BUREAU OF PUBLIC AFFAIRS

OFFICE OF THE HISTORIAN

For sale by the Superintendent of Documents
U.S. Government Printing Office
Washington, D.C. 20402

Preface

The *Foreign Relations of the United States* series presents the official documentary historical record of major foreign policy decisions and significant diplomatic activity of the United States Government. The series documents the facts and events that contributed to the formulation of policies and includes evidence of supporting and alternative views to the policy positions ultimately adopted.

The Historian of the Department of State is charged with the responsibility for the preparation of the *Foreign Relations* series. The staff of the Office of the Historian, Bureau of Public Affairs, plans, researches, compiles, and edits the volumes in the series. This documentary editing proceeds in full accord with the generally accepted standards of historical scholarship. Official regulations codifying specific standards for the selection and editing of documents for the series were first promulgated by Secretary of State Frank B. Kellogg on March 26, 1925. These regulations, with minor modifications, guided the series through 1991.

A new statutory charter for the preparation of the series was established by Public law 102-138, the Foreign Relations Authorization Act, Fiscal Years 1992 and 1993, which was signed by President George Bush on October 28, 1991. Section 198 of P.L. 102-138 added a new Title IV to the Department of State's Basic Authorities Act of 1956 (22 USC 4351 *et seq.*).

The statute requires that the *Foreign Relations* series be a thorough, accurate, and reliable record of major United States foreign policy decisions and significant United States diplomatic activity. The volumes of the series should include all records needed to provide comprehensive documentation of major foreign policy decisions and actions of the United States Government, including facts that contributed to the formulation of policies and records that provided supporting and alternative views to the policy positions ultimately adopted.

The statute confirms the editing principles established by Secretary Kellogg: the *Foreign Relations* series is guided by the principles of historical objectivity and accuracy; records should not be altered or deletions made without indicating in the published text that a deletion has been made; the published record should omit no facts that were of major importance in reaching a decision; and nothing should be omitted for the purposes of concealing a defect in policy. The statute also requires that the *Foreign Relations* series be published not more than 30 years after the events recorded. The editors of this microfiche

supplement are convinced that it meets all regulatory, statutory, and scholarly standards of selection and editing.

Structure and Scope of the Foreign Relations Series

This microfiche supplement is part of a subseries of the *Foreign Relations* series for the years 1958–1960. The subseries presents in 19 volumes and 2 microfiche supplements a documentary record of major foreign policy decisions and actions of the final 3 years of the administration of President Dwight D. Eisenhower. This supplement to volume III, National Security Policy; Arms Control and Disarmament, is the last part of the subseries published covering the 1958–1960 triennium.

Sources for the Foreign Relations Series

The *Foreign Relations* statute requires that the published record in the *Foreign Relations* series include all records needed to provide comprehensive documentation on major foreign policy decisions and actions of the U.S. Government. It further requires that government agencies, departments, and other entities of the U.S. Government cooperate with the Department of State Historian by providing full and complete access to records pertinent to foreign policy decisions and actions and by providing copies of selected records. The editors believe that in terms of access this supplement was prepared in accordance with the standards and mandates of the statute, although access to some records was restricted, as noted below.

The editors have had complete access to all the retired records and papers in the Department of State. The Department's collections of NSC papers and correspondence were of the highest value. Some of these documents are available in the central (decimal) files and lot (office) files deposited at the National Archives and Records Administration (NARA) at College Park, Maryland (Archives II). Over the last several years, all the Department's indexed central files for these 3 years, as well as several of the lot files, have been permanently transferred to Archives II. The remaining Department lot files covering this triennium are scheduled to be transferred to Archives II in the near future.

Records of the Central Intelligence Agency and certain intelligence-related files maintained in the Bureau of Intelligence and Research of the Department of State became available to the Department historians only after this supplement was compiled. Arrangements have been made for Department historians to have access to these records for future volumes.

The major decisions on national security and arms control questions were made by President Eisenhower, usually after recommendations from and discussion in the National Security Council (NSC) and his Committee of Principals, established in 1958 to advise him on disarmament matters. The most important Presidential records are the

relevant White House files at the Dwight D. Eisenhower Library in Abilene, Kansas, to which the editors had complete access. The Eisenhower Library contains, among other important collections, the memoranda of discussion at the NSC meetings, usually prepared by Deputy Executive Secretary S. Everett Gleason, and the memoranda of conference with the President, prepared by the President's Staff Secretary, Andrew J. Goodpaster.

Records of the National Security Council located at NARA include the numbered NSC papers and related documentation. Because White House and Department of State records contain many significant Department of Defense documents, the editors sought only selected access to the Department of Defense files. The editors also perused the records of the Joint Chiefs of Staff and the official papers of General Nathan F. Twining, General Thomas D. White, and Admiral Arleigh A. Burke.

The List of Sources (pp. 1–6) lists the files consulted both in government repositories and in private collections for the print volume and the microfiche supplement.

Principles of Document Selection for the Foreign Relations Series

In preparing each volume of the *Foreign Relations* series, the editors are guided by some general principles for the selection of documents. Each editor, in consultation with the General Editor and other senior editors, determines the particular issues and topics to be documented either in detail, in brief, or in summary. Some general decisions are also made regarding issues that cannot be documented in the volume but will be addressed in a microfiche supplement or in editorial or bibliographical notes.

The following general selection criteria are used in preparing volumes in the *Foreign Relations* series. Individual compiler-editors vary these criteria in accordance with the particular issues and the available documentation. The compiler-editors also tend to apply these selection criteria in accordance with their own interpretation of the generally accepted standards of scholarship. In selecting documentation for publication, the editors give priority to unpublished classified records, rather than previously published records (which are accounted for in appropriate bibliographical notes).

Selection Criteria (in general order of priority):

1. Major foreign affairs commitments made on behalf of the United States to other governments, including those that define or identity the principal foreign affairs interests of the United States;
2. Major foreign affairs issues, commitments, negotiations, and activities, whether or not major decisions were made, and including dissenting or alternative opinions to the process ultimately adopted;

3. The decisions, discussions, actions, and considerations of the President, as the official constitutionally responsible for the direction of foreign policy;

4. The discussions and actions of the National Security Council, the Cabinet, and special Presidential policy groups, including the policy options brought before these bodies or their individual members;

5. The policy options adopted by or considered by the Secretary of State and the most important actions taken to implement Presidential decisions or policies;

6. Diplomatic negotiations and conferences, official correspondence, and other exchanges between U.S. representatives and those of other governments that demonstrate the main lines of policy implementation on major issues;

7. Important elements of information that attended Presidential decisions and policy recommendations of the Secretary of State;

8. Major foreign affairs decisions, negotiations, and commitments undertaken on behalf of the United States by government officials and representatives in other agencies in the foreign affairs community or other branches of government made without the involvement (or even knowledge) of the White House or the Department of State;

9. The role of the Congress in the preparation and execution of particular foreign policies or foreign affairs actions;

10. Economic aspects of foreign policy;

11. The main policy lines of U.S. military and economic assistance as well as other types of assistance;

12. The political-military recommendations, decisions, and activities of the military establishment and major regional military commands as they bear upon the formulation or execution of major U.S. foreign policies;

13. The main policy lines of intelligence activities if they constituted major aspects of U.S. foreign policy toward a nation or region or if they provided key information in the formulation of major U.S. policies;

14. Diplomatic appointments that reflect major policies or affect policy changes.

*Scope and Focus of Documents Researched and Selected for the Microfiche
Supplement to Foreign Relations, 1958–1960, Volume III*

Most of the research for the print volume and this supplement was completed in 1988, prior to a protracted declassification review. The principles of selection followed by the editors for the print volume are described in the preface of the volume. The print volume may be used without this supplement, but the supplement should be used in conjunction with the print volume.

The documents selected for this microfiche publication by the editors of volume III provide additional details on the major issues

covered, as well as some lengthy documents and attachments which could not be printed because of lack of space, such as the full texts of National Security Council reports, National Intelligence Estimates, and Special National Intelligence Estimates.

Editorial Methodology

The documents in this microfiche supplement are arranged in two sections: national security policy and arms control and disarmament. Within each of these sections, the documents are presented chronologically, according to Washington time or in the order of individual meetings. Incoming telegrams from U.S. Missions are placed according to time of receipt in the Department of State or other receiving agency, rather than the time of transmission; memoranda of conversation are placed according to the time and date of the conversation, rather than the date the memorandum was drafted.

The documents are numbered at the top of the first page of the document. The List of Documents is ordered according to these numbers. The documents are not annotated nor is there any other editorial apparatus. Material not declassified has been blacked out; for each document not declassified, a page has been inserted that shows a title, date, classification, number of pages, and source citation.

The List of Documents, which includes for each document the title, date, participants (for memoranda of conversation), from/to information, classification, number of pages, and source citation, as well as a brief summary, is part of this printed guide and appears on the first two microfiche cards. The printed guide also includes Lists of Sources, Abbreviations, and Persons.

Advisory Committee on Historical Diplomatic Documentation

The Advisory Committee on Historical Diplomatic Documentation, established under the *Foreign Relations* statute, reviews records, advises, and makes recommendations concerning the *Foreign Relations* series. The Advisory Committee monitors the overall compilation and editorial process of the series and advises on all aspects of the preparation and declassification of the series. Although the Advisory Committee does not attempt to review the contents of individual volumes in the series, it does monitor the overall process and makes recommendations on particular problems that come to its attention.

The Advisory Committee has not reviewed this microfiche supplement.

Declassification Review

The declassification review process for this volume was particularly lengthy, requiring 8 years to complete. It resulted in the withholding

from publication of about 5 percent of the documentation selected for publication by the editors; 6 documents were denied in full. Documentation withheld from the volume consists largely of certain still classified information pertaining to intelligence and nuclear weapons. The declassified documentation provides an accurate account of the major foreign policy issues and the major policies undertaken by the U.S. Government on national security policy and arms control during this period.

The Information Response Branch of the Office of IRM Programs and Services, Bureau of Administration, Department of State, conducted the declassification review of the documents published in this volume. The review was conducted in accordance with the standards set forth in Executive Order 12356 on National Security Information, which was superseded by Executive Order 12958 on April 20, 1995, and applicable laws.

Under Executive Order 12356, information that concerns one or more of the following categories, and the disclosure of which reasonably could be expected to cause damage to the national security, requires classification:

- 1) military plans, weapons, or operations;
- 2) the vulnerabilities or capabilities of systems, installations, projects, or plans relating to the national security;
- 3) foreign government information;
- 4) intelligence activities (including special activities), or intelligence sources or methods;
- 5) foreign relations or foreign activities of the United States;
- 6) scientific, technological, or economic matters relating to national security;
- 7) U.S. Government programs for safeguarding nuclear materials or facilities;
- 8) cryptology; or
- 9) a confidential source.

The principle guiding declassification review is to release all information, subject only to the current requirements of national security and law. Declassification decisions entailed concurrence of the appropriate geographic and functional bureaus in the Department of State, other concerned agencies of the U.S. Government, and the appropriate foreign governments regarding specific documents of those governments.

Acknowledgments

The editors wish to acknowledge the assistance of officials at the National Archives and Records Administration and at the Dwight D. Eisenhower Library, in particular David Haight, who provided

invaluable help in the collection of documents for this microfiche supplement.

David W. Mabon and Edward C. Keefer compiled the material presented in this supplement under the supervision of former Editor in Chief John P. Glennen. Dr. Mabon also provided planning and direction. Former General Editor Glenn W. LaFantasie supervised the editing process. Douglas R. Keene prepared the List of Documents, and Rita M. Baker performed the technical editing.

List of Sources

Unpublished Sources

Department of State

Indexed Central Files. See under National Archives and Records Administration below.

Lot Files. A list of the lot files of the Department of State (decentralized files created by operating areas) used in or consulted for this volume and which are still in the custody of the Department follows. See also under National Archives and Records Administration below.

G/PM Files: Lot 68 D 358

Records on intelligence, national security actions, nuclear weapons, nuclear testing, et al., as maintained by the Office of the Deputy Assistant Secretary of State for Politico-Military Affairs for the years 1950–1967.

INR–NIE Files

Files retained in the Bureau of Intelligence and Research containing copies of National Intelligence Estimates and Special National Intelligence Estimates for 1958–1960.

S/S–RD Files: Lot 71 D 171

Restricted data files for 1957–1967, as maintained by the Executive Secretariat.

Dwight D. Eisenhower Library, Abilene, Kansas

Dulles Papers

Papers of John Foster Dulles as Secretary of State, 1953–1959, including General Memoranda of Conversation, Meetings with the President, General Telephone Conversations, and White House Telephone Conversations.

Herter Papers

Papers of Christian A. Herter, 1957–1961. Herter was Under Secretary of State, 1957–1959, and Secretary of State, 1959–1961.

McCone Papers

Papers of John A. McCone, Chairman of the Atomic Energy Commission, 1958–1961.

National Security Council Staff Records

Disaster File and Executive Secretary's Subject File.

President's Daily Appointments

Records of the appointments of Dwight D. Eisenhower as President, 1953–1961.

Records of the Special Assistant for National Security Affairs

Records of the Office of the Special Assistant to the President for National Security Affairs (Robert Cutler, Dillon Anderson, and Gordon Gray), 1952–1961.

White House Office Files, Additional Records of the Special Assistant for Science and Technology

XIV List of Sources

White House Office Files, Records of the Office of the Special Assistant for Science and Technology

White House Office Files, Project Clean Up

Project Clean Up collection. Records of Gordon Gray, Robert Cutler, Henry R. McPhee, and Andrew J. Goodpaster, 1952–1961.

White House Office Files, Staff Secretary Records

Records of the Office of the Staff Secretary (Paul T. Carroll, Andrew J. Goodpaster, L. Arthur Minnich, and Christopher H. Russell), 1952–1961.

Whitman File

Papers of Dwight D. Eisenhower as President of the United States, 1953–1961, as maintained by his Personal Secretary, Ann Whitman. The Whitman File includes the following elements: Name Series, Dulles–Herter Series, DDE Diaries, Ann Whitman (ACW) Diaries, NSC Records, Miscellaneous Records, Cabinet Papers, Legislative Meetings, Diary Series, Miscellaneous Series, Presidential Transition Series, International Meetings, Administrative Series, and International File.

Manuscript Division, Library of Congress, Washington, D.C.

Twining Papers

Papers of General Nathan F. Twining, Chairman of the Joint Chiefs of Staff, 1957–1960.

White Papers

Papers of General Thomas D. White, Chief of Staff, United States Air Force, 1957–1961.

National Archives and Records Administration, Washington, D.C.

Department of State Records, Record Group 59

Indexed Central Files

Among the most useful of these files in the preparation of the volume and supplement were 033.1100, 320.11, 330, 396.1–GE, 396.12–GE, 611.00, 611.0012, 700.5, 700.5611, 711.5, and 711.5611.

Atomic Energy Files: Lot 57 D 688

Consolidated collection of documentation on atomic energy policy for 1944–1962, maintained principally by the Special Assistant to the Secretary of State on Atomic Energy Affairs but also by other offices in the Department of State.

Conference Files: Lot 64 D 559

Collection of documentation of official visits by heads of government and foreign ministers to the United States and on major international conferences attended by the Secretary of State for 1959, maintained by the Executive Secretariat.

Conference Files: Lot 64 D 560

Collection of documentation of official visits by heads of government and foreign ministers to the United States and on major international conferences attended by the Secretary of State for 1960, maintained by the Executive Secretariat.

EUR/RPM Files: Lot 64 D 444

Collection of documentation on NATO and NATO countries for the years 1950–1961, as maintained by the Office of Atlantic Political and Military Affairs, Bureau of European Affairs.

G/PM Files: Lot 64 D 341

Miscellaneous Top Secret subject files maintained by the Combined Policy Staff of the Office of Politico-Military Affairs for the years 1958–1961.

Presidential Correspondence: Lot 66 D 204

Exchanges of correspondence between the President and heads of foreign governments for 1953–1964, maintained by the Executive Secretariat.

Secretary's Memoranda of Conversation: Lot 64 D 199

Chronological collection of the Secretary of State's memoranda of conversation for 1953–1960, maintained by the Executive Secretariat.

S/P Files: Lot 67 D 548

Subject files, country files, chronological files, documents, drafts, and related correspondence of the Policy Planning Staff for 1957–1961.

S/P-NSC Files: Lot 62 D 1

Serial and subject file of NSC documents and correspondence for 1948–1960, maintained by the Executive Secretariat.

S/S-NSC Files: Lot 63 D 351

Serial master file of NSC documents and correspondence and related Department of State memoranda for 1947–1961, maintained by the Executive Secretariat.

S/S-NSC (Miscellaneous) Files: Lot 66 D 95

Administrative and miscellaneous NSC files, including records of action, for 1947–1963, maintained by the Executive Secretariat.

S/S-OCB Files: Lot 61 D 385

Master set of the administrative and country files of the Operations Coordinating Board for the years 1953–1960, as maintained by the Executive Secretariat.

Joint Chiefs of Staff Records, Record Group 218

Records of the Joint Chiefs of Staff and the Chairman of the Joint Chiefs of Staff.

NSC Records, Record Group 273

Records of the National Security Council, Official Meeting Minutes File, and Policy Papers File.

Naval Historical Center, Washington, D.C.**Burke Papers**

Papers of Admiral Arleigh A. Burke, Chief of Naval Operations, 1955–1961.

Washington National Records Center, Suitland, Maryland**Record Group 59, Conference Files: FRC 83-0068**

See Department of State Records under National Archives and Records Administration above.

Record Group 330, OASD/ISA Files: FRC 64 A 2170

Country and general files of the Office of the Assistant Secretary of Defense (International Security Affairs) for the year 1960.

USAF, United States Air Force
USDel, United States Delegation
USIA, United States Information Agency
USMC, United States Marine Corps
USN, United States Navy
USSR, Union of Soviet Socialist Republics

VELA, project designed to improve detection of nuclear tests
VOA, Voice of America

WSEG, Weapons System Evaluation Group

List of Persons

Adenauer, Konrad, Chancellor of the Federal Republic of Germany
Allen, George V., Director of the United States Information Agency
Amory, Robert, CIA member, Working Group on Disarmament Policy
Anderson, Robert B., Secretary of the Treasury

Bacher, Robert F., Member, President's Science Advisory Committee
Bantz, Fred A., Under Secretary of the Navy
Berkner, Lloyd V., Chairman, Panel on Seismic Improvement
Bethe, Hans A., Chairman, Ad Hoc Panel on Nuclear Test Cessation; also Member, Panel of Experts
Bevan, Aneurin, British Member of Parliament and opposition Labor Party spokesman on foreign affairs
Boggs, Marion W., Director of the National Security Council Secretariat until July 1959; thereafter Deputy Executive Secretary
Bohlen, Charles E., Ambassador to the Philippines until October 15, 1959; thereafter Special Assistant to Secretary of State Dulles
Boster, David E., Staff Assistant to Secretary of State Dulles
Brucker, Wilber M., Secretary of the Army
Brundage, Percival F., Director, Bureau of the Budget, 1956–1958
Bulganin, Nikolai Alekandrovich, Chairman of the Council of Ministers of the Soviet Union until March 1958
Burke, Admiral Arleigh A., Chief of Naval Operations
Byers, Lieutenant General Clovis E., Military Adviser, Office of Assistant Secretary of Defense for International Security Affairs

Cabell, General Charles P., Deputy Director of Central Intelligence
Caccia, Sir Harold A., British Ambassador to the United States
Calhoun, John A., Director, Executive Secretariat, Department of State, from September 1958
Coolidge, Charles A., Director, Joint Disarmament Study
Couve de Murville, Maurice, French Foreign Minister
Cutler, Robert, Special Assistant to the President for National Security Affairs

De Gaulle, Charles, Prime Minister of France, June 1958–January 1959; thereafter President of France
Dillon, C. Douglas, Deputy Under Secretary of State for Economic Affairs until June 1958; Under Secretary for State for Economic Affairs, July 1958–June 1959; thereafter Under Secretary of State
Douglas, James II, Secretary of the Air Force until December 11, 1959; thereafter Deputy Secretary of Defense
Douglas-Home, Alexander Frederick, British Foreign Secretary from July 1960
Dryden, Hugh, Acting Administrator, National Aeronautics and Space Administration
Dulles, Allen W., Director of Central Intelligence
Dulles, John Foster, Secretary of State until his resignation on April 22, 1959
Dunning, John R., Adviser to the Atomic Energy Commission

XXII List of Persons

- Eaton, Frederick M.**, U.S. Representative to the Ten-Nation Disarmament Conference at Geneva from September 1960
- Eisenhower, Dwight D.**, President of the United States
- Eisenhower, Major John S.D.**, Assistant Staff Secretary to the President, promoted to Lieutenant Colonel in May 1960
- Emelyanov, V.S.**, Head of Soviet (non-military) Atomic Energy Authority
- English, Spofford G.**, Chief, Chemical Branch, Research Division, Atomic Energy Commission
- Farley, Philip J.**, Special Assistant to the Secretary of State for Disarmament and Atomic Energy Affairs
- Federov, Yevgeni**, member of the Soviet delegation to the Geneva Experts Conference on Nuclear Tests, 1958; thereafter Soviet Adviser to the delegation to the Geneva Conference on the Discontinuance of Nuclear Weapon Tests
- Fisk, James B.**, U.S. Representative to the Geneva Conference on the Discontinuance of Nuclear Weapon Tests; also member, President's Science Advisory Committee
- Floberg, John F.**, Member, Atomic Energy Commission
- Foster, Admiral Paul**, Member, Atomic Energy Commission; Member, Working Group on Disarmament Policy
- Foster, William C.**, U.S. Representative to the Geneva Conference of Experts on Surprise Attack
- Fox, General Alonzo P.**, Defense Member, Working Group on Disarmament Policy
- Franke, William B.**, Under Secretary of the Navy until June 7, 1959; thereafter Secretary of the Navy
- Gates, Thomas S., Jr.**, Secretary of the Navy until June 7, 1959; Deputy Secretary of Defense, June 7–December 1, 1959; thereafter Secretary of Defense
- Gleason, S. Everett**, Deputy Executive Secretary, National Security Council
- Glennan, T. Keith**, Administrator, National Aeronautics and Space Administration
- Goodby, James E.**, Atomic Energy Commission
- Goodpaster, Brigadier General Andrew J.**, Staff Secretary to President Eisenhower
- Gore, Albert**, Democratic Senator from Tennessee; member, Joint Committee on Atomic Energy
- Gray, Gordon**, Director, Office of Defense Mobilization, until July 1958; thereafter Special Assistant to the President for National Security Affairs
- Green, Howard C.**, Canadian Secretary of State for External Affairs from June 1959
- Gromyko, Andrei A.**, Soviet Foreign Minister
- Gruenther, General Alfred M.**, disarmament adviser to Secretary of State Dulles; formerly Military Adviser to President Eisenhower
- Hagerty, James C.**, Press Secretary to President Eisenhower
- Hammar skjöld, Dag**, Secretary-General of the United Nations
- Harriman, W. Averell**, former Ambassador to the Soviet Union
- Herter, Christian A.**, Under Secretary of State until April 21, 1959; thereafter Secretary of State
- Hickey, Lieutenant General Thomas F.**, Director, Net Evaluation Subcommittee Staff
- Hoegh, Leo A.**, Director, Office of Civil Defense, until July 1958; thereafter Director, Office of Defense Mobilization
- Holaday, William M.**, Director of Guided Missiles, Department of Defense
- Hood, Viscount Samuel**, British Minister to the United States
- Hoover, J. Edgar**, Director, Federal Bureau of Investigation
- Humphrey, Hubert H.**, Democratic Senator from Minnesota; Chairman, Special Subcommittee on Disarmament, Committee on Foreign Relations

Irwin, John N., II, Assistant Secretary of Defense for International Security Affairs from September 26, 1958

Jackson, Henry M., Democratic Senator from Washington; member, Joint Committee on Atomic Energy

Johnson, Lyndon B., Democratic Senator from Texas; Senate Majority Leader

Keeny, Spurgeon M., Jr., Staff Member, White House Office of Science and Technology

Kennedy, John F., Democratic Senator from Massachusetts

Khrushchev, Nikita S., First Secretary of the Central Committee, Communist Party of the Soviet Union; Vice Chairman, Soviet Council of Ministers until March 1958; thereafter Chairman

Killian, James R., Jr., President's Special Assistant for Science and Technology, and Director of the White House Office of Science and Technology until July 1959

Kistiakowsky, George B., Staff Member, White House Office of Science and Technology, until July 15, 1959; thereafter President's Special Assistant for Science and Technology and Director of the White House Office of Science and Technology

Knight, Robert H., Deputy Assistant Secretary of Defense for International Security Affairs, February 1958–June 1959

Krebs, Max V., Special Assistant to the Under Secretary of State until June 1959; thereafter Special Assistant to the Secretary of State

Latter, Albert, physicist with the Rand Corporation

Latter, Richard, Member, Panel of Experts

Lay, James S., Jr., Executive Secretary, National Security Council

Le Boutillier, Philip, Jr., Deputy Assistant Secretary of Defense for Supply and Logistics

LeMay, General Curtis E., Vice Chief of Staff of the Air Force

Lemnitz, General Lyman L., Vice Chief of Staff of the Army until June 30, 1959; Chief of Staff until October 1, 1960; thereafter Chairman of the Joint Chiefs of Staff

Libby, Willard F., Commissioner, Atomic Energy Commission, until July 1958

Ling, Donald P., Member, Science Advisory Committee

Lloyd, John Selwyn Brooke, British Secretary of State for Foreign Affairs until July 27, 1960; thereafter Chancellor of the Exchequer

Lodge, Henry Cabot, Permanent Representative to the United Nations until September 3, 1960

Long, Franklin A., Professor of Chemistry, Cornell University

Loper, General Herbert B., Assistant to the Secretary of Defense for Atomic Energy

Lovett, Robert A., disarmament adviser to Secretary of State Dulles

Macauley, John B., Deputy Director of the Office of Research and Engineering, Department of Defense

Macmillan, Harold, British Prime Minister

McCloy, John J., disarmament adviser to Secretary of State Dulles

McCone, John A., Chairman of the Atomic Energy Commission from July 1958

McElroy, Neil H., Secretary of Defense until December 1, 1959

McGuire, E. Perkins, Assistant Secretary of Defense for Supply and Logistics

McRae, James W., Chairman, Ad Hoc Panel on Nuclear Test Requirements

Merchant, Livingston T., Assistant Secretary of State for European Affairs from October 1958; Deputy Under Secretary of State for Political Affairs, August 1959–December 1959; thereafter Under Secretary of State for Political Affairs

Moch, Jules, French Representative to the Ten-Nation Disarmament Conference

Murphy, Robert D., Deputy Under Secretary of State for Political Affairs until August 1959; Under Secretary of State for Political Affairs, August–December 1959

Nixon, Richard M., Vice President of the United States

Norstad, General Lauris, Commander in Chief, European Command

Ormsby Gore, William David, British Minister of State for Foreign Affairs

Panofsky, Wolfgang K. H., Chairman, Panel on High Altitude Detection

Pate, General Randolph M., Commandant of the U.S. Marine Corps until December 31, 1959

Penney, William, British nuclear physicist

Persons, General Wilton S. (Ret.), Assistant to President Eisenhower

Plowden, Edwin N., Chairman, British Atomic Energy Authority

Polk, Brigadier General James H., Director, Office of Planning, International Security Affairs, Department of Defense

Power, General Thomas S., Commander, Strategic Air Command

Pugh, George E., Member, Weapons Systems Evaluation Group, Department of Defense

Quarles, Donald A., Deputy Secretary of Defense until his death on May 8, 1959

Randall, Clarence S., Chairman, Council on Foreign Economic Policy

Reinhardt, G. Frederick, Counselor of the Department of State

Rhea, Colonel Fred, Defense Member, Working Group on Disarmament Policy

Sandys, Duncan, British Minister of Defense until October 1959; thereafter Minister of Aviation

Saulnier, Raymond J., Chairman of the Council of Economic Advisers

Scoville, Herbert E., Assistant Director of the Central Intelligence Agency and Director of the Office of Scientific Intelligence

Scribner, Fred C., Jr., Under Secretary of the Treasury

Segni, Antonio, Italian Deputy Prime Minister and Minister of Defense from July 1958; Prime Minister and Minister of the Interior from February 1959; Minister of Foreign Affairs from March 1960

Sharp, Dudley C., Assistant Secretary of the Air Force until January 31, 1959; Under Secretary of the Air Force, August 3–December 11, 1959; thereafter Secretary of the Air Force

Shoup, General David M., Commandant of the U.S. Marine Corps from January 1, 1960

Sides, Vice Admiral John H., Director, Weapons Systems Evaluation Group

Smith, Bromley, Staff Member, National Security Council, until January 1959; thereafter Executive Officer, Operations Coordinating Board

Smith, Gerard C., Assistant Secretary of State for Policy Planning

Smith, General Walter Bedell (Ret.), disarmament adviser

Smith, Brigadier General Willard W., Deputy Director, Net Evaluation Subcommittee Staff

Spaak, Paul-Henri, Secretary General of the North Atlantic Treaty Organization

Spiers, Ronald, Officer in Charge of Disarmament Affairs, Department of State

Sprague, Mansfield D., Assistant Secretary of Defense for International Security Affairs until September 3, 1958

Sprague, Robert, Director, Security Resources Panel, ODM Science Advisory Committee on Deterrence and Survival in the Nuclear Age, from September 1957

Staats, Elmer B., Deputy Director, Bureau of the Budget

Stassen, Maurice H., Deputy Director, Bureau of the Budget, until March 1958; thereafter Director

Starbird, Brigadier General Alfred D., Director, Division of Military Application, Atomic Energy Commission

Stassen, Harold E., Special Assistant to the President for Disarmament until February 15, 1958

Strauss, Admiral Lewis L., Chairman, Atomic Energy Commission, until June 30, 1958;
Secretary of Commerce from October 24, 1958

Symington, W. Stuart, Democratic Senator from Missouri

Taylor, General Maxwell D., Chief of Staff of the Army until July 1, 1959

Teller, Edward, Director, Lawrence Livermore Nuclear Weapons Laboratory

Thomas, General Gerald C., Director, Net Evaluation Sub-committee Staff

Thompson, Llewellyn E., Ambassador to the Soviet Union

Tsarapkin, Semen K., Soviet Representative to the Geneva Conference on the Discontin-
uance of Nuclear Weapon Tests from 1958

Twining, General Nathan F., Chairman of the Joint Chiefs of Staff until September 30,
1960

Wadsworth, James J., U.S. Representative to the Geneva Conference on the Discontin-
uance of Nuclear Weapon Tests until August 31, 1960; Permanent Representative to
the United Nations from September 8, 1960

Washburn, Abbott, Deputy Director, United States Information Agency

Whisenand, Brigadier General James F., Special Assistant to the Chairman of the Joint
Chiefs of Staff

White, General Thomas D., Chief of Staff of the Air Force

Whitman, Ann C., Personal Secretary to President Eisenhower

Whitney, John Hay, Ambassador to the United Kingdom

Wiesner, Jerome B., Member, President's Science Advisory Committee

Wilcox, Francis O., Assistant Secretary of State for International Organization Affairs

Williams, Haydn, Deputy Assistant Secretary of Defense for NSC Affairs and Plans,
International Security Affairs

Wright, Michael, British Deputy Representative to the Geneva Conference on the Discon-
tinuance of Nuclear Weapon Tests from 1960

Yeagley, J. Walter, Acting Assistant Attorney General for Internal Security, Department
of Justice

York, Dr. Herbert F., Director of Research and Engineering, Department of Defense, from
December 30, 1958

Zorin, Valerian A., Soviet Representative to the United Nations and to the Ten-Nation
Disarmament Conference from 1960

Summary of Print Volume III

Following is a summary of the contents of print volume III, National Security Policy; Arms Control and Disarmament. Parenthetical citations are to numbered documents in the text. Volume III, published in 1996, is available from the U.S. Government Printing Office.

National Security Policy

A major focus of the first part of the compilation on national security policy is the Eisenhower administration's response to the Gaither Panel, which in November 1957 had submitted its report, "Deterrence and Survival in the Nuclear Age." (See *Foreign Relations*, 1955–1957, Volume XIX.) The main thrust of the report was that during the next 2–3 years the U.S. strategic position relative to the Soviet Union would be at its strongest, but that within 12–20 years both the United States and the Soviet Union would be capable of annihilating one another and that the very real dangers of miscalculation that would then exist in estimating whether or not an attack was occurring required urgent study. (1) In response to the report, the National Security Council (NSC) in early 1958 held lengthy discussions on the nation's strategic offensive and defensive weapons systems. One result was President Eisenhower's directive that the Defense Department should report back on the feasibility and desirability of supplemental "active" military measures to reduce the vulnerability of the Strategic Air Command (SAC) to a hypothetical Soviet surprise bomber attack. (2)

In response to the Gaither Panel's concerns about the status of the nation's active defenses, the Eisenhower administration held several meetings on various aspects of the problem. One was devoted to SAC alert forces. Discussions about procedures involving the deployment of these forces under emergency conditions, initially called "Fail Safe" and renamed "Positive Control," centered on the readiness and rapid launching of SAC planes as well as procedures to recall them before attack if the alarm proved to be false. Eisenhower seemed to be generally satisfied with the SAC's preparedness and emergency safeguards. (9, 16, 25)

A related question was the military's coordinated targeting strategy in the event of nuclear war. In August 1959 the President approved the use of an "optimum mix" of military and urban-industrial targets, which in the event of general war was to include all vital strategic elements of the enemy's known nuclear offensive capability and to achieve a 75 percent assurance of delivering one weapon at each target.

(90, 91) He also initially agreed with Defense Secretary McElroy that the Strategic Air Command, under JCS supervision, was the best single authority to plan the targeting of what was a complex, technical problem and required computer programs. (72, 107) But when McElroy's successor, Thomas Gates, attempted to implement a single integrated plan in August 1960, he ran into stiff resistance from the Navy. Admiral Arleigh Burke, Chief of Naval Operations, opposed a detailed plan. He wanted more flexibility of arsenal as well as delivery for the unified commanders during a first retaliatory strike. (18, 113)

President Eisenhower rejected these arguments, however, and stressed the importance of having a single, rigid plan. While plans for a second strike might allow commanders more leeway, he argued, "you can and must have a firm plan for the first strike" to make it simultaneous and avoid duplication of effort. Although the issue was somewhat different from the legislation to further centralize authority in the Secretary of Defense, in order to tame interservice rivalries on budgetary and personnel matters, which Eisenhower had pushed through Congress in 1958 (3), the need for organizational reform of the military services was similar, and the President lectured the Joint Chiefs on their responsibility to subordinate their bureaucratic self-interest to "the nation's interest." (113) Believing that "something must be done before he leaves office, because he did not want to leave his successor with the monstrosity we now see in prospect as Polaris and other new weapons come into operating status," he authorized Gates to set up a Joint Strategic Planning Staff (JSPS) under the direction of the SAC Commander in Omaha. By the end of the year the JSPS had developed a methodology for preparing a Single Integrated Operational Plan (SIOP), but Eisenhower expressed dismay over the emerging SIOP's potential for "overkill." (125, 127)

Another concern was the status of the various U.S. missile systems. President Eisenhower frequently discussed with his senior defense advisers the progress in the Atlas, Thor-Jupiter, Polaris, Minuteman, and Titan programs, to all of which he gave "the highest priority" for research and development. (56, 72, 123) These conversations allowed him to monitor closely the progress in the entire missile field and to suggest improvements. He argued, for instance, that the NSC "ought to look at the costs, what we are doing, how we are doing it, and leave a legacy of thought, if not organization, on this subject." (72) He was especially concerned that the missile race with the Soviet Union might undermine the U.S. economy. "We must cut the cost of our missile programs or go broke," he warned. (56)

During the triennium the administration received periodic intelligence estimates of the Soviet Union's military capabilities, especially its missile systems. (33, 48, 52, 75, 82, 84, 97, 98, 120) But because these

estimates tended to overstate Soviet progress in the missile field, by early 1960 the notion of future “missile gap” developed, which Congress sought to explore. Eisenhower and General Nathan F. Twining, Chairman of the Joint Chiefs, believed that if such a gap developed by 1961, new U.S. missile systems would be ready by 1962 to close it. (82) (They proved more than correct in this judgment for Soviet ICBM deployments lagged behind those of the United States until the late 1960s.) While Eisenhower was willing to approve modest increases in defense spending and to expedite certain important programs such as the development of reconnaissance satellites, he opposed any programs “on a crash basis until scientific analysis demonstrates real promise of success.” (102, 129) And despite political and demagogic attacks on his administration’s defense programs, he believed there was little public uneasiness about them. (93)

The NSC also discussed the status of U.S. continental defense policy. Following a January 30, 1958, briefing on ballistic missile programs (6), the NSC drafted a new position paper on continental defense policy, NSC 5802, which updated and superseded NSC 5408. While NSC 5802 called for “an anti-ICBM weapons system as a matter of the highest national priority,” it still emphasized the importance of defensive measures against a hypothetical Soviet bomber attack. (8) Because of rapid advances in missile development, however, by 1960 discussion about continental defense focused more on the desirability and extent of an anti-missile missile program. The Joint Chiefs of Staff argued for a firm administration commitment to accelerate the development of an extensive Nike–Zeus anti-missile missile system, but Defense Secretaries McElroy and Gates and the scientific community believed such a program would be too expensive adequately to defend missile sites and useless to defend the population. Eisenhower was also skeptical, noting that it was questionable whether an effective anti-ICBM system could be developed in the 1960s. (82, 83, 132, 133) The divisions pre-saged a similar split during the Kennedy administration, with President Kennedy basically more sympathetic to Secretary of Defense McNamara’s and the scientists’ opposition to deployment of a missile defense system than to the Joint Chiefs’ position. (See *Foreign Relations*, 1961–1963, Volume VIII.)

In the area of “passive” defense, the NSC considered the initiation of a nationwide fallout shelter plan. Although the Gaither Panel and the Federal Civil Defense Administration supported fallout shelters, others raised objections. Eisenhower, for example, “expressed a certain degree of skepticism as to the wisdom of expending billions of dollars on a shelter program as opposed to spending the money on additional measures of active defense.” He also worried that the U.S. shelter program “would insure neutralism in Europe.” (8) Secretary of State John Foster

Dulles also claimed that a shelter program would have an undesirable impact on "the psychology of the American people. There were practical difficulties in the way of maintaining, at one and the same time, both an offensive and a defensive mood." When it was noted that the new addition to the State Department building did not include shelters, Dulles replied that "the State Department was expendable." (8) Gordon Gray of the Office of Defense Mobilization, Secretary of Defense Neil McElroy, and General Twining, Chairman of the Joint Chiefs of Staff (JCS), among others, also pointed to difficulties in trying to implement an extensive shelter plan. (4)

Regular military briefings on the horrific effects of nuclear war, however, convinced President Eisenhower that more emphasis had to be given to defensive measures. (38, 97) Following one such briefing in September 1960, the President commented that "he had been making up his mind to go into training as an Indian and live on deer in the Rocky Mountains." While he still believed that "most of our money should be put on deterrence," he also recognized the political and psychological need for the U.S. Government to demonstrate its ability to destroy an incoming missile before the Soviets could do so. He continued that "if greater emphasis is not given to passive defense, there will be no U.S. Without passive defense we could retaliate but the people we are supposed to be defending would be all dead and there would be no State Department to worry about foreign affairs." He concluded by asking several agencies to re-examine the administration's shelter policy "on a down-to-earth basis. He would like to see all the agencies he had mentioned feeling a sense of responsibility for taking a new look at this question." (120)

Toward the end of the Eisenhower administration, the National Security Council again considered the question of fallout shelters. Eisenhower was now convinced that "we should be doing a lot more than we are doing for passive defense of the population." He opposed massive new federal outlays for a shelter program, however, and ultimately approved "the objective of obtaining fallout shelter for the population within five years, principally with local and private effort, and with Federal resources to be confined largely to setting an example and stimulating individual efforts to attain the objective but not to guarantee its attainment." (133)

A major preoccupation of the National Security Council throughout the Eisenhower administration was its annual review of the Basic National Security Policy (BNSP) paper. As the title suggested, these papers covered all phases of the nation's security interests, including chemical and biological weapons, military assistance, policy toward developing nations, and weapons systems. At one point the NSC even considered inclusion of a statement on birth control as a "crucial"

element of its basic policy statement on “undeveloped” countries. Eisenhower strongly objected, however, claiming that if a policy statement on the issue was adopted, “we would be accused of all kinds of terrible things.” (61)

The main debate over BNSP concerned the problem of conventional forces to fight limited wars. While these discussions foreshadowed the Kennedy administration’s subsequent adoption of the strategy of “flexible response” to potential Soviet provocations, they did not get that far under Eisenhower. The discussions initially developed in reaction to the traditional Eisenhower administration doctrine of “massive retaliation,” which could result in either a massive nuclear strike or retreat in the face of Soviet aggression, and the desire for greater flexibility in U.S. military capabilities. In this view, the need for a revised BNSP seemed more urgent as the Soviet Union moved closer to “virtual nuclear parity” with the United States. In 1957 the NSC had adopted a policy statement on “limited war” that called for “the development of a flexible and selective capability, including nuclear capability” to resist “local aggression” in developing countries where U.S. interests were involved.

General Maxwell Taylor of the Joint Chiefs of Staff especially continued to advocate great emphasis on conventional forces to resist limited aggression, and even Secretary Dulles, the principal architect earlier of the “massive retaliation” concept, believed by 1958 that the United States had to develop a more coherent policy in dealing with wars not directly involving the United States and the Soviet Union and to allow the United States “to fight defensive wars which do not involve the total defeat of the enemy.” Dulles also stressed that public opinion among the Western allies was beginning to reject the notion of reliance on a U.S. pushbutton to start a global nuclear in their defense and would demand some kind of modernized defensive capabilities of their own to resist possible Soviet aggression. But while trying to keep an open mind on these complicated issues, President Eisenhower remained skeptical, arguing that “each small war makes global war the more likely.” (18, 23)

Despite wide-ranging NSC discussions in 1958, no revision of the 1957 paragraphs on limited war were approved (24, 25), but further extensive discussions occurred in 1959. Largely because of State Department lobbying for a change in policy, the resulting BNSP added language calling for planning for “situations short of general war where the use of nuclear weapons would manifestly not be militarily necessary nor appropriate to the accomplishment of national objectives, particularly in those areas where main Communist power will not be brought to bear.” (64, 70) Although this wording suggested less emphasis on nuclear weapons, it was never implemented in force planning levels,

mainly because Eisenhower worried about the budgetary implications of large increases in conventional forces. He also continued to be "never very eager to talk about limited war and disliked the subject." (124) Perhaps because of this disinterest no BNSP was devised for 1960.

Arms Control and Disarmament

This compilation begins with the three disarmament proposals of Harold Stassen, President Eisenhower's Disarmament Adviser. Stassen's initiatives, which were to mark the beginning of serious U.S.-Soviet negotiations on the cessation of nuclear testing, consisted of agreement on installation of 8-12 test monitoring inspection sites in both the United States and the Soviet Union followed by a 2-year ban on nuclear testing, creation of an inspection zone in Central and Eastern Europe against surprise attack, and another inspection zone covering Eastern Siberia, the Arctic, the Northwestern United States, and Western Canada. The Joint Chiefs of Staff (JCS), the Department of Defense (DOD), and the Atomic Energy Commission (AEC) agreed that because a test cessation agreement in its simplest form would limit the development of smaller, "clean" weapons, it was a detriment to U.S. national security. They claimed that there were no airtight methods to confirm that the Soviets were not testing and that the cessation of testing would actually result in both nations building more, not fewer, weapons to compensate for the reduction in technical advancement. (136)

Stassen and Henry Cabot Lodge, Ambassador to the United Nations, both of whom worried that the United States was becoming morally isolated by its slow reactions on the disarmament issue, argued that a new, fresh U.S. proposal was required to regain world support for the U.S. position. (136, 137) The Eisenhower administration, while acknowledging the potential significance of these views, had not developed a new position by March 27, 1958, when the Soviet Union announced a test cessation. The Soviets' test suspension put the United States in the position of having to choose between continued nuclear weapons testing to improve the nation's defense capabilities, which would look warlike and immoral in world opinion, or stopping testing. The Eisenhower administration agreed that the Soviet initiative required a "new and more flexible position." (145)

Secretary of State John Foster Dulles believed that the Soviets' test ban initiative was its latest propaganda move designed to undermine the U.S. reputation in world opinion. Over the coming months, he argued against the rationale of the Defense Department and the Atomic Energy Commission that an immediate test cessation would hurt U.S. defense capabilities and would be giving the closed Soviet society an unfair advantage to improve their nuclear arsenal through espionage and secret testing. He commented that "unless we take a radical step

now, our failure to do so will in effect be a step to 'go it alone' as a militaristic nation in world opinion without friends and allies." (148, 150, 166) Both he and President Eisenhower agreed that although nuclear weapons and not tests were the real danger to world security, public opinion demanded a cessation of testing. (155)

In August 1958 the National Security Council finally formulated a comprehensive proposal on test suspension to present to the Soviets. The initiative consisted of a 3-year agreement to suspend testing. To take into account the Defense Department's and Atomic Energy Commission's reservations, this new proposal stipulated that the test suspension not continue beyond 3 years if satisfactory progress was not made on a viable inspection system. (165)

Meanwhile, a National Security Council ad hoc working group under Dr. Hans Bethe began to study the technical feasibility of monitoring a test ban. The recommendation of the group, supporting a suspension, concluded that inspection stations with the immediate mobile access of inspection teams would provide adequate safeguarding for an agreement limiting nuclear testing. (147) In July and August 1958, a meeting in Geneva of experts from Canada, the United Kingdom, the United States, Soviet Union, Poland, Czechoslovakia, and Romania made some progress in discussing the several technical details involved in inspection systems. (164, 176)

The first challenge the United States faced at this technical conference was gaining British support for the U.S. position. The United Kingdom did not want even to consider suspending testing until it had developed its own sufficient nuclear capabilities. (150, 155) To get around British fears of vulnerability in the face of disarmament pressures, the 1954 Atomic Energy Act was amended on June 2, 1958, to allow for increased exchange of atomic weapon information to U.S. nuclear allies, particularly the United Kingdom. (166, 175, 176)

Safeguards against surprise attack were another issue relating to disarmament that the United States tried to address during 1958. A study prepared by an inter-agency working group concluded in September 1958 that an effective safeguard to prevent surprise attacks would require an inspection system to monitor any agreed upon limitation of bomber readiness. (180) The United States also agreed to a meeting in Geneva of technical experts to study the practical problems and feasibility of inspecting against surprise attacks. Although this conference made significant progress on technical issues, the Soviet Union resisted inspection of its military sites. (185, 188, 189) Dr. George Kistiakowsky, the President's Science Adviser, wrote President Eisenhower that inspection was not sufficient—there was no way to monitor missile-launching submarines, for example. A better solution to the problem of surprise attack, he argued, was the actual disarmament

of nuclear weapons rather than inspections. (192) When the Geneva surprise attack conference was in fact suspended on January 21, 1959, the Western side was convinced that the Soviet side would not agree to limit discussions to inspection and observation measures and that future talks would have to consider disarmament measures that might affect the surprise attack problem. (193)

Another stalemate in disarmament discussions occurred when the Defense Department discovered that information discussed at the first Geneva technical meeting was inaccurate. (168) The Hardtack II tests revealed that instead of there being an 80–90 percent level of confidence in detecting a 5-kiloton and above underground explosion, this level of confidence could only occur at 20 kilotons and higher. Defense officials argued that the new information made the underground test detection system being developed at the Geneva conference unreliable. (169)

By January 1959 the Eisenhower administration had split on strategies for using the new data in the current nuclear test negotiations in Geneva. AEC Chairman John A. McCone argued that because of the unreliability of the underground test detection system, only atmospheric tests should be banned. Underground tests might be curtailed after more experimentation. Secretary Dulles believed that “there was not one chance in a hundred that the Soviets would agree to the controls that we think are necessary to police the agreement we had in mind.” He felt that the U.S. Government should keep the Hardtack II information to itself and let the Soviets take the blame and bad publicity for the failure of the talks. Because the Soviets were arguing for a veto on any potential inspections, Dulles felt that focusing on the intransigence of the Soviets on this issue seemed to be the best method to disengage the United States from the talks. (195–196, 202) President Eisenhower, however, still wanted a comprehensive test ban. He felt that despite the new information on underground inspection a workable system could still be designed. (205, 206)

The British also hoped for a test ban. With political elections getting closer in Britain and public concern growing over the issue of radioactive fallout from nuclear testing, British Prime Minister Macmillan pushed President Eisenhower to conclude some kind of test ban treaty. But while the President urged his senior disarmament advisers to move toward an agreement, he did not overrule or dismiss those who opposed any testing accord that did not include extensive safeguards for U.S. security.

By April 1959 Christian A. Herter, who that month succeeded Dulles as Secretary of State, instructed the U.S. delegation at Geneva to agree to a comprehensive test ban if two provisions were met: if the Soviets backed down on their demands for a veto, and if they accepted the adequate number of on-site inspections necessary to detect

underground explosions. If this initiative failed, Herter authorized the delegation to work for a phased approach that would include an immediate ban on atmospheric testing, and a subsequent ban on underground testing once sufficient controls, based on Hardtack II data, were established. If the Soviet Union rejected these proposals, the delegation was to announce the U.S. decision to end the conference because of the Soviets' disinterest in a treaty and to reveal its plans for a unilateral cessation of atmospheric tests. (213) President Eisenhower believed that worldwide public anger over nuclear testing would force the United States to stop atmospheric testing in the long run, and thus a partial or comprehensive bilateral ban would be better for U.S. interests than unilateral, unreciprocated actions. (216)

Perhaps also aware of the importance of maintaining worldwide public support for its disarmament policy, the Soviets also seemed unwilling to break off the talks. They refused to consider, however, that the conclusions from the meeting of experts in 1958 were anything but viable. Consequently, they would not discuss either an adequately safeguarded comprehensive plan or a phased plan. The negotiations deadlocked when the United States refused to consider any agreement that did not contain a sufficient number of inspections. (223)

As the Geneva disarmament talks dragged on, many in the Eisenhower administration became concerned that the voluntary U.S. testing moratorium first announced in October 1959 was giving the Soviets exactly what they wanted. The moratorium supposedly stopped U.S. and Soviet testing, but it was not controlled. (234) Of further concern was the fear that the British desire to reach any agreement, including an uncontrolled moratorium, would weaken Western positions on disarmament negotiations. The United States spent a large proportion of time at the Geneva test negotiations trying to reconcile the Allied positions on disarmament. (227)

In December 1959 U.S. and Soviet technical experts met for a second time to discuss difficulties relating to testing controls. For the United States it was an opportunity to try once again to revise the data from the 1958 conference. The Soviets, however, saw U.S. concerns over up-to-date safeguards as a U.S. propaganda ploy to disengage from a disarmament accord. Because the Soviets "refused to give serious consideration to anything relating to criteria for inspection" while the U.S. side insisted on talking about elaborate and effective inspection systems, the talks ended without any agreement. (238)

As a possible compromise to the conflicting U.S. and Soviet positions, Kistiakowsky suggested in January 1960 the threshold concept, whereby all tests above a certain measurable seismic magnitude would be banned. Under a threshold agreement, the United States and the Soviets would conduct joint research to improve inspection techniques

and subsequently to lower threshold limits. Adequate safeguards would be provided on banned testing levels while there would be no increase in the agreed upon on-site inspections. (239, 240) Despite skepticism about the Soviets' interest, the U.S. delegation introduced the concept at the Geneva talks.

In spite of the U.S. doubts, the Soviet Union informed the Geneva Conference in March 1960 that it was prepared to discuss a treaty based on the threshold concept. They wanted to begin discussion on suspending tests above a 4.75 seismic magnitude. (247, 248) However, disagreement over testing under the 4.75 magnitude destroyed hopes for a possible agreement on the threshold concept. The Soviets wanted a moratorium for testing under 4.75, while the United States wanted only a set moratorium period with an agreement to conduct joint research on underground test detection technology. (250) The Soviet downing of a U.S. U-2 reconnaissance plane over the Soviet Union on May 1, 1960, together with disagreement over the moratorium and U.S. frustrations over the Soviet refusal to consider seriously any type of controls, once again prevented any break-through on the nuclear testing issue at the Geneva negotiations. (253)

A fresh start seemed possible at the Ten-Nation Disarmament Conference on March 15, 1960. President Eisenhower hoped to persuade the Allies to focus on larger disarmament issues—namely, a suspension in the production of fissionable materials. (244) Here too a stalemate resulted. Ambassador Eaton, Chairman of the U.S. delegation, reported that the Western position at the conference was increasingly weakened by Allied interest in obtaining a disarmament accord at any cost. Eaton recommended revising the U.S. plan to appease allies, especially France, which were worried that U.S. intransigence would ruin any hope of an agreement. All such proposals proved futile, however, when the Soviets walked out of the conference on June 27, 1960. (256)

Meanwhile, the United States began to develop a new approach to disarmament negotiations. Preliminary talks began on a cooperative research program with the British and Soviets that was designed to improve the ability to detect underground nuclear explosions. To improve trust and cooperation in the program, all the nuclear devices to be used for the testing research would be inspected by all three countries to confirm that they would only be used for peaceful purposes. In case the Soviets refused the joint research project, the Eisenhower administration also proposed a fallback plan whereby the United States would open up its nuclear devices to the United Nations for inspection before beginning unilateral research testing. This time the administration's plans faced obstacles, not just from the Soviets, but also from an election year Congress that did not like the idea of unilaterally showing U.S. devices to the Soviets for nothing in return. (259)

President Eisenhower soon realized that domestic political problems resulting from the upcoming elections would prevent not only an agreement but the actual research. (260) When Secretary Herter determined by mid-November that the Soviets were holding off on the Geneva negotiations to see if a better deal could be made with the newly elected Kennedy administration, he proceeded to call for a recess. The First Committee of the U.N. General Assembly discussed disarmament issues in the fall of 1960, and the U.N. General Assembly passed three resolutions on disarmament in December, but hopes for substantive progress on arms control talks with the Soviet Union were deferred until President-elect Kennedy took office in late January 1961. (264, 265)

348	Letters from Farley to McCone, Quarles, and Allen Dulles, August 7, 1958. Transmits a proposed revision of U.S. nuclear testing policy. Secret. 7 pp. NARA, RG 59, Central Files, 700.5611/8-758.

No.	Document Description
349	Memorandum of conversation between Eisenhower and John Foster Dulles, August 12, 1958. Need to resolve nuclear testing policy; Quemoy and Matsu; U.N. session on Near East. Top Secret; Personal and Private. 2 pp. Eisenhower Library, Dulles Papers, Meetings with the President.
350	Record of telephone conversation between John Foster Dulles and Herter, August 13, 1958. Cessation of nuclear testing. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, General Telephone Conversations.
351	Memorandum of conversation between Lovett and John Foster Dulles, August 14, 1958. Continuation of the disarmament advisory group. Confidential. 1 p. Eisenhower Library, Dulles Papers, General Memoranda of Conversation.
352	Memorandum from Bromley Smith to Gray, August 14, 1958. Record of the Disarmament Working Group meeting. Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.
353	Telegram Denuc 163 from Geneva, August 14, 1958. Report of meeting with Soviets in Geneva on detection of nuclear explosions. Confidential. 1 p. NARA, RG 59, Central Files, 700.5611/8-1458.
354	Letter from Kistiakowsky to Killian, August 15, 1958. Conveys report of Inter-Agency Group on Surprise Attack (not included). Top Secret. 1 p. Eisenhower Library, Records of the Office of the Special Assistant for Science and Technology, Disarmament, Surprise Attack.
355	Memorandum from Keeny to Goodpaster, August 15, 1958. Forwards three papers on nuclear test cessation. Top Secret. 10 pp. Eisenhower Library, White House Office, Records of the Office of the Staff Secretary, Nuclear Testing.
356	Letter from Kistiakowsky to McElroy, August 15, 1958. Conveys report of Inter-Agency Group on Surprise Attack (not included). Top Secret. 1 p. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel, Surprise Attack.
357	Memorandum from Twining to McElroy, August 15, 1958. Conveys negative JCS views on cessation of nuclear testing. Secret; Restricted Data. 2 pp. Eisenhower Library, Whitman File, Nuclear Testing.

No.	Document Description
358	Letter from the President's Science Advisory Committee Panel on Surprise Attack to Killian, August 15, 1958. Transmits the Panel's report (not included). Secret. 1 p. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology.
359	Draft Presidential statement, August 18, 1958. For release after successful conclusion of Geneva talks on detection of nuclear tests. Confidential. 3 pp. Eisenhower Library, Whitman File, Dulles–Herter Series.
360	Telegram 1913 to London, August 19, 1958. Transmits letter from Eisenhower to Macmillan on public statement on cessation of nuclear testing. Confidential; Presidential Handling; Niact. 1 p. NARA, RG 59, Central Files, 700.5611/8–1958.
361	Record of telephone conversation between Herter and John Foster Dulles, August 20, 1958. Statement on nuclear testing; offshore islands. No classification marking. 3 pp. Eisenhower Library, Dulles Papers, General Telephone Conversations.
362	Record of telephone conversation between Herter and John Foster Dulles, August 20, 1958. Statement on cessation of nuclear testing. No classification marking. 1 p. Eisenhower Library, Dulles Papers, General Telephone Conversations.
363	Memorandum of conference with the President, and Herter, Killian, Persons, Hagerty, and Goodpaster, August 20, 1958. Statement on cessation of nuclear testing. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.
364	Telegram Secto 8 from John Foster Dulles at USUN, August 20, 1958. Draft Presidential statement on cessation of nuclear testing. Confidential. 3 pp. NARA, RG 59, Central Files, 700.5611/8–2058.
365	Record of telephone conversation between Herter and John Foster Dulles, August 20, 1958. Statement on cessation of nuclear testing. No classification marking. 1 p. Eisenhower Library, Dulles Papers, General Telephone Conversations.
366	Message from Macmillan to Eisenhower, August 20, 1958. Seeks assurance on release of nuclear testing information. Top Secret. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Eisenhower.

No.	Document Description
367	Message from Macmillan to Eisenhower, August 20, 1958. Agrees to statement on cessation of nuclear testing. Secret. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Eisenhower.
368	Message from Macmillan to Eisenhower, August 20, 1958. Urges postponement of statement on cessation of nuclear testing. Top Secret. 3 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Eisenhower.
369	Telegram 1969 to London, August 20, 1958. Conveys message from Eisenhower to Macmillan on providing technical information and political necessity of making statement on cessation of nuclear testing. Secret; Presidential Handling. 3 pp. NARA, RG 59, Central Files, 700.5611/8-2058.
370	Memorandum of conversation between Dulles, Reinhardt, and Greene and U.K. officials: Lloyd, Hayter, Moore, and Lasky, August 20, 1958. Statement on suspension of nuclear testing. Confidential. 1 p. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
371	Letter from Strauss to Eisenhower, August 20, 1958. Assures Eisenhower U.S. can provide nuclear information sought by Macmillan. Secret. 1 p. Eisenhower Library, Whitman File, Administration Series, Strauss, Adm. Lewis.
372	Telegram Dulte 2 from John Foster Dulles at USUN, August 21, 1958. Transmits for Eisenhower text of letter from Dulles to Macmillan on suspension of nuclear testing. Secret; Niact; Eyes Only. 3 pp. NARA, RG 59, Central Files, 700.5611/8-2158.
373	Record of telephone conversations between Eisenhower and Herter and John Foster Dulles, August 21, 1958. Statement on suspension of nuclear testing. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, White House Telephone Conversations.
374	Memorandum of conference with the President, and Libby and Goodpaster, August 21, 1958. Eisenhower urges full and generous exchange of information with U.K. Secret. 1 p. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, AEC, Vol. II.
375	Telegram Secto 13 from John Foster Dulles at USUN, August 21, 1958. Transmits Dulles' views on draft statement on suspension of nuclear testing. Confidential. 2 pp. NARA, RG 59, Central Files, 700/5611/8-2158.

No.	Document Description
376	Telegram Dulte 4 from John Foster Dulles at USUN, August 71, 1958. Repeats telegram to London transmitting letter from Macmillan to Dulles. Secret. 2 pp. NARA, RG 59, Central Files, 700.6511/8-2158.
377	Message from Macmillan to Eisenhower, August 21, 1958. Statement on suspension of nuclear testing. No classification marking. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Eisenhower.
378	Message from Macmillan to John Foster Dulles, August 21, 1958. Statement on suspension of nuclear testing. Secret. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Macmillan to Dulles, 1955-59.
379	Memorandum from Cumming (INR) to John Foster Dulles, August 30, 1958. Intelligence Note: Khrushchev Statement on Nuclear Test Suspension. Confidential. 2 pp. NARA, RG 59, Central Files, 711.5611/8-3058.
380	Letter from Acting AEC Chairman to Eisenhower, September 4, 1958. Initial U.S.-U.K. information exchanges. Secret; Restricted Data. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Presidential Actions-Atomic.
381	Memorandum from Breithut (S/AE) to John Foster Dulles, September 8, 1958. Briefing for meeting with McCone: IAEA, U.S.-French exchanges. Secret. 2 pp. NARA, RG 59, Atomic Energy Files: Lot 57 D 688, IAEA-General.
382	Memorandum of conversation among McCone, Vance (AEC). John Foster Dulles, Wilcox (IO), Breithut (S/AE), and Cargo (IO/UNP), September 8, 1958. IAEA. Confidential. 3 pp. NARA, RG 59, Atomic Energy Files: Lot 57 D 688, IAEA-General.
383	Memorandum from Minshull to Killian, September 23, 1958. Outlines JCS view that readiness, disposition, and level of forces not be included in Surprise Attack talks. Secret. 4 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament, Surprise Attack.
384	Memorandum of conference with the President, and Killian and Goodpaster, September 30, 1958. ABMA move to NASA, Geneva Conference on Atoms for Peace, surprise attack study. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

No.	Document Description
385	Memorandum of conference with the President, and McCone and Goodpaster, October 7, 1958. IAEA problems, Plow-share, uranium requirements. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.
386	Note from Gray to Goodpaster, October 11, 1958. Conveys memoranda of conversation between the President and Teller and Bradbury, dealing with detecting nuclear tests. Top Secret enclosures. 11 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Nuclear Testing.
387	Memorandum of conversation among Principals of Geneva Test Group, October 16, 1958. Terms of reference for surprise attack delegation, nuclear test suspension negotiations. Secret. 8 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
388	Memorandum from Wilcox (IO) to John Foster Dulles, October 27, 1958. Proposal for 81-Nation Disarmament Conference, nuclear testing resolutions in the U.N. General Assembly. Confidential. 3 pp. NARA, RG 59, Central Files, 320.11/10-2758.
389	Memorandum of conversation between John Foster Dulles and Murray, October 28, 1958. Geneva Conference on Nuclear Testing. Confidential; Personal and Private. 1 p. Eisenhower Library, Dulles Papers, General Memoranda of Conversation.
390	Telegram Supnu 45 from Geneva, November 11, 1958. Summary of first 10 days of nuclear test conference. Confidential; Priority. 2 pp. NARA, RG 59, Central Files, 700.5611/11-1158.
391	Memorandum of conversation among Dulles, Macomber, Farley, and Sen. Gore, November 17, 1958. Gore proposal on atmospheric testing. Confidential. 1 p. NARA, RG 59, Central Files, 700.5611/11-1758.
392	Memorandum of conversation among Herter, Farley, Spiers, Killian, and Bethe, November 18, 1958. Bethe's views of nuclear test suspension conference. Secret; Limit Distribution. 3 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
393	Telegram Supnu 77 from Geneva, November 21, 1958. Proposes change in negotiating position in nuclear test conference. Secret; Niact; Limited Distribution. 3 pp. NARA, RG 59, Central Files, 700.5611/11-2158.

No.	Document Description
394	Telegram Supnu 78 from Geneva, November 21, 1958. Proposed U.S.-U.K. public statement. Secret; Niact; Limited Distribution. 2 pp. NARA, RG 59, Central Files, 700.5611/11-2158.
395	Record of telephone conversation between McElroy and John Foster Dulles, November 26, 1958. Response to Nixon cable pushing for rapid change in U.S. negotiating position. No classification marking. 1 p. Eisenhower Library, Dulles Papers, General Telephone Conversations.
396	Telegram 5175 to London, personal for the Vice President from Secretary, November 26, 1958. Conveys view that there must be full deliberation on proposed change in U.S. position at nuclear test suspension conference. Secret; Priority; Limit Distribution. 2 pp. NARA, RG 59, Central Files, 033.1100-NI/11-2658.
397	Memorandum of conversation between John Foster Dulles and Gray, November 26, 1958. Use of interdepartmental machinery to deal with issues arising from nuclear test suspension conference. Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up.
398	Telegram Supnu 121 from Geneva, December 9, 1958. Basic provisions text tabled by Soviet Delegation. Official Use Only. 12 pp. NARA, RG 59, Central Files, 700.5611/12-958.
399	Telegram Supnu 136 from Geneva, December 15, 1958. U.S. text for several treaty articles. Official Use Only. 8 pp. NARA, RG 59, Central Files, 700.5611/12-1558.
400	Telegram Nusup 118 to Geneva, December 15, 1958. Textual changes to delegation's proposal. Confidential; Priority. 4 pp. NARA, RG 59, Central Files, 700.5611/12-1558.
401	Memorandum from Herter to Gray, December 17, 1958. Response of the Interdepartmental Working Group on Disarmament to a request for an evaluation of a test suspension proposal by Sen. Gore. Confidential. 3 pp. NARA, RG 59, Central Files, 700.5611/11-2658.
402	Memorandum from Herter to Gray, December 17, 1958. Transmits an interagency evaluation of a test suspension proposal by Sen. Gore. Confidential. 3 pp. Eisenhower Library, White House Office Files, Project Clean Up, Disarmament.
403	Letter from McCone to Gray, December 19, 1958. Conveys AEC views on issues that have arisen in nuclear test suspension negotiations. Secret; Defense Information. 4 pp. Eisenhower Library, White House Office Files, Project Clean Up, Disarmament.

No.	Document Description
404	Memorandum of conversation among Principals of Geneva Test Group, December 30, 1958. U.S. position in nuclear test suspension talks; Hardtack II data. Secret. 13 pp. NARA, RG 59, Central Files, 700.5611/12-3058.
405	Report of the Panel on Seismic Improvement, January 7, 1959. Suggests improvements to detection systems. Confidential. 6 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament.
406	Record of telephone conversation between Wadsworth and Herter, January 9, 1959. Need for decisions on U.S. position in cessation of nuclear testing talks. No classification marking. 1 p. NARA, RG 59, Central Files, 110.12-HE/1-959.
407	Letter from Eisenhower to Macmillan, January 12, 1959. Agrees to drop linkage of cessation of nuclear testing to progress on disarmament. Secret. 2 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Eisenhower to Macmillan.
408	Memorandum from Gray to Eisenhower, January 13, 1959. Advises against Gore proposal on nuclear testing at this time. Confidential. 4 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.
409	Telegram Nusup 157 to Geneva for Wadsworth, January 16, 1959. Account of Dulles' conversation with Mikoyan on cessation of nuclear testing. Secret; Niact; Limit Distribution. 1 p. NARA, RG 59, Central Files, 700.5611/1-1659.

Macmillan proposal to offer unilateral moratorium on underground and outer space testing while negotiations on those issues are underway. Secret; Limit Distribution. 3 pp. NARA, RG 59, Central Files, 700.5611/4-1559.
460	Letter from Killian to Herter, April 18, 1959. Transmits President's Science Advisory Committee's recommendation for arms control studies. Confidential. 10 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Surprise Attack, Miscellaneous.
461	Memorandum from Herter to Eisenhower, April 20, 1959. Recommends against Macmillan proposal for moratorium on underground and space nuclear testing. Secret. 5 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Nuclear Policy.
462	Telegram Supnu 382 from Geneva, for Herter from Wadsworth, April 22, 1959. Negotiating tactics at nuclear testing suspension talks. Secret; Niact; Limited Distribution. 3 pp. NARA, RG 59, Central Files, 700.5611/4-2259.
463	Telegram Supnu 383 from Geneva, April 22, 1959. Negotiating tactics at nuclear testing suspension talks. Secret; Priority; Limit Distribution. 2 pp. NARA, RG 59, Central Files, 700.5611/4-2259.
464	Telegram Supnu 401 from Geneva, April 29, 1959. Soviets seem to adopt Macmillan quota proposals. Secret; Priority; Limit Distribution. 2 pp. NARA, RG 59, Central Files, 700.5611/4-2959.
465	Memorandum from Panofsky to Killian, May 1, 1959. Preliminary findings of the working group on high altitude detection. Secret. 2 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Nuclear-Hi-Alt-Misc.
466	Memorandum for the record by Goodpaster, May 5, 1959. Gray's comments on Department of State proposal for disarmament policy review. Secret. 1 p. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Disarmament.

No.	Document Description
467	Telegram Supnu 433 from Geneva, May 14, 1959. Transmits text of proposed communiqué on nuclear test ban. Secret; Niact; Limit Distribution. 2 pp. NARA, RG 59, Central Files, 700.5611/5-1459.
468	Telegram Secto 67 from Herter at Geneva, May 18, 1959. Account of talk with Lloyd on Soviet refusal of technical discussions on seismic detection, criteria for inspections. Secret. 1 p. NARA, RG 59, Central Files, 396.1-GE/5-1859.
469	Memorandum of conference with the President, and a group of scientists and Goodpaster, May 19, 1959. Technical basis of disarmament; international exchange of scientific information. Secret. 5 pp. Eisenhower Library, Whitman File, DDE Diaries.
470	Telegram Tosec 144 to Herter at Geneva from the Acting Secretary, May 29, 1959. Negotiating tactics for resumption of nuclear test ban talks. Secret; Limited Distribution. 2 pp. NARA, RG 59, Central Files, 700.5611/5-2959.
471	Telegram Tosec 145 to Herter at Geneva, May 29, 1959. Transmits draft tactics paper for nuclear test ban negotiations. Secret; Limited Distribution. 5 pp. NARA, RG 59, Central Files, 700.5611/5-2959.
472	Memorandum from Irwin to Herter, June 8, 1959. Department of Defense reservations on resumption of general disarmament talks. Confidential. 2 pp. NARA, RG 59, IO Files: Lot 61 D 91, Disarmament.
473	Memorandum of conversation among Principals of Geneva Test Group, June 17, 1959. High-altitude technical talks, inspections of nuclear test ban. Secret; Limit Distribution. 4 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
474	Terms of reference for disarmament policy review, June 23, 1959. Secret. 2 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Disarmament.
475	Letter from Herter to Taylor, July 1, 1959. Requests Taylor to head disarmament policy review; includes terms of reference for review. Secret. 3 pp. NARA, RG 59, Central Files, 611.0012/7-159.
476	Memorandum of conversation among Herter, State staff, McCone, and a Congressional delegation, July 8, 1959. Congressional observer group's views on nuclear test ban talks. Secret. 3 pp. NARA, RG 59, Central Files, 033.1100/7-859.

No.	Document Description
477	Memorandum of conversation among Principals of Geneva Test Group, July 9, 1959. Public opinion; possibility of concealment of nuclear tests. Secret; Limit Distribution. 5 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament-Nuclear Policy.
478	Memorandum of conversation between Caccia and Hood and Herter and Merchant, July 10, 1959. Nuclear test ban talks. Secret. 1 p. NARA, RG 59, Central Files, 700.5611/7-1059.
479	Memorandum of conversation among Principals of Geneva Test Group, July 16, 1959. Technical aspects of nuclear test suspension talks. Secret; Limit Distribution. 8 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy.
480	Memorandum from Killian to Kistiakowsky, July 20, 1959. Proposes discussing Latter Hole in nuclear test suspension talks. Top Secret. 2 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy.
481	Memorandum of conversation between Herter and Gromyko, US/MC/164, July 29, 1959. Resumption of disarmament negotiations. Secret. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
482	Memorandum of conference with the President, and Dillon, Coolidge, and Goodpaster, July 29, 1959. Disarmament study. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.
483	Telegram Cahto 188 from Herter at Geneva, July 31, 1959. Wadsworth's views on recess of nuclear test ban talks. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/7-3159.
484	Telegram Cahto 201 from Herter at Geneva, August 3, 1959. Discussions with U.K. on nuclear test ban talks. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/8-359.
485	Letter from McElroy to Eisenhower, August 5, 1959. Plans to resume testing. Secret. 4 pp. Eisenhower Library, Whitman File, Administration Series, McElroy, Neil, 1959.

No.	Document Description
486	Report of Joint U.S.–U.K. Technical Group to Review Technical Aspects of Nuclear Weapons Test Detection. London, August 10–11, 1959. “Large Hole;” satellite detection systems. Secret. 5 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament, Nuclear Policy.
487	Letter from McElroy to Eisenhower, August 14, 1959. Conveys JCS concerns about extension of nuclear test moratorium, safety of nuclear weapons. Top Secret; Restricted Data. 4 pp. Eisenhower Library, Whitman File, Administration Series, McElroy, Neil, 1959.
488	Letter from McElroy to Eisenhower, August 20, 1959. JCS views on phased approach to agreement for the cessation of nuclear testing, underwater testing. Secret. 3 pp. Eisenhower Library, Whitman File, Administration Series, McElroy, Neil, 1959.
489	Memorandum from Twining to McElroy, JCSM–337–59, August 21, 1959. JCS views on necessity of nuclear testing. Secret. 3 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Nuclear Testing.
490	Memorandum of conversation among Principals of Geneva Test Group, August 26, 1959. Kistiakowsky report on nuclear test requirements. Top Secret; Restricted Data. 7 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.
491	Letter from Dillon to McElroy, August 28, 1959. Transmits letter from Kistiakowsky stating Geneva experts concluded that underwater tests could be detected. Secret. 2 pp. NARA, RG 59, Central Files, 700.5611/8–2559.
492	Memorandum of conversation between Herter and Lloyd and their delegations, US/MC/15, August 28, 1959. Disarmament machinery, cut-off of production of fissionable material, disarmament policy. Secret. 3 pp. NARA, RG 59, Conference Files: Lot 64 D 560, CF 1449.
493	Memorandum of conversation between Eisenhower, Macmillan, and U.S. and U.K. officials, US/MC/16, August 30, 1959. Monitoring nuclear testing, U.S. need for safety testing. Secret; Limit Distribution. 1 p. NARA, RG 59, Conference Files: Lot 64 D 560, CF 1449.

No.	Document Description
494	Memorandum of conversation between Herter, Lloyd, and U.S. and U.K. officials, US/MC/22, September 1, 1959. Tactics for nuclear test ban talks, joint research. Secret; Limit Distribution. 2 pp. NARA, RG 59, Conference Files: Lot 64 D, CF 1449.
495	Memorandum from Lay to the NSC, September 2, 1959. Transmits report on the implementation of NSC 5725/1, for the period July, 1958-June 30, 1959. Secret. 46 pp. NARA, S/S-NSC Files: Lot 63 D 351, NSC 5725.
496	Special National Intelligence Estimate, SNIE 11-9A-59, September 8, 1959. "Probable Soviet Position on Nuclear Weapons Testing." Secret; Restricted Data. 11 pp. DOS, INR Files.
497	Letter from McElroy to Eisenhower, September 14, 1959. Transmits JCS views on nuclear testing and makes his own recommendation that underground testing should resume. Top Secret. 4 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of Special Assistant for Science and Technology, Panel, Disarmament Policy, 1959.
498	Memorandum of conference with the President, and Dillon, Farley, Allen Dulles, Gates, Burke, McCone, Kistiakowky, Gray, Persons, and Goodpaster, September 22, 1959. One-point safety testing; nuclear reactor for Dutch submarine; exchange of reactor information with the Soviet Union. Top Secret. 7 pp. Eisenhower Library, Whitman File, DDE Diaries.
499	Memorandum from Coolidge to Herter, September 29, 1959. Elimination of nuclear weapons. Secret. 4 pp. Eisenhower Library, Whitman File, Administration Series, Coolidge, Charles A.
500	Record of telephone conversation between Dillon and Kistiakowsky, October 6, 1959. Control system for suspension of nuclear testing. Confidential. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
501	Memorandum from Keeny to Kistiakowsky, October 15, 1959. Comment on instructions to U.S. delegation to nuclear test ban negotiations. Secret. 3 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy 59.

No.	Document Description
502	Memorandum of conversation among Herter, Ormsby-Gore, and U.S. and U.K. officials, October 20, 1959. Tabling a limited treaty in nuclear test negotiations. Secret; Limit Distribution. 5 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
503	Memorandum from Starbird to McCone, October 26, 1959. Recommends U.S. resumption of underground testing. Secret; Personal. 5 pp. Eisenhower Library, McCone Papers, Sealed File No. 3.
504	Memorandum of conference with the President, and McCone and Goodpaster, October 27, 1959. McCone's visit to the Soviet Union; Yemelyanov visit to U.S.; Dutch request for nuclear submarine; discussion with Macmillan on nuclear testing negotiations; U.K. purchase of U-235. Secret; Restricted Data. 5 pp. Eisenhower Library, Whitman File, DDE Diaries.
505	Letter from Gates to Dillon, October 28, 1959. Question of a lack of effective system to detect high-altitude tests; includes summary of engineering studies. Secret. 8 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-NT-Policy 59.
506	Memorandum of conversation among Herter, Farley, Spiers, Coolidge, Irwin, and Panel of Disarmament Advisers, November 3, 1959. Nuclear test negotiations, stability of deterrence requires greater conventional force. Secret; Limit Distribution. 6 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
507	Memorandum for the record by Haskins, November 30, 1959. Planning Board meeting with Coolidge. Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Disarmament, General.
508	Memorandum of conversation among Herter, other U.S. officials, and Panel of Disarmament Advisers, December 1, 1959. Developments in nuclear test talks, Coolidge report, troop withdrawals from Europe, Norstad plan. Secret; Limit Distribution. 7 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
509	Record of Cabinet meeting by Starbird, December 11, 1959. Nuclear testing suspension talks. Secret; Restricted Data. 4 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.

No.	Document Description
510	Memorandum of meeting with Nixon and Principals by Gray, December 11, 1959. Moratorium on nuclear testing. Top Secret. 9 pp. Eisenhower Library, White House Office Files, Project Clean Up, Suspension of Nuclear Testing.
511	Telegram from Harold Brown to McCone, December 26, 1959. Results of technical working group no. 2: foolproof detection impossible, U.S. should resume testing. Secret. 6 pp. Eisenhower Library, McCone Papers, Test File, Dec. 1959.
512	Memorandum of conversation among the Principals of Geneva Test Group, December 28, 1959. No agreement with the Soviet Union on technical detection criteria, position to take in resumed negotiations, decision on testing. Secret. 6 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
513	Memorandum from McCone to the AEC General Manager, December 29, 1959. Details decision made by the President on U.S. position in nuclear testing ban talks. Secret; Personal. 2 pp. Eisenhower Library, McCone Papers, Test File, March 1960.
514	Telegram 5162 to London, January 7, 1960. Transmits letter from Dillon to Lloyd outlining U.S. position in resumed nuclear test suspension talks. Confidential; Limit Distribution. 4 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, UK Officials Correspondence with Secretary Herter.
515	Memorandum of conversation among Principals of Geneva Test Group, January 8, 1960. Discussion of appropriate threshold for underground testing. Secret. 8 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
516	Memorandum for the record by Keeny, January 15, 1960. Comments on Department of Defense staff paper (attached) on the threshold for underground tests. Secret. 18 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Disarmament, NT, Threshold.
517	Memorandum of conversation among Herter and U.S., Canadian, French, U.K., and Italian officials, January 18, 1960. Preparations for ten-nation disarmament talks. Secret. 6 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

No.	Document Description
518	Note from Calhoun to Goodpaster, January 18, 1960. Transmits letter from Lloyd to Herter on position on nuclear test talks. Secret. 8 pp. Eisenhower Library, White House Office Files, Project Clean Up, State Mepco Cables.
519	Tabs A and B to memorandum of conversation among Principals of Geneva Test Group, January 19, 1960 (memorandum of conversation is print Document 240). Agenda of Working Group meeting and draft instruction on threshold to U.S. delegation to nuclear test talks. Confidential. 4 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
520	Letter from Gates to Herter, January 19, 1960. Transmits joint State Department-Defense Department study on disarmament prepared under Coolidge's direction. Secret. 73 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Disarmament.
521	Telegram 5562 to London, January 23, 1960. Transmits letter from Herter to Lloyd on threshold proposal at nuclear test talks. Confidential. 6 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.
522	Memoranda of conversation between Eisenhower and Herter, January 23, 1960. Ten-nation disarmament conference; letter to Lloyd on nuclear test talks. Secret. 3 pp. Eisenhower Library, Herter Papers, Meetings with the President.
523	Message from Ormsby-Gore to Herter, January 29, 1960. Disagrees with threshold proposal for nuclear test talks. Confidential. 4 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.
524	Telegram 5847 to London, February 2, 1960. Reply from Herter to Lloyd acknowledging differences, proposing interim steps at nuclear test talks. Confidential; Priority; Limit Distribution. 5 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.
525	Memorandum of conversation among Herter, Caccia, and U.S. and U.K. officials, February 3, 1960. Attempt to coordinate positions for nuclear test talks. Confidential. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

No.	Document Description
526	Memorandum of telephone conversation between Herter and McCone, February 3, 1960. Ormsby-Gore visit. No classification marking. 2 pp. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.
527	Working paper, February 8, 1960. U.S. Views on Certain Disarmament Measures. Secret. 3 pp. Eisenhower Library, Whitman File, DDE Diaries.
528	Memorandum for the file by Herter, February 11, 1960. Record of discussion among Herter, Farley, Gates, Douglas, and Irwin on test detection improvements, cut-off in production of fissionable material. Secret. 2 pp. NARA, RG 59, Central Files, 600.0012/12-1160.
529	Memorandum from Twining to Gates, JCSM-51-60, February 12, 1960. JCS views on U.S. disarmament policy. Secret. 18 pp. Eisenhower Library, White House Office Files, Project Clean Up, NSC Special Meetings.
530	Record of telephone conversations between Herter and Eaton, Gates and Farley, February 13, 1960. U.S. position for tenation disarmament talks. No classification marking. 1 p. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.
531	Record of telephone conversation between Herter and Gates, February 15, 1960. Cut-off of production of fissionable material. No classification marking. 1 p. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.
532	Memorandum from Kistiakowsky to Eisenhower, February 18, 1960. Government organization for the development of arms limitation and control policies. Confidential. 2 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology, Panel-Disarmament-Organization.
533	Memorandum from Farley to Merchant, February 19, 1960. Five-power disarmament talks; cut-off of production of fissionable material; disarmament policy. Secret. 2 pp. NARA, RG 59, Central Files, 600.0012/2-1960.
534	Memorandum of conversation among Herter, Dillon, Merchant, and other State Department officials, February 21, 1960. French view on cut-off; five-power working paper; negotiating tactics for ten-power talks; military force levels. Secret; Limit Distribution. 7 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.

No.	Document Description
535	Letter from Khrushchev to Eisenhower, March 3, 1960. U.S. plans to share nuclear weapons with NATO. No classification marking; Presidential Handling 5 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Khrushchev-Eisenhower.
536	Telegram 6676 to London, March 5, 1960. Transmits letter for Lloyd from Herter on ten-nation disarmament talks. Secret; Niact. 3 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, UK Officials Correspondence with Secretary Herter.
537	Note from Caccia to Herter, March 7, 1960. Transmits letter from Lloyd to Herter: applauds compromise on nuclear testing talks position. Secret. 3 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.
538	Memorandum for the record by Goodpaster, March 8, 1960. Record of discussion between Eisenhower and Herter of a letter from Lloyd. Secret. 2 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, State Department.
539	Memorandum of conversation among Eisenhower, Menshikov, and Davis, March 8, 1960. Menshikov delivers Khrushchev's letter on nuclear arms for NATO. Secret; Presidential Handling. 2 pp. NARA, RG 59, Central Files, 600.0012/3-860.
540	Memorandum of conference with the President, and Dillon, McCone, and John Eisenhower, March 10, 1960. Operation Plowshare. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.
541	Letter from Eisenhower to Khrushchev, March 12, 1960. No change in U.S. policy against transferring nuclear weapons to other countries. Confidential; Presidential Handling. 6 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, Eisenhower-Khrushchev.
542	Telegram Didel 32 to Geneva, March 16, 1960. Summary of approved position paper on Communist China and U.S. disarmament policy. Secret. 4 pp. NARA, RG 59, Central Files, 396.1-GE/3-1660.
543	Record of telephone conversation between Herter and Kistia-kowsky, March 21, 1960. Disarmament organization; military planning; developments in test talks; moratorium on testing. No classification marking. 2 pp. Eisenhower Library, Herter Papers, Phone Calls and Miscellaneous Memos.

No.	Document Description
544	Memorandum from Lay to the NSC, March 21, 1960. Transmits March 14 report by Kistiakowsky on "The Feasibility and National Security Implications of a Monitored Agreement to Stop or Limit Ballistic Missile Testing and/or Production" and two JCS memoranda (attachments to print Document 249). Top Secret; Restricted Data. 50 pp. NARA, RG 59, S/S-RD Files: Lot 71 D 171.
545	Letter from Eaton to Herter, March 22, 1960. Report on first week of ten-nation conference on disarmament. Secret; Eyes Only. 4 pp. NARA, RG 59, Central Files, 396.12-GE/3-2260.
546	Note from Caccia to Herter, March 22, 1960. Transmits letter to Herter from Lloyd on nuclear test conference. Secret; Personal. 5 pp. NARA, RG 59, Presidential Correspondence: Lot 66 D 204, U.K. Officials Correspondence with Secretary Herter.
547	Memorandum of conversation among Principals of Geneva Test Group, March 22, 1960. Discussion of reply to Soviet proposal on testing moratorium. Secret. 5 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
548	Telegram 4663 from London, March 24, 1960. U.K. views on Soviet proposal for test moratorium. Secret. 2 pp. Eisenhower Library, Whitman File, Dulles-Herter Series.
549	Draft paper with Eisenhower's revisions, March 24, 1960. Outlines a U.S. position on nuclear test suspension. Confidential. 1 p. Eisenhower Library, Whitman File, Dulles-Herter Series.
550	Telegram Deldi 39 from Geneva, eyes only for Herter from Eaton, March 26, 1960. Disarmament and the Macmillan visit. Secret. 3 pp. NARA, RG 59, Central Files, 396.12-GE/3-2660.
551	Memorandum of conversation among Herter, Kohler, Farley, Caccia, and Hood, March 26, 1960. U.S. position on Soviet proposal for a test moratorium in advance of Macmillan visit. Secret. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
552	Memorandum of conversation between Herter, Macmillan, and other U.S. and U.K. officials, March 28, 1960. Coordinating the U.S.-U.K. position in nuclear test talks. Secret; Limit Distribution. 5 pp. NARA, RG59, Secretary's Memoranda of Conversation: Lot 64 D 199.

No.	Document Description
553	Paper, March 28, 1960. "The Need for Nuclear Detonations in a Seismic Research Program." Confidential. 1 p. Eisenhower Library, Whitman File, Miscellaneous Series, Macmillan, Vol. II.
554	Talking Paper, undated. Coordinated effort in the seismic improvement program. Confidential. 5 pp. Eisenhower Library, Whitman File, Miscellaneous Series, Macmillan, Vol. II.
555	Supplementary memorandum of meeting between Eisenhower and Macmillan, March 29, 1960. Instructions for test ban negotiations. Secret. 1 p. Eisenhower Library, Whitman File, Miscellaneous Series, Macmillan, Vol. II.
556	Memorandum of conference with the President, and Kistiakowsky, Persons, and Goodpaster, March 30, 1960. Research in seismic detection, radioactive strontium in wheat. Secret. 3 pp. Eisenhower Library, Whitman File, Diary Series.
557	Letter from Herter to Gray, April 11, 1960. Organization for disarmament. No classification marking, but responds to a Personal and Confidential memorandum from Gray (included). 4 pp. Eisenhower Library, White House Office Files, Project Clean Up, Disarmament-General.
558	Statement agreed to at a meeting of five Western Foreign Ministers, April 13, 1960. Tab C to print Document 252 re disarmament negotiations. Confidential. 1 p. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
559	Memorandum of conversation among Herter, Green, and other U.S. and Canadian officials, US/MC/50, April 14, 1960. Accession to nuclear test ban agreement, Chinese nuclear capability, commercial nuclear work in Europe. Secret. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
560	Memorandum of conversation between Herter and other U.S. officials, April 21, 1960. Coordinating center for U.S. disarmament efforts. Confidential. 2 pp. NARA, RG 59, Secretary's Memoranda of Conversation: Lot 64 D 199.
561	Memorandum of discussion between Eisenhower and McCone, April 22, 1960. McCone's visit to France; nuclear testing. Confidential; Eyes Only. 1 p. Eisenhower Library, McCone Papers, Sealed File No. 5.

National Security Policy

1. Minutes of Cabinet Meeting¹

Washington, January 3, 1958, 9 a.m.–12:30 p.m.

The following were present:

President Eisenhower

Vice President Nixon	Gov. Adams
Sec. Dulles	Gen. Persons
Sec. Anderson	Mr. Rabb
Sec. McElroy	Gov. Stassen
Mr. Rogers	Dr. Killian—in part
Mr. Summerfield	Adm. Strauss—in part
Sec. Seaton	Mr. Randall—in part
Sec. Benson	Mr. Siciliane—in part
Sec. Weeks	Gen. Cutler
Sec. Mitchell	Mr. Hagerty—in part
Sec. Folsom	Mr. Morgan—in part
Director Brundage	Dr. Hauge
Mr. Gordan Gray	Mr. Larson
Dr. Saulnier	Mrs. Wheaton
	Gov. Pyle
Under Sec. of Defense Quarles	Mr. Harlow
Asst. Sec. McNeil—in part	Gen. Goodpaster
Judge Walsh, Deputy AG—in part	Mr. McCabe
Mr. Stans, Budget	Mr. Patterson
Mr. Cole, MHFA—in part	Mr. Martin
Mr. Whittier, VA—in part	Mr. Minnich
Mr. Tootell, Farm Credit	
Mr. Robertson, Federal Home	
Loan Bank Board

State of the Union Message (CP 58–76)—The Cabinet discussed in great detail the content and wording of the message, each Cabinet member having full opportunity to suggest changes so as to achieve precisely the right tone and shade of meaning.

Some of the more significant comments follow:

The President stressed the desire to talk common sense, because so vast a part of America is common sense-minded and have made it evident by newspapers other than in New York and Washington.

Sec. Dulles believed that care should be taken to avoid emphasis on military “superiority”, a concept that could only result in invidious comparisons. He preferred to stand on the concept of having sufficient military power to deter aggression.

Sec. Dulles favored giving attention to the fact that new hazards result from the advent of any new weapons but that the destructive potential of missiles is not greatly different in character or scope than what could be delivered by the bombers against which we have made our preparations.

The President felt that, although he needed to refer to the increased rate of missile development in recent years, he ought not try to pin precisely the party responsibilities involved, especially since his major effort must be directed to constructive accomplishment while others would have opportunity to establish any other pertinent facts.

The President recounted for the Cabinet how the Administration set out at the beginning to take a new look at national security, particularly with regard to modern weapons, and how the Killian Committee was set up in 1954 to make some necessary studies which were reported to the NSC in 1955.

Dr. Killian pointed to the need for discussion by the military experts of the paragraph relating to the retaliatory power of the Strategic Air Command, which might be actually too categorical. Sec. Dulles reiterated his point that only the means of delivery had been changed, then added that the major need was for something to provide greater warning. The President commented that the possibility of the Russians having intercontinental missiles before we do was not catastrophic since that by no means removed the power of our bombers.

Sec. Folsom stressed the need for sacrifice by the American people by way of eliminating luxury items so as to allow not only for security planning but also for other necessities such as schools and hospitals. The President agreed that the country is capable of making all necessary sacrifices at a time when we must concentrate on essentials rather than non-essentials.

Sec. Dulles saw some possibility that the message would be criticized as being on the complacent side and he called attention to the

various forms of the Russian threat, especially economic warfare. Yet he believed the resourcefulness of a free society would always overcome the rigidity of a bureaucracy.

At the President's request, Mr. McElroy read the current draft of the section on Defense Reorganization in which the President would outline the governing principles without yet stating specific changes. This led the President to recall his long interest in the matter. In reply to a comment on the apparent absence of administration activity in this field, the President quickly cited the earlier effort which had produced only a "useless thing". He emphasized the control now possessed by the three services by virtue of direct appropriations to them, and he commented that the handling of missiles programs had been hurt by self-styled experts at Congressional hearings. He felt that interpretations like Rep. Vinson's ('this is just long range artillery') consisted of taking something that is wrong to start with and trying to build on it. He explained his feeling that it would be best for the study to be made by others than himself since he had had such positive convictions for so long a time.

The Vice President hoped the message would contain at least a sentence on the great increase in Russian economic efforts.

Sec. Mitchell felt that the message ought to be more explicit as to the purpose of our mission and he asked if it were not mainly to fight Communism. The President commented that he knew of no great problem today but what it is tied to the Communist threat.

In discussing the Education Section of the State of the Union message, the President noted Dr. Milton Eisenhower's apprehensions especially as to singling out the pay of science teachers for improvement. The President felt that the Administration program should stay away from salaries.

Regarding the section on sacrifices, the President said that somehow the United States had to put on hair shirt and sackcloth yet avoid scaring people.

Defense Department Program—For the benefit of Cabinet members who could remain and who had not heard this at the NSC meeting, Asst. Sec. McNeil gave an extensive briefing on the FY 1959 Defense budget. He reviewed the procedure used in developing the budget which now reached slightly over \$39 billion in NOA and nearly \$40 billion in expenditures. He pointed out that provision had been made over and beyond the original \$38 billion concept for (1) Cordiner implementation, (2) SAC Alert and Dispersal, (3) Ballistic Missile Detection, (4) Ballistic Missile Acceleration, (5) Satellite and Outer Space Programs, (6) Anti-sub Warfare Capabilities, (7) Increased Research and Development, (8) Modernization of Pentomic Divisions, and (9) Force Levels.

Mr. McNeil also stressed that the decision had been made to go ahead with both Thor and Jupiter, to put Polaris into production, and to increase the pace of work on Atlas.

He stressed that the services would be numerically smaller but more powerful and better equipped. He noted also that over 75% of \$15 billion procurement money would be spent for items that were not even on the market in 1955.

2. Briefing Note for the 350th NSC Meeting¹

Washington, January 4, 1958

1. The *next item* concerns the Security Resources Panel, chaired by Mr. Gaither, set up on April 4/57 by an NSC Action directing a study “as to the relative value of various active and passive measures to protect the civil population in case of nuclear attack and its aftermath, taking into account probable new weapons systems.”

2. On November 7/57, the Panel presented to the Council its 28-page report (including 5 annexes). I understand from Dr. Killian that the Panel did not officially adopt the 500-page Background Studies made by the Panel Staff (filed with the Council on December 9).

3. After the November 7 Council Meeting the Panel Report was circulated—under special security precautions and on a need-to-know basis—to responsible Executive Branch departments and agencies for comments on the 26 Panel recommendations. The Planning Board has discussed and analyzed these agency comments, which are before you.

4. The Panel based its study on intelligence and factual material furnished to it by government departments and agencies, as to Soviet and U.S. present and estimated future military capabilities. From the

¹ Source: Security Resources Panel (Gaither Panel) report. Top Secret. 5 pp. Eisenhower Library, Whitman File.

summarization of this material, appearing largely on pages 1–4 of the Report, these points stand out:

(1) The Soviet Gross National Product is now more than 1/3 of our GNP and is increasing at a faster rate.

(2) Soviet expenditures for armed forces and heavy industry in 1957 about equal ours (\$57 billion at 1955 prices).

(3) Soviet concentration since World War II on military power and heavy industry has resulted in a spectrum of nuclear bombs and enough fissionable material for over 1,500 nuclear weapons; in 4,500 long- and short-range jet bombers; in 250–300 long-range submarines, some probably equipped with aerodynamic missiles; in an air defense system which includes 4,000 ground radars, over 3,600 launching pads for surface-to-air missiles, and 10,000 jet fighter planes.

(4) Soviet ballistic missiles with 700 nautical-mile range have been in production for at least a year; with 950 nautical-mile range, have been successfully tested.

(5) The Soviets may have a capability to launch an attack with 100 ICBMs carrying megaton nuclear warheads, possibly by late CY 1959.

(6) The Soviet Army of 175 line divisions has been largely re-equipped.

5. The Panel concluded that, in case of nuclear attack against the U.S. continent, our programs in effect last summer for *active* and *passive* defense would not protect the civil population, and that SAC was currently vulnerable to surprise attack when not on a “SAC alert status” and would be seriously threatened by the early-indicated Soviet ICBM capability.

6. Accordingly, the Panel made some 26 recommendations:

(1) Measures to lessen SAC’s vulnerability to bomber and to ICBM attack, to increase SAC’s strategic offensive power, and to suggest forces for limited war. To these measures it assigned the *highest value*, relative to cost, for protecting the civil population. (Estimated 5-year cost of these measures—\$19 billion.)

(2) Measures (*lower than highest value*) to reduce vulnerability of U.S. people and U.S. cities. (Estimated 5-year cost—\$25 billion; exclusive of additional contingent measures costing \$17 billion.)

(3) Other measures of related concern. (No cost estimates provided.)

7. The Panel’s expenditure estimates cannot readily be correlated, by item, with Defense current and projected spending. They were (according to Dr. Killian) intended to represent order-of-magnitude rather than precise costs. The agencies have not calculated what part of the Panel’s total expenditure estimates for FY 59 might be covered by our proposed FY 58 Supplemental Appropriation Request and FY 59 Appropriation Request. However, Defense estimates *expenditures* in FY 58 and FY 59—above a \$38 billion level—of \$2.64 billion, as compared with the Panel’s estimate for FY 59 of \$2.87 billion for “highest value measures” and \$4.7 billion for its total program.

8. After making a brief over-all summary of the agency comments in relation to the Panel recommendations, I shall ask Dr. Killian, who has helped with this summary, to comment at the end, before the individual agencies discuss their views.

9. To facilitate Council consideration, the Panel recommendations have been grouped on the sheets distributed to you (and to be collected at the end of the meeting), in accordance with the position taken by the agency having primary responsibility to comment. Such a grouping does not indicate the position of any *other* agency, or that implementing action would be taken before Presidential decision.

10. *As to Group A:* "Panel recommendations which the agency assigned primary responsibility for comment fully concurs in, and would carry out in general conformity with Panel views", I shall advert to only four items:

No. 1. Using SAC's planning criterion for reaction time to a bomber attack, i.e., 30 to 120 minutes, depending on the base location; only 1/10 SAC (157 bombers) are at present on an alert status to get off, weapons aboard, on way to target, within the assumed tactical warning time. By mid-59, 1/3 SAC (515 bombers) will be on such an alert status.

No. 3. We will have 3 nuclear-powered Polaris submarines (each with 16 Polaris missiles)—currently budgeted for—operational well ahead of the Panel's CY 62 deadline. We are still studying whether to increase the force from 6 to 18 submarines.

No. 4. While concurring in the urgency of this anti-missile area defense program against ICBMs and of research and development therefor, Defense believes a decision as to installation of such a system would be premature before the research is completed.

No. 5. Because of the complexity of the fallout shelter program, and because the final comments of certain agencies have not yet been received, it will be desirable to put this item over until the January 16 NSC Meeting, together with certain other items not yet fully ready.

11. *As to Group B:* "Panel recommendations which the agency assigned primary responsibility for comment partly concurs in, and would carry out on a modified basis."

Generally speaking, current Defense plans would not implement Nos. 11 to 18, inclusive, as rapidly as or in the quantities recommended by the Panel.

For example, No. 11 and No. 12, which seek to lessen SAC's vulnerability to now-existing bomber threat. The main part of our early warning network from Midway to mid-Atlantic is now operational with substantial capability, and will be operational with modernized equipment by mid-1960. Segments of the network and the 100,000-ft. altitude radars will not be effective until 1960–1962. Only 29 of 52 SAC bases will have anti-aircraft missile defenses by mid-60. Whether to provide missile defenses at *all* SAC bases, in addition to area defenses, has not yet been decided.

Now look at Nos. 13, 14, and 15, which seek to lessen SAC's vulnerability to a possible late CY 59 ICBM threat. The first of three ICBM early warning stations (the Thule arc) will be operational in late CY 59, and the remaining operational by December 60. Tracking radars to identify probable targets will be operational one year after early warning radars are operational. Only one-fifth of SAC will be on a 15-minute alert by mid-CY 60 (one-fourth of SAC by mid-CY 61). SAC (which now has 31 bases) will be further dispersed to SAC bases as follows: 44 by mid-CY 59; 52 by mid-CY 60; 53 by mid-CY 61. The Air Force is studying interim dispersal to non-SAC military bases and to civilian airfields.

Now look at Nos. 16, 17, and 18, which seek to increase SAC's strategic offensive power. We will increase the IRBMs to be produced by early CY 60 to 120 (as compared with 240 recommended by the Panel for the end of CY 60). We will increase the ICBMs to be produced by the end of FY 63 to 130 (as compared with 600 recommended by the Panel). The initial operational capability of the first 15 U.S. IRBMs and the first 10 U.S. ICBMs will equal or better the Panel time phasing; but not (under present plan) the operational capability of larger numbers of these missiles.

According to the latest NIE, the earliest date at which the Soviets could have a 100 ICBM capability would be mid-1959. At this time the U.S. would have operational 10 ICBMs and at most 45 IRBMs. However, our early warning ICBM detection system, our 15-minute SAC alert status, and our dispersal of SAC to SAC bases would be deficient as indicated in the short-page table before you. (Examine table.)

12. *As to Group C:* "Panel recommendations which the agency assigned primary responsibility for comment would further study before deciding to carry out, modify, or reject.

No. 20, which is another measure to lessen SAC's vulnerability to a possible late CY 59 ICBM threat, is under study in Defense, but preliminary findings indicate that, because modification of available anti-aircraft missiles would have too limited effectiveness, Defense prefers an R & D program for a new anti-missile system.

As to *No. 21*, Defense agrees in principle that *capabilities* for limited military operations should be augmented. However, Defense believes that consideration of this problem should be deferred, pending completion of a national-level study, a plan for which will be recommended by Defense to NSC. I understand this plan will not be ready for some two months.

13. Recommendation No. 26 is the only one in *Group D*. "Not concurred in and not proposed to be carried out." Defense points out that blast shelters would not protect SAC runways or reduce fallout radiation, and believes SAC can be better protected, for the cost involved, by alert and dispersal measures.

14. As the footnote on the last page points out, Sections V and VI of the Report contained no specific recommendations. The comments of Treasury, Budget, and the Council of Economic Advisers on the “Costs and Economic Consequences” of implementing the \$44 billion recommendations over 5 years will be presented at the January 16 NSC Meeting, together with a current estimate of the fiscal and budgetary outlook.

Dr. Killian	{	On Defense recommendations
Mr. McElroy and Mr. Quarles		
General Twining		

3. Record of Legislative Leadership Meeting¹

Washington, January 7, 1958

SUPPLEMENTARY NOTES

National Security—Missiles—Satellites—Sen. Saltonstall noted the situation developing in the Defense Preparedness hearings, and how some heat generated from Gen. Gavin’s resignation. The President commented that he had had absolutely no advance notice of Gen. Gavin’s intention to resign until he saw it in the newspapers. His behavior was hard to understand, for if it was greater centralization he was after, that was what the President wanted too.

Sen. Saltonstall understood that Gen. Gavin had wanted assignment to the only 4-star post of the Army in the Continental U.S., but General Taylor had told him he ought to stay with missiles for another year, then there would be a post for him in Europe where he could expect promotion within the year. Sen. Saltonstall then went on to say that Gen. Gavin didn’t want to stay with missiles for another year because he wasn’t satisfied with the budget set-up for missiles, and he didn’t want to have to testify before Congress on that. Only after that did he testify on unification. Sen. Saltonstall added that Gen. Gavin had originally requested \$519 million for Army missile development, had agreed to a figure of \$372 million, and had only gotten \$374 million, of which some \$18 million had to be devoted to the continuation of Jupiter and Redstone, which Gen. Gavin did not desire to do.

¹ Source: Missiles, satellites, and Department of Defense unification. Confidential. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

The President commented on how Dr. Killian had given much attention to the programs for research, that a very generous \$5 billion was set up for research and development, and that things were moving so rapidly that there might well be additional requests for 30 or 40 or 50 million dollars for basic research.

The President noted how inter-service rivalries had come out into the open. He knew of several specifics, but they were not as important as public reaction to this rivalry, so he was devoting a big piece of the Message to what the Administration intends to do about it.

There was extensive discussion of the actual strength of the United States that exists in contrast with the sudden concern about Russia being ahead.

The Leaders urged the President to make a strong personal-type statement that would inspire the trust and confidence of the American people. The President replied that actually he had been trying to play down the situation, but perhaps he had been guilty of understatement in regard to the strength of the Nation's defenses despite Sputnik.

The Leaders commented on the defeatism evident in so many newspaper columns. The President commented that history seemed to be repeating itself—he recalled how there was such a tremendous gloom around Washington in 1942 after Pearl Harbor, the fall of Tobruk, and as the Japs approached Brisbane. But on July 4th, he had been asked to make a speech before the Red Cross in London, which he did, and he devoted his whole speech to how the Allies would win the war—and quickly. It had seemed to be a very effective antidote.

Sen. Knowland was anxious to see a U.S. earth satellite go up successfully soon, to keep demands on the budget from going hog wild.

On Sen. Knowland's mention of getting up a U.S. satellite, the President recalled that we had announced our plans for trying one as far back as May, 1955. Since that time, the scientists had come back several times for more money for the project, but no one had ever said anything about speeding it up. Only very recently had this psychological factor of beating the Russians to it been introduced. It seemed ironic, the President added, that we should undertake something in good faith only to get behind the eight-ball in a contest which we never considered a contest.

The President's final comment on the broad subject of defense was to highlight how this was a long term problem. It was possible to do almost anything you wanted for one year, but when it was a matter of having to carry on for thirty or forty years, that was entirely different. He referred to the import regulations that the British had had to have for so long, and he concluded that if we finally get to the point where the economy won't readily provide what is necessary, then we would have to put on controls. But what we really want is for people to do the maximum voluntarily, and if they would do that, then in his opinion

that would be enough. But it certainly wasn't the answer just to say, "give the military another ten billion dollars."

Defense Unification—The President outlined his general objective, but said specifics would come later on. What he wanted to do was to get so organized that, just as the NSC brings together all the policymakers in the security field, so the JCS ought to bring together all elements of the military to resolve questions. He said he often had to settle disputes that ought to have been settled at the Defense level. He believed the new organization should be such as to avoid having each service head devoted only to running up the plans of his own service.

The President felt deeply that authority had to be centralized in the Secretary of Defense. If the Congressional Leaders would agree to it, he would have all appropriations made to the Secretary of Defense, and the Secretary would have control of all appointments, promotions, etc.

In discussion of Congressional attitudes, the President asserted that one thing was sure: if there's any real fight in Congress on the things we need, he would take a large personal part in pressing the Administration view on the Congress.

4. Memorandum of Conference with the President¹

Washington, January 21, 1958

OTHERS PRESENT

Secretary McElroy
Dr. Killian
General Cutler
General Goodpaster

The meeting was concerned with adjustments in the priority accorded our major missile programs. Mr. McElroy had a memorandum

¹ Source: Priority for missile program. Top Secret. 1 p. Eisenhower Library, Whitman File, DDE Diaries.

for the President suggesting certain changes, and General Cutler had a summary table highlighting the proposals made.

In the course of the discussion the President indicated strongly that he thinks future missiles should be brought into a central organization, and their use should be subject to centralized control. He said he would assign operational use not to any of the existing services, but rather to the major field commands which could make use of them.

In reviewing the documents, he said he thought that the Vanguard and Jupiter C earth satellite programs should be placed in the group accorded the highest priority rating. It was left that the papers would be revised in this sense and resubmitted.

Secretary McElroy then stayed on for private discussion with the President relating primarily to reorganization of the Defense Department.

A.J. Goodpaster
Brigadier General, USA

5. Memorandum of Discussion at 352nd NSC Meeting¹

Washington, January 22, 1958

SUBJECT

Discussion at the 352nd Meeting of the National Security Council, Wednesday, January 22, 1958

Present at the 352nd NSC Meeting were the President of the United States, presiding; the Vice President of the United States; the Secretary of State; Donald A. Quarles for the Secretary of Defense; and the Director, Office of Defense Mobilization. Also present were Fred C. Scribner, Jr., for the Secretary of the Treasury; the Director, Bureau of the Budget; the Special Assistant to the President for Atomic Energy; the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Secretary of the Army; The Assistant to the President; the Deputy Assistant to the President; the Director, U.S. Information

¹ Source: Agenda item 3: Priorities for Ballistic Missiles and Satellite Programs (see print Document 5). Top Secret; Eyes Only. Extracts—3 pp. Eisenhower Library, Whitman File, NSC Records.

Agency; Dennis A. FitzGerald for the Director, International Cooperation Administration; the Under Secretary of State; Assistant Secretary of State Smith; the Special Assistants to the President for Disarmament, for Information Projects, for National Security Affairs, for Science and Technology, and for Security Operations Coordination; the White House Staff Secretary; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

[Omitted here are agenda items 1 and 2.]

3. *PRIORITIES FOR BALLISTIC MISSILES AND SATELLITE PROGRAMS* (NSC 5520; NSC Actions Nos. 1433, 1484, 1545, 1653, 1656, 1713, 1765, 1799, and 1800)

After General Cutler had read the record of action on the subject, Secretary Quarles stated in explanation that if it proved practical to provide the proposed latitude on priorities to the Secretary of Defense, such a course of action would seem desirable and helpful.

The President emphasized that when the issue of the size and scope of programs for the procurement of the missiles came up, this matter would have to be approved specifically by the President.

The National Security Council:

Noted that the President, on the recommendation of the Secretary of Defense in consultation with the Special Assistant to the President for Science and Technology, has established the following programs as having the highest priority above all others for research and development and for achieving operational capability; scope of the operational capability to be as approved by the President:

(Order of listing does not indicate priority of one program over another.)

ATLAS (ICBM) Weapon System

TITAN (ICBM) Weapon System

THOR-JUPITER (IRBM) Weapon Systems

POLARIS (FBM) Weapon System

Anti-missile missile defense weapon system, including active defense and related early warning for defense of the United States proper

IGY scientific satellite (VANGUARD-JUPITER C) programs

Satellite programs (other than VANGUARD and JUPITER C) determined by the Secretary of Defense to have objectives having key political, scientific, psychological or military import.

NOTE: The above action, as approved by the President, subsequently transmitted to the Secretary of Defense for appropriate implementation, superseding those portions of the referenced actions and of NSC 5520 which are in conflict with the above priorities.

[Omitted here is the remainder of the memorandum.]

S. Everett Gleason

6. Memorandum for the Record of Meeting¹

Washington, January 25, 1958, 9:45 a.m.

On January 25, at 9:45 a.m., the President, accompanied by General Goodpaster and Mr. Harlow, left the White House to attend a meeting called by Secretary McElroy in the Pentagon Building. The President arrived at 10:00, met for a few minutes privately with Secretary McElroy, and entered the Secretary's Press Conference room at 10:05, where the following persons were present:

Deputy Secretary of Defense Quarles
Secretary of the Army Brucker
Secretary of the Navy Gates
Secretary of the Air Force Douglas
JCS Chairman Twining
Admiral Burke
General Lemnitzer
General Pate
Admiral Radford (arrived at 10:30)
General Bradley
Mr. William Foster
Mr. Coolidge
Mr. Gale
General Randall

The meeting opened with a briefing given by Colonel Rosson, in behalf of General Twining, on JCS functions, duties and procedures. The presentation continued without interruption for approximately thirty minutes.

Thereafter, Secretary McElroy asked for comment, turning first to Admiral Radford. The Admiral said the first problem is the inadequate time the Chiefs have for JCS business, that it has always been insufficient, and that he hardly knew of a remedy. The Joint Strategic Survey system, he said, has never worked well, the officers assigned to this effort being too low-ranked; and the committee system has not been too good, the team papers, he found, being better than the committee papers.

Secretary McElroy raised the question of increased authority for the Chairman of the JCS, suggesting, as an example, that the Chairman be granted a vote, and also asked about the proposal to create a planning staff separate from the individual services.

Admiral Radford said the Chairman JCS already has great influence and is now in effect the principal military to the Secretary of Defense.

¹ Source: JCS organization. Confidential. 7 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on January 30.

He pointed out that the long-range strategic plan makes little sense because it attempts to project 12 years into the future. He thought things might be improved if Operation Deputies were located near the Chairman JCS and be available on a continuing basis.

General Bradley, on suggestion of Secretary McElroy, commented that the service chiefs do not have enough time to do their work, that they are always behind trying to stay ahead of both their service and JCS duties. He said he knew of no remedy. He added that he had seen times when there was too much emphasis on strictly service views in JCS deliberations, but again, he said, the remedy he did not know. It was his opinion that it would be very difficult to have the operational deputies working with the Chairman because the service chiefs would not take well to this arrangement. He thought the chiefs need to be together more and did not see how this could be accomplished while they remain chiefs of individual services. He thought that the Chairman needed no greater authority than he now has as long as the chiefs remain service chiefs. He pointed out that the Chairman's leadership and personal direction provide adequate authority.

As for the Joint Strategic Survey Committee, General Bradley mentioned that the Rockefeller Committee gave close attention to this activity and concluded that it must be strengthened in order to do its job properly—especially, that it should have outstanding officers assigned to it at the end of their periods of service and also that scientists should participate. He said that how and where to bring scientists into this process still is not clear. General Bradley concluded that while the JCS is a wonderful organization and is doing a good job with few disagreements, still it can and should be substantially improved by executive action and by law.

Admiral Radford commented on scientific advice available to the JCS, referring to the Weapons Systems Evaluation Group. He pointed out that this process is now on a contract basis and that the Joint Chiefs get excellent results from this Group. General Twining pointed out that this Group can go straight to the Secretary of Defense if it feels it receives inadequate or improper action from the JCS, and he confirmed that the Group is doing excellent work.

Secretary McElroy then asked the views of General Twining. The General stated the opinion that the elimination of the committees would improve JCS action—an opinion, he said, he had not held before becoming Chairman of the JCS. He said, however, that eliminating these committees might not get the unanimity that the Joint Chiefs now have. He strongly endorsed the suggestion that operational deputies be brought closer to the Chairman and suggested that these men be separated from the actual operation of the operation divisions of each of the services.

Admiral Burke thought that the operational deputy suggestion would probably be desirable and would relieve a good deal of the load now being carried by the JCS. He thought that these would take the place of the present operational deputies in the Joint Staff and might be called Deputies for Planning—the alter egos of the service chiefs.

General Lemnitzer thought that this operational deputy idea would be superior to separating the Chiefs from their service responsibilities, but he did think that this process would not remove the need for the committees in the Joint Staff. Admiral Burke agreed with this observation.

Secretary Douglas expressed the view that special deputies would help the JCS a great deal. He said however that the process might remove the chiefs of services from full responsibility for JCS activity, and he mentioned the tendency even now to rely more and more on the Vice Chiefs of Staff for the day-to-day administration of the military services. General Bradley pointed out that in World War II General Marshall left his administrative duties almost entirely to Generals Somervell and McNair while Marshall worked almost full time on JCS war planning. Admiral Radford pointed out that in time of war the Chiefs do not have to go to Capitol Hill nearly as often as in peacetime.

Secretary McElroy asked about the feasibility of short-circuiting the line between the JCS and the chiefs of services designated as agents to the Joint Chiefs. Secretary Gates commented that the peacetime problems of the forces are charged with political, economic, and public relations considerations and therefore that the intervention of the service secretaries is essential. He said the present process works satisfactorily because the service chief goes right ahead with his responsibilities but keeps the Secretary informed. He felt that this relationship would continue because many JCS undertakings have significant civilian as well as military implications. For the same reasons, Secretary Brucker also felt that the service Secretaries should not be by-passed. He said the present system does not delay action in any way, and he emphasized that this viewpoint was not prompted by any feeling on the part of any service Secretary that by-passing the Secretaries would tend to downgrade them.

General Twining said he thought the command channels should be straightened out. Secretary Douglas, however, took the same view of Secretary Gates.

Secretary McElroy observed that going around the service Secretaries would not be a substantial change, that it would simply make sure that the command line would go straight to the service chief who in turn would inform his Secretary. Admiral Burke commented that the chief certainly should contact his Secretary swiftly because of the many non-military considerations involved in such matters.

Deputy Secretary Quarles expressed the view that the greatest need is to clear up command channels. He thought the channels would

be clearest if the JCS issued the orders of the President and Secretary of Defense, using the respective service chiefs for direct action. He said that he realized that the process actually works this way now but is fuzzed up because we assert that we do not do it.

On the invitation of Secretary McElroy, the President then commented on the foregoing discussions. He said we cannot laugh off the present criticism. He said it won't do simply to justify everything now being done. Public opinion, he said, is a strong force and must be respected.

He said he thought the people present had been talking about details before discussing basic concepts. He agreed that things are going rather well now, said he had no criticism of JCS now, nor did he see any present trouble in getting overall strategic plans and concepts. But, he said, don't forget the things that happen afterwards—the administrative and operational as opposed to the strategic projects that have to be applied in the Atlantic or Pacific. He said, to be sure, the JCS can have 872 agreements and only 3 disagreements; but then he wants to know about the 3 disagreements, for these might well be the only really fundamental matters.

He then said that Congress is of course very important in these connections, and he remarked that the services now have some 130 liaison officers assigned to Congressional work. The trouble is, however, whatever differing views service leaders may have get worse as the individual service officers put out their own personal propaganda. He said the same thing applies to public relations and commented that Secretary Wilson once told him that each service has a public relations office larger than the Secretary of Defense's. The President suggested the need of better organization of such matters.

He then urged that the JCS integrate the staff, with the JCS functioning corporately as a single Chief of Staff. He thought the JCS system as it now exists is too complicated to work in wartime, especially in relation to new weapons. He said that the executive agency process is "crazy." He said that the JCS staff should be the G-2/G-3 staff. For an emergency, he said, the organization must be gotten so simple and clear that the job will be done free of delaying obstructions.

The President said it must be realized that there have been frictions and differences and some duplication of effort. We have got to work at this, he said, not merely by clearing command channels, but also by setting up under the JCS a really effective, integrated staff, with the whole business directly under the Secretary of Defense.

The President said, as regards having the Joint Chiefs always with the Chairman and as regards continuing interference from the Congress, that this practice of the Congress to demand appearances of the top men has grown markedly over the years. He said little can be

done about it, but that this might be helpful: the Secretary of Defense could say that the priority of duties lies with the Joint Chief of Staff whose main job it must be always to give good advice to the President and Secretary of Defense. The Chiefs must respect each other and be ready to act at once, the President said, and the more we get into advanced weaponry, the more this will be so. He suggested, therefore, that the Secretary of Defense give an officer an imposing enough title within each service that he could suitably assume the burden of testimony before the Congress. The President said he would certainly try to keep the JCS from having to report constantly to the Congressional committees. Such a man might be called an Operational Chief of Staff, the President suggested.

The President said that it is of course necessary for the Chiefs to maintain close relations with their individual services but that this is mainly to keep things going properly rather than to keep abreast of information.

The President said that the absolutely vital thing is the validity of the joint advice and counsel that the members of the JCS give to the Secretary of Defense and the President, how they are doing their work in allocating functions, how they formulate strategic concepts, and how they deal with new weaponry, research, etc.

The President then said he does not believe in a single Chief of Staff but that the chiefs together should constitute the equivalent of a single Chief of Staff.

The President stressed that there should be no fear of new ideas in approaching this problem. He said that the process is working better now than it was when first established.

Secretary Gates then asked what the role of service Secretaries should be. The President said he thought the service Secretaries should retain certain statutory duties. The civilian Secretaries, he said, would normally be interested in JCS plans and military orders, but that they should have a lot of duties not within the province of the JCS.

Secretary McElroy then asked Mr. Foster to comment. Mr. Foster said he thought the briefing on the JCS organization was excellent but did not meet the need. He thought the command function must be more clearly in the hands of the civilian authority than is the case today. He stressed that we are today truly in war—cold war—and that the JCS process should be thoroughly streamlined. He said there is too much confusion in some of the executive agent responsibilities. He thought the Secretary of Defense must have a staff that combines the wisdom of the service leaders and must be more available to him much more continuously than is now the case. As regards long-range planning, he said that the only way we can get a long look down the years is by some such devotion of military leaders to the single

responsibility of making such plans. These plans, he said, are of great importance to the nation.

He thought that the service Secretaries had very important jobs to do that are separate from the responsibilities of the JCS. He thought it might be wise to bring the civilian and military leaders together in a strengthened Armed Forces Policy Council, commenting that Under Secretary of War Patterson did this during World War II with General Somervell. Today, he said, the process is “all fuzzed up.”

Mr. Foster said that the present need is for a clearer and more direct source of military advice for the Secretary of Defense and a more immediately responsive command process. He expressed opposition to the committee system in the joint staff, saying that it does not work fast enough. In this connection he mentioned that it takes too long to develop new weapons.

At this point Secretary McElroy advised the President that the meeting would adjourn for lunch and would continue during the afternoon. The President’s parting remark was to emphasize the need for a completely fresh look and uninhibited ideas in approaching the problem. At 12:20 the meeting adjourned.

Bryce Harlow

7. Record of Legislative Leadership Meeting¹

Washington, January 28, 1958

SUPPLEMENTARY NOTES

Postal Rates and Salary Increases—As a preface to this discussion, Mr. Hallock joked that Mr. Summerfield should be made to pay an initiation fee since he would be meeting so often with the Leaders in the weeks to come.

Mr. Summerfield made a lengthy presentation of the situation in Congress on these matters, and an extensive discussion of tactics ensued. The entire item required about an hour, with decisions reached as stated in the letter to Mr. Brundage.

¹ Source: Defense reorganization. Confidential. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

Defense Reorganization—The President recounted to the Leadership the developments in regard to Defense reorganization.

He said it seemed clear to him, though he might be speculating a bit, that the majority of the people over in the Pentagon desired to avoid any radical change since they felt the best chance of securing *some* improvement rested on a cautious approach to a number of relatively small things.

The President said that Secretary McElroy appeared to be adamant on his right to establish new agencies within DoD as required for new developments. It also seemed clear that he hoped to get a greater degree of flexibility in the use of funds for new developments. He added that Bill Foster was strong for a tightening up of Defense organization all along the line.

The President then said that he had listened to their plans for two and a half hours the preceding Saturday morning at the Pentagon and everything seemed to be in terms of “little improvements,” whereupon he challenged them to say how they were going to do something real instead of glossing over the problem.

The President asserted to the Leadership that if something good did not come out of the Pentagon study, he would have to take the bull by the horns, otherwise he would lose his own self respect after having been into this business for eleven years. Presently, however, he very much wanted those in the Pentagon to develop an effective plan if they could so that subsequently they would be able to go to Congress and support the plan enthusiastically. Failing in this, the President continued, he would only be able to call in the Leadership, including Democrats, in an effort to try to get direct Congressional support. He then restated his hope that it would not become a situation where the Defense people would be going to Congress opposed to what he thought we needed.

Asked by Senator Knowland how much could be done under administrative authority, the President pointed out that administrative action was sharply limited ever since Congress passed the law (National Security Act of 1947) and the President at that time signed it.

The President then stated emphatically that at the very least Congress ought to repeal some of the restrictions on the Executive’s ability to shape organization. He strongly desired to see that all the strategic planning and the power to organize and direct the several unified commands would be vested right in the Office of the Secretary of Defense. He asserted also that it was necessary to establish the authority of a unified commander to be the disciplinary director, as well as the policy director, of all Services in his command rather than continuing the present situation whereby the head of a unified command has to report the improper conduct to others and ask that they do something about it.

As a third point, the President said that the Secretary of Defense had to have more freedom in regard to research and development and any other new situations such as “space operations,” all of which ought to be under a scientific czar, with the Secretary having the power of decision as to where any particular activity will be carried on, and with the Secretary being the one to whom appropriations are made by the Congress.

The President stated that he did not expect to propose doing anything more now regarding budgetary aspects beyond the already requested \$500 million contingency funds and the authority to transfer up to \$2 billion to take care of new developments.

Subsequently, the President amplified his remarks on the need for establishing an effective staff immediately under the Secretary by pointing out that the lack of such had been one of the reasons that Mr. Wilson had had to request authority for many Assistant Secretaries—he had to rely chiefly on having an “expert” here and another there, and they had to have the rank of Assistant Secretaries.

Mr. Minnich

8. **Presentation on the U.S. Ballistic Missiles Program at the 353d NSC Meeting¹**

Washington, January 30, 1958

MR. W.M. HOLADAY
DIRECTOR OF GUIDED MISSILES
OFFICE OF THE SECRETARY OF DEFENSE

I will present a progress report on the THOR, JUPITER, POLARIS, ATLAS, and TITAN ballistic missile programs for the calendar year 1957.

The over-all achievements during 1957 were good in spite of some failures and setbacks. The year’s progress gives us complete confidence

¹ Source: Secret. 10 pp. Eisenhower Library, Whitman File.

in meeting future milestones at the accelerated pace which is now programmed.

During the year, ATLAS, THOR and JUPITER missiles were produced and underwent intensive captive and flight tests with gratifying results. In addition, significant events took place in the POLARIS development and test schedule.

CHART 1

Here you see the THOR program highlights for 1957. Among these were the first THOR launch, a maximum range demonstration of over 2400 nautical miles. This was a lightly loaded missile; a successful, all-inertial guidance flight resulting in an impact within the target area. In 1957 ten THOR missiles were launched, four were completely successful, three attained partial test objectives, and three were unsuccessful.

CHART 2

The JUPITER highlights are shown here. The outstanding point was the successful re-entry test flight of the scale model of the JUPITER-C heat protected nose cone and its recovery at sea. The flight tests demonstrating full range capability with missiles of greater weight than the tactical missiles; the inertial guidance system tests to target area; the full-scale nose cone flight test; the first 150,000 pound thrust engine and the XW-35 warhead adaption kit tests. In 1957 seven JUPITER missiles were launched, three were completely successful and four were partially successful.

CHART 3

The development engineering inspection of THOR launch and ground support equipment took place at Douglas Aircraft Company in December 1957. This chart illustrates that ground support equipment comprises a large part of a ballistic missile system. In the foreground is a propellant servicing system and trailerized ground support equipment can be seen in the background. THOR ground support equipment is in production. The missile and ground support equipment is air transportable. Contracts for JUPITER ground support equipment and operational missiles have been established and the engineering design review completed.

Looking toward the deployment of the first squadrons of both THOR and JUPITER before the end of 1958, the Air Force has approved a deployment plan for the first IRBM squadron to the U.K. The JUPITER deployment plan must await detailed negotiations with NATO countries.

CHART 4

This chart represents the host air base with a launch position of three THOR missiles. The host base also provides necessary buildings for maintenance of missiles and ground support equipment and other logistical support. The other three launch positions are dispersed to insure survivability. Plans to deploy the JUPITER missile are following a similar squadron configuration.

CHART 5

The outstanding POLARIS development events of 1957 are indicated on this chart. Among these are: the successful tests of thrust termination for large solid propellant motors; the establishment of the POLARIS weapon system parameters; a demonstration of the warhead design feasibility in which the re-entry body is part of the warhead envelope.

CHART 5A

Successful tests of the gas eject method of launching the missile; the feasibility of achieving the required specific impulse in a large solid propellant motor of the size of POLARIS; excellent progress in developing precise navigation equipments and methods for POLARIS submarines; completion of the breadboard design of the missile guidance system and a successful test of the prototype first-stage POLARIS motor as well as a flight demonstration of the jetavator control system. As a result of the foregoing tests, it was decided that the POLARIS program could be accelerated. This was done in December 1957.

3 submarines

CHART 6

The year 1957 also saw many significant achievements in the ATLAS program. Three launches took place, of which, one was completely successful and two partially so. Subsequently, in January 1958, a fourth ATLAS flight test was successfully accomplished. Cooke AFB was obtained as the first ATLAS operational site in addition to being a THOR and TITAN training base. Warren AFB at Cheyenne, Wyoming, was selected as the second ATLAS operational site. Approval was obtained to conduct confidence firings for operational crews from Cooke AFB and construction of ATLAS launch sites is well under way.

CHART 7

The basic building block of the ATLAS force is the squadron. The basic squadron is composed of six horizontal readiness launchers; two block-houses or launch control centers; two guidance stations composed of six doppler radars, two track radars, and the guidance building. A squadron maintenance area is located about one mile behind the

guidance building. The redundant guidance stations can control either of the two launch complexes. In the lower left is a typical horizontal launcher with the missile in place and the environmental cover partially withdrawn. In this position, the missile is in a readiness state of something greater than 15 minutes but less than two hours. In the lower right, the missile is shown in the erected position ready for launch. This represents a readiness state of something in the order of 15 minutes.

CHART 8

TITAN. The Martin factory at Denver was completed on schedule. A design engineering inspection of the complete TITAN missile was held in March. This was the first time the using agencies were able to thoroughly examine a TITAN configuration. Design criteria were established for the TITAN operational hard base. The Aerojet General Corporation delivered the first TITAN production engine to Martin. The first complete radio inertial guidance system was delivered in the spring.

CHART 9

This is the squadron configuration of the TITAN hard base. The missile will be stored in a hardened site designed to withstand 100 psi over-pressure. The silo-type launch facilities are grouped around a central launch control facility resulting in a very compact unit.

As we near our initial operational dates, the areas of logistics and operational training assume greater priority and importance. In this respect the Air Force's Air Materiel Command established a ballistic missile logistics system designed to react instantly to resupply. This has been accomplished through an electronic data processing system for the control of spare parts for the land-based ballistic missile program.

Another significant event occurred at the close of 1957 when the Strategic Air Command assumed responsibility for the initial operational capability for Air Force ballistic missiles. This is the step that had been planned from the beginning and comes at a time when maximum benefit can be realized by the operational command. The added strength of the Strategic Air Command to the program will accelerate planning, training, and strategic-operational capabilities.

CHART 10

Now, Mr. President, I would like to present the current plans for the build-up of our ballistic missile forces. The first in the series is the land-based 1500 mile IRBM's bearing a 1500 pound thermonuclear warhead in the excess of 1 megaton yield. These missiles have been designed against conservative operational characteristics and performance criteria in order to insure their earliest possible deployment and

deterrent exploitation. On this chart, the IRBM IOC force build-up is shown under current directives. As you are aware, the recent decision to produce both the THOR and JUPITER ballistic missiles has resulted in doubling the effective operational force expectancy and prior operational dates have also been stepped up. The combined THOR–JUPITER operational inventory will total 120 missiles at the end of the initial operational capability force build-up overseas. These missiles have been designed with particular emphasis in their ground support equipment given to movability from one site location to another and dispersibility from a common support base of operations. Although somewhat different development approaches have been used by the Air Force on the THOR and by the Army on the JUPITER resulting in the development program as shown, it should be particularly noted that both missiles bear the same squadron operational dates overseas. The annual production schedule to attain this force build-up is shown along the bottom line of the chart. The total 272 missile production figure shown accounts for all missiles incurred to cover test flights, training, and exercise firings to support the operational inventory.

CHART 11

This chart shows the ATLAS IOC force build-up. In addition to the two Cooke AFB training complexes, which have inherent operational capabilities, the newly directed ATLAS program will have four soft squadrons by mid-1961. In addition, consideration to four additional hard base squadrons are planned to be completed by early 1963. The research and development part of the program remains unchanged since it is progressing as rapidly as possible.

CHART 12

The TITAN IOC force build-up is shown here. Significant scheduled development milestones during 1958 will be captive firing of the missile at Martin, Denver, in April 1958, and the first flight of the TITAN from Patrick in September 1958. There is every indication that these dates will be met. Selection of the first TITAN operational site near Denver, Colorado, was approved during January 1958 by the Air Force Ballistic Missile Committee. Plans are moving ahead to start construction in May 1959. The first operational TITAN squadron is scheduled for activation in July 1961 with 3 more squadrons to be completed in July 1962.

CHART 13

POLARIS. Significant scheduled development milestones are: the first fully guided flight in October 1959, the delivery of the first POLARIS nuclear powered submarine in October 1960 complete with

its missiles, and the delivery of two additional submarines by July 1961. It is expected that these dates will be met.

CHART 14

The Air Force ballistic missile program alone is sizable in the number of people engaged in the military-industry team effort. Illustrated are some 55,000 industrial and military personnel working in the program. Although there will be a leveling off and a gradual decrease in the number of industrial personnel in these programs, it can be readily seen that the decrease will be off-set as military personnel build-up increases in the operational units.

CHART 15

This chart summarizes the large ballistic missile funding picture. The column on the left contains the amounts originally approved in 1958 for our five missiles. The next column shows the supplemental 1958 funding. The increase in the amount for THOR includes common ground support items for both JUPITER and THOR. The third column shows the total amount of augmentation these five programs require this fiscal year and includes money reprogrammed by the Services. Total 1958 funding requirements amount to \$2223.1 millions.

The FY 1959 funding is indicated in two columns. The first shows what was originally planned. Supplemental amounts considered necessary are as indicated in the last column. The FY 1959 program for these five missile systems as we see it now calls for obligational authority of \$2023.9 millions.

In summary and conclusion, Mr. President, our ballistic missile programs are going well. Our present operational objectives, which we feel confident of meeting, are as follows:

a. Two IRBM squadrons to be operationally deployed by December 1958 with six more to follow by March 1960.

b. The first ATLAS squadron to be operational at Cooke AFB, California, by June 1959 and four more squadrons to be operational at other bases by June 1961. A total of nine squadrons are now programmed for operational use in early 1963.

c. The first TITAN squadron should be operational by July 1961 and three others will come into being by July 1962. All TITAN units are to be deployed on a hardened basis.

d. Three POLARIS FBM submarines will be operational by July 1961.

At the present time, we foresee no technical, operational, logistic or training problems during 1958 which will prevent us from meeting this schedule.

9. Briefing Note for the 353d NSC Meeting by Cutler¹

Washington, January 30, 1958

ITEM 1—BALLISTIC MISSILES PROGRAM

1. In September, 1955, the President first gave highest priority to the ICBM program. At that time, the Secretary of Defense was asked to give a special briefing once a year on the status of ICBM progress; this request being later broadened to include highest priority IRBM progress and anti-ballistic missile defense programs. Additionally, the Defense Department has for some time been reporting monthly to the President on ICBM and IRBM programs.

2. The last annual briefing was given in January, 1957. You will remember that last July the Council heard an over-all presentation by the Defense Department, dealing with 41 different ballistic and non-ballistic missiles, with cost estimates projected through FY 1963.

3. The most recent Presidential action on missiles was, of course, last week, when the ICBM (ATLAS and TITAN), the IRBM (THOR-JUPITER, POLARIS) and the anti-missile missile were all placed in the highest priority both for research and development and for achieving operational capability.

4. This morning we will hear the third *annual* briefing by Defense. Because of the amount of consideration the Council has recently given to the subject in connection with the 1958 budget augmentations, the 1959 budget, and the "Gaither Report," today's briefing will be shorter than usual. It will not deal with defense against ballistic missiles, but will cover only the ICBM and IRBM programs.

5. At next week's Council meeting the Department of Defense will report its recommendations on certain additional "Gaither Panel" resources the production of and initial operational capability dates for ICBM weapon systems, IRBM weapon systems, and POLARIS submarine weapon systems; the installation of interim defenses against ballistic missile attack at SAC bases by using modified available anti-aircraft missiles; and the hardening of SAC bases.

Secretary McElroy—

10. Letter From McElroy to Eisenhower¹

Washington, January 31, 1958

Dear Mr. President:

A short summary of progress during December 1957 on the ballistic missile programs is attached.

December was the most active and successful month to date in the ballistic missile flight test program. An ATLAS ICBM was launched on 17 December and all flight test objectives were achieved by this third flight test ATLAS missile. This was the first successful flight of our intercontinental ballistic missile. A THOR IRBM, the tenth THOR flight test missile, was successfully flight tested on 19 December. All sub-systems functioned perfectly and the IRBM impacted within approximately three nautical miles of the target at a range of approximately 1,200 nautical miles. This was the first completely successful flight with full inertial guidance. Two other flight tests of a THOR and a JUPITER were partially successful. A flight test of a POLARIS development test vehicle also successfully achieved all test objectives.

All ballistic missile programs except that of TITAN have been accelerated. The presently estimated initial operational capability dates by missile system are:

THOR and JUPITER—December, 1958

ATLAS—June, 1959

POLARIS—October, 1960 (date of completion of the first missile/submarine system)

TITAN—July, 1961

During calendar year 1957, no new technical obstacles appeared and significant advances were made in resolving previously anticipated difficulties.

With great respect, I am

Faithfully yours,

Neil H. McElroy

11. Memorandum of Conference with the President¹

Washington, February 4, 1958

OTHERS PRESENT

Dr. Killian
Dr. Kistiakowsky
Dr. York
General Goodpaster

Dr. Killian opened by saying that real progress is being made in the missiles program. It has gone at a faster clip than was foreseen in 1953 and 1954. There are grounds for real confidence that both liquid and solid-propellant missiles will perform satisfactorily, from a technical point of view. He then asked Dr. Kistiakowsky to report in more detail.

Dr. Kistiakowsky said that technical progress has been all that was expected, and more. There are no scientific problems remaining with regard to the first generation of missiles. The problems are engineering problems—specifically to build the elements so that they will perform reliably. There are certain problems which need attention. We can be sure that the Thor will function satisfactorily. The Jupiter missile is, production-wise, behind the Thor. To go forward with production on both requires the Air Force to set up two different systems for training and handling. Technically the missiles are almost identical. The Thor production model has been better tested, since the Jupiter must be redesigned for production by Chrysler. Dr. Kistiakowsky said that specifically, within the next few months, a decision ought to be made in this matter. Dr. Kistiakowsky said the major additional cost in the Jupiter program is that of putting Chrysler into production. The first missiles from Chrysler may be expected in January 1959. Dr. York added that the biggest cost in other than money terms—i.e., in talent and decision energy—is to the Air Force in preparing for the use of two missiles.

The President said that he has come to regret deeply that the missile program was not set up in OSD rather than in any of the services. Personal feelings are now so intense that changes are extremely difficult. Dr. Killian commented that the group was giving advice from the technical standpoint solely. The President asked that they give their advice to the Secretary of Defense and it will be up to him to make a decision, with the President giving him support.

¹ Source: Progress in ballistic missile programs. Top Secret. 4 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on February 6.

Dr. York suggested that the Army Ballistic Missiles Agency is a highly competent organization, and is interested in satellites. The President quickly interjected a caution not to put the satellite job in any service.

Dr. Kistiakowsky went on to say that the Titan will be superior to the Atlas, but it is behind it by eighteen months to two years. The President stressed that what we must have is the earliest possible operational capability. Dr. Kistiakowsky went on to say that work is well under way on the Polaris missile. He thought it should be said, however, that we are not sure we can meet an operational date of 1963 for a 1500-mile missile—we can meet an even earlier operational date for a 1000-mile missile, however.

Dr. Kistiakowsky said that a solid-propellant ICBM cannot be expected until 1965–66. Thus there will be a gap of about five years between quantity availability of liquid propellant ICBMs and solid propellant. There is reason in his mind to set up a systematic production-improvement program for liquid missiles, for example going to storable fuels that are ignitable on contact. Titan and Thor have many opportunities for substantial improvement. He suggested that we should terminate the Atlas program after eighty missiles are produced. He added that Titan seems to offer the best booster for space missions.

The President stressed the importance of picking out the phases of activity in which we should undertake to compete with the Soviets, and to beat them. We should not try to excel in everything. He added that psychological as well as technical considerations are important—at times appearances are as significant as the reality, if not more so.

The President asked if there is some area in the United States where we could conduct missiles tests in secrecy—keeping undesired visitors out. He was told that Camp Cooke seems to meet many of these requirements. He said he would like to see it called the Defense Testing Station—and see it kept out of service politics.

Dr. Kistiakowsky went on to give a technical net evaluation of our relative position respecting the Soviets. As to the ICBM, he thought they were probably about one year ahead of us in propulsion, one year behind us in warhead development, and somewhat behind us in guidance, but with a much simpler operational concept based on a mobile rail-based system. He added that because of more powerful propulsion, they could have simply designed their weapon to carry the heavier, older-style warhead. In the medium range missile of 100–600 mile range, they are probably about three years ahead of us, having initiated troop training in 1953 and 1954. Their weapons are highly mobile, using track-laying and road vehicles. In guidance they are probably behind us, with a one-mile CEP for small weapons and a five-mile CEP for large. Their IRBM is a 1000-mile missile, which is probably a 600-mile missile with a lighter warhead.

The President said that in evaluating material of this kind it is necessary to consider relative probabilities. Until an enemy has enough operational capability to destroy most of our bases simultaneously and thus prevent retaliation by us our deterrent remains effective. We would make a mistake to credit him with total capabilities. Dr. York pointed out that an enemy who planned to make an attack could select a time for his attack and delay until he is ready.

Dr. Killian asked if the President thought all of this should be presented to Mr. McElroy, and the President said he thought it should, informally initially, but then put into document form. He thought it was very important to act in these matters in order to avoid wasting money and talent.

The group next discussed questions of outer space. Dr. Killian referred to discussions at the Leaders Meeting earlier that morning, and said there is great pressure in the Congress and elsewhere to have some space work done outside the Department of Defense. His thought was we should get down some objectives in our space program. He hoped to come in soon with this. It would cover scientific as well as military objectives. The President said that space objectives relating to Defense are those to which the highest priority attaches, because they bear on our immediate safety. He recognized that the psychological factor is of importance to our security, for example to the attitude of our allies. He did not think that large operating activities should be put in another organization, because of the duplication, and did not feel that we should put talent etc. into crash programs outside the Defense establishment. He added one general proviso and condition to all of this—that Defense gets its own organization correct, i.e., that there is a central organization to handle this in Defense. He said he wants to get the broad principles of organization right, not bowing to pressures. He did not want to concern himself with details, but felt that it is vitally important to get the relationship to Defense correct.

Dr. York pointed out that the Army and Air Force statements concerning satellite projects are in the talking stage—none are approved projects. The President said that even the announcements and the discussion of these matters should come from Defense. The President asked for the organizational thoughts of the scientific group on space research and missiles, both in Defense and outside, now and for the future.

The President thought it would be a good thing for two or three people to meet with him every now and then just to talk over some of these questions and make sure that their thinking is correct. He named Dr. Killian and Mr. Hagerty in this respect.

A.J. Goodpaster
Brigadier General, USA

12. Memorandum From Kistiakowsky to Killian¹

Washington, February 13, 1958

SUBJECT

Technical progress and actions required in the Long Range Ballistic Missile Program

FROM

G. B. Kistiakowsky, Chairman, Ballistic Missiles Panel

I. The technical progress in long-range ballistic missiles has been faster than anticipated in 1953–54 when the large-scale effort began. This progress can be summarized as follows:

(a) there is now a high degree of confidence that both the liquid and the solid propellant engines of large thrust will perform satisfactorily, although neither type will have 100% reliability in the early phases of operational use;

(b) the airframes light enough for long-range missiles have been shown to have satisfactory structural strength and aerodynamic properties;

(c) self-contained, “all-inertial”, guidance has already exceeded initial expectations and CEP *due to guidance alone* at 5500 mile range of less than 1 mile is within sight;

(d) the re-entry of the nose-cone into the atmosphere without burning up appears to be near solution, not only for the 1500 but also for the 5500 mile range missiles;

(e) thermonuclear warheads of megaton yields and acceptably small weight, which were predicted but doubted four years ago, are now a reality.

II. This rapid technological progress gives assurance that every major ballistic missile program *can* result in a prototype operational missile system within originally planned time scale or very shortly thereafter. The initial uncertainty of success led to a number of back-up programs: Thor and Jupiter for the IRBM; and Atlas and Titan for the ICBM. Now that there is high confidence that each one of these programs will produce an operational missile within specified time requirements, the justification for continuation of all four missiles should be examined.

Thor and Jupiter are technically and performance-wise very similar, but they are sufficiently dissimilar to require two different ground support efforts, different training staff and manuals, and spare parts pipelines for each of these missiles. There seems to be very little

¹ Source: Progress and recommendations in ballistic missile program. Secret. 4 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology.

justification to producing two similar missiles with the same performance. Thor has had more advanced testing and is closer to production than Jupiter. We recommend that it alone should be chosen for continued development and use, while Jupiter should be terminated as soon as practicable. This decision will result in considerable dollar savings, will reduce the burden on the Air Force of making two weapon systems with different GSE, training procedures and spare parts operational at the same time and will make ABMA available for other projects.

In the case of Atlas and Titan the situation is different because Atlas is much nearer being operational but Titan promises to have better initial performance and has greater improvement potential. The need for an early operational ICBM makes the termination of Atlas impractical, but this project should not be encouraged to engage in development work beyond that needed for IOC, because Titan can become operational some 18 months later if adequate funding is provided.

III. The Fleet Ballistic Missile, Polaris, with a solid propellant engine, is in an early stage of development. The introduction of solid propellant engines into long-range ballistic missiles has many important advantages: the engines are comparatively simple and are instantly ready to fire; the reliability, judging by the performance of smaller rockets, is very high. The performance characteristics required of solid propellant engines for use in ballistic missiles are, however, far higher than achieved in the past. Furthermore, solid propellant engines add greatly to the difficulties of all-inertial guidance. It is believed that in time these problems will be solved and since the solid propellant ballistic missiles are very advantageous from the operational point of view, their vigorous development is strongly recommended.

The first version of Polaris, A-1, a missile of about 1000 miles range, is scheduled to be operational in 1960. This schedule appears to be realistic, but there may be navigational and guidance difficulties in conjunction with its use as a FBM which will not be entirely solved in the early stages of operational availability of Polaris.

Polaris B, a missile of 1500 mile range, is planned to become operational in 1963. The advance from Polaris A-1 to B involves some rather dramatic improvements in the solid propellant engines and we are not at all sure that the actual progress will be as rapid as planned. It should also be emphasized that the reliability of the early operational Polaris may not be all that is being anticipated for it by its enthusiasts because of several novel features never before used in solid propellant engines.

At about the same time that Polaris will become a fleet ballistic missile it should be possible to have a land based version of this missile, provided the Air Force is satisfied with its performance. If the Air Force desires to change the specifications then there might be an additional delay of one or two years in obtaining a solid propellant land-based IRBM.

IV. The earliest availability of a land-based 1500 mile missile with a solid propellant engine is thus 1963, but it will probably be delayed until 1964–65, notwithstanding a maximum effort. To develop a solid propellant ICBM is a still more difficult undertaking and its earliest availability is 1965, while 1966–67 is a more realistic date, unless a crash program is initiated. There is thus a gap of some five years or more between an early IOC of present IRBM and ICBM and the start of their possible replacement by solid propellant missiles. This gap justifies the consideration of a systematic “product improvement” program on *one* present IRBM (Thor) and *one* ICBM (Titan) to accompany the steady growth of operational capability of both. We should like to emphasize that the value of liquid propellant engines and of missiles using them need not end with the present models. It appears that the present types of airframes and engines can be comparatively readily modified to use storable, self-igniting (“hypergolic”), propellants, which will give them the advantages of solid propellant engines—simplicity and thus greater reliability, rapid reaction time, easier transportability, reduced ground support equipment and operational personnel. For a rather long time to come liquid propellant engines will carry heavier payloads for longer distances than will solid propellant engines of the same total weight.

While these considerations justify a steady improvement program for the Thor IRBM, they are truly compelling in the case of ICBM Titan. This is a missile with a great growth potential as an ICBM of unlimited range and very large payload. If anti-missile-missiles become effective the large payload of Titan may become a necessity, to carry along sophisticated devices to overcome the defenses. Solid propellant ICBM of similar payload capacity are presently not within sight. A retaliatory ICBM force made up of Titans with sophisticated nose cones and of solid propellant ICBM’s with much lighter (and therefore not so sophisticated) nose cones, may prove to have an exceptional effectiveness.

V. We as a nation seem to commit ourselves to a substantial effort toward space exploration. In any such program the propulsion is an essential and the major part. For economy’s sake we should use for this purpose rockets developed as ballistic missiles. Titan even in its presently conceived form is a better booster for space missions than is Atlas. A systematic improvement program on it will provide a satisfactory booster for rather advanced space missions. For still more advanced missions, such as manned flights to the moon and beyond, far larger and more advanced engines will be required than are now in the state of development. To avoid being caught in a crash program, it is advantageous to initiate preliminary work on such engines in the near future.

13. Memorandum From Lay to the NSC¹

Washington, February 14, 1958

SUBJECT

U.S. Overseas Military Bases

REFERENCE:

Memo for NSC from Executive Secretary, same subject, dated January 14, 1958

The enclosed report by the NSC Planning Board on the main issues of the Report to the President on the subject, prepared by the late Mr. Frank C. Nash and transmitted by the reference memorandum, is transmitted herewith for consideration by the National Security Council at its meeting on Thursday, February 27, 1958.

The Planning Board recommends that the Council:

a. Adopt the recommendations contained in the enclosed report.

b. Recommend that the President authorize the responsible agencies to circulate the Nash Report, together with the recommendations adopted pursuant to *a* above, to key operating personnel in this country and overseas, for information and such action as each agency deems appropriate consistent with approved national security policy. In view of the sensitivity of the Report in its entirety, distribution of the full Report should be limited to key operating personnel, and only appropriate extracts from the Report should be circulated to personnel having particular responsibility for specific subjects.

James S. Lay, Jr.

Enclosure

Report Prepared by the NSC Planning Board

Washington, undated

U.S. OVERSEAS MILITARY BASES

Planning Board Comments and Recommendations on the Main Issues of the Nash Report

MAIN THESIS

1. Present and Future Need for the Base System.

Statement of the Issue (Report, pp. 4–5, 7–13): Our base² system is key to our survival as a nation. During the next ten years, despite changes in weapons technology, our overseas base system will remain essential (a) to maintain and disperse our deterrent to general war; (b) to maintain tactical forces to deter and cope with local aggression; and (c) to support foreign policy objectives. The general scope and pattern of our base system are not likely to diminish in size and complexity during this period, and a net increase will probably be required, at least initially, to accommodate new weapons, to meet new Soviet offensive techniques, and to disperse. Adjustments and shifts in emphasis will occur as we adjust our strategic doctrine to new weapons, improvements in the mobility and firepower of our tactical forces, and the political or military vulnerability of particular overseas areas. The central problem, therefore, is how the United States can maintain substantially its present overseas base complex over the next ten years, recognizing that to maintain it calls for a positive but flexible approach in our relations with our allies, and in the formulation and administration of our own policies.

Planning Board Comment: Substantially our present base system will be needed for at least five years, although it is not certain that it will be needed for the next ten years. After five years, a number of technological and political developments could alter the base system or the reasons for its maintenance. Even if such technological developments should permit some reduction in base requirements related to general war, there will probably remain substantially the present requirement for bases to maintain tactical forces against local aggression and to support foreign policy.

²The word “base” is used in its broadest sense to cover the installations and deployments of all elements of the U.S. ground, sea and air forces located outside the territory of the United States. [Footnote is in the original.]

Planning Board Recommendation: Accordingly, the Planning Board recommends that the National Security Council accept the validity of the thesis that:

The tremendous changes in weapons technology will not, in the immediate future, alter the need for substantially our present overseas base system. Most probably for at least five years, this system will remain essential (a) to maintain and disperse our deterrent to general war; (b) to maintain tactical forces to deter and cope with local aggression; and (c) to support foreign policy objectives. In fact, a small net expansion of our base system may be required, at least initially, to accommodate new weapons and to meet new Soviet offensive techniques.

OTHER CONCLUSIONS AND RECOMMENDATIONS

2. IRBM's Around the Sino-Soviet Periphery.

Statement of the Issue (Report, pp. 7–10): In view of the prospective Soviet ICBM capability and the resulting vast increase in the vulnerability of the continental United States, our ability to retain the edge in the deterrent race requires the positioning of IRBM's at widely-dispersed bases around the Sino-Soviet periphery.

Such positioning must be carefully planned to avoid pressing the Sino-Soviet bloc to the point that may incline it to miscalculate our objectives and conclude that our intentions have become aggressive, thereby making it feel obliged to react violently. Because the untested state of the IRBM's prevents us from placing full reliance on them and reducing our dependence on the manned bomber, and because existing air bases will not always be the most suitable IRBM locations, the IRBM program will necessitate some enlargement of our overseas base system.

Planning Board Comment: With respect to NATO, the U.S. policy decision on this matter was taken prior to the NATO Council meeting in Paris in December 1957. The positioning of IRBM's in other selected strategic locations around the Sino-Soviet bloc might be considered a logical corollary on the grounds that such positioning would represent essentially only a modernization of our current forward strategic forces and would be designed only to maintain the present strategic balance between the United States and the USSR. Although the stationing of IRBM's outside the NATO area would probably not in itself cause the USSR to retaliate with actions that would run serious risk of general war, it might produce a strong Soviet reaction in some areas, and would cause the USSR to step up its efforts to persuade host nations to restrict our freedom to use bases.

Planning Board Recommendation: Accordingly, the Planning Board recommends that the National Security Council agree that:

In view of the prospective Soviet ICBM capability and the resulting increase in the vulnerability of the continental United States, our continued ability to deter general war will be better ensured by the

positioning of IRBM's in selected areas around the Sino-Soviet periphery. Such positioning must be carefully planned to avoid pressing the Sino-Soviet bloc to the point that may incline it to miscalculate our objectives and conclude that our intentions have become aggressive, thereby making it feel obliged to react violently. [The implications of positioning IRBM's around the Sino-Soviet periphery outside the NATO area are of such import that a decision to do so should be made through NSC procedures, only in light of the over-all advantages and disadvantages.]³

3. *Western Mediterranean Pact.*

Statement of the Issue (Report, p. 45): Because experience to date with our various mutual security arrangements has demonstrated that they afford the most enduring cement for our overseas base complex, immediate and thorough consideration should be given to the feasibility of a Western Mediterranean defense arrangement embracing Spain, France, Italy, Morocco, Tunisia, Algeria, and Libya.

Planning Board Comment: This idea is already an item of discussion between State and Defense, and consideration should be given to including the United Kingdom in any such arrangement because of its position in Gibraltar and Malta. It is questionable, however, whether such a defense arrangement would be feasible so long as the Algerian situation remains critical. In addition, NATO countries which might become members of the pact might find that such an organization would entail the diversion of resources from the NATO area. Further, there is no current U.S. military requirement for such a pact except as additional means of ensuring adequate bases in the area.

Planning Board Recommendations: Accordingly, the Planning Board recommends that the National Security Council note that:

Consideration is being given by the Departments of State and Defense to the feasibility and desirability of a Western Mediterranean defense arrangement embracing Spain, the United Kingdom, France, Italy, Morocco, Tunisia, Algeria, and Libya.

4. *A New Base Chain in Central Africa.*

Statement of the Issue (Report, p. 25): In light of the exposed position of our bases to the north, the technological developments in the long-range plane and missile fields, and the objective of getting a political "foot-in-the-door" in rapidly-developing Central Africa, we should seriously consider, from both the political and military points of view, whether a line of "back bases" across the waist of Africa, with Ethiopia as its eastern terminus, would be worth the cost involved.

³ ODM-Treasury-Budget proposal. [Brackets and footnote are in the original.]

Planning Board Comment: Paragraph 20 of NSC 5719/1 (approved on August 23, 1957), dealing with the strategic importance of Africa South of the Sahara, says:

“No immediate action appears called for. The area should be kept under periodic survey to determine any changes in our strategic requirements.”

There is no need at this time to revise this policy.

Planning Board Recommendation: Accordingly, the Planning Board recommends that the National Security Council agree that:

The United States should not, at this time, establish a line of “back bases” across the waist of Africa; but should, in accordance with NSC 5719/1, keep the area under periodic survey to determine any changes in our strategic requirements.

5. *Alternative Bases in the Far East.*

Statement of the Issue (Report, pp. 27–28, 36): In view of the weaknesses in our present Far East defense perimeter and the increased threat inherent in Soviet missile achievements, alternatives to our present base system should be examined for the dual purpose of increasing dispersion and of establishing bases in the most politically reliable areas.

Such a program would be costly, but the alternative to a soundly-based defense perimeter in the West Pacific is a retreat to “Fortress America” which would be infinitely more costly in every respect. It is not a question of withdrawing entirely from any country. This would be considered by our friends as abandonment, and they would feel compelled to make concessions to the Communists even while pursuing a policy of neutralism. The need is for alternate positions which will protect us by dispersion and afford insurance against a situation developing in the present host countries that would lead us to a decision to withdraw. There are a number of good possibilities—The Bonins, the Marianas, Ulithi, North Borneo, Brunei, and Australia.

Planning Board Comment: Because of the increasing political and military vulnerability of our existing bases, alternative bases should be considered even though sizeable expenditures would be involved and many of the alternative bases might contain weaknesses similar to those in our present Far East defense perimeter. The Department of Defense is currently giving consideration to such alternatives.

Planning Board Recommendation: Accordingly, the Planning Board recommends that the National Security Council agree that:

Because of weaknesses in our present Far East defense perimeter and the increased threat inherent in Soviet missile achievements, the Department of Defense should continue to study the desirability and feasibility of alternatives to our present bases in the area as a means of increasing dispersal and establishing bases in the most politically reliable areas.

6. *Postwar Stockpile in Australia.*

Statement of the Issue (Report, p. 28): Because of her remote geographical position, consideration should be given to transferring to Australia a portion of our “moth-balled” merchant fleet, and to establishing stockpiles of surplus grain and other provisions there.

If, as seems likely, the aftermath of an atomic war involving Europe, Russia, and the United States would be characterized by acute shortages of food and transport, it would seem prudent to develop now a reserve stockpile of both in a place relatively secure from the immediate consequences of a global atomic conflict.

Planning Board Comment: In the preparation of NSC 5713/2, the Planning Board rejected last May a similar but broader idea. The stockpiling of food and a portion of our “moth-balled” fleet in Australia would be of only marginal value to the United States in the event of nuclear war and therefore not worth involving the expense and overcoming other difficulties in implementing the proposal.

The policy on continental defense (NSC 5802/1, paragraphs 3 and 23) recognizes the desirability of “appropriately organizing, protecting and placing in a condition of readiness the resources of the country essential to national survival”.

Planning Board Recommendation: Accordingly, the Planning Board recommends that the National Security Council agree that:

The United States should not [now]⁴ transfer to Australia a portion of our “moth-balled” merchant fleet or establish stockpiles of surplus grain and other provisions there. However, studies under NSC 5802/1, paragraphs 3 and 23, should be made on placing a portion of our “moth-balled” merchant fleet and stockpiling surplus grain and other provisions in areas outside the continental United States.

7. *The Organization of American States.*

Statement of the Issue (Report, p. 46): Greater use should be made of the OAS and its military organs to provide a collective security framework for U.S. bases in Latin America. In this connection, it is further recommended that early consideration be given to the desirability of bringing the now-developing West Indies Federation into the OAS.

While it does not seem practicable at this time to consider the adoption of an infrastructure program for the OAS (similar to that in NATO), nevertheless the establishment of a framework of hemispheric defense in place of the present framework of unilateral U.S. interests would do much to relieve the U.S. of such difficulties as those recently encountered with Brazil in securing a small area for use in the guided missile testing range, and those presently involved in the efforts to obtain from Panama a limited amount of real estate for radar facilities.

⁴State-Defense-JCS-ODM proposal. [Brackets and footnote are in the original.]

If the incorporation of the West Indies Federation into the OAS should be found impracticable, consideration might be given to the development of a Caribbean security grouping.

Planning Board Comment: The present organization (the Inter-American Defense Board operating within the framework of the OAS) is an adequate institutional framework. Any additional or more substantial collective security framework within the OAS would not be desirable from a U.S. point of view and would probably not be acceptable to the Latin American states. There is no reason to hope that the Latin American states would concede to an international organization the right to establish military bases in their territories. Further, it is improbable that Brazil, Panama, or any of the others would provide facilities to the OAS which they were unwilling to provide to the United States. Almost all of the Latin American states are unwilling to enlarge in any respect the obligations they assumed under the Rio Treaty. With respect to the entry of the West Indies Federation into the OAS, any independent American state may choose to join the organization.

Planning Board Recommendation: Accordingly, the Planning Board recommends that the National Security Council agree that:

Any additional or more substantial collective security framework for Latin America would, on balance, be infeasible and undesirable at this time. Consideration should be given to bringing the West Indies Federation into the OAS at an appropriate time.

8. Criminal Jurisdiction.

Statement of the Issue (Report, pp. 53, 58–60, 63): Except as may be specifically determined to the contrary by the Secretaries of State and Defense, U.S. forces should not in the future be stationed in peacetime on any additional foreign territory unless satisfactory arrangements on criminal jurisdiction—i.e., in substance the NATO Status of Forces Agreement as a minimum—have been made in advance. Where existing agreements fall below satisfactory standards in terms and practice, they should be renegotiated at the earliest practicable time. Where U.S. forces are now stationed on foreign territory without any status arrangements and host governments refuse to agree to such arrangements, U.S. forces should be withdrawn unless the Secretaries of State and Defense jointly determine that overriding national interest demands their continued presence. The Executive Branch should undertake an urgent, intensive, and continuous effort to inform and explain to the American people and its representatives in Congress the nature and facts of U.S. policy in regard to criminal jurisdiction.

The exercise of criminal jurisdiction over American servicemen abroad is a relatively new problem resulting from the peacetime stationing of large numbers of troops in friendly countries. The issue has not yet seriously affected U.S. military operations, Free World solidarity, or

other U.S. national objectives and policies, but potentially it contains the seeds of serious danger.

Planning Board Comment: In view of public concern and Congressional sensitivity on the exercise of criminal jurisdiction over servicemen by foreign courts, it is believed that the recommended position is the appropriate standard and that the national policy should be to achieve that standard wherever possible. [In those cases where this standard cannot be met, it is believed appropriate that the decision not to insist on the standard should be taken only at a high level.]⁵

Planning Board Recommendation: Accordingly, the Planning Board recommends that the National Security Council agree that:

The objective of the United States should be to obtain, where feasible, criminal jurisdiction arrangements, with all countries in which U.S. forces are stationed now or in the future, at least as favorable as those contained in the NATO Status of Forces Agreement. [U.S. forces should not be stationed on foreign territory unless protected by criminal jurisdiction arrangements at least equal in substance to the NATO Status of Forces Agreement, except on determination by the Secretaries of State and Defense that overriding national interest demands their presence notwithstanding the absence of satisfactory arrangements.]⁶

9. *Sharing Defense Responsibilities with Canada.*

Statement of the Issue (Report, p. 19): The United States should enable Canada to assume a growing share of the responsibilities for defending North America and the North Atlantic.

Although our base relationships are generally excellent, and Canada realizes how closely her existence is identified with that of the United States, both within and without NATO, there is a growing Canadian sensitivity and feeling of national destiny that will spell trouble for us if we do not take every step we can to give Canada a practical sense of equality with the United States, particularly in defense matters. Further, the manifold problems inherent in providing [*text not declassified*].

Planning Board Comment: The same general position is taken by existing policy on continental defense (NSC 5802/1). Although we have gone far in cooperating with Canada in the military field, [*text not declassified*]. However, the principal areas for improvement are the political and economic. Better cooperation is also required in non-military defense matters. There is at present no national security policy paper on Canada. There is a Joint (U.S.-Canada) Committee on Trade and Economic Affairs, made up of the U.S. Secretaries of State, Treasury, Commerce, and Agriculture, and their Canadian counterparts.

⁵ Defense-Treasury proposal. [Brackets and footnote are in the original.]

⁶ Defense-Treasury proposal. [Brackets and footnote are in the original.]

Planning Board Recommendation: Accordingly, the Planning Board recommends that the National Security Council agree that:

Majority Proposal

The Council on Foreign Economic Policy should be requested to study all possible means of improving U.S.-Canada economic relations, and to transmit to the National Security Council any recommendations requiring Presidential consideration.

ODM Proposal

The Planning Board should prepare, for consideration by the National Security Council, a draft policy paper on all aspects of our relations with Canada.

14. Memorandum of Conversation Between Dulles and Gruenther¹

Washington, February 19, 1958, 2 p.m.

We talked about Tunisia, Mutual Security, and so forth. Then I discussed the disarmament situation. I said I felt that it was essential that the disarmament work should be an integral part of the State Department activity and not operated independently. Disarmament involved too many political considerations, the future of NATO, the future of Germany, and so forth. Gruenther said he agreed. I further said that I was very sceptical about there being any reduction of armament purely as a matter of agreement. There might be reduction for domestic reasons or because some political issues were settled, but the disarmament problem was so complex, the balance so difficult to find, and enforcement so precarious, that I doubted that there could be reduction of armament purely as a result of reciprocal and balanced agreement. Nevertheless, I felt it was vital to continue to seek limitation of armament. I referred to the German attitude prior to World War I and the disastrous consequences to them of being regarded throughout the world as militaristic. General Gruenther indicated his general agreement with this point of view. I then indicated that I was thinking of handling the matter, perhaps through Wadsworth, as far as negotiation was concerned, and through the regular Departmental officers, but I did feel it necessary to have some qualified persons from outside who could serve as kind of an advisory panel to keep us moving and moving in sound directions, taking into account all

¹ Source: Possibility of establishing disarmament advisory board. Confidential; Personal and Private. 2 pp. Eisenhower Library, Dulles Papers. Drafted by Dulles.

relevant factors, including public relations. General Gruenther expressed the thought that perhaps some of our allies were making us carry too heavy a public relations burden by getting us to take positions which they wanted but which they were not willing to associate themselves with publicly, e.g. non-suspension of testing. I agreed. I asked General Gruenther whether he would be willing to serve on such a panel and he said that he would if I thought this could be reconciled with his being out of town a good deal of the time. I said I thought it could be. I mentioned General Bedell Smith, and he thought that he would be a good member, subject to the fact that he also was out of town a good deal of the time. General Gruenther suggested Arnold Wolfers as someone here whom he regarded as intelligent and knowledgeable and a student of the subject.

I spoke of Sprague but said I was a little bit concerned because he seemed to be emotional about certain aspects of the matter including shelters. General Gruenther said he had no knowledge of Robert Sprague but did not think we needed to worry much about the shelter program. He said he did not think it would ever take hold or be a popular or political problem. He did express regret that Senator Humphrey had attacked the Administration on the disarmament theme.

I thanked General Gruenther for his willingness to serve and said I would communicate with him later on.

JFD

15. NSC Report¹

NSC 5802/1

Washington, February 19, 1958

NOTE BY THE EXECUTIVE SECRETARY
to the
NATIONAL SECURITY COUNCIL
on
U.S. POLICY ON CONTINENTAL DEFENSE

REFERENCES

- A. NSC 5408
- B. NSC 5606
- C. NSC Actions Nos. 1574, 1781, 1814, 1815, 1841 and 1842

D. Executive Order No. 10173

E. NSC 5802

F. NSC Action No. 1862

The National Security Council, the Acting Secretary of the Treasury, the Attorney General, the Acting Director, Bureau of the Budget, the Chairman, Atomic Energy Commission, and the Federal Civil Defense Administrator, at the 355th Council meeting on February 13, 1958, adopted the statement of policy contained in NSC 5802, subject to the amendments thereto set forth in NSC Action No. 1862–*b*.

In adopting the statement of policy in NSC 5802, the Council also (NSC Action No. 1862–*c*, –*d*, –*e*, –*f*, and –*g*):

c. Agreed that the statement of policy in NSC 5802, as finally adopted and approved, is intended to supersede NSC 5408; but is not intended, of itself, to cancel or change any program set forth in NSC 5408, each of which programs should be reviewed by the responsible departments and agencies in accordance with paragraph 1–*b* of NSC 5802.

d. Recommended that the responsible agencies should use, on a continuing basis, available passive devices for the detection of fissionable material, pursuant to paragraph 14 of NSC 5802.

e. Noted that the Department of State would undertake to examine and report at the next Council meeting, on whether, if there were substantial evidence that any shipment entering the United States under diplomatic immunity contained radioactive material, the Department should advise the diplomatic representatives of the country concerned that the shipment would be opened by U.S. officials, in the presence of representatives of such country, to determine the nature of the radioactive material.

f. Requested the Departments of the Treasury and Justice, in view of the decision in *Parker v. Lester*:

(1) To draft an Executive Order, to supersede Executive Order No. 10173, which will enable Federal authorities to take the most effective action possible in the circumstances to deny access to U.S. merchant vessels, ports, and waterfront facilities on the part of individuals considered inimical to the security of the United States.

(2) To draft proposed legislation, which would enable Federal authorities to take more effective action in this area, for consideration for submission at this session of the Congress.

g. Requested the Department of the Treasury to prepare for Presidential approval the programs to implement all aspects of paragraph 19 of NSC 5802; such draft to include (1) instructions taking into account the new Executive Order referred to in *f*–(1) above and (2) appropriate provisions along the lines of those stated in NSC Action No. 1781 (which related U.S. policy toward Poland to the port security provisions of NSC 5408).

The President has this date approved the statement of policy in NSC 5802 as amended, adopted, and enclosed herewith as NSC 5802/1; directs its implementation by all appropriate Executive departments

and agencies of the U.S. Government; and directs that the departments and agencies indicated in the table on “Primary Responsibilities for Implementation” (with the exception of the Department of State and the Central Intelligence Agency) report, in a special annex to their respective annual status reports, on progress in implementing the appropriate paragraphs of NSC 5802/1.

James S. Lay, Jr.
Executive Secretary

- cc: The Secretary of the Treasury
The Attorney General
The Director, Bureau of the Budget
The Chairman, Atomic Energy Commission
The Federal Civil Defense Administrator
The Chairman; JCS
The Director of Central Intelligence
The Chairman, IIC—The Chairman, ICIS

CONTINENTAL DEFENSE
PRIMARY RESPONSIBILITIES FOR IMPLEMENTATION

<i>Paragraph and Subject</i>	<i>Primary Responsibility</i>
5—International Collaboration	State in collaboration with Defense
6—Strategic Warning (1st two sentences)	Intelligence agencies under DCI coordination within existing law and established policy
(Last sentence)	All appropriate agencies
7—Tactical Warning	Defense
8—Active Defense	Defense
9—Passive Defense of Retaliatory Capability	Defense
10—Improvement of Alert Status of Air Defense Forces	Defense
11—Emergency Employment of Military Resources in Civil Defense	Defense in collaboration with FCD
12—Research and Development	All appropriate agencies
13–18—Internal Security	IIC and ICIS coordination
19—Port Security	Treasury, keeping IIC and ICIS fully informed

<i>Paragraph and Subject</i>	<i>Primary Responsibility</i>
20—Continuity of Government	ODM in collaboration with all participating agencies
21—Protection and Dispersal of Federal Facilities	ODM in collaboration with all participating agencies
22—Continuity of Industry	ODM
23—Stockpiling of Civilian Survival Items	ODM in collaboration with FCDA
24–27—Civil Defense	FCDA

STATEMENT
of
U.S. POLICY ON CONTINENTAL DEFENSE

SCOPE

1. This statement of policy on “continental defense” does not encompass all elements of U.S. or allied strength contributing to the defense of North America, but is limited as follows:

a. Only those U.S. policies are included which are essentially defensive in nature, i.e., which contribute directly to the defense of the North American Continent and to the protection of that element of our retaliatory capability based on the North American Continent.

b. This statement of policy does not include programs. The omission from this statement of programs does not of itself cancel or change any program set forth in NSC 5408. However, the responsible agencies should review such programs in the light of this policy statement to determine whether such programs are currently valid or should be cancelled or changed.

RELATIVE EMPHASIS

2. The defense of the United States is an integrated complex of offensive and defensive elements and of military and non-military measures. Each of these has its proper role in deterring an attack or in the defense of the United States should an attack occur. Predominant emphasis should continue to be placed upon measures to strengthen our effective nuclear retaliatory power as a deterrent and to improve our active defenses, as compared with—but not to the exclusion of—passive defense measures. Particular emphasis should be accorded those active and passive defense measures essential to the protection of the U.S. capability for prompt nuclear retaliation. An effective North American continental defense system will constitute one of the key deterrents to an attack on the North American Continent.

OBJECTIVES

3. The United States should be prepared at all times to counter an attack on the North American Continent in such a way as to deter Soviet attack or, if an attack occurs, to insure our survival as a free nation.

a. Such preparation requires that the United States achieve and maintain, in collaboration with Canada and other Free World nations, a continental defense readiness and capability which will protect and permit the launching of our nuclear retaliatory forces, even in the event of surprise attack.

b. Such preparation should:

- (1) Provide warning to alert the nation to impending attack.
- (2) Counter enemy subversive and clandestine efforts.
- (3) Prevent the threat of nuclear destruction from unduly restricting U.S. freedom of action or weakening national morale.
- (4) Maintain adaptability to make timely changes as technology permits and as the nature of the threat changes.

(5) Provide appropriate measures of protection for the civil population.

c. Such preparation should include appropriately organizing, protecting and placing in a condition of readiness the resources of the country essential to national survival.

TIME-PHASING

4. The time-phasing of U.S. "continental defense" measures should take into account the threat posed by the present nuclear megaton attack capability of the USSR and by anticipated future improvements in Soviet weapons and delivery capabilities, particularly the achievement of a significant ICBM capability.² Effective continental defense requires that the United States should be constantly on guard against "technological surprise" and should continually strive for technological superiority.

INTERNATIONAL COLLABORATION AND COORDINATION

5. Continental defense requires close collaboration with certain allies; in particular, Canadian agreement and participation remain essential to effective continental defense. Efforts should also be continued to achieve more effective collaboration with Mexico and Iceland.

² SNIE 11-10-57, "The Soviet ICBM Program", December 17, 1957, estimates that the USSR will probably have an operational capability with up to 10 prototype ICBM's, capable of carrying high-yield nuclear warheads, during the period mid-1958 to mid-1959; and could have 100 operational ICBM's about one year after its first operational capability date (i.e., mid-1959 to mid-1960), and 500 ICBM's about two, or at most three, years after first operational capability date (i.e., mid-1960 to mid-1962). It is estimated that the first 100 to 200 Soviet ICBM's would have a fifty per cent system reliability and that succeeding weapons would have a system reliability up to seventy per cent. [Footnote is in the original.]

STRATEGIC WARNING

6. As achievable tactical warning time decreases, it becomes increasingly important to obtain strategic warning of Soviet Bloc attack against the United States. Even if some risks have to be taken, vigorous efforts should be made, including the development of new techniques, to collect and accurately evaluate indications of hostile intentions that would give maximum prior strategic warning of hostile action against the United States. Because it cannot be concluded that the United States surely will, or surely will not, have strategic warning of attack, U.S. planning should take account of both possibilities.

TACTICAL WARNING AGAINST AIRCRAFT AND MISSILES

7. Tactical warning of an impending attack, including very high- and very low-level altitude detection and sea surveillance, should be provided to assure adequate time for counter-offensive forces to initiate action, for defense forces to achieve alert readiness, and for civil defense, internal security and other non-military measures to be effectively implemented. To this end:

a. Our early warning radar network and its seaward extensions should be improved.

b. Weaknesses in identification techniques should be remedied.

c. An effective early warning radar system against ICBM's should be developed and brought into operation as an integral part of the air defense system, as a matter of the highest national priority.

ACTIVE DEFENSE AGAINST AIRCRAFT AND MISSILES

8. The United States should continue to improve, and to maintain at a high state of readiness, an effective, integrated system of air surveillance, weapons, and control elements, providing defense in depth capable of detecting, identifying, engaging, and destroying enemy aircraft or missiles approaching or operating over the North American Continent before they reach vital targets.

a. *Defense against Bomber and Non-Ballistic Missile Attack.* Such a defense in depth should include interceptor and fighter aircraft and air defense missiles. In addition to primary air defense forces, all other forces with an air defense capability which can be made temporarily available should be made immediately available and employed as required within this system in the event of attack or the threat of immediate attack.

b. *Defense against ICBM Attack.* In view of continued USSR advances in ballistic missile development, the United States should develop an anti-ICBM weapon system as a matter of the highest national priority.

c. *Defense against the Threat of Missile Attack Launched from Ocean Areas.* In order to meet the threat of missiles launched from ocean areas, the United States should develop and maintain at a high state of readiness integrated sea surveillance systems which will provide for detection and tracking of surface ships and submarines operating within

missile-launching range of the North American Continent; and should improve its defense against submarine-launched missiles and its anti-submarine capability.

PASSIVE DEFENSE OF RETALIATORY CAPABILITY

9. Passive measures, such as dispersal, reduction of reaction time, and protection of essential facilities, should be taken to minimize the vulnerability of U.S. retaliatory striking forces.

IMPROVEMENT OF ALERT STATUS OF AIRCRAFT AND MISSILES OF AIR DEFENSE FORCES

10. The United States should continue to improve and maintain the alert status of its primary air defense forces, and cooperate in improvement of Canadian primary air defense forces, so as to provide an immediate reaction to warning of an enemy attack. Passive defense measures, such as dispersal and protection of essential facilities, should be taken to minimize the vulnerability of air defense forces.

EMERGENCY EMPLOYMENT OF MILITARY RESOURCES IN CIVIL DEFENSE

11. In the event of attack on the United States, the active defense of the United States and the U.S. nuclear counter-offensive will be the paramount and most immediate tasks of certain U.S. forces. Additionally, certain other forces will be immediately involved in support of these defense and counter-offensive forces. Forces not required in the execution of essential military missions should be prepared to assist civil authorities, for a temporary period, in maintaining law and order and in other essential civilian tasks.

RESEARCH AND DEVELOPMENT

12. A vigorous research and development program should be maintained in order to develop new weapons and needed improvements in the continental defense system and to counter improving Soviet technological capabilities for attack against the United States. Of particular importance are the following (without indication of priority):

- a.* Early warning capability against enemy aircraft and non-ballistic missiles, by radar and other techniques.
- b.* Detection and defense against very high- and very low-level attacks.
- c.* Reduction of vulnerability to electronic countermeasures.
- d.* Submarine detection, identification, and defense against submarines and submarine-launched missiles.
- e.* Early warning capability against ICBM's, by radar and other techniques.
- f.* Active defenses against ICBM's.
- g.* Defense against satellites and space vehicles.

INTERNAL SECURITY

13. The Soviet Bloc should be confronted with internal security measures presenting such risks as will serve as a deterrent to covert attack against the United States.

14. In particular, the United States should, to the extent practicable, increase safeguards so as to provide adequate deterrents (a) to clandestine introduction of nuclear weapons by any means such as submarines, small craft, merchant vessels, aircraft, illegal entries of persons and things, and diplomatic channels; and (b) to utilization of such weapons against vital targets. Intensive efforts should be continued to develop active and improved passive devices for the detection of fissionable material introduced by such means, and to assure their effective use.

15. Measures should be taken to protect U.S. aircraft and airports, as appropriate, against sabotage, espionage, and other subversive activities, and to provide appropriate safeguards relative to the operations within the continental United States of Soviet Bloc airlines.

16. Selected industrial and governmental facilities of a highly critical nature should be protected against espionage and clandestine attack by nuclear, chemical, and biological weapons and conventional sabotage.

17. Selective counterintelligence coverage should be maintained of foreign diplomatic and official personnel suspected of engaging in activities beyond the scope of their normal diplomatic assignments.

18. Plans for the detention in the event of emergency of persons potentially dangerous to the United States should be maintained in a high state of readiness.

*Port Security*³

19. Measures should be taken (a) to protect U.S. ports and vessels therein against sabotage, espionage, and other subversive activities, (b) to supervise and where appropriate deny entry of vessels, and (c) to provide appropriate safeguards relative to the presence in U.S. ports of Sino-Soviet Bloc vessels. In so far as feasible, having due regard for legal procedures and rights, subversives should be excluded from vessels and waterfront facilities.⁴

³ Certain measures under this heading are supplemental to those contained under the previous heading, "INTERNAL SECURITY". [Footnote is in the original.]

⁴ Experience has shown that only a very small percentage of the persons believed to be subversives can be excluded under procedures acceptable to the courts. [Footnote is in the original.]

CONTINUITY OF ESSENTIAL WARTIME FUNCTIONS OF THE FEDERAL GOVERNMENT

20. Plans and relocation facilities needed to ensure the continuity of essential wartime functions of the Federal Government should be completed and maintained in a state of operational readiness at the earliest time practicable.

a. Plans should provide a ready and certain system of attack warning, reaction and decision-making, with adequate communications and provision for conducting emergency operations.

b. Emergency Federal relocation facilities should be equipped as required to permit immediate activation upon arrival of relocated personnel, and should be continuously staffed as determined by the President.

c. The few most critical emergency Federal relocation facilities should be protected against blast, thermal and radiation effects at the earliest time practicable. Other Federal relocation facilities in "the Federal arc"⁵ should be protected against fallout.

PROTECTION AND DISPERSAL OF FEDERAL FACILITIES

21. *a.* Except as otherwise determined by proper authority, new Federal facilities and major expansion of existing Federal facilities, important to national security, should not be located in target areas. The location of new or expanded military installations, excluding the Pentagon and other similar administrative headquarters, shall be within the sole discretion of the Secretary of Defense.

b. Fallout shelter should be incorporated in the construction of new Federal civilian buildings, of suitable size, designed after this date, along the lines stated in NSC 5807/1.

CONTINUITY OF INDUSTRY

22. *a.* (1) Dispersal of private industrial facilities, and the inclusion of fallout shelter therein, as appropriate, should be encouraged.

(2) Guidance and leadership should be provided to industries essential to initial recovery from nuclear attack in the development of plans and programs designed to insure the continuity of essential production and services.

b. Action should be taken to determine the critical industries (such as drug, liquid fuel) in which construction of hardened, dispersed plants is essential to insure national survival.

⁵ Relocation sites are located in dispersed sectors within a westerly arc approximately 30–300 miles radial distance from Washington, D.C., zero milestone. [Footnote is in the original.]

STOCKPILING OF CIVILIAN SURVIVAL ITEMS

23. Civilian items essential to initial recovery from nuclear attack should be identified, minimum requirements determined, and industrial inventories located and related to Government and State stocks. Where total availabilities appear inadequate, measures should be developed to meet minimum requirements with the least disruption of the economy, the least cost to the Government, and maximum encouragement of private participation.

CIVIL DEFENSE

24. An essential ingredient of our domestic strength is improved and strengthened civil defense which seeks, by both preventive and ameliorative measures, to minimize damage from nuclear attack and to contribute to deterring such attack.

25. In order that Federal, State and local governments may carry out their essential responsibilities during and after nuclear attack or other grave emergency, the capability of State and local governments to function effectively should be strengthened by Federal assistance in the form of guidance, direction and resources. Such assistance should include pre-attack planning for the use of local resources and, as provided in paragraph 11 hereof, of military forces not required in the execution of essential military missions.

26. Civil defense policy for protection of the civil population in case of nuclear attack, while continuing to include local planning for the emergency dispersal of urban populations on attack warning, incorporates the concept of fallout shelter in accordance with NSC 5807/1.

27. The United States should continue its present policy of supporting activities which will:

a. Warn the people of impending attack and make possible essential communication before, during and after attack.

b. Give emphasis to the protection (including dispersal where necessary) of essential civilian survival supplies, equipment and facilities.

c. Provide for a continuing effort in research and development of civilian measures in radiological defense, defense against chemical and biological warfare, mass communications, medical care, survival requirements, and other survival measures.

d. Provide appropriate and adequate information to the public of the nature and extent of the dangers from nuclear attack on the United States now and in the future, and of the measures being taken or which could be taken to alleviate them.

16. Memorandum of Conference with the President¹

Washington, February 25, 1958

OTHERS PRESENT

Dr. Killian
Admiral Strauss
General Goodpaster

Dr. Killian reported on an unexpected effect anticipated from exploding nuclear weapons at very high altitude. An “electron capture” phenomenon is anticipated which might have major effects on communication and radar. There was discussion of the possibilities in relation to “blanking out” of radars of certain wavelength.

The significance of this discovery to the shot planned for 250,000 feet altitude during the weapons tests this year was also discussed.

ESTIMATE

I. INTRODUCTION

1. The year 1957 saw some improvement in the world position of the USSR, and some setbacks to the US; the two movements together were great enough to constitute a significant—though not necessarily a continuing—trend in world power relationships. Sino-Soviet bloc influence continued to rise in parts of Asia and the Middle East, largely as a result of mounting respect for the power and policies of the two principal Communist powers. The USSR became increasingly regarded in certain underdeveloped and uncommitted countries as a new political champion and example of progress. Remarkable Soviet scientific achievements—coupled with widely publicized initial US failures with the earth satellite—caused US power, leadership, and guarantees to be subjected to close scrutiny. US policies were more closely questioned and more often challenged, and doubts were expressed as to the wisdom of relying so heavily on US protection in the future.

2. A year ago² it was clear, as evidenced by the Suez affair, that the Western alliance system was under great strain and that the USSR was making inroads in areas of the world where previously its political assets were minimal. These developments, serious though they were, seemed less grave than they do at present, because the Soviet bloc itself was suffering severe strains. The exposé and repudiation of Stalinist terrorism created unrest in the USSR and in the European satellites, and shocked many Communists in Western countries. The change of regime in Poland and the uprising in Hungary added to Soviet difficulties. The Communist world, in the aggregate, appeared to have weakened.

3. However, during 1957 the Soviet Union regained much of its lost ground. Control was restored in Eastern Europe, and the entire Soviet bloc took on an appearance of more unity and strength, dramatized at the 40th anniversary celebrations in Moscow during November. The USSR's achievements and its comparatively unruffled emergence from major changes within its leadership have contributed to an air of recovery and self-confidence.

4. It was not in re-establishing the equilibrium of the bloc, however, that the USSR made its most formidable gains. The principal developments of 1957 were the Soviet demonstration of scientific achievement in the field of rocketry, and the extraordinary impact which this demonstration made on the world. In underdeveloped and backward countries, for example, the Soviet accomplishment was widely acclaimed as proof of the intellectual, economic, and military progress which the USSR—itself so recently an underdeveloped country—had made. Throughout the world during the year 1957 the prestige of the USSR was enhanced.

5. The prospective Soviet achievement of an ICBM capability has brought into the minds of statesmen and peoples, for the first time, a general sense of US vulnerability to Soviet attack, and consequently a sense that a major change in the world military situation is impending. It is now generally believed that the USSR will, during the next year or two rather than at some time in the distant future, be able to inflict instant and crippling damage on North America, with a consequent deterrent power as effective as that which the US has exercised. The implications of this development are not yet fully understood, but there is some belief—mixed with hope—that a general war will be rendered less likely by the mutual capacity of the two great powers to destroy each other. Corollary to this belief in the existence of a condition of mutual deterrence is a strengthened conviction in the free world that,

² See NIE 100-3-57, Estimate of the World Situation," 29 January 1957. [Footnote is in the original.]

while it is vital not to allow the USSR to attain military superiority, it will not be possible to prevent a further expansion of Soviet influence simply by strengthening the free world militarily.

6. Under the cover of this condition of mutual deterrence, the USSR apparently intends to wage against the US a vigorous contest for world leadership. This contest, already under way, is taking place against a background of accelerated social and economic revolutions in many parts of the world. Both sides possess many assets capable of exploitation, and the contest seems likely to go on for many years. In the following paragraphs we discuss the changes which have occurred and the basic forces and attitudes with which the US must contend.

II. CHANGES IN THE WORLD SITUATION

A. *The Strategic Situation*

7. The leaders of all the nations in the West have long been aware of the fact that the USSR had some capability to strike the US with nuclear weapons. They have also realized that the time would come when the USSR, through its growing nuclear weapons stockpile and as a consequence of its development of long-range aircraft and ballistic missiles, would develop the capability—barring some revolutionary development in defensive arms—to inflict critical damage upon the US. Heretofore Western statesmen and Western peoples have thought of this largely in terms of some vague future date, and many of them hoped that somehow something would intervene which would prevent this prospect from materializing or from becoming unmanageable if it did. Now, as a consequence of recent Soviet developments in the missile field, the general public has had dramatically brought home to it a realization that the USSR will be able, within the next year or two, to bring the US under direct nuclear attack with ballistic missiles.

8. Since the end of World War II, US military capabilities, and particularly the capability to deliver nuclear weapons on the USSR, together with US assurances and US demonstrations of its intention to protect victims of aggression, have created some sense of security among peoples who feared Communist internal or external aggression. What made US actions and assurances persuasive to these peoples was a conviction of US superiority over the USSR in nuclear weapons and delivery capabilities and a belief that the vital centers of North America (including its retaliatory capability) were relatively safe from severely damaging Soviet attack.

9. To many observers Soviet progress in ballistic missiles appears not merely as a gradual improvement in military capabilities but as the portent of a new military situation. They foresee a situation in which the US—although it will retain the power to deliver nuclear weapons on the USSR if the latter engages in political or military aggression—will

become increasingly inhibited from doing so because of the knowledge that the USSR could reply in kind. Thus, some of the nations now under US protection fear that the US will no longer be willing to threaten nuclear retaliation in order to deter Soviet pressure or Soviet action in matters of vital concern to them. They also fear that, even if the US did attempt to make such a threat clear to the Soviets, the latter would not necessarily believe it. One special and immediate stimulus for these fears is the belief, recently induced, that the US will not achieve an effective ICBM capability until a year and a half or more after the USSR has done so. This fear is not wholly offset by recognition of the deterrent effect of IRBMs on African and European bases.

10. This is not to say that US nuclear capabilities have ceased to have deterrent effect on the actions of the Sino-Soviet bloc. We think, and we believe that most of the free world also thinks, that Soviet respect for US nuclear power will continue and that the Soviet leaders will not pursue courses of action which in their judgment seriously risk general war. Indeed they appear to believe that much safer methods will yield sufficiently profitable results. Yet even comparatively "peaceful" methods of Communist aggrandizement lead from time to time to sharp international crises, in which the relationships of military power are likely to be all-important. As the USSR through the development of advanced weapons systems enlarges its capability to inflict major nuclear devastation upon the US, the Soviet leaders will judge that the US will risk such devastation only for the gravest reasons and that the scope of the actions which the USSR can take without serious risk of general war is somewhat expanded.

11. In this situation, many leaders of the free world are increasingly concerned with the problem of deterring minor thrusts and local aggressions, and believe that it is necessary to develop a capacity to deal with them by means short of a full counteroffensive. This involves difficult decisions. No one can be certain about how to mix and to balance nuclear and non-nuclear forces in order to gain the widest deterrent effect, or how best to prevent limited engagements and local quarrels from expanding into major war. In any case, implementing any new decisions regarding force structure, weapons, and deployment would be extremely costly, and no one could be reasonably satisfied that these decisions, once made and implemented, would not need comprehensive and costly revision at an early date. In considering how to deal with this new situation, there is much confusion and hesitation throughout the free world—as indeed there must be in the USSR.

B. Soviet Progress and Policy

12. Even before their publicized successes in the scientific field, the Soviet leaders were pursuing a policy marked by greater flexibility

and innovation than in the days of Stalin. They have sought, through a less hostile posture, to dispel the image of aggressive Soviet intentions. They no longer display Stalin's tendency to regard as hostile everyone not subservient to the USSR, and they have seized upon the aspirations and needs of the emergent Asian and African countries to undermine Western influence and to expand their own. They appear to be acting on the assumption that it is more profitable to pursue a course of "peaceful competition" with the West, and particularly to exploit weak points in the free world by diplomatic, economic, and subversive methods, than to attempt to follow the dangerous course of territorial expansion by military means.

13. The Soviet leaders, after several years of this policy, probably look upon their present position as quite favorable. They probably attribute this in part to their improved military capabilities, but primarily to the developing world situation and to their own skill in manipulating existing opportunities and issues—especially in extending economic aid to selected countries, exploiting world desires for disarmament, supporting nationalist causes in Asia and Africa, and expanding diplomatic, cultural, and commercial relations throughout the world.

14. In addition to its obvious bearing on their military capabilities, recognition of continuing Soviet scientific and economic progress has greatly advanced the Soviet political position, both directly and through its psychological impact. In mathematics and the physical sciences, including nuclear research and its applications, the USSR has amply demonstrated its high degree of skill; in other scientific fields it is making rapid progress. The output of scientifically-trained personnel already exceeds that of the US and the gap appears to be widening. Moreover, because of extensive governmental control over the use of manpower and resources, the USSR is able to concentrate its scientific personnel on activities directly concerned with foreign and military policy objectives.

15. Soviet economic progress has been continuing at a rapid pace. Soviet gross national product has recently been growing nearly twice as fast as that of the US. Currently Soviet GNP is about 40 percent that of the US, but consumption in the USSR is only at about 25 percent of US levels. The USSR—by restricting consumption and concentrating on priority objectives—is already even with the US in one or two important areas of production and is rapidly approaching equality in some others. The USSR allocates its resources in such a way that, in terms of resources available for national policy, i.e., for research, defense, industrial investment, and foreign aid, its aggregate effort already approaches that of the US. Soviet defense expenditures in recent years, when converted into dollar values, appear to be of roughly the same

magnitude as US defense expenditures, and annual Soviet industrial investment is presently about 85 percent that of the US.

16. Although the Soviet rate of economic growth is slowing down somewhat, we believe that it will continue to be faster than that of the US, and will enable the USSR to achieve along with other economic and military programs some modest gains in consumption at home. These gains will be tangible, though they will not satisfy consumer expectations, particularly in view of the continued housing shortage. While rapid advance on all these fronts at a time of reorganization, experimentation, and labor problems will cause difficulties, the size and shape of the Soviet economy is such that—even though less than half that of the US in terms of GNP—it will be possible for the USSR to utilize it extensively to advance its political and diplomatic objectives.

17. In these circumstances, the USSR has a wide range of policy choices open to it. Because of its increased military strength, it is in an improved position to engage in threats and blackmail, and it can negotiate from a stronger position than in the past. Alternatively—or even at the same time—it can soft-pedal such policies and proceed with the less dramatic business of gaining influence and prestige through diplomacy, cultural exchanges, expansion of foreign trade, grants of economic assistance, propaganda, and subversion. We do not believe that the Soviet leaders have made a decision to follow any particular line to the exclusion of others. Their entire approach has been too pragmatic and flexible to justify clear prediction. We believe that they will keep open the possibilities of negotiation on virtually every issue in the hope that they will gain something by negotiation that would not be attainable so quickly by other means. We believe they will press vigorously their campaign to gain influence in underdeveloped areas by political, economic, and diplomatic means. On the whole, we believe that the Soviet leaders will seek to avoid policies which they believe would clearly lead to serious risk of general war.

18. Nevertheless, the Soviet leaders probably believe that they can pursue bolder policies than in the past without a corresponding increase in risk. As time goes on, they might again utilize war-by-proxy to gain local objectives, particularly in situations where they calculated that the US or its allies would be unlikely to use nuclear weapons to defend their position. They almost certainly foresee that crises will develop from time to time as a consequence of Western resistance to the expansion of Soviet influence. In these situations we expect the Soviet leaders to be firm—and occasionally bellicose.

C. Psychological Impact of Soviet and US Policies

19. As a result of Soviet scientific achievements, some of the world's ideas about the US were shaken. There is now doubt in many quarters

that the US can produce anything it wants better and faster than anyone else. To the discovery that the USSR, too, is highly advanced industrially, the Soviets have sought to add another element: the belief that the USSR is more interested than the US in the independence, development, and security of the newer nations of the world. The USSR has also, and with some success, continued to attempt to establish itself as the symbol and proponent of change, movement, progress and development. The US, on the other hand, tends to be regarded, particularly among some of the newer nations, as standing for slow and cautious amelioration or as defending what they regard as the evils of the past.

20. The US, of course, possesses great moral, material, and political assets. For many people throughout the world, it continues to represent the most important force standing for political freedom and constitutional government. It is widely admired for its achievement in using its rich natural environment in the creation of an advanced industrial society and spreading the benefits among all classes of people. Other nations seek to benefit from US technical experience and economic resources. Many present and potential leaders in underdeveloped countries have been profoundly influenced by American institutions and ideas. Wherever people favor moderate, as opposed to extreme solutions, US objectives are highly regarded—even where US methods and actions are criticized.

21. Nevertheless, during the past several years the USSR has appealed more successfully than the US to the emotional needs of many of the earth's peoples. It has gained more credit for advocating the cause of disarmament; it has become more closely identified with the interests of the colored peoples; it has more consistently supported Afro-Asian nationalism against colonial rule; finally, well-advertised Soviet and Chinese Communist economic progress since the end of World War II has appeared as a demonstration of the effectiveness of "socialist" methods.

22. In many respects it has been less difficult for the USSR and Communist China to raise themselves in world opinion than it has been for the US to retain or advance its position. A higher standard of behavior for the US has been set in men's minds nearly everywhere; because we are richer, we are expected to be more forthcoming with aid; because we threw off colonial rule, we are expected to give indiscriminating support to nationalist causes. Moreover, our shortcomings are—because of our democratic processes, freedom of speech and the press—more obvious to the world. We cannot with the same ease as our competitors hide our race problems, adjust our trade policies to our foreign policy objectives, or commit ourselves in foreign policy without regard to competing domestic and foreign interests. Unfortunately, some of our most cherished traditions—our regard for

the rule of law, our desire not to offend our old friends, and even our high regard for human life—are often regarded as unrealistic in those countries where the struggle for existence and the social tradition do not encourage such attitudes.

23. While the educated classes almost everywhere have some familiarity with the Western tradition, many of them resent the high level of American consumption and deplore what they see as a US preoccupation with military security. Although not necessarily pro-Communist, and often opposed to Communism, they join many past critics in looking upon US policy as too inflexible and moralistic, and too exclusively concerned with the struggle against Communism. Thus, despite the intellectual and realistic justification of US policy, the simple formulas proposed by the USSR—European zonal demilitarization, a ban on nuclear tests and on the use of nuclear weapons, industrialization, anti-colonialism, peace, and so on—often have a greater appeal even when they are little better than slogans.

24. As a consequence, the Communist states are gaining ground as advocates of peace and social progress, while the US is increasingly accused of indifference to these causes. Whether these images of the Communist states and of the US grow more firm depends largely upon the interplay of US and Soviet policies in the years to come. The Soviet leaders are doing all they can to sharpen these images wherever the US and the USSR confront each other in both the developed and the under-developed areas of the world.

III. KEY AREAS OF US-SOVIET COMPETITION

A. Cohesiveness of Power Groupings

25. Although the nations of the world may be divided, for purposes of analysis, into three main groups—the Sino-Soviet bloc, the Western alliance system, and the uncommitted areas—we must recognize that the boundaries between these three are indistinct and changeable. Some allies are closer allies than others, some countries are less uncommitted than others, and there is frequently considerable ebb and flow in the positions and strength of individual states or regional associations. Moreover, both the USSR and the US are engaged in efforts to break existing ties in the other camp and to prevent new accretions to it.

26. *The Sino-Soviet bloc.* The solidarity of the bloc rests primarily upon the military power of the USSR and upon a strong identity of interests and ideology among the various ruling groups—the latter consideration applies especially to Communist China. Since the death of Stalin, there has been a trend toward redefinition of relationships. Moscow's monopoly of Communist thought and power has been diminished by Yugoslavia's maintenance of an independent position,

by the emergence of a semi-independent Poland, and by the growing power and influence of Communist China.

27. These changing relations have created problems for Moscow. They have released forces of instability in Eastern Europe and in satellite relations with the USSR. They have added to Peiping's stature and given the Chinese Communists a greater latitude for independent action, especially in the Far East. But they have also created the appearance of a more flexible and less monolithic group of states with which other states might think they could associate themselves without wholly losing national independence.

28. Recent Soviet successes in pulling together the Communist world have not resolved the problem, but they have stabilized a situation which for a time threatened to become disastrous. A full return to Stalinist police-state methods and enforced conformity would not only be difficult, but would be inconsistent with the more flexible approach which dominates present Soviet policy. The Soviet leaders apparently believe that they can gradually and judiciously accede to the national sensitivities of their bloc partners and still retain sufficient authority and influence to preserve Communist solidarity.

29. We see little chance that during the next several years, short of major changes within the Soviet regime itself, any of the Communist states will alienate themselves from the USSR to an extent which would damage the Soviet world position. Indeed, if the USSR grants some greater autonomy for Communist states, this might even add to Soviet stature by contributing to the Soviet pose of flexibility and respect for national aspirations. Nevertheless, we cannot overlook the possibility that some popular uprisings, perhaps on a local scale, might occur.

30. *The Western alliance system.* This system, consisting essentially of a group of multilateral and bilateral arrangements built around the US and UK, was developed largely upon three basic propositions: (a) that there was a danger of Soviet bloc external and internal aggression, (b) that alliance with the US was an effective way to deter, or if necessary to counter, such aggression, and (c) that because of Soviet bloc intransigence and determination, there was no acceptable alternative to creation of a counter-bloc. We believe that the fundamental validity of the three propositions is still generally accepted, but that the force and impact of each of them has diminished since the alliances were created. Thus, while the possibility of Soviet bloc military aggression continues to be recognized, such aggression has for some time appeared to most of the NATO partners to be much less imminent than when NATO was formed. Accordingly, NATO has lost much of the impetus which was initially supplied by an urgent sense of immediate danger, though it is still valued by its members as the chief counterbalance to bloc military power.

31. The second proposition has been weakened more recently by the developments mentioned in paragraph 9 above, relating to new weapons and the growth of the Soviet deterrent. Among our allies there is a declining confidence in the deterrent effect of US military power. This doubt has produced two contradictory results; one is a desire to knit the alliances more closely together and the other a desire to achieve greater independence from US policy. In support of the view that alliances with the US should be tightened are a variety of important considerations: the inescapable fact that the US and its allies have a common interest in preventing Soviet aggression, the mutual importance of each other's territories in maintaining and further developing deterrent and defensive military power, doubt that any one nation or even a regional grouping independently could create an adequate deterrent or defensive capability, and the gains to be achieved through sharing costs and responsibilities.

32. On the other hand, some influential political groups in allied countries see dangers in developing a closer association with the US. Some of them in particular are concerned over their inability to influence US policy, and they fear that their national interests will increasingly come under US control, that they will be unable to take independent action to support their own interests, and that they will be unable to disassociate themselves from the US when the US takes action in its own interests.

33. Finally, in its recent diplomatic offensive the USSR has encouraged an element of doubt respecting the third proposition which originally underlay the alliances: that there was no acceptable alternative to the creation of a counter-bloc. Through a variety of formal and informal proposals—such as the Soviet disarmament schemes, the ideas of a European security pact and of nuclear-free zones—and through other suggestions contained in the various Bulganin letters, the USSR has appeared to be offering an alternative worth consideration. The Soviet leaders apparently hope that some of these suggestions will produce political rifts within allied countries and reduce allied ties with the US, especially in Europe.

34. Some of these Soviet suggestions have struck a responsive chord, even in moderate Western European opinion. At the moment, public interest in talks with the USSR is still at a high point. This European responsiveness is partly the result of anticipated changes in the military situation and of lessened confidence in US power and US leadership, but primarily the result of a growing conviction that Western Europe's only hope of survival is to explore fully and patiently every possible opportunity for living at peace with the USSR. At the moment the strongest forces favoring negotiations with the USSR are political parties, predominantly socialist, who do not now exercise

effective political power. But these parties, even when out of power, exercise a strong influence upon their governments, and some of them may gain power, or come to share more effectively in it, during the next three to five years. We believe this pressure will continue and that it will eventuate in high-level talks with the USSR. However, we also believe that most European leaders do not expect significant results from such talks, since they see no indication that either side is prepared to make substantial concessions.

35. On balance, we believe that the potentially disruptive forces within the Western alliance system have been stimulated more than the cohesive forces by the recent changes in the world situation. In Europe, these changes have led to much soul-searching about the military and political adequacy of NATO, and about the role each country should play in it. Despite widespread interest in various proposals for national or collective disengagement, the alliance remains essentially intact; but its character is undergoing a gradual change in response to the changing world power situation and the increased military vulnerability of the US. The UK and the major continental powers have asserted a more independent position within the alliance, and we believe this tendency will continue.

36. Over the next decade, France, or more likely several continental European countries jointly, will almost certainly try like the UK to develop a capability in nuclear weapons and ballistic missiles sufficient to constitute in their view some independent deterrent to Soviet aggression. In some respects, the achievement of such a capability would strengthen the alliance. On the other hand, it would enable the European allies to pursue somewhat more vigorous policies in defense of their individual interests, with effects which may or may not further the interests of the alliance. Moreover, they could then afford to be more flexible in dealing with the Soviet Union; and they would be better able, if so inclined, to remain neutral in the event of a local conflict in which their vital interests were not engaged (for example, in the Far East). A gradual transformation of the Atlantic alliance could thus come about, although we do not believe that the major European powers will wish to stand alone against the USSR without a US security guarantee.

37. Trends toward neutralism will probably occur among the allies in the Middle East and Asia, with certain notable exceptions, such as Turkey and Australia. Some of the members of the Baghdad Pact are already beginning to question the advantage of maintaining their membership. In various countries, domestic groups who favor a more neutral position are becoming increasingly vocal. Japan's relationship with the US also seems likely to undergo considerable change. The Japanese are restive over restrictions upon trade, both with Communist China and the US, and they will become reluctant to withhold recognition of

Communist China. While the Japanese value US protection, they are also clearly seeking a more independent position, and their deep aversion to nuclear weapons suggests that they would make great efforts to extricate themselves from any threatened conflict in which such weapons might be used.

38. In general, we believe that the US will encounter increasing trouble in retaining overseas bases on terms assuring their availability and effectiveness in case of need. In particular, the US may well encounter new problems over the next few years in its attempts to increase allied military strength through the establishment of missile bases or the further deployment of nuclear weapons overseas. Although our Western European allies have agreed in principle to the installation of IRBMs, some of them will refuse to accept them in their own countries, and others—believing that the US considers their establishment crucial to its own defense for a period of time—may attempt to exact a stiff price for accepting them. These difficulties will be especially serious in those countries where it is believed that establishment of such bases would substantially increase the likelihood of Soviet attack in case of war, would make disengagement impossible if international tension increased, or would hinder negotiation with the USSR to settle outstanding issues. The IRBM issue may become a symbol which will divide those people who seek early negotiations from those whose principal concern is to maximize the military strength of the alliance before negotiating. The issue will certainly offer opportunities for exploitation by the USSR in both Europe and the Asian-African world and for maneuvers designed to delay the installation of IRBMs.

39. Beyond these considerations the dual control provisions of the IRBM agreements will introduce new elements into the operation of the NATO alliance. On the one hand, these provisions may stimulate closer coordination of political decisions affecting East-West relations—a process which may be used to influence the US toward adopting positions agreeable to its European partners. On the other hand, joint decision may lead to hesitation in major crises, with consequent slowing and weakening of Western response.

B. Europe

40. Even though the Atlantic alliance has declined in vitality, the Soviets still must find Europe the most frustrating of the areas of competition between the US and USSR. Despite ten years of Communist control, the vast majority of the Eastern European peoples are still anti-Soviet. In Western Europe, the Communists have retained significant support in the labor movements of certain key countries, but they have been conspicuously unable to gain political strength. Nevertheless, the Soviet leaders have remained faithful to their belief

in the inevitability of the Communist victory; while they have turned some of their attention to other areas of the world where opportunities have been greater, they have not given up the effort to find some way to bring about a Communist victory in Europe. Thus, the XXth Party Congress acknowledged the possibility of different roads to socialism, an attempt to provide doctrinal justification both for a more liberal evolution in Eastern Europe and for acceptance of parliamentary methods in Western Europe.

41. In spite of these new doctrinal approaches, there does not seem to be any likelihood that Soviet Communism *per se* will gain any greater acceptance in either Eastern or Western Europe than it has in the past. The greatest political concern of most Eastern Europeans is to escape from the Soviet yoke; although some of the social and economic changes which have occurred have been welcomed, few Eastern Europeans would willingly have paid the price for them which has been extorted by Moscow and the local Communist leadership. Despite the pressures which exist, it does not appear to us that substantial changes in Eastern Europe will occur, although minor modifications, for example through a more liberal evolution, are possible.

42. *Possibilities of Negotiation.* In Western Europe there is great anxiety to find some way to escape from international tensions, the build-up of armaments, and the dangers involved in the confrontation of US and Soviet forces in the heart of Europe. Although repeatedly frustrated by Soviet intransigence, the desire to explore the possibilities of a settlement is readily revived at every suggestion of flexibility in the Soviet position.

43. There are many uncertainties about Soviet intentions, and US policy will affect the development of the situation. The greatest problem will be that of developing an arrangement for Germany which will be acceptable to both sides. Since the USSR almost certainly considers that it occupies a position of considerable strength, we consider it most unlikely that the Soviet leaders would give up very much without very great concessions from the West. Yet they must realize that, unless they are prepared to make substantial concessions in East Germany, no settlement will go very far toward the reduction of international tensions. These concessions they are unlikely to make because of fear that the release of Soviet control over East Germany would weaken Soviet authority in other parts of Eastern Europe, and because of a longer-run fear of a revived nationalistic Germany backed by the US and determined to establish hegemony in Europe.

44. West German governments will continue to regard the achievement of reunification as a major political goal and they will seek support toward this end from their allies. In general, bloc proposals on the present scale are recognized as attempts to consecrate the political *status*

quo and to divide and weaken the alliance; Soviet leaders have made it perfectly plain that a loosening of the Soviet grip on East Germany and the other satellite countries will not be permitted. In the unlikely event, however, that the USSR should make a serious proposal for a complete mutual withdrawal from Germany—especially if coupled with an unequivocal assurance against Soviet re-entry, and with a specific US guarantee—European reaction is likely to be more favorable. As modern weapons development progresses, the European governments, and the West German government in particular, may come to believe that withdrawal of US forces from Germany and German withdrawal from NATO would no longer represent a critical loss to NATO's overall strength. The time may come when they would be willing to pay this price for the withdrawal of Soviet forces from a broad central European area, even without a simultaneous agreement on German reunification, in the hope that reunification and a general detente would follow in due course.

45. *General Prospects.* In the internal politics of Western European countries, there seems generally to be taking place a gradual shift of the political center of gravity toward the left, but it is not so great a shift as to be likely to produce strongly leftist governments—certainly not popular front governments. During the next few years center parties, where they are predominant, may be obliged to rely more extensively upon socialist support; socialist parties, where they are in power, will need to pursue moderate policies in order to retain power. While these shifts seem to presage somewhat less responsiveness to US influence and somewhat greater interest in social programs at the expense of military programs, they are not likely to produce major changes in foreign outlook.

46. The coming into effect of recent agreements for European economic integration appears likely to enhance political and military cooperation among the continental countries. Already France, West Germany, and Italy are more closely concerting their foreign and military policies, and this trend is likely to continue. However, the schemes for economic cooperation and the European atomic community are not likely to mature fully for many years. A number of important and complex issues have yet to be resolved, including the extent to which concessions to special interest groups—particularly in France—may exert a restrictive influence on the cooperative effort. In addition, the problem of assuring preferential British access to the continental market in a way which will not damage Commonwealth ties or upset the carefully negotiated arrangements among the continental countries is likely further to complicate relations between these countries and the UK. Nonetheless, these developments reflect a strong European desire to make integration a reality, and the US will probably be dealing with a more unified continent than in the past.

C. The Underdeveloped and Uncommitted Countries

47. Most of the peoples of the underdeveloped countries have one primary political and social aim; they want to modernize their countries. They are not greatly concerned with what we regard as the evils of Communism. What we regard as the advantages of democracy and capitalism are associated largely in their minds with the evils of colonialism. The methods of Communism, judging by the great success they have had in the USSR and appear to be having in Communist China, often appear more relevant to their problems than the methods of democracy and capitalism.

48. Most of these countries are undergoing social and economic revolutions in which the methods and the leaders of the past are under attack or being cast aside. Many of them are unstable politically and socially; some are coming increasingly under authoritarian control. Many are also interested in increased military strength and prestige, and thus frequently threaten regional stability. All have grave economic problems. Population growth frequently exceeds the growth of the economies; Western civilization, with its improved standards of health, has sometimes brought greater poverty. There is a widespread lack of capital and a shortage of administrative and technical skills. In some countries the indigenous Communist movement is weak, in others it is strong, but in nearly all there are serious internal divisions based upon class, religious, ethnic and other factors.

49. The world has witnessed during the past fifteen years the rapid emergence of many new and often very populous states. The process has not much farther to go. There are still a number of important areas in Africa which will probably gain statehood during the next five to ten years, but the big increase in the number of sovereign states has already occurred. The uncommitted and underdeveloped world is a problem, not so much because there are still people under colonial control as because so many people have so recently emerged from such control.

50. Most of the leaders in the new countries of Asia and Africa look upon the US and USSR as engaged in a world power struggle which is of no direct concern to them, except as it might engulf them or as they might use it to advance their economic development. These people tend to believe that the safest and most advantageous course for them to pursue is one of neutralism. The USSR is generally playing to this belief by making no ostensible efforts to recruit them into its camp. Offers of foreign aid have been made without apparent strings, and indigenous Communist movements—where they are significant—have appeared more nationalist than pro-Soviet. The US, on the other hand, has appeared to them as opposed to neutralism and as attempting to force them into the Western alliance system. This many of them interpret as an effort to prolong colonial sponsorship and authority and

as an effort to block their further development as independent states. Many of them are becoming increasingly susceptible to Sino-Soviet influence. It appears to us that the principal choice which will increasingly confront underdeveloped countries in Asia and Africa will not be between East and West but between neutralism and pro-Communism.

51. *The Middle East.* Most of what we have described in the preceding paragraphs applies with particular force in the Middle East. The politically-conscious majority throughout the area, and especially the leaders of the revolutionary governments of Egypt and Syria, are deeply suspicious of the West. Despite US condemnation of the attack on Egypt, the US is predominantly identified in the popular mind with Israeli "imperialism," support of the colonial powers, and exploitation of oil resources. The US is regarded as not genuinely interested in Arab objectives, but primarily desirous of mobilizing the area against the USSR. The Soviet leaders, on the other hand, have skillfully represented themselves as ideologically and emotionally on the side of the Arab nationalists. They have created the impression of wanting to help the Arabs because they support their general objectives. The radical Arab nationalist leaders believe they can accept a considerable amount of Soviet assistance without danger to themselves and that they can replace their traditional social and economic institutions with a state socialism of their own contrivance.

52. The Arab nationalist movement, with its devotion to Arab unity, to economic change, and to its various conceptions of neutralism, appears to be here to stay. It aims to extend its influence widely through those parts of the Middle East and Africa where the inhabitants are Moslems. We see little chance that the pro-Western conservative Arab governments will be able to direct the movement in channels satisfactory to them; indeed some of them will have difficulty in preventing their own overthrow.

53. *Asia.* The US has greater assets in Asia than in the Middle East. Respect for Communist China's power and economic progress is tempered by fear of its growing military capabilities and by dislike for certain Communist methods. In some countries there is a recognition that US assistance was essential to the establishment and maintenance of independence. In some countries, especially those which have experienced Communist pressure or aggression, there are strong and vigorous anti-Communist sectors in the society. Nevertheless, the Communist countries, and particularly Communist China, have achieved some successes in expanding their influence. Having failed notably to expand their influence further by insurrection and invasion, the Communists have shifted to the less obvious methods of diplomacy, propaganda, subversion, cultural exchanges, and economic inducement. This growth

in influence seems to us likely to continue, although we expect it to be gradual.

54. The greatest difficulties in Asia are not directly associated either with Soviet or US policies, but with the multitude and magnitude of the problems which confront many countries in attempting to establish political stability, carry on economic development, and build viable states on the rubble of insurrection, subversion, ethnic differences, and political ineptitude. In addition, the unresolved problems of Korea, Vietnam, and China are a continual irritant to relations among states within the area and a constant source of apprehension over the future.

55. *Africa.* Except perhaps in North Africa, nationalist and revolutionary movements are not as advanced as in the Middle and Far East. Nevertheless, in Tropical Africa, knowledge of the outside world, detribalization, better facilities for transportation, the growth of market economies, urbanization and industrialization, are proceeding apace. As in Asia, questions of increasing national prestige, obtaining freedom of action and implementing sweeping internal reforms are urgent issues in the newly independent African states. In the colonial areas the drive for self-government is being spurred by the example of the independent states, the moral encouragement of the United Nations and world opinion, and support from Egypt and the USSR. Relations between African territories and their former or present European metropolises will be transformed in varying ways and degrees over the next decade. In many areas under British and French control there is likely to be a rapid emergence of new native states during the next few years. If the European powers implement liberal colonial policies, they probably still have sufficient time to exert a moderating influence on nationalist movements. However, the determination of European settlers to maintain control in some areas will probably provoke extremist African response.

56. As they achieve independence, Tropical African dependencies will be confronted with enormously complex problems. The creation of political stability is likely to be critically hampered by frustrated popular expectations and by internal disputes between rival factions reflecting ethnic, tribal, religious, and linguistic differences; the experiences of such independent countries as Liberia and Ghana illustrate the difficulty of overcoming factionalism by other than authoritarian means. The problems will be particularly difficult in those parts of Africa where there are mixed racial societies in which a smaller white minority dominates a much larger native population. Virtually all Tropical African territories will continue to be highly dependent on foreign economic assistance. Whether free of colonial control or not, many of them will turn increasingly to the US—among other possible

sources—for financial aid in the likely event they are unable to obtain sufficient sums from the colonial powers.

57. The USSR will make an increasing effort to establish diplomatic and economic relations with the new African governments. Since the latter, like the USSR, maintain a high level of governmental participation in the economy, government-to-government trading is facilitated. Many African territories are dependent upon the sale of one or two primary commodities for an important share of their national income and foreign exchange, and thus are highly vulnerable to world market price fluctuations. By absorbing commodity surpluses and extending credits for development in selected countries, the USSR could gain substantial benefits both in prestige and in the opportunities thereby offered for gaining greater influence on the continent.

58. In North Africa, despite several years of a highly revolutionary atmosphere, Communism and Pan-Arabism have made comparatively little headway. Throughout the three areas of Morocco, Algeria, and Tunisia the current prevailing attitude, while strongly anti-French, is not anti-West. This is due in part to the cultural affinity for the West of the Moroccan and Tunisian leadership and in part to the US policy of extending support to Morocco and Tunisia. Even in Algeria, Communists have gained little leverage within the revolutionary organizations. In all three territories, however, there are serious potential dangers. Unless the Algerian rebels are soon able to gain some kind of acceptable conditions from France, a gradual continued radicalization of the revolutionary movement and a rise of Communist influence seems unavoidable. Moreover, in both Tunisia and Morocco, there are radical forces in opposition to the present moderate leadership. If the situation in Algeria should further deteriorate or if the Tunisian and Moroccan governments cannot make noticeable progress toward solution of their serious economic problems, they are in danger of replacement by forces less sympathetic to Western interests.

59. *Latin America.* Although Latin American society has generally been more developed and better organized than that of other underdeveloped areas, it also is passing through a social and economic revolution marked largely by industrialization and urbanization. These changes have produced serious economic problems—inflation, exhaustion of foreign exchange reserves, and labor and agrarian unrest. Traditional ruling groups, particularly the military and the landed aristocracy, are coming under increasing attack by new social forces. These forces are dominated variously by an urban and educated middle-class, by military elements with a more modern and liberal orientation than in the past, and by labor. The common denominator in most of these groups is the desire to break with the forms and the stagnation of the past. Often the groups are in conflict with each other as well as with

the traditional elites. As a consequence of all these factors, many of the governments and the societies are unstable.

60. Basic antipathy for the US is relatively limited. Anti-US attitudes tend to vary with time and circumstances. These attitudes are consistently maintained by the Communists, but in a number of countries they are also the stock-in-trade of some politicians who exploit the growing nationalism in the area. The Communists constitute a danger to the US largely because of their discipline and their alertness to opportunity. Over the longer run, the revolutionary pressures in Latin American society are irrepressible, and the society is destined to be gradually transformed. Insofar as the US is identified with the forces of change, as for example in Bolivia, it appears likely that US influence will be enhanced. In some cases, however, some unpopular ruling classes in Latin America—often supported by US citizens—have been able to retain power and have become identified in the popular mind with “Yankee imperialism” and “dollar diplomacy.”

IV. ECONOMIC PROSPECTS

61. A current source of concern is the emergence of weaknesses in the free world economy. By and large, the developed economies of the West have enjoyed unprecedented prosperity for the past several years. It now appears, however, that these economies are growing more slowly and that world trade is expanding at reduced rates. In some of the developed countries, a rise in consumption without corresponding rises in production has resulted in inflation and, in some instances, balance-of-payments crises. More pronounced inflationary pressures have occurred in most of the underdeveloped countries as a consequence of ambitious development programs. Late in 1957 the US entered a period of economic recession, and fears have been expressed abroad that the recession will develop greater intensity. Since the US accounts for about 40 percent of free world production, the economic prospects of other countries are greatly affected by the manner in which the US deals with its own problems.

62. If the US recession should terminate by mid-1958, other economies may not find it too difficult to make a satisfactory adjustment. On the other hand if the US recession is prolonged, some other countries will face increasingly serious economic and political problems, much of the blame for which they will place on the US. In any event, there is danger that some governments will seek to correct internal difficulties by raising trade barriers, which would reinforce tendencies toward world recession. Thus far, however, greater concern has been expressed abroad regarding the course of US trade policy than about the now anticipated recession in US economic activity.

63. The probable decline in the international economy during 1958 would increase the vulnerability of many underdeveloped countries to Soviet bloc economic penetration. In times of actual or expected declines in prices and foreign exchange earnings for their major export commodities, the receptivity of these countries to Sino-Soviet propaganda against the West increases, as does their willingness to expand trade relations with the bloc. Communist propaganda certainly can be expected to capitalize on the lower levels of economic activity which are in prospect.

64. Over the longer run, prospects for economic growth are favorable for many areas of the non-Communist world, but rates of growth in most cases are likely to remain well below that projected for the USSR. In Western Europe, it appears likely that, barring a severe US recession, gross national product and levels of consumption will continue to increase at only slightly lower rates than during the last five years. Although long-term inflationary pressures are likely to persist, the application of various schemes for trade liberalization and economic integration will tend to moderate these pressures, since they will oblige the European countries to adjust their economic and fiscal policies to those of their neighbors. To the extent that these inflationary pressures are moderated, the European competitive position in other areas will be improved. The outlook is equally favorable for those underdeveloped countries which are rich in resources relative to their sparse populations (e.g., Australia, South Africa, and much of Latin America).

65. For the generally over-populated and poverty-stricken countries of Africa and Asia, the outlook is less favorable. Most of them lack the degree of political and economic organization necessary for achieving desired rates of economic growth. They are nevertheless committed to ambitious economic development programs which, in the absence of a strong indigenous business community, are largely state-conducted and state-financed. Government revenues and private savings are in general grossly insufficient to provide for these programs; in many countries inflation is rampant. Economic and political uncertainties, and in some places hostility to foreign investment, are discouraging private foreign lenders and investors and to some extent foreign governments and international institutions as well. In these circumstances, many underdeveloped countries are becoming increasingly disposed to accept Soviet economic offers. Over the longer run, some of them may see no way to realize their ambitions for economic development, except by adopting the methods which appear to them to have been so conspicuously successful in the USSR and in Communist China.

V. OVER-ALL PROSPECTS

66. *Likelihood of General War.* Despite the pride which the Soviet leaders take in their achievements and the confidence with which they seem to view the future, they still have and are likely to retain a healthy respect for US power. Even when the USSR acquires a substantial capability in ICBMs it will still be faced with great uncertainties about its capacity to wage successful warfare against the US. Moreover, like the leaders in the West, the Soviet leaders have a keen appreciation of the extraordinary destructiveness of nuclear weapons and of the dangers which they pose to victor and vanquished alike. We believe it unlikely, therefore, that the Soviet leaders, for at least the next five years, will deliberately initiate general war or embark upon a course which they believe involves a serious risk of general war.

67. During the foreseeable future there will be a constant jockeying for position between the US and the USSR. This will create for the world's leaders a most difficult problem in calculating the risks involved in their actions—or their inactions—in particular situations. Failure to calculate accurately could lead to various conceivable forms of local war or even to a general conflict. We do not see any easy way to determine whether local wars will break out and whether, if they do, they can be kept limited, or to determine what techniques, weapons, diplomatic warnings, and maneuvers are most likely to contribute to a limitation of such conflicts. We believe that all the major powers will attempt to keep wars limited if they do occur, but the various pressures on chiefs of government in particular situations, the rapidity with which events often occur, and the great importance of timing and of time, often confuse and distort the intentions of the parties involved. The circumstances of today with respect to the importance of surprise and with respect to the widespread destructiveness of war are unprecedented in human history. We are not persuaded to believe that wars would remain limited simply because it would be sensible not to allow them to expand. On the contrary, we can conceive of a variety of ways in which they could expand even though it was the initial intention of the parties to limit them. Consequently, we believe that the chances of keeping wars limited, whenever major areas or causes might appear to either party to be affected, are at best not too promising.

68. The United Nations, judging by its performance during the Suez crisis, might prove in some instances a useful instrument in preventing or limiting conflicts. For example, if a country is prepared to compromise rather than to fight or to extend a conflict, the UN can provide a means to do so with less loss of prestige. In most cases, however, the UN probably will not be effective in halting a conflict unless the US and USSR happen to be agreed on such an outcome.

69. *Evolution in the Communist World.* One of the most important factors shaping the world will be the manner in which the Soviet bloc evolves. Despite some current tightening of controls, we foresee a continuation of the trend toward greater flexibility in bloc relations and toward greater recognition of individual differences among the bloc members. In the case of Communist China, this trend will be fortified by that country's growing power, self-sufficiency, and national pride. In Eastern Europe, it will probably be favored by the survival of a semi-independent Poland and an independent Yugoslavia. But we think that prolonged development in this direction would be necessary before serious differences arose within the bloc on questions of relations with the Western powers; here the cement of common interests and a common ideology among the various regimes is exceedingly strong.

70. Because the USSR will remain the keystone of the bloc structure, the most important changes will be those which will occur within its own borders. More widespread and better education, the growth of a professional and managerial class, greater personal freedom, expectations of higher living standards, and more contact with other countries are indications of significant changes within Soviet society. These changes might in the long run alter profoundly the content and structure of Soviet political life, possibly through a dissipation of the Communist party's unchecked monopoly of power, more likely through a change in the political climate within the ruling party. However, the party has lately reasserted its monopoly status against incipient challenges from several quarters and its near-term position appears to be completely secure.

71. The liberalizing tendency within the USSR and in intra-bloc relations could not be reversed without considerable difficulty, but the Soviet leadership has been generally successful in controlling its pace and course. We do not believe that such tendencies will significantly weaken the bloc during the next five years.

72. *The Free World Problem.* Assuming that the evolution in the Communist world is so gradual that its impact upon Soviet policy will not be significant for some years to come, the free world faces a prolonged period of cold war with intermittent upsurges and declines in intensity. Coincidental with these shifts in intensity, there seems likely to be a periodic rise and fall in the extent to which free world nations—both the committed and the uncommitted—will alternately fear for their futures or hopefully try to arrive at settlements for co-existence with the Soviet bloc. The combination of increasing Soviet military power with flexible Soviet diplomatic tactics will make it difficult for individual countries to determine the policies most consistent with their own long-term interests. This uncertainty will probably induce additional nations to seek refuge in neutrality.

73. In spite of the confusions and uncertainties which have been described in earlier sections and the strong desire to relax international tensions by negotiating with the USSR, there seems to be an inclination among the more powerful and thoughtful Western nations to strengthen the deterrent to general war and to improve the common defensive posture. But these objectives, if achieved, will only establish the background against which will continue to be waged an intensive and world-wide competition between the Soviet bloc and the US. In this competition, the Soviet bloc will wage vigorous economic and political offensives; it will take advantage of world trouble spots; it will exploit the nationalistic and revolutionary emotions of peoples now rapidly emerging from poverty, ignorance, and foreign control; it will vigorously pursue such profitable themes as disarmament and peace. It seems to us that the USSR and Communist China will have some measure of success in these efforts, and that this will generate increasing nervousness in the West over real or imagined losses of position.

74. While some further losses of position for the West seem likely to occur, we do not consider that there is any irreversible trend in this direction. Even though the Sino-Soviet bloc will almost certainly become an increasingly formidable opponent, its leaders must cope with major problems and difficulties in exploiting their strength. We believe that the general course of events in the East-West contest will depend more than anything else on the manner in which the West mobilizes and employs its political, economic, and military resources.

18. Briefing Note for the 356th NSC Meeting¹

Washington, February 27, 1958

NASH REPORT

1. Mr. President, in October, 1956, you asked Frank Nash to “carry out a study of and make recommendations with respect to our system of overseas military bases and operating facilities.” (This language is quoted from your detailed instructions to Mr. Nash, annexed to his Report.) Mr. Nash completed his Report just before his death last

¹ Source: Nash Report on overseas military bases. No classification marking. 4 pp. Eisenhower Library, Whitman File.

December, and you referred it to the National Security Council for appropriate consideration and further action.

2. The Report consists of a 93-page Report proper and a 191-page Appendix. The Report is remarkably fine, comprehensive, and detailed, and should be most useful to appropriate operating personnel as a source of information and guidance.

3. Much of the Report is consistent with approved U.S. policy. I do not understand that Mr. Nash thought of his Report as a means of raising policy issues for Council consideration. In fact, the Report is not framed in the form of policy recommendations or issues. Yet scattered throughout the Report, the NSC Staff identified a total of 123 separate conclusions and recommendations.

4. It would be impossible to summarize briefly the contents of this magnificent work. Its first three sections, pages 1–13, do contain a summary of past U.S. base development and of considerations for the future. The remaining sections of the Report proper cover:

Section IV—Analyses by country and by region.

Section V—Major problems common to most areas.

Section VI—Operational and Administrative Policies.

Section VII—Internal U.S. Government organization for base matters.

5. The entire Appendix volume is devoted to a country-by-country analysis of twenty-nine nations. Each of those analyses is for convenience presented in a uniform format. Naturally, each analysis varies with the importance of the area under consideration. One wonders whether any comparable mine of exact and detailed information on this subject will be found in any one place in government.

6. It would obviously not be appropriate for the Council to give detailed consideration to most of the material in the Report. However, the Planning Board has identified nine issues for Council consideration.

7. I will call to the Council's attention the Planning Board's comments and recommendations on these nine issues, with respect to which we suggest that the Council:

a. Adopt the Planning Board's recommendations, and

b. Recommend that the President authorize the responsible agencies to circulate the Nash Report, together with the Planning Board's recommendations as adopted, to key operating personnel in this country and overseas, for information and such action as each agency deems appropriate consistent with approved national security policy. In view of the sensitivity of the Report in its entirety, distribution of the full Report should be limited to key operating personnel, and only appropriate extracts from the Report should be circulated to personnel having particular responsibility for specific subjects.

8. First, *the main thesis* of the Report (which you will find on page 1 of the February 14 NSC memorandum), which I will read:

The Planning Board believed that substantially our present base system will be needed for at least five years, but thought that it is not certain that it will be needed for the next ten years. With this modification, it recommended that the Council accept the validity of the main thesis, in these words:

(*READ the recommendation on page 2, pointing out the three suggestions by the Chiefs, discuss and dispose*)

9. The *second* of the nine issues (page 3) concerns positioning IRBM's at widely-dispersed bases around the Sino-Soviet periphery. Here the Planning Board rejected the notion that such positioning is *required* to retain the edge in the deterrent race, but felt that it would *better ensure* our ability to deter general war. There was a split on whether the implications of positioning IRBM's outside the NATO area should require an NSC decision, after giving consideration to the over-all advantages and disadvantages. Specifically, the language of the Planning Board recommendation is as follows:

(*READ the recommendation on pages 3–4, discuss, and dispose*)

10. The *third* issue (page 5) concerns a policy proposal for a Western Mediterranean pact, to include Spain, the United Kingdom, France, Italy, Morocco, Tunisia, Algeria, and Libya, which the Nash Report found desirable if feasible. The Planning Board recommends that the Council note that State and Defense are considering the feasibility *and desirability* of such a pact.

(Discuss and dispose)

11. The *fourth* issue (page 6) concerns a new chain of bases across Central Africa, which the Nash Report thought should be seriously considered. The Planning Board, however, saw no reason to change the position taken in the U.S. policy on Africa South of the Sahara approved last August, which called for keeping the area under periodic survey to determine any changes in our strategic requirements. The specific Planning Board recommendation is as follows:

(*READ the recommendation on page 6, pointing out the suggestion by the Chiefs, discuss, and dispose*)

12. The *fifth* issue (page 7) concerns alternatives to our present Far East base system. The Nash Report said that such alternatives should be examined for the dual purpose of increasing dispersion and of establishing bases in the most politically reliable areas. Such a program would be costly, the Report admitted, but a retreat from the area would be even more costly. It is not a question of withdrawing entirely from any country, but rather of establishing alternate positions such as the Bonins, the Marinnas, Ulithi, North Borneo, Brunei, and Australia. The

Planning Board noted that Defense is currently considering such alternatives, and recommends the adoption of the following language:

(*READ* the recommendation on page 7, discuss, and dispose)

13. The *sixth* issue (page 8) concerns transferring to Australia a portion of our “moth-balled” merchant fleet and stocks of surplus grain and other provisions, for possible use in the aftermath of an atomic war as reserves in a place relatively secure from the immediate consequences of such a war.

(*READ* the entire Planning Board comment)

(*READ* the Planning Board recommendation, explaining the split, discuss, and dispose)

14. The *seventh* issue (page 9) involves two matters concerning the Organization of American States. The Nash Report recommended (a) that greater use be made of the OAS and its military organs to provide a collective security framework for U.S. bases in Latin America; and (b) that early consideration be given to the desirability of bringing the West Indies Federation into the OAS. The Planning Board rejected the first recommendation but accepted the second.

(*READ* the Planning Board comment on page 9, discuss, and dispose)

15. The *eighth* issue (page 11) concerns criminal jurisdiction, which the Nash Report found to be one of the major common problems of our existing base system. The Report recommendation is as follows:

(*READ* the “Statement of the Issue” except the indented portion)

(*READ* the Planning Board recommendation with its split, discuss, and dispose)

16. The *last* issue (page 13) concerns sharing defense responsibilities with Canada. The Planning Board felt that the military aspects of US-Canadian relations were already stated in a general way in existing policy, but that better cooperation is required in non-military matters. The Planning Board comment points out that there is no national security policy paper on Canada, and that there is a Joint US-Canadian Committee on Trade and Economic Affairs at the Cabinet level.

The Planning Board recommendation on page 14 is split between a majority proposal to ask the CFEP to study means of improving US-Canadian economic relations and a proposal by ODM for the preparation by the Planning Board of a full-scale policy statement on U.S. relations with Canada.

(Discuss and dispose)

(Approve suggested Council action)

19. Briefing Note for the 356th NSC Meeting¹

Washington, February 27, 1958

The next item is to hear a report from the Department of Defense on certain military measures included in the so-called “Gaither Report,” as to which there was not sufficient time available for discussion before the Council at its meeting on January 6.

Originally scheduled for the Council meeting on January 30, these measures were deferred at the request of the Department of Defense (Dr. Killian agreed).

The matters to be reported on are:

First—whether to produce additional first-generation ICBMs beyond the 130 currently programmed to be operational prior to the end of FY 1963; whether to build the additional launching sites required for an operational capability of such additional ICBMs; and whether to harden such additional launching sites.

Second—Whether to order new production of more than 3 POLARIS submarine missiles systems and whether possibly further to accelerate POLARIS production.

Third—Whether to utilize modified existing anti-aircraft missiles (THE TALOS) as interim defense against ICBM attack at SAC bases, pending the development of an initial operational capability of the more effective NIKE-ZEUS anti-missile missiles.

Fourth—Whether to harden SAC bases by providing blast shelters for a large part of SAC planes, weapons, personnel, and supplies.

MR. HOLADAY will speak on the first 3 items, and MR. QUARLES on the 4th item.

1. During a discussion relative to the Continental Defense policy at the last Council meeting concerning internal security measures to protect against the clandestine introduction of nuclear weapons, it was brought out that:

a. Soviet Bloc diplomatic personnel may enter the United States through only five port areas;

b. at the time of entry, such personnel and their diplomatic pouches, baggage, and shipments are examined externally on a covert basis by detection devices which are capable of identifying radioactive material but not of distinguishing fissionable from non-fissionable.

c. When the devices disclose the presence of radioactive material in the baggage or effects of Soviet Bloc diplomats, no internal examination

¹ Source: Defense Department report on the Gaither Report; continental defense policy. Top Secret. 2 pp. Eisenhower Library, Whitman File.

of the same may be made, but the official or package is traced to ascertain the destination.

2. As a result of this discussion, the State Department undertook to examine and report on whether, if there were substantial evidence that any shipment entering the United States under diplomatic immunity contained radioactive material, the Department would be prepared to advise the diplomatic representatives of the country concerned that the shipment would be opened by United States officials in the presence of representatives of such country, to determine the nature of the radioactive material.

3. The Secretary of State will now report on its study of the feasibility of adopting such a practice.

20. Memorandum of Discussion at the 356th NSC Meeting¹

Washington, February 27, 1958

SUBJECT

Discussion at the 356th Meeting of the National Security Council, Thursday, February 27, 1958

Present at the 356th NSC Meeting were the President of the United States, presiding; the Secretary of State; the Secretary of Defense; and the Director, Office of Defense Mobilization. Also present were the Acting Secretary of the Treasury; the Attorney General (participating in Items 2–4); Mr. Maurice H. Stans for the Director, Bureau of the Budget; the Federal Civil Defense Administrator (participating in Items 2–4); the Acting Secretary of Commerce (participating in Item 1); the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; The Assistant to the President; the Deputy Assistant to the President; the Director, International Cooperation Administration; the Deputy Under Secretary of State for Economic Affairs; the Deputy Secretary of Defense; the Special Assistants to the President for Information Projects, for National Security Affairs, and for Science and Technology; the White House Staff Secretary; the NSC Representative on Internal Security (for Item 4); the Director of Guided Missiles (for Item 2); Brig. Gen. Austin W. Betts, USA, Office of the Director of Guided Missiles (for Item 2); Mr. A.G. Waggoner, Office of the Director of Guided Missiles (for Item

¹ Source: Agenda item 4: Shipments Entering the United States Under Diplomatic Immunity. Top Secret; Eyes Only. Extracts—3 pp. Eisenhower Library, Whitman File, NSC Records.

2); Assistant Secretary of State Gerard C. Smith; Assistant Secretary of Defense Mansfield D. Sprague; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

[Omitted here are agenda items 1–3.]

4. *SHIPMENTS ENTERING THE UNITED STATES UNDER DIPLOMATIC IMMUNITY* (NSC 5802/1; NSC Action No. 1862)

General Cutler reminded the Council that at its last meeting, and in connection with the discussion of the continental defense policy, the Council had discussed internal security measures to protect the United States against the clandestine introduction of nuclear weapons, including their introduction through diplomatic pouches, baggage or shipments. As a result of the discussion, the State Department had undertaken to study and report on whether, if there were substantial evidence that any shipment entering the United States under diplomatic immunity contained radioactive material, the State Department would be prepared to advise the diplomatic representatives of the country concerned that the shipment would be opened by U.S. officials in the presence of representatives of such country, to determine the nature of the radioactive material. General Cutler then called on the Secretary of State to report on the results of this study.

Secretary Dulles said that his people had studied the matter in the light of international law, and he proceeded to read the procedure on which the State Department had agreed; noting, however, that this proposed procedure had not been staffed through the Department of Justice.

After Secretary Dulles had read the proposed procedure, Mr. Allen Dulles asked whether under this procedure we would permit our shipments to the Soviet Union under diplomatic immunity to be investigated by the Soviets if they alleged something against us. He pointed out that we needed to get certain items into the USSR. Secretary Dulles replied that in this kind of situation we would be obliged to accept the practice of reciprocity.

The National Security Council:

Concurred in the following procedure recommended by the Secretary of State, pursuant to NSC Action No. 1862-*e*, relative to the use of devices to protect against the clandestine introduction of nuclear materials as provided in paragraph 14 of NSC 5802/1:

If a detection device indicates substantial radioactivity in a diplomatic shipment, the shipment will be detained and the Department of State will request the appropriate foreign diplomatic mission in Washington to have one of its officers appear at the port of entry to remove the objectionable object for examination.

If the request is refused, the shipment will be removed from the United States forthwith. If examined, the material will either be

permitted to enter if it is not dangerous or removed as soon as possible if it is dangerous.

Foreign diplomatic missions will *not* be advised of this policy. The Department of State will develop procedures for giving appropriate instructions to all U.S. personnel concerned with the entry of diplomatic shipments.

NOTE: The above recommendation, as approved by the President, subsequently transmitted to the Secretary of State for appropriate implementation in coordination with the Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security.

S. Everett Gleason

21. Memorandum of Conference with the President¹

Washington, February 27, 1958

OTHERS PRESENT

Secretary McElroy, Mr. Coolidge
General Goodpaster

Mr. Coolidge outlined three charts, one showing the present structure of the Department of Defense, one showing in simplest outline the proposed new structure, and the third elaborating on the second.

In the discussion which resulted, the President said he thought that unified commanders should have the same disciplinary authority over personnel of all services that they have over their own service component. He also thought that the members of the Joint Chiefs of Staff and the unified commanders should be commissioned in the armed forces of the United States. Mr. Coolidge said that the group working with Mr. McElroy had felt that this arrangement was suitable for the three- and four-star officers, subject to certain safeguards which have to be worked out, but there is question regarding officers of two-star grade and lower. In the discussion, it was not completely clear whether the proposal related simply to the members of the JCS and the unified commanders, or to members of their staffs as well.

¹ Source: Department of Defense reorganization. Confidential. 3 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on February 28.

Mr. McElroy said that the unified commanders who had appeared before his group had said that they did not wish to take on the court martial responsibility for personnel of the other services. The President said that the requirements in war and peace are quite different. Negotiation and action through cooperation is all right in peacetime where time is not of the essence, but would not work in war. He did not think the system should be subjected to change at the onset of war; consequently, we should have in peace what we need in war. Mr. Coolidge said that General Twining is now making a study to assure that the unified commander is given the same authority over personnel of the other services that he has over his own component.

Mr. Coolidge said that the group has found a great deal of difficulty in deciding where to put research. One alternative is to set up a Defense Research Institute at the same level as the JCS. Another would be to set up a fourth department, paralleling the Army, Navy, Air Force. In any case, a Director of Research would allocate tasks to the services and control the funds available to them. The President said the weakness today is decentralized authority resulting from provision of law or seizure through having money voted directly to the services.

Mr. Coolidge said that the group had not settled on titles for the heads of the services but are inclined to favor a title of Deputy Secretary of Defense for the Army, etc. They were strongly of the view that the Vice Chief of Staff of each service should take on added responsibilities of his own. The President indicated he had had some question about the "Deputy Secretary" solution, but that the idea of putting the Chief of Staff in the JCS and having service operations performed by the successor to the Vice Chief of Staff gave some desirability to the use of the "Deputy Secretary" title. He said that there is substantial reason why the members of the Joint Chiefs of Staff should have some control over their respective services.

Mr. Coolidge said that there is probably a lot to be gained through straightening out the organization within the respective services but the present group feels that they should not try to get into this. The President indicated general agreement with this view.

The President advised Mr. McElroy and Mr. Coolidge to be very careful on the research arrangement. Mr. Coolidge said they are thinking of having all research funds appropriated to the Secretary of Defense. Mr. McElroy added that they may decide to recommend having all funds appropriated to the Secretary of Defense.

Mr. Coolidge reported that the group agreed the Chairman of the JCS should be in charge of the assignment of work to the Joint Staff. The President spoke in favor of making the staff an integrated staff. Mr. Coolidge said that, at least for the operations section, this would be done. The President also said that he thought the lower level committees in the

Joint Staff structure should come out. Mr. McElroy said they are planning to drop out the committees, at least on an experimental basis.

Mr. McElroy said they are also planning to recommend eliminating the service “roles and missions” from law, and the President enthusiastically endorsed this action.

The President referred to a plan announced by Mr. Vinson and other Congressmen yesterday. It showed considerable signs of being a reversion to a three-department setup. He thought that if the authority of the Secretary of Defense were thus reduced the position would be untenable and should be abolished. In that case, the result might be that Congress would also be organized in comparable committees.

The President indicated some question regarding the element called the “Joint Secretaries.” Mr. McElroy said that there will be many problems of personnel, administration and procurement which will require coordination. He reiterated that research is a great problem. The President advised them to talk with Dr. Killian, and Mr. Coolidge said they are trying to arrange a time to get together. The President said he rather liked the idea of the Defense Research Institute.

In summarizing, the President said that the essence of the matter is to establish the power of the Secretary of Defense to get things done and to go into everything that needs corrective action. He suggested that the group get their thoughts into the most simplified form possible—one that could be put out to the public should there be a decision to do so.

A.J. Goodpaster
Brigadier General, USA

22. Memorandum of Conference with the President¹

Washington, March 3, 1958

OTHERS PRESENT

Mr. Gordon Gray
General Goodpaster

Mr. Gray first discussed his proposal to send letters of appointment to Emergency Agency designees. He drew the President’s attention to the fact that the proposed titles for the agencies used the word

¹ Source: Emergency planning; Net Evaluation Subcommittee work. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on March 4.

“National,” such as National Food Agency. The President thought that the title “National Emergency Food Agency” or just “Emergency Food Agency” would be better. After discussion, the style “Emergency Food Agency” was adopted. The President also approved a proposed draft text with certain minor changes.

Mr. Gray next raised a point in connection with the Emergency Food Agency. The question is whether this should be a separate agency, or whether the functions should be handled in the Agriculture Department. The President said that he did not want the same agency handling peace-type and war-type activities at the same time. If an agency had a function that stopped in war, the agency could be used in a war-time role. Mr. Gray said the proposal was that all emergency functions relating to food would go to the Secretary and the Under Secretary; all normal functions would be handled by the Assistant Secretary. The President confirmed that he thought it would be a mistake to have both groups of functions under the same man, since there would be a tendency to use the emergency powers and merge them into the normal powers of the department. He said that Secretary Benson could of course come in to discuss the matter with him if he wished.

Mr. Gray next discussed the question of radio telephones in the cars of Cabinet officers, pointing out that there are some 46 on the same channel and that this does not seem too sound a system. After discussion of some of the values of having the capability for getting in touch with these officials immediately, the President indicated that Mr. Gray could modify the system (for example, through the addition of channels) as he might think best.

Mr. Gray then commented on the work of the Net Evaluation Subcommittee. He said that estimates of tremendous numbers of casualties, such as the ones they are providing, seem to him of diminishing usefulness. The President strongly agreed, saying that he is certain that there is some maximum amount of damage we can sustain and still operate with any organization or effectiveness at all. Mr. Gray said that he has on occasion used assumptions of up to 50 million casualties, of which one-half would be killed, and it did not seem to him that a situation involving greater losses than this would be manageable or useable as a basis for planning. The President suggested that Mr. Gray talk to General Twining, with the aim of bringing out a basis for further planning which is in the range of something reasonable. Mr. Gray said he would go ahead on the basis of developing “manageable” assumptions.

A.J. Goodpaster
Brigadier General, USA

Memorandum From Quarles to Lay

Washington, March 5, 1958

SUBJECT

Study Relative to the Capabilities of Forces for Limited Military Operations

1. Forwarded herewith, for circulation to the members of the National Security Council, is the plan on the above subject developed pursuant to NSC Actions Nos. 1842-g-(4) and 1844-b. It has been concurred in by the Department of State and the Joint Chiefs of Staff.

2. It is contemplated that the plan will form the basis for a study by the Departments of State and Defense which will be sufficiently broad

¹ Source: Transmits Defense plan on capabilities of forces for limited military operations. Confidential. 4 pp. NARA, RC 59, S/S-NSC Files: Lot 63 D 351.

to include consideration of the entire range of U.S. and allied capabilities for limited military operations. It is not intended, however, that this examination will extend to the preparation of detailed plans to deal with each situation.

/s/ Donald A. Quarles

Washington, undated

*TERMS OF REFERENCE FOR COORDINATED STUDY
GROUP PURSUANT TO NSC ACTION NO, 1844-b*

PROBLEM: To examine U.S. and allied capabilities for limited military operations from the present to 1 July 1961.

DEFINITION: *Limited Military Operations* include any armed conflict short of an overt engagement of U.S. and USSR armed forces which has been directed by or concurred in by competent political authority. There exists the possibility of isolated incidents involving small units of the U.S. and USSR forces which would not lead to war. The degree of participation in limited military operations by the United States may vary from the furnishing of military supplies to the engagement of a portion of the U.S. armed forces.

ASSUMPTIONS:

a. The essential elements of U.S. national strategy as set forth in NSC 5707/8 will remain unchanged during the period covered by the study.

b. Unrestricted U.S. military operations against mainland China would probably lead to general war. On the other hand, it is probable that the United States could engage in effective military action against mainland China without undue risk of initiating general war.

c. Limited military operations could be in progress in more than one area of the world simultaneously.

SCOPE OF STUDY:

a. An examination will be made of existing and projected (to 1 July 1961) U.S. and allied capabilities for limited military operations with or without the use of nuclear weapons.

b. An examination will be made of the most likely situations which may develop around the world and which could, in the light of U.S. commitments and security interests, involve the United States in

limited military operations. This examination will include, with respect to each such situation, a consideration of

- (1) Domestic and foreign political background and implications,
- (2) Enemy objectives and capabilities,
- (3) U.S. national objectives,
- (4) Available U.S. and allied capabilities,
- (5) Effect of U.S. involvement on the U.S. and allied posture for general war, and
- (6) Special political and military problems involved in the use of nuclear weapons.

The examination will not extend to the preparation of detailed plans to deal with each situation.

c. Conclusions will be drawn as to

- (1) Capabilities required to deal with the situations most likely to involve the United States in limited military operations, in a manner that will minimize the likelihood of general war.
- (2) Adequacy of existing and projected U.S. and allied capabilities.
- (3) Other significant issues revealed by the examination under *a* and *b*.

d. In the light of the conclusions, appropriate recommendations as to U.S. national security policy and U.S. and allied capabilities for limited military operations will be presented for NSC consideration.

DATE OF COMPLETION: The study should be completed by 1 June 1958.

24. Memorandum From Chief of Staff, USAF, to the JCS¹

CSAFM-72-58

Washington, March 10, 1958

LAUNCHING OF THE STRATEGIC AIR COMMAND ALERT FORCE (U)

1. I am concerned over the vulnerability of the Strategic Air Command alert force under current operational policies and consider that the U.S. deterrent capability is invalidated to a substantial degree by:

- a.* NORAD's marginal capability for providing early warning.
- b.* The lack of a rapid decision-making process.
- c.* The lack of authority to launch the alert force.

¹ Source: Launching of the SAC alert force. Top Secret. 2 pp. NARA, RG 218, CCS 381 U.S. (5-23-46), Sec. 94.

2. In recognition of these weaknesses, the Air Force has developed a "Fail Safe" concept designed to establish a capability to launch the alert force with positive assurance that it would not continue to the target unless specifically instructed to do so. This is accomplished by prebriefing the air crews prior to launching, to "fail safe" and return to home base at a given point along the EWP route if the "go" word is not received. During the past few months we have tested our capability to direct the force, once airborne, to continue on the mission. To date we have achieved success in passing the "go" word to 95% of the mission aircraft tested. Through the development of better communications facilities and procedures, we expect to approach 100% effectiveness in the near future. This concept insures the entire force will, as the name depicts, FAIL SAFE if authority is not received to continue to the target. At the same time, as our tests have proved, it guarantees a large portion of the force will receive the "go" word if execution is directed by higher authority after the force is airborne. Obviously, this type of operation would materially improve our deterrent posture.

3. It is apparent that as we and the Russians progress further into the missile era this problem becomes even more acute. The terrific speeds with which we must cope in the missile era and the limitations of our air defense systems reduce the time available to implement the procedures now established to obtain an effective strike decision. Our future early warning radars will undoubtedly be susceptible to false targets which would initially preclude positive identification of a missile attack against the United States. Under these circumstances, we most certainly would not want to launch our own missiles which could not be turned back if the alert were a false alarm. Launching our manned bomber alert force, however, under the "Fail Safe" concept would be most appropriate in this circumstance, providing us positive assurance of having a part of our retaliatory power airborne without the slightest risk should the alert prove to be false.

4. Accordingly, the Joint Chiefs of Staff are hereby informed that on 1 March 1958, I instructed CINCSAC in the event of a defense emergency to automatically launch his alert force under the "Fail Safe" concept.

25. Memorandum of Conference with the President¹

Washington, March 10, 1958, 10:20 a.m.

OTHERS PRESENT

Dr. Killian
Dr. Kistiakowsky
General Goodpaster

Dr. Killian spoke from a memorandum, the original of which he handed to the President.

With regard to the proposal for a well-conceived basic research effort on solid propellants, the President strongly stressed that an overall group, such as ARPA, should conduct this research. Otherwise, it would be done in bits and pieces. In fact, he thought that all research on fuels should be kept centralized, avoiding the wastes of duplicating effort. Dr. Kistiakowsky reported that there has really been very little support for, or interest in, a solid propellant development program. There have been many starts and stops, and the effort that has been devoted to these fuels has been very small. In the interest of economy of effort and continuity, he would agree with putting the program into ARPA. The President suggested that it might even be put in the civil agency now under consideration.

Dr. Killian stressed the need for a review by the President of proposals for "second generation" missiles. The President strongly agreed and asked that necessary directives be developed.

The President further agreed with the recommendation for a program of improvement on the TITAN missile, and for phasing out the ATLAS as soon as consistent with an adequate rate of buildup of total missile forces.

The President said that he conceived of the missile activity as separate and distinct from traditional air, ground, and sea operations. He would accept the logic of a decision by the Department of Defense to assign a submarine-based missile such as POLARIS to the Navy, but he saw no reason for the Air Force or for the Army to try to preempt the field. Instead, he would incline toward a single missile command. Specifically, he agreed that we should not rush into the proposed Minuteman program; he asked that there be no approval along these lines until the matter had been much more carefully considered, and presented to him. Dr. Killian repeated his recommendation that Defense

¹ Source: Centralizing direction of missile program. Secret. 2 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology. Drafted on March 11.

should not produce both THOR and JUPITER. The President said that so far as he is concerned there is no problem with dropping either of these. He asked what could be done with the team at Huntsville, which he understood was a group of outstanding ability. Dr. Killian said that they are working on the PERSHING missile family. He also said that this group is well suited to conducting space program activities, either under ARPA or NASA.

The President asked why Drs. Killian and Kistiakowsky thought that the THOR was a better missile than the JUPITER. Dr. Kistiakowsky said it is not better, but simply nearer to quantity production. He feels that the shift to industrial producers of the JUPITER (Chrysler, Ford Instrument, and Goodyear) would delay its availability. The President said that he would agree to closing out the JUPITER, but thought the Huntsville force should be promoted to space and similar activities. He thought consideration should be given to taking them out of their present assignment and assigning them to ARPA, or even to NASA. Dr. Kistiakowsky commented that the PERSHING is an excellent approach, and the President said that the Huntsville group could work on that project too.

The President asked Dr. Killian to prepare for him a series of decisions very tightly drafted and very positive in tenor to accomplish what had been recommended. He said he strongly agreed with the basic proposal to obtain centralized direction and thought this should be done soon.

Dr. Killian asked whether he should ask the Secretary of Defense to carry out studies to give effect to the proposals. The President said this would be all right, but that we should make clear what the scientific conclusions and recommendations are. Dr. Killian said he was prepared to do this.

A.J. Goodpaster

27. Memorandum of Conference with the President¹

Washington, March 12, 1958, 10:30 a.m.

OTHERS PRESENT

Secretary McElroy
Mr. Coolidge
General Randall
General Persons
Mr. Harlow
General Goodpaster

Mr. McElroy began by saying that his group, although initially divided on the matter, has now come to believe that the members of the Joint Chiefs of Staff should not also serve as Chiefs of their respective Services. The President said that a problem arises from this solution—to be sure that the Joint Chiefs of Staff member is recognized as having the highest position and authority in his Service. Control of “patronage,” i.e. promotion and assignment gives the Service Chief tremendous power; amenities of office at his command add to this. The President thought it might be well to reserve to the member of the Joint Chiefs a few specified powers of highest type, e.g. selection of individuals for top commands, and recommendation of individuals for the post of Chief of Service.

The next point raised by Mr. McElroy related to the manner in which the command line ran from the Secretary of Defense to the operating commands. The President thought that, legally, the line ran directly from the Secretary of Defense to the commands, but functionally it would go through the Joint Chiefs of Staff.

The President spoke at considerable length on the matter of research. He thought that basic research on space activities should be put into NASA, and that DOD research should be limited to the applied phase—this to be centralized in ARPA. He thought there were great gains to be made from centralizing the basic research on space activities. Mr. McElroy agreed. He said he thinks that these questions are largely extraneous to the Defense Department, which has plenty to do to handle its own tasks properly. Both he and the President recognized

¹ Source: Department of Defense reorganization and control of missile programs. Confidential. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

that there are certain military applications of outer space activities, such as reconnaissance and communications.

The President went on to question any action to put the Minuteman project in the Air Force. He thought that there is developing more and more reason to have a separate long-range missile force. Mr. McElroy saw certain logic in having this project in the Air Force, because of the close operational tie to other strategic bombardment activity. He said he, too, felt that the trend is toward a single strategic attack force, which would include non-Air Force elements such as POLARIS.

Mr. McElroy next asked as to the title for the civilian head of the Service—whether he should be called a Secretary of the Service, or an Under Secretary of Defense for the Service. The President thought that if his duty can be tightly defined, it would be well to make him a Secretary. However, if Congress tries to pull authority away from the Secretary of Defense, then in order to make clear his control, it would be preferable to make these individuals Under Secretaries. Mr. McElroy said that the group thinking is exactly in line with the President's suggestion on this matter. He thought that by having them as Secretaries they could take a great deal of the burden off his shoulders, for example, in testifying before Congress.

In discussion of the further steps to be taken, the President asked for a brief statement to be prepared of the reasons why reform of the organization is required. This should bring out the things that must be eliminated. There should then be a statement of objectives and of principles. It should also be stated that we are not prepared to write a bill in its entirety on all phases of the matter, but that we are ready to start hearings at an early date. The President stressed that the message should bring out with great clarity the necessity of organizing for top efficiency—for getting maximum results from the tremendous resources that are being put into our military establishment.

A.J. Goodpaster
Brigadier General, USA

**Memorandum From the Chairman of the NSC Special
Interdepartmental Committee on Shelters (Berry) to the
Executive Secretary of the National Security Council (Lay)**

Washington, March 14, 1958

Transmitted herewith is the report of the Special Committee on measures to carry out the concept of shelter, established pursuant to NSC Action No. 1842.

¹ Source: Transmits Interdepartmental Report on NSC 5807, "Measures To Carry Out the Concept of Shelter." Top Secret. 16 pp. NARA, RG 59, S/S–NSC Files: Lot 63 D 351, NSC 5807 Series.

Except as specifically noted, the report carries the full endorsement of the Committee, which was composed of myself as chairman; Mr. William E. Carey, Bureau of the Budget; Mr. Vincent Rock, Office of Defense Mobilization; Col. James E. McHugh, Department of Defense; and Dr. Robert L. Corsbie, Atomic Energy Commission.

In the course of preparing the report, the Committee consulted with representatives of the Department of State, the Department of the Treasury, and the Special Assistants to the President for Science and Technology and Public Works Planning as suggested by the Council. However, the Committee has not requested the representatives of these agencies to express their views on the final report.

Memorandum Prepared for the National Security Council

Washington, March 13, 1958

SUBJECT

Measures to Carry Out the Concept of Shelter

REFERENCES

- A. NSC Action No. 1814
- B. NSC 5724; NSC 5724/1
- C. NSC Actions Nos. 1841 and 1842
- D. Memorandum for the NSC dated Jan. 22, 1958
- E. NSC 5802/1

Introduction

Your Committee has adopted the following frame of reference for its task:

(1) That shelter from radioactive fallout is required to limit expected casualties from a nuclear attack to a level which would permit the United States to survive as a nation. The concept of fallout shelter is to be incorporated into the national Civil Defense program for protection of the civil population.

(2) That measures taken to incorporate fallout shelter construction must avoid so far as possible adverse psychological effects upon the United States and allied nations as well, and must not detract from support of retaliatory and active defense capabilities.

(3) That measures taken must rely primarily upon private and local Governmental initiative, stimulated by Federal leadership, including Federal example.

(4) That effective Federal leadership will require a skillful and expanded program of public education with emphasis upon weapons' effects and ways in which citizens can protect themselves.

(5) That measures adopted must not be inconsistent with the possibility that the Government may wish at some future time to initiate a program of the type recommended by the Security Resources Panel, possibly upon a compressed time schedule. However, measures undertaken at this time should not be based upon the assumption that there will be a nationwide Federal construction program; rather the effort should be designed to preclude the necessity of such direct measures if possible.

Proposed Measures²

The Committee recommends adoption of the following measures:

1. Research and Development, including prototype construction (exploiting multiple-use principle to the maximum)

	<i>\$ Millions</i>
a. <i>Research</i>	\$6.5 (annual rate)

Although sufficient knowledge of weapons' effects and of shelter design now exists to permit proceeding with a complete and effective fallout shelter program if this were deemed desirable, expanded research is necessary to refine our knowledge, particularly of blast shelter, and develop more economical and efficient shelter models. In a program of this magnitude, well considered research should save many times its initial cost.

The following program of research is already identified and can be undertaken as rapidly as funds are made available.

(1) The field testing, with nuclear weapons, of shelters, other structures, and shelter equipment; provision for development and execution of radiological defense measures; exposure of animals to weapons' effects; and the instrumentation necessary to evaluate results obtained.

----- \$2.0 Millions

² Note on Costing: The Committee has accepted without critical review the cost factors proposed by FCDA with the understanding that these cost factors are consistent with those used in the *Report to the Council by the Special Committee on Shelter Programs* and the *Report of the Security Resources Panel*, both prepared pursuant to NSC No. 1691-b. [Footnote is in the original.]

(2) The design of various prototype shelters, the development of shelter programs, and development and laboratory testing of structures, facilities, equipment and materials not requiring nuclear field tests.

----- \$1.0 Million

(3) Studies dealing with psychological, emotional, educational and morale problems and determinations of tolerance limits under emergency conditions; medical, food, and water requirements in shelter habitation; and sanitary controls to permit tolerable occupation.

----- \$1.5 Millions

(4) Development of architectural designs and specifications for new types of multiple-use shelters which will be attractive as well as practical. The Committee believes that attention should be given to the use of grants to schools of architecture and engineering which would stimulate curriculum development, training of new students, and new concepts of shelter design.

----- \$2.0 Millions

While the above program will be of highest importance in improving our capabilities to develop a comprehensive shelter system, there are serious unsolved problems relating to effects of nuclear attack on humans, including the immediate and long-range effects of radiation, and to the development of measures to provide protection against or mitigate those effects. The Committee feels that a special assessment is required to determine whether present research efforts in this field by the several agencies of Government are reasonably adequate or whether further coordination or acceleration is indicated. It is therefore recommended that a suitable group be designated to evaluate the present efforts and to report on their adequacy, including recommendations for improvement of the total national effort, if such is warranted.

b. Prototypes

\$Millions

\$55.4 (3 year program)

This program combines (1) engineering development of multiple use shelter types, (2) exercise of Federal leadership and (3) public education. Each prototype will be one-of-a-kind, multiple-use where possible. Experience will be gained not only in design and construction, but in administration. Prototype structures will be erected on Government-owned land where necessary and desirable. Costs are based on estimated cost of the shelter features only, except in the case of garages and new school prototypes, where the entire cost of the structure is included. The Federal Government will recover as much of the beneficial-use value of underground garages as possible.

The Committee recommends the following types (including in each group both blast and fallout prototype designs):

(1) Underground parking garages

10 prototypes of variable size, ranging from 100–1000 car garages
-----\$31.9 Millions

(2) Understreet shelters

4 prototypes ranging in size from 1000–3000 shelter spaces
-----\$2.1 Millions

(3) Subway shelters

4 prototypes, ranging in size from 1000–5000 shelter spaces
-----\$1.5 Millions

(4) Shelters under new highways

16 prototypes, ranging in size from 500–5000 spaces
-----\$4.6 Millions

(5) Shelters as additions to existing schools

8 prototypes, varying designs to include classrooms, cafeterias, and assembly space, and groups of 4 classrooms
-----\$1.9 Millions

(6) New schools, incorporating shelters

4 prototypes, ranging in size from 200–500 pupils, each sheltering twice the normal school population
-----\$1.6 Millions

(7) Shelters as additions to existing hospitals

6 prototypes of needed hospital additions, including cafeterias, visitors' and convalescent rooms, and reserve areas. Will vary from 500–2000 person shelters.
-----\$1.1 Millions

(8) Multiple-use shelters for incorporation in new hospitals

6 prototype multiple-use shelters ranging in size from 300–2500 shelter spaces
-----\$1.6 Millions

(9) Shelters for industrial plants

15 prototypes, ranging in size from 500–5000 spaces, including special decontamination features
-----\$6.0 Millions

(10) Shelters for commercial buildings

6 prototypes, ranging in size from 1000–5000 person shelters
 ----\$2.3 Millions

(11) Single and multi-family residence adaptations to provide shelter

16 prototypes, including bathroom shelters, basement recreation areas, farm storage areas, basement work areas, and enlarged basements under porches for storage, and larger shelters for multi-family use.
 ----\$0.8 Million

\$Millions

2. Surveys and Pilot Studies \$75 (3 year program)

a. Development of estimated availability of existing shelter on a sampling basis

As a basis for national planning, definitive information is needed regarding the capability of existing structures to provide fallout shelter, particularly in large cities. The Committee recommends that a survey of existing structures be conducted on a sampling basis to yield such information. This would be handled through direct Federal contract, and would be completed in one year.

----\$2.0 Millions

³b. Survey of Existing Shelter

The Committee recommends that priority attention be given to a systematic survey of the potential of existing buildings and other structures such as mines and subways to provide fallout shelter with little or no modification. Such areas should be identified for immediate use. Property owners should be urged to modify their buildings to provide fallout shelters where feasible, and assisted in plans and designs incident thereto.

The survey would require approximately two years for completion and would start after completion of the sample survey of existing structures. It would be conducted as an extension of the survival planning program through Federal contracts with States and cities, with the Federal Government providing the money. Costs are estimated as

³ The Department of Defense and Bureau of the Budget members believe that the survey and pilot studies described under 2b and 2c should require an appropriate percentage of State and/or local participation. They believe that this procedure would be more effective in stimulating locally financed shelter construction and would avoid establishing a precedent which might preclude local financial support of subsequent shelter construction. The other members believe that such a requirement would delay unduly an effort which gives promise of identifying quickly a substantial amount of effective fallout shelter at very little cost. [Footnote is in the original.]

follows: 100 largest cities at an average of \$200,000 per city, \$20 million dollars; the next 400 cities in order of size, an average of \$50,000 each, or \$20 million; remaining areas (predominantly rural), \$8 million. Surveys would take full advantage of data already collected by survival plans.

-----\$48 Millions (2 year program)

⁴c. Pilot Studies

The Committee believes that the nationwide survey of existing shelters should be supplemented by an intensive study of the total range and nature of problems which might arise in conjunction with a shelter program. This would be done by intensive study of selected metropolitan areas on a pilot basis. The studies would extend to the development of complete engineering plans and specifications; problems of zoning, condemnation, local organization and administration; detailed site studies, and plans for maintenance and operation.

Studies of the type proposed would cost approximately \$5 million for a major metropolitan area. It is proposed that 5 representative cities be included in the pilot study program, with all studies to be completed within two years. Studies would require State and local participation, but the major part of the work would be done through research-contract financed by the Federal Government.

-----\$25 Millions (2 year program)

	<i>\$Millions</i>
3. Public Education	\$12.5 (first year)
	25.0 (annually thereafter)

The Committee agrees that greatly increased public understanding of bomb phenomenology, especially the nature of gamma radiation, is required if Federal urging of fallout shelter construction is to be effective. There must also be increased awareness of the probable extent of the fallout hazard resulting from all-out nuclear war, and the public must be convinced that the problem is not hopeless, but can be dealt with effectively through provision of fallout shelters.

The program recommended would be conducted in a low key of gradually increasing intensity in three parts:

⁴ The Department of Defense and Bureau of the Budget members believe that the survey and pilot studies described under 2b and 2c should require an appropriate percentage of State and/or local participation. They believe that this procedure would be more effective in stimulating locally financed shelter construction and would avoid establishing a precedent which might preclude local financial support of subsequent shelter construction. The other members believe that such a requirement would delay unduly an effort which gives promise of identifying quickly a substantial amount of effective fallout shelter at very little cost. [Footnote is in the original.]

a. A nationally conducted program, using all available communications media, and working through all agencies of the Federal Government (the Agricultural Extension Service, etc.) is proposed. In addition to general information on nuclear effects, the program would urge that citizens provide themselves with fallout shelters; would provide wide dissemination of information and methods by which private citizens may provide in their homes fallout-protection for themselves and their families (1) by adapting existing cellars or other structures or (2) by incorporation of family shelter in new residential construction; and would publicize the Government's own program of incorporation of shelters in public buildings, prototype construction, etc.

-----\$6 Millions (annually)

b. Working primarily through adult education programs of the States, provide courses in "Problems of Living in the Nuclear Age." These would be designed to reach at least one person in every family in America. Generalized courses would be accompanied by personalized technical advice in planning fallout construction for those who wish it.

-----\$3.5 Millions (first year)

-----\$13 Millions (annually thereafter)

c. On a pilot area basis, find and support local leadership in neighborhood groups. Leadership would be provided with sufficient professional and other support to organize a community shelter effort. This program is regarded as a complement to the research program in that it would yield data on the extent to which local participation can be stimulated by this means. It is also regarded as a complement to the intensive pilot study program of five representative cities.

-----\$3 Millions (first year)

-----\$6 Millions (annually thereafter)

\$Millions

4. Elements of a Base for Rapid Acceleration \$1.5 (annually)

The measures proposed above are designed to promote shelter construction without extensive financial participation by the Federal Government. The Committee recognizes, however, the possibility that these measures may be ineffective and that the Government might later wish to initiate a shelter program on an accelerated basis. Many of the other recommended measures will assist in preparing a base for rapid expansion, but in addition it is believed that specific attention should be given to the preparation of a "shelf" of plans and information which might save months of delay in an emergency.

Specific items proposed are:

(1) Identification of materials, equipment and manpower

-----\$1 Million (annually)

- (2) Preparation and maintenance of standby orders and organization
-----\$0.5 Million (annually)

5. Incorporation of shelter in civilian Federal buildings

The Committee agrees that Federal example is an indispensable element in any combination of measures designed to stimulate State, local government, and private spending for fallout shelters.

	<i>\$Millions</i>
a. New Construction	\$6.5 (annually)

Projections of new Federal construction activity (including the Post Office construction program, but excluding military construction) indicate a potential level of about 125,000 shelter spaces annually at an average cost of \$52 per shelter space. This assumes utilization of new buildings for community shelter where practicable, thereby setting an example to local Government and business, and avoiding charges of favored treatment for Federal employees.

	<i>\$Millions</i>
b. Modification of Existing Federal Buildings	\$90.6 (3 year program)
	\$30.2 (annually)

Federal example is as important in providing shelters in existing buildings as in construction of new buildings, since it is hoped that a large part of all fallout shelter can be provided through renovation and alteration of existing structures.

The program proposed at this time is limited to provision of community fallout shelter in existing Post Offices on a 3-year schedule. Based on an average of 2 shelter spaces for every full time postal employee, and an average weighted cost of \$113 per shelter space, the total program would cost approximately \$90.6 million. Annual rate, \$30.2 million for 3 years.

6. Incorporation of Fallout Shelters in Military Construction⁵

The Committee believes that an effective Federal program must include selective shelter construction at military installations. In the absence of such action it is very unlikely that private individuals, corporations and local governments could be induced to finance their own shelter construction. Emphasis in the programs proposed is on military facilities whose location and function is such as to make them most effective as an example to the general public. However, the proposed

⁵ Department of Defense support of the military programs proposed herein is contingent on NSC approval of generally parallel programs of shelter construction for the protection of the civil population. These proposals are made without prejudice to the current protective construction policy of the Department of Defense. [Footnote is in the original.]

programs have also been designed to contribute to meeting military operational needs.

Selective incorporation of fallout shelter in military construction is proposed to include: public access buildings such as headquarters, new public quarters and hospitals; other facilities such as air defense and communications facilities and emergency relocation sites selected according to operational importance, estimated hazard, and effectiveness in demonstrating Federal example to the civil population.

	<i>\$Millions</i>
a. New Federal military construction	\$20 (annual rate)
b. Modification of existing military facilities	\$100 (5 year program)
	\$20 (annual rate)

*Summary of Costs by Fiscal Year**
(\$Millions)

6. a. Shelter in new military facilities	20.0	20.0	20.0
b. Shelter in existing military facilities	20.0	20.0	20.0
TOTALS	130.2	164.7	152.2

*The Bureau of the Budget believes the scope of the financial outlay proposed is too broad, and that the total three year program should be restricted to \$100 million.

LEGISLATIVE IMPLICATIONS

Adequate authority is currently contained in the Federal Civil Defense Act to undertake all measures recommended except the incorporation of shelters in Federal buildings, whether new or existing.

The incorporation of shelter in new Federal buildings would require only that express language be contained in the applicable

appropriation acts indicating that the inclusion of protective construction was contemplated. Modifications of most buildings owned by the Federal Government could be accomplished in the same manner. Incorporation of shelter in existing buildings leased by the Federal Government would, in many cases, require legislative modification specifically to exempt such expenditures from the provisions of the Economy Act.

FINANCING AND ADMINISTRATION

The Committee is agreed that responsibility for preparing detailed budgetary estimates to support the measures proposed should rest initially with the Federal Civil Defense Administration, except in the case of new Federal construction or modification of existing Federal buildings (Measures No. 5 and 6), in which cases the agency which normally budgets for construction would also budget for the additional cost of fallout shelter features. The Bureau of the Budget may later recommend that funds for certain of the detailed projects be obtained by other Federal agencies.

CONCLUSIONS

(1) The Committee has recommended measures to support the concept of shelter. Such measures are put forward as first or partial steps which if adopted, could provide the Federal leadership and example necessary to stimulate State and local governments and the private economy to take necessary shelter measures. Unless such stimulation is truly effective in inducing the provision of nationwide fallout shelter under local governmental and private auspices, and unless and until improvements in active defenses are brought about, estimated civilian casualties, in the event of nuclear attack on the United States, will not be limited to a level that will permit the United States to survive as a nation.

(2) With Federal leadership and example, it is believed that the direct measures proposed can be undertaken in ways that will obtain the support and cooperation of the American people.

(3) With respect to public information and education, it is believed that the critical factor bearing on maintaining a low-key program is not the level of effort expended, but rather the manner in which the nature and imminence of the threat is handled.

(4) Since the measures point to a partial program, they cannot engender public overconfidence in shelter, nor yet create a public passive defense psychology.

(5) Because of the emphasis which will be placed upon improved active defenses, because of the low key of the public information program on shelters, and because of existing Congressional and

public attitudes, it is not believed that the measures proposed will cause Congressional or public reaction prejudicial to higher priority national security programs; nor that the shelter proposals in and of themselves will cause a loss of support by our allies. Furthermore, it is believed that they will not present the posture of the United States as that of a nation preoccupied with preparations for war.

(6) The Committee believes that incorporation of fallout shelter in military construction on a selective basis is vital, not only for the protection of military personnel, but as an example to the civilian population.

(7) The measures recommended must be regarded frankly as experimental. If satisfactory progress in shelter construction is not achieved as a result of these measures, consideration may need to be given at a later date to additional inducements which might be resorted to on a progressive scale as required. Such inducements could include: (a) requirement of shelters as a condition for Government loan guarantees under all existing programs, (b) low-interest loans for shelter construction, (c) rapid tax amortization, (d) other incentives, including matching grants by the Federal Government.

Respectfully submitted,

Lewis E. Berry,

29. Briefing Note for the 359th NSC Meeting¹

Washington, March 20, 1958

ITEM 1—MEASURES TO CARRY OUT THE CONCEPT OF SHELTER

The Council's attention today is again directed to the question of providing shelter for the population against the hazard of radioactive fallout. This matter will be considered at two successive Council meetings. Today we shall first hear a factual presentation by FCDA on radioactive fallout and on types of protective measures against it. Following that, the Director of Central Intelligence will present a new estimate of the Soviet civil defense program, including shelter construction. Then at next week's meeting, we shall discuss the excellent report by the Interdepartmental Committee on "Measures to Carry Out the Concept of Shelter" (circulated on March 14).

A brief word on the history of civilian shelter as it has been discussed by the Council.

You will recall that on December 21, 1956, in the Indian Treaty Room, Governor Peterson presented a proposed nation-wide shelter program which would have cost \$32 billion over an 8-year period. As an outgrowth of that proposal, in April 1957 the Council called for four studies on various aspects of shelter which culminated in the Gaither Report last November 7. The Gaither Panel, although placing shelter in a second priority, nevertheless recommended a nation-wide fallout shelter program estimated to cost \$22.5 billion over a 5-year period. At its meeting on January 16, 1958, the Council agreed that existing civil defense policy should be modified to incorporate the concept of fallout shelter, but that the U.S. should not initiate a nation-wide fallout shelter program of the type recommended by the Gaither Panel, and that implementation of the shelter concept should be deferred pending Council consideration of the Interdepartmental Committee report, which we shall take up next week.

First, then, let us hear the factual presentation.

GOVERNOR HOEGH

ITEM 2—SOVIET CIVIL DEFENSE AND AIR-RAID SHELTER CONSTRUCTION

We shall now hear the intelligence estimate of what the Soviets are doing in the way of civil defense and the extent to which they are believed to have shelters for the civil population.

MR. ALLEN DULLES

1. Each year, as you know, the Planning Board undertakes to review our Basic National Security Policy. Last winter's review, based on a series of discussion papers, extended from February into May; our current Basic Policy (NSC 5707/8) having been finally adopted on June 3, 1957. Whereas it is not proposed, this year to undertake such an arduous review procedure the Planning Board has already spent five meetings in ground work for the annual review.

2. This work has been based upon the new "Estimate of the World Situation", produced by the Intelligence Community on February 26, 1958. We consider this National Intelligence Estimate most significant and serious; and the Director of Central Intelligence deserves great credit for the superior job done. Each Council Member will find its contents necessary background information to the basic policy review before us. I personally feel that it is a part of my duty to assure that so basic an intelligence appraisal is studied by the Council Members.

3. The Planning Board's consideration of this Estimate has been stimulated by a novel procedure. During the last two weeks, we have asked men outside of Government, who have very broad experience and high intelligence, to read the Estimate and sit down for an afternoon of discussion with the Planning Board on major problems affecting our national security. These men included General Gruenther, former Assistant Secretary Bowie, former Under Secretary of the Army Bendetsen, former High Commissioner McCloy, and former Chairman of the CEA Arthur Burns.

4. I am going to ask Mr. Dulles first to express in his own words what he considers the most significant changes between this Estimate and the "Estimate of the World Situation" made last year, and also to call attention to any other significant part of the Estimate that occurs to him.

MR. DULLES

5. The Planning Board has developed, in the course of its consideration of the Estimate during the last month, a great many significant points. On the blue sheets which are before you we have picked out five of these points for discussion today. I will read each of these points, and ask for comments. It will be of great help to the Planning Board in drafting the revision of our existing Basic National Security Policy (which we hope to be able to present to you about May 1st) to have the benefit of your views on the current World Estimate, whether or not they coincide with it.

cc: Messrs. Lay
Gleason
Smith

30. Paper Distributed at the 359th NSC Meeting¹

Washington, March 20, 1958

IMPORTANT POINTS IN THE "ESTIMATE OF THE WORLD SITUATION" (NIE 100-58)

(Figures in parenthesis refer to "Estimate" paragraphs)

1. *Soviet Strength and Intentions.*

a. The Soviet world position vis-a-vis the West has improved in 1957 over 1956, in part due to its demonstrated scientific capabilities, its reasserted control over Bloc countries, and the effective psychological impact of its propaganda effort to depict Russia as the advocate of "peace" and "disarmament." This Soviet trend is not necessarily irreversible. (1, 19).

b. The Soviet determination to achieve world leadership is unabated. (6, 40).

c. It is unlikely that at least in the next five years the Soviet Union, even with an ICBM capability, will embark on general nuclear war or deliberately take actions involving serious risk of such war. The Soviet Union has still a healthy regard for U.S. retaliatory capability and of damage attending nuclear exchanges. (10, 66).

d. Changes in top Kremlin personnel do not indicate a deterioration or disintegration in the Soviet regime's policy or determination to gain world leadership for Communism. However, there are evolutionary changes in Soviet society which might in the long run (but not in nearby times) turn Russia into a nation with which the Free World could live more at peace.

e. During the foreseeable future there will be a dangerous jockeying for position between the U.S. and the USSR, involving the most difficult calculations of risk of actions or inactions in particular situations. (67, 70). Failure to calculate accurately could lead to local war or even to a general conflict. Despite efforts to keep wars limited, the chances of doing so whenever major areas or causes are involved are at best not too promising. (67).

2. *The State of Mutual Deterrence and Deterioration in the Western Position.*

a. The U.S. and the USSR will soon achieve a state of mutual deterrence, under which each will try to avoid a general nuclear conflict

¹Source: Important points in NIE 100-58. Secret. 3 pp. Eisenhower Library, Whitman File.

because of the resultant inestimable damage to both and to the world. (5, 6, 66).

b. Under these circumstances, (a) potentially disruptive forces within the Western Alliance have been stimulated; (b) some friendly nations fear that the U.S. will no longer be willing to threaten nuclear retaliation in order to deter Soviet actions in matters of vital concern to them; (c) the Soviets will take more bold actions in the fields of economic penetration and subversion, perhaps in the area of limited war; and (d) there will be a weakening in the Free World alliances, less confidence in U.S. leadership and military power, increased respect for Russian achievements in science, technology, rocketry, and nuclear weapons, more susceptibility to Russian propaganda for East-West negotiations—all in the hope of escape from tension. (9, 30, 34, 42, 72, 73)

3. U.S. Bases Overseas.

a. The U.S. will encounter increasing trouble in retaining overseas bases on terms assuring their availability and effectiveness in case of need. (38)

b. The dual control provisions of the IRBM agreements will introduce troublesome elements into the operation of the NATO Alliance. The division between people who seek early negotiations with the Russians and people whose principal concern is to maximize the military strength of the Alliance before negotiating, will offer opportunities for exploitation by the USSR and for Soviet maneuvers to delay the installation of IRBM's. (38, 39).

4. Competition for Underdeveloped and Uncommitted Countries.

a. Most of these countries believe the world power struggle is of no direct concern to them. They are not greatly concerned with "anti-Communism," but are interested primarily in their own economic development. Their choice will increasingly be, not between East and West, but between neutralism and pro-Communism. (47, 50, 87).

b. Most of these countries lack political and economic organization to achieve desired economic growth. There is a shortage of administrative and technical skills. Local capital is insufficient, and economic and political uncertainties and (in some cases) hostility, discourage private and to some extent Governmental foreign investment. Population growth frequently exceeds the growth of the economies. Many underdeveloped countries are increasingly disposed to accept Soviet economic offers, and some may come to adopt Communist methods which appear to them to have been successful in the USSR and Communist China. (48, 65).

5. *Competition Between Free World and Soviet Systems.*

a. The economic strength of the USSR will continue to grow at a faster rate than that of the U.S., and the Soviet regime will continue to have the capability to direct its economic strength in support of its internal and external policies which seek world leadership. (15).

b. Weaknesses in the Free World economy have emerged, including slower economic growth, slower expansion of world trade, inflationary pressures, and the U.S. economic recession. However, over the longer run, prospects for economic growth are favorable in many Free World areas. (61).

c. An intensive, world-wide competition between the Soviet Bloc and the U.S. will continue for some years to come during which the Soviet Bloc will undertake vigorous economic and political offensives. (73).

d. The general course of events in the East-West contest will depend more than anything else on the manner in which the West mobilizes and employs its political, economic, and military resources. (74).

31. **Memorandum of Discussion at the 359th NSC Meeting¹**

Washington, March 20, 1958

SUBJECT

Discussion at the 359th Meeting of the National Security Council, Thursday, March 20, 1958

Present at the 359th Council meeting were the President of the United States, presiding; the Secretary of State; the Secretary of Defense; and the Director, Office of Defense Mobilization. Also present were the Secretary of the Treasury; the Attorney General; the Director, Bureau of the Budget; the Chairman, Atomic Energy Commission; the Federal Civil Defense Administrator (participating in Items 1-4); the Chairman, Council of Economic Advisers (participating in Items 1 and 2); the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; The Assistant to the President; the Deputy Assistant to the President; the Acting Director, U.S. Information Agency; the Director, International

¹ Source: Agenda item 1: Measures To Carry Out the Concept of Shelter; Agenda item 2: Soviet Civil Defense and Air-Raid Shelter Construction. Top Secret; Eyes Only. Extracts—4 pp. Eisenhower Library, Whitman File, NSC Records. Drafted on March 21.

Cooperation Administration; the Special Assistants to the President for Information Projects, for National Security Affairs, and for Science and Technology; the White House Staff Secretary; Mr. Karl G. Harr, Jr., Department of Defense; Assistant Secretary of State Gerard C. Smith; Paul McGrath, Charles Shafer, and Robert Stokley, Federal Civil Defense Administration (for Item 1); Dr. Gordon Dunning, Atomic Energy Commission (for Item 1); the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. MEASURES TO CARRY OUT THE CONCEPT OF SHELTER

(NSC Action No. 1814; NSC 5724; NSC 5724/1; NSC Actions Nos. 1841 and 1842; Memo for NSC from Executive Secretary, subject: "Report to the President by the Security Resources Panel of the ODM Science Advisory Committee", dated January 22, 1958; NSC 5807)

In briefing the Council, General Cutler indicated that the problem of providing shelter for the population against radioactive fallout would be considered at two successive meetings of the Council. At the first one, today, the Council would hear a factual presentation by the Federal Civil Defense Administration on radioactive fallout and on the types of protective measures against it. (A copy of General Cutler's briefing note is filed in the minutes of the meeting, and another is attached to this memorandum.) Upon the conclusion of his briefing, General Cutler called on Governor Hoegh, the Federal Civil Defense Administrator, who in turn indicated that the presentation would be given by Dr. Paul McGrath of FCDA.

Upon the conclusion of Dr. McGrath's presentation, General Cutler complimented him on the high quality of his report, and advised the Council that the purpose in hearing this factual presentation was to remind members of the Council of the basic facts relating to shelter prior to Council consideration next week of the report of the Interdepartmental Committee entitled "Measures to Carry Out the Concept of Shelter" (NSC 5807).

The Director of the Office of Defense Mobilization inquired of Dr. McGrath the number of casualties estimated in Dr. McGrath's discussion of Operation Sentinel. Dr. McGrath replied that the casualties were estimated at about 82 million.

Mr. Stans, the Director of the Bureau of the Budget, pointing out the arbitrary level of tolerance of radiation which Dr. McGrath had set at 75 Roentgens, inquired what was the general range of tolerance in human beings. Dr. McGrath explained that the figure of 75 Roentgens had been selected because this intake of radiation would not make many

people sick and accordingly unfit to work. A dose of 200 Roentgens, on the other hand, would cause disabling sickness.

Admiral Strauss commented that the natives on some of the islands in our Pacific proving grounds, and some of our own U.S. personnel there, had undergone much larger doses than 75 Roentgens without serious ill effect.

The President inquired how one could distinguish the degree of contamination from radioactive fallout in a given area at a given time. Mr. Shafer, of the FCDA, explained that it was proposed to distribute instruments for this purpose immediately after a nuclear detonation.

The National Security Council:

Noted and discussed an oral briefing by the Federal Civil Defense Administration, concurred in generally by the Atomic Energy Commission, on the hazards of radioactive fallout and on the relative effectiveness of types of protective shelter.

2. SOVIET CIVIL DEFENSE AND AIR-RAID SHELTER CONSTRUCTION

(NSC Action No. 1842-*f*; Memo for NSC from Executive Secretary, same subject, dated March 14, 1958)

Having done a lot of hard work on this intelligence estimate, the intelligence community, explained Mr. Allen Dulles, was still of the opinion that the Soviet Union did have a program of civil defense and of air-raid shelter construction. It was not easy to pin down and describe this program, but Mr. Dulles said that he would be glad to invite skeptics into his office to see the enormous mass of evidence of the existence of such a program in the Soviet Union. Incidentally, he added, the present estimate had been concurred in by all of the agencies of the intelligence community.

Mr. Dulles then went on to cite certain specific evidence from training manuals, Soviet Red Cross reports, and other sources. Weighing all the evidence, Mr. Dulles then summarized his conclusions. First, that a minimum of from 10 to 15 million people of the Soviet Union's urban population are now afforded some degree of protection, and that the effort to provide more is a continuing effort in the Soviet Union. All this was true despite much uncertainty as to the precise character and size of the Soviet program.

When the Director of Central Intelligence had concluded his remarks, General Cutler informed the Council that when it was produced before the Planning Board, this estimate on the Soviet program had been received with a certain amount of skepticism, particularly in view of two sentences—one in paragraph 2, reading "It is impossible

to determine the precise state of readiness in the USSR", and secondly, the first sentence of paragraph 11, reading "The adequacy of protection afforded by the shelter program outlined in the above paragraphs has not been analyzed in this report." General Cutler also pointed out that Ambassador Thompson was of the opinion that no shelters were being provided in the enormous Lenin Hills housing development in Moscow. Mr. Dulles replied that he was inclined to disagree with Ambassador Thompson's interpretation of what had been observed in the Lenin Hills development.

General Cutler said that in any case Mr. Dulles presumably agreed with his advice to Mr. Dulles that he should not go out too far on a limb with respect to this estimate of the Soviet program. Mr. Dulles indicated that he had been inclined to go along with this view when it had first been expressed to him by General Cutler, but that he had somewhat changed his mind after seeing more of the concrete evidence to support the existence of a Soviet civil defense and air-raid shelter program. General Cutler inquired whether Mr. Dulles proposed to continue his efforts to discover the size and character of the Soviet program, and he received an affirmative answer.

Mr. Gordon Gray questioned whether it was meaningful to cite as evidence of a modern Soviet program shelter structures which had been built as early as 1949. To Mr. Grey, such structures would have little or no use in a future nuclear war. Dr. Killian, however, pointed out that such structures might still prove helpful as shelter against radioactive fallout as opposed to blast or thermal effects. Secretary Dulles agreed with this opinion, but pointed out that this was not the type of shelter which the United States was contemplating in its current study of shelter programs.

Mr. Stans inquired of Mr. Allen Dulles how many of our American population could be protected by some of the same sort of measures, such as subways, which the intelligence estimate cited as being part of the Soviet program. There was no answer to this question.

The National Security Council:

Noted and discussed an estimate on the subject by the Director of Central Intelligence, prepared pursuant to NSC Action No. 1842-f and transmitted by the reference memorandum of March 14, 1958.

[Omitted here is the remainder of the memorandum.]

S. Everett Gleason

32. Memorandum of Conference with the President¹

Washington, March 20, 1958, 3 p.m.

OTHERS PRESENT

Dr. Killian
General Goodpaster

Dr. Killian reported the results of his analysis of Defense proposals for budgetary augmentations, which the President recently asked him to analyze. He said that the Services had asked for augmentation totalling \$10 billion. At this point the President interjected that this type of thing seemed to him to show a lack of responsibility, and that he found it hard to retain confidence in the heads of the Services when they produce such proposals as these. Dr. Killian said the sum had been screened, in prolonged discussions in Defense, to some \$1,648,000,000.

The President asked how much of this was for the continuation of the B-52 line. Dr. Killian said that \$456 million was for B-52s and the air tankers to go with them. This would be enough to keep one production line open at five per month for about a year. The President indicated he supported this program.

Dr. Killian said the next sum was \$225 billion for the conduct of the NIKE-ZEUS program, and to continue development of the anti-ICBM. Up to one-half of this total was intended for the overall development phase. The Signal Corps also had a very attractive program for acoustic detection (using a "corridor" in the upper air), amounting to \$3.7 million. The President said that is the kind of project he likes to hear about.

Dr. Killian said the next proposal is for \$400 million to increase the IOC for POLARIS. This sum would add two more submarines, plus tenders, bringing the total number of subs up to five according to Dr. Killian. (I think the correct figure may be eight).

The next project was for a radio telescope development, involving \$71 million. Dr. Killian said there are scientific and technical questions still remaining concerning this project, and he would like to suggest that it be subject to the review of the Science Advisory Committee.

The President agreed, and said that in fact he would like to see the study and review conducted, and then have Defense come in for supplemental funds if the project proves out.

¹ Source: Defense proposals for budgetary augmentations. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on March 21.

The next item was for anti-submarine warfare—\$91 million. This would provide a greater capability for keeping track of submarines once detected. The President recalled that we have put tremendous amounts of money into SONAR, and now it is apparently not satisfactory. Dr. Killian indicated the difficulty is that the total system has not been properly integrated. There has been some tendency not to concentrate funds on the basic technical system, but to disperse them over a wide range of facilities and activities. Dr. Killian said the next proposal is for \$100 million for solid propellant development. The present intent is to put this work into ARPA. The President agreed with this proposal.

Next was a project for an air-to-surface missile called GAM-77, at \$91 million. This would extend the range and penetration of the B-52. These funds are for development purposes. The President indicated concurrence.

Next was the provision of \$100 million to ARPA. Dr. Killian thought this should be made with the understanding that when the new space agency is established, this allocation will be reviewed.

It was next proposed to provide an additional \$100 million for the TITAN program, intended to accelerate development, achieve storable propellants, and harden the TITAN bases. The President said he would like to see the TITAN project given to ARPA. He did not consider that the existing Services had any proper claim on future systems development.

The final project reported by Dr. Killian was an intelligence type radar for the Far East at \$10 million. (Checking on this subsequently, he determined that it is similar to one in Turkey, and is to go into the Aleutians.)

Dr. Killian then took up a memorandum to the President from Secretary McElroy requesting authorization for certain ARPA projects. The President indicated his general approval, subject to checking out certain specific details.

A.J. Goodpaster
Brigadier General, USA

33. Memorandum of Conference with the President¹

Washington, March 20, 1958, 4 p.m.

OTHERS PRESENT

Secretary McElroy
Secretary Quarles
General Twining
Mr. Stans
Dr. Killian
General Persons
General Goodpaster

Secretary McElroy gave the President a sheet showing proposed augmentations to the military budget.

Before discussing the details, the President asked what the Pacific missile range is, and why it should be assigned to the Navy. Mr. Quarles indicated that it is to be a national missile range, and said the Navy will be serving as the executive agent, adding that the range will be available to the Services and that it will permit launching satellites on Polar orbits.

The President said he saw several groups engaged in solid propellant work—the Air Force, the Navy, and ARPA. He thought it should all be given to ARPA. Mr. Quarles said that ARPA is intended to pull together the development of solid propellants; it is not intended, however, to be the manager of the missile development aspects (i.e. the hardware).

Referring to the MINUTEMAN project, the President said it looks as though the Air Force is getting into long-range solid rockets, and he questioned whether the second generation should be approached in this way. Mr. Quarles confirmed that the intention was to start a solid ICBM development in the Air Force. The President said that he thought that this should not be assigned to any of the Services, but Mr. McElroy reported that he had assigned the development and operational use of all ICBMs and IRBMs to the Air Force. Dr. Killian said he understood that the \$75 million assigned to the Air Force for the MINUTEMAN project would not include any hardware, but would be purely for development activities for the missile itself, as distinguished from its propellant. One of the Defense representatives confirmed that this is correct.

The President said he thought there is duplication between the POLARIS and the MINUTEMAN programs. Mr. Quarles said the MINUTEMAN is based on a more advanced warhead, more advanced guidance and propellant, and more stages. The President indicated he

¹ Source: Defense budget and missile development. Secret. 3 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on March 21.

had reservations as to the wisdom of this way of going about future missile development.

After a brief discussion, the President indicated agreement with the proposal for GAM-77, as a penetration aid for the B-52.

The President then asked what the NRRO proposal is, and why it is assigned to Naval Research. Mr. Quarles said that it is the radio telescope project, and that Naval Research has the best experience for this. The President spoke strongly that we have not freed our minds from existing systems and organizations. We continually find ourselves prisoners of free-wheeling activities that have been going on for a number of years in each of the Services. Mr. McElroy said he thought that the NRRO should be an ARPA project, and the President strongly agreed. The President said he would not like to see large sums of money being expended for intelligence activities by a multitude of services and agencies. Ideally, the function should be in the CIA. Practically, we should put such activities more and more into ARPA. He asked that this be put into ARPA. Dr. Killian pointed out the tie-in between this project and some of the NASA activities, and the President confirmed that there should be coordination as the project develops.

The President again said that we are prisoners of custom, and of particular past history in which we have had all of these separate research activities. Mr. McElroy said the activity would be placed under the proposed Under Secretary for Research and Engineering in the new scheme of organization.

Mr. Stans recommended that the proposal be put into the budget process, for review and screening. He said he wanted to point out where we seem to be going. The budget has already gotten to the level of \$41 billion for FY 59, and \$42 billion plus if these accelerations are included. There is a built-in expansion of a very large magnitude, since these proposals are still in the research and development stage. Mr. McElroy said that we could not hold to \$38 billion with the world in its present state. The President pointed out that the civilian and military chiefs in Defense have a very heavy responsibility, and that he is tending to lose confidence in some of their recommendations when they come in with proposals for \$6 billion to \$10 billion augmentations.

The President then recalled that the \$400 billion shown for POLARIS is going to give us just two submarines. While he did not challenge this proposal, he did feel that this simply confirmed that aircraft carriers have run their course. Mr. McElroy said that he has been very much concerned on this subject. A wide variety of delivery systems seems to be emerging. He now has the Joint Chiefs of Staff studying what would be the best "mix" of delivery systems.

The President indicated he supported the continuation of the B-52 production line as recommended.

He indicated that because some of the supplementals have been for such things as bases, he was hoping that the program would not level off at a permanently higher level than \$40 billion a year.

Mr. McElroy said that if it were possible to have a determination of policy before the end of the month, this would help him with the Johnson Committee.

The President concluded by saying that he hoped we could get our organization plan through the Congress. Thereby we would get money into the hands of the Secretary of Defense and he could exercise much stronger control.

A.J. Goodpaster
Brigadier General, USA

34. Letter From Eisenhower to John Foster Dulles¹

Washington, March 21, 1958

Dear Foster:

Herewith a draft of the talk I am planning to make before the Editors on April seventeenth. There is still quite a bit of work to be done on it.

My theme is that *we* must find ways of reducing the *need* for armaments. I mention various proposals that we have put forward during the past five years to ease tensions and promote peace—for example disarmament, atoms for peace, science for peace, control of outer space for peaceful purposes, exchanges of students, leaders of thought and so on, and a general diminishing of the barriers between free intercourse of ideas, persons and things. But I have wanted to make a rather startling new proposal.

I wanted to suggest that, if the Soviets were interested, I would recommend to Congress the inviting of several thousand students for one year. Maybe this idea is not completely sound, but we need some vehicle to ride in order to suggest to the world, even if ever so briefly, that we are not stuck in the mud. We realize that the world is asking for something that is almost impossible when it insists that we should

¹ Source: Transmits draft speech with proposal to invite Soviet students to U.S. No classification marking. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

give to all peoples complete assurance that we are not only peaceful and friendly, but that we shall “hold the initiative” in striving for peace.

Our public relations problem almost defies solution. The need always for concerting our views with those of our principal allies, the seductive quality of Soviet promises and pronouncements in spite of their unreliability, the propaganda disadvantage under which we operate because of the monolithic character of Soviet news broadcasts, and the readiness of many nations to take a virtual black-mail position as they make more and more urgent requests for aid—all serve to make us appear before the world as something less than persuasive in proclaiming our peaceful purposes and our effectiveness in pursuing them.

I didn’t mean to write at this length. I only want to ask for your comments on the draft as it stands now. Any penciled notes in the margin would be completely satisfactory.

If you could let me have the draft back some time the early part of the week. I would be grateful.

With warm regard,
As ever,

Dwight D. Eisenhower

P.S. Your note of this morning, enclosing some comments by your staff, seems to condemn my idea as futile. But I’m not yet certain that, as presented in the accompanying draft, it may not have some value.

MEASURES TO CARRY OUT THE CONCEPT OF SHELTER
Planning Board Comments and Recommendations on NSC 5807

Research (Pages 2–3)

1. The Planning Board noted the Committee's statement, in the unnumbered paragraph on page 3 that—beyond the four research programs outlined in paragraph 1–a and continuing research bearing on the shelter problem in all its aspects—there were “serious unsolved problems relating to effects of nuclear attack on humans, including the immediate and long range effects of radiation” and measures to mitigate such effects. In support of the recommendation of the Committee, the Planning Board *recommends* that:

The Special Assistant to the President for Science and Technology be requested to recommend a qualified group to make a special assessment as to (1) the adequacy of present research efforts by the several agencies of Government on the design and testing of shelters and on the effects of nuclear attack on humans, including the immediate and long range effects of radiation and measures to mitigate such effects; and (2) whether such research efforts should be better coordinated, integrated, or accelerated; the group to report on such special assessment, with recommendations, to the Council prior to July 1, 1958.

2. The Planning Board also recommends studies additional to those proposed by the Committee:

a. One study would appraise, in relation to a massive nuclear exchange involving nuclear detonation totaling millions of kilotons concentrated within a short time, the upper limits of such nuclear detonation and its by-products which could be tolerated by the peoples of the world and by the world itself.

b. A second study would appraise the problem of survival of populations in the period following their coming out of shelter after a massive nuclear exchange. Further study is required, relating to the immediate and longer-range period following such coming out of shelter, with respect to such factors as: sources of food, water, and fuel; methods and feasibility of decontamination; measures to care for casualties and bury the dead; means of restoring transportation and utilities; requirements for stockpiling survival and relief items and of their protection from blast or fallout; the psychological and morale problems confronting survivors who have lost members of their immediate families and face an environment without accustomed social, economic, and governmental institutions.

[c. A third study would attempt to appraise what level of active defenses and of shelter, in any projected combinations, is required to limit casualties to a level which will permit the United States to survive as a nation.²]

The Planning Board, therefore, *recommends* that:

a. The Atomic Energy Commission, in consultation with the Special Assistant to the President for Science and Technology, be requested to undertake through appropriate means a study appraising the upper limits of massive concentrated nuclear detonations and their by-products which could be tolerated by the peoples of the world and by the world itself.

b. The Office of Defense Mobilization and the Federal Civil Defense Administration, in consultation with the Special Assistant to the President for Science and Technology, be requested to undertake a study appraising the problem of survival of populations in the period following their coming out of shelter after a massive nuclear exchange.

[c. The Office of Defense Mobilization, the Federal Civil Defense Administration, and the Department of Defense, in consultation with the Special Assistant to the President for Science and Technology, be requested to undertake a study appraising what level of active defenses and of shelter, in any projected combinations, is required to limit casualties to a level which will permit the United States to survive as a nation.³]

d. The reports referred to in *a*, *b* and *c* above should be made to the Council prior to July 1, 1958.

Flexibility of Prototypes (Pages 3–5)

3. The Planning Board deems the Committee's recommendation with respect to the construction of 95 prototype shelters, some designed for fallout protection and others for blast protection, to be illustrative, and believes that there should be flexibility in choosing numbers and kinds of prototypes to be constructed.

²Proposed by the ODM Planning Board Member. [Brackets and footnote are in the original.]

³Proposed by the ODM Planning Board Member. [Brackets and footnote are in the original.]

Pilot Studies (page 7)

⁴4. Decisions under the Committee's recommendation to provide Federal funds for pilot shelter and site studies in five cities, determined by FCDA to be representative, may be complicated by political considerations. The Planning Board believes that one solution might be to invite cities, so determined to be representative, to come forward on a sharing basis, matching on a stated basis local funds with Federal funds. Under such an arrangement, selection might be made on the basis of the first five cities to volunteer within a specified time, appropriately distributed among representative categories. Only if such an offer prompted inadequate response would the Federal Government undertake the studies with 100% Federal funds.

Improvement in Active Defenses (See page 12)

5. The Committee did not address itself directly to the provisions of NSC Action No. 1842-d-(2) which specifies one of the conditions upon which adoption of the concept of fallout shelter is based:

"Improvements in active defenses can give reasonable promise, together with fallout shelters, of limiting estimated civilian casualties, in the event of nuclear attack on the United States, to a level which will permit the United States to survive as a nation and will in no case be greater than a similar casualty ratio in the USSR."

The Committee did not make a determination under the foregoing condition because it did not have enough information on prospective improvements in active defenses to make a finding on this point and because its proposed measures were only partial in nature. The Planning Board does not consider itself competent to make a judgment on this point on the basis of information available at this time.

General

6. In the light of the above comments and recommendations:

a. The State, JCS, ODM, FCDA and AEC Planning Board representatives endorse the report by the Interdepartmental Committee on "Measures to Carry Out the Concept of Shelter" (NSC 5807).

b. The Treasury,⁵ Defense and Budget Planning Board Members recommend that the Council endorse those proposals contained in the report by the Interdepartmental Committee on "Measures to Carry Out

⁴(1) The Treasury Planning Board Member objects to the Planning Board's solution as not being politically practicable. However, the Treasury Planning Board Member does believe that research on site-planning should be conducted.

(2) The ODM Planning Board Member favors the pilot studies but believes that, in addition, research on site-planning should be conducted. [Footnote is in the original.]

⁵For additional Treasury comments, see Annex. [Footnote is in the original.]

the Concept of Shelter” (NSC 5807) with respect to research studies and public education, but that Council decision as to the remainder of the recommendations (specifically those contained in paragraphs 1–b, 2–c, 5 and 6 of NSC 5807) be held in abeyance pending completion of the studies recommended by the Planning Board in paragraphs 1 and 2 of its comments and the studies recommended by the Committee covering psychological, emotional, educational, morale and other problems of shelter.

Annex

ADDITIONAL COMMENT BY THE TREASURY DEPARTMENT ON NSC 5807

Deferment of Measures Which Could Commit the Nation to a Network of Large Public Shelters

Treasury notes that the Committee, recognizing the psychological, emotional, morale and other problems incident to shelter plans requiring large groups of individuals to spend many days in public shelters providing space for 500 to 5000 persons, has recommended studies covering such problems.

The Planning Board, in reviewing NSC 5807, has noted and commented on the serious unsolved problem relating to effects of nuclear attack on humans, including the immediate and long-range effects of radiation and measures to mitigate such effects, and has recommended a special assessment of the adequacy of research efforts in these areas.

An additional study has been recommended by the Planning Board to appraise the problem of survival of populations in the period following their coming out of shelters after a massive nuclear exchange, including such matters as sources of food, water and fuel, the means of restoring transportation and utilities, and the psychological and morale problems confronting survivors.

The Planning Board has also recommended a study appraising the upper limits of massive concentrated nuclear detonations and their by-products which would be tolerated by the peoples of the world and by the world itself.

The Planning Board has further noted that the Committee did not make a judgment on the question of whether improvements in active defenses can give reasonable promise, together with fallout shelters, of limiting estimated civilian casualties, in the event of nuclear attack on the United States, to a level which will permit the United States to survive as a nation and will in no case be greater than a similar casualty ratio in the USSR.

In view of the inadequacy of information in the foregoing areas, it is believed that the efficacy of large public shelters (of the range from

500 to 5000 persons) has not yet been sufficiently tested and the contribution of such shelters sufficiently evaluated to warrant the conclusion that a network of such shelters is desirable, however financed, as opposed to a program placing major emphasis on smaller private shelters available at places of residence and employment.

It is believed that construction as prototypes of a number of public shelters to accommodate 500 to 5000 persons, development of comprehensive shelter plans and organization in a few typical cities, inclusion of public shelters in new Federal civilian buildings and in many new military facilities, and the construction of shelters in existing post office buildings throughout the nation as well as in many existing military facilities, might well, because of public and Congressional reaction to such steps, commit the nation to an approach to the shelter problem which would rely heavily on large public shelters, placing only minor emphasis on shelter protection in homes, other places of residence, and places of employment.

It is believed that steps which would lead to such commitment are premature and should be held in abeyance pending completion of the above-described studies. Treasury proposes, therefore, that the Council withhold decision on recommendations 1-*b*, 2-*c*, 5 and 6 of NSC 5807.

36. Letter From John Foster Dulles to Eisenhower¹

Washington, March 25, 1958

Dear Mr. President:

I have read the draft you sent me of your proposed speech to the American Society of Newspaper Editors and make these comments: It seems to me to be unnecessarily somber. After all, quite a lot of your "Chance for Peace" aspirations have been realized.

There is the Korean Armistice. There is an Indochina Armistice. There is an Austrian State Treaty. There is an International Atomic Energy Agency. There is great progress in the development of a "European community, conducive to the free movement of persons,

¹ Source: Comments on draft speech. No classification marking. 2 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Nuclear Exchange.

trade, and of ideas.” There was achieved at Geneva at least an *agreement* for the reunification of Germany by free elections—although the Soviets have now repudiated it.

The “Chance for Peace” has been greatly increased by the apparent abandonment by the Soviet leaders of methods of violence such as were used in the prewar and postwar period up to 1953. The shift to political-economic offensives is, of course, highly dangerous, but it does bring an enhanced “chance for peace”. There has been a definite evolution within the Soviet Union toward greater personal security, increased intellectual freedom and increased decentralization. This also increases the chances of peace.

As you said in Paris, “There is a noble strategy of victory—not a victory over any peoples but victory for all peoples”.

I devoutly believe in the truth of this, and that you are carrying out that strategy. The principal aspect of your April 1953 speech which has not been realized is the limitation of armament and any permanent reduction of the costs of armament. I do not think, however, that it is necessary to be despairing even as to this. I am not particularly confident of evolving any complicated, formal agreement with the Soviets, but I think that there could be perhaps parallel unilateral acts which would slow down the pace consistently with our safety.

It does seem to me our security does not require us to develop *every* military potential, but to have sufficient to deter attack. I think in this respect we have some margin on which to operate, at least experimentally, as a challenge to the Soviets.

I am not sure but what you might not make a major point in this respect. I suspect that it might draw a positive response from the Russians if only because they must be even more burdened than we by the cost of modern weapons.

As you know, I am somewhat skeptical as to whether the proposal for the reception—or exchange of students—will make a big hit. But I certainly see no harm in trying. I do, however, suggest that attribution to democracies of “peacefulness” is perhaps not fully justified by the facts, e.g., Suez, and its statement implies that the purpose of the student exchange is not merely to import understanding but to subvert the Soviet form of government so as to make it more “democratic” and thus more peace-loving.

I would have a number of detailed suggestions, but perhaps it is not worth while to put them forward at this time in connection with this particular draft.

Faithfully yours,

John Foster Dulles

37. Memorandum From Lay to the NSC¹

Washington, March 26, 1958

SUBJECT

Measures to Carry Out the Concept of Shelter

REFERENCE

NSC 5807

The enclosed views of the Joint Chiefs of Staff on the reference report (NSC 5807) are transmitted herewith for the information of the National Security Council, in connection with its consideration of the subject at its meeting on Thursday, March 27, 1958.

James S. Lay, Jr.

Executive Secretary

cc: The Secretary of the Treasury
The Attorney General
The Director, Bureau of the Budget
The Chairman, Atomic Energy Commission
The Federal Civil Defense Administrator
The Chairman, Council of Economic Advisers
The Chairman, Joint Chiefs of Staff
The Director of Central Intelligence
The Special Assistant to the President for Public Works Planning

Enclosure

Memorandum From the Joint Chiefs of Staff to McElroy

Washington, March 25, 1958

SUBJECT

Measures to Carry Out the Concept of Shelter (NSC 5807) (C).

1. Reference is made to Armed Forces Policy Council Advice of Action, dated 29 January 1958, subject "DOD Comment on Certain Gaither Items", and to the report, NSC 5807, prepared by the Interdepartmental Committee which was established by NSC Action No. 1842-*e*.

¹ Source: Transmits JCS views on NSC 5807. Top Secret. 3 pp. NARA, RG 59, S/S-NSC Files: Lot 63 D 351, NSC 5807 Series.

2. The Joint Chiefs of Staff have reviewed the nationwide fallout shelter program as acted upon by the National Security Council at its meeting of 16 January 1958 and the report, NSC 5807, of the Interdepartmental Committee established to propose measures to carry out the concept of shelter. As a result of this review, the Joint Chiefs of Staff reaffirm their comments with respect to Item III–B–3 of the Security Panel Report, as contained in their memorandum for you, dated 4 December 1957.

3. With respect to a military fallout shelter program, the current J.C.S. Policy for Protective Construction provides adequate guidance for use of available funds.

4. The Joint Chiefs of Staff consider that the programs proposed by the Interdepartmental Committee of research, education, and construction of prototype shelters are desirable measures for carrying out the new national shelter policy. However, the following specific comments are offered for consideration:

a. As proposed by the Committee the general programs of research, education and construction of prototype shelters are considered desirable measures for carrying out the new national concept of fallout shelters. However, it appears that with the extensive knowledge already available on weapons' effects and shelter design that decreased support should be given to this phase with increased emphasis on actual construction of prototype shelter. Further, that this preliminary testing-educational program, if accelerated, would be more responsive to that period which the Security Resources Panel of the ODM Science Advisory Committee considered the critical period, namely, the next two years.

b. Although it may be desirable to construct shelter in military facilities in such a manner as to provide effective examples to the general public, first level of importance should be given to military operational needs.

For the Joint Chiefs of Staff:

N.F. Twining,
Chairman,
Joint Chiefs of Staff.

38. Letter From Eisenhower to John Foster Dulles¹

Washington, March 26, 1958

Dear Foster:

I called you on *the* phone, but find you are still on the Hill. I wanted to talk to you about your conclusion that I was becoming a pessimist.

In trying to produce a draft of a talk before the Editors, an effort which I am now disposed to postpone, I deliberately wanted to stress the difficulties now confronting the world. Of these, the greatest are:

(a). The costs of relative security with the attendant possibilities of, either:

(1). Seeing the American people get so tired of these huge expenditures as to cause them to refuse to support necessary appropriations and thus expose us to unacceptable risks.

(2). Imposing upon our people such political and economic controls as would imply a dangerous degree of regimentation.

(b). The task of reaching some reliable agreements with the Soviets that will make it possible, with confidence, to reduce armaments.

To my mind this transcends all other objectives we can have. Security through arms is only a means (and sometimes a poor one) to an end. Peace, in a very real sense, is an end in itself.

It is, of course, quite comforting to recite all of the international difficulties that have, over the five years, been either surmounted or ameliorated. I've personally recited these in a number of speeches.

But these specific successes cannot blind us to the most potentially dangerous of all the situations now developing. This is the credence, even respect, that the world is beginning to give to the spurious Soviet protestations and pronouncements. As their propaganda promotes this world confusion, the tone of Soviet notes and statements grows more strident. The more the men in the Kremlin come to believe that their domestic propaganda is swallowed by their own people and by the populations of other countries, including some we have counted upon as allies, the greater the risk of American isolation. One great step we can take to counteract this trend is to make sure our own people are not deceived.

It is not pessimistic to face up to difficulties and to seek ways to overcome them. We must never confess that we have gotten to the bottom of the barrel in searching for ideas to stem and turn the tide of Soviet propaganda success.

¹ Source: Thoughts on dealing with Soviet threat. Personal and Confidential. 3 pp. Eisenhower Library, Whitman File, DDE Diaries.

I personally believe that one of the main objectives of our own efforts should be to encourage our entire people to see, with clear eyes, the changing character of our difficulties, and to convince them that we must be vigilant, energetic, imaginative and incapable of surrender through fatigue or lack of courage.

So, no matter what the preoccupations we daily have with the unfolding scene—both international and domestic—I feel that our principal responsibility is to try unceasingly to create both general and specific situations under which the consummation of reliable agreements conforming to our ideas of right and justice can be more probable.

I have not the temerity to argue that any idea I have advanced is necessarily good; I just say that we have one basic job to do. A part of this is educating and informing our own people—so that they will support every burden we must carry, and will dedicate themselves to helping seek out new ways to dispel the basic differences between us and the Soviets that, becoming more and more unyielding in character, could finally lead to consequences that could be most unpleasant.

My own feeling about this business is simple. Optimism is not the ability to smile because of a refusal to face disagreeable facts; it is the seeking unceasingly (and, if possible, intelligently) for the methods and means to overcome difficulties.

With warm regard,
As ever,

Dwight D. Eisenhower

39. Memorandum of Discussion at the 360th NSC Meeting¹

Washington, March 27, 1958

SUBJECT

Discussion at the 360th Meeting of the National Security Council, Thursday,
March 27, 1958

Present at the 360th NSC Meeting were the President of the United States, presiding; the Vice President of the United States; the Secretary

¹ Source: Agenda item 1: Measures To Carry Out the Concept of Shelter; Agenda item 3: Proposed Reorganization of the Department of Defense. Top Secret; Eyes Only. Extracts—15 pp. Eisenhower Library, Whitman File, NSC Records. Drafted on March 28.

of State; the Secretary of Defense; and the Acting Director, Office of Defense Mobilization. Also present were the Secretary of the Treasury; Judge Lawrence E. Walsh for the Attorney General; the Director, Bureau of the Budget; Capt. John H. Morse, Jr., USN, for the Chairman, Atomic Energy Commission (participating in Item 1); the Federal Civil Defense Administrator (*participating in Item 1*); the Chairman, Council of Economic Advisers (Item 1); the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Secretaries of the Army, the Navy, and the Air Force; General Lyman L. Lemnitzer for the Chief of Staff, U.S. Army; the Chief of Naval Operations; the Chief of Staff, U.S. Air Force; the Commandant, U.S. Marine Corps; the U.S. Ambassador to NATO; Mr. Charles A. Coolidge, Special Assistant to the Secretary of Defense; Brig. Gen. Carey Randall, Office of the Secretary of Defense; Mr. Gerard C. Smith, Assistant Secretary of State; Mr. Huntington Sheldon, Central Intelligence Agency; Mr. Ralph E. Spear and Mr. Robert Stokley, Federal Civil Defense Administration (for Item 1); The Assistant to the President; the Deputy Assistant to the President; the Acting Director, U.S. Information Agency; the Special Assistants to the President for Information Projects, for National Security Affairs, for Science and Technology, for Security Operations Coordination, and for Public Works Planning; the White House Staff Secretary; the Naval Aide to the President; Mr. Bryce N. Harlow, Administrative Assistant to the President; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. MEASURES TO CARRY OUT THE CONCEPT OF SHELTER

(NSC Action No. 1814; NSC 5724; NSC 5724/1; NSC Actions Nos. 1841 and 1842; Memo for NSC from Executive Secretary, subject: "Report to the President by the Security Resources Panel of the ODM Science Advisory Committee", dated January 22, 1958; NSC Actions Nos. 1877 and 1878; NSC 5807; Memos for NSC from Executive Secretary, same subject, dated March 24 and 26, 1958)

General Cutler briefed the Council at very great length on the background of the subject report (NSC 5807), as well as the report's content and recommendations, including also the comments and recommendations by the NSC Planning Board with respect to the report, and the views of the Joint Chiefs of Staff. In addition, he distributed at the meeting an extract from the Record of Actions of the NSC meeting of January 16, 1958, which he said described the framework of the Council's considerations today. (A copy of General Cutler's briefing note and the aforementioned extract are filed in the minutes of the meeting, and are also attached to this memorandum.) Thereafter, General Cutler called on Governor Hoegh to summarize the contents of NSC 5807.

At the beginning of his remarks, Governor Hoegh referred to the simulated attack upon the United States in Operation Alert 1957, and indicated the difference between the effect of the use of “clean” nuclear weapons and “dirty” nuclear weapons in such an attack, with respect both to casualties from blast and thermal effects and casualties from radioactive fallout. His chart indicated that the total casualties (dead and injured) would have amounted to 51.3 million people if “dirty” nuclear weapons had been used by the enemy, and to 30.4 million people if only “clean” weapons had been used.

Thereafter, Governor Hoegh summarized the contents of the report of the Interdepartmental Committee (NSC 5807), including the terms of reference, the recommendations, and the conclusions.

When Governor Hoegh had completed his summary, General Cutler briefly commented, first, on the recommendations and the comment of the NSC Planning Board. He pointed out that the majority of the Planning Board had endorsed the report by the Interdepartmental Committee; but, in addition to the measures to carry out the concept of shelter in the report itself, the Planning Board had also called for the preparation of three additional studies beyond those contemplated in NSC 5807. General Cutler also referred briefly to a fourth proposed study suggested by the ODM Planning Board Member, which neither the Planning Board nor the Joint Chiefs of Staff had viewed with favor at this time. He then pointed out that while the majority of the Planning Board had endorsed the measures set forth in NSC 5807, the Treasury, Defense, and Budget Planning Board Members had confined their recommendation to the research studies and the public education programs in NSC 5807, and recommended that the Council defer a decision on the remainder of the recommendations in NSC 5807. He noted that the Treasury Department, in explanation of this view, had submitted an Annex to the Planning Board report, in which it advocated deferring measures which would commit the nation to a network of large public shelters. He thought it appropriate at this point to call on Secretary Anderson for further explanation of the Treasury’s point of view.

Secretary Anderson said that officials of the Treasury Department have given very careful thought to the report of the Interdepartmental Committee. He agreed with these officials that the decision with respect to the proposed measures was as significant a decision in the realm of domestic policy as the Government could take. First, he said, he wished to commend Governor Hoegh for reducing the broad and general recommendations of the Gaither Panel with respect to shelter, to something which was clear, tangible, and susceptible of being dealt with. The problem posed by a shelter program, continued Secretary Anderson, was not only a grave financial problem or merely a grave financial problem. The main problem lay in the fact that we simply do not know enough at present to determine whether to go ahead with a large Federal program

of shelter as a means which will really contribute to the survival of the United States in a terrible nuclear war. While the Treasury Department agreed with the Interdepartmental Committee that the Government should go ahead with the proposed educational program for the American people on shelter, the Treasury also put very heavy emphasis on the creation of home shelters by private individuals, as well as on the research programs which the Interdepartmental Committee and the Planning Board had recommended. On the other hand, the Treasury Department did not believe that the Government could proceed to build prototype shelters all over the United States (as recommended in NSC 5807) without involving a serious popular and Congressional reaction which would eventuate in a huge and costly Federal shelter program. If we proceed now to commit ourselves to such a program of prototype shelters, we shall presently find that we have committed ourselves to an economic program of such magnitude that it would be bound to have a significant bearing on the economic strength of the nation. In conclusion, Secretary Anderson stressed the point that the Treasury was not prepared to oppose such a program of shelter-building, but it was urging that we defer a decision until we know more about the implications of such a construction program.

General Cutler thereafter briefly summarized Secretary Anderson's view with respect to what portions of NSC 5807 Treasury did favor and the objections of the Treasury Department to the proposed program to construct prototype shelters. Secretary Anderson concurred in General Cutler's summation, and warned again that proceeding with the prototype construction program might commit us to a wholesale Federal shelter program whether we really wished to undertake such a program or not.

General Cutler then asked General Twining to comment on the views of the Joint Chiefs of Staff with respect to the comments and recommendations of the Planning Board regarding NSC 5807. General Twining stated that the Joint Chiefs of Staff looked with favor on the three additional studies proposed by the Planning Board, but that the Chiefs did not agree with the proposal of the ODM Planning Board Member for a study "appraising what level of active defenses and of shelter, in any projected combinations, is required to limit casualties to a level which will permit the United States to survive as a nation." In general, said General Twining, the Chiefs felt that such a study was too vague in its present terms of reference, and in particular that if such a study were to be made in the future, it should be done by the Weapons Systems Evaluation Group rather than by ODM, FCDA and the Department of Defense, as had been suggested by the ODM Planning Board Member.

General Cutler then summarized the views of the Joint Chiefs as consisting of agreement with those recommendations of NSC 5807

which called for programs of research and of public education, but that the Chiefs had certain reservations with respect to proposals to construct shelter in military facilities.

General Cutler thereafter requested the Secretary of State to present his views to the Council. Secretary Dulles stated that he wished to commend the authors of NSC 5807 just as Secretary Anderson had a while ago, for bringing the subject of shelter out of the ether and down to earth where we could observe and understand it. Beyond this commendation, he added, he had a few observations to make.

In the first place, it seemed to Secretary Dulles to be a serious question whether the emphasis in the program set forth by the Interdepartmental Committee in NSC 5807 was actually in the right place. In the United States today there are millions and millions of basements which could provide a shelter which would reduce the hazard of radioactive fallout to as much as one-tenth. On the other hand, we have no basements which would actually enable people who sought refuge in them to survive over a considerable period. There seemed to Secretary Dulles no sense whatever in providing basements where people merely died of radiation sickness more slowly than they did outside. Accordingly, the obvious first thing to do was to improve existing basement facilities to a point where people seeking shelter in them could have a real hope of surviving. This would include provision for what comes after the nuclear exchange—the provision of food, water, heat, medical supplies, and the like—in these improved basement shelters. The kind of program that he was suggesting, said Secretary Dulles, made use of widespread existing house shelters all over the nation. To achieve such a shelter program wouldn't cost the Government anything significant, and would add greatly to the chance of national survival in a nuclear war. In short, the measures he was advocating would provide the population with a high degree of protection while at the same time avoiding the problems and dangers which so worried Secretary Anderson.

Continuing, Secretary Dulles stated his firm opposition to the construction of massive shelter in the basements of public buildings. A measure like this must be approached gingerly. Programs calling for the addition of massive basements in new Federal construction would certainly involve very large costs to the Government and might not add significantly to our survival capacity. On the other hand, Secretary Dulles thought it would seem desirable to carry out the public education program recommended by the Interdepartmental Committee and programs which would convert existing facilities into shelters rather than into living tombs. Accordingly, he was inclined to cut the program of the Interdepartmental Committee further.

Secretary Dulles also said he assumed that the Interdepartmental Committee had given careful thought to the experience of the European

countries in the matter of building prototype shelters. These countries have had much more experience than we have in this field, and we could probably obtain this information from them for nothing.

In conclusion, Secretary Dulles stated that his own Planning Board Member (Assistant Secretary Gerard Smith) had gone along with the recommendations in NSC 5807 100 percent. He, Secretary Dulles, didn't go quite that far. He would cut out the construction aspects of NSC 5807, and would stress the use of private funds. He strongly opposed any massive shelter construction program.

When Secretary Dulles had concluded his observations, General Cutler said he understood that Secretary McElroy had some rather special reservations with respect to the Interdepartmental Committee's report, and that these probably related to the possible impairment of active defense measures if a large-scale shelter program were adopted by the United States. He called on Secretary McElroy to express his views.

Secretary McElroy said that of course he was concerned about the costs of a shelter program in relation to other programs deemed vital by the Department of Defense. This, however, was not the point that he wanted to emphasize at the present time. He then explained that the several research programs described in NSC 5807 were quite acceptable to him. Where he differed from the Interdepartmental Committee was on the matter of the program of public education. Secretary McElroy believed that until the Government had sufficient knowledge and information to answer the public's questions, we should not expose them to an educational program. We don't yet know enough to answer their questions, and we needed to undertake further research and study before we launched a program of public education as to the nature of radioactive fallout and the hazards resulting from all-out nuclear war. Furthermore, added Secretary McElroy, he was not at all sure that it was at present in the public interest for the Government to urge the people of the United States to store large amounts of food, water, and drugs in basement shelters, at a time when we may need to encourage other types of investment and consumer buying by our people. Such a proposal might hurt our economy at a serious time.

The President observed that he wished to ask a couple of questions with respect to the assumptions or the frame of reference which the Committee had adopted in order to carry out its task. Addressing himself to Governor Hoegh, he said that he judged that the Committee was talking about protection from radioactive fallout rather than protection from the blast and thermal effects of nuclear detonations. But if the primary targets of the enemy are to be our U.S. cities, then such things as subways and the like won't help to provide shelter—unless, of course, we prove to be wrong in our assumption that the Soviets will aim their attack on our population centers. Governor Hoegh

replied that of course it is conceivable that we might be able to prevent nuclear bombs falling upon our cities; but we could certainly never avoid the hazard of widespread radioactive fallout in the event of a nuclear exchange.

The President likewise addressed his next question to Governor Hoegh. If, he said, we are thinking of an attack which would involve some 30 million U.S. casualties in the initial exchange, we have still not approached the casualty limits because there may be repeated attacks by the enemy after the initial attack. Such attacks might occur at a time when people were just coming out of shelter from the first attack. So, said the President, he concluded that when we talk about a vast nuclear exchange between us and the enemy, we are in fact talking about something the results of which are almost impossible to conceive of.

With respect to the psychological aspects of the problem of shelter, the President said he had got together some knowledgeable people and asked them just how much money it would take to build a fallout shelter on his farm sufficient to hold some 14 or 15 people. They had estimated the cost to be between \$25 and \$30 thousand, and the shelter was by no means elaborate. This posed the psychological problem. The President said that maybe, if he got a good job after he ceased to be President, he could afford to build such a shelter, but most of his neighbors would not be able to do so. In that case, won't they argue that only the rich are managing to get shelter protection? And will they not go on from that point to insist that the Federal Government build shelters for them? The President stressed that he was all for the construction of private shelters as far as this seemed likely to go, but he confessed that he was baffled by the problem of working out a scheme that offered hope of real success. Accordingly, the over-all answer seemed to him to be for this Government to assure that no doubt whatsoever existed about the protection of our massive retaliatory capability. In summary, the President stated that he agreed with the measures which had been proposed by the Interdepartmental Committee, as modified by the comments of the other Members of the Council.

Secretary Dulles turned to Governor Hoegh and complained that no one in all these years had ever told him what he should store in the basements of his houses. Why had he not been told? Governor Hoegh explained the reasons why. Since there was no visible shelter program, anyone who was found building a private shelter was thought to be eccentric. Secretary Dulles pressed the question as to what kind of food should be stored in his basement. Governor Hoegh replied by asking the Secretary what he liked to eat.

Secretary McElroy commented that in his opinion it would be necessary to terrify the people of the United States before they will do what Secretary Dulles was suggesting—namely, to build and stock shelters

in their basements. Secretary Dulles disagreed with Secretary McElroy on this point.

General Cutler next called for the views of the Director of the Budget. Mr. Stans stated that the Budget Bureau believed it undesirable to proceed at this time with any more than a small part of the program recommended by the Interdepartmental Committee in NSC 5807. The financial problems were, of course, obvious, but Mr. Stans could perceive other objections as well. He believed that if we undertook the prototype shelter construction program, recommended in NSC 5807, we would be inevitably committed to a full-scale shelter program. Moreover, undertaking a shelter program would interfere seriously with vital programs for strengthening the active defenses of the United States. But above all other objections was the fact, attested to by both the Interdepartmental Committee and the Planning Board, that many "unresolved problems" existed with respect to the shelter program. Therefore, before we invest substantial sums in any shelter construction program, the Bureau of the Budget feels that further studies, such as those recommended by the Planning Board, should be undertaken. In illustration of his point, Mr. Stans cited the value of studies on human tolerance of radiation. In summary, concluded Mr. Stans, the Budget Bureau favored only the following recommendations of the Interdepartmental Committee: (1) research on weapons effects; (2) research on the human tolerance level of radiation; (3) a very limited program of public education; and (4) studies as to what protection now actually exists throughout the United States. Mr. Stans added his belief that all these measures should be undertaken at a cost of no more than \$25 million a year for two years, assuming some financial help from the States and the municipalities.

In reply to Mr. Stans, the President said that we could talk all we wanted about money, but if we know that shelter programs will save the lives of millions of people, money won't matter much in the final decision.

Dr. Killian expressed the view that the primary task of the United States was to concentrate on developing our active defenses in order to keep the nuclear bombs away. These should have priority over passive defense measures. Secondly, said Dr. Killian, if the Government were to embark on the kind of program of public education recommended by the Interdepartmental Committee, it was quite likely that we would find ourselves obliged to go on to undertake a much larger shelter program. Thirdly, and with respect to the Planning Board recommendations for three additional studies over and above those recommended by the Interdepartmental Committee, Dr. Killian expressed doubt that any of these studies would actually bring us to as definite conclusions as the Planning Board hoped to achieve. Nevertheless, Dr. Killian advocated proceeding with the studies recommended by the Planning

Board. The first and second studies seemed to him, on the whole, very reasonable. As to the third study—to wit, the problem of the survival of populations in the period following their coming out of shelter after a massive nuclear exchange—Dr. Killian was not sure that further study would throw much light on this problem, although he believed that it was probably worth trying. As to the fourth study, proposed unilaterally by ODM, this seemed to Dr. Killian infeasible as an undertaking. At best, it would require years to complete, and would involve an enormous effort if any conclusion were to be reached, although admittedly this was the heart of the problem.

The Acting Director of ODM, Mr. Patterson, in response to a question from General Cutler, said that he would not press for the time being the inclusion of the study proposed by the ODM Planning Board Member, although he reserved the right to bring the matter up at a later time, on grounds that ultimately it could not be passed over.

Apropos of a remark by Dr. Killian that the public education program proposed by the Interdepartmental Committee would tend to alarm the people of the United States, the President said that he must strongly disagree with Dr. Killian. He believed, on the contrary, that the program of public education would make us more effective.

At this point General Cutler reminded the Council that the Holifield (Chet Holifield, D-Calif.) Committee would commence public hearings on shelter early in April. Perhaps, therefore, it would be advisable to hear now from the Vice President as to what these hearings were likely to involve.

The Vice President replied that, generally speaking, the views that Dr. Killian had just expressed made very good sense to him, and that he would like to add that Governor Hoegh, as Federal Civil Defense Administrator, had just about the most thankless job in the world. While Governor Hoegh had done a fine job in producing the report of the Interdepartmental Committee, the Vice President said that he could not but be concerned also by the statements that Secretary Anderson had made at the outset of the meeting. The Vice President felt that if we went beyond educational and research programs in the field of shelter, we would presently generate political pressures for a Federal shelter program which might involve a serious loss in our active defenses and in our capacity for massive retaliation. He added that he shared the President's viewpoint that there really wasn't much difference, in terms of national survival, between casualties of 30 million and of 50 million Americans. While it might matter to the 20 million who were not killed, the Vice President believed that if 30 million Americans were killed in a nuclear exchange, there would be no hope of the United States surviving. What would really save the United States were our active defenses. While we certainly have to do something in the way

of a shelter program, because the country demands it, we should do as little as we can to satisfy this demand. If we went further than that, and became too involved in a shelter program, we would be bound to lose the correct balance between active and passive defenses. This, concluded the Vice President, was the right line to take in dealing with the Holifield Committee.

General Cutler asked the Vice President if he had observed strong pressure in the Congress for a large-scale shelter program. The Vice President said that he thought not, and added that he was inclined to agree with Under Secretary of the Treasury Scribner, that the Planning Board suggestion—that a selection for pilot studies might be made on the basis of the first five cities to volunteer matching funds—was politically impractical. The Vice President counselled against stirring up the public when at the present time all they want us to do is to spend ourselves out of the recession.

General Cutler next called on Governor Hoegh, suggesting that he speak to the point of the Federal example as a necessary stimulant to the construction of private shelters. He asked Governor Hoegh how we could possibly proceed with an effective public education program if we did not set some kind of example to our citizens by building shelter at the Federal level. Had this not been the gist of Governor Hoegh's arguments? Governor Hoegh replied emphatically in the affirmative, and enlarged on his point. It might be possible to reduce the size of the recommended program for the construction of prototype fallout shelters, but it was absolutely essential to build some such prototypes. Governor Hoegh also felt that the construction of shelter in new Federal buildings was a necessary example for the States and local communities.

At this point General Cutler undertook to describe the consensus of the meeting. He believed that this consensus favored going forward with the research programs which had been recommended by the Interdepartmental Committee and by the Planning Board. He believed also that the sampling surveys and pilot studies were approved by the Council. It likewise seemed to favor starting a program of public education and the program with respect to providing the elements of a base for rapid acceleration; but the consensus opposed adoption of the other programs recommended in NSC 5807.

(At this point, the President announced to the Members of the Council that he had just been brought a note indicating that Khrushchev had replaced Bulganin as head of the Soviet Government.)

General Cutler went on to say that he was not sure of the attitude of the Council toward the pilot studies, but he was sure that the rest of the Interdepartmental Committee's recommendations were not acceptable until the Council had had another look at the matter after completion of the research programs which the Council apparently endorsed.

The Acting Director of the U.S. Information Agency, Mr. Abbott Washburn, spoke in support of undertaking the construction of at least a few prototype shelters because, he warned, without such shelters it would be impossible to launch an effective program of public education. General Cutler thought well of this suggestion, and asked Governor Hoegh certain questions about this matter.

Mr. Patterson said that he, on the other hand, was disturbed about the program for public education if this were to be undertaken prior to the completion and evaluation of the recommended research programs. He felt that the Government must be in a position to answer clearly the public's questions. Governor Hoegh said that he believed that we were already in a position to answer the public's questions, as a result of the knowledge and information which had been acquired by FCDA and AEC.

Mr. Patterson then expressed himself as being in favor of a matching program for building shelter in public buildings, rather than a program in which all the costs of shelter construction were borne by the Federal Government. In reply to this argument, Governor Hoegh again stressed the value of the example set by the Federal Government.

The President said that this was one of the hardest problems in the world on which to make a wise decision. General Cutler therefore suggested leaving the matter where it was. He would undertake to write a Record of Action which he would discuss with the President so that the President could make a decision after thinking the matter over at greater length.

The National Security Council:

a. Noted and discussed the report on the subject (NSC 5807) prepared by the Interdepartmental Committee established for the purpose by NSC Action No. 1842-*c*; in the light of (1) the comments and recommendations of the NSC Planning Board on NSC 5807, transmitted by the reference memorandum of March 24, 1958, and (2) the views of the Joint Chiefs of Staff on NSC 5807 (transmitted by the reference memorandum of March 26, 1958) and on the above-mentioned Planning Board comments and recommendations (as summarized orally at the meeting).

b. Agreed that the following measures should be undertaken to carry out the concept of fallout shelter for protection of the civil population against radiation hazard, in accordance with NSC Action No. 1842-*d*:

(1) A research and development program along the lines of:

(a) The recommendations in paragraph 1-a of NSC 5807; and

(b) The recommendations by the NSC Planning Board in paragraph 1, page 1, and subparagraphs 2-*a* and -*b*, page 3, of the enclosure to the reference memorandum of March 24, 1958.

(2) A limited program of prototype construction of relatively small-capacity fallout shelters, differing in design and type (including multiple-use) and adapted to differing conditions such as climate;

appropriate tests by actual occupancy for realistic periods of time to be conducted after completion (total cost not to exceed \$6 million).

(3) A nation-wide survey along the lines recommended in subparagraph 2-a of NSC 5807.

(4) Initiation of a program of public education along the lines recommended in paragraph 3 of NSC 5807, as modified by FCDA in the light of NSC discussion and as outlined in the Annex hereto (cost estimated at not over \$12.5 million for FY 1959; subsequent annual appropriations to be determined on the basis of experience).

(5) The elements of a base for rapid acceleration along the lines recommended in paragraph 4 of NSC 5807.

(6) The incorporation of fallout shelter in the construction of new Federal civilian buildings, of suitable size, designed after this date, along the lines recommended in paragraph 5-a of NSC 5807. (Supplemental appropriations for such shelter in buildings for which funds have already been appropriated will not be sought.)

c. Requested that the studies recommended by the NSC Planning Board and referred to in *b*-(1)-(b) above, and a report by the Federal Civil Defense Administrator on the status of plans and actions to carry out the other measures described in *b* above, be submitted to the Council by July 1, 1958.

d. Deferred action on the measures recommended in paragraphs 1-b (except the limited program in *b*-2) above), 2-b, 2-c, 5-b, and 6-a and -b of NSC 5807; pending consideration by the Council of the reports requested in *c* above.

NOTE: The actions in *b* and *c* above, as approved by the President, subsequently transmitted for implementation as follows:

b (except *b*-(1)-(b)) and *c* to the Federal Civil Defense Administrator.
b-(1)-(b) and *c* to the Special Assistant to the President for Science and Technology, the Chairman, AEC, the Director, ODM, and the Federal Civil Defense Administrator.

[Omitted here is agenda item 2.]

3. PROPOSED REORGANIZATION OF THE DEPARTMENT OF DEFENSE

(NSC 5724; NSC 5724/1)

Secretary McElroy said that the presentation of the Defense Department's proposals for reorganization would be given by Mr. Charles A. Coolidge, of Boston, who was in charge of this project at the Pentagon. In anticipation of presenting these proposals to the President, and in order to obtain the best available advice, the Defense Department had employed a large group of consultants, quarterbacked by Mr. Coolidge and including Admiral Redford, General Twining, General Bradley, General Gruenther, Mr. Nelson Rockefeller, former Deputy Secretary of Defense William Foster and, on occasion (because of ill health), former Secretary of Defense Robert Lovett. As the Council would perceive, continued Secretary McElroy, we have moved in four directions in these recommended improvements in the organization of the

Defense Department, namely: (1) the command structure, (2) elimination of interservice rivalry, (3) better direction of research and engineering, and (4) improvements of efficiency both within the Military Services and within the Department of Defense, with a view especially to speeding up decision-making.

Secretary McElroy then called on Mr. Coolidge, who spoke from notes with the assistance of a large chart of the new organization. Among other matters, Mr. Coolidge pointed out that in the revised command structure it was proposed to abandon the use of one or another of the Military Services as an executive agent of the Department of Defense. The line of command for the future under this proposed reorganization plan would be from the President to the Secretary of Defense to the Joint Chiefs of Staff to the fighting forces. Thus there would be no intervention of a Service Chief of Staff in the line of command. Such an improvement should enable us to face up more promptly to any emergency.

Mr. Coolidge pointed out also that a great deal of time and thought had been given to the oft-mentioned proposal for the creation of a single Chief of Staff. However, it had been decided to retain the present system with certain changes which might, perhaps, appear at first sight picayune but which, in fact, Mr. Coolidge thought might prove very effective. He cited a number of such changes, of which perhaps the most significant related to Research and Development, whose head was in the future to be provided with a lot more authority than the heads of R&D in the past. Under the new system, the head of R&D would supervise all the research and engineering activities of the Department, and would be responsible for making certain that all the research and development required for the several missions of our armed forces (such as CONAD and Continental Defense) were actually being carried out. Appropriations for research and development would be made only to the Secretary of Defense, and not to the several military departments. Mr. Coolidge said that no decision had yet been made as to the precise title to be given the head of R&D, but that, regardless of title, he would rank as an Under Secretary.

With respect to the general functions of the Department of Defense, the new reorganization plan would suggest the elimination of paragraph 4 of Section 202 of the National Security Act of 1947, which states that the Departments of the Army, the Navy and the Air Force "shall be separately administered by their respective Secretaries under the direction, authority and control of the Secretary of Defense." Mr. Coolidge pointed out that such elimination would not mean that we would abolish the Service Secretaries, but the elimination of this phraseology would enable the Secretary of Defense clearly to direct the Service Secretaries. Moreover, all appropriations by the Congress henceforth would be made solely to the Secretary of Defense and not to the Services.

It was likewise proposed that the promotion of all officers above the rank of Major General or its equivalent in the other Services should be made on the recommendation of the Secretary of Defense rather than upon recommendation by a Service Secretary. This move was designed to encourage an over-all rather than a Service point of view among officers of senior rank. In this connection, the proposed reorganization would seek authority to transfer an officer from one Service to another with the officer's own concurrence.

With respect to cutting down the number of Assistant Secretaries of Defense, Mr. Coolidge indicated that the proposed recommendations had not gone as far as Mr. Vinson and other Congressional critics would like us to go. We believe that many of the demands for wholesale reduction in the number of Assistant Secretaries were not realistic. If we attempted to get rid of too many such people, we would find ourselves back in the Forrestal days, with a Secretary of Defense who was simply physically unable to carry out all the details of his responsibility. Nevertheless, according to these recommendations the Secretary of Defense would plan to review the operations of each of the Assistant Secretaries to see that there was no duplication or inefficiency. Thus far, only one Assistant Secretaryship will be abolished.

Secretary McElroy commented that whatever one called these Assistant Secretaries, their functions were necessary, and it was easier to induce better men to serve if they were given the rank and title of Assistant Secretary of Defense.

At this point the President said that he would presently be obliged to leave the Council meeting, and he would like to offer one or two thoughts for discussion after his departure. The President said he firmly believed that if this reorganization could achieve the elimination of the artificial roles and missions of the Services, and depend instead on the unified commands, and if, secondly, we could get rid of the concept of "separately administered" referred to by Mr. Coolidge, and thirdly, if we could achieve sufficient financial flexibility in the hands of the Secretary of Defense, the President was convinced that we would have achieved three great legislative changes which very much needed to be made. On the whole, therefore, the President seemed to indicate approval of the proposals which had been outlined by Secretary McElroy and Mr. Coolidge.

Mr. Cutler pointed out that since the recommendations which had been presented for information to the Council had yet to be formally presented to the President for his approval, the content of the proposals should not be discussed outside the walls of the Cabinet Room except under most careful security safeguards. The President agreed, and said he expected the foregoing recommendations to be coordinated, and he hoped that the Military Services would vigorously support these

recommendations. If they were so supported, the President was confident that we could win Congressional approval for the recommendations.

(The President then left the meeting.)

The Vice President inquired as to the effect of the elimination of Section 202(4) concerning the separate administration of the Departments of the Army, the Navy and the Air Force by their respective Secretaries. Secretary McElroy replied that the effect of the elimination of this phraseology would be largely psychological in character. This concept of separately administered Services was used to support divisiveness on Capitol Hill more often than in the Pentagon itself. Indeed, in general inter-service rivalry on Capitol Hill was worse than it was in the Pentagon. He believed that this was as important a change as any that the Defense Department was making in its recommended reorganization proposals.

The National Security Council:

Noted and discussed an oral report on the recommendation by the Secretary of Defense on the subject, as presented by the Secretary of Defense and Mr. Charles A. Coolidge.

S. Everett Gleason

40. Record of Legislative Leadership Meeting¹

Washington, April 1, 1958

SUPPLEMENTARY NOTES

Outer Space—Doctors Killian, Purcell and York gave a briefing similar to that at Cabinet and along the lines of the recently issued Report, elaborating somewhat on the missile requirements for carrying various payloads, showing that from any particular rocket, the heaviest payload could be had for a satellite mission, whereas the payload was sharply reduced for projects involving the moon, and still further reduced for shooting as far as Mars.

The plan for establishing the National Aviation and Space Agency was outlined. Dr. Killian emphasized that peaceful space research would long be dependent on Defense Department missiles, yet it was

¹Source: Outer space; Department of Defense reorganization; nuclear test cessation. Confidential. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

desirable to conduct the non-military research outside of the Defense Department. Hence, the decision to continue ARPA even while setting up NASA. Discussion was very limited, consisting mostly of Sen. Knowland's interest in being certain that space projects would not be considered a secondary interest by the NACA people, who would be predominant in the new agency. Dr. Killian was able to assure him that the NACA was already enthusiastically pressing into the new field, and the problem would rather be one of overenthusiasm if anything.

Defense Reorganization—Mr. McElroy and Mr. Coolidge made a lengthy presentation of the changes to be recommended by the President. The plan for revising the appropriations process, so that appropriations would be made to the Secretary of Defense (rather than the services) stirred Sen. Bridges' interest particularly. He thought this was an especially important item because it involved getting into a field that had traditionally belonged to the Congress which always had made specific appropriations to the services. Sec. McElroy pointed out that the customary specific amounts for specific items would be developed as always in the Committee hearings, but by appropriating to the Secretary, and by giving him flexibility, he could modify programs as required by new developments—but he would have to inform the Congress of any changes being made.

At the end of the presentation, the President said he wanted to put a foundation under this in terms of his own thinking. He then spoke at length and with much intensity on the importance of streamlining the security organization to meet modern requirements. Hence came the great need for looking more to the unified commanders, for giving the Secretary greater flexibility, and for eliminating and controlling the rivalries among the services in research and development. He concluded by saying that he wasn't greatly concerned with the details of changes to be made, just so the Secretary got the authority and the flexibility that would prevent him from being hamstrung in his efforts to get the best defense for the nation.

Sen. Knowland, in response to a direct question from the President, said he had no question about the basic need which concerned the President. He felt, however, that in handling the detailed proposals, there was great need to recognize the concern that people in Congress would have about maintaining their traditional power of appropriating funds; Congress would not surrender this lightly.

The President agreed this would be of concern, then went on to stress again the need for avoiding duplication among the services, especially when the defense budget was getting to \$41 billion. If just one billion could be saved through this, he pointed out, it would cover a vast amount of requirements in other places in the government.

Nuclear Test Cessation—The President told the Leaders that the Khrushchev statement on cessation of tests was something anticipated

by Administration officials. He said the Administration had had many conferences as to whether we might do something like that if only as a move in the contest for world opinion; but the decision had been made, in the interests of our national security, not to end our nuclear testing.

The President saw some relationship between the Soviet announcement and their frantic search for a Summit meeting—perhaps they hoped this would obviate the need for discussing the problem.

The President asserted that Americans can properly say they want to be friendly, but certainly they must keep their powder dry. A list of all the things the United States has done is being pulled together, the President said, so the best presentation can be made of our position—which we must stick to. The President said he would welcome any new ideas on how to convince the world of our friendliness, and our desire to be decent and peaceful.

H. NSC Action No. 1882

The National Security Council, the Secretary of the Treasury, Judge Lawrence E. Walsh for the Attorney General, the Director, Bureau of the Budget, the Federal Civil Defense Administrator, Capt. John H. Morse, Jr., USN, for the Chairman, Atomic Energy Commission, and the Chairman, Council of Economic Advisers, at the 360th Council Meeting on March 27, 1958, noted and discussed the report on the subject (NSC 5807) prepared by the Interdepartmental Committee established for the purpose by NSC Action No. 1842-*e*, in the light of (1) the comments and recommendations of the NSC Planning Board on NSC 5807, transmitted by the reference memorandum of March 24, 1958, and (2) the views of the Joint Chiefs of Staff on NSC 5807 (transmitted by the reference memorandum of March 26, 1958) and on the above-mentioned Planning Board comments and recommendations (as summarized orally at the meeting).

By NSC Action No. 1882-*b*, the Council agreed that certain measures should be undertaken to carry out the concept of fallout shelter for protection of the civil population against radiation hazard, in accordance with NSC Action No. 1842-*d*. This action is enclosed herewith as NSC 5807/1.

The Council also (NSC Action No. 1882-*c* and -*d*):

c. Requested that the studies recommended by the NSC Planning Board and referred to in NSC Action No. 1882-*b*-(1)-(b), and a report by the Federal Civil Defense Administrator on the status of plans and actions to carry out the other measures described in NSC Action No. 1882-*b*, be submitted to the Council by July 1, 1958.

d. Deferred action on the measures recommended in paragraphs 1-*b* (except the limited program in NSC Action No. 1882-*b*-(2)), 2-*b*, 2-*c*, 5-*b*, and 6-*a* and -*b* of NSC 5807; pending consideration by the Council of the reports requested in *c* above.

The President, on April 2, 1958, approved NSC Action No. 1882, and paragraphs *b* and *c* thereof have been referred for appropriate implementation as follows:

b (except *b*-(1)-(b)) and *c* to the Federal Civil Defense Administrator.

b-(1)-(b)—the recommendation by the NSC Planning Board in paragraph 1, page 1, of the enclosure to the reference memorandum of March 24, 1958—to the Special Assistant to the President for Science and Technology.

b-(1)-(b)—the recommendation by the NSC Planning Board in subparagraph 2-*a*, page 3, of the enclosure to the reference memorandum of March 24, 1958—to the Chairman, Atomic Energy Commission, in consultation with the Special Assistant to the President for Science and Technology.

b-(1)-(b)—the recommendation by the NSC Planning Board in subparagraph 2-*b*, page 3, of the enclosure to the reference memorandum

of March 24, 1958—to the Director, Office of Defense Mobilization, and the Federal Civil Defense Administrator in consultation with the Special Assistant to the President for Science and Technology.

MEASURES TO CARRY OUT THE CONCEPT OF SHELTER

1. By NSC Action No. 1882–*b*, the National Security Council agreed that the following measures should be undertaken to carry out the concept of fallout shelter for protection of the civil population against radiation hazard, in accordance with NSC Action No. 1842–*d*:

a. A research and development program along the lines of the recommendations in paragraph 1–*a* of NSC 5807, which reads as follows:

“(1) Research and Development, including prototype construction (exploiting multiple-use principle to the maximum)

\$Millions

“(a) *Research*

\$6.5 (annual rate)

“Although sufficient knowledge of weapons’ effects and of shelter design now exists to permit proceeding with a complete and effective fallout shelter program if this were deemed desirable, expanded research is necessary to refine our knowledge, particularly of blast shelter, and develop more economical and efficient shelter models. In a program of this magnitude, well considered research should save many times its initial cost.

“The following program of research is already identified and can be undertaken as rapidly as funds are made available.

“(i) The field testing, with nuclear weapons, of shelters, other structures, and shelter equipment; provision for development and execution of radiological defense measures; exposure of animals to weapons’ effects; and the instrumentation necessary to evaluate results obtained.

-----\$2.0 Millions

“(ii) The design of various prototype shelters, the development of shelter programs, and development and laboratory testing of structures, facilities, equipment and materials not requiring nuclear field tests.

-----\$1.0 Million

“(iii) Studies dealing with psychological, emotional, educational and morale problems and determinations of tolerance limits under emergency conditions; medical, food, and water requirements in shelter habitation; and sanitary controls to permit tolerable occupation.

-----\$1.5 Millions

“(iv) Development of architectural designs and specifications for new types of multiple-use shelters which will be attractive as well as practical. The Committee believes that attention should be given to the use of grants to schools of architecture and engineering which would stimulate curriculum development, training of new students, and new concepts of shelter design.

-----\$2.0 Millions

“While the above program will be of highest importance in improving our capabilities to develop a comprehensive shelter system, there are serious unsolved problems relating to effects of nuclear attack on humans, including the immediate and long-range effects of radiation, and to the development of measures to provide protection against or mitigate those effects. The Committee feels that a special assessment is required to determine whether present research efforts in this field by the several agencies of Government are reasonably adequate or whether further coordination or acceleration is indicated. It is therefore recommended that a suitable group be designated to evaluate the present efforts and to report on their adequacy, including recommendations for improvement of the total national effort, if such is warranted.”

b. A research and development program along the lines of the recommendations by the NSC Planning Board, as follows:

(1) The Special Assistant to the President for Science and Technology to recommend a qualified group to make a special assessment as to (a) the adequacy of present research efforts by the several agencies of Government on the design and testing of shelters and on the effects of nuclear attack on humans, including the immediate and long-range effects of radiation and measures to mitigate such effects; and (b) whether such research efforts should be better coordinated, integrated, or accelerated. (Paragraph 1, page 1, of the enclosure to the reference memorandum of March 24, 1958.)

(2) The Atomic Energy Commission, in consultation with the Special Assistant to the President for Science and Technology, to

undertake through appropriate means a study appraising the upper limits of massive concentrated nuclear detonations and their by-products which could be tolerated by the peoples of the world and by the world itself. (Paragraph 2–a, page 3, of the enclosure to the reference memorandum of March 24, 1958.)

(3) The Office of Defense Mobilization and the Federal Civil Defense Administration, in consultation with the Special Assistant to the President for Science and Technology, to undertake a study appraising the problem of survival of populations in the period following their coming out of shelter after a massive nuclear exchange. (Paragraph 2–b, page 3, of the enclosure to the reference memorandum of March 24, 1958.)

c. A limited program of prototype construction of relatively small-capacity fallout shelters, differing in design and type (including multiple-use) and adapted to differing conditions such as climate; appropriate tests by actual occupancy for realistic periods of time to be conducted after completion (total cost not to exceed \$6 million).

d. A nation-wide survey along the lines recommended in subparagraph 2–a of NSC 5807, which reads as follows:

“2. Surveys and Pilot Studies

“a. Development of estimated availability of existing shelter on a sampling basis

“As a basis for national planning, definitive information is needed regarding the capability of existing structures to provide fallout shelter, particularly in large cities. The Committee recommends that a survey of existing structures be conducted on a sampling basis to yield such information. This would be handled through direct Federal contract, and would be completed in one year.

“-----\$2.0 Millions”

e. Initiation of a program of public education along the lines recommended in paragraph 3 of NSC 5807, as modified by FCDA in the light of NSC discussion and as outlined below (cost estimated at not over \$12.5 million for FY 1959; subsequent annual appropriations to be determined on the basis of experience):

Outline of Proposed Coverage of FCDA
Information and Education Program

(1) Objectives

(a) Public understanding of nuclear weapons effects, particularly radiation.

(b) Instruction on effective measures of protection.

(2) Low-Key Characteristics

The program would avoid harmful over-excitement of the people by careful treatment of the nature and imminence of the threat.

(a) Prudence, not alarm, is the keynote. All of our best efforts will be directed toward avoiding nuclear war; but prudence and a concern for the Country's future dictate the desirability of taking steps to improve chances of survival in order to rebuild and protect our national heritage if nuclear attack should occur. (We pay a lot of money for insurance of various sorts while doing our best to avoid the contingencies against which we are insuring ourselves.)

(b) The national fallout shelter policy is based *firmly* on the philosophy of the obligation of each property-owner to provide protection on his own premises. The Federal Government will provide information on how to do it, backed up by example of providing fallout protection in its new buildings in the future.

(3) Programs

(a) Support of adult education programs to increase understanding of (i) the effects of nuclear weapons, (ii) what can be and is being done to provide protection, and (iii) the place of individual preparedness in the total national security program.

(b) Combination of training films, instruction materials, magazine articles (popular, trade, etc.), newspaper features, TV programs, etc., aimed in appropriate combination at the following broad subjects:

- (i) Nuclear weapons effects on people, plants and animals.
- (ii) How to provide fallout protection.
- (iii) Family fallout protection (including simple "How-to-do-it, information).
- (iv) Improvised home and basement shelters.
- (v) Protection of food and water.
- (vi) What governments (Federal, State, local) are doing about fallout protection.
- (vii) Radiological decontamination.

(c) The use of national organizations to disseminate information.

f. The elements of a base for rapid acceleration along the lines recommended in paragraph 4 of NSC 5807, which reads as follows:

"4. Elements of a Base for Rapid Acceleration	<i>\$Millions</i> \$1.5 (annually)
---	---------------------------------------

"The measures proposed above are designed to promote shelter construction without extensive financial participation by the Federal Government. The Committee recognizes, however, the possibility that

these measures may be ineffective and that the Government might later wish to initiate a shelter program on an accelerated basis. Many of the other recommended measures will assist in preparing a base for rapid expansion, but in addition it is believed that specific attention should be given to the preparation of a “shelf” of plans and information which might save months of delay in an emergency.

“Specific items proposed are:

“(1) Identification of materials, equipment and manpower
-----\$1 Million (annually)

“(2) Preparation and maintenance of standby orders and organization

“-----\$0.5 Million (annually)”

g. The incorporation of fallout shelter in the construction of new Federal civilian buildings, of suitable size, designed after this date, along the lines recommended in paragraph 5-a of NSC 5807, which reads as follows (supplemental appropriations for such shelter in buildings for which funds have already been appropriated will not be sought):

“5. Incorporation of shelter in civilian Federal buildings

“The Committee agrees that Federal example is an indispensable element in any combination of measures designed to stimulate State, local government, and private spending for fallout shelters.

\$Millions

“a. New Construction \$6.5 (annually)

“Projections of new Federal construction activity (including the Post Office construction program, but excluding military construction) indicate a potential level of about 125,000 shelter spaces annually at an average cost of \$52 per shelter space. This assumes utilization of new buildings for community shelter where practicable, thereby setting an example to local Government and business, and avoiding charges of favored treatment for Federal employees.”

42. Draft Paper¹

Washington, April 7, 1958

Some Elements of a National Military Strategy in a Time of Maximum Tension, Distrust and Destructive Capability

1. Because of the incalculable destructiveness, general war affords a means of achieving only one important national objective; i.e., use as a last resort to prevent Soviet imposition of its will on the U.S. by force.

2. Only when convinced that a Soviet all-out attack is imminent will the U.S. consider launching a preventive war.

3. The purpose of maintaining a capability for massive nuclear retaliation is deterrence.

4. Because U.S. *strategic* nuclear capability is intended *almost entirely* for retaliation

5.

6. Strategic nuclear capability, *in contrast to tactical nuclear capability*,

7.

8. The U.S. must oppose limited aggression with whatever weapons are necessary and suitable, including the use of tactical nuclear weapons. Should the Soviet Union or our allies come to suspect that fear of general war would prevent us from effectively opposing limited aggression, such aggression would become inevitable and would not be resisted by our allies.

9. (I disagree with this thought.)

10. (I disagree here, as well, on the same grounds; i.e., that the Soviets are emboldened by weakness and deterred by strength, in my view.)

43. Memorandum for the Record¹

Washington, April 9, 1958

The President said he had an excellent talk with Secretary Gates and Admiral Burke at the White House last evening. They said the Marines are particularly emotional over the proposed reorganization.

As to themselves, they said that they completely accept the basic propositions of unified strategic planning and direction, and placing all activities under the control of the Secretary of Defense. They are rather afraid of what their staffs might do, however, since there is a great deal more emotionalism and apprehension at lower levels than they themselves feel.

Also, they said that they had prepared a plan a few months ago, which was very thoroughly worked out and coordinated within the Navy Department, and they don't see how they can change their position so quickly.

They added that they knew a lot of people were calling them recalcitrants. They do not feel that they are that at all, since they support the basic concept the President has put forward. They told the President they were worried about the situation they would face when they were called to testify. The President said it is simply a matter of not getting rattled. He felt that they can answer questions quite satisfactorily, given that they have the conviction favoring unified strategic planning and command direction which they had earlier indicated.

The President said that several times in the conversation they mentioned their "apprehensions" over what might be done under some future President or some future Secretary of Defense. The apprehensions do not apply in the present circumstances. The President said he talked these apprehensions out with them. The primary one represented concern over a single service of supply. The President told them he had never believed in it and does not now. There should, however, be the capability for single management of various "common use" items. The President thought they accepted this line of thinking very well. They also said they were afraid that the services might become "mere shells" with consequent loss of morale. The President said he stressed to them the tremendous responsibilities and tasks that would still remain, and felt that their minds were much put at ease by this explanation.

Again they came back to the need for the provision "separately administered." Here he made clear that he expects the Secretaries

¹ Source: Conversation among Eisenhower, Gates, and Burke on Defense reorganization. Confidential. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

to administer their departments; the point is to remove the basis for the argument and resistance now encountered in attempts to eliminate duplication, etc.

They expressed full and wholehearted agreement with the proposals that are being made concerning research and development.

The President said they expressed most effusively their gratitude for inviting them in and talking the matter out with them, and said that he had removed a tremendous burden from their minds. The President commented that there was need for someone who has worked closely with them, such as General Persons if he were available, to stay in close contact with them, and work out additional points of concern that might arise.

45. Presentation to the NSC by Holaday¹

Washington, April 24, 1958

Mr. President:

At the 27th February meeting of the National Security Council, the Secretary of Defense agreed to report to the Council his recommendations concerning the following three points given in the Report to the

¹ Source: Missile development and deployment. Top Secret; attached tables are Secret. 11 pp. Eisenhower Library, Whitman File.

President by the Security Resources Panel of the ODM Science Advisory Committee. These are:

- (1) Report on whether decisions should be made now:
 - (a) To produce additional first-generation ICBMs beyond the 130 currently programmed, to be operational prior to the end of FY 1963;
 - (b) To build additional launching sites required to make operational any additional first-generation ICBMs so produced; and
 - (c) To harden such additional launching sites.
- (2) Report on whether to order now production of more than 3 POLARIS submarine missile systems; and on possible further acceleration of production.
- (3) Report on whether to install interim defense against ballistic missiles attack at SAC bases, utilizing modified available anti-aircraft missiles.

The Secretary of Defense agreed at the 16 January meeting to report on whether to increase the number of operational IRBMs beyond the 8 squadrons (120 missiles) now approved.

In arriving at our decisions it appeared appropriate to consider these questions in the light of the over-all missile capabilities which the U.S. would have during this time period. Presented on this chart are the following missiles:

JUPITER
 THOR
 ATLAS
 TITAN
 POLARIS
 MACE
 REGULUS
 SNARK

The basic chart shows those programs specifically approved by the President in black. The programs recommended by the JCS as a part of JSOP 61 are shown in blue on the first overlay.

Although the three additional programs here indicated, the MACE, the REGULUS II and the SNARK are aerodynamic missiles somewhat more vulnerable to enemy defenses than are the ballistic missiles, we consider that these missiles will be effective weapons for some time to come. The capability which they represent must be considered as complimentary to the several ballistic missile programs.

On the basis of the information available, the Department of Defense does not at this time propose an increase in the ATLAS program over the 9 squadron approved program. While ATLAS bases are currently planned to be soft, latest studies indicate that the

effectiveness of these missiles can be improved by diversification of deployment. Plans call for 1 squadron at Camp Cooke, 2 squadrons at Warren AFB, Wyoming, 1 squadron at Offutt AFB, Nebraska and 1 squadron at Fairchild AFB near Spokane, Washington. Considerations are being given to a semi-hard, 20 1b. base deployment method for the 6, 7, 8 and 9 squadrons.

With respect to the TITAN program, the 1959 budget augmentation request includes 50 million additional dollars for this program. Total will now be \$454.5 million. This funding will permit the deployment of three TITAN squadrons on a hard base by CY 1961. The 4th squadron will be deployed in CY 1962, using later funding. These squadrons will be deployed outside of Denver, Colorado and will be serviced by the Martin plant located at Denver.

We are at the present time reviewing the TITAN program to determine whether it will be practicable to substitute a storable propellant combination instead of the current liquid oxygen-kerosene combination. There are several factors in favor of making such a substitution, including a significant reduction in logistics and reaction time. On the other hand, there are certain engineering problems which must be resolved before we can be assured that this simplified technique can be used. It is expected that these studies will be completed this summer. While we are not recommending an increase in the TITAN program over the approved level of 4 squadrons and 40 missiles, we believe that if the fuel work is successful we will need additional squadrons and would ask for an increase to a total of 8 squadrons as part of the 1960 budget.

With respect to the POLARIS program, the FY 1959 budget augmentation request included funds for two more POLARIS submarines and the necessary missiles. This will provide 5 submarines plus missiles as the approved program. It is not practicable to program, at this time, for additional submarines and missiles until the development program proceeds into the test phase and a better measure is established of system performance and the projected availability dates. The present Navy plan is to continue the production of POLARIS submarines at a rate of about 1 per quarter. If the program continues to show promise, it is likely that additional funds will be included in the 1960 budget request to finance 3 additional submarines.

The Joint Chiefs of Staff have recommended that the number of operational IRBMs be increased to a total of 16 squadrons (240 missiles) by FY 1963. On the basis of a review of the possible deployment locations suggested by the Joint Chiefs of Staff, comments on these locations by the State Department, and progress at the NATO

meeting, it appears that we can make reasonably firm plans for the following deployments:

United Kingdom	4 squadrons
France	3 squadrons
Italy	2 squadrons
Turkey	1 squadron
Alaska	1 squadron
Okinawa or Near East	1 squadron
Total	<u>12 squadrons</u>

Accordingly, at this time the Department of Defense recommends that the total number of squadrons for the first generation of IRBMs be held for planning purposes to 12 squadrons (180 missiles). On the basis of a review of the THOR and JUPITER programs and even though we have only had sporadic successes in both programs, we would not have any reason to believe that either program will result in a complete failure. Because of the inherent differences between the two missile systems, particularly the ground support equipment, we do not feel that it would be desirable to place both JUPITER and THOR in the same overseas deployment locations. Accordingly, we have allocated the first three squadrons of JUPITER to France and would propose that the fourth JUPITER squadron be dropped from the program. We would propose that the remaining requirement of five squadrons be met by the THOR to achieve the program objectives at the lowest cost. To meet the schedules for deployment shown on the chart and the needs of the space program, it will be necessary to increase the THOR production rate from 6 to 8 missiles per month. We also propose to arrange with the Army for a finite program for a total of 3 JUPITER squadrons. This is essentially a buy-out type program. We feel it is necessary to pursue this course of action so long as we do not have proven weapon systems, but are at the same time proceeding with the assumption that both programs will be successful.

The decision as to whether to install interim defense against ballistic missiles attack at SAC bases, utilizing modified, available anti-aircraft missiles, such as NIKE-HERCULES and TALOS has been given extensive study. It is estimated that a 25 unit land-based TALOS program, to be effective in a timely manner, would require immediate approval and obligation of nearly one billion dollars, mostly to be spent over a period of three years, with additional funds required to develop and incorporate the anti-ballistic missile capability. A lesser program, on the order of 12 land-based TALOS units, would require expenditure of approximately

600 million dollars over a period of three years. Although the implementation of this program could result in the earliest possible interim defense against ballistic missiles at a limited number of SAC bases, the expenditure of additional funds in these amounts does not appear to be justified. Since the NIKE-ZEUS system on the basis of available data will probably have a much greater capability, although it will be a year to 18 months later, the Department of Defense feels that the available effort should be devoted toward moving the NIKE-ZEUS system along at an optimum rate to achieve the earliest practicable capability with that system.

Accordingly, the Department of Defense proposes to accelerate the development of the NIKE-ZEUS system, placing particular emphasis on the electronic part of the development program.

Mr. Holaday here summarized.

In summary,

(1) We do not recommend an increase in the ICBM program above the approved 13 squadrons and 130 missiles at this time.

(2) If the development work on the TITAN missile continues successfully, we may recommend an increase of 4 additional squadrons of TITAN in submitting the 1960 budget, that will give a total of 17 squadrons and 170 missiles.

(3) Bases have been selected for the deployment of 5 squadrons of ATLAS missiles on soft bases. A study is being made on making semi-hard the remaining 4 squadrons. Selection of these bases has not been made to date; they will probably be selected to give diversification of deployment at or near present SAC bases.

(4) One hard base for the deployment of 4 TITAN squadrons has been selected near Denver, Colorado. Sufficient money is in the present budget to provide for the deployment of three squadrons. The 4th squadron will be financed in the 1960 budget request. If additional squadrons of TITAN missiles are provided, they will be deployed on hard bases.

(5) We do not recommend an increase in the POLARIS program above the 5 submarines and 80 missiles at this time. We may request additional money in the 1960 budget request to add 3 more submarines, giving a total of 8 submarines and 128 missiles.

(6) We recommend an increase in the IRBM program from 8 squadrons and 120 missiles to 12 squadrons and 180 missiles.

(7) We recommend an accelerated program using the NIKE-ZEUS system as a defense against ICBM missiles.

46. Memorandum From McNeil to McElroy¹

Washington, April 25, 1958

SUBJECT

Comments on NSC 5810, "Basic National Security Policy"

The paper as proposed for NSC consideration is definitely an improvement over NSC 5707/8 which it is designed to replace. I note that many of the suggestions we made last year in connection with the review of NSC 5707 have been incorporated in the present paper. In one most important respect, however, the paper is still seriously deficient; namely, US objectives towards the USSR itself.

The policy paper in this regard appears to suffer from what might be called a "containment psychology"—not in the old Kennan or geographical sense of the term, but rather in the sense of trying to contain Russian progress in science, technology, education, production, foreign

¹ Source: Comments on NSC 5810. Top Secret. 6 pp. Eisenhower Library, White House Office Files, Project Clean Up.

trade, etc. Throughout the paper there are statements of policy which imply that we should try to isolate the Communists behind the Iron Curtain and minimize their contact with the rest of the world. Our major political and economic efforts, apparently, are to be devoted to maintaining the free world alliances and winning over the neutrals to our side, thereby helping to isolate the Communists.

In my judgment this policy is both negative and inadequate. Note paragraph 4 of the new paper which deals with the "basic problem". Listed in this paragraph are four courses of action which, if followed, are supposed to achieve our basic objective "to preserve and enhance the security of the United States and its fundamental values and institutions". I submit that even if we are successful in carrying out these four necessary courses of action, this, in itself, would not achieve our basic objective as stated in the paper. Even if we were to win over to our side all the neutral nations and succeeded in completely isolating the Communists behind the Iron Curtain, our national security would nevertheless continue to be endangered. The Communists already have very great resources and a rapidly advancing technology behind the Iron Curtain. There is no way in which we can alter this situation. It is the military power which these resources and technology generate that poses the basic threat to our national security. In fact, isolating the USSR from contact with the rest of the world might well increase our danger.

It seems to me that the only way in which we can hope to alleviate the basic threat to our national security is to effect a fundamental change in the character of the government of the USSR. No matter how remote this eventuality may seem to be, it must remain our *ultimate* objective.

But this is not enough. We must also know in which direction we wish to effect this change in the Russian government. To my mind the desired direction is unmistakable. It must be toward a government more responsive to the will of the people, and, eventually, a government squarely based on the will of the people. This is the most dependable and perhaps only real assurance for world peace in the future. Agreements with dictators, no matter how well meant they may be, are always subject to sudden renunciation. Furthermore, Khrushchev is here today but may be gone tomorrow. The United States could not with assurance embark on a major disarmament program so long as the government of the USSR is in the hands of a real dictatorship. It is much more difficult for democratically based governments to initiate sudden aggression, especially when it would expose their people to virtual annihilation. It should, therefore, be our objective not only (in the words of paragraph 4(d) of the paper) "to engage successfully in a world-wide peaceful contest with the USSR", but more importantly to influence and encourage the USSR directly

in every possible way to move, no matter how slowly, towards a more popularly based government—and to move, no matter how slowly, into becoming a respected member of the family of nations.

It will probably be argued by many people that this is a Utopian objective; that there is no hope of ever converting the Communists to a less aggressive, more peaceful and democratic way of life. This, to my way of thinking, denotes a negative and defeatist attitude. It denotes a crisis of confidence in our ability to surmount the obstacles confronting us. This psychology is dangerous to our leadership in the world—moreover, it is not justified.

The increasingly dangerous situation in which we now find ourselves is by no means one-sided. The increasing threat to our security arises from the explosive progress in science and technology which is producing weapons of ever increasing speed and destructive power. But the USSR is in the same boat. They have every reason to be just as fearful as we are—and more so. Ironically, of all the peoples in the world, they and we are the most in danger. In this we have a community of interest and for this reason the people of the USSR and the people of the United States have the greatest stake in the achievement of a solution to this terrible dilemma.

On the political-economic side of the problem we have every reason to be confident that ours is the “wave of the future”. Present trends in the USSR give strong encouragement to this belief. President Eisenhower, in his recent address to the American Society of Newspaper Editors, noted this trend. He said:

“And slowly but significantly the Iron Curtain has started to lift. Behind it the personal security and intellectual freedom of the oppressed peoples gradually increase—another development not without promise.”

It is unfortunate that this same hopeful and positive note is not reflected in the proposed policy paper. In this connection, of all nations in the Communist bloc the USSR is, in certain respects, the best prospect for conversion to a way of life more similar to ours. The more advanced, educated and prosperous the people of the USSR become the greater will be their demand for a voice in their own destiny and the right of freedom of speech and movement and in the selection of jobs. It is not fortuitous that Khrushchev holds up the United States as a shining example of achievement towards which the Russian people should strive. He is constantly exhorting the Russian people to catch up with the United States in food, clothing, industrial production, etc. After forty years the leaders of the USSR are still striving to achieve the material success that we have achieved in this country. Our policy should be to encourage this competition; to take up this challenge and make it more difficult for the Russian

leadership to reverse this trend. The Russian people have everything to gain and we have nothing to lose in a race to see which system can do more for its people.

This point of view was most eloquently expressed by President Eisenhower in his Second Inaugural Address. He said at that time:

"We honor, no less in this divided world than in a less tormented time, the people of Russia. We do not dread, rather do we welcome, their progress in education and industry. We wish them success in their demands for more intellectual freedom, greater security before their own laws, fuller enjoyment of the rewards of their own toil. For as such things may come to pass, the more certain will be the coming of that day when our peoples may freely meet in friendship."

Again, it is unfortunate that nowhere in the policy paper do we find this positive objective with respect to our policy towards the USSR itself. Instead, we find in those paragraphs of the paper dealing with "Other Means of Influencing the Communist Bloc" (pp. 16, 17, 18) vague references to "alternatives. . .which would be acceptable to the United States"—"Measures which make more difficult the reversal of policies more acceptable to us"—"Sustaining current ferment in the thinking, and fostering evolutionary trends, within the Bloc"—"Accelerate evolutionary changes in Sino-Soviet policies"—etc. Nowhere in the paper is there any clear indication as to what alternatives", what "measures", what "evolutionary trends" and what "evolutionary changes" we would like to see take place behind the Iron Curtain. Certainly, in this most important of all policies, we should have positive, specific objectives.

The negative tone of the paper is clearly indicated in paragraph 33 *a* (5), "undermine the faith of the Communist ruling classes in their own system and ideology". Why should not our policy be positive? Why should we not seek to hold up to them the advantages of our own system and way of life? Do we or don't we believe that our system is superior to the Communist system as a way of life? Undermining their faith in their own system would simply leave a vacuum. Would it not be wiser to offer something better to take its place? Certainly if we have faith and confidence in our own way of life we should not hesitate to urge it on other peoples for their own good and ours as well.

I am personally convinced that as time goes on our way of life with its many freedoms and respect for the rights of the individual will look better and better to the people of the USSR. Already the Russian leadership is under great pressure to meet the growing demands of the people for more and better consumer goods. Khrushchev's constant harping on such bourgeois frills as better food, more attractive clothing, is a far cry from the hard-bitten, austere communism of the Stalin regime. Already the communist economic system of the USSR

is beginning to show signs of its inability to cope effectively with the problems emerging as a result of Russia's present stage of economic development. Note the recent decentralization of industrial administration and the transfer of farm machinery to the collective farms. (For a further discussion of USSR economic problems see Harry Schwartz's article beginning on p. 145 of the April Conference Board Business Record.)

Regarding specific paragraphs of the paper, I would like to offer the following comments:

Paragraph 3 (d)—It seems to me that this overstates the problem. We have a tendency in government to blame the people for our own failures.

Paragraph 14—The words in brackets, "an appropriate conventional capability", do not appear to be necessary. It is getting increasingly difficult to define "conventional capability". For example, does it include non-nuclear armed missiles? small nuclear weapons?

Paragraph 27 c (5)—With respect to economic development aid, we should recognize that here is another competitor for the government dollar. If what is said in paragraph 43, "Sound U.S. Economy", is to be taken literally, care must be exercised not to go overboard on expanding economic development assistance to other countries, or seek to outbid the USSR in every instance.

Paragraph 28—This paragraph represents an improvement over existing policies but it does not go far enough. While we should do everything possible to prevent the Communist bloc from subverting or gaining political control of independent states through economic aid, we should not oppose Communist economic aid, per se, to these countries. The US must recognize that the productivity and technological capabilities of the USSR will continue to grow. These capabilities will be used for one purpose or another. It would seem that the use of Soviet resources in the form of economic aid to independent states offers less of a danger to the security of the US than the use of these same resources for weapons production or for advancing their military technology. Therefore, we should oppose Communist economic aid only when there is clear evidence that such aid is being directed towards subverting or winning political control of independent states.

Paragraph 35 a (1)—Here is another good example of the negative approach in this paper. The paragraph talks about giving the peoples of communist nations a clear conception of the true US and the free world purposes and offers as an example only what we are against—not what we are for. The quote from the President's Second Inaugural Address is highly pertinent in this connection.

Paragraph 35 b—Should be read in conjunction with the first sentence of Paragraph 39. In paragraph 35 *b* the point is made that we

should, among other things, take every opportunity to negotiate with the Soviet bloc. Paragraph 39 reads, "The United States should continue its readiness to negotiate with the USSR whenever it appears that U.S. interest will be served thereby." Paragraph 35 *b* says we should take the initiative—paragraph 39 is completely passive. This inconsistency probably arises from the fact that paragraph 35 *b* is new, whereas the first sentence of paragraph 39 has not been revised and except for the deletion of one word is the same as in the old paper.

Paragraph 36 b (2)—This is another example of the timid, uncertain approach toward the USSR. Why must we *discreetly* inform Free World nations that expansion of US-Soviet Bloc contacts does not signify US acceptance of Soviet Bloc attitudes? Why should our talking to the Communists raise any question about our accepting their attitudes? It seems to imply a lack of confidence in our own values. We should say openly and most emphatically to the whole world, and particularly to the USSR, that we are expanding contacts with them in the hope of making them better neighbors in this world that we both inhabit.

Paragraph 40—The last part of this paragraph is a considerable improvement over the old paper. But I believe it can be sharpened. Our overriding objective with respect to disarmament, arms reduction, etc., should be to make more difficult a surprise attack against the US. Any reduction in the possibility of surprise would be of the utmost value to the US—of much greater value, for example, than say a 25% reduction in the active duty strength of Communist forces or even a 25% reduction in the number of their active aircraft. It is reasonably certain that the USSR would never contemplate an all-out attack on the US unless it felt sure of virtually complete surprise. President Eisenhower recognized this point in his address to the NATO heads of government last December when he talked of "establishing a system which would exclude the risk of massive surprise attack".

Paragraph 42 c—This should be the job of many people in government, not just the USIA. We should have a positive program which would entail the deliberate preparation of official statements designed to get our views across to the world and particularly to the people of the USSR. We should carry the battle to the Communists by taking the initiative and every allegation made by the Communists should be promptly answered by an appropriate official of the US Government. We should exploit their vulnerabilities and expose their every weakness in an organized, planned national effort. For example, on the matter of housing the head of the Federal Housing Administration, should, in public statements, point out the glaring inadequacies of Russian housing as compared with the US; the Secretary of Agriculture should point to the great

advances in American agriculture as compared with the backwardness of Russian agriculture, etc.

Paragraph 43 a (1)—This sentence should be revised to read:

“Counter the current recession *in such a way as to* foster sustainable economic growth”, etc.

This is the essential point in the present policy as I understand it.

Paragraph 47—The last sentence of this paragraph should be revised to read:

“Implementation of these objectives should *give priority to those* measures which would contribute to immediate combat readiness,” etc.

This would be more in line with our intent.

W.J. McNeil

Assistant Secretary of Defense

47. Memorandum From Twining to McElroy¹

Washington, April 25, 1958

MEMORANDUM FOR THE SECRETARY OF DEFENSE

SUBJECT

Basic National Security Policy—NSC 5810

1. With respect to the Service comments on the whole of the proposed Basic National Security Policy—NSC 5810, I do not agree with the Army-Navy-Marine Corps view, nor do I agree with the Air Force position.

2. The key to both positions is the wording of paragraph 14 in the draft statement of the Basic National Policy.

3. The wording supported in the Army-Navy-Marine Corps view was proposed by the Chairman of the Planning Board, General Cutler, contrary to the views of the majority of the Planning Board. In my judgment, this wording would water down our resolution to strike back against Russia in any aggression, and would indicate that we are willing to conduct limited wars without using the force required. This

¹Source: JCS views on NSC 5810. Top Secret. 12 pp. Eisenhower Library, Whitman File.

intent would probably become known to the USSR and would be an invitation to start limited wars.

4. The Air Force position supports the wording in paragraph 14 as now written in the draft, which is a repeat from last year's edition of the statement of Basic National Security Policy—NSC 5707/8. However, it proposes delaying the settlement of this issue until the results of a study now being conducted jointly by State, Defense, and the JCS are available. This study was directed by NSC action No. 1844b and is an investigation of limited wars. In my judgment, there is no need to await the findings of this study in order to settle one of the most important controversies in military strategy of recent years. We have sufficient information at hand, now, for decision.

5. I recommend that your position before the National Security Council be to support the wording of paragraphs 13 and 14 as now written in the draft statement of the Basic National Security Policy — NSC 5810. I further recommend that you non-concur in the footnote which refers to paragraph 14 and which recommends deferral of decision.

N.F. Twining
Chairman
Joint Chiefs of Staff

Enclosure

Memorandum From Twining to McElroy

Washington, April 25, 1958

SUBJECT

Basic National Security Policy (NSC 5810) (C).

1. The Joint Chiefs of Staff submit herewith their divergent views regarding a draft statement of policy on the above subject, prepared by the National Security Council Planning Board for consideration by the National Security Council at its meeting on 1 May 1958.

2. The majority view submitted by the Chiefs of Staff, U.S. Army; the Chief of Naval Operations; and the Commandant of the Marine Corps is attached as Appendix "A". The minority view submitted by the Chief of Staff, U.S. Air Force, is attached as Appendix "B".

For the Joint Chiefs of Staff:

N. F. Twining
Chairman
Joint Chiefs of Staff

Appendix A

Washington, undated

*VIEW OF THE CHIEF OF STAFF, U.S. ARMY: CHIEF OF NAVAL
OPERATIONS: AND THE COMMANDANT OF THE MARINE CORPS*
on
BASIC NATIONAL SECURITY POLICY (NSC 5810) (C)

1. The Chief of Staff, U.S. Army; Chief of Naval Operations; and the Commandant of the Marine Corps have reviewed the draft statement of policy (NSC 5810) which was prepared by the National Security Council Planning Board for consideration by the National Security Council at its meeting on Thursday, 1 May 1958.

2. From a military point of view, the Chief of Staff, U.S. Army; Chief of Naval Operations; and the Commandant of the Marine Corps consider that certain changes are necessary in order to provide a Basic National Security Policy which is responsive to the present world situation. Over the past several years, a trend in world affairs has developed which has increased Sino-Soviet power and influence, both actually and relatively. The United States, as the leader of the Free World and the heart of its collective security system, has reached a point where we must take action to halt and reverse this trend or resign ourselves to its indefinite continuation.

3. Our national military strategy must not only be designed to cope with the condition of nuclear parity in an era of mutual deterrence to general war, but it must be a strategy which attracts rather than repels the rest of the Free World if we are to maintain an international environment in which the United States can sustain its fundamental values and institutions.

4. Basic National Security Policy must provide the guidance for strong Free World leadership. Four issues are fundamental:

a. Initiative and an Active Policy. The United States must act to seize the initiative, thus shifting the onus of counteraction to the Communist leaders. Initiative is required in all fields but particularly in the political and economic, where it must be supported by appropriate military measures. The adroit employment, particularly movement, of U.S. or allied forces as a cold war operation might spell the difference between success or failure of a bold political move. The United States must exert active pressures against the Sino-Soviet Bloc wherever and whenever possible in order to disrupt Communist designs for world domination. Pressures should specifically include efforts to splinter and reduce the existing Communist structure.

b. Mutual Deterrence. Relative nuclear parity has already made the policy of massive nuclear retaliation unacceptable as anything but a deterrent to total nuclear warfare. Both the United States and the USSR will be increasingly deterred from implementing such a policy except

in response to an attack on them of such proportions as to threaten their national survival, since its implementation could only result in mutual destruction.

c. Nuclear Weapons Policy. Because of mutual deterrence and the dangers of limited conflicts broadening into general war, the United States can no longer base its national policy on placing main reliance on atomic weapons for situations short of general war. In such situations the United States must maintain forces capable of reacting to aggression with *either* nuclear or non-nuclear means in the most effective manner to achieve U.S. national objectives while at the same time minimizing the risk of general war.

d. Limited War. It is important that our policy recognize that limited aggression is essentially any war in which neither the national survival of the United States nor that of the USSR is at stake, that it may include direct conflict between U.S. and Soviet forces, and that it may be intense and of significant duration. The objective may require a military victory, in the traditional sense, or some lesser solution which is to our net advantage. Since limited aggression is increasingly the more probable form of conflict which we must face, national policy should put increasing emphasis on suitable ready forces with a flexible combat capability and provided with transportation which insures their strategic mobility.

5. It is recommended that the four objectives outlined above, together with the implementing textual changes in NSC 5810 which are attached as the Annex hereto, form the basis of your position on Basic National Security Policy.

Annex to Appendix A

RECOMMENDATIONS OF THE CHIEFS OF STAFF, U.S. ARMY, THE CHIEF OF NAVAL OPERATIONS, AND THE COMMANDANT OF THE MARINE CORPS

on

BASIC NATIONAL SECURITY POLICY

(Changes indicated in the usual manner)

1. Page 2, paragraph 5, second sentence—Change to read: “5 . . . (b) in a time of relative nuclear parity and increased Soviet political and economic aggressiveness, to place greater emphasis on ~~non-military~~ political and economic measures and on the military capability to support these measures and to deal with limited Communist aggression.”

REASON: Relative nuclear parity increases the likelihood of limited aggression and requires a military capability to deal with it and to support more active U.S. political and economic policies.

2. Page 3, paragraph 6—Insert as subparagraph 6b and reletter subsequent subparagraphs:

b. To apply pressures actively against the Sino-Soviet Bloc whenever and wherever possible in order to disrupt Communist designs for expansion and

aggression, to reduce Communist influence and control, and to further U.S. objectives.

REASON: U.S. policies should be designed to mount a psychological, economic, and political offensive against the Bloc as well as to shore up the defenses of the Free World against a comparable Bloc offensive.

3. *Page 4, paragraph 8, last sentence*—Change to read: “Hence the Communist rulers must be convinced *by obvious U.S. ability and willingness to meet a wide range of military contingencies with means appropriate to the objective at stake* that aggression will not serve their interest; that it will not pay.”

REASON: To meet the flexible Communist strategy, the U.S. deterrent must include both a nuclear retaliatory force to deter total war and flexible ready forces to deter or deal with limited aggression; and above all, must be made credible to Communist leaders and our Allies by an unmistakable U.S. willingness to employ military force of a quality and degree appropriate to the situation.

4. *Page 4, paragraph 9*—Change to read:

“9. The higher purpose of military strategy must be to affect the will of the enemy, not merely to destroy him. The U.S. recognizes the increasing probability of long term mutual deterrence with respect to general war and the reduced political usefulness of massive retaliation as a means of insuring the security of the Free World. In this era of mutual deterrence to general war, massive retaliation can only be used as a threat, and in the event of general war, in reprisal. To deter the Communists from the use of their military power, the If this purpose is to be achieved U.S. and its allies in the aggregate will have to have, for an indefinite period, military forces with sufficient strength, flexibility and mobility to enable them to deal swiftly and effectively severely with Communist overt aggression in any possible its various form, including general war. and to prevail in general war should one develop. In addition the. This deterrent is much more likely to be effective if the U.S. and its major allies show that they are united in their determination to use military force when necessary against such any aggression.”

REASON: As set forth in Section A of NSC 5810 the United States must recognize the existence of a mutual deterrence to general war and the reduced political usefulness of massive retaliation as the principal means of insuring the security of the Free World.

5. *Page 4, subparagraph 10a*—Change to read:

“10. a. It is the policy of the United States to place main, but not sole, reliance on nuclear weapons to integrate nuclear weapons with other weapons in the arsenal of the United States; and to place main, but not sole, reliance on nuclear weapons in general war, remaining prepared to fight limited war with or without such weapons. to consider them as conventional weapons from a military point of view, and to Nuclear

weapons will be used them when required to achieve national objectives. Advance authorization for their use *in either general or limited war* is as determined by the President."

REASON: It is essential that U.S. policy, in an era of relative nuclear parity, be extremely flexible and provide for adoption of whatever forces and weapons best serve U.S. interests.

6. Page 5, paragraph 13—Change to read:

"13. In carrying out our aim of deterring general war, the United States must develop and maintain *under its own control*, as part of its military forces, ~~sufficient its effective nuclear retaliatory power and must keep that power secure from neutralization or from a Soviet Knockout blow, even by surprise~~ *capability to reduce the Soviet powercomplex to impotency. To the degree that it approaches invulnerability, this force can be made progressively smaller without any decrease in the certainty of its availability for effective application. Security of the deterrent force is a crucial factor in obviating the requirement for immediate or automatic political decision as to its use. Thus, it would minimize the risk of hasty or ill-considered decision in time of crisis.* The United States must also develop and maintain adequate military and non-military programs for continental defense. *Defensive elements must be premised on acceptance of the fact that general war would probably result in large scale damage to the United States. The national effort devoted to defense should provide for early warning, defense of retaliatory forces, and a level of defense in vital areas sufficient to require a significant enemy effort to overcome it, leaving no single threat totally unopposed.* So long as the Soviet leaders are uncertain of their ability to neutralize the U.S. nuclear retaliatory power, there is little reason to expect them deliberately to initiate general war or actions which they believe would carry appreciable risk of general war, and thereby endanger the survival of the USSR."

REASON: To establish terms of reference for the deterrent force and defense requirements.

7. Page 5, paragraph 14—Delete and substitute the following:

"14. *a.* There is a steadily increasing probability that armed conflicts of the future will be limited wars. Limited war can be defined as an armed conflict in which U.S. national survival is not directly at stake. It would probably be characterized by mutually accepted limitations on objectives, locale, weapons and participants. While maintaining our nuclear capability to deter general war, and during a period of relative nuclear parity, it becomes increasingly important further to develop and maintain a capability to oppose limited military aggression wherever U.S. security interests are involved.

b. In each case of limited military aggression, the United States must determine whether: (1) vital U.S. interests require the defeat of such limited aggression by prompt and resolute application of whatever

degree of force is necessary, even at the risk that major Communist counteraction may spread the hostilities into general war, or whether (2) U.S. interests would be served by applying only that degree of force judged necessary to confine the hostilities to a limited area and to the objective of restoring the *status quo ante*, thereby seeking to minimize the risk that major Communist counteraction would spread the hostilities into general war.

c. Within the total U.S. military forces, therefore, there must be included ready forces which, with help as may realistically be expected from allied forces, are adequate (1) to present a deterrent to limited military aggression, and (2) while minimizing the risk of general war, to defeat or hold, in conjunction with indigenous forces, any such limited aggression, pending the application of such additional U.S. and allied power as may be deemed necessary to suppress the limited aggression. Such ready forces must be highly mobile and suitably deployed, recognizing that some degree of mal-deployment from the viewpoint of general war must be accepted. Military planning for U.S. forces to oppose limited military aggression will be based on a flexible and selective capability, including an appropriate nuclear capability for use as authorized by the President."

REASON: This paragraph is a realistic and workable policy for the United States in an era when Soviet ability to deliver a massive nuclear attack on the United States will provide a strong deterrent to such an attack by the United States, except in retaliation. It properly emphasizes the increasing importance of further developing and maintaining the capability, including a nuclear capability, to oppose limited aggression, and recognizes that limited aggression may occur wherever our potential enemies see advantage in such action. Furthermore, it allows much needed political flexibility in that it does not require in advance that the United States, once committed to action in a limited war, must apply unlimited force to achieve military victory regardless of consequences, but leaves the United States free to fight for a limited objective if such is the best course under the conditions then existing.

8. Page 7, paragraph 19—add new last sentence to read:

"In addition to the foregoing, the United States should be prepared to provide limited military assistance to uncommitted nations as required to prevent such nations from seeking and obtaining military assistance from Communist sources and thus falling within the Communist sphere of influence."

REASON: To establish a policy intended to avoid repetition of difficulties in Egypt, Indonesia, etc.

9. Page 8, paragraph 20, third sentence—Change to read:

". . . At the same time it must be recognized that the attainment of relative nuclear parity by the USSR will probably result in Sino-Soviet Bloc

actions at a higher level of provocation than in the past which will confront us with increasingly difficult decisions. Therefore, the United States. . . ."

REASON: A logical consequence of nuclear parity is an increasingly provocative attitude on the part of the Sino-Soviet Bloc. Aggressive actions stemming therefrom will pose an ambiguous threat to national security. Nonetheless, they must be resolutely opposed at the moment of their initiation, if the Free World is to avoid a steady attrition of its position.

Appendix B

Washington, undated

VIEW OF THE CHIEF OF STAFF, U.S. AIR FORCE on BASIC NATIONAL SECURITY POLICY (C)

1. The Chief of Staff, U.S. Air Force, has reviewed the draft statement of policy (NSC 5810) which was prepared by the National Security Council Planning Board for consideration by the National Security Council at its meeting on Thursday, 1 May 1958.

2. It is the view of the Chief of Staff, U.S. Air Force, that the majority position on NSC 5810 is suitable as a basic statement of United States policy. In reaching this conclusion the following areas have been especially considered:

a. Over-all U.S. Strategy. The basic U.S. security objective should continue to be the maintenance of a position of military strength permitting aggressive political action to achieve, by peaceful means, U.S. national objectives. NSC 5810, as written, is a comprehensive and adequate development of this objective. It provides a comprehensive basis for the development and execution of those programs in the political, economic, military and other fields necessary to give meaning to the basic strategy. The supporting military forces and tasks, and their priorities, necessary to provide the position of strength to permit the exercise of U.S. initiative in world affairs, are correctly and adequately described. In this connection, in the annual report to the National Security Council on the Status of U.S. Military Programs as of 30 June 1957, the Department of Defense indicated, based on Joint Chiefs of Staff advice, that forces are in fact in existence to fulfill the military commitments and the basic objectives outlined in basic policy.²

b. Nuclear Parity. The Chief of Staff, U.S. Air Force agrees that we may be approaching a position of relative nuclear parity between the

² NSC 5720, Part 1. [Footnote is in the original.]

United States and the USSR. As stated in national policy, the basic threat to U.S. security is the Communist Bloc determination and ability effectively to direct rapidly growing military and economic power toward the objective of world domination. The most dangerous military manifestation of this threat is the possibility of general war. The over-riding military requirement thus continues to be the development and maintenance of adequate and safe-guarded nuclear retaliatory power. As the USSR approaches relative nuclear parity with the United States it becomes even more essential to deter conflict. The United States must ensure that the Soviet leaders recognize as unacceptable the consequences of retaliation for actions which the United States considers threaten its security.

c. Nuclear Weapons Usage. Primary reliance on nuclear weapons as a deterrent, and for selective use in actual conflict, is the keystone of U.S. policy and posture. This concept is the only course of action open to the United States compatible with the economic well-being of the United States and the free world, and hence with the preservation of our fundamental values and institutions.

d. Limited Aggression. With regard to the position taken by the majority of the Planning Board in connection with paragraph 14 of NSC 5810, it is the view of the Chief of Staff, U.S. Air Force that review of this paragraph should be deferred pending the State-Defense-Joint Chiefs of Staff consideration of limited aggression now in progress. However, a valid statement of national policy in this regard is a continuing essential; therefore, current national guidance, as repeated in paragraph 14, NSC 5810, should remain in effect for the interim. In this connection the Chief of Staff, U.S. Air Force agrees that within the total United States military forces there must be a capability of deterring or, if necessary, defeating, local aggression with forces able also to contribute in general war. This requirement has existed and will continue to exist regardless of forecasts as to relative probabilities of local aggression requiring United States military intervention. With respect to existing U.S. limited aggression capabilities, as of 30 June 1957, the Joint Chiefs of Staff concurred in the Department of Defense advice to the National Security Council that "the United States has ready forces capable of responding selectively and flexibly to local aggression in peripheral areas of the Sino-Soviet Bloc and to carry out initial general war tasks."³

3. It is recommended that the foregoing form the basis of the Department of Defense position on NSC 5810 at the National Security Council meeting on 1 May 1958.

³ NSC 5720, Part 1. [Footnote is in the original.]

48. Record of Telephone Conversation Between John Foster Dulles and Anderson¹

Washington, April 30, 1958, 3:45 p.m.

TELEPHONE CALL FROM SECRETARY ANDERSON

The Sec returned the call and A said he was briefed for NSC tomorrow. It seems to him we are getting away from what he has thought of as military power being a means of enforcing the policies of the U.S. and being an implement by which we achieve our policy. A thinks we should develop more flexibility to give strength to State—apart from dropping the atomic bomb. The Sec said the trouble is people doubt we would do it and therefore we have nothing. The Sec went to the Pres and asked if he could not go to Defense and meet with the officials and JCS and discuss this problem and he agreed and the Sec went and they are making a review of the strategic concept, but the fact is our present policies are running into a dead end. They agreed we need more flexibility but also think we are getting more in the way of deterrent power than we need. A said if he says he thinks we should have more flexibility they say this is good—give us money for the nuclear defense and [illegible in the original] what we need for flexibility. We, said the Sec, have got to make some kind of an estimate and admit it cannot be 100%. Our deterrent capacity does not go down as the Soviet capacity goes up. The Sec said it goes down as they develop means of shooting down bombers so we can't get through. The Sec thinks we are embarked on a theory—not on a really thought-out thing. We are trying to get all we can as fast as we can and not accepting any limit other than the limit which seems to be imposed by physical limitations or lack of knowledge or budgetary controls. If we are given knowledge and no limitation from a budget point of view, there is no limit. A said it will never be settled by Defense or the JCS and the Sec agreed. A said para 14 is the focus of it and he was wondering tomorrow. . . . The Sec. said we should spend several sessions on it. A said to get the top fellows of the NSC spelling it out *clearly*, review it for the Pres and take it in as top-side policy for his consideration. The is the top problem ever since A hit Defense. A said it is worthy of such time and debate as it takes to get it resolved. The Sec did initiate this request to reexamine the strategic concept which involves pretty much what is in para 14. He might want to see it before we try to formulate this. A said that is perfectly all right. They agreed it is crazy to resolve the paper between

¹ Source: Basic national security policy. No classification marking. 2 pp. Eisenhower Library, Dulles Papers, General Telephone Conversations.

9 and 11. The Sec thinks at the proper time the three of them (probably McElroy too) should sit down and work out what they think is sound, show it to the Pres but it should come from the top down and not down up. A agreed and said we should not pass on this.

49. Draft Briefing Note for 364th NSC Meeting by Cutler¹

Washington, April 30, 1958

Introduction

1. The Planning Board has devoted much of the last two months to concentrated discussions of the world situation and in annual review of Basic National Security Policy (the current policy statement having been approved by the President last June).

2. Our review took into account major security policy decisions since last June; the Intelligence Community's February "Estimate of the World Situation"; the Council's discussion of that Estimate at its March 20 Meeting; and other factors. We were stimulated by informal discussions with General Gruenther, Arthur Burns, Jack McCloy, Karl Bendetson, and Robert Bowie.

3. The result of this reappraisal is the proposed revision before you, NSC 5810. The chief elements of this revised policy are stated in *Section A* on p. 2–3, (The Outline of U.S. National Strategy), and developed in detail in *Section B* (Military, Political and Economic Measures, and Domestic Strength and Other Measures). The chief elements are substantially the same as in existing policy, but there is different emphasis upon them.

4. As an orderly procedure, consideration today will be divided into three parts:

First: an introductory summary of the principal factors influencing our review of last year's statement, and of their reflection in the new statement before you.

Second: focussing attention on two significant paragraphs—one on limited military aggression; and the other on Red China-Formosa. Here will be taken up the oral views of Defense and of the Chiefs.

Third: five economic paragraphs which reflect splits of opinion in the Planning Board. Here will be taken up Mr. Randall's comments.

¹ Source: Basic national security policy, NSC 5810. Top Secret. 14 pp. Eisenhower Library, Whitman File.

Part I

1. Very many factors influenced, and are reflected, in this revision. I have placed the major factors on a single white sheet, which is at your place.

(REVIEW FACTORS)

Major Factors Influencing Review of Basic Policy

First. The realization that both sides are capable of delivering massive nuclear devastation (regardless of which side strikes first) increasingly deters each side from initiating, or taking actions which directly risk, general nuclear war.

Second. During this time of nuclear parity and mutual deterrence: (a) there is growing doubt in the Free World whether the United States will use its massive nuclear capability, except in retaliation to direct attack on the United States or its forces, leading to a growth of neutralism and a weakening of Free World alliances; (b) the USSR will be more bold—especially toward less developed and uncommitted nations—in economic penetration, in political action, and perhaps in probing through means of limited military aggression.

Third. Weakness or instability in less developed or uncommitted nations, and their primary aim for “modernization”, renders them vulnerable to expanding Sino-Soviet political and economic penetration.

Fourth. Changes in top Kremlin personnel do not indicate a deterioration or disintegration in the Soviet regime’s policy or determination to achieve world domination for Communism.

Fifth. A U.S. massive nuclear retaliatory capability, invulnerable and sufficient to deter general nuclear war, and to prevail in such a war if it comes.

Sixth. A U.S. flexible and selective capability (including nuclear) to deter or suppress limited military aggression; realizing that the chances of keeping a conflict limited—whenever major areas or causes are involved—are at best not promising.

Seventh. Advances in Soviet military technology and scientific skill.

Eighth. The false images presented by Communism to the world of U.S. intentions and objectives, and of the USSR as the advocate of “peace and disarmament”.

Ninth. The adverse effect of the U.S. economic recession upon a healthy, expanding U. S. economy, which is essential to the security of the United States and the Free World.

Tenth. The ability of the Soviet and Chinese Communist regimes to direct their economic strength in support of internal and external policies which seek world domination.

Eleventh. The American people lack appreciation of the extent of the crisis facing the United States.

2. I wish to draw attention to some of the new guidance and new emphasis in the revision before you, which reflects the impart of these factors. Please turn to Page 2, the “Outline of U.S. National Strategy,” where we restate the basic threat (Par. 3), the basic problem (Par. 4), and the nature of U.S. policies to meet them. (Pars. 5 and 6).

(READ)

3. Perhaps the *principal new emphasis* in this Planning Board revision may be characterized as follows:

a. The U.S. is facing an enduring crisis *greater* than heretofore recognized, which calls for mobilization of *more* human and material resources and for better appreciation by the American people of the extent of the crisis. (Pars. 3, 46).

b. If general nuclear war can be deterred, this crisis will involve a long, drawn-out contest for world leadership with the Sino-Soviet Bloc. (Par. 4).

c. During this time of relative nuclear parity, while the U.S. must securely maintain its deterrent power, military aggression will more likely be of a limited nature. Such limited conflicts should be dealt with in ways which will minimize their spreading into general nuclear war.

d. Concurrently, the U.S. must take a more positive initiative by increasing its efforts (1) in peaceful *political* and *economic* competition with the Sino-Soviet Bloc for the uncommitted and less-developed areas of the world (Par. 5, 6–*a*), and (2) in influencing acceptable changes in the Soviet Bloc through expanded exchanges and contacts, liberalized multilateral trade controls, etc. (Par. 35–37).

Part II

1. How I draw attention to two significant paragraphs in the new statement, which repeat and continue in effect the texts of last year’s statement: *Par. 14* dealing with limited military aggression, and *Par. 41*, dealing with Communist China.

2. There was some sentiment in the Planning Board that *both* paragraphs required amendment. However, the Planning Board did *not* formally recommend their revision;—in part because there is in existence high-level consideration of limited war strategy and in part because both paragraphs affect most sensitive relations with our allies. Instead, it was left that I, as Chairman, would report *orally* upon the views shared by some of us on the Planning Board.

3. *a.* First, as to *Par. 14, p. 5*, dealing with limited war. For discussion purposes, I have drafted an alternative *Par. 14* on the single blue sheet before you. This alternative is based upon the estimate that, in a period of relative nuclear parity and growing unwillingness on the part of both sides to start general war, the USSR may be more bold—not only in political and economic fields—but also in probing (perhaps by proxy) through means of limited military aggression. (NIE *Par. 18, p. 4*).

b. This alternative would make two major changes in existing policy guidance:

first—that, in this period of relative nuclear parity, limited aggression may *not* always be confined to less-developed areas;

second—that, this period of relative nuclear parity, it may *not* be in the U.S. interest to deal with *every* limited aggression by applying whatever degree of military force necessary to suppress it.

The purpose of the proposed changes is to ensure that the U.S. will have a flexible capability so that it can determine the application of force best serving U.S. interests under the circumstances existing in each case of limited military aggression.

c. I will read the alternative on the blue sheet:

(READ ALTERNATIVE)

May 1/58—R.C.

ALTERNATIVE VERSION OF PARAGRAPH 14

14. *a.* During a period of relative nuclear parity, it becomes increasingly important—while maintaining our nuclear capability to deter general war—to develop further and to maintain a capability to oppose limited military aggression wherever U.S. security interests are involved.

b. In the case of any such limited military aggression, the United States should decide whether: (1) vital U.S. interests require the defeat of such limited aggression by prompt and resolute application of whatever degree of force is necessary, even at the risk that major Communist counter-action may spread the hostilities into general war, or whether (2) U.S. interests would be served by the application of only the degree of force necessary to achieve objectives of limiting the area and scope of the hostilities and restoring the *status quo ante*, thereby seeking to minimize the risk that major Communist counter-action would spread the hostilities into general war.

c. Within the total U.S. military forces, therefore, there must be included ready forces which, with such help as may realistically be expected from allied forces, are adequate (1) to present a deterrent to limited military aggression, and (2) in accordance with *b* above, to defeat or hold, in conjunction with indigenous forces, any such limited aggression, pending the application of such additional U.S. and allied power as may be deemed necessary. Such ready forces must be highly mobile and suitably deployed, recognizing that some degree of mal-deployment from the viewpoint of general war must be accepted. Military planning for U.S. forces to oppose limited military aggression will be based on a flexible and selective capability, including an appropriate nuclear capability for use as authorized by the President.

d. The reasoning behind this suggested alternative is:

(1) The *present* guidance (Par. 14 in the revision before you) does *not* envisage the possibility of limited aggression in “developed areas” (including the NATO area). For two reasons this guidance seems “unrealistic”, in a period when both sides are coming to realize that general war is so horrible that it must be avoided.

First, in such a period, limited aggression may occur, and have to be dealt with, in *any* area. For example, the Soviet Union might take steps which seemed to risk general war—even in a place like Berlin—in the belief that the U.S. or its allies would not allow the confrontation, or the military conflict which might ensue, to get out of hand.

Second, while it is obvious that the capability for massive nuclear retaliation remains the deterrent to general war, is that capability *sure* deterrent to limited military aggression? Both the Free World and the Soviet Union are beginning to doubt whether massive retaliation to punish limited acts of aggression will actually be invoked, because of the devastation which would inevitably result to all concerned.

(2) The *present* guidance states that the best way to prevent limited military aggression from spreading is the prompt and resolute application of the degree of military force necessary to defeat it. But, in a time of nuclear parity, is this course in *every* case the *best* way? Because of the unacceptability of a general nuclear conflict, which might result from application of such a degree of military force, should a different principle be invoked? Whether in limited aggression to crush the enemy, or to seek only to restore stability to the situation, may depend on the circumstances of each case.

Expending the degree of force necessary promptly to defeat limited military aggression may, through resulting action and counteraction, bring on general nuclear war. Despite this risk, *some* cases may be so vital to U.S. interests that prompt and massive action to defeat limited aggression may *have* to be taken. But may there not be other cases where U.S. interests would be better served if we did not try to win *too much*, and thereby provoke hostile counter action and perhaps resultant general war,—if we satisfied ourselves with trying to restore the *status quo ante*:

- (2) GENERAL TWINING
- (3) General TAYLOR (BURKE & PATE)
- (4) GENERAL WHITE
- (5) GENERAL TWINING
- (6) SECRETARY OF STATE
- (7) OTHERS

My suggestion is that the Council might recommend approval of the revised policy statement before you (NSC 5810), including as Par. 14 the existing basic policy regarding limited aggression, without change; pending submission of recommendations by the Department of Defense as to any revision of the military strategy paragraphs of this

new basic policy in the light of Council discussion at this meeting and of the joint study on capabilities for limited warfare called for by NSC Action 1881 (due June 1, 1958).

4. *a.* Now, as to Par. 41 (p. 20), which repeats last year's guidance dealing with Communist China. This paragraph contains no guidance as to a future attempt by other nations to seat Red China, rather than the Chinese Nationalist Government, in the United Nations.

b. In this connection, the Planning Board considered:

(1) that the General Assembly in 1957 adopted the "moratorium resolution" by a vote of 48 to 27, with 6 abstentions and 1 absent;

(2) the current withdrawing of Chinese Communist troops from Korea;

(3) the indication by Prime Minister Nash of New Zealand that at some time he might have to honor Labor's pledge to recognize Red China;

(4) the possibility that in 1960 (or perhaps earlier), in U.K. general elections, the victory may go to the Labor Party, which has repeatedly called for the admission of Red China to the UN; and

(5) informal estimates that the U.S. might not be able to hold enough votes to defeat some resulting move in the UN to seat Red China and to turn out the Chinese Nationalist Government as representative of China.

c. Some Planning Board members thought the U.S. should be considering *how*, while it still enjoys its strong position in the UN, alternative ways of dealing with such a contingency, and of finding a way—so vital to U.S. interests—to preserve the independence of Taiwan despite the loss of her status as representative in the UN of all-China.

d. Whether stated in the policy paper or not, should we now be thinking about how to preserve an independent Taiwan in a future contingency that the U.S. might not be able to rally enough UN votes to prevent the seating of Red China in the UN?

SECRETARY OF STATE

Part III

1. There remain five split views to be resolved, all dealing with foreign economic matters.

2. Mr. Randall (who cannot be here today) has advised that the draft statement is generally satisfactory and consistent with U.S. foreign economic policy, with three exceptions relating to the three following splits:

(1) *Page 12, par. 27-d*

This paragraph, part of our economic policy towards less-developed nations (especial "one-crop" nations) provides that the U.S., for political reasons, may on "occasion join in multilateral examination of price, production, and demand trends which might help to promote

readjustments between supply and demand and reduce price fluctuations. *Treasury* and *Commerce* wished to add that the U.S. should not discuss the making of, or participate in, any international commodity agreement. The Planning Board did not agree with this addition.

Mr. Randall has called my attention to the fact that the CFEP on October 11/55 generally disapproved international commodity agreements, and that CFEP policy requires interagency policy level approval before such an agreement may be discussed with a foreign nation. Neither of these points is reflected in par. 27–d. Mr. Randall believes that the whole paragraph should be deleted until present policy in this regard is modified by the CFEP, on motion of a CFEP member.

May I suggest, accordingly, because I agree, that this paragraph should be stricken and its substance referred to the CFEP for action as a matter within its jurisdiction.

(COMMENT:)

(2) *Page 13, par. 29–a.*

This paragraph deals with the total level U.S. economic assistance world-wide. *Treasury* and *Budget* wished to continue the qualifying provision, which appeared in the 1957 policy statement: "Increases in economic development assistance should, to the extent politically and militarily feasible, be offset by decreases in other economic or in military assistance programs." The Planning Board did not agree with this addition.

Mr. Randall thinks the addition of this provision undesirable, because there may be circumstances where such an offsetting would not be wise. He thinks each problem should be determined individually in the light of all the pertinent considerations.

SECRETARY OF THE TREASURY
DIRECTOR, BUDGET
SECRETARY OF STATE

(3) *Page 18, par. 37–c.*

This paragraph states the existing U.S. policy for a unilateral embargo on U.S. trade with the Chinese Communist Bloc. The ODM member suggested a liberalization of our embargo policy to conform with multilateral liberalization. The Planning Board did not agree with this suggestion at this time.

Mr. Randall commented that proposals for changes in our economic defense policy should be made first in CFEP. I agree with his position.

MR. GRAY

(4) *Page 12, par. 27–e (6).*

This paragraph, part of our economic policy towards less-developed nations, provides: "Be prepared to consider, on a case-by-case basis, participation with other Free World nations in multilateral development projects or funds." *Treasury* and *Commerce* would delete. The Planning Board did not agree with the deletion.

Since the circulation of the policy statement before you, State, Treasury, and Commerce have agreed to a rewording of this paragraph as

follows: "Be prepared to study the acceptability of proposals for the establishment of international institutions for development financing." The agreement on this language stems from a current study by the National Advisory Council on proposals for an affiliate of the IBRD which would help in financing less-developed countries.

SECRETARY OF THE TREASURY
SECRETARY OF COMMERCE
SECRETARY OF STATE

(5) *Page 5, par 14.*

This is a modification which the ODM member wished to make in the old text of the guidance on limited military aggression: to specify that the "flexible and selective capability" should include "an appropriate conventional capability" as well as a nuclear capability. The Planning Board did not agree with this amendment.

MR. GRAY

3. On *Page 3, par. 6-e*, I would like to suggest a correction which has recently come up. The present provision is that our policies should be designed—"e. To deter *Communist* limited military aggression" etc.

I suggest that it is not only *Communist* limited military aggression that should be deterred and defeated. The Communists may well seek to act by stirring up a neutral or uncommitted nation to aggress. Furthermore, *any* limited military aggression is dangerous. Therefore, I suggest that this provision should read:

"To deter limited military aggression wherever U.S. security interests are involved,"

Such a revision would conform to the general language on limited military aggression in existing policy.

SECRETARY McELROY
GENERAL TWINING

Attachment

Summary Paper

Washington, April 30, 1958

SUMMARY OF TEXTUAL CHANGES IN DRAFT BASIC POLICY
*PROPOSED BY CHIEFS OF STAFF OF ARMY,
NAVY AND MARINE CORPS*

Para. 5, second sentence (page 2)

Greater emphasis on those military forces needed to support a U.S. political and economic offensive and to deal with limited Communist aggression.

Para. 6 (page 3)

New subparagraph (6–b) basically alters present strategy by calling for active, intensified pressures on the Sino-Soviet Bloc, including deployment of U.S. forces to back up bold political moves. Purpose of new offensive is to splinter and reduce existing Communist structure.

Para. 8, last sentence (page 4)

Military posture to meet all contingencies is required in order to convince Communist leaders that the U.S. is willing *and* able to make any aggression unprofitable for them.

Para. 9 (page 4)

Two major changes in military thinking:

1. Use of force is to affect will of enemy, not merely to destroy him.
2. Massive retaliation can no longer insure the security of the Free World. It can only be used as a threat, and in the event of general war, as reprisal.

Para. 10–a (page 4)

Two major changes in the use of nuclear weapons:

1. Main, but not sole reliance on such weapons in *general* war.
2. Limited war to be fought with or *without* nuclear weapons.

Para. 13 (page 5)

Major changes are:

1. Sufficient nuclear retaliatory power to reduce Soviet power complex to impotence must be *under U.S. control*.
2. As nuclear retaliatory power approaches invulnerability, (a) it can be reduced in size, and (b) launched only after due consideration rather than, as now, automatically or hastily to prevent its destruction in the event of surprise attack.
3. No continental defense can prevent large-scale damage to the U.S. in event of general war. Vital areas in U.S. should be defended to the extent that a significant enemy effort is required to destroy them.

Para. 14 (page 5)

Two now introductory sentences to alternate para. 14:

1. Defines limited war as *an armed conflict in which U.S. national survival is not at stake*. (Explanation of this definition in Appendix A, para. 4–d, states that direct conflict between the U.S. and Soviet forces may be included within the new definition.)

2. Estimates that future armed conflicts will probably be characterized by mutually accepted limitations on objectives, locale, weapons and participants.

Para. 19 (page 7)

New last sentence authorizes limited military assistance to uncommitted nations in sufficient quantities and on terms adequate to prevent such nations from accepting Communist military assistance.

Para. 20, third sentence (page 8)

Estimates that achievement by USSR of relative nuclear parity will result in increasingly provocative actions by the Sino-Soviet Bloc with the corresponding increase in number of difficult decisions to be made by U.S.

50. Letter From Cutler to McElroy¹

Washington, May 5, 1958

Dear Neil:

The President has just approved the Record of Action of the Meeting of the National Security Council for May 1, relative to NSC 5810—the revision of Basic National Security Policy—and it is being transmitted to you formally. In addition, I thought it might be useful for me informally to summarize the points made by the President at the NSC Meeting which affect the Department of Defense (the following statement of which he has checked):

(1) He doubted the validity of the concept that “mutual deterrence” provides an umbrella under which “small wars” could be waged in areas such as NATO without expanding into general nuclear war. Accordingly, he thought this concept required further study.

(2) He asked for further study and debate on the view that it would be possible to withhold involving our massive nuclear retaliatory capability in the event that the Soviet Union attacked in the NATO area.

(3) He thought there were various alternative courses of action, if we were to strengthen our forces and our capabilities for limited war. One alternative might be at the expense of our nuclear deterrent capability. If such an alternative were adopted, we would need a detailed accounting by the Joint Chiefs of Staff as to precisely what would constitute a satisfactory deterrent. Another alternative could involve a massive increase in resources allocated to defense. If such a course were adopted, it would be necessary to study what methods might be found

¹ President's comments on NSC 5810. Top Secret. 2 pp. Eisenhower Library, White House Office Files, Office of the Special Assistant for National Security Affairs.

to maintain much greater forces, without resorting to a controlled society or becoming a garrison state.

(4) He thought there should be provided to the National Security Council more definitive information as to the exact size of the deterrent forces which the U.S. requires in this calendar year and will require over the next two or three calendar years.

As you will see from the Record of Action, we have included in NSC 5810/1 the exact language for pars. 13 and 14 of the existing basic policy (NSC 5707/8) without change.

You will note in the approved Record of Action that the President revised the June 2 date for receiving from the Department of Defense (perhaps in the form of a limited-distribution-supplement) recommendations for any revision of the military strategy outlined in NSC 5810/1, after Defense shall have given further consideration in the light of the Council discussion at the May 1 Meeting. The President has authorized an extension of this date to June 16, because he wants these important matters brought up for further discussion and final approval, while the significant issues raised are still fresh in our minds, without there being requested any further postponement.

Accordingly, he has approved a Council Meeting on June 26 to hear the Defense recommendation. This schedule will permit advance circulation of the Defense recommendation due June 16 (on such limited basis as may be deemed necessary) to Council Members, in plenty of time to be fully prepared for the Council Meeting on June 26.

It would obviously be very desirable to receive the joint study on limited war capabilities pursuant to NSC Action No. 1881 on or before June 16, so that its consideration could be coordinated with the above Defense recommendations.

Sincerely yours,

Robert Cutler

Special Assistant to the President

51. Letter From McElroy to Eisenhower¹

Washington, May 7, 1958

Dear Mr. President:

I am forwarding herewith the first quarterly report of progress in the Military Reconnaissance Satellite Program undertaken by the Advanced Research Projects Agency, Department of Defense.

The Military Reconnaissance Satellite Program is the initial satellite program (other than VANGUARD and JUPITER C) which I have this far determined, in accordance with National Security Council Action No. 1846, "to have objectives having key political, scientific, psychological or military import."

This initial report covers historical background and program plans for the development of Weapons System 117L which consists of the satellite vehicle, its information sensing, storage and transmission devices, and the ground receiving equipment and facilities. A financial plan for this project through Fiscal Year 1959 is also included.

Weapons System 117L is the culmination of extensive research and investigation since 1946 to determine the feasibility and operational capability of a satellite as a military reconnaissance vehicle. These studies have concluded that a Satellite Intelligence System is feasible and has potential operational capability of providing current and reliable intelligence information. Need for this information will continue to become more critical as technological advances enable a potential enemy to bring into being offensive weapons with constantly increasing range and greater destructive power.

Contracts for development and test of Weapons System 117L were let in October and November 1956. The first test flight of the Weapons System 117L satellite vehicle is planned to be conducted in late 1958. Successive tests of orbital capability of the vehicle and performance of the reconnaissance equipment are planned to continue through 1960.

Expected useful life for pioneer versions of the Military Satellite Vehicle equipment is 10 to 30 days and for later versions one year. The satellite vehicles are planned to be equipped with sensing devices which will relay reconnaissance information to the earth at a rate which would permit coverage of the entire Soviet Bloc by a single vehicle as frequently as once every eight days.

Successive progress reports will be provided to you each quarter showing highlights and significant accomplishments in the execution

¹ Source: Transmits report on military reconnaissance satellite program. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

of the Military Reconnaissance Satellite Program. Additional interim reports will be submitted in event of breakthrough or other occurrence which would rapidly modify the schedules or objectives of the program.

In accordance with National Security Council Action No. 1846, the “scope of operational capability” of Weapons System 117L will be promptly raised for your approval when such approval becomes necessary in carrying forward the program.

With great respect, I am

Faithfully yours,

Neil H. McElroy

**52. Memorandum of Discussion at the 365th NSC Meeting
of the NSC¹**

Washington, May 8, 1958

SUBJECT

Discussion at the 365th Meeting of the National Security Council, Thursday, May 8, 1958

Present at the 365th NSC Meeting were the President of the United States, presiding; the Acting Secretary of State; the Secretary of Defense; and the Director, Office of Defense Mobilization. Others present were Mr. Fred C. Scribner, Jr., for the Secretary of the Treasury; the Director, Bureau of the Budget; the Special Assistant to the President for Atomic Energy; the Chairman, Council on Foreign Economic Policy (for Item 1); the Special Assistant to the President for Science and Technology (participating in Item 6); the Federal Civil Defense Administrator; the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Deputy Secretary of Defense; Dr. George B. Kistiakowsky, President’s Science Advisory Committee; Colonel John White, Central Intelligence Agency; The Assistant to the President; the Deputy Assistant to the President; Mr. Abbott Washburn for the Director, U.S. Information

¹Source: Agenda item 6: US–USSR Ballistic Missile Developments. Top Secret; Eyes Only. Extracts—4 pp. Eisenhower Library, Whitman File, NSC Records.

Agency; the Director, International Cooperation Administration; the Special Assistants to the President for Information Projects (Item 1), for National Security Affairs, and for Security Operations Coordination; the Naval Aide to the President; the White House Staff Secretary; Mr. Howard Furnas, Department of State; the Executive Secretary, NSC; the Deputy Executive Secretary, NSC.

There follows a summary of the discussion of the meeting and the main points taken.

[Omitted here are agenda items 1–5.]

6. *US-USSR BALLISTIC MISSILE DEVELOPMENTS*

(NSC Action No. 1833)

In introducing the subject, Dr. Killian indicated that it was essentially a comparison of developments in the Soviet ballistic missiles program with our own U.S. ballistic missiles program. This was primarily a technical study, but the conclusions that he was about to produce were based upon sound technical judgments. The study was essentially an analysis of Soviet tests since 1954 of ballistic missiles in the various ranges, in comparison with U.S. experience in developing and testing similar missiles. Among the conclusions thereupon presented by Dr. Killian, there was one to the effect that in the field of the shorter-range ballistic missiles the Soviets had a larger variety of types and ranges than did the United States. With respect to both the intermediate range ballistic missiles and the intercontinental ballistic missiles, the Soviet Union was approximately a year ahead of the United States. There was also a suggestion of greater mobility for the longer-range Soviet ballistic missiles. ICBMs may be transportable by railroad. If so, this would indicate that the Soviets had developed a storable liquid fuel for their ballistic missiles.

Dr. Killian added that this general situation stemmed from the fact that the Soviets had inaugurated their ballistic missiles programs so much sooner than had the United States, rather than from the fact that the U.S. program was itself behind schedule. Dr. Killian then asked Dr. Kistiakowsky to provide the technical back-up and details behind these conclusions.

In his report, Dr. Kistiakowsky used two charts. The first was entitled "Guided Missiles Test Ranges"; the second, "Soviet Ballistic Missiles and Satellite Firings Since 1954".

Following Dr. Kistiakowsky's report, Dr. Killian added two conclusions.

The President commented that he had just read in the papers that a high official of the Defense Department had spoken in opposition to the creation of a civilian space agency. The President inquired whether this could be true. General Cutler identified the Defense Department official as Mr. Roy W. Johnson (Director of the Advanced Research Projects Agency in the Pentagon).

Secretary Quarles rose to defend Mr. Johnson. He first described his own difficulties during his testimony before the Lyndon Johnson committee, and explained that Mr. Roy Johnson had been led into a trap of words. He was quite sure that Mr. Johnson did not disagree with the fundamental proposition of civilian control of the space program.

Mr. Dulles pointed out that the report of Dr. Killian and Dr. Kistiakowsky again brought up the matter which he had earlier proposed to the President and the Council, of the desirability of relative net estimates respecting U.S. and Soviet programs. Since that time, some weeks ago, he, General Twining, Dr. Killian, and General Cutler had had some conversations on this subject and were still working on a possible procedure to provide such comparative estimates. In a certain sense, the report today constituted the first trial of such a relative estimate. The President expressed his very strong approval of this kind of comparative estimate.

General Twining inquired of Dr. Killian whether he thought that there were any measures by which we could speed up the procedure for testing U.S. ballistic missiles. Dr. Killian replied that we were building a new test area on the West Coast to supplement the test facilities at Cape Canaveral. On the other hand, our immediate problem was not to provide more room for ballistic missiles tests, but to solve the propulsion problem in our ballistic missiles.

The President observed that Dr. Kistiakowsky's report clearly showed that the Soviets were ahead of us in developing propulsion systems for their missiles. They may not, however, have been so successful in other aspects of their missiles program. Secretary McElroy wondered whether this report did not tend to over-emphasize Soviet capabilities for the reason mentioned by the President. It might be well if we did so over-estimate their capabilities, but we should bear the matter in mind. Dr. Kistiakowsky stated that every effort had been made to avoid over-emphasis.

At the conclusion of the presentation on this subject in the Cabinet Room, the President and certain members of the Council adjourned to the President's office, where Dr. Killian and Dr. Kistiakowsky discussed for a quarter of an hour the intelligence material on which their report on Soviet ballistic missile developments had been based. A list of the persons attending this meeting is filed in the minutes of the NSC meeting; another is attached to this memorandum.

The National Security Council:

a. Noted and discussed an oral report on the subject by the Special Assistant to the President for Science and Technology, assisted by Dr. George B. Kistiakowsky.

b. Noted the comment by the Director of Central Intelligence that this report was an example of the comparative estimates of U.S. and

Soviet capabilities which he had recommended in NSC Action No. 1833; and that he was continuing to consult with Dr. Killian, General Twining and General Cutler to develop the best procedure for making such estimates.

NOTE: The action in *b* above, as approved by the President, subsequently transmitted to the Director of Central Intelligence, the Chairman, Joint Chiefs of Staff, and the Special Assistants to the President for Science and Technology and for National Security Affairs.

S. Everett Gleason

53. Memorandum From Stroh to Robertson¹

Washington, May 8, 1958

SUBJECT

Basic National Security Policy

Encl: (1) CNO's Views on Basic National Policy—NSC 5810

1. Attached hereto (encl (1)) is a copy of the paper which I understand Admiral Burke spoke to you about last evening (7 May).

2. Admiral Burke would very much appreciate it if you could glance over it and give him the benefit of your reaction as to the language, grammar, or any other field, but more particularly the appropriateness and verity of the thoughts expressed.

3. As you know, the Joint Chiefs of Staff are to confer with the Secretary of Defense next Tuesday (13 May) on this matter, at which time each of the Chiefs and the Chairman will express their views and state why they feel NSC 5810 should be altered or left alone as the case may be.

4. Admiral Burke would also very much appreciate it if you could find the opportunity to ask for Mr. Murphy's opinion in this matter even if he can spare the time only for a cursory glance.

Very respectfully,

Robert J. Stroh

¹ Source: Transmits views of Chief of Naval Operations on NSC 5810. Top Secret. 9 pp. NARA, RG 59, Central Files, 711.5/5-858.

Enclosure

Paper Prepared by the Chief of Naval Operations

Washington, undated

THE CHIEF OF NAVAL OPERATIONS' VISION ON THE BASIC NATIONAL POLICY—NSC 5810

Basic National Security Policies—as other statements of policies and objectives—are frequently defined in such broad and ambiguous terms that, although everybody can agree to the wording, the language cannot serve as a guide in any specific case.

Our major difficulty in writing a National Security Policy is to obtain specific language which will convey the same general thoughts to those who must plan for, and execute the policy.

There are several different ways of losing Europe, the Middle East, Asia and other areas; one of them being destruction of the United States, another being by permitting any one of our allies to be attacked by any communist country without immediately coming to our allies' aid; and another by permitting our allies to lose confidence in our intentions, or our strength, or our willingness to help, or our judgment; and as a result, accommodate themselves to communism.

The main military elements of national strategy—*now*—are:

To reject the concept of preventive war or acts intended to provoke war, while at the same time making it clear that we are determined to oppose aggression despite risk of general war.

To deter the Soviets from starting general nuclear war by convincing them the United States has the nuclear power to destroy Russia, and will do so if they initiate general war.

To maintain the various United States nuclear retaliatory forces in such deployment and posture that regardless of what Russia does, even with a surprise attack, Russia will be utterly destroyed by the retaliatory attacks.

To build and maintain a defensive system for the continental U.S. of sufficient size and effectiveness that our military striking forces in the U.S. cannot be dealt a knock-out blow by a Russian surprise attack and be sure that the Russians are convinced that this is true.

To convince our allies that an overt military attack by Russia on any one of our allies will automatically cause the U.S. to unleash a nuclear retaliatory attack on Russia.

To maintain United States military forces of appropriate types, adequate and ready to defeat or hold, with the help of indigenous forces, local communist aggression in undeveloped areas of the world.

To render direct economic and military assistance to allies in order to build up recipient nation's ability to participate in its own defense.

The Situation Now

The United States has had, for quite a few years, the assured nuclear retaliatory capability to destroy Russia.

Russia probably *is* convinced she will be destroyed if she attacks the United States in general war.

Russia on the other hand probably also is convinced she cannot destroy U.S. retaliatory power, in a surprise attack, or by any other means.

The United States does not find itself in a wholly satisfactory international position at the present time. American prestige is not as great as it has been in the past, our influence throughout the world is lessening somewhat, our military and economic power does not command the respect and admiration it once did.

The Soviets and the other Communist States have lived under the shadow of powerful United States nuclear retaliatory forces for a decade—and have become accustomed to their existence, and yet—the Communists have taken actions to expand their control over more territory and more people of the world without let up.

Egypt and Syria are coming more and more under communist domination. Nasser is in Russia being advised that the sure way of filling his empty coffers is to seize all Middle East oil properties, a view he may find attractive if he can figure how to do it—and the Soviets will assist in the machinations to accomplish this end.

Indonesia is in a turmoil and the probability of this rich undeveloped country coming under communist control is greater than it was a year ago.

Should Indonesia go communist, Thailand, Laos and other Asian countries may follow suit to accommodate themselves to what they may consider the winning side.

Russia has made technical advances as well. The USSR has developed the capability to wreak severe damage on the United States with nuclear weapons. She has a large number of submarines. She has developed some ICBM capability. She was the first to put a satellite in orbit.

The world was surprised at the technological advances made by Russia, and probably credits the USSR with capabilities greater than actually exist.

It is just recently that the world has come to place significance on the USSR ability to severely damage the United States with several weapons systems regardless of the efforts we may make on our continental defense.

People are now commencing to question our policies, or perhaps only our relative superiority to the USSR, probably due to many factors, but certainly including the continuing expansion of communism,

the increasing technical competence of the USSR, and the means Russia now has to damage the United States.

The fact that, despite our great defensive efforts, the USSR can now inflict severe damage on continental United States, apparently has shaken the confidence of some of our allies that the United States will in fact make a nuclear retaliatory attack on the USSR unless the immediate security of the United States is jeopardized. They may believe that the fear in the United States of the threat that we have not yet learned to live with stoically will immobilize our will—and our power—at the crucial showdown. They really question our national will to act as we say we intend to.

Others among our allies question our judgment on placing sole reliance on massive nuclear retaliation to defeat aggression, of launching headlong into a general nuclear war in retaliation of what they may consider a “small aggression.” Especially is this questioned when they visualize that the nation aggressed against is not a near neighbor, nor is its opinion necessarily asked before action is taken. These people are reported not to want to associate themselves in alliances which may become involved in a general nuclear war, automatically initiated to defend some other nation—and a war to which they cannot contribute, will have little voice in the control thereof, and, in their view, provide only their country as a battleground to be devastated.

Probable Future Situations

The USSR, as she develops an ICBM and a submarine missile capability, also may come to believe that the United States will not actually launch retaliatory strikes unless United States security is directly jeopardized. If she comes to believe this, the USSR can be expected to continuously expose the United States to the *threat* of severe destruction so as to keep the United States so pre-occupied with preparing for general nuclear war that we will not take appropriate action in time to stop the gradual expansion of communist domination of other countries by other means. She can also be expected to be very careful not to provide sufficient provocation to the United States to launch our nuclear retaliatory forces.

Also, Russia may be expected to continue to exploit U.S. general war posture in perpetrating fear among our allies that through nervous anxiety the U.S. might itself set off the nuclear war either (1) as an inappropriate response to little probes or (2) by accident.

The communists, by intrigue, subversion, political warfare, and propaganda, will do their best to intensify any lack of confidence of our allies, not only in our ability and willingness to conduct general war in the protection of our allies, but also in our willingness and skill to prevent nations from coming under communist domination by less dramatic action.

They will continue blackmail, sabotage, espionage, guerrilla warfare, economic warfare, local civil insurrection, and all the other tricks that they have used in the past, including limited war by proxy, to conquer more countries.

The threat of massive nuclear retaliation will not stop these actions in the future any more than it has in the past. Massive nuclear striking power is important, but it is not the solution to all of our problems, or even most of them.

Future Policy

It isn't that we don't need adequate retaliatory power of diverse types. We do. The difficulty is in determining how much we need. Any more than what we need is not only wasted, but it uses resources which might otherwise be made available for the more probable military actions. Of course, we must have a safety factor in determining the amount that we need. Probably the maximum amount of retaliatory force the U.S. needs for a general war would not exceed twice the amount required to kill half the Russians. These retaliatory forces should be reasonably immune to a Soviet long-range missile build up. The point is, I think, that even if we had an unlimited and overwhelming retaliatory force, there are many situations which have arisen, and similar situations will arise again, where these overwhelming forces would not provide the solution. We should not therefore imply that these forces can solve all of our military problems. It comes down to a question of emphasis, or degree, or balance. In my opinion, we have given the appearance of becoming so engrossed and absorbed in the prospects of general nuclear war that our allies, as well as the communists, and I think even we ourselves, are not sufficiently alert to the prospects of other types of military action.

The USSR must remain convinced that if the USSR overtly attacks any one of our allies directly, we will launch those retaliatory forces against the USSR. But at the same time, the USSR, as well as our allies, must also be convinced that we would not launch a massive retaliatory effort against the Soviet Union in reply to every *communist* effort to expansion, including overt attacks by non-Russian communists.

Russia and China and other communists, and most particularly the free world, should be convinced that we will use sufficient force promptly to quell even non-Russian communist attacks and will not rely solely upon massive retaliation as punishment. The punishment must fit the crime.

The world must realize that we intend to use atomic weapons when the situation may call for atomic weapons in any action, but at the same time, they must have confidence that we will use them with

discrimination in limited war because we realize that excessive amounts of force would unnecessarily destroy people and facilities.

We are at war now—not peace. We should not only realize, but act upon the realization, that treaties, negotiations and economic pacts, as well as limited military operations, are the weapons of this war.

Therefore, in addition to the performance of their combatant functions, the U.S. must have military forces also capable of performing various other functions which will permit diplomatic maneuvering in support of U.S. cold war offensive.

The U.S. must be able to recognize and act quickly on small problems as they occur in the world and before those problems grow to a big size requiring big action.

In order for the U.S. to continue to be an influence in the world, the U.S. must have allies and friendly neutrals.

Our allies will require forces under their own control sufficient to enable them to contribute significantly to their own defense, since they are showing increasing reluctance to placing major reliance on the United States' massive retaliatory strikes on Russia.

The U.S. should permit our allies the pride of achievement associated with contributing significantly to their own defense. Since their greatest commodity is manpower, the U.S. will probably have to continue to supply our allies with a great deal of their armaments.

In my opinion, these steps would make it clear to the world that communist expansion by whatever means will be dealt with by the U.S. by the most appropriate means. No one, least of all the Russians, should have any doubt of our determination.

Probably the only effective way of convincing the world of our resolution is to take firm and timely action of whatever kind is necessary to prevent the communists from gaining further footholds in non-communist countries. This should include the willingness to conduct limited war, to assist friendly countries to maintain freedom from communism regardless of the steps that are taken to impose communism.

It is my opinion that the adoption of the more specific language proposed by the JCS majority view will more nearly provide the necessary guidance for reorientation of our military strategy to meet the requirements of the situation which now faces us.

54. Memorandum From Green (FE) to Robertson (FE)¹

Washington, May 9, 1958

SUBJECT

Basic National Security Policy

Rear Admiral Stroh has just brought over to you for comment a copy of a paper (at Tab A) which Admiral Burke proposes to read at a meeting of the JCS with Secretary McElroy next Tuesday (May 13). According to Admiral Stroh, Admiral Burke has already spoken to you about this paper.

The background, I understand, is as follows: General Cutler has recommended fairly extensive rewording of paragraphs 13 and 14 of the new Basic National Security Policy paper (NSC 5810). The general effect of Cutler's proposed revisions would be (a) to include Europe and Turkey within the area where potential limited wars might be fought, (b) to require the use of "precision" weapons and something less than maximum nuclear countermeasures in the event of local war, and (c) to recognize that in certain local war situations it might be in our national interests if we could restore the status quo ante rather than try to "defeat" the enemy and occupy his terrain.

The JSC are split over the Cutler reformulation of paragraphs 13 and 14. The Air Force opposes, whereas the Army, Navy and Marine Corps favor the Cutler changes. Admiral Burke's paper provides effective and logical arguments for the majority JCS view.

I believe you will agree with the point of view presented in Admiral Burke's paper, for he argues for the retention of a diversified arsenal of weapons systems, both conventional and nuclear, and for a capability to cope with small brushfire wars quickly and in a manner least likely to cause a spread of the war. The nucleus of his argumentation will be found on pages 6-8 of his paper at Tab A.

It is therefore recommended that you telephone Admiral Burke to say that you have read his paper with great interest and appreciation; that you thoroughly agree with the logic of his case; that you could supply any number of political arguments in support of what he has so effectively analyzed from a military viewpoint; and that you are passing his paper on personally to Mr. Robert Murphy (as Admiral Burke requests).

¹ Source: Comments on CNO's views on NSC 5810. Top Secret. 2 pp. NARA, RG 59, Central Files, 711.5/5-858.

Comment

When occasion permits you might make the following additional comment:

There are many types of war or crises situations requiring many types of weapons to meet those situations. If we narrow the spectrum of our weapons system to nuclear weapons or if we are only prepared to use large-scale military measures designed to “defeat” the enemy, we may well find ourselves frozen into inaction in situations where we would properly hesitate to apply the required atomic weapon (as in infiltrations, evacuations, guerilla fighting, etc.). On the other hand, if we were to plunge into these situations from the outset with nuclear weapons or with excessive retaliatory measures, we not only would risk a major nuclear war but would forego all possibilities of settlement involved in diplomacy conducted at the outset of a conflict before it spreads into the nuclear field or before it spreads geographically.

55. Memorandum of Conference with the President¹

Washington, May 12, 1958

OTHERS PRESENT

General Twining
General Goodpaster

This was the first of General Twining’s “periodic” meetings with the President (intended to take place once each two weeks unless there is not enough agenda to justify a meeting).

General Twining first took up the question of the internal organization of the Joint Staff following defense reorganization. He said there is now a chance to set it up on a sound basis. However, there is one view

¹ Source: Defense reorganization; nuclear test ban; outer space. Secret. 3 pp. Eisenhower Library, Whitman File, DDE Diaries.

in the Chiefs that the present set-up should be continued simply adding an integrated operational section; others feel that a J-Staff should be instituted, comparable to the staffs the unified commanders now have. He felt that if this step is not taken now, it may never be taken.

The President, after reviewing charts showing alternative patterns, said that the "J-Staff solution" is the way he would do it.

General Twining reported on recent developments regarding the reorganization proposal. General Twining said Congressman Vinson had tried to freeze the joint staff organization in its present form, but Defense is not agreeing to that. The President referred to several recent instances of Defense representatives departing from Administration positions in testimony to the Congress. The Navy is trying to get authorization for twice as many Polaris submarines as approved. Mr. Roy Johnson is opposing the Administration's proposals regarding the NACA. The President was delighted, however, to see the fine support Admiral Radford had given for the Defense reorganization bill. General Twining added that Admiral Burke has really been doing a good job on the Defense reorganization. His problem comes from the pressures on him from within the Navy.

General Twining then showed the President a copy of a memorandum the Chiefs have submitted to the Secretary of Defense opposing the stopping of nuclear tests. He said the Chiefs of course realized that there are many factors that enter into the question with which they are not concerned, but they felt that the military aspect of the matter is such that there should be no cessation. The President said that if he could get the changes made in the law that he had asked, and could provide information to the United Kingdom, he thought we might very well want to achieve an agreement to stop tests after the present series. For the present, however, he thought we should just be negative on the proposal; after Hardtack, and on the basis of an agreed and effective monitoring system, he thought he would be agreeable to cessation. General Twining said the Joint Chiefs felt this action should be part of a wider package. The President stressed the great importance of getting inspection groups, capable of unimpeded movement, into Russia. Profound consequences could be expected, and we could anticipate extension of such inspection to other phases of disarmament. He repeated that as of now he would not stop the tests.

The President reverted to his comment about organization for outer space activities, and said he was concerned that the top-most officials in Defense do not see the need to be firm on these matters and to stop the free-wheeling testimony now going on. He recalled that Secretary McElroy and the scientists had agreed with him on the assignment of

these responsibilities (for other than military applications) to civilian organization. General Twining said it was not clear to him what the point of some of the recent testimony was.

Referring to Defense organization, General Twining said that Defense is not giving an inch on the provision concerning “separately administered.” He said the President’s letters to business leaders are having an effect, as well as is other activity, and grass roots sentiment is showing up heavily in favor of the reorganization proposal. There is an increasing feeling in Congress that Defense will get what the President has proposed. The President recalled that he has felt the Joint Chiefs of Staff should have less and less to do with the administration of the military departments. Instead they should spend their time studying the over-all Defense problems that affect our country. Visits such as those to Puerto Rico and to Quantico were, in his view, highly useful techniques for this purpose.

58. Briefing Note for 367th NSC Meeting¹

Washington, May 29, 1958

ITEM 3

1. The next item is a Progress Report by the Department of Defense, relating to the Military Mobilization Base Program.

2. In March, 1957, the Department of Defense presented to the Council a new Military Planning Concept to Govern Planning and Development of the Mobilization Base.

3. That concept was reflected in our 1957 and 1958 Basic National Security Policy statements. The significant new features of this concept were:

(1) Meeting the requirements of only those forces which would be mobilized by M + 6 months (instead of M + 36 months).

(2) Taking account of the possibility of substantial bomb damage to the U.S.

(3) Covering the eventualities of cold war, military conflict short of general war, and general war.

(4) Positioning pre-D-Day stocks overseas sufficient to insure reasonable effectiveness of forces there surviving enemy nuclear attack.

4. Defense was then requested to prepare at the earliest practicable date an outline—using this new concept—of the Military Mobilization Base Program, force structure, and annual costs in order of magnitude.

5. Today we will hear from Defense a report of difficulties encountered and progress made in meeting this request. Later, in the 1958 Defense annual status report, we shall receive a statement of the actions taken by Defense up to June 30 to develop the Military Mobilization Base Program, using the new concept. Still later, hopefully in early fall, Defense will present to the Council its proposed Military Mobilization Base Program for FY 1960.

ASSISTANT SECRETARY McGUIRE

59. Memorandum of Discussion at the 367th NSC Meeting¹

Washington, May 29, 1958

SUBJECT

Discussion at the 367th Meeting of the National Security Council, Thursday,
May 29, 1958

Present at the 367th NSC Meeting were the President of the United States, presiding; the Acting Secretary of State; the Secretary of Defense; and the Director, Office of Defense Mobilization. Also present were Mr. Fred C. Scribner, Jr., for the Secretary of the Treasury; the Acting Director, Bureau of the Budget; the Special Assistant to the President for Atomic Energy; the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Deputy Secretary of Defense; Assistant Secretary of Defense McGuire; the Assistant to the President; the Deputy Assistant to the President; the Director, U.S. Information Agency; the Director, International Cooperation Administration; the Special Assistants to the President for Information Projects, for National Security Affairs, for Science and Technology, and for Security Operations Coordination; the White House Staff Secretary; Assistant Secretary of State Smith; Assistant Secretary of Defense Sprague; the Naval Aide to the President; Mr. Harrell B. Altizer and Mr. Donald Schwartz, Department of Defense; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

[Omitted here are agenda items 1–2.]

3. STATUS OF MILITARY MOBILIZATION BASE PROGRAM

(NSC Actions Nos. 1680 and 1698; NSC 5707/8, paragraph 47; NSC 5810/1)

General Cutler briefed the National Security Council on the subject item. (A copy of General Cutler's briefing note is filed in the minutes of the meeting, and another is attached to this memorandum.) He then called on Assistant Secretary of Defense E. Perkins McGuire, who read his report with the assistance of visual aids. (A copy of Secretary McGuire's report is filed in the minutes of the meeting.)

At the conclusion of Secretary McGuire's report, General Cutler first called on Secretary McElroy, who complimented Secretary McGuire and said he had nothing to add.

¹ Source: Agenda item 3: Status of Military Mobilization Base Program. Top Secret; Eyes Only. Extracts—3 pp. Eisenhower Library, Whitman File, NSC Records.

Mr. Gordon Gray commented that Secretary McGuire's office was doing a splendid job on those responsibilities for the mobilization base which pertained to the Department of Defense. On the other hand, ODM was gravely concerned about the three problem areas which Secretary McGuire had mentioned in his report, and particularly the last one, namely, the lack of any bomb damage assessment.

Mr. Gray said that ODM was also concerned about a matter relating to the prepositioning of military supplies. While some protection was being afforded to military materiel prepositioned overseas, there was no adequate protection for military materiel prepositioned in the United States.

The President noted that one reason which clearly explained the need for affording greater protection to existing military supplies had derived from the conclusions of the studies by the Net Evaluation Subcommittee. These results had indicated that even after a not too devastating Soviet nuclear attack on the United States it would be extremely difficult to go on producing any single military end-item because components which went into the production of the end-item were manufactured in a variety of different cities, all of which would be target areas in a Soviet attack. Mr. Gray said that the subject of the President's comment—the so-called vertical factor of production—also concerned him. The component situation had not improved.

Secretary McElroy predicted that it would not improve in the future, and suggested that there were good reasons why it should not improve.

Mr. Gray then pointed out what he considered to be a development which needed to be watched and which was under study in the ODM. It would appear that under the new mobilization planning concept if we could assume that limited war would last for as long as three years the United States would not be confronted, as in past wars, by the familiar conflict between guns and butter. Instead, it might face a serious unemployment problem. This was true because under the new mobilization planning concept we no longer assume full-scale mobilization during a war.

The National Security Council:

Noted and discussed an oral report on the subject by the Department of Defense, prepared pursuant to NSC Action No. 1680-*b*, as presented by Assistant Secretary of Defense McGuire and commented upon by the Director, Office of Defense Mobilization.

[Omitted here is the remainder of the memorandum.]

60. Memoranda From Several DOD/ISA Offices¹

Washington, June 11, 1958

MEMORANDUM FOR THE DIRECTOR, OFFICE OF PLANNING**SUBJECT**

US and Allied Capabilities for Limited Military Operations to 1 July 1961

This planning study was received on June 2nd and while the time element imposed upon the Office of Department of Defense is appreciated, the Regional Director, Far East would have preferred additional time for thorough study of so important a matter and to allow more people to express their views.

In general this is an excellent planning study and certainly a good thinking exercise. It cannot help but be felt however that a succession of limited wars or simultaneous limited wars on two far-flung fronts could pitch the U.S. economy and way of life to a point where it might become preferable to throw aside normal restraint and restrictions defined for limited war in this study. Limited wars have brought the UK and France to an economic crisis that has only avoided catastrophe through extensive US support. Also it is felt that the study could stand a little more emphasis on the psychological, economic warfare phases. There is no doubt that limited warfare is precarious at best and any use of nuclear weapons, "Tactical, Minor or Clean", can hardly but raise a doubt that the action will remain a limited rather than an overt conflict.

Specifically, (1) On page 11, at the end of paragraph 2, after the word "southward" recommend that the period be deleted and the following added: "as a concurrent and supporting operation." (2) It would appear that the present version of US and Allied capabilities was prepared before the recommendations submitted concerning appendix D were considered. It is suggested that attention be invited to the Regional Director, Far East comments on this subject. (3) Attention is invited in conjunction with the immediately previous comment concerning the U.S. capabilities together with strong loyal Vietnamese forces to reestablish the independence and territorial integrity of Laos. This is not considered possible with forces outlined in this study, especially in view of the conclusion on page 3 that the U.S. cannot assume effective employment outside their national territory of the Vietnamese. (4) Another possible conflict exists in the

¹Source: Comments on "U.S. and Allied Capabilities for Limited Military Operations to 1 July 1961." Top Secret. 10 pp. NARA, RG 218, JCS Files.

statement on page 13 that the provision of airlift could present a major problem and the general conclusion that the U.S. has the capability of dealing successfully with the situation. It is suggested that conclusion #1 be hypothecated to some degree to account for the present lack of adequate airlift to move ground forces.

Memorandum From the Director of the Near East, South Asia and Africa Region, DOD/ISA (Bergin) to the Director of the Office of Planning

Washington, June 11, 1958

SUBJECT

U.S. and Allied Capabilities for Limited Military Operations to 1 July 1961

Reference is made to I-14298/8, returned herewith.

This Regional Office has studied the attached document and, in accordance with your request, desires to comment as follows:

This is a well-constructed study and the conclusions and recommendations appear to grow logically from the facts used, the assumptions employed, and the lines of action considered in the formulation of the 12 hypothetical situations utilized in the development of the study.

Although this Office has been asked to limit itself to major points of substance, it feels obligated to comment on the methodology of the study, since the results flow inescapably from it and their validity depends directly upon it. At the outset, it is agreed that the choice of the method of study—the use of a sampling of hypothetical situations—was a reasonable one, probably the only method applicable. The crux of the matter is stated in Para 5, page 10: “The military responses are hypothetical ... and have not been war-gamed to develop detailed plans.” This is understandable, but it does not prepare one for the uncompromisingly self-satisfied tone of Conclusion 1, page 2: “The U.S. has the capability to deal successfully” Somehow this is all too comfortable, and too comforting, and scarcely squares up with what might well develop in the way of “limited war”.

To cite just a single item: our performance to date in creating adequate transportation capabilities for the “quick” application of U.S. force—the *sine qua non* of a successful response—has been anything but

reassuring. One fears the possible soporific effect upon the NSC of such an optimistic assessment as Conclusion 1, page 2.

On the whole—and with the above reservation—the section labeled “III. CONCLUSIONS”, on pages 2–6, is a very well put-together and persuasive passage, and this Region is in general agreement. It is difficult to conceive of how “nuclear strikes deep into Communist China” will fail to bring on a general war.

With the major caveat that Conclusion 1, page 2, may have mischievous results in creating an unwarranted feeling of self-satisfaction about our conventional forces, this Region feels the paper should prove most interesting to the NSC.

Memorandum From the Director of the European Region, DOD/ISA (Guthrie) to the Director of the Office of Planning

Washington, June 10, 1958

SUBJECT

U.S. and Allied Capabilities for Limited Military Operations to 1 July 1961

The following comments on the study prepared by a State-Defense-JCS Working Group are offered in furtherance of your memorandum of 29 May:

GENERAL COMMENTS:

In view of the importance of a study on this subject, it is considered extremely important that the generalized conclusions and recommendations regarding our military capabilities to conduct such operations must be supported by a detailed analysis and study within the Department of Defense. A review of the attached document indicates that there is no such documentation. Instead, the discussion rests primarily on the views of the authors without any factual backup. In light of this fact, it is considered most important that the Department of Defense should not take a position on this paper in the NSC until such a time as the views of the Joint Chiefs of Staff have been formulated and considered by the Office of the Secretary of Defense.

*SPECIFIC COMMENTS:**a. Conclusions:*

1. The first conclusion that “The United States has the capability to deal successfully with situations requiring limited military operations” is not completely supported by the remaining conclusions and the discussion. It would seem that the conclusion requires qualification.

2. Reference Para. 4. The intent of the first sentence, i.e., “No military tasks were found to be unique to limited military operations,” is not clear. Certainly many of the tasks which may have to be performed under such conditions would be vastly different from those in the event of general war. This raises the question as to whether the present trend of weapons is such that U.S. forces will become increasingly more inflexible. In this connection, it would appear that this Para. was written primarily from a viewpoint of air operations and does not give due recognition to the problems arising in connection with ground forces.

3. Reference Para. 7. It is noted in this Para. that “initial reliance was placed upon Air and Naval forces because they were in position and most capable of fast reaction.” While the Air and Naval forces may be positioned and capable of fast reaction in certain instances, there is a question as to their capability to react effectively under all situations. In this connection it is pointed out that in the early days of Korea the initial U.S. position was to counter the aggression by use of Air and Naval forces. It soon became evident that such action was not sufficient and that ground forces had to be deployed to the Peninsula at an early date. Although this Para. recognises that in many cases the intervention of U.S. ground forces will be essential, the timely availability of these forces is predicated on their proximity or on available air/sea lift.

4. Reference Paras. 9 and 11. These conclusions indicate that for U.S. forces to be most effective, they must be applied quickly. Yet the rapidity with which ground forces can be committed to action is dependent upon availability of sea/air lift, a questionable capability.

5. Reference Para. 15. This conclusion raises a question as to whether or not the U.S. stocks of “low yield weapons” and “clean weapons” are available in sufficient quantities for use in the operations as visualized to allow the U.S. to carry out defense without generating adverse reactions referred to in Paras. 17 and 18. A more complete factual exploration and exposition of the subject seems indicated.

b. Recommendations:

1. Reference Para. 2. This Para. points out that “even though nuclear weapons are not used in limited military operations, public reaction world-wide, based primarily on fear of general war, will be adverse to U.S. military intervention.” This recommendation would seem to be

based more on a matter of opinion than on fact and in this connection it is pointed out that the bulk of the free world applauded the decision of the U.S. intervening in Korea at a time when the prospects of World War III were equal to, if not greater than, might be the case today.

2. Reference Para. 4 (See Para. 5., above). It is not made clear just what degree of "cleanliness" will not arouse adverse world opinion.

3. With reference to Paras. 6 and 7, it would appear that effective and prompt U.S. response to limited military aggression requires facilities and capabilities to a greater extent than that now in existence.

In view of the above comments, it is believed that the first conclusion and the first recommendation are not borne out by the supporting comments and recommendations. As pointed out above, it is believed that ISA should suspend further action on the document pending the receipt of the formal views of the Joint Chiefs of Staff as to their professional judgment as to any military capability to conduct limited operations.

No detailed comments are made with regard to the "hypothetical situations" in view of the comments contained in Para. 8 of the basic memorandum and of the earlier comments furnished your office by this office.

**Memorandum From the Director of the Office of Planning,
DOD/ISA**

Washington, May 29, 1958

MEMORANDUM FOR MR. SPRAGUE

SUBJECT

U.S. and Allied Capabilities for Limited Military Operations to 1 July 1961

1. The study on limited military operations which the State-Defense-JCS working group has prepared is being reproduced by the Joint Staff and is expected to be in our hands this afternoon.

2. General Cutler has indicated the desirability of having the limited military operations study available on or before 16 June so that it can be reviewed by the other members of the Planning Board prior to its consideration on Friday 20 June. As you are aware, the Planning Board is also scheduled to take up at that time the residual problems in the basic policy paper. The close relation between the two studies makes it desirable to speed up the processing of the limited military operations study.

3. Attached for your signature is a brief memorandum requesting comments from appropriate elements of OSD. The Joint Chiefs of Staff will be concurrently reviewing the study as will the State Department. It is our intention together with State and the Joint Staff to try to produce shortly after 10 June a draft letter to the NSC which both Secretaries McElroy and Dulles would sign, reflecting their views and comments on the study.

4. Signature is recommended.

P.H. Greasley
Brigadier General, USAF
Director, Office of Planning

61. Memorandum of Conversation¹

Washington, June 17, 1958

Rear Admiral Charles O. Triebel, USN
General Cutler

Secretary Dulles said he would like to commend the cooperation which the Department of Defense had given in connection with the Lebanon affair, pointing out that needed equipment had been supplied to the Lebanese government in exceptionally fast time. He pointed out that it would be best if the Lebanese forces could handle the problem themselves. If we have to intervene, it will be only the choice of the lesser of two evils—the greater of the two evils being the political repercussions of our failure to come to the aid of our friends, the Lebanese.

Secretary McElroy then opened the discussion on the Strategic Concept. He said that Defense officials and the JCS had two discussions on the matter. They had given a good deal of thought to the type of military backing that the US should have for its diplomatic aims.

Secretary McElroy felt that, perhaps, Defense had failed to give the Secretary of State a clear picture of our limited war capabilities. He suggested that some situations could best be handled by non-US forces. Of course, it would be preferable if these were UN forces. But until that became possible, he wondered if some type of volunteer forces,

¹ Source: Strategic concept for the defense of Europe. Top Secret. 14 pp. NARA, RG 59, S/P Files: Lot 67 D 548.

including non-white forces, should not be recruited. This idea is being examined now in the Department of Defense. Also being examined is whether the US needs the numerous strategic weapons systems which it now plans for. It does not follow that, if our strategic weapons can be cut down, we would automatically build up our limited war capabilities. Over the long run one might be able to reduce over-all defense expenditures, but not now. He speculated as to whether we should let our allies know more about our limited war capabilities—but, perhaps, we don't have enough to do this.

Secretary McElroy then introduced Rear Admiral Triebel, who gave a briefing on the Joint State-Defense-JCS limited war capabilities study. As this study is available in the Department of State, this briefing will not be detailed here.

Upon conclusion of the briefing, Secretary McElroy asked what the basic problem was. Is it because our allies do not know about our limited war capabilities or are our capabilities insufficient?

Secretary Dulles said there were two problems: (a) the Strategic Concept; and (b) our limited war capabilities.

These capabilities are relevant if our strategic concept contemplates limited war. The Joint State-Defense-JCS study shows that we do have a doctrine for limited war, and we seem to be in reasonably good condition in regard to limited war capabilities and in the matter of relations with our allies in this respect.

Secretary Dulles said that, although there is no US commitment to come to Iran's defense, there is a gap in our military capabilities in regard to Iran. He referred to the concern reported by General Taylor last winter that Iran would be used as a funnel for an attack. We must face up to this problem in connection with the forthcoming visit of the Shah of Iran.

The Secretary said that the big problem involving the strategic concept is in relationship to NATO. In our thinking we assume that there can be no limited war in Europe. He said he did not quarrel with this assumption—he shared this judgment. However, we in the State Department detect a growing concern, voiced by responsible European officials as well as demagogues, that the US, when it comes squarely under the threat of ICBM attack, will not launch an all-out nuclear attack on the Soviet Union if another NATO nation is attacked.

Secretary Dulles referred to Duncan Sandys' concern to this effect, of which he had been advised at Copenhagen. The Secretary then read pertinent excerpts from Sandys' paper which had been presented to the British Cabinet.

Secretary Dulles also reported Ambassador Houghton's judgment that, during the forthcoming visit to Paris, de Gaulle would make two points in justification of a French nuclear weapons production program.

First, the prestige of being in the nuclear club; and, second, France's fear that the US would not call upon massive retaliation to save Europe when the cost in US casualties became clear to US leaders.

Secretary Dulles said that none of us doubts that President Eisenhower will order a strategic nuclear attack in that event. But his term has but two years to run and who knows what his successor's views will be. Secretary Dulles said he knew of one potential successor who might not be as firm as President Eisenhower on this score.

Secretary Dulles said he felt that the time was near when our European allies are not going to be satisfied with a strategic doctrine depending on a US decision to invoke all-out nuclear war in the event of an attack on Europe. He felt that the European countries would go their independent ways unless we find with them a concept they consider more dependable.

The Secretary said he did not think limited war in Europe was possible. The important thing, however, was what the allies think and do. The Europeans are just starting to think about this problem in a fuzzy manner. Two alternatives seem to be opening to them. One was to develop independent nuclear weapons production capability, such as the British and the French are trying for. It is only logical that others will follow. Maybe this course is right. But it is dangerous not to have an agreed strategic concept which is satisfactory to all the NATO partners. It is dangerous for them to prefer that each one have its own nuclear capability.

In the case of the French, a nuclear weapons program is something of a gesture. They cannot afford a real program. They must depend on us or accept risks of another kind. Even the United Kingdom cannot afford such a program. Certainly Italy cannot. In the case of Germany, there are strong public opinion controls. The Brussels treaty only prevents production of nuclear weapons on German territory. The French-Italian-German (FIG) program may get into nuclear weapons production.

The second alternative is to drift into neutralism.

Secretary Dulles said that he and others had thought about the possibilities of "area" defense with tactical weapons. He did not believe a war in Europe could be confined to a limited area. However, in order to give our allies a credible policy, we should think of how to create a situation where our allies would have greater rights in regard to the future use of tactical nuclear weapons in Europe. If we insist that, with the exception of possible hostilities in Yugoslavia and Berlin, the only conceivable type of European war is all-out nuclear war, the result will be a feeling of futility—a brief effort to manufacture nuclear weapons, followed by an abandonment of that effort because of its expense, and then a drift to neutralism. That is the likely course of events under present circumstances. We can hold on one or two years.

Secretary Dulles pointed out that Sandys' statement was no mere informal effort. It had been formally submitted to the Cabinet, which had apparently acquiesced in Sandys' subsequent publication.

Mr. Quarles asked what Sandys' alternative was. The Secretary replied that it was total disarmament, which no responsible official considered seriously.

Secretary Dulles said that he quoted Sandys as representative of leading statesmen in Europe. He could quote plenty of others to the same effect. Indeed Sandys' doubt is a rational doubt. No one knows what a future President will do. There may be future moods of isolation in the US. No nation likes to have its national existence depend on a decision which may involve the destruction of another nation—so thought is being given in Europe to alternatives. Sandys' alternative is fantastic. But Prime Minister Macmillan thought it was good propaganda.

The Secretary said there seemed to be two serious alternatives under consideration—separate national nuclear weapons programs or neutrality. The Secretary said he had no definite answers to this problem. He did feel that a strategic concept, which was wholly dependent on a US decision to incur nuclear devastation, would not be gambled on by our allies. We must think of alternatives. He has no cure for the problem and no special competence in this field.

Secretary McElroy asked if the Europeans think that we would withdraw our forces from Europe. If they do, that would really be bad. But our forces in Europe are developing an increased tactical weapon capability. In the event of war, how would it be possible for the US nuclear forces not to be drawn into action.

Secretary Dulles recalled a Sunday afternoon in December 1950. It then seemed possible that the American divisions in Korea would be wiped out. Radical alternatives were considered, but no thought was given to using nuclear weapons. Who was to say that the same situation might not come up in the future in regard to our divisions in Europe.

Mr. Gates asked if this situation warranted a reconsideration of preventive war. Secretary Dulles said it did not in his judgment. This might be a logical alternative, but it was not practical in view of the beliefs of the American people and their form of government. He said he wanted to make it perfectly clear that he was not backing down nor did he have any feeling of fear. Mr. Quarles said that we didn't have any freedom of choice about preventive war. Mr. Gates said he had in mind preventive strikes after a European ally is attacked. Secretary Dulles said that is different. If our allies thought that "we could shoot the works" without getting badly hurt they might have more confidence in us. Mr. Quarles said that is our present policy. General Twining confirmed this. General Taylor said that he had some doubts that this was our policy.

Mr. Sprague asked how it would help European nations' confidence to have control over nuclear weapons since they would not have enough weapons to give them parity with the Soviet Union. In this situation, would not the same doubts about non-use of nuclear weapons crop up?

Secretary Dulles agreed and said he felt that European nations would not long pursue individual programs to manufacture weapons. He feared they would then attempt to "stay out" of the conflict.

Mr. Quarles said that, as a matter of logic, if countries become neutral they are in more danger than if they are in the alliance. If this is true, why would they drift to neutralism?

Secretary McElroy said that it appeared that we could not match the USSR in Europe without resorting to at least tactical nuclear weapons, but use of such weapons would bring all-out nuclear war unless the hostilities were quickly stopped by common consent.

Secretary Dulles said he thought a war in Europe could not be limited. Many people think that US involvement in a European war would be more likely if it developed gradually than if the US was faced suddenly with a "cold blood" decision looking to all-out war, which might lead to the end of the US.

Secretary Dulles recalled being in Japan at the beginning of the Korean war when it was thought that no US ground forces would be needed—only some air support. Later it was felt that small ground forces would be needed to stiffen the Korean forces. Later large US forces were required. In the first World War, American participation was in the beginning to be only logistical. Later large manpower contributions had to be made. Once in a fight, emotions may lead to decisions different from those facing a nation in "cold blood" when a decision may have to be taken which would involve destruction of all life in the northern latitude.

Secretary McElroy said the important thing is the continued deployment of US troops in Europe. He recognized the possibility of American divisions being sacrificed in a European war, but failure in such situations to bombard the USSR would sit terribly with Americans. Secretary Dulles pointed out that the same was true in the case of the alternative.

Secretary McElroy pointed out that if we lost Western Europe, we would be isolated by the Communists.

Mr. Quarles said it would be poor tactics for the Soviets to destroy US forces in Europe. It would be a sure way to incur the destruction of Russia. Even if the Soviets felt that in the first instance we would not fight, an attack on American troops would lead to the opposite result.

Mr. Douglas asked if we would be able to hold allies if we could assure them of tactical nuclear weapons sufficient to meet Soviet attack with conventional forces. He recalled Secretary Dulles' point that it

was important to force the Soviets to first use of nuclear weapons. Mr. Douglas said that this would avoid having to meet conventional attack with strategic bombardment.

Secretary Dulles said that our allies' concern is based on doubt that they can count on a nuclear response from the US. He mentioned thinking in the State Department about a NATO authority which might hold custody of nuclear weapons and suggested that this might be a useful project to explore.

General Taylor said that that was the objective of our program—to spread nuclear weapons laterally and to our allies. We have no illusions that 175 divisions can be stopped without the use of large yield nuclear weapons. But we have to believe and act as if we believed that there is an intermediate response to a Soviet attack in Europe short of all-out nuclear war.

Secretary McElroy asked if we had been too preoccupied and made too many statements in regard to our strategic bombing capabilities. Have we deemphasized our tactical nuclear and carrier forces and Marine divisions? Perhaps not enough attention had been paid to the fact that somewhere between 25% and 40% of the defense budget was going to our limited war capabilities. Perhaps our allied visitors should see our limited war capabilities rather than concentrate on visits to SAC and Cape Canaveral.

General Pate pointed out that during the past two years the Marines and the Navy had had ten joint exercises involving seven different nations.

Mr. Sprague pointed out that George Brown (UK laborite), a recent visitor to the Pentagon, had told him that too few people knew about US limited war capabilities.

Secretary Dulles observed that from the briefing he had gathered that we do have plans for the use of small nuclear weapons—that we are not gambling everything on high yield weapons. This means to him that there are some possibilities in regard to “area” defense. General Taylor said that this is what we are shooting for—small, light weapons with little fall-out.

Secretary Dulles said that there was time enough—if our allies knew that we had more to our strategy than trans-polar strategic nuclear exchanges with megaton weapons.

Governor Herter asked if the number of our limited war effectives would be reduced if there was a concurrent threat of general war. Admiral Burke said that in such a situation, which would be like the Suez situation, we would be increasing both our capabilities for limited and general war simultaneously. General Twining said in such a situation we would limit mobilization. Governor Herter asked if our limited

war air and sea lift capabilities would be prejudiced by a simultaneous general war threat. Mr. Gates observed that our capabilities for air and sea lift for general war and for limited war were compatible. General Taylor was inclined to disagree with this conclusion and stated that one could not be sure where we would stand in regard to sea and air lift if there was both a limited and general war threat at the same time.

Mr. Quarles pointed out that if events developed in that sequence, we could generate more capabilities by mobilization, but he acknowledged that certain transport would have to be pre-empted for general war preparation. General Pate said that under these circumstances the Navy would be in a building-up phase. General Twining said you can't have capabilities for both situations simultaneously. In the given circumstances, you would have to go all-out for general war preparation and your limited war capability would have to suffer.

General Twining said one cannot say categorically that there could be no limited war in Europe. Anything can happen. But we must keep the Russians believing that a limited war cannot happen there. The Russians apparently believe that now. They have not gained an inch in Europe since we promulgated our present strategic concept. We don't know how a future President would reply to a nuclear attack in Europe, but we must keep the integrity of our present strategy. We must stay with it for awhile.

Admiral Burke said that it was not a question of our capability but of the allied attitude toward our strategy. They know that in regard to nuclear weapons they are mendicants. If they are attacked "they can only cry". What they want is a mortgage on our future action. They have hostages in the form of our ground forces in Europe. Is this not enough for the present? They apparently want some control over nuclear weapons. But it is up to us to keep some control over their control. We must look out for the danger of possible "trigger happy" foreigners to whom we may have transferred some control over nuclear weapons. But we will have to take some chances in this respect.

Secretary Dulles said that surely General de Gaulle will raise with him next month the question of a French nuclear weapons capability. The French will want to be on an equal basis with the US and the UK. If we turn down his request for some share in the nuclear deterrent, de Gaulle will press on to develop an independent nuclear weapons capability for France and an independent foreign policy which may even involve making an accommodation with the USSR.

Mr. Gates asked if the cause of European concern was our failure to finish up the jobs in Korea and Indochina. If we did not push for victories there, perhaps the Europeans feel there is little chance that we will take risks in Europe where the dangers were much greater. Secretary Dulles said he doubted that this was the reason. He felt the

primary cause of European concern was simply that they could read current articles about the tremendous casualties estimated to occur in nuclear war and logically had been led to wonder if any country would be willing to pay such a high price to come to the aid of its friends. He believes the US would pay such a price—not because of any “love” for our friends, not because of any agreement which we would feel an obligation to honor, but out of the belief that if we did not take this action we would be faced with a worse alternative later. We would be crowded and crowded by the Soviet Union.

Secretary Dulles emphasized that he never shows any sympathy for foreign anxieties in this respect. He personally truly believes that the US will, if necessary, carry out its strategic plans.

Mr. Quarles said in regard to General de Gaulle that we should make clear to him that US policy is not to try to prevent the French from developing a nuclear weapons capability. He believed that our previous policy of trying to stop the French had been greatly resented. He also felt that it was not logical to think of transferring nuclear weapons to the French because they could not obtain enough to have an independent deterrent. France is a member of an alliance and as such should rely on the capabilities of the alliance and not on the few weapons which it may be able to construct. (The tenor of Mr. Quarles’ remarks was that France should be “admitted” into the nuclear weapons club.²)

Secretary Dulles said that General de Gaulle might well take the position that the US’s attitude means that France will have to spend much of its treasure for obsolete weapons during a period of critical financial strain. And France will wonder if this is the type of treatment an ally should receive.

Secretary McElroy thought that France merely wanted to produce weapons and not necessarily to receive US help in producing them. He feels that the French don’t care about the quality of the weapons, but are mainly interested in salving national pride.

Mr. Quarles observed that our law prevents the transfer of nuclear weapons to the French.

Secretary McElroy said that he now had a better understanding of Secretary Dulles’ views and would like to be of help. He reverted to the concept of volunteer forces which might be used until a truly UN force could come into being. He suggested that such force would not wear US uniforms. It would be made up of yellow, black and white people, and would not be identified with national units. The idea would be to try to avoid involvement of national pride in certain types of limited hostilities.

² NSC policy on France is that we should seek to persuade France not to make nuclear weapons. [Footnote is in the original.]

Secretary Dulles felt that this was a very useful concept. He pointed out that some years back a Volunteer Freedom Corps had been explored but abandoned because of practical considerations. For example, where would the forces be located? However, the Indonesia situation justified a restudy of this problem. Prime Minister Macmillan had raised this question with the President during his recent visit. He had in mind recruiting forces out of the North Atlantic alliance to function somewhat like a UN Emergency Force. Macmillan was keen for the idea and wanted to pursue it further with the President. If such a force was not a US national force, it would meet the type of problem we are going to have to face. Even though Secretary Dulles feels that our massive retaliation policy may be losing credibility, the fact is that it has stopped communist aggression and now the primary threat is subversion. The communists have great assets to carry out subversion.

Secretary Dulles cited their control over various informational media. He pointed out that the communists can effectively assist revolts against legitimate governments. He spoke of their capability to manipulate mass emotions. He referred to their participation in the Lebanon affair. In such a situation, it would be extremely valuable if we could turn to some international force.

Another aspect of this threat is inherent in the world-wide movement toward self-government. Actually this gives promise of being in some cases merely a transfer from one form of despotism to another.

Secretary Dulles cited the slow evolution of American political democracy, pointing out how in the beginning only a small percentage of our governmental officials were directly elected by the people. Contrary to this experience, the new countries today are trying to go directly to an advanced form of democracy. The communists are capitalizing on this fact.

Secretary Dulles spoke of Soviet professional capabilities in agitation and subversive work, and the lack of capability of the US in this respect. He spoke of communist organization in Indonesia in labor groups and among teachers.

The combination of the two above-mentioned aspects of the subversive threat in Secretary Dulles' judgment is more serious than that of overt military aggression. The USSR believes our strategic doctrine even if our allies don't. Massive retaliation still has a certain life expectancy, but in the case of civil wars we don't have a good strategic answer. Perhaps the US will have to go in more for manipulation of government structures of other countries. These questions raise serious problems calling for original thinking.

Secretary McElroy suggested that a joint State-DOD study of the "volunteer" problem be undertaken. Governor Herter pointed out that

Allen Dulles was presently thinking about a study of the covert capabilities the US had in this field.

Mr. Brucker recalled that in 1953 a study was made of the Volunteer Freedom Corps idea and recommended that it be reviewed.

Secretary McElroy said that what we needed was a force somewhere between the covert type of force and the US Marines. The question of whether or not such a force would be directly managed by the Pentagon was not important. It was felt that the US could do a good deal to help train and equip such a force. He recognized that such a force would obviously be ascribed to the US and its non-national character would be a fiction, but we would have to learn to deny these things as does the USSR. It was decided that the matter would not be pursued with the UK until we had a US position clarified.

Secretary McElroy said in regard to the strategic concept, the DOD would have another go at preparation of the statement.

Secretary Dulles felt that it was not so much a matter of formally modifying the statement of the present strategic concept or of changing our defense budgets. Rather it was "the way these things are presented." We must find a way to let our allies feel that there is some "intermediate cushion" between unconditional surrender and total war.

Secretary Dulles recalled the "trip wire" theory put forward by the UK which had proved shocking to Europe and had been rejected. We have more than a "trip wire". There can be intermediate stages in the application of our military force. Let us learn to become somewhat more articulate about these possibilities.

Secretary McElroy said that he would like to direct more of our allies' attention to our limited war capabilities—to show them some of our new equipment and our reconnaissance and surveillance capabilities.

Secretary Dulles said that it was a matter of psychology—to get away from the "nuclear death" neurosis that has appeared in Europe. There are other ways of defending ourselves and we must get across to the Europeans that we are not neglecting to develop these ways. However, Secretary Dulles said, if a war comes in Europe he believes that it cannot be kept limited.

Mr. Quarles said that is the most important and the most dangerous problem, and that is why we are so sensitive to any changes in our strategic concept. The dilemma is how to improve our allies' confidence and yet at the same time keep the Soviet certain that any substantial attack by them in Europe will lead to strategic bombardment of the Soviet Union.

62. Note From Cutler to Goodpaster¹

Washington, June 18, 1958

For your information, I enclose a draft of some rough notes I made at the Dulles/McElroy Conference Tuesday afternoon.

Obviously, these should be very closely held.

Notes Prepared by Cutler

Washington, June 17, 1958

CONFERENCE—June 17, 1958

Sec/State; Under Sec/State; Sec/Defense; Deputy Sec/Defense; Service Secretaries; Joint Chiefs; Smith; Sprague; Cutler; Irvin; Triebel; Randall.

Concluding Recommendations of Study

1. Increase capability of CRAF for limited war—also parallel shipping facilities.
2. Notify enemies of intention in limited war action.
3. Public information to place in proper context use of nuclear weapons.

Secretary of State

1. We do have a strategic concept for use of limited war.
2. We are in reasonably good shape as to capabilities to wage limited war in twelve areas studied: Far East (4), Mid-East (4), Europe (2), South Asia (2).
3. Query as to capability in Iran. Iran is worried and we have no real plan. Do a little extra preparatory work in this regard.
4. Big question is as to Europe and NATO allies.
 - a. Little chance of limited war in Europe—he does not quarrel with this judgment.
 - b. However, growing concern if U.S. will accept general war alternative when it comes, especially when USSR has ICBM capability and

¹ Source: Strategic concept for the defense of Europe. Top Secret. 5 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Nuclear Exchange.

we do not. This doubt is increasingly expressed by governments and demagogic mass leaders. Reads Sandys' statement at Copenhagen (based on Cabinet submitted paper) to above effect (i.e., after U.S. is under USSR ICBM capability of attack, will it go to help Turkey or Western Europe). Cannot rely indefinitely on our nuclear retaliatory attack to preserve peace?

c. France pushing nuclear programs (a) to get in nuclear club; (b) sharing Sandys' doubts, it wants own capability to invoke nuclear defense of France. What will JFD say when he visits de Gaulle in July.

d. Time is soon coming when our NATO allies will not be satisfied that U.S. will surely go to general nuclear war to defend them, if attacked, and risk American devastation; and will demand a surer strategic concept. They do not yet know what they will do:

(1) Probably try to develop own nuclear stocks so as to create nuclear war, if they wish, regardless of U.S.

(2) Dangerous situation if we do not have *common* strategic concept to use in defending our *common* alliance.

(3) France can't financially afford to be an independent nuclear power. Can the British or Italians? Will public opinion permit West Germans to do so? Perhaps the four together could.

e. Is an area defense in Europe based on use of tactical nuclear weapons a feasible enough arrangement to calm our allies? If they have somewhat greater right to use nuclear weapons in area defense, would that suffice? Otherwise, a futile brief effort on their part to become nuclear powers, followed by trend to neutralism. Dulles feels this trend is inevitable, within a few years (not in next one or two).

f. The European doubt is rational—will U.S. return to isolationism? Would another President than Eisenhower take the awful risk of damaging so much America to go to help Turkey?

g. Dulles does not have answer to problem. All he says is to doubt whether Europeans will long continue to rely on the military concept that U.S., after ICBM capability of USSR to plaster U.S., will come to help an attack on Europe by USSR.

5. *McElroy*: Is not the continued presence of U.S. troops in large numbers in Europe a gage that the U.S. *will* respond to protect them in Europe.

Dulles: If a conventional war starts in Europe, would we involve in nuclear retaliation or would we consider slaughter of U.S. troops overseas? Neither he nor *McElroy* could answer this question.

He does not consider preventive war as a solution to the problem. (Even with preventive war, the U.S. cannot be safe from terrible harm. (*Quarles*))

6. *Quarles*: Does not neutralism endanger a European country more than association with the U.S., and punishment resulting?

7. *McElroy*: Can you use tactical nuclear weapons in Europe without spreading into general nuclear war? Dulles thinks not. But he says many people might think the U.S. more likely to get into defense of Europe, if gradually by using tactical weapons, instead of a massive sudden nuclear retaliation.

Retention of American forces in Europe should be a great assurance to Europeans. (McElroy)

8. *Douglas*: If our allies in Europe had sufficient limited nuclear capability to defend themselves against conventional attack by USSR, would they not be less fearful of the outcome? (Meaning, if *we* increased their capability.)

9. Dulles thinks we should explore a wider internationalization in NATO of nuclear capability. Max Taylor—this is the ultimate answer: act on it and believe in it.

10. Have we been too focused on massive nuclear retaliation with large weapons to realize our current, increasing ability with tactical nuclear ability, carrier forces, mobile marine battalions? (McElroy) Perhaps 30% of our money is going into this kind of capability. Should we emphasize this capability more to our allies and to the public and to the Congress?

11. *Dulles*: We are planning to make small nuclear weapons in quantity. For what purpose?

McElroy: To use against conventional forces which would overwhelm us.

JFDulles: We will have time if this comes in 1961–1962 and *allies know we have this intended capability and use it*.

Quarles does not think small war preparations would hinder going on into general war, but that going into a general war would limit your limited war capability.

12. *Twining*: You can't say that there will never be a limited war in Europe. But you must never let Russians think that we won't use our nuclear retaliatory capability, toy with idea of limited war. Only solution is to get comprehensive safeguarded arms control system.

13. *Burke*: Our allies want a mortgage on us, as security we will come to help. Our forces in Europe are hostages. Must we give a new, different, or bigger mortgage? Perhaps giving them a nuclear capability of their own or in common control.

14. What will JFDulles tell de Gaulle? He will require France to have a greater nuclear independence *or* to have an independent foreign policy.

15. Dulles always tells our allies we're going to help you because if we don't we'll be crowded and crowded against our own interest. They are convinced as to this in the case of present Administration.

16. *Quarles*: We should make clear to de Gaulle (a) not part of our policy to prevent France from acquiring independent nuclear capability, (b) our equipping them is a different thing. But would de Gaulle be in a good posture unless France had enough by itself to defend France? No, in a better posture to share in our common nuclear power in NATO. Perhaps let him have a few to bolster his morale.

JFDulles: De Gaulle will ask—"Why should I spend a lot of money to get a few inadequate weapons? Why don't *you give* me some?"

(Our law does not permit us to give weapons to France now.)

17. *McElroy*: Desirability of supporting indigenous forces in non-identifiable national units (as mercenaries?) for use in limited wars throughout the world.

Dulles: A useful concept, though not an answer to the main question. Volunteer Freedom Corps referred to. Perhaps this concept should be restudied.

Can we recruit from our various alliances certain elements to function on behalf of Free World, like UN force for UN world? Macmillan interested in idea. Idea of usable forces other than distinctly national U.S. forces.

Memorandum for the National Security Council From McElroy and John Foster Dulles

Washington, June 17, 1958

SUBJECT

Study relative to the Capabilities of Forces for Limited Military Operations in
Response to NSC Action No. 1881

1. There is submitted herewith a coordinated study of United States and allied capabilities for limited military operations to July 1961, prepared by the Department of State, the Department of Defense and the Joint Chiefs of Staff, with appropriate participation of the Central Intelligence Agency.

2. We wish at the outset to stress the limitations of this study.

a. It does not examine capabilities for limited military operations against Soviet armed forces. The study was undertaken within the framework of our current strategic concept which holds that a war in which the armed forces of the USSR and the United States are overtly engaged is a general war.

b. It does not examine capabilities for limited military operations against an enemy using nuclear weapons. The study assumes that enemy use of nuclear weapons to 1 July 1961 would be construed as overt employment of Soviet armed forces.

c. It does not examine capabilities for covert limited military operations.

d. The study's approach to limited military operations in the Far East is based upon an assumption—i.e., “that the United States could engage in effective military action against mainland China without undue risk of initiating general war”—which the NSC observed in

Action No. 1881-c was "to be regarded only as a working assumption for the purposes of this study."

e. The study is not a complete and final analysis of limited military operations upon which the size and nature of United States forces required for limited military operations can be determined for future years. Estimates of enemy action were, of necessity, hypothetical and thus are not a basis for military planning. None of the situations studied have been war-gamed. The conclusions and recommendations, based as they are on hypothetical but possible situations, should not be considered as definitive.

3. We consider the significant findings of the study to be as follows:

a. *U.S. Capabilities*

(1) Within the limitations set forth in paragraph 2 and if the use of nuclear weapons as required to achieve military objectives is authorized, United States capabilities for limited military operations are adequate to undertake and carry out limited operations of the nature examined.

(2) In many such limited military operations, the use of nuclear weapons would be required only as an unlikely last resort.

(3) In the Far East, however, the United States does not now have a ready non-nuclear capability which alone could cope satisfactorily with limited military operations against overtly engaged substantial Communist forces. The selective use of nuclear weapons against such forces and the facilities supporting them would be necessary.

(4) The withholding of authorization to use nuclear weapons for limited military operations against overtly engaged substantial Communist forces in the Far East would be likely to entail requirements for additional overseas deployment of United States forces, the construction of bases and other facilities overseas, augmentation of sea/airlift in being and expanded logistic support capabilities and "pipelines" both overseas and in the United States.

(5) The burden of the initial military response will fall on the U.S. forces deployed in or near the area involved, regardless of Service. Prompt and vigorous response by these forces may obviate a requirement for major reinforcements.

(6) The effectiveness of United States limited military operations will be affected by the timely availability of sea/airlift for the provision of logistic support to our own and friendly forces and particularly for the movement from the United States of ground forces committed to action. To the extent that the limited military operations examined in this study are expected to affect adversely our posture for general war, the temporary diversion of transport from general war tasks is usually cited as the principal adverse factor.

(7) Only small numbers of "clean" nuclear weapons, which will be in the high yield category, will be available to United States forces to 1 July 1961.

b. Allied Capabilities

(1) The indigenous forces which we might find it necessary to support in limited military operations will have widely varying capabilities. Some, such as the GRC and ROK forces, have significant capabilities on the ground. Practically all have marked deficiencies in air and naval capabilities.

(2) Very few of our allies could or would provide significant forces for limited military operations outside their national territory. Most lack capability. Some, e.g. Pakistan facing a real or assumed threat from India, would be loath to send substantial forces abroad. The provision of forces by others, e.g. France in the Middle East, would be politically disadvantageous.

(3) Our allies can provide base and other facilities that will ease and lend flexibility to the application of United States power in limited military operations.

c. Political Considerations

(1) Failure by the United States to undertake effective limited military operations in support of other free nations in situations such as those examined would have seriously adverse consequences throughout the free world, particularly among our allies, and would encourage the Communists to adopt a more aggressive posture.

(2) Anticipation of the need for United States limited military operations in developing situations and the earliest possible decisions (i) to intervene if necessary and (ii) on the nature and objectives of the intervention are essential.

(3) We need the political support of our allies for United States limited military operations. We should also ensure that appropriate regional collective security organizations and their members have some military role, no matter how minor, in such operations in order to maintain the solidarity and *raison d'être* of these organizations.

(4) Emotional aversion to nuclear weapons is widespread in the free world, particularly among Asians, and our use of these weapons in limited military operations would incur seriously adverse political consequences.

4. We make the following additional observations.

a. The study understandably devotes relatively little attention to the deterrent aspects of United States capabilities for limited military operations. Deterrence of local aggression undertaken or inspired by, or serving the interests of, the Communists is a major aim. As the study suggests, timely political action supported by capabilities for limited operations can frequently avert the need for the commitment of United States forces in combat.

b. The determinative factors in decisions as to the initiation and conduct of United States limited military operations are political rather than military. In practically all likely situations, it is the political

consequences for our general position in the world of inaction or action, and the nature of our action, that will govern United States decisions.

c. Selective nuclear strikes deep into Communist China, as contemplated in the Quemoy and Matsu, Taiwan and Korea hypothetical situations, could elicit a Sino-Soviet nuclear response. Serious consideration would, therefore, have to be given to the proclamation of at least a limited national emergency if the United States were to undertake limited military operations of this nature.

d. The increased possibility of general war inherent in most limited military operations requires precautionary and alerting steps. Even one limited military operation requiring heavy logistic support and deployment of major forces from the United States might necessitate partial mobilization.

e. Additional comments which should be taken into consideration in any possible further use of this study are contained in the Annex immediately hereunder.

5. We make the following recommendations.

a. The Director of Central Intelligence should be asked to initiate the preparation of National Intelligence Estimates on (i) world reactions and (ii) Sino-Soviet military reactions to United States use of nuclear weapons in limited military operations against Communist (non-Soviet) forces in the Far East.

b. The findings of the present study with respect to the availability of allied forces for employment outside their national territory should be taken into account among other factors in the review of 1962 force goals for nations receiving United States military assistance directed by NSC Action No. 1908.

c. Greater efforts should be made to clarify to the free world United States intentions with respect to the use of nuclear weapons and to inform the free world of the radiation effects of low yield weapons and their relative efficiency in certain limited military operations.

/s/ John Foster Dulles

Annex

SUPPLEMENTAL POINTS TO BE CONSIDERED ALONG WITH THE STUDY

1. The studies do not in all instances give sufficient emphasis to the difficult command and communications problems which would be encountered in operations in areas remote from the U.S.

2. The studies give no specific recognition of future modernization or buildup of military forces hostile to the U.S. by Soviet Bloc military

aid. It is possible that such aid in any given instance could be significant, particularly if the recipient forces were applied exclusively against local allied forces.

3. While employment of chemical and biological capabilities has not been reflected in the studies, it should be noted that limited supplies of standardized chemical and biological capabilities are currently in the U.S. stockpile; much greater quantities of these could be produced before 1961 without further development.

64. Briefing Note for 369th NSC Meeting¹

Washington, June 19, 1958

1. The next item is to report on a review which the President directed of a paragraph in another security policy statement—Par. 27-*d* on Page 12 of the draft Basic National Security Policy discussed at the Council Meeting on May 1.

2. This paragraph—which appeared in the economic section of the basic policy paper—proposed, in recognition of the problems of “one-crop” countries, that, for political reasons, the U.S. might “on occasion, join in multilateral examination of price, production, and demand trends” for basic commodities “which might help to promote readjustments between supply and demand and reduce price fluctuations”. Treasury and Commerce wished to add that the U.S. should not *discuss* the making of, or *participate* in, any international commodity agreement without Presidential approval.

3. Mr. Randall called attention to the fact that this paragraph, as proposed by the Planning Board, did *not* reflect existing CFEP policy of general disapproval of international commodity agreements, or the requirement that *CFEP* give its advance approval to any participation by U.S. representatives in international discussion of any such agreement, or to U.S. participation in any such agreement.

4. At the Council Meeting on May 1 it was agreed to delete Paragraph 27-*d* and to refer it, and an alternative proposed by the Secretary of State, to the Council on Foreign Economic Policy to consider in reviewing the existing CFEP policy on international commodity agreements.

¹ Source: Draft basic national security policy paper. Secret. 1 p. Eisenhower Library, Whitman File, NSC Records.

5. On May 22 Mr. Randall filed with the Council a memorandum report, which is before you, stating (1) the text of the existing CFEP policy on international commodity agreements, and (2) the consensus of CFEP that this policy should be continued in effect. In the light of this review, there appears no need to include any paragraph on this subject in the basic policy statement, and none has been included.

6. It may interest the Council to know that the CFEP, under the exceptions procedure in its existing policy, recently authorized the Department of State to participate in an international coffee study group and to discuss an international coffee agreement, if such an agreement is proposed by one of the members of the study group. The CFEP also urged State to take every precaution not to imply directly or indirectly, that the U.S. *would* participate in or police such an agreement.

cc: Mr. Harr
Mr. Lay
Dr. Gleason
Mr. Johnson

65. Memorandum of Discussion at the 369th NSC Meeting¹

Washington, June 19, 1958

SUBJECT

Discussion at the 369th Meeting of the National Security Council, Thursday, June 19, 1958

Present at the 369th NSC Meeting were the President of the United States, presiding; the Vice President of the United States; the Secretary of State; the Secretary of Defense; and the Director, Office of Defense Mobilization. Also present were Mr. Fred C. Scribner, Jr., for the Secretary of the Treasury; the Attorney General; the Director, Bureau of the Budget; Mr. Walter Williams for the Secretary of Commerce (Items 2 and 5); the Chairman, Atomic Energy Commission; the Federal Civil Defense Administrator; the Chairman, Council on Foreign Economic Policy (Items 1 and 5); the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Deputy Assistant to the President; the Acting Director, U.S. Information Agency; the Director, International

¹ Source: Agenda item 1: Basic National Security Policy. Top Secret; Eyes Only. Extracts—4 pp. Eisenhower Library, Whitman File, NSC Records.

Cooperation Administration; the Special Assistants to the President for National Security Affairs, for Science and Technology, and for Security Operations Coordination; the White House Staff Secretary; Assistant Secretary of State Gerard Smith; Assistant Secretary of Defense Mansfield Sprague; the Naval Aide to the President; the Executive Secretary; NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. *BASIC NATIONAL SECURITY POLICY*

(NSC Action No. 1903; NSC 5810/1; Memo for NSC from Executive Secretary, same subject, dated May 26, 1958)

General Cutler explained that the President would be delayed for a few minutes and he would accordingly change the order of items on the agenda, dealing first with the question of U.S. policy with respect to international commodity agreements which had been unresolved when the Council last discussed it in connection with Paragraph 27–*d* of our new Basic National Security Policy (NSC 5810/1), at the Council meeting on May 1, 1958. He pointed out that on this occasion the issue had been referred to the Council on Foreign Economic Policy. On May 22, 1958 the Chairman of the CFEP, Mr. Randall, had filed a report with the Council giving the text of existing CFEP policy on international commodity agreements and also the consensus of the CFEP that this policy remained valid and should be continued in effect. (A copy of General Cutler's briefing note is filed in the Minutes of the Meeting and another copy is attached to this memorandum).

At the conclusion of General Cutler's briefing, Secretary Dulles stated that he had an observation to make with respect to the text of our policy in the matter of commodity agreements. He pointed out that the text of our policy as formulated by the CFEP revealed two different emphases. The first paragraph which reads as follows:

"The United States shares the concern of other nations about the problems arising from commodity price and market instability and is prepared to discuss and explore with other governments possible approaches to these problems"

according to Secretary Dulles emphasized the willingness of the United States at least to discuss and explore approaches to these problems. On the other hand, the last paragraph of our policy reading as follows:

"Representatives of the United States will not participate in any discussion or meeting with respect to an international commodity agreement and will make no commitment as to U.S. participation in such an agreement until approved at the interagency policy level within the Executive Branch."

appeared to have a somewhat conflicting emphasis. It seemed quite possible to Secretary Dulles that the discussions authorized by the first paragraph could lead to a commodity agreement in which other nations than the U.S. would participate. A current example is that of coffee. Under existing world economic conditions, Secretary Dulles felt that we would want to be sure that the first paragraph of this policy was literally interpreted when it was implemented, although of course we would not agree to actual U.S. participation in any commodity agreement.

Mr. Randall said he not only understood Secretary Dulles's point but agreed with him. Indeed this specific matter had been discussed at great length by the CFEP. The general view in the CFEP was that the U.S. should go ahead and discuss commodity problems with other nations as much as they desired but not to the point of sticking our necks out too far and being committed to participation in an international commodity agreement. Mr. Randall thought it was extremely difficult to express in words the sensitive emphases that both he and Secretary Dulles were agreed upon. It was hard to draw so fine a line.

Secretary Dulles said he believed that Mr. Randall was on the right track. Under current conditions the U.S. simply could not hold itself aloof from these problems of commodity price and market instability as we had been in a position to do when our policy on this subject had first been adopted and when commodity prices were relatively high.

The National Security Council:

a. Concurred in the recommendation by the Council on Foreign Economic Policy, prepared pursuant to NSC Action No. 1903-b-(5) and transmitted by the reference memorandum of May 26, 1958, that existing policy or international commodity agreements is satisfactory and should be continued.

b. Noted a statement by the Secretary of State that, in the implementation of U.S. policy on international commodity agreements, a liberal interpretation should be given to that portion of the policy which states that the United States is prepared to discuss and explore with other governments possible approaches to problems arising from commodity price and market instability; while adhering to that portion of the policy which states that the United States will not participate in any discussion or meeting with respect to an international commodity agreement and will make no commitment as to U.S. participation in such an agreement until approved at the interagency policy level within the Executive Branch.

NOTE: The above actions, as approved by the President, subsequently transmitted to the Chairman, CFEP.

[Omitted here is the remainder of the memorandum.]

S. Everett Gleason

66. Memorandum of Conference with the President¹

Washington, June 23, 1958

OTHERS PRESENT

General Twining
General Goodpaster

General Twining reported that General Cutler is recalling copies of instructions regarding the Net Evaluation Sub-Committee's next effort in order to edit one provision. A small follow-up study will be made after the main project, and an oral report will be given to the President on that phase.

General Twining said that Secretary McElroy has read in full Admiral Burke's testimony on defense reorganization. His general feeling is that Admiral Burke had done well in his testimony, but did not go "down the line" as some of the others had. General Pate goes up to testify this week, and there is more concern regarding his appearance. General Twining next mentioned a direct leak to Hanson Baldwin of some of the proceedings in a very private meeting Mr. McElroy had held with the Chiefs and Secretaries last week, with no one else present. This matter is being pursued.

Next General Twining reported that the President's talk at Quantico had a very fine effect on the participants—it gave them a shot in the arm in stirring up interest in the meeting, and what the President had to say, as well as his personal vigor and force in saying it, had a profound impact on the participants.

The JCS are starting work tomorrow on the budget guidelines for fiscal year 1960. General Twining has told the Chiefs that if they do not turn in a satisfactory job on the guidelines, the Secretary will make the determination himself.

The President referred briefly to additions that the Congress is proposing in the FY-59 budget. He said that the talk that having one more division in reserve in the United States makes a great difference in our small war capability is meaningless to him. Also, he said we are apparently planning to "kill every Russian three times" in the development of our forces for massive retaliatory attack; because the Polaris looks like a promising weapon, to be fired from under water, we are hurrying into construction of nine submarines, without apparent study of the capability as a whole. Finally, he said that statements

¹ Source: Defense reorganization, FY 1959 Defense budget. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

such as Sam Anderson's regarding "shooting the moon" in August are very harmful, and muddy the water. We have gone to great effort to make this project a scientific project under ARPA direction and cognizance.

The President said it is clear to him that we are all going to have to think a great deal more of national solvency. General Twining said the Quantico meeting was useful in that respect. There was greater consciousness of this factor as a result. He indicated that the Secretary stated if he could not get such a program from the JCS he would do the job himself—he stressed that we must cut out some of the duplicatory weapons systems we have carried through the development stage.

Finally, the President suggested that General Twining stress some theme such as "security and solvency demand unity" in our defense effort, at every opportunity. Apparently it takes persistence to get such a point across. He added he would like to see Admiral Radford do some speaking on this—his testimony had been very effective. General Twining said he had been taking the line that economy and defense go hand in hand and that if one is destroyed the other must also be lost. In concluding, the President said that our country can afford what is needed for defense, but it cannot afford the costs that might be added by wastefulness.

A.J. Goodpaster
Brigadier General, USA

67. Briefing Note for the 370th NSC Meeting¹

Washington, June 26, 1958

1. The principal item today is the 250-page State-Defense Study on "U.S. and Allied Capabilities for Limited Military Operations to July 1, 1961", based on the examination of 12 hypothetical situations in Europe, the Middle East, and the Far East.

2. This Study grew out of a recommendation of the Gaither Panel last November (classified by the Panel as a "highest value measure") that U.S. and allied forces for limited military operations be augmented

¹ Source: U.S. and Allied capabilities for limited military operations. Top Secret. 2 pp. Eisenhower Library, Whitman File, NSC Records.

and that a Study be undertaken to develop current doctrine on when and how nuclear weapons could contribute to such limited operations.

3. State and Defense prepared terms of reference for a limited was Study covering the entire range of U.S. and allied capabilities for limited military operations (NSC Action No. 1844–b).

The terms of reference, as approved by the Council (NSC Action No. 1881, March 20) anticipated that recommendations as to U.S. national security policy and U.S. and allied capabilities for limited military operations would result from the Study.

The terms of reference precisely defined limited military operations, Study assumptions, and the scope of the Study—matters which will be covered in the presentation of the Study by Admiral Triebel.

4. The written memorandum of the Secretaries of State and Defense, submitting the Study to the Council, summarized 14 Study findings which they deemed significant, made 8 additional observations, and stressed 5 Study limitations. While listening to the presentation of the Study, the Council should keep in mind these 5 limitations:

(1) The Study does *not* contemplate limited military operations against *Soviet* armed forces; because, under the current U.S. strategic concept, overt military engagement of USSR and U.S. armed forces is deemed to be general war.

(2) The Study does not cover *enemy use of nuclear weapons* in limited military operations; because such use of nuclear weapons up to July 1, 1961, would be construed as overt employment of Soviet armed forces. (However, I should point out that some of the 12 hypothetical cases call for use by the U.S. of nuclear weapons.)

(3) The Study does not examine U.S. capabilities for covert limited military operations.

(4) The Study assumes—as a working assumption—“that the U.S. could engage in effective military action against Mainland China without undue risk of initiating general war.”

(5) The Study should not be used for determining the size and nature of U.S. forces required for limited military operations; and its conclusions and recommendations are not to be considered definitive.

5. The two Secretaries state in their memorandum, as a significant finding of the Study, that, within the foregoing limitations and if the use of nuclear weapons as required to achieve military objectives is authorized, U.S. capabilities for limited military operations are adequate to undertake and carry out limited operations of the nature examined.

6. The Secretaries’ memorandum makes three recommendations (par. 5, page 4):

a. A National Intelligence Estimate should be prepared on world reactions and Sino-Soviet military reactions to U.S. use of nuclear weapons in limited military operations against Communist (non-Soviet) forces in the Far East.

b. The review of 1962 force goals of nations receiving U.S. military assistance—to be presented to the Council on September 1 (NSC Action No. 1908)—should take into account the findings of the Study as to the availability of allied forces for employment outside their national territories.

c. Greater effort should be made to clarify to the Free World U.S. intentions with respect to the use of nuclear weapons, and to inform the Free World of the radiation effects of low-yield weapons and their relative efficiency in certain limited military operations.

7. Because of the importance of this fine Study and of the submissions by the two Secretaries, and before the Council takes positive action on the recommendations in the Study and the submission, it is suggested that, after today's presentation of the Study, the Planning Board be asked to prepare comments and recommendations on the subject for future consideration by the Council.

Admiral Triebel will present the Study.

68. NSC Report¹

NSC 5816

Washington, July 1, 1958

NOTE BY THE EXECUTIVE SECRETARY
to the
NATIONAL SECURITY COUNCIL
on
A NET EVALUATION SUBCOMMITTEE

Reference: NSC 5728

The President, on the recommendation of the Chairman, Net Evaluation Subcommittee, approved on June 25, 1958, the withdrawal of NSC 5728 and the issuance, on a special limited-distribution basis, of the amended Directive enclosed herewith as NSC 5816. The amendment consists of the deletion of the last two sentences of paragraph 3 and of subparagraphs 3-*a*, *b* and *c* of NSC 5728, and the substitution therefore of a new paragraph 3.

The enclosed Directive has also been revised in paragraph 5, to include on the membership of the Subcommittee the Director of the Office

¹ Source: "Directive on Net Evaluation Subcommittee." Top Secret; Special Limited Distribution. 4 pp. NARA, RG 59, S/S-NSC Files: Lot 63 D 351, NSC 5816 Series.

of Defense and Civilian Mobilization in place of the Director of the Office of Defense Mobilization and the Federal Civil Defense Administration, in accordance with Reorganization Plan No. 1 of 1958, effective July 1, 1958.

NSC 5816, as approved by the President is transmitted herewith for the information of the National Security Council, and is being referred to the members of the Subcommittee for appropriate implementation.

The enclosed Directive supersedes NSC 5728.

Special security precautions should be observed in the handling of the enclosure, with access thereto limited to those individuals having a strict "need to know" in the performance of their official duties.

James S. Lay, Jr.
Executive Secretary

cc: The Secretary of the Treasury
The Attorney General
The Director, Bureau of the Budget
The Chairman, Atomic Energy Commission
The Chairman, Joint Chiefs of Staff
The Director of Central Intelligence
The Chairman, Interdepartmental Intelligence Conference
The Chairman, Interdepartmental Committee on Internal Security

Enclosure

DIRECTIVE

on

A NET EVALUATION SUBCOMMITTEE

1. Pursuant to the recommendations of the National Security Council in NSC Action No. 1260–b (November 4, 1954) and my subsequent approval thereof, I hereby establish the following permanent procedure (superseding NSC 5605) to provide integrated evaluations of the net capabilities of the USSR, in the event of general war, to inflict direct injury upon the continental United States and to provide a continual watch for changes which would significantly alter those net capabilities.

2. Each integrated evaluation should:

- a.* Cover all types of attack, overt or clandestine;
- b.* Include consideration of the several courses of action which the USSR is capable of executing; and
- c.* Take into account the estimated future status of approved military and non-military U.S. defense programs.

3. Each integrated evaluation report should estimate, from the practical standpoint, the extent and effect of direct injury, including radioactive fall-out, upon the continental United States, resulting from the most probable types and weights of attacks which the USSR is capable

of delivering during the nuclear phase of a general war (i.e., the period during which the Soviet nuclear weapon stockpile or means of delivery of nuclear weapons on the United States would be substantially expended). Military operations overseas should be considered only in so far as they (a) require a diversion of Soviet resources from attack on the continental United States, or (b) affect U.S. capabilities to execute the Bravo mission and consequently the Soviet capability to attack the continental United States. Each report should consider, in so far as damage to the USSR is concerned, the effects of U.S. attacks on the USSR which would affect their capability to damage the United States. In addition, a general estimate should be made of the over-all effects of the U.S. attacks against the USSR which would show the general order of magnitude of destruction, disruption of communications and government, and loss of life in the USSR. In arriving at this general estimate, it is not expected or anticipated that detailed analyses will be undertaken. An evaluation will be made annually on the basis of an assumption or assumptions of conditions under which a general nuclear war might be initiated. Such assumption(s) should be developed by the Subcommittee after careful consideration of the implication of the world situation, and submitted for my approval.

4. Integrated evaluations should be submitted to the Council on or before November 15 of each year, and relate to the situation on a critical date normally about three years in the future. In addition to these annual integrated evaluations, an integrated evaluation should be submitted to the Council at such times as the Subcommittee feels that a change has become apparent that would significantly alter the net capabilities of the USSR to inflict direct injury upon the continental United States.

5. In order to prepare these integrated evaluations I hereby establish a Net Evaluation Subcommittee of the National Security Council, composed of the Chairman of the Joint Chiefs of Staff, who will serve as Chairman, the Director of the Office of Defense and Civilian Mobilization, the Chairman of the Atomic Energy Commission, the Director of Central Intelligence, the Chairman of the Interdepartmental Intelligence Conference, and the Chairman of the Interdepartmental Committee on Internal Security. Each Subcommittee member shall be consulted regarding and given ample opportunity to review the following prior to adoption by the Subcommittee: (a) subsidiary terms of reference, (b) the assumptions to be used as a basis for each evaluation report, (c) the complete evaluation report (less background material, which shall be made available only on a "need-to-know" basis), and (d) any recommendations which the Subcommittee may choose to submit. If the Director of the Subcommittee Staff, after adoption of the evaluation report by the Subcommittee, has any additional comments which he believes should be presented to the

NSC, such comments may be submitted to the President, through the Chairman of the Subcommittee, for consideration. The Chairman of the Subcommittee, in consultation with the Director of the Subcommittee Staff, will prepare regulations and establish procedures for the handling of highly sensitive information² required in the preparation of an evaluation report so as to safeguard its security on a strict “need-to-know” basis and to preclude the assembly of an unwarranted amount of sensitive information in one document. Such regulations and procedures shall not be finally adopted until the other members of the Subcommittee have been consulted concerning them.

6. Subcommittee members are designated to act as individuals, but each shall have the right to consult, at his discretion and under appropriate security safeguards, with his agency or committee prior to Subcommittee action on matters normally within the cognizance of his committee or agency. In subscribing to the reports and recommendations of the Subcommittee the individual members shall not be expected to assume responsibility for technical matters or conclusions not normally within the cognizance of his own parent committee or agency. Reports as submitted to the Council should show, so far as possible by textual footnotes, any dissents by Subcommittee members.

7. The Subcommittee will have a Staff, composed of individuals assigned by member agencies, as required by the Director, and under the direction of a Director whom I shall designate. The Director may be compensated through the National Security Council from contributions by the member agencies. Individuals assigned to the Staff from each military service and by the Central Intelligence Agency should normally serve for two years and be so appointed that, to insure continuity, not more than fifty per cent will vacate each year.

8. The Net Evaluation Subcommittee hereby established is empowered under the terms of this Directive to call on any agency of the Government for relevant information, evaluations, and estimates, subject only to establishment of appropriate security regulations and procedures for the handling of highly sensitive information as provided under paragraph 5 above.

9. Distribution of each completed Subcommittee report will be determined at the time by me.

Dwight D. Eisenhower

² Information such as that relating to war plans, new weapons and equipment, techniques and tactics for their employment, the vulnerability of U.S. defenses, and domestic and foreign intelligence sources and methods. [Footnote is in the original.]

69. Memorandum From Smith (S/P) to John Foster Dulles¹

S/P-58-193-1A

Washington, July 10, 1958

SUBJECT

National Security Council Meeting, July 14, 1958

The items for discussion at this meeting are four reports called for by NSC action, approved by the President on April 2, 1958, on Measures to Carry Out the Concept of Shelter. There will be oral briefings on the reports (attached as Tabs A to D). High points in them are:

1. ADEQUACY OF GOVERNMENT RESEARCH PROGRAMS IN NON-MILITARY DEFENSE. Principal conclusions are that adequate shielding is the only effective means of preventing radiation casualties; that there is no lack of essential scientific knowledge which warrants postponement of basic shelter construction; that if no action is to be taken on shelter construction, the decision must be based on other than technical reasons; that there is need to investigate many details in order to provide an effective and coordinated shelter system; that since a substantial program of shelter construction could not be completed for a period of years, supplementary research and studies should be carried out while the basic shelter structures are being constructed; and that although a shelter system is the essential core of an effective non-military defense system, it cannot of itself be regarded as sufficient to assure our survival as a nation.

2. THE NUMBER OF NUCLEAR WEAPONS WHICH MIGHT BE TOLERABLE TO WORLD POPULATIONS. The report concludes that there would be adverse effects on populations of non-combatant countries of the Northern Hemisphere as a result of nuclear detonations in general war but they would not be as serious as some have assumed. This is based on the assumption that nuclear weapons used on both sides would have a total yield of 15 million kilotons. (15,000 megatons).

3. SURVIVAL OF POPULATION FOLLOWING A MASSIVE NUCLEAR EXCHANGE. This report assumes an attack on the United States in 1965; fallout shelter will be provided for the population; and the war will be over after one exchange of nuclear weapons. Principal conclusions are:

a. Ninety-four million Americans (49 percent of the estimated 1965 population of 192 million) will survive the attack and its aftermath of fallout.

¹ Source: Briefing for July 14 NSC meeting. Top Secret. 2 pp. Eisenhower Library, Whitman File, NSC Records.

b. Fallout shelter will save 67 million, while 27 million will survive in any event, since the areas where they live will be substantially free from fallout.

c. The people who emerge from fallout shelter will be able to survive in the postattack environment, provided that emergency food supplies have been located at suitable distribution points prior to the attack.

d. The nation will be able to rehabilitate itself, provided that measures have been taken to insure the availability of refined petroleum at key locations.

e. The struggle for survival and recovery will be long and difficult, and the rehabilitated United States may bear little resemblance to the pre-attack nation.

4. STATUS OF SHELTER MEASURES AS OF JUNE 30, 1958. Very little has been done to carry out the concept of shelter approved by the President on April 2, partly because no appropriation has been made for the purpose. It was then estimated that \$28.5 million would be required for the program in FY '59. The figure recently approved by the Budget Bureau is \$11.35 million but a request for this amount has not yet been sent to Capitol Hill. Because of the lateness of the time it is possible that no appropriation for shelter will be made at this session of Congress.

COMMENT. If, as indicated in report No. 3 above, fallout shelter could save 67 million Americans in a future war, the Government should move more rapidly and with more vigor to carry out the concept of shelter. This is especially necessary because the States and individual citizens will do little if the attitude of the Executive and Legislative branches of the Government is lukewarm. The President has not yet mentioned the subject publicly.

RECOMMENDATION: That at the NSC meeting, which is expected merely to note these reports, you stress the need for more urgency in the shelter program because of the present and long-term danger to the United States from nuclear war.

Attachments:

Tabs A, B, C and D

70. Briefing Note for the 372d NSC Meeting¹

Washington, July 14, 1958

1. This meeting is chiefly concerned with the problem of shelter against radioactive fallout in case of nuclear attack—three studies previously requested by the Council and an interim report by Governor Hoegh on the status of shelter measures.

2. Following the meeting of the Council on January 16, the President approved a modification of then-existing civil defense policy by incorporating the *concept of fallout shelter* for protection of the civil population against radiation hazard, subject to certain specified conditions. One of these conditions was that the implementation of the concept be deferred pending Council consideration of a report by an Interdepartmental Committee as to appropriate measures to carry out the concept.

3. On March 27 the Council considered the measures recommended by this Committee, together with recommendations by the Planning Board for certain further studies. Thereafter, the President approved (1) the taking of six specific measures (to be mentioned later) to carry out the concept of fallout shelter; (2) the submission of a report by Governor Hoegh on the status of these measures through July 1; (3) the making of the three studies recommended by the Planning Board; and (4) the deferring of action on five other measures proposed by the Interdepartmental Committee, pending consideration by the Council of the studies and the report.

4. Today, there will be presented the three studies and Governor Hoegh's report. The Council is not being asked to take any policy decision on these items at this time.

5. a. The *first* study was to make a special assessment as to (1) the adequacy of present research efforts by the several agencies of Government on the design and testing of shelters and on the effects of nuclear attack on humans; and (2) whether such research efforts should be better coordinated, integrated, or accelerated.

b. The *second* study was to appraise the upper limit of massive, concentrated nuclear detonations which could be tolerated by the peoples of the earth and, in fact, by the earth itself.

c. The *third* study was to explore the problem of survival of populations in the period following their coming out of shelter, after a massive nuclear exchange.

d. The *fourth* item is Governor Hoegh's status report.

¹ Source: Problem of shelter against fallout. Top Secret. 3 pp. Eisenhower Library, Whitman File, NSC Records.

6. First, then, the report on the “Adequacy of Government Research Programs in Non-Military Defense”—a study prepared by the Advisory Committee on Civil Defense of the National Academy of Sciences and the National Research Council, under the chairmanship of Dr. Lauriston Taylor of the Bureau of Standards, with the assistance of consultants from within and without the Government. The study lists research areas in which the initiation or acceleration of projects might save lives or enable survivors better to cope with their environment. One of the principal conclusions of the Committee appears to be that the low priority hitherto placed on civil defense makes it difficult to attract high calibre scientists into civil defense research projects.

DR. TAYLOR

MR. STANS—Comment.

7. *a.* The purpose of the *second* Study, to have been made by AEC in consultation with Dr. Killian, was to appraise the upper limits of *massive concentrated* nuclear detonations and their by-products which could be tolerated by the peoples of the world and by the world itself. The question had arisen in the minds of laymen as to whether a massive nuclear exchange, involving the detonation simultaneously or within a few hours of many millions of kilotons, could be sustained by the peoples of the earth and by the earth itself. It was desired to have the most qualified scientific opinion upon this question.

b. The formal study prepared by AEC assumes four instances of massive nuclear exchanges in the Northern Hemisphere (varying in intensity from 10,000 MTs to 1 million MTs) and examines the *average* effect of the radiation fallout therefrom on all peoples in the Northern Hemisphere *outside* of the areas in which the nuclear weapons were actually detonated. This study, although a partial answer to the question, does not deal with all aspects of the problems. Therefore, Dr. Libby has agreed to make a broader statement, to be followed by Dr. Killian.

DR. LIBBY

DR. KILLIAN

8. *a.* The *third* study is concerned with the survival of populations in the period following their coming out of shelter, after a massive nuclear exchange. ODM and FCDA requested Stanford Research Institute to undertake this study within the terms of an existing research contract. Three representatives from Stanford who worked on the study are here this morning.

b. The study conclusions have not been approved or disapproved by ODM and FCDA; and are still being evaluated by the successor agency, OCDM.

c. The study assumes (1) a hypothetical attack initiated by the Soviet Union upon the United States in 1965, directed at both military and

industrial targets; (2) that there will be one nuclear exchange *only*; (3) that fallout shelter will be available for the population of the United States, and that 90% of the people not killed by blast and thermal effects will enter and stay in shelter for the necessary periods of time (which will vary from a few hours to as many as 13 weeks); (4) that no assistance (food, medicine, etc.) will be available from *outside* the United States.

d. Because the assumed attack (a) takes place in 1965 (when more weapons, including ICBMs, will be available), and (b) uses more than one weapon per target, the severity of the attack—and the resulting fallout and casualties from fallout—is greater than we have seen in other hypothetical attacks (98 million fatal American casualties).

e. The details of the attack assumed are covered in Chapter II of the Study and form a framework for the later chapters, which deal with the problems faced by *survivors in a post-attack environment*.

MR. CANNELL, of the Stanford Research Institute, will speak on the problems of survival and recovery.

Questions.

9. The last of the four items is the report to be given by Governor Hoegh on the status of the six approved measures to carry out the concept of shelter. Those measures are: (a) research on shelter design, shelter habitation, shelter equipment, weapons effects on animals, etc.; (b) a limited progress of construction of shelter prototypes; (c) a sampling survey of existing structures; (d) a program of public education; (e) a “shelf” of emergency plans; and (f) incorporation of fallout shelter in appropriate *new* Federal civilian construction. At the time the President approved these measures in March, it was estimated that the cost to FCDA in FY 1959 of the first five items would approximate \$28.5 million. I now understand that the FCDA program for these five measures, as agreed upon with the Budget Bureau in late June, comes to only about \$11 million.

10. Action on five other measures proposed by the Interdepartmental Committee in March was deferred pending consideration by the Council of the reports you are hearing this morning (NSC Action No. 1882-*d*). Those five measures are further shelter prototype construction, pilot studies in selected communities, shelters in existing civilian Federal buildings, and shelters in existing and new military construction. I understand that OCDM is not seeking Council approval *now* for those additional measures, but will come back to the Council later in this calendar year after further evaluation of the studies presented today.

GOVERNOR HOEGH

71. Memorandum of Discussion at 372d NSC Meeting¹

Washington, July 14, 1958

SUBJECT

Discussion at the 372nd Meeting of the National Security Council, Monday, July 14, 1958

Present at the 372nd NSC Meeting were the President of the United States, presiding; the Vice President of the United States; Gerard C. Smith for the Secretary of State; and the Director, Office of Defense and Civilian Mobilization. Also present were the Secretary of the Treasury; the Attorney General; the Director, Bureau of the Budget; the Chairman, Atomic Energy Commission; the Special Assistants to the President for Science and Technology and for Public Workd Planning; the President, National Academy of Sciences; Dr. Willard F. Libby, Member, Atomic Energy Commission; Lt. Gen. Charles P. Cabell for the Director of Central Intelligence; The Assistant to the President; the Deputy Assistant to the President; the Director, U.S. Information Agency; the Special Assistants to the President for the Atoms for Peace Program, for Information Projects, for National Security Affairs, and for Security Operations Coordination; the White House Staff Secretary; the Deputy Director, Office of Defense and Civilian Mobilization; Huntington Sheldon, Central Intelligence Agency; Gordon Gray, NSC Consultant; Charles A. Haskins, Member, NSC Special Staff; Dr. Lauriston Taylor, National Bureau of Standards; Richard Park, National Academy of Sciences; William L. White, Rogers Cannell, and George Hopkins, Stanford Research Institute; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

**1. ADEQUACY OF GOVERNMENT RESEARCH PROGRAMS IN
NON-MILITARY DEFENSE**

(NSC Action No. 1882; NSC 5807/1; Memo for NSC from Executive Secretary, same subject, dated July 1, 1958)

General Cutler briefed the Council on this and the following three studies. (A copy of General Cutler's briefing note is filed in the minutes

¹Source: Agenda item 1: Adequacy of Government Research Programs in Non-military Defense; Agenda item 2: The Number of Nuclear Weapons Which Might Be Tolerable to World Populations; Agenda item 3: Survival of Population Following a Massive Nuclear Exchange; Agenda item 4: Status of Shelter Measures as of June 30, 1958; Agenda item 5: National Security Council and NSC Planning Board Meetings, September 1947 Through July 21, 1958. Top Secret; Eyes Only. 6 pp. Eisenhower Library, Whitman File, NSC Records.

of the meeting, and another is attached to this memorandum.) He then called on Dr. Lauriston Taylor to summarize the contents of the subject report.

Dr. Taylor's summary was related to the seven Conclusions set forth in the Summary at the beginning of the written report. (A copy of the report is filed in the minutes of the meeting.)

At the conclusion of Dr. Taylor's presentation, General Cutler suggested, by way of Council action, that the above-mentioned report be referred to Governor Hoegh for study and such recommendation to the Council as he might deem appropriate.

General Cutler next called upon the Director, Bureau of the Budget. Mr. Stans pointed out that, as the report itself said, there was certainly a lack of coordination in some of the areas of research in non-military defense programs. The most effective use to which the report could be put would be to fill in these gaps in coordination.

The President counseled Governor Hoegh to pay particular attention to the 6th and 7th Conclusions, which seemed to him to deal largely with procedural problems.

The National Security Council:

a. Noted and discussed the report on the subject prepared, pursuant to NSC Action No. 1882-*b*-(1)-(2), by the Advisory Committee on Civil Defense of the National Academy of Sciences-National Research Council, with the advice and assistance of personnel from a number of other committees of the Academy-Research Council and of individual consultants, and transmitted by the reference memorandum of July 1, 1958; as summarized at the meeting by Dr. Lauriston Taylor.

b. Referred the aforementioned report on the subject to the Director, Office of Defense and Civilian Mobilization, for study of the Conclusions contained therein (especially Conclusions Nos. 6 and 7 on page 2 of the Summary), and such recommendations to the Council as he may deem appropriate.

NOTE: The action in *b* above, as approved by the President, subsequently transmitted to the Director, Office of Defense and Civilian Mobilization, for implementation.

2. THE NUMBER OF NUCLEAR WEAPONS WHICH MIGHT BE TOLERABLE TO WORLD POPULATIONS

(NSC Action No. 1882; NSC 5807/1; Memo for NSC from Acting Executive Secretary, same subject, dated July 7, 1958)

After a further short briefing by General Cutler, Dr. Libby was called upon to comment on the written report. He pointed out that the world-wide effect of a nuclear war fought with "dirty" bombs having a megatonnage of 15,000, would result in serious effects on the health of the non-combatant peoples of the world, but would not actually lead to the end of life on the earth. The main point was that these effects

depend particularly on whether the bombs detonated are “dirty” or “clean”, because the world-wide effects of the nuclear exchange (as opposed to the effects on the combatant nations) derive from radioactive fallout. Certainly a nuclear exchange involving the detonation of 15,000 megatons would push the people of the world toward the limit of tolerance.

Dr. Libby went on to point out that it was extremely difficult to estimate the biological effects of such a detonation on the peoples of the non-combatant nations, simply because we do not know enough about such biological effects. On the other hand, with respect to the physical effects of such a holocaust, these were easier to establish, on the basis of some experience—for example, in the field of weather. Dr. Libby stated that the physical effects of such a detonation of nuclear weapons would be quite minor.

General Cutler pointed out the Planning Board’s fear that the concentrated explosion of 15,000 megatons would have particularly grave effects because of concentration. As a result of Dr. Libby’s statements and the conclusions of the written study, the Planning Board was now less fearful. General Cutler then asked Dr. Killian if he had any comments to make.

Dr. Killian stated that he and his people had not participated in the making of this study, but he was inclined to agree that Dr. Libby’s views were certainly conservative and perhaps even pessimistic. At the very least, it was a reasonable statement of the problem.

The President inquired as to the assumptions in the study regarding the mix between “clean” and “dirty” bombs. Dr. Libby replied that the assumed mix had been 50–50 between fission and fusion.

Secretary Anderson inquired the reason behind the apparent lack of Russian concern about “clean” nuclear weapons. Does this lack of concern derive from the Soviets’ realization of our superior knowledge in the field of making “clean” weapons? Dr. Libby stated that we did not know the reason for the apparent lack of concern, a statement in which Admiral Strauss concurred, adding, however, that the apparent lack of concern in the Soviet Union over the “clean” bomb may reflect merely what is said in Soviet public statements and not what the Soviets are thinking about in their laboratories.

The National Security Council:

Noted and discussed the report on the subject showing the radiation effects on non-combatant population of a massive, concentrated exchange of nuclear weapons, prepared by the Atomic Energy Commission pursuant to NSC Action No. 1882–b–(1)–(b) and transmitted by the reference memorandum of July 7, 1958; as summarized at the meeting by Dr. Willard F. Libby, Member of the Atomic Energy Commission.

3. SURVIVAL OF POPULATION FOLLOWING A MASSIVE NUCLEAR EXCHANGE

(NSC Action No. 1882; NSC 5807/1; Memo for NSC from Executive Secretary, same subject, dated June 27, 1958)

After a short briefing, General Cutler called on Mr. Rogers Cannell, of the Stanford Research Institute, to summarize the contents of the written report by the Stanford Research Institute. (A copy of the SRI report is filed in the minutes of the meeting.) After Mr. Cannell had set forth the general conclusion that both survival and recovery were possible if the nation possessed fallout shelter in 1965, General Cutler noted that the qualified optimism of the report rested on two assumptions: First, that the Soviets would make a single nuclear attack only on the United States, with no repeats; and second, that 90% of the American people who were not killed by blast and thermal effects would make effective use of the fallout shelter provided.

The President inquired as to the ways and means of decontamination, to which question Mr. Cannell provided an answer.

The President then inquired whether it was fair to conclude from the Stanford study that if we do undertake to create a fallout shelter system in the United States, every American should do his best to provide the shelter with emergency food rations and emergency fuel storage. The President thought that every industrial plant should have underground fuel storage and each American household ought to store up food for use in a shelter in the event of an emergency. Mr. Cannell agreed with the President, and pointed out that it would be extremely difficult for the average American to know how much food or fuel to store, inasmuch as he would not know whether he would have to stay in his shelter for as little as three days or as much as thirteen weeks. As a result, many people would simply give no thought to the problem.

Governor Hoegh commented that the FCDA had advocated that every individual stockpile in his own home a supply of food and other necessities designed to last for two weeks. The requirements thereafter should be taken care of by the public authorities of the community.

Secretary Anderson asked how, with so many people in shelter, anyone would know when to come out. Governor Hoegh and General Cutler attempted to answer Secretary Anderson's question.

The National Security Council:

Noted and discussed the report on the subject (including its assumptions) prepared, pursuant to paragraph I-b-(3) of NSC 5807/1 ("Measures to Carry Out the Concept of Shelter"), by the Stanford Research Institute and transmitted by the reference memorandum of

June 27, 1958; as summarized at the meeting by Mr. Rogers Cannell, of the Stanford Research Institute.

4. STATUS OF SHELTER MEASURES AS OF JUNE 30, 1958

(NSC Action No. 1882; NSC 5807/1; Memo for NSC from Executive Secretary, same subject, dated July 1, 1958)

Governor Hoegh stressed that it was the note of prudence rather than the note of alarm which had been emphasized in the FCDA program on shelter measures. The program had been given to the American people in a low key. He then went on to summarize the contents of his report, a copy of which is filed in the minutes of the meeting. After concluding his summary, Governor Hoegh stressed the importance of Congressional provision of sufficient funds if the shelter program was to be carried forward along the lines suggested. Governor Hoegh felt that the program could be successfully accomplished if Congress provided \$13 million. After Congress had acted on the appropriation, Governor Hoegh indicated his desire to present to the Council a supplementary status report.

The President asked several questions about the construction characteristics of shelters, particularly as to means of entrance and exit. These questions were answered by Governor Hoegh.

The National Security Council:

a. Noted and discussed the report on the subject prepared by the Federal Civil Defense Administration pursuant to NSC Action No. 1882-*c* and transmitted by the reference memorandum of July 1, 1958; as summarized at the meeting by the Director, Office of Defense and Civilian Mobilization.

b. Noted that the Director, Office of Defense and Civilian Mobilization, would submit to the Council a supplementary status report following Congressional action on FY 1959 appropriations, and appropriate recommendations on shelter measures (including those on which action was deferred by NSC Action No. 1882-*d*) in the light of Congressional action on appropriations and of further study of the reports presented in Items 1 through 3 above.

NOTE: The action in *b* above, as approved by the President, subsequently transmitted to the Director, ODCM, for appropriate action.

5. NATIONAL SECURITY COUNCIL AND NSC PLANNING BOARD MEETINGS, SEPTEMBER 1947 THROUGH JULY 21, 1958

General Cutler asked the President's indulgence while he briefly explained a tabulation comparing the number of meetings of the National Security Council and the NSC Planning Board during the Truman and Eisenhower Administrations. General Cutler stated that he realized that more important than the number of meetings was the quality of the actions taken by the Council, but, being possessed of a finite mind, he could not resist giving the Council members this

tabulation. There was no comment. (A copy of General Cutler's tabulation of Council and Planning Board meetings from September 1947 through July 21, 1958, is filed in the minutes of the meeting; another is attached to this memorandum.)

The National Security Council:

Noted the tabulation of Council and Planning Board meetings, from the establishment of the Council in 1947 through July 21, 1958, as distributed at the meeting by the Special Assistant to the President for National Security Affairs.

* * * * *

NOTE: Following completion of Item 5 above, the President held a special meeting in his office to consider current developments in the Near East, in the light of a briefing by the Director of Central Intelligence. In attendance at this meeting were the Vice President, the Secretary of State, the Acting Secretary of Defense, the Secretary of the Treasury, the Chairman of the Joint Chiefs of Staff, the Director of Central Intelligence, the Special Assistant to the President for National Security Affairs, Mr. Gordon Gray, and other staff officials.

S. Everett Gleason

72. Memorandum From Smith (S/P) to John Foster Dulles¹

Washington, July 15, 1958

SUBJECT

Basic National Security Policy (NSC 5810/1): NSC Review of Military Paragraphs 13 and 14 Scheduled on July 24, 1958

I

Your concept of main reliance on a capability for massive retaliation to deter Communist aggression has served the free world well. You have, however, recently expressed doubts as to the continuing validity of this concept. These doubts are shared by W, C, ARA, FE, NEA and IO which believe that the time has come to adopt a new concept placing greater emphasis on varied and flexible capabilities. (See Tabs A-F.)

Doubt has arisen because:

¹ Source: NSC review of military paragraphs of NSC 5810/1; recommendation for a new strategic concept. Top Secret. 3 pp. NARA, RG 59, S/P-NSC Files: Lot 62 D 1.

1. Given present and prospective Soviet nuclear capability, our decision to launch massive retaliation would also be a decision to commit national suicide. (The JCS February 1957 statement, "Strategic Concept", attributes to both the US and the USSR "the capability to destroy each other even after a surprise attack.")

2. Our allies, and in time the Communists, will become increasingly doubtful that we would launch massive retaliation unless nuclear attack on the US itself had taken place or was imminent.

3. Our allies (and in time perhaps our own people) will also become increasingly doubtful that massive retaliation is a rational response to anything less than Communist aggression on a scale that clearly threatens major free world areas—e.g. Western Europe as a whole.

4. Communist aggression is likely to be of an ambiguous nature which neither our allies nor our own people would recognize as warranting massive retaliation.

5. Our capability for massive retaliation will continue to be improved at the expense of other capabilities with the result that we shall become increasingly dependent upon a capability which we shall be increasingly inhibited from using.

EUR, while recognizing the force of some of the preceding considerations and sharing the concern of other offices at the growing inflexibility of US capabilities, believe that "a possible revision of the US strategic concept requires far more consideration than the Department has yet been able to give." (See Tab G)

II

I believe that continued main reliance on a capability for massive retaliation entails unacceptable risks to the US. This reliance is gradually limiting our freedom of action to two choices: total nuclear war with unimaginable death and devastation, or cumulative retreat before Communist menace and subversion ending in the isolation of the United States and the perversion of "its fundamental values and institutions."

In certain Far Eastern situations we may already be limited to a choice between total nuclear war and retreat. You will recall that the recent State-Defense study of capabilities for limited military operations projected immediate US nuclear retaliation in the hypothetical event of substantial Communist aggression against Quemoy and Matsu, Taiwan or the ROK. Nuclear retaliation of the magnitude indicated in the study would, in the opinion of a number of qualified State and CIA officers, entail grave risk of nuclear counter-strikes by the Communists which could lead to progressive expansion of the hostilities to general war. The President has directed the preparation of an NIE evaluating this risk.

III

The NSC agenda for July 24 includes reconsideration of the military strategy paragraphs of Basic National Security Policy (paragraphs 13 and 14 of NSC 5810/1).² If as a result of Council discussion the President confirms those paragraphs, your concept will continue to shape military plans and weapons development. Unless you take the lead, it seems likely that the paragraphs will be confirmed and movement toward a new concept deferred at least until mid-1959.

Delay would, I believe, be unfortunate. Although your recent discussions with Secretary McElroy on the strategic concept produced no tangible result, there is considerable evidence that your initiative has stimulated new thinking in the Pentagon, particularly in the Army, Navy and Marine Corps. If we could move quickly to a *joint* State-Defense review of an alternative concept (in contrast to the unilateral Defense review which presumably took place between your two meetings with Secretary McElroy), a practicable new concept might emerge.

You will recall that General Cutler circulated to the NSC an alternative version of paragraph 14 of NSC 5810/1. (See Tab I.) W, C, FE and IO specifically endorse the Cutler alternative. I understand, however, that Defense and the JCS strongly oppose that version. I accordingly do not recommend that you seek NSC agreement to Cutler's paragraph 14 on July 24.

Recommendations

It is recommended that

1. You inform the Secretary of Defense that you have concluded that we must now begin to move toward a new strategic concept.
2. You suggest to the Secretary of Defense that you jointly propose to the President that (a) NSC consideration of paragraphs 13 and 14 of NSC 5810/1 be deferred until early October and (b) State and Defense immediately undertake a Joint study of an alternative strategic concept on the basis of which the two Departments will prepare, and circulate to the NSC by the end of September, an agreed revision of paragraphs 13 and 14.

Approved____JFD____
Disapproved_____
Date_____

²(See Tab H). [Footnote is in the original.]

73. Note From Howe (S/S) to John Foster Dulles¹

Washington, July 17, 1958

THE SECRETARY

Basic National Security Policy (NSC 5810/1); NSC Review of Military Paragraphs 13 and 14 Scheduled on July 24, 1958

On July 16 you approved recommendations contained in Mr. Gerard Smith's memorandum of July 15; 1) that you inform the Secretary of Defense that you have concluded that we must now begin to move toward a new strategic concept and 2) that you suggest to Mr. McElroy that you jointly propose to the President that NSC consideration of paragraphs 13 and 14 of NSC 5810/1 be deferred until October and State and Defense immediately undertake the joint study of an alternative strategic concept (Tab II).

Mr. Smith has drafted a letter to Mr. McElroy for your signature along the lines of the recommendations that you approved yesterday (Tab I).

Fisher Howe

¹ Source: Approval of recommendation for a new strategic concept; transmits draft letter to McElroy from Dulles. Top Secret Attachments (not included). 1 p. NARA, RG 59, S/S-NSC Files: Lot 63 D 351.

74. Memorandum of Conversation¹

S/P-58203-3A

Washington, July 18, 1958

PARTICIPANTS

DOD/ISA

State—S/P

Mr. John N. Irwin II

Mr. Gerard C. Smith

Gen. Alonzo P. Fox

Mr. Elbert G. Mathews

Mr. Robert H. B. Wade

Mr. Smith told the DOD representatives that the Secretary of State would probably send the attached letter to the Secretary of Defense

¹ Source: New strategic concept. Top Secret. 2 pp. NARA, RG 59, S/S-NSC Files: Lot 63 D 351.

and informed them of its contents. He explained that the letter reflected growing State concern over our current strategic concept which seems in a very wide range of contingencies to face us with a choice between doing nothing and moving to general war which, according to the JCS, could result in the destruction of the US. Many people in State believe that we must develop doctrine and capabilities that would afford us some intermediate choices.

Mr. Irwin indicated that DOD would be reluctant to have NSC action on paragraphs 13 and 14 of NSC 5810/1 further postponed. DOD had submitted to Secretary McElroy for signature a memorandum to the NSC urging confirmation of the two paragraphs. A copy of this memorandum was displayed. *Inter alia*, it said that there were no "present developments" that changed the "military undertakings" required of the US, that the US and its allies had adequate limited war capabilities which were in any case being improved and that there could be no limited war between the US and the USSR.

Mr. Smith commented that State was less concerned with the formalities of NSC endorsement of the two paragraphs than with reaching an understanding with DOD that there would be a thorough review of our current strategic concept with recognition of its inevitable inacceptability in a few years time. We must begin to plan and prepare for an alternative strategic concept allowing us a wider range of responses to Communist aggression.

Mr. Mathews pointed out that the DOD memorandum perpetuated and strengthened the current, orthodox interpretation of paragraphs 13 and 14 of NSC 5810/1. If the NSC confirmed paragraphs 13 and 14 on the basis of this paper, there would be little room for the re-examination desired by State.

The DOD representatives stressed the budgetary difficulties of changing our strategic concept, our manpower deficiencies as compared with the Soviet bloc and the strong probability of any US-USSR clash, even if we desired and had the capability to deal with it in a limited way, developing into total war.

As the discussion ended, Mr. Smith again emphasized State's conviction that we must begin a thorough re-examination of doctrine and capabilities.

75. Letter From McElroy to John Foster Dulles¹

Washington, July 18, 1958

Dear Foster:

I am sending the enclosed Memorandum on Basic National Security Policy (NSC 5810/1) to the National Security Council today. In view of our recent conversations on this subject I wanted you to have a copy simultaneously.

You will note that this Department considers that the military section of NSC 5810/1 provides adequately for this segment of our security policy. Our belief is that there is plenty of flexibility in this statement to let us adjust our balance of forces as may be desirable. At the same time, by retaining the present language we do not suggest to any of our allies that there is any retreat in the offing from our past policy of firm resolution to use all required military force for whatever may be the situation that must be met.

I think it would be highly constructive if State and Defense might have reached a common point of view on this matter before the meeting of the Security Council next Thursday. If you find difficulty in accepting the position we have taken in the attached, perhaps you would phone me and give me your views.

Sincerely,

Neil

¹Source: Department of Defense position on retaining current strategic concept. Top Secret. 1 p. NARA, RG 59, S/S–NSC Files: Lot 63 D 351.

76. Memorandum From Smith (S/P) to John Foster Dulles¹

Washington, July 19, 1958

SUBJECT

Military Paragraphs of Basic National Security Policy Paper (NSC 5810/1)

Secretary McElroy has formalized the DOD position on this matter by sending in a memorandum to the NSC urging that the existing “military” paragraphs of the Basic National Security Policy paper be

¹Source: Question of a new strategic concept. Secret. 2 pp. NARA, RG 59, S/S–NSC Files: Lot 63 D 351.

retained. (*Tab A*). Before knowing of McElroy's action, we prepared for your signature a letter proposing that the NSC postpone decision on this matter pending a further joint State-Defense study. (*Tab B*).

In view of this difference between State and Defense, I suggest the following procedure:

That you call McElroy and point out the desirability of keeping this matter as "private" as possible. To this end you might suggest that Gordon Gray at the NSC meeting merely state for the record that it has been agreed that paragraphs 13 and 14 of the existing paper are to stand unchanged. This acquiescence by you in the existing language would be based on the expectation that the President, at a subsequent private meeting with yourself, McElroy and the JCS, would direct that this whole matter be further urgently studied.

You may recall that at the last NSC meeting on this subject General Max Taylor seemed to agree with your diagnosis of the short-life expectancy of our present strategic concept, but he expressed the opinion that within existing budgetary limitations important steps in the way of planning and weapon research and development could be accomplished to permit us subsequently to live with a modified strategic concept. Perhaps the President would direct a study of the implications of the type of program General Taylor had in mind.

In addition, it would be your hope that the President would direct the Joint Defense-State study of the possibility of formulating a new strategic concept which you propose in your letter to Secretary McElroy (*Tab A*).

Gerard C. Smith

77. Letter From John Foster Dulles to McElroy¹

S/P-58202-3A

Washington, July 19, 1958

Dear Mr. Secretary:

It is my understanding that at the next meeting of the NSC on July 24 you are to report on the key military paragraphs (13 and 14) of NSC 5810/1.

¹ Source: Question of a new strategic concept. Top Secret. 1 p. NARA, RG 59, S/S-NSC Files: Lot 63 D 351.

It seems to me that, in the light of our two recent conversations concerning the “strategic concept”, much work still remains to be done in our two Departments before a final recommendation can be made to the President concerning these paragraphs. If you agree, I suggest that you advise the President that both of our Departments would like to have this matter deferred for several months.

In the meantime, I suggest that we urgently undertake a joint study to determine whether we can begin to move toward a new strategic concept. I do not conceive that we should abruptly abandon our present concept, but I am increasingly convinced that we shall have to adopt a more flexible alternative within the next few years. Therefore, I believe planning should now start for the weapons systems and doctrines which will be needed to support such a change.

If you agree, I will ask Assistant Secretary Gerard C. Smith to stand ready to meet with your people to develop the necessary study for our consideration. It might be well to inform the President also of our intended joint study.

Sincerely yours,

John Foster Dulles

Enclosure

Memorandum From McElroy to the NSC

Washington, June 18, 1958

SUBJECT

Basic National Security Policy

REFERENCES

- A. NSC 5810/1
- B. NSC Action No. 1903-*b*-(3)
- C. NSC Action No. 1934

1. Transmitted herewith are Department of Defense comments and recommendations pursuant to NSC Action No. 1903-*b*-(3). In the formulation of these views, the conclusions and recommendations of the State-Defense study, "U.S. and Allied Capabilities for Limited Military Operations to 1 July 1961", the memorandum signed by the Secretaries of State and Defense forwarding that study to the National Security Council, and the comments on that study developed by the Planning Board and forwarded by the Chairman of the Planning Board, have been seriously studied and taken into account.

2. As a result of the review by the Department of Defense of the military aspects of Basic Policy, it is concluded that there have been no recent developments which change fundamentally the major undertakings for which the military should be prepared. The major threat to the security of the United States continues, and will continue in the foreseeable future, to reside in the capability of the Soviet Union to precipitate and wage general nuclear war against the United States. Therefore, the highest priority in our military effort must continue to be given to the deterrent to all-out nuclear war.

3. In this connection, it is the intention of the Department of Defense to insure that this deterrent is adequate for its purpose but not excessive. It is believed that the conclusions of the Department of Defense study on Defensive and Offensive Weapons Systems, which

will be presented to the NSC upon completion, will be pertinent in this regard.

4. The Department of Defense fully recognizes the need for flexibility in U.S. forces, to the maximum degree attainable within available resources, in order to deter or meet limited war. Both the limited war study and our recent thorough examination of our force structure have revealed a significant U.S. and allied capability to cope with a wide variety of limited war situations, and efforts are continuing toward the improvement of this capability.

5. Certain problem areas relating to limited military operations are raised by the study on this subject, and others are highlighted in the memorandum from the Chairman of the Planning Board. These problem areas have significant bearing on our capabilities for limited war and must receive continuing attention in our national planning—military, political, and economic—in order to insure the most effective use of available resources. The questions raised will receive continuing attention in our military planning.

6. In earlier NSC discussions a question was raised concerning the implications of increasing doubt on the part of our European allies that the United States would risk its own devastation by “massive retaliation” in response to aggression not directly involving U.S. territory. There was expressed the possible need for a modification of U.S. strategy in order to convince our allies that their security is not subject to an “all-or-nothing” decision by the United States. The problem raises the issue of whether limited war with the USSR is possible.

7. The Department of Defense has given careful consideration to this question. It is our considered opinion that war with the USSR cannot be held to limited operations and limited objectives. Moreover, to imply that we might seek to hold a war with the USSR to limited operations and limited objectives would involve a dangerous weakening of our deterrent position and certainly have a deleterious effect on the attitude of our allies.

8. Because of the almost certain adverse effect on our over-all deterrent inherent in any modification of strategy, the Department of Defense does not favor any such modification at this time for the purpose of reassuring our allies, nor does it favor any revision of the military paragraphs of NSC 5810/1 which can be interpreted as a departure from current strategy. The Department of Defense does subscribe to any measures designed to allay doubts on the part of our allies as to the firmness of our purpose and intentions and to reinforce their confidence and determination, along the lines contemplated in paragraph 17 of NSC 5810/1, which states in part: “. . . In particular, to counter existing uncertainty, the United States should reaffirm that its nuclear weapons will be used, as necessary, to defend the Free World interests.”

9. In the light of the foregoing, the Department of Defense considers that the military section of NSC 5810/1 adequately sets forth the military role in national strategy and provides the necessary basic guidance for development of the U.S. and Free World force structure in the national security interest. Accordingly, the Department of Defense recommends no change in the military section of NSC 5810/1 and recommends adoption of paragraphs 13 and 14 thereof, as already tentatively approved.

/s/ Neil McElroy

79. National Intelligence Estimate¹

NIE 100-7-58

Washington, July 22, 1958

SINO-SOVIET AND FREE WORLD REACTIONS TO US USE OF NUCLEAR WEAPONS IN LIMITED WARS IN THE FAR EAST

THE PROBLEM

This estimate was requested by the NSC as a result of a study prepared by the Departments of State and Defense and the Joint Chiefs of Staff, with appropriate participation of the Central Intelligence Agency, on *US and Allied Capabilities for Limited Military Operations to 1 July 1961*, 29 May 1958. Among the limitations under which this study was prepared were that it did not examine US and Allied capabilities against overtly employed Soviet armed forces; nor against an enemy employing nuclear weapons, since the latter case was construed as overt employment of Soviet forces. On the other hand, it was assumed that the US used nuclear weapons selectively from the outset in four hypothetical cases involving Communist aggression in the Far East.

This estimate examines whether or not the enemy would employ nuclear weapons if the US employed them, and assesses the impact on world attitudes if either the US or both sides employed them. It confines itself to assessing the above reactions in the four hypothetical cases given in the State-Defense study where the US employed nuclear weapons at the outset in response to Communist aggression through mid-1961: (1) North Korean invasion of South Korea, (2) Chinese

¹ Source: "Sino-Soviet and Free World Reactions to US Use of Nuclear Weapons in Limited Wars in the Far East." Top Secret; Limited Distribution. 12 pp. DOS, INR-NIE Files.

Communist attack on Quemoy and Matsu, (3) Chinese Communist attack on Taiwan, and (4) North Vietnam attack on South Vietnam and Laos. It is based on the hypothetical situations which are developed in Appendices A–D of the State-Defense study and which are summarized at the outset of Sections III–VI of this estimate.

CONCLUSIONS

1. We believe that if the US used nuclear weapons in meeting Bloc local aggression in the Far East, there would be a grave risk that the Communists would retaliate in kind. Indeed any Far East Communist state, taking into account the possibility of such US action, would be unlikely to launch a local aggression without having received assurances of Soviet support.

2. We estimate that, though the USSR will be determined to avoid courses of action gravely risking general war throughout the period concerned, it probably calculates that its growing military capabilities likewise increasingly deter the US from taking such risks. Therefore, the Soviets would probably estimate that local Communist use of nuclear weapons in direct and localized response to their use by the US would not necessarily lead to expansion of hostilities into general war, and they would under certain circumstances be prepared to use such weapons.

3. If the Communists retaliated with nuclear weapons, they would attempt to do so in such a manner as to limit the risks of general war. The USSR itself would probably prefer to avoid open involvement, and would probably provide the necessary weapons to Communist China or North Korea, though retaining Soviet control. Moreover, the Communists would probably confine their use of nuclear weapons within limits comparable to those observed by the US.

4. The likelihood of Communist retaliation with nuclear weapons would be greatest if the US mounted nuclear attacks deep into Communist China, creating a situation to which Moscow and Peiping would almost certainly feel compelled to respond by attacks on US bases and nuclear capable forces in the Far East. If, in the case of Communist aggression against South Korea or Taiwan the US nuclear response were limited to Korea or the Straits area, the Communists would probably respond in kind in the same area. In the case of local aggression against Quemoy and Matsu or South Vietnam, the Communist response would be less certain. If US nuclear attacks were confined to the immediate Quemoy and Matsu areas or Vietnam and Laos, the Communists might attempt to win without using nuclear weapons or seek to break off the action. However, even if the US nuclear response were limited to the immediate area of Korea, Taiwan, Quemoy and Matsu, or Vietnam and

Laos, we cannot exclude the possibility that the Communists would respond in kind, possibly including nuclear attacks against US bases in the area selected to minimize the additional risk of general war.

5. Many Free World governments and countries would be impressed and encouraged by the prompt US resistance to Communist aggression, but the US use of nuclear weapons would arouse widespread fear of general war and would tend to obscure Communist responsibility for initiating hostilities. The US would be widely condemned by popular opinion, especially in Asia, for the use of nuclear weapons. We believe that the adverse reactions would overshadow the favorable effects in most countries.

6. The adverse reaction would be mitigated if the US response quickly halted the fighting without causing large civilian casualties, and respect for US power would be enhanced. Even so, the stigma resulting from the US initiation of the use of nuclear weapons would not be removed. On the other hand, if the Communists responded with nuclear weapons and hostilities were prolonged and expanded, fears of general war would rise even higher, and great pressure would be exerted on the US to reach a settlement.²

² The Deputy Director for Intelligence, the Joint Staff, agrees with the principal conclusions that:

a. US nuclear response to Communist aggression would be likely to result in Bloc response with nuclear attacks in the first two cases examined and less likely in the second two cases.

b. Considerable adverse political and psychological reaction, particularly in Asia, would initially result from US nuclear attacks.

The DDI, Joint Staff, disagrees, however, with certain lesser estimative judgments and estimative yardsticks applied in these conclusions and in the supporting discussion. He believes:

a. The paper fails to recognize adequately the meaning of *selective* US use of nuclear weapons: specifically, it tends to equate "selectivity" to geographical limitations on target areas. "Selectivity" also applies to weapons yield, precise target choice, and accuracy of delivery. Given these factors, references to "heavy civilian casualties" appear incompatible with the basic assumption.

b. The paper reaches certain qualitative judgments as to the relative weights of adverse popular reaction and favorable popular reaction to US nuclear attacks: these relative measurements are largely conjectural. Such judgments also appear to fail to give due weight to many factors which would influence popular reactions in addition to the fact that the United States employed nuclear weapons. Some of these additional factors would be the initial success achieved by US military forces, the public statements of US governmental leaders concerning US objectives and intentions, and the extent to which popular opinion clearly recognized the military action as resulting from Communist aggression. There would certainly be both applause and boos; to say that in most countries the boos would drown out the applause—as in the words "... would overshadow ..."—is to attempt a precision of estimating not considered feasible for the hypothetical situations being analyzed. [Footnote is in the original.]

DISCUSSION

I. THE GENERAL SINO-SOVIET MILITARY REACTION

A. Factors Bearing on the Initial Communist Decision to Attack

7. In our view the crucial determinant in any Sino-Soviet decision to initiate local aggression, or subsequently to respond in kind to US use of nuclear weapons in countering such aggression, would be the Sino-Soviet estimate of the resultant risks of general war. We continue to estimate that respect for US nuclear power will remain such that neither the Soviets nor the Chinese Communists are likely to pursue courses of action which in their judgment seriously risk general war. Largely for this reason, we do not believe that any of the four hypothetical cases of Communist aggression considered in this estimate is likely to occur through mid-1961.

8. We must assume, however, for the purposes of this estimate, that such aggression has taken place. Several consequences flow from this assumption. Most important, the Communists would have launched this aggression only after careful calculation of the likelihood of US intervention and of the resultant risks of general war. Both US statements and the general posture of the US forces in the Far East would almost certainly lead them to calculate that US intervention with nuclear weapons would be the only immediately effective US response.

9. The most likely calculations, therefore, under which the Communists would decide to launch local aggression in the Far East would be that the chances that the US would be deterred from even a local nuclear response were sufficient to justify taking the risk and that even if the US did respond, their own capabilities were sufficient both to cope with this reaction and to deter the US from broadening the conflict to general war. This circumstance might arise in the case of a substantial increase in Communist capabilities vis-à-vis those of the US, especially in the Far East—as for example by the possible stationing of nuclear weapons and advanced delivery vehicles in Communist China. Particularly in this situation, the Bloc leaders might estimate that the US would be unwilling to accept the risks and the adverse Free World reactions involved in responding with nuclear weapons to Bloc attacks, and being unable to respond effectively in any other manner, would choose not to do so at all.

10. We believe it most likely that any Communist aggression in the Far East would be undertaken only in full consultation with Moscow, since the Chinese, North Koreans, or North Vietnamese would almost certainly insist upon certain guarantees of Soviet support in event of US retaliation beyond their capabilities to counter. However, we cannot exclude the possibility of unilateral action on the part of the Chinese Communists, based on their calculation that despite Soviet reluctance

the USSR would be compelled to come to their support if the US replied with nuclear weapons. We regard such adventurism as unlikely, although possibly less so in the case of Quemoy and Matsu.

11. In any event, regardless of their estimate of the likelihood of US nuclear intervention, the Communists almost certainly would have made plans and preparations to meet this contingency. If the decision to launch a local war had been taken well in advance, Moscow might have already provided Peiping with some nuclear weapons and perhaps advanced means of delivery, both to deter a US nuclear response and to counter it if it came. We believe that in any event the Chinese will press the USSR for such weapons, and that the USSR may introduce these weapons into Communist China by 1961, although they will almost certainly remain under Soviet control. Alternatively, the Soviets might promise the Chinese to provide them quickly with such capabilities if required. Moscow would also probably attempt to deter the US at the time of the aggression by threats of intervention in case the US uses nuclear weapons.

B. Factors Bearing on the Subsequent Communist Reaction

12. Once Communist local aggression in the Far East had been launched, and the US had responded locally with nuclear weapons, Moscow and Peiping would face a critical decision. Broadly speaking, their reaction might range from abrupt termination of the conflict or seeking negotiations, through continuing the fight with conventional forces, to replying in kind with nuclear weapons.

13. As already stated, we believe the crucial determinant would be their estimate of the resultant risks of general war. Moscow and Peiping would be acutely conscious that the risks of general war had materially increased. The very fact of US use of nuclear weapons would reflect US determination to accept some risks. We believe, however, that if they had initially launched the aggression anticipating a US nuclear response and if they were confident of their capability to deal with it locally, they would promptly react with nuclear weapons themselves.

14. If, on the other hand, Moscow and Peiping had miscalculated our response, they might be more disposed to seek a quick settlement on the basis of the *status quo ante* rather than further increasing the risk of general war by a nuclear response of their own. Even in this case of initial miscalculation, however, the Soviets might regard their over-all nuclear deterrent power as making US resort to general war sufficiently unlikely that they could afford to take the risk of making a nuclear response. Moreover, they would have powerful additional reasons for a nuclear response, among them: (a) considerations of prestige, including a Soviet feeling that having threatened dire consequences if the US intervened with nuclear weapons, they must save

face by following through; (b) the vulnerability of the US bases in the Far East; (c) on the Soviet side, the importance of supporting their chief ally; and (d) the damage to the Soviet deterrent posture if the USSR failed to respond.

15. The manner in which the US employed nuclear weapons could have a critical bearing on whether or not the Communists made a nuclear response. If such use were highly selective, and above all if confined to the immediate area of hostilities, the Communists might not respond with nuclear weapons. But especially if the US launched nuclear strikes deep into Communist China, Peiping would almost certainly appeal desperately for Soviet assistance, and we believe that the Soviets would feel compelled to come to the support of their chief ally. They would probably calculate that they could not afford the loss to the Bloc and the blow to their own prestige and position of a crippling of Communist Chinese power.

16. The Communist reaction would also be conditioned by their appreciation of the general US posture at the time. They would look to other US military movements, the degree of alert in the US, and US statements for evidence of whether the US was preparing to fight a prolonged local war if necessary, to expand the conflict, or to accept a return to the *status quo*. In this connection US statements of the limited nature of our objectives, if consistent with our military actions, might have considerable impact. Such statements might tend to reassure the Communists that a negotiated termination of the conflict on an acceptable basis was feasible. On the other hand, these statements might reassure them that their use of nuclear weapons locally would not lead the US to broaden the conflict.

17. If it appeared to the Communists that the US was not prepared to expand the conflict or to conduct a prolonged war, they would probably be more inclined to continue the fighting using nuclear weapons selectively. If on the other hand the US, while limiting its initial nuclear response, nevertheless appeared determined to press on to victory, and prepared to expand the conflict in the Far East if necessary, the Communist reaction would tend to be more cautious. They might still launch some nuclear attacks to reduce US strike capabilities in an attempt to achieve a stalemate, but they would probably also move to secure an early end to the conflict.

C. The Modes of Sino-Soviet Nuclear Response

18. In case the Communists decided to react with nuclear weapons if the US had used such weapons in the Far East, Peiping and especially Moscow would nevertheless do so in such a manner as to limit the risks that hostilities would expand into general war. For this reason we believe that the Soviets would be loath to intervene directly

through using identifiable Soviet forces to attack US bases and forces. They would probably prefer covertly to provide the necessary weapons and support to the Chinese Communists or possibly the North Koreans. We believe they would also calculate that the limited US base structure in the Far East would be highly vulnerable even to attack by Chinese Communist forces alone. But the Soviets would provide extensive aid and support, extending possibly to "volunteers." They would almost certainly provide Soviet forces to participate in the air defense of Communist China. Moreover, in event of widespread US attacks on Communist China, we cannot exclude the possibility of open Soviet intervention in the Far East.

19. Peiping and Moscow's desire to limit the risks of general war also would probably lead them to confine their nuclear attacks within limits comparable to those observed by the US. If US use of these weapons was confined to the immediate combat area, we believe that the Communists would similarly limit their response. However, the possibility cannot be excluded that even if US use of these weapons were confined to the immediate combat area, the Communists might also launch nuclear attacks against US bases in the Western Pacific selected so as to minimize the danger of general war. If the US attacked targets deep in Communist China, the enemy would probably react by attacking selected US bases in the Western Pacific.

II. GENERAL FREE WORLD REACTIONS

20. Free World reactions to a US response with nuclear weapons to Communist aggression in the Far East would vary widely. Provided that the aggression were clearly identifiable, most of our allies, and probably some neutral opinion, would be inclined at least initially to view with approval our prompt and forthright aid to the victim of attack. However, this feeling would be overshadowed by fear that nuclear war in the Far East would spread into general war. Such apprehension would rise greatly if the US nuclear counterattack were of such a nature—including for example strikes deep into Communist China—that it appeared to be in excess of the force required, and particularly if the Communists employed nuclear weapons in retaliation. Even if the war were localized there would be fear that one side or the other might subsequently broaden it. These developments would lead to strong pressures on the part of other governments to seek a prompt end to hostilities.

21. Along with Free World fear of expanding hostilities would be a widespread adverse emotional reaction to US use of nuclear weapons. Should these weapons inflict large casualties, particularly among civilians, it would intensify this feeling. If, however, US use of nuclear weapons led to a quick victory without large civilian casualties this

attitude of repugnance would tend to diminish and to be offset by confidence in US deterrent power.

22. The adverse reaction to US use of nuclear weapons would be particularly strong throughout most of Asia. Here such use would tend to be looked upon as callous white indifference to the lives of Asians. Indeed the inflicting of large-scale casualties on Asian civilians might have enduringly adverse consequences for the anti-Communist position in Asia. The reaction in Japan would be especially adverse, in view of deep Japanese emotional antagonism to the use of nuclear weapons, and Japan would probably not allow US use of bases on its territory. The adverse reaction might be mitigated to a limited extent if the Communists in turn employed nuclear weapons, but the US would still incur the odium of having used them first.

III. THE CASE OF NORTH KOREAN INVASION OF SOUTH KOREA

23. *Assumptions.* It is assumed for the purpose of this estimate that at a time when the situation in South Korea is confused following President Rhee's incapacitation, and rival groups are seeking power, the North Koreans charge South Korean border violations, step up subversive activities in South Korea, and then invade. Chinese Communist assistance to North Korea is covert, including troops disguised as North Koreans. It is also assumed that most US forces have been withdrawn prior to the attack. However, the US intervenes initially largely with air power, and with subsequent commitment of ground forces as necessary. The US uses nuclear weapons against enemy military targets in Korea and China, the destruction of which is considered requisite to successful prosecution of the action. The US seeks UN backing, or, failing this, the support of the other fifteen members of the UN Command, but does not await such support before intervening.

A. The Sino-Soviet Military Reaction

24. The initial Communist attack on the ROK would probably only have been undertaken in anticipation that victory could be gained despite US counteraction, or that the US would be deterred from effective counteraction by the chaotic situation within the ROK, allied hesitations, and fear of Sino-Soviet countermoves. Nevertheless, the Sino-Soviet leaders, recognizing that the US might use nuclear weapons in Korea, would probably be prepared to counter this development by similar local use of nuclear weapons.

25. If the initial US reaction were quick, effective, and limited to Korea, the Bloc might attempt to achieve a cease-fire, cut its losses, and redress its loss of face, in the belief that the fruits of victory were not worth the risks of expanded war. In this case it would attempt to exploit

politically the US use of nuclear weapons, but we regard it as more likely that the Chinese Communists and North Koreans would reply with nuclear weapons obtained from the USSR.

26. If US use of nuclear weapons were restricted to North Korean targets, the Communists would probably use nuclear weapons only against targets in South Korea. However, we cannot exclude the possibility that if the attacks were launched from outside Korea, the Communists might also launch nuclear attacks against US bases selected so as to minimize the additional risk of general war even though the US strikes had been confined to Korean territory. If a stalemate developed on the ground, a new armistice would be sought.

27. The likelihood of Communist nuclear reaction would be greatest in the event that US nuclear attacks were directed against targets in China itself. The Chinese Communists would probably attack with nuclear weapons selected US bases and naval forces in the West Pacific. If ballistic missiles capable of reaching these targets had been deployed in China prior to the aggression, they would also be used.

B. Free World Reactions

28. Assuming Bloc aggression appears clear-cut, the general attitude of the Free World, probably even including India and other neutrals, would initially be sympathetic toward the ROK and the United States. A large measure of diplomatic support would be forthcoming and some of our allies would be inclined to offer some token military assistance, though the US could not count on any significant Free World military support.

29. Free World sympathy would be overshadowed generally by fear that the conflict would expand since the US had used nuclear weapons, particularly if the US attacked targets outside of Korea. Our principal NATO allies would probably seek to restrain the United States from continuing nuclear attacks. The neutralist countries would almost certainly have backed away from any initial approval. Conversely, if the Communists did not launch nuclear attacks, or if the conflict were effectively localized, concern over the spread of hostilities would diminish, and initial Free World approval of the US action would probably be strengthened. Even so, if heavy civilian casualties were inflicted, it would probably cause a feeling of revulsion, particularly in Asia, against the US.

30. From the outset, the Japanese reaction would constitute one of the greatest problems for the US. While the government and much of the public would be sympathetic to the US-ROK cause, fear of Japan's involvement would create great pressures to deny the United States the use of Japanese bases. US use of nuclear weapons, whatever the targets, would inflame Japanese reactions, public and official, almost certainly

to the point of demanding that the US not use its bases in Japan for nuclear attacks. Japan might even insist on complete US withdrawal, particularly if the US expanded air attacks beyond Korea.

IV. THE CASE OF CHINESE COMMUNIST ATTACK ON QUEMOY AND MATSU

31. *Assumptions.* Two weeks of stepped-up artillery attack on the offshore islands, a buildup of jet fighters and bombers in the Southeast China area, and concentration of amphibious assault forces herald a coming invasion. GRC supply and reinforcement of the islands becomes difficult, due to heavy bombardment. In this charged atmosphere, Soviet spokesmen recall the 1950 Sino-Soviet Treaty of Mutual Assistance, and the US in turn stresses its Mutual Defense Treaty with the GRC. The US informs our allies that it will assist in repelling an invasion, using nuclear weapons, if necessary against mainland China. A general alert is declared throughout the Pacific Command. Japan announces it will never permit bases on its territory to be used for atomic warfare. When the invasion begins, the US immediately provides assistance to the GRC including selective nuclear attacks on military targets within a 500 n.m. radius from the islands (including targets in the Shanghai, Nanking, and Canton areas), and on enemy strike force bases wherever located in China, as well as on the invasion force itself.

A. The Sino-Soviet Military Reaction

32. Confronted with such an extensive nuclear response, Peiping and its Soviet ally would probably feel compelled to react with nuclear attacks at least on Taiwan and on the Seventh Fleet. Whether they would extend their attacks to other US Far East bases would depend largely upon whether these bases were used in our nuclear offensive and upon their assessment of our intentions. If US nuclear weapons were used extensively against interior Chinese targets, the Communists would probably feel compelled to respond against other US bases and forces in the Far East.

33. On the other hand, the firmness and promptness of our response would probably convince Peiping of our determination to retain control of Quemoy and Matsu. If at the same time our attacks were initially limited to forces and facilities in the immediate area and directly supporting the aggression, this factor might also convince Peiping that our objectives were limited to defense of the islands. Under these conditions, the Chinese Communists, if they had failed to seize the islands, would probably abandon the attempt despite the loss of face they would suffer from this defeat. This outcome would be most likely in the remote event that Peiping had launched the aggression without full Soviet concurrence and support. In this situation the

USSR, despite Chinese Communist pressures, would probably seek to close out the actions as quickly as feasible, and attempt to compensate for Communist military defeat by political exploitation of the US use of nuclear weapons.

B. Free World Reactions

34. The predominant immediate Free World reaction to the US use of nuclear weapons against Communist China would be highly adverse, with many allies as well as the neutrals considering that the US was risking general war over what most of the world regards as unimportant parcels of real estate. Most of our allies, including those in NATO, would probably shun any responsibility for, or connection with, the US action, in an attempt to avoid involvement in hostilities developing from Quemoy and Matsu. In Asia, only a few countries, notably Nationalist China and South Korea, would be encouraged by the vigor of the US response to Chinese Communist aggression, whereas strong antagonism would be aroused generally throughout the continent by US use of nuclear weapons.

35. The adverse reaction would tend to be modified to the degree that the US action brought the hostilities to an early successful end without heavy civilian casualties. Under these conditions, some Asian countries would probably come to have greater confidence in the ability of the United States to defend them against Communist aggression. But the reaction in most countries would remain adverse.

36. Conversely, if the conflict were prolonged or were to spread, and especially if large-scale casualties were inflicted on Chinese civilians, the adverse consequences for the US might be irreparable. Particularly in Asia. We might be forced to withdraw from our bases in Japan, and Japanese pressure for our withdrawal from Okinawa would increase. Our influence in most other Asian countries would be seriously undermined. In Western Europe fears of general nuclear war and popular pressures on governments to end the fighting would increase.

V. THE CASE OF CHINESE COMMUNIST INVASION OF TAIWAN

37. *Assumptions.* As a result of effective Chinese Communist interdiction of the offshore islands, the GRC successfully evacuates Quemoy and Matsu, unopposed and with the assistance of the US Seventh Fleet. There follows a buildup of invasion forces and air-power in East China. The GRC calls on the UN to condemn such war preparations, and asks for military assistance; the US reiterates readiness to aid the GRC if it is attacked. Japan announces it will never consent to its bases being used for atomic warfare, while the Philippines and South Korea announce their support of the GRC. There is a

7–10 day warning period before the actual attempted invasion, during which US forces could deploy in the area. Upon the actual invasion attempt, the US renders assistance by air and naval forces, employing nuclear weapons against the enemy invasion forces, enemy bases for the attack (including air bases wherever located), and any successful enemy lodgment on Taiwan. If this does not fully succeed, SAC is to be employed against other Chinese Communist forces and the warmaking capabilities of Communist China. All present US bases in the area are used, except those in Japan.

A. The Sino-Soviet Military Reactions

38. Since Chinese Communist invasion of Taiwan would require the commitment of a significant portion of the Chinese Communist armed forces, and would in Peiping's eyes carry great risk of US nuclear intervention, we regard it as almost certain that Peiping would not undertake such an operation without prior assurances of Soviet support. Furthermore, we believe that the Sino-Soviet leaders would have regarded the likelihood of US nuclear intervention to be sufficiently great that they would have deployed Soviet nuclear weapons (under Chinese Communist cover) in East China. In the assumed case, the Bloc would probably calculate either that the US would be deterred by fear of Bloc nuclear retaliation from responding with sufficient force to thwart the invasion, or that Bloc nuclear capabilities were sufficient to cope with US nuclear intervention.

39. If the initial US response with nuclear weapons were limited to the attacking forces and the immediate area of Taiwan, and particularly if it quickly defeated the initial Chinese Communist attempt at invasion, the Communists might seek to close out the war quickly, preferring military defeat to expanded war. They might calculate that their loss of military prestige would in part be compensated by propaganda dividends from US use of nuclear weapons against Asians and that the ultimate effects in weakening the US position in Asia might be considerable.

40. However, the extent to which Chinese Communist prestige had been committed by an operation of this size and the difficulty of reaching a settlement which the Chinese Communists could accept without loss of face might lead the Bloc to retaliate with nuclear weapons even if this meant serious risk of expansion of hostilities in the Far East. Accordingly, if they decided to continue the campaign in the face of US nuclear attacks in the Taiwan Straits area, they would retaliate with similar nuclear attacks upon bases in Taiwan and upon the Seventh Fleet.

41. If the US extended the area of its nuclear attacks deep into mainland China, we believe that the chances of Communist nuclear

counterblows would be substantially greater. The USSR would be faced with the difficult decision either of permitting its major ally to suffer a humiliating defeat, or of taking the risks involved in the necessary steps to prevent such a defeat. We estimate that the Communists would launch reciprocal nuclear strikes against selected US bases and naval forces. If ballistic missiles capable of reaching these targets had been deployed in China prior to the aggression, they would also be used.

B. Free World Reactions

42. Even though most Free World countries would recognize that Communist aggression had clearly occurred, this factor would be outweighed by concern throughout the Free World lest World War III result from the postulated US use of nuclear weapons. Most of our allies, including those in NATO, would probably think that protection of Taiwan was not of sufficient importance to warrant actions which they would consider to promote serious risk of general war, or even of major war in the Far East. Some of them would express some support of the US, but they would exert strong pressure for a ceasefire. Popular pressures on Allied governments for ending the fighting would increase, as would sentiment for restricting US ability to launch nuclear strikes from bases elsewhere in the world. The US would almost certainly be denied the use of its bases in Japan for the campaign.

43. The adverse reaction would tend to be modified to the degree that the US action brought the hostilities to an early successful end without heavy civilian casualties. Under these conditions, even some Asian countries would probably come to have greater confidence in the ability of the United States to defend them against Communist aggression. But the reaction in most countries would remain adverse.

VI. THE CASE OF NORTH VIETNAMESE INVASION OF SOUTH VIETNAM AND LAOS

44. *Assumptions.* The Vietnamese Communists infiltrate the equivalent of two regular divisions and as many irregulars into all the Indochinese states, and concentrate a dozen divisions of regular forces in North Vietnam. Sporadic clashes occur and there is a spate of assassinations in Vietnam. President Diem proclaims a state of national emergency and siege, invokes the SEATO treaty, and calls for aid from all members. There is no clear cut beginning of the invasion. US military action would include the selective use of nuclear weapons as appropriate, against the invading forces, targets in North Vietnam, and in adjacent areas of Communist China. The US, before moving, advises Communist China and the USSR of its intention to assist Vietnam militarily unless the invaders withdraw.

A. The Sino-Soviet Military Reaction

45. In initiating the attack on South Vietnam, the Bloc would almost certainly have counted on achieving its objectives before an effective US intervention could develop, and possibly on deterring any US intervention at all. Once the US nuclear response occurred, the Bloc would be confronted with a difficult choice among: (a) seeking a negotiated settlement; (b) continuing the war without Bloc use of nuclear weapons, calculating that the US would not in this case employ nuclear weapons against Communist China itself; or (c) reacting by use of nuclear weapons against US forces, with the resultant risks involved.

46. If US use of nuclear weapons were restricted to targets in Indochina, there is an even chance that the Communists would attempt to continue the campaign without using nuclear weapons themselves. In this case, the Bloc would continue to provide military assistance and equipment to the North Vietnamese, including a buildup of Communist air power. If the Communists were able to continue effective military operations in South Vietnam and Laos despite US use of nuclear weapons the impact in Asia would be substantial. If US-Vietnamese forces were threatening to cross the 17th Parallel they would probably seek to close out the conflict on the basis of restoration of the *status quo*. Should North Vietnam nevertheless be invaded, Chinese Communist forces would probably enter in force to hold at least the Hanoi-Haiphong and northerly areas. In this case, the Communists would also probably threaten to use—and indeed might use—nuclear weapons in Indochina itself to stave off defeat.

47. Moreover, if at any stage the US made nuclear attacks on adjacent areas in China, the Communists would probably respond with nuclear attacks on targets in Indochina, and possibly on selected US bases in other countries.

B. Free World Reactions

48. Initial support among Free World governments and peoples for US determination to resist Communist aggression would be offset in large measure if the US used nuclear weapons. Opposition to US use of nuclear weapons would be particularly strong if the US attacked targets in Communist China, even if Communist Chinese use of “volunteers” in Vietnam were large-scale and widely known. As in the previous cases, opposition to US use of nuclear weapons would be sharpest in Asia.

49. If the US response involved only limited and selective use of nuclear weapons in Indochina alone, the reaction of most US Allies would be less adverse. Such action would have the support of South Korea and Nationalist China, and would have the support of some SEATO governments if they thought this action necessary to repel the aggression.

However, the reaction of most Free World countries, and particularly of the Asian neutrals, would still be generally adverse, even if the conflict remained localized and the aggression were turned back.

80. Memorandum for the Record of Conversation Between John Foster Dulles and McElroy¹

Washington, July 22, 1958

SUBJECT

Military Paragraphs of Basic National Security Policy Paper (NSC 5810/1)

In a discussion of the above subject with the Secretary on July 21, Secretary McElroy said that Defense felt that, while it is appropriate to continue work on the development of an alternative strategic doctrine, the present situation required us to have a firm basis on which we could proceed in the meantime.

The Secretary asked if it would be acceptable to Secretary McElroy if we agreed that, as far as the record was concerned, paragraphs 13 and 14 of the paper would stand unchanged, but that the President would privately ask Secretary McElroy and himself to continue studying the question until a better recommendation could be made. Secretary McElroy accepted this idea.

The Secretary emphasized it was important that this information be closely held to a small group, since it would be dangerous if our allies and others knew about it before an adequate alternative doctrine was evolved. He said he would instruct our Planning Board representative to state that we accept paragraphs 13 and 14, but that information about the President's request for further study would be kept secret. Secretary McElroy agreed.

81. Letter From John Foster Dulles to Eisenhower¹

Washington, July 23, 1958

Dear Mr. President:

At the National Security Council meeting on July 24, 1958 I shall concur in Secretary McElroy's recommendation that paragraphs 13 and 14 of the Basic National Security Policy (NSC 5810/1) be adopted without change.

I have told Secretary McElroy that I remain of the opinion that the doctrine set forth in paragraphs 13 and 14 is rapidly outliving its usefulness and that we need to apply ourselves urgently to finding an alternative strategic concept. I did not, however, wish to air my misgivings on this sensitive subject before the Council.

I suggested to Secretary McElroy that we should seek your approval of further urgent study of our strategic concept and doctrine by a small State-Defense group, the existence of this group and its task to be very closely held. He agreed.

I should be grateful for an early opportunity to discuss this matter further with you and Secretary McElroy.

Faithfully yours,

John Foster Dulles

The National Security Council, the Secretary of the Treasury, the Director, Bureau of the Budget, and the Chairman, Atomic Energy Commission, at the 373rd Meeting of the Council on July 24, 1958, noted and discussed the recommendations by the Department of Defense relative to the military elements of national strategy in NSC 5810/1, including paragraphs 13 and 14 thereof (prepared pursuant to NSC Action No. 1903-*b*-(3) and transmitted by the reference memorandum of July 21, 1958), in the light of (1) an oral summary by the Secretary of Defense, (2) an oral summary by the Chairman, Joint Chiefs of Staff, of the views of the Joint Chiefs of Staff, originally presented at the 364th NSC meeting on May 1, 1958 (NSC Action No. 1903-*a*); and (3) a statement by the Secretary of State that he concurred at this time with the recommendation by the Secretary of Defense that no change be made in the military section of NSC 5810/1, but that U.S. military doctrine should be kept under study and review.

On July 28, 1958, the President, after further study and consideration following the meeting, approved paragraphs 13 and 14 of NSC 5810/1, with the understanding that they would be kept under continuing study pending the next annual review of basic policy.

The above decision by the President is accordingly transmitted herewith to all holders of NSC 5810/1.

James S. Lay, Jr.
Executive Secretary

83. Briefing Note for the 374th NSC Meeting¹

Washington, July 31, 1958

ITEM 3—OPERATIONAL CAPABILITY OF RECONNAISSANCE SATELLITES

1. Last January, the Council noted (NSC Action No. 1846) that the President had established certain missile and related programs “as having the highest priority above all others for research and development and for achieving operational capability; scope of the operational capability to be as approved by the President.”

2. Included were “satellite programs (other than VANGUARD and JUPITER C determined by the Secretary of Defense to have objectives having key political scientific, psychological or military import.”

3. On April 10, 1958, Defense advised that pursuant to delegated authority, the Secretary of Defense had determined that the Air Force reconnaissance satellite vehicle program was a satellite program having key political, scientific, psychological or military import.

4. Before proceeding to the question of operational capability, I am going to call on Mr. Quarles to give the Council a brief report on the status of the reconnaissance satellite program—its progress, objectives, potentials, and priority.

5. There has been circulated to you a table which shows a proposed launching schedule. I should point out, however, *that the Council is not being asked to approve any specific number of test shots. That decision will be worked out in due course through the normal budgetary process.* Mr. Stans understands this.

(CALL ON MR. QUARLES)

6. On July 3, there came before the Council the question of Presidential approval of the “scope of the operational capability” of the reconnaissance satellite. The Council noted and discussed a Defense Department recommendation on operational capability, but deferred action on the recommendation pending study and report back to the Council by Dr. Killian on July 31 (NSC Action No. 1941).

7. Before the Council today is the original Defense recommendation and Dr. Killian’s proposed amendment thereto, as shown on the sheet before you. The JCS have indicated their concurrence with Dr. Killian’s modification, which clarifies the language and makes clear that Presidential authorization will be sought before any actual launching

¹ Source: Operational capability of reconnaissance satellites. Top Secret. 4 pp. Eisenhower Library, Whitman File, NSC Records.

over the Soviet Union, of a satellite carrying reconnaissance equipment. The modified language reads:

(READ)

8. If that recommendation is adopted, it will authorize the development of an operational capability of 8 Atlas-boosted satellites, although it will leave the decision as to the actual launching to be made later by the President.

(CALL ON: Secretary of Defense (or Deputy SecDef) *Dr. Killian*)

Attachment

Defense Recommendation on the Reconnaissance Satellite (submitted to the NSC on July 3, 1958, NSC Action No. 1941–a) and Proposal for Modification in Dr. Killian's Recommendation of July 28, 1958

Although a satellite with reconnaissance equipment in orbit over the USSR is not expected to be operational prior to March 1960, it is necessary at this time to plan for the launching of eight test satellites of this general type. Accordingly, it is recommended that the reconnaissance satellite program, including the eight test vehicles which will orbit over the USSR, be approved for planning purposes,

Defense

with the understanding that Presidential authorization with respect to the scope of the operational capability of the program will be sought by the Department of Defense in early 1960.

Dr. Killian

with the understanding that Presidential authorization with respect to the launching of the eight development satellites capable of reconnaissance over the USSR and the subsequent scope of the operational capability of the program, will be sought by the Department of Defense in early 1960 or prior to the launching of the first of the above eight satellites, whichever date is sooner.

84. Memorandum of Discussion at the 374th NSC Meeting¹

Washington, July 31, 1958

SUBJECT

Discussion at the 374th Meeting of the National Security Council, Thursday, July 31, 1958

Present at the 374th NSC Meeting were the President of the United States, presiding; the Vice President of the United States; the Secretary of State; the Secretary of Defense; and the Acting Director, Office of Defense and Civilian Mobilization. Also present were the Secretary of

¹ Source: Agenda item 3: Operational Capability of Reconnaissance Satellites. Top Secret; Eyes Only. Extracts—4 pp. Eisenhower Library, Whitman File, NSC Records.

the Treasury; the Attorney General; the Director, Bureau of the Budget; the Chairman, Joint Chiefs of Staff; the Deputy Secretary of Defense; The Assistant to the President; the Deputy Assistant to the President; the Director, U.S. Information Agency; the Special Assistants to the President for Atomic Energy, for the Atoms for Peace Program, for Information Projects, for National Security Affairs, for Science and Technology, and for Security Operations Coordination; Assistant Secretary of State Smith; the White House Staff Secretary; the Naval Aide to the President; Bryce N. Harlow, Administrative Assistant to the President; the Executive Secretary, NSC; and the Director, NSC Secretariat.

There follows a summary of the discussion at the meeting and the main points taken.

[Omitted here are agenda items 1 and 2.]

3. *OPERATIONAL CAPABILITY OF RECONNAISSANCE SATELLITES*

(NSC Action No. 1946; NSC 5814; NSC Action No. 1941; Memo for NSC from Executive Secretary, same subject, dated July 29, 1958)

Mr. Gray briefed the Council on the subject (copy of briefing note filed in the minutes of the meeting and attached to this memorandum). After Mr. Gray had read paragraph 5 of his briefing note, the Director of the Bureau of the Budget confirmed Mr. Gray's statement that the decision as to the specific number of reconnaissance satellite test shots to be attempted would be worked out through the normal budgetary process. Mr. Gray then called on Secretary Quarles for a brief report on the status of the reconnaissance satellite program.

Secretary Quarles said the reconnaissance satellite program antedated the IGY satellite program and was motivated by the desire to have a vantage point from which to view what goes on behind the Iron Curtain. In order to operate reconnaissance satellites for this purpose, however, it would be necessary to establish the doctrine of freedom of outer space. In the last two years, technology had advanced to the point where we can now proceed actively with the development of reconnaissance satellite vehicles. The program for the current fiscal year calls for the use of intermediate-range rockets to put into orbit reconnaissance test vehicles weighing from 20 or 40 pounds up to a few hundred pounds. Later intercontinental-range rockets will be used, and the reconnaissance vehicle will weigh 3000-4000 pounds. The goal of the program (but not a firm commitment) is to send up the first operational reconnaissance satellite in March, 1960.

Secretary Quarles summarized the objectives of the reconnaissance satellite as follows: (1) to photograph the earth through TV cameras and on command transmit these pictures to a station in the United States; (2) to survey and transmit information on electromagnetic radiations;

(3) to develop infra-red reconnaissance techniques; (4) to act as a line-of-sight relay station for communications purposes. In conclusion, Secretary Quarles noted that substantial sums had been budgeted for the reconnaissance satellite program.

Mr. Gray then continued his briefing, and read a Defense recommendation on the subject (as submitted to the NSC on July 3, 1958, NSC Action No. 1941–*a*) and Dr. Killian's proposal of July 28 for modification of the Defense recommendation.

Dr. Killian said his review of the subject had been addressed to a proposed NSC Action, not to the budgetary aspects of the reconnaissance satellite program nor to the number of vehicles. He then read from his memorandum (as transmitted by the reference memorandum of July 29) in order to explain his proposal for modification of the Defense recommendation.

The Secretary of Defense said he was in full accord with Dr. Killian's proposed modification of the Defense recommendation. Dr. Killian had said better than Defense did what Defense thought it was saying.

The President approved the Defense recommendation as modified by Dr. Killian's language.

The National Security Council:

a. Discussed the amendment to the recommendation on the subject by the Department of Defense contained in NSC Action No. 1941–*a*, proposed by the Special Assistant to the President for Science and Technology and transmitted by the reference memorandum of July 29, 1958; in the light of the views of the Joint Chiefs of Staff as reported at the meeting, and of an oral summary of the advanced reconnaissance satellite program as presented at the meeting by the Deputy Secretary of Defense.

b. Noted that the President approved for planning purposes the advanced reconnaissance satellite program presented by the Department of Defense, including the eight test vehicles which will orbit over the USSR; with the understanding that Presidential authorization with respect to the launching of the eight development satellites capable of reconnaissance over the USSR and the subsequent scope of the operational capability of the program, will be sought by the Department of Defense in early 1960 or prior to the launching of the first of the above eight satellites, whichever date is sooner.

c. Noted that the total number of test vehicles and the amount of funds required for the advanced reconnaissance satellite program were subject to further review.

NOTE: The action in *b* above, as approved by the President, subsequently transmitted to the Secretary of Defense for implementation.

The action in *c* above, as approved by the President, subsequently transmitted to the Secretary of Defense, the Director, Bureau of the Budget, and the Special Assistants to the President for National Security Affairs and for Science and Technology, for appropriate action.

Marion W. Boggs

*Director
NSC Secretariat*

85. Memorandum of Discussion at the 375th NSC Meeting¹

Washington, August 7, 1958

SUBJECT

Discussion at the 375th Meeting of the National Security Council, Thursday,
August 7, 1958

Present at the 375th NSC Meeting were the President of the United States, presiding; the Vice President of the United States; the Acting Secretary of State; the Secretary of Defense; and the Director, Office of Defense and Civilian Mobilization. Also present were the Secretary of the Treasury; the Attorney General (participating in Item 6); the Director, Bureau of the Budget; the Chairman, Council on Foreign Economic Policy (participating in Item 5); General Thomas D. White for the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Deputy Secretary of Defense; the Director of Guided Missiles (for Item 3); The Assistant to the President; the Deputy Assistant to the President; the Director, U.S. Information Agency; the Director, International Cooperation Administration; the Special Assistant to the President for Atomic Energy (for Items 1, 2 and 3); the Special Assistants to the President for the Atoms for Peace Program, for Information Projects, for National Security Affairs, and for Security Operations Coordination; the White House Staff Secretary; Mr. Howard Furnas, Department of State; Assistant Secretary of Defense Sprague; Dr. George B. Kistiakowsky, President's Science Advisory Committee (for Item 3); the Acting NSC Representative on Internal Security (for Item 6); the Executive Secretary, NSC; and the Director, NSC Secretariat.

There follows a summary of the discussion at the meeting and the main points taken.

[Omitted here are agenda items 1–5.]

6. TECHNICAL SURVEILLANCE COUNTERMEASURES

(NSC Action No. 1640; NSC 5618; Memos for NSC, same subject, dated July 22 and August 8, 1957, and June 24, 1958; NSC Action No. 1774)

Mr. Gray presented the Annual Report of the NSC Special Committee on Technical Surveillance Countermeasures. (A copy of Mr. Gray's briefing note is filed in the minutes of the meeting, and another is attached to this memorandum.)

The President asked whether there was any possibility of placing electronic "jamming" devices in such rooms as the Cabinet Room to

¹ Source: Agenda item 6: Technical Surveillance Countermeasures; Agenda item 7: U.S. Policy on Antarctica. Top Secret; Eyes Only. Extracts—3 pp. Eisenhower Library, Whitman File, NSC Records. Drafted on August 8.

make clandestine listening devices ineffective. Mr. Ash said that the NSC Committee had this defensive measure under consideration, and that State Department technicians were experimenting with a prototype “jamming” device which, however, required excessive voltage for operation. Mr. Allen Dulles commented that one object of searches is to tune in on the wave-length of the opposition device. The President understood that this type of search applied to radio-type devices.

The President then asked whether the United States tried to exploit devices that had been discovered in a kind of “double-agent” way. Mr. Dulles said attempts were made to exploit discovered devices, but that such exploitation was rendered difficult because of the tendency to rip out the device immediately upon its discovery. He felt that discovery of a device should be reported but the device should be left in place.

The President felt that experts should be available at foreign posts to exploit clandestine devices when they are discovered. He asked how often important offices and conference rooms were checked for clandestine listening devices, and recalled from his experience in World War I that induction principles could be used for listening without actual connection with a telephone line. Mr. Ash said that periodic technical examinations were made of White House and NSC offices. He added that the technicians could, through examining impedances on the lines, detect listening by induction.

The Vice President said he had been told that it was possible, through the medium of metal venetian blinds, for a man across the street to hear what was going on in a room.

The President remarked that the great ingenuity being displayed in connection with communications devices pointed to the need for the services of experts in this field.

Mr. Allen Dulles said CIA was engaged in a major research effort in the technical surveillance countermeasures field. Mr. Gray said that a panel of the Science Advisory Committee was engaged in basic research on passive (“room within a room”) and active countermeasures.

The President observed that if clandestine listening devices continued to improve, it might eventually be necessary to stop talking and start writing instead.

The Vice President asked if there were not measures which could be taken to prevent the use of a telephone instrument as a listening point. Mr. Ash said that telephones such as those in the White House and other important offices can be equipped with a mercury switch to knock out the tap.

The National Security Council:

Noted and discussed the Annual Report of the NSC Special Committee on Technical Surveillance Countermeasures, prepared pursuant to paragraph 7 of NSC 5618 and transmitted by the reference memorandum of June 24, 1958.

7. U.S. POLICY ON ANTARCTICA

(NSC 5804/1; OCB Report on NSC 5804/1, dated June 25, 1958)

Mr. Harr briefed the Council on the reference OCB Report on the subject. (A copy of Mr. Harr's briefing note is filed in the minutes of the meeting, and another is attached to this memorandum.) There was no discussion.

The National Security Council:

Noted the reference Report on the subject by the Operations Coordinating Board.

Marion W. Boggs
Director
NSC Secretariat

86. Memorandum of Conference with the President¹

Washington, August 11, 1958

OTHERS PRESENT

General Twining
General Goodpaster

General Twining said that the Chiefs had been considering the situation in China, in the Formosa Straits area. They have started the preparation of contingency plans, and have alerted commanders in the area, but have directed no specific action. He understood the matter would come up for consideration in the NSC this week, and commented that the situation is unclear, perhaps intentionally so, with respect to the objective of defending the offshore islands. The President said he had spoken to Gordon Gray a few minutes earlier on this same subject, and had suggested it might be best to have just the statutory NSC members meet with him to discuss the question. He confirmed that the picture is cloudy regarding the offshore islands. There are good reasons for taking the view that they should be abandoned. However, a great part of the Chinese Nationalist forces are now deployed on the islands, and their removal or loss would be a signal to all of Asia that there is no hope that can be held out against the Communists in China. General

¹ Source: Formosa Straits; SAC dispersal; withdrawal from Lebanon; Department of Defense reorganization. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

Twining commented that the military authorities are concentrating on getting the F-86s on the islands into operational status quickly.

General Twining next reported briefly on SAC dispersal. He said he understood the President had expressed recent question about this. In general, our plans do not call for going beyond squadron dispersal and he did not think they should. He showed the President a graphic summary indicating that a substantial fraction are kept constantly ready and bombed up; others could be gotten in the air quickly, although not bombed up, unless there had been an alert warning (as in the case of the Lebanese crisis). The President raised for consideration the idea of putting parallel runways on existing bases, since the runway presently limits the number of planes that could be gotten off. He then said he questioned the validity of planning which contemplated putting on one field more planes than could be reasonably gotten away. Additional runways on the base would cost much less than additional aircraft which probably can't get off anyhow. He thought we should make all possible arrangements to "bomb up" rapidly and get the planes into the air. General Twining undertook to have this matter studied.

General Twining said that the Chiefs are making plans for troop withdrawal from Lebanon, so that when the time comes we will be in position to do it in a proper way. He thought any out-movement of troops should be done quietly and with dignity, without making a fanfare. The President indicated general agreement, commenting that he would have to look at any specific proposal.

As a final item, General Twining said that Defense is moving forward on the question of reorganization. A phased series of steps will be taken over the next three or four months. The President stressed the importance of watching the allocation of research and development projects very carefully—to see that once a project is assigned, other services do not duplicate the activity.

The President asked me to make sure Gordon Gray understood that General Twining should attend any meeting of the statutory members of the NSC, and I did so.

A.J. Goodpaster
Brigadier General, USA

87. Memorandum of Conference with the President¹

Washington, August 19, 1958

OTHERS PRESENT

Chairman McCone
Mr. Gordon Gray
General Goodpaster

Mr. McCone said the question of custody of large weapons had been raised with him. The AEC retains custody of these, even if they are deployed to outlying locations. Defense now recommends shifting the custody to themselves, and the AEC has no objection if the President should prefer this. Senator Hickenlooper and others, however, bring out that there is a matter of civilian cognizance which may have considerable importance.

The President recalled that the point of this distinction had been the danger that some military man, acting without civil restraint, might so use these weapons as to start a war. The military people have authority for action in case of attack on the United States or on U.S. forces, but this is for tactical response. The larger weapons are intended for great retaliatory action, and this is not for military officers to authorize. He said it is not only a question of the danger, but also as to the concern our country might feel as to what military men could do. He asked Mr. McCone to consult the State Department on the matter.

Mr. McCone next talked briefly about the proposal to cease the testing of atomic weapons. He said he is sympathetic with the President's desire to find a way to move forward with disarmament after five and one-half years of effort. His Commission has strong feelings on this, but will accept the President's decision. Mr. McCone said he would like to ask reconsideration on one point—that of including, as an exception, fully contained underground tests for peaceful purposes. He cited the possible use of atomic explosions to extract oil from the Athabaska sands, and to achieve useful heat power by using the salt domes of the southwest. These uses could be made subject to UN agreement and inspection. The President said he had been searching his mind for some way to allow this exception. Mr. Wadsworth however had thought we would lose the political gains we are seeking if we try to make this exception. The President added that he had agreed with Secretary Dulles that if the Geneva meetings resulted in agreement—no matter what our military might

¹ Source: Control of large nuclear weapons; cessation of nuclear testing. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

say—then we would make a public statement on this matter. The President said he would be sympathetic, if we would not therefore lose the entire effect of our action, to including the exception to having fully contained underground explosions conducted for peaceful purposes under UN observation. He asked Mr. McCone to take this matter up with Secretary Herter. The President added that Mr. Herter had told him that the protocol is expected to be signed at Geneva on Thursday, and that we hope we can make our announcement immediately thereafter. The British have, however, been showing some opposition to the project. Mr. McCone said he would get in touch with Secretary Herter at once.

SOVIET CAPABILITIES IN GUIDED MISSILES AND SPACE VEHICLES²

THE PROBLEM

To estimate Soviet capabilities and probable programs for the development of guided missiles and space vehicles, including earth satellites, through 1966,³ and to analyze factors affecting Soviet operational capabilities in these fields.

FOREWORD

This estimate supersedes NIE 11-5-57, SOVIET CAPABILITIES AND PROBABLE PROGRAMS IN THE GUIDED MISSILE FIELD, 12 March 1957, and SNIE 11-10-57, THE SOVIET ICBM PROGRAM, 10 December 1957, as well as those paragraphs dealing with guided missiles (paras. 108 through 114) in NIE 11-4-57, MAIN TRENDS IN SOVIET

² The title of this estimate, when used separately from the text, is classified CONFIDENTIAL. [Footnote is in the original.]

³ For comparability with earlier estimates on this subject, the terminal date chosen for this estimate is the same as that of its predecessor, NIE 11-5-57, SOVIET CAPABILITIES AND PROBABLE PROGRAMS IN THE GUIDED MISSILE FIELD, 12 March 1957. [Footnote is in the original.]

CAPABILITIES AND POLICIES, 1957–1962, 12 November 1957. The new estimate, like its predecessors, is made in the light of our previous judgments that the USSR does not now intend to initiate general war deliberately and is not now preparing for general war as of any particular future date. It also assumes that through 1966 there will be no international agreements on the control of armaments or of outer space.

The estimate is intended primarily to reassess and update our estimates of probable Soviet missile development programs, missile characteristics, and first operational capability dates. Some discussion is provided on factors likely to affect Soviet acquisition of substantial operational capabilities with missile systems, and Soviet capabilities to place various arbitrarily-selected quantities of ICBMs in operational use are estimated. The reader is cautioned that Annex A of NIE 11–5–57 is no longer applicable.

For the most part, changes in estimated missile characteristics and first operational capability dates result from the accumulation over the past year of a considerable body of new evidence. Of the 13 missile systems estimated as probably available for operational use in 1958 or earlier, we now have direct evidence on the existence of nine; we also have direct evidence on Soviet development of an ICBM. For some of these systems the evidence is extensive, while for others we have only limited information relative to characteristics and components. Serious intelligence gaps remain, particularly with respect to the operational status of various systems. Furthermore, we do not have sufficient evidence available on which to base an estimate of the vulnerability of Soviet systems to specific electronic countermeasures.

In making this estimate in a field where positive intelligence remains limited, we have considered the available evidence in the light of estimated Soviet military requirements, known and estimated Soviet capabilities in related fields, and US guided missile experience. The entire study rests upon our belief, now well-supported by evidence, that a concerted and continuous Soviet research and development effort in guided missiles was underway by 1948.

For guided missiles, except where noted otherwise, the operational capability dates given are the earliest years during which we believe missiles could probably have been placed in the hands of trained personnel in one operational unit, thus constituting a limited capability for operational employment. We estimate that when they first become operational, the missile systems discussed herein will have a system reliability of 40–60 percent, and that improvement will occur thereafter.⁴ For space flight activities, the dates given are the earliest *possible*

⁴ The term “system reliability” is here defined as the percentage of missiles which function according to specifications from missile launching to detonation in the target area, excluding malfunctions prior to launching. [Footnote is in the original.]

time periods by which we believe each specific accomplishment could be achieved.

SUMMARY AND CONCLUSIONS

1. The USSR has continued to press ahead with its extensive guided missile research and development, generally along the lines indicated in our previous estimates. As a result of this effort, the USSR now has available for operational use a variety of missile systems. Soviet achievements in ballistic missiles have been especially impressive and have contributed to early successes in the USSR's space flight program. Substantial success in developing surface-to-air missile systems has also been achieved. Available evidence is not sufficient to indicate equal emphasis and similar success in other Soviet missile programs.

2. By itself, each of the guided missile or space programs estimated as a future development appears feasible both as to technical achievability and date attainable. However, some programs may be slowed or even halted by the competition of other missile or non-missile delivery systems, unforeseen development or production difficulties, rapidity of obsolescence, changing military requirements, and/or broad considerations of Soviet national policy. On the other hand, a significant advance in one or more of the programs might be possible if a scientific breakthrough is achieved.

3. *Surface-to-surface missiles.* We believe that the Soviet ballistic missile development program has emphasized reliability and simplicity, rather than miniaturization or extreme refinement of design. System mobility appears to have been a basic consideration since the early developmental stages. In developing longer-range systems maximum use has been made of proven components.

4. Since 1954 the USSR has probably had available for operational use ballistic missiles with maximum ranges of about 100 nautical miles (n.m.), 200 n.m. and 350 n.m. We believe that, depending upon various operational factors, nuclear, high explosive (HE) or chemical (CW) warheads would be used with these missiles.⁵ In addition, the USSR probably now has operational a very short range anti-tank missile equipped with shaped-charge HE warhead.

5. An extensive Soviet program to develop a 700 n.m. ballistic missile is indicated by a long series of test firings, averaging about two per month since 1955. We estimate that this missile probably became operational in 1956. On the basis of about a dozen test firings over the past year, we estimate that the USSR will also probably have operational in 1958 a modification of the 700 n.m. missile, capable of an 1,100 n.m.

⁵ Estimated nuclear warhead capabilities for these and other missiles discussed in this estimate are given in Annex C (limited distribution under separate cover). [Footnote is in the original.]

range. Nuclear warheads would almost certainly be used in both these missiles, although we do not exclude the possibility of CW use in the 700 n.m. missile.

6. *Intercontinental ballistic missile (ICBM)*. Since August 1957, the USSR has test fired at least four and possibly six missiles to a distance of approximately 3,500 nautical miles. We believe this represents the development of an ICBM system which, when first operational, will probably be capable of delivering a nuclear payload to a maximum range of about 5,500 n.m., with an accuracy (CEP) of 5 n.m. and a system reliability of about 50 percent. By the early 1960's reliability will probably be considerably improved. At the beginning of the period 1962–1966, the CEP could be about 3 n.m., and could be reduced to about 2 n.m. later in the period.

7. Available evidence is inconclusive as to the designed payload-carrying capacity of the Soviet ICBM, which we have previously estimated as about 2,000 pounds. Recent evidence and re-analysis may indicate that the USSR is developing an ICBM with a 5,000 pound payload. Serious logistical and operational problems are associated with missiles of the sizes necessary to deliver 2,000 or 5,000 pounds to a range of 5,500 n.m.; these problems would be greater in the case of the heavier payload. In the light of this consideration, we estimate that the Soviet ICBM is designed to carry a nuclear payload of about 2,000 pounds, although there is a possibility that it is designed to carry about 5,000 pounds.

8. The USSR will probably have a first operational capability with ten prototype ICBMs at some time during calendar 1959; the possibility should not be disregarded, however, that in the latter part of 1958 the USSR may establish an ICBM capability with missiles comparatively unproven as to accuracy and reliability.

9. We believe that Soviet planners intend to achieve a sizeable ICBM operational capability at the earliest practicable date, although we have no direct evidence on Soviet preparations for ICBM production and deployment. We estimate that the USSR has the technical and industrial capability to produce ICBMs, complete launching facilities, establish logistic lines and train troops at a rate sufficient to have an operational capability with 100 ICBMs⁶ about one year after its first operational capability date (i.e. some time in 1960), and with 500 ICBMs⁷ two or at most three years after first operational capability date (i.e.

⁶ These numbers are selected arbitrarily in order to provide some measure of the Soviet capacity to produce and deploy ICBMs; they do *not* represent an estimate of probable Soviet requirements or stockpiles. [Footnote is in the original.]

⁷ These numbers are selected arbitrarily in order to provide some measure of the Soviet capacity to produce and deploy ICBMs; they do *not* represent an estimate of probable Soviet requirements or stockpiles. [Footnote is in the original.]

some time in 1961, or at the latest in 1962). This implies that the USSR could achieve an operational capability with ten or more, but less than 100 ICBMs by the end of 1959, depending upon when during the calendar year the first operational capability is achieved.

10. *Surface-to-air-missiles.* For several years the USSR has had in operational use a fixed surface-to-air system which we believe is now capable of employment against aircraft at ranges up to 20–30 n.m., with greatest effectiveness at altitudes of 30,000 to 60,000 feet. This system is known to be employed in a dense and costly complex of 56 sites around Moscow; targets of lesser importance will probably be provided with considerably less elaborate surface-to-air missile defenses. We believe the Soviets also have available for operational use a surface-to-air missile with similar characteristics, except for improved capability to intercept small, supersonic targets. It is probably suitable for employment either with the Moscow system or with a semi-mobile system.

11. Neither of the above systems is likely to be effective against very low altitude attack. We therefore estimate that the USSR is developing and will probably have in operation in 1959–1960 a surface-to-air system with a maximum range of about 15 n.m., effective at altitudes from 50 feet to at least 40,000 feet. We estimate that for improved defense of critical areas, the USSR will probably have available in 1960–1961 a surface-to-air system with effectiveness at altitudes up to 90,000 feet and a maximum range of 75–100 n.m.

12. We estimate that in 1963–1966 the Soviets will probably achieve a first operational capability with a surface-to-air system of limited effectiveness against ICBMs. Such a system could possibly have some effectiveness against IRBMs. A surface-to-air system with limited capability to counter reconnaissance satellites could and possibly will be developed for use in 1960–1964; a more sophisticated system could be integrated with an anti-ballistic missile system at a later date.

13. *Air-to-air missiles.* Three short-range systems which employ HE warheads are now estimated as operational. Two are believed to have radar guidance with ranges of 5–6 n.m.; the other, with a range of up to 2½ n.m., is believed to use infrared guidance. Most currently operational Soviet fighter aircraft types could be modified to employ these missiles. In 1960 the USSR will probably have available a 15–20 n.m. air-to-air missile.

14. *Air-to-surface missiles.* The present operational system is capable of carrying a nuclear or HE warhead at subsonic speed to a range of about 55 n.m. against well-defined targets, such as ships. With different guidance, the system could be employed against land targets. We estimate that the USSR is probably developing and may now have operational an air-launched decoy to simulate medium or heavy bombers. We believe that the USSR will probably develop and have operational

in 1960–1961 a supersonic missile with improved guidance and a range of at least 100 n.m., suitable for employment against a wide variety of targets.

15. *Naval-launched missiles.* The Soviet navy probably now has the capability to launch subsonic cruise-type missiles from a few converted submarines of conventional design, although there is little direct evidence of submarine-launched missile development in the USSR. We estimate that the current system could deliver nuclear warheads against land targets within about 200 n.m. of the launching submarine. These cruise-type missiles could be launched by a submarine only after surfacing. We believe, however, that in 1961–1963 the USSR will probably have a submarine-launched ballistic missile system available for first operational use in a prototype submarine of new design. This system will probably be capable of delivering a nuclear warhead from a submerged submarine to a range of about 1,000 n.m.

16. We estimate that during 1959–1960 the USSR will begin equipping its surface fleet with surface-to-air missiles having a maximum range of 20 n.m., with effectiveness at altitudes from 50 feet to at least 40,000 feet. A Soviet shipborne surface-to-air system for use against targets at higher altitudes and longer ranges will probably become available in 1960–1961. These systems, while primarily for air defense, could be modified for employment against surface targets. Late in the period of this estimate, the USSR will probably also have available a missile system for use in anti-submarine warfare.

17. *Soviet space programs.* We believe that the ultimate foreseeable objective of the Soviet space program is the attainment of manned interplanetary travel. The program is supported by extensive Soviet research efforts in a number of related fields, including rocket propulsion, electronics, space medicine, astrobiology, astrophysics and geophysics. Present activities appear to be directed toward the collection of scientific data and experience applicable to future space accomplishments, the ICBM program, and basic scientific research. Soviet requirements for space vehicles have probably been established for fairly specific scientific and/or military purposes in accordance with a planned step-by-step progression.

18. Soviet success in ballistic missile development and earth satellite launchings to date leads us to estimate a considerable Soviet capability for early accomplishments in space including: surveillance satellites, recoverable aeromedical satellites, lunar probes and impacts, lunar satellites and planetary probes to Mars and Venus (1958–1959); “soft landings” by lunar rockets and recoverable manned earth satellites (1959–1960); a manned glide-type high altitude research vehicle

(1960–1961); heavy earth satellites and manned circumlunar flights (1961–1962); and manned lunar landings (after 1965). While each individual achievement appears feasible as to technical capability and earliest date attainable, we doubt that the USSR can accomplish all of these space flight activities within the time periods specified.

SIMPLIFIED TABULAR SUMMARY¹

Probable Soviet Guided Missile Development Program

Arbitrary Designation	Operational Date	Maximum Range	Payload Weight and Type	Design Altitude
Ground-Launched Ballistic Missiles				
SS-1*	1954	100 n.m.	1,500 lbs. Nuclear, HE, CW	—
SS-2*	1954	200 n.m.	2,000 lbs. Nuclear, HE, CW	—
SS-3*	1954	350 n.m.	Up to 5,000–6,000 lbs. Nuclear, HE, CW	—
SS-4*	1956	700 n.m.	Up to 5,000–6,000 lbs. Nuclear, poss. CW	—
SS-5*	1958	1,100 n.m.	Up to 3,000 lbs. Nuclear	—
SS-6 ICBM*	1959	5,500 n.m.	2,000 lbs., poss. 5,000 lbs. Nuclear	—
Ground-Launched Anti-Tank Missile				
SS-a. t.	prior to 1958	6,000 yards	20–40 lbs. HE	—
Submarine-Launched Missiles				
SS-7 cruise-type	1955–56	200 n.m.	2,000 lbs. Nuclear	—
SS-8 ballistic	1961–63	1,000 n.m.	1,000 lbs. Nuclear	—

Arbitrary Designation	Operational Date	Maximum Range	Payload Weight and Type	Design Altitude
Ground-Launched Surface-to-Air Missiles				
SA-1*	1954	20–30 n.m.	500–800 lbs. ²	30,000–60,000 ft.
SA-2*	1957	15–30 n.m.	500–700 lbs. ²	20,000–60,000 ft.
SA-3	1959–60	15 n.m.	150–250 lbs. ²	50 ft–40,000 ft.
SA-4	1960–61	75–100 n.m.	500 lbs. ²	Up to 90,000 ft.
SA-5	1963–66	limited effectiveness against ICBMs		
Shipborne Surface-to-Air Missiles				
SA-6	1959–60	20 n.m.	150–250 lbs. ²	50 ft–40,000 ft.
SA-7	1960–61	75–100 n.m.	500 lbs. ²	Up to 90,000 ft.
Air-to-Air Missiles				
AA-1*	1955–56	5 n.m.	70 lbs. HE	—
AA-2	1955–56	2½ n.m.	25 lbs. HE	—
AA-3	1958	6 n.m.	50 lbs. HE	—
AA-4	1960	15–20 n.m.	150 lbs. ²	—
Air-to-Surface Missiles				
AS-1*	1956–57	55 n.m.	3,000 lbs. Nuclear, HE	—
AS-2	1960–61	100 n.m.	3,000 lbs. Nuclear	—

¹ Detailed summaries of each missile category, including all estimated characteristics and other pertinent data, are presented in Tables 1–5 in Annex A. A summary of estimated Soviet capabilities in space flight is presented in Table 6.

² Nuclear warheads would increase the kill probabilities achievable with these missiles and will be required for effective use of the missiles under some conditions. However, HE warheads will be effective in most applications.

* Those missile types for which our estimates are supported by significant current intelligence are indicated by an asterisk following the missile designation.

89. Memorandum of Conference with the President¹

Washington, August 27, 1958

OTHERS PRESENT

Secretaries McElroy and Quarles, General Twining, Chairman McCone, General White, General Loper, Colonel Harbour, Colonel Foster, Mr. Gordon Gray, General Goodpaster

The President referred to Dr. Fisk's comment which seemed to question the advisability of holding another large shot at Eniwetok.

The group then turned to its main subject which was a proposal for the conduct of SAC exercises involving aircraft carrying the "sealed pit" weapons. A "briefing" was given by Colonel Harbour and Colonel Foster, the charts of which are attached.

During the discussion the President alluded to his proposal to put parallel runways on SAC bases, so as to increase the number of planes that could be gotten off on short notice. General Twining said a study is going forward, and Mr. McElroy said he is setting up a project on this.

The President indicated a generally favorable view of the SAC exercise proposal. Mr. McCone asked whether, during the ground alert phase, aircraft would be taking off carrying these weapons all over the country, and General White said they would. Mr. McCone then said the AEC is concerned about this, since even if the weapons are safe against nuclear detonation the accidental HE explosion would scatter plutonium; he would recommend that they take off only from Loring. Colonel Harbour indicated that some detonation might occur; decontamination would not, however, be difficult. He pointed out that there is much less HE in these new weapons than in the old ones. The President asked if the test could be made using aircraft without weapons loaded, and was informed that tests of this kind are constantly being conducted.

The President then asked for a memorandum to which he might give his consideration. Mr. Quarles gave him one, requesting approval, but the President asked me to have the matter checked with the State Department. Subject to such a check he was generally agreeable to the proposal.

General White, General Loper and Colonels Harbour and Foster then left and the President discussed further the proposed test of a large weapon at Eniwetok. Mr. Quarles said that Defense is asking for this,

¹ Source: Testing at Eniwetok; SAC exercises. Top Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on August 29.

since it is a more powerful weapon than we now have for our ballistic missiles. Defense would not press the matter, however, since it is an improvement not too high in priority or importance. Mr. McElroy also indicated Defense could give way on this. The President asked Mr. McCone to have work go forward constructing the weapon, and placing it in stockpile without making it the critical item in the stockpile. He did not think it was a good moment to conduct a large test in the Pacific. Mr. McElroy suggested building a modest number of weapons of this type.

Brigadier General, USA

90. Memorandum of Conference with the President¹

Washington, August 28, 1958

MEMORANDUM OF CONFERENCE WITH THE PRESIDENT August 28, 1958—following Cabinet Meeting

OTHERS PRESENT

Secretary McElroy, Secretary Quarles, General Twining, General Goodpaster

Mr. McElroy said the group had come in to take up with the President certain proposed steps in the Defense Reorganization program. These relate to eliminating the executive agent system. General Twining said that the establishment would be phasing over to the new system, and that it would be completely in effect by January first, with USEUCOM making the first transfer—on 15 September. The J-Staff system has been initiated, and should also be completely in effect by that time. Necessary changes in the command plan are being made, to strengthen the command authority of the unified commanders, to fix their force structure, and to eliminate the designation of departments as executive agents. He then outlined the main features of the change.

The President heartily welcomed this report. He hoped the Joint Staff would be made a true staff, getting away from the team system. He said he would be interested to see whether the Joint Staffs recognize the need for streamlining service staffs, and having plans originate with the central organization. He thought there should be savings in

¹Source: Defense reorganization and discipline on intelligence matters. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on August 30.

our best staff officers. General Twining said that the Joint Staff is taking in some of the best officers from each service. The President added that he hoped the G-2 and G-3 activities in each service would be minimized. He again said he was delighted with what was being done.

Mr. McElroy next referred to a request the President had made for thorough investigation of three instances reflecting faulty discipline. All three have been investigated. Regarding the violation of international boundaries by a B-47 over the Caspian Sea, it is clear that the commander of the plane was not at fault. Any fault that existed was that of his superiors, and this is mitigated by the fact that the location of the border is not certain or agreed. The President said he understood there was an agreement between Russia and Iran, and I confirmed that this was correct. Regarding the disclosure of location of storage sites for atomic weapons, Mr. McElroy said this occurred through a request for funds for military construction at AFSWP sites. There was a degree of carelessness, and Defense is undertaking to correct this. With regard to the balloons, decisions were taken by at least one officer and one civilian which were in error and in excess of authority; appropriate action will be taken. The President said that there is an evident usurpation of authority, and it is this he wishes to have corrected. Mr. McElroy asked if the President wished to know the specific action taken, and the President said he did not—he regarded that as Mr. McElroy's responsibility so long as the tendency he spoke of was corrected. He thought that we have too long been taking errors for granted. Mr. McElroy said this action has already had a tightening effect throughout the establishment. The President then said, with regard to the balloons, that much of the mistake had been made through people going ahead and developing and procuring the balloons, then telling him on short notice that the money would be wasted if some use could not be made of them.

Finally, Mr. McElroy raised the question of whether he should appoint an assistant secretary for legislative liaison, or retain the Assistant Secretary for Medical Affairs at least until Dr. Berry finishes his tour. The President said that the assistant secretaryship for legislative liaison had been strongly proposed by the man who has more experience probably than any other in this whole field—General Persons. The President said he thought he saw the value of it, but would leave the matter to Mr. McElroy and asked him to talk to General Persons about it.

A.J. Goodpaster
Brigadier General, USA

91. Letter From Senator Symington to Eisenhower¹

Washington, August 29, 1958

Dear Mr. President:

Allen Dulles, Director of CIA, briefed me in his office in late July re the current position of the Soviet in the long-range missile field, intermediate range ballistic missiles and intercontinental ballistic missiles.

I subsequently received information that would appear to show that Mr. Dulles heavily underrated Soviet missile development to date, as well as planned capabilities.

Upon receiving this information I analyzed our own missile programs and thereupon became convinced the latter are inadequate to meet the growing danger.

This conclusion would seem obvious if our planning has been based on incorrect information—and that is why I am presenting this paper to you.

More specifically, if the information contained is correct, we believe the planning incident to our weapons system, primarily missiles, beginning now and lasting at least into 1964, is so insufficient in this area as to leave ourselves and our allies subject to overt political, if not actual military aggression from the Sino-Soviet alliance—with a relatively slight chance of effective retaliation against such aggression between 1960 and 1962.

On August 6, therefore, I again saw Mr. Dulles with Mr. Thomas G. Lanphier, Jr. We pointed out to Mr. Dulles in some detail our reasons for believing that his estimates were inaccurate.

In each case where there was disagreement, the figures presented to Mr. Dulles were much greater as to Soviet accomplishment than the figures he had presented me a few days previously.

When Mr. Dulles inquired where we had obtained our information, we replied: "From your own and other elements of the national intelligence system."

Two days later, August 8, when Mr. Dulles briefed the Senate Subcommittee to which the CIA reports, the figures he gave that committee were the same as the figures he had originally given me.

The estimates he presented the Senate on August 8th are as follows:

The Soviets have fired many missiles up to 700 miles in range also many up to 1,000 miles. The total firings in these two categories are estimated to be some 300.

¹ Source: Question of a missile gap. Top Secret. 6 pp. Eisenhower Library, Whitman File, Administration Series.

So far the Soviets have accomplished 12 test firings of 1100 miles, and are considered to be operational with this missile this year.

The Soviets are known to have established a new 3500 nautical mile test range.

In the ICBM field, Russia is concentrating on a 5500 mile missile, with a warhead which may weigh 5,000 pounds.

Six ICBM missiles have been launched to date, of which four are known to have landed in the impact area.

It is estimated the USSR will have an operational quantity of ten of these 5500 mile missiles some time during 1959. They may have this capability some time in 1958.

From 2 to 3 years after the Soviets acquire these first ten, they will have 500 operational ICBM's.

The picture of the Soviet test program, as indicated by Mr. Dulles, finds the Soviet progressing from the basis of 12 IRBM test firings and 6 ICBM test firings to date, to 500 operational ICBM's two to three years from now.

The above presentation in itself is immediate ground for concern that Mr. Dulles' figures are too low, because the short lead time from this brief test schedule to 500 operational missiles two to three years from now is incompatible with the program planned for our own ICBM, the Atlas.

As example, the Atlas will have test fired approximately 100 missiles by the time some 64 Atlases are operational in 1961—three and a half years from now.

Mr. Dulles gave no indication of the number and location of medium and long-range missile bases the Soviets now have, or may be building.

Nor did he give any indication of the number and status of ballistic missile test ranges being used by the Soviets, as compared with our one range. This latter information is vital to any understanding of the true nature of the threat.

As to our own ballistic missile program, I am told we have successfully launched 29 Redstone type missiles of ranges 100–200 miles; 8 Thor type missiles of ranges from 1250 to 2,000 miles; and 5 Jupiter type missiles of ranges of 1500 to 1600 miles.

I am also told we have launched 3 Jupiter test systems (as compared with weapons systems) of ranges from 1200–3300 miles; and that, as of early this month, we launched our first relatively complete ICBM, an Atlas, over a range of 2600 miles.

I further understand that our planned ballistic missile schedules call for 10 IRBM bases and 150 operational IRBM missiles to be in position by the end of 1960; and also that we plan to have, by 1962, 12 bases and 180 missiles.

In the ICBM field I understand that in 1960 we will have 2 groups of launching sites, one in Wyoming and one in Nebraska, with a maximum capability of launching 24 ICBM's in twenty-five minutes. (This

excludes the training base in Southern California which may be established prior to this time, because the base itself is beyond the operational range from which the Atlas could reach a majority of the Soviet targets; and because the Atlas missile will not yet be reliably capable of less than 1/2 hour reaction time before 1960.)

By 1962 I understand we plan to have 13 groups of launching sites, with a maximum capability of launching 120–130 ICBM's in twenty-five minutes.

There are no known plans beyond this number of bases and missiles for the Atlas or Titan; nor are there any such plans for contemplated ICBM weapons systems like the solid-propelled ICBM Minute Man.

As to the Polaris systems, my understanding is that none of these systems would be operational until 1960 at the earliest; and that date appears over-optimistic to us.

There follow the figures given us by Mr. Dulles as to the Russian position:

1957	1958	1959	1960	1961	1962
6 launchings, 4 impacts in 1957 to date, ranges 3500 mi. or more.					
	Maybe 10 operational @ 5500 mi. in this year.	-----	500 operational		Additional number, estimated to be operational, not given.
		10 operational	-----	500 operational	

As presented, we believe the above CIA estimate vastly understates Soviet testing to date. Even so, however, it predicts a greatly superior operational Soviet ICBM force, from 1960 through 1962, as compared with the actual program of the United States.

This latter program follows:

1957	1958	1959	1960	1961	1962
3 @ 600–800 miles. 2 @ 2600 mi. 10 more Atlas and 1 Titan test this year		Approx. 100 test flights of Atlas & Titan scheduled for '59–'60 period. None fully operational.	24 Atlas operational capability. Polaris possibly operational.	65 operational Atlas, plus some Titans and Polaris	120–130 operational Atlas & Titan & Polaris

As to Soviet testing to date, we believe the more valid figures are as follows:

RUSSIA	1957	1958
Source #1	Approximately 60 test firings over ranges 3500 miles or more.	Approximately 20 test firings this year over ranges of 3500 miles or more. [Also 2 thermo-nuclear test firings accomplished as part of ICBM or IRBM test flights] ²
Source #2	Approximately 45 firings over ranges of 3500 miles or more.	Approximately 10 test firings this year, over ranges of 3500 miles or more. [Launching sites being established in Murmansk and Kamchatka area.]

The reason the number of ICBM firings, as reported by both the above sources, is so much less to date in 1958 as against 1957, is because of the long time lag incident to developing the final integrated analysis of the raw data.

This time lag may in itself furnish part of the clue to the difference between the Dulles estimates and the larger estimates we believe to be more accurate.

In analyzing raw data from either source, there may be gradations of opinion as to the meaning of the data. We would assume that these gradations of analytical opinion have been assessed at the policy level of the intelligence system. We would also assume one source of information has been integrated with the other.

If both these steps have been taken in the assessment of the information indicated from Sources 1 and 2, however, it is very hard to understand how the final conclusion as to the rate of ICBM test activity of the Soviets could be many times less than the raw data would indicate.

SUMMARY

The United States plans to have 24 operational ICBM's by 1960; and 120-130 by 1962.

In the same time period the CIA estimates the Soviets will have 500 ICBM's by 1960 or 1961.

Based on these accepted figures alone, we believe our currently planned defense programs are insufficient to meet the threat which the CIA estimates the Soviets will pose by 1961.

² These and following brackets are in the original.

But if we are correct in our belief that the Soviet ballistic missile testing program has been much greater than as estimated by the CIA, and if construction of Russian ICBM launching sites is as advanced and as wide-spread as we understand to be the case, it is clear that our planned defense programs are even more insufficient.

May we respectfully present the fact that you have said many times we should not underestimate a possible enemy.

Based on the information outlined, however, we believe our national intelligence system is underestimating the enemy's current and future ballistic missile capability.

As a result, we also believe that our national defense plans and programs are not being effectively related to sound estimates of Soviet capability.

Sincerely yours,

Stuart Symington

92. Memorandum From Lay to Gray¹

Washington, September 3, 1958

SUBJECT

Analysis of Draft "Implementing Instructions" submitted to the President for approval by letter from the Secretary of State and the Deputy Secretary of Defense, dated August 23, 1958

Background

1. On April 18, 1956, the President approved the original "Authorization for the Expenditure of Atomic Weapons in Air Defense". This Authorization covered [*text not declassified*] the use of nuclear weapons, under specified conditions, for defense against air attack:

- a. In the United States, its territories and possessions;
- b. In coastal air defense identification zones;
- c. [*text not declassified*]

¹ Source: Analysis of draft implementing instructions on use of nuclear weapons. Top Secret. 5 pp. Eisenhower Library, White House Office Files, Records of the Special Assistant to the President for National Security Affairs, NSC Series, Briefing Notes.

This Authorization still remains in effect.

2. On May 22, 1957, the President approved a new "Authorization for the Expenditure of Nuclear Weapons" under certain conditions:

a. This Authorization first stated that, [*text not declassified*] nuclear weapons could be expended for:

(1) Defense of the United States, its territories and possessions:

(a) Against air attack in U.S. territories and coastal air defense identification zones (the same provision covered by the original Authorization);

(b) Against sea attack in U.S. territories and adjacent international waters (new provision);

(c) [*text not declassified*]

(2) Defense of U.S. forces in foreign territory and in international waters against Sino-Soviet Bloc attacking forces (substantially a new provision).

b. This Authorization also stated that, in circumstances involving nuclear attack upon the continental United States [*text not declassified*] subject in the case of retaliation from friendly foreign territory to agreements or understandings with the countries concerned (a new provision).

3. The new Authorization was not to come into effect until "Implementing Instructions" had been prepared by Defense, concurred in by State, and approved by the President.

4. On June 27, 1958, a meeting was held in the President's office to discuss two issues which had developed between State and Defense in preparing the "Implementing Instructions". The first issue, which the Secretary of State did not press, was the fact that the retention by the President of control over the use of nuclear weapons was of great political advantage at the present time. The other issue related to the question of whether authority to expend nuclear weapons for defense of U.S. forces in foreign territory should be made subject to existing and future agreements and understandings with the country or countries involved.

5. As a result of this meeting, the President approved the following further action:

a. Defense, with the assistance and concurrence of State, would amend the draft instructions presented at the meeting to provide that the authority to expend nuclear weapons for defense of U.S. forces in foreign territory against Sino-Soviet Bloc attack must not be implemented in violation of existing and future agreements or understandings with the country or countries concerned. Such amended instructions (to be made in only three copies) were to be submitted for the President's approval as a basis for the subsequent preparation and submission for Presidential approval of separate implementing instructions to each appropriate commander. Each such separate instruction was to contain specific guidance regarding applicable agreements or understandings

with friendly foreign countries, and was to be submitted in one sealed copy to the commander concerned.

b. State, in consultation with Defense, would review all existing agreements and understandings with friendly foreign countries affecting the "Implementing Instructions" and take action as deemed appropriate by the Secretary of State to revise any such agreements or understandings which impede U.S. forces in foreign territory in exercising the right to defend themselves.

6. State and Defense have now submitted to the President for approval the draft "Implementing Instructions" amended pursuant to 5-a above.

Comparison of Subject Draft Instructions With Previous Draft

7. After review of the notes taken by General Goodpaster and myself at the June 27 meeting, the amended draft instructions appear to carry out fully the President's action in 5-a above. Throughout these instructions, the authority to expend nuclear weapons for defense of U.S. forces in foreign territory against Sino-Soviet Bloc attacking forces is made "subject to applicable agreements or understandings, if any, with the government exercising sovereignty over the country or countries concerned."

8. In addition, this quoted wording has also been used in paragraphs 4-a-(3) and 4-c, in place of the wording used in the original "Authorization" and the previous draft instructions. The new wording does not make a significant change in paragraph 4-c, which originally read "subject in the case of retaliation from friendly foreign territory to existing and future agreements or understandings with the country or countries concerned." There does appear, however, to be a significant change in paragraph 4-a-(3), which originally read "subject to the consent of the country sovereign over the territory involved." Under the new wording, whether we obtained the consent of the sovereign country would depend upon any applicable agreements or understandings.

Comparison of Subject Draft With Original "Authorization"

9. Except as indicated in 8 above, all of the provisions of the original "Authorization" appear to have been appropriately taken into account in the subject draft instructions. However, certain new or supplementary material has been added as follows:

Paragraph 5-c, last sentence, adds a new limitation, which appears to be consistent with existing basic policy.

Paragraph 6-a, second sentence, contemplates that commanders of joint task forces and of other commands, "equivalent in stature to the

numbered forces”, might be “Authorizing Commanders”. The original “Authorization” stated that its implementation “will be extended where necessary and appropriate to the level, but not below that, of the commanders of numbered field armies, fleets, and air forces.” This does not appear to be a change in the sense of the original, [text not declassified].

Paragraph 6-a, third sentence, continues in effect the earlier “Authorization” described in 1 above rather than superseding it as contemplated in the “Authorization” described in 2 above.

Paragraph 6-d contains new factors to be considered by an “Authorization Commander”.

[text not declassified]

Section “B”, paragraph 2. Does the term “within effective enemy striking range of the United States, its Territories and possessions” have any real meaning in view of the long-range ballistic missiles?

Section “B”, paragraph 3-a, adds specific examples of attacks. *Subparagraph 3-a-(2)* cites as an example of an attack a submarine attempting submerged penetration of a major U.S. port or harbor. The term “attack” is elsewhere defined as “a major hostile assault of such magnitude and against such areas or forces as to constitute an immediate and vital military threat to the security of the United States or to major U.S. forces”. Presumably one submarine penetration of a major U.S. port is considered sufficient evidence of hostile intent to fit the definition of “attack”.

Section “B”, paragraph 3-a, provides that an unidentified submarine or aircraft engaged in an attack may be assumed to be a Sino-Soviet Bloc attacking force. Isn’t it conceivable that hostilities on the Middle East might under certain circumstances involve an attack on U.S. forces by submarine or aircraft of Middle Eastern countries?

Section “B”, paragraph 4-c-(1), authorizes expenditure of nuclear weapons “against all elements of the attacking forces, including those within Sino-Soviet Bloc territory.” While this fits the definition of defense against an attack, it also may become equivalent to retaliation in the case of long-range weapons.

[text not declassified]

James S. Lay, Jr.
Executive Secretary

93. Memorandum for Record of Meeting Between Eisenhower and Gray¹

Washington, September 12, 1958

On September 10, I departed Washington at 5:50 a.m., by special mission aircraft in the company of General Goodpaster for a meeting with the President.

The President came to his office on the BARBARA ANN, and after General Goodpaster had completed his business, I discussed four items with the President.

1. The amended draft of "Instructions for the Expenditure of Nuclear Weapons in Accordance with Presidential Authorization dated May 22, 1957" which was transmitted to the President from the Secretary of State and the Deputy Secretary of Defense on 23 August 1958. After recounting the history of this document to the President, I suggested that it might not be profitable for him to go through it paragraph by paragraph but for me to indicate in what respects it deviated from the "Authorization for the Expenditure of Nuclear Weapons approved by the President on May 22, 1957." I used as a basis for my discussion, Mr. Lay's memorandum to me of September 3, which is attached.

I indicated to the President that the concern of the Secretary of State with respect to whether authority to expend nuclear weapons for defense of U.S. forces in foreign territories should be made subject to future agreements and understandings with the country or countries involved, had been met in the draft document. I also pointed out to the President that the draft document when finally approved, would be the basis for subsequent preparation and submission for Presidential approval of separate implementing instructions to each appropriate commander.

I pointed out what appeared to be a change of some consequence in paragraph 4 a (3), which originally read: "Subject to the consent of the country sovereign over the territory involved." It was indicated that under the new wording whether we obtained the consent of the sovereign country would depend upon any applicable agreements or understandings. The President found no difficulty with this change.

There follow the other points I made with the President:

Paragraph 5 c, last sentence. The President felt the new limitation, which is designed to limit hostilities, was an improvement.

¹ Source: Expenditure of nuclear weapons; NSC structure; Taiwan Straits. Top Secret. 6 pp. Eisenhower Library, White House Office Files, Project Clean Up.

Paragraph 6 a, second sentence. The President wished this sentence amended by adding after the words “numbered forces”, “as specifically approved by the President.”

Paragraph 6 a, third sentence. I felt it unnecessary to take the President’s time with this item.

Paragraph 6 d. The President felt that the new factors to be considered by an authorizing commander were helpful to the document.

Paragraph 6 g. The President indicated that he did not understand this paragraph and wants more information with respect to it. He expressed great concern about security and would not be inclined to approve this paragraph unless there were convincing evidence of the need for it.

Section B, paragraph 2. The President felt it was not necessary to make any change in this paragraph although he felt it was not entirely clear.

Section B, paragraph 3 a (2). This paragraph cites as an example of an attack which would be a basis for a decision by an authorizing commander within the context of the paper, “a submarine attempts submerged penetration of a major port or harbor in the U.S., its territories and possessions.” The President was quite emphatic in rejecting this as an example of what might be considered an attack. He pointed out that we had various other methods of dealing with a submerged submarine, if it were identified and located, without the use of nuclear weapons. He felt that this was similar to U.S. planes flying over the Caspian Sea.

Section B, paragraph 3 c. This paragraph gave the President some concern and he asked first why it was not possible simply to shoot the plane down or destroy the submarine without resort to nuclear weapons. However, as he thought about it, he thought perhaps that it might be appropriate to employ nuclear warheads on antiaircraft weapons and nuclear depth charges.

Section B, paragraph 4 a (1). (General Goodpaster joined us for discussion of this item, at my request). The President was disinclined to accept this paragraph as written feeling that it was too broad, general, and unqualified. He asked that it be tightened up measurably before again being submitted to him for approval. He particularly would not wish to have this paragraph in effect authorize a nuclear attack on the Soviet Union when the attack that had been launched upon the U.S. forces did not involve or threaten to involve the continental U.S.

Section C, paragraph 3 b. The President was not willing to accept this paragraph without a means of authentication having been specified for the authorizing commander. He recalled the Orson Wells radio episode. He spoke at some length of the seriousness of nuclear strikes on the basis of incorrect or misleading information. He would wish that

it be made very clear that an authorizing commander in fact knew that the nuclear attack had occurred on the continental U.S. He accepted the thought that it was insufficient in a case such as this to delegate authority to the Department of Defense but would wish to approve personally the specific authorizing commanders given authority under this section.

After this discussion, which consumed about an hour and a half, the President felt that he wished to tighten up the general authorization wherever it appears in the paper. For example, he wished the first sentence of paragraph 4 to read as follows: "When *the urgency* of time and circumstances *clearly* do not permit a specific decision by the President. . ."

2. I then indicated to the President that I had made available to Mr. Hagerty a copy of the OCB draft standby statements for possible use by the President in the event of the successful Soviet moon shot. General Goodpaster had earlier brought to the President's attention the fact that between September 11 and September 15 there was a high degree of possibility that the Soviets would succeed in such an effort.

3. I then discussed with the President the question of attendance at NSC meetings. He approved the amendments on page 5 (attached) of the document entitled, "The Structure and Functions of the National Security Council."

Paragraph 8 b should read as follows: "*Special request members*: For all agenda items which are the subject of official interest to his responsibilities until the President otherwise determined. (Currently the Attorney General, the Chairman, Atomic Energy Commission, and the Administrator of the National Aeronautical and Space Administration)"

In the subsequent discussion, the President made it clear that he wished, of course, the statutory members (including the statutory advisers) to attend all regular NSC meetings. In addition, he wanted the Secretary of the Treasury and the Director, Bureau of the Budget to attend. He would also expect the Director, USIA, the Special Assistant for National Security Affairs, the Executive Secretary of the NSC and the Deputy Executive Secretary of the NSC, to attend and sit at the table.

For agenda items which are the subject of official interest, he would expect the Attorney General, Chairman, AEC and the Administrator, NASA to sit at the table. He expressed his view that this should mean that the Attorney General and the Administrator, NASA would not find it necessary to attend all regular meetings. However, he felt that he wished the Chairman, AEC to participate as regularly as his convenience and conscience dictated.

Particularly with respect to the Chairman of the AEC, the President expressed the following views: In the context of modern and perspective

weapons systems, there is very little in the way of defense policy with which the Chairman of the AEC is not concerned. Furthermore, because of the special characteristics of the legislation under which the AEC operates and because of the constant effort of the Joint Congressional Committee on Atomic Energy, to have a dominant voice in all matters pertaining to atomic energy, the President wishes to make every effort possible to keep the Chairman of the AEC in the family of the Executive Branch of the Government. He therefore is willing in various ways to take what might be considered unusual steps to identify the Chairman of the AEC with the formulation of national policy. Finally, he felt that men such as Mr. McCone came to Washington at a considerable sacrifice and with only the motivation of service and to appear to exclude them from the high councils was something the President wished to avoid.

With respect to those who attend regular NSC meetings but do not sit at the table, he made the following comments:

Now that Arthur Larson has departed, he would not expect Mr. Larson's successor to attend meetings. He said that he had never understood why Larson had originally been invited. He felt that the Director, ICA, should continue to attend as long as Jimmy Smith occupies that position. He had not fully understood previously that the Under Secretary of State for Economic Affairs had succeeded to the coordinating functions formerly assigned to ICA. He felt that the Special Assistants for Atoms for Peace Program, Foreign Economic Policy, Science and Technology, and Security Operations Coordination should attend regular meetings and sit at the table when participating.

He had no objection to attendance as observers of the Assistant to the President, the Deputy Assistant to the President, the White House Staff Secretary and the President's Naval Aide.

The President felt that the foregoing would be appropriate for general NSC meetings. However, he acknowledged the need for special NSC meetings, and gave me the following instruction:

When, after talking with the Secretary of State and/or the Secretary of Defense, it was deemed by me that an item was of sufficient sensitivity to justify a separate meeting, he would wish one called with notification only to those who were to attend. The meeting would be simply described as a special meeting with the President. Upon the convening of the meeting the President would be asked whether he considered this a special NSC meeting and upon his affirmative reply it would be understood that the results of the meeting would become a part of the official records of the National Security Council. At such meetings he would expect the statutory members, the statutory advisers, the Secretary of the Treasury, the Special Assistant for National Security Affairs and the Executive Secretary of the NSC.

Others who might be invited, depending upon the nature and character of the items under discussion, would be the Director, Bureau of the Budget, the Chairman, AEC, the Special Assistant for Science and Technology, as well as other officials whose presence might be from time to time required.

4. We then discussed the Taiwan Straits situation. I raised the question with the President as to how long we should continue to encourage Chiang Kai-shek in the notion that we would support his return to the mainland by force inasmuch as it seemed to me that this was no longer a reasonable possibility. The President said that Chiang Kai-shek hoped that there would be disintegration from within Communist China and that in the ensuing chaos he would be in a position, with our support, to move in and take over. He felt that this was a possibility and was to be distinguished from an attack by the Chinese Nationalists which would result in their taking over control of the country. He believed as long as the first possibility existed that it was important to maintain the morale of Chiang and his people.

With respect to the Off-shore Islands, I expressed my concern that we would not have the support of neutral countries, our allies, or indeed even possibly domestic public opinion if we engaged in hostilities which promised to become wide-spread simply for the purpose of holding on to the real estate. The President agreed with this in principle and said that he had done everything he could four years ago to prevent the movement of large numbers of troops to the Off-shore Islands. He indicated that he had sent two of his most persuasive spokesmen (Walter Robertson and Admiral Radford) who found Chiang adamant. He felt, however, that another principle was involved and that was the protection of the symbol of the free world. He felt that inasmuch as the Chinese Communists themselves had by statement and action indicated that the forceable capture of the Off-shore Islands was only a prelude to the forceful capture of Formosa, we would be compelled to assist Chiang if this became necessary, to prevent loss of the Off-shore Islands by force.

He did agree with the view that some honorable way out of the Off-shore Islands dilemma was desirable. In this he indicated that perhaps his views as to methods were somewhat at variance with the Secretary of State's.

Gordon Gray
Special Assistant to the President

cc: Mr Lay

94. Memorandum of Discussion at the 379th NSC Meeting¹

September 18, 1958

SUBJECT

Discussion at the 379th Meeting of the National Security Council Thursday,
September 18, 1958

Present at the 379th NSC Meeting were the Acting Secretary of State, presiding; the Acting Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present were the Acting Secretary of the Treasury, the Attorney General (participating in Items 1 and 2); the Acting Director, Bureau of the Budget; the Acting Chairmen, Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security (Attending for Items 1 and 2); the Chairman, Joint Chiefs of Staff; the Acting Director of Central Intelligence; the Assistant to the President; the Deputy Assistant to the President; the Director, U.S. Information Agency; the Director, International Cooperation Administration; the Special Assistants to the President for Foreign Economic Policy, for National Security Affairs, for Science and Technology, and Security Operations Coordination; the White House Staff Secretary; the NSC Representative on Internal Security; the Assistant Secretary of State; the Executive Secretary NSC, and the Deputy Executive Secretary NSC.

There follows a summary of the discussion and the main points taken:

[Omitted here is agenda item 1.]

**2. STATUS OF NATIONAL SECURITY PROGRAMS ON JUNE 30,
1958: THE INTERNAL SECURITY PROGRAM (NSC 5819)**

Mr. Gray indicated that before getting into the details of this item he wished to raise a related point occasioned by the publication on September 17, 1958, in one of the Washington newspapers, of an article which attributed to Lt. General Arthur Trudeau, USA, a statement allegedly made on the previous day to the effect that the advanced state of Soviet technology was due more to Soviet success in espionage and subversion than it was to their scientific apparatus. Mr. Gray thought it timely to raise the Trudeau statement at this time inasmuch as the Status Report on Internal Security, which was before the Council for consideration, covered areas to which General Trudeau had made

¹ Source: Agenda item 2: Status of National Security Programs on June 30, 1958: The Internal Security Program (NSC 5819). Top Secret; Eyes Only. Extracts—6 pp. Eisenhower Library, Whitman File, NSC Records.

reference. Mr. Gray thought that if General Trudeau's statement were true, it was quite a serious matter. If it was not true, then it appeared not to be helpful inasmuch as it cut across efforts being made elsewhere in our Government to educate our people concerning Soviet scientific advances.

The Acting Chairman, IIC, indicated that representatives of the FBI had talked with General Trudeau following the appearance of the story in the Washington newspapers. General Trudeau indicated to the FBI that he made a talk before the annual convention of the American Society for Industrial Security; that he had thought, in appearing before these officials of industry, it would be an excellent opportunity to needle them concerning their responsibility for safeguarding classified security information and classified critical equipment in their possession. He said that in making his statements he did not have any specific cases in mind not already known to the FBI. He said he did have in mind past cases like the Abel espionage case, the cases which developed at Fort Monmouth, and the German espionage cases which were developed in World War II. He said his motivation in making his statement was simply to alert his listeners to the very real need for providing adequate industrial security.

The Director, USIA, indicated that when General Trudeau raises the hackles of the industrial security people in this manner, it has adverse reverberations elsewhere. Mr. Allen mentioned that the Department of State was presently negotiating with the USSR on increased exchanges of people and that he, himself, has been endeavoring of late to negotiate exchanges of films with the Soviet Union. On the latter score, arrangements had been made for the Soviet Ambassador to the United States to visit Hollywood to observe the making of a film, and the motion picture people involved were concerned from a security standpoint to the extent of requiring a letter from the Director, USIA, before they would permit Ambassador Menshikov to observe the making of a film. He thought that statements of the type attributed to General Trudeau would tend further to aggravate these and other exchange efforts which State and USIA had undertaken.

The Special Assistant to the President for Science and Technology, Dr. Killian, stated that, without belittling the importance of adequate security, he thought that U.S. scientists would feel that statements of the type attributed to General Trudeau constituted a disservice to this country to the extent that such statements created the impression that the Soviet scientists did not have the scientific prowess which they do in fact possess.

Mr. Gray indicated that he had raised the Trudeau matter for discussion, not with any intent of suggesting action be initiated against

General Trudeau, but merely because of its timeliness and its relationship to Item 2 on today's Council agenda.

Mr. Gray then went on to Item 2 and asked Mr. J. Patrick Coyne, the NSC Representative on Internal Security, to provide the Council with an oral summary of the highlights of the Annual Report submitted jointly by the Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security.

The NSC Representative on Internal Security then provided an oral briefing of the Status Report (a copy of his presentation is filed in the Minutes of this Meeting and another is attached to this Memorandum).

Following the oral presentation, Mr. Gray singled out for discussion the problem of clandestine introduction of nuclear weapons, noting that it was a very serious one and that it involved a type of attack against which it was most difficult to defend adequately. He said that he had the impression that the Status Report was a little more gloomy concerning the resolution of this problem than were the experts who discussed it with the Planning Board. Nonetheless, the Planning Board did feel that additional steps might be taken with respect to that aspect of the clandestine entry problem which involved the development and use of devices for the detection of radioactive material. Accordingly, he said, the Planning Board recommended unanimously that the Council adopt and the President approve an action calling for accelerated activity to develop, procure, and utilize devices designed to detect attempted introduction into the United States of materials which were or may be characteristic of fissionable material or other nuclear weapons components.

Mr. Gray referred to the fact that new and better detection devices would soon be available, adding that on this score there was some feeling in the Planning Board that a Council action along the lines suggested would give further stimulus to the program and might thereby expedite to some extent the development, procurement, and use of such devices.

The Acting Secretary of the Treasury, Mr. Scribner, observed that the largest expense in connection with the device program involved operations and personnel, as distinguished from the cost of the devices themselves. He said that he had received a recent indication from the Bureau of the Budget that the Department of the Treasury should reduce rather than increase the number of its personnel, and he wondered how the direction of the Bureau of the Budget fitted in with the recommendation of the Planning Board for accelerated efforts in the detection devices area.

Mr. Gray agreed that the indication received from the Budget Bureau was a commendable one and consistent with recently expressed views of the President, but he added that it was not his understanding that the President had said that there must be a personnel cut in connection

with each and every program. It was Mr. Gray's view that hard choices had to be made in assessing the validity of all programs, but that this did not mean a personnel cut had to be made in each and every program. Mr. Gray thought that if the military and internal security people felt as strongly as they did about the clandestine entry problem, it was very important that their views be considered. He then related the cost of the device program to the very much larger cost of one cruiser or one B-52, noting that the clandestine entry program has its role to play in our defenses along with such items as the military ones he had cited.

The Acting Secretary of the Treasury inquired what the language proposed by the Planning Board would add to the language already contained in the policy paper on Continental Defense (NSC 5802/1) wherein it was directed that "intensified efforts should be continued to develop active and improved passive devices for the detection of fissionable material by such means, and to assure their effective use."

Mr. Gray recalled that this point had been made at the Planning Board and that he had asked the experts in attendance if the device program were proceeding as rapidly as possible, and he had received a negative response. He therefore asked at the Planning Board if a word from the President calling for further acceleration of that program would result in such acceleration, and the response was in the affirmative. Accordingly, the Planning Board agreed unanimously to recommend that such acceleration be directed.

The Acting Secretary of the Treasury said he assumed that the recommended language related only to the acceleration of the program as it involved the new devices which are coming in, and not to the existing devices. Mr. Gray advised that his assumption was correct.

The Acting Secretary of State indicated that the Department of State favored the acceleration of the development, procurement, and use of the new devices which are coming in. He said that such devices would be tremendously helpful from the standpoint of his Department in that they would reduce the likelihood of retaliation being taken against our pouches going into the Soviet Bloc countries, should we open an incoming pouch which contained innocuous radioactive material.

Mr. Gray indicated that there was now before the Planning Board, and will soon be before the Council, a paper dealing with the recommended procedures to be followed in connection with incoming diplomatic pouches which might contain radioactive materials.

The Acting Secretary of the Treasury indicated that he would have no objection to the action proposed by the Planning Board so long as it was limited to the better devices which were now being developed.

The National Security Council:

a. Noted the report on the status of the internal security programs on June 30, 1958, prepared jointly by the Interdepartmental Intelligence

Conference and the Interdepartmental Committee on Internal Security (transmitted as Part 8 of NSC 5819), as summarized orally at the meeting by the NSC Representative on Internal Security.

b. Agreed to submit to the President a recommendation that accelerated efforts should be made to develop, procure and utilize devices designed to detect attempted introductions into the United States of materials which are or may be characteristic of fissionable material or other nuclear weapons components.

NOTE: The recommendation in *b* above subsequently approved by the President and transmitted to the Secretary of the Treasury, the Attorney General, the Chairmen of the Atomic Energy Commission, the Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security for appropriate implementation.

[Omitted here is the remainder of the memorandum.]

S. Everett Gleason

95. Paper for Presentation to the NSC¹

Washington, September 18, 1958

U.S. Internal Security Program

In the joint report of the IIC and ICIS on the Internal Security Program of the United States, the Council's Internal Security Committees have presented the nature of the threat involved, the status of some 50 programs designed to meet the threat, and an assessment of the overall program as measured against the requirements of approved national policies which relate to internal security matters.

As provided in the charter responsibilities of IIC and ICIS, the overall objective of the Internal Security Program is the establishment, and maintenance by responsible agencies, of the highest practicable state of internal security, including plans for a war-related emergency. Consistent with this assignment of responsibility, and with the provisions of specific directives, the Internal Security Program is principally directed toward meeting the threat of Communist subversion, espionage, and sabotage, including the clandestine introduction of nuclear weapons for use against military and other key installations in this country.

¹Source: U.S. internal security program. Secret. 8 pp. Eisenhower Library, Whitman File, NSC Records.

Based on an appraisal of specific programs, the Internal Security Committees have made a general assessment which is highlighted by the following views and conclusions: (1) recognizing the impossibility of achieving total internal security defenses, it is nevertheless possible to establish a practical program providing substantial deterrents to espionage, sabotage and subversion, (2) however, because of lack of progress in certain important areas, such a program has not been achieved, (3) most of the measures required to implement the internal security provisions of our basic national security policy (Par. 44, NSC 5810/1) are expected to remain inadequate over the period of this fiscal year, particularly in the field of countermeasures against clandestine introduction of nuclear weapons, and (4) Net Evaluation Studies by IIC and ICIS, reflect that implementation of current internal security programs does not pose sufficient risk to deter clandestine attack, nor will sufficient progress to that end be made in the years immediately ahead.

In certain of the broad categories of internal security programs, progress is reported by the Committees. Some of the results of full-time investigative effort by the IIC agencies are reflected in the FBI's substantial coverage and penetration of the Communist Party, USA; the identification by FBI of U.S. citizens and aliens (now approximating 13,000 persons) who would be considered by the Justice Department for detention in an emergency, [*text not declassified*] and the development of evidence upon which legal action can be taken against subversive individuals and organizations. The IIC agencies anticipate no material change in the level of these particular aspects of the investigative side of the internal security program during this fiscal year, in the absence of a revision of present responsibilities as the result of international developments, new legislation, or new policy requirements.

In the prosecutive field, convictions have been successfully obtained in cases of individuals involved in Soviet espionage and other offenses of an internal security nature. (Examples of these are: (1) the conviction of a Colonel in the Soviet espionage service whose operations in New York included the use of fraudulent birth certificates, ciphers, radio and microfilm messages, etc., (2) convictions obtained under the Labor Management Relations Act for offenses involving the filing of false non-Communist affidavits by labor union officials, (3) successful prosecutive action in cases involving perjury before grand juries and Congressional Committees in internal security matters, false denials of Communist Party affiliations in loyalty certificates executed by Armed Forces personnel, and convictions for perjury and obstruction of justice arising out of grand jury investigations, (4) convictions of 6 defendants obtained under the Trading With the Enemy Act in cases involving trade with Communist China, and (5) as another example, in the cases of Cuban revolutionist activity in the U.S., 89 defendants were indicted, and 62 convictions obtained, on charges of

unlicensed exportation of arms, transfers of unregistered weapons, and violation of neutrality laws.) In other prosecutive areas, however, our internal security has suffered as the result of Supreme Court decisions reversing convictions under the Smith Act of 19 Communist Party leaders, the acquittal on appeal of 20 additional CP functionaries, and the remanding for retrial of 29 others. Although a selected number of these cases are to be re-tried, the prospects of successful prosecution are limited by the unavailability of witnesses by reason of death, illness, or the loss of their usefulness as confidential informants should they appear in court.

Some progress has been made in programs calling for security checks and other internal security safeguards on the entry and exit of persons who present a threat to the national security. However, the development of adequate safeguards in this area is hampered by such factors as (1) the extensiveness of our land and sea borders, (2) Supreme Court decisions under which the issuance of U.S. passports may not be denied to known Communists, (3) the current practice of admitting alien ships crewmen into the U.S. on the basis of visas issued to an entire ships crew, instead of issuing individual visas to each crew member, and (4) the ease with which enemy espionage agents may establish fraudulent identities with falsified birth records and other false means of identification in this country.

The ICIS, in consultation with the IIC, has established, or is in the process of establishing, security safeguards with respect to the substantial internal security hazards presented by the admission of Soviet bloc nationals under the current East-West Exchange Program; the admission of ships personnel from Polish vessels permitted entry to U.S. ports under present agreements with Poland; the prospect of admissions of Soviet bloc aircrewmen and administrative personnel under current policy looking to agreements for the operation of Soviet bloc airlines into this country; the prospective admissions in increasing numbers of Soviet bloc nationals under current policy calling for substantial increases in the admission of such persons as tourists, and cultural, information, and scientific specialists from Soviet-dominated countries in Eastern Europe; and the admission of refugees from Soviet bloc countries whose numbers have proved to include bona fide Communists and intelligence agents.

In the area of providing physical security for vital industrial and Governmental facilities, the Department of Defense and AEC are maintaining physical security programs for the protection of installations under their cognizance against sabotage, espionage and subversive activities. Insofar as other facilities are concerned, for which OCDM has overall responsibility by Executive Order issued in 1951, that agency has indicated that physical security measures will remain inadequate until security cognizance over the facilities has been assigned to appropriate

agencies, and until funds for the program are forthcoming. Meanwhile, the OCDM is in the process of preparing an order providing guidance to the agencies concerned. As for the protection of Government facilities housing essential functions, a guidance order to agencies is in preparation at OCDM—meanwhile the ICIS has circularized government agencies alerting them to the necessity for determining the extent of safeguards required to protect Government buildings against clandestine attack by chemical, biological, and radiological means.

Insofar as the problem of excluding subversives from employment in vital industries is concerned, Administration efforts to obtain remedial legislation has not resulted in action by the Congress.

With respect to the protection of classified U.S. defense information, the ICIS has continued to carry out the responsibility assigned to it by the NSC for surveying the implementation of the governing executive order issued in 1953. Its surveys reflect a general failure on the part of the agencies to effect downgrading and declassification of security information. These surveys have resulted in recommendations by ICIS for the improvement of the program, which recommendations are awaiting action by State and Defense preparatory to the submission by Budget of recommended amendments to the governing executive order.

With respect to the protection of other strategic information, under current policies directed toward foreign intelligence collection activities in the U.S., appropriate restrictions are applied to Soviet bloc officials on a reciprocal basis, bloc personnel and establishments are required to be appropriately identified as such, and Defense and AEC periodically alert their contractors to the efforts of Soviet bloc officials to obtain strategic information in this country.

Our defenses against clandestine introduction of nuclear weapons continue to be inadequate. Indeed, we have not achieved the general objective of our Continental Defense policy wherein that policy directs that "The Soviet bloc should be confronted with internal security measures presenting such risks as will serve as a deterrent to covert attack against the United States". While some improvement has been effected in the capability and operation of devices designed to detect the presence of radioactive material, the likelihood is remote that we will achieve in the near future a practical device which is capable of distinguishing fissionable material from other radioactive sources. While we do have less discriminating detection devices in operation at key points of entry, they are not being used in the numbers considered as an essential minimum by the Council's Internal Security Committees. (To achieve that minimum program, 9 additional Mark I and 60 additional Mark II devices should be added to the 6 Mark I's and the 162 Mark II's now in operation). Meanwhile, the diplomatic pouch affords a channel of introduction for small, high-yield nuclear weapons for under present practices, Soviet bloc pouches and other diplomatic shipments

are afforded immunity from search even though our devices register the presence of radioactive materials which could conceivably contain nuclear weapons components. Aside from the diplomatic pouch channels, our defenses against clandestine introduction of nuclear weapons are further affected by limitations inherent in the control of our vast coastal and land borders and by the limitations placed upon our spot-check inspections of incoming parcels, express, and freight shipments.

In the event you have questions concerning any aspect of the Annual Status Report on Internal Security, I am sure that the IIC and ICIS representatives who are present at this meeting will be happy to answer them. If I can also be of assistance to that end, I will of course do so.

96. Memorandum for the Record¹

Washington, September 22, 1958

SUBJECT

Revision of NSC 5410/1

Mr. Smith discussed with the Secretary this afternoon the subject of the attached memorandum.

The Secretary authorized Mr. Smith to take the position indicated during Planning Board discussions on this subject.

Howard Furnas

cc: Mr. Mathews

Attachment

Memorandum From Smith to Dulles

Washington, September 22, 1958

SUBJECT

Review of NSC 5410/1 "US Objectives in the Event of General War with the Soviet Bloc"

On Gordon Gray's initiative, the NSC Planning Board is again considering this subject which was postponed last May at our request

¹Source: State position on NSC 5410/1. Top Secret. 3 pp. NARA, RG 59, S/P-NSC Files: Lot 62 D 1, NSC 5410 Series.

when you and Secretary McElroy were discussing alternatives to the present Strategic Concept.

This policy paper is an extremely important one, not because of the use which might be made of it during a period of hostilities, but because of the influence it has upon the development of a Strategic Concept and upon US military capabilities including force levels, weapon systems and strategic and tactical planning. It is the logical intermediary between Basic National Policy and the Strategic Concept and will, in large measure, determine the Strategic Concept since the latter depends for its characteristics upon the nature of the objectives which the US sets for itself in military situations.

The present statement of US war aims deals only with general war with the Soviet Bloc, and does not consider our objectives in any military engagement short of general war. In my judgment this is an incomplete treatment of this important subject, and the resulting gap can have serious consequences. So long as there is no stated objective for the case of limited operations, the development of doctrine and capabilities for such operations is inhibited. The policy statement is used as a guide for the planning of the whole range of US military activities. Under the present policy the emphasis is placed upon general war capability to the virtual exclusion of those factors necessary to provide the flexible capability called for in Basic National Policy, and this emphasis makes itself felt in inter-service competition for resources and in the overall structuring of US military strength. Thus a range of military alternatives is not available, the free choice of foreign policy alternatives may be correspondingly restricted, and at a time of serious threat the US may well be prevented from responding effectively to any military aggression short of general war.

I believe US war aims policy should consider three kinds of war, (1) general war initiated by the USSR; (2) major war initiated by Communist China; and (3) other war with the Sino-Soviet bloc; and that our objectives should be spelled out carefully and in detail in order to give the military the maximum guidance necessary for the development of an overall flexible capability consistent with the requirements of Basic National Policy.

Recommendation:

That I be authorized during Planning Board discussions of NSC 5410/1 to take a position along the lines described above.

97. Briefing Note for 380th NSC Meeting¹

Washington, September 24, 1958

STATUS OF MOBILIZATION AND CIVIL DEFENSE
PROGRAMS ON JUNE 30, 1958
(Parts 4 and 5 of NSC 5819)

The next item on the agenda consists of two annual status reports, one on the mobilization program and one on the civil defense program. These reports were prepared separately again this year, even though FCDA and ODM were merged on July 1, because they deal with a period before the merger.

The planning Board was particularly interested in five policy questions which arise out of the reports:

1. Should we continue to assume in our planning that there would be no further attacks after an initial massive attack?

2. Should the mobilization program be reviewed to assure that the requirements of the nuclear and missile age, as opposed to World War II concepts, have been taken into consideration, particularly in such fields as post-attack military production, economic warfare, and censorship?

3. Should we continue to base our relocation planning on the assumption that there will be adequate warning?

4. Does the question of emergency agencies vs. regular agencies need to be re-studied?

5. Should arrangements be made to relocate the families of relocated personnel?

I understand Governor Hoegh will cover these questions in his remarks.

Governor Hoegh ———

98. Memorandum of Discussion at 380th NSC Meeting¹

Washington, September 25, 1958

SUBJECT

Discussion at the 380th Meeting of the National Security Council
Thursday, September 25, 1958

Present at the 380th NSC Meeting were the President of the United States, presiding; the Secretary of State; the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present were Mr. Fred C. Scribner, Jr. for the Secretary of the Treasury; the Acting Director, Bureau of the Budget; the Acting Chairman, Joint Chiefs of Staff; the Acting Director of Central Intelligence; the Assistant to the President; the Deputy Assistant to the President; the Director, U.S. Information Agency; the Director, International Cooperation Administration; the Special Assistants to the President for National Security Affairs, for Science and Technology, for Security Operations Coordination; the White House Staff Secretary; the U.S. Ambassador to NATO; the Deputy Secretary of Defense; Assistant Secretary of State Gerard C. Smith; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion and the main points taken.

[Omitted here is agenda item 1.]

**2. STATUS OF NATIONAL SECURITY PROGRAMS ON JUNE 30,
1958: THE MOBILIZATION PROGRAM AND THE CIVIL DEFENSE
PROGRAM**
(NSC 5819)

Mr. Gray introduced Governor Hoegh and provided a short briefing to the Council on certain policy questions which seemed to emerge from the Status Report on the Mobilization Program (A copy of Mr. Gray's briefing note is filed in the Minutes of the Meeting and another is attached to this Memorandum).

Governor Hoegh said that he would first report on the status of the mobilization program and thereafter on the status of the civil defense program inasmuch as the status reports covered the period

¹ Source: Agenda item 2: Status of National Security Programs on June 30, 1958: The Mobilization Program and the Civil Defense Program. Top Secret; Eyes Only. Extracts—4 pp. Eisenhower Library, Whitman File, NSC Records.

to June 30, 1958 and that the Office of Defense Mobilization and the Federal Civil Defense Administration had not been merged until July 1, 1958. Next year these two Status Reports would be combined. Continuing, Governor Hoegh pointed out that the emergency agencies, proposed to be set up in event of war or national emergency, were being evaluated in the light of the findings of OPERATION ALERT 1958. Recommendations as to the emergency agencies would be made to the President on October 10, 1958.

Likewise, Mobilization Plans C and D-Minus were being reviewed. The results of the review of these plans would be ready by November 1, 1958 at which time all the President's Emergency Action Documents would be completed.

As to the program to strengthen the U.S. Mobilization Base, Governor Hoegh pointed out that it had been agreed that while we could fight a World War II type of war with our present mobilization base, further study was being undertaken with respect to the adequacy of the mobilization base in the event of general nuclear war.

The program for the relocation of federal agencies, said Governor Hoegh, was likewise being re-evaluated in the light of OPERATION ALERT 1958. Recommendations on this subject would be made to the President and the Cabinet on October 10. As Mr. Gray had pointed out, warning times were of the very greatest importance and the relocation plans needed a complete new look and evaluation. We did have, however, at the present time a continuing operational capability for nineteen agencies in the event of war.

Finally, Governor Hoegh pointed out that the results of the plan to disperse federal facilities had practically negligible results. The one exception was the Atomic Energy Commission which had relocated out of Washington.

Turning to the status of the federal civil defense program as of June 30, 1958 Governor Hoegh stated that the situation described in the Status Report was still far from satisfactory despite marked improvement in the course of the last fiscal year. Governor Hoegh illustrated this point by providing certain highlights of developments in that fiscal year. He stated that the passage of the Durham Bill on August 8 was a landmark in the development of the national civil defense program. No funds, however, had yet been provided for the shelter program and it would be necessary to go back to the Congress with a presentation on this program early in January 1959.

At this point Secretary Dulles interrupted and indicated that he would have to leave the meeting at 10 o'clock and wanted to raise one issue before being obliged to leave. He said he wished to deal with the statement on Page 18 of the Report on the Mobilization Program

which called for the creation of an economic warfare agency in the event of war or national emergency. The Secretary of State added that he did not think that the proposal to create such an emergency agency was wise. The Department of State and other agencies were already carrying out a considerable amount of activity related to economic warfare and would be able to carry on this activity in the event of war. While Secretary Dulles said he sought no decision on this matter at this time, he did wish to raise the question of the desirability of planning to create an emergency agency for the conduction of economic warfare.

In reply Governor Hoegh said that he and his people had come to much the same conclusion as the Secretary of State. Having reevaluated this proposal, he had come to feel that such an agency would not be necessary in the event of a general nuclear war.

Secretary Dulles left the meeting at 10 a.m. after which Governor Hoegh concluded his report on the status of the key elements of the civil defense program.

The National Security Council:

a. Noted and discussed the reports on the status of the Mobilization Program and the Civil Defense Program on June 30, 1958, prepared by the Office of Civil and Defense Mobilization (transmitted as parts 4 and 5 of NSC 5819), as summarized at the meeting by the Director, Office of Civil and Defense Mobilization.

b. Noted that the Secretary of State and the Director, Office of Civil and Defense Mobilization, were in agreement that the concept of an emergency organization for economic warfare will not be adopted at this time.

NOTE: The action in *b* above as approved by the President subsequently transmitted to the Director, Office of Civil and Defense Mobilization.

3. *U.S. POLICY TOWARD GERMANY*

(NSC 5803; OCB Reports, dated September 3, 1958, on NSC 5803)

The National Security Council:

Noted the reference Reports on the subject by the Operations Coordinating Board.

S. Everett Gleason

99. Memorandum of Discussion at the 381st NSC Meeting¹

Washington, October 2, 1958

SUBJECT

Discussion at the 381st Meeting of the National Security Council
Thursday, October 2, 1958

Present at the 381st NSC Meeting were the President of the United States, Presiding; the Secretary of State; the Acting Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present were the Acting Secretary of the Treasury; the Attorney General; the Acting Director, Bureau of the Budget; Brig. General Alfred D. Starbird for the Chairman, Atomic Energy Commission; the Director, U.S. Information Agency (participating in Item 3); the Chairmen, Interdepartmental Intelligence Conference and Interdepartmental Conference on Internal Security (attending for Item 1); the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Deputy Assistant to the President; the Director, International Cooperation Administration; the Special Assistants to the President for National Security Affairs, and Security Operations Coordination; Assistant Secretary of State Gerard C. Smith; Assistant Secretary of Defense Mansfield D. Sprague; the Press Secretary to the President (attending for Item 3); the White House Staff Secretary; the NSC Representative on Internal Security; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion and the main points taken.

**1. *SHIPMENTS ENTERING THE UNITED STATES UNDER
DIPLOMATIC IMMUNITY***

(NSC 5802/1; NSC Actions Nos. 1868 and 1984; NSC 5527; Memos for NSC from the Executive Secretary, same subject, dated September 22 and 23, 1958)

Mr. Gray briefed the Council on this item along the lines reflected in the briefing note, a copy of which is filed in the Minutes of this Meeting. Mr. Gray then called on the Secretary of State for comment.

The Secretary of State indicated that the Department of State concurred in the proposed modification of NSC Action No. 1868 and he recommended that the modified language be approved by the President.

¹ Source: Agenda item 1: Shipments Entering the United States Under Diplomatic Immunity. Top Secret; Eyes Only. Extracts—4 pp. Eisenhower Library, Whitman File, NSC Records. Drafted on October 3.

The Chairman, IIC, Mr. J. Edgar Hoover, observed that it is well recognized by all that there is a threat posed by the capability which the Soviets have clandestinely to introduce nuclear bombs into the United States through diplomatic channels. He indicated that past studies reflect that two bombs, so introduced, could destroy Washington, D.C., and New York City. He noted that under the proposed modification of NSC Action No. 1868 nothing would be done in terms of opening suspect diplomatic shipments until sometime later when improved devices were installed at key ports of entry. He said that the Internal Security Committees, at the request of the Planning Board, were presently studying the question whether examination of diplomatic shipments by detection devices should continue to be covert, and he advised that there was some difference of opinion on this score among the interested agencies. He added that in due time a report would be submitted to the Council by the Internal Security Committees on the basis of the review which it was now making on this question.

The President inquired of Mr. Hoover whether the Atomic Energy Commission had given the Internal Security Committees the whole story relative to what the Soviets would have to do in order to introduce clandestinely into the United States a two or three megaton weapon. The Chairman replied that full information on this subject had been provided to the Internal Security Committees by the Atomic Energy Commission.

The President indicated that he was not thoroughly familiar with the sizes of diplomatic packages entering the United States and he wondered whether the size of such diplomatic packages was sufficient to accommodate large nuclear weapons. Mr. Hoover responded that some of the diplomatic packages entering the country weigh as much as two or three tons, and he added that it was quite feasible to introduce disassembled segments of such weapons in different incoming diplomatic shipments with the idea of assembling them subsequent to their arrival in this country.

The President inquired the reasons for having such large sized diplomatic packages, and the Secretary of State responded to the effect that the United States had to have the privilege of sending diplomatic packages of similar size to the Bloc countries in order to get in needed supplies and needed equipment such as heavy coding machines.

Mr. Gray indicated that some of the heavy packages coming into the United States under diplomatic immunity contained such things as household furnishings, liquor, and the like. Citing an example of the size of some of the incoming packages, Mr. Gray made reference to the fact that sometime ago the Czechs introduced four packages, each of which weighed 3,000 pounds.

The Director of Central Intelligence noted that each time this question came up in the Council, it was his suggestion that our Government work toward an international agreement which would restrict the size of diplomatic pouches. He could not see, for example, why it was necessary that household furnishings of an incoming diplomat be introduced via diplomatic channels.

The President observed that an agreement to reduce the size of such pouches might adversely affect our interests in getting coding machines into the Bloc countries via the U.S. diplomatic pouch. Mr. Allen Dulles agreed with this point but added that, if necessary, this Government could revert to the use of the one-time pad for coding purposes although, admittedly, this would effect substantially the time of delivery of such messages.

The Chairman, ICIS, Mr. J. Walter Yeagley, in response to Mr. Gray's inquiry, advised that he had no comments to add to those which had already been made on this subject.

The President concluded the discussion on this item with the thought that the modification of NSC Action No. 1868 contained a satisfactory statement of policy on the subject.

The National Security Council:

a. Noted and discussed the draft NSC Action on the subject (transmitted by the reference memorandum of September 22) prepared by the NSC Planning Board, with the assistance of representatives of the Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security as an amendment of the procedure states in NSC Action No. 1868, in the light of the views of the Joint Chiefs of Staff (transmitted by the reference memorandum of September 29).

b. Amended NSC Action No. 1868 by deleting the first paragraph of the procedure stated therein and substituting the following:

"If a detection device indicates the presence in a diplomatic shipment of plutonium (or other neutron source) or uranium, the shipment will be detained and the Department of State will request the appropriate foreign diplomatic mission in Washington to have one of its officers appear at the port of entry to remove the objectionable object for examination."

NOTE: The amendment in *b* above, as approved by the President, subsequently transmitted to the Secretary of State for appropriate implementation in coordination with the Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security.

[Omitted here is the remainder of the memorandum.]

S. Everett Gleason

100. Memorandum From Lay to All Holders of NSC 5819¹

Washington, October 6, 1958

The enclosed Part 1 of NSC 5819 (Military Program) and Annex A thereto, are transmitted herewith for the information of the National Security Council. *The enclosures are being given a special limited distribution, and access to them should be on a strict need-to-know basis.*

In view of the fact that Part 1 contains “RESTRICTED DATA”, if it is inserted in the covers previously circulated for NSC 5819, such covers should be stamped “RESTRICTED DATA”.

Annex A provides the special annex pursuant to NSC Action No. 1862 and the supplement required by NSC Action No. 1842–g–(10), –(11) and –(12).

This distribution completes NSC 5819.

James S. Lay, Jr.
Executive Secretary

Enclosure

National Security Council Memorandum 5819, Part 1

NSC 5819, Part 1, THE MILITARY PROGRAM

I. OBJECTIVES OF THE MILITARY PROGRAM.

The basic national objective of the United States is to preserve and enhance the security of the United States and its fundamental values and institutions. The primary threat to fulfillment of this objective is that posed by an aggressive and deeply hostile International Communism. All elements of U.S. national power must be resolutely directed toward meeting this Communist challenge.

The objectives of the U.S. military programs, in support of the basic national objective and in light of the primary threat, are to provide:

An effective nuclear retaliatory capability, adequately safeguarded and ready for immediate action.

An adequate continental defense system.

Highly mobile and suitably deployed ready forces, with the capability to respond selectively and flexibly to local aggression, using all weapons (including nuclear weapons) as required, and to carry out general war tasks.

A capability of maintaining control of essential sea areas and air communications.

A cold war contribution of U.S. military power to reinforce and support, in appropriate ways, overt and covert political, economic, psychological, technological and cultural measures.

II. *SUMMARY EVALUATION BY THE JOINT CHIEFS OF STAFF OF OUR ACTUAL AND POTENTIAL CAPABILITIES TO FULFILL CURRENT MILITARY COMMITMENTS AND BASIC OBJECTIVES AS OUTLINED IN NSC 5810/1.*

The nuclear retaliatory forces continue to provide the United States with a capability to inflict such loss and damage upon the enemy as to achieve a margin of advantage which, if exploited effectively in conjunction with other military operations, would permit the United States and its allies to prevail in general war. "However, despite continued improvement in the quality and posture of these forces during FY 1958, and notwithstanding the promise of continued improvement in the future, recent Soviet technological advances and the concurrent quantitative reductions in U.S. forces have combined to diminish that margin of U.S. military superiority. If these trends continue, it is estimated that this superiority will be lost in the foreseeable future."

Improvements have been made in Continental Defense during FY 1958; but concurrent Soviet offensive improvements have made any relative U.S. gain questionable. The Continental Defense system is not capable of preventing an attack which could seriously damage the United States.

The ready forces of the United States are capable of responding selectively and flexibly to local aggression in most parts of the world. These forces have been quantitatively decreased but qualitatively improved during FY 1958. This qualitative improvement has been attained by the further equipping of forces with advanced weapon systems, including more nuclear weapons, and by improved organization, planning, and techniques. The scope and timing of response to local aggression would be limited primarily by the degree to which maldesployment for initial tasks of general war could be accepted. The capabilities of our Allies to assist in coping with local aggression, with few exceptions, are very limited.

The United States and its Allies are capable of controlling essential air communications. The Soviet threat to the control of essential sea areas at the onset of a general war is so great that U.S. and allied forces, because of quantitative deficiencies and technological difficulties, are only marginally adequate to deal with it. As attacks at the source, offensive ASW operations and coastal and shipping defense operations take effect, U.S. capabilities to control essential sea areas will improve. The capabilities of allied forces to assist in the control of essential air communications and sea areas generally are limited to their homelands and coastal waters and are steadily diminishing.

The contributions of U.S. military forces to cold war activities have been significant, but potential capabilities have not been exploited fully. The increased emphasis recently given to this field should produce dividends.

A. *AN EFFECTIVE NUCLEAR-RETALIATORY CAPABILITY, ADEQUATELY SAFEGUARDED AND READY FOR IMMEDIATE ACTION.* The U.S. forces with a nuclear retaliatory capability include strategic bomber forces, carrier striking forces, tactical air forces, and other forces employing weapons armed with nuclear warheads which are ready to strike immediately and effectively against targets within the Sino-Soviet Bloc area.

The *Strategic Air Command* (SAC) has primary capability for nuclear retaliation and is charged with exploiting U.S. current superiority in nuclear weapons and long-range delivery systems against selected targets and target systems immediately after outbreak of hostilities. Overall effectiveness of SAC has increased during FY 1958 with introduction of new equipment and procedures. Total SAC force has been reduced from 50 wings of bomber, reconnaissance, and fighter aircraft at end FY 1957 to 44 wings at end FY 1958. This reduction was effected through inactivation of 5 strategic fighter type wings (2 were redesignated fighter bomber and 2 fighter day) and one medium reconnaissance wing. Total of 39 bomber (11 heavy and 28 medium) wings remain unchanged; all but 5 of SAC's 39 bomber wings have a high degree of readiness. Inactivation of one more medium reconnaissance wing in FY 1959 will reduce the total to 43 wings, 39 bomber and 4 (3 medium and one light) reconnaissance.

Combat capability of SAC heavy bomber wings increased during FY 1953 as B-36 units were converted to B-52's and as the number of heavy bombers per wing was increased from 30 (B-36) to 45 (B-52). As of 30 June 1958, 7 wings have been converted and equipped with B-52 aircraft (compared to 3 on 30 June 1957), and one more wing is undergoing conversion. Of the 7 B-52 equipped wings, 4 are considered fully capable and 3 have limited capabilities due to combat crew training and recent conversion status. Remainder of 3 B-36 wings are fully operational. By end FY 1959, 9 wings will be fully converted to B-52's, and 2 more wings will be in process of conversion.

As the Soviet delivery capability increases, the vulnerability of SAC bases within and outside the United States becomes a matter of greater concern. To reduce vulnerability, SAC dispersal and alert programs are being implemented. The status of these programs is:

a. *Heavy Bomber Dispersal.* Although there is a goal to have no more than one heavy bomber squadron on any one base, 33 squadrons are presently (30 June 1958) located on 11 bases. By end FY 1959, these squadrons are programmed to be dispersed on 18 bases; i.e., 5 bases

each with 3 squadrons, 5 bases each with 2 squadrons, and 8 bases each with one squadron.

b. *Medium Bomber Dispersal*. At present there are 28 wings on 18 bases. Two heavy bomber bases are presently accommodating one medium wing each. At end FY 1959, medium bomber wings are programmed to be located on 17 bases; 11 bases each with 2 wings, and 6 bases each with one wing. Dispersal for heavy bomber squadrons, plus a required location of medium bombers on optimum strike bases, causes this temporarily reduced dispersal of medium bomber wings during FY 1959. (See SAC Base Dispersal Map, Section VIII, Installations).

c. *Alert*. As of 30 June 1958, 156 bombers with associated tankers are on *continuous* 15-minute alert. In December 1957, 20 bombers were on 15-minute alert. By end FY 1959, about 350 SAC bombers with associated tankers are expected to be on *continuous* 15-minute alert. Under emergency conditions, the present alert force can be readily increased by curtailing training operations, but the increased alert capability can only be sustained for short periods, possibly 30 days.

In addition to the increase in the status of alert forces, new concepts for meeting the threat were implemented in the Strategic Air Command. Two of the most significant are as follows:

"Positive Control". This allows CINCSAC to launch his alert force under conditions of little or no warning and buy "precious time" for a national decision. This concept, it is hoped, will save the force while the threat is being evaluated.

"Reflex Action". This concept replaced the old plan for rotation of bomber units to overseas bases. It gives SAC an improved overseas alert posture with reduced vulnerability, i.e., the only strategic bomber aircraft in the forward area are "cocked" and ready to go on emergency war plan missions.

In addition to the above, SAC is presently testing a plan for airborne alert in which a significant portion of the alert force remains airborne continuously.

Supplementing SAC retaliatory capabilities are the *USAF tactical nuclear strike forces*. In the *Pacific*, tactical forces consist of 3-2/3 wings (2-1/3 nuclear capable) of fighter bombers and day fighters, *decreasing* to 3 wings (all nuclear capable) of tactical fighters by end FY 1959; one wing of tactical bombers which remains through FY 1959; and one detachment of MATADOR tactical missiles, increasing to 2 groups by end FY 1959. Based in the *United Kingdom and Europe*, tactical strike forces consist of 6-2/3 fighter bomber and fighter day wings (in addition, one fighter day and 3 fighter bomber squadrons are maintained on rotation to Europe from continental U.S. based wings). Of these wings, 6-3/4 are nuclear capable. These tactical fighters remain through FY

1959. There is also one wing of tactical bombers on 30 June 1958, which remains through FY 1959; and 3 groups of MATADOR tactical missiles. One of the 3 MATADOR groups will be converted to the more advanced TM-76 A (MACE) tactical missile by end FY 1959. MATADOR missiles released by this conversion are expected to be transferred to a selected Ally. Tactical air forces in *United States*, capable of augmenting forces overseas, consist of 12-3/4 fighter day and fighter bomber wings (less 4 squadrons on rotation) of which 7 wings are nuclear capable, to be reduced to 7-1/4 tactical fighter wings (less 4 squadrons on rotation) all of which are nuclear capable, by end FY 1959; and one tactical bomber wing to be inactivated during FY 1959. By end FY 1959, all tactical fighter wings are planned to be totally equipped with modern "century series" fighters.

Continuing progress is being made in providing the above delivery systems with smaller diameter and lighter weight weapons and warheads of various yields. The *continuing dispersal of nuclear weapons* to combat units in the field has improved greatly the operational readiness of our offensive forces. This action, coupled with the streamlining of our release procedures, has reduced substantially the reaction time of these forces to counter enemy aggression. However, due to political denial of storage rights in certain countries, weapons allocated to some combat units are not immediately available to those units. Action is continuing to obtain greater latitude in the dispersal of nuclear weapons.

Certain *major U.S. Navy forces*, with the primary mission of maintaining control of essential sea areas and air communications, possess a significant nuclear retaliatory strike capability. This capability exists primarily in attack carrier striking forces with a secondary capability in missile delivery from surface ship and submarine. There are 15 attack carriers and 17 associated carrier air groups. Since the previous report (30 June 1957), deliveries of new jet aircraft and modernization and new construction of attack aircraft carriers have materially increased Navy's nuclear weapon delivery capability. Three CVA 59 (FORRESTAL) class carriers have replaced ESSEX class carriers for fleet operations. Included in Naval forces are *Marine Corps forces* which contribute to the over-all nuclear retaliatory capability. These include 3 Marine Aircraft Wings, 2 in continental U.S. and one deployed in the Pacific area, maintained in a state of readiness to operate from land or sea bases, and to deploy rapidly to a theater of operations from present locations.

Present *Naval capability for guided missile delivery of large nuclear warheads* from surface ships and submarines is represented by the REGULUS system, for which nuclear warheads are stockpiled. REGULUS I system is now installed in 3 submarines and 4 heavy cruisers. There are 8 submarines equipped with REGULUS radar guidance

system (TROUNCE). One of the 3 missile submarines in the fleet possesses both a REGULUS I and a REGULUS II capability.

Currently, *U.S. Army forces* contribute to the nuclear retaliatory capability with REDSTONE, CORPORAL, HONEST JOHN, 280mm gun, 8-inch howitzer units, and atomic demolition munitions now deployed in Europe; and with HONEST JOHN, 280mm gun, 8-inch howitzer units, and atomic demolition munitions in the Pacific.

The following *air defense capabilities opposing U.S. retaliatory forces apply in general to the Soviet Bloc's air defense system*:

a. Against penetrations conducted during daylight and in clear weather, at altitudes between about 5,000 and about 35,000 feet, capabilities of the system are greatest. At about 35,000 feet they would begin to diminish, and above 45,000 feet would fall off markedly; at altitudes below 5,000 feet, they would also be progressively reduced.

b. Against penetrations conducted at night and under poor visibility conditions, the capabilities of the system would be considerably reduced.

c. Against varied penetration tactics utilizing altitude stacking, diversionary maneuvers decoys, and electronic countermeasures, capabilities of the air defense system would be diminished through disruption and saturation.

The advantage accruing to the United States and its Allies as a result of a retaliatory offensive would be dependent on the amount of warning of Soviet attack and the degree of protection afforded military installations, particularly those installations from which our retaliatory effort would be launched. It is estimated that enemy losses sustained as a result of a U.S. offensive retaliatory attack would provide a margin of advantage to the United States and its Allies which, if exploited effectively in conjunction with other military operations, would assure eventual victory.

B. HIGHLY MOBILE AND SUITABLY DEPLOYED READY FORCES WITH THE CAPACITY TO RESPOND SELECTIVELY AND FLEXIBLY TO LOCAL AGGRESSION, USING ALL WEAPONS (INCLUDING NUCLEAR WEAPONS) AS REQUIRED, AND TO CARRY OUT GENERAL WAR TASKS.

1. OVERALL CAPABILITIES.

a. *Army.* U.S. Army forces are capable of reacting flexibly to local aggression or general war utilizing selective fire power of the appropriate magnitude. Development of new infantry, armored, and airborne divisions, with organic nuclear capability, has greatly increased the operational capability of Army to meet the threat of a nuclear war. All active Army divisions are organized in the new Pentomic structure and are capable of integrating nuclear fire support with that of conventional

weapons and with maneuver. A nuclear projectile for the 8-inch howitzer is now in the stockpile. Additionally, Army has developed Army Missile Commands capable of rendering nuclear fire support to allied ground forces by various ground delivery systems. Addition of a limited number of helicopter units has provided Army with increased battle mobility. Principal limitations on effectiveness of Army forces are related to lack of modernization of non-nuclear fire support and an insufficiency of combat and logistic support because of manpower and budgetary limitations.

b. *Naval*. Increased nuclear capabilities of U.S. naval forces add materially to their effectiveness as a part of the ready forces. Included in naval forces are Fleet Marine Force divisions and air wings, with an organic surface and aircraft launched nuclear capability, capable of reacting to local aggression or general war. The new vertical helicopter assault doctrine provides a high degree of mobility for landing forces in assault and subsequent operations.

c. *Air Force*. USAF forces include units of Tactical Air Command, tactical air units of overseas theater air forces, and SAC bombardment forces described in previous paragraphs. USAF tactical air forces world-wide have been reduced from a total of 55 (including 15 airlift) wings on 30 June 1957 to 45 (including 13 airlift) on 30 June 1958, further to be reduced to 35 (including 11 airlift) by 30 June 1959. *The effectiveness, however, of both strategic and tactical air units to respond to local aggression or general war has not decreased since the 30 June 1957 status report as a result of the growing nuclear delivery capabilities of tactical air weapons and the improving reaction time and mobility of strategic bombardment units.*

d. In the succeeding paragraphs the ready forces capable of responding selectively and flexibly to local aggression and general war are treated by geographical areas.

[Omitted here is the remainder of Section II, JCS Evaluation of Actual and Potential Capabilities.]

III. EVALUATION BY THE JOINT CHIEFS OF STAFF OF OUR ACTUAL AND POTENTIAL CAPABILITIES TO PROVIDE AN ADEQUATE CONTINENTAL DEFENSE SYSTEM.

A. *OBJECTIVES OF THE DEPARTMENT OF DEFENSE CONTINENTAL U.S. DEFENSE PROGRAMS (Based on NSC 5802/1)*. To be prepared at all times to counter an attack on the North American Continent in such a way as to deter Soviet attack, or, if an attack occurs, to insure our survival as a free nation. Such preparation requires that the United States achieve and maintain, in collaboration with Canada and other Free World nations, a continental defense readiness and capability which will protect and permit the launching of our nuclear retaliatory

forces, even in the event of surprise attack. Such preparation should: (1) Provide warning to alert the nation to impending attack; (2) counter enemy subversive and clandestine efforts; (3) prevent the threat of nuclear destruction from unduly restricting U.S. freedom of action or weakening national morale; (4) maintain adaptability to make timely changes as technology permits and as the nature of the threat changes; (5) provide appropriate measures of protection for the civil population; and (6) include appropriately organizing, protecting, and placing in a condition of readiness the resources of the country essential to national survival.

B. ESTIMATED SOVIET THREAT AND CAPABILITIES.

1. Soviet capabilities for full-scale air attack on the continental United States, while still subject to limitations, have been improved by phasing-in of additional jet bombers, by continued improvement in forward and staging air base capacities, by availability of greater numbers of megaton yield weapons and emergence of a limited capability for in-flight refueling. The numbers of aircraft launched against the United States in an initial attack, even under conditions where surprise was a major Soviet consideration, could range in the several hundreds.

2. In light of recent tests, it is estimated that USSR is developing and stockpiling a versatile group of nuclear weapons ranging from very low yield warheads to high yield thermonuclear weapons.

3. It is estimated that Soviets will achieve an initial limited capability for ICBM attack in 1959.

4. USSR could now have subsonic cruise-type guided missiles with nuclear warheads suitable for launching from submarines against targets in U.S. coastal areas, and have several guided missile submarines equipped to carry and launch these missiles.

5. Clandestine attack on the United States itself by sabotage, biological warfare, and placement of nuclear weapons, could occur against specifically selected targets.

C. SUMMARY EVALUATION OF U.S. AIR DEFENSE CAPABILITY AND PROBLEMS. *The absolute capability of our forces to defend the United States against air attack has progressively increased since last report, as of 30 June 1957. This over-all increase is the result of establishment of North American Air Defense Command (NORAD); installation of additional early warning radar coverage, including seaward extensions of DEW Line, and contiguous seaward coverage; provision of more effective control of the air defense system through automation; increased coverage of the sea surveillance system; and availability of improved weapons systems, to include nuclear warheads. Although U.S. defense*

capabilities have improved during FY 1958, Soviet nuclear weapons development and improved delivery capabilities during same period, e.g., as demonstrated by Soviet launchings of space satellites, have made any relative U.S. gain questionable. Soviets are probably now capable of exploiting weaknesses in our defense system at very high and very low altitudes and of utilizing electronic countermeasures, sabotage, and deception to reduce the effectiveness of our defense system and contribute to success of their mission. During 1959, the estimated Soviet initial limited ICBM capability will provide an additional means of exploiting weaknesses in our defense system. The continental air defense system cannot be expected to counter completely an all-out attack of the magnitude which Soviets are capable of launching against the North American Continent. Solutions to following problems are being pursued on a high priority basis:

1. Procurement, training, and retention of highly skilled personnel required by modern and increasingly complex defense systems.
 2. Detection of airborne vehicles at very high and very low altitudes, and development and availability of weapons which can be effectively used at these altitudes.
 3. Development and implementation of measures to overcome or counteract enemy electronic countermeasures.
 4. Development of a system which can be used in defense against enemy ballistic missiles.
 5. Development of an effective and integrated sea surveillance system which will provide for detection, identification, and tracking of surface ships and submarines operating within missile launching range of the North American Continent, toward goal of development of capability to establish control over the submarine or surface ship prior to launching of its missile.
 6. Identification and engagement of hostile aircraft as far from our borders as possible.
 7. Means to mitigate or shorten the long lead time involved in completion of programmed improvements to systems.
- [Omitted here is the remainder of the report.]

101. Memorandum From Briber to Killian¹

Washington, October 9, 1958

SUBJECT

Dr. Kistiakowsky's Views on the N.I.E., "Soviet Capabilities in Guided Missiles and Space Vehicles"

Dr. Kistiakowsky is "not completely happy" with this intelligence estimate, although in total it fits pretty well with the Gaither Panel estimate of the 1960–62 critical period.

His modest dissatisfaction stems mainly from the conservative impression left by the report. The Soviets are first credited (para. 75) with an I.O.C. of ten missiles sometime in 1959, and only later in the report is the qualification added, in speaking of the *end* of 1959, of "ten or more, but less than 100" missiles. Kisty was responsible for the qualifying phrase, but feels the report still gives the impression that 10 missiles are the only concern for 1959. He feels they will quite certainly have closer to 100 by the end of the year. He concurs with the final estimate of 500 Soviet missiles in 1961–62. This will be a critical period and so, in general, corresponds to the Gaither Report. We will then have 100 missiles but then bases will not be hardened, nor will BMEWS be operational.

He also criticizes this N.I.E. in that it speaks (para. 75) of an initial 50 per cent Soviet missile reliability and a 5 n.m. CEP; he feels both of these estimates are somewhat harsh toward real Soviet capabilities.

Robert M. Briber

102. Memorandum of Discussion at the 382d NSC Meeting¹

Washington, October 13, 1958

SUBJECT

Discussion at the 382nd (Special) Meeting of the National Security Council, Monday, October 13, 1958

Present at this special meeting (382nd) of the National Security Council were the President of the United States, presiding; the Secretary of State; the Acting Secretary of Defense; and the Acting Director, Office of Civil and Defense Mobilization. Also present were the Acting Director, Bureau of the Budget; the Chairman, Atomic Energy Commission; the Director of Central Intelligence; the Secretaries of the Army and the Navy; Mr. Richard Horner for the Secretary of the Air Force; the Chairman, Joint Chiefs of Staff; the Chief of Staff, U.S. Army; the Chief of Naval Operations; the Chief of Staff, U.S. Air Force; the Acting Commandant, U.S. Marine Corps; the Assistant to the President; the Special Assistants to the President for National Security Affairs and for Science and Technology; the White House Staff Secretary; and the Executive Secretary, NSC. The following members of the Weapons Systems Evaluation Group, Department of Defense, also attended the meeting: Vice Admiral Sides, Director; Charles A. Boyd, Director of Research; Richard H. DuBois, Assistant; Lt. Col. Bolton Miller; M/Sgt. Ralph Pearson; Michael Picchioni.

There follows a summary of the discussion at the meeting and the main points taken.

1. EVALUATION OF OFFENSIVE AND DEFENSIVE WEAPONS SYSTEMS

(NSC Action No. 1733)

Mr. Gray explained the background of the subject report. (Copy of Mr. Gray's briefing note is filed in the minutes of the meeting.) Mr. Gray asked Secretary Quarles if he had anything to add before calling on Admiral Sides.

Secretary Quarles emphasized that this evaluation should be viewed as an abstraction of the problem, as are all such evaluations. It treats of the problem apart from some of the practical aspects which are normally cranked in by the Joint Chiefs of Staff and the Secretary of Defense. Secretary Quarles stressed that this was a report by the Weapons Systems Evaluation Group and not by the Joint Chiefs of Staff as such.

¹ Source: Agenda item 1: Evaluation of Offensive and Defensive Weapons Systems. Top Secret; Eyes Only. Extracts—4 pp. Eisenhower Library, Whitman File, NSC Records.

Admiral Sides presented the evaluation with the use of charts. (Copy of Admiral Sides' notes for the presentation and of the charts used, filed in the minutes of the meeting.)

The President remarked that he would like to say one positive thing about the presentation. He thought that it was as dispassionate, low-key and thorough an exposition as he had ever heard.

The President went on to say that this evaluation opens doors for additional investigation. It alerts us to what we must do if anyone studies the fiscal situation. There must be some substitution in these programs. Otherwise we will no longer be able to say that we are defending freedom. The President said he did not believe that we could keep these expenditures going up indefinitely without some kind of controls on the financial situation. He pointed out that interest on bonds is going up at a time when we are not yet out of the recession. The President concluded by congratulating the Group on its report, but expressing the view that it gives us more anxiety than he had imagined it would.

Mr. Gray said that he would like to point out one serious statement. This was that some of the interim systems examined were designed as defense against manned aircraft, but would not be completed and installed in time to deal with advanced types of weapons. Mr. Gray pointed out that Admiral Sides had raised a question for decision as to whether some of these systems should be completed.

The President said that he thought we should identify what systems are obsolete. Perhaps some of them should be "bought out" at an earlier date than now planned. He believed that more evaluation should be made of our present and future plans, to determine what the rule of reason requires. He thought that we should identify those, such as the second generation of BOMARCs, which by the time they were completed would be outmoded by other systems, such as the NIKE-ZEUS.

In answer to the President's question, General Twining and General White indicated that the cost of a B-58 was about \$20 million and the cost of a B-70 about \$23 million.

The President said that he had the impression we were somewhat pessimistic about really developing a defense against ICBMs. He repeated that we should carefully review programs to see where they are antithetical or overlapping. General Twining assured the President that the Joint Chiefs were all taking a soul-searching look at this subject. Secretary Quarles said that such a review was beginning with the preparation of the FY 1960 budget.

The President commented that we were now seeing a new phenomenon in weapons development. It used to be that changes in weapons systems were made slowly and obsolescent models replaced gradually. Now, because of the urgent time element, we are trying to develop rapidly whole weapons systems to replace other systems. What he was

trying to say was that in this process we must make sure we are not substituting money for brains. He reiterated that in the long run he did not believe we could defend our freedom if we put too much money or resources into the machinery of war.

Mr. Allen Dulles commented that the report points up the vital need for improved intelligence on what the Soviets are doing. He noted that they had recently been cutting back production of heavy bombers. Also, they were not testing ICBMs to the extent expected. He wondered how effective the elaborate protective screen around Moscow would be.

Mr. Gray said that he thought one of the questions raised by the evaluation was the problem of dealing with limited wars, which had been before the NSC recently.

The President repeated that he expected the Weapons Systems Evaluation Group to lay out clearly for the Joint Chiefs of Staff the advantages versus the disadvantages of various weapons systems. Then, he felt, some very tough decisions would have to be made. Admiral Sides said that the WSEG had presented its report in full detail to the Joint Chiefs of Staff, who were now considering it.

Secretary Quarles expressed the belief that, just as we have gone back to the manned bomber as an effective weapon, he expected that the Soviets would too. He thought it was risky to assume that the Soviets would forgo manned bombers. He believed they would find it very much to their advantage to have the same kind of capability that we are trying to develop. He thought that the Soviets might end up producing a heavy bomber somewhere between our B-58 and B-70.

Mr. Allen Dulles estimated that the Soviets will keep up a substantial manned bomber force. He didn't know yet whether they would be able to get high speed together with the necessary range.

The President noted that we expect to level out with about 600 B-52 s, while the Soviets will level off at about 200 heavy bombers. He questioned whether, as we convert to heavy bombers of 3-mach speed, we would still feel that we needed 600. He questioned whether we always needed to be three times better than the Soviets.

General White said that our problem was that we must assume that the Soviets will strike first. If they do, we cannot stop them by our Distant Early Warning lines. We must, therefore, find the number of bombers which it is logical for us to maintain in order to strike back after the initial Soviet attack.

Mr. Gray suggested, and it was agreed, that the Department of Defense be asked to review within the next year its report on relative advantages of ballistic missiles versus manned bombers.

[Omitted here is the remainder of the memorandum.]

James S. Lay, Jr.

103. Record of Actions by the NSC¹

Washington, October 16, 1958

RECORD OF ACTIONS
by the
NATIONAL SECURITY COUNCIL
at its
THREE HUNDRED AND EIGHTY-SECOND MEETING
held on
October 13, 1958

(Approved by the President on October 16, 1958)

The President presided at this meeting. The Acting Director, Bureau of the Budget, and the Chairman, Atomic Energy Commission, participated in the Council actions below. The Service Secretaries and the Joint Chiefs of Staff attended this meeting.

ACTION

NUMBER

SUBJECT

1994. *EVALUATION OF OFFENSIVE AND DEFENSIVE WEAPONS SYSTEMS*

(NSC Action No. 1733)

a. Noted and discussed an oral presentation by the Director, Weapons Systems Evaluation Group, of an evaluation of offensive and defensive weapons systems, prepared by the Weapons Systems Evaluation Group pursuant to request by the Secretary of Defense.

b. Noted the President's remarks that, while he congratulated the Group on an objective and thorough exposition, the evaluation and discussion also indicates the need for additional investigation to identify those weapons systems which may be obsolescent, antithetical or overlapping. The President stated that, unless tough decisions were taken regarding such systems, in view of the fiscal situation, we would find that in the long run we would encounter increasing difficulty in preserving our free way of life if we put unnecessary money and resources into the machinery of war.

c. Noted the President's request that the Joint Chiefs of Staff conduct the additional investigation referred to in *b* above in the light of the evaluation and discussion, and report the resultant identification of obsolescent, antithetical or overlapping weapons systems.

d. Noted that although the above presentation contained a brief discussion with respect to limited war capabilities, the Joint Chiefs of

¹ Source: NSC Actions No. 1994 and 1995 taken at the 382d (Special) NSC meeting. Top Secret. 2 pp. NARA, RG 59, S/S–NSC (Miscellaneous) Files: Lot 66 D 95, Records of Action by the National Security Council.

Staff would not be requested to include limited war capabilities in the investigation referred to in *c* above, in the light of the President's decision in NSC Action No. 1952.

e. Agreed that, in view of the above presentation, the results of this year's review, pursuant to NSC Action No. 1733-*c*, of the report on "Relative Military Advantage of IRBM-ICBM vs. Manned Aircraft and Non-Ballistic Missiles" did not require presentation to the NSC; but that this report should be again reviewed within the next year and results reported to the Council.

NOTE: The actions in *b*, *c*, *d* and *e* above, as approved by the President, subsequently transmitted to the Secretary of Defense for appropriate implementation.

1995. *SIGNIFICANT WORLD DEVELOPMENTS AFFECTING
U.S. SECURITY*

Noted and discussed an oral briefing by the Director of Central Intelligence on the subject, with specific reference to recent unusual Soviet activity connected with outer space developments; Soviet nuclear tests conducted since September 30; and recent developments in the Taiwan Strait situation.

104. Memorandum of Discussion at the 383d NSC Meeting¹

Washington, October 16, 1958

SUBJECT

Discussion at the 383rd Meeting of the National Security Council, Thursday,
October 16, 1958

Present at the 383rd NSC Meeting were the President of the United States, presiding; the Secretary of State; the Acting Secretary of Defense; and the Acting Director, Office of Civil and Defense Mobilization. Also present were the Acting Secretary of the Treasury; the Acting Director, Bureau of the Budget; the Chairman, Atomic Energy Commission (participating in Item 1); Dr. Willard F. Libby, Commissioner, Atomic Energy Commission (for Item 1); Brig. Gen. Alfred D. Starbird,

¹ Source: Agenda item 1: Status of the National Security Programs: The Atomic Energy Program. Top Secret; Eyes Only. Extracts—4 pp. Eisenhower Library, Whitman File, NSC Records.

Assistant to the Chairman, AEC (for Item 1); Capt. John H. Morse, Jr., USN, AEC Observer on the NSC Planning Board (for Item 1); the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; The Assistant to the President; the Deputy Assistant to the President; the Director, U.S. Information Agency; the Director, International Cooperation Administration; the Special Assistants to the President for the Atoms for Peace Program, for National Security Affairs, for Science and Technology, and for Security Operations Coordination; the White House Staff Secretary; Assistant Secretaries of State Rountree and Smith; Assistant Secretary of Defense Irwin; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. *STATUS OF NATIONAL SECURITY PROGRAMS: THE ATOMIC ENERGY PROGRAM*

(NSC 5819)

The Special Assistant to the President, Mr. Gordon Gray, introduced the new Chairman of the Atomic Energy Commission, Mr. McCone, who stated that he would give the first portion of the report on the status of the atomic energy program. In the course of his report, Mr. McCone dealt with the following main subjects: *First*, U.S. commitments for the purchase of uranium ores at home and abroad for the next several years; *second*, availability of fissionable materials—U-235, plutonium, and tritium—in the light of requirements of various kinds; *third*, the aging and deterioration of U.S. reactors and forthcoming problems of replacement; and *fourth* the program for nuclear power for peaceful purposes. On the latter subject, Mr. McCone indicated that the U.S. goal was to achieve economically competitive nuclear power in the United States in ten years, and in friendly foreign nations in five years.

Following Mr. McCone, the remainder of the status report was presented by Dr. Willard F. Libby, of the Atomic Energy Commission, who discussed the following subjects: The U.S. basic research program; the program for the study of radioactive fallout; isotopes; the non-military uses of atomic explosions (Project PLOWSHARE); forthcoming PLOWSHARE plans; the U.S. atomic weapons program (HARDTACK I); and the HARDTACK II series of tests now proceeding in Nevada. (Copies of the reports by Mr. McCone and Dr. Libby are filed in the minutes of the meeting.)

The President asked a question with respect to the use of atomic explosions to recover oil, and was answered by Dr. Libby. Thereupon

Secretary Quarles indicated a desire to comment on the Department of Defense atomic weapons requirements. He pointed out that the Department of Defense had yesterday sent to the Chairman of the Atomic Energy Commission its estimates of its requirements over the next ten years for both plutonium and U-235. Secretary Quarles indicated that the minimum requirements for small tactical nuclear weapons would continue to exceed the plutonium estimated to be available. The President, with a smile, stated that he was at least perfectly certain that Secretary Quarles was not going to reduce the requirements for fissionable materials.

The Acting Director of the Bureau of the Budget, Mr. Roger Jones, asked whether these Defense Department requirements took account of the material discussed by Admiral Sides at the special meeting of the National Security Council on last Monday afternoon. The subject of this meeting was the evaluation of offensive and defensive weapons systems.

Secretary Quarles replied to Mr. Jones by stating that the Defense Department requirements were based on all the latest available information, including that presented at the special Council meeting on Monday. He again pointed out that the trend toward smaller sizes of nuclear bombs, such as the DAVY CROCKETT, was greatly increasing the plutonium content per bomb.

Mr. Jones pointed out that in view of the constant criticism by the Joint Congressional Committee on Atomic Energy of the alleged failure of the Department of Defense to indicate its future requirements, which criticism extended also to the Administration as a whole, it would be worth while to advise the Joint Committee that the Defense Department had just sent to the Atomic Energy Commission its requirements over the next ten years.

The National Security Council:

Noted and discussed the report on the status of the atomic energy program on June 30, 1958, prepared by the Atomic Energy Commission and transmitted as Part 3 of NSC 5819; as supplemented by an oral presentation by the Chairman, Atomic Energy Commission, and AEC Commissioner Libby, on developments in the program since June 30, 1958.

[Omitted here is the remainder of the memorandum.]

S. Everett Gleason

105. Memorandum Prepared by the Office of the President's Special Assistant for Science and Technology¹

Washington, undated

SELECTED ISSUES IN THE FY '60 DEFENSE BUDGET

(As of November 1, 1958)

Limitations and Approach of this Memorandum

1. It collects and classifies current questions about specific budgetary items; it does not seek to answer these questions. The questions selected deal primarily with the development and procurement of weapons systems. It does not, for example, cover military construction.

2. It reflects the methods and approach of scientists and engineers; it does not express or assume military judgment and experience. It does not attempt to evaluate the military risks entailed in making changes in the military program. It does not deal with factors arising from national domestic policy.

3. It does not assume that the total defense budget is too large, too small, or just right. The objective is to suggest those detailed questions which can help in answering this general question:

"How much military capability do we need and how much more or less will it cost?"

4. It does not exclude the possibility that our military capability may be substantially increased by a small increase in the total military budget. It is based on the conviction that expenditures for some weapons systems need to be increased, while expenditures for others can be cut back. It has not sought to determine whether the net effect of increases and reductions will be a reduction or an increase.

5. It reflects the strong conviction that questions about the effectiveness of weapon systems require a combination of technical evaluation and military value judgments, and that this combined evaluation is so complex that it warrants continuous effort by highly skilled analysts. It reflects the belief that increasing benefit can be derived from increasing the input of technical analyses. It recognizes that evaluation of the effectiveness of a particular military budget depends upon interaction between weapons systems, the nature of the threat, the strategic concept and consideration of relative costs.

¹Source: Selected issues in the FY '60 Defense budget (As of November 1, 1958). Top Secret. 21 pp. Eisenhower Library, White House Office Files, Project Clean Up, Offensive and Defensive Weapons.

6. It is not intended to imply that the questions raised have not already been considered by the services. Rather its purpose is to examine the basis for decisions on specific budgetary items and the extent to which relationships have been considered among alternate weapons systems designed to perform similar military missions.

7. The memorandum has organized the questions listed in the following four categories:

- a) the strategic striking force
- b) the defense of the striking force and home base
- c) ground and sea forces
- d) general military support

Determination of the balance of expenditure between the four categories presents many difficult issues. One class of issues is basically scientific, dealing with the estimation of probable consequences of allocation of military resources in the face of an assumed threat. The other class of issues involves value judgments as to what consequences, and hence what resource allocation are to be preferred. Military policy must be based upon decisions of both kinds.

Examples of technical questions relating to probable consequences are:

1. What is the most economical division of funds between the striking force and the defense of it, with the object of achieving a given strike force capability? Elements of the striking force are so expensive that a small expenditure on hardening, active defense, or quick reaction capability may significantly increase effectiveness per dollar of the striking force system.

2. What kind and what size of overseas war capability is needed to deal with the expected threat and what would be the costs of alternative assumed levels of capability?

Examples of questions requiring value judgment are:

1. What should be the proportion of the striking force directed to enemy attack bases as opposed to industrial or population targets?

2. What fraction of the military budget should be devoted to population defense against air attack?

Other questions of balance within each category are discussed below where relevant.

D. *Navy Radio Telescope*E. *Pacific Missile Range*F. *Aircraft, nuclear propelled*G. *Dyna-Soar*H. *ARPA Space Program*I. *BW-CW*I. *STRATEGIC STRIKING FORCE*A. *General Discussion*

The mission of the strategic striking force determines, of course, related questions such as the size of the force, composition of the force, and the number of nuclear weapons it requires. In turn, the quantity of nuclear weapons assigned to the striking force will influence the number available for defense of the home base and for ground and sea forces and will affect substantially the budget of both the DOD and the AEC.

Is the size of the strategic striking force, therefore, to be determined principally in terms of its expected effectiveness against bases of the enemy striking force, or by its effectiveness for retaliatory purposes, or both? If intended targets consist of population centers and enemy war mobilization potential, would a smaller force be possible? Alternatively, if intended targets consist of enemy striking force bases alone, or such bases together with population centers, will a larger force be necessary?

With regard to the composition of the striking force, what is an appropriate balance between bombers and missiles? Is it desirable to have a mixed force of missiles, as, for example, a combination in the future of Titan, Polaris and Minuteman? Would such combinations reduce the vulnerability of the striking force and complicate the enemy's problems of countering it?

Decisions to proceed with research and development of new delivery systems should clearly be distinguished from decisions to develop operational capabilities. The parallel development of competing

delivery systems must take into consideration questions of relative technical certainty, costs, performance, time phasing and vulnerability to countermeasures.

It is within the framework of such considerations as these that the individual items listed below need to be evaluated when weighing their value to the striking force and in seeking alternative approaches.

B. Strategic Missiles

What is the most economical, fully adequate program for achieving a dependable strategic missile capability?

The strategic missiles, Atlas and Titan, are possibly redundant. Is this redundancy necessary to the reliable attainment of an ICBM capability?

Concerning Atlas, Titan, and Minuteman, the following comments are applicable.

1. Atlas

This missile provides the earliest possible ICBM capability.

If the Titan program is continued, should Atlas program be terminated as soon as adequate production of operational Titans is assured?

2. Titan

Do the improved characteristics of this missile justify its continued development in parallel with Minuteman?

Should there be a program for converting Titan to storable propellants?

Titan has much greater payload capability (or range) than Minuteman and promises an earlier availability. It is an improvement over Atlas and in the presently-planned sites is less vulnerable than Atlas.

3. Minuteman

Does this missile have a technical certainty and an expected operational performance and availability that would warrant exclusive reliance on it for an ICBM capability?

The most important feature of Minuteman is its large solid propellant booster. This feature may also be the most critical aspect of its development. Although there appears to be adequate back-up for the large-scale development of solid propellant grains required by Minuteman, the early stage of the development makes it difficult to predict the date of operational availability.

Is the level of development effort for Minuteman adequate to solve its problems and meet reasonable IOC dates?

4. Polaris Force

What constitutes an effective force level for this system, seen as an integral part of the strategic missile force of USA?

The cost and a great part of the complexity of this program arise from the nuclear submarine, not the missile. This makes an evaluation of force level an important consideration in assessing its effectiveness. Could the cost of this program be reduced and its effectiveness extended by installing Polaris missiles on other types of ships and by stretching out submarine procurement?

5. *Thor, Jupiter*

Are the problems of vulnerability as well as political acceptability of IRBM's sufficiently great to warrant limiting these weapons systems to a very small number of squadrons?

Should one of these programs be terminated at an early date since the missiles operationally are so similar?

Difficulties of obtaining foreign bases may considerably limit the use of these weapons.

Both of these missiles depend on cryogenics and lack mobility.

C. *Manned Bomber Striking Force*

1. *B-52*

Can the B-52, equipped with Hound Dog, compete with possible new developments? What is the potential of the B-52 system for growth in the future?

2. *B-58*

Does the B-58 represent a sufficient improvement over the B-52 delivery system to warrant its further development? What would be its requirement for increased KC-135 support?

3. *KC-135 Jet Tanker*

What is the proper relation of the size of the jet tanker force to the manned bomber force? What is the vulnerability of the jet tanker refueling system?

4. *B-70*

Are the speed and altitude advantages of the B-70 over the B-52 great enough to warrant the substantial investment such a force will require?

What will be the capability of the B-70 for penetrating enemy defenses at the time it is operationally available?

What capability would the B-70 have for maintaining a force on airborne alert?

5. *Goose*

Assuming the availability of Quail, what is the requirement of Goose, considering its inflexibility?

II. DEFENSE OF THE STRIKING FORCE AND HOME BASE

A. General Discussion

It is perhaps in this area that the interrelations of weapons systems with each other is most complex and the evaluation of the technical facts is most dependent upon policy judgments. Important among the issues involving policy judgments are:

- a. The size of the striking force to be defended;
- b. The missions assigned to that force and for which it must then be defended—this influences the composition of the striking force and the fraction of each component which must, in extremis, be preserved;
- c. The relative needs for defense of other targets on the home base, e.g. cities; determination of these needs involves judgment directly; it also involves judgment indirectly because decisions made under “a”, and “b”, above influence the amount of the enemy’s force available to attack targets other than the striking force.

In principle, once policies have been set which establish a yardstick for effectiveness, many technical issues can be settled by adequate analyses of systems and their costs. Interpreted in this light, the broader technical questions relate to:

- a. The choice of means for best defending the striking force—e.g., by warning and alert, by dispersal and hardening, and by active measures;
- b. The extent to which defense against aircraft must be prosecuted in a missile age;
- c. The choice of means for air defense;
- d. The extent to which the threat from missiles launched at sea should be countered by warfare at sea.

Once the policies mentioned above are set and the technical analyses just listed are done, it is possible in principle to consider the broadest issues: the extent to which a given budget should be apportioned between striking force and its defense, and finally, the budget for the two which best meets the country’s needs as set by policy.

Another issue of a somewhat different sort seems important in connection with defense. The complexity of the defensive mission places great demands upon the organization which conducts this mission. The present organization, NORAD, is unified in the somewhat narrow sense that it can deploy and command the forces made available to it. But the technical composition of these forces and the nature of their equipment and of their supporting elements, (e.g., SAGE), are determined by separate actions of the three services (and also the services of Canada). On these matters NORAD can advise and request but not control.

Nor, outside of NORAD, is there any other mechanism of authority by which policy decisions, such as those mentioned above, can be brought directly to bear upon procurement, or upon research and development as these relate specifically to defensive efforts.

For these reasons, the most complex of the military tasks facing this country, and the task most needing careful balancing and inter-relating of many components, is without an adequate structure for its management. Is an effort to improve the effectiveness of defense as a whole likely to fail without more centralized management?

The subsequent paragraphs of this section examine some specific technical issues.

B. Active Defense

1. Nike-Zeus

Is this system effective enough as planned at present to permit procurement plans to proceed, or should hardening of a fraction of SAC be undertaken instead, while R & D on the Zeus system is carried on at the highest practical rate?

A large ICBM can carry more than a dozen appropriately designed warheads which reenter separately and must be countered individually. The cost of an effective defense by Nike-Zeus then depends critically upon the cost of furnishing the necessary fire power. Does this fact, together with the fact that the radars of the Zeus system are necessarily soft targets, suggest that hardening may be both a cheaper and a more dependable alternative?

2. Nike-Hercules

Should this defense system, now becoming available, be installed to defend population centers or be used principally for the defense of SAC bases?

Would economy result from concentrating on the use of this weapon for SAC base air defense during the early time period when the manned bomber threat to SAC is predominant, and would this be militarily wise?

3. Super Hawk

What effectiveness will this weapon offer over other ground-to-air missile systems? Could this added effectiveness be bought more cheaply by increasing the use of Nike-Hercules or other existing weapons systems?

These questions seem particularly relevant in view of the similarities between Super Hawk and other air defense weapons, and in view of the fact that development costs are always high.

4. Bomarc

Since this system is controlled by the ground environment, is it so vulnerable to ICBM attack as to represent a questionable air defense?

Alternatively, should greater reliance be placed on more nearly autonomous weapons systems (including manned interceptors) with appropriate armament, designed for this mode of operation?

5. *F-108 and GAP-9*

What effectiveness will this interception system add to air defense of the home base? Is this development the best means to get this added effectiveness?

An interceptor system which does not depend too heavily on the ground environment is desirable during the ICBM era. But is the F-108 system too complex and the vehicle too small fully to exploit the concept? Can an effective radar for this plane be developed without degrading the performance of the plane?

6. *ASW Expenditure*

Is the large fraction of the Navy budget expended on ASW in need of redirection? Should there be more emphasis on development of better methods, including sea surveillance, as distinguished from marginal improvement and test of existing methods? Is the Navy recommending funds large enough to deal adequately with the solution of this complex problem?

7. *ASW Seaplane Development*

The prospect of success should be critically examined here on technical grounds. The use of the open ocean as a landing platform poses an extremely difficult problem under most conditions. Can this be considered a high-priority item if the questions in "6" above are answered affirmatively?

C. Passive Defense

1. *SAC Alert*

Is the planned SAC alert adequate to meet the enemy missile threat? Has there been a realistic forecast of the operating costs entailed by the continuous alert over the next several years?

How would these costs, as well as the operating capability of SAC, be affected by hardening a portion of each base?

2. *Hardening*

In addition to earlier questions which have related hardening of SAC bases to other defensive alternatives, the following questions appear:

To what level of pressure should bases be hardened? How is this level related to the number of aircraft to be protected by hardening? What levels of hardening are best for missile bases, and how many bases should be protected at this level?

In all cases, the protection obtained by greatly hardening a few bases needs to be compared in its cost with more widespread hardening to a lower pressure level.

D. Ground Environment

1. SAGE

Is this system so vulnerable to bomb damage that some of the scheduled improvements are of marginal value? Alternatively, should additional funds be allocated to hardening SAGE installations? What will be the traffic handling capacity of SAGE in the face of electronic countermeasures? Is this adequate to support the air defense mission of the interceptor and Bomarc force?

2. AEW and C

Are the Air Force and Navy programs in this area adequate to support the air defense of our coastal areas? Would augmenting these programs be an economical way to increase the effectiveness of air defense? Do these two programs lead to equipment which is mutually compatible, compatible with SAGE, and compatible with existing and programmed interceptor forces?

3. Badge—Alaska (extending air defense ground control into Alaska)

Would enough defense of the striking force be provided by this proposal to warrant the expenditure?

4. Dewline

Is the system likely to fail to give warning unless the contemplated radar replacements are made, or do the changes make only a marginal difference in performance? Should the programmed extensions to Dewline be accelerated?

5. BMEWS

Should the proposed additional site in Scotland be authorized?

What is the relation of the BMEWS system to the possible use of infra-red airborne devices for early warning (IREW, see 6 below)?

6. IREW

Should aircraft, devices, and communications for this warning system be developed? How, and how effectively, can this system supplement BMEWS or substitute for extensions of BMEWS?

III. GROUND AND SEA FORCES

A. General Discussion

New technological developments impinge directly on such questions as the size and make-up of conventional forces, logistic support, mobility, and increased firepower in relation to manpower.

The use of nuclear weapons by the fleet and by ground forces raises questions, furthermore, as to the extent to which these weapons

will contribute increased effectiveness for a given investment. What should be the relative emphasis given to increasing the use of nuclear weapons, as opposed to conventional weapons for tactical systems?

Other technical advances as, for example, nuclear engines for ships, will require examination. To what extent do they simplify the logistic support of ground and sea forces and increase the effective mobility of such forces?

At a more general level, the question arises, whether, on the whole, present funds for the Navy give adequate support to its several missions. The Navy contributes to the strategic striking force; the extent of this contribution, and the cost thereof, will increase as the Polaris program advances. At the same time, the Navy assists in defending the home base, contributes a mobile tactical force, is a stabilizing and deterrent element in peace time, and is a major troop carrier in the case of general war.

B. *Ground Forces*

1. *Davy Crockett*

Is there a clear understanding of the nuclear warhead requirements for this weapon system based on approved operational concepts for its employment?

This system provides great explosive power in a weapon of light weight. It is effective against armor, troops, and installations; nevertheless, its effects are restricted enough that it can be used safely in the vicinity of friendly forces, and discriminately against ground targets.

2. *Vigilante-Mauler (new AA gun and missile)*

Are both of these projects necessary for battlefield defense?

3. *Redstone*

Does this weapon have sufficient mobility and invulnerability to make it dependable under combat conditions and useful under present Army organization and requirements for mobility?

4. *Hawk*

Should the procurement of Hawk missiles be limited to the number required for use overseas?

This air defense weapon for general tactical use should be considered in relation to other tactical air defense weapons. It may be that Hawk is the only available air defense weapon under the direct control of Army field forces.

5. *Short-range Missiles (Little John, LaCrosse, Missile A, Missile B)*

Is there need for all of these tactical weapons?

C. *Sea Forces*

1. *Fleet Missiles*

Will the increased use of missiles in the fleet permit reductions in numbers and types of aircraft and carriers?

With cruisers and other vessels having a missile capability in the fleet, does the number of carriers needed for air defense, air attack of land installations and other carrier attack missions diminish?

2. *Nuclear Powered Fleet*

Does a second nuclear carrier commit the Navy to planning for an all nuclear task force? How much improvement in effectiveness and economy results from the use of an all-nuclear task force?

Since carriers are organized as units of a task force and cannot operate alone, do nuclear carriers of high speeds and long endurance require other ships in the force to have the same performance?

3. *Eagle Missile*

In view of the Navy's growing AA missile capability in ships of the fleet is the Eagle missile and associated aircraft development necessary? Is this program redundant?

4. *Bullpup v. White Lance*

Can one of these tactical air missiles be developed for use by both the Navy and Air Force?

IV. GENERAL MILITARY SUPPORT

A. *General Discussion*

This section does not include any items of general military support except those which clearly involve technical issues. For example, the possible economy that might result from a reduction of mobilization reserve procurement is not discussed.

B. *Research and Development*

Should an adjustment be made in the direction of more research and less development? Only a very small part of the total research and development budget goes into research, especially basic research.

There are several kinds of military *research*:

1. Basic fact-finding concerning natural phenomena. Examples are meteorology, solid state physics, and radio astronomy.

2. Inventions of components and devices of obvious utility to existing or foreseeable weapon systems. Examples are transistors, infra-red detectors and new rocket fuels.

3. Analytical studies of possible weapon system developments, utilizing all available scientific facts and guidance as to the objective to be achieved. The studies of the Nike-Hercules and Bomarc, in advance of their actual development, are typical of this type of research.

It is by no means true that all, or even a large fraction, of the research studies of the kind mentioned in (3) should lead to weapon system developments. The practical question is whether expensive delays and mistakes could be prevented by reducing the number of developments and using the money thereby saved to assure, by research studies, that the developments actually undertaken embody the best approaches to their military objectives.

Is the ratio of research to development expenditure too small for most economical operation and for the furtherance of our military technology? Any proposed reduction in research needs to be examined carefully in terms of its effect on the future national science effort and current policy for strengthening this effort.

C. Communications

1. High altitude nuclear weapons effects

Do any of the planned communication systems that are expected to operate during an all-out war depend upon the ionosphere?

Any such systems are expected to be undependable if high altitude nuclear explosions take place anywhere within hundreds of miles of the propagation path. A single shot of this kind produced strong effects, not yet fully understood, during recent tests in the Pacific.

Such communication systems, if they exist in present plans, may require substitution of other types, such as cable, which would not be affected. Are the budget implications of these findings reflected in the FY-60 budget?

2. Global Communications Systems

Should the expansion and improvement of a military global communications system be developed as a unified communications system for all three services?

All services require communication to many points on the globe. The increased vulnerability of overseas communications to enemy countermeasures and the corresponding need for greater reliability through use of alternate compatible routes raises the basic question of whether there is not need for a properly designed unified communications system. Has this possibility been examined for the armed services? The individual services will, in addition to any common global net, continue to need specialized communications to their mobile elements and for command purposes.

D. Navy Radio Telescope

The intelligence application of the system has been seriously questioned as well as the desirability of making so large a jump in size at one step. In the light of these technical questions, is the continuation of this project warranted under conditions of a tight budget?

E. *Pacific Missile Range*

Is all the presently planned instrumentation for this range necessary?

F. *Aircraft, nuclear propelled*

Has a major technical advance occurred since the recent technical review to warrant programs of the size put forth for FY-60 by the Air Force and the Navy?

G. *Dyna-Soar*

Does it have sufficient military usefulness to justify its inclusion in the Air Force budget?

H. *ARPA Space Program*

Has the proposed program been coordinated with that of NASA?

Presumably the National Aeronautics and Space Council will review the combined budget of the two agencies. Information is still incomplete about this combined budget, but enough information is available to indicate that a top policy decision must be made about the size of the national space program and the allocation of items between NASA and DOD.

I. *BW-CW*

Should research be expanded to uncover potential capabilities? Most of the funds for BW-CW are currently in procurement.

106. Memorandum From Gleason to the NSC Planning Board¹

Washington, November 5, 1958

SUBJECT

Review of NSC 5410/1

REFERENCES

- A. NSC 5410/1
- B. NSC 5810/1
- C. Memos for Planning Board, May 16 and October 17, 1958
- D. Record of Meeting of Planning Board, October 17, 1958

As a result of discussion by the drafting committee constituted by the Planning Board on October 17 (Reference D), the enclosed alternative policy statements on the subject are transmitted herewith

¹ Source: Encloses alternative policy statements on NSC 5410/1. Top Secret. 7 pp. NARA, RG 59, S/P-NSC Files: Lot 62 D 1.

for consideration by the Planning Board at its meeting on Friday, November 7, 1958.

Alternative A is a draft revision of NSC 5410/1 submitted by the Defense and JCS members of the drafting committee. Other members of the drafting committee feel that it might be preferable to deal with the substance of NSC 5410/1 along the lines of Alternative B, which is in the form of a draft Annex to NSC 5810/1.

Joint Chiefs of Staff**

Washington, undated

Alternative A

Defense-JCS Revision of NSC 5410/1

*U.S. OBJECTIVES IN THE EVENT OF GENERAL WAR
WITH THE SINO SOVIET BLOC*

(Assumes that general war has been forced upon the United States, directly or indirectly. Reference to territory of the Soviet Union means the area included within the August, 1939, borders.)

1. To achieve a victory which will insure the survival of the United States.

2. To preserve and retain as many of its effective allies as possible.

3. To reduce by military and other measures the capabilities of the *USSR Sino Soviet Bloc* to the point where it has lost its will or ability to wage war against the United States and its allies.

4. Delete old par. 4 and renumber subsequent paragraphs.

5. 4. To render ineffective the control structure by which the Soviet and Chinese Communist regimes have been able to exert ideological and disciplinary authority over individual citizens or groups of citizens in other countries *and over their own peoples*.

6. 5. To prevent, so far as practicable, the formation or retention, after the war, of military power in potentially hostile states sufficient to threaten the security of the United States.

6. While avoiding premature decisions or commitments, commence now formulation of, and keep under continual review, plans with respect

to such issues as terms of enemy surrender, border and territorial rearrangements, the forms or administration of government in enemy territory, independence for national minorities, and the degree of postwar responsibility to be assumed by the United States in readjusting the inevitable political, economic and social dislocations resulting from the war.

7. In pursuing the above objectives, the United States should from the outset of general war:

a. Mobilize fully its moral, human and material resources.

b. Obtain the full participation of its principal allies in the collective war effort.

c. Seek the participation in or contribution to the collective war effort by other nations, as consistent in each case with attainment of the above objectives.

d. Divide, as practicable, the peoples and armed forces of the Soviet Union and Communist China from their communist regimes, and the peoples of the satellites from their Soviet-dominated regimes; and so far as possible enlist the active support of these peoples on the side of the United States and its allies in prosecuting the war against the Soviet regime.

e. Make clear that this war is not an attempt by the United States to impose by force of arms a particular political or economic system upon the world, but rather a defense against efforts by the Soviet regime to do so.

f. Exert U.S. influence at every opportunity during the war to shape political and other developments in ways favorable to U.S. post-war objectives.

8. The United States should maintain after the cessation of hostilities, U.S. and allied military strength adequate to achieve post-war objectives.

Enclosure

Alternative B

DRAFT ANNEX A TO 5810/1

U.S. POLICY TOWARD ARMED HOSTILITIES

1. Basic National Security Policy (NSC 5810/1) calls for sufficient U.S. military strength to deter the Communists from use of their military power. The initiation by the U.S. of preventive war to reduce Soviet or Chinese Communist military power is rejected as an unacceptable course of action.

2. If a general nuclear attack is launched against the U.S. directly or indirectly by the USSR, the U.S. plans to insure the survival of the United States by using all available means to destroy the will or ability of the USSR to wage war against the U.S. The only additional factor to be taken into account in such planning is the increase or decrease in

the amount of anticipated damage to the United States resulting from different kinds of U.S. retaliatory attacks on the USSR.

3. It is not now feasible to state U.S. policy for the period following a nuclear exchange between the USSR and the U.S. Decisions will have to be made at the time as to the post attack missions of U.S. military forces then existing. Consequently, the U.S. must refrain from public discussion of political actions it might take during the second phase of a general nuclear war with the USSR but must make clear its determination to prevail if general nuclear war is forced upon it.

4. If Communist China joins the USSR in a general nuclear war, the U.S. will seek to reduce by military and other measures the capability of Communist China to the point where it has lost its will or ability to wage war against the United States. The active participation of Communist China on the USSR side should be prevented by all means consistent with other U.S. objectives.

5. In the event that Communist China initiates all-out war against the United States or its allies, the U.S. will carry out its treaty commitments and seek to destroy the will and ability of the Chinese Communists to wage war against the U.S. or its allies. In conducting the war against Communist China, the U.S. will make a major effort to keep the USSR from actively engaging in the conflict.

6. Basic national security policy calls for U.S. military strength adequate to present a deterrent to limited aggression. In the event the deterrent fails, and if U.S. forces are to be employed, a decision will be made at the time (a) whether vital U.S. interests require the defeat of the limited aggression by using whatever degree of force is necessary, or (b) whether U.S. interests would be served by using force to achieve the objectives of restoring the *status quo ante* and of limiting the area and scope of hostilities.

a. The United States should take the necessary steps to convince its allies that it is committed to carry out its treaty obligations, including the UN Charter, and possesses the capability to fulfill its commitments, using nuclear weapons as necessary to defend Free World interests.

b. The U.S. should make clear that it will not use force to impose a particular political or economic system upon the world, but will take all actions necessary to defend against Communist use of force to impose its system upon the non-Communist world.

107. Memorandum of Discussion at the 385th NSC Meeting¹

Washington, November 6, 1958

SUBJECTDiscussion at the 385th² NSC Meeting on Thursday, November 6, 1958

Present at the 385th Meeting of the National Security Council were the President of the United States, Presiding; the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present were the Secretary of the Treasury, the Director, Bureau of the Budget, and the Deputy Secretary of Defense. The following members of the Comparative Evaluation Group also attended this meeting: the Under Secretary of State; the Director of Central Intelligence; and the Special Assistants to the President for Science and Technology and for National Security Affairs. Also attending the meeting were the Director and Mr. John H. Daniel of the Weapons Systems Evaluation Group; the Assistant to the President; the White House Staff Secretary; the Assistant White House Staff Secretary; Lt. General Karl W. Barnes and Mr. Charles Ahern of the Central Intelligence Agency; the NSC Representative on Internal Security; and the Acting Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. COMPARATIVE EVALUATION GROUP

(NSC 5815)

Mr. Gray opened the meeting by noting that its purpose was to hear an oral presentation of a Comparative Evaluation Study of U.S. and Soviet Air Defense Radar Developments and Capabilities. He said the study was undertaken pursuant to NSC 5815, which established, under the NSC, a Comparative Evaluations Group (CEG) responsible for making comparative evaluations of U.S. and Soviet capabilities in selected weapons systems. He mentioned that the CEG is comprised of the Chairman, Joint Chiefs of Staff; the Under Secretary of State; the Director of Central Intelligence; the Chairman of the President's Board of Consultants on Foreign Intelligence Activities; and the President's Special Assistants for Science and Technology and for National Security

¹ Source: Agenda item 1: Comparative Evaluation Group. Top Secret; Eyes Only. 3 pp. Eisenhower Library, Whitman File, NSC Records.

² This was a Special Meeting with limited attendance to hear the report of the Comparative Evaluation Group. [Footnote is in the original.]

Affairs. He said that the CEG was assisted in this study by Vice Admiral John H. Sides, Director, WSEG, and by Lt. General Earl W. Barnes, USAF (Ret.), of the Central Intelligence Agency. He then called upon Admiral Sides who made an oral presentation of the highlights of the study, a copy of which has been deposited in the files of the Executive Secretary, NSC.

Following Admiral Sides' oral presentation, the Secretary of Defense made inquiry as to what, if any, radar capabilities the Soviets have below 500 feet. Admiral Sides responded that the Soviets would not have too much capability below 500 feet. He mentioned that 500 feet is generally accepted as a realistic, minimum low level attack altitude because any attack attempted beneath the 500 foot level could result in serious trouble for the attacker.

Mr. Gray indicated that, as to future evaluations of this kind, the CEG, at a meeting held on October 27, recommended that the following topics, listed in order of suggested priority, be considered by the President as suitable subjects for comparative evaluations studies: (a) long-range ballistic missiles systems (to include ICBM's and IRBM's, but to exclude air-breathers); (b) computer technology; and (c) submarine weapons systems and anti-submarine warfare capabilities. Mr. Gray suggested that the President might wish to designate one of these topics as the subject of the next study to be undertaken by the CEG.

The President stated that he personally favored the topic "submarine weapons systems and anti-submarine warfare capabilities", and Mr. Gray pointed out that this was also the selection of the Chairman of the Joint Chiefs of Staff.

The President inquired whether we knew enough about computer technology to make a meaningful evaluation. It was his thought that a study of computer technology would be dependent in large measure upon the opinions of Dr. Killian's technical people as distinguished from the WSEG experts.

Dr. Killian thought that a meaningful evaluation could be made of computer technology, and he emphasized the view that such an evaluation would yield considerable valuable information concerning important aspects of various Soviet weapons systems.

Admiral Sides pointed out that it was not intended that WSEG should make all of the evaluations to be conducted pursuant to NSC 5815. He said that if computer technology were selected as a topic that others, such as Dr. Killian, might be given responsibility for the evaluation study.

The Director of Central Intelligence, reverting to the fact that the President had earlier indicated that he favored item (c), above, as the topic for the next evaluation study, stated that at the moment the Soviets are converting to and starting to build a new class of submarine. He said that we do not have much data as yet concerning this new class of submarine, and while the new sub will not be coming in for a year or two, it might be desirable to put off the selection of this subject for evaluation study until additional information is available.

The President again inquired as to what we know about Soviet computer systems, and Dr. Killian indicated that we have mixed information on that score. Dr. Killian commented there is reason to believe that the Soviets have misled the West concerning their computer technology capabilities. He said it appears that the Soviets may have developed much theory with respect to computer technology, but not too much technical apparatus in areas involving practical application of computer technology theories.

The Secretary of Defense noted that although the Soviets have embarked on the development of a new generation of submarines, the new subs will not actually be coming in for a year or two. He said in the meantime there is a present threat from existing Soviet submarines which threat will be with us for at least two or three years. It was his thought, therefore, that it would be desirable to make an evaluation study of this existing threat.

The President concluded that the next topic to be undertaken by the CEG as the subject of a comparative evaluation study should be submarine weapons systems and anti-submarine warfare capabilities. It was the President's thought that when the submarine evaluation is completed, it should be followed by an evaluation of computer technology.

The National Security Council:

Noted and discussed the first report of the Comparative Evaluations Group, pursuant to NSC 5815, as presented orally at the meeting by the Director, Weapons Systems Evaluation Group.

Internal Security*

108. Memorandum From Murphy (G), Reinhardt (C), and Smith (S/P) to John Foster Dulles¹

Washington, November 8, 1958

SUBJECT

Your conversation with Mr. McElroy and Mr. Quarles this afternoon

You asked us to suggest some thoughts for your meeting with McElroy. We believe that it would be unwise for you to get involved in any discussion of various weapons systems or any Department of Defense operational matters.

We believe that you should say that from a foreign policy point of view it would be well if the United States posed a more impressive military capability to meet less than all-out war situations. If additional budget cuts are essential the foreign policy argument favors a placing of the burden of the reduction on the massive retaliation capability and not on the limited war capability.

We see great political dangers in the suggestion that the United States security would permit of over-all inferiority militarily to the Communist bloc.

¹ Source: Suggestions for conversation with McElroy on Department of Defense budget. Top Secret. 1 p. NARA, RG 59, Central Files, 611.00/11–858.

109. Memorandum of Conversation between the President and Gray¹

Washington, November 19, 1958, 3:45 p.m.

MEMORANDUM OF CONVERSATION WITH THE PRESIDENT

(Wednesday, November 19 at approximately 3:45)

I reminded the President that the upcoming meeting of the NSC on Thursday, 20 November, would be devoted to the 1958 Net Evaluation Subcommittee report. I indicated to the President that in my judgment

¹ Source: Nuclear targeting. Top Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Meetings With the President. Drafted on November 22.

this meeting could be an important springboard for proposing vital questions looking to the future of our defense posture.

I recalled to the President's attention that the current study was based upon an attack pattern not addressed strictly to military targets but was based upon his directive that the attack pattern be designed to paralyze the Russian nation without, however, excluding military targets which would contribute to this objective. Thus, the study was an urban industrial-military mix with the emphasis on industrial urban resulting in effective paralysis with fewer weapons and less kilotonnage than used in the 1957 attack pattern. Incidentally, I reported to the President that in my judgment, he would not find the 1958 study "too academic in nature" as he had feared and had indicated to me in an earlier conversation.

Inasmuch as our military force requirements, including numbers and types of weapons and delivery systems were based entirely upon the purposes of our retaliatory force, the targeting system was central to our long-range planning with overwhelming implications for future defense budgets.

I then said to the President that I felt this was very closely related to the review of 5410/1 now in process. I reported that Robert Cutler had started this review in April and I had carried it forward at innumerable meetings of the Planning Board without an agreement as to the kind of paper that should go to the Council. I indicated to the President that in my judgment, we could not separate the question of effective deterrence from the question of war objectives and neither could be separated from our targeting plans. I then posed for the President the first problem in connection with 5410/1, which was whether we needed such a paper at all, expressing the judgment that the paper, as written in March 1954, was out of date and should either be updated or rescinded.

The President expressed his doubt as to our ability to do effective planning against a situation of mutual devastation. However, he approved the notion of bringing a discussion paper to the Council.

I suggested to him then that he might wish, following the presentation by the Net Evaluation Subcommittee, to ask for a study of the targeting system for his consideration.

The President felt that I should raise this question and that I had a sufficient basis for it by reason of the directive he gave for the different targeting system to be used in this year's exercise. I then told him that I would make the effort to relate such an appraisal to the question of war objectives and seek to pull all of these matters together, which would also include weapons requirements.

I then reported to the President that with respect to the Defense budget, one of the recommendations he might have to face was one to cancel out the TITAN program. I reminded him that this might present

personal difficulties for him because the Glenn L. Martin Co. was reported to have spent \$30 million in Denver getting into the TITAN program. The President thanked me for bringing this to his attention but observed that “we must be selective or we will be broke.”

Gordon Gray

Brig. General Goodpaster
Major Eisenhower

The purpose of this meeting was to brief the President on the status of the Department of Defense budget request for FY 1960. The presentation was delivered by Secretary McElroy.

I.

Secretary McElroy began by giving the overall budget estimate for FY 1960 as compared to previous years. New obligational authority (NOA) for 1960 is estimated at \$42.8 billion, expenditures at \$41.6 billion. This cost level exceeds that of FY 1959, in which NOA is \$41.8 billion and expenditures are estimated at \$40.8 billion. Expenditures in FY 1958 were \$39.0 billion. Mr. McElroy noted that of the increase of

¹ Source: Department of Defense budget issues. No classification marking. 10 pp. Eisenhower Library, Whitman File, Diary Series.

expenditures in FY 1959, over FY 1958, \$850 million has been required by the military and civilian pay raise.

Mr. McElroy then covered what he considered his “key” decisions. These had resulted in reduction of an original estimate of \$43.6 billion NOA for FY 1960 to \$42.8 billion. He then ran down the individual items, largely by Service, as follows:

NIKE-ZEUS—In this program \$700 million had been recommended by the Army. A scientific group in the Pentagon had revised this recommendation to include only \$626 million, of which \$300 million should be R&D funds. The reason for this reduction, besides economy, is uncertainty as to the efficacy of the NIKE-ZEUS. The cost of ZEUS overall would be \$7.0 billion. Therefore, Mr. McElroy feels that only the \$300 million R&D funds should be released for this year, and the country should be apprised of the overall cost before we go to production on this weapon.

The President then stated that we have wasted too much money by going prematurely into production on various items. In particular, he mentioned those of interceptors of interim value only.

Overseas Deployments—Mr. McElroy then mentioned the impact of cutbacks on the overseas deployments of the Army and pointed out the fact that every squeeze in manpower is difficult on the Army. He cited as an example the fact that 10,000 men are needed in 1962 for dispersion of atomic storage sites in Europe (this figure was questioned and discussed, but was used for illustrative purposes). Additionally, he mentioned the fact that the Army must expend manpower in the mission of training the National Guard. All this, he states, cuts into the Army combat forces. Therefore, in order to save as much as possible, areas other than manpower have been cut in this budget. Mr. McElroy’s concern with overseas deployments applies as of FY 1960.

REDSTONE—One of those areas is the REDSTONE, for which there will be no additional funding after FY 1959. To compensate for this cutback to some extent, Mr. McElroy plans to expedite the solid propellant PERSHING. He realizes that the cutback in REDSTONE means that some U.S. commitments in Europe will not be met.

Air Defense—One of Mr. McElroy’s key decisions is to cut back missile air defense by reducing both NIKE-HERCULES and BOMARC below NORAD-recommended levels. The Department of Defense feels that if we must be inadequate, the inadequacy should be sustained in air defense on the basis that no air defense is perfect and the best hope for protection of the U.S. is the threat of retaliation. Mr. McElroy feels that we must protect SAC bases and go beyond that only as necessary for psychological reasons.

Army Modernization—As a final item on the Army, Mr. McElroy pointed out that the Army's programs for modernization will slip, primarily with regard to modernization of those forces which will be mobilized between M-Day and M+6. (Note: The objectives and capabilities plans in the Pentagon are based on the assumption, for computational purposes, that D-Day will occur at M+6 months.)

Navy Missiles—In keeping with the policy of close scrutiny of air-breathing missiles, the Department of Defense has cancelled REGULUS II, which Mr. McElroy considers the best air breather in its range. This cancellation is considered justified in view of the advent of POLARIS.

The question of simultaneous R&D and production then came up. Mr. McElroy and Mr. Quarles ventured the opinion that we are currently undergoing a technical revolution which requires unusually large R&D funds. This situation, they feel, should correct itself when the transitions now under way are achieved.

With regards to POLARIS, the release of one submarine in FY 1959 brings the total at beginning FY 1960 to six, with three additional authorized by Congress but frozen by the Administration. Department of Defense, under its proposed budget, plans to release those three, bringing the total to nine, but not to request authority for any additional POLARIS from Congress during FY 1960. In addition, however, Department of Defense is including some specified long lead-time items for three more POLARIS in this FY 1960 budget. Mr. McElroy considers this a conservative approach with which the Navy and the Congress might disagree. If pressed on this issue, Mr. McElroy feels that he can request additional procurement when technical problems are solved.

Nuclear Attack Carrier (CVAN)—Mr. McElroy then stated that he proposed a second nuclear attack carrier to be built. Mr. McElroy pointed out the Navy planning now contemplates a two-year cycle in shipbuilding with a carrier program every other year for at least a couple more years, and support ships programs for the alternate year. He reminded the President that under such a program a carrier would have been included in 1959 but it was deferred. This statement caused rather considerable discussion. The arguments advanced in favor of the building of a second CVAN as set forth by General Twining were:

(a) Carriers are useful in cold war situations (General Twining discounts any great value of the CVAN in general war).

(b) If new carriers are built, in General Twining's view, they should be nuclear. He admits, however, that in his mind this production of a second nuclear carrier is one of the more questionable items in this budget.

Mr. Gray then interposed a word at the request of Secretary Dulles, not present at this meeting. Secretary Dulles had stated to Mr. Gray on

November 26 that were he present in the meeting he would make the following comment. Without wishing to pose as an expert on Defense budget matters, he nevertheless would like to point out that from the point of view of the conduct of foreign relations, the capabilities which we had recently exercised in Lebanon and the Taiwan Strait had been significant and vital. Mr. Dulles' view is that as long as we retain our deterrent capability, the major threat in years ahead is not one of general war but of local aggression. He therefore wishes to express the hope that budget decisions not be made which would cripple our capability in this area. Mr. Gray did not go so far as to specify whether this view indicated the necessity of the building of a new atomic carrier.

In justification for a sizeable carrier fleet, Mr. McElroy pointed out that the attack carriers had been extremely useful in Lebanon and Taiwan and that we had employed four in the Lebanon situation and five in the Taiwan situation.

As regards this item, the President has several reservations. First of all, he does not visualize a battle for the surface of the sea. Further, he desires to point out that our defense depends on our fiscal system. It is not a question of *either* defense *or* fiscal solvency. You do not have defense without fiscal soundness. He stated that he did not see building a new carrier at the moment but desires to defer decision temporarily. (This matter was brought up again later, at which time the President stated that he would defer this for a year.)

Block Obsolescence—Mr. McElroy then stated that we are currently facing block obsolescence of our naval vessels. He indicated that Defense had engaged the services of people outside the government to go over the Navy problem of block obsolescence and specifically referred to the President of the Newport News Shipbuilding Company as a participant. They had felt that a "refurbishing" program was indicated and the Navy's best judgment is that the report is sound. It involves three stages:

(a) When a ship has gone beyond repair it should be dropped off or replaced.

(b) Above that, there is proposed \$2–\$2.5 million per ship for piping and wiring which would extend the ship's life for five years.

(c) With respect to ships that are still in better condition, a program of real modernization is contemplated involving \$7–\$10 million per ship which would extend the ship's life eight to ten years. This total program involves \$200–\$250 million.

Mr. McElroy stated that the alternate to such a program is to postpone modernization but this would require an even larger program later. Mr. McElroy also stated that the Navy is reducing the number of its ships and aircraft.

THOR-JUPITER—With regard to the IRBM program, Mr. McElroy specified that only eight of the planned twelve squadrons of THOR-JUPITER will be organized. Four of these eight squadrons will go to the U.K. and one to Okinawa. The basis for this decision is that none of our allies desire IRBMs to be based on their soil. Mr. McElroy admits, however, that we must take into consideration the countries' desire to buy IRBMs from us.

The President asked why we spent billions on these systems which are to be deployed among our allies and then and only then ascertain from them whether the systems are acceptable. The real question is whether we are doing our homework ahead of time. Mr. Quarles then commented that when the ICBM programs were given the highest priority, the State Department asked for a high priority also for the IRBM. Mr. Quarles stated that State still feels that it is valid to have the IRBM and is not happy about the reduction to eight squadrons, wishing to have ten squadrons to meet the Norstad commitment. He pointed out that the remaining two squadrons can be taken care of through MAP procurement if the countries involved desire the weapons.

In this connection, Mr. McElroy stated that the development of the GOOSE, a long-range decoy, is being dropped, as is SNARK.

TITAN-ATLAS—The Department of Defense plans to retain TITAN in the ICBM program since the scientific community considers it superior to the ATLAS despite the fact that it comes in a year later than ATLAS, and like ATLAS is a liquid-propelled missile. The time in which MINUTEMAN can take over is unknown. Currently, the Department of Defense plans to program eleven squadrons of TITAN and nine squadrons of ATLAS.

Manned Bombers—In the manned bomber field, production of the B-52G is being stepped up to five or six planes per month. This is being done because "the B-47 is undergoing fatigue." One squadron of B-52s replaces two squadrons of B-47s.

Mr. McElroy went on to say that the Department of Defense considered cutting back B-58s and actually is planning to buy only three a month. Some procurement of this aircraft is considered justified since its speed of mach 2 will be a great advantage, and a limited number of these going in against Soviet defenders can open the way for the B-47s and B-52s.

Here the President interposed the question of why we produce B-58s along with more B-52s. He concurs with the policy of introducing a few new high performance aircraft for psychological purposes, but he questions the retention of TITAN, ATLAS, B-52s and B-58s. He voiced the question, "How many times do we have to destroy Russia?" This question, though rhetorical, was partially answered by General Twining when he stated that the total wings in the active Air Force go

down. He further specified that the B-58 may be able to replace the F-108.

Interceptors—Secretary McElroy specified that in line with the calculated rise of favoring nuclear retaliation over air defense, no programs for interceptors are being initiated in FY 1960.

MACE—This missile, although an air breather, has not been dropped from the FY 1960 program because of its contributions to NATO. It has a good tactical range and carries a large warhead. Furthermore, it provides the only all-weather capability in NATO against airfields.

Mr. Quarles then made a brief reference to the relationships between the Department of Defense (ARPA) and the National Aeronautics and Space Administration (NASA). In particular, he pointed out that the two agencies had joint research programs in solid propellants and in space activities.

Finally, Mr. McElroy expressed his concern with the unemployment effects of program elimination. He pointed out, as an example, that the TITAN cancellation would have involved some 25,000 people.

II.

At this point Mr. Stans began his discussion of the budget as presented by the Department of Defense. He began first by review of the general situation. He pointed out that in the original budget estimate the defense proportion of total national budget (of \$85 billion) was \$43/\$85. However, the civilian budget has since been reduced from \$42.0 billion to \$36.5 billion under a condition of extremely tight guidelines, in which all low priority items have been eliminated. Mr. Stans emphasized that the most optimistic revenue picture would indicate an income of \$76.0 billion; therefore, any failure to stay within this limit would result in a deficit. Accordingly, in the view of the Director of the Budget, the Department of Defense expenditures should be limited to \$40.0 billion with \$39.0 billion NOA. He desired, however, to congratulate the Department of Defense on the substantial reductions which had already been effected.

At this point the President interposed the idea that NOA should be reduced to the level of expenditures for the reason that NOA in excess of expenditures inevitably results in a raising of the expenditure level when the obligations become due.

Mr. Stans, in completing his overall view, mentioned that he had questioned some \$8.0 billion worth of programs and \$3 billion in expenditures in the initial Department of Defense budget, of which Department of Defense actually cut 10%. He pointed out that this effort still contains elements of a \$50.0 billion budget due to the inclusion of exotic and duplicatory programs. He admitted that his own view would include some strength and structural reduction, but he feels that

much room for reduction exists in construction, ARPA, maintenance and operation, installations, and proficiency flying.

There was then considerable discussion on the nuclear powered aircraft (ANP) involving \$200 million, including the AEC portion of \$130 million. The budget proposed the elimination of ANP, but Mr. McElroy argued for the validity of the program from the psychological point of view. The President questioned the nuclear-powered aircraft, asking if it were not slow. Mr. Quarles responded that it was up to mach 1 and that it could penetrate to enemy defenses and launch missiles. Mr. Quarles felt that it had real military use but agreed that it was premature to “barge” into the systems application at this time.

The President then questioned why the development of ANP was not given to NASA and to AEC. Mr. Quarles suggested that he get Drs. Killian and Glennan and Mr. McCone and bring the results of further study to the President. The President approved this suggestion but said he still thinks it should be out of Defense.

A discussion then followed, based on an example used by Mr. Stans, of the DYNA-SOAR. Since this program represents a space experiment, there is considerable question as to whether the program should be pursued with the Department of Defense or with NASA. The discussion of switching the program to NASA was not conclusive. However, the whole question of basic research was touched on to include the matter of reconnaissance satellites. In this connection, the President observed that he felt that satellites should be orbiting and working before Defense takes them over. Mr. McElroy defended the reconnaissance satellite but the President returned to his point, saying whenever we have the satellite we want, let us then give a defense application to it.

As a result of his studies of the practices of the Department of Defense, Mr. Stans concluded that as the President’s budget officer, he could not recommend approval of the budget as presented by the Department. His recommendation was to instruct the Defense Department to utilize the figure of \$40.0 billion as a ceiling in a fresh attempt to make up a new FY 1960 budget. The President did not directly respond to Mr. Stans’ proposal.

III.

The discussion then turned to basic philosophy. The President made a pointed effort to emphasize that Defense is the key to a balanced budget. He pointed out that if the Department of Defense desires to spend the kind of money requested in this proposal, they should realize that increased taxes are necessary in order to make it possible if the budget is to be balanced. He stated that he will, of course, listen when the Department of Defense says to him that national security

is imperiled; however, he wants everyone in the Department to have a complete understanding of the total problem of the interrelationship between national defense and the balanced budget, *that unless the budget is balanced sooner or later, procurement of defense systems will avail nothing.*

Mr. McElroy defended the Defense Department budget by pointing out the risks which he had consciously taken already in its composition. He pointed out the deliberate downgrading of the requirement for continental air defense confining our concern to the protection of our retaliatory bases. He further pointed out that this is the type of judgment which he feels qualified to make; but he emphasized that he hesitates to second-guess the scientists and those other people who are scientifically competent in judgments pertaining to their field. He concluded that there are two kinds of judgment involved and he himself is in a position to make only one kind.

As a final discussion item, the President reopened the matter of overseas deployments of Army forces. More specifically, he asked why we do not consider some redeployment from Europe. He pointed out the great savings that could be made by reduction of divisions in Europe by three. In this connection, the President drew upon his own experience as the first SACEUR. The U.S. had agreed to maintain six divisions in Europe on a temporary basis, with the concept that the ground role should be taken over by the countries on the spot.

General Twining agreed that it would be desirable to reduce forces in Europe by one division this year. All agreed, however, that the State Department should be consulted before this is pursued further.

Conclusions—The presentation and discussion being completed, it was concluded that a stag dinner scheduled for December 3 would give this group an opportunity to discuss philosophy in some detail. Based on this meeting, the Department of Defense will re-examine their budget with an effort toward further reductions for consideration at a later date.

(The NSC meeting scheduled for December 4 was deferred to December 6 to allow further study of the matter by the Defense staff.)

John S.D. Eisenhower

111. Memorandum From Smith (S/P) to John Foster Dulles¹

Washington, November 28, 1958

SUBJECT

Basic National Policy: Approach to President

1. Present budgetary policies seem increasingly likely to have the following consequences:

(a) The FY 1960 Mutual Security Program will, if there are significant BOB cuts in the Department's request, be inadequate to achieve the development objective which you outlined to your Wednesday press conference: that of creating enough progress so that there will be a feeling of dynamism rather than stagnation. Recent NSC Planning Board discussion indicates that attainment of this objective would call for substantial increase in present levels of development financing.

(b) Our local war capability will not be enhanced. As you suggested the other day, measures which might be directed to this end will probably be the first to feel the effect of a very tight DOD budget ceiling.

(c) The result could be a gradual weakening of our position in Asia, the Middle East, and Africa, in the face of increasing Communist efforts at subversion and aggression. For we will not be able to offer needed help to countries which are progressively seeking economic growth; and we will not be able to respond effectively to limited military challenges.

2. We would not wish this administration to be recorded as thus having presided, in its last two years, over a weakening of US strength which could have even more serious consequences than the economy drive which preceded the Korean aggression.

What are the alternatives?

(a) We could proceed with deficit financing of necessary additional national security expenditures, which would probably run to a very few billion dollars, at most.

(b) We could raise these additional sums through taxes, e.g., a national sales tax explicitly designed to meet national security requirements until these could be covered out of rising revenues resulting from a resumption of economic growth.

¹ Source: Defense budget; includes three transmittal notes. Secret. 5 pp. NARA, RG 59, S/S-NSC Files, Lot 63 D 351.

3. I do not believe that there has so far been any deliberate comparison of the economic effects of these two courses of action with the security effects of the course on which we are now embarking.

4. If the President should decide to propose increased national security expenditures, and—if necessary—increased taxation, I believe that the country would welcome his leadership and rally vigorously to his support.

Present aggressive Communist policies in Berlin, and the tougher world-wide Communist posture, would provide a convincing rationale for that leadership.

Such a Presidential initiative—and the US response thereto—would encourage our allies to increased effort. It might deter the Communists from considering that the elections and the present budget-cutting exercise portend a period of weakness, which they can exploit through more frequent probing operations.

5. This need not involve abandonment of the President's economy campaign. Domestic expenditures could still be held to minimum feasible levels, and the disagreement with Congressional advocates of greater spending would focus on these levels.

6. *Conclusion.* It may be worth making these points to the President on Sunday:

(a) There is growing need for a more effective development program and local war capability, to hold our own against the increasingly aggressive Communist policies which now seem likely.

(b) If this need cannot be met within presently planned budgetary limits, it might be useful to have the executive branch (using the NSC mechanism as appropriate) urgently undertake a deliberate comparison of: (i) the security effects of failing to meet this need, (ii) the economic effects of meeting it through deficit financing and/or additional taxes. This comparison could provide a basis for final Presidential decisions on the FY 1960 DOD and MSP programs.

112. Memorandum of Conversation Between Eisenhower and John Foster Dulles¹

Augusta, November 30, 1958, 11:30 a.m.

MEMORANDUM OF CONVERSATION WITH THE PRESIDENT**ALSO PRESENT**

Dr. Milton Eisenhower
Mr. Merchant
Mr. Greene

[Omitted here are paragraphs 1–5.]

6. I said that, with regard to the Mutual Security Program for FY 1960, there has emerged disagreement between the State Department and the Bureau of the Budget. While I would not ask for a decision on the spur of the moment I would hope that the President would give us our day in court before cuts are made as I believe that we cannot do what we must do to lift the peoples of the underdeveloped nations up onto a plane of economic dynamism with the cut in mutual security funds on which the Bureau of the Budget is now insisting. Given the size of the resources which the Soviets and the Chinese Communists are devoting to an economic offensive in underdeveloped countries I thought that we must be prepared to make some sacrifices if we are successfully to meet this competition. I suggested that increased taxation, perhaps new forms of taxation such as a national sales tax, might be envisaged.

The President agreed that the American people must better understand that they may have to undergo sturdy measures in order to be successful in the kind of world struggle in which we are engaged, and said that he felt this should be made clear in his State of the Union Message. He noted two conflicting elements of the problem: Indispensable confidence in the economic health of the US and in the dollar will not endure unless we balance our budget and correct our current unhealthy fiscal situation; at the same time we must find the funds to assist in the economic development of other countries. In this connection he referred to a letter which he had had from Lewis Douglas (copy attached) about the importance of the availability of dollars to the underdeveloped countries. He also mentioned a letter he had had from Lamar Flemming about the difficulties being experienced by American companies operating in Latin America.

¹ Source: Mutual Security Program funding. Secret; Personal and Private. Extracts—4 pp. Eisenhower Library, Dulles Papers, Meetings with the President.

The President also noted the political opposition in the US, as it is expressed in Congressional attitudes, toward cutting budgets for domestic programs in order to make funds available for Mutual Security Programs within a balanced budget. Dr. Milton Eisenhower suggested the policy of a two-year balanced budget, to get away from the problem to annually trying to accomplish this end; the President acknowledged that multiple-year budget balancing is intrinsically preferable but not sufficiently understood by the public to be politically practicable. He asked that the views of Secretary Anderson be sought on what further could be done to accomplish the objectives we had discussed.

John Foster Dulles

113. Memorandum for the Record²

Washington, December 3, 1958

SUBJ:

Meeting at the White House—12/3/58

Nothing was said about budgets until after dinner when we all gathered in the library in the basement. The following were present:

The President	Mr. Gordon Gray
The Vice President	LCOL Eisenhower
Secretary of the Treasury	Secretary of Defense
Controller of the Budget	Deputy Secretary of Defense
(Mr. Stans)	All Service Secretaries
Mr. Bryce Harlow	and all Chiefs
MGEN Persons	

The President: The President opened the meeting by making his usual speech that this country was endangered not only militarily but particularly economically. That if we increased our budgets very much we would have to go to a police state in order to get the tax. Our security in defense was tied up irrevocably in budgets and we all had the duty

²Source: White House meeting on Department of Defense budget. Top Secret; Hold Closely. 5 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on December 4.

to help him get the budget as low as possible. He made this speech of about half an hour.

I agreed with his statements.

Then he asked each of the Service Chiefs, not the Secretaries but the Services Chiefs, to make a speech in general terms, nothing specific, he wanted philosophical discussions.

Mr. McElroy tried to have the time divided into five minutes periods for the Secretary followed by his Chief, but Max Taylor was told to start it just the same.

Gen. Taylor: Made a speech on deployments, on our world-wide responsibilities. Stated that this was no time to cut personnel because of its effect on other nations.

Adm Burke: I made a speech stating that I believed Khrushchev, and that we hadn't read Marx, Lenin and Stalin enough. I thought that Khrushchev was going to use every trick in the book to try to beat us, including local wars, subversion, economic pressure, political, and everything else, and that we had to defeat him at every turn on each one of these moves. I agreed with the President that we could not continue going in debt indefinitely. I stated that the military could only solve a part of the problem and perhaps only a small part. As the President pointed out, the real problems in a conflict with the Soviet Union were not military problems, but were economic and political problems. The same thing was true inside the United States. The real problem inside the United States was political and not military. For example, the tremendous sums that were going into farm subsidies (this was a subject which had been previously discussed a little bit). The people were working for dollars instead of pride of workmanship which meant that everybody was out to get as much money as he could. This meant competition for money among various groups which perhaps caused a lot of inflation, and certainly did cause greatly increased prices for our military hardware. Labor and management both had to be controlled to bring prices down and to keep inflation from going up. Somehow or other we had to get the idea across that we were in a really dangerous period and that this period would last for generations, and that we had to sustain ourselves for generations of fight.

I then stated that I thought we should reexamine our air defense capabilities—there was too much money going into air defense. We were defending ourselves too much and spending too much money on marginal systems for their psychological effect.

We should perhaps reexamine all of our general war retaliatory systems and choose quantities of the various systems available which

would give us the cheapest, best all around retaliatory systems. We couldn't expect the people to agree on what would come out of this thing, but at least we ought to examine all of the programs together. I thought that we would have to continue to be able to apply military force quickly, positively, and with firm decisions whenever there was a local aggression or the need for the application of U.S. military force.

The President generally agreed but in his discussion of my remarks emphasized primarily his inability to control many things which were, such as farm subsidies, and emphasized primarily dollars.

Gen White: General White made a very short speech stating that he thought that our problems could be solved by more unification and a further reorganization towards centralization.

The President sort of agreed with him.

Gen Pate: Stated that we should be told what to do and that we would be very happy to do it.

The President: The President stated that he had to rely upon his advisers and that we were the chief advisers.

During the course of the evening the President said several times that he trusted the people in this room more than he did any other group of people. It was quite evident that he meant the military people. By his remarks it was evident that he believed that if the military people got together they could get anything done in Congress or in the country that they wanted to get done.

The Secretaries then spoke in general terms.

Mr. Anderson: Mr. Anderson then spoke about debts. He said that we were now in debt for \$283 billion. That the indirect debt, and this I don't understand, was close to \$500 billion if we included only our indirect obligations to the world bank. He then went to the various international agencies, one at a time, stating the indirect obligation that we had with those agencies and it amounted to a total of \$1000 billion obligations which we had—direct and indirect—and a run on the U.S. bank would of course completely swamp us. It would be impossible to pay any such thing as this. The \$283 billion direct debt was bad enough, but coupled with the indirect debt we were in an impossible position if the world ever lost much confidence in our dollars.

Then he went to the New Delhi conference and stated that every nation, every fiscal expert, every Chief of State that he had talked to was concerned not about an attack by Russia, not about the spread of communism, but about the economic stability of the United States.

They stated that in the periods of the greatest national progress of the United States in the world, in a period when we had full employment, in a period of peace, in a period of expansion, we could not meet our obligations on a day to day basis and therefore there must be something wrong with our system if we were borrowing from the future in these good times, and we could certainly not pay back in bad times, so there was doubt. He said this was repeated by every nation from little nations, who didn't know very much about finances, to big powerful nations. He further said that nearly all of our outstanding obligations are not in the hands of the little countries—they are in the hands of our major allies. I don't know what he meant by this unless he was fearful of them putting the squeeze on us in our competitive marketing. He stated that there was a gradual flow of gold away from the United States, but that this did not mean that our gold reserves were in danger at the moment.

All in all it was a very sobering ten minute discussion.

Mr. McElroy: Then Mr. McElroy picked up the ball and gave a speech on the need for not cutting personnel, not cutting budgets too much.

It was a pretty good speech.

Vice President: The Vice President then repeated some of the President's remarks that what was needed was a unified voice from the Pentagon. He stated that if we put out the same story that this was enough—that we could sell the program regardless.

Gen Taylor: Max Taylor correctly brought out that we were subjected to very probing questions by Congress and that if, for example, they asked him whether or not the modernization of the Army was fast enough, he would have to say no.

He went into this at quite some length and the President started to take him apart.

Mr. McElroy: Then made a speech and said that in view of the remarks made by the Chiefs and the Services that it was apparent that we had to reexamine the budget. He misinterpreted the remarks or at least some place during about this period the remarks in general were misinterpreted by most everybody.

The President: The President stated that he hoped that we could get down to an agreed budget of about 40.8 or less—he meant expenditures.

I tried to break in twice to state that this could be done but if it were done we would have to do it—each Service would have to do it in its own way. We couldn't have people telling us what should be in the

budget and what should not be in the budget, and at the same time put tight limits on the budget. However, I was shut up twice before I got the words out—once by the President and once by Mr. McElroy, they each wanted to speak at that time.

The end result was that the NSC meeting for today was called off and was established for 8:30 or 9:00 on Saturday. The Department of Defense is to reexamine the budget, complete. The Joint Chiefs, I suspect, will be required to go over the other Services' programs.

Arleigh Burke

114. Memorandum of Conference with the President¹

Washington, December 8, 1958, 11:15 a.m.

The following items were discussed with the President:

1. I raised with him the question of a "debriefing" for the Planning Board members with respect to the NSC meeting on December 6 involving the Defense budget. I indicated to the President that I had a feeling that the regular debriefing process should not be followed in this case. He agreed.

2. I then took up with the President the Record of Actions of the meeting of the National Security Council on December 3. He approved it with the amendment suggested by Mr. Dillon and agreed to by Defense and the JCS.

3. I then took up the Record of Actions of the meeting of December 6. The President read it carefully and initialed it. I then pointed out to the President that even the language he had approved would perhaps not be adequate guidance in the premises. I reported to him that there was not a clear and general agreement as a result of the Saturday meeting and that his statement in the Council perhaps would mean one thing to Defense and another thing to the Bureau of the Budget. I informed him that Defense and the BOB as far as I knew had not gotten together following the meeting on December 6 and that on the basis of a conversation with Mr. McElroy and Mr. Quarles I believed

¹ Source: Department of Defense budget; detection of underground testing. Secret. 3 pp. Eisenhower Library, White House Office Files, Project Clean Up. Drafted on December 9.

Defense was awaiting a next move from someone else, probably the President himself.

The President then said that he felt there had been some progress and that he was hopeful that Mr. McElroy was finding it possible to make an adjustment in the Defense figures which would meet the budget problem. He based this optimism on a report of a meeting between Mr. Anderson and Mr. McElroy on Sunday. I indicated to the President that I believed his optimism misplaced and that as of the morning of December 8, Mr. McElroy was not prepared to make any meaningful adjustment. I told the President that Mr. McElroy was meeting again with Secretary Anderson at 11 o'clock on the morning of the 8th.

The President then asked me how I felt the Defense Department interpreted the Presidential statement in the NSC on December 6. I told him that Defense felt that the budget had gone through the normal budgetary process; that they had presented it to the President; and that it should be printed as presented. I told him on the other hand that I felt the Budget interpretation was that the whole budget was subject still to challenge specifically including the programs presented in the meeting.

The President then said that what he had meant by budgetary process was an examination of non-program areas, such as administrative costs, housing, construction, inventories, logistic support, etc., and that there had been no discussion in his presence of these matters.

I then pointed out to the President that time was an important factor inasmuch as Mr. McElroy was departing early on the morning of the 9th for the NATO Ministerial Meeting and that Mr. Stans was insisting that the budget had to go to print before Mr. McElroy's return. The President then expressed his irritation of the frequent absence of Cabinet Ministers.

The President then said that if he were in charge he felt that he could take \$5 billion out of the Defense budget but that Defense seemed not to be yielding at all. I observed to the President that if he were talking large amounts of money there couldn't be any significant reduction by further squeezing and that the only way to accomplish it was by the elimination of programs. He said he fully understood this. He said that if Defense, after all of the meetings and conversations on the subject, still maintained that the programs presented in the NSC meeting were essential to the national security, he had little choice but to approve them.

I repeated to the President that I felt that clarification was needed as to the result of the December 6 meeting.

He then said he thought he would call Secretary McElroy. I suggested that Mr. McElroy would probably still be with Mr. Anderson and the President did indeed reach him in Mr. Anderson's office.

The main points in the conversation between the President and Mr. McElroy were:

1. The President indicated that he had been "dragooned" into approving the Defense programs as presented. He made it clear to Mr. McElroy that his approval was reluctant but was given only because he felt he had no choice. He continued to have, however, reservations about the numbers of ATLAS and TITAN missiles, wondering if it was necessary to program as many of both. He then said that he wanted Mr. McElroy to get together with Mr. Stans right away and subject to further discussion the non-programmed items which he had mentioned to me earlier.

When he concluded the conversation the President instructed me to communicate the substance of it to General Persons with the request that General Persons reach Mr. Stans immediately and instruct him to get together with the Secretary of Defense.

4. I then presented for the President's signature a letter to the Chairman of the Net Evaluation Subcommittee thanking him for the work of the Committee and staff. The President signed this letter.

5. I then reported briefly to the President with respect to the questions which had arisen in connection with the detection of underground testing as a result of the evaluation of HARDTACK II. I pointed out to the President that the findings were not now considered to be authoritative or conclusive but they seemed to indicate a need for a vastly greater number of inspections than had been contemplated in the agreement of the experts at Geneva last summer. I reminded the President that this had important implications for the Gore proposal and that I expected in a few days, in any event, to have a coordinated government view with respect to the Gore proposal. I also reported to the President that Dr. Killian, with the approval and assistance of Mr. McCone, had established a high-level committee of scientists to review and report on the matter of detection of underground testing.

Immediately upon leaving the President's office at 11:40, I got General Persons out of a meeting in his office and informed him as requested by the President. He immediately got Mr. Stans on the telephone, with me on an extension, and I, at General Persons' direction, reported to Mr. Stans the substance of the President's conversation with Mr. McElroy. General Persons directed Mr. Stans to get in touch with Secretary Anderson to be brought up-to-date on his conversation

with the Secretary of Defense and then to get in touch with Secretary McElroy.

Gordon Gray

115. Memorandum From Stans to Persons¹

Washington, December 10, 1958

SUBJECT

Meeting with the President, Secretary of Treasury Anderson, Assistant to the President Persons, and Budget Director Stans on December 3, 1958

The Budget Director explained to the President that budget allowances for most of the agencies had now been worked out, and that the matter of a balanced budget hinged upon figures still to be determined for the Department of Defense and the Mutual Security Program. He stated that while he had originally urged, and still believed, that the Defense budget should not exceed \$40 billion, there was still room for balancing the budget if Defense were allowed as much as \$40.8 billion in expenditures, and if the Mutual Security expenditures were limited to \$3.5 billion.

The President indicated his strong desire for a balanced budget. Secretary Anderson reviewed the various reasons in support of so doing, including particularly the need of preserving the integrity of the dollar. The President indicated that he would go along with the \$3.5 billion figure for Mutual Security and suggested that the cut be made principally from the Military Assistance Program. He also supported the effort to resolve the Defense budget at \$40.8 billion, and directed General Persons to meet with Secretary McElroy along these lines.

Maurice H. Stans

116. Memorandum of Discussion at the 390th NSC Meeting¹

Washington, December 11, 1958

SUBJECTDiscussion at the 390th Meeting of the National Security Council Thursday,
December 11, 1958

Present at the 390th Meeting of the National Security Council were the President of the United States presiding, the Vice President of the United States; the Acting Secretary of State; the Acting Secretary of Defense; the Director, Office of Civil and Defense Mobilization. Also present were the Secretary of the Treasury and the Director, Bureau of the Budget. Also present and participating in Council action on Item 1 were the Attorney General; the Chairman, Atomic Energy Commission; the Chairman, Council of Economic Advisers; the Special Assistants to the President for Science and Technology and for Public Works Planning. Also attending were the Acting Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Acting Director, U.S. Information Agency; the Director, International Cooperation Administration; the Under Secretary of State for Economic Affairs; Assistant Secretaries of State Gerard C. Smith and Livingston T. Merchant; the Deputy Director, Office of Civil and Defense Mobilization, The Assistant to the President; the Deputy Assistant to the President for Congressional Affairs; the Special Assistants to the President for National Security Affairs and for Security Operations Coordination; the White House Staff Secretary; the Assistant White House Staff Secretary; the Naval Aide to the President; the Executive Secretary, NSC; and the Deputy Executive, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. MEASURES TO CARRY OUT THE CONCEPT OF SHELTER

(NSC 5807; NSC 5807/1; NSC Actions Nos. 1882 and 1948–b; Memos for NSC from Executive Secretary, same subject, dated November 5 and 18, and December 4, 1958)

Mr. Gordon Gray explained briefly the nature of this item and called on Governor Hoegh to summarize the main points in his report. (A copy of Mr. Gray's briefing note is filed in the Minutes of the Meeting.)

After describing in general the status of measures to carry out the concept of shelter, Governor Hoegh went to the main point which was his specific recommendation for one additional measure to carry out

¹ Source: Agenda item 1: Measures To Carry Out the Concept of Shelter. Top Secret; Eyes Only. Extracts—5 pp. Eisenhower Library, Whitman File, NSC Records.

the concept of shelter, namely, to provide fall-out shelters by modification of existing Federal buildings on a selected basis. Governor Hoegh's recommendation envisaged a cost of this procedure of approximately \$5 million during the next fiscal year.

After Governor Hoegh had explained the reasons for making this recommendation and the great need for a Federal example, he pointed out that the Joint Chiefs of Staff had signified their approval of the recommendation. General Taylor, the Acting Chairman, Joint Chiefs of Staff, indicated that the approval of the Joint Chiefs was to be interpreted in terms of the principle but not the dollar costs.

The President referred to the fact that in the course of his remarks earlier, Governor Hoegh had referred to an individual who had built an extremely comfortable, commodious, and safe blast shelter at a cost of only \$15,000. The President inquired how deep this shelter was and how it was possible to build one for as little as \$15,000. Governor Hoegh replied by pointing out that the shelter in question was built only to withstand blast pressures of 30 psi. although it did qualify as a blast shelter.

The President said that the reason he had asked this question was that he himself had long been undecided as to whether or not it would be a good thing for the President to build such a shelter and thus set an example to other people or whether if he went ahead and built such a shelter, the effect would be to scare other people to death. But all his calculations had added up to a cost much larger than \$15,000. Governor Hoegh said he would undertake to get plans for the \$15,000 shelter to which he had referred for the President and the President said that he would very much like to see them.

The President then asked if there were any other comments. The Director, Bureau of the Budget said that he would like to make four points regarding Governor Hoegh's recommendation for a \$5 million appropriation to provide fall-out shelters on a selected basis in existing Federal buildings. The first point, said Mr. Stans, was to warn that the proposed \$5 million program might end up by becoming only the down payment on a much larger program. He reminded the members of the Council of an earlier \$90 million estimate for providing fall-out shelter in U.S. post offices over the country. He therefore doubted whether this program would stop with an expenditure of \$5 million.

Secondly, Mr. Stans said, he wished to raise a question as to timing. He pointed out that Governor Hoegh had already referred to research prototype programs which were being undertaken in order to determine the best type of shelter. Five million dollars had been allocated to this program. Would it not be premature to proceed to build shelters in existing Federal buildings until the results of the research and prototype programs had come in?

Mr. Stans' third point related to the nation-wide survey now underway to determine what existed by way of shelter in existing buildings.

Should not this survey likewise be completed and analyzed before Governor Hoegh's new recommendation was adopted?

His further and final point, said Mr. Stans, was to suggest that some of the \$5 million which had been allocated to the above-mentioned prototype shelter program might also be used to provide for shelters in existing Federal buildings and thus serve a dual purpose of building prototypes and setting an example of shelters in Federal buildings. Accordingly, Mr. Stans recommended that action on Governor Hoegh's recommendation be deferred for six months or a year until the results of the various surveys had come in.

The President expressed relief at being confronted with a figure of \$5 million which was low in comparison with the estimated costs of some of the shelter programs which the Council had considered in the past. He added that he did not wish to argue the matter of the \$5 million for Governor Hoegh's recommendation and said that the two or three officials most concerned should meet with him in the next few days and decide how to act on this recommendation. On the other hand, he did not believe that those in charge of the shelter program should cease in their efforts to determine what it is best for the country to do in this field. We are, of course, now discounting the likelihood of a worldwide holocaust as a result of nuclear war. Nevertheless, we are also anxious to give our people a feeling of confidence so we were on a kind of knife edge between providing some degree of confidence through the medium of a shelter program while at the same time not scaring our citizens to death by too elaborate a program. It was not, said the President, that he felt he knew exactly what to do about it and he therefore wanted to ponder the problem before adding anything more.

The President also commented on the fact that we were trying to prevent the General Services Administration from building any more new Federal buildings.

Governor Hoegh agreed that this latter statement was correct and explained that it was because we were unlikely to have examples of shelters in newly built Federal buildings that made it seem important to him for the Federal Government to set an example through the means of providing shelter in modified existing Federal buildings.

Secretary Anderson expressed the opinion that it might be wise to select and concentrate on one example of shelter in an existing Federal building. We would thus be doing something by way of setting an example for the people of the U.S. and would also in the course of so doing learn what is the best kind of shelter to build. Governor Hoegh replied to Secretary Anderson that the OCDM believed that we already knew pretty well what was needed in the way of building fall-out shelters.

The President concluded the discussion by stating that we should wait a day or two and then make our decision.

The National Security Council:

a. Noted and discussed the report on the subject by the Director, Office of Civil and Defense Mobilization, contained in the enclosures to the reference memoranda of November 5 and 18; in the light of the views of the Joint Chiefs of Staff thereon, transmitted by the reference memorandum of December 4, 1958, and the views of the Director, Bureau of the Budget as presented orally at the meeting.

b. Noted the President's statement deferring action for a short period on the recommendations presented in *a* above, pending further consideration of these recommendations by the President and the other officials most directly concerned.

[Omitted here is the remainder of the memorandum.]

S. Everett Gleason

117. Memorandum From Gray to Morse (AEC)¹

Washington, December 11, 1958

Many thanks for your memorandum of December 5, which unfortunately did not reach me until after the NSC meeting. I shall be glad to discuss this with you at our convenience.

Gordon Gray

Special Assistant to the President

Memorandum from Morse to Gray

Washington, December 5, 1958

SUBJECT

NATIONAL SECURITY COUNCIL MEETING SATURDAY—DECEMBER 6, 1958

You may know that on Saturday the DOD will present before the NSC its proposed programs indicating an across-the-board cut applied

¹ Source: Returns Morse's preview of December 6 NSC meeting on defense budget. Top Secret. 3 pp. Eisenhower Library, White House Office Files, Projects Clean Up.

to all services approximately in proportion to their last year's budget apportionment.

Such an approach to budget control has no rationale except necessity, and represents arbitrary fiscal ceiling control at its worst. Even more seriously, it accords no recognition whatever to the coming revolution in concept whereby massive deterrent will receive less emphasis while capability for limited engagements receives more.

As you probably know, this issue first arose in the NSC last May 1, and was postponed until July 24, at which time the President requested continuing study of our military doctrine.

The issue is receiving great attention outside the Executive Branch, particularly within Congress where it will be used politically against the Administration during this coming session. If the cuts mean the withdrawal of one Army division from Germany as the Army is prepared to say they will, serious political repercussions both internally and abroad will occur.

Mr. Dulles may raise this issue at Saturday's meeting. If he does, one way to handle it might be for the President to postpone such politically dangerous across-the-board cuts pending completion of the study he requested July 24, which bears directly on this issue. Or, he might allow a week or two additional time for the two sides on the issue to prepare and present their views before him much as was done in the more general case before the NSC last May 1.

While I assume you will not wish to take sides at the Council table, I believe you should know what is behind the issues, if you do not already. And you might be in a position to suggest a solution. You probably know that I believe we shall be frozen into our present rigid and deadly posture forever if we do not begin to change some time, and soon. Even if we started *now* to change it would be several years before forces or weapons could significantly reflect changed emphasis. (This will be almost impossible without continued nuclear testing for air defense and tactical nuclear capabilities.)

I believe that any and every voice raised on the side of reason might help.

J.H. Morse, Jr.,
Captain, USN
Special Assistant to the Chairman

118. Briefing Note for the 391st NSC Meeting¹

Washington, December 16, 1958

PRESENTATION OF MILITARY MOBILIZATION BASE

1. In March, 1957, the Department of Defense presented to the Council a new Military Planning Concept to Govern Planning and Development of the Mobilization Base.

2. That concept was reflected in our 1957 and 1958 Basic National Security Policy statements. The significant new features of this concept were:

(1) Meeting the requirements of only those forces which would be mobilized by M/6 months (instead of M/36 months).

(2) Taking account of the possibility of substantial bomb damage to the U.S.

(3) Covering the eventualities of cold war, military conflict short of general war, and general war.

(4) Positioning pre-D-Day stocks overseas sufficient to insure reasonable effectiveness of forces there surviving enemy nuclear attack.

3. Defense was then requested to prepare at the earliest practicable date an outline—using this now concept—of the Military Mobilization Base Program, force structure, and annual costs in order of magnitude.

4. Last May, the PB and the Council received a progress report. The report, however, was more a listing of difficulties encountered and assumptions made in working on the military mobilization base program, and did not fulfill Action 1680-*b* with respect to “an outline of the military mobilization base program, force structure, and annual costs in order of magnitude”. Neither did it show what OCDM needs for its work: how we stand item-by-item with respect to a military mobilization plan.

5. In the military status report there was a brief statement of the actions taken by Defense up to June 30 to develop the military mobilization base program, using the new concept.

6. Today we are expecting to hear from Defense about its proposed military mobilization base program.

Briefing Note for the 391st NSC Meeting

Washington, December 17, 1958

ITEM—FALLOUT SHELTER IN EXISTING FEDERAL BUILDINGS

An additional item before the Council today is some unfinished business concerning the provision of fallout shelter in existing Federal buildings.

At the Council meeting last week, we had before us a proposal by Governor Hoegh upon which the President deferred action for a short period pending further consideration.

Since then, Governor Hoegh and Mr. Stans have prepared a joint memorandum on the subject (copies of which have been circulated around the table.) In essence, their proposal is that contained in the recommended draft record of action which is also before you and which reads as follows:

(READ)

119. Memorandum of Discussion at the 391st NSC Meeting¹

Washington, December 18, 1958

SUBJECT

Discussion at the 391st Meeting of the National Security Council, Thursday,
December 18, 1958

Present at the 391st Meeting of the National Security Council were the President of the United States, Presiding; the Vice President of the United States; the Acting Secretary of State; the Acting Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also attending the meeting and participating in the Council actions below were Mr. Laurence Robbins for the Secretary of the Treasury; the Director, Bureau of the Budget; and the Chairman, Atomic Energy Commission.

¹Source: Agenda item 1: Status of Military Mobilization Base; Agenda item 2: Fallout Shelters in Existing Federal Buildings. Top Secret; Eyes Only. Extracts—6 pp. Eisenhower Library, Whitman File, NSC Records.

Also attending the meeting were the Director of Central Intelligence; the Acting Chairman, Joint Chiefs of Staff; the Acting Director, U.S. Information Agency, the Under Secretary of State for Economic Affairs; the Assistant to the President; the Special Assistants to the President for National Security Affairs, for Science and Technology, and Security Operations Coordination; the White House Staff Secretary; the Assistant White House Staff Secretary; Mr. Howard Furnas, Department of State; from the Department of Defense: Assistant Secretary Perkins McGuire, Donald F. Bradford, and Harrell B. Altizer; the Executive Secretary, NSC, and the Director of the NSC Secretariat.

There follows a summary of the discussion at the meeting and the main points taken.

1. *STATUS OF MILITARY MOBILIZATION BASE PROGRAM*

(NSC Actions Nos. 1680, 1698, and 1918; NSC 5810/1, para. 47)

Mr. Gray introduced the subject to the Council² and called upon Mr. Quarles for a presentation by the Department of Defense.

Mr. Quarles said the presentation which would be given by Defense would show the basis for mobilization planning, i.e., for the procurement of materials and the establishment of reserves. This basis as it now exists has some weaknesses. However, the test of a mobilization base should be, what is procured and what reserves are set up? The Department of Defense has attempted to establish a pattern of mobilization and is seeking to improve the pattern. Mr. Quarles then called upon Assistant Secretary McGuire to make the presentation.

A copy of Mr. McGuire's presentation is filed in the Minutes of the meeting and another is attached to this memorandum.

At the conclusion of the presentation, Mr. Quarles remarked that fundamentally the report just made represented a transition from World War II mobilization concepts to concepts consistent with the atomic age. From this point of view, the base has some inconsistencies, e.g., the National Guard and reserve programs. Defense can set up a logistics plan for the reserves, but Congress can upset that plan by its reserve legislation.

The President said he was intrigued by the assumption of a six months' period between M-Day and D-Day. He would repeat an old saw: plans are worthless but planning is absolutely invaluable. Plans would probably be inapplicable to the actual war situation, but their value lay in the study and thinking required to produce them. The mobilization base presented represents a doubt that war

² A copy of Mr. Gray's briefing note is filed in the Minutes of the meeting and another is attached to this memorandum. [Footnote is in the original.]

will necessarily begin with an atomic exchange; if it did, 42 divisions would not be very useful. It was wise to try to provide a base which would fit various contingencies. The President applauded the effort had been expended on this difficult problem. Mr. McGuire said he was glad someone applauded.

Mr. Gray said the Planning Board, when it heard the presentation, had been impressed by the progress made in Defense. The six-months' concept we still being examined. Defense had been frank in saying that its plans might be subject to great changes in case a satisfactory answer were found to the bomb damage problem. Mr. Gray hoped a later presentation would shed some light on this latter problem.

Mr. McCone recalled that 30 days ago the Council had heard a presentation indicating the war would be over in 30 hours.

The President said mobilization plans were affected by the amount of warning of attack received. If the 30-hour war occurred, little could be done unless strategic warning were received during the six-months period. Only in the pre-World-War-II period had any preplanning whatever been accomplished, and even this had been on a very austere basis. In 1941 many units drilled with dummy guns. Before the Korean War, the Chiefs of Staff warned of our weakness; despite these warnings we were unprepared when war broke out in Korea. The President believed the need for mobilization planning was absolute.

Mr. Dulles cautioned that six-months warning of attack would probably not come from intelligence sources. An intermediate possibility was that our mobilization activities during a period of increasing international crisis would serve as a deterrent.

Mr. McGuire hoped an assessment of probable bomb damage would eliminate the assumption that nothing useful could be done in the mobilization field. The President observed that he had asserted many times that if we assumed too much damage there would be little point in planning, since everything would be ashes. An earlier presentation had estimated that some areas would not be useable for 30 years after an attack; of course planning on that basis is impossible. While we won't get off scot free in case of attack, we should make assumptions which describe a realm in which humans can operate.

Mr. McCone felt a distinction between limited and general war was necessary. In general war maximum emphasis would be on readiness to respond on D-Day. Mobilization activities preparatory to a small war, however, would be possible.

Mr. Quarles said the concept was that the mobilization base could handle a limited war without unacceptably impairing the general war base.

Mr. Quarles then raised the question of "packaged plants". He said Defense had analyzed about half of these plants and considered

that about two-thirds of those analyzed might be liquidated. The tremendous stock of material involved might be of great significance for underdeveloped nations. The President said he had earlier opposed the "packaged plant" idea. He had been told by business that the material involved in this concept could not be suddenly thrown on the market but would have to continue to be held by the Government.

Governor Hoegh wondered whether the machine tools in the "packaged plants" could be used in the recovery period after a nuclear attack on the U.S. when the industrial capacity of the country would be impaired. He felt this matter should be examined before the plants were "unloaded." The President pointed out that, while machine tools were very hard to destroy, the labor force which would use them and the buildings in which they would be used were easier to destroy. Governor Hoegh, while admitting the importance of manpower, felt the problem should be studied. The President agreed; and added that the potential value of the plants to Latin America should also be studied.

The National Security Council:

a. Noted and discussed the subject in the light of an oral report by the Department of Defense, presented by Assistant Secretary of Defense McGuire.

b. Noted the President's statement that he concurred in the general direction being taken by the Department of Defense in its Mobilization Base planning, and that it should:

(1) Keep under study whether its Mobilization Base planning should continue to assume a mobilization period of six months prior to D-day.

(2) Continue its efforts to find a means of taking bomb damage into account in its Mobilization Base Planning, while keeping the assumptions as to the extent of damage within limits which provide a basis for feasible planning.

c. Noted the President's directive that the Department of Defense should, in its study of the disposition of Defense package plants:

(1) Consult with the Office of Civil and Defense Mobilization as to the possible need for such plants or equipment during the recovery and rehabilitation phase if there were nuclear attack upon the United States.

(2) Consult with the Department of State as to the possible use of such plants or equipment in assisting the economic development of under-developed Free World nations.

NOTE: The action in *b* above, as approved by the President, subsequently transmitted to the Secretary of Defense for appropriate implementation, and report back to the NSC on developments within the next three months.

The action in *c* above, as approved by the President, subsequently transmitted to the Secretary of Defense for appropriate implementation, in consultation with the Director, Office of Civil and Defense Mobilization, as to *c* (1) above, and with the Secretary of State as to *c* (2) above.

2. *FALLOUT SHELTER IN EXISTING FEDERAL BUILDINGS*

(NSC 5807; NSC 5807/1; NSC Actions No. 1882, 1948–*b*, and 2015; Memos for NSC from Executive Secretary, subject, “Measures to Carry Out the Concept of Shelter”, dated November 5 and 18, and December 4, 1958)

Mr. Gray briefed the Council on this subject. (A copy of Mr. Gray’s briefing note is filed in the Minutes of the meeting and another is attached to this memorandum.) A draft Record of Action and copies of a letter from Mr. Hoegh and Mr. Stans to Mr. Gray (attached) were distributed.

Mr. Stans explained that a program of building shelters would not be started at this time, but it was proposed to make \$2 million available for research and the building of prototype shelters. The President wondered whether a strong ground floor in a building such as a public garage could be used as a fallout shelter.

In reply to a question from Mr. Dulles, Governor Hoegh indicated that under our policy the use of funds was authorized for installing fallout shelters in new Government buildings under construction.

The National Security Council:

a. Noted and discussed a joint memorandum on the subject (circulated at the meeting) by the Director, Office of Civil and Defense Mobilization, and the Director, Bureau of the Budget, prepared pursuant to NSC Action No. 2015–*b*.

b. Agreed that, as an additional measure to provide some Federal example in the area of fallout shelter, the present program of shelter research and prototype construction should be broadened to provide specific emphasis on such research and prototype construction in existing Federal buildings.

NOTE: The action in *b* above, as approved by the President, subsequently transmitted to the Director, Office of Civil and Defense Mobilization, and the Director, Bureau of the Budget for appropriate implementation; and incorporated in a revision of NSC 5807/1, circulated as NSC 5807/2.

[Omitted here is the remainder of the memorandum.]

Marion W. Boggs

120. Presentation by McGuire Before the NSC¹

Washington, December 18, 1958

STATUS OF THE MOBILIZATION BASE 1 JULY 1961

PRESENTATION BY PERKINS MCGUIRE BEFORE THE NSC
DECEMBER 18, 1958

INTRODUCTION

Mr. President, Gentlemen:

I will report on the projected status of our mobilization base as of July 1, 1961 with particular reference to the adequacy of our materiel to meet the requirements of basic national security policy objectives.

Basic policy states "The mobilization base should be designed to meet the requirements of:

- (a) General war, initiated by the enemy with a nuclear onslaught or as a result of hostilities which were not intended to lead to general war
- (b) Cold war, and
- (c) Military conflict short of general war.

Emphasis should be given to those elements that will increase U.S. D-Day readiness and capability. Within the military, first emphasis should be placed on achieving readiness for the forces in being. The base should meet the objectives which I have summarized as follows:

(1) Maintenance of the active forces in a condition of optimum readiness to execute initial wartime missions.

(2) Maintenance and support of certain selected reserve forces in a high state of readiness.

(3) Maintenance and support of phased expansion to M/6 months force levels.

(4) The capacity to meet the combat requirements of all forces which would be mobilized by M/6 months.

(5) Pre-M-Day positioning of selected supplies within the continental United States.

(6) Pre-M-Day positioning of selected supplies reasonably protected outside the United States.

(7) Maintenance and support of industrial capability to replenish stocks used in local war.

The presentation consists of four parts:

The force basis used in determining requirements.

¹ Source: Status of the mobilization base, July 1, 1961. Top Secret. 18 pp. Eisenhower Library, Whitman File.

Materiel readiness against the mobilization base objectives in quantitative and qualitative terms.

Selected problems.

Summary.

FORCE BASIS FOR DETERMINING REQUIREMENTS

The force basis used in determining requirements is shown on the next three charts. All data are expressed as a percent of the active forces in being on M-Day. For logistic planning purposes we place D-Day at M/6 months. The first chart shows the Post M-Day mobilization of forces authorized in the Joint Strategic Objectives Plan with an M-Day of July 1, 1961 which is our authorized planning base. The Post M-Day mobilization build up by Military Service is shown on the right. Army enters M-Day with 14 divisions, and proceeds to build up its forces to 21 divisions at M/1; then continues as indicated to 42 divisions by M/6 or D-Day. Navy begins with 684 combat ships, increases its forces to 1,044 ships by the end of the first month and, as indicated, to 1,630 combat ships by M/6. Air Force increases its 101 wings to 140 wings by M/1 and maintains that 140 wing structure constant throughout the build-up period. In like manner, the Marine Corps' strength at M-Day is 3 divisions and air wings. These are increased immediately to 4 division/air wings and maintained constant thereafter. The forces are portrayed on the left as a percentage increase to the active forces on M-day, during the M to D-Day build-up period. The Army mobilizes its forces throughout the six months, increasing to 150% of the M-Day forces by M/1 month; 229% by M/3; and 300% by M/6 months. Comparable positions for the Navy are 153% of its beginning forces by M/1; 225% by M/3; and 238% by M/6. Both the Air Force and the Marines complete their build up by M/1 month with the former increasing to 139% of its M-Day force and the latter 133%

The deployment of these forces during the M to M/6 and D to D/6 planning period is pictured here. JSOP-61 stops at D-Day. Post D-Day force projections, therefore, represent Service plans. For logistic planning purposes only, the deployment depicted here provides a basis for determining combat requirements for the forces engaged. Accordingly, they should not be interpreted as how deployment of the forces would actually take place under a variety of possible conditions. The effects of nuclear attack are not reflected in these force levels. For the Army and Marine Corps, the deployment figures represent total forces outside the U.S. For the Navy, deployment figures represent ships on station, and exclude ships in port in the U.S., or enroute. For the Air Force all combat units are shown as deployed, including those in the U.S., since all are in a position to perform their mission from their home bases. Of the 14 Army Divisions in being on M-Day, 8 are deployed; these rise to a level of 21 divisions by D-Day and continue upward, as indicated, until all 42 are assumed to be deployed at D/6 months. Of the Navy's

684 combat ships on M-Day, 610 are deployed. These rise to a level of 1,141 ships by D-Day, which remain on station throughout the D to D/6 period. The Air Force increases the deployment of its total forces to 140 wings by M/1. It remains constant through D/1, after which attrition reduce the force by 52 wings, leaving 88 wing equivalents at D/6. The Marine Corps starts on M-Day with one of its three divisions deployed and increases that deployment to the point where the D-Day force of 4 division/air wings is assumed to be fully deployed. This level of force remains constant during the Post D-Day period.

The third chart shows the relationship of U.S. forces engaged in limited war, to the active force structure and the Post M-Day mobilization of forces. An actual unified command contingency plan for resumption of hostilities in Korea is used for logistic planning purposes. 2 Army divisions or 13% of its active forces are assumed in this plan to be committed on M-Day to limited war. These rise to 6 divisions or 40% of the active forces by M/3 months. 114 combatant ships or 16.6% of those in the active forces will be committed on M-Day, increasing to 245 ships or 36% of the active forces by M/3. The Marine Corps with 1 division or 1/3 of its M-Day force, will increase its commitment of forces to 2 divisions or 2/3 of its active forces by M/2 months. It is not planned for the Air Force to commit forces over and above the 6 wings planned for commitment on M-Day. This amounts to 6% of its active forces on that day. Not shown here, are those indigenous forces which may require support in limited war. The degree of support could be substantial, particularly for Army materiel.

This chart shows the overall status of our quantitative readiness, in percent to total dollar figures. The requirement to support the total force objectives under the plan is shown as the 100% line. Assets on 1 July 1961 to meet this requirement will be 77% of this need, of which 48.5% will be comprised of aircraft, ships and strategic missiles. If we look at the active and selected reserve forces portion of the total, our estimate of assets will bring us to a readiness position of 84% of the requirement for these forces. For such capital items as aircraft, ships and strategic missiles, the requirement is based on the estimated availability of the items involved. For other hard goods, the requirement is derived from the force objective, just discussed.

An evaluation of our readiness status, by Military Service, for these other hard goods which are calculated against the force objective, shows that materiel to support the active and selected reserve forces is as follows:

- 66% for Army
- 65% for Navy
- 81% for Air Force
- 40% for the Marine Corps

We are faced with a qualitative as well as quantitative problem which reduces the effectiveness of our inventories, and accordingly,

attainment of 100% readiness on a quantitative basis will still leave us with a substantial modernization problem.

Illustrative of our qualitative situation is the following chart which shows the problem of modernization cycles. The 90 millimeter and 120 millimeter anti-aircraft guns have served their purpose for over 15 years. They now have a very limited defense capability and are being phased out for modern weapons capable of destroying today's supersonic aircraft. The Nike-Ajax has been operational for only five years but is being modernized to the Nike-Hercules. Within the next five years, it is anticipated that the Nike-Zeus will be in the engineer-user test phase. The next chart shows the projected M-Day composition of the fighter-interceptor forces in the Air Defense Command and the Air National Guard. Nearly all the aircraft in the regular forces will be supersonic and most will have an atomic capability. The National Guard forces are equipped primarily with subsonic aircraft, with 69% of the forces equipped with aircraft having no atomic or Falcon capability. This is explained by the fact that generally new aircraft are not purchased for the Air National Guard. Both the Air Reserve and Air National Guard units are equipped with aircraft which are transferred from the Regular Air Force as it receives more modern aircraft equipment. Some of these aircraft, even though subsonic, are nevertheless effective operational aircraft.

In other areas, our rate of modernization is not keeping pace with the obsolescence of existing equipment. Our deferral of ship replacement has reached a point where the Navy foresees the loss of one half its force within the next ten years. To varying degrees, elements of the other Services are faced with like situations in either their force or equipment needs. In several instances our technology complicates the problem by out-distancing previously accepted modernization cycles.

Basic policy refers to two other aspects of our material readiness and I will address myself to these very briefly. One of these requires provisions of reasonably protected prepositioned stocks outside the United States. The next chart shows the current status of such stocks. The bars show the percentage of the requirement for prepositioned stocks which is located with forces or in depots overseas. All Services have met more than two thirds of their requirement, with Marine Corps and Navy in the best position. Most of the Air Force prepositioned stocks are with or immediately accessible to the using units as shown on the green portion of the bar, while most of the Army and Marine Corps stocks are in depots as shown in the yellow portion of the bars. Navy ammunition and petroleum products are likewise in storage sites. Additional pre-positioned stocks of *all types* of Navy supplies, are afloat with their mobile logistic support forces.

Limited protection of these prepositioned reserve stocks has been provided for ammunition and part of the petroleum products. This protection is of substantial value where coupled with dispersion, but is of

doubtful value against direct attack with nuclear weapons. Protection of other supplies depends almost wholly on dispersal. The Navy's mobile logistic support forces represent one type of dispersal. The Army gains protection by dispersing its reserve stocks into numerous small general depots, instead of concentrating them in a few large specialized depots. The growth of the Soviet tactical missile capability, which is forecast in current National Intelligence Estimates, makes it unlikely that substantial protection could be provided against direct attack. It now appears vital that greater emphasis be placed on the protection of critical supplies and facilities in the United States. I will discuss this problem further in connection with the problem of incorporating attack damage assumptions into our planning for general war.

Our industrial base to support the plan is generally adequate. This base consists of our current producers, which are a combination of private enterprise and the active portion of our DOD owned industrial facilities. This chart shows the progress being made in readjusting our packaged plants to the changes in strategic concepts. Packaged plants are, for the most part, groups of machine tools and production equipment held at a manufacturing facility or in storage to produce *specific* military end items for mobilization. As a result of our continuing review, considerable progress has been made in making these tools available for general re-distribution and utilization or disposal. Since April of this year, we have cancelled 210 such packages or 35% of the total that had been established. 105 or 17% have been re-approved while the remainder amounting to 294 or 48% are under review.

CONCLUSION

The status against the NSC objectives may be summarized as follows—necessarily these represent overall situations and do not reflect the Service variations associated with each of the objectives.

Readiness against the *first* objective exists in terms of quantities but not in terms of modernized materiel.

Readiness against the *second* objective exists in part but deficiencies in quantities as well as quality preclude a status equal to the high standards contained in this objective.

Readiness against the *third* objective is extremely limited.

Readiness against the *fourth* objective exists in terms of industrial capacity to meet the rate of combat consumption, provided there is no damage to our production resources.

Pre M-Day positioning of selected supplies within the continental United States is reasonable for limited war but relocation may be required under attack damage assumptions.

Pre M-Day positioning of selected supplies, reasonably protected, outside the United States has been accomplished in part.

Maintenance and support of industrial capability to replenish stocks for use in local war exists.

SELECTED PROBLEMS

I come now to the planning problem areas which I cited last Spring: namely, the M to M+6 months build up, individual Service interpretations of Post D-Day planning and the question of reflecting attack damage assumptions in our planning for general war.

In my May briefing, I listed as a major problem area in planning guidance, the assumption that “six months of full scale mobilization and deployment might precede the outbreak of general war” and stated that a reevaluation of this assumption would be undertaken. A revaluation of these assumptions has been undertaken, but as yet we have *not* come to a satisfactory conclusion.

As noted earlier, we have not attempted to reflect the effects of attack damage in planning force levels for general war. The JCS have felt it infeasible to base planning on the results of any single war-game analysis, because of the many possible variations in the design of enemy attacks and in the effectiveness of our active defenses against attack. Further, it would not be *necessary* to reflect attack damage in force levels in order to insure balanced support, *if* we could reasonably assume that the effects of attack damage on forces would be proportional to the effects on support.

Studies have now made clear that we can *not* reasonably assume that attack damage to forces will be even roughly proportional to damage to support, but may be either much higher or much lower, depending on the type of forces, and on the policies for the geographical distribution of logistic support. Thus it is clearly essential to consider in some detail the probable effect of attack on both *forces* and *supporting resources*, if we are to have any prospect of providing effective post-attack support for surviving forces.

A study of *hazard probabilities* consistent with forecast Soviet capabilities in 1962 is now nearing completion. This new study, being made in collaboration with OCDM, considers: (a) A range of possible attack designs; (b) chance variations in aborts, attrition, and aiming error; (c) random variations in the direction and speed of the winds carrying fall-out. The results of this analysis will provide a basis for calculating *the chance of loss of personnel or materiel* at particular locations; *for finding the places* where the hazard is least; and *for appraising the effectiveness* of alternative kinds of protective measures in relation to their cost.

Preliminary results of this study show that about one-third of the depot warehouse space in the U.S., would likely survive a premeditated surprise attack in 1962. Despite the substantial amounts of materiel surviving attack, war-game studies have shown that under present distribution patterns very little continuing military capability would survive. This is because most of our depots are specialized in a

particular class of products, and the surviving stocks would be so badly unbalanced that no surviving weapon system would be supportable. It seems clear that study must be given to the desirability of relocating a limited portion of selected assets so as to provide greater assurance of balanced post-attack support for a few weapon systems. To do this, however, we must decide what our post-attack national and military objectives will be. If we plan to try to support everything, we will not likely be able to support anything.

SUMMARY AND EVALUATION

To summarize, Mr. President, we have reviewed the status of our material readiness on a quantitative and qualitative basis, related to Basic National Security Policy Objectives. We have also reported on the progress being made on the planning problems outlined last Spring. We believe the answers to some of the problems outlined may evolve from the studies we are undertaking in refining the mobilization base support concept and the application of attack damage to our logistics planning. Solutions are essential for the improved material posture required by Basic National Security Policy Objectives.

General Twining
Secretary Quarles
Mr. McCone
General Loper
Mr. Gordon Gray
Admiral Parker
Colonel Schinz
General Goodpaster
Major Eisenhower

The purpose of this meeting was to present for the President's approval the joint Defense/AEC proposal for dispersal of atomic

¹ Source: Discussion of Presidential approval of Defense/AEC proposal for dispersal of atomic weapons. Top Secret. 5 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on December 31.

weapons. (State had concurred.) Various items of discussion came out during the presentation. Essentially, these were:

a. Custody of atomic weapons, specifically that the military commanders be authorized to act as the agent of the AEC in maintaining custody of atomic weapons.

b. The precarious nature of our base agreements in such countries as [*text not declassified*] from a political standpoint.

c. Means of safeguarding dispersed atomic weapons in the event of limited or general war.

d. Relationship of the AEC with the Joint Congressional Committee on Atomic Energy in operational matters.

In further discussion, the President stressed certain points of particular interest. He queried how well protected our weapons are overseas, and Mr. Quarles said they have the same protective arrangements as here. The President added that he had the feeling there was increasing lack of control on these weapons, and emphasized that there must be no carelessness in their custody. General Twining pointed out the need to balance conflicting considerations: while dispersal undoubtedly lessens control, if the weapons are not locally available to commanders in an emergency they may not arrive in time. The President commented that, as to anti-aircraft and anti-submarine weapons, he did not have too much reservation; when it comes to increasing the number of large weapons that are dispersed, he wanted very careful review of protective arrangements.

The President then asked how many weapons could be carried [*text not declassified*] on the first sortie; no one was able to give him a definite answer. He said his thinking was that the United States may not be able to carry out more than one sortie from this area, because fields could well be immediately destroyed. He asked as to the Defense thinking on this matter, indicating that while enough weapons to arm the planes that are stationed there could logically be kept on hand one must ask why we could not send the other B-47s planned for straight from the United States with weapons aboard. The Defense members said they would study this matter further.

The President approved the dispersal plan as presented by Admiral Parker. However, he desired that he be briefed at a later date on the planning by which this dispersion scheme has been calculated in order to afford optimum economy and usefulness of our national stockpile. (Scheduled for January 5, 1959.)

At this point Admiral Parker and Colonel Schinz departed and Mr. Lay joined the group.

The group then presented a letter for the President's approval entitled "Instructions for the Expenditure for Nuclear Weapons in Accordance with the Presidential Authorization dated May 22, 1957." Mr. Gray brought the President up to date on this subject by reminding him that the matter had been discussed this last September in Newport, at which time Mr. Gray had presented a version of these instructions agreed between Department of State and Department of Defense. At that time the President had raised certain questions. Mr. Gray stated that the language had been agreed but had at that time been too broad in that it allowed [*text not declassified*] attack any element of Sino-Soviet forces, without restriction. He pointed out the revised language in this letter states with relation to retaliatory missions: [*text not declassified*].

In regard to this language, the President questioned the status of China pointing out that only the Soviet Union has been mentioned.

(At this time word was received that the ATLAS satellite was transmitting the President's voice over the radio.)

Mr. Quarles, in answer to the President's question, stated that this limitation does not preclude an attack on China.

The President then asked whether these instructions were confined to a situation in which the enemy used nuclear weapons. Mr. Gray responded to this by pointing out that they apply to any attack, nuclear or non-nuclear, which threatens to destroy U.S. forces overseas. He pointed out, however, that it requires a clear situation [*text not declassified*]. Mr. Quarles affirmed this statement adding that pursuit into any territory as necessary is permitted except into the USSR, unless [*text not declassified*] there has been an attack on the U.S.—in which case pursuit into the USSR is authorized.

The President expressed his concern by citing the example in which an enemy submarine shoots two torpedoes into a carrier. In this case, does the commander suddenly decide that he must destroy targets on land in order to assure the safety of the rest of the force? In other words, he points out there is an infinite variety of conditions possible. To this Mr. Quarles answered that this letter sets forth principles only and that each commander will receive separate instructions, each set to be specifically approved by the President.

The President continued to stress the point of degree of retaliation. He cited the case of China. There he felt that we might hit bases which threaten U.S. forces and would not go so far as to hit Chungking with big weapons. Mr. Gray said that retaliation would be only sufficient to eliminate the local threat of Sino-Soviet Bloc forces.

The President continued to express doubt on the degree of response, citing the USS PANAY incident of 1937 as a case of attack on a portion of a U.S. force. This type of incident is exactly what he does

not want parlayed into a major attack on our fleet. (Mr. Murphy gave as an example the necessity to strike [*text not declassified*] in the event of action in Korea.) The President let this subject pass, however, with Mr. Quarles' assurance that this letter sets forth principles only and that the implementing instructions will deal with these contingencies specifically.

The discussion then turned to [*text not declassified*] permission must be granted by the Joint Chiefs of Staff, with Presidential approval in each case. Such instructions will go to the unified commanders sealed.

[*text not declassified*]

Mr. Gray pointed out that if this letter is approved, it should be typed in three copies, one of which should be addressed to the Defense Department, one to the State Department, and one retained in the President's files. To this the President did not respond, but stated that he would like to retain this letter for further examination.

Mr. Quarles pointed out that the Secretary of Defense and the Joint Chiefs of Staff would be seeing the President on Monday, December 22, and it could be discussed further at that time. This the President approved.

(It was later decided to hold off this discussion in order to give the President time to study the paper.)

John S.D. Eisenhower

122. Memorandum of Conference with the President, and Department of Defense, NSC, and White House Officials¹

Washington, December 22, 1958, 10 a.m.

OTHERS PRESENT

Secretary McElroy
 Secretary Quarles
 General Taylor
 Admiral Burke
 General Pate
 General White
 General Lemay
 Mr. Gordon Gray

¹ Source: Department of Defense reorganization and organization of military intelligence. Top Secret. 5 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on December 23.

Mr. Harlow
General Goodpaster
Major Eisenhower

Secretary Quarles, in speaking for the Department of Defense, summarized the questions for discussion as: (a) the revision of the Key West Directive in the light of the Defense Department reorganization, and (b) certain issues as to Service-DOD relationships in that directive.

Turning first to the revision of the Key West Directive as a whole (DOD Directive 5100), Mr. Quarles described it as a functional paper which sets forth the working relationship between unified and specified commands, the Joint Chiefs of Staff, channels of command requests, etc. As pertains to the military Services, and their relationship to each other (roles and missions), Mr. Quarles stated that this directive indicates nothing new. He assured the President, however, that the provisions of the new unified command plan have been brought into this directive without disagreement.

Mr. Quarles went on to say there were one or two points unresolved in this directive, however. In particular, he mentioned the manner in which the Joint Chiefs of Staff are portrayed in the organization charts of the Department of Defense. In the two directives which are current, the Office of the Secretary of Defense proper is considered an extension of the person of the Secretary of Defense himself; whereas the Joint Chiefs of Staff are treated as a separate military staff, through whom the Secretary of Defense issues his instructions in exercising strategic direction of our armed services. Mr. Quarles said that this proposed revision of the directive has also placed the Joint Chiefs of Staff outside the Office of the Secretary of Defense; however, he feels that the Joint Chiefs of Staff could better be included within the Office of the Secretary of Defense. In response to a question from the President, Mr. Quarles admitted that this problem is largely one of semantics, since the Joint Chiefs of Staff and the Secretary of Defense in either case would be components under the Secretary of Defense. Mr. McElroy pointed out that in the proposed directive the Assistant Secretaries are in one group and the Joint Chiefs of Staff in the other.

General Twining then spoke for the Joint Chiefs of Staff. He pointed out that the Chiefs wish to avoid being under Assistant Secretaries of Defense. He supported this view by citing that the Joint Chiefs of Staff are responsible by law to be advisers to the President and to the National Security Council, as well as to the Secretary of Defense. He feels that incorporation of the Joint Chiefs establishment into the Office of the Secretary of Defense would be downgrading to them, and this would be bad for morale. He finished by stating that the "reorganization group" had not recommended this change.

The President then stated a basic viewpoint with regard to the Joint Chiefs of Staff, which is that a staff should be organized as the boss wants it organized. Minute organizational details he described as “straining at a gnat.” Regardless of the wording of the law, the Joint Chiefs of Staff are direct subordinates of the Secretary Defense—they are his military staff. He recognized that the Joint Chiefs are probably concerned most about being placed under the Assistant Secretaries. General Twining assured the President that any arrangement will work and that this disagreement as to organization is largely a matter of prestige; the President then went on to summarize his conviction that in the defense of the United States the Joint Chiefs of Staff are far more important as a corporate body than as a collection of individual Service Chiefs; that if he were the Secretary of Defense he would not object to anything designed to maintain the dignity of the Joint Chiefs; and that the Joint Chiefs serve the Secretary of Defense primarily.

After Admiral Burke reinforced General Twining’s opinion as to the importance of the Joint Chiefs of Staff vis-a-vis the Assistant Secretaries, General Taylor showed the President a diagram indicating an organization with the Joint Chiefs carried separately from the Office of the Secretary of Defense. To this the President commented that military chiefs have always been technically considered advisers to the President (ever since 1903); but he is anxious that the Joint Chiefs be recognized as primarily a military staff for the Secretary of Defense. Therefore, he criticized drawing the line on the chart from the Joint Chiefs to the President equally as dark as that drawn from the Joint Chiefs to the Secretary of Defense. (The line to the Secretary of Defense should be *solid*, indicating direct line of responsibility.) He admitted that the Joint Chiefs do have an additional responsibility and stated that he will always see the Chief of a Service on matters of importance to that Service.

In summation, the President stated that he would solve the organization diagram by drawing two boxes, one for the Joint Chiefs of Staff and the other for the Office of the Secretary of Defense. These two boxes should be joined with a dotted line, indicating close coordination, and he did not object to another dotted line running from the Joint Chiefs to the President. He recognized that the problem that would exist if the Joint Chiefs of Staff were incorporated directly into the Department of Defense office in that Assistant Secretaries might be prone to oversupervise. He stated further that Assistant Secretaries are created in order to make the job of the Joint Chiefs easier; and are not designed to be their superiors.

The President then proceeded to a problem corollary to that just discussed. He said that he did not see why we continue to use the

term "joint." Any strategic plan should be considered a "defense" plan (rather than a "joint" plan) which means that it is unified *from its inception* and is not the result of a welding of separate efforts. He stated that he would designate the senior military body the "Military Chiefs of Staff for Defense" rather than the "Joint Chiefs of Staff." This he said he would do in spite of current legislation, in answer to Mr. Quarles' statement that the name "Joint Chiefs of Staff" is statutory. (In this connection, the President pointed out that his residence is designated by law as the Executive Mansion, but he has never heard it referred to as anything but the White House. He voiced the opinion that many of these terms came about as a result of the school systems.)

The President then summarized the matters he would like to insure in his last two years in office. These he listed as follows:

(a) A realization of the fact that the Joint Chiefs of Staff are responsible to the Secretary of Defense.

(b) Recognition of the fact that the Joint Chiefs of Staff comprise a single group and not a collection of Service Chiefs. (The President recognizes that the Joint Chiefs of Staff have some responsibilities to the President.)

(c) Amalgamation of the present "Joint Staff" into a truly single staff.

Mr. Quarles then stated that the only problem is to be sure that the Department of Defense is implementing the President's desires. He invited comments from Mr. Harlow and General Goodpaster. Mr. Harlow summarized his view of the President's desires on the responsibilities of the Joint Chiefs of Staff to the Secretary of Defense, emphasizing the statement of the President that excessive debate over organizational detail constitutes "straining at a gnat." He considered these matters clear. He then questioned the matter of budgeting in this new directive.

To this Mr. Quarles stated that the unified commanders make military requirements known to the Joint Chiefs of Staff. Provisioning as such is requested by the Services through the Joint Chiefs of Staff to the Secretary of Defense. Mr. Harlow objected to this explanation, pointing out that a separate provisioning channel sets up two channels, in that the component commanders of the unified commands go directly to the Services for their "provisioning."

When the President voiced objections, Admiral Burke attempted to explain the situation to some extent by assuring the President that the unified commander does know what is going on but does not concern himself with costs and finances. This appeared to alleviate the President's concern. General Taylor attempted to bring the matter into focus by pointing out that the channel from the component commander to the chief of a service is a budgetary channel; but that the channel from

a unified commander to the Joint Chiefs of Staff is a strategic channel. The President stated that he would approve this arrangement, provided that decisions on strategic matters such as the strength of reserves, the numbers of carriers, etc., are reserved to the unified commanders.

Mr. Harlow expressed doubt that the paragraph places it in quite that perspective. Therefore, Mr. Quarles and the President checked the wording and agreed it should be substantially as follows: “. . . upon the basis of the agreed defense military requirements of that command.”

The President then brought up the question of intelligence services. He asked why there is not a solid military intelligence plan, pointing out that under existing arrangement three separate intelligence jobs must be done, and the material brought together. He stated he felt that the Joint Chiefs of Staff could be better served by an autonomous intelligence service at the Defense level.

Admiral Burke made a case for separate intelligence services based on his experience in CINCUNC, in which General Willoughby (G-2 of a unified command) had believed there were no Chinese in North Korea (November 1950). He expressed the opinion that in this circumstance Service disagreements were healthy. He further went on to mention a meeting on the subject of Laos conducted by the CIA. Here the CIA had been able to quote from many sources, including service intelligence. He felt the diversity had been helpful.

General Taylor reinforced the views of Admiral Burke to some extent by stating that the Joint Staff is providing autonomous intelligence service for the Joint Chiefs of Staff, and as such, will make a great contribution. He went further, however, to say that there are intelligence matters of unilateral Service concern that separate services should perform.

The President admitted that every military force needs its means of intelligence. He felt that the basic difficulty in this area was the intelligence services located in the Pentagon. They should produce unified intelligence and the intelligence which is used by the Joint Chiefs of Staff should come through unified channels. He went on to comment on the fact that the War Colleges may contribute to the present insistence on separate intelligence services. He stated his opinion that War Colleges should lose their Service identification and should be designated as Defense Colleges No. 1, 2, 3 and 4. On all the matters of intelligence, the President stated that he is not specifically requesting a change, but that he *is* requesting that the Department of Defense ponder these matters seriously.

John S.D. Eisenhower

 - (1) "Report to the President by the Security Resources Panel of the ODM Science Advisory Committee", dated January 22, 1958
 - (2) "Measures to Carry Out the Concept of Shelter", dated March 24 and 26, and November 5 and 13, 1958
 - (3) "Adequacy of Government Research Programs in Non-Military Defense," dated July 1, 1958
 - (4) "The Number of Nuclear Weapons which Might be Tolerable to World Populations", dated July 7, 1958
 - (5) "Survival of Population Following a Massive Nuclear Exchange", dated June 27, 1958
 - (6) "Status of Shelter Measures as of June 30, 1958", dated July 1, 1958

At the 360th NSC Meeting on March 27, 1958, the National Security Council, the Secretary of the Treasury, Judge Lawrence E. Walsh for the Attorney General, the Director, Bureau of the Budget, the Federal Civil Defense Administrator, Captain John H. Morse, Jr. USN for the Chairman, Atomic Energy Commission, and the Chairman, Council of Economic Advisors, noted and discussed a report on the subject (NSC 5807) and (NSC Action 1882, approved by the President on April 2, 1958):

(1) Agreed that certain measures should be undertaken to carry out the concept of fallout shelter for protection of the civil population against radiation hazard, in accordance with NSC Action No. 1842-*d*. A statement of these measures was circulated as NSC 5807/1.

(2) Deferred action on the measures recommended in paragraph 1-*b* (except the limited program in NSC Action No. 1882-*b*-(2)), 2-*b*, 2-*c*, 5-*b* and 6-*a* and -*b* of NSC 5807; pending consideration of certain studies and reports requested by the Council.

¹ Source: "Measures To Carry Out the Concept of Shelter." Top Secret. 9 pp. NARA, RG 59, S/S-NSC Files: Lot 63 D 351, NSC 5807 Series.

Subsequently, such studies and reports were submitted to the Council, which:

(1) Noted and discussed a report on “Adequacy of Government Research Programs in Non-Military Defense” (Reference C(3)) and referred it to the Director, OCDM, for study of the conclusions therein (especially Conclusion Nos. 6 and 7 on page 2 of the Summary) and such recommendations to the Council as he might deem appropriate (NSC Action No. 1945).

(2) Noted and discussed (NSC Actions No. 1946 and 1947) reports on “The Number of Nuclear Weapons which Might be Tolerable to World Populations” (Reference C(4)) and “Survival of Population Following a Massive Nuclear Exchange” (Reference C(5)).

(3) Noted and discussed (NSC Action No. 1948) a report on “Status of Shelter Measures as of June 30, 1958” (Reference C(6)); and noted that the Director, OCDM, would submit to the Council a supplementary status report following Congressional action on FY 1959, appropriations, and appropriate recommendations on shelter measures (including those on which action was deferred by NSC Action No. 1882-*d* in the light of Congressional action on appropriations and of further study of the reports referred to in subparagraphs (1) and (2) above.

In this supplementary status report (Reference C(2), November 5 and 18, 1958), the Director, OCDM, stated that, except for paragraph 5-*b* of NSC 5807, he did not recommend further action at that time on the shelter measures on which action was deferred by NSC Action No. 1882-*d*.

With reference to paragraph 5-*b* of NSC 5807, the recommendations of the Director, OCDM, were discussed by the Council on December 11 and 18, 1958. At the latter meeting, the Council (NSC Action No. 2020-*b*) agreed that, as an additional measure to provide some Federal example in the area of fallout shelter, the present program of shelter research and prototype construction should be broadened to provide specific emphasis on such research and prototype construction in existing Federal buildings. This action was approved by the President on December 24, 1958.

Accordingly, NSC 5807/1, revised by incorporation therein of NSC Action No. 2020-*b* and by deletion therefrom of paragraphs which called for reports which have now been noted and discussed by the Council, is transmitted herewith as NSC 5807/2 for appropriate implementation of paragraph 1 by the Director, OCDM, and of paragraph 2 by the Director, OCDM and the Director, Bureau of the Budget.

NSC 5807/2 supersedes NSC 5807/1.

MEASURES TO CARRY OUT THE CONCEPT OF SHELTER

1. By NSC Action No. 1882-*b*, the National Security Council agreed that the following measures should be undertaken to carry out the concept of fallout shelter for protection of the civil population against radiation hazard, in accordance with NSC Action No. 1842-*d*:

a. A research and development program along the lines of the recommendations in paragraph 1-*a* of NSC 5807, which reads as follows:

“(1) Research and Development, including prototype construction (exploiting multiple-use principle to the maximum)

	<i>\$Millions</i>
“(a) <i>Research</i>	\$6.5 (annual rate)

“Although sufficient knowledge of weapons’ effects and of shelter design now exists to permit proceeding with a complete and effective fallout shelter program if this were deemed desirable, expanded research is necessary to refine our knowledge, particularly of blast shelter, and develop more economical and efficient shelter models. In a program of this magnitude, well considered research should save many times its initial cost.

“The following program of research is already identified and can be undertaken as rapidly as funds are made available.

“(i) The field testing, with nuclear weapons, of shelters, other structures, and shelter equipment; provision for development and execution of radiological defense measures; exposure of animals to weapons’ effects; and the instrumentation necessary to evaluate results obtained.
----- \$2.0 Millions

“(ii) The design of various prototype shelters, the development of shelter programs, and development and laboratory testing of structures, facilities, equipment and materials not requiring nuclear field tests.
----- \$1.0 Million

“(iii) Studies dealing with psychological, emotional, educational and morale problems and determinations of tolerance limits under

emergency conditions; medical, food, and water requirements in shelter habitation; and sanitary controls to permit tolerable occupation.

----- \$1.5 Millions

“(iv) Development of architectural designs and specifications for new types of multiple-use shelters which will be attractive as well as practical. The Committee believes that attention should be given to the use of grants to schools of architecture and engineering which would stimulate curriculum development, training of new students, and new concept of shelter design.

“----- \$2.0 Millions”

b. A limited program of prototype construction of relatively small-capacity fallout shelters, differing in design and type (including multiple-use) and adapted to differing conditions such as climate; appropriate tests by actual occupancy for realistic periods of time to be conducted after completion (total cost not to exceed \$6 million).

c. A nation-wide survey along the lines recommended in subparagraph 2-a of NSC 5807, which reads as follows:

“2. Surveys and Pilot Studies

“a. Development of estimated availability of existing shelter on a sampling basis

“As a basis for national planning, definitive information is needed regarding the capability of existing structures to provide fallout shelter, particularly in large cities. The Committee recommends that a survey of existing structures be conducted on a sampling basis to yield such information. This would be handled through direct Federal contract, and would be completed in one year.

“----- \$2.0 Millions”

d. Initiation of a program of public education along the lines recommended in paragraph 3 of NSC 5807, as modified by FCDA in the light of NSC discussion and as outlined below (cost estimated at not over \$12.5 million for FY 1959; subsequent annual appropriations to be determined on the basis of experience) :

Outline of Proposed Coverage of FCDA

Information And Education Program

(1) *Objectives*

(a) Public understanding of nuclear weapons effects, particularly radiation.

(b) Instruction on effective measures of protection.

(2) *Low-Key Characteristics*

The program would avoid harmful over-excitement of the people by careful treatment of the nature and imminence of the threat.

(a) Prudence, not alarm, is the keynote. All of our best efforts will be directed toward avoiding nuclear war; but prudence and a concern for the Country's future dictate the desirability of taking steps to improve chances of survival in order to rebuild and protect our national heritage if nuclear attack should occur. (We pay a lot of money for insurance of various sorts while doing our best to avoid the contingencies against which we are insuring ourselves.)

(b) The national fallout shelter policy is based *firmly* on the philosophy of the obligation of each property-owner to provide protection on his own premises. The Federal Government will provide information on how to do it, backed up by example of providing fallout protection in its new buildings in the future.

(3) *Programs*

(a) Support of adult education programs to increase understanding of (i) the effects of nuclear weapons, (ii) what can be and is being done to provide protection, and (iii) the place of individual preparedness in the total national security program.

(b) Combination of training films, instruction materials, magazine articles (popular, trade, etc.), newspaper features, TV programs, etc., aimed in appropriate combination at the following broad subjects:

- (i) Nuclear weapons effects on people, plants and animals.
- (ii) How to provide fallout protection.
- (iii) Family fallout protection (including simple "How-to-do-it" information).
- (iv) Improvised home and basement shelters.
- (v) Protection of food and water.
- (vi) What governments (Federal, State, local) are doing about fall-out protection.
- (vii) Radiological decontamination.

(c) The use of national organizations to disseminate information.

e. The elements of a base for rapid acceleration along the lines recommended in paragraph 4 of NSC 5807, which reads as follows:

"4. Elements of a Base for Rapid	\$Millions
Acceleration	\$ 1.5 (annually)

"The measures proposed above are designed to promote shelter construction without extensive financial participation by the Federal Government. The Committee recognizes, however, the possibility that these measures may be ineffective and that the Government might later wish to initiate a shelter program on an accelerated basis. Many of the other recommended measures will assist in preparing a base for rapid expansion, but in addition it is believed that specific attention should be given to the preparation of a "shelf" of plans and information which might save months of delay in an emergency.

“Specific items proposed are:

“(1) Identification of materials, equipment and manpower
----- \$1 Million (annually)

“(2) Preparation and maintenance of standby orders and organization

“----- \$0.5 Million (annually)”

f. The incorporation of fallout shelter in the construction of new Federal civilian buildings, of suitable size, designed after this date, along the lines recommended in paragraph 5–a of NSC 5807, which reads as follows (supplemental appropriations for such shelter in buildings for which funds have already been appropriated will not be sought):

“5. Incorporation of shelter in civilian Federal buildings

“The Committee agrees that Federal example is an indispensable element in any combination of measures designed to stimulate State, local government, and private spending for fallout shelters.

	<i>\$Millions</i>
“a. New Construction	\$6.5 (annually)

“Projections of new Federal construction activity (including the Post Office construction program, but excluding military construction) indicate a potential level of about 125,000 shelter spaces annually at an average cost of \$52 per shelter space. This assumes utilization of new buildings for community shelter where practicable, thereby setting an example to local Government and business, and avoiding charges of favored treatment for Federal employees.”

2. By NSC Action No. 2020–b, the National Security Council agreed that, as an additional measure to provide some Federal example in the area of fallout shelter, the present program of shelter research and prototype construction should be broadened to provide specific emphasis on such research and prototype construction in existing Federal buildings.

124. Memorandum of Conversation Between Eisenhower and Gray¹

Washington, December 24, 1958, 9:45 a.m.

1. I discussed the Record of Actions of the December 18 NSC meeting with particular reference to the Status of the Military Mobilization Base Program. I reminded the President that he had indicated that he wished the Department of Defense to keep under study the question of whether its mobilization base planning should continue to assume a mobilization period of six months prior to D-Day. The President said that he felt that it should be studied but that his guess was that planning had to assume both such a period and no period whatsoever. I also pointed out to the President that he had indicated that the Department of Defense should continue its efforts to find a means of taking bomb damage into account in its mobilization base planning while not making damage assumptions so extravagant that no planning is feasible. I indicated to the President that Assistant Secretary McGuire felt that it would be helpful to be asked to report back to the NSC on developments arising out of this study and I asked the President's approval for inclusion of a directive to this effect in the Record of Action. The President approved such a directive.

2. I discussed the Record of Actions of the December 23 NSC meeting with particular reference to the intelligence briefing with respect to Cuba. I indicated to the President that I was a little concerned as to what should be reflected in the Record of Actions in view of the indeterminate discussion. I suggested to him that the Record should reflect the statement that "responsible departments and agencies, particularly the Departments of State, Defense and Justice and the CIA are keeping the situation in Cuba under continuing scrutiny with a view to taking appropriate actions in U.S. security interests, and to making necessary contingency plans." The President felt that this would be satisfactory with the addition of a clause reading, "on the initiative of the Secretary of State."

With further reference to the intelligence item with respect to Cuba, I pointed out to the President that I had not been informed as to what was going on but that I had not pressed for any kind of directive in the meeting because it was not clear to me whether there were

¹ Source: Military mobilization base, situation in Cuba, intelligence procedures, Geneva conferences on test suspension and surprise attack. Top Secret. 2 pp. Eisenhower Library, White House Office Files, Project Clean Up, Meetings with the President. Drafted on December 30.

not some programs which he had approved. The President indicated that whereas General Goodpaster and Major Eisenhower kept him well informed as to intelligence reports, he had not known until the NSC meeting that the view of the U.S. Government was that of wishing to oppose Fidel Castro in any event. He then said that he felt the situation had been allowed to slip somewhat.

He then said, in the light of the Hull Board meeting with him on December 16, and in view of what I had told him with respect to the inadequacies of the 5412 Group and its procedures, he wished to discuss this matter with Allen Dulles and me as a matter of urgency and that he particularly had in mind an effort to regularize the 5412 procedures. He instructed me to get Allen Dulles at the earliest opportunity (this meeting was set up for Friday morning, December 26 at 9:00 a.m.).

3. I then discussed in general terms with the President further preparations for the Geneva conferences on test suspension and on surprise attack in the light of reports that he had received at the NSC from Ambassador Wadsworth and Mr. William C. Foster. I pointed out to him that some time ago he had instructed me to suggest to the Secretary of State that he have one committee which might deal with both conferences but that no formal action had been taken. I pointed out that the Secretary of State for one reason or another had been out of his office for an extended period of time. I recommended to the President that the continued preparations be lodged in an interdepartmental committee under the Chairmanship of the Secretary of State and composed additionally of the Secretary of Defense, Chairman, Atomic Energy Commission, the Director of Central Intelligence and Dr. Killian. The President approved this suggestion and indicated that he saw no reason now to continue Secretary Anderson as a member of this committee working on this problem. He also said that he wished George Allen brought in to the deliberations whenever his advice would be helpful and his official responsibilities were involved. He instructed me to follow the course of these matters and to continue to “needle” for action where necessary and to report to him when desirable.

Gordon Gray

125. Questions and Answers Drafted in JCS¹

Washington, January 7, 1959

Q. To what extent did the JCS as a corporate body participate in the formulation of the FY 60 budget?

A. (C) The JCS approved on 3 Jan 58 a Joint Strategic Objectives Plan (JSOP 61), which had been prepared in accordance with personnel guidelines furnished by the Secretary of Defense and budgetary guidelines adopted by the JCS. The Joint Program for Planning states, as one of the purposes of the JSOP:

"e. Provide one of the bases for:

"(1) The annual statement by the Joint Chiefs of Staff of military requirements to the Secretary of Defense for his consideration in developing his annual budgetary guidelines for a fiscal year² beginning two years subsequent to the scheduled date of approval.

"(2) The preparation and justification of the annual departmental budget requests for the same fiscal year as in (1) above, in conjunction with the Secretary of Defense's annual budgetary guidelines."

(C) The Deputy Secretary of Defense subsequently approved this JSOP for use by the DOD as a common point of reference for strategic and mobilization planning, subject to certain additional guidance which, included a statement that the JSOP would not be used as automatic justification of personnel, procurement, installation, or budget programs.

(C) DOD later issued directives to the individual services containing guidance on materiel requirements programs, and FY 60 strength for the active services, the National Guard, and the Reserves. There resulted a series of meetings in which each service discussed its budget with the Secretary of Defense and after which service budget ceilings were established. The services then submitted their individual budgets based on these ceilings to the Secretary of Defense for consolidation into a single Defense budget.

(C) On 5 Dec 58 this Defense budget was presented to the JCS who advised³ the Secretary of Defense that the Defense budget level is adequate to provide for the essential programs necessary for the defense

¹ Source: JCS role in Department of Defense budget formulation. Confidential. 3 pp. Eisenhower Library, White House Office Files, Project Clean Up.

² For JSOP 61 the pertinent fiscal year is FY 60. [Footnote is in the original.]

³ JCS Memo for Sec/Def "JCS Position on the FY 60 Budget" dated 6 Dec 58, quoted in answer to next question. [Footnote is in the original.]

of the nation but the JCS all have reservations with respect to funding some segments of their respective service programs.

(C) As reflected above, the JCS participation in budget formulation was minimal. The JSOP and JCS deliberations on individual weapons, plans, procedures and strategic and organizational concept undoubtedly have an influence on the budget, but since budget submissions are made directly by the services to the DOD and not through the JCS, the JCS as a corporate body were not directly involved in the formulation of the FY 60 budget; they merely commented on the overall Defense budget after it was completed.

Q. What is the position of the Joint Chiefs of Staff as to the military sufficiency of this budget?

A. (C) On 5 Dec 58 the DOD budget for FY 60 was presented to the JCS who sent the following comment to the Secretary of Defense:

“The Joint Chiefs of Staff consider that the FY 1960 proposed expenditure figure of \$41,165,000,000 is adequate to provide for the essential programs necessary for the defense of the nation for the period under consideration. They find no serious gaps in the key elements of the budget in its present form, but all have reservations with respect to the funding of some segments of their respective service programs.”

Discussion Paper

Washington, undated

DISCUSSION PAPER
on
U.S. POLICY IN THE EVENT OF WAR INITIATED
BY THE SINO-SOVIET BLOC

NSC Planning Board review of NSC 5410/1, "U.S. Objectives in the Event of General War with the Soviet Bloc" (approved April 29, 1954) has developed a number of fundamental issues which the Planning Board submits herewith for discussion by the National Security Council, with a view to receiving guidance as a basis for rescinding or revising NSC 5410/1.

1. Should a statement of U.S. policy in the event of war be limited to the subject of existing policy (NSC 5410/1), i.e., U.S. objectives in the event of general war with the Soviet Bloc; or should it cover additional contingencies such as (a) major war initiated by Communist China, and (b) other war initiated by a member of the Sino-Soviet Bloc?

2. In the light of the capability of the United States and the USSR in the foreseeable future to destroy one another, even after a surprise nuclear attack, should the United States in the event of general war initiated by the USSR:

Despite the loss of U.S. lives and resources which might be involved, endeavor by all necessary means to reduce the capabilities of the USSR to the point where it has lost its will or ability to wage war against the United States and its allies; and yet be prepared to consider an offer by the USSR to cut short the nuclear exchange at a point advantageous to the United States, even though the USSR might retain some will and ability to continue the struggle?

3. Should the United States accept an otherwise advantageous settlement:

- a. If Communist control were maintained over the satellites?
- b. If a Communist Government retained power in the USSR?
- c. Only if all Communist controls were destroyed?

4. In the event of general war initiated by the USSR, should the United States seek to keep Communist China out of the war, *or* endeavor by all necessary means to reduce the capabilities of Communist China to the point where it would be unable to endanger the security of the United States?

5. In the event of major war initiated by Communist China, or war initiated by a state other than the USSR, in which the USSR did not participate at the beginning, should the United States, in order to avoid a clear and immediate danger of general war with the USSR, be prepared to terminate hostilities before the aggressor state had lost its will or ability to continue to wage war?

6. Can and should the United States undertake now to formulate post-war policies and plans, e.g., terms of enemy surrender, border and territorial arrangements, administration of enemy territory, and independence for national minorities?

127. Memorandum of Conference with the President¹

Washington, January 12, 1959

OTHERS PRESENT

Dr. Killian
Dr. Kistiakowsky
General Goodpastor

Dr. Kistiakowsky said that, as the Geneva meetings on Surprise Attack went along, he became more and more impressed with the hazards to the United States of a system of inspection against surprise attack. While we tabled papers asserting the value of such a system, privately he had growing concern about it. Such a system would reveal detailed information on our deployments, our readiness, and the protective strengths and arrangements for our striking forces. If the system failed to give us warning, it would have given great net advantage to

¹ Source: Concerns about inspection against surprise attack and nuclear testing. Secret. 3 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on January 14.

the Soviets. This advantage becomes especially great with ballistic missiles and supersonic aircraft.

The President recalled that he took initiative in 1955 (at Geneva) in proposing aerial inspection against the "means of delivery" of highly destructive weapons; at that time such means of delivery were aircraft. Except for that proposal, he said he had never been wedded to the concept of inspection against surprise attack. In particular, he questioned the significance of the far north, which to him is simply an area of passage.

Dr. Kistiakowsky added that, as against missile launching submarines, no way to monitor was seen. He added that both the scientists and the military men of the group came to feel that the only fruitful approach to this is to couple inspection with arms limitation. Through such a means, a reduction in the threat would be accomplished, without it being dependent for us upon obtainer split-second warning. There would be ample time to observe whether forces had in fact been reduced to and held at agreed levels. Such a limitation, in the case of aircraft, might provide that only so many could be in the air at once. Total numbers of missiles might be limited. As to submarines, not more than a certain number might be allowed to be on station.

The President recognized the difficulties but pointed out that, if we do not follow this line, we must face the question what line do we follow. He did not see much hope for a world engaged in all-out effort on military build-up, military technology, and tremendous attempts at secrecy. One reason for seeking an inspection system in connection with the atomic testing is that if we get one such system we may then be able to go on to another. He recognized that this matter is very difficult, but added that, with aerial inspection, we can find out where great military concentrations are located, and what is their state of readiness. Even if the Soviets should be contemplating a massive surprise attack, if they wish to secure the results of such an attack they must prepare forces to move into the devastated areas, and these we could see. He concluded by saying that, in the long run, no country can advance intellectually and in terms of its culture and well-being if it has to devote everything to military build-up.

Dr. Killian said that in view of the gravity of this matter there is a need to have a more sustained study under way. He suggested setting up study groups, and a standing group of top governmental officials concerned who would follow the matter. They would go deeply into the problems involved in monitoring surprise attack. Dr. Kistiakowsky commented at this point that the Soviets have had a high-powered group at work since the end of World War II on disarmament. They were very well up on this subject, as evidenced by the fact that when our delegation made proposals at Geneva, the Soviets instantly showed knowledge of the weak points and the implications of such proposals. The President agreed with the suggestion. He thought that someone

should draw up a charter for the effort, showing just who would participate—i.e., from what agency, having what qualifications—whose time would be devoted to the effort, and who would comprise the top-standing body.

To indicate the need for a competent body in this area the President cited the importance of a periodic inspection of the inspection system and operations incident to supervision of suspension of atomic weapons tests.

Dr. Kistiakowsky added the point that everything to this point has been done on paper. He thought there was need for a high-level command (actually a task force) under the Joint Chiefs of Staff whose job would be to conduct monitoring and inspection, carry out maneuvers and tests against various combinations of forces and develop the necessary doctrine. The President thoroughly agreed. Dr. Killian recalled that our group at Geneva had proposed that we set up in the United States a small pilot system to see just how the proposals would work.

Dr. Killian next said that there is a group studying ways of improving the inspection system for the supervision of test suspension, thus offsetting the effects of the findings of the Hardtack II series of tests (which indicated that the test system devised last summer at Geneva is less effective than was then thought). The President said he saw possible merit in a scheme which allowed underground tests up to perhaps 10 KT. A corollary would be, however, that we would have to tell if test shots greater than this size were fired.

Dr. Killian next referred to some of Dr. Kistiakowsky's impressions and observations about the Soviet missile capability, since these impressions ran counter to our best intelligence estimates. Dr. Kistiakowsky said he was very much impressed with the importance that the Soviets attach to long-range ballistic missiles. These are in fact a focal point in their whole defense concept. They referred to it as a special area not subject to discussion at the Geneva meeting. He said it is his opinion that they now have an operational long-range missile force. The President said he could accept this possibility, but still holds a question as to the numbers and accuracy of such weapons. He then asked the question, if the Soviets should fire these weapons at us, where this action would leave them. They would still be exposed to destruction. In his mind there is the question whether this is a feasible means of making war; he granted that it is a feasible way of destroying much of the nation's strength, but the resulting retaliation would be such that it does not make sense for war. He said he thought it would be at least a few years before the Soviets could conceivably have enough missiles so as not to have grounds to fear retaliation.

A.J. Goodpaster
Brigadier General, USA

128. Memorandum of Conference with the President¹

Washington, January 14, 1959

OTHERS PRESENT

General Twining
General Goodpaster

General Twining said he wished to give the President a further report on the proposal for dispersal of certain high-yield weapons to [*text not declassified*]. A certain number are to be there in storage, another number in aircraft that are always there on the ground, and an additional number would be authorized to be sent in, and kept in aircraft on the ground, if reason developed to send in such aircraft.

The President said that he saw the reason for this but that, if this is what is proposed, the authorization should be stated in these terms. Otherwise it would seem we are being insufficiently strict in our arrangements. He thought a provision should be introduced indicating that for brief transit, during authorized maneuvers or in an emergency, this third group of weapons is authorized to be there, in aircraft, but never to be unloaded. General Twining said he was confident this could be worked out.

General Twining next brought out, for the President's information, that, following coordination with State and CIA, the Air Force is training a certain very limited number of Chinese Nationalist pilots in the U-2 aircraft. No commitment whatsoever has been made concerning their future use. The President stated that he thinks we must stay out of the northern area of mainland China; but the same considerations do not apply in the south.

General Twining next reported that meetings have been held on planning for the Berlin situation, with representation from State, JCS and CIA. He added that the French and the British are showing some tendency to talk about use of airlift as a possible line of action but that our State Department is strongly opposed to this type of solution. The President recalled a recent exchange he had had with Macmillan on this subject. He commented also that we are handicapped by the fact that our rights on the ground for access to Berlin are not fully clear and explicit.

Finally, General Twining asked that when the President visits Colorado Springs in mid-year he dedicate the golf course there, in the

¹ Source: Dispersal of nuclear weapons, training Chinese Nationalists in the U-2, Berlin. Secret. 2 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on January 15.

process making clear that it was not built at government expense. The President did not think he could dedicate the golf course since it is named for him, but would be glad to have some kind of ceremony there at which he would be able to make this point clear.

A.J. Goodpaster
Brigadier General, USA

129. Memorandum of Discussion at the 393d NSC Meeting¹

Washington, January 15, 1959

SUBJECT

Discussion at the 393rd NSC Meeting Thursday, January 15, 1959

Present at the 393rd NSC Meeting were the President of the United States, Presiding; the Vice President of the United States; the Secretary of State; the [Deputy?] Secretary of State; the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present and participating in the Council actions below were the Secretary of the Treasury; the Director, Bureau of the Budget; the Chairman, Atomic Energy Commission; and the Secretary of Commerce (Item 1). Also attending the meeting were the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Director, U.S. Information Agency; the Director, International Cooperation Administration; the Special Assistants to the President for National Security Affairs, for Science and Technology, and for Security Operations Coordination; the White House Staff Secretary; Assistant Secretary of Defense John N. Irwin, II; Assistant Secretary of State Gerard C. Smith; the Assistant White House Staff Secretary; the Executive Secretary, and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

[Omitted here are agenda items 1 and 2.]

¹ Source: Agenda item 3: U.S. Military Bases Overseas. Top Secret; Eyes Only. Extracts—5 pp. Eisenhower Library, Whitman File, NSC Records.

3. U.S. MILITARY BASES OVERSEAS

(SNIE 100–10–58; NSC Action No. 1876)

Mr. Gray pointed out that last autumn when trouble arose over the retention of our bases in Morocco, the Planning Board had asked CIA to prepare an Estimate on the prospects for the retention of U.S. bases in Morocco and eight other countries. The Planning Board discussed this Estimate and agreed that it would be desirable for the Council to hear a summary of the Estimate together with the views of the Secretary of State and the Chairman of the Joint Chiefs of Staff as to the net advantage to U.S. security of each of our overseas bases. In this connection he also reminded the Council that last March when the Nash Report on U.S. Military Bases Overseas had been discussed, the President had directed that our base system be reviewed each year and that “earnest and continuous scrutiny should be given . . . as to whether each U.S. overseas base throughout the world continues to represent a net advantage to U.S. security.” Mr. Gray then called on Mr. Allen Dulles who proceeded to report on our bases in North Africa, the Near East, on the three Far Eastern areas, Spain, Greenland, Iceland, and Latin America which latter area had not been in the original CIA Estimate.

Upon conclusion of Mr. Dulles’s report, Mr. Gray called on Secretary Dulles. Secretary Dulles said he had one observation to make about U.S. bases overseas. It was his view that in some of these countries at least we can probably carry on with our bases on a *de facto* basis for quite a little while if we are willing to do so. This was true especially of our bases in Africa. If, on the other hand, we try to formalize or legalize our position with respect to our bases, great difficulties would be created for us vis-a-vis the indigenous governments. Thus we have a situation which can be kept going on a *de facto* basis but not on a basis on which we formalize our specific rights and privileges over a specific number of years. Secretary Dulles said he realized this was not wholly satisfactory from the point of view of the Joint Chiefs of Staff but was probably a situation which would have to be lived with.

Secretary McElroy commented that if the Secretary had summed up the situation with respect to our bases in North Africa accurately, it would be important to avoid announcing any agreement with the indigenous governments there but that instead we should simply let matters drag on.

Mr. Gray then called on General Twining who asked permission to run through briefly each of the nine base areas covered in the original CIA Intelligence Estimate in order to point out the importance of each base to the U.S. The President expressed his approval and General Twining read a report dealing with our bases in Iceland, Greenland, Spain, Morocco,

Libya, Saudi Arabia, the Philippines, the Ryukyus, and Japan. (A copy of General Twining's report is filed in the Minutes of this Meeting).

In the course of this report the President inquired as to what constituted a reasonable *quid pro quo* for the maintenance of U.S. bases in Morocco while Secretary Dulles said that the situation with respect to our bases in Libya was very precarious. Secretary Dulles also pointed out that our negotiations with the Philippine Government on bases were not going at all well and that we have called Ambassador Bohlen home for consultation. He was expected to arrive in a few days.

As to Okinawa, Secretary Dulles recalled that about a year ago the President had suggested that a study be made as to the feasibility of consolidating all our military installations in Okinawa on one segment of the island. Secretary Dulles said he did not know whether this could actually be done but certainly at the moment our base installations in Okinawa sprawled all over the island. He then inquired as to the status of the study that the President had suggested. Neither Secretary McElroy nor General Twining knew about the precise status but Assistant Secretary Irwin pointed out that the study was being carried on. Already it had indicated the great difficulties of trying to concentrate all our military installations in one area of Okinawa. For one thing, such concentration would take up a disproportionate amount of arable land which would be hard on the natives of Okinawa.

The President commented in a familiar vein about the terrible difficulties which were inherent in the maintenance of U.S. bases in foreign countries. Secretary McElroy said that we would have to continue to run the island of Okinawa for a considerable time to come despite these difficulties. The President agreed that this was indeed the case but that we should run Okinawa in a way to cause the minimum amount of resentment from the inhabitants of the island. The President concluded the discussion of the subject by commenting on the spreading commitments of the U.S. both in the Atlantic and in the Pacific areas and suggesting that we might sometime have to make choices about our commitments.

The National Security Council:

a. Noted and discussed the subject in the light of an oral summary of SNIE 100–10–58 as brought up to date and with the addition of Latin American bases, presented by the Director of Central Intelligence.

b. Reviewed, on the basis of statements by the Secretary of State and the Chairman, Joint Chiefs of Staff, the net advantages to U.S. security of U.S. bases in Japan, Okinawa, the Philippines, Saudi Arabia, Morocco, Libya, Spain, Iceland and Greenland; as required each year, pursuant to NSC Action No. 1876.

c. Noted a statement by the President:

(1) Requesting a review of the importance of continued maintenance by the United States of the Sangley Point Naval Base in the Philippines.

(2) Agreeing as to the need for a timely report on the results of the study as to the feasibility of concentrating U.S. military installations in Okinawa in a single area.

NOTE: The action in *c* above, as approved by the President, subsequently transmitted to the Secretary of Defense for appropriate implementation.

[Omitted here is the remainder of the memorandum.]

131. Letter From John Foster Dulles to McElroy¹

Washington, January 24, 1959

Dear Mr. Secretary:

I believe the time has come for our two Departments to undertake the joint study of our strategic concept which you and I have

¹ Source: Proposes State-Defense study of U.S. strategic concept; encloses S/P paper and covering memorandum. Top Secret. 8 pp. NARA, RG 59, S/S-NSC Files: Lot 63 D 351.

discussed on several occasions in the past. This is, of course, related to the President's directive that paragraphs 13 and 14 of NSC 5810/1, Basic National Security Policy, be kept under continuing study.

In order to provide a point of departure for study of the strategic concept, the Policy Planning Staff of this Department has prepared the enclosed paper entitled "A Concept of US Military Strategy for the 1960s". This is a staff paper, put forward as a basis for discussion. I am myself reserving judgment on this paper pending such discussion.

As I have previously told you, I do not have in mind that we should make any abrupt change in our strategic concept, I am, however, convinced that IF we are to make a change in the next few years, we must now determine the direction in which we wish to go and begin to pave the way for the change.

Assistant Secretary Gerard C. Smith stands ready to meet with your people to discuss the enclosed paper or any other related proposals that your Department may wish to advance. I hope that we shall be in a position to report progress to the President within the next few months.

Sincerely yours,

John Foster Dulles

Paper Prepared in S/P

Washington, January 5, 1959

A Concept of US Military Strategy for the 1960s

I. Objectives

1. The objective of US military strategy should be:

Primary, to deter Communist imperialism from resort to force; and

Secondary, to deal with Communist aggression if it occurs.

We also need to prevent and halt resort to force within the non-Communist world. We shall be militarily prepared to act to this end if we have an effective strategy and capability to deal with limited Communist aggression.

II. Deterring Communist Aggression

A. General War

2. We must deter Soviet nuclear attack on the US and other major Communist aggression which would threaten a permanent alteration of

the world balance of power against us. Although we must have active and passive defensive capabilities to reduce the disastrous effects of a Soviet nuclear attack and should undertake preparatory measures to facilitate national recovery after attack, the primary component of our general war deterrent is our strategic nuclear striking force.

3. If our deterrent is to be effective, the Communists must be convinced that retaliation will be inevitable. This requires that our strategic striking force be relatively invulnerable. As the USSR will know the location of most fixed installations (air bases, missile sites, etc.) in the non-Communist world, mobility and elusiveness are among the qualities we should emphasize in the further development of our striking force.

4. A relatively invulnerable US strategic striking force would make impracticable a pre-emptive Soviet nuclear attack to disarm us. It would also reduce the risk of war by misadventure as we would not have to react instantaneously to an ambiguous threat of major Communist aggression; we would have time to verify the threat; we might also have time for maneuver.

5. The Communists must also be convinced that our strategic striking force could inflict a scale of damage that would be fatal to the structure of their empire. It may not be necessary that we be able to destroy most Communist military targets, with the side effect of killing most of the Communist peoples. It may be sufficient to have a known capability to destroy the imperial control centers and power bases. A capability so designed would be more acceptable to our allies and the uncommitted peoples than a counter-force capability with its attendant danger of severe fall-out effects extending around the world.

B. Overt Limited Aggression

6. We must deter a wide range of possible overt limited aggressions by Communist imperialism. This kind of Communist aggression can best be deterred by further development of our present strategy of forward defense.

7. We should continue to encourage states on the periphery of the Communist empire to maintain armed forces commensurate in their economic capacity. Where the threat is great and the will to resist strong, but the indigenous economy weak, we should, as we have in the past, provide appropriate assistance upon request to enable the endangered state to maintain forces at least capable of harassing and delaying a Communist invasion.

8. We should also continue to encourage those few non-Communist states that have the requisite military experience, manpower and economic capacity to develop armed forces that could be made available outside their national territory for collective defense. We should where necessary provide military aid to this end.

9. The US will have to provide the major supporting force at all points on the periphery of the Communist empire. For us, the essence of a strategy of forward defense is speed of reaction.

10. Our deterrent limited war force should, therefore, be highly mobile and so deployed as to be able to react quickly in any part of the world. It should comprise a balanced and flexible combination of ground, sea and air power. In view of the growing difficulty of maintaining foreign bases, much of this force may have to be sea-borne in the 1960s. Its training should enable it to perform effectively in conjunction with widely varied local forces and in all types of terrain and climate.

11. The force should have nuclear capabilities but should be able to fight effectively without using those capabilities.

12. Such a US limited war force would give the nations under the threat of overt Communist limited aggression greater confidence than they now have in their security and defensibility.

C. Indirect Aggression

13. We must deter Communist imperialism from indirect aggression—covert resort to force. We should continue to encourage and where necessary assist all states outside the Communist empire to maintain the effective internal security forces and procedures which constitute the first line of defense against Communist indirect aggression. While this function can normally be left to police forces, the magnitude of the threat of indirect aggression to states on the periphery of the Communist empire requires that the training of their military forces include preparation for internal security duties.

14. Indigenous efforts to deter covert Communist resort to force should be reinforced by a readily available US limited war force as described in paragraphs 10 and 11. This is particularly important for the peripheral non-Communist states where the proximity of Communist military power, unless offset by the evident, prompt availability of US power, tends to sap the courage of non-Communists and to feed the aggressiveness of Communists.

III. Dealing with Communist Aggression

15. *General War.* Given a relatively invulnerable US strategic nuclear striking force with a known capability to inflict a scale of damage that would be fatal to the structure of the Communist empire, it is very unlikely that the Communists would venture major aggression which would risk bringing that force into action. If they did, the relative invulnerability of our force would enable us to tailor our response to the character of the aggression. At the maximum, we should employ the full power of our force to destroy the structure of the Communist empire.

16. *Limited Aggression.* Our military response to Communist limited aggression, overt or covert, should deny the objectives of the aggression in a manner least likely to lead to a large expansion of the scope and intensity of the hostilities.

Enclosure

Memorandum From Smith to John Foster Dulles

Washington, January 20, 1959

SUBJECT

Review of Strategic Concept

In your letter of July 23, 1958, to the President, you said you had told Secretary McElroy that you remained of the opinion that the military doctrine set forth in paragraphs 13 and 14 of the Basic National Security Policy paper (Tab B) is rapidly outgrowing its usefulness and that we need to apply ourselves urgently to finding an alternative strategic concept. You stated also that we should seek the President's approval of further study of an alternative doctrine by a small State-Defense group. You will recall that the President later gave his approval for this study.

When I approached Defense on this subject in early August, they requested that the study be deferred until the FY 1960 budget was behind them. I accordingly let the matter lie dormant.

The budget process is now drawing to a close, and we should press ahead without further delay. My talks with General Picher, Director of the Joint Staff of the JCS, and others in the Pentagon have convinced me that we must take the initiative, as Defense and the Chiefs seem to be paralyzed by inter-service differences.

S/P has accordingly ventured to draft "A concept of US Military Strategy for the 1960s" (Tab C) to serve as a basis of discussion with the Pentagon. This concept, which I believe reflects views that you have expressed in several conversations with Secretary McElroy, differs from the current strategic concept in the following major respects:

1. We abandon the major premise of the current concept—i.e. the threat of massive nuclear retaliation is the primary deterrent to all kinds of Communist aggression. A corollary current premise is that general war forces are also limited war forces. Our premise is that the massive retaliation threat of our general war capability effectively deters only major Communist aggression. To prevent limited Communist aggression, a *separate* deterrent strategy and force, specifically designed for this purpose, is required.

2. We also abandon a major thesis of the current concept—i.e. any substantial overt engagement of US and USSR armed forces or any substantial Soviet aggression against the NATO area would automatically trigger massive nuclear retaliation against the USSR. As you have pointed out, this thesis is becoming less and less credible. Although not specifically stated in our paper, we assume the probability of lesser US response to Soviet aggression which does not clearly threaten a permanent alteration of the world balance of power against us.

3. We question the current counter-force strategy which provides that the primary mission of our strategic nuclear striking force is to destroy military targets, especially nuclear strike capabilities, in the Communist empire. We believe that this strategy will become increasingly infeasible in the dawning era of quick-reacting and elusive missile weapons systems. Moreover, the destruction of many military targets would require ground bursts of very large yield weapons with resultant heavy fall-out, the effects of which, in addition to causing millions of unnecessary casualties in the Communist empire, would extend around the world. Finally, the cost of matching the Communists missile for missile, an inherent necessity of the counter-force strategy, would in a very few years require defense budgets substantially larger than the much debated FY 1960 budget. You will recall that the President has on a number of occasions expressed concern that we seem to be “over-insuring” by accumulating too many strategic weapons systems. Our paper, therefore, inclines toward an alternative strategy, which has many adherents in the Pentagon, of striking a finite number of control centers and power bases of the Communist empire. Although the prime targets of this strategy are population centers, the fall-out effects and the number of casualties would be far less than under a counter-force strategy as we believe that air bursts of many fewer weapons of much lower yield would suffice to accomplish the mission.

4. Because we incline to a smaller strategic striking force, we place much greater emphasis than the present concept on the invulnerability of the force.

5. We question a major assumption of the current concept—i.e. nuclear weapons will be used in most limited war situations. The fact is that whenever the issue has arisen in the past decade, we have consistently drawn back from using nuclear weapons in limited war situations. We believe that we would rarely find it politically practicable or militarily desirable to use nuclear weapons and accordingly propose that our limited war force be able to fight effectively without these weapons.

Since the question of cost is now very much to the fore, it is pertinent to mention my belief that it is reasonable to assume that the savings resulting from a shift to a smaller strategic nuclear striking force would offset the increased costs of an effective limited war force.

As you indicated to the President that the review of the strategic concept would be held very closely, I have sought clearance of this memorandum from G and C only.

Recommendation

It is recommended that you sign the attached letter (Tab A) to Secretary McElroy transmitting the S/P paper as a basis for State-Defense discussion.

/S/ John Foster Dulles

132. Memorandum From John Eisenhower to Goodpaster¹

Washington, January 27, 1959

SUBJECT

Comparison of NIE 11-4-58 with NIE 11-4-57

NIE 11-4-58 (hereafter referred to as NIE 58) and NIE 11-4-57 (hereafter referred to as NIE 57), which it supersedes, are generally consistent except for the estimates on Soviet long-range bombers.

ICBM

NIE 57 estimates ten prototype missiles of 5500 nautical miles, CEP 5 nautical miles, to be available for operational use in 1959. This assumes that the first operational unit will be equipped with prototype rather than series produced missiles. NIE 59, while it states that progress in ICBMs has not been so fast as had been estimated, continues to give the Soviets 10 operational ICBMs during the year 1959. It adds the factor of 50% operability and further estimates that as of 1962-66 the CEP could be reduced to about 3 nautical miles, with a payload of 2000-5000 pounds. Furthermore, NIE 58 estimates that the Soviets could have

¹Source: Comparison of NIE 11-4-58 with NIE 11-4-57. Top Secret. 2 pp. Eisenhower Library, White House Office File, Records of the Office of the Staff Secretary, CIA.

in their inventory 500 ICBMs in 1962, a date which could possibly be pushed forward to 1961.

IRBM

NIE 57 estimates that the first operational capability of 1000 nautical mile missile occurred in 1958. NIE 58 deals with the IRBM very little but estimates this capability to be in existence.

Surface-to-Air-Missiles

Both NIE 57 and NIE 58 picture an extensive system of surface-to-air missiles in the complex around Moscow. These missiles are estimated to be effective at altitudes up to 60,000 feet. NIE 57 mentions vulnerability to low-altitude attack. This is confirmed in NIE 58 with the additional estimate that the horizontal range would be only 15–30 nautical miles. Furthermore, NIE 58 believes the Soviets will have a limited A-ICBM capability between 1963 and 1966.

Long-Range Aircraft

In the area of long-range aircraft, the two estimates represent a continuing downward trend. NIE 57 states that production of both BISONs and BEARs has fallen short of NIE 56 estimate. NIE 58 goes much further stating the belief that despite the efforts devoted to developing the BISON and BEAR the Soviets have probably decided within the last year or so to forego a rapid buildup with present heavy bomber models. The following estimates apply to heavy bombers and tankers.

<i>NIE 11-4-57²</i>			<i>NIE 11-4-58</i>		
1957	—	90–150		—	
1958	—	150–250	1958	—	100–125
1959	—	250–450	1959	—	100–150
1960	—	400–600	1960	—	100–200
1961	—	400–600	1961	—	150–250
1962	—	400–600	1962	—	200–300
1963	—		1963	—	200–300

² Here we have a three-way split. The Air Force claims that these figures will represent only bombers. The Army and Joint Staff think the figures are too high. The Navy thinks that the low-limit figures should be correct (400 aircraft in 60–62). [Footnote is in the original.]

ANNEX

MAIN TRENDS IN SOVIET CAPABILITIES AND POLICIES, 1957–1962

THE PROBLEM

To review significant developments affecting the USSR's internal political situation, relations with Bloc states, economic situation, military programs, and foreign policy, and to estimate probable Soviet courses of action through 1962.

SUMMARY ESTIMATE

1. Both the Soviet internal scene and Soviet external policy continue to be strongly marked by change and innovation. The ascendance of Khrushchev has further accentuated the flexibility and pragmatism of the post-Stalin leaders' approach to their major problems. But none of the changes in Soviet policy suggests any alteration in basic aims or in the concept of an irreconcilable conflict between the Communist and non-Communist worlds. Indeed the Soviet leaders display a great deal of confidence, buttressed by their recent political and technological successes, in the prospects for ultimate victory of their side.

Trends in Soviet Foreign Policy

2. The respect of the Soviet leaders for US nuclear power will continue and they are unlikely to initiate general war or to pursue courses of action which, in their judgment, gravely risk general war, over the next five years. At the same time, however, they are probably confident that their own growing nuclear capabilities, added to their great conventional strength, are increasingly deterring the US and its allies from courses of action gravely risking general war. As a result the USSR probably regards itself as progressively achieving greater freedom of maneuver in local situations.² The USSR's posture during the Suez and

² The Assistant Chief of Staff, Intelligence, USAF, does *not* agree with the estimate that the Soviets are likely to feel that they are achieving *greater* freedom of maneuver nor that they will regard the US as *increasingly* inhibited by growing Soviet strengths.

The US has always been cautious of risking general war. This is certainly evident to the Soviets. But also evident to them are examples such as Berlin, Korea, Taiwan, and Syria which underline US firmness when a clear challenge is presented.

The Assistant Chief of Staff, Intelligence, USAF, has found no specific evidence or indicators from which the Soviets could derive the opinion that US caution will *increase* as Soviet nuclear capabilities grow. In fact, a convincing case could be made for increasing *Soviet* caution, based on fear that the West would feel compelled to exercise its superior military capabilities before the Soviets might reverse the relative military advantage.

Syrian crises convinces us that the use of threats will remain a basic element in Soviet policy. At times the Soviet leaders will probably bring the threat of Communist military strength into the open by menacing words or harsh diplomatic exchanges. Moreover, the USSR might go considerably further in certain situations—e.g., by supporting indigenous Communist or other forces in local military action, or even sending Soviet “volunteers,” judging that grave risk of general war would not result. Thus the risks of general war arising through miscalculation may increase.

3. But in general the Soviet leaders will probably continue to prefer non-military means of achieving their objectives. They probably regard the present world situation as ripe to develop further in their favor through continuation of such tactics. While determined to build up their armed strength against any eventuality, the present leaders have probably decided that a continuation of “peaceful co-existence” will best assure against the risks of nuclear conflict and at the same time offer far-reaching opportunities to weaken and divide the Western powers and to promote Soviet influence in the key underdeveloped areas of the world.

4. Almost certainly the Soviet leaders expect further crises as the interests of the two great power groupings clash in the Middle East and elsewhere. They will take a strong line in such crises. Yet we believe that in general they will continue to emphasize such tactics as high-level goodwill visits, broadened contacts, promotion of cultural and other exchanges, expanded foreign trade, long-term credits and technical assistance, and arms aid. Their aim will be to cause further blurring of the lines between the Communist and non-Communist worlds and to undermine and cause a retraction of Western, especially US, strength from around the periphery of the Bloc.

It appears to the Assistant Chief of Staff, Intelligence, USAF, that *increasing* Soviet boldness during the next five years will be unlikely unless the Soviets attain clear military superiority, or unless the Soviets have reason to expect a wavering or irresoluteness in US policy. The first condition is not believed attainable; the second is not believed demonstrable. The Assistant Chief of Staff, Intelligence, USAF, believes therefore that paragraph 2 should read as follows: “The respect of the Soviet leaders for US nuclear power will continue and they are unlikely to initiate general war or to pursue courses of action which in their judgment, gravely risk general war over the next five years. At the same time, however, they probably regard their own growing nuclear capabilities, added to their great conventional strength, as enforcing caution on the Western powers. The USSR’s posture during the Suez and Syrian crises convinces us that the use of threats will remain a basic element in Soviet policy. At times the Soviet leaders will probably bring the threat of Communist military strength into the open by menacing words, harsh diplomatic exchanges, by supporting indigenous Communist forces, or even sending “volunteers,” judging that grave risk of general war would not result. The Soviets must recognize, however, that the possibilities of miscalculation in crisis situations are such that general war might nevertheless occur, and that preparedness for it is therefore essential. We remain convinced that the USSR will not desire to let any crisis develop to the point of seriously risking general war.” [Footnote is in the original.]

5. The Soviets will almost certainly intensify their efforts to woo the underdeveloped countries, particularly in Asia and Africa, in order to estrange them from the West and to lay the groundwork for growing Soviet influence. The USSR has the economic resources for considerably expanding its "trade and aid" campaign, while its extensive stocks of obsolescent arms will permit it to capitalize further on the desires of many underdeveloped countries to strengthen themselves vis-a-vis their neighbors.

6. The USSR clearly regards the chief immediate opportunities for expanding its influence to lie in the Middle East. It is shrewdly supporting Arab nationalism against the West and thereby attempting to avoid the appearance of seeking undue political influence of its own. It is also conscious of the extent to which vital Western interests are involved in the area, and of the risks which would arise from a direct test of strength between the great powers themselves. Nevertheless, its longer run aims are to eliminate Western military power and political influence from the area; to attain a position from which to control Middle East oil, and ultimately to dominate the area.

7. During the next few years the chief Soviet objective in Western Europe will be to weaken and divide the NATO powers and above all to induce a withdrawal of US military strength. To this end the USSR will continue to promote some form of European security treaty to replace both NATO and the Warsaw Pact. But the USSR will almost certainly remain adamant on German reunification on any terms except its own, however much this may limit its maneuverability in Western Europe.

8. As a means of forwarding their peaceful co-existence policy and of advancing their efforts to neutralize US nuclear striking power, the Soviets will seek on the whole to give the appearance of a flexible and constructive attitude on disarmament. They probably desire some form of simple, "first-stage" agreement with minimum inspection and control but we remain convinced that they will reject comprehensive inspection and controls.

Trends in Soviet Relations with Other Communist States

9. The USSR's reluctant acceptance of a degree of Polish autonomy and of Yugoslavia's special position, as well as its recognition of Communist China's stature and role within the Bloc, indicates a continuing belief that some greater flexibility in Soviet relations with other Communist states is both necessary and desirable in order to preserve and strengthen the Bloc. However, mindful of last year's developments in Poland and Hungary, the USSR now seems determined to go slow in any further evolution of its relationships with the European Satellites, and above all to avoid any repetition of the Hungarian or even Polish experiences. It would almost certainly revert to repressive policies in

event of serious threats to its position in Eastern Europe. Barring such developments, we think the USSR will pursue a cautious policy of economic aid, adjustment to national peculiarities, and toleration here and there of a somewhat greater degree of Satellite autonomy.

10. The strong identity of interest among the various Bloc regimes, their dependence upon Soviet aid and support, and the USSR's overwhelming military power will tend to maintain the essential solidarity of the Bloc over at least the next five years. But the underlying forces released by developments since Stalin's death will persist, creating further instability within the Satellites. Additional changes in intra-Bloc relations are likely.

Internal Developments

11. Two of the major problems posed by Stalin's death have persisted: who is to rule, and how is the ruling to be done. While Stalin's successors agreed on fundamental objectives—maintenance of Party dictatorship, continued military buildup, and rapid economic growth—they differed as to the policies best suited to pursue these aims in the conditions of the USSR today. These differences in turn complicated the problem of who was to rule, rendering the leadership unstable.

12. Now, after four years of uneasy collective leadership, Khrushchev has emerged as dominant. Although he still lacks the degree of power achieved by Stalin through the use of police terror, he has disposed of his major rivals and asserted Party mastery over the economic bureaucracy and the military. These developments have probably enhanced the stability of the Soviet leadership, though this leadership will be subject to continuing strain over the next several years as difficult policy problems arise. We think that only the most severe problems could threaten the present leadership arrangements, but, considering the magnitude of the problems which the regime faces, and the risks of failure in the bold programs which Khrushchev has undertaken, issues of such gravity could arise. In such an event Khrushchev would probably move toward absolute rule, if necessary attempting to reinstitute terror for this purpose. But important elements among the elite groups would be alert to and would probably oppose such a development, particularly if a recourse to terror were involved.

13. As to the question of how to rule, the present leadership has shown awareness of the need to overcome the alienation of the Soviet population which has been caused by fear and deprivation and expressed in apathy. Instead of a widespread use of terror, which in the end might not spare the leaders themselves, another approach was felt to be necessary in order to keep the society cohesive and responsive to central direction. In addition, a shift in emphasis to the use of incentives and the encouragement of initiative seemed to give promise of increasing Soviet strength, particularly in the economic field.

14. This approach has been extensively applied to the Soviet economy. A series of administrative reforms has sought to make better use of specialist knowledge, local talent, and individual initiative. The latest and largest of these is a radical reorganization of industry which seeks to transfer to officials on the spot more powers in the detailed execution of national policy. The incentive program particularly in agriculture, aims not only at stimulating higher labor productivity but also at increasing popular support for the Khrushchev regime. The highly ambitious housing and agricultural programs will probably be successful enough to provide a gain of perhaps as much as one-fifth in per capita consumption over the next five years.

15. The achievement of such a gain would probably produce some increase in popular support, but a consumption program of this size will compete more sharply than heretofore with requirements for industrial investment and defense. This competition has already been partly responsible for the abandonment of the Sixth Five-Year Plan (1956–60) in favor of a seven-year plan for 1959–65. The issue of competing priorities, however, has not been finally settled by this action and is certain to arise again.

16. Most of the changes which have occurred bear the stamp of Khrushchev; given his self-confidence and flexibility, the outlook is for further experimentation so long as he remains in power. By and large, we believe that his policies will be successful in generating more positive support among the population and in stimulating a further substantial growth in over-all Soviet power over the next five years. But his changes have created tensions and forces in Soviet society, the ultimate impact of which is difficult to foresee. The policy of a cautious relaxation applied in the intellectual field, for example, has had disagreeable consequences for the regime. Wider contacts with foreign countries have opened the USSR to disturbing influences. Youthful nonconformity is an increasing problem, and a number of critical writers are spreading among a small but increasing circle of readers a climate of dissatisfaction and of impatience with the pace of official reforms. The regime has made little progress in its counterattack upon these forces.

17. Moreover, Khrushchev's expansion of the Party's role as the chief instrument for managing the reform process places a heavy load upon it. With the downgrading of the secret police, the Party apparatus has assumed new responsibilities for insuring political conformity; with the abolition of most economic ministries it now has a much larger role in carrying out centrally determined economic policies. If the Party proves inadequate to these tasks, the prospects for success of the regime's ambitious economic and political programs will be greatly diminished.

18. The role of the party becomes even more critical when viewed in a perspective extending beyond the period of this estimate. For the next five years at least, the regime's totalitarian controls over the Soviet people almost certainly will not be seriously compromised. But over the longer run it is far from certain that the Soviet citizen can be educated to a higher level, urged to exercise his own initiative, given increasing opportunity for comparisons with other countries, and encouraged to expect a significant improvement in his living standard, and at the same time submit without question to a leadership which incessantly proclaims, and frequently exercises, the right to make all important decisions for him, regardless of his personal desires. Eventually it may turn out that the benevolent totalitarianism which Stalin's successors seek to achieve is an impossible contradiction and that the forces released in the search for it will require the leadership to revert to earlier patterns of control or to permit an evolution in some new direction. Even the latter changes would not necessarily alter the basic threat which a dynamic USSR poses to the Free World.

Trends in the Growth of Soviet Power

19. Notwithstanding the many problems confronting the Soviet leaders, we foresee a further rapid growth in the chief physical elements of Soviet power over the next five years. Particularly notable will be the continued rapid expansion of the Soviet economy, further scientific and technical advances in a wide variety of fields, and a continued buildup and modernization of the USSR's already massive military strength.

20. *Economic Growth.* Soviet economic growth over the next five years will continue to be faster than that of the US, though somewhat slower than during the Fifth Five-Year Plan (1951–55), chiefly because of some redirection of investment and a declining rate of growth in the labor force. We estimate the average growth in Soviet GNP as around six percent annually during the next five years. In dollar terms Soviet GNP would rise from about 40 percent of US GNP in 1956 to about 45 percent in 1962. However, estimated Soviet defense expenditures, in dollar terms, are already about equal to those of the US.

21. *Scientific and Technical Progress.* The rapid expansion of the USSR's technical and scientific capabilities, critical to the growth of Soviet industrial and military power, will also continue. Although total Soviet scientific capabilities may not equal those of the US, the USSR has been able to make comparable achievements and to forge ahead in certain areas of critical military and industrial significance by concentrating its efforts in these fields. The number of university level graduates employed in scientific and technical fields already exceeds that in the US, and probably will be about 40 percent greater than that in the US by 1962.

22. *Military Strength.* Of outstanding significance has been the USSR's progress in the development of advanced weapons and delivery systems:

a. The USSR is developing a variety of improved nuclear weapons, particularly those employing thermonuclear principles; its present stockpile could include weapons with yields ranging from about 4 KT up into the megaton range. By 1958–59 the most powerful Soviet bombs could probably yield up to 20 MT, but missile warheads would still have yields considerably less than this. We also estimate a substantial Soviet program for expanding fissionable materials production, but the availability of such materials will continue through 1962 to be a limiting factor on the size of many military as well as nonmilitary programs.

b. The USSR has probably tested an ICBM vehicle and we now tentatively estimate that it could have a few (say 10) prototype ICBMs available for operational use in 1959 or possibly even earlier, depending upon Soviet requirements for accuracy and reliability.³ The USSR could now have available ballistic missiles with maximum ranges of 75, 175–200, 350, and 700 n.m.; by 1958 it could probably also begin to have available a 1000 n.m. IRBM.

23. Meanwhile, the USSR will probably continue to maintain a balanced and flexible structure of strong naval, air, and ground forces, supplementing these with new weapons. Nevertheless, the manpower strength of the Soviet forces appears to have been reduced considerably from Korean War peaks, and some further reductions and streamlining are likely, though not to a substantial degree.

a. We estimate that the Soviet long-range bomber force has grown to some 1,500 bombers at present, though it includes a larger number of jet medium bombers and fewer heavy bombers than we had previously estimated. While we think that this force will not change significantly in size during the period of this estimate, we believe that it will be further strengthened by the replacement of obsolete BULL piston medium bombers with jets, by the introduction of additional heavy bombers, and by further development of inflight refueling. However, any estimate of future strength must be highly tentative, especially for heavy bombers, since Soviet policy in these respects is still shrouded in doubt. Subject to such qualifications, we estimate that the Soviets may by mid-1960 have about 400–600 heavy bombers and tankers of jet and turboprop types, in a long-range air force totalling something between 1400 and 1700 bombers. We also estimate that the number of heavy bombers and

³ The estimate made in this paragraph must be considered tentative pending completion of SNIE 11–10–57: The Soviet ICBM Program. [Footnote is in the original.]

tankers will probably remain fairly steady after 1960, while the total long-range bomber strength will probably decline slightly.⁴

b. Further strengthening of Soviet air defenses will occur as a result of improved fighter performance, a higher proportion of improved all-weather fighters, better radar and communications equipment, and widespread employment of improved surface-to-air and air-to-air missiles.

c. The Soviet ground forces have been extensively reorganized and modernized; further improvements in firepower and mobility are likely during 1958–62. Training and doctrine are being adapted for modern warfare, nuclear as well as non-nuclear. We still estimate about 175 line divisions, but their actual strengths probably vary from somewhat in excess of 70 percent of war strength to as low as 30 percent. Increasing attention is being paid to airborne and air-transportable forces, whose capabilities will increase considerably by 1962.

d. The Soviets are engaged in an extensive naval program, especially in the submarine category. There are recent indications that a shift to new designs of submarines may be in progress. Their submarine force is estimated at about 475 at mid-1957, including nearly 300 submarines of modern design. We estimate that the submarine force will approximate 560 submarines by mid-1962. The first submarine propulsion reactor could now be available, and by mid-1962 the USSR could probably produce about 20 nuclear-powered submarines. A few converted missile-launching submarines could now be in operation; and by mid-1962 the USSR may have a total of 50 in all categories of submarines equipped with guided missile armament.

I. INTERNAL POLITICAL DEVELOPMENTS

The Victory of Khrushchev and the Party

24. During the past year Khrushchev has succeeded in re-establishing the Communist Party's dominance over other elite groups in Soviet society and, within the leadership itself, has established his

⁴ The Assistant Chief of Staff, Intelligence, USAF, believes that the USSR would regard it as essential to have a more substantial intercontinental attack capability, providing for greater strategic flexibility and a much larger capability for re-attack—in short, a force which would provide the Soviets a greater chance of success in general war—while they are working to acquire an additional nuclear delivery capability with new weapon systems, including long-range missiles. He therefore believes that the 400–600 heavy aircraft estimated above would all be bombers and that by mid-1961 there will be 300–500 additional aircraft as tankers in operational units.

The Assistant Chief of Staff, Intelligence, Department of the Army, and the Deputy Director for Intelligence, The Joint Staff, believe, on the other hand, that the number of heavy bomber/tanker aircraft and the total number of long-range aircraft are both more likely to approximate the lower than the higher figures given above. See their footnote on page 33. [Footnote is in the original. For reference footnote, see the footnotes following paragraph 139.]

own pre-eminence. By means of the June and October 1957 purges and the industrial reorganization, the Party demonstrated its supremacy over the economic bureaucracy and the military, while Khrushchev, through skillful political maneuvering, eliminated his chief rivals from the Party Presidium.

25. The June purge of Malenkov, Molotov, and Kaganovich ended four years of joint rule by a small circle of Stalin's most prominent heirs. Both policy differences and personal rivalries were involved. The losing group not only distrusted many policy innovations sponsored by Khrushchev, but probably was alarmed by the way in which his energy and political acumen were enabling him gradually to assume a dominant role. From the key position of First Secretary, he had built a political machine within the Party apparatus, managing Party appointments so thoroughly that, although he seems to have faced defeat in the Presidium in June, he won an apparently hard-fought and decisive victory once he managed to transfer the dispute to the larger Central Committee.

26. Then in October, the Party moved against Marshal Zhukov, who had been elevated to full membership in the Presidium at the time of the June purge. It is likely that the Party feared an attempt by Zhukov to use his new political strength to resist certain aspects of Party control in the armed forces. He is known to have been impatient with such controls in the past. However, nothing in the Zhukov affair suggests that he had been preparing a coup by the armed forces against the Party or that he even had political ambition of this kind. But Khrushchev and other Party leaders were probably extraordinarily sensitive to the potential dangers of a military force not thoroughly under Party domination. Furthermore, Khrushchev himself may have regarded Zhukov as a potentially dangerous rival.

27. Although there remains a gap between Khrushchev's present powers and those accumulated by Stalin, he does not appear, for the present, to have any close rivals. Probably no major policy can be adopted without his approval. A majority of the new Presidium are his proteges, and the others lack resources sufficient to oppose him if they were inclined to do so. But while Khrushchev has gained a clear field for his policies, he has not used police terror against his colleagues in the manner of Stalin and has indicated in various ways that he does not propose to try. Moreover, though the Presidium is still the major repository of political power and is likely to remain so, Khrushchev by his recourse to the Central Committee in both June and October has re-emphasized the formal subordination of the Presidium to that body.

Future Leadership Problems

28. The same factors which led to the events of 1957 are likely to generate recurrent problems in Soviet politics over the next five years. Certain of these problems will arise from the Party leadership's continuing efforts, while utilizing the professional skills of specialized groups, to suppress the accompanying tendency for these groups to expand their political influence. Others will be created if Khrushchev, as seems likely, attempts to place beyond challenge his own position as undisputed head of the Party, and thereby of the USSR.

29. We believe that, despite the decisive victories scored by Khrushchev and the Party during 1957, these closely-related problems will provide continuing elements of instability in the Soviet leadership. As for Khrushchev's own position, even some of his present supporters in the Presidium and Central Committee may in time come to doubt the wisdom of his bold foreign and domestic policies. Others may become alarmed as they see in his maneuvers a tendency to one-man rule and perhaps a threat to themselves. The problem of succession to Khrushchev might add a further unsettling element; the usual intrigues within the Party are likely to be intensified by the maneuverings of his colleagues and subordinates to get into position for the struggle which they will anticipate following his death or incapacitation.

30. Furthermore, we do not regard the defeat of the economic bureaucrats and the military as necessarily final. So long as the Party refrains from a resort to widespread terror and continues to place a high premium upon professional competence, these groups will try again to influence policy in directions which accord with their professional interests and assessments. The economic bureaucrats are indispensable to the industrialized Soviet state, and this will tend to restore at least some of their political influence. The military impatience with Party controls which Zhukov represented is too widespread to be eradicated by his ouster and will probably find other spokesmen. A weakening of unity within the Party apparatus would improve the opportunities for such a development, since these groups probably will remain important enough to be regarded as desirable allies in intra-Party intrigues.

31. These elements of instability will subject the leadership to strain during the next several years as difficult policy problems arise. We think it probable, however, that only the most severe problems could threaten the present leadership arrangements. Khrushchev will almost certainly attempt further to consolidate his position, perhaps following up the Presidium purge with the elimination of opponents in the Central Committee as well. In view of his present strength and demonstrated political skill, only an issue grave enough to produce a general coalition against him appears likely to upset him or to force him into more than temporary compromises.

32. But considering the magnitude of the problems which the regime faces, and the risks of failure in the bold programs which Khrushchev has undertaken, we believe that issues of such gravity could arise. For example, the dislocations created by his industrial reorganization program, coming on top of an overambitious combination of programs—defense, heavy industry, agriculture, and housing—might so aggravate existing problems as to produce a severe crisis. So might foreign policy moves which appeared to raise the risk of general war to a level considered foolhardy by spirits less bold and confident than Khrushchev. In such grave instances his colleagues and perhaps even his defeated opponents might muster a formidable challenge.

33. We do not regard Khrushchev's denunciation of Stalin's use of terror against political opponents as a guarantee that, under such circumstances, or perhaps even in anticipation of them, he would not seek to reinstitute police terror to achieve absolute rule. Instead, we think it probable that, if other means were exhausted, he would make such an attempt. But important elements among the elite groups would be alert to, and would probably oppose, such a development, particularly if a recourse to terror were involved.

34. Whatever developments occur within the Soviet leadership over the next five years, they are not likely to result in widespread civil violence or to involve broad sections of the population in active politics. Instead, we believe that any changes which take place will be confined within a relatively small group which will continue to monopolize political power, although it may exercise that power with a somewhat greater regard for public morale.

Changes in Internal Policy

35. At present, despite the many problems created by the changes in internal policy, the regime's position vis-a-vis the population remains basically stable. A number of elements of stability have long been evident: the regime's monopoly of physical force and the means of communication, the vested interests which tie important groups to the existing system, the unifying effect exerted by the Party, a wide-spread apathy towards politics and a general disbelief in the possibility of radical change. In addition, Western contacts with the Soviet population have revealed a wide-spread sense of national pride over the USSR's material accomplishments and its role as leader of a world bloc.

36. Nevertheless, Stalin's successors recognized that his policies toward the Soviet population had produced so much apathy, antagonism, and fear that they were depriving the regime of popular support and inhibiting economic growth. Although differing among themselves on many issues, they generally agreed on the need, while maintaining as much control as possible, to find ways to narrow the rift between the

regime and the population. In contrast to Stalin's harshness and mistrust, they apparently started from the premise that the Soviet citizen is a basically loyal supporter whose energy and initiative, if encouraged and rewarded rather than repressed, can serve the regime's purposes. Most of the post-Stalin internal changes stem from this premise, of which Khrushchev is the prime exponent. He is, however, no less an exponent of the equally important principle that the Party retains unlimited rights to determine the pace and scope of relaxation, to reverse it at will, and to intervene at all levels of society.

37. In consequence, changes have been extensive but cautious. In the political sphere, they include the leashing of police terror, the destruction of the Stalin cult (but also the endorsement of much of Stalin's work), and an effort to humanize the style of leadership, both central and local, so as to narrow the rift dividing those in authority from the masses. Within the Party itself, a number of special channels by-passing the formal organization have been eliminated, the semblance of democratic procedures has been revived, and "loyal" criticism from rank-and-file members is encouraged in an effort to restore the Party's vigor and make it an effective political instrument. In economic matters, incentives are more widely used and a series of administrative reforms, culminating in a radical reorganization of industrial administration, has sought to make better use of specialist knowledge, local talent, and individual initiative. In the intellectual sphere, the regime has relaxed censorship to allow greater artistic freedom and has permitted, even encouraged in some cases, wider contacts with the West on a variety of levels.

Impact on Popular Attitudes

38. These innovations have produced mixed results. The lessening of terror has won the regime a favorable reaction from all sections of the population. Economic responses are less clear. Probably a part of the gain in agricultural output is attributable to improved morale among the peasants, but the campaigns for increases in worker productivity and for the rapid introduction of new technology, both dependent upon broad initiative, have to date fallen short of the regime's expectations.

39. Results in the intellectual field have also been largely disagreeable to the Soviet leaders. Wider contacts with foreign countries have opened the USSR to disturbing influences, not only from the Free World but also from Eastern Europe and Communist China. Youthful nonconformity is an increasing problem, especially on the occasions when it extends beyond rebelliousness to disagreement with the official line on matters of principle. A group of writers has arisen who, with bold criticism of the harsh and unpleasant aspects of Soviet life,

are spreading among a small but increasing circle of readers a climate of dissatisfaction and of impatience with the pace of official reforms.

40. This consequence of de-Stalinization, stemming from many of the same causes which produced direct challenges to Soviet rule in Poland and Hungary, has led the regime to define more sharply the limits of its liberalization program. Just as the Polish and Hungarian events led to renewed stress on Soviet leadership of the Bloc, so the unorthodox views of writers and students have been countered with a reassertion of Party infallibility. As part of the effort to stifle negative criticism, the propaganda line on Stalin has shifted: none of the crimes charged to him by Khrushchev has been whitewashed, but emphasis is now laid upon his "positive achievements" and on those of his ideological formulations still regarded as valid. The publication in August 1957 of Khrushchev's vigorous attack on dissident authors, like his recent endorsements of hard-line leaders in Czechoslovakia and East Germany, served notice that the June purge, with its condemnation of dogmatism, was not to be taken as a license for continued liberties.

Probable Developments in Domestic Policy

41. We do not believe that the foregoing measures indicate a change in the regime's basic intentions. Rather they appear to be an attempt to correct extreme interpretations of approved policies. Over the next several years, the regime is likely to continue its cautious experiments, especially in the economic field, constantly readjusting its policies in search of a better balance between freedom and coercion. We do not believe that the trend towards reform is as yet irreversible, and under circumstances of political crisis reversal may occur. Khrushchev's increasing ascendancy, by freeing him from the need to defend his past policies against the criticism of his colleagues, might facilitate such a reversal in response to difficulties or changed conditions. But the longer the period of relaxation is maintained, the higher the price the regime must pay, in terms of forfeited popular support and new disruption of the machinery of control, if it chooses to return to wholesale harshness in its dealing with the population.

42. Barring such a return, we estimate that, over the next several years, the fear and apathy which Stalinism produced will slowly diminish. Among the majority, this process will probably lead to a somewhat closer identification with the regime, which is being given credit for ending fears of the police and improving living standards. But the regime's own liberalizing policies, as well as Khrushchev's extravagant promises, raise the possibility that popular expectations will outrun actual gains and generate more disappointment than gratitude. A small minority, made up chiefly of students and intellectuals in cultural fields, appears already to have become so independent in its thinking that it

cannot be brought, either by persuasion or pressure to a whole-hearted acceptance of the regime. This group probably will maintain attitudes of dissatisfaction and even some oppositional feelings unless changes proceed far faster than is likely. Since these people are in a position to influence the public opinion now emerging in the USSR, they may be subjected to sterner measures in the future.

43. The regime's chief instrument for managing the reform process is the Party. With the downgrading of the secret police, the Party organization assumed new responsibilities for insuring political conformity; with the abolition of most economic ministries, it now has a much larger role in carrying out centrally-determined economic policies. Its capabilities for these assignments are uncertain; thus far it has demonstrated no marked success in eliminating dissent and has even shown a few signs of being itself infected with the same dissatisfactions which are agitating students and intellectuals. If the Party proves inadequate to these tasks, possibilities for success of the regime's ambitious economic and political programs will be greatly diminished.

44. The role of the Party becomes even more critical when viewed in a perspective extending beyond the period of this estimate. It is far from certain that the Soviet citizen can be educated to a higher level, urged to exercise his own initiative, given increasing opportunity for comparisons with other countries, and encouraged to expect a significant improvement in his living standard, and at the same time submit without question to a leadership which incessantly proclaims, and frequently exercises, the right to make all important decisions for him, regardless of his personal desires. The regime's best hope of managing the resulting tension lies in the activity of a disciplined minority, able, persuasive, highly resourceful, but completely responsive to the wishes of its leaders. Despite its highly favored position, this minority itself is subject to many of the same tensions as the population at large. Eventually it may turn out that the benevolent totalitarianism which Stalin's successors seek to achieve is an impossible contradiction and that the forces released in the search for it will require the leadership to revert to earlier patterns of control or to permit an evolution in some new direction.

II. TRENDS IN THE SOVIET ECONOMY

Shifts in Economic Policy

45. The Soviet leaders continue to view their economy primarily as an instrument for the creation of national power. Thus heavy industry, and particularly military production, retain first-priority status. But the gap in the priority structure which separates heavy industry from other sectors is being narrowed by a new attitude toward consumption. Along with the traditional emphasis upon heavy industry, higher

living standards are being sought in an effort to stimulate higher labor productivity, to generate some active support among the Soviet population, and to remove the stigma of poverty from Communism in order to increase its attractiveness at home and abroad.

46. Accompanying this modification of Stalin's rigid priorities is a recognition that many of his economic methods—reliance more upon coercion than on incentives, extreme centralization of administration, resistance to innovation—are ill-suited to the current requirements of the Soviet economy. Thus his successors have exhibited more concern with material incentives and more readiness to experiment, exemplified in such ventures as the New Lands and corn programs in agriculture and the administrative reorganization in industry. These sweeping moves have been accompanied by a large number of lesser innovations, all designed to modernize an economy which, despite its rapid growth, was still being managed by methods developed during prewar years. Khrushchev has been the chief sponsor of these changes, and his present ascendancy suggests that, apart from such basic matters as state ownership and central planning, all of the institutional features and managerial practices of the Soviet economy are subject to critical review.

47. Both these tendencies—to modify the system of priorities and to revise the economic structure itself—are exemplified in the policy decisions of the last 12 months. First, when production results during 1956 indicated that the very high growth rates of the five-year plan were threatened by a failure to build enough new industrial capacity, the Soviet leaders refrained from the traditional response of cutting into the consumer sector for extra resources to meet the targets in heavy industry. Instead, they accepted the necessity of at least a temporary slowdown in industrial growth, meanwhile increasing allocations to agriculture and housing. Second, Khrushchev seized upon the defects of the ministerial structure as responsible for the difficulties experienced in 1956 and embarked upon a radical reorganization as the means of regaining the tempo of industrial advance.

48. During the next five years, it is almost certain that various ambitious programs for defense, industrial growth, and popular welfare will turn out to be incompatible. In these circumstances, we believe that the overall defense program would not be significantly curtailed. But the investment resources needed in industry to make acceptable progress towards overtaking American industry might conflict with the requirements of defense officials for expanded military expenditures. Furthermore, Khrushchev's sweeping pledges to improve consumer welfare, made in a bid for popular support in the aftermath of the Satellite crisis and during the Presidium struggle, commit him to achieving a palpable increase in consumption. Well before they reach their targets, however, his agricultural and housing programs will

probably compete with defense and industrial investment for both materials and labor.

49. The difficulty of pursuing all these goals simultaneously probably lay behind the decision to abandon the Sixth Five-Year Plan (1956–60) in favor of a seven-year plan for 1959–65. Apparently the regime wished to erase from public record 1960 targets which it doubted its ability fully to meet. Probably it judged that, in the light of industrial lags in 1956–57 (see paras. 58–59), the original targets for this sector, particularly those for some key industrial materials, could not be reached without cutting too deeply into other programs. If this interpretation is correct, abandonment of the original plan appears to reaffirm and to extend into the future the decision, embodied in the 1957 plan, not to put all-out stress on heavy industry irrespective of the cost to other economic goals. The issue of competing priorities, however, has not been finally settled by this action and is certain to arise again.

Prospects for Economic Growth

50. Soviet economic growth during the coming five years will continue to be faster than that of the US, though somewhat slower than the pace achieved during the Fifth Five-Year Plan (1951–55). The principal factors behind the past rapid rate of growth have been a high level of investment concentrated in sectors providing most rapid growth, increases in the industrial labor force, and gains in economic efficiency. We believe that a high level of investment will be maintained, amounting to more than one-quarter of GNP (in the US, investment's share is about one-fifth). However, in the future a greater share of total investment will have to be directed to programs in which the returns, in terms of additional production, are relatively low. These programs include expansion of the fuel and raw material base, where a chronic lag in new construction finally produced severe supply stringencies in 1956; development of the eastern regions, where initial investment requirements are high; and the large effort in housing. Total output will grow less rapidly under such a distribution of investment than it did when a greater share of funds were directed into such sectors as machine-building and chemicals.

51. Another major limitation upon rapid growth is the fact that the labor force will not grow as rapidly as before, especially toward the end of the 1957–62 period, as war-reduced age groups move into employment. Whereas during the period 1950–57 the labor force grew by an average of 1.6 million new workers each year (apparently with the aid of some reduction of military personnel after the Korean War—see para. 98), population growth will provide an average of only about 1.1 million during 1957–62. The planned reduction from 48 to 41 hours in the industrial work week, which will probably be carried out, will

reduce the net gain in labor time even further. On the other hand, if further reductions in military manpower occur, they will have some offsetting influence.

52. For these reasons, and because labor cannot be freely drawn from agriculture, the USSR must rely heavily on productivity gains to maintain the extremely high growth rates it desires. There is much room in the Soviet economy for gains in labor productivity resulting from the use of more modern machinery, from a wider and more precise application of incentives, and from improved efficiency in a multitude of planning and managerial activities. As a result of the vigorous attention being given to such problems and Khrushchev's relatively undogmatic approach to them, we expect continued gains in labor productivity over the next five years. The impetus to growth obtained from this source, however, seems unlikely to be so great as to offset the limitations cited above.

53. Thus we estimate that the average yearly growth of Soviet GNP will drop from perhaps as much as seven percent in recent years to around six percent during the next five years. Even so, the USSR will slowly gain further ground upon the US economy, which is expected to grow at an annual rate of about 3.5 percent. In dollar terms, Soviet GNP will rise from about 40 percent of US GNP in 1956 to about 45 percent in 1962. The USSR and the US, however, will allocate resources in sharply different ways. With a GNP only two-fifths that of the US, the dollar value of Soviet defense expenditures is estimated to be about equal to those of the US, and investment is about 55–60 percent as large as American investment; Soviet consumption outlays, on the other hand, have a dollar value only about one-quarter that of US consumption.

*Trends in Defense Expenditures*⁵

54. We estimate that in 1957 Soviet defense expenditures are about 15 percent of GNP in terms of rubles (the comparable US figure in dollars is about 9 percent). If our estimates of military trends are correct, defense expenditures will increase gradually, reaching in 1962 a level one-quarter to one-third higher than at present. Since GNP will probably increase at the same rate or faster, the relative burden on the economy will become no heavier in the aggregate, although defense needs will have to compete with other programs for manpower and for specific industrial products, such as electronics.

⁵ Estimates of Soviet defense expenditures are subject to a wider margin of error than other statistical estimates in this section and should therefore be used with greater caution. [Footnote is in the original.]

55. Most of the increase in defense expenditures will be caused by increasing allocations to aircraft, guided missiles, military research and development, and nuclear weapons. These programs together probably account for more than 35 percent of total expenditures at present. By 1962 they are expected to require about 50 percent more resources and to account for nearly 45 percent of total defense programs.

56. Soviet defense expenditures in recent years, when converted into dollar values, appear to be of roughly the same magnitude as US defense expenditures. Thus the Soviet defense effort, which consumes about one-seventh of the USSR's much smaller GNP, produces military goods and services with a dollar value roughly the same as the US. This is owing primarily to the facts that in the USSR military end-items are less expensive, relative to consumption items, than they are in the US, and that the average level of real pay and subsistence provided Soviet military personnel is much lower than in the US.

Industrial Prospects

57. The Soviet leadership remains committed to rapid industrial growth, with the eventual aim of overtaking US industry in per capita production. The now defunct Sixth Five-Year Plan, however, already contemplated a lower increase—65 percent—than the 85 percent claimed during the Fifth. Even this target now is apparently judged too high. As for overtaking the US, total Soviet output is increasing faster than US production but is still less than half that of American industry (see Figure 1).

58. Cumulative failures in completing new installations for several basic industries reached a point in 1956 which produced serious imbalances in the Soviet economy and necessitated a reduction of goals in the 1957 plan. Figure 2 indicates that these difficulties were not overcome during 1957. During 1957, moreover, the building of new capacity for coal, iron ore, rolled steel, and electric power almost certainly continued to lag behind plan. Accelerated production gains would have been necessary during the next three years if the original 1960 targets for these commodities, vital to the growth of other industrial sectors, were to be met.

59. The Soviet leaders hope that the slower growth of the industrial labor force will be offset to some degree by increased production per worker. One of the most important programs for raising productivity is the modernization and re-equipment of industrial plants. This program, of which automation is the ultimate expression, has lagged behind schedule, however, and seems unlikely to catch up. Industry as a whole probably will have to bear the brunt of increased investment in the consumption sectors and also the reduction in total investment at which Soviet sources have hinted in discussion of plan revisions.

Figure 1

US AND USSR
OUTPUT OF SELECTED PRODUCTS

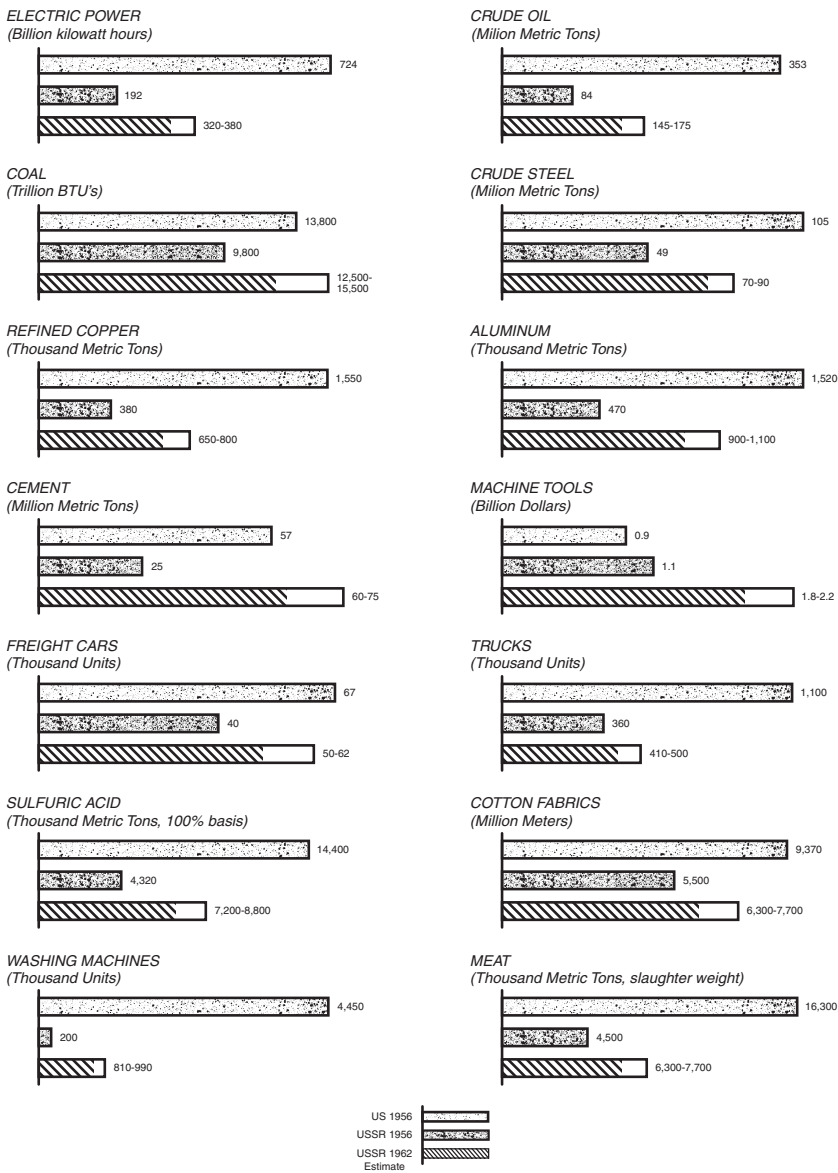

Figure 2

USSR
ANNUAL PERCENTAGE INCREASES
IN OUTPUT OF SELECTED COMMODITIES

Within industry, furthermore, increased demands for investment in raw materials may require machine-building, upon which the modernization program depends, to get along with less. Apart from investment problems, inherent difficulties in getting new machinery first into large-scale production and then into use continue to plague Soviet industry. The productivity gains from modernization, therefore, while contributing substantially to industrial growth, are likely to fall short of the USSR's high expectations.

60. The Khrushchev regime has laid great stress on another means of raising productivity, by improvement of general economic administration and plant management. The major innovation in this field is the replacement of most industrial ministries with 105 regional economic councils. Basically, the new structure attempts to distinguish between those decisions which define national policy and those which concern its detailed execution and, while maintaining Moscow's monopoly in the first sphere, to leave the second to officials on the spot. We do not believe, however, that the reorganization itself will make much contribution to industrial growth. The inevitable period of initial confusion will perhaps last longer than anticipated. Even over the long run, while many sources of inefficiency will be eliminated, the regional system promises to breed its own bureaucratic excesses and perhaps, because of its greater susceptibility to local interests and consumer pressures, to deform central policy itself. A net gain will probably result, but this is likely to be rather small unless the reorganization is followed by other reforms which are at present only in the discussion stage, such as expansion of managerial rights, a more realistic pricing system, and improved criteria for economic performance.

61. During the coming five years, large-scale transfers of labor from agriculture in order to compensate for productivity shortfalls in industry will be much more difficult to carry out than in the past. Agricultural employment, which declined steadily during Stalin's later years, has risen with the higher priority which his successors have attached to this sector. While one of the ultimate aims of the agricultural program is to resume the flow of labor into industry, the immediate goal is to increase output. During the next five years, prospective agricultural programs seem as likely to increase labor requirements as to reduce them. Khrushchev will be loath to reduce the agricultural labor force until production successes are achieved.

62. Therefore, it appears that the lag in production of basic materials and the relative stringencies in labor and especially in investment funds available to industry will result in a somewhat slower growth of industrial production than in the past. Against a very large increase estimated at 65–75 percent during the Fifth Five-Year Plan, we believe that the gain from 1957 to 1962 will probably be about 50–60 percent.

The Consumption Program

63. A third major economic task is fulfillment of Khrushchev's consumption goals, which are more ambitious and more specific than those embodied in Malenkov's economic policy of 1953–54. In place of Malenkov's emphasis upon light industry; priority is now focused upon agriculture and housing. The goals are unlikely to be attained on schedule, but even the effort required to make substantial progress toward them may involve sharp competition with other priorities. In the distribution of state investment, for example, agriculture and housing together, which received less than one-fourth of the total in 1953, got almost one-third in the 1957 plan. Again, in its attempt to increase peasant incentives, the state markedly increased the prices it pays for deliveries of agricultural products. Great priority is being attached to the state farms, which are currently being rapidly expanded, partly at the expense of the collective farm sector.

64. The major agricultural target is to reach American levels of per capita production of milk and meat, the former by 1958, the latter by 1960–61. Fodder supplies are the primary obstacle, but a large increase in the grain harvest is hoped for. This increase is to be obtained from reduced losses as more machinery makes possible faster harvesting, from higher yields resulting from better cultural practices, and from some further expansion of cultivated area. A plan has been launched to increase the New Lands acreage by about one third in the next two years, partly to provide for proper crop rotation, and Khrushchev may be considering even further expansions of cultivation into marginal areas. The New Lands and any future additions will produce lower crop yields than those obtainable in the traditional areas of cultivation and will be subject to frequent failures, but we estimate that they will increase the total harvest at a cost acceptable to the Soviet authorities.

65. While many of the major commodity goals cannot be met, agricultural production as a whole will increase faster than population growth and may by 1962 be nearly one-fifth over the peak year 1956. Achievement of US levels of per capita meat and milk output on the stipulated schedule is out of the question, but the progress recently made and the great emphasis now being placed on these branches suggest that the Soviet consumer will note a substantial increase in supplies of animal products.

66. The housing decree of mid-1957 raised the Sixth Five-Year Plan target from 289 million to 329 million square meters. While the state left its own house-building target virtually unchanged, it did increase by about one-fifth the allocation devoted to meeting that target, and it also committed itself to provide additional materials to private builders. If the housing goal is to be met, either a substantial above-plan increase in production of building materials or diversion of them from other

uses will probably be necessary. Fulfillment would raise urban housing space per capita above the level attained before forced industrialization was launched three decades ago, but would still leave the Soviet population very poorly housed by Western standards.

67. If these and other programs to raise Soviet living standards retain their present priority, they will probably produce a gain of perhaps as much as one-fifth in per capita consumption between 1957 and 1962. As has been true for the last two or three years, this increase will probably be spread over the bulk of the population rather than directed toward small favored groups. As a result, the regime will probably enjoy some increase in popular support. On the other hand, Soviet failure to make at least the above estimated progress towards higher living standards would considerably undermine Khrushchev's attempt to create an image of a regime dedicated primarily to popular welfare and determined to fulfill its promises to the people. Such a failure would tend to weaken popular support and might even, by its effect upon worker incentives, damage the prospects for economic growth. To some extent, therefore, the regime's freedom of action relative to the population has been diminished, and the cost of regaining it has been increased.

Foreign Trade

68. Foreign trade continues to be of minor importance to the Soviet economy, accounting for only about two percent of GNP. While earlier attitudes of rigid autarky have weakened somewhat, the USSR is still far from willing to abandon considerations of self-sufficiency and to enter world markets whenever opportunities arise for economic gain. Trade is instead conducted for quite specific purposes, frequently political, and Bloc members or potential allies are preferred as trading partners.

69. Soviet imports and exports together rose by about one-tenth in 1956 to a total of about \$6.9 billion. Other Bloc states continued to account for about three-quarters of this trade; exchanges with the European Satellites grew by about five percent, and those with Communist China fell as Soviet aid shipments declined. The USSR and other Bloc members continued to boost their trade with underdeveloped countries, and in 1956 five such nations—Afghanistan, Iceland, Egypt, Yugoslavia, and Burma—conducted more than 20 percent of their total trade with Bloc partners.

70. The USSR's harsh economic exploitation of the Satellites, which had gradually softened in the years following Stalin's death, virtually ended late in 1956. As a consequence of policy decisions in the wake of the Polish and Hungarian crises, the USSR has assisted the East European regimes with new credits and the cancellation of old obligations, which together will cost about \$2.5 billion over the next

decade. Soviet exports to this area have increased significantly, but the return flow of goods has grown slightly if at all. The current pattern of exchange requires the USSR to increase its shipments of grain and scarce industrial materials such as steel, coal, iron ore, and nonferrous metals, while simultaneously importing less Polish coal and Rumanian oil. While these shifts are less of a difficulty to the USSR than are its domestic economic problems, they do serve to aggravate the solution of these larger difficulties.

71. Trade outside the Bloc remains concentrated in the developed nations of Western Europe, which continue to account for about four-fifths of Soviet trade with the Free World. But Soviet trade with the underdeveloped countries, though small, is rising; in 1956 it grew by 35 percent to a total of nearly \$400 million. This trade is still roughly in balance, and drawings on nonmilitary credits extended by the USSR have amounted to slightly over \$100 million since the inception of this program. Thus the credit program, of which the USSR has provided about \$900 million out of the Bloc total of \$1.5 billion, is as yet a negligible drain on the Soviet economy. Even when the utilization of these credits increases, the net drain to the domestic economy will be small. The slowdown during 1957 in extension of new Soviet credits is due to the exhaustion of the most ready opportunities during the preceding two years rather than to limitations upon Soviet economic capabilities. The USSR will continue to press its foreign credits wherever it sees potential political gains, and considerations of economic impact on the USSR will remain relatively unimportant unless the magnitude of the program increases drastically.

71a. *Civil Air*. The USSR is in the first stages of a determined and vigorous program to enter international air routes and is embarking on an ambitious program to produce a modern civil air fleet. In entering international air routes the USSR is probably motivated more by political than by commercial considerations. The USSR apparently has now realized the significance of civil aviation capabilities as an element of national power and prestige and is developing a growing capability in this field.

III. TRENDS IN SOVIET SCIENCE AND TECHNOLOGY⁶

72. The closely-controlled Soviet scientific effort has focussed preponderantly on the building of a strong industrial base and the development of modern weapons. The USSR has placed great emphasis on science and technology and has concentrated manpower and facilities in an effort to achieve the high priority goals which it has established

⁶ For details on Soviet scientific strengths, developments, and policy, see NIE 11–6–56, “Capabilities and Trends of Soviet Science and Technology,” 9 October 1956. [Footnote is in the original.]

for military production and for the industrial base. As a consequence, the USSR's achievements in areas of critical military and industrial significance are comparable to, and in some cases exceed, those of the United States. Research in areas to which the Soviets assign low priorities tends to progress at a much slower rate.

73. Highest priority will continue to be accorded to military-industrial research and development, but the rapid expansion of Soviet scientific resources will now permit greater flexibility. Greater individual initiative will probably be encouraged within assigned tasks of research, basic research in new fields undertaken, and somewhat more scientific and technical effort allocated to the consumer sector of the economy. Better direction of agricultural research is likely. As part of the current reorganization of the Soviet economy, efforts are apparently being made to improve coordination of the Soviet scientific and technical effort, and industrial research and development will probably be brought into better balance with production requirements at the local as well as national levels. At the same time, ideological obstacles to scientific research and development (never of much consequence in major industrial or war-supporting fields) will probably continue to diminish in the fields previously affected. These factors, together with continued emphasis on increasing scientific resources, will contribute to further substantial gains in Soviet science and technology over the next five years.

Scientific Manpower, Training, and Facilities

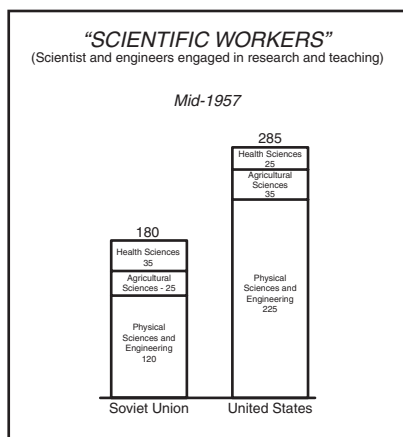

74. The reservoir of scientifically and technically trained manpower available to the Soviet Union has increased tremendously in the postwar period. Of the estimated mid-1957 total of 1,810,000 living graduates of university-level scientific and technical curricula, over 1,060,000 have graduated since the end of World War II. The total number of graduates actually employed in all scientific and technical fields in the USSR now exceeds those so employed in the US (see Chart on following page). We estimate that the high graduation rates of recent years will continue during the period of this estimate. By 1962 the USSR will probably have about 40 percent more graduates engaged in scientific and technical work than the US. In the particular fields of physical sciences and engineering, the number of Soviet scientists engaged in research and teaching is substantially smaller than in the US. However, Soviet emphasis on research in military and basic industrial fields probably results in a near numerical equality between the two countries in scientific manpower devoted to these critical activities.

75. In the postwar period the quality of Soviet scientific training has approached, and in some cases surpassed, US levels. Engineering training in the USSR, while not as broad as that given an engineer in the West, is good within the particular field of specialization. Some

US AND USSR

COMPARISON OF MAJOR SCIENTIFIC GROUPS

(Cumulative totals in thousands)

* Numerical estimates of Soviet scientific personnel are believed to be correct to within plus or minus 10 percent. [Footnote is in the original.]

** Requirements of the Soviet Kandidat degree roughly equal those for the US Ph.D. In the physical sciences and engineering and in certain of the agricultural and health sciences. However, in health sciences, the Kandidat degree is more closely equals a US Master's degree. [Footnote is in the original.]

deficiencies continue in the practical and experimental aspects of training, particularly in some fields of biology and engineering, although efforts are being made to overcome them. The USSR is also not as well supplied with nonprofessional technicians, mechanics, and maintenance men as are the Western industrial countries, where broader sections of the population have acquired mechanical skills over a longer period. Considerable progress is being made in increasing the supply of such personnel, but shortages of skilled technicians will persist in the USSR as in other countries.

76. Soviet scientific facilities, in terms of financial support, organizational direction, and number and quality of laboratories, are generally adequate for the effective utilization of scientific talent. In a few fields Soviet facilities are superior to corresponding installations in the West. Notable in this regard are certain high energy particle accelerators and electronics research establishments. Although some shortages of complex research instruments are believed to exist, they probably do not significantly hamper research programs of major importance. For instance, though the US has a considerably larger number of high speed electronic computers than the USSR, the number of computer hours actually utilized for high priority research is probably nearly the same, since Soviet computers are not called upon to serve routine business and government functions.

77. During the next five years the Soviet Union will continue efforts to improve its capabilities in scientific instrumentation. More highly qualified engineers will probably be made available for the development and production of scientific equipment, especially in priority research areas, and an increasing amount of equipment will reflect original design concepts.

78. The Satellites continue to make significant contributions to Soviet technological development in certain fields, principally in optics, electrical measuring instruments, electronics, communication equipment, synthetic fibers, and pharmaceuticals. However, the importance of Satellite contributions is diminishing as Soviet capabilities in these fields improve.

79. The USSR is also progressively less dependent on Western research and development. Nevertheless, the Soviet leaders have adopted a policy of acknowledging foreign achievement and encouraging maximum use of foreign experience. The USSR is clearly anxious to take advantage of the possibilities in international scientific exchange, and to make Soviet scientists fully conversant with developments in the West. The All-Union Institute of Scientific and Technical Information of the Academy of Sciences publishes and circulates extensive abstracts of foreign journals, and at least in high priority fields Soviet scientists

have access to the full range of scientific research published throughout the world.

Scientific Capabilities in Major Scientific Fields

80. Soviet scientists have made striking progress over the past few years in many areas of fundamental research. In mathematics, many fields of physics, and a few fields of chemistry, fundamental research appears to be comparable in quality to that performed in the US. In at least some fields, the best Soviet scientists are as gifted and competent as the best in the West, and have a similar potential for wholly new discoveries.

81. *Atomic Energy.*⁷ There is substantial evidence that the USSR is continuing to expand steadily not only its military atomic energy activities but its program for non-military uses. We estimate that the Soviet atomic energy program will continue to enjoy the very high priority that has been accorded to it in the past. The USSR is conducting extensive research in all major fields related to atomic energy, including controlled thermonuclear reactions.

82. The USSR is engaged in a comprehensive reactor development program which will permit it to keep generally abreast of world progress in this field. Although the USSR appears to have revised its ambitious mid-1960 nuclear power goal from 2,000–2,500 megawatts down to 1,400 megawatts of electric power, this reduced plan is still quite substantial, and is within Soviet capabilities if a high priority effort is devoted to it. The USSR will probably make further offers of technical aid, as well as of assistance in the construction of nuclear power stations, within the Bloc and to non-Bloc countries.

83. *Physical Sciences.* The present capabilities of Soviet scientists in the various fields of physics and mathematics are comparable to those of scientists in the leading nations of the West. Greatest capabilities are exhibited in nuclear physics, solid state physics, theoretical physics and high-speed digital computers. In the geophysical sciences, Soviet capabilities are also generally comparable to those of leading Western nations; during the next five years significant advances will probably be made in geomagnetism, permafrost research, geochemical prospecting, and polar geophysics. Recent progress has also been achieved in chemistry and metallurgy, notably in high-temperature alloys and ceramic cutting tools. Soviet capabilities in electronic component development

⁷ For further details on Soviet atomic energy research and nonmilitary programs, see NIE 11–2–57, “The Soviet Atomic Energy Program,” 7 May 1957 (Limited Distribution). Soviet atomic energy activities of direct military significance are discussed below in Chapter IV. [Footnote is in the original.]

will keep pace with those of the West and may lead the US in some respects.

84. *Medical Sciences.* Soviet medical practice lags behind that of most major Western countries, but appears to meet standards adequate for current civil and military requirements. Clinical practice is of a fair standard in large urban areas but is still backward in rural areas. Medical research, on the other hand, is pursued with vigor and may reach a level which approximates or even surpasses that of the US in certain fields relative to military and civilian defense, notably neurophysiology, radiobiology, aeromedicine, and hematology.

85. *Biological and Agricultural Sciences.* Soviet biological and agricultural research has hitherto been generally backward, but a trend toward improvement in the quality of research is becoming evident as ideological restrictions on research diminish. Heavy emphasis will be placed on increasing per-acre crop yield and livestock productivity.

86. *Industrial Technology.* For the immediate future, we estimate that the over-all level of Soviet industrial technology will remain below that of the US. However, the most modern Soviet plants are already on a par with those in the US, and we expect the general level of heavy industrial technology to be improved. Striking progress has been made over the past few years in the theory and practice of automation. Additional semiautomatic and possibly fully automatic production lines will be established during the period of this estimate. There will probably be increased emphasis on engineering process research and on shortening the lead times necessary to bring developed items into production. However, research and technology in consumer goods fields will continue to lag far behind that in the US.

87. *Military Technology.*⁸ The USSR has the capability to develop weapons and military equipment generally equal to those of any other nation. Despite the increasing complexities of military equipment, the USSR will be capable of continuing the successful design and development of modern, integrated weapon systems.

IV: TRENDS IN THE SOVIET MILITARY POSTURE

SOVIET MILITARY THINKING AND POLICY

88. In the years since World War II, Soviet military thinking and the Soviet military establishment have been in a process of transition, dictated by rapid advances in military technology and by the fact that the USSR's chief potential enemy, the US, lies beyond the reach of traditional Soviet military power. This rethinking has been reflected in

⁸ Specific Soviet capabilities in military fields are discussed below in Chapter IV. [Footnote is in the original.]

greater emphasis on air defense, submarines, nuclear weapons, long-range bombers, and guided missiles. Further evolution in Soviet military policy and force structure can be expected during the coming period under the impact of further rapid advances in technology, the growth in mutual capabilities for nuclear devastation, and other factors affecting the balance of military power.

89. The chief factor affecting Soviet military thinking and leading to changes in the Soviet military establishment has been a growing appreciation of the devastation inherent in all-out nuclear conflict, and of the threat to Soviet security and Soviet objectives posed by Western nuclear capabilities. This realization has led to strenuous Soviet efforts to develop both adequate air defenses and offensive nuclear capabilities. These efforts, as well as various declarations of Soviet political and military leaders, clearly indicate that the chief military contingency against which the USSR feels it must guard is that of general war involving all-out use of nuclear weapons. The USSR almost certainly believes that the West's current military posture and strategic doctrine are such as to compel the West, if general war occurred, to fight it primarily by nuclear means.

90. Despite their strenuous efforts to develop nuclear capabilities, the Soviets probably consider that present US capabilities to wage nuclear war remain greater than their own. They show acute awareness of the advantage accruing to the US from its deployment of nuclear striking forces on the periphery of the Bloc as well as within the continental US. We believe that, under these circumstances, the Soviet planners have concluded that at present the USSR, even if it launched a surprise attack, would receive unacceptable damage in a nuclear exchange with the US. Notwithstanding probable further improvements in the Soviet nuclear and delivery capabilities over the coming period, the USSR almost certainly will still not be confident that it can attack the US without receiving unacceptable damage in return. These estimates of Soviet military judgments underlie our basic estimate (see paras. 190 and 191, chapter VI) that the USSR will not deliberately initiate general war or undertake courses of action gravely risking general war during the period under review.

91. On the other hand, the Soviet civilian and military leaders probably regard their own growing nuclear capabilities, added to their already great conventional strength, as enforcing caution on the Western powers. They are probably confident that their own nuclear capabilities have already reached the point where the US and its allies will also be deterred, except under extreme provocation, from deliberately initiating general war or from reacting militarily to any local crisis in a manner which would gravely risk broadening such a conflict into general war.

92. We believe that the highest priority objective of Soviet military policy during the period of this estimate will be to maintain, and to develop further, such formidable nuclear capabilities as to continue to deter the US from resorting to all-out nuclear conflict on any provocation save the most extreme threat to national survival and to support continuation of an aggressive foreign policy. But the Soviets must recognize that the possibilities of miscalculation in crisis situations are such that general war might nevertheless occur, and that preparedness for it is therefore essential. For this and other obvious reasons they aim eventually to achieve a clear military superiority over the US. Accordingly, the Soviet planners probably desire to achieve a nuclear attack capability sufficient, together with the USSR's air defenses, not only to deliver a devastating attack on the US, but also to neutralize a US nuclear attack on the USSR (i.e. to prevent unacceptable damage to the USSR).

93. Given foreseeable technological developments and maintenance of US armed strength, however, the Soviets may regard the capability to neutralize US nuclear attack capabilities as unattainable during the period of this estimate. On the other hand, they probably consider that although they cannot prevent, even with surprise attack, a crippling retaliatory blow, they can maintain such capabilities to damage the US as will deter the US from resorting to general war. To this end they must keep a strong long-range bomber striking capability, while they are working to acquire an additional nuclear delivery capability with advanced weapon systems, including long-range missiles. But the Soviet planners may nevertheless think the prospects for development of advanced weapons systems so promising that they can accept a temporary risk of maintaining their manned bomber force at something less than they would otherwise consider desirable.⁹

94. In our view a major corollary aim of Soviet military policy, to which the maintenance of a strong deterrent posture is an essential concomitant, is to provide the Soviets with military superiority in situations which they may estimate can be dealt with short of all-out nuclear war. To the extent that such superior capabilities can be developed and

⁹ As estimated elsewhere in this NIE, the USSR must recognize that the possibilities of miscalculation in crisis situations are such that general war might occur, and that preparedness for it is therefore essential. The Assistant Chief of Staff, Intelligence, USAF, therefore believes that the Soviet leaders will not be likely to accept needlessly the risk of maintaining their long-range bomber capability at less than they otherwise would consider desirable, and he believes a conclusion should be added to the paragraph as follows: "However, we think it unlikely the Soviet leaders will take such a risk." [Footnote is in the original.]

maintained, they enhance Soviet ability to use the latent threat of military action as an instrument of political warfare.¹⁰

95. An additional objective of Soviet military policy, which has assumed increased importance since the Hungarian revolt and Polish crisis, is to ensure essential Soviet control over the European satellites. Whatever plans the USSR might have had to withdraw forces from the Satellites prior to these developments, we believe that they must now contemplate an indefinite retention of Soviet forces in Eastern Europe.

96. In assessing the size and types of forces essential to meet the above requirements the Soviets have apparently concluded that they must keep a large and diversified force structure designed to meet a wide variety of contingencies. While they will place further stress on maintaining strong strategic nuclear attack capabilities and air defenses, the evidence indicates that they also are continuing to modernize and strengthen their forces in other fields. In view of their growing appreciation of the devastation inherent in all-out nuclear conflict, they must regard the growth of nuclear capabilities on both sides as making each side increasingly reluctant to use such weapons, and logically would not wish to deprive themselves of other military capabilities. In our view their continued maintenance of strong ground, naval, and tactical air forces, indicates their belief that such forces, equipped with conventional and nuclear weapons, would be of great importance in both general war and limited conflicts.

97. Since an important technological break-through by either side could greatly affect the present balance of military power, the USSR will continue to devote the highest priority to weapons research and development. It will produce advanced weapon systems in operational quantities using such weapons to enlarge its existing military

¹⁰ The Assistant Chief of Staff, Intelligence, Department of the Army, believes that paragraphs 92–94, unless balanced by other considerations, represent an overemphasis on one segment of Soviet strategic thinking which is not necessarily the most significant in the Soviet view.

In the Soviet view the objectives of any military action would have to include definite gains for the Soviet state. In view of the devastation which could result to both sides in an all-out nuclear exchange it is almost certain that they see no advantage to any one in initiating such an exchange. Rather, they probably judge that as the nuclear delivery capabilities of both sides increase, the range of issues over which either the Bloc or the West would launch all-out nuclear war decreases.

Consequently, since both sides are developing effective forces to deter all-out nuclear war, the Soviet leaders probably believe that their strong ground, naval, and tactical air forces would permit resort to local military action, with substantial prospects of success, in any area where the US and its allies could not rapidly react on a comparable scale or where the issues or circumstances were such that the US and its allies chose not to broaden the conflict. The real threat of Soviet military action therefore lies in the type of situation in which the Soviets estimate the West while opposing the Bloc would not risk the devastation of all-out nuclear war. [Footnote is in the original.]

capabilities. We think it will not make early major alterations in its present force structure, although such factors as the increasing cost and complexity of new weapons and equipment, the competing demands of highly important nonmilitary programs, and the rapid obsolescence of various types of military equipment will probably dictate some alterations in the present balance of Soviet forces over the next five years.

98. *Likelihood of Force Reductions.* The USSR has publicized two reductions in military personnel strength: the first, a 640,000 cut, was announced in August 1955 and completion was claimed by the end of that year; the second, a 1.2 million cut, was announced in May 1956, with completion promised by May 1957. In our last estimate in this series, we concluded that total Soviet military manpower had probably increased during the Korean War period and that the first of the two Soviet claims may have related to a post-Korean reduction in force levels. Further evidence and analysis supports the belief that substantial changes in numerical strength have in fact occurred. The pattern of conscript call-ups and terms of service over the past decade suggests that military manpower may have increased to a peak of around six million in the early 1950's, and has been reduced substantially during the past several years. Moreover, recent analysis of Soviet statistics reveals increases in civilian employment which point to the possibility of a sizable flow from the armed forces since 1953. Thus the USSR, in announcing force reductions, may have been taking propaganda credit for force reductions from peak Korean War levels which had been made in large part prior to the announcements.

99. Some reductions probably continued to take place after the May 1956 Soviet announcement, but evidence is lacking as to the extent of these cuts. The promised token withdrawals from East Germany were actually carried out with much publicity in the summer of 1956, and there were fragmentary indications of a selective weeding out of officers and men elsewhere in the Soviet forces. But in the fall of 1956 there were reports that demobilization had been halted; since then we have had no evidence of further cuts, and Soviet propaganda has failed to make the claims that we would have expected had the announced cuts been completed. Therefore, we do not believe that cuts of the size the USSR announced in May 1956 for completion by May 1957 were carried out during that period. The disturbances in East Europe in autumn 1956, and further uncertainties created by the Middle East situation, may have led to Soviet suspension of such demobilization plans.

100. In any event, with respect to current Soviet military personnel strength, there is substantial agreement between our estimates made on the basis of unit order of battle and those made by analyzing conscription trends and population and labor statistics. On the basis

of estimated order of battle, total Soviet active military personnel as of mid-1957 would be about 4,275,000, including about 2,650,000 in the ground forces, 825,000 in the air forces (including 110,000 Naval Aviation personnel), 725,000 in the navy, and about 75,000 personnel whose subordination is unknown.¹¹

101. Because of the shortage of manpower in the Soviet economy and for various other reasons noted elsewhere in this estimate (Section VI, paras. 213, 215), the Soviet leaders probably believe that some further reductions in the numerical strength of their armed forces would be desirable. The relatively great size of Soviet forces-in-being may persuade the Soviet leaders that some reductions can be made without undue prejudice to the security or other interests of the USSR. Whether Soviet forces are in fact reduced, however, will depend to a great extent on the degree of danger and tension that the Soviet leaders feel in the international situation. It is possible that they will conduct their policy in such a way as significantly to increase international tensions, and thus to require armed forces as large, or even larger, than they have at the present day. We think it more likely that there will be some further reduction in Soviet force strengths during the period of this estimate, but we do not believe that the reduction will be substantial.

102. *Soviet Military Policy Toward the Satellites.* The Soviet leaders regard the Satellite area in general as vital to the military posture of the USSR, both as an extension of the defense perimeter of the homeland and as a base for Bloc offensive power. Even prior to the Polish and Hungarian uprisings the USSR probably had some reservations concerning the reliability of Satellite military forces, but we believe the events of last fall have reinforced Soviet determination to maintain substantial Soviet forces in and near the Satellites for an indefinite period. However, additional token withdrawals from East Germany may occur, and there may be some reduction in present Soviet strength in Hungary as the local situation stabilizes.

103. The events of last autumn probably reemphasized to Soviet leaders the desirability of using the Warsaw Pact, an ostensibly voluntary mutual defense arrangement, as the basis for Soviet-Satellite military relations. Under this pact the USSR will continue its efforts to develop and maintain reliable and effective Satellite forces, but it will probably not permit any significant expansion of these forces.

¹¹ In addition, there are an estimated 400,000 personnel in Soviet security forces. For detailed personnel strength estimates of Soviet and other Bloc military forces in mid-1957, see Annex, Table 1. [Footnote is in the original.]

TRENDS IN SPECIALIZED SCIENTIFIC AND TECHNICAL CAPABILITIES

Nuclear Weapons¹²

104. The USSR is making a concerted effort to perfect a variety of improved nuclear weapons, particularly those employing thermonuclear principles. Of the 42 Soviet nuclear tests detected between August 1949 and 10 October 1957, a total of 23 have been detected since January 1956, [text not declassified]. We estimate that the Soviet weapons stockpile in 1957 could include a variety of nuclear weapons, with yields ranging from about 4 kilotons (KT) up into the megaton range.

105. In general, we anticipate that the USSR will be capable of producing improved nuclear weapons of the yields and characteristics needed to support its military requirements. By 1958–59, the most powerful Soviet bombs could probably yield up to 20 MT, but the maximum yields of missile warheads will continue to be considerably less than this. In addition to the mononuclear [mononuclear] weapons, a wide variety of fission weapons, including very small, low-yield weapons, will become available. We believe that development of advanced weapons will require additional testing. The absence of such tests, however, would not preclude Soviet stockpiling of very high yield (above 8 MT) weapons on an emergency or provisional basis.

106. Although we estimate a substantial Soviet program for the expansion of fissionable material production, the availability of such materials will continue throughout the period of this estimate to be a limiting factor in determining the size of many military and nonmilitary programs. Our estimate of the cumulative quantities of nuclear materials available for weapon uses is given below. The amounts have been calculated by deducting from estimated production those quantities of nuclear materials estimated to meet pre-1957 nuclear test expenditures, and to meet the inventory and fuel requirements of research and power reactors. No deductions have been made for production reactor expenditures, future nuclear tests, propulsion applications, or materials tied up in weapons manufacturing pipelines. If a major nuclear propulsion program were undertaken, this would require substantial allocations of nuclear material.¹³

¹² For detailed estimates of Soviet capabilities in nuclear weapons design and dates of availability, see NIE 11–2–57, The Soviet Atomic Energy Program, 7 May 1957 (Limited Distribution). [Footnote is in the original.]

¹³ The Director of Naval Intelligence does not concur in the quantities of fissionable materials listed herein as available for weapons uses, nor in the estimated production of fissionable materials upon which these figures are based. He believes that the quantities of material which will be available for weapons use will not exceed the lower limit of uncertainty indicated for the estimate. [Footnote is in the original.]

	<i>mid-1957</i>	<i>mid-1960</i>	<i>mid-1962</i>
Uranium-235	17,500 Kg.	56,000 Kg.	101,000 Kg.
Plutonium Equivalent ¹⁴	5,500 Kg.	12,400 Kg.	18,300 Kg.

The uncertainty in our estimate of cumulative U-235 availability through mid-1957 is large but probably does not exceed one-half to twice the value shown. The uncertainty in our estimate of cumulative availability of Plutonium equivalent through mid-1957 probably does not exceed plus or minus 50 percent of the value shown. These uncertainties increase rapidly as the estimate is extended into the future, and no meaningful numerical range of uncertainty can be given beyond mid-1957.

107. While there is considerable evidence to indicate the types of weapons the USSR is probably stockpiling and the delivery systems it contemplates, there is no direct evidence to support a quantitative estimate of the Soviet weapons stockpile by type.

*Guided Missiles*¹⁵

108. The USSR is capable of developing and producing during the period of this estimate advanced types of guided missile systems in all categories, and its research and development program in the guided missile field will continue to enjoy a very high priority. The USSR is also capable of developing various sizes of nuclear, high explosive (HE), and chemical (CW) warheads for its guided missiles, although the availability of fissionable materials will limit the extent of nuclear warhead production during the period of this estimate.

109. *Surface-to-Air Missiles*: An extensive system of surface-to-air guided missile installations is now operational in the Moscow area, and similar installations appear to be under construction at Leningrad. The Moscow system, which could include a limited number of nuclear warheads, can probably direct a very high rate of fire against multiple targets at altitudes up to about 60,000 feet, although it is probably vulnerable to very low altitude attack. During 1958–61, surface-to-air systems with increased range and altitude capabilities for static defense of target complexes, and with low and high altitude capabilities for defense of static targets, field forces, and naval vessels, could probably become operational. The maximum altitude capabilities of Soviet surface-to-air missile systems will probably keep pace with those of operational Western

¹⁴ The term "Plutonium equivalent" is used because our method of estimation does not permit us to distinguish between Plutonium, Uranium-233, tritium, or any other reactor-produced isotopes. [Footnote is in the original.]

¹⁵ For a more extended discussion of Soviet guided missiles, see NIE 11–5–57, Soviet Capabilities and Probable Programs in the Guided Missile Field, 12 March 1957; see also appropriate sections of NIE 11–57, Sino-Soviet Bloc Air Defense Capabilities through mid-1962, 16 July 1957. [Footnote is in the original.]

bombers and cruise-type missiles. On the other hand, we believe the USSR will not be able to place in operation a weapon system capable of successfully intercepting ballistic missiles by mid-1962.

110. *Surface-to-Surface Missiles*: The probable Soviet firing of two ICBM test vehicles in the summer of 1957 and the successful Soviet launching of earth satellites attest both to the high capabilities of the USSR in long-range ballistic missile development and to the extremely high priority this program enjoys. In the light of this and other new evidence, we have re-examined our previous estimate of Soviet ICBM development, and have tentatively advanced from 1960–61 to 1959 the probable date when a few (say, ten) prototype missiles of 5,500 nautical miles (n.m.) range could first be available for operational use. This estimate is predicated upon: (a) a top priority flight test program over a period of about two years from the first firing of a test missile this summer; (b) a maximum range of 5,500 n.m. and a CEP of about 5 n.m.; and (c) the equipping of the first operational unit with prototype rather than series-produced ICBMs. Early success of any phase of the test program, or relaxed accuracy and reliability requirements, could advance the date of availability.¹⁶

111. We have likewise re-evaluated the Soviet program for development of an IRBM. Recent evidence indicates that the USSR has probably elected to develop a 1,000 n.m. ballistic missile which is essentially a modified 700 n.m. missile with a lighter warhead. With such a program, the USSR could take advantage of existing development, production, and operational capabilities and could probably achieve a first operational capability with a 1,000 n.m. missile in 1958. Most of the present targets on the Eurasian periphery which we believe the USSR would wish to attack would be within range of this missile fired from within the Bloc. While firm evidence indicated an early Soviet interest in IRBMs with ranges up to 1,600 n.m., there are no current indications of development of ballistic missiles of ranges beyond about 1,000 n.m., save for the ICBM.

112. As previously estimated on the basis of considerable evidence, the USSR has developed and could now have available for operational employment at least four shorter-range ballistic missiles, with maximum ranges of about 75 n.m., 175–200 n.m., 350 n.m., and 700 n.m. We believe the Soviet surface-to-surface program also includes submarine-launched missiles. We estimate that for this purpose the USSR could now have supersonic cruise-type missiles capable of maximum ranges of about 500 n.m., and that in 1962 a supersonic cruise-type missile of up to 1,000 n.m. range could probably become available. To an extent

¹⁶ The estimate made in this paragraph must be considered tentative, pending completion of SNIE 11–10–57: The Soviet ICBM Program, now in process. [Footnote is in the original.]

varying with the missile guidance system employed, their accuracy would depend on the ability of the launching or guidance submarine to fix its own position.

113. *Other Missile Categories*: For improving the effectiveness of its interceptors, the USSR could now have available short-range air-to-air missiles equipped with HE warheads, probably including one suitable for all-weather engagement at ranges up to 5 n.m. Soviet air-to-air capabilities will probably improve, and some large-caliber air-to-air rockets or guided missiles could be equipped with nuclear warheads during 1958–62. In the air-to-surface category, subsonic missiles capable of carrying nuclear warheads up to about 55 n.m. could probably now be available, primarily for use as anti-ship weapons, but also suitable for use against isolated and well-defined radar targets on land. In 1961, a 100 n.m. supersonic air-to-surface missile could probably be available for employment by heavy bombers. It will probably also be within Soviet capabilities to develop specialized decoys and anti-radar missiles to aid in penetrating enemy defenses.

114. *Earth Satellite*. In addition to their obvious psychological purpose, the artificial earth satellites launched by the USSR are intended to acquire data of scientific and military value. While it is too soon to say how much data is being acquired, the satellites launched to date are known to be providing new information on ionospheric effects and refractions at certain radio frequencies, and probably also on the effects of weightless flight and outer space radiation on equipment and living organisms. They are also providing data on pressure, temperature, and meteoric densities at extreme altitudes. Future Soviet earth satellites, which may be launched at any time, will provide additional scientific data contributing to both military and non-military Soviet projects. A reconnaissance satellite, previously estimated for 1963–65, may be available considerably earlier. Space vehicles and space platforms are almost certainly included in Soviet planning.

115. *Chemical and Biological Warfare*. Current Soviet military doctrine recognizes the potentialities of CW and BW as adjuncts to nuclear and other weapons, and Soviet forces are thoroughly trained in the offensive use of CW. A stockpile of CW agents is believed to have been maintained at least at World War II levels, and may have been increased. It probably consists primarily of such nerve gases as GA (Tabun) and GB (Sarin), as well as some standard agents such as mustard. One of the "V" series of nerve agents, far more persistent and toxic than the "G" series, may have been in production in the USSR since 1956; effective use would depend on Soviet solution of the problem of generating a proper aerosol for its dispersal.

116. Accumulated evidence also indicates an active Soviet BW research and development program encompassing anti-personnel, anti-livestock, and possibly anti-crop agents. Although relatively little is known about the scope of the program, particularly its offensive aspects, the USSR has probably had a capability for small-scale, clandestine BW operations for at least several years. We have no evidence of large-scale production of BW agents and munitions, but the USSR has the facilities, personnel, and materials needed for such production.

117. In the field of defense against BW and CW, Soviet capabilities are at least comparable to those of the major Western nations, and in the case of CW may be superior. Soviet troops are well-equipped with CW defense items, and the current issue gas mask appears to afford adequate protection against inhalation of known agents. Extensive programs are under way to indoctrinate both military personnel and civilians in defensive techniques.

118. *Electromagnetic Warfare.* Soviet offensive and defensive programs in this field are likely to be pressed forward during 1958–62. We believe that at present the USSR is capable of jamming and seriously disrupting Western long-range radio communications, and that it also has an appreciable capability for jamming Western bombing and navigational radars. Its jamming capabilities now extend up to frequencies of at least 10,000 mc/s; by 1960 some Soviet jamming equipment could operate at frequencies of 30,000 mc/s or higher. The USSR could also develop devices to enable missiles to home on electronic emissions. Soviet forces are now training in the use of CHAFF, research is under way on anti-radar coating materials, and we believe the USSR is developing active airborne jamming equipment. Conversely, known types of Soviet radio and radar equipment are vulnerable to electronic countermeasures, particularly Soviet blind-bombing and air defense radars, all of which operate in a few narrow frequency bands. The USSR is capable of increasing its spread of frequencies and of developing anti-jamming devices, but through 1962 Soviet defensive electronic systems will probably still be subject to disruption by properly employed techniques.

TRENDS IN SOVIET MILITARY STRENGTHS

Soviet Ground Forces

119. There has been an extensive program over the past several years to reorganize and modernize the Soviet ground forces to meet the requirements of modern warfare, both nuclear and non-nuclear. More advanced designs of practically all types of equipment in Soviet line divisions have appeared. The fire power of individual units has been increased markedly, additional vehicles (including amphibious

vehicles) have been provided, and communications equipment has been augmented. Our evidence on these developments relates primarily to the Group of Soviet Forces, Germany, but we believe they are proceeding throughout the Soviet field forces.

120. All these changes are in line with revised Soviet tactical doctrine, which emphasizes the need to supplement standard ground force tactics and training with those designed to meet the conditions of nuclear warfare. This doctrine stresses firepower, mobility and maneuverability, greater initiative, deeper objectives, intensified reconnaissance, and the protection of individuals and units against the effects of atomic and chemical weapons. It also envisages the use of tactical nuclear weapons and guided missiles in support of Soviet field force operations. Thus far, however, both the revised tactical doctrine and the reorganization of ground force elements reflect evolutionary changes without basic alteration in the field force structure.

121. The order of battle of Soviet Army ground forces is still estimated at about 175 line divisions plus supporting units.¹⁷ Present evidence suggests that the actual strengths of comparable units vary widely according to their locations. First category units, with the best equipment and highest manning levels, are believed to be those near the borders of the USSR, with second category units in occupied areas abroad and lowest category units in the interior of the USSR. The average is probably about 70 percent of authorized wartime strength; in border areas actual strength probably exceeds 70 percent, in East Germany and other occupied areas it is 70 percent or slightly less, and in remote interior districts it may be as low as 30 percent. All units probably have a high proportion of authorized officer strength, however, and full equipment is believed to be kept locally available. These peacetime manning practices, together with standard conscription and stockpiling programs, would probably enable all Soviet line divisions to be brought to full strength by M+10 and permit the activation of about 125 additional line divisions by M+30.

122. During 1958–62 further improvements in the firepower and mobility of Soviet ground forces are likely, and there may be further gradual alterations in organization to permit greater dispersion and flexibility of control. Nuclear weapons and guided missiles—with both nuclear and non-nuclear warheads—will probably become available in significant quantities during the period. The USSR will probably employ those weapons for relatively long-range support of tactical operations, however, and conventional field artillery and unguided rockets will continue to provide the major direct fire support for units in close combat. Anti-aircraft artillery, on the other hand, will tend to

¹⁷ For detailed estimates of the strength of Soviet and other Bloc ground forces in line divisions as of mid-1957, see Annex, Table 2. [Footnote is in the original.]

be replaced by guided missiles, first in static defenses within the USSR and later in mobile field force units.

123. *Airborne Forces.* Increasing attention is now being paid to the development of Soviet airborne and air transportable forces, as indicated by: the rapid augmentation of transport capabilities, especially in assault-type helicopters and converted BULL medium bombers; the appearance in 1956 of the CAMP, a twin-turboprop assault transport; the development of a new light-weight self-propelled anti-tank gun for airborne use; and further improvements in personnel and cargo parachutes. The USSR has sizable airborne forces in being, estimated at 10 divisions and a total strength of about 100,000 men. Soviet Aviation of Airborne Troops now comprises approximately 500 twin-engine transports, 180 BULL transports, 140 large helicopters, and 220 large gliders. This strength could be augmented substantially by other military and civil transports.

124. Soviet airlift capabilities will increase considerably during 1958–62, primarily as additional helicopters and transports are introduced. The largest operational Soviet helicopter can now carry 8,800 lbs. (40 men with combat equipment), and by 1961 the USSR could probably have in operation helicopters with payloads up to 30,000 lbs. The BULL will probably be employed as an interim medium transport until late in the period, when it will probably have been completely replaced by the CAMP and possibly other advanced types. Better auxiliary transport will also become available as improved aircraft are introduced into the civil air fleet. New turboprop medium and heavy transports will probably become operational in 1958, and a new four-turbojet transport in 1959.¹⁸

Soviet Air Forces

125. We estimate the over-all actual strength of Soviet military air units in mid-1957 at about 18,000 aircraft.¹⁹ Further modernization of all components of the Soviet air forces will occur during 1958–62, and will include increases in the proportion of jet all-weather fighters, in the numbers of jet medium and heavy bombers, and the emergence of a substantial inflight refueling capability. The present combat effectiveness of Soviet military aviation is, on the whole, below that of the US. However, the introduction of new aircraft types and the relatively low turnover of personnel will almost certainly raise combat proficiency to a high level by 1962. In the long run, guided missiles will replace manned aircraft within many of the missions performed by the latter, but we doubt that this process will go so far during the period of this estimate as to lead to a major reduction in the numbers of Soviet military aircraft.

¹⁸ For estimated performance characteristics of Soviet transport aircraft, see Annex, Table 8. [Footnote is in the original.]

¹⁹ For detailed estimates of the strength of Soviet and other Bloc air forces during the period of this estimate, see Annex, Tables 3–5. [Footnote is in the original.]

126. Soviet air capabilities will be augmented by improvements in a wide variety of ground and airborne supporting equipment, especially in the electronics field. There will almost certainly be advances in the performance characteristics of early warning, ground-controlled intercept and airborne intercept radars. The accuracy of navigational and bombing radars will probably be improved. There will probably be significant increases in the quantity and quality of ECM equipment and of ground and airborne communications equipment, including modern high-speed data-handling equipment for air defense. Continued expansion of the network of modern, well-equipped air facilities is also likely.²⁰

127. We estimate the mid-1957 actual strength of Soviet fighter units at approximately 10,000 jet fighters, of which over 3,700 are in Soviet Fighter Aviation of Air Defense with air defense as their sole mission, while the remainder are in tactical and naval units with air defense as one of their missions. At present about 1,300 of these aircraft have at least limited all-weather capabilities; by 1962 all-weather fighters may comprise about 60 percent of total Soviet fighter strength. Future numerical strength will probably not be increased and, primarily because of the influence of guided missile systems, a cutback in the number of Soviet manned interceptors will probably begin late in the period. Other factors which might contribute to a Soviet decision to decrease its numerical strength in manned interceptors include probable increases in the destructive power of individual interceptors, and increased demands on industrial capacity resulting from the advent of more complex fighters.

128. Although the subsonic FRESCO day fighter is now the principal equipment of Soviet fighter forces, the supersonic FARMER day fighter and the all-weather FLASHLIGHT are rapidly being phased into operational units. We estimate that during 1958–62, the USSR will probably introduce new day and all-weather fighter types with considerably improved altitude and speed characteristics though at the expense of combat radius; the 1962 Soviet all-weather fighter will probably be capable of operating at altitudes up to 67,000 feet, and of climbing to 40,000 feet in less than two minutes.²¹

129. Tactical Aviation includes approximately 4,600 jet fighter aircraft and 2,400 jet light bombers. The latter are primarily the obsolescent BEAGLE, with combat radius of approximately 750 n.m. In 1958,

²⁰ For further information, see appropriate sections of SNIE 11–6–57, Soviet Gross Capabilities for Attack on the Continental US in mid-1960, 15 January 1957 (Limited Distribution), and NIE 11–57, Sino-Soviet Bloc Air Defense Capabilities through mid-1962, 16 July 1957. [Footnote is in the original.]

²¹ For estimated performance characteristics and dates of operational availability of Soviet fighters, see NIE 11–57, Sino-Soviet Bloc Air Defense Capabilities through mid-1962, 16 July 1957, Annex B, Tables 1 and 2. However, we now believe it unlikely that the FLASHLIGHT “C,” which is included in these tables, will be placed in operational service. [Footnote is in the original.]

improved jet light bombers will probably be introduced into service, including the USSR's first bombers with supersonic "dash" capabilities.²² Ground attack regiments, formerly equipped with piston aircraft, have been re-equipped with jet fighters, and there is continuing evidence of the employment of jet fighter regiments of Tactical Aviation for both ground support and air defense missions.

130. *Long Range Aviation*. The capabilities of Soviet Long Range Aviation have continued to increase during the past year. Its estimated strength in bomber aircraft has grown from about 1,300 to some 1,500. The number of bomber regiments has also increased, although at a somewhat slower rate than during the preceding year. The trend in training activities during the year is believed to have been toward larger-scale operations and longer-range flights out of home base areas, including flights to potential forward staging bases. Inflight refueling has been under development for both the BISON jet heavy bomber and the BADGER jet medium bomber, apparently using convertible tanker-bomber versions of these aircraft, and is at least in limited use by BISONs assigned to operational units. Finally, there is evidence that the USSR has established nuclear weapons storage facilities in the vicinity of Long Range Aviation bases.

131. Recent evidence indicates that Soviet production of BADGERs, and the number in operational units, are considerably in excess of our previous expectations. We now estimate that there were about 850 BADGERs in Long Range Aviation units as of mid-1957, and on the basis of current evidence we believe BADGER strength will continue to increase during the next year or two. At the same time, the USSR apparently continues to employ the BULL piston medium bomber for training, reconnaissance, bombing, and other purposes, and it is being phased out of Long Range Aviation at a slower rate than formerly estimated. We do not now expect BULLs to be entirely phased out until about 1960. Thereafter, there will probably be some decline in jet medium bomber strength in Long Range Aviation as a result of the increased availability of heavy bombers, the assignment of more medium bombers to naval and probably to tactical aviation, and the advent of significantly advanced delivery systems, including longer range air-to-surface and surface-to-surface guided missiles. The BADGER will remain the primary medium bomber through 1962, although by mid-1961 a new medium bomber with supersonic "dash" capabilities may be introduced.²³

²² For estimated performance and dates of operational availability of Soviet light bombers, see Annex, Table 7. [Footnote is in the original.]

²³ For estimated performance characteristics of Soviet long-range bombers, together with estimated dates of operational availability, see Annex, Table 6. [Footnote is in the original.]

132. In mid-1956, the USSR apparently settled on an improved production model of the BISON jet heavy bomber, with a new bombing-navigation system as well as provision for inflight refueling. Considering the somewhat better performance characteristics of the BISON, its greater development potential, and the development of an inflight refueling capability, the USSR may have decided to place greater emphasis on the BISON than on the BEAR. We therefore believe that the BISON will probably comprise the greater proportion of Soviet strength in heavy bombers in the later years of this period. A BISON with additional improvement in performance could probably be operational in 1959.

133. No positive evidence of Soviet research specifically directed toward nuclear propelled aircraft has been obtained. However, we estimate that:

a. The Soviet aircraft nuclear propulsion program is probably now engaged in development and testing of reactor components and sub systems.

b. A reactor system suitable for nuclear propulsion of subsonic aircraft could probably be available to the Soviets in 1962. It is possible that the USSR could for propaganda purposes fly an experimental aircraft powered in part by nuclear power at an earlier date.

134. To employ its long-range bomber force most advantageously, especially for intercontinental operations, the USSR would require a substantial inflight refueling capability. Refueling is particularly desirable for jet heavy bombers; for example, one refueling by a compatible tanker could approximately double the area of the continental US that could be reached by the BISON on a two-way mission from bases in the Chukotski area. BADGER coverage of US targets on one-way missions could also be increased by refueling. Refueling for the BEAR, while less essential than for the jet bombers, could increase its coverage of US targets from interior bases in the USSR. The USSR could employ turbo-prop heavy bombers in the tanker role. Aircraft configured specifically as tankers might also appear as the period advances. But on the basis of present evidence, we believe most of the tankers in Soviet Long Range Aviation during the period are likely to be convertible jet tanker-bombers, and that the bulk of these will probably be in the heavy category. The use of convertible tanker-bombers would permit greater flexibility in the employment of Long Range Aviation.

135. While evidence is inadequate to establish precisely the total size of the Soviet heavy bomber force, we have unusually good evidence on the one plant known to be producing BISON jet heavy bombers, which indicates a cumulative BISON production of 65 by mid-1957. Evidence on BEAR turboprop heavy bomber production is

less extensive but indicates about 50 produced. On this basis, about 50 BISONs and 40 BEARs would have been available for operational units as of 1 July. If this is in fact the case, both BISON and BEAR production have fallen short of our estimate of last year.

136. Beyond this point of good evidence, however, there is an area of considerable uncertainty, particularly with regard to the BISON program. There is some evidence suggesting that as many as 90 BISONs may have been in operational units as of mid-1957. This would mean that the rate of BISON production has increased considerably since late 1956, and that an additional unknown aircraft plant has entered the BISON program, although we have almost no evidence to support this. It is similarly possible that BEAR production could have increased to an extent sufficient to provide about 60 in operational units, though we also lack good evidence. Indeed, there is evidence that additional plants estimated to be capable of producing heavy bombers are either continuing in the BADGER program or are preparing to produce transport or tanker aircraft.

137. If recent heavy bomber production has in fact been as low as the preponderance of evidence indicates, a partial explanation may lie in the field of technical problems. For example, it is possible that larger-scale production has been delayed pending the availability of higher-thrust engines or other developments expected to improve performance characteristics. But we would believe it more likely that Soviet planners have deliberately decided on a relatively modest heavy bomber program. In our view, such a Soviet decision would probably have been based on such judgments as the unlikelihood of general war during the next few years, the great expense of a large-scale heavy bomber program, the existence of a reliable jet medium bomber force with one-way intercontinental capabilities for interim use in emergency, and the expectation that new and improved intercontinental delivery systems will become available in a few years. On the other hand, if heavy bomber production has reached the higher levels mentioned in paragraph 136, it would indicate greater Soviet emphasis on the heavy bomber weapon system for intercontinental attack.

138. We have noted statements of Khrushchev stressing his view of the declining importance of manned fighter and bomber aircraft as contrasted with guided missiles. If these views had been contained solely in statements beamed to the outside world they could be dismissed as mere propaganda. It is hard, however, to interpret their inclusion in the Soviet press, with the resulting advertisement to the Russian people, unless they were intended to prepare the Russian people for some de-emphasis on the heavy bomber, or to cover up delays in production

which might have been occasioned by difficulties experienced with the heavy bomber production. We cannot disregard, however, the possible conclusion that such statements are a deliberate effort to discredit and degrade the effectiveness of US retaliatory forces in the eyes of the Soviet people as well as the Western powers, and to exploit to the fullest extent the psychological advantage gained by recent Soviet missile/satellite advances.

139. In any event, we believe that the USSR will retain a strong long-range bomber force, including both medium and heavy bombers, at least until it has acquired a substantial nuclear delivery capability with more advanced weapon systems. However, it is difficult to predict with assurance how large the USSR will desire this force to be, particularly in heavy bombers. The estimate of heavy bomber and tanker production, particularly for the period 1959–62, presents unusual difficulties. Future Soviet policy in these respects is still shrouded in doubt. In view of this uncertainty we have expressed below our estimates of Soviet long-range bomber/tanker strength in terms of ranges.

SOVIET LONG RANGE AVIATION
(Estimated Strength in Operational Units)^{1 2 3}

See qualifications in paragraphs 135–139

	<u>Mid-1957</u>	<u>Mid-1958</u>	<u>Mid-1959</u>	<u>Mid-1960</u>	<u>Mid-1961</u>	<u>Mid-1962</u>
HEAVY BOMB- ERS AND TANKERS	90–150	150–250	250–450	400–600	400–600	400–600
MEDIUM BOMB- ERS AND TANKERS						
Jet	850	1000–1050	1000–1100	1000–1100	950–1100	900–1000
Piston	550	350	150	—	—	—
TOTALS	1500–1550	1500–1650	1400–1700	1400–1700	1350–1700	1300–1600

¹ The Assistant Chief of Staff, Intelligence, USAF, believes that the USSR would regard it as essential to have a more substantial intercontinental attack capability, providing for greater strategic flexibility and a much larger capability for re-attack—in short, a force which would provide the Soviets a greater chance of success in general war—while they are working to acquire an additional nuclear delivery capability with new weapon systems, including long-range missiles. He therefore believes that the strengths estimated above would all be bomber aircraft and that additional aircraft will be in operational units as tankers as follows:

	<i>Mid-1957</i>	<i>Mid-1958</i>	<i>Mid-1959</i>	<i>Mid-1960</i>	<i>Mid-1961</i>	<i>Mid-1962</i>
TANKERS	0	50–100	150–200	300–350	300–500	300–500

² The Deputy Director for Intelligence, The Joint Staff, and the Assistant Chief of Staff, Intelligence, Department of the Army, believe that the above projected future strength of the heavy bombers is contrary to the available evidence and foreseeable trends. Past estimates predicted an extensive production program of heavy bombers. This program has failed to develop as had been anticipated. Despite this the present estimate still implies an extensive program even though reduced below previous estimates. Even the lower figures of the table would require an increase of heavy bomber production which is not yet evident nor indicated by trends. In regard to total numerical strength, the upper range of figures implies a continued build-up of total strength which is in seeming contradiction to the indicated trends and to the judgment expressed in paragraph 135. The Deputy Director for Intelligence, The Joint Staff, and the Assistant Chief of Staff, Intelligence, Department of the Army, believe that the composition of the Soviet Long-Range Aviation will change with the introduction of higher performance bombers and possibly tanker aircraft. However, they believe that the total numerical strength will show no further increase but on the contrary will probably decrease, as indicated by the lower range of figures.

³ The Director of Naval Intelligence believes that while the Soviets will certainly maintain a substantial heavy bomber force during the period of build-up of new intercontinental delivery systems, the heavy bombers/tankers available in operational units through mid-1958 will almost certainly approximate the lower range estimated in the above table. [All footnote in the table are in the original.]

Soviet Naval Forces

140. During the postwar years Soviet naval forces have been greatly strengthened by an intensive building program, concentrated on light cruisers, destroyers, and submarines. The Soviet submarine force is by far the largest in the world; over half its present strength consists of long-range craft, of which a significant and increasing proportion are of postwar design and construction. We estimate main Soviet naval strength in mid-1957 at 28 cruisers, 158 destroyers, 82 escort vessels, and about 475 submarines. These totals include vessels of postwar design numbering 15 light cruisers, 92 fleet destroyers, 82 escort vessels, about 250 long-range submarines (“Z” and “W” classes) and about 40 medium-range submarines (“Q” class).²⁴

141. Several important developments are likely in Soviet naval forces during 1958–62 as a result of changing weapon systems and new concepts of naval warfare. These will probably include the application of nuclear propulsion to naval vessels and use of both surface-to-surface and surface-to-air missiles. Although we have no firm evidence that the

²⁴ Detailed estimates of Soviet naval strength by major type and fleet area are given in Annex, Table 9. [Footnote is in the original.]

USSR has a nuclear-powered submarine, we believe that a program for its development has reached an advanced stage and we estimate that a reactor could be available for installation in 1957. Development of nuclear power plants for cruisers may follow the operational testing of a nuclear-powered icebreaker, which will probably occur in late 1958 or early 1959. We believe the USSR is presently capable of adapting nuclear warheads to torpedoes and depth charges.

142. Although the evidence pointing to the existence of Soviet guided missile submarines is not conclusive, we believe that the USSR will construct or convert submarines for surface-to-surface guided missile launching. Converted boats with topside missile stowage could already be in operation. Twenty submarines with topside missile stowage could be converted by the end of 1958, and by mid-1962 the USSR may have a total of about 30 guided missile submarines built on basically new designs, including boats with nuclear or other improved propulsion systems. Air defense missile systems for surface vessels, also capable of modification for shore bombardment purposes, could probably begin to be available in 1958; the unfinished hulls of six cruisers, which have been in Soviet shipyards since the cessation of the cruiser construction program several years ago, may be completed with guided missile armament.

143. The operating efficiency of Soviet naval forces, while still below that of the US Navy in some fields, is quite high and will continue to improve. The submarine force is undergoing intensified training, particularly in long-range operations. The principal weaknesses of the USSR as a naval power will continue to derive from the wide separation of its sea frontiers and its inability to control the sea routes between these areas, although improvements in inland waterways will increase its ability to interchange smaller vessels including submarines. The lack of adequate supply lines to its Northern and Far Eastern fleet areas and the land-locked position of its fleets in the Baltic and Black Seas are additional handicaps.

144. *Submarine Construction.* The Soviets will probably continue to place primary emphasis on submarines in their naval construction program. Since 1950 the Soviets have built about 300 submarines of postwar design. It is estimated that about 50 boats, "W" and "Q" class, will be built during 1957. We estimate that the total number of Soviet submarines of all types at the end of 1957 will be about 500. Throughout the period of the estimate we believe that the production of medium-range submarines will continue at about the present rate of 20 per year. The most recent evidence indicates that the program for production of "W" class conventional propulsion long-range submarines has been curtailed and may possibly be terminated this year. The

Soviets will retain their capability for submarine production however, and we believe that after an interim period for changeover and development of prototypes, series construction of new long-range types will be resumed. This procedure would be parallel to that followed in the period 1949–51 in the changeover to the “W,” “Z,” and “Q” classes.

144a. We estimate that the USSR could now have a prototype nuclear-powered submarine, and that they may develop other improvements in propulsion design during the period. The Soviets also could produce a new type of submarine specifically designed for guided missile firing. Although they have adequate fissionable material and the over-all technological potential to produce larger numbers of the new types, we believe that their program will be of the magnitude indicated unless they adopt less sophisticated designs for reasons of urgency. Subject to successful development of prototypes, we believe the Soviets could build, within the period, about 70 submarines with advanced weapon systems and improved propulsion, about 20 of which probably would be nuclear powered. Considering such factors as the decommissioning of obsolete boats and the development of new propulsion and weapon systems, we estimate that the total force will approximate 560 submarines by mid-1962.

145. *Naval Aviation.* Soviet Naval Aviation, comprising nearly 20 percent of total Soviet air strength, is now the second largest naval air force in the world. It is engaged in a concentrated training program which stresses coordinated action between its land-based aircraft and naval vessels (both surface and submarines), offensive action against enemy naval forces, and air defense. During this period, its strength will probably be increased and its modernization will continue. There is no evidence of intention to build aircraft carriers. Improved light bombers and all-weather fighters will probably be introduced. Long-range maritime reconnaissance and attack capabilities should be improved materially by increases in the number of jet and piston medium bombers allocated to Naval Aviation, and by the probable availability of air-to-surface guided missiles for attack against ships.

TRENDS IN SOVIET STRATEGY AND CAPABILITIES

146. For reasons which have been set forth elsewhere in this estimate we believe that the Soviet leaders wish to avoid an all-out nuclear exchange with the US. We have also pointed out that they almost certainly consider that any general war with the US would involve such an exchange. Consequently, we think that a key element of Soviet strategy in any war, whether with the US or with another nation, would be to attempt to keep the conflict limited in geographic scope. The Soviets would probably also prefer that nuclear weapons not be used, at least

in a war commencing during the next year or two, since they probably think that their relative capabilities would be greater if the local war were fought with conventional weapons only. However, they probably consider that such a limitation would be impossible in many circumstances.

147. The number and variety of conceivable local wars is so great as to preclude any attempt to consider in this estimate the manner in which the Soviets might conduct them. We therefore confine ourselves to one aspect only of Soviet military strategy—that for the initial phase of general war. Even though the Soviets almost certainly desire to avoid such a war, and probably believe that their increasing nuclear capabilities powerfully deter the US from initiating it, they cannot ignore the possibility that general war may occur, and their planners must prepare for it.

Soviet Strategy for the Initial Phase of General War

148. General war might grow out of local war, or directly out of a situation of intense international crisis, or it might (though we think this highly unlikely) be initiated in a period of comparative international calm. We believe that the Soviets recognize the advantages that would accrue to the side that struck the first blow in any all-out nuclear exchange. Therefore we believe that, whenever the Soviet leaders decided that the likelihood of general war had reached a certain point, they would themselves initiate it by strategic nuclear attacks.²⁵ The primary objective of such attacks would be to destroy or neutralize Western nuclear retaliatory capabilities, both in the continental US and overseas. Consistent with this assignment of first priority, the USSR

²⁵ The Assistant Chief of Staff, Intelligence, Department of the Army, believes that the USSR would avoid initiation of nuclear attacks and would seek to achieve its objectives by limited or local war if military action became necessary. The Soviet leaders would attempt to secure a limitation on the use of nuclear weapons prior to hostilities or to conduct hostilities under conditions which would limit or preclude the use of nuclear weapons.

It has been estimated in paras. 90 and 91 that the Soviets would not be confident that they would not receive unacceptable damage in an all-out nuclear exchange and that they would not deliberately initiate general war or undertake courses of action gravely risking general war. Moreover they are probably confident that the US would be similarly deterred except under extreme provocation.

Consistent with these judgments, the Soviet leaders, before making a decision to initiate nuclear attacks, would have to judge that their own deterrent capabilities were no longer effective and that their gains from an all-out nuclear attack would outweigh their losses. Paramount in such calculations would be survival of the state without which any gain would be meaningless.

It follows that the Soviet leaders would launch a nuclear attack against the US only if it offered the only hope of survival. Such a situation would occur only if the Soviet leaders came to believe that the US was irrevocably committed to launching an all-out nuclear attack against the USSR. [Footnote is in the original.]

would probably also seek to destroy other key US war-making capabilities. At the same time, the USSR would make a maximum air defense effort against those Western nuclear striking forces which had escaped the initial Soviet attacks.

149. During any local war or intense international crisis it is virtually certain that the USSR (as well as the US) would prepare against the possibility of a greatly broadened conflict. These preparations would almost certainly include some redeployment of forces, mobilization of additional strength, civil defense precautions, and the like. However, the USSR would not want to push preparations so far as to convince the US that general war was imminent, lest this lead the US to strike the first all-out nuclear blow. This factor would constitute a limitation on the degree of Soviet preparation.

150. Another major limitation on Soviet preparations for general war would lie in the importance of achieving surprise. The necessity of attempting to neutralize Western nuclear retaliatory capabilities would make surprise in the initial nuclear attack a key element of Soviet strategy. While the USSR could not count upon achieving surprise against all Western nuclear capabilities, both within the US and elsewhere, it would almost certainly attempt to do so to the fullest extent possible. Thus, if the Soviets decided to begin the general war themselves, they would try to avoid compromising the element of surprise in their initial nuclear attack by observable preparations.

151. The foregoing considerations lead us to believe that the outbreak of general war would find the Soviets at a stage of military readiness beyond that of ordinary peace-time, but short of what their planners might believe best for the most rapid exertion of the total military effort. The actual state of readiness would depend on the development of the particular situation and on the Soviet calculation of the risks involved, and is impossible to predict in advance.

152. The Soviet leaders would probably launch an attack by ground and tactical air forces against Western Europe in order to prevent NATO mobilization, deployment, and counter-attack. We believe that the USSR would plan to commit its ready forces to an offensive, especially in Western Germany, as soon as possible consistent with maintaining surprise for the initial assault against the US, US and allied nuclear bases overseas, and carrier task forces. Under favorable circumstances from the Soviet point of view, advances against NATO could be initiated concurrently, i.e., at the moment the West obtained warning of the Soviet strategic attack. The Soviets would probably also regard an attack to seize the Turkish Straits as of early high priority, but we believe that they would probably delay initiation of other major

campaigns in the Middle and Far East until they could assess the results of the initial nuclear exchange.²⁶

153. In the naval field, Soviet objectives would be: to prevent NATO carrier strikes and submarine-launched missile attacks on Bloc targets as part of the highest priority effort to neutralize US nuclear capabilities; subsequently, to interdict US reinforcement of overseas areas and to isolate the European theater.

Strategic Attack Capabilities

154. Soviet capabilities for strategic air attack will improve during the period of the estimate, as the Soviet stockpile of nuclear bombs and the number of high-performance long-range bombers grow. Present Soviet capabilities for attack on the continental US are restricted by the relatively small numbers of operational heavy bombers, the status of support facilities at Arctic bases, and the lack as yet of a substantial inflight refueling capability. We estimate, however, that during the period of this estimate, the capacity of Soviet forward base areas could be increased sufficiently to permit the staging of the entire estimated long-range bomber and tanker force. Moreover, the USSR will be capable of launching increasing numbers of heavy bombers from interior bases on two-way missions against the US.

155. Soviet planners would attempt to distribute their initial attacks in such a way as to achieve the optimum combination of surprise and weight of attack against all areas where US and Allied nuclear retaliatory capabilities were deployed. Nearly all available Soviet heavy bombers and many medium bombers would almost certainly be used against the continental US in an attempt to destroy or neutralize US retaliatory capabilities and other key elements of US war-making capabilities. Light bombers could be employed in initial attacks against overseas targets within their range.

²⁶ The Assistant Chief of Staff, Intelligence, Department of the Army, believes that any Soviet delay in initiating operations in the Middle and Far East would be minimal, and, if it occurred, would be occasioned primarily by a desire to place maximum logistic, combat, and manpower support behind operations in the NATO area. The Soviets possess adequate ground, naval, and tactical air forces to support simultaneous offensives on several fronts. The difficulty in shifting forces over long lines of communication (which presumably would be disrupted) to or from the Middle and Far East obviates the value of waiting to assess the results of a nuclear exchange. Under the assumed conditions of an all-out nuclear war, the Soviets would have to commit forces to an attack on Western retaliatory bases in the Middle and Far East. Hence, surprise would already have been minimized by preparations for and execution of such attacks. Immediate launching of combined arms operations into Western territory in these two areas would best exploit any surprise attained in initial long-range attacks. Moreover, such operations would make it difficult for the West to attack Bloc forces without also damaging Western civil populations and military forces. Conversely, any delay would provide the West with opportunities to build-up and re-attack the Bloc from these areas and would expose Bloc forces to Western retaliation in their homeland. [Footnote is in the original.]

156. The scale and timing of attack with bomber aircraft would also depend upon the availability and effectiveness of other delivery systems which will probably become available as the period progresses. At present the USSR is probably capable of employing small numbers of both bomber-launched air-to-surface missiles and submarine-launched surface-to-surface missiles against targets in the continental US. These weapons, together with ground-launched surface-to-surface missiles with ranges up to about 700 n.m., could also be employed in initial attacks on Western nuclear striking forces deployed on the periphery of the Bloc. As the period advances, the numbers and types of offensive missiles available to Soviet forces will increase, and by mid-1962, Soviet guided missile capabilities for strategic attack could probably include more effective air-to-surface and submarine-launched missiles as well as IRBMs and ICBMs. Soviet planners would probably recognize that long-range ballistic missiles could impose maximum surprise and difficulty of interception, but also that during this period the accuracy and payload capacity of such missiles will be inferior to those of manned aircraft of comparable ranges. The large-scale use of missile-launching submarines in an initial attack would probably be precluded by the risk of premature disclosure of Soviet intent.

157. *Air Defense Capabilities.*²⁷ Although the effectiveness of Soviet defenses against nuclear attack would depend in large measure upon the success of an initial assault on Western nuclear delivery capabilities, the USSR's large air defense forces would be used to reduce the effectiveness of counterattack by Western forces. All Bloc forces with capabilities for air defense are integrated into an over-all active air defense system, which places primary emphasis on providing defense in depth for key administrative, industrial, and military centers within the USSR. Large passive defense organizations contribute to the Bloc's readiness for air defense, but we believe the general population is inadequately prepared against large-scale nuclear attack.

158. Principal current weaknesses of Bloc air defenses include the limited all-weather fighter capability, the low traffic-handling capabilities of communications and control components, the probable inadequacy of radar height-finding capabilities at high altitudes in certain areas, inadequate low altitude radar coverage, and the limited early warning time available in Bloc border areas. Bloc air defenses are most highly concentrated in the European USSR (east to a line roughly from the Kola Peninsula to the Caspian Sea), East Germany, Poland, Czechoslovakia, and the Maritime and Sakhalin areas of the Soviet Far East, with some concentrations at specific locations elsewhere. The

²⁷ For a detailed estimate on this subject, see NIE 11-57, Sino-Soviet Bloc Air Defense Capabilities through Mid-1962, 16 July 1957. [Footnote is in the original.]

approaches to Moscow are by far the most heavily-defended area in the Bloc. Moscow's defenses are estimated to have a high capability to engage large-scale attack at altitudes up to 60,000 feet under all weather conditions, but they probably remain vulnerable to low altitude attack.

159. In general Bloc air defense capabilities would be as follows:

a. Against penetrations conducted during daylight and in clear weather, at altitudes between about 5,000 and 35,000 feet, the capabilities of the system would be greatest. Above 35,000 feet they would begin to diminish and above 45,000 feet would fall off markedly. At altitudes below 5,000 feet they would also be progressively reduced.

b. Against penetrations conducted at night and under poor visibility conditions, the capabilities of the system would be considerably reduced.

c. Against varied penetration tactics utilizing altitude stacking, diversionary maneuver, decoys and electronic countermeasures, the capabilities of the system would be diminished through disruption and saturation.

160. Over the next five years there will be significant improvements in the performance characteristics of most Soviet air defense equipment, including fighters, radars, and communications and control equipments. Air defense guided missile and unguided rocket capabilities will increase. These developments will considerably improve Bloc capabilities for all-weather defense against manned aircraft and cruise-type missiles. Nevertheless, at the end of the period, warning times available to Bloc targets in border areas will probably be deficient for fighter interceptors and marginal for surface-to-air missile defenses against the highest performance Western aircraft and cruise-type missiles. The Bloc will also continue to have difficulty in opposing very low altitude attack, air defense electronic systems will still be subject to disruption, and the USSR will probably not have in operation a weapon system capable of successfully intercepting ballistic missiles.

161. *Offensive Capabilities in Western Europe.* The 22 Soviet line divisions in East Germany, together with forces available in adjacent areas, could initiate an attack without reinforcement by major units. To augment the strength of the ground attack and to seize bridgeheads and other key objectives in NATO territory, the USSR could mount initial airborne operations from within Soviet territory. We estimate that in the European area, the Soviet airlift capacity is sufficient for troops and light equipment equivalent to 4–5 divisions (of 7,500 men each) in a one-day operation, and 8–9 divisions in a five-day operation, using half the civil and military transport aircraft normally in that area. Airlift operations on this scale would be limited to the radius of the smaller aircraft employed (i.e. about 550 n.m.).

162. Air support of tactical operations in Western Europe could be provided by about 1,600 jet light bombers stationed in Eastern Europe and Western USSR, as well as more than 4,500 tactical jet fighters stationed in these areas. However, the dual missions of tactical fighter units and the probable assignment of a considerable number to air defense would limit the availability of fighter aircraft for tactical support in the initial phase of the land campaign. Ballistic missiles and tactical nuclear weapons could now be available for the support of offensive operations, and their availability will almost certainly increase as the period advances.

163. *Offensive Capabilities in the Far East.* The USSR has about 30 line divisions in the Far East, together with nearly 3,500 aircraft and a sizable naval force. Stockpiles of supplies are probably sufficient, not only for the initiation of operations, but also for a considerable period of combat. Soviet forces in the Far East could, alone or in conjunction with Chinese Communist and North Korean forces, renew hostilities in Korea. They could probably launch an operation against Japan with an airborne force equivalent to 3 divisions in a one-day operation, and up to 5 divisions in a five-day operation. An initial seaborne attack for the purpose of seizing port facilities could be undertaken by lightly-equipped troops landed from a heterogeneous group of ships and craft. Balanced forces equivalent to 5–6 divisions could be embarked in a follow-up operation and landed through the port facilities seized. The same technique could be employed in other areas of the Far East within range of land-based aircraft. Airborne and amphibious attacks on a small scale could also be launched against Alaska.

164. *Capabilities for Naval Warfare.* At the present time the capabilities of Soviet naval forces include: extensive submarine operations along most of the world's strategic sea lanes, employing conventional and possibly nuclear torpedoes and mines; attacks against US and Allied carrier task forces by submarines and shore-based naval aircraft, some of which could probably be equipped with air-to-surface missiles; operations in Bloc coastal areas by surface units and supporting shore-based aircraft, primarily to deny Western access and to protect the seaward flanks of ground campaigns; attacks against port facilities which would be used by US overseas reinforcements, employing shore-based aircraft, surface forces and submarines, some of which could probably employ surface-to-surface missiles. In short, we estimate that the USSR has an extensive capability to interfere seriously with US and Allied sea communications in the event of war.

165. Soviet capabilities for naval warfare will continue to increase, especially with the probable advent of nuclear-powered submarines, increases in over-all submarine strength, increasing capabilities to

employ guided missiles and nuclear weapons for both offensive and defensive purposes, and increasing naval air reconnaissance and attack capabilities. Soviet naval forces will remain capable of lifting balanced forces of considerable strength, but the landing of heavy supporting elements of such forces will be contingent upon the seizure of adequate port facilities.

V. TRENDS IN SOVIET RELATIONS WITH OTHER COMMUNIST STATES

166. The trend toward redefinition of intra-Bloc relationships consequent upon the death of Stalin has continued; it eventuated in the Polish crisis and the Hungarian revolt of late 1956. The special position of Yugoslavia, the emergence of a semi-independent Communist regime in Poland, and Communist China's growing power and doctrinal influence have, in effect, broken Moscow's onetime monopoly of Communist thought and power. The USSR's reluctant acceptance of these developments may signify a belief that greater toleration of local variations is the best way to preserve and strengthen the Bloc. However, alarmed by developments in Poland and Hungary, the USSR has moved to preserve the status quo in the orthodox Satellites and, in its repression of the Hungarian uprising, has demonstrated that it is determined to retain its hegemony in Eastern Europe.

167. The strong identity of interest among various Bloc regimes, their dependence upon Soviet aid and support, and the USSR's overwhelming military power will tend to maintain the essential solidarity of the Bloc over at least the next five years. But the underlying forces of change released by developments since Stalin's death will continue to operate, creating further instability in the states of Eastern Europe and in their relations with the USSR. The growth of Chinese Communist power and influence will also create problems as well as benefits for Moscow. Thus, additional changes in the pattern of intra-Bloc relationships are likely in the period ahead.

Soviet Policy Toward the Satellites

168. The Soviet leaders are still confronted in Eastern Europe with a problem partly of their own creation. Moscow appears to have decided that the best way to encourage the long-run development of a sounder Soviet-Satellite relationship was to move away from the rigidity of Stalinist policy and, in its stead, to give limited play to national sentiments and local peculiarities within the various Satellites. But this policy set in motion forces which tended to defeat the basic objective, the strengthening of the Bloc. The over-all liberalization of policy, together with the rapprochement with Tito and the Soviet XXth Party Congress, led to rising Satellite unrest, which threatened Soviet control.

169. Prior to the Hungarian revolution and the Polish coup, the Soviet leaders clearly underestimated the strength of forces within the Satellites seeking reform and change. Moscow apparently did not recognize or seriously attempt to cope with Satellite ferment evoked by the denunciation of Stalinism at the XXth Party Congress, until June, when the riots in Poznan (and the Polish regime's disagreement with Moscow over the causes of the riots) demonstrated the dangers of loosening the reins. But the damage had already been done in the two Satellites where nationalism was strongest and where party factionalism was most disruptive. Faced in the fall with a new and defiant regime in Poland and a popular revolt in Hungary, the USSR was forced into unwelcome decisions, adopting a policy of accommodation in the former and of repression in the latter.

170. The reason for the differing Soviet treatment of Poland and Hungary lay in the USSR's determination to preserve Communist regimes in Eastern Europe and to keep the states of that area in the Soviet Bloc. When Hungary suddenly declared its neutrality and its intention to leave the Warsaw Pact, the Soviet leaders felt compelled to intervene in the only way they could, through military action. In Poland the USSR was reassured by Gomulka's promises that Poland would remain in the Bloc. Thus, though disliking the Gomulka regime, the USSR concluded that it was more tolerable than the political risks involved in a military attempt to unseat it.

171. In the light of the Hungarian and Polish crises, the USSR now seems determined to go slow in any further evolution of its relationships with the Satellites and, above all, to avoid if possible any repetition of the Hungarian or Polish experiences. It has shifted its emphasis toward attempts to combat the influence of those forces—principally nationalism, anti-Sovietism, and economic distress—which have been responsible for most of the Satellite ferment. Major reliance will still be placed on Satellite parties that will subject themselves—voluntarily, if possible—to Soviet ideology, Soviet directives concerning foreign and defense policies and Soviet leadership in general. In exchange for their fealty, the orthodox Satellite leaders can anticipate some Soviet economic aid, perhaps a measure of internal autonomy, occasional grants of recognition and prestige, and support for their own power positions and party policies.

172. Although the security of the Satellite system is thus uppermost in their minds—with measures to insure this security given first priority—the Soviet leaders do not seem to view a return to Stalinist severity and conformity as either necessary or desirable; they may even regard it as infeasible. There is unlikely to be any Soviet attempt to resume the previous degree of economic exploitation of the area.

The Soviets appear willing to tolerate certain differences among the Satellites and to tailor their policy to meet varying Satellite requirements. They apparently still believe that if some concessions to autonomy are gradually and judiciously meted out, the Satellite peoples will eventually become reconciled to a close relationship with the USSR.

173. Czechoslovakia, economically the most successful and politically the most stable of the Satellites, appears to be Moscow's favorite, and may be intended to serve as a model for the others. Czech party leaders have been relatively successful in utilizing the threat of Soviet intervention as a means of suppressing popular ferment, while at the same time pointing to economic and political improvements since the death of Stalin. The arguments appear to have persuaded the population not to jeopardize its relatively favorable status by precipitate action.

174. Hungary presents the Soviet Union with numerous practical problems. To accomplish its primary goal of restoring Hungary as quickly as possible to orthodox Satellite status, Moscow has encouraged the Soviet installed regime to combine severe political repression with limited economic bribery. There appear to be no suitable alternatives to this tactic. Both repression and bribery, however, are probably scheduled to diminish with time and accomplishment.

175. Soviet policy toward East Germany seems motivated primarily by the same considerations which underlie the USSR's rigid opposition to German reunification (see para. 231, Chapter VI). Aware of the unpopularity of the Communist regime in the GDR, the USSR is fearful that any relaxation of tight controls would stimulate the growth of pressures for reunification and promote increasing unrest or even a popular revolt in this highly sensitive area. Therefore, little liberalization has been attempted and Moscow has re-endorsed Ulbricht's repressive policies. The USSR probably feels that it has no alternative but to support the doctrinaire, Stalinist East German regime.

176. The reluctant Soviet acceptance of the "new" Poland now appears to be a long-range adjustment rather than a temporary accommodation. Tenseness in Soviet-Polish relations has abated since 1956, in large part because the Gomulka regime has restrained anti-Soviet and anti-Communist popular sentiments and has removed the immediate threat to the party's position. Concurrently, direct Soviet press attacks on Polish liberals have ceased and the strength of the pro-Soviet (Natolin) faction in the Polish party has diminished. The Soviet leaders retain a large arsenal of political, economic, and military weapons with which to exert pressure on the Gomulka regime or ultimately to destroy it, although they cannot be certain that pressures will always prove effective or that their use would not, in fact, boomerang.

177. Soviet military leaders almost certainly feel that the lines of communication through Poland to their 22 divisions in East Germany are insecure. Politically, Moscow must also be concerned over the dangerous influence of the Polish experiment on the remainder of the Bloc. It has attempted to offset this by insisting on doctrinal conformity in the other Satellites. It has also sought to minimize Poland's unique status by granting paper concessions to the orthodox Satellites—such as status of forces agreements—which parallel some of the actual privileges obtained by Poland. Nevertheless, the continuation of the Gomulka regime will at a minimum prove embarrassing to Moscow and will probably aggravate the USSR's problems in the other Satellites.

178. Current Soviet policy toward Poland thus represents a calculated risk. The Soviet leaders still do not view the risk as sufficiently dangerous to justify military action. Moreover, Moscow probably hopes that the risk will diminish with time and that Poland will gradually prove more susceptible to Soviet pressures.

179. The ability of the Soviet Union successfully to handle the increasingly complex issues associated with its presence in Eastern Europe—at a time when its own internal policies and its relations with Communist China are also changing—is by no means certain. Popular dissatisfaction, party factionalism, intellectual ferment, and chronic economic difficulties in the Satellites all appear to be long-range problems and probably are now causing great concern in Moscow. Varying Chinese, Polish, and Yugoslav “roads to socialism,” Soviet vacillations and purges, growing contacts with the West—all combined with the very real popular pressures from within—will probably continue to stimulate at least the desire for reform and change.

180. The current Soviet effort to minimize ferment, while simultaneously attempting to control the general movement for change through limited concessions, will probably prevent further explosions and national Communist “coups” but it does not appear to offer a lasting solution. Should essential Soviet control over the Satellites not be seriously threatened and should Poland remain in a state of semi-orthodoxy and dependence on the USSR, Moscow might in time be willing to allow a greater development toward autonomy in other Satellites. It might consider that evolution toward a grouping of semi-independent Eastern European states (still closely allied to Moscow) would quiet Satellite unrest and thus serve long-term Soviet aims.

181. On the other hand, should essential Soviet control over the area appear to be seriously threatened, and should Poland move notably farther away from orthodoxy, pressures in Moscow for a reversion to a harsher policy would probably grow. In the event of another Satellite

revolt or the attempt of any Satellite regime to secede from the socialist camp, the Soviet leaders would almost certainly decide to intervene militarily. This, in turn, would probably lead to the conclusion that the post-Stalin Satellite policies in general were a failure and that a return to more repressive policies offered the best means of coping with the problems in Eastern Europe.

Soviet Policy Toward Yugoslavia

182. Moscow's more flexible post-Stalin policies toward the Satellites may have been influenced by its apparently strong desire for a rapprochement with Yugoslavia. Efforts to accomplish this—most notable since the spring of 1955—have not been uniformly successful; in fact, Soviet-Yugoslav relations descended to a name-calling stage during the winter of 1956–1957. But the present Soviet leaders apparently believe that the split with Yugoslavia was one of Stalin's major policy failures and that, on balance, the prospective gains from a rapprochement outweigh the possible dangers. Moscow's immediate objective is probably to re-establish close party, state and ideological relations with Belgrade and, concomitantly, to encourage a weakening of Yugoslavia's ties with the West; the ultimate objective is to bring Yugoslavia back into the Bloc. For its part, Yugoslavia almost certainly desires to avoid compromising its independence but wishes to maintain close relations with the Bloc. As long as Belgrade assesses Soviet policies favorably, we believe that Yugoslavia will maintain its rapprochement with the USSR and may gradually move toward a somewhat closer alignment within limits which would safeguard its independence.

Sino-Soviet Relations

183. Communist China's stature in the Bloc has continued to grow. Peiping last fall backed the Soviet intervention in Hungary and generally supported the Soviet attempt to preserve Bloc solidarity. Earlier, however, it probably exercised a moderating influence in the dispute between Moscow and the Gomulka regime. Communist China's use of its influence in this manner was presumably motivated in large part by Peiping's desire to maintain the strength of the Bloc and to assert its right to a major voice in Bloc affairs. Further, Peiping has clearly indicated that its ideological pronouncements are intended to represent "original" and significant contributions to Marxism-Leninism, a contention which is probably of concern to Moscow. The ideological and political leadership of the Bloc can no longer be said to rest solely with the Soviet Union.

184. Moscow's willingness to allow Peiping a share in the ideological leadership of the Bloc and to acquiesce in Peiping's increased

role in Bloc affairs is probably based to a large extent on the absence of any practical alternative. In Soviet eyes, any heavy pressure on Peiping, such as threats to reduce economic or military aid, would almost certainly put an undesirable strain on Sino-Soviet ties. Therefore, despite anxiety, and probable subtle attempts to insure Peiping's basic conformity and to minimize its growing influence and assertiveness, the Soviet leaders will probably accept Peiping's increased stature with outward grace. Khrushchev has already admitted that Peiping too can be a fount of Communist wisdom. For its part, Peiping will probably continue to acknowledge publicly the USSR's leadership of the camp and its dependence on Soviet assistance and advice.

185. Though new points of friction will probably arise in the course of the next several years, differences will almost certainly be minor when compared to the basic points of agreement. In addition to ideological bonds, the USSR and Communist China share hostility to the US and are linked by the belief that concerted political and economic activities are mutually advantageous. Further, Communist China's manpower and strategic location and the USSR's military, industrial, and technical capabilities have served to create an interdependence fully appreciated in both capitals.

VI. TRENDS IN SOVIET FOREIGN POLICY

The Soviet View of the World Situation

186. In none of the many changes that have taken place since the death of Stalin has there been any suggestion that the USSR is abandoning its basic attitudes and aims. The outlook of the present Soviet leaders remains fundamentally conditioned by their concept of irreconcilable conflict between the Communist and non-Communist worlds. They have shown no diminution of vigor in their search for ultimate victory, though their views as to the best policies and tactics for winning it have undergone important change.

187. In looking at the world situation from this viewpoint of conflict, the Soviet leaders display much confidence in the prospects of the Communist side. They show pride in the USSR's achievements over the last four decades and appear convinced of the over-all strength of their present position in the world. Despite their setbacks in Eastern Europe, and the manifold internal problems which beset them, the new leaders seem confident of their ability to cope with these problems and to continue the growth of Soviet strength and the expansion of Soviet influence.

188. At the same time the USSR's post-Stalin leaders, especially Khrushchev, appear flexible and pragmatic in their appraisal of the factors at play in the world situation and of their impact on Soviet prospects. In particular, they seem to have a healthy respect for the strength of the US as the principal source of opposition to their ambitions and a keen awareness of those gaps which still separate Soviet from US power. Khrushchev himself clearly regards it as one of the primary Soviet objectives to outstrip the US. Indeed the Soviet leaders may tend to assess the strength of the Western powers as greater than it often appears to us in the West. They almost certainly still regard the US as having superior capabilities to wage nuclear war, and they may overestimate the unity of the Western coalition.

189. Given this respect for Western power, the Soviet leadership is highly unlikely to believe that the present situation would be altered to Soviet advantage by resort to general war. In fact its own growing appreciation of the destructive potentialities of nuclear weapons and advanced delivery systems, as the USSR itself develops such capabilities, has almost certainly had a major impact on Soviet thinking as to the risks of nuclear war. Doctrinal acknowledgment of a modified outlook toward war occurred at the XXth Party Congress, which abandoned the thesis of the inevitability of war between the Communist and capitalist worlds.

190. In our view the Soviet Union, except in the case of an unforeseen technological breakthrough which gives high promise of victory without unacceptable losses, will not deliberately initiate general war during the next five years. At the same time the Soviet leaders, despite their suspicions of US intentions, are probably confident that their own growing nuclear capabilities will deter the US from embarking on this course. Consequently they must regard miscalculation as the most likely way in which general war would occur.

191. For the same reasons which inhibit it from deliberately initiating general war the USSR will almost certainly seek to avoid courses of action which in its judgment would involve serious risk of general war. During any international crisis the Soviet calculation of this risk will be of paramount importance. We think that the Soviet leaders estimate that because of Soviet nuclear capabilities the US is becoming increasingly disinclined to engage in an all-out nuclear exchange. Consequently the Soviet leaders may believe that they can pursue certain aggressive courses of action, extending even to local war, with less risk of general war than the same courses would previously have involved. In general, therefore, we believe that insofar as Soviet courses of action are restrained by fear of the US resorting to general

war, these restraints will tend to diminish during the period of this estimate.²⁸

192. We cannot confidently estimate how the Soviets will calculate the risk in various contingencies during the period of this estimate. We believe they would consider that open attacks by Soviet forces across the frontiers of non-Communist states would in most areas involve risk of general war. The Soviet assessment of the degree of risk would depend on the particular frontier crossed, the magnitude of the issues at stake, and the whole complex of attendant circumstances.

193. Whether or not the Soviets actually use armed force during the period of this estimate, it is clear that the latent threat of Communist military strength will remain a basic element in the conduct of Soviet foreign policy. At times the Soviet leaders will probably bring this threat into the open, by menacing words or harsh diplomatic exchanges. They may go considerably further in certain situations—e.g., by supporting indigenous Communist forces in local military action, or even sending Soviet “volunteers,” if opportunities should occur which did not seem to involve serious risk of large-scale conflict, or if they judged that confusion and division rather than a strong Western reaction would result. But we remain convinced that the USSR will not desire to let any crisis develop to the point of seriously risking general war.

194. Since the Soviets believe in irreconcilable conflict between themselves and the West, their major policy decisions will always be affected to a great degree by their calculation of the risks of war. In the present phase this calculation almost certainly causes them to prefer non-military means of achieving their objectives. But we believe that they also see many intrinsic advantages in a comparatively peaceful course. Viewed in retrospect, it would seem that when the post-Stalin leaders reassessed the situation bequeathed to them by Stalin they came to two basic conclusions: (a) that, on the whole, Soviet foreign policies had reached a point of diminishing returns; and (b) that these policies involved needless risks for the returns realized. To limit these risks and open new opportunities for enhancing the Soviet position, they apparently decided on a number of major policy shifts.

195. As reflected in the main characteristics of post-Stalin foreign policy, these opportunities must have appeared to the present leadership to lie broadly in two fields. First, concerned over the impetus to

²⁸ The Assistant Chief of Staff, Intelligence, USAF, does *not* agree with the estimate that the restraints on Soviet courses of action imposed by fear of the US resorting to general war will *tend to diminish* during the period of this estimate because of an *increasing* disinclination by the US to engage in an all-out nuclear exchange. See footnote to paragraph 2, Summary Estimate, page 1. [Footnote is in the original.]

Western strength and unity provided by Stalin's postwar policies, they have hoped through a less rigid and hostile posture to dispel the image of aggressive Soviet intentions and thus complicate Western efforts to maintain and develop a position of anti-Communist strength. In this connection the Soviet leaders must consider the extent to which new aggressive moves might compromise this hope.

196. Second, they saw in support of the nationalist movements in Asia and Africa, with their largely anti-Western bias, major opportunities to weaken and divide the Western powers, and to substitute Communist influence for that of the West. They look upon the upsurge of nationalism in Asia and Africa as a fulfillment of Lenin's prophecy that these areas would prove to be the Achilles heel of the imperialist Western powers. Moreover, they probably expect that the revolution of rising popular expectations in all underdeveloped areas will far outrun the possibilities of fulfillment, thus enhancing the attractiveness of Communist methods and creating local instability which the Communists can exploit.

197. However, the purge of June 1957 revealed that there had by no means been unanimous Presidium agreement over many aspects of post-Stalin foreign as well as domestic policy. Molotov in particular has been blamed for opposing certain doctrinal innovations, the Austrian peace treaty, the rapprochement with Belgrade, high level goodwill visits abroad, and normalization of relations with Japan. Some latent opposition to present policies undoubtedly remains in the Soviet hierarchy, and may again come to the fore in event of a crisis, but the June purge seems to confirm the ascendancy of Khrushchev's policy line.

198. Khrushchev and his colleagues probably regard the present world situation as highly fluid and credit this fluidity largely to their own actions. They are probably pleased with the situation in Asia and the Middle East in particular, and look upon it as ripe to develop further in their favor. Though concerned over the risks inherent in a confrontation of Western and Soviet interests in such areas, they probably see possibilities of major gains through continuation of their present policies, at minimum cost to themselves. Moreover, Soviet behavior in international affairs, now that the Stalinist isolation of the USSR has ended, has become subject to a momentum of its own—broadened diplomatic relations, technical and cultural exchanges, and expanded trade and aid programs—which are not only projecting a different image of the USSR to the outside world but are giving the Soviet people themselves a less distorted image of the world at large. These factors will tend to prevent any sudden reversal of Soviet external policy. Under these circumstances we see the Soviet leadership as likely to continue its present policies for some time.

General Aspects of the Co-existence Policy

199. Viewed in the above context, we see the present phase of Soviet external policy as one designed to achieve certain important though limited objectives, while avoiding any substantial risks of nuclear war and providing time for the further forced draft growth of Soviet power. These objectives are: (a) to impress the world with Soviet military strength and national power, while at the same time creating a general sense of Soviet peacefulness and respectability which will further blur the image of an aggressive USSR; (b) to cause a retraction and decline of Western power, especially withdrawal of the US from its bases around the Bloc; and (c) to hasten the ejection of Western influence from Asia and Africa, while expanding Soviet influence in these areas.

200. A hallmark of present Soviet policy is its tactical flexibility in execution, in contrast to the heavy-handedness of Stalin's time. The pragmatic approach of Khrushchev and his fondness for experimentation suggest that this will continue at least so long as he remains in power. The present leadership, for example, shows fewer doctrinal preconceptions as to tactics, and greater willingness to modify doctrine to meet the exigencies of the time. In this category fall the ostensible acceptance of other roads to socialism and the concept, endorsed by the XXth Party Congress, that neutralist though non-Communist governments can also serve Soviet purposes. This concept has found particular application in Soviet efforts to encourage neutralism in the Afro-Asian area.

201. The significance of these doctrinal and tactical developments is very great. The advance of Communism is designed to occur by gradual stages instead of by convulsive upheavals. Thus the USSR has not recently pursued with its old vigor the forcible absorption and Communization of other states; it even manages to pose, convincingly to some, as the champion of national independence. The lines which divide the Communist from the non-Communist world have become somewhat blurred. The result is that when crises occur (e.g. in Egypt, Jordan, Syria), the underlying issues between the Bloc and the West do not stand out with the clarity that was evident, for example, in the Korean situation.

202. We believe that the Soviet leaders foresee the likelihood of further crises as the interests of the two great power groupings clash in such areas as the Middle East. With respect to Soviet behavior in such crisis situations, Khrushchev's boldness and apparent impetuosity give cause for concern. But the practicality of Khrushchev, his absorption with the USSR's manifold internal problems, and the Soviet desire to avoid undue risks of nuclear war will probably militate against hasty decisions in foreign affairs.

203. Whatever their flexibility, moreover, the present Soviet leaders apparently see no need to make concessions on the most important issues dividing East and West. They appear determined, for example, not to relinquish any territory now under Communist control. Similarly, on such issues as German reunification and disarmament, we think that there will be little give in Soviet policy during the period of this estimate.

204. *Techniques of "Peaceful Co-existence."* In line with its new tactical flexibility, the USSR will continue to place heavy reliance on such conventional methods of international intercourse as high level goodwill visits, broadened diplomatic contacts, promotion of cultural and other exchanges, expanded foreign trade, long-term credits and technical assistance, and arms aid. Non-Communist governments will continue to be cultivated in an attempt to create an identity of interests between them and the USSR and to inculcate the image of the USSR as a respectable, peace-loving state. Following traditional Soviet practice, the USSR's extensive propaganda apparatus as well as the network of front organizations and Free World Communist parties will also be used to this end. A particular technique of increasing significance, is the Soviet capability and intention to enter international air routes. With few reciprocal concessions the Soviets can thus demonstrate their technological prowess to Free World countries, particularly in underdeveloped areas.

205. By such means the USSR will continue to stress a number of already well-established diplomatic and propaganda themes. Playing upon growing concern over avoiding nuclear war, it will contrast the USSR's role as the foremost protagonist of peace and disarmament with the aggressive intentions of the US. Another major theme is to portray the USSR as the chief supporter of the emerging former colonial countries, willing to help them "without strings attached," as opposed to US efforts to force these countries into anti-Communist alliances and continued US identification with the colonial powers. The USSR, through stressing peaceful Soviet intentions, is also seeking to convey the thesis that Communist-Free World collaboration is now possible in a wide variety of fields.

206. Despite the USSR's emphasis on "peaceful co-existence," its continued hostility toward the West implies the continuation in varying intensity, of more aggressive cold war tactics wherever the prospective gains appear to outweigh any damage to the over-all "co-existence" line. Savage propaganda attacks on capitalism, imperialism, and the West, especially the US, are likely to recur. The USSR will almost certainly also use subversion and infiltration to achieve local Communist goals in situations susceptible to advantageous handling along these

lines. These techniques reflect the continuity of Soviet attitudes from the Stalin through the post-Stalin era, and there is little reason to expect their disappearance. Finally, the Soviets have recently laid a good deal of public stress on their growing nuclear capabilities, and we think they will increasingly use the latent threat of their military strength as an instrument of policy.

207. *Policy Toward the Underdeveloped Areas—Trade and Aid.* As previously suggested, one of the principal characteristics of current Soviet policy is its stress on underdeveloped countries, in an effort to estrange them from the West and to lay the groundwork for growing Soviet influence. In the needs of the new and underdeveloped countries of Asia and Africa for help and guidance in industrialization the USSR sees opportunities for influencing these states by providing assistance and encouraging them to employ Communist techniques. Therefore one of its principal weapons has been the so-called “trade and aid” campaign, of offering both arms and technical and economic aid on liberal credit terms. Not only do such efforts serve specific Soviet objectives vis-a-vis the underdeveloped countries, but they contribute to the desired image of the USSR as a respectable and economically advanced member of the international community.

208. By mid-1957 the USSR and its satellites had agreed to extend some \$1.15 billion in economic credits for this purpose, the bulk of which will be drawn upon over a period of several years. In addition arms of an estimated value of some \$350 million had been delivered, probably on credit, to Egypt, Syria, Yemen, and Afghanistan. In return the Bloc has been willing to accept otherwise largely unsaleable raw material surpluses, an appealing feature to underdeveloped countries. Bloc trade agreements with Free World nations rose from 113 in effect at the end of 1953 to 212 by mid-1957, the largest part of this rise representing trade agreements with underdeveloped countries. Between 1954 and 1956 Bloc trade with underdeveloped countries rose 70 percent. Technical assistance, though still small in comparison with that of the West, continues to rise; during the first half of 1957, some 2,000 Bloc technicians are estimated to have been in 19 underdeveloped countries for a month or more, compared to an estimated 1,400 in 1956.

209. The volume of Bloc trade with the underdeveloped areas as a whole is still insignificant compared with that of the West, and the technical and economic assistance which the Bloc has thus far supplied is also relatively very small. Both trade and aid have had a highly significant impact, however, partly because they represent a new departure in Bloc policy, vigorously followed up, and partly because they have tended to be concentrated in certain areas (Egypt, Syria, Afghanistan, Yugoslavia) where they loom large in the economies concerned.

210. The Soviet leaders are probably pleased with what they regard as their success to date with this policy and will almost certainly intensify their efforts in this field. The USSR has the economic resources for a considerable expansion in its trade and aid campaign, while its extensive stocks of obsolescent arms will permit it to capitalize further on the desires of many underdeveloped countries to strengthen themselves vis-a-vis their neighbors. In areas where they expect local governments to be receptive, as in the Middle East and South Asia, the Soviets will probably continue to supply arms as a means of exacerbating local tensions and creating opportunities for the expansion of Soviet influence.

211. *Relations with Free World Communist Parties.* Soviet policy toward the Communist parties in Free World countries has been adjusted to the requirements of the “peaceful co-existence” line. Moscow continues to allow them somewhat greater autonomy and local tactical flexibility than was permitted under Stalin, though it has sought to retain its essential control. The over-all tactic set down for the Free World parties, as reiterated at the XXth Party Congress, remains that of advancing Communist interests primarily by parliamentary means, if possible in collaboration with non-Communist parties, rather than through violent struggle.

212. Such developments as the denigration of Stalin, the Hungarian revolt, and ostensible Soviet acceptance of “many paths to Socialism” (as in Poland and Yugoslavia) have caused confusion and division in many foreign Communist parties and led to some defections. To date, however, these parties apparently continue to accept Moscow’s leadership and will probably continue to do so for some time to come. Some foreign Communist parties may adopt more of a national Communist character than is considered desirable by Moscow, but the essential solidarity of the international Communist movement appears unlikely to be seriously shaken, at least in the short run.

213. *Soviet Policy on Disarmament.* Active exploitation of the disarmament issue is one of the key aspects of present Soviet external policy. The USSR clearly regards this issue not only as an essential part of its pose of “peaceful co-existence” but, even more important, as a possible means of neutralizing Western nuclear striking power and inducing its withdrawal from around the periphery of the Bloc. It is probably also concerned over the potential threat to its position in the Satellites from US and NATO power in Europe. For these reasons the USSR has tended to concentrate on such disarmament proposals as nuclear test suspension, a ban on use of nuclear weapons, liquidation of foreign bases, and troop withdrawals from Europe. By its maneuvers on such issues the USSR clearly hopes to encourage the relaxation of Western defense efforts, help undermine NATO and create divisions among its partners, and above all create a climate inhibiting Western use of

nuclear weapons. In addition the USSR is probably concerned about the enormous cost of its military establishment and would welcome a measure of disarmament which would permit some diversion of resources to meet other pressing needs. It may also have some concern over the possible development of nuclear capabilities by "fourth countries," particularly in Europe. However, we do not believe that either of these concerns would be compelling in Soviet thinking.

214. The Soviet leaders, no doubt pleased with the impact to date of their disarmament maneuvers, will continue to give the appearance of a flexible and constructive attitude in an effort to mobilize world opinion in their favor. They will lay further stress on simple proposals, calculated largely for their propaganda appeal, such as ending tests or banning the use of nuclear weapons. They clearly hope to broaden the UN discussions to include other powers, as also serving their ends. Further vague proposals designed to appear as attempts to meet the Western position are likely. The USSR may even make some further unilateral gestures at disarmament, perhaps the sloughing off of certain marginal forces, provided this seems desirable for other reasons.

215. While the USSR will thus rely largely on diplomatic and propaganda exploitation of the disarmament issue, it probably feels that some form of limited international agreement would reinforce its pose as the strongest exponent of disarmament, stimulate further relaxation of Western defense efforts, and inhibit the use of nuclear weapons. In Soviet eyes the preferred form of agreement would be a loosely drawn mutual pledge without significant inspection features. But the Soviet leaders undoubtedly recognize that they must pay some price for such an agreement in terms of inspection and controls. In our view they would be willing to accept limited inspection arrangements to detect violation of a nuclear test ban, and a minimal number of fixed observation posts in connection with any agreed arms reductions. Their interest in inducing a US troop withdrawal from Europe would probably lead them to go even further in allowing mutual inspection in Europe.

216. But the USSR clearly regards the present Western disarmament proposals as heavily loaded in favor of the West. In particular it will almost certainly continue to reject comprehensive inspection and controls. As is amply indicated by their repeated denunciation of such proposals as elaborate intelligence gathering schemes, the Soviet leaders react suspiciously and defensively to these proposals as Western efforts to pry into Soviet weaknesses and to interfere with Soviet efforts to maintain a controlled society. In our view this deepseated distrust of the West and Soviet preoccupation with security will long remain a bar to any but the most limited inspection and controls. With equal suspicion, they almost certainly will reject any cut-off of nuclear weapons

production as a Western attempt to condemn them to a permanent position of inferiority. Finally, the USSR does not as yet seem to regard itself as under any compulsion to reach an early agreement, since it sees that other factors are already leading to some degree of Western disarmament. It is also probably confident that growing Soviet capabilities and the pressure of world public opinion will eventually induce the Western powers to settle for less in the way of controls and inspection than they presently demand.

217. *Soviet Policy in the UN.* The Soviet leaders regard the UN and its various organs and specialized agencies as important forums for their “co-existence” policy in all its aspects. They have evinced growing awareness that when acting jointly with the Asian-African bloc, the Soviet bloc can frustrate Western policies or proposals, and they may even hope for UN endorsement of Soviet policies on certain issues. We believe that in the period of this estimate the USSR will seek to exploit the possibilities inherent in this situation and to this end will maintain and probably increase its activities in the UN and the specialized agencies.

Soviet Policy in Particular Areas

218. *The Middle East.* The USSR clearly regards the chief immediate prospects for expanding its influence as lying in the Middle East. The events of the past two years—the growing estrangement from the West of Egypt, Syria, and Yemen, and the Anglo-French invasion at Suez—have almost certainly appeared to the USSR as offering further opportunities for substantial gain.

219. We consider that the USSR’s aims in the Middle East are to eliminate Western bases and influence, to attain a position from which it could deny oil to the West, and ultimately to establish dominance in the area. The USSR is shrewdly supporting Arab nationalism against the West and is carefully avoiding an appearance of seeking undue political influence of its own; it is careful of Arab sensibilities and is soft-pedaling subversive activities aimed at promoting Communist regimes. Thus the short run Soviet emphasis will be on promoting neutralism and undermining the position of the West. The USSR will probably attempt to bring the Arab states gradually within the Soviet sphere of influence, but it is unlikely, over the next few years at least, to install Communist regimes.

220. The USSR appears to be carrying out a flexible and opportunistic policy of limited risk in the Middle East. It can be relied on to continue its attempts to capitalize on such disruptive forces in the area as Nasser’s ambitions for Arab hegemony, Yemeni designs on the Aden Protectorate, the leftist coup in Syria, and the Arab-Israeli conflict, on which it is taking an increasingly pro-Arab position. It will provide

further aid and support to Egypt and Syria in their attempts to undermine other Arab regimes. Above all, the USSR will seek to exploit the Arab-Israeli dispute, as the one issue on which Arabs are united and which can serve as a counter to Western efforts to unite the area against the Communist threat.

221. The USSR can be expected to continue to assert a right to a direct voice in the affairs of the area and to propose four-power or other negotiations to that end. It will also use the regimes in Egypt, Syria, and Yemen as indirect instruments of its policy in the area. The USSR might seek bases in one or more of these countries if opportunities offer; in any event the construction of installations, including port facilities, in the area for the operation and maintenance of Soviet-made armaments creates facilities which could be used on short notice by the USSR. In addition it will continue its attempts to promote good relations with other states of the area. Renewed trade and aid, technical assistance and in some cases arms offers are likely. When local issues such as the revolt in Oman can be exploited, the USSR will do so.

222. But in pursuing the above policies, the USSR will be conscious of the extent to which vital Western interests are involved in the area, and in particular of expressed US determination to protect these interests. It will be concerned lest the further crises which will almost certainly develop in the area lead to local conflict between Western and Soviet-backed power or even between the great powers themselves, with resultant risks of general war. We believe that the conduct of the Soviet leaders in any such crises will depend directly upon the Western reaction they expect. They have already shown that they will not hesitate to provide arms and advisors or to adopt a threatening pose. In certain situations they might employ limited numbers of "volunteers." But the USSR must recognize the geographic factors which make it difficult to intervene militarily in the Middle East without violating the boundaries of US and UK allies. We believe that they will not desire to let any crisis or local outbreak reach such proportions as to involve serious risks of general war.

223. *South Asia and the Far East.* In these areas Soviet policy will probably remain focussed on promoting neutralism and reducing Western influence through trade and aid, goodwill visits, cultural and other exchanges, political support for popular nationalist causes, and a variety of other means. The USSR can be expected to concentrate further on India and Japan as the pivotal non-Communist nations in this area. It will almost certainly capitalize on India's growing economic difficulties and on the deep antagonisms between India and Pakistan through additional offers of assistance to India. Renewed Soviet arms offers are also likely to take advantage of India's concern over US military aid to Pakistan.

224. With respect to Japan, the “normalization of relations” will continue, with the objective of encouraging Japan to assume a more independent attitude at the expense of its ties with the US. Moscow and Peiping may make further limited concessions to Japan for this purpose. They are probably confident that Japan’s critical foreign trade needs will impel it to seek increased Sino-Soviet Bloc trade and that the domestic political forces at work in Japan are already gradually leading it toward a more independent foreign policy.

225. The USSR probably regards Southeast Asia as primarily a Chinese Communist area of influence. However, the Soviets will continue to stress their willingness to assist the countries of this area with long-term credits, technical aid, and purchases of their raw materials, while touting the value of Communist methods as the best way to achieve the economic development which these states desperately seek. The USSR will utilize still strong anti-colonial sentiments in these areas to stimulate and exploit differences with the Western powers.

226. Since 1954 the USSR has devoted special efforts to strengthening its influence in Afghanistan, perhaps initially because of fear that the Afghans would join the Baghdad Pact. We do not believe that the USSR intends to go so far as to convert Afghanistan into a satellite, primarily because such a move would alarm the non-Communist world and probably could be accomplished only through the use of Soviet military force. It is seeking instead to establish Afghan economic and military dependence on the USSR.

227. *Africa*. As part of its effort in the underdeveloped areas, the USSR will almost certainly increase its activities in Africa during the next five years. It is already trying to develop diplomatic and economic relations with the newly independent states of Morocco, Tunisia and Ghana, and is devoting somewhat greater efforts to Libya and the Sudan. It has offered trade, aid, technical assistance and, in some cases, arms. We do not believe that the USSR will during the period of this estimate undertake serious commitments or become deeply involved in areas of Africa far removed from the center of Soviet power. Instead, it will probably confine itself to the establishment of its diplomatic and economic presence on the continent, to some limited encouragement of nationalist and anti-colonial movements, and to an attempt to end the exclusiveness of Western influence in most of the area.

228. Up to the present the USSR has been cautious in its support of Arab nationalism in North Africa against the French. If a settlement of the Algerian conflict does not occur fairly soon, however, we believe that the Soviets will probably become more active and outspoken in

this respect, though it is likely that material support will be rendered through Egypt rather than directly.

229. *Western Europe.* Post-Stalin Soviet policy toward Western Europe appears to be strategically defensive in character, aimed more at protecting the USSR's position in Eastern Europe than at expanding Soviet influence beyond its present frontiers. Though the USSR obviously does not intend to neglect Western Europe, it probably considers that its opportunities for maneuver are limited at present, and is concentrating its efforts on more vulnerable areas.

230. The chief Soviet objective in Western Europe is to weaken and divide the NATO powers, and above all to induce a withdrawal of US military strength. Soviet disarmament policy and its attendant propaganda is directed largely at this target. The USSR will also continue to promote the concept of a detente in Western Europe, via some form of European security treaty which would replace both NATO and the Warsaw Pact. Indeed the USSR probably expects simply through its policy of "peaceful co-existence" and relaxed tensions to secure a reduction in NATO unity and arms outlays. Special attention will also be paid to exploiting differences among the NATO powers as well as weaknesses in individual countries.

231. We believe that the USSR will remain adamant on German reunification despite its recognition that its immovable stand on this issue limits its maneuverability in Western Europe. In our view the Soviet leaders are still acutely concerned over the potential threat of a revived and nationalistic Germany, backed by the US in seeking the recovery of its eastern territories. In Soviet eyes the continued division of Germany, with the USSR holding 18,000,000 East Germans as hostages, is the best means of limiting this threat. The Soviets are highly unlikely to believe that any formula for reunification will offer adequate guarantees against a reunified Germany's tacit or open alliance with the West. In addition, besides East Germany's military value to them, they are probably fearful of the impact that loss of their East German satellite would have on their position elsewhere in Eastern Europe.

232. *Latin America.* This area has also been the target of Bloc diplomatic, economic, and cultural activity in an attempt to promote trade and other contacts and encourage friction with the US. Further efforts in this direction are likely, as well as continued local Communist Party and front group activity to promote anti-US sentiments and to obstruct Latin American cooperation with the US.

BLOC TOTALS	6,764,000	1,028,250	815,000	75,000	1,303,000	8,682,250

¹Figures in this table are based on estimated order of battle. Estimates of this type yield approximate rather than precise measures of actual strength at any given time, and can lag considerably behind changes in actual strength. [All footnotes in the table are in the original.]

²For purposes of this table, an estimated 110,000 Naval Aviation personnel are included in total Soviet air forces personnel strength.

³Does not include MVD naval forces, which for purposes of this table are carried in Soviet security forces total.

⁴Believed temporarily disbanded.

⁵Includes 2,000 naval air.

⁶Includes 8,000 naval air.

⁷Air defense control and warning (AC and W) personnel. The Assistant Chief of Staff, Intelligence, USAF, believes that of the total of about 75,000 Soviet AC and W personnel, 55,000 are in the air forces, 15,000 are in the ground forces; and 5,000 are in the naval forces. The Assistant Chief of Staff, Intelligence, Department of the Army, believes that of the 75,000 AC and W personnel, 60,000 are in the ground forces and the remainder in aviation units.

¹In addition to the major surface vessels shown, we estimate that in mid-1957 there were 1,760 minor surface vessels in Soviet service, and 475 in the Satellites and Communist China. Minor surface vessels include amphibious, minewarfare, and patrol vessels. "Old" surface ships are those more than 20 years old. [All footnotes in the table are in the original.]

²For a discussion of the factors which may affect future Soviet submarine construction and strength, see DISCUSSION, paragraphs 144 and 144a. "Old" submarines are those 15-20 years old.

³Conventional submarines of post-World War II design and construction, including W and Z-class long-range and Q-class medium-range.

⁴Submarines older than post-World War II but less than 14 years old.

⁵Of these 70 new type submarines, the following tentative estimate is made of the possible types: 10 nuclear-powered, 10 nuclear-powered guided missile, 20 conventional-powered guided missile, and 30 submarines of improved design.

MAIN TRENDS IN SOVIET CAPABILITIES AND POLICIES,
1958–1963

THE PROBLEM

To review significant developments affecting the USSR's internal political situation, economic developments, military programs, relations with other Bloc states, and foreign policy, and to estimate probable Soviet courses of action through about 1963.²

SUMMARY ESTIMATE

1. New tendencies have appeared on the Soviet political scene during the past year. Externally, the lines of conflict with the West have been drawn more sharply once again, and "reduction of tensions" no longer is the major theme of Soviet foreign policy. Internally there has been both in the USSR and in the Bloc an attempt to consolidate and stabilize, to check the pace of change, to curb the expectations and discipline the unruly tendencies aroused among the people by the milder policies of the post-Stalin years. There has been a return to a certain rigor in policy and in ideology. Nevertheless, the changes which affected almost every aspect of Soviet internal and external policy in the years after Stalin's death have for the most part not been reversed. The flexibility and pragmatism of the current leadership continues; innovations in policy may still be forthcoming, particularly in internal affairs.

Trends in Foreign Policy

2. During the course of the last year there has been a distinctly hardening tone in Soviet foreign policy. It is true that many of the new features introduced after the death of Stalin remain in force. The claim to be pursuing policies in the interest of establishing "peaceful coexistence" is still made; programs of cultural exchange and generally freer contact with the outside world have been continued. Nevertheless, a new militancy and assertiveness in Soviet policy has emerged more and more clearly. This has been most strikingly manifest in the Quemoy and Middle East crises, and in the developing crisis over Berlin.

3. The Soviet leaders probably decided that the special emphasis they had given to "peaceful coexistence" and easing of tensions had out-lived its usefulness. It had not had the anticipated effect of weakening Western alliances. Some features of the relaxation line—the new approach to Yugoslavia, the repudiation of Stalin, and the leeway given for some national autonomy in the Satellites—proved dangerous to

² "The reference to a five-year period is approximate. The economic calculations carry through 1965, to conform to the Soviet Seven-Year Plan; some of the political judgments, on the other hand, pertain to periods of less than five years. [Footnote is in the original.]

Soviet authority in Eastern Europe. A return to a harder course probably seemed desirable on these grounds alone. But at the same time, it appeared justified by the Soviet leaders' belief that, in power terms, there had been an enhancement of the Bloc's position and a decline in that of the West. This belief probably was based in the first place on Soviet weapons advances and scientific achievements. There was also a feeling that the outlook was good for new advances in Bloc economic strength after a period of some difficulty in 1956–1957, while at the same time Western economies were believed to be showing symptoms of economic crisis. Then, too, the Soviet leaders considered that Communist influence was generally growing stronger in underdeveloped countries of Asia, Africa, and the Middle East, while Western influence continued to decline. The confidence of the Soviet leaders that they were entering upon a promising phase in the "struggle against imperialism" has been articulated in a new doctrine, namely, that an irrevocable shift in the relation of forces in the world has taken place to the advantage of the Communist Bloc.

4. This more confident and militant attitude on the part of the Soviet leadership does not mean that it has revised its attitude toward war as an instrument of policy. We continue to believe that the Soviet leaders have no intention of deliberately initiating general war and still wish to avoid serious risks of such a war. They almost certainly believe that, even with the acquisition of long-range missiles capable of striking the US, the scale of damage they would suffer in a general nuclear war would threaten the survival of their regime and society. Moreover, they regard the final victory of Communism as inevitable, and to be achieved mainly through political forms of struggle. The maintenance and further strengthening of great military power is primarily intended to deter a resort to force by the "imperialist" enemy, and to count as a weighty factor in persuading him to submit peacefully to a succession of political reverses as the revolutionary tide advances. Situations might arise, however, in which the Soviets would judge that military force could be used without unacceptable risk or that an imminent threat left them with no recourse but to initiate military action.

5. Currently, while the Soviets still wish to avoid serious risks of general war, they probably believe that the Bloc can increase its pressure on the West and can exploit local situations more vigorously, perhaps even through the use of Bloc armed force, without incurring the same degree of risk as they would have previously. While we have always considered it possible that Bloc forces would be used in overt local aggression if this could be done without much risk of serious involvement with Western forces, we do not believe that the likelihood of such aggression has increased. The Soviets may even believe that the West, also conscious of Soviet gains in military power, will be more

and more disinclined to react vigorously. Consequently, they now seem disposed to test Western firmness and probe for weaknesses in the hope that some key position may be abandoned without serious resistance, or that the Western alliance will split over some such issue.

6. In employing pressures against the West, the Soviet leadership doubtless intends to proceed with care. But its preoccupation with calculations of power, and its evident confidence in the strength of the Communist position, may lead it to underestimate dangers. We believe that if the current attitude of the Communist leaders persists, the danger of war arising from miscalculations will be increased.

7. The USSR has directed a major effort over the last several years toward underdeveloped countries. Its trade and aid programs, propaganda and cultural offensives are intended to displace Western influence, and to orient the policies of such states increasingly toward the Communist Bloc. The Soviet leaders believe that if they can associate the aspirations of underdeveloped peoples with their own cause they can increasingly constrict the political maneuverability of their main enemies, the Western Powers. We believe that the Soviet leaders will continue to regard the effort to develop Communist influence in underdeveloped countries as a major facet of their policy. The USSR's targets among the underdeveloped countries may shift considerably, in accordance with changing opportunities and local setbacks. In those countries where its efforts are most successful, the USSR may increasingly be tempted to support local communists in attempts to seize power. But the Soviets would carefully weigh such gains against the harmful consequences such a policy would inevitably evoke elsewhere. They will probably generally maintain the pose of peaceful cooperation. Since the claim to a "peace-loving" policy is one of the principal elements of the Soviet appeal to the neutralist states, the desire to sustain the plausibility of this claim will impose some restraint on the hard and uncompromising tone of Soviet policy toward the West.

8. The major Soviet effort to extend influence in underdeveloped areas has been made in the Middle East, where the West has important economic and strategic interests. The USSR will continue its policy of economic and military aid to Arab states, hoping to deepen the conflict of Arab nationalism with the West. The initial aim of this policy is to displace Western and increase Soviet influence, and to make Western access to the resources of the area precarious. The Soviet leaders probably also contemplate the eventual achievement of a long-sought Russian goal—land access to the strategic areas of the Middle East. To this end, they will continue to encourage and support such movements as that for an independent pro-Soviet Kurdish state and for a pro-Communist government in Iraq, and will also continue pressures against Iran and Turkey.

9. The Soviets also hope that radical anti-Western nationalism in the Middle East can eventually be given a revolutionary turn toward Communism. While they probably intend for the present to support Nasser's claim to leadership of the Arab nationalist movement, they regard him as a "bourgeois nationalist" whose role is a transitory one. Given a favorable opportunity in some Arab country, they may encourage local Communists to capture the nationalist movement and attempt a seizure of power. An open conflict between Soviet revolutionary policy and Nasser's claim to leadership of the Arab nationalist movement may occur during the period of this estimate.

10. In South Asia and the Far East, Soviet and Chinese Communist policy will probably continue to emphasize governmental contacts, supported by programs of economic aid and cultural exchange and an active propaganda, with a view to encouraging neutralist policies and where possible openly anti-Western ones. Short of a favorable opportunity to establish Communist power in a key country, the Chinese and Soviets will probably continue to put their main reliance on diplomatic action intended to influence governments rather than to overthrow them, and if possible to associate them with the Bloc against the Western Powers. As regards Africa and Latin America, the Soviet Government apparently views with optimism its prospects for successful diplomatic and economic penetration and, in keeping with a current trend, can be expected to intensify its efforts in these areas.

11. Soviet policy in Europe appears to be aimed more at consolidating the USSR's position in Eastern Europe than at an early expansion of Soviet power beyond the frontiers of the bloc. Soviet policy toward Western Europe is concerned mainly with breaking up the NATO political and military alliance and the defense structure located in that area. This is the main purpose of their maneuvers and proposals aimed at achieving "European security." Apart from the ever-present aim of creating discord among the NATO allies, the more immediate Soviet objectives are to prevent an increase of West German military strength and to prevent the establishment of additional missile bases in Western Europe.

12. The current Soviet diplomatic offensive over the status of Berlin is the most striking example of Khrushchev's activist foreign policy. It appears designed to strengthen the East German regime as well as to stimulate a more receptive atmosphere for other Soviet proposals on Germany and to create divisions among the NATO allies. The Soviet leaders probably intend to be cautious and tactically flexible. We believe that they will try to direct Soviet and East German maneuvering in a manner which will avoid military conflict with the Western allies, while at the same time they will be prepared to take advantage of any signs of weakness on the part of the West, or of inclinations to compromise

on major issues. Nevertheless, they have already committed themselves considerably, and we believe that the crisis may be severe, with considerable chance of miscalculation by one or both sides. We do not believe that the Soviets intend to modify the main lines of their policy on the German problem as a whole, but will continue to insist on maintaining the present division of Germany. They regard the preservation of Communist control in East Germany as essential to the maintenance of Communist power in Poland and Eastern Europe as a whole. They hope to consolidate their control of that area and to force Western recognition of the legitimacy and permanence of the Communist regimes there.

13. Soviet disarmament policy, which has at times shown some flexibility, is designed at a minimum to earn credit for the USSR as the leading proponent of "peace." Actual Soviet proposals are aimed mainly at the withdrawal of US military power from Western Europe and other bases, and also at discrediting and inhibiting US reliance on nuclear weapons. While it is possible that the USSR would accept some limitations on its own military posture in order to further these objectives, the Soviets would almost certainly not consent to any very extensive scheme for mutually inspected disarmament. We believe that there is little likelihood that the Soviets will desire a broad disarmament agreement strongly enough to move their policy significantly in the direction of the positions now held by the Western Powers.

Intra-Bloc Relations

14. In the last year a major effort has been undertaken to consolidate the unity of Bloc states. The conference of Communist parties in November 1957 launched the so-called antirevisionist campaign in order to curb deviationist tendencies which threatened in 1956 to eliminate Soviet influence from Poland and Hungary. The latter regime is again effectively under Moscow's control and the Gomulka government in Poland, while still preserving Party autonomy and some degree of independence in its internal policy, is showing itself more deferential to Soviet guidance. As compared with Stalin's methods, Moscow's authority in the Satellites will continue to be exercised discreetly out of deference to national sensitivities. In the very long run, we believe there will be a tendency for direct Soviet control over these states to be diluted. Popular dissatisfaction will remain widespread in Eastern Europe, but we believe that the recurrence of popular revolt or of an attempt by a Satellite Communist Party to defy Moscow on vital issues is unlikely at least over the next few years.

15. The scale of China's power and the fact that the Chinese Communist Party has long been organizationally independent of the USSR has made the Sino-Soviet relationship more nearly one of equality. The parallelism of material, strategic, and ideological interests will continue to weigh decisively in favor of cementing the alliance of the

two countries, even though frictions over a variety of questions—ideological issues, economic and military support by the USSR to China, competition for influence in other Communist parties—may from time to time make the relationship a sensitive and difficult one. We believe that Communist China will attain over the next several years an increasing influence on general Bloc policy and Communist ideology. However, so long as the struggle against the Western Powers remains the principal concern of both regimes, there is unlikely to be any serious split between them.

Soviet Internal Political Situation

16. Khrushchev's leadership of the Soviet regime does not seem likely to be seriously challenged so long as his health remains vigorous. In the absence of such a challenge, or of any major setback to his policies, he does not seem likely to attempt a return to the terroristic methods of dictatorship employed by Stalin. He appears to recognize that the abandonment of such methods has improved the political climate within the country. Nevertheless, the regime is now again emphasizing its vigilance against dissenters, and would probably not hesitate to use more severely repressive measures if it judged this to be necessary. We believe that, even though the regime continues to alienate many, especially among intellectuals and the youth, it has gained wider acceptance among the population generally. This is due mainly to the relaxation of police terror, to improvements in material standards, and to pride in the power, world position, scientific and economic achievements of the Soviet state.

17. We believe that, although there will be differences within the Soviet leadership over certain issues of policy, and discontents within some groups of the population, the regime will seldom be constrained in major foreign policy decisions by concern for internal political weaknesses. Should Khrushchev die, there would probably again be a period of confused jockeying for the leadership. It is unlikely that this would basically affect the continuity of the regime's policies or its ability to carry them out, but such a period might diminish the authority of the Soviet Party within the Bloc and lead to divisions within and among Communist Parties. Over the very long run, loss of belief in the ideological doctrine the regime imposes, and the increasing influence of professional elements who are not ideologically inclined, may moderate the Soviet outlook. At present, however, we see no prospect of change on the Soviet domestic scene so fundamental as to diminish the motivation, will, or capacity of the regime to project its rapidly growing power externally.

Trends in the Soviet Economy

18. Soviet economic policy continues to aim primarily at a rapid expansion of the economic bases of national power. We believe that

the goals laid down in the new Seven-Year Plan, which begins in 1959, are in the main feasible, except for those in agriculture, and that the USSR's gross national product (GNP) will grow at an average annual rate of about six percent during the plan period. Assuming that the US maintains an average rate of growth of about 3.5 percent per year, Soviet GNP in 1965 will be, in dollar terms, about half that of the US, as compared with about 40 percent at present. Despite the smaller size of its economy, the dollar value of the USSR's defense expenditure is about equal to that of the US. Our estimates of the probable trend of military expenditures indicate that by 1963 these will be 45–50 percent greater than in 1957. Since growth of GNP in this period is estimated at 45 percent, the defense burden may thus be slightly heavier in 1963 than at present. Despite this, we estimate that Soviet industrial production will grow over the new plan period at an average annual rate of about nine percent, and that per capita consumption will be about one-third higher in 1965 than it was in 1957.

19. Beyond what they contribute to Soviet military power, the achievements of the Soviet economy have become a vitally important element in the impact which Soviet policy has on the world situation. First is the direct politico-economic impact, arising from the ability of the USSR to initiate and support programs of economic aid or credit to foreign countries, to import goods from countries which would otherwise be hard-pressed to find markets, and to export various materials in quantities which (if the Soviet leaders so desired) could disrupt previously existing patterns of world trade. In this connection, manipulation of prices is a key weapon of the USSR. Second is the political and psychological effect on underdeveloped countries of the successful and rapid economic development achieved by Soviet and Chinese methods. The Soviet and Chinese Communist leaders attach great importance to the possibility of convincing these countries that only by adopting Communist methods and accepting Communist assistance can they too achieve rapid economic growth. Third is the economic impact in a narrower sense, arising inevitably from the appearance in the world of a great new producing and trading unit, the influence of which could not fail to be great even if it were not deliberately used for political purposes by the Soviet leaders. In all three ways the Soviet economy will present a growing challenge to the Western world.

Developments Affecting the Soviet Military Posture

20. The Soviets will almost certainly continue to believe that they must have a large and diversified military establishment, designed to meet contingencies up to and including general war. Thus they will at all times maintain substantial forces-in-being. Meanwhile, they will press ahead with research and development programs in order to

acquire additional capabilities with advanced weapon systems, and if possible to achieve clear military superiority over the US.

21. The present Soviet nuclear weapons stockpile could include weapons in a range of yields from about 2 KT to about 8 MT. The USSR probably possesses sufficient nuclear weapons to support a major attack by its long-range striking forces, but the supply of fissionable materials is probably insufficient for large-scale allocation of such weapons to air defense and tactical uses as well. Since we estimate a substantial and high priority Soviet program for the expansion of fissionable material production and considerable further improvement in nuclear weapons technology, we believe that current limitations will ease during 1959–1963.

22. The principal Soviet military component presently capable of long-range nuclear attack is Long Range Aviation, with about 1,450 bombers (including some convertible tanker-bombers), among which are about 950 jet medium bombers and about 100 to 125 jet and turbo-prop heavy bombers. This force—best suited for attacking targets in Eurasia and its periphery—is capable of large-scale attacks against the US only through the extensive use of medium bombers on one-way missions. While the size of the long-range bomber force will probably decline gradually, Soviet long-range striking capabilities will increase markedly as the stockpile of nuclear weapons grows, improved bombers are introduced, the readiness and proficiency of the bomber force increases, and especially as the Soviet capacity to deliver nuclear weapons by missiles expands.³

23. The USSR will rely increasingly upon missiles as nuclear delivery systems during 1959–1963. Present operational weapons include ground-launched ballistic missiles with ranges up to 700 and probably 1,100 nautical miles (n.m.), as well as bomber-launched air-to-surface missiles suitable for use against ships and certain other targets. A few conventional submarines have probably been converted to employ 200 n.m. cruise-type missiles. The USSR will probably achieve a first

³ The Assistant Chief of Staff for Intelligence, Department of the Army, does not concur in the last sentence of this paragraph. He agrees that Soviet long-range striking capabilities will increase markedly but believes that this increase cannot be attributed to the introduction of improved bombers of the types and within the strength levels estimated, or to continued training of bomber crews. In his view, the estimated acquisition by the USSR of a substantial ICBM capability, along with the anticipated increase in the Soviet nuclear weapons stockpile, are factors which far outweigh comparatively routine improvements in the existing force. Therefore, he believes that the last sentence of this paragraph should read as follows: "The Soviets can be expected to introduce improved bombers and to increase the readiness and proficiency of Long Range Aviation units, but the size of this force and its significance in a long-range attack role will gradually decline during the period. Nonetheless, Soviet long-range striking capabilities will increase markedly as the Soviet missile delivery capability expands and as the stockpile of nuclear weapons grows." [Footnote is in the original.]

operational capability with 10 prototype ICBMs of 5,500 n.m. range at some time during 1959. While it is possible that a limited capability with comparatively unproven ICBMs might have been established in 1958, we believe this to be unlikely. We believe that Soviet planners intend to acquire a sizeable ICBM capability as soon as practicable.

24. Air defense capabilities will increase through improvements in the performance characteristics of weapons and equipment, a higher proportion of all-weather fighters, further incorporation of guided missiles in the defenses of numerous targets, and especially through wide employment of semiautomatic air defense control. But the Soviets will continue to have difficulty in opposing very low altitude attack, the air defense system will still be subject to disruption and saturation, and the problem of warning time will become more critical. The USSR will probably not have a weapon system with even limited effectiveness against ballistic missiles until 1963 or later.

25. The ground forces, estimated to have 67 mechanized or motorized rifle divisions, 75 rifle divisions, 23 tank divisions, and 10 airborne divisions, have been extensively modernized and reorganized, in accordance with revised Soviet tactical doctrine which supplements standard tactics and training with those designed for conditions of nuclear warfare. These forces are closely supported by tactical aviation consisting of fighters trained in the ground attack role (in addition to their air defense role) and light and medium bombers trained in ground support bombing techniques. With appropriate air and naval support, Soviet ground forces are capable of conducting large-scale operations on several fronts into peripheral areas, separately or concurrently. The increasing availability of nuclear weapons and guided missiles during 1959–1963 will bring further evolutionary changes, but probably no major alterations in size or deployment of forces. Tactical and naval air units, some of which have already received jet medium bombers, will probably receive new supersonic fighters and bombers. Increasing attention is being paid to the development of airborne forces and air transport capabilities.

26. The present Soviet force of about 440 submarines includes about 260 long-range craft of postwar design and construction. A recent slowdown in construction probably reflects a shift to new types, including nuclear-powered submarines and submarines designed specifically to employ guided missiles. A submarine-launched ballistic missile system with a missile range of about 1,000 n.m. will probably be available for first operational use in 1961–1963. Construction of conventional submarines will probably continue, but the greater complexity of nuclear-powered and missile submarines will probably result in a total annual production rate considerably below the high levels of recent years.

27. *Space Programs.* We believe that the USSR is presently capable of orbiting earth satellites weighing on the order of 5,000 pounds, of launching lunar probes and satellites, and of launching planetary probes to Mars and Venus. Its space program could also include: surveillance satellites and recoverable aeromedical satellites (1958–1959); “soft landings” by lunar rockets and recoverable manned earth satellites (1959–1960); a manned glide-type high altitude research vehicle (1960–1961); earth satellites weighing as much as 25,000 pounds and manned circumlunar flights (1961–1962). While each of these individual achievements appears feasible as to technical capability and earliest date attainable, we doubt that the USSR could accomplish all of these space flight activities within the time periods specified. If the Soviets desire to do so, an earth satellite could be launched from the territory of Communist China within the next year or so.

Soviet Scientific Achievements

28. The USSR’s achievements during the last year, including earth satellite launchings, weapons development, and the scale of its efforts in the IGY program, have strikingly demonstrated that the USSR has acquired a scientific establishment of the first rank. As a result of a sustained effort over the last three decades, the number of graduates in scientific and technical disciplines has steadily increased, research facilities have been greatly expanded, and the quality of Soviet scientific training has improved. Soviet scientists have made marked progress in many areas of fundamental and applied research and in some fields rank among the best in the world. We believe that significant Soviet advances in science and technology are likely to occur in the future with greater frequency than in the past.

DISCUSSION

I. INTERNAL POLITICAL DEVELOPMENTS

Ascendancy of Khrushchev

29. Khrushchev’s position as the dominating figure on the Soviet scene appears to be well established. There does not appear to be any other leader or any group able or willing seriously to challenge his position. The Twenty-First Party Congress, scheduled for January 1959, may install still more of his followers in the highest Party organs and further dramatize his personal and ideological authority. Thus, it is likely to be Khrushchev who will preside over the Soviet regime throughout the period of this estimate, assuming that he retains his health and vigor. However, Khrushchev’s policies will probably continue to arouse concern among certain elements of the Party, and an attempt to reduce his authority cannot be entirely excluded.

30. Although he is in a sense Stalin's heir, Khrushchev will almost certainly not rule as Stalin ruled. The style of his leadership is characteristic of his own personality, and is reflected in a suitable myth: the new leader is a gregarious man of the people, and remains "close to the masses;" he is a rough and practical-minded man, but his political judgment is unerring, and like Lenin he commands the Party by the persuasive force of his arguments rather than by the fear he inspires. This image probably reflects the manner in which Khrushchev prefers to rule; he fancies himself as the popular boss-persuader. His method of leadership is also consistent with the needs of the post-Stalin period. Consequently, he will be disposed to avoid the use of terror as a main instrument of rule, though the police will be kept strong and employed as necessary. Errors in judgment, even opposition on some issues, will not generally be treated as political crimes. The Central Committee and Party Congresses will probably continue to meet regularly. There will be greater representation of outlying regions at the center, and more concern displayed for local interests. In short, the consolidation of Khrushchev's power will probably not mean a return to dictatorship of the Stalinist type.

31. Moreover, there will continue to be pressures on Khrushchev which will work to limit his exercise of dictatorial power. Since his authority, unlike Stalin's, does not rest on the use of terror, Khrushchev must to a far greater degree seek to win and hold the support of groups within the Party apparatus. Inner Party maneuverings are complicated by the fact that greater account must be taken of popular sentiment than was true under Stalin; Khrushchev's position in particular is exposed because he is identified with economic and social programs which have stimulated popular desires for further material improvement and he is thus personally accountable for maintaining a good record of performance in relation to promises. At some point within the period of this estimate Khrushchev may face the dilemma either of tolerating radically opposing views within the leadership, thus imperiling his control, or of attempting to suppress opposition tendencies, at the cost of a return to terror. If, although we think it unlikely, a serious challenge to Khrushchev's personal position should arise, not all of the allies and associates who supported him during his rise to power would necessarily remain loyal to him.

32. The ebullient personality of Khrushchev has been considered by some observers as likely to give Soviet foreign and domestic policy an erratic and unstable course. We think this is unlikely. His public manner is probably in large part that of the conscious actor-politician, intended to confound his opponents and to impart vigor to the execution of his policies. His advocacy of certain unexpected departures in Soviet policies in recent years was probably not unrelated to efforts to

steal a march on his competitors in the succession struggle. We think that the substance, as distinguished from the style, of Soviet policy is likely to be little affected by Khrushchev's idiosyncrasies.

Role of the Party

33. The victory of Khrushchev has been paralleled by an increasing use of the Party apparatus in all aspects of control and administration. At the top, in the Party Presidium, the majority now consists of Khrushchev's followers who were elevated from the Secretariat and of important regional Party secretaries; the former overwhelming representation of men in leading government positions has been drastically reduced.⁴ Party personalities either preside over or play important roles in the regional economic councils which now administer the economy in place of the former central ministries. Local Party secretaries have also been brought into the district military councils, giving the Party a closer hold on military administration. In rural areas measures have been taken to give the local Party more effective control over agriculture.

34. This increased role of the Party at all levels of administration was probably intended in part to insure Khrushchev's firm control over the country, since the Party apparatus was his principal instrument of power. But the reforms in industry and agriculture which he has sponsored in recent years—all involving decentralization and a fuller reliance on local initiative—have also made closer Party supervision more necessary in order to combat local violations of the Party's economic directives. Under Khrushchev much more will depend on morale and discipline within the Party at local levels than has been the case in the past.

35. The increase in authority of the Party apparatus has taken place at the expense of the various interest groupings which compete for place and influence behind the façade of totalitarian Party unity. The professional military opposes the system of political commissars and, despite Zhukov's removal for attempting to reduce Party control over the armed forces, this attitude will persist. Government administrators and economic managers will continue to resent what they regard as the bungling interference of Party hacks in their technical spheres. Intellectuals—writers, artists, scientists, students—will continue to press for a greater area of freedom and a loosening of the Party's ideological strait-jacket. While each of these groups has a stake in the success and prosperity of the Soviet state, each has also professional interests to further. One purpose of Khrushchev in elevating the Party

⁴ At present, 11 of the 14 full members of the Party's Presidium hold key posts in the Party apparatus (including 9 of the 10 secretaries), and only 3 other than Khrushchev himself hold leading governmental positions. By contrast, at the time of Malenkov's removal in 1955, of the 9 full members of the Presidium 8 were in leading governmental positions, and only Khrushchev was a full time official in the Party apparatus. [Footnote is in the original.]

apparatus is to prevent the hardening of these professional interests into self-contained, autonomous groups which might ultimately have independent political importance.

36. It has been suggested by some Western observers that, as the Soviet economy matures and becomes more complex, as the needs of society come to be met by more specialized administrative skills, as education is extended and diversified, the totalitarian character of the regime will be diluted. The dictator or the Party as the single focus of power, it has been argued, will give way to autonomy in areas of less immediate political significance. Even in the political field, institutional arrangements will have to be found for representing many diverse interest groups: it was possible to see signs of such a tendency in the post-Stalin period of confusion occasioned by the succession struggle. On occasion, the Central Committee of the Party became an arena of political decision with factional and policy differences represented within it. In the post-Stalin period the rulers have also seemed to think it necessary to take account of public opinion generally in framing their policies. Such tendencies to dilute arbitrary power and to broaden participation in policymaking beyond the narrow circle of the Party Presidium may reappear at the time of Khrushchev's death or at some other period of weakened authority. For the present, however, Khrushchev's restoration of one-man leadership, and his manner of achieving it through the Party apparatus, has maintained Soviet society firmly in the totalitarian mold.

Issues in Soviet Politics

37. This development does not mean that there will not continue to be group pressures and much pulling and hauling over issues of policy. Even under one-man leadership the normal play of politics is not adjourned, though it may become less visible. There are a number of issues over which lines are likely to be drawn behind the façade of unity. For example, whatever the degree of its practical success, the economic reorganization scheme is laden with political significance. It calls for the removal of a host of bureaucrats from Moscow to the provinces, a fate little relished by the migrants. The reorganization could lead to a regionalism which would be a new source of tension, although the revitalized Party must, in Khrushchev's calculation, serve as the cement which binds the periphery to the center. This reorganization, like the ideologically controversial measures Khrushchev has sponsored in agriculture, has yet to be fully proved in practice. Khrushchev may yet be driven to some agile maneuvering to defend his innovations.

38. Also among the issues likely to affect inner Party politics are those related to Soviet economic growth. The growth achieved may not be high enough to attain all the goals—high rates of investment, increase in agricultural output, rising living standards, modern armaments—which now have priority in Party programs. Cutting

back on any of these objectives could lead to dispute. The leaders of the armed forces, for example, would not willingly accept either a substantial cut in the military budget or reduced investment for industries of military significance. The Party apparatus itself, influenced by the lower ranks where there is direct contact with popular pressures, would be reluctant to sacrifice prospective gains in living standards. Failure to achieve satisfactory rates of growth could produce resistance to further outlays in foreign aid or bring into question Khrushchev's economic reorganization.

39. There are likewise some purely political issues which may have divisive effects. The Soviet ruling groups would be reluctant to see a return to the systematic use of terror. The question of the control of the secret police is of widespread concern and would become paramount in case Khrushchev's mastery were ever placed in doubt. There must be some in positions of influence who are concerned with what seems to them the downgrading of Soviet authority in the Bloc, as represented by toleration of the Gomulka regime in Poland and the increasing weight of China in ideological and policy matters. There may be others who question Khrushchev's policy of alliance with "national liberation movements" in underdeveloped areas on the ground that such a policy increases the danger of war arising from clashes with Western interests, and involves support of bourgeois movements which cannot be used to promote Communism.

40. Khrushchev's late arrival at supreme power (he is now 64) will make the prospect of a new succession struggle a lively, if seldom discussed, factor in inner Party maneuverings. As he grows older it will be difficult to separate policy issues like those discussed above from the succession question. Thus major tensions will probably continue to be present within the Soviet body politic despite the stabilization of power at the top, and these will from time to time affect the face which Soviet policy presents to the outside world.

Attitudes in Soviet Society

41. The post-Stalin leadership set out to effect a basic improvement in the attitude of the Soviet people toward the regime. The relaxation of police terror and the greater attention to living standards served this end. The greatest material gains so far have been made by the peasantry, but a continuing improvement of urban standards over the next few years, particularly in housing, is also promised. In terms of its standing with the population as a whole, the regime is probably stronger now than it was five years ago. We believe that the measures which have produced this improvement will be continued.

42. Soviet society continues nevertheless to be marked by substantial areas of discontent. There exists, and will probably continue to exist,

considerable disaffection among intellectuals, particularly among Soviet writers and university students. It is significant because it touches a highly vulnerable area, the regime's ideological authority. Intellectuals are aware of the discrepancies between the Marxist-Leninist ideal and Soviet reality and they also resent the regime's encroachments on private life and professional interests. They doubt that adequate safeguards exist to prevent the repetition of Stalinist terror. They feel contempt for Party careerists. They resent restrictions on travel abroad, and limitations on access to Western publications and broadcasts. These discontents do not take the form of active opposition but are limited for the most part to a retreat into an inner world so as to minimize the degree of involvement with the Party and the state.

43. There continues also to be dissidence among some national minorities. The peoples of the old Baltic states harbor vigorous Russophobe feelings. They feel strongly that they are exploited and that their homelands lag far behind their prewar cultural and living standards. A considerable residue of anti-Russian sentiment is also to be found in the western Ukraine, as well as in Georgia, where the downgrading of Stalin and the loss of its former privileged status also rankle. It seems probable, furthermore, that many of the two million Jews in the Soviet Union would like to emigrate. Because many Jews hold key professional positions and have connections abroad, the regime probably regards them as a continuing security problem.

44. We do not believe that any of the discontents and tensions described above are likely to have major political significance during the period of this estimate, although they will place restrictions on the regime's ability to mobilize the population for its own purposes. The regime will deal with them by its well-practiced methods of concession and suppression. Moreover, its success in identifying with itself the sense of national pride and power, extending even to chauvinism, is a formidable asset with which to counter discontent. The Soviet people are well aware that under Communist rule Russia has been transformed from a backward, agrarian, defeated nation into the world's second most powerful state, perhaps, they would like to believe, the most powerful. The Russian tradition takes it for granted that government is by nature tyrannical, arbitrary, and exacting. If it fulfills the aspiration to national power, it can be forgiven much.

The Longer View

45. Have the processes of change which have operated so broadly and visibly in Soviet society since the death of Stalin opened up perspectives for more fundamental change in the long run? It seems undeniable that such a possibility exists. One source of such change could be a failure by the totalitarian Party repeatedly to renew its vitality; this might result in a dilution of its monopoly of power in favor of other

interest groups upon which the functioning of the society will increasingly depend as its industrialization proceeds. Another could be inability of the Party to maintain its intellectual and ideological authority as awareness of the gap between reality and ideology increases, a process which will be accelerated as contacts with the West are extended. We consider that the effect of factors like these cannot now be reckoned to have any assured outcome. At present, we see no prospect of change on the Soviet domestic scene so fundamental as to diminish the motivation, will, or capacity of the regime to project its rapidly growing power externally.

II. TRENDS IN THE SOVIET ECONOMY

General

46. The performance of the Soviet economy has become a vitally important element in the impact which Soviet policy has on the world situation. This importance derives from an extraordinary record of growth over the last decade, a growth which is certain to continue at a rate faster than that of the US economy. The strength of the Soviet economy has provided a foundation of great national power for Soviet policy, first and foremost military power: the USSR has had available the means to maintain military programs and to develop advanced weapons on a scale which no other state except the US can undertake.

47. However, apart from its function as a basis for Soviet military power, there are three other ways in which the impact of the Soviet economy on the world situation is already observable to a greater or lesser degree, and is certain to increase. First is the direct politico-economic impact, arising from the ability of the USSR to initiate and support programs of economic aid or credit to foreign countries, to import goods from countries which would otherwise be hard-pressed to find markets, and to export various materials in quantities which (if the Soviet leaders so desired) could disrupt previously existing patterns of world trade. In this connection, manipulation of prices is a key weapon of the USSR. Second is the political and psychological effect on underdeveloped countries, achieved through the exhibition of successful and rapid economic development by Communist methods, and through the encouragement of such countries to do likewise under Soviet advice—the Soviet leaders attach great importance to this aspect. Third is the economic impact in a narrower sense, arising inevitably from the appearance in the world of a great new producing and trading unit, the influence of which could not fail to be great even if it were not deliberately used for political purposes by the Soviet leaders. In all three ways the Soviet economy will present a growing challenge to the Western world.

Shifts in Economic Policy

48. Soviet economic policy continues to be marked by a spirit of innovation and experimentation. With the announcement early in 1958 of the program to abolish the Machine Tractor Stations, the present leadership added another to the series of major measures of change it has undertaken in recent years. Most of the steps taken, in particular the reorganization scheme of 1957 involving the dissolution of central ministries and their replacement by 104 regional economic councils, have figured as issues in the political struggle for Stalin's succession. Khrushchev's rise to power was probably due at least in part to his initiative in sponsoring novel measures to cope with the problems of economic policy with which the regime found itself confronted at Stalin's death.

49. These problems arose in part because of the great growth and increasing complexity of the Soviet economic system and the failure of the Soviet leadership to adapt its planning and control mechanisms to these developments. Difficulties were aggravated during Stalin's later years by his unwillingness to countenance any departures from the pattern of economic policy laid down during the early Five-Year Plans. Concentration on heavy industry led to imbalances in the economy; agriculture and housing were denied investment and generally neglected. When the Soviet leaders turned to reforming measures after 1953, the problems which immediately confronted them included the increased complexity of planning and administration as industrial output became more varied and specialized, the need to employ labor and material resources more efficiently as these came to be more fully utilized, higher investment requirements to maintain gains in output, and the necessity to provide greater material incentives in order to improve labor discipline and obtain higher labor productivity.

50. The attack on these problems has involved a variety of measures over the last five years. First, there was a change in the political atmosphere—the easing of police terror and penalties for economic dereliction. The intention was to improve the conditions for managerial initiative in enterprises and to aid the campaign for faster growth of labor productivity. Second, changes in investment priorities were made in order to alleviate the desperate situation in housing, to lift agricultural output out of its stagnation, and to overcome the failure of basic materials output to keep pace with the requirements of fabricating industry. These changes also reflected the regime's desire to improve living conditions, in the expectation that political and economic benefits would flow from improved attitudes on the part of the Soviet population. Finally, in 1957–1958, the regime undertook a sweeping reform of economic administration in an effort to overcome the impediments

which bureaucracy had come to put in the way of efficient operation of the economy.

51. The economic reorganization scheme has been described as a decentralization plan, but it was this in only a limited sense. There never was any intention to weaken the basic apparatus of centralized planning or to give up the political determination of economic priorities in favor of decision-making at lower levels according to economic criteria alone. The plan aimed at eliminating the top-heavy vertical administration of the Moscow industrial ministries. It was hoped that this would result in a more efficient response to central plan directives. The theory was that, by allowing a greater degree of local initiative and by placing the administrators in the regions close to the enterprises they were supervising, the implementing of decisions would be more realistic and less wasteful.

52. The results obtained thus far probably have included some gains of the kind anticipated—better use of local resources, fuller use of transportation facilities, less delay on routine decisions. But the new system contains dangers of its own, which have been heavily attacked in the Soviet press under the name of “localism.” To the extent that freedom to dispose of resources locally has been allowed it has been difficult to prevent decisions from being taken in local rather than national interests. There evidently has been a tendency, aside from some cases of outright corruption, for the local authorities to divert resources to plans of their own for the greater development of their regions, sometimes to the neglect of centrally imposed plans and priorities. The chronic problem of obtaining conformity to economic goals imposed by political fiat from the center, with little regard for local desires or the economic criteria which appeal to the managers of enterprises, seems to persist. We believe, therefore, that the regime will continue to experiment with new techniques of economic planning and administration.

53. The Soviet leadership under Khrushchev seems confident nevertheless that it has already overcome the difficulties which emerged in 1956 when cumulative mistakes in planning caused shortages in basic materials and forced abandonment of the Sixth Five-Year Plan. The regime has announced a new Seven-Year Plan which again sets ambitious goals. It reaffirms the traditional emphases upon the rapid growth of heavy industry, and upon maintaining large military programs. But the Plan also provides for other key programs to which the regime has committed itself in recent years. The Soviet leaders intend to go forward with increasing living standards. Programs of lesser cost will include maintaining Soviet power in Eastern Europe by supporting the Satellite economies as needed, assisting the industrialization of Communist China, and backing up Soviet political objectives in underdeveloped countries with trade and aid programs. The main

question affecting Soviet economic policy over the next five years is whether these multiple priorities, all of which bear on the competitive struggle with the West in which the Soviet leaders see themselves involved, can be met simultaneously. On the whole, we believe that the Seven-Year Plan production goals are feasible, except in agriculture, but that their achievement will impose considerable strains on the economy, and that some programs may have to be modified as the plan period proceeds.

Prospects for Economic Growth

54. The Soviet economy will grow less rapidly during the next seven years than it did during the last seven. Soviet gross national product (GNP) increased at an average annual rate close to 7 percent from 1950 to 1955, and at about 6.5 percent from 1955 to 1957. This slight slackening in the rate of growth obscures a decline in the growth of industrial production from an annual rate of about 11 percent to about 9 percent, and a nearly offsetting acceleration in the growth of agriculture. Because of favorable weather and a large agricultural output the rate of growth of GNP in 1958 has apparently again risen somewhat. Over the period 1958–1965 we believe that GNP will probably grow at an average annual rate of about 6 percent. At this figure, assuming that the US achieves an average annual rate of 3.5 percent,⁵ Soviet GNP in 1965 will be, in dollar terms, about half that of the US, as compared with about 40 percent of US GNP at present.

55. As Soviet GNP continues to gain in size relative to US GNP, the differences between Soviet and US use of national product will continue to be marked. With a GNP only about two-fifths the size of US GNP, the dollar value of Soviet defense expenditure is approximately equal to that of the US.⁶ Soviet investment, in dollar values currently around two-thirds as great as US investment, will grow more rapidly than Soviet GNP during the next seven years, and will approach still closer the absolute size of US investment. Investment in industry alone was about 90 percent of US investment in industry (manufacturing, mining, and utilities) in 1957. The dollar value of Soviet total consumption is less than one-third that of the US. Soviet consumption, on the other hand, will increase at a slower rate than total GNP during the 1958–1965 period, thus becoming a smaller share of the latter. (See graph below.)

⁵ This projected rate of the US is approximately midway between the postwar rate and the long run trend. [Footnote is in the original.]

⁶ The dollar value referred to here was derived by valuing manpower at appropriate US pay rates and other items of military significance at comparable US costs. [Footnote is in the original.]

**SOVIET CONSUMPTION, INVESTMENT, AND DEFENSE
AS A PERCENTAGE OF US, 1957**
(Measured in Comparable Prices)

56. The slightly reduced pace of Soviet economic growth anticipated in this estimate reflects increasing difficulties in obtaining labor, material, and machinery. The economy may be better able to cope with such difficulties as a result of recent changes in the planning, organization, and implementation of economic activity, but the benefits from these changes will be offset by other factors. Agriculture will tend to grow more slowly following the period of sharp output gains of 1954–1958. Industrial growth will be affected by rising investment requirements per unit of additional output and by continuing difficulties in supplying adequate quantities of key material inputs, especially ferrous metals. In addition, there will be a reduced rate of growth of the labor force, owing to the growing impact of the decline in the birth rate during World War II, at a time when the introduction of a shorter work week in industry may increase the need for new industrial workers.

Trends in Defense Expenditures⁷

57. Our estimates of the probable trend of military expenditures through 1963 indicate a defense allocation in that year approximately

⁷ Estimates of Soviet defense expenditures are subject to a wider margin of error than other statistical estimates in this section and should therefore be used with greater caution. [Footnote is in the original.]

45–50 percent greater than the 1957 level. Achievement of the estimated 45 percent growth in Soviet GNP would mean that the defense burden, taken in the aggregate, would be slightly heavier in 1963 than at present, though still not as heavy as in the years immediately prior to 1957. Defense requirements will impose burdensome claims upon various types of resources needed for investment and economic growth.

58. Most of the increase in defense expenditures will result from increasing allocations to more costly aircraft, to guided missiles, military research and development, and nuclear weapons. These programs together probably account for about one-third of total expenditures at present. By 1963 they are expected to require about twice as much in resources as at present and to account for about 45 percent of total defense programs.

59. Soviet defense expenditures in recent years, when converted into dollar values, appear to be of roughly the same magnitude as US defense expenditures. As stated above, the USSR, with a much smaller GNP than the US, produces military goods and services with a dollar value roughly the same. It is able to do this primarily because in the USSR military end-items are less expensive, relative to consumption items, than they are in the US, and because the average level of real pay and subsistence provided Soviet military personnel is much lower than in the US.

Industrial Prospects

60. The eventual aim of overtaking US industry in per capita production continues to dominate Soviet planning for industry. Shifts in the allocation of resources during the period 1953–1955 in support of the economic innovations of the post-Stalin regime—first Malenkov's broad consumer goods program and then Khrushchev's agricultural consumer goods and housing programs—contributed to a moderate decrease in the rate of growth of heavy industry. Heavy industry was expected to benefit, however, from a new program of automation and re-equipment and from changes in industrial management, planning and control, introduced during this period. But by 1956 the failure to provide sufficient new capacity in the raw materials industries caused a severe shortage of industrial raw materials, particularly steel, coal, and cement.

61. The leadership's response to this situation during the last two years has been to abandon the Sixth Five-Year Plan, cut back industrial output goals for 1957 and subsequently for 1958, and to order the formulation of a new Seven-Year Plan for the period 1959–1965. It also launched a remedial investment program which was to increase capacity in raw materials industries while still maintaining

ambitious programs in agriculture and housing. The reorganization plan of July 1957, as already indicated, was also intended to insure a better utilization of materials by permitting greater leeway for local decisions.

62. Industrial growth was claimed by the Soviets to be 10 percent for 1957 and for the first three quarters of 1958, and while this claim was probably somewhat overstated, it indicates that the reduced goals of 7.0 and 7.5 percent for these years were set too low. These rates of increase, however, obscure the continuing poor performance of some basic industries, particularly ferrous metallurgy. Moreover, in spite of the remedial investment program, additions to production capacity in these industries continued to fall short of planned goals in 1957, and probably in 1958 also. Production goals for 1965 in the basic materials industries indicate that they must continue to receive priority treatment if planned rates of increases are to be achieved. Substantial overfulfillment of presently planned goals in these industries, although not likely to occur, would be necessary to approach the 11 percent annual increases in industrial production which we believe were achieved during the Fifth Five-Year Plan (1951–1955). However, we believe that the 8.7 percent average annual rate of growth given in the present version of the New Seven-Year Plan is feasible. (See table below for a list of some Soviet industrial output goals.)

63. One of the factors affecting future industrial growth will be the impact of raw material constraints on the machinery and metal fabricating sector. Despite the current effort being directed into raw materials it is expected that the rate of growth of metals will fall from the 10.5 percent annual average of the past seven years to about 8 or 9 percent per year for the period 1958–1965. This slower growth of metals output will have a restraining effect on the growth of the machinery and metal fabricating sector. Even so, the Seven-Year Plan targets in many of the metals industries are impressive even in terms of past Soviet accomplishments. The announced 1965 goal for steel, stated as 86 to 91 million tons, suggests uncertainty as to what can be achieved in this industry. Even the lower figure represents an increase of 31 million tons over the present level of output, as compared with a gain of 24 million tons in 1951–1958.

SOVIET INDUSTRIAL PRODUCTION 1957-1965

Product	Unit ¹	US-USSR Outputs in 1957			USSR 1965 Goals
		US	USSR ²	USSR as Percent of US	
Electric Power	Billion KWH	754	210	28	500-520
Crude Oil	Million Tons	354	98	28	230-240
Coal	Million Tons	469	463	99	596-609
Crude Steel	Million Tons	102	51	50	86-91
Primary Copper	Thousand Tons	1,319	440	33	946
Primary Aluminum	Thousand Tons	1,500	550	37	1,830
Cement	Million Tons	50	29	58	75-81
Machine Tools	Thousand Units	62	130	210	140-200
Generators for Steam & Hydraulic Turbines	Million KW	10.8	5.6	52	17.5-18.4
Commercial Vehicles	Thousand Units	1,100	382	35	750-856 ³
Sulfuric Acid	Thousand Tons (100%)	14,700	4,569	31	10,176 ⁴
Cotton Fabrics	Million Meters	8,748	5,600	64	7,700-8,000
Leather Footwear	Million Pairs	594	315	53	515
Washing Machines	Thousand Units	3,589	377	10	4,048

¹All tonnage figures in metric tons. [All footnotes in the table are in the original.]

²Except for primary aluminum and copper, which are estimated, the production data are based on official Soviet announcements and are accepted as valid.

³Includes automobiles.

⁴Since no official goal has been published, this figure represents our estimate.

64. The slower natural increase of the labor force during the period of this estimate may also be a limiting factor on the rate of Soviet industrial growth. Population increase and a continuation of past school programs would provide an estimated increase of only about seven million men in the total civilian labor force over the next seven years. The Seven-Year Plan requires an increase of about 11 million men in the nonagricultural labor force. Moreover, the regime is heavily committed to reduce hours of work and has reaffirmed such an intention in its Seven-Year Plan announcement. The goals for gains in productivity reflect the regime's recognition that the labor supply is now a limitation on the rate of economic expansion. One of the aims of current programs in agriculture is clearly to increase productivity in this area so as to permit the release of workers to industry. Moreover, recent and prospective changes in the educational system are in part designed to free additional young people for employment in industry; these changes might release as many as one million to the nonagricultural labor force over the seven-year period.

Agricultural Prospects

65. In the years 1954–1958 agriculture—which had remained largely stagnant during Stalin's last years—underwent rapid development. This was due both to the programs for cultivating the new lands and planting corn, and to other less spectacular but no less important measures such as increased farm supplies and greater financial incentives. In the new lands the weather was better than average. No slackening of attention is apparent in the Seven-Year Plan and the relatively high levels of agricultural investments of the last several years are scheduled to continue. However, the growth rate gains in agricultural output of recent years cannot be maintained. Total acreage is expected to increase during the next seven years at a rate only about one-fourth of the earlier period. Most of the future increase will have to come from increased production per unit of land. This is more difficult to achieve, particularly since the unfavorable effect of indiscriminate acreage expansion will manifest itself. Nevertheless, the existing potential is by no means exhausted, and a number of measures such as soil improvement will be undertaken.

66. Recent organizational changes and better prices in agriculture probably have softened the critical attitude of the peasant toward the regime, as have other earlier measures which were focused upon tax, product procurement, and income conditions in agriculture. State control over agricultural activity, however, has not been weakened. The central organs continue to determine state procurement goals even though the enterprise manager in Soviet agriculture is likely to exercise more choice over what and how he will produce. Collective farm

control over most of the machinery formerly under the MTS may also prove of some significance in increasing output by eliminating conflict between the collective farm chairman and the MTS director concerning day-to-day operations of the collective farm. Proposals have also been advanced recently to introduce more rigorous cost accountability on the collective farms. If carried out, these procedures, taken in conjunction with the gradual introduction of a guaranteed cash wage, will increase the efficiency of collective farm operations, and perhaps permit the release of farm workers to industry. Moreover, the improvement in peasant attitudes brought about by the abolition of the MTS and the effect of 1958 reforms in raising the income of the poorer collective farms will probably have a positive effect on peasant work habits.

67. The Seven-Year Plan carries an unrealistic goal of a 70 percent increase in agriculture. We believe that the actual increase will be less than half of this. Dissatisfaction with the progress of agriculture is likely to lead the regime to continue its experimenting in the agricultural field.

Trends in Consumption

68. The Soviet consumer will not enjoy as rapid an increase in overall consumption during the next seven years as he did during the last seven, when per capita consumption increased by approximately 40 percent. This will be true despite recently announced programs to provide more meat, milk, housing, furniture, and clothing. But per capita consumption is still likely to be as much as one-third higher in 1965 than it was in 1957, with some qualitative improvement in consumer goods. However, except probably in milk production, the USSR will not succeed in its announced effort to match US per capita consumption of meat and other selected food products in the time periods set. Even if it is able to do so eventually, other areas of consumption, such as consumer durable goods and housing, will continue to lag far behind US levels.

69. The increase in the level of consumption anticipated in this estimate should be adequate to keep the population reasonably well satisfied with the regime's efforts to provide higher living standards. The regime will continue to exploit the propaganda value of rising consumption levels. The dollar value of Soviet total consumption is less than one-third that of US consumption, and on a per capita basis only about one-fourth that of the US. The Soviet consumer occupies only about one-fifth the housing space enjoyed by the US consumer. Khrushchev's much publicized housing program will continue to receive a rising share of investment for the next two years and then may level off at a volume of construction which should

provide an increase of about one-third in per capita living space over the next seven years.

70. The post-Stalin leadership has sought to make the most out of increases in consumption by selectively raising the money incomes of particular groups in the population while holding retail prices relatively stable. Although both rural and urban workers have received increases of approximately 18 percent, in total real income during the period 1953–1957, rural workers gained relative to urban workers during the earlier part of the period and urban workers received the greater share of their increase during the latter part of the period. In industry, wages and salaries have been adjusted with the aim of relating incomes more closely to productivity in different occupations and in different industries. Continuation of this policy during the period of this estimate should bring considerable improvement to the Soviet wage structure.

Foreign Trade

71. Soviet foreign trade policy will continue to subordinate short-run economic gains to the furtherance of national political objectives. Trade will continue to be utilized in an effort to strengthen Satellite ties with the Soviet Union, to provide capital goods for Chinese Communist industrialization, and to promote Soviet relationships with underdeveloped non-Bloc countries. Trade with the industrialized countries of the non-Bloc world will probably grow somewhat, and economic considerations will be the governing factor affecting such trade.

72. The maintenance of the Soviet empire in Eastern Europe and the alliance with Communist China, as well as trade policy toward the underdeveloped areas, will require exports of raw materials and capital equipment which otherwise would be used by the USSR to further its own economic growth, but the burden imposed upon the domestic economy by this policy will not affect significantly the planned rate of Soviet internal economic growth. On the other hand, internal forces affecting domestic growth will provide incentive for an increase of Soviet trade with the West, although such trade will continue to account for only about one-fourth of total Soviet foreign trade. The aggregate impact of Soviet foreign trade upon the domestic economy is slight because exports and imports together amount to only approximately eight billion dollars or less than five percent of Soviet GNP. However, the export of scarce resources or the import of advanced design machinery and equipment for use as prototypes can be of greater significance to the economy than the total value of foreign trade would suggest.

73. Future developments in Soviet-Satellite trade will be influenced by the outcome of recent attempts to increase intra-Bloc

economic integration and specialization but the effect will probably not be large. Although Bloc economic integration is expected to increase, the benefits will be of greater importance to the smaller Satellite economies than to the USSR. The Soviet Union imports machinery from the Satellites, though the contribution to the Soviet economy of machinery imports from the Satellites will continue to be offset by the necessity of exporting scarce Soviet raw materials. The Soviet export surplus in its trade with the European Satellites will be reduced if repayments of credits granted to Satellite countries, scheduled to begin in 1960, are carried out.

III. TRENDS IN SOVIET SCIENCE AND TECHNOLOGY

74. The USSR has for many years placed great emphasis on science and technology with a view to creating a corps of superior personnel and building a scientific establishment adequate to support its aspirations to national power. Soviet scientific effort has been focused preponderantly on the building of a strong industrial base and the development of modern weapons. As a consequence, the USSR's achievements in areas of critical military and industrial significance are comparable to, and in some cases exceed, those of the US. During the past year, the Soviet Union has strikingly demonstrated to the world its maturity in science and technology. Earth satellite launchings, striking progress in weapons development, and fundamental research of military and economic significance attest to a rapidly increasing Soviet capability which presents a growing challenge to the Western World.

75. We believe that the rate of advance of Soviet science is accelerating in consequence of the building over the past three decades of a broad scientific and technical foundation. During this period, the number of graduates of scientific and technical curricula has constantly increased, research facilities have been greatly expanded, and the quality of Soviet scientific training has improved. The size of the Soviet research and development effort, in absolute terms, has been smaller than that of the US. However, the Soviet effort has been far more highly concentrated on fields related to national power, while research in consumer products has been proportionately much less. Soviet expenditures on science and technology are increasing yearly and probably permit full utilization of new personnel and facilities. Consequently, significant Soviet advances in science and technology are likely to occur in the future with greater frequency than in the past.

76. The reorganization of economic administration in 1957 has probably been accompanied by improved planning and coordination of science, especially in the formulation of long-range and nationwide scientific policies. New scientific coordinating bodies have been

established with authority to cut across administrative barriers, and planning is being centralized under the State Planning Committee, which heretofore has had only a passive role in science planning. Scientists are being given more voice in planning and Soviet policies in science and technology are likely to reflect their point of view more fully. Concurrently with the centralization of planning and coordination, operational authority over research is being decentralized and directors of institutes are being given more administrative authority.

77. Applied research will continue to receive great emphasis in the USSR, although the importance of adequate fundamental research is well understood at the planning level. Highest priority will continue to be accorded to military-industrial research and development, but the rapid expansion of Soviet scientific resources will now permit greater flexibility. Greater individual initiative within assigned tasks of research will probably be encouraged, basic research in new fields undertaken, and somewhat more scientific and technical effort allocated to the consumer sector of the economy.

Scientific Manpower, Training and Facilities

78. The number of scientifically and technically trained people in the Soviet Union has increased approximately three-fold in the postwar period. We estimate that as of mid-1958, about 1,625,000 graduates of university level scientific and technical curricula are actually employed in all scientific and technical fields, about 15 percent more than in the US. Although US graduations in scientific and technical fields are expected to increase, the USSR will continue to enjoy a numerical advantage. Based on current trends, by 1963 the USSR will probably have nearly 35 percent more graduates employed in scientific and technical work than the US, as indicated by the accompanying table.⁸ It should be noted that the bulk of Soviet numerical superiority will continue to derive from graduates employed in industrial and agricultural production. The number of Soviet scientists engaged in research and teaching in the physical sciences has remained substantially smaller than in the US, and is perhaps half the US total at present. However, Soviet emphasis on research in military and basic industrial fields probably results in a near numerical equality between the two countries in scientific manpower devoted to these critical activities.

⁸ Such numerical comparisons provide only a rough measure of relative scientific and technical strength, since: (a) the professional categories are not precisely equivalent in the two countries; (b) the figures do not reflect the broader US supply of scientific and technical personnel who hold no degrees; and (c) they give no weight to qualitative differences in training and experience. [Footnote is in the original and repeated in table title that follows.]

COMPARISON OF MAJOR SCIENTIFIC GROUPS, USSR AND US⁸
(in thousands)

Estimated Numbers of Graduates of Higher Educational Institutions
Employed in Scientific and Technical Fields*

	Mid-1958		Mid-1963	
	USSR	US	USSR	US
Engineering	856	500	1,227	630
Agricultural Sciences	228	163	368	183

Total	1,626	1,379	2,266	1,693

Estimated Numbers of Soviet Kandidats and American Ph.D.'s in
Scientific and Technical Fields**

	Mid-1958	
	USSR	US
Engineering	27	6
Agricultural Sciences	8	5
Health Sciences	17	1
Physical Sciences	18	34
Biological Sciences	8	18
Total	78	64

*Estimates of the current total of Soviet scientific personnel are believed to be correct within plus or minus 10 percent. The probable error of certain groups, however, may exceed this amount. [All footnotes in the table are in the original.]

**In the physical sciences, engineering, and the health sciences, the quality of the Kandidat degree is roughly equivalent to or slightly below that of the US Ph.D. In agricultural and biological sciences it is closer to that of a US Master's degree.

79. In the postwar period the quality of Soviet scientific training has been high. Engineering training, while not as broad as that given an engineer in the West, is good within the particular field of specialization. Some deficiencies continue in the practical and experimental aspects of training, particularly in some fields of biology and engineering. Recent changes in higher school curricula, intended to overcome these deficiencies, include requirements for more laboratory and independent experimental work outside the classroom, as well as a plan to allow superior students to follow individual study schedules. The USSR is not as well supplied as the Western industrial nations

with nonprofessional technicians, mechanics, and maintenance men. Shortages of skilled technicians will persist, but the number available should increase significantly as a result of the high proportion of scientific and technical subjects in the lower grades and the current emphasis on specialized training after lower school.

80. Soviet scientific facilities, in terms of financial support, organizational direction, and number and quality of laboratories, are generally adequate for the utilization of scientific talent. In a few fields the USSR has facilities which are comparable, if not superior, to corresponding installations in the West. The continued expansion of these facilities, as well as a Soviet attempt to establish a broader geographic base for research activities, is indicated by the establishment of new scientific centers in Siberia. Announced plans call for completion in 1960 of a new "scientific city" near Novosibirsk, consisting of 13 research institutes and a university now under construction. Another center near Irkutsk, consisting of eight research institutes, is scheduled for completion in 1965. The regime is making a major effort to attract competent scientific personnel to the new centers by creating favorable living conditions, establishing excellent research facilities, and assigning certain eminent scientists to these locations.

81. Some shortages of complex research instruments are believed to exist, particularly in low priority fields, but they probably do not significantly hamper research programs of major importance. For example, although the US has a considerably larger number of high speed electronic computers than the USSR, the number of computer hours actually utilized for high priority research is probably nearly the same since Soviet computers are not called upon to serve routine business and government functions. Although Soviet-produced equipment is often the equal of foreign-produced equipment and occasionally its superior, the USSR will probably continue to import equipment for reasons of expediency. During the next five years the USSR will continue to improve its capabilities in scientific instrumentation. Increasing numbers of highly qualified engineers will probably be made available for the development and production of scientific equipment, and an increasing amount of equipment will reflect original design concepts. However, we believe that the West will continue to lead in the development of scientific equipment except in fields given very high priority by the Soviets.

82. The Satellites have made significant scientific contributions to Soviet technological development in only a few areas, principally in optics, electrical measuring instruments, communications equipment, synthetic fibers and pharmaceuticals. We expect an increase in Soviet use of Satellite resources in some basic theoretical and experimental fields. The Council for Economic Mutual Assistance (CEMA) recently

expanded the scope of its activities to include greater coordination and exchange in research and development activities. CEMA member-nations are assigned major research, development, and production responsibilities for the entire Soviet Bloc in specified fields.

83. The USSR has become progressively less dependent on Western research and development. Nevertheless, the Soviet leaders have adopted a policy of acknowledging foreign achievement and encouraging maximum use of foreign experience. The USSR presently has an outstanding program for collection and dissemination of scientific and technical information. The All-Union Institute of Scientific and Technical Information of the Academy of Sciences publishes and circulates extensive abstracts of foreign journals and, at least in high priority fields, Soviet scientists have access to the full range of scientific research published throughout the world. Evidence of Soviet work on such new methods as machine translation, data searching, and data processing suggests that Soviet information handling facilities probably will improve during this period.

84. The Soviets have evidently profited from espionage in a few key fields. However, on an over-all basis the performance of Soviet science—especially the number of original concepts and discoveries—reinforces our belief that the aggregate contribution of espionage to Soviet scientific progress has been far less important than the USSR's own achievements.

85. The USSR is clearly anxious to take advantage of the possibilities in international scientific exchange. Soviet participation in international scientific meetings and conferences has increased markedly during the last year, primarily in connection with the International Geophysical Year (IGY), but involving other scientific fields as well. The Soviet IGY program has been well-executed and comparable to the US program in scope. For the most part, the Soviets probably will live up to their agreements to exchange IGY information, but are likely to withhold the results of related investigations outside the formal IGY program. They are believed to have withheld considerable data derived from their earth satellites. The USSR probably will continue its active participation in the various international committees and organizations which are planning to extend programs begun under the IGY.

Soviet Capabilities in Major Scientific Fields

86. The USSR's achievements during the last year, including earth satellite launchings, weapons development, and the magnitude of its efforts in the IGY program, provide impressive evidence of the present high level of Soviet scientific capability. Animated by a spirit of intense competition with the US, Soviet scientists have made striking progress over the last year in many areas of fundamental and applied research.

In mathematics, many fields of physics, and a few fields of chemistry, fundamental research appears to be comparable in quality to that performed in leading nations of the West. In some fields, Soviet scientists are among the best in the world; their potential for wholly new discoveries must be considered equal to that of Western scientists.

87. *Space program.*⁹ The establishment of the Interagency Commission for Interplanetary Communications, announced by the USSR in April 1955, indicated the existence of a program with manned interplanetary travel as its stated ultimate objective. The program is supported by extensive Soviet research efforts in a number of related fields, including rocket propulsion, electronics, meteorology, space medicine, astrobiology, astrophysics, and geophysics. Activities to the present appear to be directed toward the collection of scientific data and experience to provide the basis for future space programs, and to advance basic knowledge in the above fields. Since some satellite vehicles have probably employed basic ICBM hardware and some future space vehicles may also utilize ICBM components, the two programs are to some extent complementary.

88. Soviet successes with ballistic missiles and earth satellites point to a considerable capability for early accomplishments in space. We believe that the USSR is presently capable of orbiting earth satellites weighing on the order of 5,000 pounds, of launching lunar probes and satellites and of launching planetary probes to Mars and Venus. Its space program could also include: surveillance satellites and recoverable aeromedical satellites (1958–1959); “soft landings” by lunar rockets and recoverable manned earth satellites (1959–1960); a manned glide-type high altitude research vehicle (1960–1961); earth satellites weighing as much as 25,000 pounds and manned circumlunar flights (1961–1962). While each individual achievement appears feasible as to technical capability and earliest date attainable, we doubt that the USSR could accomplish all of these space flight activities within the time periods specified.

89. Communist China has announced its intention to launch an earth satellite, and there are indications that Chinese personnel are studying rocket technology with Soviet assistance. The Chinese would value highly the political and propaganda gains resulting from a launching, and we believe that an attempt in China is a possibility within the next year or so. Using Soviet equipment, and with Soviet direction throughout the project, the Chinese Communists could probably perform a successful earth satellite launching in about one or two

⁹ For a more detailed discussion of the Soviet space program, see NIE 11–5–58, “Soviet Capabilities in Guided Missiles and Space Vehicles,” 19 August 1958 (TOP SECRET). [Footnote is in the original.]

years after initiation of the project. The USSR itself probably has the capability, with about six months' preparation, to place an earth satellite in orbit from Chinese territory. There is as yet, however, no firm evidence of the initiation of any projects to launch earth satellites from the territory of Communist China.

90. *Nonmilitary applications of atomic energy.* There is evidence of a further reduction in the ambitious Soviet nuclear power program announced in February 1956 as part of the Sixth Five-Year Plan. At that time, the USSR set a mid-1960 goal of 2,000–2,500 megawatts of nuclear-electric generating capacity. However, a Soviet reply to a UN questionnaire in March 1957 described a program which could produce a total capacity of about 1,400 megawatts by that date. Recent statements by Soviet officials indicate a planned capacity of about 700 megawatts in mid-1960. We estimate that an additional 200 megawatts or more could be obtained from dual-purpose reactors installed at plutonium production sites, giving the USSR a total of at least 900 megawatts by mid-1960 if the latest plans materialize. Continued references to the 2,000–2,500 megawatt goal by leading Soviet authorities indicate that the progressive decrease in nuclear generating capacity planned for 1960 reflects a slippage in Soviet plans rather than a reduction in the Soviet nuclear power program. The USSR is conducting extensive research on controlled thermonuclear reactions.

91. Soviet employment of radioactive isotopes and radiological techniques in medical, chemical, metallurgical, biological, and agricultural research lags behind that of the US by up to five years. While the USSR has been actively employing these means in research investigations, little originality has been displayed and only recently has the quality of this type of research shown improvement.

92. Despite this lag, the USSR has initiated a sizable technical assistance program in nuclear energy within the Bloc and has offered aid in this field to a number of non-Bloc countries. To encourage collaboration among nuclear scientists within the Bloc, the USSR established in 1956 a Joint Nuclear Research Institute near Moscow. Although the USSR is a member of International Atomic Energy Agency, its attitude toward the agency has been passive. Future Soviet activities outside of the Sino-Soviet Bloc probably will continue to be largely limited to unilateral offers of aid to non-Bloc nations. However, visits by Soviet scientists to Western nations and Soviet participation in international conferences may be increased.

93. *Physics and mathematics.* Some Soviet scientists in the various fields of physics and mathematics are the equals of those in the leading nations of the West. Greatest capabilities are exhibited in theoretical mathematics and physics, high-energy nuclear physics, low temperature physics, solid state physics, and acoustics. Research during this

period will probably stress a number of studies related to the Soviet missile and space programs, and will also include theoretical antigravity investigations, work in plasma physics, and elaboration of present theories of ion, photon, and free radical propulsion. Of great aid to research in physics and mathematics is the considerable Soviet capability in the design, development and application of computers with larger memory capacity and increased operation speeds, as well as small computers suitable for mass production and usable in small computation centers.

94. *Geophysics.* Soviet performance in the geophysical sciences is believed to be generally equal to that of the US, and superior in some fields, particularly polar geophysics. The large and comprehensive Soviet IGY program is expected to have a considerable effect on the development of geophysics in the USSR. The orbiting of earth satellites carrying heavy payloads of complex instrumentation probably has already given the USSR a lead in these methods of upper atmosphere and space research. The USSR probably will make advances comparable to those of the US in meteorology and oceanography. It will probably continue to be among the world leaders in seismology, gravimetry, geomagnetism and geoelectricity, and will add to its already considerable achievement in permafrost research and geochemical prospecting.

95. *Chemistry and metallurgy.* The USSR lags behind the US in the magnitude and level of research effort in most fields of chemistry and metallurgy; however, Soviet research in certain areas continues to be of high caliber. A major strength will continue to be in the theoretical aspects of some fields of chemistry. There will probably be a major expansion of all chemical research, with particular emphasis on fields where the West now leads, such as in petrochemicals, new plastic materials, and synthetic fibers. In metallurgy, research will be especially pushed in the high temperature field and in those areas of metallurgy related to solid state physics, particularly in semiconductors and thermoelectric power generation.

96. *Medical sciences.* With some exceptions, Soviet medical research is still behind that of the US. Soviet research assets, however, are expanding rapidly and will continue to be concentrated in areas of high economic and military priority. The Soviets are conducting an advanced program in space medicine and astrobiology. The availability of rocket vehicles and effective propulsion systems has enabled the Soviets to use animals to test life-sustaining systems in space and under space equivalent conditions to a greater degree than has been possible in the US. We believe that they lead the US in rocket flight physiology, studies of possible forms of life on other planets, and in the techniques and equipment for recovery of test subjects from extreme altitudes. However, there are no indications that they have conducted prolonged

space equivalent work similar to the US manned balloon experiments. The USSR will expand its intensive research program in the control of human behavior, especially in conditioning techniques. In addition, the Soviets will probably maintain their lead in research on the effects of radiation on the nervous system. It is possible that they will attain the lead in the study of the effects of cosmic radiation on organisms.

97. *Biological and agricultural sciences.* There has been a notable improvement in the quality of Soviet research in certain areas of the biological and agricultural sciences. Except in a few specific fields, however, the USSR still lags behind most Western countries in these sciences. Although Lysenko retains some limited political support, ideological theories are probably no longer permitted to interfere with sound research in biology and agriculture, and Soviet genetics research should improve markedly. We believe that agricultural research and development will receive increasing support, which should assist the Soviet effort to increase food supplies.

98. *Industrial technology.* For the immediate future, we estimate that the general level of Soviet industrial technology will remain below that of the US. However, the most modern Soviet plants are already on a par with those in the US, and the average level of heavy industrial technology will probably improve. Striking progress has been made over the last few years in the theory and practice of automation. Additional semiautomatic and possibly fully automatic production lines will be established during the period of this estimate. There will probably be increased emphasis on engineering process research and on shortening the lead times necessary to bring developed items into production. However, research and technology in consumer goods fields will continue to lag far behind that of the US.

IV. DEVELOPMENTS AFFECTING THE SOVIET MILITARY POSTURE

SOVIET MILITARY THINKING AND POLICY

Major Objectives of Military Policy

99. Soviet military thinking and policy since the end of World War II, and particularly since the death of Stalin, have been strongly influenced by a growing appreciation of the devastation inherent in nuclear war and of the threat to the USSR's objectives and security posed by Western nuclear capabilities. The Soviet leaders have made strong efforts to build a substantial offensive nuclear capability of their own and to improve their air defenses; indeed, to build up a broad range of offensive and defensive capabilities, both nuclear and nonnuclear. At the same time, Soviet political activity has aimed at reducing the

military and political usefulness of US nuclear capabilities by attempting to make US overseas bases untenable and to increase the inhibitions attached to any use of nuclear weapons.

100. We believe that despite these efforts the Soviet leaders appreciate that if they launched a general war at present, even with surprise nuclear attacks, the USSR would suffer unacceptable damage from US nuclear retaliation. On the other hand, they are probably confident that their own nuclear capabilities, even though not as great as those of the US, have grown to the point where they constitute a powerful military deterrent to the US. It is therefore probable that in the Soviet view both sides are now militarily deterred from deliberately initiating an all-out nuclear war or from reacting to any crisis in a manner which would gravely risk such a war, unless vital national interests at home or abroad were considered to be in jeopardy.

101. The Soviets probably see this situation as a great improvement over the relation of forces which existed some years ago. Nevertheless, we believe that the Soviet leaders will continue to seek ways to achieve, if possible, a clear military superiority over the US. To this end they will continue their intensive weapons research and development, particularly in such fields as long-range missiles, aircraft and missile-launching submarines capable of attacking the continental US, air defense weapons and associated equipment. But despite further improvement in Soviet capabilities over the next five years, we believe that the USSR will still not become confident that it can attack the US without receiving unacceptable damage in return. This judgment assumes the maintenance and improvement of US armed strength and the absence of an unforeseen Soviet technological breakthrough of major military significance.

102. While strengthening their capability for waging general war, the Soviets will endeavor to maintain forces which they consider adequate to insure military superiority in situations short of general war. To the extent that Western inhibitions against vigorous reaction in local situations are increased by the USSR's growing capability for general war, superiority in forces for local conflict will enable the Soviets to exert greater political pressure in local situations, and even give them greater freedom to use force in such situations. In sum, the Soviet leaders will view large deterrent and other military capabilities as an essential support to their foreign policy and to the USSR's status as a leading world power.

Soviet Attitudes Toward Limited and General War

103. As indicated elsewhere (Chapter VI, paragraphs 224–227) we believe that the Soviet leaders do not at present intend to pursue their objectives by employing their own forces in warfare, limited or general.

But they will also recognize that, particularly in consequence of the policies they are pursuing to compel a retraction of Western power by political means, situations might arise in which the use of force on a local scale would seem essential to one side or the other. In such situations the Soviets would prefer to provide logistic and other support for local operations in which only non-Soviet forces participated directly. Their objectives in such operations would be limited, and they would seek to avoid direct Soviet involvement, to limit the geographic area of engagement, and to prevent the use of nuclear weapons by either side.

104. Soviet planners probably consider, however, that such limitations might be impossible in some instances, and that encounters between their own and Western forces might result. They would prefer to minimize the amount of force employed in such situations, in order to limit the scale of conflict and the degree of their own involvement as much as possible. For example, they would almost certainly wish to avoid the use of nuclear weapons. In deciding whether to employ their own forces in any particular local situation the Soviets would have to balance the risk of provoking a train of counteractions, possibly leading to general war, against the stakes involved in the area of local conflict. They probably believe that the West's military posture and doctrine rest increasingly upon the use of nuclear weapons, even in limited wars. But they probably also view their own nuclear deterrent capabilities as already having raised the threshold at which the West would react in such a manner.

105. It is impossible to forecast how the Soviets would behave in all the situations of local conflict which might arise. Despite the confidence they evidently now have in the power of their own deterrent, we believe that they would handle such situations with the greatest caution. They would realize that the dangers of miscalculation would mount as each side increased the scale of its involvement. Therefore we believe that the Soviets would seek to prevent any crisis from developing in such a way as to leave themselves only a choice between accepting a serious reverse and taking action which would substantially increase the likelihood of general war. The Soviet leaders would almost certainly not decide to precipitate general war unless they concluded that conceding a position to the West would sooner or later threaten the survival of their regime.

106. We believe that the Soviets recognize that very great advantages would accrue to the side striking the first blow in an all-out nuclear war, and that therefore, in the event that they decided on general war, they would themselves initiate it by strategic nuclear attacks. The primary objective of such attacks would be to destroy or neutralize Western nuclear retaliatory capabilities—or at any rate to achieve the maximum possible reduction in the weight of Western retaliation that

would have to be met by Soviet air defenses. To an extent consistent with this first priority, other key US war-making capabilities would probably also be attacked.

107. The outbreak of general war would probably find the USSR at a state of military readiness beyond that of ordinary peacetime, but short of what Soviet planners might believe best for the most rapid exertion of their total military effort. During any local war or crisis which they viewed as likely to become increasingly serious, Soviet planners would almost certainly prepare against the possibility of a general conflict. However, they would not want to push preparations so far as to convince the US that general war was imminent, lest this lead the US to strike the first all-out nuclear blow. The probability of increased Western readiness during a crisis, together with the normally widespread deployment of Western nuclear striking forces in the US and overseas, would make it doubtful that the Soviets could count on achieving surprise against all of these forces, but they would almost certainly attempt to do so.

108. Soviet recognition of the importance of surprise in modern military operations has been reflected in articles and statements over the last few years, but it is evident that Soviet military theoreticians do not regard surprise as the decisive factor in the outcome of a major war between great powers. In fact, they hold that in such a war the strategic attack capabilities of both sides might expend themselves and leave eventual victory to the side with the greatest residual strength, capacity for recovery, and ability to occupy territory. They visualize an important role for their ground, tactical air, and naval forces in a general war, which in their view would probably become a protracted war of attrition.¹⁰

109. In the event of general war, Soviet ground, tactical air, and naval forces would probably be launched in major campaigns against Europe, the Middle East, and the Far East, in order to defeat those Western forces within reach and to seize military objectives in those areas as well as their industrial and economic resources. The USSR would probably plan to commit its ready forces to an offensive against NATO, especially through Western Germany, as soon as possible consistent with its attempt to achieve surprise for its initial assaults against the US, overseas US and allied nuclear bases, and naval striking forces. Campaigns in other areas would be of lesser priority, but we believe

¹⁰ The Assistant Chief of Staff, Intelligence, USAF, believes that as written this paragraph does not correctly reflect the Soviet judgment of the role of surprise in a general war. He believes it is evident that Soviet military theoreticians consider surprise probably would be the decisive factor in the outcome of a war between great powers. [Footnote is in the original.]

that in a general war situation they would probably be initiated with little delay.

110. In addition to participation in initial strategic attacks and support of other major Soviet campaigns, the major offensive effort of the Soviet Navy in general war would be the worldwide interdiction of Western sea communications and reinforcement, intended to isolate overseas theaters from the US. The major defensive effort of Soviet naval forces would be to prevent Western carrier strikes and submarine-launched missile attacks against Bloc targets.

Policy on Size and Types of Forces

111. In assessing the size and types of military forces which would best fulfill their major objectives, the Soviets will almost certainly continue to believe that they must keep a large and diversified military establishment, designed to meet various contingencies, up to and including general war. While they will work to acquire additional capabilities with advanced weapon systems, they will at all times maintain substantial forces-in-being. Nevertheless, there will be increasing competition among military requirements of different types, and between military requirements and the demands of highly important nonmilitary programs, resulting in part from the cost and complexity of new weapons and equipment. In deciding whether to produce complex new weapon systems in quantity, the USSR will probably apply increasingly severe tests as to whether these would add greatly to current capabilities or tend significantly to alter the world balance of forces, and as to whether costs were justified by likely periods of use before obsolescence. There may therefore be a growing tendency in some fields to make do with existing equipment until significantly advanced weapons can be acquired.

112. We also believe that for several years the Soviet leaders have been interested in finding ways to reduce the number of men under arms. The reasons for doing this will continue to apply, and in the future may become more compelling. An important factor will be the pressure imposed by a shortage of manpower for the rapidly growing Soviet economy (see Chapter II, paragraph 64). Other reasons include the desire for economies in order to ease the burden of increasing costs of new equipment, and the propaganda value of force reductions. The importance of the last of these factors has been evident in the USSR's well-publicized announcements of military personnel cuts over the last three years. Reductions amounting to over 1.8 million men in the 1955-1957 period have been claimed, and in January 1958 a further planned reduction of 300,000 men was announced, bringing the total to more than 2.1 millions.

113. On the basis of Soviet conscription trends, published labor statistics, and other indirect data, we believe that there has in fact been a substantial reduction in the number of men in service since the peak reached during the Korean War. A considerable portion of this reduction apparently occurred prior to the first Soviet announcement of cuts in 1955. Reductions are known to have been made in nonessential supporting and administrative elements. It is probable that other reductions were accomplished by cutting down the strength of certain units and by the transfer of labor troops from military to nonmilitary status. On the other hand, we have acquired no evidence of the deactivation of any major units and we are fairly certain that most of the units withdrawn from satellite areas in recent years were merely moved to locations within the USSR.

114. The evidence suggests that in their announcements the Soviets took propaganda advantage of fairly substantial reductions made after the Korean War, and that additional reductions were in fact begun but were delayed or cancelled entirely. The apparent failure to carry out the announced cuts may have been due in part to increased tension in the satellites, and in the world situation generally, beginning in the fall of 1956. It may also have resulted in part from Soviet discovery that reductions in some elements were to a large extent offset by the increased need for technically-qualified personnel to serve new and more complex equipment.

115. On the basis of available order-of-battle information, we estimate present Soviet military manpower strength at somewhat more than 4 million men, of whom about 2,650,000 are in ground force units, about 835,000 are in the air forces (including about 110,000 naval aviation personnel), about 765,000 are in naval units, and about 75,000 are in air defense control and warning. In addition, we carry about 400,000 men in border guard and internal security forces.¹¹ While there has been no reliable evidence of reductions over the last year, we do not exclude the possibility that the Soviet leaders believe that some additional cuts can be made without danger to Soviet security. But we think it unlikely that in the present state of the Bloc's relations with the West further reductions of substantial size would be made.

116. *Military policy toward other bloc nations.* The Soviet leaders view the East European area as vital to the military posture of the USSR, both as an extension of the defense perimeter of the homeland and as a base for offensive power; Communist China and North Korea similarly

¹¹ For more detailed estimates of the personnel strength of Soviet and other Bloc forces, see Annex, Tables 1 and 2; it should be understood that these figures are only approximate and that there is considerable uncertainty inherent in this type of estimate. [Footnote is in the original.]

strengthen the strategic position of the USSR. The Soviets will therefore continue to provide substantial military aid to the Satellite and Chinese Communist military establishments, including weapons, equipment, and training assistance. They will continue their efforts under the Warsaw Pact to develop and maintain reliable and effective forces in the East European Satellites, but they probably do not contemplate any significant expansion of these forces. It is unlikely that Soviet planners would count on East European forces in general to make an important contribution to Soviet military operations, except perhaps in air defense and in maintaining security for lines of communication.

117. The Soviets probably regard the increasing military capabilities of Communist China with mixed feelings. While Chinese military strength is a valuable addition to the power of the Communist Bloc, as this strength grows it will also give China increasing weight within the Bloc. It will be many years before the Chinese have a large and modern arms industry of their own, a development the Soviets might view with misgivings in any case, and in the interim the Chinese will press for Soviet aid to effect a costly modernization of their forces. We believe that the Soviets will probably try to restrain the pace of Chinese military development in order to prevent the Chinese from achieving too large a degree of military independence. But they will probably also feel that they have no choice but to support such development. It is probable therefore that they will continue to assist the Chinese in developing and producing certain types of modern equipment. They will also probably begin to supply such Soviet-made weapons as jet medium bombers, advanced fighters and guided missiles for air defense, and possibly short-range missiles for offensive use as well. The USSR would probably retain control over any nuclear weapons based in the territory of Communist China or other Bloc nations.

SPECIAL WEAPON DEVELOPMENTS

Nuclear Weapons

118. The USSR is known to have conducted more than 70 nuclear tests since August 1949 in its program to develop a variety of nuclear weapons. Two test series were conducted during 1958. In the first series, 13 tests were conducted at two widely separated proving grounds during the three months preceding the USSR's announcement of a unilateral test suspension on 31 March 1958. The Soviets resumed testing in a second series which began in September 1958. Explosions in the latest series have included two of about seven megatons, about twice the yield of the largest Soviet explosion detected previously. The latest two tests were of low yield and were conducted in the general vicinity of Kapustin Yar. From the present technical evaluation of the 1958 tests, it appears that the Soviets made further advances in the development

of high yield weapons suitable for use in bombs or missile warheads. They also apparently sought to improve low yield weapons from the standpoint of size and economy of fissionable materials, probably in order to meet air defense as well as other requirements.

119. We estimate that at present the Soviet stockpile could include nuclear weapons in a range of yields from about 2 KT to about 8 MT; we do not exclude the possibility that untested bombs with yields of as much as 20 MT could be in stockpile on an emergency or provisional basis.¹² We have insufficient evidence to support a firm estimate of the numbers and types of nuclear weapons in the Soviet stockpile. There is, however, considerable evidence from the Soviet nuclear test program and from other intelligence sources, providing indications as to what types of weapons the USSR may be stockpiling and on what delivery systems it contemplates. Based on an analysis of various factors involved, we believe that:

(a) nuclear weapons, including high-yield weapons suitable for bomber delivery, are now widely deployed to Long Range Aviation units, and the Soviets will seek to provide such weapons for all bombers of this component which are designated for weapons delivery;

(b) nuclear warheads are being and will be produced in numbers sufficient to equip substantially all operational submarine-launched missiles; and ground-launched ballistic missiles of 700 n.m. range and greater;

(c) Soviet doctrine contemplates the tactical use of nuclear weapons by ground, tactical air, and naval forces, and some such weapons are probably now available for this purpose;

(d) the Soviets' emphasis on air defense will lead them to provide nuclear warheads for some proportion of their surface-to-air and air-to-air missiles, but a sizable allocation for such purposes has probably not yet been made.

120. Considering the estimated availability of fissionable materials and the level of Soviet nuclear weapons technology, we believe that at present the USSR probably possesses sufficient nuclear weapons to support a major attack by its long-range striking forces, but that current stockpiles are probably insufficient for large-scale allocation to air defense and tactical use. We estimate a substantial and high priority Soviet program for the expansion of fissionable material production through the period of this estimate, and we believe that the USSR is capable of considerable further improvement in nuclear

¹² For a detailed estimate of the present and future Soviet nuclear weapons development potential, see NIE 11-2-58, "The Soviet Atomic Energy Program," 14 January 1958 (Limited Distribution). See also the forthcoming NIE 11-2-59. [Footnote is in the original.]

weapons technology. Thus, by the end of the period the current limitation on the allocation of nuclear materials to air defense and tactical operations will have eased, although even then and for a longer period, limitations imposed by the availability of fissionable materials will still be felt.¹³

121. Prior to its suspension of testing in March 1958, the USSR had probably developed types of nuclear weapons which could meet most of its major requirements for such weapons. However, strong technical motivations have continued to exist for further testing, for example in the categories of lighter-weight, more efficient warheads for air defense and other purposes, higher yield warheads, and antimissile defense techniques. The USSR's reasons for conducting nuclear tests in the fall of 1958 probably included the desire to fulfill technical requirements and, to a lesser extent, the desire to create a situation in which there would be increased world pressure for a ban on further testing. Considering the achievements of the Soviet nuclear test program to date and the broader advantages the USSR may feel it can achieve by negotiating a multilateral test cessation, we believe that technical requirements alone would not prevent the USSR from joining in a test ban. We also believe that if an agreed ban with a suitable control system were negotiated, the Soviets would be unlikely to attempt to carry out a concealed test or abrogate the agreement, at least for some time, but would incorporate into their weapons program such refinements as could be achieved without new test explosions.

122. Although we do not know the Soviet estimate of minimum stockpile requirements for fissionable materials, we doubt that such requirements have been met and we know that production facilities are expanding. Therefore, while the USSR might enter negotiations on cessation of weapons material production, we believe it would neither unilaterally cease such production nor agree to mutual cessation in the near future.

Guided Missiles

123. The USSR continues to press ahead with an extensive research and development program embracing all major categories of guided missiles. Soviet achievements in surface-to-surface ballistic missiles have been especially impressive, and substantial success has also been

¹³For estimates of present and future cumulative availability of fissionable material in the USSR, see NIE 11-2-58. For theoretical ranges of mixed nuclear weapon stockpiles, as well as illustrative stockpiles showing reasonable maximum and minimum limits for certain categories of weapons, see the Supplement to NIE 11-2-58, "Possible Soviet Allocations of Fissionable Material to Weapons Stockpiles," 1958-1962, 30 September 1958 (Limited Distribution). [Footnote is in the original.]

achieved in developing surface-to-air missiles. While available evidence is not sufficient to indicate comparable emphasis and success in other Soviet missile programs, we believe the USSR now has a variety of missile systems available for operational use. It is capable of developing advanced systems in all categories during the period of this estimate, and the experience it has already acquired in missile production, troop training, logistics, and deployment procedures will facilitate the expansion of its operational capabilities.¹⁴

124. On the basis of considerable evidence concerning the research and development program, we believe that for several years the USSR has had available for operational use surface-to-surface ballistic missiles with maximum ranges of about 100 n.m., 200 n.m., 350 n.m., and 700 n.m. It has also been developing and probably now has available for operational use a ballistic missile of 1,100 n.m. maximum range. In addition, a very short range antitank missile is probably now operational.

125. *Intercontinental ballistic missile.* Since the completion of NIE 11–5–58, we have conducted an intensive re-examination of the Soviet ICBM test firing program and its implications. On the basis of sufficient intelligence coverage to establish with a high degree of confidence the number of Soviet ICBM test firings, it is clear that over the past year this number has not been as great as we had anticipated. Nevertheless, considering the Soviets' progress in the whole field of missiles and the capabilities demonstrated in their ICBM, earth satellite, and other ballistic missile launchings, we continue to estimate that the USSR will probably achieve a first operational capability with 10 prototype ICBMs at some time during the year 1959. While it is possible that a limited capability with comparatively unproven ICBMs might have been established in 1958, we believe this to be unlikely.¹⁵

126. When it first becomes operational, the Soviet ICBM system will probably be capable of delivering a nuclear payload to a maximum range of about 5,500 n.m., with an accuracy (CEP) of about 5 n.m.

¹⁴ For an extended discussion of the USSR's guided missile development program, and of factors likely to affect its acquisition of substantial operational capabilities, see NIE 11–5–58, "Soviet Capabilities in Guided Missiles and Space Vehicles," 19 August 1958 (TOP SECRET). [Footnote is in the original.]

¹⁵ NOTE: Some statements by high Soviet officials during the past year have indicated that the USSR already possessed, or at least wished us to think it possessed, a considerable operational ICBM capability. Such a capability cannot be ruled out as impossible if the Soviets have had a test philosophy involving fewer long-range tests and more reliance upon component tests at Kapustin Yar than we think likely. Such a philosophy would run greater risks of failure and provide less assurance of accuracy and reliability but also (if all went well) much more rapid achievement of operational capability. The Soviets may have believed the political and psychological value of ICBMs is so great as to justify extreme measures to attain a substantial and early deployment. [Footnote is in the original.]

and a reliability of about 50 percent after launching. (Some additional percentage of missiles, which we are unable to estimate, would prove unserviceable before launching.) We estimate that the Soviet ICBM is designed to carry a nuclear payload of about 2,000 pounds, although there is a possibility that it is designed to carry about 5,000 pounds. Reliability will probably be considerably improved by the early 1960's. At the beginning of the period 1962–1966, the CEP could be about 3 n.m. with radio command/inertial guidance, and could be reduced to about 2 n.m. later in that period. In 1960–1963, an all-inertial system with a CEP of 3–5 n.m. will probably be available.

127. For air defense, the USSR now has available two different types of surface-to-air missiles, one of which is employed in the fixed missile complex around Moscow and the other of which is probably suitable for employment with the Moscow system or with a semi mobile system. These missiles have greatest effectiveness against aircraft at altitudes of 30,000 to 60,000 feet; they are relatively short range (15–30 n.m.) and almost certainly neither is effective at very low altitudes (below about 1,500 feet). During 1959–1961, surface-to-air systems with increased range and improved high and low altitude capabilities will probably become operational for defense of fixed targets, field forces, and naval vessels. Short-range air-to-air missiles (up to 6 n.m.) suitable for employment with currently operational Soviet fighter aircraft types are probably also available, and a longer-range missile (15–20 n.m.) will probably be developed by 1960. In 1963–1966 the USSR will probably achieve a first operational capability with a surface-to-air system of limited effectiveness against ICBMs and possibly against IRBMs.

128. For employment by submarines, the USSR probably now has available a subsonic cruise-type missile system capable of delivering nuclear warheads against land targets within about 200 n.m. of the launching submarine. These missiles could be launched by a submarine only after surfacing. In 1961–1963 the USSR will probably have available for first operational use a submarine-launched ballistic missile system capable of delivering nuclear warheads from a submerged submarine to a range of about 1,000 n.m. It is also possible that the USSR will develop a 1,000 n.m. cruise-type system for first operational use in 1960.

129. A Soviet air-to-surface missile system is now capable of carrying nuclear warheads at subsonic speed to a range of about 55 n.m. against ships and other targets clearly definable on radar. The USSR will probably have operational in 1960–1961 a supersonic air-to-surface missile with a range of at least 100 n.m., suitable for employment against a wide variety of targets.

Chemical and Biological Warfare

130. Current Soviet tactical doctrine recognizes the potentialities of CW and BW as useful complements to other weapons. Soviet military forces receive thorough training in the offensive use of CW as well as in defense against it. A stockpile of CW agents is believed to be maintained at the World War II level and may have been increased. It probably consists of the nerve agents, principally Tabun (GA) and in lesser quantity Sarin (GB), as well as standard agents such as mustard. A nerve agent of the "V" type, far more persistent and toxic than the "G" agents, may have been in production in the USSR since 1956. Research is probably also under way in the field of nonlethal, incapacitating agents.

131. The Soviets possess standard munitions, for the dissemination of toxic agents by artillery shells, and it is probable that a supply of such munitions is normally carried by artillery units. CW agent dispersion by bombs and aircraft spray is also contemplated. Improved aerosol-producing devices necessary to the effective employment of "V" agents are believed to be under development. It is also possible that CW warheads have been developed for certain types of guided missiles.

132. The existence of an active Soviet BW research and development program has been confirmed, through identification of a research center and field test site as well as through extensive Soviet literature applicable to this subject. While most known Soviet research is also applicable to public health problems, we believe the Soviet program includes research on antipersonnel, antilivestock, and possibly anti-crop agents. There is no evidence of the existence of a mass-production facility for BW agents, but existing plants for the production of biologicals, together with other laboratories, could easily produce BW agents in quantities sufficient for clandestine employment and probably for larger-scale use.

133. In the field of defense against BW and CW, present Soviet capabilities are at least comparable to those of the major Western nations, and in the case of CW are probably superior. Soviet troops are well-equipped with satisfactory CW defense items, many of which are also suitable for use in defense against BW. The current issue gas mask affords adequate protection against inhalation of known toxic agents, and articles of protective clothing issued to all troops afford protection against toxic agent spray and area contamination. Extensive programs continue to indoctrinate the civilian populace as well as military personnel in defensive techniques.

Electromagnetic Warfare

134. We believe that at present the USSR has an appreciable capability for jamming Western radars at frequencies up to 10,000 mc/s and

possibly higher, and especially for jamming at lower frequencies normally used in Western long-range radio communications. The Soviets are now producing magnetrons and traveling wave tubes suitable for jamming in the microwave frequencies, and research in this field is continuing. They are also currently employing passive detection equipment believed capable of detecting signals from the very low frequencies up into the microwave spectrum. By 1963, the USSR will have in operational use equipment capable of jamming at frequencies from 10 kc/s through 36,000 mc/s, including all frequencies likely to be employed by Western communications, radar, and navigation equipment.

135. In recent months a trend toward greater frequency diversification in Soviet radar and radio equipment has appeared, in contrast to the earlier concentration of frequencies in a few narrow bands. The USSR is capable of further increasing the spread of frequencies employed and of developing improved antijamming techniques, but through 1963 Soviet electronic systems will probably still be subject to disruption by properly employed techniques.

STRENGTHS AND CAPABILITIES OF SOVIET FORCES

136. *High command.* Top control over all administrative and operational activity in the Soviet military establishment is vested in a single authority, the Minister of Defense. Directly under the Minister of Defense is a single general staff, organized along functional lines into operations, intelligence, communications, military transportation, organization and mobilization, historical, and topographical sections. The major administrative elements of the Soviet armed forces include the chief directorates of ground, air, air defense, and naval forces, each headed by a commander-in-chief who reports directly to the Minister of Defense. Operational control flows in a direct chain of command from the Minister of Defense to the commanders of the major operational elements: military districts, groups of forces, naval fleets, air defense forces, Long Range Aviation, and possibly airborne forces.

137. Despite extreme centralization of responsibility, the Soviet command system retains sufficient flexibility to effect integrated employment of all types of forces in either large- or small-scale operations. Constant attention to new requirements will bring about significant changes in armament and some realignment among components, but we anticipate no radical alteration of the Soviet high command structure in the near future. In the following paragraphs, the different types of Soviet forces are discussed in terms of their capabilities to perform those military missions which we believe would be assigned by the Soviet high command, i.e., long-range attack, air defense, major land campaigns, and naval warfare.

Long-Range Striking Forces

138. Since the end of World War II the USSR has devoted a major effort to the development of nuclear striking forces capable of attacking distant military, industrial, and other targets, not only in and near Eurasia but in North America as well. This effort has been dictated by the fact that the US, itself possessed of long-range striking forces, lay beyond the range of traditional Soviet military power. The principal component of Soviet military strength presently capable of long-range nuclear attack is Long Range Aviation, equipped with medium and heavy bombers. The medium bombers of Naval and Tactical Aviation, as well as the light bombers of these components, contribute to the Soviet capability for attack on targets in Eurasia and its periphery. Ground-launched and submarine-launched guided missiles probably now supplement the bomber capability.

139. *Long-range bombers.* We estimate the strength of Soviet Long Range Aviation, as of 1 October 1958, at approximately 1,450 bombers, including about 400 obsolete BULL piston medium bombers, about 950 BADGER jet medium bombers, and about 100 to 125 BISON jet and BEAR turboprop heavy bombers. At least one-fourth of the BISON and BADGER regiments in this force have some aircraft of these types which are convertible tanker-bombers. Medium bombers have also been supplied to other components—there are now about 250 BADGERS and a few BULLs in Naval Aviation units and about 100 BADGERS in Tactical Aviation units.

140. The capabilities of Long Range Aviation have been markedly increased in the last five years, through the introduction of large numbers of modern aircraft, more realistic and larger-scale training exercises, improvement of potential staging bases in the Arctic, development of inflight refueling, and improvement of electronic equipment for ECM, bombing, navigation and other purposes. Nuclear weapons storage sites have been identified at many Long Range Aviation home bases, and we believe that nuclear bombs are now the primary weapons of this force. A few BADGER units of both Long Range and Naval Aviation are probably now trained and equipped to employ air-to-surface missiles suitable for use against ships and other well-defined targets.

141. Despite these improvements Soviet Long Range Aviation still consists primarily of medium bombers, best suited for operations against targets in Eurasia and its periphery, and capable of attacking the continental US only through extensive use of one-way missions. The history of the Soviet heavy bomber program leads us to believe that despite the efforts devoted to developing the BISON and BEAR, Soviet planners probably decided within the last year or two to forego a rapid build-up with present heavy bomber models. This decision may have

been reached as a result of one or more of the following factors: dissatisfaction with the performance of BISON and BEAR; progress in developing new or improved bombers; confidence in Soviet ability to acquire an ICBM capability at an early date. Contributing to the decision may have been a Soviet belief that the USSR's medium bomber force, together with a small heavy bomber capability, is at least temporarily acceptable as a deterrent force, and for use against the US should general war occur.

142. The Soviets will almost certainly continue to strive for technological superiority over the US in intercontinental weapon systems. Presumably they set great store by the ICBM as posing an entirely new type of threat. But Soviet military planners almost certainly feel that even though they have good prospects of acquiring a substantial long-range striking capability with missiles, manned bombers will still be required. Manned bombers, especially advanced types, will provide the Soviets with flexibility and diversification of attack capabilities, and will remain particularly applicable for attacks on small, hardened targets, damage assessment, and reconnaissance. We therefore believe that the USSR will retain a large force of long-range bombers throughout the period of this estimate, although its size will probably decline gradually. Its inflight refueling techniques will probably be improved and extended to a larger part of the force; however, there is no present evidence of the development of an aircraft specifically for use as a tanker. Improved electronic and other supporting equipment will probably be provided. Air-to-surface missile launching capabilities will probably be augmented as more effective missiles are developed.

143. Future projections of the strength and composition of Soviet Long Range Aviation are complicated by the fact that at present the entire Soviet medium and heavy bomber industry is in a state of transition, involving considerably less current production than a year or two ago. Production at BADGER plants now appears to be tapering off, although it will probably be sufficient to provide moderate further increases in the jet medium bomber force. The one identified BISON plant, at Moscow, has continued to produce aircraft of this type at a low and uneven rate, while its design bureau has been working to develop a new type of large bomber. A total of about a dozen BISONs have been completed since April 1958, bringing cumulative production to about 100 aircraft. While considerably less evidence is available on BEAR production, we believe it unlikely that any new BEAR bombers have been produced for well over a year, or that more than 50 to 60 were produced altogether. In the interim, the one identified producer has probably been overhauling existing BEARs, modifying some aircraft of this type for transport use, and building a few new transports of the CLEAT type (similar to the BEAR). Despite the decline in long-range

bomber production, the USSR's plant capacity suitable for production of large aircraft has been considerably enlarged over the last few years, and there is some evidence to suggest that several plants are preparing to produce large bombers or transports.

144. Research and development in new bomber types has continued and we believe that it will be intensively pursued throughout the period of this estimate. Considering the demonstrated level of Soviet technology in such fields as aircraft propulsion and aerodynamics, and the normal development of these capabilities, we have estimated that within the next few years the USSR could probably place into operational units: (a) improved versions of the BISON and BADGER, at any time; (b) a new subsonic heavy bomber with range and other performance characteristics somewhat better than those of an improved BISON, in 1959 or 1960; (c) a new medium bomber with supersonic "dash" capabilities and a range approximating that of an improved BADGER, in 1960 or 1961.

145. Since none of these aircraft types would add substantially to Soviet capabilities for two-way intercontinental operations, we have reasoned that the USSR might proceed directly to more advanced types, such as a heavy bomber powered by high-energy chemical fuel, capable of supersonic speed and high altitude, or possibly a subsonic nuclear-powered aircraft capable of long endurance, even at low altitudes. We continue to estimate that some aircraft of either or both these types could probably be in operational units by mid-1963. We also believe that within the next few years the USSR could fly an airborne nuclear testbed, with at least one nuclear power unit providing useful thrust during some phase of the flight.¹⁶ The attainment of a nuclear propulsion system for operational use in *supersonic* aircraft would probably require a long test and development program extending beyond the period of this estimate.¹⁷

146. Recent evidence of Soviet developmental efforts includes the observation at Moscow of a new bomber, designated BOUNDER, of large size and heavy weight, with a modified delta-wing configuration apparently designed for supersonic flight. With the limited information available, it has not been possible to determine the BOUNDER's

¹⁶The Assistant Chief of Naval Operations for Intelligence, Department of the Navy, and the Director for Intelligence, The Joint Staff, believe that the USSR could fly such a testbed during 1959. The Assistant Chief of Staff, Intelligence, USAF, believes that an aircraft nuclear propulsion system could now be undergoing flight tests in a prototype airframe. [Footnote is in the original.]

¹⁷See SNIE 11–58, "Possible Soviet Long Range Bomber Development, 1958–1962," 4 March 1958 (SECRET), and SNIE 11–7–58, "Strength and Composition of the Soviet Long Range Bomber Force," 5 June 1958 (TOP SECRET). For estimated performance characteristics of Soviet long-range bombers for operational use to 1961, see Annex, Table 6. [Footnote is in the original.]

intended mission, but we believe it could represent a significant step forward in Soviet bomber design. Preliminary analysis indicates BOUNDER to be powered by four turbojet engines. The use of conventional fuels would give it a range marginal for intercontinental bombing. The possibility for development of BOUNDER with a more advanced propulsion system exists, and the design intent for a nuclear-powered vehicle cannot be excluded at this time. However, present information is inadequate to permit an estimate of BOUNDER's probable development.

147. Our evidence also continues to support the existence of one or more other prototypes of new or improved long-range bombers. Past experience cautions that existing prototypes may represent competitive designs. The Soviets may not yet have evaluated such prototypes in relation to each other or to their missile programs. Such evaluation will have an important bearing on the future strength and composition of Long Range Aviation.

148. We continue to project Soviet heavy bomber and tanker strength for mid-1960 as lying within the range of 100 to 200 aircraft. The high side reflects a Soviet option to produce additional aircraft of BISON and perhaps BEAR types, and perhaps to introduce a few of a new heavy bomber into operational units. The low side reflects their option to forego a further build-up in heavy bombers through mid-1960, relying primarily on their one-way medium bomber capability against the US for at least a little longer. Our estimates of trends in Long Range Aviation beyond 1960 are more uncertain, but reflect our belief that the USSR will probably introduce new or improved intercontinental bombers during the period of this estimate. Should Soviet planners desire a large force of heavy bombers and tankers, there is no question that they could have five or six hundred BISONs, BEARS, and new heavy bombers in units by mid-1963. As indicated in the table below, however, it seems to us more likely that the heavy bomber and tanker force will remain considerably smaller than this—say, about two or three hundred, including some of new types.

149. *Intercontinental ballistic missiles.* We believe that Soviet planners intend to acquire a sizable ICBM operational capability at the earliest practicable date. However, we have insufficient evidence to judge the magnitude and pace of a Soviet program to produce and deploy ICBMs. Considerable preparations for a build-up of operational ICBM capabilities could already have been made without detection by intelligence, as implied by Khrushchev's recent statement that the production of ICBMs has been "successfully set up." In the light of such indirect evidence as exists, we have considered those factors which would affect an operational ICBM build-up, including the Soviet capacity to produce missiles and associated equipment, and concurrently to complete launching facilities, establish logistic lines, and train operational units.

SOVIET LONG RANGE AVIATION
(Estimated Strength in Operational Units)

	1 Oct 58	Mid-1959	Mid-1960	Mid-1961	Mid-1962	Mid-1963
HEAVY BOMBERS AND TANKERS	100–125	100–150	100–200	150–250	200–300	200–300
MEDIUM BOMBERS AND TANKERS						
Jet	950	1,025	1,100	1,100	900	800
Piston	400	300	150	—	—	—
TOTALS	1,450– 1,475	1,425– 1,475	1,350– 1,450	1,250– 1,350	1,100– 1,200	1,000– 1,100

150. Taking into account the complexities of the tasks which would have to be accomplished, we believe that the Soviets could achieve an operational capability with 500 ICBMs¹⁸ about three years after first operational capability date. Based on our estimate that a first operational capability will probably be achieved in 1959, we therefore believe that a capability with 500 ICBMs could be achieved some time in 1962. With overriding priority and exceptional success in the test and production program, this capability might be achieved in as little as two years after first operational capability date, i.e., some time in 1961. Assuming a build-up in three years from first operational capability to a capability with 500 ICBMs, a capability with 100 ICBMs¹⁹ would be achieved in about a year and a half; assuming a two year build-up, 100 would be achieved in about a year. The achievement of operational capabilities such as these within the time periods estimated would require an extremely high order of planning and accomplishment, and would also require an increase in the average rate of ICBM firings for test and training purposes.

151. There is evidence that mobility is an important consideration in Soviet ballistic missile development generally. For an ICBM system a degree of mobility could be obtained by use of rail transport to previously prepared launching sites, some of which would have only a minimum of

¹⁸ These numbers of ICBMs are selected arbitrarily in order to provide some measure of the Soviet production and deployment capacity; they do not represent an estimate of the probable Soviet requirement or stockpile. [Footnote is in the original.]

¹⁹ These numbers of ICBMs are selected arbitrarily in order to provide some measure of the Soviet production and deployment capacity; they do not represent an estimate of the probable Soviet requirement or stockpile. [Footnote is in the original.]

fixed equipment. This would provide flexibility and security through the use of relatively simple alternate launching sites which would be difficult to identify and locate. Our estimate of the Soviet capacity to acquire ICBM operational capabilities, given in the preceding paragraph, applies to either a rail-transportable system or a system of moderately hardened fixed launching sites, or a combination of the two.

152. *Other long-range ballistic missiles.* The Soviets probably consider ballistic missiles of 700 and 1,100 n.m. maximum range as contributing primarily to their capabilities to deliver nuclear payloads on distant, fixed targets in Eurasia and its periphery, although shorter-range ballistic missiles could also be employed for this purpose within their range. We estimate that nuclear warheads would be provided for virtually all missiles of 700 and 1,100 n.m. range, but we do not exclude the possibility of CW use in some 700 n.m. missiles. On the basis of available intelligence, we cannot judge the present scale of production and we have not identified any units equipped with these missiles. It is possible that at present the USSR has only a very limited capability to employ them in military operations. But considering such factors as estimated Soviet requirements, nuclear materials availability, and experience in shorter range missiles, we believe that the USSR may now have an operational capability with as many as several hundred ballistic missiles of 700 n.m. range, and with a few 1,100 nm. missiles.

153. The wide availability of medium and light bombers capable of reaching Eurasian targets probably reduces Soviet requirements for missiles of these ranges. Since the 700-mile missile has probably been operational since 1956, we believe that the Soviets may meet their requirements for this missile early in the period of this estimate. A build-up in 1,100 n.m. missiles would take longer. Missiles of these types are probably designed for road or rail mobility. They are probably not deployed in Satellite areas at present, but some operational units may exist within the USSR.

154. *Missile-launching submarines.* A few conventional submarines have probably been converted for topside stowage and launching of 200 n.m. cruise-type missiles. The Soviets could convert a large number of existing submarines, but the problems involved lead us to believe that such conversion is not likely to be large-scale. A total of about 20 long-range submarines could be converted within 4–6 months of a decision to do so. The USSR is probably also developing one or more new types of missile-launching submarines, designed for internal missile stowage. These types will probably include ballistic missile submarines for first operational use in 1961–1963, and possibly cruise-type missile submarines at an earlier date. If the latter are in fact developed and constructed, the USSR may have about 35 submarines, some nuclear and some conventional-powered, equipped for internal missile stowage by mid-1963.

155. *Capabilities for long-range attack.* Present Soviet capabilities for attack on the continental US are limited by the relatively small numbers of operational heavy bombers, the requirement to stage most bombers through forward bases in the Arctic, and the lack of a substantial inflight refueling capability. Nevertheless; by employing their entire heavy bomber force, many of their medium bombers, and their small submarine-launched missile capability, the Soviets could mount large-scale initial nuclear attacks against retaliatory strengths and other war-making capabilities in North America. The actual weight of attack launched against the US would depend upon the Soviet judgment as to the optimum combination of surprise and weight of attack against all areas where US and Allied nuclear retaliatory capabilities and other essential targets are located. Against those Western capabilities deployed on the periphery of the Bloc, the Soviets could employ medium bombers, light bombers, and ballistic missiles with ranges up to 700 and probably 1,100 n.m. Bombs and air-to-surface missiles could be employed against Western naval forces possessing nuclear strike capabilities. All Western targets of importance in North America and overseas, as well as major naval operating areas, are within range of one or more of the Soviet weapon systems described above, although most of the Soviet bombers would have to be dispatched on one-way missions to reach targets in the continental US.

156. Soviet long-range striking capabilities will increase markedly as the stockpile of nuclear weapons grows, improved bombers are introduced, the readiness and proficiency of the bomber force increases, and especially as the Soviet capability to deliver nuclear weapons by guided missiles expands.²⁰ The USSR will rely increasingly upon missiles as long-range delivery systems as the period advances. While Soviet planners almost certainly recognize that ballistic missiles can impose maximum surprise and difficulty of interception, they probably consider that for some years the accuracy and payload capacity of such missiles will be inferior to those of manned aircraft of comparable ranges. We therefore believe that through the period of this estimate, Soviet long-range striking capabilities will lie primarily in a mixed force of manned bombers (probably equipped increasingly with air-to-surface missiles) and ballistic missiles. The Soviets may consider that ballistic missiles can best be employed to neutralize Western retaliatory and other capabilities temporarily in an initial blow, relying upon bombers for follow-up attacks of maximum weight. In any event, effective Soviet employment of long-range striking capabilities against Western

²⁰ The Assistant Chief of Staff for Intelligence, Department of the Army, does not concur in this sentence. See his footnote to paragraph 22 of The Summary. [Footnote is in the original.]

retaliatory and other essential targets will still face great difficulties of timing and distribution of attack against widely deployed, mobile, and ready Western strengths. The USSR's missile-carrying submarines will contribute further to its capabilities, but the scale of their use in an initial attack would depend upon the Soviet judgment of the risk of premature disclosure of intent.

Air Defense Forces

157. All Bloc forces useful for air defense are organized for participation in an integrated system which places primary emphasis on providing defense in depth for key administrative, industrial, and military centers within the USSR. We believe that air defense will continue to be given high priority.

158. *Air defense weapons.* The principal current weapon system for defense of Sino-Soviet Bloc targets against high-altitude attack is the high-performance jet fighter, of which there are over 14,000 in operational units throughout the Bloc. More than 10,000 of these fighters are in Soviet units, about 4,200 of them in units whose sole mission is air defense and the remainder in units with air defense as one of their primary missions. The principal day fighter in Soviet forces is the subsonic FRESCO, although about 1,200 supersonic FARMER day fighters were in units as of 1 October 1958. Also in service are the FLASHLIGHT all-weather fighter, as well as the FRESCO "D" and FARMER "B" with limited all-weather capabilities, but their introduction has proceeded at a relatively slow pace. Total Soviet strength in the FLASHLIGHT and FRESCO "D" types was about 1,730 as of 1 October 1958, with some FARMER "B" types also in operational units.

159. Most Bloc jet fighters in operational units have combat ceilings of 50,000–55,000 feet; FARMER and certain FRESCO versions probably have combat ceilings on the order of 60,000 feet. During 1959–1963 the USSR will probably introduce new day and all-weather fighter types, whose characteristics will emphasize speed and altitude at the expense of combat radius. By 1962 the latest operational Soviet fighters will probably be capable of operating at altitudes up to 67,000 feet, and of climbing to 40,000 feet in less than two minutes.²¹ Air-to-air missiles are probably now available to improve the kill capabilities of Soviet interceptors, although we have no evidence that they have as yet been supplied to operational units. Total numerical strength in fighters will probably decrease after another year or two, because of the growing destructive power of individual interceptors, greater demands on industrial capacity resulting from the advent of more complex fighters,

²¹ For estimated performance characteristics of Soviet fighter aircraft, see Annex, Table 9. [Footnote is in the original.]

and the increasing availability and capabilities of surface-to-air missile systems.

160. Surface-to-air missiles designed for optimum effectiveness at altitudes of 30,000–60,000 feet and probably having limited effectiveness at 80,000 feet are now in operation in a dense and costly complex of 56 sites around Moscow. This complex, which could include a limited number of missiles with nuclear warheads, can probably direct a very high rate of fire against multiple targets under all weather conditions. It is probably ineffective against very low altitude attack, however. We believe the USSR may have altered an earlier intention to install a somewhat similar surface-to-air missile complex around Leningrad, and that the missile defenses of this and other critical Soviet targets will employ systems with greater flexibility and less cost than that at Moscow. There is now some evidence of the installation of surface-to-air missile sites in a few other key areas, such as Baku. We believe that more such sites will be built through the period of this estimate as improved systems for both high and low altitude defense become available, and that surface-to-air missiles will be provided for numerous Soviet fixed targets as well as field forces and naval vessels. Surface-to-air defenses in key areas will probably become effective both at very low altitudes and up to 90,000 feet during the period.

161. The Soviets continue to employ antiaircraft guns for defense of field forces and fixed targets, including airfields. More than 25,000 light and medium antiaircraft guns are believed to be available to Soviet forces at present; in addition, about 5,000 are available to East European forces and nearly 4,000 to Communist China, North Korea, and North Vietnam. Large numbers of automatic antiaircraft machine guns are also available to field forces. As suitable surface-to-air missiles become available in quantity, a large portion of the medium and some light antiaircraft guns will probably be phased out of the air defenses of static targets in the USSR.

162. *Air defense radar and control equipment.* Radar coverage now extends over the entire USSR and East European Satellite area, except for certain inland portions of central and eastern Siberia; coverage also extends along the entire coastal region of Communist China. The long-standing gaps in radar coverage in the Soviet Arctic are now believed to have been filled, although this deployment is probably not as extensive as in many other areas. About 1,200 heavy prime radars, primarily of the TOKEN type, and about 3,000 light auxiliary radars are employed in various combinations at about 1,700 radar sites in the Sino-Soviet Bloc. Under average conditions, TOKEN radars can probably detect jet medium bomber aircraft, penetrating at altitudes up to their combat ceilings, at distances between about 80 and about 180 n.m. from radar sites. New radars of much higher quality,

including radars capable of more accurate height-finding, are already in service and will probably be widely deployed during 1959–1963.²²

163. For several years the Soviets have been developing computers and other components suitable for data-handling use. The use of such equipment will have a marked effect in increasing traffic-handling capabilities, reducing system reaction time, and improving coordination within the Soviet air defense system. For example, it is expected that data-handling equipment will increase the traffic capacity of each Soviet radar reporting site to at least 20 simultaneous tracks. We believe that an air defense system with some semiautomatic features, including a data-link system for vectoring interceptors, is being widely deployed in western USSR in association with early warning and GCI sites. This system is believed to be similar in concept to the US SAGE system, but less complex. It will probably come into use throughout the USSR and East Europe within a few years. The Soviets are also introducing a new IFF system which will probably be fully operational by 1960.

164. *Air defense concentrations.* The areas of highest concentration of Bloc air defense weapons and associated equipment include that portion of European USSR from the Kola Peninsula to the Caspian Sea, East Germany, Poland, Czechoslovakia, and the Maritime and Sakhalin areas of the Soviet Far East. High defense concentrations are also found at some specific locations outside these areas, such as Tashkent, Novosibirsk, and Khabarovsk. The approaches to Moscow are by far the most heavily defended of these areas, including (in addition to the surface-to-air missile complex mentioned above) about 1,100 day and 275 all-weather fighters as well as about 700 antiaircraft guns. We believe the Moscow defenses are a unique case, dictated by the importance of that area to the USSR.

165. *Passive defense.* Large passive defense organizations contribute to the air defense readiness of both military personnel and the civilian population. Civil defense training is a normal part of the program of DOSAAF, the Soviet paramilitary mass organization whose recruitment has been stepped up markedly in recent years. The incorporation of air raid shelters into newly constructed buildings is a program of long standing in the USSR. This program probably now affords some degree of shelter for roughly one-sixth of the urban population of the USSR, and this proportion will probably rise considerably during the period to 1963. Although most existing shelters were not designed for protection against blast from nuclear weapons, some newer building shelters are of heavier construction. It is probable that up-to-date protection is

²² Estimated performance characteristics of Soviet early warning and ground-controlled intercept radars are given in Annex, Table 10. [Footnote is in the original.]

available to selected elements of the government, but the general population is inadequately prepared against large-scale nuclear attack.

166. *Air defense capabilities.* Present Soviet air defense capabilities against attack by aircraft and cruise-type missiles can be summarized in general terms as follows:

(a) Against penetrations conducted during daylight and in clear weather, at altitudes between about 5,000 feet and about 45,000 feet, capabilities are greatest.

(b) At altitudes above about 45,000 feet, capabilities would decrease progressively as altitude increased, except in the limited areas equipped with surface-to-air missiles where capabilities would be unimpaired to at least 60,000 feet.

(c) At altitudes below about 5,000 feet, capabilities would decrease progressively as altitude decreased, and would probably be seriously reduced at altitudes below about 1,500 feet.

(d) Against penetrations conducted at night and under conditions of poor visibility, the capabilities of the system would be greatly reduced because of the limited availability of all-weather fighters and surface-to-air missiles.

(e) Against varied penetration tactics utilizing altitude stacking, diversionary maneuvers, decoys, and electronic countermeasures, the capabilities of the system would be diminished through disruption and saturation.

167. The amount of warning time available significantly affects the capabilities of air defenses in various areas of the Bloc. Early warning radar could now give Moscow and many other targets in the interior more than one hour's warning of attacks made with present Western bomber types. The more limited early warning time available in Bloc border areas would reduce the effectiveness of the defenses of even heavily-defended targets in such areas. As the speeds of Western delivery vehicles increase, the problem of warning time will become more critical, despite probable Soviet employment of picket ships, airborne radar and other extensions of warning capabilities.

168. Over-all Bloc capabilities against aircraft and cruise-type missiles will increase, however, through improvements in the performance characteristics of most Soviet air defense equipment and especially through the wide employment of semiautomatic air defense control. Air defense guided missile capabilities will increase. Higher-performance fighters will be employed, and the proportion of all weather fighters in Soviet forces may increase to about 60 percent. But the Soviets will continue to have difficulty in opposing very low altitude attack and air defense electronic systems will still be subject to disruption and saturation. The USSR will probably not have an operational weapon system

with even limited effectiveness against ballistic missiles until the very end of this period or later.

Ground Forces and Tactical Air Forces

169. The Soviet ground forces represent the largest part of the Soviet military establishment and are closely supported by tactical aviation, consisting of fighters trained in the ground attack role (in addition to their air defense role) and light and medium bombers trained in ground support bombing techniques. These forces are well-balanced, ably led, and equipped for the most part with excellent materiel of modern design. Units are distributed among 17 military districts in the USSR and three groups of forces in the European Satellites. The strongest concentrations are in East Germany, the western and southern border regions of the USSR, and the Maritime area of the Soviet Far East. Stockpiles maintained in these areas are believed sufficient to support large-scale ground combat operations for several months without replenishment from current production.

170. The order of battle of Soviet Army ground forces is estimated at about 175 line divisions plus supporting units. These divisions probably average about 70 percent of authorized wartime strength, although the manning level in some interior districts may be as low as 30 percent. All units probably have a high proportion of authorized officer strength, however, and full equipment is believed to be kept locally available. These peacetime manning practices, together with standard conscription and stockpiling programs, would probably enable all Soviet line divisions to be brought to full strength by M+10. Conversion to a war footing could be executed rapidly, and about 125 additional line divisions could be mobilized by M+30.

171. There has been an extensive program over the last several years to modernize and reorganize the Soviet ground forces to meet the requirements of modern warfare. More advanced designs of practically all types of equipment have appeared. The firepower of individual units has been increased markedly, additional vehicles (including amphibious vehicles) have been provided, and communications equipment has been augmented.

172. A reorganization in the Group of Soviet Forces, Germany, during 1957 produced a new type of Soviet line division—the motorized rifle division—which appears well-adapted for fast, hard-hitting action. The mechanized divisions were converted to the new motorized type by removing heavy tank and assault gun units, and the rifle divisions were converted by addition of medium tanks, armored personnel carriers and rocket launcher. During the same period a resubordination of divisions resulted in the creation of “tank armies” composed exclusively of tank divisions to provide for rapid, deep exploitation

in enemy rear areas. The other units remain grouped into “combined arms” armies, now composed of motorized rifle and tank divisions. We believe that similar developments have been under way since 1956 throughout the Soviet ground forces.

173. These changes are in line with revised Soviet tactical doctrine which emphasizes the need to supplement standard ground force tactics and training in order to meet the conditions of nuclear warfare. New doctrine stresses firepower, mobility and maneuverability, greater initiative, deeper objectives, intensified reconnaissance and the protection of individuals and units against the effects of atomic and chemical weapons. It also envisages the tactical use of nuclear weapons in support of Soviet field force operations.

174. Surface-to-surface ballistic missiles with ranges of 100 n.m., 200 n.m., and 350 n.m. have probably been available for operational use since 1954. We believe these missile types are intended for mobile use in support of field forces, and for attacking fixed targets such as air bases. Depending upon operational considerations and the availability of nuclear warhead materials, nuclear, HE, or CW warheads could be employed. We have only a small amount of evidence of military units equipped to launch ballistic missiles, and it is possible that at present the Soviet capability to employ them in military operations is quite small. On the other hand, the Soviets have had experience in producing missiles in the 100–350 n.m. range class, probably have an extensive production capacity, and have had ample time to train troops in their use. Very recent evidence indicates that Soviet missile units equipped with 100 n.m. missiles may have been deployed to East Germany. It is possible therefore, that the USSR’s present operational capability in the 100–350 n.m. range class comprises as many as several thousand missiles, although in view of other Soviet requirements for nuclear materials it is unlikely that many would be equipped with nuclear warheads at present. Missiles of these types may now be held in the high command reserve, but as their availability increases they will probably be organically assigned to field armies. Some 700 n.m. missiles may also be allocated to the support of Soviet field forces.

175. Air support for ground operations is provided mainly by Tactical Aviation, the largest single component of the Soviet air forces. Its units are assigned to the military districts and groups of forces. Tactical Aviation has acquired at least some nuclear delivery capability. It is now equipped (as of 1 October 1958) with jet aircraft estimated to include about 4,700 fighters and 2,800 light bombers. The fighter units are predominantly equipped with FAGOTs and FRESCOs; however, the more advanced FARMER day fighter and FLASHLIGHT all-weather fighter are also in service. Tactical bomber units are still equipped with the obsolescent BEAGLE, although a few units have received BADGER

jet medium bombers. Prototypes of several new fighter types and two new jet light bombers have been displayed since 1956, but none of these aircraft has been identified in an operational unit.

176. The increasing availability of nuclear weapons and guided missiles during 1959–1963 will bring further changes in equipment and organization of Soviet ground and tactical air forces and a steady improvement in their capabilities. We believe that these changes will be evolutionary in nature, and do not anticipate any major alterations in size or deployment. While nuclear weapons and guided missiles probably will be used in support of tactical operations, conventional field artillery and unguided rockets will continue to provide the major direct fire support for units in close combat. Tactical Aviation will probably receive new supersonic fighters and bombers, but both fighters and bombers are expected to decline in numbers as increasing reliance is placed on guided missiles.

177. The USSR has sizable airborne forces, estimated at 10 divisions and a total strength of about 100,000 men. Airborne troops are well-equipped, but the air transport component has lagged far behind combat air units in the Soviet aircraft re-equipment program. Aviation of Airborne Troops now comprises approximately 500 light transports of the CAB, COACH, and CRATE types, 200 BULL medium bombers converted to transport use, 200 helicopters and 200 gliders. This strength could be augmented substantially by other military and civil transports.

178. The appearance of new transports and air-transportable equipment indicates that the USSR is now paying increasing attention to the development of its airborne forces. Soviet airlift capabilities will probably increase considerably during 1959–1963 as additional helicopters and transports are introduced. The BULL will probably be employed as an interim medium transport until late in the period, when it will have been replaced by the CAMP twin-turboprop assault transport (which has, however, not yet appeared in units) and possibly other advanced types. Better auxiliary transport will also become available as improved aircraft are introduced into civil aviation. In 1957, a number of new transports were displayed, including the CAT and COOT turboprop medium transports, a four turbojet transport designated COOKER, and a turboprop heavy transport, the CLEAT. Of these aircraft, only the COOT is now in service, and there is some evidence that technical difficulties have caused the transport program to proceed more slowly than previously estimated.²³

²³ For estimated performance characteristics of Soviet transport aircraft, see Annex, Table 8. [Footnote is in the original.]

Capabilities for Major Land Campaigns

179. Soviet ground forces are capable of conducting large-scale operations on several fronts into peripheral areas, separately or concurrently. These operations could be supported by the large available air forces, but the high priority assigned to air defense would limit the availability of fighter aircraft for such support operations in the initial phase of a general war. Surface naval vessels, naval aircraft and submarines would be available for operations in Bloc coastal areas in support of ground campaigns. The logistic environment is an important limitation on these capabilities, and the capacities of military transportation systems have been considered in the following estimates of Soviet offensive capabilities against selected land areas. These estimates do not take into account the effects of an initial nuclear exchange, of direct Western opposition to advancing Soviet forces, or of Western interdiction of essential logistic lines. Moreover, these are not estimates of the numbers of divisions the USSR would consider it tactically feasible or necessary to employ in the areas discussed.

180. *Against Western Europe and Scandinavia.* Without prior build-up, Soviet forces in East Germany and Poland could initiate an offensive campaign into Western Europe with 22 line divisions, half tank and half motorized, supported by about 1,400 tactical aircraft. To augment the strength of the initial attacks, a maximum simultaneous airlift of two lightly-equipped airborne divisions of 7,500 men each could be mounted by Aviation of Airborne Troops based in Western USSR. If approximately one-half of the civil transport aircraft normally in the area also participated in the airlift, the equivalent of an additional 2–3 divisions could be lifted in a one-day operation. However, we doubt that the Soviets would risk loss of strategic surprise by assembling such a large number of civil aircraft prior to an initial attack. In addition to airborne reinforcements, a maximum of four divisions could be lifted in merchant ships across the Baltic Sea. Air reinforcement could be drawn from the nearly 2,000 aircraft of Tactical Aviation units in Western USSR, and ground reinforcements from the 56 divisions in Western USSR could be brought up rapidly. Lines of communication through the northern satellites are estimated to be capable of supporting a theoretical logistic maximum of about 160 divisions.

181. Soviet campaigns to seize Norway and Sweden could be launched from northwestern USSR through Finland and from west central Europe through Denmark. Forces immediately available in northwestern USSR consist of nine line divisions and about 2,600 tactical and naval aircraft. Operations against Norway would be limited logistically in the north to four divisions over Finnish land routes plus one waterborne division, and in the south to a maximum of five divisions waterlifted from Denmark. If Sweden were also attacked, as many as six

additional divisions could be moved across Finland and a maximum of nine divisions could be ferried from Denmark to southern Sweden. Additional reinforcements might be water-lifted across the Baltic from the USSR to Sweden, and airborne forces could be used in securing debarkation facilities.

182. *Against Greece, Turkey, and the Middle East.* Forces available for operations in this area include 44 line divisions and 2,750 tactical and naval aircraft in southern and southwestern USSR. For operations west of the Black Sea, lines of communication would be adequate to support as many as 10 divisions against Greece or as many as 16 against Turkey, but not more than a total of 22 could be supported concurrently. At most, 14 of these divisions could be supported in an extension of this campaign into northwestern Anatolia, while seven divisions from the Caucasus could move against eastern Turkey. Three additional divisions could be water-lifted to the northern Turkish coast, provided that port facilities could be secured. One or two airborne divisions could be employed in the area. Lines of communication could support a force of 15–20 divisions in offensive operations against Iran.

183. *In the Far East.* The USSR has 31 line divisions, approximately 2,350 tactical and naval aircraft and sizable naval forces available in this area. These forces could renew hostilities in Korea, either alone or in conjunction with North Korean and Chinese forces. One airborne division could be employed against Japan. A seaborne force equivalent to three lightly-equipped divisions could be launched against Japan, using a mixed group of ships and other craft. Provided port facilities could be secured, fully-equipped forces equivalent to 5–6 divisions could be landed almost immediately in a follow-up operation. The same technique could be used in other areas of the Far East within range of land based aircraft. Adverse climate, terrain and logistic environment would probably limit operations in Alaska to one airborne division and a seaborne force of about 6,000 troops.

Naval Forces

184. During the postwar years, Soviet naval forces have been greatly strengthened by an intensive building program concentrated on light cruisers, destroyers and submarines. The Soviet submarine force is the largest ever assembled by any single power; over half of its present strength consists of long-range craft of postwar design and construction. Due to a recent slow-down in the naval construction program, which included a temporary halt in submarine production, there has been little quantitative change in Soviet naval forces since last year. We estimate Soviet naval strength as of 1 October 1958 at 28 cruisers, about 140 destroyers and 80 destroyer escorts, and about 440 submarines. These totals include vessels of postwar design numbering 20 light cruisers, 110 fleet destroyers, 80 destroyer escorts, about 260

long-range submarines (18 "Z," 4 "F," and 237 "W" class) and about 35 medium range submarines ("Q" class). They are grouped in four major forces: the Northern Fleet, located in the Barents Sea area; the Baltic Fleet; the Black Sea Fleet; and the Pacific Fleet, concentrated largely at Vladivostok.

185. The surface forces are supported by Soviet Naval Aviation, which comprises more than 15 percent of total Soviet air strength and is now the second largest naval air force in the world. Approximately 3,200 aircraft are assigned to the Soviet fleets, including about 1,750 fighters, 600 jet light bombers, 250 jet medium bombers and nearly 700 miscellaneous types. The combat aircraft are the same types as are assigned to Tactical Aviation: FAGOTs, FRESCO, FARMERs, FLASHLIGHTs, BEAGLEs, and BADGERs. We believe that selected naval bomber units have been assigned an atomic delivery role and there is evidence of a developing air-to-surface missile capability in naval BADGER units. Lack of aircraft carriers limits the operational effectiveness of Soviet Naval Aviation to the combat radius of its shore-based aircraft.

186. The operating efficiency and equipment of Soviet naval forces, while still below US standards in some fields, are quite high and will continue to improve. The great increase in world-wide unidentified submarine contacts in recent years probably reflects the intensified training of the Soviet submarine force, particularly in long-range operations. In the naval weapons field, in addition to the development of submarine-launched guided missiles, the Soviets have vigorously pushed the production of more effective mines with magnetic, acoustic and pressure actuated firing devices. We estimate that the USSR has stockpiled mines of advanced types as well as conventional mines. It is technically capable of adapting nuclear warheads to mines, torpedoes and depth charges. Nuclear tests in the Novaya Zemlya area have probably included the testing of naval weapons. The Soviet Navy has become increasingly aware of its initial failure to keep pace with the rapid postwar technological advances in antisubmarine warfare. In recent years there has been a steady improvement in its ASW tactics and equipment and a major effort has been made in the construction of escort ships in order to overcome this deficiency. The Soviet Navy is also quite limited as to amphibious capability. To meet the lift requirements of divisional-size units the USSR would have to rely almost exclusively upon merchant ships.

187. Several important developments in Soviet naval forces are likely during 1959–1963 as a result of changing weapon systems and new concepts of naval warfare. In addition to conversion of some submarines for the launching of surface-to-surface missiles, new submarines specifically designed for this purpose probably will enter service. Some Soviet cruisers and destroyers will probably be equipped with

dual-purpose surface-to-air/surface-to-surface missiles. Nuclear propulsion will be applied to submarines, and improvements in submarine hull design are expected early in the period. We believe that antisonar coatings have probably been applied to some Soviet submarines. To meet the threat from US missile-launching submarines, the USSR probably will continue to emphasize improvement of its anti-submarine warfare capability. This could include construction of new and better antisubmarine vessels including "killer" submarines, use of specialized aircraft and helicopters, development of improved detection systems (both sonar and radar) and more sophisticated antisubmarine weapons including guided missiles. Naval Aviation will probably receive aircraft of improved performance as they become available, as well as improved air-to-surface missiles.

188. *Submarine construction.* The USSR will probably continue to place primary emphasis on submarines in its naval construction program. Since 1950 the Soviets have built about 290 submarines of the medium-range "Q" class and the long-range "W" and "Z" classes.²⁴ Construction of "Z" class submarines ended in 1955, but the "W" class and "Q" class programs continued into 1957. Their termination probably marked the initiation of new submarine programs. A new class of conventionally-powered long-range submarine has been in production at Leningrad since the beginning of 1958. This class (designated "F") is apparently a torpedo-attack type, larger than the "Z" class and with improved sonar. Four "F" class submarines are believed to have reached operational status. Additional submarine programs believed to be under way include a nuclear-propelled type and submarines specifically designed to employ guided missiles.

189. Although the evidence is not firm, we believe that the USSR may already have commissioned one or more nuclear-powered submarines. Soviet capabilities in this field have been indicated by the development of the icebreaker *Lenin*, which will probably become operational in 1959. The *Lenin* is powered by three nuclear reactors of a type which would be suitable, with some redesign, for use in a submarine. We estimate that by mid-1963 the USSR will have about 25 nuclear-powered submarines.

190. Construction of conventional submarines will probably continue but, because of the greater complexity of nuclear-powered and missile submarines, annual submarine production almost certainly will not reach the high levels of recent years. Considering such factors as the decommissioning of obsolete boats, the possible conversion of some additional submarines to missile use, and the development of new

²⁴ For estimated characteristics and performance of these submarines, see Annex, Table 12. [Footnote is in the original.]

propulsion and weapons systems, we estimate that the total force will approximate 470 submarines in mid-1963.

191. *Capabilities for naval warfare.* A grave threat to Allied naval forces and merchant shipping is posed by the Soviet submarine force, which is about eight times the size of the submarine force with which Germany entered World War II. In the event of war, Soviet submarines could conduct intensive operations against Allied sea communications in most of the vital ocean areas of the world. Mining could be undertaken on a large scale and would constitute a serious threat to Allied sea communications. This threat is greatest in waters relatively close to Soviet-controlled air and naval bases, but Soviet submarines provide a distant minelaying potential of major proportions. Soviet Naval Aviation could attack Allied naval forces, shipping and port facilities within range using bombs, mines, torpedoes and air-to-surface missiles. Soviet Long Range Aviation probably would also conduct attacks on naval targets, but its participation at the outset of a war presumably would be limited to missions of the highest priority. Although the primary threat to Allied naval forces in the Atlantic, the Pacific and the peripheral seas of Eurasia would come from Soviet submarines and aircraft, the surface navy would play a role in preventing attacking forces from operating with impunity close to Soviet shores. Naval exercises of the last several years, stressing defense of the sea approaches to the USSR, indicate a strong defensive capability in the fleet operating areas.

192. The Northern Fleet, with more than 100 long-range submarines and direct access to the open Atlantic, is considered the most formidable of the Soviet fleets. Northern Fleet submarines could deliver attacks throughout the North Atlantic and the large "Z" class submarines could operate in the Caribbean. Soviet seizure of Norway would greatly extend the submarine and air offensive capability of this force. The geographic position of the Baltic and Black Sea Fleets limits their offensive capabilities. Seizure of the Baltic exits would allow the Baltic Fleet submarine force to join in the interdiction of Allied sea communications in the North Atlantic and would increase the potential of Baltic Fleet surface forces for operations in the North and Norwegian Seas. Similarly, seizure of the Turkish Straits would permit submarines of the Black Sea Fleet to range throughout the Mediterranean and threaten Allied sea communications in that area. Submarines from both the Baltic and Black Sea Fleets might also be deployed outside of home waters prior to the initiation of hostilities. Aircraft and submarines of the Soviet Pacific Fleet could attack Allied sea communications in the North Pacific and adjacent Far Eastern waters from the outset of hostilities.

193. The capabilities of Soviet naval forces will improve steadily throughout this period with the acquisition of more advanced

submarines, aircraft, and naval weapons. The principal weaknesses of the USSR as a naval power will continue to derive from the wide separation of its sea frontiers and its inability to control the sea routes between these areas, although improvements in inland waterways will increase its ability to interchange smaller vessels including submarines. The lack of adequate supply lines to its Northern and Far Eastern fleet areas and the land-locked position of its fleets in the Baltic and Black Seas are additional handicaps.

V. TRENDS IN SOVIET RELATIONS WITH OTHER COMMUNIST STATES

194. The USSR's relations with other Bloc states continue to be of pressing concern to the Soviet leaders. During the past year Moscow has moved energetically to repair the damage done to its political control and ideological authority by developments of the last several years. To this end, it sponsored an international Communist conference—heralded as the most significant in more than 20 years—broke the three-year old rapprochement with Yugoslavia, ordered the execution of Imre Nagy, held a dual CEMA and Warsaw Pact meeting in Moscow, and began publication of an international Communist periodical designed to replace the defunct Cominform journal. The Moscow conference of Communist parties in November 1957 produced a codification of nine fundamental Marxist-Leninist "laws" to which all true (Soviet-oriented) "socialist" states must adhere. It was the signal for an intensified drive against "revisionism" calculated to inhibit departures from the approved norms by member parties, especially those which might be infected by the spirit of nationalism.

195. These efforts have been intended to cope with what has become one of the fundamental problems in the Communist world: how to preserve ideological conformity and political unity. The Communist parties in the various states are confronted with quite diverse local conditions in "building socialism;" they are tempted to resort to practical expedients which have no counterpart in Soviet experience and require ideological justification in terms close to "deviationism." In addition, as parties now possessing state power they are bound to think in terms of their own state interests, not always identical with those of the Soviet state, and to show some deference to the national sensitivities of their peoples. Consequently, there are present within the Communist parties elements and factions which harbor latent or open resentment of Moscow's domination, and they are strengthened by the knowledge that within the general population anti-Soviet sentiment continues to be vigorous and widespread.

196. The tradition of the Communist movement took little account of localist proclivities or the autonomy of national parties; it was

“internationalist” and centralist. This tendency was enormously reinforced during the period of Stalin’s ascendancy. He rose to undisputed mastery of the Soviet party at a time when other Communist parties were weak and had little prospects of attaining power. His organizational controls, his unquestioned ideological authority made him as much the absolute dictator over them as he was in the USSR itself. Only the Chinese Communists, isolated in the interior reaches of China, established organizational and even some degree of ideological autonomy. In the postwar period, after the Communist parties gained power in Eastern Europe and China, Stalin had become a towering historic figure in the Marxist-Leninist hierarchy. Even where Moscow had other and more direct means of control over Satellite parties, its authority rested to a considerable degree on the magic of Stalin’s name and myth. Only the Yugoslavs challenged his authority and survived the assault of the whole Communist world, though they had to pay the price of exclusion. The Chinese, although able to go their own way, nevertheless accepted the ideological authority of Stalin.

197. Stalin’s death left a legacy in Eastern Europe of inefficient maladjusted economies and of hatred for Soviet domination; Moscow’s ideological and organizational control was crippled. The confusions resulting from divisions within the Soviet leadership, Moscow’s modification of Stalin’s oppressive controls and policies, the attempts to redefine ideological positions under new conditions, and the partial repudiation of Stalin himself contributed to factionalism in the Eastern European parties and facilitated the overt expression of latent popular hostility to Soviet domination. Communist China, which initially at least appeared to view with sympathy the desire of some Satellite regimes for greater local autonomy, emerged as a second ideological center within the Bloc. Since the events of 1956 in Poland and Hungary, the Communist leaders of all Bloc states, including especially the Chinese, have presumably recognized that the interests of all in the struggle against the non-Communist world depend upon preserving unity on essential issues. In Communist terms a necessary means of enforcing such unity is conformity to ideological programs. This was the point of the 12-party pronouncement of November 1957 and subsequent insistence on ideological conformity.

198. On the surface, unity has been restored and the leading position of the USSR has been re-emphasized. But the unity of ideological program was achieved by collective discussion in which at least some of the parties evidently played an independent role, however heavy may have been the weight of Soviet views in the final outcome. We believe that the front of unity—both ideologically and in terms of state policy on the international stage—will be effectively preserved for some time. But over a longer period the divergence of state interests and the need

to develop policies in accordance with local conditions and nationalist sentiments will tend increasingly to dilute Moscow's control over the Communist Bloc.

Relations with the Satellites

199. The Soviet approach to the European Satellites during the past year represents, in essence, an attempt to synthesize the post-Stalin trend toward greater autonomy with the post-1956 efforts to re-establish the stability of the Bloc structure. While this has meant renewed emphasis on Soviet hegemony, it has not led to a general resumption of police terror, nor has it involved an abandonment of Soviet economic aid and equitable trade relations. Further, the Soviet leaders—though now playing down the possibility of “many roads to socialism”—still concede limited freedom of action to Satellite leaders and tolerate certain divergences—in the case of Poland substantial ones—based on differing internal conditions.

200. The Soviet leaders thus appear to retain their belief that Stalinist methods were inefficient and dangerous; even if they should want to return to Stalinist policies toward the Eastern European Satellites, the example of Communist China's relative independence and the special position of Poland would make such a move exceedingly difficult. The Soviet leaders still have not discovered any definitive answers to the basic questions concerning intra-Bloc relations: How best to reconcile the contradictions between a policy toward Eastern Europe which is at once “soft” (designed to insure the Satellites economic and political growth) and “hard” (intended to guarantee stability and Soviet overlordship); and how best to adjust to the changes since 1953 in the USSR's position as Bloc leader.

201. With the exception of Gomulka in Poland, and possibly Kadar in Hungary, all of the Satellite leaders have responded with vigor to the Soviet call for ideological conformity and fealty to the USSR. Needing no encouragement to combat “revisionist” trends, they have been able to thwart those elements which have sought basic reforms. Moreover, their efforts to assure internal security have been successful; there has been no serious threat to the stability of any of these regimes during the past year.

202. Popular hostility to the Communist system and to the USSR has probably not been reduced, however, although there may have been some diminution in public resentment in countries where there has been a gradual improvement in living standards. Popular unrest does not appear to be an immediate problem except in Poland, where it still could lead to strikes and riots, and in East Germany, where continuing emigration to West Germany reflects active discontent and remains a seemingly insoluble problem.

203. *Prospects.* A continuation of the current pattern of Soviet policy toward the Satellites for the next few years is probable so long as outside events or developments within the Satellites themselves do not force a change. In general, the USSR is likely to limit its direct interference in Satellite affairs as much as it believes feasible, striving to give these regimes the appearance of full sovereignty. Most of the orthodox Satellite leaders will probably be allowed to exercise day-to-day control over internal affairs, provided they retain control over their own parties and conform to Soviet-established guidelines. The fact that these leaders depend on Soviet support for their position and share many of the same interests tends to reduce the risk for the USSR in such a policy. The apparent right of Bloc leaders to speak relatively freely and frankly to the Soviets about their own problems and about intra-Bloc economic affairs will probably be maintained, although this right is undoubtedly viewed in Moscow solely as a consultative one. The renewed Soviet effort to push Bloc economic integration and to achieve a better division of labor will receive continuing emphasis. But past resistance to this program, based on the national economic interests of the individual Satellites, has been stubborn and persistent and will almost certainly not be eliminated over the next few years.

204. We believe that the recurrence of popular revolt or of an attempt by a Satellite Communist party to defy Moscow on vital issues is unlikely at least over the next few years. Such developments are possible, however, and even probable if Soviet policies should again become indecisive, or if, because of Soviet internal or foreign policy considerations, controls should be significantly relaxed. In the event of a rebellion in the Satellites beyond the capacity of the local regime to repress, the Soviet leaders would almost certainly intervene militarily. Soviet reaction to an attempt of a Satellite to secede from the Bloc would probably be the same. In the event of another Satellite party “coup” like that in Poland—aimed at greater autonomy rather than secession—the Soviet response would be dependent on the particular local and international circumstances of the moment. One of the aims of the current “antirevisionist” campaign is to prevent any disaffected inner party faction from organizing a challenge to the official leadership.

205. We believe that the Soviet Union will almost certainly maintain or increase its efforts to reduce or eliminate the distinctive features of the Polish regime. But, since Gomulka would almost certainly resist pressures on any fundamental aspects of his policies and would have the support of the Polish people in doing so, we think that the Soviet approach will be cautious. If moderate pressure proves ineffective, however, the USSR might work for Gomulka’s ouster. Even in this case, we think that the USSR would resort to military intervention only if

developments in Poland were likely to jeopardize the political or military security of the Bloc.²⁵

206. Concerning East Germany, the Soviet leaders will almost certainly continue their campaign to build up the GDR as an ostensibly sovereign power. Internally, the political and economic weakness of the East German regime will continue to pose major problems for the Soviets. Attempts to give greater stability to the GDR through more liberal internal policies would involve political risk and would probably require greater economic subsidy from the Soviet Union, something the Soviet leaders would be reluctant to give. On the other hand, turning up the screws to enforce popular submissiveness and to make the GDR more economically self-dependent has led to the mass flight of key professionals, and may lead to other serious losses. Thus the Soviet tactical approach to the GDR regime will probably continue to show signs of vacillation and uncertainty.

Bloc Relations with Yugoslavia

207. Concern over their position as Bloc leader and prime center of Communist doctrine, and fear that the acceptance of Yugoslavia as a non-Bloc Communist power was at least potentially a serious danger to that position, were probably the principal causes of the Soviet leaders' decision to break off the rapprochement with Yugoslavia. The Soviet effort to re-establish close relations with Tito in the summer and early fall of 1957 was aimed at inducing Yugoslavia to identify itself with the Soviet camp. When it became clear—as it evidently did at the International Communist conference in Moscow in November 1957—that Tito was unwilling to so align himself on Soviet terms, the break in the rapprochement was probably inevitable. The appearance of the “revisionist” Yugoslav Party program the following spring probably only helped to shape the nature and timing of the subsequent Soviet campaign.

208. For the foreseeable future, the USSR is unlikely to attempt any essentially new approach to its Yugoslav problem. The tenor of the Bloc anti-Yugoslav campaign, however, will probably vary somewhat with time and place, the greatest weight being given to it by Albania, Bulgaria, and Communist China. Moscow evidently does not intend to resume the program of development credits for Yugoslavia and will probably also hamper the normal flow of trade from time to time, while denying that these measures are intended as economic sanctions. Though it wishes to exert pressure on Yugoslavia in order to discourage independence-minded and revisionist elements in Poland and the other European Satellites, it is fearful that dramatic anti-Yugoslav measures

²⁵ See NIE 12.6-58: “The Outlook in Poland,” dated 16 September 1958. [Footnote is in the original.]

would do real harm to Soviet relations with the uncommitted nations. However, the USSR will continue its attempts to discredit Yugoslav foreign policy, particularly in the Middle East and Asia, and will try to link Tito with the colonial powers in the minds of Afro-Asian leaders.

Relations with Communist China

209. Communist China over the past several years has emerged as a nearly-equal partner of the USSR within the Communist world. The preponderant influence is still in Moscow, but this appears to operate through discussion and persuasion rather than by the exercise of authority or control. The foundations of the alliance remain unimpaired: a common ideology, which charts the broad course of domestic developments and posits hostility toward the capitalist enemy; a mutual dependence, economic and military in the case of China, political and strategic in the case of the USSR; and a shared realization that any major disruption of the alliance would probably have catastrophic effects on the future of the entire Communist movement. We thus believe that the bases for the Sino-Soviet partnership are compelling, that the two regimes will remain closely allied over the period of this estimate, and, indeed, that neither regime is likely to believe that it could afford a break even if serious divergencies arose.

210. We also believe, however, that there are certain differences between them which have perforce led to compromises or which have been glossed over. Such divergences are more likely to grow than to diminish over the next few years and we believe that because of them, and because of its growing power and prestige, the Peiping regime poses a potential threat to the kind of Sino-Soviet Bloc which the Soviet leaders would like to envisage for the future. Although the USSR will retain its senior position, it is possible that the process of reconciling differences between the two may increasingly involve compromises on the part of the USSR, with corresponding adjustments in Soviet policy.

211. Possible Chinese Communist differences with the USSR in policy or tactical approach—but not ultimate goals—have included the doctrinal innovations of 1956 and 1957 concerning the “100 flowers” concept and the possibility of “contradictions” between the party and the masses; and the apparent sentiment in 1956 that the USSR had overplayed its role of Bloc leader and was, in fact, guilty of “great power chauvinism.” At present Peiping and Moscow may view relations with the West somewhat differently; the Chinese Communists appear to be more militant than the Soviets and less fearful of the consequences of a “high risk” policy. In addition, there have been differences at least in propaganda emphasis concerning various international questions.

212. In the future, areas of friction may arise from the general question of Communist China’s influence as an ideological and political force within the Bloc as a whole. The unprecedented Chinese organization

of "communes" must be a development ideologically embarrassing to the Soviets, since it implies that the Chinese are advancing toward Communism more rapidly than the Soviets themselves. There may also be Soviet concern over a Chinese tendency toward "adventurism" in pushing for Communist advances, and over the role to be played by Communist China in those areas of the Far East where it has independent interests. Thus far these matters do not seem to have occasioned serious difficulty, although even if they had every effort would certainly be made to conceal the fact. Peiping has been in the forefront in proclaiming Soviet leadership of the Bloc, the USSR has acknowledged Communist China's high place in Bloc councils and its ability to make independent contributions to Marxism-Leninism, and to date Sino-Soviet interests in the Far East apparently have not clashed.

213. Problems associated with Sino-Soviet economic and military relations could also lead to friction. However, Soviet aid programs have apparently gone forward on the planned scale, and there is no evidence that the Chinese have sought more aid than they are getting; Peiping's desire for more assistance probably has been counterbalanced by its wish to limit the degree of its economic dependence. The question of nuclear weapons may be a delicate one; the Chinese have presumably sought them from the USSR, or will do so. The USSR is probably reluctant to supply them because of unfavorable repercussions on the Soviet disarmament position, the attendant loss of Soviet leverage over Communist China, and the potential military risks involved. We believe that nuclear weapons have not been given to China, but that the Soviets may make them available in the future under some form of Soviet control.

214. In sum, we believe that Communist China will attain over the next several years an increasing influence on general Bloc policy and Communist ideology. The Soviet leaders themselves are almost certainly aware of this likelihood and probably view it with concern. Moscow will wish to retain its pre-eminent position in the Bloc and, to the extent that it fears the eventual emergence of an actual rival, will attempt cautiously to minimize Peiping's influence within the Bloc. On the other hand, Peiping's growing stature strengthens the Bloc both internally and externally and in this respect is welcome in Moscow. Moreover, both partners recognize the importance of solidarity to overall Communist objectives and realize that mutual adjustments are inevitable consequences of the alliance.

VI. TRENDS IN SOVIET FOREIGN POLICY

Introduction—The Current Conduct of Soviet Policy

216. Soviet foreign policy, over the more than five years since Stalin's death and increasingly since the consolidation of Khrushchhev's

personal power, has acquired certain characteristics which are important to note in gauging the threat posed to US security. Though they relate more to manner than to content, these characteristics taken together are revealing as to the development of Soviet policy in recent years, and as to the changing assumptions about the world situation which underlie it.

217. Most striking perhaps has been the fact that the conduct of Soviet foreign policy has shown itself more energetic, assertive, and rapid both in response and in seizing the initiative. In part, of course, this reflects the impress of Khrushchev's personal style of leadership, in part also Soviet consciousness of the USSR's growing military and economic power. But it also reflects the Soviet belief, first, that a more dynamic posture would be effective in the present world situation, and second, that the main struggle with the West lies at present in the world political arena, rather than at the military frontiers between the power blocs. Soviet policy has come to employ its propaganda weapons with greater aggressiveness and shrewdness, attempting to build the image of a "peace-loving" yet formidable power, confident that by so doing it can effectively alter the alignment of political forces in the world.

218. Tactical and ideological flexibility has become another hallmark of current Soviet foreign policy. The Soviet leaders have shown themselves willing to entertain a variety of new policies without regard to positions taken up earlier and have accommodated ideology more and more to the changing requirements of policy. Thus in 1956, in support of the tactics of peaceful coexistence, they undertook a major revision in Communist doctrine: they found that war with capitalist states was no longer "fatally inevitable." They also found it expedient to abandon Stalin's rigid division of the world into the socialist camp and the capitalist encirclement; instead of assuming that all countries beyond the Bloc were tools of world imperialism, they came to discriminate various shades of political alignment, even among allies of the US.

219. There has also been an extension of the scope of Soviet foreign policy. There are no longer any neglected areas in the world as there were in Stalin's time. Since 1955 the Soviet leaders have taken major initiatives in the Middle East, and have become far more active in Asia, Africa, and Latin America. The Soviet press frequently tells its readers that no longer can any issue in the world be resolved without taking account of Soviet views. Doubtless there is an element of propaganda bravado for domestic consumption in this, but it also reflects an increasing disposition to regard the USSR as now one of two great world powers, and therefore entitled to have global concerns. In situations of crisis everywhere there has been a tendency to put forward the Soviet view assertively and to refer to the factor of Soviet military power in a more blunt fashion.

220. Finally, Soviet conduct is marked by an apparently high and genuine confidence. The Soviet leaders evidently believe that, despite the many and serious problems which face them, the movement of events increasingly justifies their long-held hopes for the ultimate triumph of "world socialism" under Soviet leadership and tutelage. This mood probably reflects satisfaction with Soviet economic and scientific advances, and with the growth of Soviet military power, as well as gratification over the sharpening difficulties for Western interests in certain areas of the world. While we do not conclude that the Soviet leaders are so overconfident that they would be tempted to incautious behavior, this is one of the hazards which might attend any striking new advance of Communist power or reversal for the West.

Current Soviet Objectives and Main Lines of Policy

221. How do the Soviet leaders view the outlook over the next several years and what are the immediate objectives which they consider feasible to pursue in moving toward an expansion of Communist power? In broad terms, they probably believe that there is an accelerating trend toward enhancement of the world power position of the Communist Bloc and a corresponding decline in that of the US and its allied states. This is the traditional view which springs from Marxism-Leninism, but which they will see as confirmed recently by their own gains in economic power, their weapons advances, and the sharp political disturbances in the non-Communist world. At the same time, they appear to believe that the strength of the Western states continues to be formidable and that it should not be frontally challenged.

222. Consequently, the main strategy of Communist policy continues to be that of reducing the Western power position by gradualist means and enhancing that of the Bloc. The Soviet leaders probably list their principal objectives over the next few years as follows: (a) reinforcing the unity of the Communist Bloc and pushing rapidly its growth in military and economic power; (b) encouraging political divisions within the non-Communist world, particularly with a view to isolating the US and constricting the deployment of its military power and the extent of its political influence; (c) seizing whatever opportunities may offer for alignment of non-Communist states with the Bloc, and, where expedient, for outright territorial expansion of Communist power.

223. The means which the Soviet leaders intend to employ in pursuing these objectives are various. As indicated, they will of course push the actual expansion of their own economic and military power base as rapidly as they can. They see this as the foundation of their policy. But they will also use all the means at their command to make it widely believed that Communist power is great and growing, that in some important respects it already outpaces the West, and that the future belongs to their kind of society and their power system. To project

this image of themselves and of the world situation they will press the programs they have developed in recent years: an active diplomacy, a large-scale propaganda effort, trade and aid, and cultural exchanges.

224. *Attitude toward war.* We believe that at least for the period of this estimate the Soviet leaders will continue to put their main reliance in the struggle with the West on such political weapons. Despite the continuing growth of their military power, in particular their acquisition of growing capabilities for nuclear attack on the US, we continue to believe that they will not deliberately initiate general war. They will probably estimate that even with a lead in long-range missiles, they could not be certain of winning a general war, and that the scale of damage in such a war would threaten the survival of their society.

225. In the Soviet conception, military power should be used in the first instance and by preference as a political weapon. The enemy should be maneuvered into such a vulnerable military-political situation that he forfeits key positions without military resistance. Actual use of military power is envisaged only if there is confidence both that the gains will outweigh the losses, and that the risks are acceptable. Therefore, the immediate question posed by the growth of Soviet military power is whether the Soviets will be increasingly tempted over the next several years to use the threat of their military power more overtly and boldly as a means of pressure on the West.

226. Another serious question arises from the increasingly aggressive conduct of Soviet foreign policy on the one hand and the continuing growth of Soviet military power on the other: will the Soviets employ their own or other forces controlled by them in local military actions, estimating that the US will be deterred from making an adequate military response by fear of general war or of adverse political consequences?

227. National Estimates have stated consistently over the last several years that the Soviet leaders would try to avoid general war and that they would seek to avoid situations which in their view involved serious risk of general war. We believe that this estimate can be reaffirmed. However, we also believe that the Soviet judgment with respect to the kind of situations which do involve serious risk may be changing. The advance of their own military power, together with the growing political vulnerability of key Western positions, will probably lead the Soviet leaders to increase their general pressure on the West and to exploit local situations more vigorously. While we have always considered it possible that Bloc forces would be used in overt local aggression if this could be done without much risk of serious involvement with Western forces, we do not believe that the likelihood of such aggression has increased. However, we do believe that the Soviets will combat more actively than hitherto the presence of Western influence in

contested areas, relying upon threats to prevent the West from taking counteraction to preserve its influence. In this sense, we believe that there is currently a tendency on the part of the Soviets to view the risks of a more aggressive policy as less serious than in the past. This tendency could be reversed as a result of Western actions or as the result of a change in the Soviet leadership. But so long as this tendency persists we believe that the danger of war by miscalculation will be increased. At present, we believe that this danger is somewhat greater than our estimates in recent years have indicated.

228. *A posture for "peace."* Even if Soviet political warfare does become more vigorous and increasing pressure is applied against the West, Soviet policy will continue to garb itself with the slogans of "peace." It will not go over to an overtly and frankly aggressive posture. Rather it will continue to present itself as still striving for "peaceful coexistence" and as leading the "struggle for peace." The Soviet leaders recognize that the world-wide fear of war is so intense that great political strength is added to that side in the power struggle which can capture the force of this sentiment, and thus align large bodies of opinion with its own cause. Identification of the USSR with hopes for peace and the US with war and aggression will remain a principal aim of Soviet propaganda strategy.

229. To some extent, the desire to maintain the plausibility of this posture imposes inhibitions on the use of force; this is one reason for regarding open aggression by Bloc forces across state frontiers as unlikely. In general, Soviet leaders, believing they can continue to reap rewards with their "coexistence" tactics with little risk, are likely to view open military aggression as politically undesirable and unnecessary. Instead it will be their aim to create, mainly by political means, situations in which the West must either concede a Communist advance or resort to the use of force under unfavorable circumstances. Western concessions could then be construed by Soviet propaganda as bowing to the Soviet deterrent. If the West elected to use force, it would be compelled to do so under political and perhaps military handicaps. In either case, the Soviets would expect to intensify divisions within free world alliances and to align the uncommitted more closely with the Communist camp.

230. The Soviets will probably continue also to display an apparent readiness to engage in direct negotiations to settle outstanding issues. Proposals for high level talks will probably be renewed at any juncture the Soviet leaders find favorable to themselves. They will regard such meetings as primarily of a demonstrative character, intended not to result in freely negotiated settlements, but rather to force the Western Powers under pressure of world opinion to accede to Soviet-proposed formulas. They will attempt to pose the alternatives of "peaceful

coexistence” on the one hand, or of tensions bringing a rising danger of nuclear war on the other, hoping by occasional measured reminders of the latter to stimulate acceptance of the former on Soviet terms.

231. *The underdeveloped countries in Soviet strategy.* The effort to align the USSR in apparent support of broadly held popular aspirations takes its most general form, other than in peace propaganda, in identification with various “national liberation movements.” People in underdeveloped countries are being told that the USSR champions peace, progress, and national independence, while the West stands for war, reaction, and colonialism. Moscow clearly sees the underdeveloped countries—with their weak economic and political systems, strong nationalist and anticolonialist sentiments, neutralist tendencies, and resentment at past and present domination by Western European countries—as the most susceptible ground for expansion of Soviet influence at Western expense. It is this calculation which underlay the Soviet attack in recent years on Western interests in the colonies and former colonial countries of the Middle East, Asia, and Africa.

232. In part this campaign is intended to deny resources and bases in these areas to Western use. But the Communists have apparently come to believe also that it is precisely in underdeveloped and colonial areas that the best prospects for Communist advances now lie. At a minimum, they hope to bring national movements and states in these areas under Soviet diplomatic and economic influence. By thus entering into what in current Soviet parlance is called the “zone of peace” these peoples would enhance the weight of the Bloc in the world political balance. At a maximum, the Soviet leaders hope that anti-Western national movements can with native Communist participation be given a gradually more radical complexion, a process which would result ultimately in the establishment of Communist or Communist-controlled parties in power. They anticipate that rising expectations in these areas will far outrun the possibilities of fulfillment, thus giving the Communists a chance to seize the revolutionary initiative. We believe that the effort to capture a dominant position in underdeveloped areas of the world will continue through the period of this estimate to be one of the main preoccupations of Soviet policy.

233. The USSR’s targets among the underdeveloped countries may shift considerably during the period under consideration, in accordance with changing opportunities and local Communist successes and reverses. Frictions between Moscow and Afro-Asians will tend to arise in many countries—as they have already arisen in some instances—as the first bloom of friendly cooperation wears off. Moreover, the basic rationale for Moscow’s present collaboration with most Afro-Asian countries—their common anti-Western orientation—may even be somewhat eroded as some of the current points of difference

between the rising nations and the former imperial powers diminish. At the same time, Moscow will seek out new areas for the expansion of its political and economic influence, particularly in Latin America and Africa. In those countries where its efforts are most successful, the USSR may increasingly be tempted to resort to more direct means, that is, support of local Communists in attempts to seize power. But the Soviets would carefully weigh such gains against the harmful consequences such a policy would inevitably evoke elsewhere.

234. *Trade and aid.* Soviet trade and aid programs are the economic adjunct to the strategy of penetration in underdeveloped areas. The underdeveloped countries, many of which are also politically uncommitted, are generally receptive to Soviet offers of aid and offer the prospect of high political gains in return for comparatively small economic investment. Rather than being widely dispersed, aid has been concentrated on countries which are especially susceptible to Soviet influence and also in most cases are of political or strategic interest to the West.

235. From January 1954 to June 1958 the USSR extended approximately \$1.2 billion in credits to underdeveloped countries in the free world, of which \$300 million has already been used. Credits and grants by other Bloc countries bring the total to more than \$2 billion, of which \$1.3 billion has been obligated and \$740 million has been expended. About three-fifths of the total Bloc credits expended have been in the form of arms deliveries to Syria, Egypt, Yemen, Afghanistan, and Indonesia. These same countries plus Ceylon, India, Burma, and Cambodia have received the major part of the economic aid. During the first half of 1958 there were at one time or another an estimated 3,700 Bloc technicians (including military specialists, totaling about one-third of this number) in 17 underdeveloped countries, representing an increase of more than 50 percent over the preceding six months. In magnitude these programs are relatively small compared with Western efforts on a global basis, and the burden they impose on the Soviet economy is slight, annual expenditures thus far being only a few tenths of one percent of Soviet national product.

236. *Attitude toward the UN.* To the extent that the Soviets succeed in gaining influence over the policies of underdeveloped and neutralist countries, and as the number of Afro-Asian members increases, the UN will become a more attractive forum for them. They probably expect ultimately to find issues on which they can align majorities against the US and obtain endorsement of Soviet policies. They calculate that such a demonstrative isolation of the US would disturb US-allied relations and curtail US influence in many areas. If the UN then became an issue in US domestic politics, the repercussions abroad would compound the Soviet advantage. We believe that the Soviets consider the chances for

political warfare victories within the UN framework to be sufficiently promising so that they will continue to give that body major attention.

237. *Disarmament.* The Soviet leaders evidently believe that by showing an active interest in disarmament they can enhance their claim to leading in the cause of peace. More specifically, they hope to neutralize Western nuclear striking power by intensifying the stigma attached to nuclear weapons and thus inhibiting their actual or threatened use by the West. They may also believe that disarmament negotiations can help to reduce the chances of nuclear war. They will almost certainly, when circumstances seem to them appropriate, press for a continuation of such negotiations.

238. It is possible that the Soviets will conclude limited agreements in the field of disarmament, even if these involve some limitations on their own military capabilities, in order to gain what they would consider to be a net advantage. Probably they have not yet resolved on the precise shape of agreements which would meet this prescription. We believe that their deep suspicion of the West and their aversion to extensive inspection in the USSR will forbid their acceptance of any truly comprehensive disarmament scheme, and will make negotiations on even the most limited measures highly complicated and drawn out.

Soviet Policy in Particular Areas

239. *The Middle East.* This area has offered since 1955 the most striking example of the attempt by Soviet policy to support anticolonialism and nationalist movements against Western interests and influence. The USSR did not create the Arab nationalist movement, but in providing the political backing of a great power, together with substantial military and economic assistance, it has enormously increased the power and effectiveness of the movement.

240. The immediate Soviet aim is to deny this area to the West and to expand Soviet influence there, rather than to gain direct control of it. If Soviet policy can deepen the conflict between Arab nationalism and the West to the point of irreconcilability, several results follow: closer association of Arab states with the Bloc tends to alter the world political alignment in the latter's favor; Western military bases in the Arab states are eliminated; Western control of the oil resources becomes tenuous. Consequently, we believe that Soviet policy will continue to present itself in the Middle East as the friend and supporter of Arab nationalism in the latter's struggle against Western "imperialism," and more particularly, will for the present support Nasser as leader of the Arab nationalist movement. Further military and economic assistance will be made available to the United Arab Republic; UAR positions on Jordan, Lebanon, the Aden Protectorate, and other trouble spots involving Arab-Western conflict will be supported in Soviet propaganda and in the UN.

241. The Soviet leaders probably believe that at some stage the Arab nationalist movement can be given a revolutionary turn toward Communism and brought under Soviet control. They believe that a sharpening of the Arabs' conflict with the West, to which their propaganda and Communist subversive elements in the area can contribute, will facilitate this development. To the extent that such a revolutionary turn towards Communism actually takes place, the basic incompatibility of Soviet aims with those of the present leaders of Arab nationalism, whom the Communists regard as "bourgeois nationalists" playing a transient historical role, will emerge. Communist penetration and subversion of the nationalist movement may occur unevenly in different Arab countries and the Soviets may at some point be tempted to abandon their restraint and encourage a Communist takeover in some key Arab state, provided they consider the stakes high enough to compensate for the resulting damage to Moscow's relations with other Afro-Asian neutrals.

242. Insofar as Western influence is eliminated from the area the Soviets will seek to reduce Nasser's pretensions and to make him increasingly their prisoner. They will try to deny him the opportunity to pursue a truly neutralist policy in which he tries to keep lines open to both power blocs. They will seek to displace his influence over other Arab states with their own and to prevent the consolidation of Arab unity under his aegis. They will oppose his suppression of local Communist parties and try to bring these into the open as leaders of the nationalist movement. There are already some signs, in Iraq for example, that the Soviets are opposing Nasser's leadership of the Arab nationalist movement in these ways. We believe, however, that they will be extremely cautious in their efforts to undermine Nasser and, before moving openly against him, will await a time when they believe that the local Communists have captured control of the mass movement or when Nasser has so isolated himself from the West that he can no longer hope to get its support against the Soviets and the Communists. An open conflict between Nasserism and Communist expansionism seems unlikely in the immediate future, but it might develop during the period of this estimate.

243. The Soviet leaders must be aware that the Western Powers are bound to attach the highest importance to the protection of their interests in the Middle East. How do they evaluate the possibility that their pledges of support to the leaders of the Arab nationalism, who cannot be fully controlled by them, may entrain the USSR in situations of great risk? Developments in the area over the past few years have probably led Moscow to place considerable confidence in the growing effectiveness of a Soviet deterrent against Western use of force to overthrow an Arab government friendly to the USSR. The Soviet leaders

probably also believe that the Western Powers in most instances would be restrained from such action by the unfavorable political reactions that would follow, both in the area and in the neutralist countries throughout Asia and Africa. Nevertheless, the intervention of the US and UK in Lebanon and Jordan demonstrated that there are circumstances in which Western powers would be willing to use military force. If the Western Powers became involved in conflict in the area, the Soviet leaders would probably not engage Soviet forces openly or take other actions which involved in their view serious risk of expanding hostilities. However, we believe that the Middle East is one of the areas where the danger of war by miscalculation has increased.

244. While Soviet policy in the Middle East is not aimed primarily at military gains, the Soviet leaders probably view the developing situation there as offering opportunities to build potential military assets. They undoubtedly calculate that in the event of Soviet military operations in this area they would benefit from their earlier peacetime introduction of military technicians, Soviet type weapons, fuel and materiel, from their increased capabilities for espionage and subversion, and from the improvements which have been made in local airfields, harbors and other facilities. The Soviet leaders probably also contemplate the eventual achievement of a long-sought Russian goal—land access to the strategic areas of the Middle East. To this end, they will continue to encourage and support such movements as that for an independent pro-Soviet Kurdish state and for a pro-Communist government in Iraq, and will also continue pressures against Iran and Turkey.

245. *Asia.* The USSR will probably rely on its current policies—propaganda about the successes of Communism, support of national independence against Western imperialism, and offers of trade, aid, and cultural exchange—to sustain and deepen neutralism, promote pro-Soviet alignments, and gradually to erode Western influence in Asia. Further increase in the strength of the Communist parties in Indonesia and India might induce the Soviet leaders to switch to open support of them, but it is more likely, in the case of India at least, that for the next several years Soviet policy will find greater advantage in cultivating the existing governments. In Asia, it is probably these two countries which are of primary interest to Communist policy at present.

246. Policy toward Japan will probably continue along the routine line laid down over the last several years—propaganda to stimulate Japanese neutralism, disturb Japanese-American relations, and maintain pressure for denial of bases to the US. The Soviet leaders probably do not believe that they have the means to alter the situation in Japan in any important way for the present. Likewise, they probably regard the situation in Korea as stalemated, although they will continue to agitate for withdrawal of US forces.

247. Soviet policy in Southeast Asia appears to operate jointly with that of Communist China on the principle of shared influence. The Soviets will probably continue to give primary emphasis to cultivating closer relations with neutralist governments in the area. They will maintain their effort to disrupt SEATO and to align uncommitted states with the Sino-Soviet Bloc on all broad international issues. They will also stress their willingness to extend economic aid to the Southeast Asian states and will tout the value of Communist methods as the best way to achieve the economic development these countries so desperately seek. However, we believe that, should favorable opportunities arise and should they estimate that the gains would outweigh the losses, the two Communist powers might support a local Communist party in an attempt to seize power. At present, Indonesia or Laos seem the most likely places for such a development eventually to occur.

248. *Africa.* As part of its effort in the underdeveloped areas, the USSR will almost certainly increase its activities in Africa during the next five years. It is already developing diplomatic and economic relations with the newly independent states of Morocco, Tunisia, and Ghana, and is devoting somewhat greater efforts to Libya and the Sudan. It has offered trade, aid, technical assistance and, in some cases, arms. Although Soviet policy is somewhat constrained by the desire not to appear to compete too obviously with Nasser in the primarily Arab and Moslem areas in which he hopes to extend his influence, the USSR will almost certainly expand its efforts to establish its diplomatic and economic presence on the continent, to encourage nationalist and anticolonial movements, and to attempt to end the exclusiveness of Western influence in most of the area.

249. Up to the present the USSR has followed a policy of restraint toward North Africa, largely out of regard for Soviet relations with France and for the position of the French Communist Party. At some point, however, the USSR may abandon this policy. Internal developments in France or in Algeria might convince the Soviet leaders that they would gain more from open support of North African nationalism. In any case, material support may be given to the Algerian nationalists, though probably through Egypt rather than directly. Arms and economic aid offers will probably be pressed on the Tunisian and Moroccan Governments.

250. *Western Europe.* Current Soviet policy in Europe appears to be aimed more at consolidating the USSR's position in Eastern Europe than at an early expansion of Soviet power beyond the present frontiers of the Bloc. In order to achieve greater security for Communist control of Eastern Europe, as well as to weaken the position of Western Europe, the Soviets are bound to regard the dissolution of the NATO alliance and the withdrawal of US military power from Europe as

basic objectives of their policy. These are the main purposes of all their maneuvers and proposals aimed at achieving "European security." The more immediate Soviet objectives are to prevent an increase in West German military strength and the establishment of additional missile bases in Western Europe. Soviet disarmament policy and its attendant propaganda is directed largely at these targets. Moreover, the Soviet policies in the Middle East, Asia, and Africa, apart from their intrinsic importance, are themselves calculated to impose material and political losses on Western Europe and to encourage divisions there.

251. The current Soviet diplomatic offensive over the status of Berlin is the most striking example of Khrushchev's activist foreign policy. The Soviet leader must be aware that there is virtually no point of controversy between East and West on which the West has so thoroughly committed itself, and that there can scarcely be a more dangerous international issue to push to the point of crisis. In raising the issue, the Soviets have had in mind the achievement of a number of major objectives. They seek to compel the Western Powers to deal with East Germany and thus to accord at least tacit recognition to the GDR. This in turn would constitute an important step toward a ratification of the status quo in Eastern Europe, a development which the Soviets have long sought. Further, the removal of the Western presence from Berlin would permit the Soviets to handle the escapee problem and generally to reinforce the internal security of their East German Satellite. They probably further calculate that the Berlin initiative, even if only partially successful, will stimulate a more receptive atmosphere for other Soviet proposals on Germany, particularly disengagement and peace treaty negotiations. In addition, the Soviets probably expect that a serious Western retreat on Berlin would bring into question for many West Germans the desirability of the NATO alliance.

252. It is not clear why the Soviets have chosen the present moment to raise the Berlin issue, but their action is certainly in accord with the generally hardening tone of their foreign policy. This in turn is related to their growing conviction, manifest over the last year or so, that their relative power position has improved. They are presumably acting on the assumption that what they describe as "a shift in the relation of forces in the world arena" in their favor gives them an opportunity to test the solidarity of the Western Alliance over a major issue. The Soviet leaders probably intend to be cautious and tactically flexible. We believe that they will try to direct Soviet and East German maneuvering in a manner which will avoid military conflict with the Western allies, while at the same time they will be prepared to take advantage of any signs of weakness on the part of the West, or of inclinations to compromise on major issues. Nevertheless, they have

already committed themselves considerably, and we believe that the crisis may be severe, with considerable chance of miscalculation by one or both sides.

253. We do not believe that the raising of the Berlin issue signalizes a Soviet willingness to move toward a settlement of the German problem as a whole on other than Soviet terms. We foresee no change at present in the USSR's adamant opposition to German reunification despite the handicaps this imposes on Soviet maneuverability in Western Europe. The Soviet leaders cannot contemplate abandonment of East Germany because of the threat which would probably develop to their whole position in Eastern Europe, beginning with Poland. Over the longer run, a major political change in West Germany, such as might develop after the death of Chancellor Adenauer, could lead to a new and seemingly more flexible Soviet and East German approach to Bonn and to the reunification problem. The Soviets probably believe that a period of political uncertainty would ensue, and that party realignments would give them new opportunities to promote West Germany's separation from NATO and the withdrawal of Allied military forces, to achieve international recognition of East Germany, and eventually a reunification scheme acceptable to the USSR.

254. Moscow probably has come to view the Communist Parties in Western Europe more as a vehicle for propaganda and agitation than as the basis for revolutionary action, at least for the next several years. While the long-range subversive and political potential of these Parties will be cultivated, their present role is mainly to support Soviet foreign policy objectives, such as arousing popular concern against West German nuclear armament and the stationing of missiles in Europe.

255. *Latin America.* The trend noticeable in the last year of increased Soviet attention to Latin America will continue during the coming five years. The USSR apparently estimates that current economic and political differences between the US and Latin America and the elements of political instability in certain countries provide a promising opportunity to expand Soviet influence. In the immediate future, Moscow will concentrate on broadening its diplomatic and cultural relations and on trade or economic assistance offers in selective, politically sensitive situations in order to expand Soviet influence on the governmental level and to facilitate both the overt and the subversive activities of local Communists. The most significant recent Soviet economic moves in Latin America have been the conclusion in October 1958 of a \$100 million credit to Argentina for the purchase of Soviet petroleum equipment (the largest Soviet credit offer extended to any non-Communist country outside the Afro-Asian Bloc), large-scale Soviet purchases of Uruguayan wool, and the conclusion of a barter deal with Brazil.

BLOC TOTALS (Rounded)	6,750,000	1,050,000	850,000	75,000	750,000	8,725,000

¹Figures in this table are based on estimated order of battle. Estimates of this type yield approximate rather than precise measures of strength at any given time, and can lag considerably behind changes in actual strength. [All footnotes in the table are in the original.]

²These figures do not include ground, naval, and air forces personnel permanently assigned to the air defense forces (PVO) with aircraft control and warning as their primary duty.

³For purposes of this table, an estimated 110,000 Naval Aviation personnel are included in total Soviet air forces personnel strength.

⁴Does not include KGB naval forces which in this table are carried in Soviet security forces total.

⁵Includes 2,000 naval air.

⁶Includes 8,000 naval air.

TABLE 2—ESTIMATED STRENGTH OF BLOC GROUND FORCES IN LINE DIVISIONS, 1 OCTOBER 1958¹

North Vietnam	14	12,640	10,250													14
TOTAL	255			52			32			33			14			389 ⁶

¹Actual strengths of divisions vary. The figures shown represent estimated averages. [All footnotes in the table are in the original.]

²Additional Soviet combat units are estimated to include 20 artillery divisions, 80 antiaircraft artillery divisions, and 120 separate brigades.

³Estimated dispositions of Soviet line divisions: Occupied Europe, 25; Northwestern USSR, 9; Western USSR, 56; Southwestern USSR, 20; Southern USSR, 24; Central USSR, 10; Soviet Far East, 31.

⁴The total of Chinese Communist divisions includes 3 small cavalry divisions.

⁵The Hungarian Armed Forces not now considered to be effective; ground force in process of formation will amount to some 4 divisions.

⁶Estimated breakdown by major groupings: USSR, 175; Communist China, 123; European Satellites, 59; North Korea and North Vietnam, 32.

[Omitted here is Table 3.]

¹Additional possible developments during the period of this estimate, for which no detailed performance characteristics have been estimated, are mentioned in the Discussion, Chapter IV, paragraph 144. [All footnotes in the table are in the original.]

²Refueling estimates based upon use of compatible tankers which provide approximately 30–40 percent increase in radius/range.

³Future improvements of BISON and BADGER aircraft are based on normal expected improvements through the 1960 period; in particular, replacement of the present 18,000 lb. thrust engines with those having a thrust of about 20,500 lbs.

⁴Jet medium bomber with supersonic “dash” capability.

⁵Capable of carrying 100 n.m. range ASM, of approximately 11,000 lb. gross weight.

⁶Includes 500 n.m. “dash” at Mach 1.5.

⁷For 10,000 lb. bombload unless otherwise indicated.

⁸For 3,300 lb. bombload.

⁹Service ceiling at maximum power with one hour fuel reserves plus bombload aboard. No range figure is associated with this altitude.

¹Unless otherwise noted, performance figures are calculated with internal fuel only. [All footnotes in the table are in the original.]

²Highest altitude at which aircraft can climb at the rate of 500 feet per minute with maximum power.

³Data shown at gross take-off weight with maximum power unless otherwise noted.

⁴FRESCO D and E have a limited all-weather capability (i.e., equipped with search radar, but without tracking capability). The E version, however, has no afterburner and has about the same performance as the A and B.

⁵FISHBED, the delta-wing version of FACEPLATE, is believed to have similar performance characteristics.

⁶FISHPOT, the delta-wing version of FITTER, is believed to have performance characteristics somewhat inferior to FITTER's. However, it is estimated that the USSR will continue to develop and improve FISHPOT as an all-weather fighter for first operational use in 1959. FISHPOT appears compatible with installation of a search-track radar.

⁷Military power (without afterburning).

¹In addition to the major surface ships shown, we estimate in mid-1958 there were 1,980 minor surface ships in the Soviet service, and 599 in the Satellites and Communist China. Minor surface ships include amphibious, mine warfare, and patrol ships. "Old" surface ships are those more than 20 years old. [All footnotes in the table are in the original.]

²"Old" submarines are those 14–20 years old.

³Conventional submarines of post-World War II design and construction, including "W," "Z," and, "P" Class long range, "Q" Class medium range, and a new medium range submarine.

⁴New Soviet submarine programs now under way will probably include ballistic missile submarine systems, and possibly also submarines designed for internal stowage of cruise-type missiles. While there is little evidence on the progress of such programs, the figures given here take account of both possibilities. For further information as to types, see Chapter IV, paragraph 154.

⁵Submarines older than post-World War II but less than 14 years old.

TABLE 12—ESTIMATED CHARACTERISTICS AND PERFORMANCE OF SOVIET
"Z," "W" AND "Q" CLASS SUBMARINES

Class	Length/ Beam (ft)	Displace- ment (tons) Surfaced/ Submerged	Diving Limit (ft)	Arma- ment Torpedo/ Mine	Performance—Speed (Kts)/Endurance (n.m.)			Operation Radii* n.m./days on station
						Surfaced	Snorkeling	Sub- merged
"Z" (Long range)	290/26	1950/2290	650	24/48	Maximum	16/6900	11/7100	17/8.5
					Cruising	10/17,200	8/12,400	3/108
"W" (Long range)	240/22	1300/146	650	14/26	Maximum	15/6000	11/5100	16/8
					Cruising	10/12,000	8/8300	4/144
"Q" (Med. range)	165/17	400/465	450	8/12	Maximum	16/1700	12/1300	15/7.5
					Cruising	4/4600	8/2500	4/144

*These radii are based upon the following arbitrary patrol conditions: Each day of transit consists of 12 hours of surface running at 10 knots during hours of twilight and darkness and 12 hours of snorkel running during the day at 8 knots. Fuel consumption on station is based upon submerged running at 3 knots with sufficient snorkeling to maintain batteries. [Footnote is in the original.]

135. Memorandum of Conference with the President¹

Washington, February 9, 1959, 10:30 a.m.

OTHERS PRESENT

General Twining
Major Eisenhower

General Twining opened by telling the President of the visit of General Norstad, who had been in Washington for the week end. The purpose of his trip had been to testify before the Mahon Subcommittee (Defense) of the House Appropriations Committee. On Saturday morning General Norstad met with the Joint Chiefs of Staff. The subject at that time had been the current U.S. position on contingency plans for Berlin, which General Norstad had thought was very fine. To this the President added Secretary Dulles had had a successful trip to Europe and had reported that the French are taking a much more positive view on the Berlin question. (The Secretary had pointed out, however, that despite their resolution, the French have very little capability available in Europe itself.)

General Twining then mentioned the idea of a military representative to the tripartite meetings which are being held in Washington between Alaphand, Caccia and Murphy. (These are being held in response to De Gaulle's desire for tripartite discussions within NATO.) Specifically, Admiral Dennison had been present at the first meeting, held recently, to brief on the subject of the Far East. The Joint Chiefs of Staff desire to terminate this procedure of providing a military representative at first chance, fearing that too many political problems will be pushed off on the military. General Twining promised that he would see Mr. Murphy on the subject. He added, however, that at the meeting between Secretary Dulles and General De Gaulle it had been helpful to the Secretary to be able to state that we provided a military representation to this tripartite meeting. General Twining believes that he has now arrived at an estimate of what De Gaulle wants. Primarily, he desires to have a veto over the use of our Strategic Air Command.

* * *

General Twining then brought up the matter of personnel changes in Europe. General Norstad had voiced the desire to remain in his present job to the end of this Administration; specifically, he feels he should

¹ Source: Senior military personnel appointments, publicizing defense efforts; Congressional hearings. Top Secret. 7 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on February 10.

wait until after the 1960 election. General Norstad had pointed out that he desires to retire rather than continue on active duty, since his investment in the European job is so heavy as to practically cut him off from any terms of reference of a job in the U.S.

The President was in general agreement with General Norstad's desires, although he feels that late summer of 1960 would be a preferable time for the switch. He stated that he would like to make the change about three or four months before the end of the Administration. He would like General Norstad to remain on active duty after his return to the U.S.; but he fully realizes the difficulty in readjusting from a position of SACEUR to any other. He asked General Twining to request General Norstad to come and visit him next time he is in Washington.

As to the timing of a departure by General Norstad, the President sees no problem. General Schuyler's changeover will occur in June 1959. His replacement will eventually become SACEUR. This will make June 1960 the first time in which General Schuyler's replacement could take over from General Norstad, since it would require at least a year for an officer in the Chief of Staff position to "sell himself" to the European nations. The President pointed out that he had followed this procedure with General Gruenther, and that only in the case of General Ridgway had an officer been sent in from another area to take over that command.

General Twining then stated that General Norstad would favor General Taylor as his replacement, although they all realize that General Taylor has completed his tour as Army Chief of Staff, and the Secretary of Defense thinks it unwise to appoint him for a third term. Accordingly, General Twining feels that General Taylor could take over the position of Deputy CINCEUR, now held by General Palmer. On this the President reviewed some names of officers he would nominate for this position. He agrees with the difficulties in the appointment of General Taylor, but feels (and General Twining agrees) that the officer should come from the Army. Specifically, the President mentioned General Decker, General Davidson, and General Lemnitzer. In response to General Twining's statement that General Lemnitzer is slated to be Chief of Staff, the President answered that that officer should be groomed for General Twining's position, Chairman of the Joint Chiefs of Staff. Some discussion of individual officer qualifications then followed, with General Twining expressing the view that if SACEUR is to be an Army officer, then the position of Deputy CINCEUR, presently held by General Palmer, should be held by an Air Force officer. He also stated that General Norstad is making every effort to consolidate some Army headquarters in Europe. To this the President responded with enthusiasm.

The President then brought up the matter of a recent Air Force promotion list which had been sent to his desk. The promotion of the five officers involved (to three star general) would have resulted in exceeding current vacancies; however, the recommendation had included no notation to that effect.

As a corollary to this matter, the President expressed the opinion that there are too many high ranking slots in all three Services. He told the story of a colonel in North Africa who had recommended his own promotion to brigadier general on the basis that he could not do his job as a colonel. When informed that he could then be sent home, the officer changed his mind. Further, the President pointed out that he had been a three-star general with a five-star British admiral under his command.

General Twining stated that they are working on a study in this connection and will make recommendations in the near future. He recognized that the President had normally been prompt in signing promotions, and had recommended in the strongest terms that under such circumstances any promotion should be accompanied by an analysis of the necessity for exceeding the quotas and a complete presentation for the President. General Twining had stated that the President should not be hit cold on these matters. The President admitted that he had been somewhat shocked by the fact that there had been no indication on this promotion list that the quotas had been exceeded.

* * *

The President now brought up the matter of publicity in connection with our defense posture. Specifically, he has been advised by General Persons that the American public should know more about missiles and armaments. In order to give proper publicity in this matter, General Persons feels that we should do something a little different. Speeches are inadequate. Accordingly, it has been recommended that the President make a trip to a Strategic Air Command base, to Cape Canaveral, and to a NIKE site, and at each location, he should make an appearance to the press and attempt to give some understanding of what our defense structure is all about. Accordingly, he requests a restudy of our public information policies on the part of the Joint Chiefs of Staff to determine what type of facts the President might give out under these circumstances.

General Twining, while he expressed approval of this scheme, pointed out that facts and logic are often wasted when the opposition employs tactics similar to those of Senator Symington on the matter of airborne alert. While testifying before Congress, General Twining had been asked by Senator Symington how many aircraft were on airborne alert that particular day. There had been a recent exercise which involved an airborne alert in SAC, but that exercise having been terminated, General Twining so advised Senator Symington. As a result, Senator Symington had made a great issue of this matter to the effect that

it is a shame that none of our aircraft are on airborne alert and blamed the budget for this deplorable fact. Senator Bush had also expressed shock. When General Twining mentioned this later to General Power, he learned that Senator Symington had telephoned General Power that morning and asked how many aircraft were on airborne alert. General Power had given him the facts. As the result, General Twining has received a volume of mail, and in his answers, has cleared the record. In General Twining's view, we have no need for an airborne alert and our capability to respond with SAC on fifteen minutes warning is adequate for our military posture. General Twining then proceeded to describe the tendency on the part of some people to discount everything but relative ICBM capabilities. He pointed out that our Air Force is four times the size of that of the Soviets and ten times as good. It does execute airborne alert exercises from time to time to keep the Soviets uncertain. General Twining expressed admiration for the performance of the Secretary of Defense in his testimony before Congress.

The President stated that he had spoken before about self-appointed military experts. He is considering another statement about neurotics—either honest or dishonest neurotics—who are so fearful that they advocate taking the entire SAC into the air and keeping it there. He conceded that these people realized the aircraft must come down occasionally to gas up. General Twining expressed the view that the public must realize that the USSR has a capability to hit the U.S. and to live with this realization. It is a hard fact of life. The President agreed except that he pointed out that our estimates for the last four years have included the Soviet capability to destroy the U.S. 100%. This was first based on one-way bomber missions and is now based on the ICBM. He reiterated his stand for a reasonably adequate program.

General Twining continued the discussion on enemy capabilities by stating that in his testimony before Congress he personally admitted that he had previously fought for more bombers. He had been concerned over the Soviet capability to build BISONS and BEARS. However, as it had turned out, the Soviets had not built these aircraft and now possess only 100–115 heavy bombers. He had further pointed out to Congress that missiles are only as good as their launching sites. We have not as yet obtained any hard intelligence on any launching sites in the Soviet Union.

The President and General Twining then reviewed the concept of a trip by the President to SAC, to a NIKE site, and to Cape Canaveral, and to issue statements at each location. General Twining stated he would open a study on what might be said at these locations. In this connection, he made mention of the successful flight of the TITAN on February third, adding that this is the first missile which had been successful on its first launching. The President observed that manufacturers in Denver had predicted this.

General Twining then completed his report on the Congressional hearings by describing the question on the subject of the missile gap. When asked how to remedy the missile gap, he had answered that we should merely produce lots of big ATLAS missiles. However, he does not advocate this: The ATLAS is not the weapon that we would ultimately like, and, therefore, large quantities of this weapon would be obsolete soon. He does not believe the USSR is in a mood for general war, particularly in view of the pride that they take in having rebuilt their cities from World War II. He repeated the desires on the part of fearful people, stating that if we bought everything they advocated we would wind up spending \$70 billion for defense alone. Finally, he had suggested to the Congress that they employ the word "operational" when discussing missile sites. He pointed out that there is no glamor to the subject of base building, only to the production of missiles. The President suggested we might mention to the Congress that every missile site near a city makes that city a prime target. General Twining now reiterated his admiration for the performance of the Secretary of Defense before these hearings. In this connection, the President expressed the view that Secretary McElroy, while he should not be made to look too partisan, possesses talents which are such that he should not be lost to Government service when this particular job is terminated.

* * *

As a matter of interest, General Twining then mentioned the attitude of the Congress relative to jurisdiction, which had caused considerable disturbance for a couple of days during the hearings. Primarily, Congress fears that the Executive is taking over prerogatives which are provided theoretically by the Constitution to them. In particular, the prerogative of raising and maintaining "armies." The main problem is that of personnel strengths of the Army, the Marines, and the Reserve components. In the course of these discussions, General Twining mentioned that the Secretary of Defense had been grilled extensively. Finally, he had stated flatly that he did not pretend to be a lawyer, but that whatever the President had done in this matter he concurred in and thought it was right. Although the President had not been aware that the prerogatives question had been a major issue recently, he was quite familiar with the pattern. The Army, Marines, and Reserve components would be, in his view, the only logical areas in which the politicians would be concerned, primarily because these are the areas in which the Administration is cutting back. When an installation is cut out it does injury to some locality.

This resulted in some discussion of the motives of individual Congressmen, particularly in the matter of interfering with Administration plans for projected force structures. In this connection, General Twining mentioned that Representative Arends had come and

hit hard on the side of the Administration, stating that it is not the function of the Congress to interfere in military strategy. Even Mr. Vinson had added some words of help in this regard. Here the President stated that he was not overly concerned with this particular item since he felt he could handle it. He digressed to point up that in the matters of housing and depressed areas, where the Congress appears determined to expend large sums in excess of those recommended, he must win. If not, he fears the most serious consequences to the value of the dollar. He pointed out an article he had read today in the New York Times financial section which indicated a movement of U.S. capital overseas which is reaching the proportion of a "flight from the dollar." Apparently private investors are convinced that the Europeans are building a more viable economy than ours and will overtake us.

* * *

General Twining then mentioned a matter pertaining to command structure of Unified Commands. In the old law the term "operational control" had been employed, implying only the vaguest type of command. The new law has undergone a change in wording which now substitutes the term "operational command." In the course of the proceedings, the term of operational command had been defined the same as the old operational control. Based on this, the Marines have complained to the Congress about the definition of operational command as employed by the Department of Defense, and which, by the President's desires, gives the Unified Commanders complete command responsibility except for technical administrative matters. In the course of the hearings, Mr. Vinson had asked General Twining for the Department of Defense definition. General Twining had explained the difference. Mr. Vinson had then requested that the new definition be incorporated into the Congressional Record. This has been done. In this matter, the President stated he was not concerned, for he is the Commander-in-Chief and can construe the wording as he sees fit. He can be called to account for this matter only by the courts.

* * *

As General Twining was departing, the President asked that he take a check into the matter of comparative grades and position vacancies among the three Services. This had come to the President's attention primarily through briefings that had been held by the Navy requesting new legislation to overcome their rather considerable World War II hump. He cited certain cases with relation to promotion inequities within and among Services. General Twining said he would check into the matter with the Joint Chiefs of Staff.

John S.D. Eisenhower

136. Memorandum of Conference with the President¹

Washington, February 12, 1959, 10:40 a.m.

OTHERS PRESENT

Secretary McElroy
Secretary Quarles
General Twining
General Goodpaster
Major Eisenhower

The President called this meeting to discuss the 1968 projection of our atomic weapons requirements. In particular, he is concerned, in making our long-term estimates, over the use of the actual term “requirements.” He feels that when we deal with numbers in these circumstances we should call them “estimates under bad conditions.”

The President stated that he is not addressing right now the matter of \$145 million for a plutonium reactor with a convertible feature. We are far enough down the road now that he is not going to fight that project. He dislikes, however, the process in which the Joint Chiefs of Staff state so-called “requirements” to the Congress, causing the figures so listed to practically govern our future actions.

The President emphasized that in this meeting he is merely desirous of expressing his doubts and is not issuing a directive. He fears that we have developed a shibboleth which we are then required to live by. In short, we are not being governed by common sense.

Mr. McElroy agreed that the difference between “requirement” and “estimate” is a technical question. However, the President pointed out that the use of the term “requirement” invites demagogues to treat these figures with the sanctity of the psalms and parables.

Mr. McElroy expressed general agreement with this approach and pointed out that the figures ultimately used in this connection were greatly reduced from the original service submissions and were indeed considerably reduced from the requirements as stated by the Joint Chiefs of Staff. The President, however, continued by recalling to mind a graph on our 1968 atomic weapons figures which indicated a stockpile which he considered astronomical. These figures as the President recalled, would be attained by July 1, 1958, if a certain new plant were installed. Without that plant, the figures would be reached by January 1, 1969. Some of these days, in his view, we are going to realize how ridiculous we have been and at that time we will try to retrench. In particular, the President

¹ Source: Projected nuclear weapons requirements for 1968. Top Secret. 4 pp. Eisenhower Library, Whitman File, DDE Diaries.

pointed out that the Executive Branch itself has been fairly sensible, but has been pushed by demagogues and special interests.

The President expressed understanding of the problems of the Joint Chiefs of Staff in testifying before a hostile Congress. He agreed with Mr. McElroy that the best way for a hostile Congress under these circumstances to attack the Administration is to attack it for not fulfilling its military requirements. Mr. McElroy pointed out that the concept of efficiency in government represents the "hard sell" rather than the "easy sell."

Mr. Quarles then offered certain background in this area. He stated that the Department of Defense had resisted the AEC on the matter of forecast of requirements so far in advance as ten years. The AEC feels, however, that it is necessary to forecast requirements this far in order to plan efficiently the construction of our production capacity. Mr. Quarles and Admiral Radford had taken the initial position that our plutonium supply is adequate. However, this position had been overtaken by service requirements for the DAVY CROCKETT and for small nuclear warheads for air defense. These two programs require much plutonium. The second position then taken by Mr. Quarles and Admiral Radford had been that a certain amount of additional plutonium was needed, but not in large quantity since we would have the opportunity to increase efficiency by continued testing. Upon the implementation of the current test suspension, the Department of Defense could not see any further position beyond that of moderate increases in plutonium.

Mr. McElroy then outlined the tack which the Department of Defense follows on these matters. Since the estimated requirements of the Department of Defense always exceed the amount of available plutonium by large amounts, the Secretary of Defense had estimated that in order to obtain a small bite we must raise our estimated requirements considerably. He pointed out the relationship between requirements and time. If we are given a few more years, our annual production can be considerably reduced. He added, however, he realizes that the term "requirements" is a poor word.

The President again focused on the term "requirements" with a thought that the number of weapons actually *required* in 1968 is probably required in 1961. Therefore, a statement of figures as 1968 requirements would invite an emergency mobilization in order to produce them quickly.

Mr. Quarles, in this connection, pointed out that the progression from 1963 to 1968 does not represent significant increase in the number of weapons or in yield; what it does represent is an increase in tactical weapons. This progression is more expensive in terms of plutonium. He admits we would like to reach these levels in 1963 but reasonable production rates require a stretch-out to 1968.

In connection with small weapons, Mr. Quarles continued, the military has stated before Congress that we need a figure much higher than that submitted by the Department of Defense. This has made the Joint Committee highly critical of us.

The President again repeated his concern with the impact on Congress. If we state that we have a requirement now which will not become available until 1968, Congress will be tempted to spend \$20 billion this year in this field alone. The President understands the need for small weapons in air defense and missile defense, although he pointed out that the three scientists who had visited him the day before (Drs. Land, Purcell and Killian) had shown less enthusiasm than he has heard at other times in this area. The President continued that when we come to supplying small yield weapons for the Infantry and the Marines we are getting in to the area of marginal utility. He does not visualize great stockpiles of these weapons around the periphery of the USSR. He pointed out further that our total current megaton capability is estimated so high that if we should employ this quantity of atomic weapons, the fallout from our own weapons could destroy our own country, and indeed the entire Northern Hemisphere. He further expressed the view that we are taking council of our fears. He reiterated that we should push atomic weapons for air defense but be more moderate in development of tactical atomic weapons. He suggested that we indoctrinate ourselves that there is such a thing as common sense. Mr. McElroy agreed and stated that the Department of Defense had fought this line of reasoning when they cut service requests.

The discussion then turned to the subject of military experts, with the President expressing the view that if you try to fight a war with a Board of Political Directors, you will soon find all military commanders being told by Congress exactly what they need. Mr. McElroy also pointed out the number of military “experts” available in Congress. The President illustrated the types of difficulties under which the military works in wartime, citing anecdotes from his own experiences in the Operations Division of the War Department right after Pearl Harbor.

138. Memorandum From Gray to McElroy¹

Washington, February 18, 1959

SUBJECT

Defense Presentations to the President

Pursuant to the understanding reached during discussions with you, Mr. Quarles, and General Twining on February 6, I plan to schedule a series of special meetings with the President which will be devoted to a discussion of major policy questions with respect to military missions and related weapons systems. Attendance at such meetings will be restricted to the following:

The President
The Vice President
The Secretary of State
The Secretary of Defense
Chairman, Joint Chiefs of Staff
Director of Central Intelligence—*for item 1 only*

Special Assistant to the President for Science and Technology
(Dr. Killian)

Special Assistant to the Presidential for National Security Affairs
(Mr. Gray)

White House Staff Secretary (General Goodpaster)
Assistant White House Staff Secretary (Major Eisenhower)
Executive Secretary, National Security Council (Mr. Lay)

¹ Source: Proposes series of meetings with Eisenhower to discuss policy related to military missions and weapons systems. Top Secret; Restricted Handling. 5 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology.

These meetings will be held in the Cabinet Room.

The following four major areas will be considered in these special meetings:

(1) Strategic nuclear striking force requirements and capabilities, including the "optimum mix" both of weapons systems and of targets. (References: NSC Actions Nos. 1846, 1994, 2009)

(2) Continental defense against aircraft and missiles (excluding antisubmarine warfare). (References: NSC 5802/1; NSC Action No. 2009)

(3) Control of the seas, with particular reference to antisubmarine warfare. (References: Report by the Panel on Antisubmarine Warfare of the President's Science Advisory Committee dated December 1, 1958; Study being prepared for the President by the Comparative Evaluations Group, pursuant to NSC 5815)

(4) Tactical forces and requirements for tactical weapons systems. (References: Paragraph 14, NSC 5810/1; NSC Action No. 1934)

I must say to you that as to the fourth area, I myself am not satisfied with the description of it and it may be that we should talk further about the scope and nature of this part of the overall study. However, I feel that it should be included and it seems to me that the kinds of questions asked with respect to it are appropriate.

A useful procedure might be for you to have prepared a concise discussion paper on each topic which could be circulated in advance on an "Eyes Only" basis, one copy each, to those who will attend the special meetings. Any further reproduction and circulation would be subject to your determination. I should hope you would identify major issues and cast them in a form appropriate for discussion and consideration by the President. It would seem probable that major national security policy issues identified during these discussions would later be taken to the National Security Council.

I am attaching a list of some of the kinds of policy questions which might be considered. I shall be glad to discuss with you further, as necessary, the scope of coverage of the four topics.

It would be helpful if you could indicate feasible target dates for each topic.

I wish to confirm the withdrawal of the request contained in my memorandum of January 17, 1959, subject, "Presentation to the National Security Council on Aircraft Programs," inasmuch as its purpose will be served by the plan above set forth.

Gordon Gray
Special Assistant to the President

Enclosure

Paper Prepared in the Department of Defense

Washington, undated

Questions for Consideration

1. *Strategic Nuclear Striking Force*

a. What will be the effect of the appraisal of the relative merits of alternative target systems, directed by NSC Action No. 2009, upon the size and composition of the striking force?

b. In the light of the appraisal referred to in *a* above, what is the most desirable mix of missile systems from the point of view of our optimum strategic nuclear striking capacity on the one hand, and from the point of view of the greatest degree of invulnerability on the other hand, and can these be easily reconciled?

c. Is there a valid requirement to develop another generation of strategic bombers, taking into account the probable capabilities of enemy defenses and the problems of maintaining such aircraft in an alert status?

d. Would it be desirable to extend the effectiveness of POLARIS missiles by adapting them for use on surface vessels, and on land bases, assuming the development of an appropriate mobile launching unit?

e. Should further priority be given to MINUTE MAN by the earlier establishment of a production capability and by seeking to afford it more mobility? What effect would further emphasis on MINUTE MAN have on the TITAN and ATLAS missiles program?

f. What is the proper balance between procurement of additional retaliatory weapons and expenditures to protect those now available against surprise attack?

2. *Continental Defense*

a. What are the best means for defending the striking force? What mixture of active defenses, hardening, dispersal, and quick reaction leads to the greatest certainty of survival for the striking force? How does this best mix change with Soviet capabilities?

b. Assuming that point defenses will be required, what areas are to be protected—SAC bases or urban industrial areas, or both?

c. In the light of the changing nature of the Soviet attack capability, how should air defenses be allocated as between the manned bomber threat and the ballistic missile threat?

d. Are our present programs for early warning against aircraft and missiles adequate to the changing threat? Will our communications

have the certainty and reliability to insure that all forces can respond when warning is received?

e. What facilities have we now for determining that our bases are under attack? What facilities for disseminating this information?

f. Will the concept of perimeter, area and point defense continue to have validity in the 1960–65 period?

g. What is an appropriate balance between manned interceptors, interceptor missiles and ground-to-air missiles?

h. To what extent do our present continental defenses meet the threat of missiles launched from submarines? What measures have promise to be effective against this threat?

i. Is there a need for more centralized management of the various aspects of continental air defense?

3. *Control of the Seas—Antisubmarine Warfare*

a. In what ways can our present ASW capability be improved?

b. Should further emphasis be placed on methods for broad ocean surveillance?

c. Is the effort currently being devoted to ASW commensurate with the threat:

(1) against the continental U.S.?

(2) against task forces and against shipping?

d. Is there a need for more effective, centralized direction of the ASW effort?

4. *Tactical Forces*

a. In the event of general war involving a nuclear exchange, is it assumed that there will be a requirement for further deployment of ground forces overseas? If so, can the probable requirements be determined?

b. Taking into account our commitments and the nature of the threat with respect to hostilities short of general war, do our tactical forces have adequate mobility, flexibility and readiness? Should this requirement have priority over mobilization reserves for general war?

c. Do present programs provide aircraft and weapons wholly appropriate to such tactical combat?

d. Is there a need for so many different tactical weapons (i.e., the 280-mm gun, the 8-inch howitzer, the 155-mm howitzer, HONEST JOHN, LITTLE JOHN, LACROSSE, SERGEANT)?

e. Is there an element of overlap between the Army's growing arsenal of short-range missiles and the Air Force's tactical aircraft; and if so, is this desirable?

f. What will be the requirement for small nuclear weapons to equip ground forces? Can this requirement be met by our programmed production capabilities?

g. Is there an appropriate balance between the amount of resources being devoted to BW–CW procurement and those devoted to research?

139. Briefing Note for the February 26 NSC Meeting¹

Washington, February 25, 1959

SUBJECT

Port Security (NSC Meeting, 2/26/59)

1. The next item for consideration is a report to the Council in response to an NSC Action of 2/19/58 in connection with the approval of U.S. Policy on Continental Defense. At that time, Treasury and Justice were requested to seek new legislation, and draft a new Executive Order. The objective was to increase the effectiveness of that portion of the Port Security Program which provides for the exclusion of subversives from employment on U.S. merchant vessels, and from restricted port areas and waterfront facilities.

2. For reasons which Treasury and Justice may wish to elaborate upon today, they have recommended against the obtaining of legislation and the issuance of the Executive Order called for in the previous NSC Action.

3. The considerations which prompted the Council's action of a year ago were as follows:

a. Under a present law passed in 1950, the President is empowered to adopt measures and issue regulations for the protection of vessels, ports, and waterfront facilities against sabotage and other subversive acts.

b. Pursuant to the 1950 statute, Executive Order 10173 was issued, providing in effect that no person shall be employed as a seaman on a U.S. merchant vessel, nor shall any person be given access to a restricted waterfront facility unless the Commandant of the Coast Guard is satisfied that such persons are not security risks. This Executive Order is still in effect.

c. By 1956, the Coast Guard had checked hundreds of thousands of seamen and dockworkers against U.S. agency files, with the result that

¹Source: Port security. Secret. 7 pp. Eisenhower Library, Whitman File.

the Commandant denied seamen's papers and dockworkers cards to over 3000 individuals (some 400 of whom the FBI had listed for possible detention in the event of a wartime emergency).

d. In 1956, a Federal Circuit Court ruled (*Parker v. Lester*) that the denial and revocation procedures followed by the Coast Guard under the Executive Order failed to meet the constitutional requirements of due process, including the right to confront and cross-examine Government witnesses. The Commandant of the Coast Guard was ordered by the Court to issue seamen's papers, forthwith, to those persons previously denied them. As of 6/30/58, the Commandant had complied with the Court order by granting applications of over 300 persons whom he had previously denied papers because he considered them to be security risks.

e. Treasury previously pointed out several practical problems posed by the Federal Court ruling, including the following: (1) the Commandant of the Coast Guard is compelled by Court order to take action contrary to that required of him under the present Executive Order, (2) it may not be possible to produce certain confidential informants as witnesses in hearings to revoke the papers of a subversive, and (3) witnesses who might be available for testimony are scattered, and funds for witness fees are lacking. (As of 6/30/58, Coast Guard had revoked papers in 2 cases; hearings were pending in 4 cases; the availability of witnesses who could appear to testify was being examined in 65 cases; witnesses were unavailable in 4 cases; data and witnesses were considered to be insufficient at this time in 99 cases; and 105 cases remained to be processed with a view to determining whether hearings should be instituted).

4. Against this background, the Council adopted and the President approved, as part of U.S. Continental Defense Policy (NSC 5802/1), a Port Security section which provides that the various measures for the protection of U.S. ports and vessels shall include: "such exclusion of subversives from vessels and waterfront facilities as is feasible, having due regard for legal procedures and rights". Based on that policy, Treasury submitted and the President approved on 4/21/58 the details of an overall Port Security program which includes a screening program under which the Coast Guard will (a) request FBI name and fingerprint checks of applicants for seamen's papers and dockworkers' cards, (b) keep a list of the persons on whom derogatory information is obtained, and (c) on a *selective* basis, hold hearings to revoke the papers and cards of persons considered to be security risks, in those cases where action can be taken with a reasonable probability of success, in accordance with procedures acceptable to the courts.

5. Meanwhile, Treasury and Justice were asked to propose legislation, and draft an Executive Order, to strengthen the approved Port Security screening program. As reflected in the Justice transmittal which has been circulated to the Council, both Treasury and Justice recommend against seeking additional legislation in this field because it would not stand the test of constitutionality and would raise "broader issues" which might reduce the effectiveness of the program. With respect to the drafting of the Executive Order called for by the NSC

Action, Treasury proposed an amendment to the present Order which would require the Coast Guard to observe due process in the holding of revocation hearings; however, Justice recommends to the Council that an Executive Order not be issued "pending legislative and judicial developments with respect to other personnel security programs". In discussions at the Planning Board, and in conversations which I have had with the Attorney General, it has been indicated that Justice is primarily concerned over the prospect that new legislation or Executive Order provisions which would open up the issue of the right to confront witnesses and thereby prejudice the outcome of present Court proceedings involving the Industrial Security Program.

6. Both of the NSC's Internal Security Committees (which are represented here today) have submitted views on the position taken by Treasury and Justice. *The IIC* has stated that (a) it is concerned over the apparent trend toward backing away from various security programs as a result of recent court decisions, (b) in spite of the difficulties presented by those decisions, the Executive Branch should nevertheless do all that it can to preserve necessary security procedures, (c) the Port Security Program is but one of the security programs considered necessary to protect essential industry and other facilities, and (d) it is necessary to take a long, hard look at what appears to be a softening of our attitude toward necessary security measures, and an aggressive policy should be followed to implement them within the framework of constitutional requirements. *The ICIS* has advised that (a) it does not object to holding a new Executive Order in abeyance, on the understanding that the Coast Guard is presently proceeding under discretionary authority to proceed in selective cases against seamen and dockworkers on whom there is derogatory information, and (b) although proposed legislation is necessary in the countering of the clandestine introduction of nuclear weapons and other subversive activities, it is recognized that the necessary legal procedures must meet constitutional issues already passed on by the courts.

7. Based on all of the above considerations, the Planning Board recommends that the Council adopt and the President approve the following action:

1. Agree that the submission of the draft legislation and Executive Order called for in NSC Action 1862-f be held in abeyance by Treasury and Justice pending the "legislative and judicial developments with respect to other personnel security programs" referred to in the Justice memorandum which was circulated to the NSC on 1/7/59.

2. Note that the Treasury Department will continue to implement, to the best of its ability, the provisions of Par. 19 of NSC 5802/1, and of Par. 8 of the Port Security program approved by the President on 4/21/58, concerning the exclusion of subversives from vessels, ports and waterfront facilities.

3. Note that, although recent court decisions make it impossible to carry out certain internal security programs effectively, it is nevertheless important that the responsible agencies of the Executive Branch make every effort to implement necessary internal security measures within the framework of constitutional requirements.

8. CALL ON the Attorney General.

9. CALL ON the Acting Chairman of the IIC, Mr. Al Belmont, Assistant to the Director, FBI.

10. CALL ON the Chairman of ICIS, Mr. Walter Yeagley, Assistant to the Attorney General in charge of the Internal Security Division.

Attachment

Letter From Rogers to Gray

Washington, February 25, 1959

Dear Mr. Gray:

I am enclosing, for your information, a copy of a letter which I have addressed to the Director of the Bureau of the Budget, following the discussions of the Port Security Screening Program in Secretary Anderson's Office.

Sincerely,

/s/ William P. Rogers
Attorney General

Attachment

Letter From Rogers to Stans

Washington, February 25, 1959

Dear Mr. Stans:

Under date of November 24, 1958, I returned, without my approval, a proposed Executive Order entitled, "Amending Regulations Relating to the Protection and Security of Vessels, Harbors, Ports and Waterfront Facilities." In doing so I recommended that further consideration of this proposed Order or any other order proposing changes

in the Port Security Program be held in abeyance pending legislative and judicial developments with respect to other personnel security programs.

The problem of strengthening the Port Security Program has been re-examined within this Department and has been the subject of a discussion with the Secretary and Under Secretary of the Treasury. The proposed Executive Order, by conforming the provisions of Executive Order 10173 to the program conducted by Treasury under that Order subsequent to the Ninth Circuit decision in *Parker v. Lester*, would have served to eliminate a dilemma which has faced the Commandant of the Coast Guard, in that the Commandant has been forbidden by court order from discharging fully his responsibilities under Executive Order 10173. However, it is agreed that the proposed Order would not have enabled Treasury to conduct a more effective screening of merchant mariners and dock workers than that currently being conducted under the limitations imposed by court decision. It is also agreed that because of the problem of confrontation it does not appear possible at the present time to strengthen the Port Security Screening Program either by legislation or executive order.

Final resolution of the issue of confrontation in one Personnel Security Program will logically lead to insistence, judicial or otherwise, that the same rule be applied in the other programs. Since the Port Security Screening Program involves persons who are neither employees of the United States nor employees of contractors of the United States, it would appear that security interests would be better served if this issue were to be considered in connection with the more critical Federal Employees or Industrial Personnel Security Programs. As a practical matter it appears that some resolution of the confrontation issue may be fast approaching. Already a number of bills have been introduced this session of Congress relating to various aspects of Personnel Security Programs and the Supreme Court is expected to hear argument during March on the case of *Greene v. McElroy* which will test the validity of the Industrial Personnel Security Program.

Sincerely,

Attorney General

140. Memorandum of Discussion at the 397th NSC Meeting¹

Washington, February 26, 1959

SUBJECT

Discussion at the 397th Meeting of the National Security Council, Thursday, February 26, 1959

Present at the 397th NSC Meeting were the President of the United States, presiding; the Acting Secretary of State, the Secretary of Defense; and Mr. John S. Patterson for the Director, Office of Civil and Defense Mobilization. Also present and participating in the Council actions below were the Secretary of the Treasury; the Director, Bureau of the Budget; the Acting Secretary of the Interior (Item 1); the Administrator, National Aeronautics and Space Administration (Item 1) and the Attorney General (Item 2). Also attending the meeting were Mr. Alan N. Belmont for the Chairman, Interdepartmental Intelligence Conference (for Item 2); the Chairman, Interdepartmental Committee on Internal Security (for Item 2); the Chairman, Atomic Energy Commission; Admiral Arleigh Burke for the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Director, U.S. Information Agency; the Deputy Secretary of Defense; the Special Assistants to the President for National Security Affairs, for Science and Technology, and for Security Operations Coordination; Assistant Secretary of State Gerard C. Smith; Assistant Secretary of Defense John N. Irwin, II; the Chairman, Guided Missile and Astronautics Intelligence Committee; the White House Staff Secretary; the Assistant White House Staff Secretary; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

[Omitted here is agenda item 1.]

2. PORT SECURITY

(NSC 5802/1; NSC 5819, part 9; NSC Action No. 1862-*f*; Memos for NSC from Executive Secretary, same subject, dated January 7 and January 26, 1959)

Mr. Gray briefed the Council on the background of the problem and referred to a letter from the Attorney General to the Director, Bureau of the Budget dated February 25, 1959 which was handed out by Mr. Lay. (Copies of the briefing note, portions of which Mr. Gray used at the Council meeting, as well as copies of the Attorney General's

¹ Source: Agenda item 2: Port Security. Top Secret; Eyes Only. Extracts—5 pp. Eisenhower Library, Whitman File, NSC Records.

letter are filed in the Minutes of the Meeting and are also attached to this Memorandum). After summarizing the views of the two Internal Security Committees (the IIC and the ICIS) and after reading the Council action proposed by the NSC Planning Board, Mr. Gray suggested that the Council hear from the Attorney General.

Apropos of the adverse effect on the Port Security program of decisions of the lower courts, the President asked whether any thought had been given to taking such decisions to the U.S. Supreme Court or were we proposing to give up the fight in the face of the Circuit Court decision? The Attorney General replied that there was already a case, that of *Greene v. McElroy*, on this subject which would be argued before the Supreme Court in March and which the Attorney General hoped would have the effect of clarification.

The President then asked specifically why the decision in *Parker v. Lester* had not been taken to the Supreme Court. The Attorney General replied that this case had not been considered to be a good one for a test. He added that the Department of Justice also felt that we should give very serious consideration to what Mr. J. Edgar Hoover, as Chairman of the Interdepartmental Intelligence Conference (IIC), had said about the apparent trend toward backing away from various security programs as a result of recent court decisions. There might indeed be something of a tendency to beat a retreat in the face of difficulties posed by the courts. While there might be some things that we could do in a positive way to arrest this trend, there was not much hope of significant action until the case of *Greene v. McElroy* was finally decided by the Supreme Court in March, particularly the issue of confrontation of witnesses by the accused.

Mr. Gray pointed out that the Acting Chairman of the IIC, Mr. Alan Belmont and the Chairman of the ICIS, Mr. Yeagley, were present in the room and might wish to say a few words. Mr. Belmont pointed out that the concern of the IIC had been expressed in its memorandum of January 26, 1959 to the Executive Secretary. He would, however, like to pin point the problem in order to illustrate it for the Council. Mr. Belmont then supplied figures to show that 357 individuals who had been barred, prior to the *Parker v. Lester* decision, from the waterfronts have since succeeded in obtaining their papers. The records of the FBI indicated that these individuals were very dangerous to the national security and included saboteurs whom we would feel compelled to "pick up" in case of war.

The President said that it did not seem reasonable to him that the U.S. should be so confoundedly limited by its Constitution in trying to keep out such undesirables as these. The Attorney General agreed with the President's point but repeated that we should know better how to proceed after the case of *Greene v. McElroy* had been decided.

Mr. Yeagley said that he had nothing to add on the subject beyond what had been contained in the memorandum of the ICIS to the Executive Secretary dated January 26, 1959.

Mr. Gray commented that all of us shared with the President a certain sense of frustration between the two horns of the dilemma but he too put hope in the outcome of the *Greene v. McElroy* case. If the decision of the Supreme Court should be adverse, he wondered whether new legislation might help to remedy the internal security situation. The Attorney General replied that if the decision of the Supreme Court in *Greene v. McElroy* went the wrong way, new legislation was not likely to help any.

The President inquired whether the subversive people we were talking about were all citizens of the U.S. The Attorney General replied that in most cases he understood that they were. The President added that if they were not citizens they could presumably be deported. The Attorney General agreed but again pointed out that most of them were citizens and added that we faced the same problem in industrial security programs that we were facing in the matter of the Port Security program. Mr. Gray suggested that the Council take another look at the problem after the Supreme Court decision. The President concluded the discussion by stating that if he had his way, the retreat would be a slow one if the decision of the Supreme Court were unfavorable in the case of *Greene v. McElroy*.

The National Security Council:

a. Noted and discussed the subject in the light of the report by the Department of Justice on the implementation of NSC Action No. 1862-*f* (transmitted by the reference memorandum of January 7), the views of the Interdepartmental Intelligence Conference and the Interdepartmental Committee on Internal Security (transmitted by the reference memoranda of January 26), the letter from the Attorney General to the Director, Bureau of the Budget, on the subject, dated February 25, 1959 (circulated at the meeting), and the discussion in the Planning Board (presented orally at the meeting by the Special Assistant to the President for National Security Affairs).

b. Agreed that the submission of the draft legislation and Executive Order called for in NSC Action 1862-*f* should be held in abeyance pending the "legislative and judicial developments with respect to other personnel security programs" referred to in the memorandum by the Department of Justice enclosed with the reference memorandum of January 7 and the letter from the Attorney General to the Director, Bureau of the Budget, dated February 25, 1959.

c. Noted that the Treasury Department will nevertheless continue to implement, so far as possible, the provisions of paragraph 19 of NSC 5802/1, and of paragraph 8 of the Port Security program approved by the President on April 21, 1958, relating to the exclusion of subversives from vessels, ports and waterfront facilities.

d. Noted that, although recent court decisions make it impossible to carry out certain internal security programs effectively, it is nevertheless important that the responsible agencies of the Executive Branch

make every effort to implement necessary internal security measures within the framework of constitutional requirements.

NOTE: The above actions, as approved by the President, subsequently transmitted to the Secretary of the Treasury and the Attorney General for appropriate implementation, and to the Interdepartmental Intelligence Conference and Interdepartmental Committee on Internal Security for information and guidance.

[Omitted here is the remainder of the memorandum.]

S. Everett Gleason

141. Record of Telephone Conversation Between John Foster Dulles and Herter¹

Washington, March 2, 1959

[First page missing from microfiche.]

say he will leave the actual putting into operation of this scheme to his successor and the Secy agreed saying President only had another year and a half in office and might consider this something not necessarily to do himself but to leave to his successor. Secy said he just wanted to let CAH know about his concern on this matter.

CAH said he was sorry he missed the Secy's earlier call and understood Secy had reached Mr. Merchant. Secy said he was just checking in on the Soviet response. CAH reported on President's latest message to Macmillan and said the reference to Dieffenbacher sitting in with President and Macmillan had been knocked out at suggestion of Mr. Merchant. Secy thought this was good; said he thinks Macmillan cherishes the sort of tete-a-tete relationship with the President and the Secy and would not like the idea.

Discussed Secy's health.

142. Record of Telephone Conversation Between Anderson and Herter¹

Washington, March 3, 1959

[Omitted here is a record of another conversation.]

5:00—Secy Anderson telephoned to say he understood CAH is lunching with Arthur Fleming on the organization plan. He just wanted to be sure CAH is aware of Secy Dulles' deep concern about it, as his own is; he thinks it would be a very bad mistake. CAH said he does know how Secy Dulles feels and discussed it with him only yesterday. Secy dwells particularly on the political weakness in it. Anderson said he had told the President about the lunch (although he himself can't come) and that he had grave misgivings, and Pres. has said he would not want to do it unless it is the right thing to do. In any event, he just wanted to be sure CAH was aware of Secy Dulles' feeling about it.

[Omitted here is a record of another conversation.]

Enclosure

Memorandum From Burke to McElroy

Washington, March 2, 1959

SUBJECT

U.S. Policy in the Event of War (NSC 5904)(C)

1. The Joint Chiefs of Staff have reviewed the draft statement of policy, subject as above, prepared by the NSC Planning Board, for consideration by the NSC at its meeting on Thursday, 5 March 1959.

2. Subject to the comments contained in Appendix "A" hereto, it is recommended that you concur in the draft of NSC 5904 to supersede NSC 5410/1.

3. Additional information considered by the Joint Chiefs of Staff to be suitable for your talking purpose, with regard to paragraph 15 on pages 4 and 5 of NSC 5904, is contained in Appendix "B" hereto.

For the Joint Chiefs of Staff:

/s/ Arleigh Burke
Chief of Naval Operations

Appendix A

Paper Prepared by the Joint Chiefs of Staff

Washington, undated

COMMENTS ON NSC 5904

1. *Reference Paragraph 2—Page 1.* Support the view of the Secretary of Defense and the Secretary of the Treasury and the Joint Chiefs of Staff.

REASON: U.S. policy is based upon the assumption that any war with the USSR would be general war. It must be presumed that the Chinese Communists will be in any general war as an active ally of the USSR, or will be a power center capable of assuming world leadership when the U.S. and the USSR have so weakened themselves that they cannot maintain their power positions. It is improbable that any of the

other Bloc nations could maintain a non-belligerent status in a general war. Therefore, the qualifying phrases as applied to subparagraphs 2 *b*, *c* and *d* are misleading. Furthermore, these phrases are inconsistent with the Heading of Section A of the paper.

2. *Reference Paragraph 6—Page 2.* Support Defense, Treasury and Joint Chiefs of Staff views.

REASON: The phrases recommended for deletion are unnecessary and in the context of the paragraph weaken the guidance the paper is developed to provide. It is almost a certainty that the USSR and Communist China will be in a war together; therefore, the phrase is unnecessary in 6 *b*. In *c* and *d* the phrase is redundant in view of the limiting words “requisite”, “selected” and “as necessary” already in the paragraph.

3. *Reference Paragraph 7—Page 2.* Support Defense, Treasury and Joint Chiefs of Staff views, and delete.

REASON: The paragraph is inappropriate in the present paper. It might be proper and desirable in a paper dealing with pre-war preparations. The subject paper (NSC 5904) deals with war situations. Under war conditions, an attempt by Government departments and agencies to carry out the policy stated in this paragraph would divert effort and resources from the vital active military role. While the United States must be able to absorb and recover from a nuclear onslaught, to adopt this paragraph as a wartime philosophy would in effect channel U.S. resources and efforts to activities that cannot win the war. The first two words of the first U.S. general war objectives are “to prevail.” This is defined as “to win mastery,” “to triumph,” “to succeed,” and “to predominate.” This objective cannot be attained by the policy stated in paragraph 7.

4. *Reference subject, Section “B”—Page 4.* Support the JCS view.

REASON: The majority view would restrict limited war policy to Soviet satellite states. Neither the recent U.S. action in Lebanon nor the British, French, Israeli venture into Egypt involved a satellite state. Therefore, it would appear that if the United States is to have a policy for limited war, it should permit policy guidance for any limited war situation and not be restricted to Soviet satellites.

5. *Reference paragraph 13, page 4.* Delete.

REASON: While this is a valid statement, it does not materially contribute to the policy statement. Moreover, it does not properly belong under “Objectives.”

6. *Reference paragraph 15, pages 4 and 5.*

- a.* Delete the JCS proposed wording in lines 1 and 2 of paragraph 15.
- b.* Support the position of the JCS Alternative.

REASON: The phrase recommended for deletion is redundant. At the same time it can be interpreted to mean that political and military factors are not all examined and weighed in every decision to commit United States forces to war.

The proposed JCS Alternative is the only one of the three proposals that is consistent with the remainder of the paragraph.

The danger of general war being initiated by the USSR is present in any conflict in which the United States or its Free World allies are involved. Therefore, this risk must have been assessed and accepted before any U.S. forces are committed to war in support of U.S. national objectives. It is impossible to know what U.S. action would cause the USSR to enter the conflict and thus broaden it into general war. Since a policy to provide guidance to the departments and agencies of the Government of the United States must have a reasonably finite foundation, it cannot be based upon an unknown.

Further, including in a policy statement the thought that the United States, to avoid a general war with the USSR, would revise downward or would abandon part or all of the political and/or military objectives for which it was then engaged in a war with a country other than the USSR could lead to fatal consequences in terms of the U.S. national existence, since it would:

- a.* Foster indecision in the planning of political and military actions and in the utilization of the U.S. armed forces in war in support of these plans;
- b.* Place the decision of war or peace completely in the hands of the USSR regardless of the importance of that decision to the United States;
- c.* Open the way to a series of political-military defeats like Korea and Vietnam;
- d.* Seriously, if not fatally, weaken the U.S. position as leader of the Free World; and, as a consequence,
- e.* Destroy the world-wide systems of military alliances so painfully erected by the United States.

Appendix B

Talking Points Prepared by the Joint Chiefs of Staff

Washington, undated

Policy Guidance

Recognizing that the prompt and resolute application of the degree of force necessary to defeat local aggression is the best means to keep such hostilities from broadening into general war and that any decision to commit U.S. forces to war would be taken only after consideration of all factors, including probable Soviet reaction, the United States should

utilize all requisite force to attain its objectives, opposing the aggression with clear determination despite the risk of general war. If during the course of hostilities general war becomes a clear probability, the U.S. will have to decide in the light of the circumstances then existing whether it is in the U.S. interest to alter its original objectives.

144. Notes by Killian for Presentation to the President¹

Washington, March 4, 1959

In some respects, the analysis we present to you is a follow-up on the report that the Technological Capabilities Panel made in 1955—the report in which we recommended that our ballistic missile program be given top national priority.

The preparation of the analysis which Dr. McMillan is going to present to you was initially prompted by a technical appraisal which the Science Advisory Committee has been making of our anti-ballistic missile program, including the technical aspects of early warning. Among the conclusions reached by the Panel studying this complex technical problem are the following:

“1. The Nike-Zeus system cannot be a factor in protecting the retaliatory force before 1964 or 1965.

“2. In general the tactics of dispersal, hardening, concealment through mobility, and quick reaction upon early warning, all seem more certainly effective, and more inexpensively effective, than active defenses, for protecting the retaliatory force. Furthermore, these tactics are available and can be implemented to an effective degree relatively soon.

“3. The Panel believes that these ‘passive’ tactics should be considered as the basic anti-missile defenses for both the aircraft and the missiles of the U.S. retaliatory force. We urge in the strongest terms that they be exploited more fully, and more rapidly than present plans call for.”

The analysis also reflects our interest in techniques and principles for achieving a greater degree of stability in our deterrent position in a period when possible uncertainty in intelligence and in estimates of relative strength, together with rapid technological change tend to augment the uncertainties in our deterrence. Of course, one of the

¹ Source: Anti-missile program and maintaining deterrence. Top Secret. 4 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology.

major factors introducing a greater degree of instability is the possibility of impending achievement by the USSR of a substantial ICBM capability.

I would stress that the material which we present represents an analysis of one part of our military problem. It is the opinion of the Science Advisory Committee, however, that this analysis, limited as it is, presents certain principles and concepts which appropriately can be weighed anew along with the many other factors involved in formulating military policy. In making this analysis we have been concerned with measures which increase the sureness of our retaliatory power. It is not our purpose to suggest increases in our military budget, even though we recognize the large budgetary implications involved. It is our purpose to suggest that we need to give higher priority to certain kinds of military programs. This could be achieved by reducing the emphasis on certain other programs, or if that is not possible alternately by increased expenditure. I suggest further that any implications for our military budget or for our military policy which may be inherent in this presentation have to do mainly with the future, not necessarily with the present.

In the report of the Technological Capabilities Panel in 1955, we presented a time-table which identified a transitional period reflecting our military position relative to that of the Soviet Union when we might find our position changing from one of very great offensive advantage to one in which our situation would be relatively less advantageous.

The report described the effects of this period as follows:

"Deterrent effect of U.S. power dangerously lessened if Soviet production of multimegaton weapons and an adequate... delivery capability is achieved prior to the development of an adequate U.S. warning and defense system and before we have achieved a reduction of the vulnerability of our strategic delivery systems. Under these conditions, Soviet possession of such weapons and delivery capabilities would place the U.S. in danger of surprise attack and possible defeat.

"The situation might develop as early as 1958. If we permit our military position to worsen to this extent, we will be in a poor position to ward off Russian political and diplomatic moves or to make such moves of our own.

"The intercontinental ballistic missile can profoundly affect the military posture of either country with respect to Period III... If the U.S. were to achieve an intercontinental ballistic missile capability first, it could maintain [a]² position of advantage... so long as the Soviets did not have this missile capability. If the Russians achieve an intercontinental ballistic missile capability first, they might gain a comparable position of advantage."

² Brackets are in the original.

It was suggested that this period might be followed by another when both the U.S. and Russia would be in a position in which neither country could derive a winning advantage because each country will possess enough multimegaton weapons and adequate means of delivery, either by conventional or more sophisticated methods, through the defenses then existing.

While we do not suggest that either of these periods exactly fits our present situation, we do emphasize that the impending advent of substantial ballistic missiles capability raises again with greater urgency the question.

In concluding this introduction, may I also note that the views on hardening and on dealing with the problem of instability and uncertainty reflected in this analysis have been consistently held by your Science Advisory Committee and emphasized in all of its reports beginning with the Technological Capabilities Panel in 1955. We would stress again the great importance of achieving a secure—and sure—retaliatory capability.

145. Presentation by McMillan to Eisenhower¹

Washington, March 4, 1959

*An Analysis of Technical Factors in the Strategic Posture of the
United States—1956–64*

What I have to present is an analysis—illustrated with charts—relating to our strategic posture over the next few years.

The particular material we will see today has developed out of a study by the Panel of the Science Advisory Committee concerned with anti-ballistic missiles, a study of the technical possibilities for defending our striking force. I think you will see, however, that what we have to say falls into the pattern of earlier conclusions of the Science Advisory Committee about the influence of continuing technological change upon our strategic position, and about the steps we must take to keep technically abreast of this change.

In looking at ways of defending the striking force, the anti-missile Panel was forced to consider two related, but nevertheless distinct,

¹ Source: “An Analysis of Technical Factors in the Strategic Posture of the United States—1955–64.” Top Secret. 18 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology.

questions. We have organized our presentation around these two questions.

The first question is: what array of targets does the continental United States present to the Soviet attacker, and how much force would the attacker need to destroy or neutralize these targets? This is a natural question to ask in examining the defense of the striking force. An answer to the question would show the extent to which defensive measures might be useful in increasing the enemy's force requirements against us. Indeed, one would like to find, or to bring about by defensive measures, that the attack the enemy would need to destroy our striking force is much larger than any attack he could possibly mount. In such a case, one could be fairly sure, without further study, that an enemy aware of the circumstances would not attempt an attack except under extreme provocation.

Should it appear, in looking at force requirements, that the enemy might possibly have a force large enough for a completely destructive attack against our strategic bases, then one must probe more deeply into the situation. This possibility raises the second question: what retaliatory force can we muster even if our bases are attacked with the enemy's best capabilities? A later part of our discussion is devoted to this second question.

For the purpose of our discussion, it has been necessary to prepare charts illustrating both some facts and some estimates we have made. It is in the nature of such graphic presentations that they tend to make all data look like fact—even mere estimates—by emphasizing exact numerical values. We ask you to bear with us in this, because we do not wish to present our charts as exactly descriptive of the strategic position of the United States. Rather, we wish to use them as a basis for discussing some uncertainties in that strategic position. Perhaps our main message is that, because of changing technical factors, the strategic position of the United States is now subject to a range of uncertainty and that this uncertainty can lead to a condition of instability internationally. We hope we can also show that there are some relatively simple things that this country can do to reduce uncertainty and increase stability.

We can turn now to the first of our two questions—how much force would the Soviets need to destroy as completely as possible the ability of the continental United States to mount retaliation? The first chart sets a scale by picturing something of the range covered by recent and current intelligence estimates. Specifically, the numbers on the vertical scale represent operational intercontinental ballistic missiles—missiles produced, deployed, and supported by trained troops with the necessary logistics. The dots show specific capabilities discussed in recent intelligence estimates. The August, 1958, national estimate, for example,

grants the Soviets the capability to begin deployment during 1959, to reach 100 missiles one year later, and to reach 500 a year after that. The estimates are not committal as to when, during 1959, one should reckon the starting date. A supplement to this August estimate was issued in November, emphasizing that dates about a year later than the original ones seemed more probable for the Soviet capability to reach 100 and 500 respectively. This supplement also emphasized the difficulties the Soviets might encounter in reaching even these objectives. What has been drawn on this chart are then two curves which include between them something of the range of possibilities allowed by the August and November estimates. They picture, of course, a range of estimates; not the whole range allowed by the published NIE. They illustrate one of the variable factors that enter into an examination of the strategic situation. These same curves have been repeated on some of the subsequent charts.

The second chart, plotted to the same scale, shows for comparison the present United States intercontinental missile programs. As you well know, these have proceeded rapidly in the recent past, and operational intercontinental missiles will begin to appear in 1959. Present programs terminate in early 1964 with 180 Atlas and Titan missiles on site, and nine Polaris submarines capable of carrying a total of 144 missiles. All 144 Polaris missiles have been shown, even though, typically not more than half of them will be at sea at one time.

We turn specifically now to the question of the force needed by the Soviets to attack us. The third chart shows, against the background of the intelligence estimates, an estimate of the number of aiming points we present in the continental United States, and an estimate of the number of intercontinental ballistic missiles the Soviets would need against them. The lower curve counts the targets the Soviets would have to attack in order to destroy or neutralize:

1. all SAC air bases in the United States,
2. key air defense installations in the United States,
3. all missile bases in the United States.

This curve begins with about 40 targets at the present time and grows to about 140 as we add SAC bases, missile bases, and air defense control centers.

The blue curve above estimates the number of Soviet missiles needed to attack these targets. In addition to these missiles, the Soviets would probably wish to bring over some aircraft in a follow-up blow, but at no time would he need more than *[text not declassified]* over the United States to complete the destruction of all strategic targets.

The number of intercontinental ballistic missiles here estimated as his needs makes generous allowance for unreliability and aiming error

in his missiles. It is assumed that these missiles are only 60% reliable with an aiming error—CEP—of 3-1/3 miles. Thus, five missiles are directed at each SAC base, and up to 30 missiles at each hardened missile site. Fifty to 100 attacking missiles are allotted to installations other than bases of retaliatory force, e.g., air defense and communication centers. It is felt that an attack by even half this many missiles could deal us a destructive blow.

Using this generous basis of estimate, the chart shows the Soviet needing 200 missiles to attack us in 1959. The figure then increases with time as we activate more SAC bases, add SAGE centers, and later add missile sites to our target system.

One cannot, from this chart, draw with certainty the conclusion he would like to draw—namely that the Soviet force will always be inadequate for a decisive attack against our continental forces.

This is a rather weak conclusion—the conclusion that one can't conclude—and is not the primary reason for setting up this chart. Rather, we would like to pursue the argument on force requirements beyond this point, in order to illustrate some of the technical possibilities. We would like to discuss here how to get out of the red.

In looking at defense against ballistic missiles, our Panel was impressed by the relative simplicity and effectiveness of certain passive means available to our striking forces. For example, using the kind of missile postulated for the construction of this chart, the Soviet attacker needs five missiles to be certain of destroying an array of SAC aircraft on the ground or a cluster of three Atlas missiles of the early type. These are targets which can be destroyed by a one megaton bomb burst, 3-1/2 miles away. If these targets are sheltered to withstand 100 pounds per square inch of blast pressure, a one megaton bomb would need to burst within $\frac{3}{4}$ of a mile. Correspondingly, the Soviet would need almost 200 of the missiles postulated to be certain of destruction—in other words, he wouldn't even attempt direct destruction with such a missile. He would have to await a better missile, or resort to artillery tactics and pin his target down until he can kill it with his aircraft. Even pinning his target down would cost him 20 to 40 missiles, in place of his original five.

It has seemed to the Panel that there are no technical reasons why this tactic of hardening cannot be used as a means for greatly increasing the enemy's force requirements against us. If we could harden effectively overnight, for instance, the Soviets would now, in 1959, need something more than 1000 missiles to neutralize our SAC.

In terms of an example more practical than hardening overnight, the overlay shows an estimate of the effect on the Soviets force requirements of what appears to be a reasonable series of steps for sheltering of SAC aircraft and further dispersal and hardening of missile sites.

To develop this rapidly rising curve of Soviet needs, it was assumed that some construction could begin at SAC bases late in fiscal 1960; this then first bears fruit in calendar 1961. Also in 1961, our present Atlas and Titan programs begin to add to the target system bases hardened in differing degrees. Here it has been assumed that about 1/3 of the Titan missiles—all of which are expected to be hardened to 100 pounds of blast—would be deployed to individual aiming points, rather than sited in groups of three. It has also been assumed that the Atlas missiles—now expected to appear in groups of three hardened to 25 pounds—would either be deployed to individual sites or else hardened to 100 pounds. We have just heard that Defense has been examining the possibility of further dispersal within present programs, and we are encouraged.

There isn't room on the chart to show the full effect of a program of this kind; and certainly not room to show the effect of a more ambitious program of sheltering and dispersal. What has been shown is in fact a conservative estimate of the effect of the program I have described. It shows the steps toward stability which even a relatively simple program of passive protection can bring about. Until such time as the Soviets have a highly advanced missile, one hardened aiming point added to our target system costs the Soviets from 10 to 20, or even many more, missiles to negate. This factor applies to every missile of ours we can add to the system.

In sum, with respect to the question of force requirements, we find the situation now unclear. There seems to be no technical obstacle to creating a picture both more clear and more favorable; indeed, this appears possible by steps relatively much simpler than the creation of new weapons systems.

We can turn now to the second question—what kind of retaliatory force can we get off against the USSR if he does elect to attack us? We have prepared a chart which attempts to answer this question under different assumptions about the size of the Soviet attack.

You will observe that this chart, except in its reference to Polaris missiles, is directed specifically to the state of affairs in the continental United States. It is recognized that the United States does have elements of force elsewhere in the world that could, potentially, contribute further retaliation. However, virtually all of these forces are within the reach of Soviet tactical air and missiles. The intelligence has been clear for sometime that the Soviets have a tactical air force and tactical missiles adequate to cope with any targets we may present to them. There is no basis for assuming that this circumstance will change under our present programs.

In the presence of this Soviet superiority in the tactical theater, if we are to make our overseas forces effective when the Soviets initiate

intercontinental war, we must achieve, between our continental and our overseas forces, a very high degree of coordination. In fact, the technical conditions imposed upon us in this situation seem much more stringent than those imposed upon the Soviets if they choose to negate our efforts by careful coordination of their own attack.

We can see no technical obstacles to prevent the Soviets from attaining the kind of coordination they would need. Therefore, in fixing our attention in the next chart upon forces in the continental United States, plus Polaris, we feel that we are not presenting an inaccurate description of our whole strategic position.

Two different estimates are here shown of the retaliatory force which we might be able to mount after a Soviet attack upon us. In presenting these estimates I must emphasize how many assumptions one must make to arrive at them, and how difficult it is to verify these assumptions. For example—how does one know how fast SAC can take off aircraft in 1961? We have access to, and have used, the figures they have developed for planning purposes, but there is no possibility of testing these against fact. Similarly, we have had to postulate a rate of arrival for an initial salvo of Soviet missiles. So as not to be guilty of painting too black a picture, we have assumed for this chart a rather ragged initial salvo against SAC—a full hour's duration for the attack, with three quarters of the attack arriving in the first half of the hour.

The estimates given on the chart then correspond to attacks based on the two curves projecting Soviet capabilities as displayed earlier. That is, the upper curve in this chart assumes that the Soviet missile force builds up with time in the manner of the smaller intelligence estimate and the lower curve assumes an attack based on the larger intelligence estimate. Thus, for example, in mid 1961, an attack by 100 Soviet missiles allows us the upper estimate of retaliation, an attack by 500 missiles, the lower estimate.

It will be helpful first to examine the effect upon our *strategic aircraft* of a Soviet attack; the important relations are best displayed by looking first at the lower blue curve.

Prior to mid 1959, the intelligence estimate allows the Soviets no significant force of missiles. Therefore, during this period the Soviets first blow upon the continental United States would be an attack by aircraft and something like two hours warning would be available to all SAC bases. During 1959 then, the curve of aircraft available follows SAC's present estimates of the number of aircraft they will have available in two hours. The rise in the curve reflects SAC's expectations for improving readiness. By the end of 1959 the intelligence estimate allows the Soviets a significant force of missiles and an attack under these conditions would take its toll of our aircraft. This curve reaches its minimum during 1961, at a time when the Soviets are estimated to

have about 500 missiles and before our Ballistic Missile Early Warning System is in full operation. Thereafter, the curve rises again under the assumptions that the BMEWS system will be installed as scheduled, and will be operational.

The smaller intelligence estimates of November lead to the upper estimate of aircraft available. Here, because until 1961 there is no significant force of Soviet missiles, the upper curve continues to follow SAC's present estimates of the number of aircraft to be available in two hours. The continued rise in the curve reflects SAC's expectations for improving readiness.

After January 1961, the Soviet missiles begin to take their toll, while, on our side, BMEWS is going into operation.

So far we have been discussing the force of aircraft which we could mount in retaliation. As our missile forces build up, they contribute to the picture, as shown on the overlay. Following the lower curve, we find a final total of about 70 missiles surviving and available for retaliation. These correspond to that half of the Polaris force which, because it is at sea, escapes attack.

Under the lighter Soviet attack of the upper curve, a fraction of the hardened Titan missiles also are likely to survive attack. This fraction diminishes as the forces available to the Soviets increase.

We find, in the end of the period, a retaliatory force estimated at about 700 bomb carriers. Such a force is not to be dismissed lightly, but we must recognize that there are many factors which can influence the actual size of this force and cause it to differ from these estimates. We will want to discuss some of these factors, not with the aim of degrading these curves to a more gloomy picture of our condition, but in order to illustrate our main thesis.

As we said at the start, our main thesis is this: that our true strategic position is unclear, and that our estimates of it are set about by doubts. Our actual position is greatly sensitive to factors over which we have no control, necessarily then our estimates of this position are sensitive to the assumptions we make about these factors.

We feel that there are several things further that this country can do to remedy the situation, but before discussing solutions, I would like further to explore the anatomy of the problem.

What are the main sources of uncertainty in our situation as illustrated by these charts?

First, we are greatly dependent upon warning and upon decisive and impressively rapid response thereto.

Every blue aircraft on this chart is one that took off after a decision that attack was imminent or that war was unavoidable. When the real attack comes, every minute of indecision costs us about 40 bombing

aircraft; five minutes of indecision cost us 200 bombing aircraft; every SAC base covered with snow costs us about one aircraft per minute. A complete failure of BMEWS—perhaps because of jamming or spoofing—would cost us about 450 bombers.

It is worth noting also that, especially in the early period, as we respond to the immediate warning that an attack is in progress, those aircraft which escape destruction do so by winning a race against the attacker. The force that escapes, therefore, is not exactly of our choosing, but is selected by the fortunes of war. It may not therefore conform in its structure to a pre-determined war plan; it may have to be regrouped and re-directed to targets for which it is adequate, according to information and a plan developed during the attack.

It may be felt that the emphasis in this chart upon warning is unrealistic because the chart assumes an attack which, apart from the last minute warning we get from BMEWS or a bomb burst, takes us completely by surprise. But the situation postulated here is really quite otherwise. In fact, this chart assumes a great deal of strategic warning; indeed a background of international tensions so ominous that the United States has undertaken to bring the whole of SAC to a peak of readiness. There remains only enough equivocation in the picture of Soviet intent to keep us hopeful that war can be avoided. In such a situation, we cannot respond freely to possible false alarms, lest we on the one hand fall victim to a feint and get caught on the ground after our forces are recalled, or on the other hand provoke an otherwise avoidable attack upon us. We must then await a clearly overt act by the Soviets to remove our doubts. This act could be the penetration of BMEWS, or the burst of a bomb on one of our bases. In sum, the assumptions here about our readiness seem to be favorable to us rather than otherwise.

A *second* important feature of our position is that we are greatly sensitive to the mass, coordination, and technical excellence of a Soviet missile attack. Sensitivity to mass hardly needs more emphasis than the difference between the upper and lower curves already gives it. Let us also recognize that the lower curve does not call for a Soviet attack as large as the national estimates leave room for. Sensitivity to coordination prevails throughout the period.

To see the sensitivity of these estimates to the coordination of the Soviet attack, we have tried to estimate what would happen to our aircraft if the Soviets mounted a *perfectly* coordinated missile attack—by perfectly coordinated, I mean an attack in which 100 to 300 missiles arrived in the first five minutes. In mid 1960, the lower blue curve would be depressed to about 130 aircraft. In mid 1961 it would go virtually to zero. In late 1963, even with the full operation of BMEWS, the curve would go to less than 200. At the other extreme, of course, in a

ragged and very poorly timed attack we could expect to get off almost all of our available aircraft—from 300 to 800 bombers.

The disparity between these two extremes is impressive. This disparity is the measure of our sensitivity. Whatever one's private judgment about where, between these extremes, reality lies, it is clearly evident that a tremendous premium is being offered to the Soviets for skill in coordinating their forces. Again, we can find no basic technical reasons for assuming that the Soviets cannot reach a high degree of coordination, particularly in the initial salvo of an attack for which they had long prepared.

Sensitivity to technical excellence is similar to sensitivity to coordination. If the Soviet missile had a one mile aiming error, rather than the two to three miles assumed in constructing the chart, we would get off less than 400 aircraft in 1963.

A *third* important feature of our position as shown by this chart is that the bulk, if not the total, of our potential retaliation is borne by aircraft. We know that the USSR has an extensive and improving air defense system. We must assume that this system will in time include nuclear weapons. It is difficult to know exactly how effective this system will be against our aircraft, and even more difficult to guess how effective the Soviets *think* it will be. Therefore, it is hard to know exactly how impressed the Soviet planner will be with our ability to do him retaliatory damage.

It is fairly certain, however, that if we are to do him much damage with our aircraft it will be because we have been able to get off a fairly large and well coordinated attack. One need not count the trees in order to see the outline of the forest: we are not only dependent upon aircraft for the bulk of our retaliation, but also we are dependent upon their ability to survive as a coordinated military unit.

In mentioning these sources of uncertainty, we are not calling into question the value to the United States of current programs to provide warning of attack and to accelerate reaction to that warning. Indeed, the discussion of the uncertainties should serve to emphasize the presently supreme value of these measures. But, as long as the success of these measures is sensitive to factors over which the United States has little control, it is in the nature of the measures themselves to create a condition of instability. For in relying upon warning and rapid response, we offer to pay a great premium to the Soviets—in fact, either to ourselves or to the Soviets—for haste in reacting to a threat.

To restore stability one needs certainty. To create certainty, one needs a retaliation which is inevitable, is inevitably decisive, and is clearly recognizable as such by a potential attacker. In the long run, to do this requires a force which is large enough, is so secure against attack that it neither provokes attack nor need react in haste, and is insensitive to defensive action.

The United States is, of course, building the foundation for such a retaliatory force through its missile programs. It seems to us, in fact, on technical grounds, that a force of the right kind of missiles, adequately dispersed and protected by sheltering or mobility, can always be relied on as a prime deterrent: it is relatively insensitive to attack and to defensive action, and is therefore able to react deliberately and—if in sufficient force—decisively.

In the meantime, major reliance must remain upon aircraft. Here we feel that there are some further simple steps that the United States can take to increase the certainty of its retaliation.

First, we have already mentioned the possibility of sheltering aircraft to increase the Soviets' force requirements. Sheltering also increases the survivability of a useful fraction of the force, and decreases dependence upon haste.

Second, we can rather easily do more toward getting, or toward better insuring, warning. It may be possible to hasten the Ballistic Missile Early Warning System; it appears possible, and indeed attractive, also to supplement this radar system with an airborne infra-red system capable of detecting missile launchings. We refer here to a simple system that might be implemented soon—not to more remote satellite-borne system. The United States can also simply, and therefore soon, provide SAC bases and other key centers with automatic bomb alarms tied together by communications to warn all bases immediately and certainly when any one base is attacked. This could be a very simple system indeed. It appears that it could be available by the end of fiscal 1960; there is no funded program for such a system at the present time.

The Panel also recognizes the value of more certain strategic warning and would encourage any steps in this direction.

Third, we can increase the ability of SAC to take off rapidly by the simple step of providing more runways.

Such further measures as these just mentioned pay off well. In talking earlier of hardening, for example, we noted that each hardened aiming point, when added to our target system, costs the Soviet from 10 to 20 or more missiles to negate. This rate of exchange would apply, for example, to every new missile that we could add to the force in a hardened configuration.

We can also estimate the effect of better warning in the same terms used to develop the present chart. For example, and to set the scale, in 1963 the difference between having a fully functioning BMEWS system—as postulated for the chart—and no such system, is about 450 aircraft. A similar difference prevails on the lower curve as early as 1961. Presence of an infra-red system alternative and supplementary to BMEWS is therefore insurance for a precious possession. It also insures against under-shooting BMEWS on low angle trajectories. Furthermore, since an infra-red system is alerted by launchings,

rather than by penetration during flight, it can be expected to speed up our responses; if for example it added ten minutes to our warning time in mid 1961, this would be worth 120 aircraft. A similar value attaches to a bomb alarm system in this period. Either type of warning would have a much greater effect were we to assume a more sharply timed Soviet attack.

Doubling SAC's take-off rate would add 100 or more aircraft in 1961, perhaps 50 in 1963, under the attack postulated for this chart. It could have more value in a more highly coordinated attack, and it is always insurance against damage to, or accidental clogging of, runways.

To summarize our views then:

We feel that it is very clear, and for good technical reasons, that the most effective way for the United States now to invest its resources in military measures is to proceed in the direction of hardening, dispersal, and increasing dependence upon protected forces of intercontinental ballistic missiles. For the near future we must also look to further measures for the protection of our aircraft. There are programs now in the Department of Defense aimed at increasing our security, which simply do not attack the heart of the problem as we see it. We have raised questions about some of these programs in an earlier discussion of technical factors relating to the Defense budget. We feel that if some of these programs were given their proper emphasis, most of the steps that we have here emphasized as important could be implemented effectively and without adding to the Defense budget.

146. Briefing Note for the March 5 NSC Meeting¹

Washington, March 2, 1959

*MAIN TRENDS IN SOVIET CAPABILITIES AND POLICIES,
1958–1963
AND
ESTIMATE OF THE WORLD SITUATION*

In the Planning Board we are now starting upon the annual review of Basic Policy. As a first step, and by way of background, we have been discussing two National Intelligence Estimates—Main Trends in Soviet

¹ Source: NIEs 11–4–58 and 100–59. Secret. 3 pp. Eisenhower Library, Whitman File.

Capabilities and Policies, 1958–1963 (NIE 11–4–58) and Estimate of the World Situation (NIE 100–59).

This morning Mr. Allen Dulles is going to summarize the two estimates for the Council, after which there will be an opportunity for questions and discussion. No policy issues are being put forward for decision at this time.

(CALL ON: ALLEN DULLES)

(Note: To the extent that Allen Dulles does not cover or adequately highlight them, you may wish to mention the following 5 points which were identified in the P/B)

The Planning Board noted five respects in which the estimate of the world situation this year differs from last year's:

1. More emphasis on Soviet Bloc confidence.
2. Decline of Communist influence in Western Europe.
3. Strengthened cohesion of NATO.
4. The restoration of faith as to U.S. leadership, in Western opinion.
5. The lack of Communist success with immediate objectives in under-developed areas.

It was noted that these developments of 1958 seem to look favorable when compared to the rather gloomy developments of 1957. However, it was pointed out that the East-West struggle continues and indeed during 1958 "took on a somewhat more ominous character."

(Para 6, NIE 100–59)

(Note: If adequate Council discussion is not generated, you may wish to mention some of the following issues which were identified at the P/B.)

The Planning Board identified five longer-range developments which it thought should be called to the Council's attention:

1. The rise in scale and intensity of the Soviet threat: the new confidence of the Soviet leaders; a more assertive and challenging policy; the continuing increase in military power; and an already powerful economy, growing faster than ours
 2. The continuing chance of general war occurring through misinterpretation of the opponent's acts in a major international crisis
 3. The growing challenge to the West of the Soviet increased emphasis on trade and aid, and particularly the impact upon under-developed countries
 4. The long-range implications of the growing strength of Communist China
 5. The conclusion on the part of some members of the intelligence community (although, of course, there is a split) that "the Soviet leaders feel freer to adopt an aggressive posture in peripheral areas, and probably feel somewhat freer to encourage or instigate armed conflict in those areas, although probably not initially with overt Soviet forces."
- (Para 16, NIE 100–59)

147. Briefing Note for the March 5 NSC Meeting¹

Washington, March 4, 1959

NSC 5904

At its meeting on January 22, the Council discussed NSC 5401/1, “U.S. Objectives in the Event of General War with the Soviet Bloc”, in the light of a series of questions sent forward by the Planning Board. With the guidance from the Council discussion, the Planning Board has drafted a new statement of policy, NSC 5904, which is before you today. The new paper is entitled, “U.S. Policy in the Event of War”, and is divided into two separate sections: a first section (Section A) deals with *general war*; then, because some Planning Board members felt that the paper should also give policy guidance for *limited war*, a second section (Section B) was written addressed to other kinds of war than *general war*.

Taking up Section A, then, there was general agreement as to the first objective.

(READ Para 1)

There was also agreement as to the second objective and the policy guidance to carry it out, insofar as the USSR is concerned.

(READ Para 2a with last 2 lines,
Para 6a with last line)

There was a split as to whether the same objective and guidance that apply to the USSR should automatically apply to Communist China; the European Bloc countries, such as Albania or Poland; and the non-European Bloc countries, such as North Viet Nam, North Korea or Outer Mongolia. As indicated by the bracketed clauses in Paragraph 2 and Paragraph 6, some members of the Planning Board believed that the guidance should apply to those other Bloc countries only if they were “involved in the hostilities.”

Other members of the Planning Board pointed out the difficulty of determining whether a Bloc country was “involved in the hostilities” once general war was upon us. There was a strong feeling that whether or not we were “at war” with Country A or Country B in the classical sense would be academic; and that the purpose of the policy guidance

¹ Source: NSC 5904. 4 pp. Eisenhower Library, Whitman File.

was to authorize, in advance, the use of requisite military force against selected targets in the country or countries listed.

(CALL ON: GOVERNOR HERTER
GENERAL TWINING
SECRETARY McELROY
and attempt to resolve splits)

The objective in Paragraph 3 follows generally the language of the old paper except that the language “over their own peoples” is an addition.

(READ Para 3)

The objective in Para. 4 is the same as in the old paper except that the word “effective” before allies has been omitted.

(READ Para 4)

Paragraph 5 is now and provides:

(READ Para 5)

The other split in Section A is a proposal by State and OCDM for a Paragraph 7 of the Policy Guidance to read:

(READ Para 7)

The remainder of the Planning Board felt that guidance on developing a recovery capacity was out of place in a paper on policy in the event of general war, that is, after general war has started, and believed that the proposal should be advanced in connection with the review of Basic National Security Policy.

(CALL ON: GOVERNOR HERTER
GOVERNOR HOEGH)

Paragraph 8 is new.

(READ Para 8)

There are four paragraphs (Paras 9–12) on Post-War Objectives. These are necessarily stated in the most general terms, but could serve as a basis for forward planning by the responsible agencies.

Turning next to Section B, the majority of the Planning Board would entitle the section, “U.S. Policy in the Event of War with a Sino-Soviet Bloc State (or States) Other Than the USSR.” I call particular attention to the footnote at the bottom of page 4 which reads:

(READ Footnote)

The JCS propose a different title, on the grounds that Section B should cover *any* limited war and not be restricted to limited war with a Sino-Soviet Bloc state. I shall later call on General Twining to explain their position.

In their written comments, the JCS withdraw their proposal for a Paragraph 13.

There is agreement on the rather general objective in Paragraph 14:
(READ Para 14)

There is also agreement on the first part of the Policy Guidance in Paragraph 15, the JCS in their written comments having withdrawn the bracketed phrase.

(READ first 3 sentences, Para 15)

A real difference of opinion developed as to our policy after U.S. forces are once committed, as indicated in the splits at the end of Paragraph 15 (Page 5). The majority proposal is:

(READ Majority Proposal)

The JCS have an alternative which would say:

(READ JCS Alternative)

Defense proposed still a third alternative, which I shall ask Mr. McElroy to explain in a moment. Since the paper was written, the JCS have prepared language for a fourth alternative (Appendix B, JCS comments). But first let us hear an explanation of the JCS splits, beginning with the title.

(CALL ON: GENERAL TWINING
GOVERNOR HERTER
SECRETARY McELROY)

148. Memorandum of Conference with the President¹

Washington, March 9, 1959, 10:30 a.m.

OTHERS PRESENT

General Twining
General Goodpaster (for discussion of airborne alert exercise)
Major Eisenhower

General Twining initially brought up the question of the proposed airborne alert exercise to be executed by the Strategic Air Command. This would be directed primarily toward the testing of procedures for airborne alert and would be done on a relatively modest basis. The Secretary of Defense approves of the conducting of such an exercise.

¹ Source: SAC airborne alert exercise; JCS support for Mutual Security Program; Berlin; JCS-Congressional relationship. Top Secret. 3 pp. Eisenhower Library, Whitman File, DDE Diaries.

The President had certain reservations with respect to this exercise, primarily in the light of the possibility that it might be construed as developing a continuing requirement. Therefore, representatives from the Departments of State and Defense and the AEC will meet with the President this afternoon at 2:30 for a complete briefing on this question.

* * *

The President then brought up with General Twining a report which the President had seen in the newspapers relative to a written submission by the individual service chiefs concerning their additional needs at this time. This causes the President considerable concern in that he views this Congressional inquiry as a potential threat to a full promulgation of the mutual security program. He asked General Twining why it is not possible for the Joint Chiefs of Staff to speak out in more positive terms in favor of the mutual security program in order to keep our overall security needs in perspective. The discussions of individual service needs, without a positive support of the mutual security problem would destroy the perspective of our overall requirements.

General Twining expressed complete agreement with this viewpoint and told the President that he would bring this up with the Joint Chiefs in his meeting with them this afternoon. He expressed concern over the fact that the Chiefs of Staff are being required to appear before the Senate Military Preparedness Committee as a corporate body.

General Twining then informed the President that some members of the Joint Chiefs of Staff (General Twining does not concur) fear that we are not going far enough in responding to the Berlin crisis. Some of the Chiefs have recommended actions which General Twining considers provocative. The Joint Chiefs are going to see the Secretary of Defense prior to testifying before Congress and will benefit from his guidance at that time. General Twining remarked that Secretary McElroy's views on this matter are identical to those of the President.

The President then stressed the necessity to avoid over-reacting. In so doing we give the Soviets ammunition. The President stressed the view that Khrushchev desires only to upset the United States. He expressed once again his view that we must address this problem in terms, not of six months, but of forty years. During this time the Soviets will attempt continually to throw us off balance. First, they will hit the situation in Berlin. They will then go to Iraq, then to Iran, and then will attempt to worry us over the situation of the Kurds. They would like us to go frantic everytime they stir up difficulties in these areas. The President feels that we should stand on our program which we consider to be adequate. This program is based primarily on deterrence, our air power, our missiles, and our allies. We maintain at the same time the capability to deal with brush fire actions. The

President admitted that we may miscalculate and become involved in a general war. However, he questioned the effectiveness of any crash military measures to alleviate this current Berlin situation. He feels the measure of raising the levels of Army forces in Europe by 10,000 over that currently planned is useless, except perhaps as a psychological measure. He feels that this is primarily going to give General Taylor ammunition for avoiding his programmed cut of 30,000. General Twining confirmed that General Taylor desires to keep those 10,000 men in Europe.

General Twining then referred again to the nature of the hearings. The President instructed him to caution the Joint Chiefs that the military in this country is a tool and not a policy-making body; the Joint Chiefs are not responsible for high-level political decisions. General Twining agreed, and again expressed his displeasure at the idea of the Joint Chiefs being called as a corporate body to testify before Senator Johnson's Committee. He is certain that Senator Johnson's lawyer will ask policy type questions of the Joint Chiefs. He went on to say that he has his own lawyers working on the legality of the Joint Chiefs being called as a body before Congress. Legally, the Joint Chiefs as a body are required to advise only the President and the Secretary of Defense. General Twining is perfectly willing to walk out of the meeting; however, he has discussed the matter with his own lawyers and has concluded that it is necessary to respond to this call to appear before the Johnson Committee. The Joint Chiefs will not discuss military planning or any other matters which are not Congressional prerogatives. He said again that Secretary McElroy is going to have a talk to the Joint Chiefs, while remarking that this procedure has not been uniformly successful in the past.

As the meeting was coming to a close, the President philosophized briefly on the difficulties of a democracy running a military establishment in peacetime. He reiterated his conviction of the value of mutual security and expressed as his greatest cause of concern the prospect that the Congress will twist the testimony of the Joint Chiefs as a pretext for cutting this vital program.

John S.D. Eisenhower

149. Memorandum of Conference with the President¹

Washington, March 9, 1959, 2:30 p.m.

OTHERS PRESENT

Secretary McElroy
Secretary Quarles
Secretary Murphy
General Twining
General LeMay
General Loper
General Persons
General Goodpaster
General Starbird
Mr. Vance
Major Eisenhower
Colonel Brown (briefer)
Lieut. Colonel Meade (briefer)

The first part of this meeting was comprised of a briefing on the airborne alert exercises entitled Headstart I and Headstart II. The first of these exercises had been conducted between September and December 1958. The essence of the briefing was as follows:

1. Security of the Strategic Air Command from attack may be attained by any one of a combination of the four following measures:

- (a) Ground alert
- (b) Dispersal
- (c) Hardening
- (d) Airborne alert

2. Headstart I had maintained an aircraft airborne for twenty-four hours a day. This had involved four B-52 flights per day, each aircraft carrying two atomic weapons. Each aircraft had received one refueling during the time of flight. The exercise had been based off Loring Air Force Base, and the route chosen had been such that each aircraft would have been effective for an attack on the Soviet Union during most of its route.

3. Headstart I, as an exercise, had been considered 92.5% effective. It had indicated the following conclusions:

- (a) Airborne alert is feasible.
- (b) It is possible to attain increased alert status with the same number of personnel.
- (c) It is possible to increase combat efficiency.

¹ Source: SAC airborne alert exercises. Top Secret. 6 pp. Eisenhower Library, Whitman File, DDE Diaries.

(d) It is possible to maintain aircraft in the air for twenty-four hours a day.

(e) The operation of KC-135s at accelerated rates is feasible.

(f) Command control and weapons safety were proven to be effective.

(g) By conducting lengthy fights at optimum altitude, the B-52 had reached greater efficiency levels cost-wise.

4. The following were not achieved by Headstart I:

(a) Determination of the maximum capability for airborne alert.

(b) Determination of the supply support required.

(c) Adequate crew training.

(d) Firm cost data.

5. Further exercises would accomplish the following:

(a) Determine the maximum capability for airborne alert.

(b) Develop new concepts of operation.

(c) Achieve a greater degree of crew training.

(d) Achieve better cost data.

6. Headstart II, if approved, would be conducted along the following lines:

(a) The test would be conducted over a four-month period, from March to June. In March, there would be eight B-52s and twelve KC-135s aloft per day; in April there would be eleven B-52s and seventeen KC-135s; in May and June, sixteen B-52s and twenty-four KC-135s.

(b) The objectives of Headstart II would be to further investigate manpower and cost figures, to develop an optimum ground and airborne alert ratio, to develop a manning doctrine, to refine maintenance data, to improve operational readiness, and to improve methods of positive control.

(c) To attain these objectives, the problems of maintenance, material, real facilities, fiscal matters, and operations would be emphasized. The cost of Headstart II would be \$20 million over costs for ground alert during this period.

(d) The following flight patterns would be followed:

(1) The 28th Bomb Wing, located at Ellsworth Air Force Base would send one sortie at 2000 hours daily. Its route, generally in the Eastern United States and Canada, would involve support by KC-135s from Loring Air Force Base. Canada has granted overflight permission.

(2) The 92nd Bomb Wing, located at Fairchild Air Force Base, would send three sorties at 1700 hours daily and three sorties at 2300 hours daily. These aircraft would be in the air for twenty-four hours and would receive two refuelings. This route would involve a flight from Fairchild to Kodiak Island in the Aleutians as the initial leg of the journey.

(3) The 4238th Strategic Wing at Barksdale Air Force Base would conduct an exercise involving one of the B-52 squadrons. This would involve one sortie daily, which would receive two refuelings from Westover Air Force Base.

(e) This exercise would be conducted under current manning levels.

7. The briefer then requested approval of the conducting of Headstart II.

* * * *

In discussing the briefing, the President questioned the proposed direction of flight of the 92nd Bomb Wing from Fairchild toward the Aleutians (Headstart II). This, he feels, is a bad direction since it is heading directly toward the USSR. General LeMay said this can be easily fixed. He pointed out that this flight is not within known Soviet radar range nor within an area where Soviet reconnaissance aircraft might be operating. However, Secretary McElroy and Secretary Quarles were of the view that this route should be pulled back closer to the American Continent, and the promise to do so satisfied the President.

The President then questioned the matter of the flight routes. In view of the fact that for a certain portion of each sortie an aircraft would be incapable of diversion to strike the USSR, it appeared to him that our overall capability during this ineffective period would be lessened. He asked why we do not shorten these routes to eliminate the ineffective time. General LeMay answered that the purpose of this exercise is to determine the best flight time. If we do not stretch these flights to the maximum, it will not be possible to determine the optimum. To this Colonel Brown added that the efficiency of the B-52 is increased due to increased length of time in the air. This fact is the result of the greater proportion of time at optimum altitudes per flight. General Lemay also added that another purpose of this test was to determine data on metal fatigue. These answers appeared to satisfy the President.

The President then questioned the effect of this exercise on the calendar life of the aircraft involved. Mr. McElroy added that we will probably discard most of these aircraft before they are worn out.

The President inquired of General LeMay whether provisions are made for the crew to be rested while airborne, and General LeMay answered in the affirmative. The crew is organized so as to allow adequate rest.

The President now turned to a political question which is of some concern to him. In the light of the pressures from Congress to maintain an "air-borne alert," the President dislikes that name. He is concerned

over the possibility that once this exercise is conducted, it will establish a requirement for its continuance; and the implication will be that at the end of the test we will no longer be alert. The President pointed out his mentioning in press conference that a continuous airborne alert may become essential during certain phases of the missile age, but it is *not* essential now. He therefore desires that a training name be placed on this exercise, in order to alleviate the effect of possible leaks. A training name would emphasize that we are only preparing to do what we need to do in the future. Mr. McElroy pointed out that this will go under the code name of Headstart II; but this did not satisfy the President in itself. He desired that we have a name in case we are asked for a description of this exercise. Mr. McElroy voiced his agreement that there is no current military need for an airborne alert.

(The President then digressed for a moment to tell of an episode reported by Macmillan on his recent trip to Moscow. Khrushchev had apparently dropped the thought that the Soviets have no interest in small bombs. Further, their large bombs have now been developed satisfactorily and they have adequate weapons in the megaton class in their stockpiles. Consequently, the Soviets claim they have little interest in conducting tests and are actually shutting down some nuclear reactors. Mr. Quarles stated that recent Soviet tests have verified that their main interest lies in large bombs.)

In conclusion, the President approved the conducting of exercise Headstart II. In describing this operation, he directed that it be called "advance training" rather than an "airborne alert exercise." Further, he understood that the route of the 92nd Bomb Wing from Fairchild to the Aleutians would be modified so as to avoid frightening the Soviets in the event they picked it up.

* * * *

The President then questioned Secretary Murphy about political aspects of this exercise with the Canadians. Mr. Murphy pointed out that although the Canadians had granted permission for overflights, they had done so in a somewhat negative fashion. They had denied having a right to withdraw their approval for such an exercise if it involved the efficiency of SAC. However, they had expressed some fears and had desired no publicity and no tie-in to Berlin. They also expressed the view that in the light of their cooperation in military matters, the United States should see fit to improve its cooperation with them on the matter of oil quotas. According to Mr. McElroy, the military side of the Canadian Government seems easier about this exercise than the civilian side. (General LeMay here indicated that the Canadian Government has been briefed on this exercise.) In connection with the oil quotas, however, the Canadians are, at the appropriate time, going to "explode."

This latter fact diverted the discussion briefly to the matter of oil quotas. The President expressed the desire that advanced information be delivered to Diefenbaker on this subject. He pointed out that these oil quotas are not injurious to Canada. It is important that the Canadian Government know this in the light of the quid pro quo (which approaches blackmail) which they are apparently attempting to implement in this matter.

Mr. Murphy confirmed that the planned oil quotas will result rather favorably for the Canadians; it will be the Venezuelans who will be hurt. Here Mr. Quarles stated that Canada's fears are not for the present but for the future. Mr. Murphy agreed, stating that the principle of a quota is what disturbs the Canadians. They have announced that any restriction on oil imports from Canada will create such surplus in their Western Provinces as to necessitate their constructing a pipeline from West to East. This the President considers highly undesirable. Accordingly, he requested Secretary Quarles to get together with Secretary Seaton to devise some scheme to insure that it does not become necessary for Canada to build a pipeline. He feels that such construction would be a waste of resources and should be avoided. He further requested Mr. Murphy to designate an official to visit Diefenbaker as a personal representative of the President to explain the real facts of the oil import quotas.

* * * *

The President then brought the meeting back to the subject of Headstart II with a warning that if this exercise is leaked, it will probably have to be stopped, due primarily to the political impact in Canada and other nations. General LeMay pointed out here that the only thing new in this exercise is the regularity of dispatch of the aircraft, but the President pointed further to the magnitude and scope of this exercise.

Mr. Murphy pointed out a peculiarity of the Canadian requirements. Whereas the clearance of these flights is normally on a service-to-service basis (USAF to RCAF), the Canadians have specified that the RCAF is responsible for obtaining "ministerial clearance." Secretary Quarles expressed considerable doubt as to the significance of this wording. He does not feel that the Canadians are going to require any exceptional clearance for this exercise. General LeMay concurred in Mr. Quarles' view, stating that the other test had required no change from normal clearance procedures. The President remarked that the greatest danger to the entire exercise lay with the politicians—in this case the Canadian politicians.

John S.D. Eisenhower

150. Memorandum From Gray to Quarles¹

Washington, March 12, 1959

SUBJECT

Defense Presentations to the President

REFERENCE

Memorandum for the Secretary of Defense, subject as above from the Chairman, JCS dated 21 February 1959 (Attached)

1. In my conversation with you and General Twining yesterday I failed to remind you of the suggestion that I made in my memorandum for the Secretary of Defense dated February 19, 1959, that there be prepared a concise discussion paper on each study area which could be circulated in advance on an "Eyes Only" basis. I expressed the hope that the major issues could be identified and cast in a form appropriate for discussion and consideration by the President. I also suggested the kinds of policy questions which might be covered in such a discussion paper.

I raise this in connection with the first study area to be presented which we agreed would be "Control of the Seas with Particular Reference to Antisubmarine Warfare." I am aware that we are planning to present the Comparative Evaluations Group study but I would also hope that there might be related to this presentation the pertinent results of the report by the Panel on Antisubmarine Warfare of the President's Science Advisory Committee dated December 1, 1958. Moreover, it seems to me that in preparation for such meetings we should have a discussion paper with some advance circulation. Therefore, the schedule of the meetings might well depend on the circulation of such a paper. I should appreciate a word from you on this matter.

In this connection I am prompted to observe that you may wish to include in the overall presentation to the President some of the problems which should be discussed in the broader subject of "Control of the Seas."

2. We agreed that the presentation on "Tactical Forces and Requirements for Tactical Weapons Systems," could be made about the middle of April. Again, I feel that a discussion paper could be useful. I think we also agreed that this presentation might perhaps serve only to open issues for later study.

¹ Source: Question of defense presentations to the President on military missions and weapon systems. Top Secret. 2 pp. Eisenhower Library, White House Office Files, Additional Records of the Office of the Special Assistant for Science and Technology.

3. With respect to the study on “Continental Defense Against Aircraft and Missiles (excluding antisubmarine warfare)”, the Chairman of the Joint Chiefs of Staff had recommended a schedule date of about 15 August. We agreed that it would be desirable to advance this date if possible and that you and General Twining would keep under study the possibility of such a change.

4. With respect to the fourth study, “Strategic Nuclear Striking Force Requirements and Capabilities” including the “optimum mix” both of weapons systems and targets, the Chairman of the Joint Chiefs of Staff had indicated that the staff of the NESC had been assigned this project with a due date of 31 October 1959 followed by comments by the JCS, the presentation being ready by about December 1, 1959. I think we all agreed that whereas it is vital that adequate time be allowed for the study, it was desirable to try to advance each of the dates. It was my understanding that General Twining will talk to General Hickey in this connection.

I return herewith General Twining’s memorandum.

Enclosure

Memorandum From Quarles to Lay

SUBJECT

Status of Military Mobilization Base Program (U)

NSC Action No. 2019 requires that the Department of Defense report to the National Security Council on developments in the review of its Mobilization Base planning concepts.

In reference to paragraph *b*–(1) of NSC Action No. 2019, the Department of Defense is now reviewing the validity of the assumption of a mobilization period of six months prior to D-Day. The results of this review will be incorporated into our recommendations to be made in connection with the current review of Basic National Security Policy (NSC 5810/1).

In reference to paragraph *b*–(2), the Department of Defense, in cooperation with the Office of Civil and Defense Mobilization, has just completed the first in a series of hazard probability studies for use in identifying logistics problems which might reasonably be predicted in connection with the initial phase of a General War. These studies constitute an important initial step in giving us a capability for taking bomb damage into account in future mobilization base planning.

/s/ Donald A. Quarles
Deputy

152. Memorandum of Discussion of the 403d NSC Meeting¹

Washington, April 23, 1959

SUBJECT

Discussion at the 403rd Meeting of the National Security Council, Thursday,
April 23, 1959

Present at the 403rd NSC meeting were the President of the United States, presiding; the Vice President of the United States; the Secretary of State (Item 1); the Under Secretary of State (Items 2 and 3); the Secretary of Defense; and the Acting Director, Office of Civil and Defense Mobilization. Also present and participating in the Council actions below were the Secretary of the Treasury and the Director, Bureau of the Budget. Also attending the meeting were the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Director, U.S. Information Agency; the Deputy Secretary of Defense; Assistant Secretary of State Gerard C. Smith; Mr. Robert Amory, Central Intelligence Agency; Special Assistants to the President for National Security Affairs; for Science and Technology; and for Security Operations Coordination; the White House Staff Secretary; the Assistant White House Staff Secretary; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

[Omitted here is agenda item 1.]

2. U.S. OVERSEAS MILITARY BASES

(NSC Actions Nos. 1876 and 2034; SNIE 100-10-58; SNIE 100-3-59; Memo for NSC from Executive Secretary, same subject, dated March 17, 1959)

Mr. Gray briefed the Council on the problem of U.S. Military Bases overseas and noted that the last time the Departments of State and Defense had reported to the Council on various U.S. Bases (January 15), they had covered everything except our bases in Brazil, the Caribbean area, and the Philippines. He understood that the Secretaries of State and Defense were now prepared to render a supplementary report covering these areas.

The report was summarized for the Council by General Twining who indicated that the Memorandum addressed to the Council by the Secretaries of State and Defense on these bases showed no apparent adverse factors sufficient to over-ride the desirability of continuing to maintain these bases and their facilities. However, the Secretaries of

¹ Source: Agenda item 2: U.S. Overseas Military Bases. Top Secret; Eyes Only. Extracts—4 pp. Eisenhower Library, Whitman File, NSC Records.

State and Defense in their Memorandum did indicate that it would be desirable to review carefully U.S. military requirements prior to renewing the existing agreements with Brazil and the Dominican Republic. It was likewise indicated that certain facilities in the Philippines and Caribbean areas could probably be released because there was no clear military need for them. Similarly, with respect to the Philippines it was planned that areas no longer required by U.S. forces would be released during the current negotiations.

Secretary Dillon, who had taken the place of Secretary Herter at the beginning of discussion of this item, said that the State Department had found this review of our base requirements a very useful exercise indeed. In the course of the review, it had become obvious that the State Department lacked important information on a number of bases. Accordingly, the Department was instructing the appropriate embassies and legations to report regularly on U.S. bases within their jurisdiction.

The Vice President inquired specifically about the U.S. base at Guantánomo Bay in Cuba. He wondered whether it might not be a good idea for us to withdraw from this base in view of Fidel Castro's suggestions and the rash statements which he had been making in criticism of the U.S. The Vice President said that he did not imagine that the Guantánomo base was very important to U.S. security.

General Twining replied that on the contrary this base was considered the key to the whole military defense of the Caribbean. We should certainly not abandon the base at Guantánomo Bay if we could avoid doing so.

Mr. Gray then raised the question originally posed by the President as to the necessity for the U.S. to continue to maintain base facilities at Sangley Point in the Philippines. General Twining replied that the Department of Defense had a report in response to the President's question which they would send to General Goodpaster. The President said that it would be sufficient for this report to come to him and that it need not be brought up in the Council.

Mr. Gray then inquired about the report requested by the President with respect to the feasibility of concentrating U.S. military installations on Okinawa in a single area. General Twining said that this problem was still under active consideration in the Defense Department and that a report on it would be forthcoming soon.

The National Security Council:

a. Noted and discussed the report on the subject by the Acting Secretary of State and the Secretary of Defense pursuant to NSC Action No. 1876, transmitted by the reference memorandum of March 17, 1959.

b. Noted an oral report by the Chairman, Joint Chiefs of Staff, that:

(1) A report was being submitted to the President pursuant to NSC Action No. 2034-c-(1), stating that the Sangley Point naval base in the Philippines was still considered militarily important.

(2) The study as to the feasibility of concentrating U.S. military installations in Okinawa in a single area was being actively conducted by the Department of Defense pursuant to NSC Action No. 2034-c-(2).

NOTE

Immediately preceding the above regular meeting, the President held a special NSC meeting to note and discuss two studies analyzing possible contingencies relating to the maintenance of Western access to Berlin.

153. Letter From Herter to McElroy¹

Washington, April 25, 1959

Dear Neil:

On February 26, 1959, Deputy Secretary Quarles and I agreed that Assistant Secretaries Irwin of Defense and Smith of State would consult together on the problems of US strategy raised in Secretary Dulles' letter of January 24, 1959 before the military paragraphs of NSC 5810/1, "Basic National Security Policy", were taken up by the NSC Planning Board in the 1959 annual review of that paper.

In the course of a preliminary discussion on April 16 Mr. Irwin suggested to Mr. Smith that it would be helpful if this Department could provide a brief statement of foreign policy requirements bearing upon military strategy. I am accordingly sending you the enclosed paper.

I recognize that there are various considerations in addition to those of foreign policy that must bear upon the formulation of our military strategy. I hope, however, that the enclosed paper will be of assistance to your Department in its re-examination of the military paragraphs of NSC 5810/1.

With warmest personal regards,
Most sincerely,

/S/ Christian A. Herter

Staff Paper Prepared in the Department of State

Washington, April 24, 1959

Summary Statement of Foreign Policy Requirements Bearing upon US Strategy

US strategy should serve our national policy objectives of maintaining the cohesion of the Free World and influencing the policies of the Communist empire in directions compatible with US national security interests. From the point of view of foreign policy this requires:

1. *An evident, secure nuclear retaliatory capability and an acceptable doctrine for its use.* This capability is the primary requirement. Its existence does not, however, solve all problems. We need to reassure our allies that this capability would be used only in defense of vital interests and that its use would be consistent with their continued survival.

2. *An evident, adequate and flexible capability for military operations short of general war and an acceptable doctrine for its use against the range of possible Communist aggressions.* This requirement is of increasing importance. As Soviet nuclear capability grows, so does Free World and Communist questioning that the US would use its strategic nuclear capability in any situation that did not clearly and imminently endanger vital US security interests. Deterrence of Communist limited aggression, and Free World confidence that such aggression will be deterred, will depend more and more on the strengthening of US limited war capability. The present degree of US reliance on nuclear weapons for this purpose disturbs large segments of the Free World and impedes the fulfillment of our national policy objective of maintaining the cohesion of the Free World. We need from the point of view of foreign policy a capability and a doctrine that are flexible enough to enable us to deter and to defeat limited Communist aggression in ways that are acceptable to Free World public opinion and that minimize the danger of expanding local war into general war.

The foregoing generalizations apply to the deterrence and defeat of three categories of Communist aggression as follows:

1. *Substantial Soviet aggression against the NATO area* would mean general war.

2. *Overt Soviet non-nuclear aggression against non-NATO areas.* For deterrent purposes we must retain the threat of nuclear response. In the event of such aggression, however, it would be preferable if our initial response were non-nuclear. Should the USSR persist in its aggression,

limited and local use of nuclear weapons against military targets would be acceptable from the foreign policy point of view.

3. *All other kinds of Communist aggression.* For deterrent purposes we should not explicitly deny ourselves the use of nuclear weapons. It should, on the other hand, be evident to the Free World that we are not overly dependent on these weapons for deterrence or actual military operations. In the event of such aggression, recourse to the use of nuclear weapons would, in most situations, have highly adverse consequences from the foreign policy point of view. We should, therefore, plan and be prepared for a non-nuclear response in these situations. The use of nuclear weapons should be regarded as a last resort.

154. Memorandum of Conference with the President¹

Washington, May 4, 1959

OTHERS PRESENT

Mr. Harr
General Goodpaster

Mr. Harr said he had asked to see the President because the changes incident to Mr. Herter's assuming the Secretaryship of State provided a point in time for review of OCB affairs. A key question is that of State's chairmanship of the Board. He recalled that this question had been considered with the President, at several times in the past, and that because of this consideration the President had appointed Mr. Herter as Chairman not ex officio but as an individual. The points of concern are first as to State Department domination and lack of impartiality in the conduct of the affairs of the Board (the consequence of which is that other agencies tend to "dry up"), and second that it has been difficult in the past achieving a proper coordination of Mutual Security affairs by the Board with the Board's chairman being the number two man and the Mutual Security coordinator being the number three man in the State Department hierarchy. With these two posts now reversed, it seems even less likely that effective coordination will be achieved.

¹ Source: Relationship of State and OCB. Confidential. 2 pp. Eisenhower Library, Whitman File, DDE Diaries. Drafted on May 5.

The President spoke at some length on his concept of State Department primacy in matters of foreign policy, indicating that the other departments have more the role of instruments of policy. He recalled that the OCB had been set up to follow through on NSC policies once established—to assure coordinated operations and also the carrying out of policy decisions. The President also noted that the OCB, having taken over from the PSB, is concerned with psychological questions and efforts. In pushing these, he recognized that they verge on foreign policy at times.

As to the Chairmanship, the President said that the only other possibility that came to his mind was that of having Gordon Gray chair the OCB. He would have objectivity and could review its actions from the standpoint of policy considerations. The President then asked me for my view on the matter, and I told him that the essential point, in my opinion, was to establish the need for objectivity as well as the relationship of the Board to the Mutual Security Program; I also mentioned that there is some possibility that the OCB mechanism may lose its steam, and that consequently a push to keep up its vitality would be valuable.

I also commented that there is some natural overlapping between foreign policy, which the President views as the affair of the State Department, and security policy, with which the OCB is more directly concerned. Some would feel that the State Department itself is an instrument of security policy, charged with the narrow function of diplomatic activity. This may be extreme view, but the opposite—that any matter that can be classed as foreign policy is primarily the business of the State Department, even though it affects security—is also an extreme view. The President pointed out that the State Department is more than a diplomatic instrument. The Secretary advises him and formulates matters for his consideration. After further discussion he agreed that there was a considerable area of overlap.

The President said he would talk to Mr. Herter about this. Later in the morning he did so.

A.J. Goodpaster
Brigadier General, USA

155. Memorandum of Conference with the President¹

Washington, May 4, 1959

OTHERS PRESENT

Secretary Herter
General Goodpaster

The President said he had asked Secretary Herter to come over in order to talk about the set-up for the OCB. Mr. Harr had been in earlier in the morning, expressing essentially a concern that the OCB should not run out of steam, and that the shifts of top State personnel should not contribute to such a process. The President said he had given some consideration as to whether it would be of value to have Gordon Gray chair the Board, but had thought that it would not, largely because Mr. Gray is already carrying a maximum load. There are two questions that need consideration, however. The first is the reversal of the relationship of the Chairman of the Board to the Coordinator of Mutual Security incident to Dillon's becoming Under Secretary and Murphy as the Board Chairman, being the No. 3 man in the State Department. The second is that there be no loss of enthusiasm for the OCB operations, and that the Chairmanship not be over slaughtered by the changed arrangements. The President thought that this should be taken up in the letter of appointment of the new Chairman. He also asked Mr. Herter to make sure that Mr. Dillon maintains in Mutual Security operations a responsive regard for OCB activity.

Mr. Herter said that a lot of the difficulty is that the powers of the OCB are limited to recommendation alone. This is especially true in carrying out NSC policies. On the side of psychological activities, there is need for initiative and suggestions of a specific character. With regard to Mutual Security, his effort had been to keep the OCB away from the assertion of operating jurisdiction, especially on day to day and specific country decisions.

The President added that we have had one idea from the start with the OCB, and that is that it should press and prod the responsible agencies into action. The President said he did not think that Murphy would be guilty of any errors of decision or blundering in the OCB; he implied some question as to whether Murphy would use the machinery vigorously enough, however. Mr. Herter thought that Mr. Murphy would be very valuable in the OCB because of the tremendous experience and detailed knowledge that he possesses over a very broad field of

¹ Source: Department of State-OCB relationship, nuclear test ban negotiations. Confidential. 2 pp. Eisenhower Library, Whitman File, DDE Diaries.

international affairs. He said he would be happy to talk to Mr. Harr. The President said that would be fine, and also suggested that Mr. Herter might have a luncheon with Dillon, Murphy and Harr present so that everything could be fully understood.

Secretary Herter next mentioned the issues that still remain regarding next steps by the United States on nuclear test suspension negotiations. He said he thought this could be worked out with Mr. McCone, and he would plan to bring in a very brief statement of the remaining issues at the meeting planned the following day with the President. He stressed the importance of trying to get the Soviets to go along with us on a few jointly conducted underground tests, the purpose of which would be to gain additional scientific (seismographic) data. The President agreed with this.

The President suggested that Mr. Herter might wish to have a special little luncheon for Sir Winston Churchill, on Tuesday or Wednesday. He said he would ask Mr. Churchill at once as to his desires. (Subsequently he informed Mr. Herter that Sir Winston preferred not to go out for luncheons.)

156. Briefing Note for the 405th NSC Meeting¹

Washington, May 6, 1959

SUBJECT

Port Security (Proposed Revisions of Par. 19 of NSC 5802/1 and Par. 33-*b* of NSC 5808/1)

1. The first item for consideration by the Council grows out of recommendations made to the Planning Board by the State member, who proposed that revisions be made in our Port Security policies and programs, with a view to permitting freer access to U.S. ports by Soviet Bloc and other flag vessels which are presently denied entry to our ports in the absence of exceptional circumstances.

¹Source: Port security program. Secret. 3 pp. Eisenhower Library, Whitman File.

2. The Port Security Program which is currently in operation under responsibility of the Secretary of the Treasury and the Coast Guard is governed by the following:

a. U.S. Policy on Continental Defense, in Par. 19 on the subject of Port Security, calls for measures to be applied by Treasury to protect U.S. port areas against sabotage, espionage and clandestine introduction of *persons* and *things* inimical to U.S. security, including measures, on a selective basis as appropriate, for (1) the denial of entry to vessels, and (2) the boarding, searching and surveillance of vessels (NSC 5802/1, Par. 19, p. 2). State and Treasury, propose that the Port Security paragraph of Continental Defense Policy be revised by deleting provisions for the denial, boarding, searching, and surveillance of Bloc vessels. The majority of the Planning Board recommend that Par. 19 of Continental Defense Policy should *not* be revised at this time, and the JCS, and IIC and ICIS, excepting the State member, concur in this view.

b. U.S. Policy Toward Poland also deals with Port Security in Par. 33 which provides that Polish flag vessels are to be treated in the same manner as Soviet Bloc flag vessels, *except* that Polish flag passenger vessels may enter at New York, and Polish flag cargo vessels may be permitted entry at designated U.S. ports for the specific purpose of taking on cargo for Poland under U.S.-Polish economic arrangements (NSC 5808/1, Par. 33, p. 11). All members of the Planning Board recommend that this policy be revised so as to permit Polish cargo vessels to enter designated U.S. ports for purposes of normal trade, not necessarily limited to the taking on of cargoes under a U.S.-Polish economic agreement. The JCS *do not* concur.

c. Pursuant to NSC Action, Treasury submitted a detailed Port Security Program to carry out the previously mentioned policies governing the denial and control of Sino-Soviet Bloc and Polish vessels. This program *prescribes* specific measures to be taken by Treasury and Coast Guard, with respect to: (1) the *admission of Polish vessels at designated ports*, after boarding and search, when taking on cargo under an economic agreement, and Polish passenger vessels at New York after boarding and search; (2) the *denial of entry to Sino-Soviet bloc flag vessels*, and any other flag vessel which is suspected of being under Bloc control; and (3) the *boarding and search of other flag vessels* which are suspected of being under Bloc control or which have touched at a Bloc port during the preceding four months. It is also provided that any vessel otherwise excludable from U.S. ports under this policy may be admitted under circumstances as determined by the Secretary of the Treasury, in consultation with the Secretaries of State and Defense and the Director of Central Intelligence. (It should be noted that this Presidentially approved program would in effect be rescinded should there be approval of the State-Treasury proposal to amend present policy by eliminating requirements for the denial, boarding, search, and surveillance of Bloc and other suspect vessels.)

3. *In support of the State-Treasury proposal* The following points were advanced: to revise the Port Security provisions of Par. 19 of Continental Defense Policy, are the points made in the State Department

memorandum previously circulated to the Council. The State position was summed up at the Planning Board as follows:

a. The risk of clandestine introduction of nuclear weapons into U.S. ports via merchant vessels is less than it once might have been, in view of developments which have taken place subsequent to the adoption of the Port Security Program during the Korean crisis.

b. Some of the broader objectives of over-all national security policy, particularly with respect to increased peaceful trade with the Soviet Bloc, are being made difficult of achievement as the result of our present Port Security Policy which should, therefore, be relaxed.

c. Although internal security is an important element of national security, it is but one segment of over-all policy and must be viewed in focus.

4. *Considerations in opposition* to the State-Treasury proposal were raised in the Planning Board discussion as follows:

a. No basis has been produced for considering that there has been any reduction in the threat of clandestine delivery of nuclear weapons via vessels entering U.S. ports—a threat which is recognized in our present Basic National Security Policy (NSC 5810/1, Par. 44).

b. Rescission of the present denial policy and removal of the requirement for the boarding and searching of suspect vessels, will withdraw our only defense (the Commandant of the Coast Guard states that it is a minimum defense) which we now have against the destruction of U.S. ports by means of nuclear weapons clandestinely introduced via vessels. If the policy is revoked, the Coast Guard would not feel justified in continuing harbor patrols.

c. In view of the forthcoming international conferences it is argued that this is probably not a propitious time for the United States to indicate a relaxation of policy toward the Soviet Bloc by removing Port Security controls.

5. CALL ON: Secretary of State
Secretary of the Treasury
Chairman, IIC (Mr. J. Edgar Hoover)
Chairman, ICIS (Mr. J. Walter Yeagley).

6. With regard to the proposed change in our Polish policy, I am committed to inform the Council as to the following: Subsequent to agreeing on this recommendation, Commerce directed to the Planning Board's attention a CIA report to the effect that a number of vessels flying the Polish flag are actually under the joint ownership and control of Poland and the Government of Communist China. Commerce believed that this situation would make more difficult the enforcement of Export Control and Foreign Assets Control regulations. Treasury and State, however, have informed the Planning Board that (1) these controls rest on authorities other than Port Security denial policy, (2) any Chinese Communist-owned vessels entering U.S. ports would be controlled under the Trading with the Enemy Act which prevents trade or financial transactions in which Communist China has any beneficial interest,

and (3) State will warn the Poles that action will be taken under the Trading with the Enemy Act if any ship in which Communist China has ownership or interest visits U.S. ports. (In any case, the Council's attention is invited to the fact that the Port Security restrictions on Polish vessels, as now set forth in our Polish policy, would become inoperative if approval is given to the State-Treasury proposal to drop our present Port denial program.)

157. Memorandum of Discussion at the 405th NSC Meeting¹

Washington, May 7, 1959

SUBJECT

Discussion at the 405th Meeting of the National Security Council, Thursday, May 7, 1959

Present at the 405th NSC Meeting were the President of the United States, presiding; the Vice President of the United States; the Secretary of State; Donald A. Quarles for the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also attending the meeting and participating in the Council actions below were the Acting Secretary of the Treasury; the Director, Bureau of the Budget; the Attorney General (Items 1 and 5); Frederick Mueller for the Secretary of Commerce (Item 1); and the Chairman, Atomic Energy Commission (Item 5). Also attending the meeting were the Chairman, Interdepartmental Intelligence Conference (Item 1); the Chairman, Interdepartmental Committee on Internal Security (Item 1); the U.S. Ambassador to Iraq (Jernegan) (Item 5); the Director, U.S. Information Agency; General Curtis E. LeMay for the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Under Secretary of State; Assistant Secretary of State Gerard C. Smith; Assistant Secretary of Defense John N. Irwin II; the Assistant to the President; the Special Assistants to the President for National Security Affairs, for Foreign Economic Policy, for Science and Technology, and for Security Operations Coordination; the White House Staff Secretary; the Assistant White House Staff Secretary; the NSC Representative on Internal Security; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

¹ Source: Agenda item 1: Port Security; Agenda item 5: Overseas Internal Security Program. Top Secret; Eyes Only. Extracts—12 pp. Eisenhower Library, Whitman File, NSC Records. Drafted on May 8.

There follows a summary of the discussion at the meeting and the main points taken.

1. *PORT SECURITY: Proposed Revision of Paragraph 19 of NSC 5802/1 on Continental Defense and Paragraph 33–b of NSC 5808/1 on Poland* (NSC 5802/1; NSC 5808/1; NSC 5819, Part 9; NSC Action No. 2051; Memos for NSC from Executive Secretary, same subject, dated April 8, 21 and 22, 1959)

Mr. Gordon Gray briefed the Council in detail concerning the subject. (A copy of Mr. Gray's briefing note is filed in the Minutes of the Meeting, and another is attached to this Memorandum.)

Mr. Gray then called on the Secretary of State for comment. Secretary Herter observed that two separate problems were involved in the Port Security problem; the first related to Polish ships and the Second to other Soviet Bloc ships. He indicated that in the case of Polish ships, State considered it of very great importance, in terms of increased peaceful trade and in terms of effecting reciprocal arrangements with Poland, that the U.S. liberalize its policy on the number of Polish vessels permitted entry into the U.S. and on the kind of cargo such vessels were permitted to carry. He said that in the case of Soviet ships, State was very conscious of the threats to our internal security which were inherent in the visits of such vessels to our shores. As regards the threat of clandestine entry of nuclear weapons, however, it was his understanding that the intelligence community had reviewed this problem and had come to the conclusion that this was the least likely method that the Soviets would employ for the purpose of introducing nuclear weapons into this country. He observed that introduction by this means would be unlikely not only because of the possibility of detection but also because the vessel carrying such a bomb would be destroyed at the time the weapon was detonated.

Secretary Herter indicated that only this morning the State Department had received a note from the Canadians saying that a Soviet ship was headed for the St. Lawrence Seaway and expressing the hope that the U.S. would not interfere with it.

Secretary Herter indicated that the Department of State recognized that its proposal posed a most serious problem for the Coast Guard, and hoped that it could accomplish its objective without adding greatly to the burdens of that service. To that end, it was hoped that the present situation could remain substantially as it is until the fall with the Treasury Department, in the interim, exercising a degree of flexibility concerning Soviet Bloc ships attempting to enter our ports. It was also hoped that, in exercising its responsibilities for the Port Security Program, the Treasury Department would take into account the foreign policy implications involved. It was the Department of State's thought that the whole matter might subsequently be reviewed

by the Council when we saw the outcome of the upcoming international conferences.

The Acting Secretary of the Treasury, Mr. Scribner, emphasized the difficulties encountered by the Treasury Department in implementing the Port Security Program. He said thus far three exceptions had been made as to entry of Soviet Bloc vessels. He noted that the Treasury Department presently had two programs in effect in the Port Security area; the first involved boarding and searching of vessels, the second involved the checking of such vessels after they tied up at the dock for the purpose of processing suspect materials or suspect persons. He indicated that the proposal before the Council did not envisage doing away with the second program pertaining to the processing of persons and materials.

Mr. Scribner concurred in the view that it was unlikely that the Bloc would utilize vessels for the introduction of nuclear weapons when it would be more logical to introduce them by aircraft.

Mr. Scribner asked that the Treasury Department not be given the difficult task of determining, from a foreign policy standpoint, whether a particular ship should be granted or denied entry. He did not feel that the Treasury Department was either prepared or qualified to fulfill such an assignment. He said it was the Treasury Department's view that the present Port Security Program should continue until the fall, at which time it should be re-examined.

Secretary Herter noted that it was present policy to step up exchanges with the Bloc; that the Russians were planning to send larger groups to the U.S.; and that Soviet or other Bloc vessels might be used to bring such groups to this country. Accordingly, the Department of State felt that some additional flexibility should be exercised in arriving at decisions to permit or deny entry to such vessels.

The President thought that the Department of State was asking the Treasury Department to take on a heavy responsibility which it seemed to the President should continue to be the responsibility of the Department of State.

Secretary Herter commented that under existing arrangements, the Secretary of the Treasury was responsible for determining which vessels would be permitted to enter by way of exception to the Port Security Policy, but that the Department of State would be happy to take on as much responsibility in this area as the President wished to assign.

Mr. Scribner, in response to the President's inquiry, explained the consultative procedure which is now in effect whereby the Secretary of the Treasury, after consultation with the Secretary of State, the Secretary of Defense, and the Director of Central Intelligence, determines the circumstances justifying the granting or denial of entry of suspect vessels.

The President observed that it must be most difficult to search effectively a ship for the purpose of determining whether it was carrying

a nuclear weapon. He noted, for example, that the weapon could be located in a false bottom constructed in the ship.

Mr. Scribner concurred with the President's observation, noting that many people think that more safeguarding is being done in this area than is actually the case.

Secretary Quarles indicated the view of the Department of Defense that there was sufficient flexibility in the present Port Security Program; that there was no need for amending the existing policy in that regard. He said that the Department of Defense would defer to the Department of State as to the degree of relaxation which should be exercised with respect to the Polish vessels. While agreeing with the President and with Secretary Scribner that the searches made for clandestine nuclear weapons in such vessels could only be partially effective, Secretary Quarles thought, nonetheless, that they served as a deterrent to attempted introductions through such means.

The Director of the FBI, when called on for comment by the President, indicated that the Interdepartmental Intelligence Conference concurred in the view that the present Port Security Policy and Program should not be modified until after the completion of the Geneva Conference. *[text not declassified]* Mr. Hoover said that the present policy and program served to some degree as a deterrent to the introduction of nuclear weapons and to the introduction of large numbers of intelligence agents. He emphasized that the present policy included an arrangement which permitted exceptions in particular cases and he concluded that from an internal security point of view, the present policy and program should not be modified at this time.

The Chairman of the Interdepartmental Committee on Internal Security, when called upon by Mr. Gray, concurred in the view that review of existing policy should be deferred until the fall. He added that while it was recognized that there may be over-riding considerations which suggested a liberalization of policy on Polish vessels, it was his view that the Poles, as well as the Soviets, constituted a threat to the U.S.

General LeMay, on behalf of the JCS, noted that no information has been brought to the attention of the JCS which would reflect that there has been a change in the threat since the present Port Security Policy was adopted. It was the JCS view that the Port Security Committee had been working satisfactorily and consequently the present policy should be left as is.

The President asked General LeMay if it was the view of the JCS that the policy as regards the Polish vessels should likewise remain unchanged and General LeMay replied in the affirmative.

Mr. Mueller of the Department of Commerce, directed the Council's attention to the recent CIA report indicating that a number of vessels

flying the Polish flag were actually under the ownership or control of the Government of Communist China. He observed that these Chinese Communist-controlled ships were probably sailing under the Polish flag to deceive the Free World and particularly to deceive the Chinese Nationalists. He said that the Chinese Communists now owned nine or ten such ships and that they propose to achieve ownership of an additional number of such vessels. He thought that this could cause a problem for the U.S. if such vessels appeared in our ports. He also thought that an arrangement of this kind raised serious doubt regarding the honesty and integrity of the Poles.

Mr. Herter indicated that the Department of State has already notified the Polish Government of the U.S. position in this regard. He said that the Poles have been warned that action would be taken against any vessel entering the United States under the Polish flag which was in fact owned by Communist China.

The President asked if one could always prove such ownership, and the Secretary of State indicated this was not always possible. He said that someone would have to give evidence to the Department of State that such Polish flag vessels are actually owned by the Chinese Communists.

The Director of Central Intelligence elaborated on the aforementioned point, as raised by the Department of Commerce, by giving the Council an oral summary of the CIA report which was circulated to the Council on the Chinese Communist vessels. Thereafter, Secretary Herter emphasized that whenever the Department of State received evidence that a Polish flag vessel entering one of our ports was actually owned by the Chinese Communists, such vessel would be excluded.

Mr. Gray indicated that the points raised by the Commerce Department had been discussed by the Planning Board and he briefly summarized that discussion. The President indicated that he was not clear why any change in our present port security program was being suggested at this particular moment and Secretary Herter indicated that this was being done now because of difficulties encountered by the Treasury Department in applying the port security program in particular situations. He indicated that while we were trying to normalize our situation as regards the Poles, based on our policy of increased trade and increased exchanges, the port security program sometimes militated against the accomplishments of those objectives. He cited, by way of example, the case of the Polish ship which carried its passengers to a Canadian port rather than the port of New York, for reasons relating in part to our port security policy.

Mr. Scribner stated that the Treasury Department wished to urge no change in the policy at this time except in the case of the Polish vessels. He wished to make clear, however, that if the policy on Polish vessels were liberalized, such vessels would continue to be boarded

and searched. It was the Treasury Department view that the general port security policy should be continued in its present form rather than to leave it in some indefinite status.

Mr. Hoover, referring to Secretary Herter's comments on the Polish passenger vessel calling at a Canadian port rather than at the port of New York, noted that the vessel in question was the Batory. He said that when the Batory earlier called at our ports, it was used to get Gerhard Eisler out of the country; that when its master defected to the British, he reported that his entire crew was under the direction of the Polish Intelligence Service which, in turn, was supervised by the Soviet Intelligence Service; that the master of the crew had no control over his men except for purposes of operating the ship. [*text not declassified*]

The President asked whether, if the Polish policy were liberalized, such vessels would be limited to our major port areas and whether they would continue to be boarded and searched. Mr. Scribner replied in the affirmative saying that such vessels would only be permitted to enter where we have boarding and searching crews and that they would in fact be boarded and searched. The President asked if they would be permitted entry only at specified ports, and Mr. Scribner replied in the affirmative. [*text not declassified*]

[*text not declassified*]

The President said at this point that the only change being recommended related to a limited increase in the number of Polish vessels with the understanding that those vessels could come in only at specified ports; that they would be boarded and searched; and that they would be permitted to engage in some general trade rather than be limited to carrying only cargo specified by the U.S.-Polish economic agreements. Secretary Herter concurred in the foregoing, stating that the number of ports of entry would not be enlarged. Mr. Scribner confirmed the foregoing, stating that entry would be limited to the ten major port areas.

The President observed that this came down to the matter of our general policy wherein we were trying to get the Poles to feel a little better toward us, and in the process we were trying to drive a wedge between the Poles and the Soviets.

The Vice President observed that underlying another aspect of the proposal was the realization that it would be more profitable for the Poles to bring their vessels here if they could take out cargo additional to that specified in the economic agreements, and that an increase in the number of such vessels entering our ports would make for some increased problems for our security and intelligence services.

The President said he did not believe that by itself an increase in the number of Polish vessels would be critical unless the increase became so great that the Treasury people could not handle the boarding and searching of such vessels and the processing of the people thereon.

The President then asked if the FBI engaged in such searches, and Mr. Scribner replied in the negative. Mr. Scribner added, however, that apart from the boarding and searching, other services engaged in various kinds of personnel processing. Mr. Scribner cited the Immigration Service as an example.

The President thought it best to leave the policy as it was for the moment, except to take a liberalized outlook as to the kind of goods which might be carried in Polish vessels. He thought also that if there was a great increase in the number of such vessels, occasioning problems for the Treasury Department, the Treasury Department could come back and report that fact to the Council.

Secretary Herter inquired whether any internal security problems had been encountered with respect to the several ships which have been permitted entry thus far, and Mr. Hoover responded that in the case of the Polish ships the FBI had found six intelligence agents. He added that in the case of the British, they had reported the discovery of forty such agents.

The Attorney General observed that there was another aspect of the problem which had not as yet been discussed, and he referred specifically to the matter of trying to keep track of the crews of these vessels once the ships had docked at our ports. The President asked if such crews were permitted to go ashore, and the Attorney General replied in the affirmative, noting that it was most difficult, in fact impossible, to surveill all the members of such crews. He noted that other correlative problems arose, such as the question of ascertaining whether defectees were bona fide in character. He said the last mentioned problem sometimes required drawn-out processes in our courts to determine whether they would be sent back to their country of origin. The Attorney General said that he agreed with the suggestion that the present program be continued with a view to re-examining it in the fall.

The President again referred to U.S. attempts to try to open up certain areas with the Poles in an endeavor to drive a wedge between them and the Soviets. He said underlying such efforts was the desire to get some of these countries to appreciate that we have not abandoned them. He noted that these efforts sometimes caused differences between the Soviets and the satellite countries involved, and that we ought to continue to try to exploit such differences. The President did not see, however, why it was necessary to alter the policy under discussion in order to accomplish this purpose.

Secretary Herter referred to our continuing efforts to keep the Poles from complete submission to the Soviets, and he indicated that a number of these efforts were involved in the proposal made to the Council by the Department of State.

The President inquired whether there would be any advantage to telling the Poles that we would permit a specific number of additional

Polish vessels to enter our ports, and by way of example he cited the number six. Secretary Herter thought that this could be done.

The President said he did not wish to give up completely on Poland, though at times, after reading Gomulka's speeches, he wondered what we were accomplishing by our efforts with the Poles.

The Commerce representative, referring to the President's inquiry about increasing the number of Polish vessels by six, asked if it would not be well to limit the number of such vessels on a strict reciprocity basis to the number of U.S. vessels permitted into Polish ports.

Secretary Herter called on Mr. Dillon for comment and Mr. Dillon indicated that the Poles might not be conscious of the fact that they were under limitations insofar as we were concerned. He said that it might complicate things if we were to advise the Poles that they would be permitted to bring in a specified number of additional vessels. Mr. Dillon also commented upon the cargo aspect of the problem, noting that the policy as stated permitted them to take out only such cargo as came under the terms of economic agreements made between the United States and Poland. He said that if we were to suggest that they bring in additional ships but that that cargo be limited to aid-type cargo, we might have a serious problem on our hands.

The Attorney General thought that in view of the comments made by Mr. Dillon it would be best not to change our present policy but possibly to be a bit more flexible, as circumstances permitted.

The President said in the light of the discussion he thought it best to let the present policy and program stand as is for a while, recognizing that there is a procedure available for making limited exceptions in certain instances. Mr. Scribner concurred, suggesting that the matter be re-examined in three months or so.

The Vice President also expressed the view that the present policy should be left unchanged with the understanding that there would be a more liberalized interpretation thereof in terms of the number of Polish ships permitted entry. He thought it best to let the matter be played by ear for the time being rather than to amend our policy.

The President asked if it would be possible or wise to let the Poles know that they are on their honor insofar as we are concerned, and if they violate, as in the matter of Communist-controlled vessels, they will be treated accordingly. Mr. Herter said he thought that this could be done.

Mr. Dillon mentioned that the Moore-McCormack Lines and the Lykes Service were running ships into Poland. Based thereon the Poles had indicated to us that they were considering inaugurating similar service to the United States. In giving this indication Mr. Dillon did not think that the Poles were aware of the port security limitations which we had applied to them. He said there was a danger that if we acquainted the Poles with these limitations, they might prohibit

Moore-McCormack and others from running ships to Poland with the result that this could aggravate the U.S.-Polish situation in terms of economic warfare. Mr. Dillon indicated that the Poles had not made a formal request to establish services similar to Moore-McCormack, but that they had said that, as a matter of reciprocity, they might wish to make an application along these lines at a later time.

Mr. Gordon Gray suggested that in the light of the discussion it appears that there was no need to change the language in the paper under discussion; that it appeared that a limited number of additional Polish vessels could be permitted to enter our major port areas under a liberalized interpretation of the policy; and that if this number exceeded reasonable proportions, the policy could be re-examined.

The President concluded the discussion by noting that if we did not have a better answer than the one proposed, it was best not to make mistakes in a hurry and accordingly we should keep the present policy, utilizing the exception procedure sparingly as regards the entry of Polish vessels.

The National Security Council:

a. Discussed the recommendations submitted by the NSC Planning Board on the subject, transmitted by the reference memorandum of April 8, 1959; in the light of the views of the Joint Chiefs of Staff thereon, transmitted by the reference memorandum of April 22, 1959.

b. Agreed that, subject to review following the conclusion of the forthcoming negotiations with the USSR, paragraph 19 of NSC 5802/1 and paragraph 33 of NSC 5808/1 and the operations of the exceptions procedure thereunder should not be revised; with the understanding, however, that the exceptions procedure for Polish flag vessels may be interpreted liberally unless undue numbers of Polish flag vessels take advantage of such procedure, in which case this procedure shall be subject to review.

NOTE: The action in *b* above, as approved by the President, subsequently transmitted to all holders of NSC 5802/1 and NSC 5808/1.

J. Patrick Coyne
NSC Representative on
Internal Security

[Omitted here are agenda items 2-4.]

5. OVERSEAS INTERNAL SECURITY PROGRAM

(Memos for NSC from Executive Secretary, dated April 2 and December 1, 1958; NSC 5810/1; NSC 5819, Part 2; NSC Action No. 2012; Memo for NSC from Executive Secretary, dated April 10, 1959).

In making his summary of the report Mr. Harr related the conclusions of the report to certain paragraphs in the Basic National Security Policy. When Mr. Harr had finished the President inquired whether the

NSC Planning Board would take the conclusions of the report into consideration in the course of its review of Basic National Security Policy. Mr. Gray replied that the Planning Board had already considered the matter and would do so further.

Mr. Allen Dulles stated his conviction that the Overseas Internal Security Program had proved extremely useful. The real issue underlying the OCB report was that the International Cooperation Administration people did not like to find themselves in the position of providing arms. [text not declassified] Likewise the Department of Defense and our military people did not want to get into the business of supplying arms to police forces.

Secretary Quarles pointed out that the Defense Department was by no means opposed in principle to providing arms for police purposes but that the Defense Department itself was simply not in a position to do so.

The National Security Council:

a. Noted and discussed the report on the subject by the Operations Coordinating Board pursuant to NSC Action No. 2012–b, transmitted by the reference memorandum of April 10, 1959.

b. Noted that the NSC Planning Board is taking the OCB report into account in its current review of Basic National Security Policy (NSC 5810/1)

S. Everett Gleason

158. Briefing Note for May 13 NSC Meeting¹

Washington, undated

Priorities for Space Programs

On January 22, 1958, the President on the advice of the National Security Council, by NSC Action No. 1846, established the highest priority for certain ballistic missile and space programs. In March 1959, as a result of developments in various satellite programs over the intervening months, the Secretary of Defense recommended certain changes in satellite priorities. These changes are:

1. That the VANGUARD-JUPITER C scientific satellite programs be deleted from the priority list.

¹ Source: Priorities for space programs. Top Secret. 1 p. Eisenhower Library, Whitman File, NSC Records.

2. That three other satellite programs be added, notably, SENTRY (Satellite-borne visual and Ferret reconnaissance system); DISCOVERER (Satellite guidance and recovery); and MERCURY (Manned satellite).

In addition, the Secretary of Defense recommended a change in the system whereby he determined satellite priorities, so that in the future changes in priorities for space programs will be made by the President on the advice of the National Aeronautics and Space Council. The proposed changes were approved by the President on the advice of the National Aeronautics and Space Council at its meeting on April 27, 1959.

The purpose of bringing this matter before you this morning is to ask the National Security Council to note these changes and make necessary revisions in the existing NSC statement of policy on the subject (NSC Action No. 1846). The Joint Chiefs of Staff concur in this proposal.

159. Memorandum of Conversation¹

Geneva, May 23, 1959

SUBJECT

Strategic Concept and Military Paragraphs of NSC 5810/1

PARTICIPANTS:

State

Secretary Herter
Gerard C. Smith

Defense

Secretary McElroy
John N. Irwin II

Mr. McElroy opened the discussion by saying that he foresaw a time when we would have to change our counterforce strategy. He suggested that this might be some years in the future when the USSR has invulnerable missile sites. They do not have such an invulnerable striking force now and Mr. McElroy is accordingly opposed to a change away from our present counter-force strategy.

On our limited war capability, the Secretary of Defense pointed out that last year's State-Defense limited war study had shown that the US had the capability to handle two limited war situations at the same time. Mr. Smith pointed out that this study had been based on the assumption, insisted upon by the JCS, that only the US would use nuclear weapons in limited war situations.

¹ Source: Strategic concept of basic national security policy. Top Secret. 4 pp. NARA, RG 59, S/P Files: Lot 67 D 548, Military and Naval Policy.

Mr. McElroy tentatively suggested that perhaps there should be a new limited war study on a different assumption, although he was not prepared to agree immediately to the launching of such a study. The Secretary of State commented that if such a study were undertaken it might help the Department of Defense if it showed up areas in which our capabilities needed improvement. Mr. Herter spoke of the need for mobility. The Secretary of Defense said the problem of mobility was not so much one of aircraft as of ground facilities at prospective landing points.

There was considerable discussion of the language in paragraph 10a in NSC 5810/1 to the effect that nuclear weapons are to be regarded as conventional weapons from the military point of view. Mr. Smith pointed out that each time a situation had arisen in which the possible use of nuclear weapons had been considered the decision had been against using them. He thought that our weapons systems and force structure had been erected on a fallacy—i.e., that the use of nuclear weapons would be authorized in less than all-out situations.

The Secretary of State pointed out that our existing doctrine might call for the automatic use of nuclear weapons in limited situations. (In that connection, he inquired concerning the status of the advance authorization for the use of nuclear weapons. Mr. Irwin said that the papers had recently been sent to State Department for resubmission to the President.) Mr. Herter hoped that the US could develop such forces as would make an automatic nuclear reaction unnecessary. Mr. McElroy expressed agreement with this position and said that paragraph 14 of NSC 5810/1 might well have some change to clarify this point. The Secretary of Defense took the line that it was not so much the language of the basic National Security Policy that mattered; more important thing was that State and Defense had a common understanding of what the language means.

Mr. Smith said that another central point was whether or not massive retaliation could still be relied on to deter all kinds of Communist aggression. He cited the present Berlin situation and possible troubles to come. Mr. McElroy doubted that massive retaliation had lost its effect. Mr. Irwin said that it was the threat of massive retaliation that was now restraining the USSR from turning over its responsibilities re Berlin to the GDR. The Secretary of State indicated a measure of agreement with this assessment.

In a discussion of possible requirements for the use of force in the Middle East, the Secretary of Defense said that we ought to use all force necessary to deal with a specific situation. Mr. Smith identified this as the Radford doctrine and expressed dissent from it.

Mr. Irwin described in general terms Defense thinking re possible limited military operations in the Middle East. Mr. Smith pointed out

that the planning described was inconsistent with the strategic doctrine which had been discussed earlier in the meeting. He felt that this illustrated the difficulty that we were in. We could not even in planning for possible situations follow current doctrine.

Mr. McElroy commented that if there was a "fundamental" line of State Department thought on the strategic concept perhaps it would have to be changed for foreign policy reasons.

Mr. Irwin raised the point that a change in the strategic concept would at bottom be a budget matter. Two other things that would have to be taken into account were the statement of foreign policy requirements which State had provided to Defense and the Gray target mix study which is still to come. Mr. Smith said that in his view the Gray study should come after, not before, a decision on the strategic concept.

Mr. Irwin subsequently commented to Mr. Smith that there were two possibilities with respect to language of NSC 5810/1: (1) there might be some change in the language about nuclear weapons being conventional weapons; (2) there might be some virtue in including a definition of limited war.

On May 25, the Secretary of State commented to Mr. Smith that even if there were no language change in the National Security Policy, State should try to get into the NSC record the State paper on foreign policy requirements and a Department of Defense statement that the currently planned Military Establishment can meet these foreign policy requirements.

160. Presentation by Beale at the 409th NSC Meeting¹

Washington, June 4, 1959

TRADE POLICY AND NATIONAL SECURITY

The broad objective of US foreign economic policy is identical with that of our general foreign policy: to protect and advance the national interest, to improve the security and well-being of the US and its people.

¹ Source: Trade policy and national security. No classification marking. 9 pp. Eisenhower Library, Whitman File.

This broad objective of our foreign economic policy has three major components. First, to promote the economic strength of the US, second, to promote the economic strength of the rest of the free world, and third, to build and maintain cohesion in the free world.

To achieve these objectives we have followed three basic economic policies: The expansion of trade; the promotion of private investment; and provision of mutual assistance.

During the past 6 years, by building on existing programs and, even more important, by developing new programs designed to meet new needs and changing conditions, there has been created a complex pattern of interrelated programs. Some of them we carry out on our own and others in cooperation with friendly nations. These programs are well suited to the promotion of our basic objectives.

At the present time, however, the achievement of these objectives is endangered from within by the growth of protectionist sentiment and from the outside by the Soviet economic offensive. My purpose this morning is to suggest some of the ways in which protectionism adversely affects our domestic economy, our political-economic relations with our allies and therefore our national security.

I would like to deal first with the general aspects of the problem and then turn to specific illustrations.

Protectionism has certain recognizable benefits. It can assure the survival of a sensitive industry which might otherwise succumb because of its competitive disadvantages. It can provide a blanket for an infant industry during its formative years. It can prevent economic and social disruption in a community dependent on a single industry and without the resources to develop alternative industries.

In spite of these recognizable advantages, however, there are relatively few people who would contend that protectionism provides a basis for a dynamic expanding economy. The reasons are obvious.

Protection discourages the development of new products, new methods of production and distribution, and cost-saving techniques.

Protection reduces our ability to compete with other industrialized economies.

Protection contributes to inflation by raising the costs of the products we buy abroad.

It imperils our export markets by making it more difficult for other countries to earn the dollars they need in order to buy from us. It also endangers those markets by inviting retaliation on the part of other countries.

Protectionist measures inevitably reduce total US output by preventing the shift of domestic resources from less efficient to more efficient industries. By lowering our total national product, such measures

slow down our rate of growth and reduce the resources available for our security needs, including aid to the less developed countries.

Having indicated the effects of protectionist policy on the domestic economy, I would like to indicate briefly the effects on the economies of other countries.

Foreign trade is vitally important to our economy, but even so it constitutes only 4% of our gross national product. In other major industrial countries (such as the UK, West Germany and France) the ratio of exports to gross national product is 3 to 4 times greater. It is 5 to 9 times as great for smaller advanced nations such as Belgium, Sweden and the Netherlands. For example, approximately one-half of everything the Netherlands produces is shipped abroad.

Our trade policy is of tremendous concern to all these countries, first because exports play such a major role in their economies and secondly because the United States is a major market for their goods. Both of these reasons explain why any action by the United States which adversely affects sales of their key products, or threatens those sales, is front page news abroad and has a serious effect on our international relations with those countries. This is true even when the action itself does not seem important to us.

I can cite five specific examples of restrictive measures which have adversely affected four important allies. Lead and zinc affecting Canada, cheese affecting the Netherlands, electrical equipment and woolen fabrics affecting the United Kingdom and cotton textiles affecting Japan.

In the case of many less developed countries, one, or a few commodities, comprise the bulk of their exports. For many of these countries the US market is especially important. To illustrate this point, the United States imports

- 2/3 of Chile's copper
- 1/2 of Cuba's sugar
- 1/4 of Indonesia's rubber
- 1/3 of Bolivia's tin
- over 1/2 of Brazil's coffee
- 2/5 of Venezuela's oil
- 2/3 of Peru's lead and zinc.

The ability of the less developed countries to sell their products in the United States affects their ability to import capital goods and other necessary manufactured products.

Therefore, it determines in large measure the basis of their economic growth and their ability to raise standards of living.

The promotion of economic growth in the less developed countries is of course a prime objective of our foreign policy. By this means we hope to help those countries to achieve peace and stability.

Unfortunately their economic health can be seriously damaged by US import restrictions. Our import quotas on petroleum, lead and zinc, and cotton, for example, have had that effect on Mexico, Venezuela, Peru, Indonesia, Egypt, the Sudan and other less developed countries.

The Soviet Union, of course, recognizes clearly the major role that trade can play in furthering its objectives. The evidence clearly shows that friendly countries, when denied access to our market, are forced to increase their economic dependence on the Soviet Bloc. As a specific example, after the imposition of restrictions against Uruguayan wool tops in 1953, the Soviet Bloc steadily increased its purchases, and as a result it is now the most important outlet for Uruguayan wool tops. Recently our countervailing duty on wool tops was removed. As you know, our action to impose quotas on lead and zinc was followed by violent anti-American reactions in Peru and there have been sharp reactions in Venezuela to our oil import policy.

In assessing where we stand today it is important, of course, to keep the picture in balance. On the one hand, since 1953 we have pursued an active policy for the promotion of international trade. We have taken part in two successful trade conferences in 1955 and 1956. It is true that many of the tariff concessions we gave at those conferences were small, amounting to no more than a 15% reduction in the existing duty. Nevertheless imports of the products affected by the concessions were valued at approximately \$1 billion. A great deal of attention has been given to escape clause actions that we have found it necessary to take in recent years. Unfortunately little account is taken of the applications that were turned down. Other countries often fail to acknowledge that out of 27 cases in which escape clause action was recommended by the Tariff Commission no action was taken in 19 cases.

On the other side of the balance, there are the various restrictive measures that have been taken. You will note from the chart that since 1953 we have taken restrictive action on 29 commodity groups exported from 45 free world countries.

*NS TAKEN TO RESTRICT IMPORTS, SINCE JANUARY 1, 1953, AND
COMMODITIES AFFECTED*

Commodities Affected (29)	No. of Countries Affected (45)	Type of Action*	Date of Action

¹ Removed, March, 1959. [Footnote is in the original.]

June 5, 1959

It is statistically impossible to determine precisely how much trade is affected by these restrictions. However, it has been calculated on the basis of the latest figures available, that is for 1957, the trade affected by these restrictions represented about \$2.1 billion or 28% of US imports of competitive items. Out of this total oil products account for approximately \$1.5 billion and the remaining items account for about \$600 million. These figures are subject to a number of qualifications. For one thing the more effective the action in restricting imports the smaller the trade.

You will note from the map that some countries are affected by only one restriction, whereas others are affected by as many as twelve. Venezuela for example, has been affected only by our restrictions of oil imports, but oil directly involves more than 80% of that country's exports to the United States.

I would like to comment briefly on several of the more important cases shown on the chart.

First, *Heavy electrical equipment*—Our decision on the Greer's Ferry case created an uproar in the United Kingdom. One extreme sector of British opinion called for immediate discrimination against purchases in the United States. The British consider the pending OCDM heavy electrical equipment case "the most important subject in economic relations between the United States and the United Kingdom since the institution of the Smoot Hawley Tariff."

Lead and Zinc—When quotas were imposed Australian press and official comments were unusually severe in their criticism. Our action became a major political issue. The case has clearly affected our position in a country which is the southern anchor of our Pacific defense perimeter.

In Canada our lead and zinc action was viewed in the context of a number of other United States policies and actions which have been the source of increasing resentment, such as our restrictions on agricultural imports and our surplus agricultural disposal operations.

Mexican press, labor and management officials were also very critical. Intensely emotional demonstrations and condemnation of the United States occurred in Peru.

Petroleum—The Venezuelans have asked for equal treatment on the grounds that their oil, like Canada's, is vital to the defense and security of the Western Hemisphere. We are worried that the Venezuelans will institute oil pro-rationing and export controls to the disadvantage of US companies. We have to recognize that they may want to change our bilateral trade agreement drastically and possibly abrogate it. Either course of action would seriously hurt our large export sales to Venezuela.

The second chart shows that there are now outstanding 13 requests for restrictions on imports. These represent trade valued at

approximately \$300 million in 1957. They would affect six new countries, in addition to those already affected by previous measures.

This second chart also reflects a trend which is giving other countries great concern. You will note that seven out of the thirteen requests now pending have been made under the national security amendment. There is a strong feeling abroad that domestic industries are seeking to use the national security amendment to achieve protection which they do not think they can obtain by applying under the escape clause.

PENDING PROPOSALS FOR RESTRICTIVE ACTION

Commodities—13	Old Countries Affected—36	New Countries Affected—6	Type of Action Proposed
Hardwood Plywood	10	1	EC
Mink Skins	6		EC
Stainless Steel Flatware	6		EC
Woven Silk Fabrics	6		EC
Red Fescue Seed	4		EC
Long Staple Cotton	4		22
Cobalt	7		NSA
Dental Burrs	4		NSA
Fluorspar	6		NSA
Heavy Electrical Equipment	6		NSA
Steam Turbine Generators	6		NSA
Tungsten	11	4	NSA
Wool Knit Gloves	6	1	NSA

June 5, 1959

No discussion of restrictive measures would be complete, of course, without some mention of so-called "voluntary export controls." These are the measures which other countries, such as Japan and Italy, have taken to restrict their exports to us. They represent a new kind of protectionism—protection in reverse—under which the exporting country limits its exports rather than the importing country its imports. At present, it is estimated, one-half of Japan's exports to the US are subject to some form restriction.

Viewed independently, and in perspective, the specific restrictions imposed in recent years may seem relatively unimportant. Nevertheless, it has been made abundantly clear to us that these restrictions are having an increasingly serious effect upon our ability to achieve our foreign

policy objectives. And it is apparent that the *potential* for harm *greatly* exceeds the harm done thus far. It is possible to identify, as I have done, the cases where individual countries have been adversely affected by restrictions we have imposed. The impact has varied in each case. The cumulative impact has also varied.

We believe that we have reached a point, however, where any action has a disproportionate impact because of the preceding actions, and where the element of fear of the future can be expected to play an increasingly important part in determining foreign reactions to any further restrictive measures we may impose.

At the present time most of the important industrialized countries of the world have overcome, or are about to overcome, the balance of payments difficulties which justified their retention of protective measures following the war. Therefore we can expect to see an expansion of world trade and, consequently, of our own export sales. At the same time the less developed countries of the world are seeking to expand their economies. It is clear, however, that at this juncture the course of future events will be determined almost entirely by what the US does. If we provide the leadership in liberalizing trade, the rest of the free world can be expected to follow our example.

There are a number of critical choices to be made in the immediate future. Regional trading arrangements are proliferating around the world. In Europe the six-country common market is already a going concern. Negotiations are seriously under way toward establishment of a free-trade area of seven other countries in Western Europe—the UK, the Scandinavian countries, Austria, Switzerland and Portugal. South America is determined to organize one or more common markets; and Central America is already committed to establishing a customs union.

US policy in the trade field will determine to a very large extent the evolving course of these arrangements—whether they will look *outward* toward the development of a multilateral world trading system, or whether they will look inward in the pursuit of self-sufficiency.

A major test of US policy is pending in the tariff negotiations scheduled to start in September 1960. These negotiations are the result of our initiative. A principal element will be the effort of many countries to negotiate reductions in the common tariff of the European common market. However, some of our European allies have already expressed doubt about the extent to which we will be willing to offer real and meaningful concessions in our own tariff in order to give impetus to the successful conclusion of the world-wide negotiations. The success of these negotiations, therefore, will depend upon us.

Our basic national security interests require that we continue to exercise positive and dynamic leadership not only in political and military fields but also in the economic fields.

That is why the Department of State is convinced that every action we take that adversely affects our ability to maintain a dynamic expanding domestic economy and weakens the ability of our allies to maintain their political and economic stability, has serious implications for our national security.

Let me conclude by saying that, in our judgment, the organizational means are already available through which national security considerations can be brought to bear in the most important cases involving proposals for restrictive measures. This is true in escape clause cases, where the Trade Policy Committee is responsible for advising the President. It is also true in cases arising under the national security amendment to the Trade Agreements Act, which provides that the advice of all interested agencies shall be sought in arriving at a recommended course of action. Measures taken under Section 22 are the most outstanding exception to this generalization. Furthermore, considerations of national security cannot be brought to bear in determining whether restrictive action should be taken in other cases, such as antidumping cases. However, these exceptions do not affect the general conclusion that the existing machinery is generally satisfactory and is working well. It is the Department's view that it would not be desirable, if indeed politically feasible, to attempt to revise existing legislation to insure the inclusion of appropriate provisions permitting national security considerations to be taken into account in all cases involving restrictive action.

I do not mean to suggest that there is no need for action in this field. We are much aware of the need for more information as a basis for policy determinations. As you know, a number of studies are currently underway which will provide an analysis of the causes of recent changes in our foreign trade position. An interdepartmental committee, under the chairmanship of the Department of Commerce, will search for the answers to a number of pertinent questions. Have advances in productivity in the US lagged behind those occurring elsewhere? Have our major costs increased too rapidly? Have we, through price supports and import restrictions, artificially raised the costs of raw materials to our own manufacturers? Does our domestic tax system militate against investment and technological improvement?

At the initiative of the Department of State the Committee for a National Trade Policy is also devoting special attention to the problem of our foreign trade position.

Increasing protectionism is not the answer to the problem of stimulating advances in productivity. It would insulate domestic industries from pressures to reduce costs and thereby make them less competitive.

Unfortunately, at the present time when an industry is faced with serious injury as a result of imports, there is no alternative but to consider raising duties or imposing quotes. Therefore, the Department of State believes that renewed consideration should be given to sponsoring another avenue of relief through adjustment assistance. This alternative might provide for low-cost loans for modernization and technological improvement, facilities for retraining workers, or conversion to other kinds of manufacture, or even encouragement to relocate factories.

Adjustment assistance is the approach being taken in the European Common Market to deal with the problem of internal adjustments to competition. The British have also embarked on a similar program with respect to their domestic textile industry.

In short, we have to search constantly for new ways to improve the competitive position of our industry through affirmative actions rather than by building a wall against entry of goods from abroad.

Our conclusion is relatively simple. What we do to restrict trade and what other countries fear we may do, will determine to an important extent whether our foreign economic policy measures are successful, and whether we are successful in the economic contest with the Soviet Union.

161. Memorandum of Discussion at the 409th NSC Meeting¹

Washington, June 4, 1959

SUBJECT

Discussion at the 409th Meeting of the National Security Council, Thursday, June 4, 1959

Present at the 409th NSC Meeting were the President of the United States, presiding; the Vice President of the United States; the Acting Secretary of State (Dillon); the Acting Secretary of Defense (Gates); and the Director, Office of Civil and Defense Mobilization. Also present and participating in the Council actions below were the Secretary of the Treasury; the Director, Bureau of the Budget; the Secretary of Commerce (Item 1); and the Chairman, Council on Foreign Economic Policy (Item 1). Also attending the meeting were the Chairman,

¹ Source: Agenda item 1: Effects of U.S. Import Trade Policy on National Security. Top Secret; Eyes Only. Extracts—7 pp. Eisenhower Library, Whitman File, NSC Records.

Atomic Energy Commission; the Chairman, Council of Economic Advisers (Item 1); the Special Assistant to the President for Economic Affairs (Item 1); the Deputy Assistant Secretary of State for Economic Affairs (W.T.M. Beale) (Item 1); General Thomas D. White for the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Director, U.S. Information Agency; the Assistant to the President; the Special Assistants to the President for National Security Affairs and for Security Operations Coordination; the White House Staff Secretary; Mr. Howard Furnas, Department of State; the Assistant White House Staff Secretary; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the meeting and the main points taken.

1. EFFECTS OF U.S. IMPORT TRADE POLICY ON NATIONAL SECURITY

Mr. Gray reminded the Council that the President had recently asked the State Department to prepare for the Council a report on the effects of our trade policy, primarily our import restrictions, on the national security. He then indicated that Mr. Beale, the Deputy Assistant Secretary of State for Economic Affairs would make the presentation.

(A copy of Mr. Beale's report is filed in the Minutes of the Meeting).
(A copy of Mr. Beale's report is also attached hereto).

When Mr. Beale had concluded his report, the President commented that while a number of business interests were seeking import restrictions on a number of products, Mr. Saulnier and the Council of Economic Advisers were reporting to the President such a boom in our U.S. economy that we were actually concerned about a real runaway boom. It therefore seemed a good time for the U.S. to try to develop a better feeling and sentiment about our trade policy insofar as it concerned friendly foreign countries. The President pointed out that no less than eleven foreign countries were affected by our import restrictions on clothespins yet the President believed that all the clothespins in the U.S. were made by six small companies in the State of Maine, employing as the President recalled, only some 260 employees. This kind of situation seemed silly to the President.

The President then observed that meetings have been occurring designed to devise some kind of an adjustment policy which would enable us to find a solution for some of our domestic industries in the face of foreign competition. For example, it might be possible to change from the manufacture of clothespins to the manufacture of baseball bats. Most such suggestions, however, get turned down. Secretary Dillon pointed out certain difficulties which lay in the way of making the kind of adjustments mentioned by the President.

The President next observed that in effect what we have to do is to bribe the Congress by agreeing to the restriction of imports in order to induce Congress to agree to extending the Trade Agreement Acts.

Secretary Anderson commented on an interdepartmental study of our trade policy. He believed that we ought to take a look, industry by industry, to try to calculate the gains and losses in the light of our current trade policy. Once such a painstaking examination had been made, continued Secretary Anderson, there ought to be a broader consideration before the study was made public. Specifically, Secretary Anderson recommended that the findings of the interdepartmental study should be looked at by the National Advisory Council (NAC) in the light of our balance of payments situation and the out-flow of American gold and dollars. There had been a very significant change with respect to our balance of payments situation even since 1956. In most of the highly developed foreign countries at the present time, as well as in a number of less well developed countries, there had ceased to be any such thing as a dollar shortage. Altogether they held some sixteen billions of our dollars at the present time. To these facts must be added commercial balances, the cost to the U.S. of maintaining soldiers and other U.S. Nationals abroad, and payments made abroad by American tourists. The total result was that the U.S. is confronted by a consistent balance of payments running against us. The acid test of a sound economy and of a sound currency as well, was the balance of payments situation. In fact, what we are now tending to do is to have the U.S. finance European exports. These European countries should themselves be urged to take some of the same measures we take to finance our own exports. Secretary Anderson said that he was not really concerned at all at present about encouraging the export of U.S. capital to the Western European countries. They were doing very well. He was, however, concerned about Asia and Africa.

Secretary Anderson went on to say that if the balance of payments disparity continues for any considerable number of years, we in the U.S. would be in for real trouble. We have bitten off rather more obligations than we can chew even in the opinion of some foreign experts. In conclusion, Secretary Anderson repeated his request that the results of the interdepartmental study be examined in the light of our whole policy.

The President inquired whether in effect Secretary Anderson was advocating higher U.S. tariffs. Secretary Anderson replied in the negative but said he was advocating that we cut down on our U.S. expenditures in certain foreign countries.

Mr. Dillon, the Acting Secretary of State, commented that the State Department fully recognized the seriousness of the balance of payments problem. We could not continue running a deficit indefinitely. He also

expressed himself as in close agreement with Secretary Anderson's suggestions as to what to do about the problem. There were, however, still other things that might be done, notably, to increase our own U.S. exports. He added that the State Department was working hard on this objective and had experienced a real measure of success as the published figures would ultimately show. In support of this point, Secretary Dillon cited examples of agreements by foreign countries to permit an increase in the quotas of U.S. exports to these countries. Thus we were getting rid of some of the examples of discrimination against the dollar and Secretary Dillon believed that the effort should continue to have priority status.

Secondly, continued Secretary Dillon, if it was necessary to go still further to solve our problem, we must consider amending our current policy on world-wide procurement, as Secretary Anderson had said. We should perhaps furnish goods rather than dollars because when we furnish dollars to other countries they often use these dollars to purchase goods in Europe rather than to purchase them from the U.S.

Lastly, Secretary Dillon pointed to the problem of U.S. investment in Europe. He believed that some sort of action, other than trade restrictions, might have to be taken to cut down U.S. capital investment in industrialized foreign countries, although not in the underdeveloped countries. These several possible remedies all recommended themselves to Secretary Dillon as being better than resort to further restrictions on the U.S. imports from foreign countries.

Secretary Anderson commented that Secretary Dillon's statements seemed to him to be very fair.

Secretary Strauss stated that in the study that is being made, he agreed on the need for an overall policy review and in that respect the Department of Commerce did not hold views at variance with the views of Secretaries Anderson and Dillon. On the other hand, an overall review could not ignore separate and individual cases, problems, and situations. For example, a certain industry might actually constitute the sole support and living for an entire U.S. community. One could not ignore either the political or the sociological considerations relating to such communities. They are factors to be weighed in looking at individual instances of appeals for restrictions in the import of specific commodities.

The President then referred to the National Security Amendment designations in the Trade Agreements Act. He was sure that in this connection there was one consideration which, while it could not be accurately weighed, was nevertheless of very great importance. This was the consideration of our national defense and the effect of restrictions under the NSA designations on the vitality of our military alliances. In illustration of his point, the President cited what he described as the

near hysteria occasioned in the U.K. by our decisions against importing British electrical equipment. The President believed that trade restrictions which tend to drive away an ally as dependable as Great Britain would do much more harm in the long run to our security than would be done by permitting a U.S. industry to suffer from British competition. Thus, while intangible, this factor must always be weighed in NSA cases. Yet another illustration of the point that he was making, said the President, was represented by the various stages in the development of atomic weapons. In the early stages of this development, there had been very real and very complete cooperation between the British and ourselves. This superb cooperation had now been destroyed by a law which greatly restricted exchange of atomic energy information with the British. The effect of this restriction on the British had been very serious indeed and because of their own contributions in the early stages, they had felt severely let down when the U.S. imposed its restrictions in the Atomic Energy Act. Thus, said the President, we have got to take account of these intangibles as well as of the tangibles and he certainly agreed likewise that the U.S. must increase the volume of its own exports and improve its own competitive position. The President added that every time he declared a restriction on the import of a commodity from abroad, he was occasioned considerable mental anguish even though approval of the restrictive action had been unanimously recommended to him.

With respect to the National Security Amendment, Mr. Gray pointed out that even though Secretary Beale had reported that our organizational arrangements were adequate, there were some of us who were worried about such matters as TVA purchases of electrical equipment. The President replied that the role of such independent agencies as the TVA had bothered the Administration for quite a while inasmuch as the Government could of course not control such agencies and there was doubt about the nature of their relation to the Presidency. In this connection Governor Hoegh commented on the effect of the Buy American Act. The President again expressed himself as puzzled about the relation to the President of such entities as the TVA and the GAO (General Accounting Office) which he added, laughingly, did not seem to have any. Nevertheless, such entities the President thought were rather minor and exceptional causes of friction.

Mr. McCone predicted that the problem of foreign competition with American business was a problem that was going to grow rapidly in the future. The costs of production abroad of competitive products were shockingly lower than costs in the U.S., mostly as a result of cheaper labor costs. Our shipbuilding industry for example has totally lost its foreign markets. The President commented that one reason for this situation was that it had become so easy for a Board of Directors

to think that it can safely pass on added costs to the consuming public. As a result these Boards of Directors soon price their product right out of the market.

Mr. Gray asked Mr. Clarence Randall whether he wished to make any comments. Mr. Randall replied that he certainly did but he would try to spare the President and the Council a lengthy recital of his very strong feelings on the subject. Mr. Randall then expressed himself as very deeply concerned about the erosion of the U.S. trade position. He was convinced that what was really vital above all else was a continuation of the policy of liberalizing trade which the President had proclaimed and stood for since the beginning of his first term. There was another matter which concerned him, said Mr. Randall, and which had not thus far been mentioned in the discussion. This was our obvious and increasing dependence on overseas markets for certain very important raw materials. As for the National Security Amendment, Mr. Randall [illegible in the original] it was never intended to apply other than in a very broad sense. We must therefore continue to look upon its application in the broadest possible sense. The President expressed thorough agreement with Mr. Randall's position on this point.

The National Security Council:

a. Noted and discussed the subject in the light of an oral presentation by the Deputy Assistant Secretary of State for Economic Affairs.

b. Noted the President's statement that, in reaching decisions as to restrictions on U.S. imports, one important consideration should be the damage to national security which could result from restrictions which might weaken the ties which bind us to our allies in the collective security effort.

c. Noted the President's agreement that the interdepartmental study of the U.S. competitive position in world markets, being conducted under Department of Commerce auspices, should when completed be referred to the National Advisory Council for consideration of the implications for the U.S. domestic economy and finances as well as the U.S. balance of payments.

NOTE: The action in *b* above, as approved by the President, subsequently circulated for the information and guidance of all departments and agencies.

The action in *c* above, as approved by the President, subsequently referred to the Secretaries of Treasury and Commerce for appropriate implementation.

[Omitted here is the remainder of the memorandum.]

162. Memorandum of Conversation¹

Geneva, June 5, 1959

SUBJECT

Strategic Concept and Military paragraphs of NSC 5810/1

PARTICIPANTS:

State

Secretary Herter
Gerard C. Smith

Defense

Secretary McElroy
John N. Irwin II

The Secretary of State opened the discussion by saying that his review of the new language which State had proposed in the Planning Board for the military paragraphs of NSC 5310/1 suggested that the place to make changes was in paragraph 10A rather than paragraph 14. The Secretary of Defense read the State redraft very carefully and expressed a measure of sympathy with the thrust of the proposed changes. He asked whether State would agree to tie a clause on the use of nuclear weapons when required to achieve national objectives to the first sentence of revised paragraph 10A rather than make it a separate sentence as in the State redraft. Secretary Herter agreed that this could be done.

Mr. Irwin said that the proposed change in paragraph 10A could have a great impact on the budget and urged that the results of the Gray target mix study be awaited before making a decision on paragraph 10A.

Secretary McElroy said he assumed that there would be no change in hardware flowing from the proposed change in paragraph 10A as last year's limited war study had shown that our limited war capability was adequate. Mr. Smith reminded Mr. McElroy that that study was based on the assumption that only the US would use nuclear weapons, although a subsequent SNIE on the Quemoy situation cast considerable doubt on that assumption. The Secretary of Defense commented that he could not understand why this unrealistic assumption was used. Both Mr. Smith and Mr. Irwin pointed out that any other assumption would have contradicted the current strategic concept.

The Secretary of Defense then asked whether the proposed change in paragraph 10A would result in budgetary changes in FY 1962. Mr. Smith replied that he thought not in that year but was bound to say that in later years he thought it would. Secretary McElroy indicated concern at this prospect.

¹ Source: Strategic concept and NSC 5810/1. Top Secret. 2 pp. NARA, RG 59, S/P Files: Lot 67 D 548, Military and Naval Policy.

The Secretary of State inquired concerning the effect upon our NATO forces of withdrawals for limited military operations in other areas. Secretary McElroy indicated that this was manageable.

There was discussion of certain aspects of the Quemoy situation of last year and of the nature of hostilities in the event of an attack by Communist China. (Reference was made in this connection to the status of the advance authorization for the use of nuclear weapons.)

At one point Mr. Irwin said that the two Departments should agree for the present that we want no change in philosophy and, having done so, agree that paragraph 10A be amended to delete the reference to nuclear weapons as conventional weapons. Mr. Smith pointed out that this language change would constitute a fundamental philosophical change.

The group concluded that they would not try to reach any quick decision on revising the military paragraphs of NSC 5810/1.

163. Memorandum of Conference with the President¹

Washington, June 8, 1959

OTHERS PRESENT

Dr. Killian
Mr. Gordon Gray
General Goodpaster

Dr. Killian said he had asked for the opportunity to place before the President a few of the issues that will arise when the President considers the Defense Department presentation relating to NIKE-HERCULES and BOMARC tomorrow.

He said that as he understands the Defense thinking, it is to continue the NIKE-HERCULES as now programmed, concentrating its use on the defense of cities in the northeastern region of the United States and SAC bases. The prime consideration is that it is a proven weapon now available and already in an operational condition. The BOMARC will not be available until later, particularly the BOMARC B which is the version we are interested in. (It has a low altitude capability and 250-mile range; the BOMARC A does not appear to be worth further consideration.) The

¹ Source: Continental air and missile defense. Secret. 5 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Bomarc. Drafted on June 9.

Defense plan will call for a substantial cutting back of the BOMARC program, deploying it on the northern, eastern, and western segments of the perimeter of the United States. A cutback in the SAGE system is also contemplated, with hardening of the control centers retained. There remain significant questions concerning the ground environment for each of the two systems, NIKE–HERCULES and BOMARC.

The use of the term “master plan” for air defense to describe the Defense position is open to question, since this position does not include consideration of other factors in the problem such as the F–108 and other interceptors. If decision is taken to use BOMARC simply on the periphery as indicated above, the question of the F–108 should also be resolved; and there would appear to be strong reason to drop the project, which is a \$5 billion projected program. The relationship of the F–108 to the B–70 should also be considered, inasmuch as the F–108 was being designed to have the dual capability of use for defense or for high performance attack.

Dr. Killian said a further point is that this master plan should in no way interfere with the carrying forward of the comprehensive study of air defense being prepared at the President’s request on the basis of a letter from Gordon Gray.

The President said it is to him an indication of weakness in the top leadership of the Defense Department when a choice between two weapons systems comes to the President for resolution. He felt that this type of problem should be settled in the Defense Department.

Dr. Killian said there are certain other questions involved. Admiral Radford, he understands, feels that the whole air defense program should be cut back in a very major way, using the resources to increase offensive forces. A further question is as to the validity of our estimates of the Soviet aircraft threat, which is evidently considerably smaller than had been estimated at earlier times.

A further issue is the organizational problem. In Dr. Killian’s judgment the operation of the total system of defense missiles, BMEWS, the DEW line, SAGE, etc., will not be effective until NORAD has been made effective. There is need for centralized operational direction to tie all these together. The President strongly agreed, saying that this is the whole theory of the unified commands, and the role of the services should simply be to prepare the forces and turn them over to NORAD for operational employment.

A.J. Goodpaster
Brigadier General, USA

Enclosure

Washington, undated

BASIC PRINCIPLES IN THE EVALUATION OF THE
CONTINENTAL AIR DEFENSE PLAN

1. We expect a continued bomber threat.
2. We expect the ballistic missile—ICBM or submarine-launched—to be the increasing and ultimately the principal threat.
3. We recognize we cannot destroy all incoming bombers in a mass attack so we should have enough anti-bomber defense to increase the cost to the enemy and reduce his assurance of success.
4. We should continue to accelerate the development of anti-missile defense to the maximum justifiable extent.
5. We should re-appraise the character of the threat each year and consider defense in the light of the threat as then appraised.
6. We should push the defensive engagement of enemy bombers as far from our borders as possible.
7. We should gradually reduce the number of our interceptor squadrons.
8. We should continue the NIKE on a buy-out basis.
9. We should continue the BOMARC-A now on a buy-out basis; the BOMARC-B on a minimum basis for peripheral deployment.
10. BOMARC should not be deployed in the interior of the continental United States.

Enclosure

Handwritten Note to Goodpaster From the Army Chief of Staff

Washington, May 20, 1959

Gen. Goodpaster,

We were very disturbed to hear the report that Mr. McElroy informed the President that the Stennis action revoking last years authorization for the const. of Hercules sites was *not* in the Bill now before the Senate.

Unfortunately it *is*, as Section 105 therein. As we understand it the President was informed that it was only in the Comm. report and not in the Bill.

Mike Michaelis has sent this attached Memo to Bryce Harlow—

164. Memorandum of Conference with the President¹

Washington, June 9, 1959

OTHERS PRESENT

The Vice President, Acting Secretary Dillon, Secretary McElroy, Deputy Secretary Gates, Budget Director Stans, General Lemnitzer, Admiral Burke, General White, Mr. Holaday, General Persons, Dr. Killian, Mr. Gordon Gray, General Goodpaster

Mr. McElroy said the group had come in to talk about the air defense problem and specifically the issue of the BOMARC and NIKE–HERCULES. He gave the President a paper on basic principles in the evaluation of the continental air defense plan. Before beginning the discussion, he told the President that Defense has decided to procure no fighter aircraft in FY–60. At his request, Mr. Holaday then displayed, on a map of the United States, deployments presently in effect, as previously planned, and as now planned for the NIKE–HERCULES. In addition to deployments presently programmed, a certain number of additional SAC bases are to be protected. He then showed the deployments now proposed for the BOMARC; these lie along the eastern, northern, and western segments of the periphery of the continental United States, with the BOMARC A generally in the northeastern United States and the BOMARC B to be used for the remainder.

The President asked why the BOMARCs along northern sector were not moved further north into Canada. He asked whether the Canadians would like to have them there. Mr. McElroy said he would like to put them there if the Canadians would. General White said he feels that we have pushed the Canadians about as far as we can on bases for military activities. Admiral Burke added there would probably be great resistance by the Canadians to taking these on. The President then spoke, indicating that he does not believe in forcing weapons on other countries. What he wanted to know was whether we had ever asked them “Do you want us to deploy BOMARCS further north so as to give you additional protection?”

Mr. McElroy said that the money implications of the decision being proposed were essentially that there would be a saving of \$75 million from the FY–59 program, \$60 million from the FY–60 program, and \$418 million from the FY–61 and 62 programs. He went on to say that the over-all saving would be in the order of \$1,300,000,000, arising from a reduction of total program from \$3.8 to \$2.5 billion. The

¹ Source: Continental air and missile defense. Secret. 6 pp. Eisenhower Library, White House Office Files, Records of the Office of the Staff Secretary, Bomarc. Drafted on June 10.

President said he understood that this action is being proposed on the basis that beyond the programs being recommended additions would not be very useful. Mr. McElroy confirmed this, stating that since we prepared these programs the threat has changed. We now visualize that enemy bombers, if they attack, would do so after we had been hit by long-range missiles.

Dr. Killian asked whether the proposals reflect an acceleration of the BOMARC B program. Mr. Holaday said that they did not because the SAGE system and the bases would not be ready in time. He added that the program includes a recommendation to spend an additional \$250 million to bring the peripheral SAGE areas up to "high grade SAGE" capabilities through the addition of radars, gap fillers, etc. In the interior, SAGE would be cut back to "minimum capability SAGE." Mr. McElroy added that the decision not to deploy the BOMARC in the central areas of the United States reduces the requirement for high-grade SAGE. The minimum that is being proposed is needed to guide interceptors, SAC bombers, etc. He added that the FAA will make use of the minimum SAGE system in its peacetime operations.

Dr. Killian commented that in order to put the BOMARC bases in Canada it would be necessary to extend the SAGE system and the base support structure up into that area. Mr. McElroy said what the Canadians principally need is to modernize the interceptors in their Air Force. The President asked whether we do not think that the BOMARC is an improvement on interceptors—otherwise why would we have gone to the BOMARC. The President asked if the problem of identification had been solved—whether we have perfected the IFF. General White said that we had not, and do not have a solution to the problem. We continue to work on it.

The President asked General Lemnitzer whether he thought this plan was reasonable. General Lemnitzer said that it involved a cut-back in previously planned programs but that he did think it was a reasonable solution to the problem; he commented that the threat is changing as had been previously mentioned.

At this point the President said that he feels there must be one great, over-all operational command to which the air defense weapons, regardless of the service providing them, must be assigned. He said it made little difference to him which service provided the forces; some one commander must be in full control, however. Admiral Burke said that General Partridge has the command but wants a great deal more in resources than can be provided. General White disagreed as to the adequacy of General Partridge's command authority; he commented that he does not believe that General Partridge has the authority he needs. The President stated strongly "then he should have it." Admiral Burke

said that General Partridge has command over the forces but cannot move them about and does not have control of the budget.

The President noted that an additional \$250 million is being proposed for the SAGE system. He asked whether any other additions were being proposed. Mr. McElroy said there is a proposal to put \$150 million additional into NIKE–ZEUS. This would be added to \$300 million now budgeted for research and development on NIKE–ZEUS and \$250 million for “novel” defense means. Mr. McElroy said, in relation to NIKE–ZEUS, that he wants to do anything that makes sense as a defense against missiles. He said the NIKE–HERCULES would have some small capability against a missile similar to the Hound Dog.

The President asked, in light of the foregoing, whether there was any need for any more squadrons of interceptors. General White thought this question should be deferred until the next programming period.

The President then asked if what had been presented to him is the decision of the Defense Department. Mr. McElroy said that it is the best decision in his judgment. He had not been able to get unanimous agreement on it, however. Nevertheless, it had been thoroughly discussed and he was satisfied with it for the present.

The President recalled that the strength of the Soviet Air Forces was apparently greatly overestimated a couple of years ago. Now we are more certain of our estimates, and they are much lower. The bomber threat is therefore not so serious as had been thought. He understood that the Defense proposal involved pushing the NIKE–ZEUS and the SAGE harder, while cutting back in other areas. Mr. McElroy said that there is a change occurring in the balance between Soviet bombers and Soviet missiles and that this change may go either faster or slower than we estimate. Accordingly, it will be necessary to review the situation frequently. The President said he thought that funds in this whole area ought to be made available in a lump sum so that the Secretary of Defense could shift funds as revised estimates are developed. He noted that our program has changed materially between last January and the present. He had the impression that the change in our estimate of Soviet strength has been relatively slight.

Mr. Stans then said he hoped it would remain possible to raise questions regarding the budgetary coverage of these programs for FY–61. Mr. McElroy agreed but said there is one point to be made concerning BOMARC. An alternative considered was to cancel it now. He felt if we do less than is now proposed we should cancel it. The President said he felt that the program should not be expressed in specific sums for specific years. The total program should be expressed instead in terms of trends. Mr. McElroy pointed out that Defense thinking is for

the program to decline from \$900 million in FY-59 to \$619 million in FY-60, and \$500 million in FY-61, these figures representing substantial reductions over previous planning.

Dr. Killian asked whether there has been any thought of giving the NIKE-ZEUS a capability against aircraft. General Lemnitzer said that, within resources available, it has been thought best to concentrate on the main goal, which is anti-missile use. The President said he did not see why a missile that could shoot down another missile could not shoot down an incoming airplane.

Mr. Stans spoke about budgetary trends. Under existing Defense programs, he could foresee budgetary expenditures in the range of \$43½ billion to \$44 billion coming in FY-61. Although reductions in program were being discussed, these were reductions in programs that had not yet been approved by funding, and he was desirous that action should not imply funding approval. He suggested that an over-all study of air defense later this year might result in knocking the BOMARC out entirely, as an item of very low priority. The President commented that the process of concentration upon the things that are most useful might lead us to eliminate a good deal now included in the programs to which Mr. Stans referred.

Dr. Killian said he understood that the current discussion in no way precludes another thoroughgoing look later on, on a more comprehensive basis, including consideration of the F-108, hardening, concealment, and other features. Mr. McElroy said he thinks that the F-108 is a very vulnerable proposition, i.e., he doubts that it can be justified for continuation. He recognized the Air Force might not agree with this and said he is not prejudging the matter at this time.

Mr. Nixon asked whether this presentation would tend to commit the Administration to these air defense programs for FY-61. Mr. Gates said it would be difficult to cancel these programs later this year if the presentation is made as now proposed; therefore this decision does commit us somewhat. General White said that in his opinion this should be a firm decision as of the present, but that each segment would of course be re-examined each fiscal year. Mr. Nixon stressed the need for an "escape hatch" of some kind, perhaps a statement that we are watching developments so as to revise the program from time to time.

The President asked how much the Soviets are exercising their bomber aircraft at the present time. General White said that our information is that they are conducting an extensive training effort. The President said there is reason not to get complacent over the fact that the estimate of Soviet bombers has been cut back.

Mr. McElroy commented that if we were to go out of the BOMARC program, he did not think we could live with the Canadians, who just recently, after long joint discussions, adopted it in preference to interceptors for their air defense. The President asked why we do not give the Canadians the equipment for six or so BOMARC squadrons. General White said instead that he has been thinking of giving them interceptors. The President asked Mr. McElroy to make an approach to the Canadian Defense Minister to see if they would like to have the BOMARCs moved up into Canada.

Mr. McElroy said there would soon be another question on which the group would wish to meet with the President. This is the nuclear powered aircraft. The President said he had the impression from Mr. McCone that the latter thought it should be taken out of Defense for the moment and that no crash program should be attempted. After discussion, Mr. Gates said he thought what Mr. McCone probably had in mind was to take the proposal out of a weapons system approach and put it on a “test bed” basis. There was some uncertainty as to whether Mr. McCone favored accelerating or decelerating the program.

The Chairman, Joint Chiefs of Staff
The Director of Central Intelligence
The Chairman, Council of Economic Advisers
The Chairman, Council on Foreign Economic Policy

Enclosure

Memorandum From Phillips to Lay

Washington, June 19, 1959

SUBJECT

Paragraph 62 of Basic National Security Policy 5906

1. The subject draft paragraph supplied with your memorandum of June 3, 1959, was forwarded to those members of the National Aeronautics and Space Council whose departments had not participated in preparation of the draft. It is my understanding that the Department of State, Department of Defense, and National Aeronautics and Space Administration had participated in its drafting. Because of the imminent consideration of this policy by the NSC, there has only been opportunity for individual members to comment without the benefit of discussion at a NASC meeting.

2. AEC Chairman McCone, NSF Director Waterman, and Messrs. Bronk, Burden, and Rettaliata have concurred in the paragraph with the following exceptions:

a. Both Mr. Burden and Dr. Bronk objected to the bracketed phrase proposed by Budget and Treasury. Mr. Burden was the more eloquent: "I am strongly opposed to the insertion of the phrase, 'in fields where such applications appear to offer advantages over other possible means for achieving required capabilities.' I think that proposals in relation to the military space program should be judged on their merit and not
