating policies with respect to disarmament, including the limitation and control, by international agreement, of armed forces and weapons of all kinds and for direction and support of international negotiations on these subjects. As in the past, the Secretary of State will continue to coordinate definition of these policies with you as appropriate to your responsibilities.

The Disarmament Administration will permit the United States to marshal the best available political, technical and scientific skills in a continuing campaign to discover practical means for easing the burden of armaments, lessening the dangers of war by miscalculation, and winning a just and durable peace.

I am confident that your agency will give full and continued support to the Secretary of State in developing an effective organization and in building a strong and imaginative policy.

My own devotion to this endeavor is deep and abiding. The well being and safety of our country and of the world may be significantly advanced by its efforts. I shall support it in every way I can.

I am sending letters related to this one to the Secretary of State and to other agencies and Departments with responsibilities in the field of arms control.

595. Memorandum From Farley to Herter¹

Washington, August 27, 1960

SUBJECT

Developments in Connection with the Negotiations for the Discontinuance of
Nuclear Weapons Testing, August 12–27, 1960

Recess

At a meeting in London of Chairman McCone and Under Secretary Merchant with Minister of State Ormsby-Gore and Sir Roger Makins, it was agreed that a recess of approximately four weeks' duration would be desirable, and the delegations were instructed to approach the Soviets on this basis. It was further agreed that, during the recess, there would be U.S.–U.K. coordination to develop tactics for the post-recess period and that this should take place in good time to permit review of positions by the principals of both sides (TAB A and TAB B).

The Soviets readily acceded to our informal proposal, and the conference was recessed from August 22 to September 27, after the Western delegations put on record a restatement of major differences and stressed the need for a more flexible Soviet attitude.

In the past week, there have been two meetings of the interdepartmental working group for the purpose of outlining positions for a report to the principals and coordination with the U.K. Mr. Charles Stelle and Mr. David Popper are expected to arrive on August 28 and September 7, respectively, for the purpose of taking part in interdepartmental consultations and consultations with British political and technical people beginning September 7.

Nuclear Detonations in Connection with Seismic Research Program

At the London meeting, the British readily accepted our explanation as to our inability to proceed with the fallback position. They expressed the opinion, however, that any proposal short of unilateral disclosure of devices would not be acceptable to the Soviets, that no marked progress can be made in the negotiations without putting forward a new position on safeguards, and that we could not go ahead unilaterally with seismic research shots without causing a breakoff in the conference. They feel that, aside from safeguards, the question of decoupling shots is the only serious outstanding issue on the research

¹ Source: Update on test ban negotiations. Secret. 4 pp. NARA, RG 59, Central Files, 700.5611/8–2760.

program, and it is an issue on which the Soviets will not be in a strong position.

The British tried unsuccessfully to obtain assurances that we do not intend to schedule a nuclear shot until the next administration. We pointed out that the basic position remains as stated by the President on December 29, 1959, but that we have no intention of announcing a test during the recess or immediately afterwards. (TAB A and TAB B)

The President replied to the Prime Minister on August 26, pointing out the impossibility of obtaining congressional approval now for the fallback position and expressing the intention to consult further on the safeguards problem. (TAB C)

Moratorium on Testing Below the Threshold

At the meeting of August 12, the Soviets repeated that the duration issue is the most important before the conference and put forward once more a proposal of four to five years. Responding generally, the U.K. delegate called for a moratorium sufficiently long to allow research to show results and to allow discussion of these results.

In the London discussions, it was agreed that it would be desirable to put forward our position on duration of a moratorium after the recess, along the lines that it should be no longer than the time required for the research program (2 years) plus a few months (3-6) to assess results. (TAB A and TAB B)

Package Proposal on Organizational Matters

Although plenary discussion failed to reveal any Soviet movement on staffing issues, Soviet deputy representative Usachev, in a dinner conversation, expressed conviction that "a deal was possible" on the package proposal which had been informally presented by Ambassador Wadsworth on August 9. He interpreted Moscow's rapid agreement to recess as a sign that quick and serious consideration is to be given the package.

Annex I, Detection and Identification System

Further informal technical discussion has taken place on reconciliation of the Soviet and the Western approach on phasing of installation of the system. The Soviet counter proposal of August 11 had revealed substantial agreement with our concept, but had suggested a rearrangement of the installation schedule in the southern hemisphere and 15 control posts on the territory of the Soviet Union instead of 21. Provision is made for formation of inspection groups only after entry into operation of Phase I control posts.

Soviet deputy representative Usachev told Mr. Popper that discussion could be based on the current U.S. draft of the Annex, rather than

on the old Soviet version, and that there is general similarity of views on phasing. He implied that there are relatively few serious obstacles in connection with the Annex.

Quota of On-Site Inspections

At numerous pre-recess plenary meetings, debate has continued on the approach as to inspection of the two sides, the Western delegations stressing the paramount importance of technical considerations in determining a quota and the Soviets defending their politically based offer of three annual inspections, applicable to events above or below the threshold. The Soviets attempted to prove that a technically based quota would result in five times as many inspections on the territory of the United States as in the Soviet Union. They proposed that auxiliary aids be included in the treaty, so as to reduce drastically the number of unidentified events.

In the London discussions, Mr. Ormsby-Gore agreed that we should be “stern” on the inspection quota. He expressed belief that the Soviets would compromise on a figure, but not above ten. He wondered whether it would be feasible to carry out more than ten annual inspections. (TAB B)

AFTAC has prepared an estimate, showing average seismic activity in the U.S. to be one to one and a half times as great as in the Soviet Union and slightly more than that in territory under jurisdiction of Great Britain.

Parties Article

Usachev stated informally that the Soviets are adamant in their insistence on automatic accession of nth parties and on use of the term “states” in place of “states or authorities” in identifying parties in the text of the article.

High Altitude Detection

General, but inconclusive, discussion took place at the London meetings. The interdepartmental working group agreed that a briefing be arranged for the British on or about September 9.

Budget Contribution Shares

The concept of West-Soviet parity of budget contributions is contained in our organizational package. The U.K. has informally presented to us its views on ratio of contributions between it and the United States and on the share to be borne by nth countries. The British could accept a 12:38 ratio, as compared with the United States, and proposed that ultimately 25% of the total costs of the organization should be borne by countries other than the original three. We had previously expressed

our opinion that such countries could not be expected to bear more than 10% of annual operating costs.

As Tab D to this memorandum there is also attached a report of an informal US-UK Delegation Meeting in Geneva, August 22, 1960.

596. Report of Working Group to Committee of Principals¹

August 31, 1960

Report of Working Group to Committee of Principals on Preparations for Resumption of Nuclear Test Negotiations

The Conference on the Discontinuance of Nuclear Weapon Tests will resume on September 27 in Geneva. Preparations on both political and technical aspects of the negotiations are under way and staff level consultations with the U.K. have been arranged in Washington beginning September 7. A report will be made to the Principals on these preparations and consultations during the week of September 12.

We expect to propose the following general approach in discussions with the U.K.:

1. Pending further consultations and decisions regarding the dates and arrangements under which the U.S. will conduct its first nuclear detonation in connection with project Vela we should reaffirm our readiness to proceed on the basis of the safeguards proposal advanced July 12 and reaffirm the White House statements of December 29 and May 7 regarding nuclear explosions. We should likewise press for Soviet acceptance and lay the groundwork by full explanations in the conference for public understanding of the necessity for the program of seismic research we have proposed.

2. Pursuant to the recent discussions in London we will take the position at an early appropriate time after resumption of negotiations that the moratorium referred to in the Eisenhower-Macmillan communique of March 29 be effective upon treaty signature for the remaining portion of the two year seismic research program (which will begin

¹ Source: Preparations for resumption of nuclear test negotiations. Confidential. 2 pp. Eisenhower Library, McCone Papers, Testing.

when announced by the U.S.) plus a period of three to six months to review results of the program.

3. We will upon resumption press for a resolution of the complex of technical issues relating to the number of inspections, the number and location of control posts, the treaty article on on-site inspection, the phasing of installation of control posts and Annex I on the Detection and Identification System. Preparations are under way on key issues in this field which are listed as *TAB A*. An AFTAC review of the technical aspects of these issues is attached as *TAB B*.

4. We will seek U.K. agreement to press in informal negotiations outside the conference the package of organizational issues as authorized NUSUP 968 (*TAB C*) to determine the price the Soviets would be willing to pay for a 4–4–3 parity arrangement in the Control Commission. In consultations with the U.K. during the recess we will stress that we consider it of the utmost importance that there be no deviation from present Western staffing positions on chief of posts and staffing of inspection teams and observers on special aircraft flights during these informal negotiations.

5. We hope to reach agreement with the U.K. during the forthcoming consultations on a definition of nuclear detonations.

6. We will during the recess begin exploration with the U.K. of the technical aspects of the high altitude question without prejudging the position the U.S. will finally take with respect to it.

7. If the general approach outlined above is followed upon resumption of negotiations it will be necessary to strengthen the technical side of the U.S. and U.K. delegations during the period immediately following resumption.

597. Letter From Herter to Gray¹

Washington, September 14, 1960

Dear Gordon:

I was most happy to receive your comments of September 13 on the suggested letter from the President and the statement of functions

¹ Source: Approves Gray's proposed amendments to statement of functions for the new U.S. Disarmament Administration. No classification marking. 6 pp. Eisenhower Library, White House Office Files, Project Clean Up, State Department.

of the new U.S. Disarmament Administration. I am in general agreement with your suggestions and have asked that appropriate changes be made in the two documents in the light of such comments as we receive from the agencies concerned.

With warmest personal regards,
Most sincerely,

Christian A. Herter

Attachment

Letter From Gray to Herter

Washington, September 13, 1960

Dear Chris:

I inclose a rather hastily prepared set of comments with respect to the suggested letter from the President and the statement of functions of the new U.S. Disarmament Administration which you sent to me with your letter of September 9. I submit these for whatever they may be worth to you.

With warm regards, I am,
Sincerely,

Gordon Gray
Special Assistant to the President

Enclosure

Paper Prepared in the Office of the Special Assistant to the President

September 13, 1960

The two documents seem to raise two major questions:

First, does the President really intend to delegate to the Secretary of State and the U.S. Disarmament Administration the making of ultimate policy decisions? It would appear desirable to make it clear that the President reserves to himself policy decisions.

Second, do the documents as written provide for essential *meaningful* Department of Defense participation. The same question might be raised about AEC participation.

(A revision of the last sentence of paragraph 3 in the suggested letter from the President might substantially meet the problem of the first question and be helpful with respect to the problem involved in the second question. This sentence could read as follows: “As in the past the Secretary of State will continue to coordinate definition of these policies with you as appropriate to your responsibilities before obtaining Presidential approval.”)

My other comments are:

1. As to the suggested letter, in the first paragraph should not the word “safeguarded” be inserted before “arms limitation and control”?

In the fourth paragraph should there not be some reference to *military* skills? The word “technical” may include people familiar with military technology, but does this not ignore the strategic military considerations?

2. As to the statement of functions:

Should not the necessity of Presidential approval be somewhere referred to in the first paragraph?

In the second sentence of the first paragraph should not the last line read: “inter alia, assisting the Secretary of State in the following functions in the arms control field.”

Finally, would it not be desirable to involve the Director of the U.S. Information Agency in some way in this enterprise?

Enclosure

Letter From Herter to Gray

Washington, September 9, 1960

Dear Gordon:

As you know, the Department of State has today issued a press release announcing the establishment of the United States Disarmament Administration.

To help launch this new organization, it has been proposed that the President set forth its purpose in a letter to the heads of agencies who are most closely associated with the United States Government’s disarmament activities. A copy of this proposed letter is attached.

I am also enclosing a statement of the functions of the United States Disarmament Administration on which I would appreciate your comments. The functional statement will be incorporated in appropriate Department of State announcements and will, undoubtedly, be used in Congressional presentations.

I think it would be desirable if the Presidential letter could be issued and subsequent Department of State announcements on the new Administration be made within the next two or three days. I would, therefore, appreciate your urgent consideration of the attachments.

With warmest personal regards,

Most sincerely,

Christian A. Herter

Attachment 1

Suggested Letter From Eisenhower to Multiple Recipients

SUGGESTED LETTER FROM THE PRESIDENT TO:

The Secretary of Defense
The Chairman of the Atomic Energy Commission
The Director of the Central Intelligence Agency
The Special Assistant to the President for Science and Technology

Pursuant to the plans which I initiated last fall, the Secretary of State has established the United States Disarmament Administration to strengthen leadership and coordination of the manifold activities of the United States Government in the field of arms limitation and control.

This Administration will be responsible to the Secretary of State and will be staffed with personnel drawn from other agencies and from outside Government as well as from the Department of State, thus assuring the blending of skills essential to the highly complex work in which it will be engaged.

In addition to coordinating or conducting an intensified program of study and research, the new organization will be responsible for formulating policies with respect to disarmament, including the limitation and control, by international agreement, of armed forces and weapons of all kinds and for direction and support of international negotiations on these subjects. As in the past, the Secretary of State will continue to coordinate definition of these policies with you as appropriate to your responsibilities.

The Disarmament Administration will permit the United States to marshal the best available political, technical and scientific skills in a continuing campaign to discover practical means for easing the burden of armaments, lessening the dangers of war by miscalculation, and winning a just and durable peace.

I am confident that your agency will give full and continued support to the Secretary of State in developing an effective organization and in building a strong and imaginative policy.

My own devotion to this endeavor is deep and abiding. The well being and safety of our country and of the world may be significantly advanced by its efforts. I shall support it in every way I can.

I am sending letters related to this one to the Secretary of State and to other agencies and Departments with responsibilities in the field of arms control.

Attachment 2

Paper Prepared in the Department of State

Functions of the New United States Disarmament Administration

The mission of the Administration will be to assist the Secretary of State in leading and coordinating the effort of the United States government in formulating, negotiating and implementing policies in the field of control and limitation, by international agreement, of armed forces and weapons of all kinds, including agreements to safeguard against surprise attack and to lessen the danger of war by miscalculation. This mission, which will be carried out with the cooperation of the other interested parts of the government and with the assistance, where necessary, of experts and consultants under contract will include, *inter alia*, the following functions in the arms control field:

A. Development, review, analysis, evaluation and coordination of plans, policies and programs, and research in connection therewith, where necessary;

B. Coordination, and where appropriate, commissioning or assisting in the conduct of research and development activities in such matters as systems of limitation, inspection and control;

C. Formulation and coordination of U.S. positions for use in negotiation in international conferences, including analysis of the proposals of other countries; preparation of instruction to delegations, taking account of established procedures and responsibilities for U.S. participation in the U.N.; provision, where appropriate, of members of U.S. delegations; and maintenance of contact with representatives of foreign governments;

D. Stimulation, coordination with and, where appropriate, financial support of such U.S. activity as is carried on by non-governmental agencies;

E. Planning, cooperation with, and assistance in public information programs designed to keep foreign and domestic public opinion accurately informed of U.S. policies;

F. Planning and coordination of U.S. participation in such arrangements for monitoring and inspection as may be required under international agreements to which the United States may be a party.

598. Memorandum From Twining to Eisenhower¹

Washington, September 15, 1960

SUBJECT

Arms Control Proposals and Your Speech at the United Nations, 22 September 1960

1. I have reviewed an early draft by the State Department Staff of a speech which you might make to the United Nations General Assembly and consider that certain basic aspects of the approach proposed in the arms control area would have serious implications relative to the security of the United States. The draft I saw probably will be revised. However, I feel that the following comments, which are addressed to the early draft, should be considered in formulating the arms control section of the speech you plan to make:

a. I question the view reflected in the speech that in a time of increasing tensions, as at present, the United States should feel compelled to increase the attractiveness to the Soviets of U.S. disarmament proposals by offering the Soviets one-sided military advantages. To do so, would be dangerously misleading to people throughout the world. The Soviets could only interpret this approach as a sign of weakness on the part of the United States and a sign of U.S. uncertainty about fulfilling its world-wide commitments.

b. I don't mean to imply that we should refuse to entertain new ideas, but it does seem clear that in the arms control field we can't expect to out-match the Soviets in offering fancy gimmicks for their propaganda appeal. Our interests surely lie in sticking to a responsible arms control program based on sound principles and realistic regard for the facts of international life.

c. Rather than the arms control approach taken in the draft speech, I believe that the United States should make clear that the unrenounced and frequently repeated Communist objective of world domination is the prime reason for the present level and deployment of U.S. armed forces and armaments.

d. With respect to arms control proposals, I believe that the United States should reiterate its interest in and willingness to negotiate international arms control agreements, and should demonstrate that the Soviets have consistently sabotaged all efforts in this direction through their repeated threats against and attacks on other peoples, their continued use of negotiations strictly as propaganda exercises and their refusal to negotiate in the 1960 Geneva disarmament conference, highlighted by their walk-out from that conference. In this connection, far greater stress than is now given in the draft should be placed on the Soviet penchant for secrecy as an obstacle to arms controls.

¹ Source: Views on a draft speech on disarmament. Secret. 5 pp. Eisenhower Library, Whitman File, Administrative Series, Joint Chiefs of Staff.

e. The United States should then restate—not renounce, as the draft speech implies—its 27 June 1960 disarmament proposals and invite participation in renewed negotiations on these proposals. As you no doubt recall, these proposals received your approval shortly before they were tabled in Geneva. To discard the 27 June 1960 proposals, as would be the case if we were to come forward now with what, in effect are new proposals, would—in addition to being a sign of great weakness—play into Soviet propaganda charges used to justify the Communist walk-out at Geneva in June 1960.

f. The arms control proposals in the draft speech are contrary to U.S. Basic National Security Policy in that they do not provide for balanced and phased disarmament. For example, the arms control proposals contained in the draft advocate the reduction of nuclear military capabilities without requiring substantial conventional disarmament, thus potentially impairing U.S. nuclear capabilities while leaving Sino-Soviet conventional capabilities unimpaired. The following are additional examples of proposals contained in the draft considered undesirable:

(1) One proposal asks the United Nations to “call on nations to engage in no military activities” on celestial bodies. This would be an uncontrolled ban, probably binding on the United States, but not on the USSR. A major principle of U.S. policy is that disarmament measures must be controllable and controls must be operative; this proposal is contrary to this principle and could establish a dangerous precedent. Also, this proposal could and probably would lead to additional U.N. resolutions such as ban the bomb, liquidate overseas bases, and eliminate means for delivering nuclear weapons.

(2) Another proposal asks that an “urgent study be initiated” in connection with control of nuclear delivery systems. This proposal, presented out of the context of the 27 June U.S. program, unduly emphasizes this aspect of the program in keeping with the Soviet desire to place the control of nuclear delivery means in Stage One.

(3) The proposals concerning nuclear weapons, aside from being undesirable because they are not tied to conventional disarmament, invite the ninety-odd nuclear have-nots, who have no capability and no responsibility for preserving the security of the Free World, to negotiate and pass resolutions on arms controls for U.S. nuclear weapons. In addition, the proposal to close nuclear production plants one-by-one is undesirable because it is offered without requiring verification to assure that new plants are not being established on the territory of the Sino-Soviet Bloc.

(4) The United States cannot agree to terminate “nuclear” production, as is proposed in the speech. This would encompass tritium without which many of our existing or remaining nuclear weapons would quickly become ineffective. For this reason, the U.S. proposals have only suggested termination of the production of “fissionable” materials.

(5) The speech deals inadequately with Soviet aggression over international waters and with the problem of obtaining the release of the RB-47 crewmen; also, it hands the initiative in this matter to the Soviets. The major points to be stressed are that a continuation of Soviet aggressive acts over international waters is a bar to peaceful negotiations; that

the continued illegal imprisonment of the RB-47 crewmen is a constant reminder of the fact of Soviet aggression; and that the RB-47 crewmen must be released immediately to afford any hope that Soviet brigandage over international waters will be stopped and, therefore, any hope that negotiations might be fruitful.

(6) The section on arms control fails to specify that nuclear and non-nuclear arms controls must be balanced and that "general disarmament" must be under effective international control.

2. I believe that specific arms control measures listed in the draft speech, should be redrafted to conform to the U.S. proposals of 27 June 1960, which are the latest arms control proposals which have been fully coordinated within the Government and approved by the President. The arms control proposals contained in the draft speech have not been so coordinated. They represent a drastic departure from the concept of balanced and phased arms control measures at all times under effective international verification and inspection, as reflected in the 27 June proposals, and would have serious security implications.

3. The Joint Chiefs of Staff concur fully in the views expressed above.

N.F. Twining

Chairman

Joint Chiefs of Staff

599. Memorandum From Parsons (FE) to Merchant¹

Washington, September 20, 1960

SUBJECT

Possible addition of Communist China to 10-Nation Disarmament Commission

My reactions from the strictly Far East viewpoint to a *U.S.* proposal to add the Federal Republic of Germany and Communist China to the 10 nation Disarmament Group are as follows:

1. It has long been the United States position that Communist China must indeed be included in any effective disarmament scheme but that until it is determined that the U.S.S.R. will agree to such a scheme rather than merely making propaganda, it would be premature

¹ Source: Possible addition of Communist China to Ten-Nation Disarmament Commission. Secret. 3 pp. NARA, RG 59, Conference Files: Lot 64 D 559, CF 1772.

to bring in the Chinese Communists whose interest it is to exploit disarmament only to expose the imperialists, i.e. propaganda. We think our present stance is still sound and serviceable.

2. This position has the merit of minimizing pressures upon us as regards United Nations representation. If we think it important here and now to bring the Chinese Communists into the disarmament negotiations, we would be urged to concede that their presence in the United Nations would be important too. We could justify a seeming inconsistency in this regard if we could say we had evidence of a favorable Chinese Communist position on disarmament but our evidence is just to the contrary.

3. If Mr. Khrushchev for reasons related to his dispute with the Chinese Communists makes a big pitch to get them into the United Nations, I do not think we could one day go all out to oppose this and then turn around and propose adding them to the 10 nation group. The sophisticated nations might understand but they are in the minority.

4. If Chinese Representation problem goes routinely, point 2 applies less obviously but nonetheless importantly, I think.

5. In so far as the exacerbation of Soviet-Chinese Communist relations is concerned, I could argue for throwing the monkey wrench either way. On balance I feel that they are more likely to stick together if they are at the same table than if one is sulking in outermost Peiping. Also, if they are at the same table, the Russians will no longer feel a partial responsibility and will tell us to deal directly with the Chinese Communists.

6. In the Far East any apparent change of United States attitude toward the Chinese Communists arouses apprehension. Indeed, even the invitation to Khrushchev to come here a year ago caused consternation. The Thai are already jittery and critical as you know because we have been allegedly less anti-Communist and firm in Laos than we should have been. The Vietnamese and others in some degree share this concern.

7. I am afraid that this proposal would appear to many as a gimmick, none too sincere, at the expense of a substantive policy to which we have long consistently adhered. If some one else were to propose this, some of my misgivings would be removed but I would still suspect that we would be opening one or more boxes of Pandora with no clear sight ahead as to how to put the contents back under the lid or lids. There is little doubt that if present the Chinese would aggressively seek to blackmail the "imperialists" and try to divide them. We would be dealing across the table with two arch-obstructionists instead of one.

8. Incidentally, Chou-en-lai has said he would not take part in any disarmament conference involving countries, which have not recognized Communist China.

9. Finally, I am told the Department is putting the final touches on a Disarmament paper which rejects the idea of bringing the Chinese Communists into the group.

600. Memorandum From Farley to Herter¹

Washington, September 23, 1960

SUBJECT

Today's Soviet Disarmament Proposals

I have compared the Soviet proposals on disarmament introduced today in the General Assembly with the proposals of June 2.

The only change of any significance is the shift of the proposal for reduction of U.S. and Soviet armed forces to 1.7 million, from para. 2 of the second stage to para. 2 of the first stage. Corresponding paragraphs concerning the duties of inspectors and other control measures have been shifted from para. 3 of the second stage to the end of para. 8 of the first stage.

The present sub-paragraphs III (f) and (g) have been moved up from their former locations in para. 3 of the second stage and para. 8 of the first stage respectively.

Other changes are even more trivial. They consist of:

(a) modifying the lead-in language to refer to the governments of states "participating in negotiations on disarmament" rather than "members of the Ten Nation Committee on Disarmament set up in 1959".

¹Source: Analysis of new Soviet disarmament proposals. No classification marking. 2 pp. NARA, RG 59, Conference Files: Lot 64 D 559, CF 1772.

(b) Deleting the underlined words in the following phrase from sub-paragraph III (d): “each party to the Treaty will undertake to give the *inspectors and* inspection teams timely and unrestricted access within its territory.

(c) Adding the word “scientific” to “peaceful purposes” everytime the launching of rockets is referred to.

601. Memorandum of Conference with the President¹

Washington, October 2, 1960

OTHERS PRESENT

Prime Ministers Menzies and Macmillan; Ambassador Beale, Lord Home,
Mr. de Zulueta, Secretary Herter, General Goodpaster

The President, after greeting Prime Minister Menzies, said he could not understand why the rest of the world had not reacted with shock and resentment to the resolution by the five neutral nations calling upon Khrushchev and himself to meet. He was especially surprised at Nehru joining in this, since Nehru certainly understands the Communist tactics. However, Nehru had said that his mind was confused regarding the situation that has developed. The President said he does not have much use for the others (Nkrumah, Nasser, Tito and Sukarno).

Mr. Menzies said that it is an old trick of Nehru's to sit silent, not giving his views on matters up for discussion, in order to embarrass the

¹ Source: Resolution of five neutrals calling for a U.S.-Soviet summit. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

other man. He recalled that Sukarno had objected to a summit meeting of four people, noting that he was now joining in proposing a summit meeting of two people.

The President said that he has been working hard on a reply to the five neutral leaders. The key point is that the problems are not problems of the United States and the USSR alone, but affect the whole of humankind. Mr. Menzies noted that in Cabinet meetings, when he has a problem it seems impossible to solve, a good technique is to refer it to a committee. He thinks the action of the neutral leaders is of this character—If Hammarskjold, as well as the Western nations, were going to be kicked around in the UN, then he thought those doing the kicking should be allowed to go ahead and break up the UN, since there would be no point in pretending that we have anything of value in those circumstances. The President concluded by saying that there is one Khrushchev recommendation he favored and that is to get the United Nations out of New York City. Having the United Nations there imposes a great burden on a free country, with a free press that people like Khrushchev and Castro can exploit for their own purposes.

Lord Home brought up one additional point—Khrushchev wants to add five “Neutrals” to the Disarmament Committee which now consists of ten members. He said his thought was to say that the Soviets may propose the addition of five, but we would like to add five also. Lord Home said it would be very difficult and undesirable to vote against the addition of Mexico, the UAR and one or two of the other nations proposed by the Soviets. Mr. Herter pointed out that the twenty-member committee would be getting quite unwieldy and discussion brought out that it is not desirable to approach this problem on a two-party basis.

A.J. Goodpaster
Brigadier General, USA

602. Memorandum of Conversation¹

SecDel MC/110

New York, October 7, 1960, 1:10 p.m.

SECRETARY'S DELEGATION TO THE FIFTEENTH SESSION
OF THE UNITED NATIONS GENERAL ASSEMBLY
New York, October 3–7, 1960

PARTICIPANTS

United States
The Secretary of State
Mr. Max V. Krebs

United Kingdom
Lord Alexander Home
Mr. I. A. Samuel (Private Secretary)

SUBJECT

Disarmament

The Secretary opened the conversation by asking Lord Home how Prime Minister Macmillan's second conversation with Khrushchev had gone. The Foreign Secretary said almost the entire conversation had been devoted to disarmament with Khrushchev adding a new element in suggesting a special session of the General Assembly in February or March 1961 to take up only disarmament. Macmillan countered that he thought some progress could be made in Committee I during the General Assembly. He made no commitment regarding Khrushchev's suggestion. Lord Home went on to say that Khrushchev is expected to speak tomorrow when the Assembly discusses adoption of the agenda, and may advance his line regarding disarmament at that time.

Lord Home said that British tactic will be to refuse to be drawn into any general discussion of disarmament in the plenary. He questioned how long Boland would allow Khrushchev to go on with any statement on disarmament noting that the vote in the Committee on referral of disarmament to Committee had been better than a two-thirds majority. The Secretary said that in several of his talks with representatives of smaller nations he found them all in agreement with the idea of taking up disarmament in Committee first. As far as he was concerned Lord Home said he planned to leave on the morning of the 8th and would come back to New York only if the General Assembly got involved in the disarmament item and then only for a few days. He did indicate he might return to take part if the item came under serious consideration in Committee I.

¹ Source: Disarmament at the United Nations. Secret. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

Continuing, Lord Home said Macmillan had tried to get Khrushchev into discussion of controls and inspection, but that Khrushchev had shied away. The Foreign Secretary said that in a talk with Moch yesterday he had raised the question of DeGaulle's proposals on control of means of delivery. Moch had said there had been a misunderstanding of French intentions in this regard and that they had intended only inspection of the means of delivery in the first stage.

In reply to Lord Home's question the Secretary said the only other item which had been under consideration by the U.S. for possible advancement into the first stage was the matter of nuclear missiles. The Secretary added, however, that we had run into difficulty since this would involve submarines and other naval vessels as well as any aircraft capable of delivering nuclear weapons.

603. Letter From Eisenhower to Kistiakowsky¹

Washington, October 25, 1960

Dear Dr. Kistiakowsky:

Pursuant to plans which I approved last fall, the Secretary of State has established the United States Disarmament Administration to strengthen leadership and coordination of the manifold activities of the United States Government in the field of safeguarded disarmament and arms control.

This Administration will be responsible to the Secretary of State and will be staffed with personnel from the interested U.S. Government departments and agencies, together with personnel recruited from outside Government where appropriate, thus assuring the blending of skills essential to the highly complex work in which it will be engaged.

In addition to coordinating or conducting an intensified program of study and research, the new organization will be responsible for formulating recommendations for policies and basic positions for consideration within the U.S. Government with respect to effective disarmament and arms control, and for direction and support of international negotiations on these subjects. As in the past, the Secretary of

¹ Source: U.S. Disarmament Administration. No classification marking. 3 pp. Eisenhower Library, Records of the President's Science Advisory Committee, U.S. Disarmament Administration.

State will continue to coordinate these policies with you as appropriate to your responsibilities.

The Disarmament Administration will permit the United States to marshal the best available skills applicable to the field in a continuing campaign to develop practical means for attaining effective disarmament and arms control agreements, for easing the burden of armaments, for lessening the dangers of surprise attack, or of war by accident or miscalculation, and for promoting a just and durable peace.

I am confident that your agency will give full and continued support to the Secretary of State in developing an effective organization and in building a sound and imaginative disarmament and arms control policy.

My own devotion to this endeavor is deep and abiding. The well-being and safety of our country and of the world may be significantly advanced by its efforts. I shall support it in every way I can.

I am sending letters related to this one to the Secretary of State and to other agencies and departments with responsibilities in the field of arms control.

Sincerely,

Dwight D. Eisenhower

Attachment

FUNCTIONS OF THE U.S. DISARMAMENT ADMINISTRATION

The mission of the Administration will be to assist the Secretary of State in formulating disarmament and arms control policies and basic positions consistent with national security for consideration within the U.S. Government, and in negotiating international agreements in this field. This mission, which will be carried out in cooperation with the other interested parts of the government, and with the assistance, where necessary, of experts and consultants under contract, will include assisting the Secretary of State in the following functions:

A. Development, review, analysis, evaluation and coordination of plans, studies, policies and programs, and research in connection therewith;

B. Maintenance of up-to-date information on all studies and research and development activities which are being carried on, both inside and outside the government, in support of the United States governmental effort in the disarmament and arms control field; development of a long-term cooperative program for such studies and activities; and undertaking or commissioning such studies or activities as may be appropriate in the light of the long-term program;

C. Formulation and coordination of policies for the guidance of U.S. delegations to international negotiations;

D. Maintenance of contact on disarmament, arms control and related matters with the representatives of foreign governments;

E. Planning for, cooperation with, and assistance in public information programs designed to keep foreign and domestic public opinion accurately informed of U.S. policies;

F. Development in cooperation with the other interested U.S. agencies of plans for U.S. participation in such arrangements for control and inspection as may be required under international disarmament and arms control agreements.

604. Memorandum From Herter to Persons¹

Washington, November 16, 1960

Dear Jerry:

You may recall my telling you that we should reach a decision soon with regard to the continuation of the Nuclear Test Suspension discussions in Geneva. On the basis both of Soviet statements and the current slow pace of their responses in Geneva it seems unlikely that they will be prepared to make any substantial negotiating moves or to seek seriously any resolution of remaining differences until they know whether a new administration is prepared to offer them a better deal on the outstanding issues. If a satisfactory resolution of remaining issues is not now likely, it would not seem to be in the U.S. interest to make concessions or offer compromises at a time when instead of enabling us to determine whether agreement is possible they might serve only to reduce our bargaining position for the final effort to reach agreement. Just as the prospects of agreement seem slight at present, so also do the prospects of breaking off negotiations or proceeding with nuclear research explosions in December on terms favorable to the West. In this connection it would be particularly difficult at this time to secure the assent of Congressional leaders to the fallback position on opening nuclear devices (without which the U.K. would not support us in initiating nuclear research shots).

¹ Source: Proposes recess in test ban negotiations. Confidential. 2 pp. Eisenhower Library, Whitman File, Presidential Transition Series.

In light of these factors it would seem advisable to seek a recess in the negotiations in the latter part of this month and to propose that negotiations reconvene in February. Since a firm reconvening date would be set we foresee no likelihood that a recess would have any serious repercussions in the UN. Prior to a recess we should maintain essentially our present positions with such elaborations and developments on relatively minor aspects as can be handled through the normal day to day instructions.

Before consultation with the British and the Soviets on this matter, I think it would be well to advise Clark Clifford of what we propose to do. My guess would be that he would approve.

Christian A. Herter

605. Memorandum From Persons to Clifford¹

November 18, 1960

Memorandum of Information for Mr. Clark Clifford Furnished to me by the Secretary of State

SUBJECT

Nuclear Test Suspension Discussions in Geneva

You may recall my telling you that we should reach a decision soon with regard to the continuation of the Nuclear Test Suspension discussions in Geneva. On the basis both of Soviet statements and the current slow pace of their responses in Geneva it seems unlikely that they will be prepared to make any substantial negotiating moves or to seek seriously any resolution of remaining differences until they know whether a new administration is prepared to offer them a better deal on the outstanding issues. If a satisfactory resolution of remaining issues is not now likely, it would not seem to be in the U.S. interest to make concessions or offer compromises at a time when instead of enabling us to determine whether agreement is possible they might serve only to reduce our bargaining position for the final effort to reach agreement. Just as the prospects of agreement seem slight at present, so also do

¹ Source: Conveys Herter's memorandum on recess in test ban negotiations. Confidential. 2 pp. Eisenhower Library, Whitman File, Presidential Transition Series.

the prospects of breaking off negotiations or proceeding with nuclear research explosions in December on terms favorable to the West.

In light of these factors it would seem advisable to seek a recess in the negotiations in the latter part of this month and to propose that negotiations reconvene in February. Since a firm reconvening date would be set, we foresee no likelihood that a recess would have any serious repercussions in the UN. Prior to a recess we should maintain essentially our present positions with such elaborations and developments on relatively minor aspects as can be handled through the normal day to day instructions.

Before consultation with the British and the Soviets on this matter, I think it would be well to advise Clark Clifford of what we propose to do.

The above information is the type that I would think would be given to Senator Kennedy's State Department designee, but I am passing it on to you pending the naming of this official.

Wilton B. Persons

606. Letter From Gray to Herter¹

Washington, November 30, 1960

Dear Chris:

In a letter to you dated November 19, 1960, copies of which were sent to each of the Principals, the Secretary of Defense recommended that United States policy on Arms Control be set forth in a single NSC document.

I heartily endorse the recommendation of the Secretary of Defense which, as I understand it, proposes only the codification in a single document of existing policy on arms control.

At present, United States policy on Arms Control is recorded in two NSC policy documents. It is set forth, but only in the very broadest terms, in a single paragraph of Basic National Secretary Policy (Paragraph 52, NSC 5906/1). It is also set forth in NSC 112, which was

¹ Source: Endorses Gates' proposal for single NSC document on U.S. arms control policy. Secret. 5 pp. Eisenhower Library, White House Central Files, Records of the Office of Special Assistant to the President for National Security Affairs, Arms Control.

approved on July 19, 1951 and which still remains unrescinded on the NSC records.

On July 22, 1960, I raised in the NSC Planning Board the question as to whether there should not be an up-to-date policy statement on the control of armaments. At that time the State Department representative stated that the Department would consider the possibility of developing a draft statement of current policy on the subject. I am advised that the State Department has not as yet undertaken to prepare such a policy statement.

Because paragraph 52 of NSC 5906/1 is cast in such general terms and because NSC 112 is over nine years old, I strongly urge the preparation of an up-to-date policy codification on arms control, suitable for submission to the National Security Council and approval by President Eisenhower.

I should suppose that the Committee of Principals would recommend such a paper and that the Interdepartmental Working Group for Disarmament would be the logical body to prepare a draft for this purpose.

Sincerely,

Gordon Gray
Special Assistant to the President

Enclosure

Note From Gray to Lay

Washington, November 25, 1960

Mr. Lay:

I agree with Mr. Gates that there should be a single document setting forth the U.S. Arms Control Policy. You will recall that we had such a codification project on the books many months ago.

I think we should give every possible impetus to this.

Gordon Gray

Enclosure**Letter From Gates to Herter**

Washington, November 19, 1960

Dear Mr. Secretary:

The Joint Chiefs of Staff on several occasions have pointed out the need for a formally approved comprehensive United States policy on Disarmament and Arms Control and for an official current statement of the United States position in order to provide definitive guidance (a) for the formulation of future United States proposals and (b) for our representatives in international negotiation and discussion on this subject. Current United States Basic Policy on Arms Controls, set forth in Paragraph 52—NSC 5906/1, is stated in very broad terms, and, while adequate for general guidance, requires clarification in the interests of common interpretation and understanding among the various governmental individuals and working groups concerned with the subject of disarmament.

With the foregoing in mind, the Joint Chiefs of Staff were requested to submit their views regarding the principles which should govern U.S. arms control policy and regarding specific measures which the United States might propose which would be in consonance with that policy. The Joint Chiefs of Staff have now submitted their recommendations. Except for minor modifications, principally in format, these recommendations are contained in the inclosure hereto and its annex, which I have reviewed and consider to be suitable for adoption. The position recommended (annex to the inclosure hereto) takes into consideration and is consistent with the Program submitted by the United States to the Ten-Nation Committee on June 27, 1960. The policy recommended (inclosure hereto) is comprehensive, and in my view, soundly based.

I believe it to be desirable that the arms control policy be set forth in a single NSC document to which the current U.S. arms control position should be appended. As in the case of other NSC documents, they should be kept current as revisions may occur from time to time. In the view of the possibility of an early resumption of international arms control negotiations, I believe it particularly important to establish an approved comprehensive U.S. arms control policy and the current U.S. position quite soon. Accordingly, I suggest that the proposed policy and United States position be referred to the Interdepartmental Working Group for Disarmament for review, with instructions to submit their final report to the Principals not later than November 10, 1960, with the

view of early approval by the President. Such final action would serve the dual purpose of formally recording U.S. arms control policy, which should govern the formulation of United States proposals now and in the future, and of setting forth the current U.S. position on an international disarmament program.

A copy of this letter is being transmitted to each of the Principals.

Sincerely yours,

Thomas S. Gates

607. Memorandum From Gray to Herter and Gates¹

Washington, December 14, 1960

MEMORANDUM FOR

Secretary of State
Secretary of Defense

I am directed by the President to request that the Secretary of State and the Secretary of Defense prepare a codification of U.S. Policy on Arms Control in a single document which would become a part of the National Security Council record.

If I or any members of the NSC staff can be of any assistance I trust you will let me know.

Gordon Gray

Special Assistant to the President

¹ Source: Directs preparation of a codification of U.S. arms control policy in a single document. No classification marking (Top Secret enclosure). 2 pp. Eisenhower Library, White House Office Files, Records of the Office of the Special Assistant to the President for National Security Affairs, Arms Control.

Attachment

Letter From Haskins to Gray

November 29, 1960

Mr. Gray:

Attached is a proposed draft letter to the Secretary of State, seconding the recommendation of the Secretary of Defense for a codification of U.S. policy on arms control in a single NSC document.

I am afraid that I share Bob Amory's estimate as to the unlikelihood that such a document can be prepared by January 20, let alone by December 10.

The JCS draft enclosed with the letter from the Secretary of Defense seems scarcely a recapitulation of agreed existing policy. It states, for example:

"The U.S. negotiations effort must ensure that in the post-arms control agreement era the U.S. will be able to maintain at any stage an adequate response to the entire spectrum of the remaining Sino-Soviet Bloc threat; namely, an evident, secure nuclear retaliatory capability and an evident, flexible capability for military operations short of general nuclear war."

If you do wish to give every possible impetus to achieving a codification during this Administration, I suggest that you ask the President to raise the matter in the presence of Secretaries Herter and Gates and request them to produce an agreed codification for adoption in the NSC by a day certain.

Charles A. Haskins

608. Memorandum From Lay to the NSC¹

Washington, December 16, 1960

SUBJECT

Peaceful Uses of Atomic Energy

REFERENCE

NSC 5725/1

The enclosed Report by the Atomic Energy Commission and the Department of State on the implementation of NSC 5725/1, for the period July 1, 1959 through October 15, 1960, is transmitted herewith for the information of the National Security Council.

James S. Lay, Jr.
Executive Secretary

cc: The Secretary of the Treasury
The Director, Bureau of the Budget
The Chairman, Atomic Energy Commission
The Chairman, Joint Chiefs of Staff
The Director of Central Intelligence

Enclosure

Progress Report by the Atomic Energy Commission

ATOMIC ENERGY COMMISSION

PROGRESS REPORT BY THE ATOMIC ENERGY COMMISSION
AND THE DEPARTMENT OF STATE ON THE STATE OF
IMPLEMENTATION OF NSC 5725/1—PEACEFUL USES
OF ATOMIC ENERGY—FOR THE PERIOD OF JULY 1, 1959
THROUGH OCTOBER 15, 1960

1. This report summarizes major developments and problem areas for the period of July 1, 1959, through October 15, 1960, in the programs implementing NSC 5725/1, "Peaceful Uses of Atomic Energy", dated December 13, 1957.

¹ Source: Transmits report on implementation of NSC 5725/1, "Peaceful Uses of Atomic Energy." Confidential. 23 pp. NARA, RG 59, S/S-NSC Files: Lot 63 D 351, NSC 5725.

2. During the reporting period, the United States maintained its leadership in fostering peaceful uses of atomic energy and assisting the programs of other countries and international organizations in this field. This leadership was demonstrated convincingly at the Third and Fourth General Conferences of the International Atomic Energy Agency in Vienna in September 1959 and 1960.

3. At the 1959 Conference, the United States recommended a balanced expansion of Agency activities, much of which has been incorporated in IAEA programs, particularly in technical assistance to lesser developed countries.

4. In 1960, despite the continued opposition from important neutral and Soviet Bloc countries, progress was made toward a major U.S. objective, that of the Agency fulfilling its statutory responsibility of establishing and administering an international system of safeguards to assure against diversion to military purposes of materials and facilities supplied by or through the Agency or placed under its jurisdiction. (See "International Agency", paragraphs 21-32, and "Safeguards", paragraphs 11-19.)

5. In nuclear power development abroad, technical problems and general education in delivered prices of fossil fuels caused stretchouts and modifications in most major programs. The U.S. domestic program has been unaffected as fossil fuel costs have been and remain relatively stable.

6. It has been recognized that competitive power will be difficult to attain in the United States. There is confidence, however, that the short-term goals of the U.S. 10-year program ending in 1968 will be achieved and that the diversity and magnitude of the U.S. reactor development effort will provide continued leadership in this area. (See "U.S. Power Development", paragraphs 50-60.)

7. In 1960, U.S. cooperation was extended to three countries not previously associated with the Atoms for Peace program. These were Indonesia (research Agreement for Cooperation effected) and Finland and Yugoslavia, assistance to the latter two being made possible by the U.S.-IAEA agreement. (See paragraph 26.) Also, financing of work in this country in direct support of the Canadian heavy water moderated power reactor development was a significant expansion of cooperation with our Canadian ally. (See paragraph 54.)

8. Other events include the successful organization, in October 1959, along lines proposed by the United States, of the Inter-American Nuclear Energy Commission (IANEC) and orderly development of its program without opposition at the second IANEC meeting in Brazil in July 1960 (Cuba not represented); increasing requests from countries and international organizations for U.S. experts and consultants (48 supplied in the reporting period); and success of the comprehensive Atoms for Peace exhibits in India and the United Arab Republic.

9. The U.S.S.R. so far has confined its own Atoms for Peace program primarily to the Soviet Bloc countries. Some aid has been given to Iraq (exchange of missions), Yugoslavia (a research reactor), Indonesia (offer of reactor and technicians) and the United Arab Republic (training and a research reactor). The Franco-Soviet agreement signed April 2, 1960 is limited largely to exchanges of scientists somewhat along the same lines of the US-USSR program.

10. There always is the possibility that the Soviet Union may add more substantial aid in the nuclear field to its current economic and technological offensive against the Free World. There are reports that the U.S.S.R. will offer to supply on attractive credit terms and with "no strings attached" (e.g., safeguards) a large power reactor to India which is in the market for such a facility.

SAFEGUARDS

11. After long consideration, the IAEA Board of Governors in April 1960 approved provisionally and referred to the Fourth General Conference, a proposed system of Agency administered safeguards. The proposed policies and procedures are acceptable to the United States and were strongly endorsed by U.S. representatives in the Board and at the September 1960 Conference.

12. During the Conference debate, at our request, eight nations went on record as favoring consultation with the United States with a view of transferring to Agency administration the safeguards provisions of their present bilateral agreements with the United States. Negotiations to accomplish such a transfer will be undertaken with the countries involved.

13. It is recognized that the Agency system, if implemented by the IAEA Board at its January 1961 meeting, is only a first step toward the goal of a comprehensive internationally administered control system that would be applicable to all types of materials and facilities where there is the possibility of diversion for military purposes. The proposed controls would apply only to reactors of up to 100 megawatts thermal power and are not applicable to facilities such as chemical processing plants or large power reactors.

14. In recognition of the evolutionary nature of the Agency system, the 15-power resolution, initiated by the United States and adopted by the Conference, provides that the Board of Governors shall report to the Sixth Conference in 1962 on the results of experience gained, as well as technological developments so that operation of Agency safeguards may be reviewed and evaluated.

15. To provide a field laboratory for the Agency procedures and to demonstrate that international inspection is not an unwarranted infringement on national sovereignty, the United States at the Fourth

Conference unilaterally offered to place under IAEA inspection two research, one experimental power, and one small power reactor—all representative of the types of facilities that would be covered under the proposed Agency system. The U.S. offer was well received and a project agreement is being worked out to put it into effect.

16. At the 1960 Conference, India and the Soviet Bloc continued their strong opposition to the proposed system. A large majority of members, however, rejected a five-power resolution initiated by India which would have had the effect of emasculating the proposed system and delaying its installation. Instead, by a better than two-to-one vote, the Conference adopted the 15-power resolution which returned the safeguards document to the Board for implementation and instructed the Board to take into account the views expressed during the debate.

17. It is anticipated, however, that the Soviet Bloc, India and other neutral states will continue their opposition to proposed safeguards system during the January 1961 Board discussions and, even if passed, may not join in its application.

18. (The President was informed on October 31, 1960 of rights and sanctions available to the United States to recover reactor fuel furnished by this country in event a recipient nation failed to comply with provisions of the Agreement for Cooperation under which the material was made available.)

19. U.S. preparation for the January 1961 Board meeting will be directed toward obtaining maximum support for the proposed Agency system and for a common position among other supplier nations to apply comparable safeguards to their bilateral transactions. Should these objectives fail to be achieved, the United States must re-assess its safeguards position, taking into account both actual developments and the requirements of national security.

20. As of this date, under bilateral agreements, U.S. safeguards are applicable to 62 facilities in 23 countries. Inspections are continuing on normal schedules without incident. Materials being controlled, as of September 30, 1960 amount to more than 20, 000 kilograms of uranium fuel and 365 tons of heavy water.

21. Meanwhile, Euratom has activated its safeguards operation and inspections by three-man teams of different nationalities are proceeding. No objections have been encountered either to the inspections or the nationality of the personnel. A master inventory of materials and facilities subject to Euratom controls is being prepared.

INTERNATIONAL ATOMIC ENERGY AGENCY

22. Despite statutory and financial handicaps, the Atomic Energy Agency in the past 15 months has made significant progress in

competence and in scope of its technical programs. U.S. support of the Agency was expanded. Noteworthy was the U.S. effort to encourage our bilateral partners to look to the Agency for its future Atoms for Peace assistance. To this end, four bilateral agreements were allowed to expire: Chile, Colombia, Lebanon and Pakistan.

23. Six other bilaterals expiring in 1960 or 1961 (Argentina, Brazil, Republic of China, Greece, Israel, and Portugal) were extended for only two years with a view to encouraging these countries to seek future assistance from the Agency. The same was true for a three-year extension of the U.S. agreement with the Philippines.

24. The United States continued to be the largest financial contributor to the Agency. During calendar year 1960, the United States will provide not less than half of the voluntary budget and 32.43 per cent of the assessed budget. (See paragraph 28). Other monetary support includes \$192,000 worth of equipment as gifts in kind to certain member nations under the IAEA technical assistance program and \$700,000 for cost-free fellowships.

25. Under a master contract negotiated with the Agency, the United States, during the reporting period, placed 12 research contracts for work costing \$134,000 to be performed in other IAEA Member States.

26. These actions do not mean that the bilateral system of agreements is to be abandoned. The United States has adopted the policy of encouraging an increasing number of its bilateral partners to seek special nuclear materials and other assistance through the Agency. For those countries with which we have substantial joint programs, or in cases where political considerations dictate a preference, however, the bilateral agreement probably will continue to be the instrument of choice.

27. The US–IAEA Agreement for Cooperation, which went into force August 7, 1959, made it possible for the United States to use the Agency to provide reactors and fuel to Agency members whether or not such members had a bilateral agreement with the United States. Under this agreement, Finland and Yugoslavia will obtain, through the IAEA, research reactors and fuel of U.S. manufacture. In this connection, the United States awarded a \$200,000 grant to Yugoslavia towards the purchase of its reactor and an additional \$150,000 commitment for purchase of U.S. equipment.

28. Accepting the U.S. offer made at the 1959 IAEA General Conference, Agency scientists in 1960 began visits to some unclassified U.S. small nuclear power plant projects. At the 1960 IAEA meeting, the U.S. offer was extended to include additional projects in the small and medium-sized reactor field. Arrangements are being made to place Agency visits on a periodic basis. The IAEA technical staff is not large enough to permit long-term work assignments to these projects.

29. Other assistance included the offer to donate up to \$50,000 worth of nuclear fuel for the Agency-sponsored Finnish reactor project; participation of 35 U.S. scientists and engineers in many fields as consultants to countries requesting them through the IAEA or as members of Agency expert panels; and continuation of the program of making a minimum of 80 cost-free fellowships for training in the United States available through the Agency program.

30. Future financing of the Agency is one of the major problems confronting the United States in its continuing effort to make the Agency a more effective instrument in dealing with international matters such as health and safety, including waste disposal; safeguards; information dissemination; etc., and for channeling U.S. nuclear energy assistance to underdeveloped nations.

31. The present system of two budgets, one termed "administrative" and supported by assessments and the other, designated "operational", funded by voluntary contributions is inadequate and cumbersome. Voluntary contributions have not been as large as expected to the detriment of those Agency activities dependent on this source of funds. As of October 1, 1960 it did not appear that payments of other members will exceed \$500,000 (the goal was \$1,500,000 to which the United States contributed \$500,000). This means that none of the \$250,000 pledged additionally by the United States on a matching basis for contributions in excess of \$1,000,000 will be used. Although pledges of voluntary contributions have increased in the past two years, the Agency faces a difficult problem in obtaining adequate support on a regular basis from those Members able to pay more.

32. The present detailed statutory supervision of Agency operations by the Board of Governors impedes efficient administration of Agency programs and often results in undue delays in obtaining non-policy decisions and approvals. The United States will examine the desirability of changes in the Agency Statute, revision of which will be considered at the Fifth and Sixth General Conferences in 1961 and 1962, that would contribute to solving these problems.

33. A continuing problem at IAEA General Conference is injection of political and propaganda issues, principally by the Soviet Bloc, into general debate and committee discussions. This is resented particularly by some of the scientist-delegates from other member states but no practical solution appears at hand.

34. The term of former Representative Sterling W. Cole as Director General expires in 1961. The Board of Governors will appoint the Director General for the 1962-1966 term in time for approval at the Fifth General Conference in September 1961. Although no political commitments, direct or implied, were made when Mr. Cole was chosen, the

fact that he was from the “West” may lead to claims that he should be succeeded by a Soviet-oriented person. The United States contemplates seeking support among non-Soviet Bloc Members for a mutually agreed upon candidate for the Director General post.

EURATOM AND ORGANIZATION FOR EUROPEAN ECONOMIC COOPERATION (OEEC)

35. The deepening impact of economic factors that have produced a lessened urgency for nuclear power (see paragraphs 5–6) resulted in a setback in the joint US-Euratom effort to encourage European utilities to build large-scale nuclear plants in Western Europe. In the first round of invitations for plants to be constructed by the end of 1963, only one final proposal qualified for benefits of the joint program.

36. This was the 150,000 KWe project in Southern Italy for the Italian Societa Electronucleare Nazionale (SENN). Construction is proceeding and a U.S. manufacturer will supply the boiling-water-type reactor. With agreement of all parties involved and no objection from the Joint Congressional Committee on Atomic Energy, this project—already initiated under bilateral arrangements—was placed under the Euratom program.

37. Invitation for two plants, to be completed by December 1965, is to be issued shortly by Euratom, with indications that the 150,000 KW(e) project of the Baden-Wurtemberg consortium in West Germany (AKS) and the 210,000 KW(e) joint Franco-Belgian proposal (SENA) may be submitted.

38. Euratom remains of the belief that, over the long term, nuclear power will be important in Europe. Its recent study forecast that, by 1980, the Community would require, in addition to expanded conventional output, some 40,000,000 KW installed nuclear capacity. This same study put nuclear power by 1970 at 9,600,000 KW. The 1956 “Target for Euratom” envisaged 15,000,000 KW by 1968.

39. The joint US-Euratom research and development program was cut back to limit proposals generally to work on the boiling water system. This policy will be reviewed after evaluation of proposals received for the 1965 reactors. To date, 45 projects totaling \$7,800,000 have been approved by the Joint US-Euratom Research and Development Board. The United States will finance \$2,200,000 of this work and Euratom the remaining \$5,600,000.

40. An Additional Agreement for Cooperation with Euratom came into force July 25, 1960 which covers transfer of highly enriched fuel and U-233 contained in fuel for use in research and development projects not connected with the joint program. A perfecting amendment to

the Euratom Cooperation Act to permit implementing this Additional Agreement will be submitted to the next Congress.

41. Euratom acquired, through lease, the excellent Ispra Center in Italy which will become its major research facility. The Community also made substantial progress in the use of national laboratories in Member States for research projects. Agreements are in force or being negotiated for joint or Community work at laboratories in Germany, the Netherlands and Belgium.

42. There have been important developments in the area of public liability. Signed and awaiting ratification is an OEEC convention setting up to \$15,000,000 of private protection as the maximum for each nuclear accident with a proviso that no state would require less than \$5,000,000. Euratom staff is developing a supplement to the OEEC convention which would permit its members, unilaterally, to add government indemnity to raise the maximum liability to between \$50,000,000 and \$80,000,000 with the possibility that, jointly, the Euratom countries might take action to bring the total available for public claims to approximately \$120,000,000.

43. There remain some problems which affect the U.S.-Euratom joint program. Among these are the recent Euratom request to lease enriched fuel inventories for the joint power reactor projects instead of purchasing them on the deferred payment plan; Euratom encouragement of the West Berlin project, BEWAG, which poses technical and political problems for the United States; and recurring friction between French and Euratom executives.

44. (The International Atomic Energy Agency continued its work on drafting public liability conventions which would have world-wide application to land based facilities and nuclear-powered ships.)

45. Euratom also has Agreement for Cooperation with the United Kingdom and Canada. The former has not resulted in any joint projects to date and discussions have tended to range over long-range programs. Canada and Euratom have established a joint board to administer a five-year \$10,000,000 research and development effort on the heavy-water moderated reactor system.

46. United States expanded its cooperation with the OEEC and the latter's European Nuclear Energy Agency, through an agreement for exchange of data on experimental high-temperature, gas-cooled reactor (DRAGON in England; the Philadelphia Electric-General Dynamics project in this country); consultative assistance to Eurochemic (the semi-governmental share-holding company now building a chemical reprocessing plant at Mol, Belgium); and to the OEEC experimental reactor project at Halden, Norway.

*INTER-AMERICAN NUCLEAR ENERGY COMMISSION (IANEC)
AND PUERTO RICO NUCLEAR CENTER*

47. The new Inter-American Nuclear Energy Commission (IANEC) is composed of representatives of the governments of the Organization of American States. Its statute, adopted in April 1959, sets up IANEC as a coordinating and consultative body in the field of peaceful uses of nuclear energy.

48. Several problems emerged from the two IANEC meetings and its symposium on industrial applications of nuclear energy, all held during the reporting period. Coordination of effort in training, education, and research remains the paramount need. The United States, at both IANEC meetings, committed itself to increased financial support on a bilateral basis to national centers and specialized research and training facilities when a comprehensive plan for practical development has been completed and given IANEC approval.

49. The acute lack of facilities for gathering and interchanging technical information in Latin-American countries also was demonstrated at the symposium. The United States supported resolutions adopted at the second IANEC meeting urging development of a coordinated training program and recommending revision of O.A.S. fellowship, technical assistance and other applicable programs to promote greater use of these programs in the nuclear science field.

50. The Puerto Rico Nuclear Center was strengthened during the reporting period with the completion of a small training reactor and the dedication of a large research reactor and related laboratory facilities in August 1960, and the appointment, effective July 1, 1960, of Dr. John Bugher, former Director of the AEC Division of Biology and Medicine, as Center Director. Dr. Bugher's appointment fills the need for putting an outstanding Scientific Administrator at the head of the Center.

51. Current objectives are effective recruitment of students from Latin America, establishment of strong research programs and achieving closer relationship with the University of Puerto Rico in planning Center and University programs. Approximately 20 Latin-American students were enrolled at the Center in the 1959 academic year.

52. With respect to the concept of a cooperative Center to serve Asian countries: There has been no revival of interest in the countries which were consulted several years ago.

U.S. NUCLEAR POWER AND PLOWSHARE PROGRAMS

53. One objective of the U.S. 10-year power program has been changed by the economic factors previously noted (see paragraphs 35–39). The hope that within five years U.S. assistance and progress in our program would bring competitive nuclear power to high cost areas in

friendly countries, especially in Europe, does not appear likely to be realized.

54. The U.S. effort is moving ahead. The 180,000 KW(e) Dresden plant near Chicago is in operation and attracting an increasing number of foreign visitors. The Yankee 110,000 KW(e) project in Massachusetts has gone critical. Plants in operation or under construction will raise the total U.S. installed nuclear capacity above the 1,000,000 KW(e) mark by 1964. See Appendix "A", page 20. If other planned plants materialize, the total by 1966 would be about 1,500,000 KW(e).

55. During the past year, active negotiations were begun for at least three additional large-scale nuclear plants: the proposed 300,000 to 360,000 KW(e) plants for Southern California Edison and Pacific Gas and Electric Companies and studies looking toward a 350,000 to 500,000 KW(e) project in New York State for which seven utilities are organizing a special company.

56. The first phase of a long range AEC study, completed in Fiscal Year 1960, indicates that the pressurized and boiling water and the organic moderated reactor systems, with reasonable success in programmed development effort, will meet the near-term goal of competitive power with large scale reactors in high cost U.S. areas by 1963. Also for the first time, leading reactor manufacturers are offering to build plants in the 300,000 KW range on a fixed price scale.

57. For the long range goal of competitive power in low cost areas and with smaller plants, the United States is programming substantial research and development on several advanced reactor systems. It is estimated that at least \$2 billion will be required for the U.S. Government sponsored nuclear power program in the 1960's. The bulk of the developmental work such as design, construction and operation of reactor experiments, and prototypes and general engineering will be funded by the Government. Privately financed projects are expected to add substantially to the total expenditures.

58. In addition to the U.S. work with Euratom and OEEC (See paragraphs 31-36, 41) a cooperative program entered into with Canada is expected to make substantial contributions to heavy water moderated reactor technology. Under this program, the United States will spend in this country up to \$5,000,000 over a five-year period for research and development supporting the Canadian program in this field.

59. Civilian applications are assuming more importance in efforts directed at nuclear rocket propulsion (ROVER program) and at developing small, light-weight auxiliary nuclear power and heat sources (SNAP program). Last August, work heretofore carried out separately by the AEC and the National Aeronautics and Space Administration (NASA) was consolidated in a joint Nuclear Propulsion Office.

60. Although an experimental ROVER graphite reactor tested in July 1960 ran for five minutes at about a 90,000 kilowatt power level, an effort to develop reactors of high power, higher gas temperatures and lower weight is being pursued. The goal is to achieve three to four times more power and thrust which would increase payload capabilities.

61. Progress was made in the two approaches to small nuclear auxiliary power sources—one using heat from isotope decay and the other based on small, compact reactors. Both have been successfully demonstrated. An experimental power package for a remote weather station was completed in Fiscal Year 1960. The U.S. Coast Guard has established a requirement for unattended power sources for several types of navigational aids.

62. In the nuclear ship program, the N.S. SAVANNAH is nearing completion and sea trials are scheduled for the spring of 1961. It will use a pressurized water reactor. Longer range development of other reactor systems is being carried out but it is not considered likely that nuclear merchant ship operation will be economic in the near future.

63. Negotiations are proceeding with the United Kingdom for permission for the NS SAVANNAH to call at Southampton and Tilbury (near London) and talks have been held with other European countries. Agreement has been reached with the British except for terms of third party liability.

64. In Europe interest in nuclear ship propulsion continues high despite the present lack of economic incentive. Recently, 11 shipyards in Germany were asked by the consortium of government and private industry at Hamburg, known as GKSS, to bid on design and construction of West Germany's first nuclear ship—to be a 10,000 horsepower "floating laboratory" powered by a 30,000 KW organic moderated reactor. Besides other German projects, mostly in the planning stage, studies are being pursued in Italy, France, Great Britain, the Netherlands, and Scandinavian countries.

65. Start of nuclear detonation experiments for peaceful uses (Project Plowshare) awaits decision related to negotiations on nuclear weapon tests ban. In the reporting period, cratering experiments with chemical high explosives have continued. Also, based on a technical study, the Panama Canal Company reported on April 29, 1960, that if certain preliminary experimentation should be successful, nuclear explosions could be used to build a new sea-level trans-Isthmian canal. The report urged that these experiments be conducted.

ACTIVITIES UNDER BILATERAL AGREEMENTS

66. Activities carried on under bilateral agreements continued to expand. The most notable was the increase in transfer of reactor fuel. Most of the 339 kilograms of contained U-235 (total uranium 10,998 kg)

were shipped to other countries in the form of fuel elements manufactured in the United States. The total for this reporting period compares with 486 Kg of U-235 (total uranium 9,134 Kg) for all previous shipments.

67. This increase reflects the dominant position the United States has had in the sale of research and training reactors abroad since most of this fuel was for U.S. manufactured facilities. Foreign sales are dropping both in the United States and the United Kingdom, as other countries acquire the ability to design and construct reactors and as current needs are satisfied.

68. No large-scale power reactors were sold either by the United States or the United Kingdom in the reporting period. Plans of the Franco-Belgian and the Arbeitsgemeinschaft Kernkraftwerke Stuttgart (AKS) groups, however, are based on U.S. designed reactors. On October 10, 1960, India invited international bidding on a 300,000 KW(e) nuclear plant for the Bombay area. Brazil has announced that invitations for 200,000 KW(e) between Rio and Sao Paulo will be issued in 1961.

69. Reflecting the adverse economic climate for nuclear power, the only group to take advantage of the special deferred fuel payment plan offered for reactors that could be completed by 1964 was the Societa Elettro-nucleare Italiana (SELNI), a corporation 85 per cent privately owned, with the majority held in Edisonvolta. Its 165,000 KW(e) plant, using a U.S. reactor, is to be located in the Ligurian region and will serve the Milan industrial complex.

70. Changes in civilian bilateral agreements not previously noted include the coming into force of one for power with Venezuela (signed October 8, 1958) and two for research with Indonesia and Austria, the last-named being an updating of an earlier agreement. Amendments expanding the scope of cooperation were effected with Canada, New Zealand, and Thailand. The total agreements in force now stand at 41 with 39 countries, plus those with Euratom and IAEA.

71. The Canadian amendment clarified patent arrangements, provided for sale lease or loan of special nuclear materials and heavy water and extended the duration of the Agreement for Cooperation.

TRAINING

72. Training of foreign nationals in Commission and other U.S. institutions continued to increase. During the Fiscal Year 1960, more than 1,100 persons from 52 countries participated in formal courses (260) or received on-the-job training at Commission facilities (900 estimated). Guidance on opportunities and financial assistance available in private industry and U.S. colleges and universities was given to several hundred others.

73. The training program is kept flexible to meet changing needs. The first class at the school at Argonne National Laboratory, renamed, in 1960, the International Institute of Nuclear Science and Engineering, entered on much more advanced courses of study. Basic work now available elsewhere was dropped in the curriculum revision.

74. The first courses, primarily for foreign students, in various phases of reactor technology and operation were completed in this reporting period at Oak Ridge National Laboratory, the nuclear ship project, and the Shippingport nuclear power plant.

75. Education-and-training continued to be an important and popular phase of the Atoms for Peace program, particularly in view of the increased efforts in technical assistance through IAEA research and equipment grants for use by foreign nationals in their own countries. Facilities for basic training are improving in quality and expanding in number in the more advanced nations. The AEC program will be altered as necessary to meet changing conditions.

EXHIBITS AND CONFERENCES

76. The Commission continued, on a selected basis, to support financially international conferences and symposia. Fourteen such meetings received support between February and October, 1960.

77. Subject to approval of the United Nations General Assembly, a Third International Conference on the peaceful uses of atomic energy is scheduled tentatively for 1962 or 1963. The United States has taken the position that the International Atomic Energy Agency should have a major role in this next conference.

78. Major nuclear energy exhibits in New Delhi, India, and Cairo, United Arab Republic were most successful. A total of 2,800,000 viewed the U.S. exhibit at the New Delhi World Agricultural Fair between December 11, 1959, and February 29, 1960. Eleven seminars were held there for scientists and students. An operating reactor produced a number of isotopes some of which were used in experiments performed at the exhibit. Other major exhibits planned for the remainder of 1960 will be held in Pakistan and Argentina. During 1961, major displays are scheduled for Lebanon, Brazil, Peru and Venezuela.

79. The United States continued to support the objectives and work of the United Nations Scientific Committee on Effects of Atomic Radiation.

REACTOR AND EQUIPMENT GRANTS

80. In December 1959, the United States terminated the AEC research reactor grant program, effective June 30, 1960. Except for several applications received just before the deadline which are being evaluated, future requests will compete with other aid proposals from the specific country

involved and, if granted, be funded by country program appropriations rather than from the Atoms for Peace budget.

81. In the reporting period, grants were committed for Turkey, Pakistan, and Yugoslavia, bringing the total to 22, of which 6 have been paid following completion of the reactor projects (see paragraph 26, Yugoslavia).

82. In general, the research reactor grant effort has been a successful phase of the Atoms for Peace program. This is attested in several ways: One has been concrete results in terms of research and development activities that are beginning to accumulate as these "grants" reactors continue successful operation. Another has been the stimulation that these projects provided for nuclear research and training in the recipient countries. In most cases, the total amount invested in facilities exceeded by many times the \$350,000 grant.

83. One of the more successful "grant" reactors is the Munich, Germany project which is doing important work in irradiation of elements and materials, experiments with neutron beams and reactor experiments. An Israeli team spent several months at Munich, learning how to operate and use the swimming pool reactor, the type that Israel has just completed with U.S. grant assistance. (The U.S. company that built the Israeli reactor has reported that this project has been the most successful of any of its many overseas installations.)

84. Some grant projects have encountered delays which can be charged to some extent to lack in the recipient country of proper organization for design, specification and construction and unrealistic and overly optimistic time schedules. The United States, where appropriate, is endeavoring to assist in remedying such situations. In one case (Japan) much of the delay of over a year appears to have been due to the U.S. manufacturers.

85. In some countries, there will be a problem of using these new reactors fully. The United States recommended to the IAEA that this factor be taken into account in its technical aid program.

86. Assistance in procurement of equipment is assuming added importance because of its value to lesser developed countries. U.S. grants are used to meet urgent needs ranging from integrated packages of laboratory equipment, including hot cells, to simple teaching tools needed in a radioisotopes course. These grants now are being handled in three ways: Direct by the AEC; through ICA country programs; and by U.S. grants in kind made through the IAEA. State and AEC are re-examining the methods of funding equipment grants.

87. In fiscal year 1960, the totals for all three categories of equipment grants were \$1,183,000 for 19 grants to 13 countries.

AEC PARTICIPATION IN US–USSR EXCHANGES

88. A Memorandum of Cooperation was signed in November 1959 by Chairman McCone of the USAEC and Professor V.S. Emelyanov, his counterpart in the Soviet Union. This understanding is incorporated as a formal addendum to the US–USSR 1960–61 Scientific, Technical and Cultural Exchange Agreement.

89. A modest program of exchanges of visits of US and USSR nuclear scientists under the Memorandum has made satisfactory progress and is being continued. In the reporting period, there have been reciprocal visits in the fields of high energy physics and controlled thermonuclear research. An exchange of visits in the area of radioactive waste disposal is expected to take place shortly as a result of further McCone-Emelyanov talks in Vienna in September, 1960.

90. Reports of these visits, as well as technical reports developed as a result of the discussions, are being made available to the IAEA. AEC is withholding direct exchange of its technical reports with the Soviet Union until the latter begins to fulfill its reciprocal obligations in this respect.

91. Professor Emelyanov has been urging discussion of possibilities of joint US–USSR projects, especially in waste disposal and high energy physics. The United States has responded cautiously because it is felt that such developments, particularly in high energy physics, should proceed on a broader international base.

92. At a meeting in New York City on September 16, U.S. and U.S.S.R. physicists agreed on the desirability of a particle accelerator in the energy region above 300 Bev. The U.S. group (private physicists not representing the Government) recommended that other countries and areas be encouraged to participate in the studies. This possibility is under consideration. The understanding calls for channeling any joint projects, to the extent that it is possible, through the International Atomic Energy Agency.

CONCLUSIONS

93. The six years of operation of the Atoms for Peace program has contributed to U.S. foreign policy with a relatively modest expenditure. The program brought to millions of people all over the world the realization of the potential of nuclear energy for peaceful applications.

94. Our effort to share with other nations the fruits of our progress in this field and our willingness to assist others has identified the United States as the world leader in seeking to encourage the development of peaceful uses of nuclear energy. The historic United Nations conferences in Geneva in 1955 and 1958, initiated by the United States, contributed greatly to this image.

95. The program has resulted in thousands of person-to-person exchanges between U.S. nationals and those of most of the nations of the world. There have been more than 4,700 visitors from other countries to U.S. government and private nuclear laboratories, plants, and research centers. Some 2,500 foreign nationals have received training in nuclear science and technology in the United States.

96. One of the principal objectives of the program has been achieved. The International Atomic Energy Agency began operations in October 1957 and has grown slowly but steadily in competence and prestige. It has been recognized by other international organizations as having a leading role and competence in the nuclear field.

97. The Agency has, in less than two calendar years of full operation (staffing and organization predominated the first year), achieved noteworthy success in developing its fellowship program (about 1,000 awards made). Its publications are recognized internationally, particularly its manuals in the health and safety field. It has developed the ability to program and carry out large technical conferences and its smaller panels of experts have made significant contributions in the field of public liability and adoption of pertinent international standards.

98. The IAEA has made substantial progress toward implementing one of its most important statutory functions, that of establishing and administering an international system of safeguards to assure against diversion to military purposes of material designated for civilian use. If the safeguards proposal now before the IAEA Board for implementation is adopted and supplier and recipient nations do not bypass the Agency, administration of an international system of controls in the civilian area may assist in working out a practical contribution to new efforts to reach with the Soviet Union an agreement on a safeguarded formula for nuclear arms control.

99. One major goal has not been attained, that of the Agency becoming the chief custodian and broker of source and fissionable materials. Two factors are largely responsible: One is that the basic raw material, uranium ore, a scarce item in 1953, is now a surplus commodity on the world market. The other is that economic civilian uses for large quantities of uranium, particularly in nuclear plants, have not developed as fast as had been anticipated.

100. The basic objectives of U.S. policy in the Atoms for Peace effort, set forth in NSC 5725/1, continue applicable to programs implementing that policy. Consideration should be given to updating some of the background material. Some of the specific guidelines should be studied with a view to revision as necessary to reflect changing conditions such as the lessened urgency for nuclear power, development of multilateral agencies, and the emergency of new and underdeveloped countries which are becoming full-voting members of the United Nations, the IAEA, and other international organizations.

Appendix A

CENTRAL STATION AND EXPERIMENTAL NUCLEAR POWER PLANTS IN OPERATION, UNDER CONSTRUCTION
OR CONTRACTED FOR IN THE UNITED STATES AS OF OCTOBER 19, 1960

Name and/or Owner	Location	Principal Nuclear Contractor	Type	Net Power kw(e)	Startup
<u>Operable:</u>					
Shippingport Atomic Power Station (AEC and Dequesne Light Co.)	Shippingport, Pa.	Westinghouse Electric Co.	Pressurized Water	60,000	[illegible in the original]
Dresden Nuclear Power Station (Commonwealth Edison Co.)	Morris, Ill.	General Electric Company	Boiling Water	100,000	[illegible in the original]
Yankee Atomic Electric Co.	Rowe, Mass.	Westinghouse Electric Co.	Pressurized Water	110,000	[illegible in the original]
Experimental Boiling EBWR Water Reactor	Argonne, Ill.	Argonne National Laboratory, operated by the University of Chicago	Boiling Water	4,500	[illegible in the original]

Name and/or Owner	Location	Principal Nuclear Contractor	Type	Net Power kw(e)	Startup
Vallecitos Boiling VBWR Water Reactor, (General Electric Company and Pacific Gas and Electric Company)	Pleasanton, Calif.	General Electric Company	Boiling Water	5,000	[illegible in the original]
Sodium Reactor Experiment SRE (AEC and Southern California Edison Co.)	Santa Susana, Calif.	Atomics International, a Division of North American Aviation, Inc.	Sodium graphite	6,000	1957
<u>Being Built:</u>					
Consolidated Edison Co. Thorium Reactor	Indian Point, N.Y.	The Babcock & Wilcox Co.	Pressurized water	255,000	1961
Enrico Fermi Atomic Power Plant (Power Reactor Development Co.)	Lagoona Beach, Mich.	Owner	Fast breeder	94,000	[illegible in the original]
Hallam Nuclear Power Facility, Sheldon Station (AEC and Consumers Public Power District)	Hallam, Nebr.	Atomics International, a Division of Forth American Aviation, Inc.	Sodium graphite	75,000	1962

Name and/or Owner	Location	Principal Nuclear Contractor	Type	Net Power kw(e)	Startup
Northern States Power Co. Pathfinder Plant	Sioux Falls, S. Dak.	Allis-Chalmers Mfg. Co.	Boiling water nuclear superheat	60,000	[illegible in the original]
Rural Cooperative Power Association and AEC	Elk River, Minn.	Allis-Chalmers Mfg. Co.	Boiling water	22,000	[illegible in the original]
City of Piqua and AEC	Piqua, Ohio	Atomics International, a Division of North American Aviation, Inc.	Organic cooled and moderated	11,400	1961
Carolinas-Virginia Tube Reactor (Carolinas-Virginia Nuclear Power Associates, Inc.	Parr, S.C.	Westinghouse Electric Co.	Pressure tube, heavy water	16,950	1962
Boiling Reactor Nuclear Superheat Project (AEC and Puerto Rico Water Resources Authority)	Punta Higuera, Puerto Rico	General Nuclear Engineering Corp., a Subsidiary of Combustion Engineering, Inc.	Boiling water, international nuclear superheat	16,300	1962
Experimental Breeder FBR-2 Reactor No. 2	NRTS, Idaho	Argonne National Laboratory, operated by the University of Chicago	Fast breeder	16,500	[illegible in the original]

Name and/or Owner	Location	Principal Nuclear Contractor	Type	Net Power kw(e)	Startup
Boiling Reactor BORAM-5 Experiment No. 5	NRTS, Idaho	Argonne National Laboratory, operated by the University of Chicago	Boiling water	2650	[illegible in the original]
Saxton Nuclear Experimental Reactor Project (Privately Owned)	Saxton, Pa.	Westinghouse Electric Co.	Pressurized water	3250	1961
Experimental Gas Cooled EGCR Reactor (AEC and Tennessee Valley Authority)	Oak Ridge, Tenn.	Kaiser Engineers, a Division of Henry J. Kaiser Co.—ACF Industries, Inc.	Gas cooled, graphite moderated	32,900	1961
Humboldt Bay Power Plant, Unit No. 3 (Pacific Gas and Electric Co.)	Humboldt Bay, Calif.	General Electric Company	Boiling water	48,500	[illegible in the original]
Consumers Power Company	Big Rock Point, Michigan	General Electric Company	Boiling water	50,000	1962
<u>Contracted For:</u>					
High Temperature Gas Cooled Reactor (Philadelphia Electric Co.)	Peach Bottom, Pa.	General Atomic Division, General Dynamics Corp.	Gas cooled, graphite moderated	40,000	1963
