Office of the Historian

## Preface

The *Foreign Relations of the United States* series presents the official documentary historical record of major foreign policy decisions and significant diplomatic activity of the United States Government. The series documents the facts and events that contributed to the formulation of policies and includes evidence of supporting and alternative views to the policy positions ultimately adopted.

The Historian of the Department of State is charged with the responsibility for the preparation of the *Foreign Relations* series. The staff of the Office of the Historian, Bureau of Public Affairs, plans, researches, compiles, and edits the volumes in the series. This documentary editing proceeds in full accord with the generally accepted standards of historical scholarship. Official regulations codifying specific standards for the selection and editing of documents for the series were first promulgated by Secretary of State Frank B. Kellogg on March 26, 1925. These regulations, with minor modifications, guided the series through 1991.

The statutory charter for the preparation of the series is prescribed by Title IV to the Department of State's Basic Authorities Act of 1956 (22 USC 4351, *et seq.*). The statute requires that the *Foreign Relations* series be a thorough, accurate, and reliable record of major United States foreign policy decisions and significant United States diplomatic activity. The volumes of the series should include all records needed to provide comprehensive documentation of major foreign policy decisions and actions of the United States Government, including facts that contributed to the formulation of policies and records that provided supporting and alternative views to the policy positions ultimately adopted.

The statute confirms the editing principles established by Secretary Kellogg: the *Foreign Relations* series is guided by the principles of historical objectivity and accuracy; records should not be altered or deletions made without indicating in the published text that a deletion has been made; the published record should omit no facts that were of major

#### IV Preface

---

importance in reaching a decision; and nothing should be omitted for the purposes of concealing a defect in policy. The statute also requires that the *Foreign Relations* series be published not more than 30 years after the events recorded. The editors of this supplement are convinced that it meets all regulatory, statutory, and scholarly standards of selection and editing.

##### *Structure and Scope of the Foreign Relations Series*

This supplement is part of a subseries of the *Foreign Relations* series for the years 1961–1963. The subseries presents in 25 print volumes and 5 microfiche supplements a documentary record of major foreign policy decisions and actions of the administration of President John F. Kennedy. The record of U.S. policy on arms control and disarmament, national security issues, and foreign economic matters during 1961–1963 has been compiled in three separate print volumes and this microfiche supplement.

##### *Sources for the Foreign Relations Series*

The *Foreign Relations* statute requires that the published record in the *Foreign Relations* series include all records needed to provide comprehensive documentation on major foreign policy decisions and actions of the U.S. Government. It further requires that government agencies, departments, and other entities of the U.S. Government cooperate with the Department of State Historian by providing full and complete access to records pertinent to foreign policy decisions and actions and by providing copies of selected records. The editor believes that in terms of access this volume was prepared in accordance with the standards and mandates of the statute, although access to some records was restricted, as noted below.

The editors had complete access to all the retired records and papers in the Department of State except for certain intelligence-related files maintained in the Bureau of Intelligence and Research, which had not been retired and became available to the Department historians only after this microfiche supplement was compiled. Arrangements have been made for Department historians to have access to these records for future volumes.

The editors of the *Foreign Relations* series also have access to the papers of President Kennedy and other White House foreign policy records at the John F. Kennedy Library. The records maintained and preserved there include some of the most significant foreign affairs-related documentation from other federal agencies. Department of State historians also have full access to records of the Department of Defense, particularly the records of the Joint Chiefs of Staff and the Secretary of Defense and his major assistants.

The Central Intelligence Agency provides access for Department historians to high-level intelligence documents from those records still in the custody of that Agency. Department historians' access is arranged by the History Staff of the Center for the Study of Intelligence, Central Intelligence Agency. The development of this access arrangement coincided with the research of volumes for the 1961–1963 triennium. As Department of State and CIA historians have continued to work out the procedural and scholarly aspects of this access, the variety and quantity of documentation made available and selected for publication in the volumes have expanded. Those volumes whose research was conducted later were the beneficiaries of the expanding access.

The List of Sources (pp. 1–15) lists the files consulted both in government repositories and in private collections for the print volumes and the microfiche supplement.

*Principles of Document Selection for the Foreign Relations Series*

In preparing each volume of the *Foreign Relations* series, the editors are guided by some general principles for the selection of documents. Each editor, in consultation with the General Editor and other senior editors, determines the particular issues and topics to be documented either in detail, in brief, or in summary. Some general decisions are also made regarding issues that cannot be documented in the volume but will be addressed in a microfiche supplement or in bibliographical notes.

The following general selection criteria are used in preparing volumes in the *Foreign Relations* series. Individual compiler-editors vary these criteria in accordance with the particular issues and the available documentation. The compiler-editors also tend to apply these selection criteria in

accordance with their own interpretation of the generally accepted standards of scholarship. In selecting documentation for publications, the editors gave priority to unpublished classified records, rather than previously published records (which are accounted for in appropriate bibliographical notes).

*Selection Criteria (in general order of priority):*

1. Major foreign affairs commitments made on behalf of the United States to other governments, including those that define or identify the principal foreign affairs interests of the United States;

2. Major foreign affairs issues, commitments, negotiations, and activities, whether or not major decisions were made, and including dissenting or alternative opinions to the process ultimately adopted;

3. The decisions, discussions, actions, and considerations of the President, as the official constitutionally responsible for the direction of foreign policy;

4. The discussions and actions of the National Security Council, the Cabinet, and special Presidential policy groups, including the policy options brought before these bodies or their individual members;

5. The policy options adopted by or considered by the Secretary of State and the most important actions taken to implement Presidential decisions or policies;

6. Diplomatic negotiations and conferences, official correspondence, and other exchanges between U.S. representatives and those of other governments that demonstrate the main lines of policy implementation on major issues;

7. Important elements of information that attended Presidential decisions and policy recommendations of the Secretary of State;

8. Major foreign affairs decisions, negotiations, and commitments undertaken on behalf of the United States by government officials and representatives in other agencies in the foreign affairs community or other branches of government made without the involvement (or even knowledge) of the White House or the Department of State;

9. The role of the Congress in the preparation and execution of particular foreign policies or foreign affairs actions;

10. Economic aspects of foreign policy;

11. The main policy lines of U.S. military and economic assistance as well as other types of assistance;

12. The political-military recommendations, decisions, and activities of the military establishment and major regional military commands as they bear upon the formulation or execution of major U.S. foreign policies;

13. The main policy lines of intelligence activities if they constituted major aspects of U.S. foreign policy toward a nation or region or if they provided key information in the formulation of major U.S. policies;

14. Diplomatic appointments that reflect major policies or affect policy changes.

*Scope and Focus of Documents Researched and Selected for the Microfiche Supplement to Foreign Relations, 1961–1963, Volumes VII, VIII, and IX*

The research for the print volumes and for this microfiche supplement was completed in 1991 and 1992. The principles of selection followed by the editors for the print volumes are described in the prefaces of those volumes. The volumes may be used without this supplement, but the supplement should be used in conjunction with the printed volumes.

The documents selected for this microfiche publication by the editors of volumes VII, VIII, and IX provide additional details on the major issues covered, as well as some lengthy documents and attachments which could not be printed because of lack of space, such as the full texts of the National Intelligence Estimates and Special National Intelligence Estimates.

*Editorial Methodology*

The documents in this microfiche supplement are arranged in three main parts: arms control, national security policy, and foreign economic policy. The last is subdivided into four sections. Within each of these sections, the documents are presented chronologically according to Washington time or in the order of individual meetings. Incoming telegrams from U.S. Missions are placed according to time of receipt in the Department of State or other receiving agency, rather than the time of transmission; memoranda of conversation are placed according to the time and date of the con-

version, rather than the date the memorandum was drafted.

The documents are numbered at the top of the first page of the document. The List of Documents is ordered according to these numbers. The documents are not annotated nor is there any other editorial apparatus. Material not declassified has been blacked out; for each document not declassified, a page has been inserted that shows a title, date, classification, number of pages, and source citation.

The List of Documents, which includes for each document the title, date, participants (for memoranda of conversation), from/to information, classification, number of pages, and source citation, as well as a brief summary, is part of this printed guide and appears on the first two microfiche cards. The printed guide also includes Lists of Sources, Abbreviations, and Persons.

#### *Advisory Committee on Historical Diplomatic Documentation*

The Advisory Committee on Historical Diplomatic Documentation, established under the *Foreign Relations* statute, reviews records, advises, and makes recommendations concerning the *Foreign Relations* series. The Advisory Committee monitors the overall compilation and editorial process of the series and advises on all aspects of the preparation and declassification of the series. Although the Advisory Committee does not attempt to review the contents of individual volumes in the series, it does monitor the overall process and makes recommendations on particular problems that come to its attention.

The Advisory Committee has not reviewed this microfiche supplement.

#### *Declassification Review*

The declassification review of this microfiche supplement resulted in the decision to withhold 5 percent of the documentation originally selected: 5 percent of arms control documentation, 3.5 percent of national security documentation, and .1 percent of foreign economic documentation. The remaining documents, together with the documents in the published volumes, provide an accurate account of the major foreign policy issues confronting, and the policies under-

taken by, the U.S. Government concerning these issues during this period.

The Division of Historical Documents Review of the Office of Freedom of Information, Privacy, and Classification Review, Bureau of Administration, Department of State, conducted the declassification review of the documents published in this volume. The review was conducted in accordance with the standards set forth in Executive Order 12356 on National Security Information, which was superseded by Executive Order 12958 on April 20, 1995, and applicable laws.

Under Executive Order 12356, information that concerns one or more of the following categories, and the disclosure of which reasonably could be expected to cause damage to the national security, requires classification:

- 1) military plans, weapons, or operations;
- 2) the vulnerabilities or capabilities of systems, installations, projects, or plans relating to the national security;
- 3) foreign government information;
- 4) intelligence activities (including special activities), or intelligence sources or methods;
- 5) foreign relations or foreign activities of the United States;
- 6) scientific, technological, or economic matters relating to national security;
- 7) U.S. Government programs for safeguarding nuclear materials or facilities;
- 8) cryptology; or
- 9) a confidential source.

The principle guiding declassification review is to release all information, subject only to the current requirements of national security and law. Declassification decisions entailed concurrence of the appropriate geographic and functional bureaus in the Department of State, other concerned agencies of the U.S. Government, and the appropriate foreign governments regarding specific documents of those governments.

#### *Acknowledgments*

The editors wish to acknowledge the assistance of the federal agencies, particularly the National Archives and Rec-

ords Administration, for their cooperation in granting access to their records. They also thank officials at the John F. Kennedy Library, in particular Suzanne Forbes, who assisted in the collection of documents for this volume. Mary McAuliffe of the Central Intelligence Agency History Staff assisted in arranging access to that agency's materials. Officials at the Department of Defense, especially Sandra Meagher, and officials at the National Defense University also deserve special thanks.

Evans Gerakas, David W. Mabon, David S. Patterson, William F. Sanford, Jr., and Carolyn B. Yee compiled the documents in this supplement, under the supervision of former General Editor Glenn W. LaFantasie. Deb Godfrey prepared the List of Documents.

#### Department of State

*Central Files.* A major source of documentation for this volume was the indexed central files of the Department of State. Many of the documents were selected from the following files:

- 100.4: Interagency boards and committees
- 102.7: Department of Commerce
- 110.11: Secretary of State
- 110.12BA: Under Secretary of State Ball
- 374.800: Organization for Economic Cooperation and Development
- 394.41: General Agreement on Tariffs and Trade
- 396.1-PA: International conferences at Paris
- 396.12: Conferences on international political relations
- 397.5611: Conferences on atomic weapons
- 398.00: Conferences on economic, industrial and social affairs
- 398.051: U.N. Special Fund
- 398.10: International financial conferences
- 398.13: International Monetary Fund
- 398.14: International Bank for Reconstruction and Development
- 400.0041: Trade relations
- 400.11: Export trade of the U.S.
- 400.116: Other administrative measures affecting import trade
- 400.119: U.S. export controls
- 411.004: U.S. import tariffs
- 411.0041: U.S. trade relations
- 411.006: Other U.S. administrative matters affecting import trade
- 411.414: U.S. import tariff on the United Kingdom
- 411.9441: U.S. trade relations with Japan
- 460.119: U.S. export controls on trade with Eastern Europe and the Soviet Union
- 460.509: COCOM restrictions on trade with Eastern Europe and the Soviet Union

**611.0012:** U.S. arms control agreements  
**611.0041:** U.S. trade agreements, treaties, and conventions

*Lot Files.* Documents from the central files are supplemented by lot files of the Department, which are decentral-

ized files created by bureaus, offices, divisions, and the Executive Secretariat. A list of the lot files cited or consulted in this volume follows:

Ball Files: Lot 74 D 272

Files of Under Secretary of State George W. Ball, 1961–1963.

Conference Files: Lot 65 D 366

Documentation on official visits to the United States by heads of government and foreign ministers and on international conferences attended by the President, Secretary of State, and Under Secretary of State for 1961.

Conference Files: Lot 65 D 533

Documentation on official visits to the United States by heads of state and foreign ministers and on international conferences attended by the President, Secretary of State, and Under Secretary of State for 1962.

Conference Files: Lot 66 D 110

Documentation on international conferences attended by the President, Secretary of State, and other U.S. officials, May 1961–December 1964.

E Files: Lot 64 D 452

Files of Assistant Secretary for Economic Affairs, 1962–1963, covering economic policy.

INR/EAP Files: Lot 90 D 110

NIEs and SNIEs on East Asia and the Pacific, 1952–1985, maintained by the Bureau of Intelligence and Research

INR Historical Files

Records of 5412 Special Group, 1954–1964, as maintained by the Bureau of Intelligence and Research

INR–NIE Files

Files retained by the Bureau of Intelligence and Research containing copies of National Intelligence Estimates and Special National Intelligence Estimates

Presidential Correspondence: Lot 66 D 204

Presidential exchanges of correspondence with heads of government for 1953–1964, maintained by the Executive Secretariat.

Presidential Correspondence: Lot 72 D 204

Exchanges of correspondence between President Kennedy and British Prime Minister Macmillan for 1960–1962.

Presidential Correspondence: Lot 76 D 435

Exchanges of correspondence between President Kennedy and Chairman Khrushchev for 1961–1963.

Presidential Correspondence: Lot 77 D 163

Correspondence between Presidents Kennedy and Johnson and the Chairman of the Soviet Union, Prime Minister of the United Kingdom, and President of France, 1961–1964.

Presidential Memoranda of Conversation: Lot 66 D 149

Complete chronological record of cleared memoranda of conversation with foreign visitors for 1956–1964, maintained by the Executive Secretariat.

Rusk Files: Lot 72 D 192

Files of Secretary of State Dean Rusk, 1961–1969, including his memoranda of telephone conversations.

Secretary's Memoranda of Conversation: Lot 65 D 330

Memoranda of conversation of the Secretary of State and the Under Secretary of State, 1961–1964.

S/P Files: Lot 67 D 548

Files of the Policy Planning Staff for 1961–1964

S/P Files: Lot 69 D 121

Files of the Policy Planning Staff for 1961–1964.

S/P Files: Lot 70 D 199

Files of the Policy Planning Council for 1963–1964.

S/P–NSC Files: Lot 62 D 1

Serial and subject master file of National Security Council documents and correspondence for the years 1948–1961, as maintained by the Policy Planning Staff.

Special Group (CI) Files: Lot 68 D 451

Minutes and memoranda of the Special Group, Counterinsurgency, January 1962–December 1963.

Special Group (CI) Files: Lot 70 D 258

Master file of counterinsurgency plans, including memoranda, airgrams, cables, and correspondence on various countries.

S/S Briefing Books: Lot 66 D 219

Various policy briefing books and situation chronologies used by the Secretary and Under Secretaries of State, 1962–1966.

S/S Files: Lot 66 D 147

Records of the Secretary of State's Staff Meetings, 1961–1964.

S/S Files: Lot 70 D 328

Records of State–JCS meetings, 1959–1963.

S/S–NSC Files: Lot 70 D 265

Master set of papers pertaining to National Security Council meetings, including policy papers, positions papers, and administrative documents, 1961–1966, maintained by the Executive Secretariat.

S/S–NSC Files: Lot 72 D 316

Master file of National Security Action Memoranda (NSAMs), 1961–1968, maintained by the Executive Secretariat.

S/S–NSC (Miscellaneous) Files: Lot 66 D 95

Administrative and miscellaneous National Security Council documentation, including NSC Records of Action, 1947–1963, maintained by the Executive Secretariat.

S/S–RD Files: Lot 71 D 171

Restricted data file maintained by the Executive Secretariat for 1957–1967.

Vietnam Working Group Files: Lot 66 D 193

Files of the Vietnam Working Group, 1960–1962.

- Galbraith, John Kenneth**, Ambassador to India, April 18, 1961–July 12, 1963
- Gardner, Richard N.**, Deputy Assistant Secretary of State for International Organization Affairs from April 3, 1961
- Gilpatric, Roswell L.**, Deputy Secretary of Defense from January 24, 1961
- Giscard d'Estaing, Valéry**, French Finance Minister from January 18, 1962
- Godber, Joseph B.**, British Minister of State for Foreign Affairs and Chairman of the British Delegation to the Eighteen-Nation Disarmament Committee
- Goldberg, Arthur J.**, Secretary of Labor, January 21, 1961–September 24, 1962; Associate Justice, U.S. Supreme Court, from October 1, 1962
- Good, Robert C.**, Director, Office of Research and Analysis for Africa, Bureau of Intelligence and Research, Department of State, from September 18, 1961
- Goodby, James E.**, Officer in Charge, Nuclear Test Negotiations
- Goodpaster, General Andrew J.**, Special Assistant to the Chairman of the Joint Chiefs of Staff
- Gore, Senator Albert**, Democratic Senator from Tennessee
- Graham, John S.**, Commissioner, Atomic Energy Commission, until 1962
- Gromyko, Andrei A.**, Soviet Foreign Minister
- Gudeman, Edward**, Under Secretary of Commerce until February 15, 1963

- Gullion, Edmund A.**, Acting Deputy Director of the U.S. Disarmament Administration until 1961; Ambassador to the Republic of the Congo from August 3, 1961
- Hailsham, Quintin M.H.**, British Leader of the House of Lords and Minister for Science and Technology from 1960; British representative to the test ban treaty negotiations in Moscow, July 1963
- Hamilton, Fowler**, Administrator of the Agency for International Development, October 3, 1961–December 7, 1962
- Harkins, General Paul D.**, Commander, Military Assistance Command, Vietnam
- Harriman, W. Averell**, Ambassador at Large, February 13–December 3, 1961; Assistant Secretary of State for Far Eastern Affairs, December 4, 1961–April 3, 1963; thereafter Under Secretary of State for Political Affairs
- Haworth, Leland J.**, Commissioner of the Atomic Energy Commission
- Heller, Walter W.**, Chairman of the Council of Economic Advisers from January 1961
- Henning, John F.**, Under Secretary of Labor from September 1962
- Herter, Christian A.**, Secretary of State until January 20, 1961; Special Representative for Trade Negotiations from November 1962
- Hickenlooper, Bourke B.**, Republican Senator from Iowa
- Hilsman, Roger, Jr.**, Director, Bureau of Intelligence and Research until April 25, 1963; thereafter Assistant Secretary of State for Far Eastern Affairs
- Hodges, Luther H.**, Secretary of Commerce from January 21, 1961
- Hoffman, Paul G.**, Managing Director of the United Nations Special Fund
- Holifield, Chet**, Democratic Representative from California and Vice Chairman of the Joint Committee on Atomic Energy
- Home, Alexander Frederick Douglas**, British Secretary of State for Foreign Affairs until October 20, 1963; thereafter Prime Minister
- Hood, Samuel**, British Minister to the United States until December 1962; thereafter British Deputy Under Secretary of State for Foreign Affairs

**Hosmer, Craig**, Republican Representative from California  
**Hughes, Thomas L.**, Deputy Director, Bureau of Intelligence and Research, Department of State, until April 28, 1963; thereafter Director

**Humphrey, Hubert H.**, Democratic Senator from Minnesota

**Jackson, Henry M.**, Democratic Senator from Washington

**Jacobsson, Per**, Managing Director of the International Monetary Fund until May 1963

**Johnson, G. Griffith**, Assistant Secretary of State for Economic Affairs from May 18, 1962

**Johnson, Lyndon B.**, Democratic Senator from Texas until January 20, 1961; Vice President of the United States, January 20, 1961–November 22, 1963; thereafter President

**Johnson, U. Alexis**, Deputy Under Secretary of State for Political Affairs from May 2, 1961

**Katzenbach, Nicholas deB.**, Assistant Attorney General, Office of the Legal Counsel, Department of Justice, until May 1962; thereafter Deputy Attorney General

**Kaysen, Carl**, President's Deputy Special Assistant for National Security Affairs from November 1961

**Keeny, Spurgeon M., Jr.**, National Security Council Staff member from January 1961

**Kelly, John M.**, Assistant Secretary of the Interior for Mineral Resources

**Kennedy, John F.**, President of the United States, January 20, 1961, until his death on November 22, 1963

**Kent, Sherman**, Assistant Director and Chairman, Board of National Estimates, Office of National Estimates, Central Intelligence Agency

**Kennedy, Robert F.**, Attorney General from January 1961

**Khrushchev, Nikita Sergeivich**, Chairman of the Council of Ministers of the Soviet Union and First Secretary of the Central Committee of the Communist Party

**Kitchen, Jeffrey C.**, Deputy Assistant Secretary of State for Politico-Military Affairs from May 16, 1961

**Klein, David**, National Security Council Staff member from January 1961

**Klutznick, Philip H.**, U.S. Representative to the United Nations Economic and Social Council until December 21, 1962

- Kohler, Foy D.**, Assistant Secretary of State for European Affairs until August 19, 1962; Ambassador to the Soviet Union from September 27, 1962
- Komer, Robert W.**, member, National Security Council Staff, from January 1961
- Kuznetsov, Vasili Vasilievich**, First Deputy Soviet Foreign Minister
- Labouisse, Henry R.**, Director of the International Cooperation Administration, February 22–October 6, 1961; Ambassador to Greece from March 7, 1962
- Lansdale, Major General Edward G.**, Deputy Assistant to the Secretary of Defense for Special Operations until May 1961; thereafter Special Assistant for Special Operations
- Leddy, John M.**, Special Assistant to the Under Secretary of State until April 4, 1961; Assistant Secretary of the Treasury, April 1961–June 1962; Representative to the Organization for Economic Cooperation and Development from October 3, 1962
- LeMay, General Curtis E.**, Chief of Staff, U.S. Air Force, from June 30, 1961
- Lemnitz, General Lyman L.**, Chairman, Joint Chiefs of Staff, until September 30, 1962
- Long, Franklin**, Assistant Director of the Bureau of Science and Technology, Arms Control and Disarmament Agency
- Macmillan, Harold**, British Prime Minister until October 20, 1963
- Mansfield, Michael J.**, Democratic Senator from Montana and Senate Majority Leader
- Mansholt, Sicco L.**, Vice President, European Economic Community Commission
- Marjolin, Robert**, Vice President, European Economic Community Commission
- Martin, Edwin M.**, Assistant Secretary of State for Economic Affairs until May 17, 1962; thereafter Assistant Secretary of State for Inter-American Affairs
- Martin, William M., Jr.**, Chairman of the Board of Governors, Federal Reserve System
- McCloy, John J.**, President's Adviser on Disarmament
- McCone, John A.**, Director of Central Intelligence from November 29, 1961

**McCormack, John W.**, Democratic Representative from Massachusetts and Speaker of the House

**McDermott, Edward A.**, Deputy Director, Office of Civil and Defense Mobilization until September 22, 1961; Deputy Director, Office of Emergency Planning, September 22, 1961–February 2, 1962; thereafter Director

**McGhee, George C.**, Counselor of the Department of State and Chairman, Policy Planning Council, February 16–December 3, 1961; Under Secretary of State for Political Affairs, December 4, 1961–March 27, 1963; Ambassador to Germany from May 18, 1963

**McGovern, George**, Director, Office of Food for Peace, January 1961–April 1962

**McNamara, Robert S.**, Secretary of Defense from January 21, 1961

**Murrow, Edward R.**, Director of the U.S. Information Agency, from March 15, 1961

**Myrdal, Alva**, Swedish Delegation head to the Eighteen-Nation Disarmament Committee

**Nitze, Paul H.**, Assistant Secretary of Defense for International Security Affairs, January 29, 1961–November 29, 1963; thereafter Secretary of the Navy

**Norstad, General Lauris C.**, Supreme Allied Commander, Europe, until November 1, 1962

**Ormsby Gore, Sir William David** British Ambassador to the United States from October 26, 1961

**Owen, Henry**, member, Policy Planning Council, Department of State, until November 25, 1962; thereafter Vice Chairman

**Parsons, J. Graham**, Assistant Secretary of State for Far Eastern Affairs until March 30, 1961

**Pastore, John O.**, Democratic Senator from Rhode Island and Chairman of the Joint Committee on Atomic Energy

**Penney, Sir William**, Chairman, British Atomic Energy Authority

**Powell, Sir Richard**, Permanent Secretary, British Board of Trade

**Prado y Ugarteche, Manuel**, President of Peru until July 18, 1962

**Price, Benjamin**, Chief Science Officer, British Ministry of Defense

- Price, Charles M.**, Democratic Representative from Illinois
- Ramsey, Henry C.**, member, Policy Planning Council, Department of State
- Rathbone, Monroe J.**, President of the Standard Oil Company of New Jersey
- Reed, James A.**, Assistant Secretary of the Treasury from February 1962
- Reischauer, Edwin O.**, Ambassador to Japan from April 27, 1961
- Reuter, Richard W.**, Director, Office of Food for Peace, from July 24, 1962
- Rey, Jean**, European Economic Community Commissioner for External Relations
- Riddleberger, James W.**, Director of the International Cooperation Administration, until February 22, 1961; Special Assistant to the Secretary of State, February 23–August 1961; Head of U.S. Delegation to Development Assistance Group meeting, July 1961; Mission to the North Atlantic Treaty Organization and European Regional Organizations, August 1961–October 1962; Ambassador to Austria from November 1962
- Riley, Paul H.**, Deputy Assistant Secretary of Defense for Matériel Requirements
- Riley, Vice Admiral Herbert D.**, Director, Joint Staff, Joint Chiefs of Staff, from February 25, 1962
- Roosa, Robert V.**, Under Secretary of the Treasury for Monetary Affairs from January 1961
- Rosson, William B.**, Special Assistant to the Chief of Staff for Special Warfare, Department of Defense
- Rostow, Walt W.**, Deputy Special Assistant to the President for National Security Affairs, January–November 1961; Counselor of the Department of State and Chairman, Policy Planning Council, from November 29, 1961
- Rowen, Henry S.**, Deputy Assistant Secretary of Defense for International Security Affairs
- Rusk, Dean**, Secretary of State from January 21, 1961
- Russell, Richard B.**, Democratic Senator from Georgia
- Salinger, Pierre E.G.**, President's Press Secretary
- Saltonstall, Leverett**, Republican Senator from Massachusetts

- Schaetzel, J. Robert**, Special Assistant to the Under Secretary of State for Economic Affairs, February 3, 1961–March 26, 1962; Special Assistant to the Under Secretary of State, March 27–September 15, 1962; thereafter Deputy Assistant Secretary of State for European Affairs
- Schlesinger, Arthur M., Jr.**, President's Special Assistant from January 1961
- Schroeder, Gerhard**, West German Foreign Minister from November 14, 1961
- Schweitzer, Pierre-P.**, Managing Director of the International Monetary Fund from September 1, 1963
- Scoville, Herbert, Jr.**, Assistant Director, Bureau of Science and Technology, Arms Control and Disarmament Agency
- Seaborg, Glenn T.**, Chairman of the Atomic Energy Commission from March 1, 1961
- Shoup, General David M.**, Commandant, U.S. Marine Corps
- Smith, Bromley**, Executive Officer, Operations Coordinating Board, until February 1961; Acting Executive Secretary, National Security Council, June–August 1961; thereafter Executive Secretary
- Smith, Major (later Colonel) William Y.**, Assistant to General Maxwell D. Taylor
- Sorensen, Theodore C.**, President's Special Counsel from January 1961
- Southard, Frank A., Jr.**, U.S. Executive Director, International Monetary Fund, until November 1, 1962; thereafter Deputy Managing Director, International Monetary Fund
- Spaak, Paul-Henri**, Secretary General of the North Atlantic Treaty Organization until March 5, 1961; Belgian Foreign Minister from April 25, 1961
- Staats, Elmer B.**, Deputy Director, Bureau of the Budget
- Stahr, Elvis**, Secretary of the Army
- Stelle, Charles C.**, U.S. Deputy Representative at the Geneva Conference on the Discontinuance of Nuclear Weapon Tests until 1962; Deputy Representative to the Eighteen-Nation Disarmament Committee, 1962–1963
- Stevenson, Adlai E., II**, U.S. Permanent Representative to the United Nations from January 23, 1961
- Symington, Stuart**, Democratic Senator from Missouri

- Takeuchi, Ryuji**, Japanese Vice Minister of Foreign Affairs until April 1963; thereafter Ambassador to the United States
- Taylor, General Maxwell D.**, President's Military Representative, July 1, 1961–October 1, 1962; thereafter Chairman, Joint Chiefs of Staff
- Thant, U.**, Acting Secretary-General of the United Nations, November 3, 1961–November 30, 1962; thereafter Secretary-General
- Thompson, Llewellyn E.**, Ambassador to the Soviet Union until July 27, 1962; Ambassador at Large from October 3, 1962
- Tito, Josip Broz**, President of Yugoslavia
- Treize, Philip H.**, Deputy Assistant Secretary of State for Economic Affairs from October 9, 1961
- Tsarapkin, Semen Konstantinovich**, Soviet Representative to the Eighteen-Nation Disarmament Committee
- Tuthill, John W.**, Representative to the Organization for European Economic Cooperation, March 6–October 3, 1961; Representative to the Organization for Economic Cooperation and Development, October 4, 1961–October 22, 1962; thereafter Representative to the European Communities
- Tyler, William R.**, Deputy Assistant Secretary for European Affairs until May 24, 1961; Assistant Secretary of State for European Affairs from September 2, 1962
- Van Zandt, James E.**, Republican Representative from Pennsylvania until January 1963
- Wheeler, General Earle G.**, Director, Joint Staff, Joint Chiefs of Staff, until February 24, 1962; Chief of Staff, U.S. Army, from October 1, 1962
- White, Lee C.**, President's Assistant Special Counsel from January 1961
- Wiesner, Jerome B.**, President's Special Assistant for Science and Technology and Director of the White House Office of Science and Technology from January 1961
- Wirtz, W. Willard**, Under Secretary of Labor until September 25, 1962; thereafter Secretary of Labor
- Woods, George**, President of the International Bank for Reconstruction and Development from January 1, 1963

**Wyndham White, Eric**, Executive Secretary of the General Agreement on Tariffs and Trade

**Zorin, Valerian A.**, Soviet Permanent Representative to the United Nations until 1962; Soviet Representative to the Eighteen-Nation Disarmament Committee, 1962

## Summary of Print Volume VII

Following is a summary of the contents of print volume VII, Arms Control and Disarmament. Parenthetical citations are to numbered documents in the text. Volume VII, published in 1995, is available from the U.S. Government Printing Office.

The question of resuming nuclear weapons tests dominated discussions on arms control at the beginning of the Kennedy administration. Since 1958, the United States had adhered to a joint moratorium on nuclear testing with the United Kingdom and the Soviet Union. The three countries had worked for a permanent test ban at the ongoing Geneva Conference on the Discontinuance of Nuclear Weapons Tests. The negotiations had not yet produced an agreement when John F. Kennedy became President in 1961.

The Joint Chiefs of Staff and Department of Defense advocated a return to weapons testing. Adhering to the moratorium, they thought, delayed weapons development and jeopardized national security. (14, 22) Other advisers, especially Secretary of State Dean Rusk, along with President Kennedy himself, had misgivings about the wisdom of abandoning the moratorium. The U.S. Mission to the United Nations thought resuming tests would damage U.S. international political standing. (29) Adlai E. Stevenson, U.S. Representative to the United Nations, was an outspoken critic of nuclear testing.

Kennedy had named John J. McCloy as his special adviser on disarmament. McCloy formed his own group of experts, known as the Fisk Panel after its chairman, James Fisk, to study the technical considerations of an agreement for the discontinuance of nuclear tests. The panel reported that a test ban agreement could hinder nuclear weapons development; however, this risk "must be appraised in the light of all the courses and risk factors the United States [considers] in its endeavor to reduce the likelihood of war and promote strong conditions of peace." The panel ultimately recommended that the United States resume testing if timely progress was not made at the Geneva Conference. (5)

At the Conference, the United States and the Soviet Union quarreled over the issues of inspection and verifica-

tion. Even within the Kennedy administration, there was disagreement over how many on-site inspections would be necessary. (4) Soviet Chairman Nikita S. Khrushchev often maintained that three inspections a year would be sufficient; any more would be tantamount to spying. The Soviets also opposed draft treaty provisions for a worldwide detection system headed by a single administrator; they preferred a three-man body that would not be prejudicial to any side. Khrushchev insisted that the controls proposed by the United States would endanger the Soviet Union's national security and subject its defense program "to the will of a third party." (31) The Soviets' refusal to accept inspection and verification remained a stumbling block throughout the negotiations.

In June 1961, Ambassador to the Soviet Union Llewellyn E. Thompson suggested the formal renewal of the proposal for a ban on atmospheric and undersea tests. (33) The Geneva negotiations soon stalled, however, as the Soviet Union maintained that any inspection and control had to be subject to Soviet veto. (35) There was also concern that the Soviets had secretly broken the moratorium and resumed testing. (48, 49)

In a TASS broadcast on August 30, 1961, the Soviet Union ended speculation by announcing it had resumed atomic testing. A few days later, President Kennedy and British Prime Minister Harold Macmillan issued a joint declaration for a ban on atmospheric tests. (63) On September 5, after the Soviet Union conducted three nuclear weapons tests, Kennedy ordered the resumption of underground weapons testing. (65)

Later that fall, India introduced a resolution in the U.N. General Assembly that called for an uninspected ban on all forms of testing. The Kennedy administration responded that the "proper road to a nuclear test ban is through a treaty among the countries that can test nuclear devices." (83) The President emphasized that he remained prepared to sign the atmospheric test ban proposed by the United States and the United Kingdom.

At the reopening of the Geneva Conference on November 28, 1961, however, agreement did not seem possible. Secretary Rusk stated that the United States would not make

a pre-treaty commitment to withhold resumption of tests. The Soviet Union had broken the moratorium; it was only fair, he argued, that the United States continue its weapons program. (99)

Semyon Tsarapkin, a member of the Soviet Delegation to the Conference, maintained that the Soviets had resumed testing because the United States was ahead in weapons development. The Soviet Union could not allow the United States to retain this advantage, as the United States remained committed to the destruction of the Soviet Union. Soviet leaders also refused to submit to control posts or on-site inspections. Despite U.S. admonitions that the Soviets were being unrealistic, Tsarapkin maintained the previous Soviet position that general and complete disarmament had to come before inspection and control of armaments. (106)

With talks stalled once again, the Kennedy administration engaged in internal debate over resuming atmospheric tests. Most of Kennedy's advisers, in particular the Joint Chiefs of Staff and the Atomic Energy Commission (AEC), advocated following the Soviets' lead and beginning a new series of tests. (137) Secretary Rusk thought the nation's security depended on atmospheric testing. (131)

Other advisers took more moderate positions. Jerome Wiesner, the President's special assistant on science issues, believed that atmospheric tests would be desirable for military development, but also felt "the security of the United States would not be endangered by a decision not to test in the atmosphere at this time." (110) Arthur Schlesinger, the President's Special Assistant, advised that adhering to the moratorium could make the United States look weak, while testing could make the arms race seem out of control. (113) Adlai Stevenson argued that the United States could make major gains with the non-aligned world by refraining from tests. (137)

One of Kennedy's main concerns was the bad press that would result from performing an atmospheric test in the United States. He asked Prime Minister Macmillan to allow the United States to use remote Christmas Island for the first test. Macmillan feared world outcry over U.S. resumption of atmospheric tests. Before allowing the United States to use Christmas Island, Macmillan required a clearer picture

of the kind of tests the United States would perform, as well as a better understanding of the purpose of the tests. He was concerned that a return to testing would hurt disarmament efforts. Although the Soviet Union had broken the moratorium, the Prime Minister did not believe the United States had to respond in kind. (95) Macmillan eventually agreed to Kennedy's request, but he wanted any announcement of tests to be connected with a new disarmament initiative. (122)

On March 2, 1962, Kennedy delivered a radio and television address announcing his decision to begin preparations for atmospheric tests. He stressed recent Soviet tests and U.S. security needs as reasons for this decision. Despite the resumption of tests, he stated that the United States remained committed to a comprehensive disarmament agreement at the Eighteen-Nation Disarmament Committee (ENDC) in Geneva. (143) The ENDC, opening on March 14, 1962, replaced the Geneva Conference as the major forum for test ban negotiations. It included five NATO countries, five Warsaw Pact countries, and eight non-aligned countries.

U.S. representatives at the ENDC still insisted on an objective international inspection system that could distinguish between natural and artificial seismic events. (163) The British felt the United States should be more flexible in the negotiations for a test ban treaty. The United Kingdom put forth its own proposal at Geneva, one that did not provide for as many inspections as the U.S. plan. Kennedy feared the United States would appear to have ruined a chance for agreement if he rejected the British plan. He was fairly sure the Soviet Union would not agree to the plan because it also included inspections; perhaps the United States should go along with the plan and let the Soviets take the heat for blocking agreement. (161) Kennedy's hunch was correct, and the Soviets rejected all Western proposals.

At an April 18, 1962, National Security Council (NSC) meeting, Kennedy approved an atmospheric test series, held in the Pacific Ocean area from April 25 to November 3, 1962. Kennedy was sensitive to world reactions to the tests and wanted them completed as quickly as possible. At the NSC meeting he asked for a short lead time between announcement and actual testing to minimize publicity. The President also inquired about the possibility of a photographer taking

a picture of the mushroom cloud. A meeting memorandum noted that "everyone but the President seemed to feel that radiation in milk was no real problem." (176)

Failure to make real progress in gaining Soviet acceptance of on-site inspections as part of a comprehensive test ban resulted in the U.S. resurrection of a proposal for a ban on atmospheric testing. Secretary Rusk thought it was useless to haggle over the number of inspections when the Soviets had repeatedly told negotiators they would accept none. (203) Instructions sent in August 1962 to Arthur H. Dean, head of the U.S. negotiating team, reflected the realization that a limited treaty might be more feasible. The instructions stated that Dean should declare a willingness to discuss a comprehensive test ban treaty involving internationally supervised control posts. However, if the two superpowers could not agree on this aspect, the United States should suggest an atmospheric-outer space-underwater test ban treaty. (211) On August 27, Kennedy and Macmillan issued a joint statement indicating their representatives had been authorized to negotiate a limited treaty as an alternative to a comprehensive ban. (224)

While test ban negotiations continued, Secretary Rusk began to explore the possibility of an agreement on the non-transfer of nuclear weapons. Rusk first approached France, the United Kingdom, and Germany at a North Atlantic Treaty Organization (NATO) meeting in December 1962. The United Kingdom agreed to the concept, but Germany and France had some reservations. (249, 265) The Soviet Union was unenthusiastic, claiming that NATO contradicted the professed U.S. desire for non-proliferation. (261) Although eclipsed by the test ban negotiations, talks on "non-diffusion," as it was sometimes called, continued sporadically throughout 1963. Secretary Rusk's initiative ultimately bore fruit with the signing of the multilateral Nuclear Non-Proliferation Treaty in 1968.

Soviet leaders had become interested in the idea of using automatic seismic recording stations, or "black boxes," as the means for monitoring violations of a test ban. At the Pugwash Conference in September 1962, Soviet and U.S. scientists approved the suggestion for using automatic seismic stations for the purposes of control. Khrushchev wrote

to Kennedy saying that he would like to view the U.S.-Soviet scientists' agreement as an encouraging sign. (232) Wiesner advised the President that the stations would not eliminate the need for on-site inspections, because so little was known about the characteristics of earthquakes in the Soviet Union. (233) Kennedy rejected the idea of relying on the black boxes. As he told Khrushchev, "My scientists indicate that it would require much more than the two or three such stations you mentioned." (236)

The Cuban missile crisis in late October 1962 sounded an alarm to both Kennedy and Khrushchev. Their messages to each other at the end of the crisis mentioned the need for renewed efforts on arms control. Khrushchev wrote to Kennedy, "We should like to continue the exchange of views on the prohibition of atomic and thermonuclear weapons." (239) Kennedy responded, "Perhaps now, as we step back from danger, we can together make real progress in this vital field." (239)

In December the number of permitted on-site inspections again moved to the forefront of negotiations, this time in a dispute over the meaning of two conversations between Dean and the Soviet Deputy Foreign Minister. The Soviets supposedly came away from the two meetings with the impression that the United States would be willing to accept two to four inspections a year. On December 19, Khrushchev wrote to Kennedy saying that the Soviet Union was prepared to accept Dean's "offer." Although Kennedy informed Khrushchev that Dean had mentioned the possibility of eight to ten inspections, not two to four, Soviet negotiators continued to refer to the two-to-four offer. (251, 256)

Dean maintained that he had suggested the United States might be willing to accept eight to ten inspections, only two of which had to be in aseismic areas. He pointed out that there had been no interpreter during the conversations, which were supposed to have been on an informal level. Dean's aide at the meetings confirmed his figures. The Director of the Arms Control and Disarmament Agency, William Foster, attempted to clarify Dean's comments at a plenary session of the Eighteen-Nation Disarmament Committee in March 1963. He stated that he regretted any misunderstanding Dean may have caused, but the United States would not accept only two to four inspections. (251)

On July 10, 1963, Kennedy gave W. Averell Harriman, special emissary to the test ban negotiations, instructions for the next round of talks in Moscow. The President asked Harriman to try to negotiate the most comprehensive nuclear test ban treaty possible. Kennedy realized that agreement with the Soviets on a comprehensive treaty was unlikely, however, and so advised Harriman to seek an agreement banning testing in the atmosphere, outer space, and underwater. Kennedy also wanted Harriman to continue to emphasize the relationship between a nuclear test ban and the U.S. desire to control nuclear weapons proliferation. In addition, Kennedy instructed his emissary to explore Soviet intentions on a number of issues, such as the establishment of nuclear free zones and an agreement not to place nuclear weapons in orbit. (319)

The final round of negotiations began on July 15, 1963. Any hopes for a comprehensive ban were immediately dashed when Khrushchev said that the Soviet Union would not permit any inspections, even the two or three they had previously accepted. (325) Full attention then turned to a ban for atmospheric-outer space-underwater testing. The Soviets agreed to a three-environment test ban drafted by the United States and United Kingdom in August 1962, with two exceptions. (328) The draft treaty allowed peaceful explosions in the three environments if treaty signatories agreed to the explosions. It also provided a procedure for withdrawal from the treaty if a country performed a nuclear weapons test that others believed might threaten their national security. This matter was settled on July 17, when the United States gave up the peaceful uses clause in exchange for Soviet acceptance of the withdrawal clause. (329)

The negotiators also addressed the problem of Soviet desire for a non-aggression pact (NAP). (325, 333) Although Soviet Foreign Minister Andrei Gromyko repeatedly stated that the Soviet Union saw a non-aggression pact as an important part of the negotiations, he eventually agreed that a test ban would not be contingent upon the pact. (335, 343) Likewise, Harriman decided to downplay the issue of non-proliferation when Khrushchev and Gromyko showed no interest in the subject. (331, 332)

With these differences resolved, the United States and Soviet Union agreed to initial the treaty once they developed

language for the communiqué. (343) Two days later, on July 25, 1963, the United States, United Kingdom, and Soviet Union initialed the document and released its text. (353) On August 5 representatives from the three countries signed the Treaty Banning Nuclear Weapons Tests in the Atmosphere, in Outer Space, and Underwater, commonly known as the Limited Test Ban Treaty (LTBT) in Moscow. (359) President Kennedy hailed the agreement as an important step in reducing world tension and limiting the nuclear arms race.

Senate approval had been a concern throughout the negotiations. On July 21 the Department of State held a special meeting to consider any Congressional problems that might arise over the treaty. Administration officials reported that most key Senators were on board. (337) Kennedy later decided to include several Senators in the delegation sent to the official treaty signing. According to a memorandum, "the purpose of the Senate delegation is to interest them as well as to provide additional opportunities to direct public attention to the benefits of a test ban treaty." (340)

Secretary Rusk and Harriman also met with the Joint Chiefs of Staff (JCS) to reassure them that the treaty did not prevent the use of nuclear weapons in hostilities. The Secretary also stated that the treaty permitted the United States to continue underground "peaceful uses" experimentation for Plowshare, an area of concern for the Chiefs. The JCS ultimately reported that they had no major problems with the treaty. (362)

On September 24, 1963, the U.S. Senate gave its consent to the Limited Test Ban Treaty by a vote of 80 to 19. The treaty entered into force on October 10 when the instruments of ratification were exchanged in similar ceremonies in Washington, Moscow, and London. (366) In spite of the achievement of the treaty, the United States had no plans to abandon underground testing. The Department of Defense and the Atomic Energy Commission began preparing for a series of higher yield underground tests, as well as new testing techniques in August 1963. (363, 364)

Arms control efforts continued, however, as the Kennedy administration prepared for the next meeting of the Eighteen-Nation Disarmament Committee, scheduled to resume on January 21, 1964. Upcoming issues included pro-

duction cut-offs of fissionable materials and the formal inspection of production facilities and armaments that were to be destroyed. (373) The United States and Soviet Union also began efforts to refrain from placing weapons of mass destruction in orbit. (370, 371) In a September 1962 speech, Deputy Defense Secretary Roswell Gilpatric had stated the U.S. intention to prevent the arms race from extending into space, (226) and by the end of 1963, the two sides had developed outlines of an agreement. The administration of Lyndon Johnson resumed the talks, and the Outer Space Treaty was signed in 1967.

## Summary of Print Volume VIII

Following is a summary of the contents of print volume VIII, National Security Policy. Parenthetical citations are to numbered documents in the text. Documents in this Microfiche Supplement are also cited here. Volume VIII, published in 1996, is available from the U.S. Government Printing Office.

The volume deals with the internal evolution of national security policies within the Executive branch of the U.S. Government. At its very outset, the Kennedy administration undertook a major restructuring of the existing national security bureaucracy to suit the new President's management style. In effect, it adopted a great many of the recommendations of the Subcommittee on Policy Machinery of the Senate Government Operations Committee, which was chaired by Senator Henry M. Jackson of Washington. The Subcommittee had attacked the existing NSC organizational structure for being too cumbersome and slow-moving to respond to either fast-breaking foreign crises or internal executive initiatives.

Kennedy abolished the Operations Coordinating Board, announced that he was transferring some of the functions of the Planning Board to the Department of State, and consolidated under McGeorge Bundy, his Special Assistant for National Security Affairs, the NSC Secretariat and certain White House foreign policy staffers who were given area and substantive responsibilities. In so doing he created the embryo of the modern NSC organization, although the Kennedy NSC was smaller and far more loosely organized than is today's. Individual staffers had wide-ranging, and often constantly shifting, substantive responsibilities. After the failure of the Bay of Pigs operation, Kennedy appointed General Maxwell D. Taylor as the President's Military Representative, a White House post intended to increase the President's ability to monitor the state of the armed forces.

Several of them enjoyed frequent personal access to the President, and Bundy often forwarded their memoranda directly to him. The new administration issued its policy directives in the form of brief, one- or two-page National Security Action Memoranda (NSAMs), always signed by the

President or Bundy. The President called fewer formal NSC meetings than had Eisenhower. In the 1958–1960 triennium, the Council met 123 times, but in the period 1961–1963 it met only 49 times. The change was progressive: while the Council met 23 times in 1961, it met only 13 times in 1963. From time to time Bundy attempted to reintroduce more formal policymaking procedures. The NSC Standing Group was one result of these efforts. The few documents on NSC organization included here are the essential minimum needed to convey basic information in aid of understanding the substantive documentation on national security topics. (6, 9, 31, 108, 131; Supplement, July 19, 1963) Much fuller treatment of White House, Department of State, and other foreign policy organizational changes will be included in Volume XXV.

The Kennedy administration's organizational innovations were swiftly reflected in the policymaking process. The White House set up ad hoc committees and working groups to deal with crises and ongoing confrontations (see especially Volumes I–III, Vietnam; X–XI, Cuba; XIV–XV, Berlin; and XXIV, Laos), while the traditional NSC process of grinding out approved interagency policy papers on regional and thematic topics slowed to a halt. The White House took a dim view of the State Department's "Country Papers," an effort partially to fill the gap left by the disappearance of NSC papers. "Actual policy," Bundy was reported as saying at a White House Staff Meeting in November 1961, "was determined by adding up actions that the President had approved on the country concerned or by asking the White House staff how the President felt about a particular country." Walt Rostow, then Bundy's deputy, agreed, saying that the NSC staff should not "waste time" on Country Papers. The White House believed that these papers had only the virtue of dissemination of policy to low-level staff. (55)

The battle over these State-originated documents, later known as "National Policy," and eventually as "Strategic Policy" Papers continued throughout the administration. After moving to the Department late in 1961, Rostow championed these papers and eventually secured approval of a procedure whereby they acquired status as interagency papers with some White House staff-level input, even though

the White House remained dubious about their efficacy. As one participant observed: "There is no subject that makes Bundy's staff bristle as much as this one." (135, 146, 148)

One policy paper that the administration took seriously and initially intended to bring up to date, however, was that on Basic National Security Policy (BNSP), NSC 5906/1 of August 5, 1959. (For text, see *Foreign Relations*, 1958–1960, volume III, pages 296–316.) Early in February 1961, Kennedy ordered that it be revised, and substantial work was done at both the State and Defense Departments. (15)

At Defense, it was Nitze's subordinates in International Security Affairs (ISA) who pushed the project most aggressively. Their May 19 draft of proposed military policy sections of the BNSP received a mixed reception. The White House approved its emphasis on "flexible response," that is, initial response short of nuclear weapons, to potential Soviet provocations, but wanted consideration of further raising the "threshold" of nuclear response and thought the paper did not deal adequately with the problems inherent in counterforce doctrine. (28, 30) Dean Rusk also wanted recommendation of additional conventional forces. (35)

Although Deputy Secretary of Defense Roswell Gilpatric was receptive to Rusk's arguments, discussion ceased shortly after McNamara was reported as deciding that a finished paper was not worth "six-eight weeks of arguing inside the Pentagon." This may have been a reference to a degree of opposition in the Joint Chiefs of Staff (JCS) to the Kennedy team's emphasis on flexible response and "managing" the entire course of conflict with an end to limiting casualties. The JCS submitted their own draft, and in a talking paper warned that "an overly inhibited BNSP" could vitiate "the offensive spirit" and "the all-important will to win." Preoccupation with the Berlin crisis also dampened the administration's interest in pushing ahead with the BNSP.

At the Department of State, however, drafting of a more comprehensive BNSP continued in George McGhee's Policy Planning Council. At 85 double-spaced pages, the Council's draft of December 5 was longer than NSC 5906/1 and broader in scope. There was more emphasis on the need for economic development worldwide, on the need for non-military ties with other free nations, and on various types

of contact with the Soviet Union. The military sections echoed the administration's emphasis on flexible response and a buildup of conventional forces. The grand theme of the paper is on the building of a worldwide community of free nations, rather than on winning over other free countries to U.S. views. This draft does not appear to have been circulated outside the Department and in its details may be a good reflection of the thinking at that time of the career Foreign Service. Devoting less than one page to counterinsurgency, on the other hand, it certainly did not reflect the administration's increasing emphasis on irregular warfare, discussed below. (62; Supplement, December 5, 1961)

Under McGhee's successor Walt Rostow, the Policy Planning Council continued to work on a BNSP intended for eventual NSC and Presidential approval. A 193-page draft of February 24 was read by the President, who, according to Bundy, felt it was "quite a good paper, and that everyone should study it thoroughly and give Rostow their comments." The 285-page draft of March 26 circulated throughout the government. While the Rostow drafts retained considerable emphasis on the development of the free world community of nations, they also had much more extensive and detailed military sections and prescriptions for dealing with the Communist nations. (70, 73)

The reception accorded the March 26 draft revealed sharp differences in policy emphases. Ambassador to the United Nations Adlai Stevenson believed that the March 26 draft concentrated too narrowly on the "contest with Communism and how to win it," that even within that framework, too much emphasis was laid on the military factor, and that there was a dangerous underemphasis on the threat of uncontrolled nuclear weapons systems to our national security." (75) The JCS, on the other hand, largely seconded by ISA, stated that there was need for more emphasis on a military power sufficient to defeat the enemy. It was said that McNamara liked the draft as a form of general guidance, but believed that making it an exact guidance would be a lengthy and unremunerative process. (76, 78) From the White House, McGeorge Bundy expressed approval of the paper's military passages but expressed grave reservations about the paper's length, its doctrinaire character, and its lack of rank-

ordering of priorities. "I doubt very much if we can achieve consensus or clear Presidential approval on anything as comprehensive as this." (77)

Later drafts showed some responsiveness to the various comments and criticisms but came no closer to NSC or Presidential approval. Leakage of at least two of the drafts to newsmen led to Congressional hearings in June 1962 at which Rostow defended himself from the charge of sponsoring a policy that was insufficiently anti-Communist. While the later drafts were shorter, they were far longer than the adopted BNSP papers of previous administrations. A portion of the 186-page June 22 draft, the last to incorporate extensive revisions, is printed, and its full text appears in the Microfiche Supplement. (79–80, 83–85, 89–90, 93–94; Supplement, June 22, 1962)

In August 1962 Bundy was said to feel that "the big document would never fly although Rostow [was] still trying to push it." That fall, General Taylor, by then Chairman of the JCS, stated that the BNSP should be like the British constitution, "that is, not written down." (94) In January 1963 the President approved rescission of NSC 5906/1 and an NSC memorandum stated that "for the present, current policy guidance is to be found in existing major statements of the President and Cabinet Officers, both classified and unclassified." (123)

Plainly, the BNSP was dead by the winter of 1963 but the Policy Planning Council at State and, for a time, ISA at Defense refused to accept its demise. In April Nitze submitted to McNamara a memorandum summarizing differences within the DOD, as well as between State and DOD, on key BNSP issues and asking for a resolution of interagency issues. Although documentation is murky, McNamara apparently chose instead just to resolve certain issues within DOD. (132, 136)

At State, Rostow was sponsoring a draft as late as November. (146; Supplement, November 8, 1963) In one of his pleas for continued consideration of the BNSP, he pointed out that the BNSP had been developed in the Truman administration and carried forward in several iterations under Eisenhower. "I doubt that it will redound to the credit of our Administration that we failed to thrash out any successor

document.” Stating a view shared by many in both the State and Defense Departments, he continued that a BNSP “should not tie the President’s hands,” but could “provide an occasion for debating and defining the bone structure of policy and communicating it to the troops who never see the four star generals.” (136) This argument, however, carried little weight in an administration that tended to regard policy as the sum of its constantly evolving practice.

If Kennedy did not care for comprehensive documents, on at least two occasions he gave an extensive verbal tour d’horizon to the assembled NSC. In January 1962, he stressed the interdependence of U.S. economic strength and U.S. cold war obligations and accepted the necessity of nuclear deterrence while emphasizing the need for non-nuclear military alternatives. In a passage that developed further one of the themes of his inaugural address and indicates some of his historical thinking, Kennedy was reported as saying: “The record of the Romans made clear that their success was dependent on their will and ability to fight successfully at the edges of their empire. It was not so clear that we were yet in a position to do the same.” (69)

Almost exactly a year later the President addressed the NSC again, once more stressing the interrelation of domestic and foreign policy, but with increased analysis of specific areas—including Cuba—and an admonition to work more effectively, in the interest of maintaining the world balance of power, with neutral states such as India, with which the United States nonetheless had important differences. Bundy, in referring to this talk as “mood music,” plainly indicated that it was intended as policy dissemination, not policymaking—the function Rostow wanted for the BNSP. (125; Supplement, 3 documents all dated January 22, 1963)

Kennedy’s preoccupation with the “edges” of U.S. influence is pertinent to his emphasis on both counterinsurgency and paramilitary operations. At his very first NSC meeting, he ordered McNamara to “examine means for placing more emphasis on the development of counter-guerrilla forces.” (8) By late June 1961, in NSAMs related to the aftermath of the Bay of Pigs affair, the President reemphasized the responsibilities of the JCS in counterinsurgency as well as conventional warfare, requested a thorough inventory of

U.S. paramilitary assets, and gave to the Special Group (5412), chaired by General Taylor, which oversaw all covert activities, responsibility for paramilitary operations as well. (32–34)

In December 1961, Kennedy received from a CIA-chaired interagency committee a report on U.S. strategy regarding “wars of liberation,” which recommended especially the creation of a coordinating authority for counterinsurgency. It suggested that the 5412 Special Group take on this function too, but the White House, perhaps not wishing to create too powerful a body, formed in January 1962 a new Special Group (Counterinsurgency) (SG(CI)) instead. It was initially charged with monitoring insurgencies in Laos, South Vietnam, and Thailand, but was also charged with keeping under review potential insurgencies around the world. Coordination of the two groups was to be assured by General Taylor’s chairing both. (64, 68) After Taylor became Chairman of the Joint Chiefs of Staff, Deputy Under Secretary of State for Political Affairs U. Alexis Johnson chaired the SG (CI) and McGeorge Bundy chaired the Special Group. During 1962 the administration augmented its structure for dealing with countries on the “edge” by instructing the Agency for International Development to place increased emphasis on police assistance (this in the face of a certain reluctance on the part of Administrator Fowler Hamilton), issuing instructions for exploration of a “Civic Action” (military assistance in economic projects) program, and adopting a report on counterinsurgency doctrine. (65, 71–72, 99, 105–106; Supplement, September 1962)

Evaluation of the work of the Special Group (CI) was mixed. Although there was a consensus that the Group was adequately performing monitoring duties, by January 1963 Attorney General Robert F. Kennedy, a member, believed that the President looked “upon the Group as having wider responsibilities than the members seem to interpret them to be.” (74, 102, 122, 128) In July, a Department of State analysis held that the SG(CI)’s “rather doctrinaire counterinsurgency approach” to the problems of underdeveloped countries interfered with recognizing that the Soviet challenge was shifting to “less aggressive but just as deadly forms of cultural and economic penetration.” (139)

The President, however much he may have recognized also these more subtle Soviet pressures, remained enamored of the counterinsurgency approach. In July 1963, after reviewing a Special Forces parade in Germany, he called for increased emphasis on dispatching the Special Forces to areas threatened by guerrilla action. He stated he had been "very much impressed by the appearance and demeanor of the special forces I have seen and believe that their presence in other countries can project a U.S. image which will be a very useful political influence." He continued, in the face of lukewarm response from both State and Defense, to press this initiative until his death. (133)

Kennedy also interested himself to a limited extent in deterrent theory, but the main force in the theory's constant evolution during his administration was McNamara. In January 1961 the outgoing Eisenhower administration discussed several issues that would preoccupy its successor. On January 12 Eisenhower and his advisers discussed reports on U.S. limited war, reaching the conclusion that "U.S. capabilities to conduct limited war are substantial and will show a further improvement on the basis of the 1962 budget as submitted." The administration also specified force goals of 540 Minuteman missiles by mid-1964 and a total authorization of 19 Polaris submarines. (Supplement, January 5, 1961) At a conference with President-elect Kennedy held January 19, Secretary of Defense Thomas Gates assured Kennedy and Secretary of Defense-designate Robert McNamara that "the United States can handle any number of small limited war situations at one time." (3)

From the outset, it was clear that the new administration would not accept previously projected missile force levels or assurances that limited war capabilities were adequate at existing funding levels. The report of a transition team headed by Paul H. Nitze, who became Assistant Secretary of Defense for International Security Affairs under McNamara, started from the premise that the most basic strategic judgment was "between attempting to follow a politically meaningful 'win' capability in general war versus the creation of a secure retaliatory capability" and concluded that "in addition to a secure deterrent posture, some admixture of possible 'win' capabilities is called for." (1)

At a policy meeting held in early February, McNamara reported decisions to accelerate procurement of five Polaris submarines by ten months, increase airlift capacity, and carry out a complete reappraisal of the pending FY 1962 military budget. (8) McNamara reported to Kennedy on the major work of this reappraisal on February 20, and recommended an increase in \$2 billion for items designed to strengthen both strategic retaliatory and limited war capabilities. McNamara chose to boost Polaris rather than Minuteman production because of the Navy missile's invulnerability, but proposed also to double Minuteman production capability to afford the option of increasing this program later. For conventional forces, McNamara proposed funds for training, readiness, and a higher supply level to forward a long-range objective of making "non-nuclear warfare" the "primary mission of our overseas forces." (17)

The interim increases were but the first result of a massive inquiry into the role, mission, and doctrine of strategic and conventional forces that would continue throughout the Kennedy administration. One of the first surprises to the public at large was a newspaper article in early February 1961, apparently based on a briefing by McNamara, stating that the "missile gap," during which it had been expected that the Soviet Union would bring large numbers of ICBMs on line before the United States, was unlikely to materialize. (14) Firm, widely disseminated figures fully backing the end of the "missile gap," however, did not materialize until new intelligence estimates were circulated in June and especially in September 1961. (29, 45, 129)

By the fall of 1961 the outline of some of the administration's major changes in strategic nuclear policy was visible. In the first of a series of "Draft Presidential Memoranda" (usually known as "DPMs") to Kennedy regarding the FY 1963 defense budget, McNamara recommended substantial increases over the Eisenhower administration ICBM force objectives, for a total of 1,000 Minuteman and 656 Polaris missiles by the end of FY 1967. In justification McNamara enunciated a variant of the doctrine known as "counter-force," in which the first salvo of nuclear weapons in a retaliatory attack would be directed against enemy forces instead of enemy population centers, while a certain portion of the

strategic force would be withheld for potential later use against military, industrial, and population targets. McNamara specifically rejected "minimum deterrence," a relatively small retaliatory capability targeted on enemy population centers only, on the ground that in an actual war "a capability to counterattack against high-priority Soviet military targets can make a major contribution" to "limiting damage and terminating the war on acceptable terms." Minimum deterrence would also fail to protect U.S. allies. McNamara was equally emphatic in rejecting "a full first strike capability," in which most nuclear weapons would be discharged in an attempt to destroy enemy in one blow, on the grounds that it was infeasible and that attempting to arm for this objective would intensify the arms race. (46)

Implicitly McNamara was also rejecting the "optimum mix" targeting doctrine which had guided preparation of the first Single Integrated Operations Plan, or SIOP-62, approved in December 1960. (Documentation is included in *Foreign Relations*, 1958-1960, Volume III) New guidance for SIOP-63, the replacement targeting plan, which went into effect in June 1962, in general reflected the priorities of McNamara's DPM. (41, 62) Guidance for the following year's plan, SIOP-64, was closely similar. (92; Supplement, November 14, 1962)

Also for FY 1963 McNamara recommended only enough funds for the Nike-Zeus anti-missile system to allow its limited deployment "in the near future," curtailment of long-range bomber procurement, improvements in Army equipment and reserve readiness rather than a large increase in personnel, and a strengthening of land-based tactical air units. (48, 50, 51) The Bureau of the Budget and the President's Deputy Special Assistant for National Security Affairs, Carl Kaysen, unsuccessfully advocated some cuts in the missile program. (57, 63) General Maxwell Taylor, the President's Military Representative, recommended greater emphasis on Nike-Zeus and a buildup in conventional forces. (58, 60) For the most part, however, the budget as submitted to the Congress reflected McNamara's priorities. The administration also approved substantial civil defense expenditures, but these were never approved by the Congress. (61, 63)

As noted above, McNamara had embraced counterforce doctrine in his first DPM. In the spring of 1962, he advocated counterforce to the NATO Foreign Ministers assembled in Athens, and he expounded some of the same ideas in unclassified form in Ann Arbor, Michigan, in June. (82) Thereafter he moved steadily away from counterforce. Even before the Ann Arbor address he scribbled on a memorandum that the “concept of ‘worsened relative military position after a general nuclear war’ is not a meaningful one to me when each side has the capacity to destroy the other’s civilization.” (89) In his rationale for strategic retaliatory forces, contained in a DPM of November 1962, he placed counterforce after the need “to provide the United States with a secure, protected retaliatory force able to survive any attack within enemy capabilities and capable of striking back and destroying Soviet urban society, if necessary, in a controlled and deliberate way.” (112)

In the equivalent report for 1963, McNamara shifted to a greater emphasis on deterrence by stressing “assured destruction,” which was “the ability to destroy, after a well planned and executed Soviet surprise attack on our Strategic Nuclear Forces, the Soviet government and military controls, plus a large percentage of their population and economy. . . . This calculation of the effectiveness of U.S. forces is not a reflection of our actual targeting doctrine in the event deterrence fails.” Beyond “assured destruction,” which focused almost entirely on deterrence, McNamara was willing to expend some money on “damage limiting,” or reduction of damage to the United States in the event of war, but not to the point of giving the United States a “full first strike capability,” which McNamara always regarded as infeasible and destabilizing. (151)

Others in the administration also experienced this shift toward pure deterrence, in some cases reaching that position before, and more unconditionally than McNamara. In February 1963, “Bundy said in the most serious way that he felt there was really no logic whatever to ‘nuclear policy.’ What he meant by this was that the military planners who calculate that we will win if only we can kill 100 million Russians while they are killing 30 million Americans are living in a total dreamland.” (127)

At a September 1963 meeting of top officials with the Net Evaluation Subcommittee (NESC) of the JCS to discuss nuclear issues, the President too revealed his concern with excessive production and deployment of nuclear weapons—the problem of “overkill.” While the NESC and McNamara both appeared, for different reasons, to be interested in a somewhat larger force than the President appeared to, the meeting demonstrated unequivocally a consensus at the highest level regarding the futility of any U.S. attempt at a preemptive strike. (141) The administration entertained some fear that certain military, particularly Air Force, circles were in favor of a first strike. (118)

While the debate on strategic nuclear weapons was relatively clearly focused, and a rough consensus on their role and use had emerged by mid-1963, the Kennedy administration never succeeded in formulating clear policy on the deployment and potential use of tactical nuclear weapons. There was a consensus on the need for increased emphasis on non-nuclear forces, both “conventional” and for counter-insurgency. Secretary of State Dean Rusk in particular periodically reminded McNamara of the need to spend more, not less, money on conventional forces for foreign policy reasons: to reassure the NATO allies and to present a consistently determined force posture against Communist nations. (10, 35, 53) (Rusk, unlike McNamara, also strongly endorsed funding for development of an anti-ballistic missile defense system.) (114)

Beyond the area of consensus, however, major variations persisted. General Taylor had retired from the Army in 1958 partly because of his desire to “go public” on flexible response, and it was his position on this issue that had initially recommended him to the President. Yet as Taylor made clear in memoranda to Kennedy, he desired a buildup in conventional forces and increased development of tactical nuclear weapons. His objective was to achieve “dual capable” ground forces which could use or not use nuclear weapons as the occasion demanded. The issue with tactical nuclears was not whether to have them but how to “improve them down to the fractional kiloton yields which offer the possibility of a separate stage in escalation short of the use of weapons of mass destruction.” (10, 60, 80, 87)

The questions raised by McNamara, Kaysen, and others, on the other hand, make clear their overall skepticism on the usefulness of tactical nuclears and the possibility of employing them in situations that would not escalate into general war. Studies ordered by McNamara did not convince him that an answer to the problem had been found: "Our own studies, not being definitive, don't persuade." Regarding the problem of further escalation in a hypothetical scenario in which the United States had initiated use of tactical nuclears in Europe, one study quoted with approval USCINCEUR's conviction that it was "doubtful that Soviet leaders would regard success of ventures into Western Europe as so vital an objective as to be willing to escalate the level of conflict, especially in view of the risk of bringing about a general war from which the destruction of their homeland would result." (86; Supplement, April 1963) McNamara continued to believe, however, "that the escalation potential of tactical nuclear warfare, of the type on which present plans are based, [was] high," and that "we have not been able to clarify fully the role of tactical nuclear weapons in our over-all strategy." (151)

## Summary of Print Volume IX

Following is a summary of the contents of print volume IX, Foreign Economic Policy. Parenthetical citations are to numbered documents in the text. Volume IX, published in 1995, is available from the U.S. Government Printing Office.

### *General Foreign Economic Policy*

The need to reverse the deteriorating U.S. balance of payments, which had become the growing concern of the Eisenhower administration in its second term, became the core of the Kennedy Presidency's foreign economic policy. Briefed on the problem by President Eisenhower shortly before he took office, President Kennedy delivered a major address only 2 weeks after his inauguration, in which he proposed both short- and long-term measures to eliminate the deficit and stem the outflow of gold caused by the loss of foreign confidence in the dollar. (1, 2)

Kennedy mobilized the Departments of the Treasury, State, Defense, Commerce, and Agriculture, the Bureau of the Budget, and the newly created Agency for International Development (AID) to implement his program of export promotion, burden-sharing in defense and foreign assistance, and financial restraints and incentives designed to encourage foreign dollar investments. Kennedy instructed Secretary of the Treasury C. Douglas Dillon to oversee and coordinate the balance-of-payments effort (2, 3, 4, 7, 8, 9) and created the Cabinet Committee on the Balance of Payments in the summer of 1962 to assist him. (10, 11)

All agencies worked to implement the President's program. The Departments of Commerce and State (and later the Special Representative for Trade Negotiations) concentrated on general tariff reductions and export promotion. AID attempted to reduce its foreign expenditures (i.e., not including assistance funds spent on U.S. goods) first to \$1 billion and then \$500 million. (12, 17, 18) Treasury, in addition to its central role as coordinator, attempted to promote foreign investment in the United States through tax incentives and international cooperation. (18)

Perhaps the most controversial efforts to reduce capital outflows were made by Secretary of Defense McNamara,

who developed a program of far-reaching reductions in U.S. overseas military expenditures. His proposals were dramatic and impressive. If implemented, they promised to create a significant improvement in the U.S. payments position. (13, 26, 28, 36) They elicited strong reservations from the Department of State hierarchy, however, which feared that the proposed cuts would send a message of weakness and vacillation to the Soviet Union and the nations that the United States had pledged to protect from Communist aggression. (15, 27, 34) Ultimately, senior Department of State officers succeeded in watering down the reductions in the interest of national security. (37, 38)

In the end, the Kennedy administration had only mixed success in reducing U.S. balance of payments deficits. After its initial success in reducing net capital outflows early in the administration, a significant fourth quarter deficit in 1962 dashed hopes of achieving a balance before 1965 at the earliest. Although the Department of the Treasury had some success in restoring international confidence in the dollar and stemming the gold outflow, it remained necessary for the incoming Johnson administration to take additional steps to reduce U.S. expenditures abroad.

#### *Financial and Monetary Policy*

While President Kennedy mobilized his Cabinet under the leadership of Secretary of the Treasury Dillon to reverse growing balance-of-payments deficits, he also launched negotiations on various fronts to gain the cooperation of other nations in reducing U.S. expenditures abroad as well as their understanding for unpopular measures deemed necessary to achieve U.S. objectives. The major portion of these negotiations were held with West Germany, which the Kennedy administration attempted to enlist in several burden-sharing arrangements. The Department of State worked to persuade the West Germans to expand its foreign aid program, particularly to the underdeveloped world, thereby allowing the United States to trim its own foreign assistance commitments. (40, 41, 44, 45, 46, 64)

Simultaneously, the Departments of the Treasury and Defense worked to achieve a German military offset agreement, whereby the German Government would reduce the

net U.S. payments outflow required to maintain U.S. troops in Germany by increasing military purchases in the United States. The results of these negotiations proved only partially satisfactory to the Kennedy administration. Despite reaching an agreement with the German Government on these issues, the German actions ultimately fell short of their promises. (49, 50, 53, 65, 72, 73, 74, 80, 82)

Another major foreign policy issue arose with Japan over Kennedy's interest equalization tax proposal. The proposed tax, which was one of the measures announced in Kennedy's second major balance-of-payments address on July 18, 1963, would have imposed a tax equal to a one percent interest increase on all capital borrowed by foreign individuals or governments from U.S. sources. The Japanese, at that time heavy borrowers in U.S. capital markets, protested vigorously, particularly in view of U.S. willingness to make an exception for Canada. U.S. leaders were only partially successful in allaying Japanese resentment, which had been fanned on other fronts (79, 81, 83), particularly trade and textile imports. In any event, the tax was not formally approved until September 1964, and then only for a relatively short duration.

Other issues covered in the compilation include negotiations leading to the creation of the Group of 10 and the General Arrangements to Borrow (GAB) in late 1961 (54, 55, 59) as well as some of the more technical aspects of the balance of payments problem (gold flows, foreign dollar balances, lending, and taxation issues). (56, 57, 58, 63, 66, 67, 68)

### *Foreign Assistance Policy*

This compilation focuses on the Kennedy administration's attempts to develop new approaches to foreign assistance policy. President Kennedy believed that the United States had a major responsibility to try to help the developing nations get on their feet economically. One of his first executive orders centralized government oversight of the movement of U.S. agricultural surplus products abroad in the White House under George McGovern, Director of the Food for Peace Program. Kennedy wanted to transform this program from the routine disposal of U.S. agricultural surpluses

abroad to a “food for development” program, and he early endorsed a McGovern mission to Latin America to explore ways in which U.S. food abundance could be used to help end hunger and malnutrition throughout the Western Hemisphere. (85, 86)

Throughout most of 1961, the Kennedy administration gradually developed its foreign aid program. Believing previous administrations had tried to bolster weak economies for short-term gains, Kennedy officials fashioned a “new look” that would promote a coordinated long-term strategy with other developed nations to move the peoples of the developing nations into self-sustained economic growth. Departmental reports and several meetings with the President formulated aspects of the new program. In his special message to the Congress on foreign aid, he emphasized that a new agency would be created to supplant the International Cooperation Administration and Development Loan Fund and serve as the single coordinating agency for all forms of foreign assistance. (94, 95, 100, 106)

Under Secretary of State for Economic Affairs George Ball visited several European countries to explain the administration’s program and to encourage the Development Assistance Committee (DAC) of the nascent Organization for Economic Cooperation and Development (OECD) to increase its foreign assistance funding and to coordinate their programs. The administration persisted with some success thereafter in enlisting the cooperation of DAC and OECD members, particularly Germany. (99, 101, 102, 104, 149, 153, 156, 157, 165, 172, 174) Kennedy also appointed several task forces to draft legislation for the new agency and provide other details for its operation. The resulting Foreign Assistance Act of 1961, various executive orders, and interagency reports created the Agency for International Development (AID) and sought to define its functions. (103, 116, 117)

Although President Kennedy and the new AID Administrator Fowler Hamilton received much well-intentioned advice on foreign aid (115, 118, 120, 121, 122, 124), the administration’s assistance programs encountered difficulties. At the outset Secretary of Agriculture Orville Freeman tried to persuade Kennedy to assign a larger role on food and technical assistance to the Department of Agriculture. As Freeman

put it to Under Secretary Chester Bowles, "We just want to do a job & not from left field where the Dept. has been for 8 years. Tell us what to do & and we will go!" While not unsympathetic to Agriculture's position, senior policymakers in the White House and the other relevant agencies persisted with plans to make AID the central coordinating agency for economic assistance. (105, 106, 110, 111, 119) The White House also gave it responsibilities over the training and equipment of police in foreign countries and the utilization of U.S. military engineers on AID projects. (131, 132, 137, 138, 139, 150)

The President and his assistants nonetheless were somewhat critical of AID's inability to implement and coordinate the various programs. Following one meeting, Kennedy's aides told AID officials that the President noted "certain deficiencies in AID's preparation" and "was unhappy with the inability of A.I.D. to provide information on (a) the follow-up and implementation of loans and projects, and (b) the effect of these loans, grants and projects on balance of payments." (142, 143, 145)

AID was also given responsibility for coordinating economic and military assistance. Until AID's establishment, the Departments of State and Defense studied the premises underlying the Military Assistance Program as part of a broader long-range study of U.S. military posture. (84, 93, 96) The two agencies also hired consultant Charles Burton Marshall to investigate whether the complex economic and military issues might require a different approach to military aid. An interagency Military Assistance Steering Group followed with a study of "feasible alternative methods" that would better accomplish U.S. long-term objectives and "facilitate a more complementary programming of U.S. economic and military assistance." In early 1962 the NSC assigned AID the responsibility for preparing further progress reports for specific countries and the coordination of military and economic assistance programs. Robert Komer called one of these reports "a d— bald-faced whitewash. . . . When you add up five pages of words they total 'no progress' at all." (108, 109, 112, 123, 128, 129, 130, 140, 149, 167, 168)

Kennedy also asked AID for reports on the net effects of foreign assistance on the U.S. balance of payments. In

addition to other studies on this subject, Kennedy turned to John Kenneth Galbraith, Ambassador to India, for advice. Galbraith proposed among other things a form of super-tying of foreign assistance dollars to the major recipient countries' purchase of U.S. exports, but the President's aides argued that some of Galbraith's proposals might contradict U.S. traditional support for free multilateralism. (142, 143, 146)

When Hamilton resigned in late 1962, Kennedy appointed David Bell as AID Administrator. The President also created a private advisory group headed by General Lucius Clay to take a fresh look at the Agency for International Development and recommend ways to revive public support for foreign assistance. The Clay Committee generally approved the main thrust of AID's efforts but criticized their application to some specific areas and countries. (154, 158, 160, 161, 166)

Despite Kennedy's efforts, Congress consistently slashed his requests for economic and military assistance appropriations. President Johnson inherited this situation in November 1963. Concerned about the congressional reductions, at the end of the year Johnson appointed another interagency committee to try to find ways "to present to the Congress next year a more effective, efficient aid program." (175, 176)

#### *International Investment and Development Policy*

This compilation deals with U.S. efforts to promote its foreign assistance and development goals in multilateral forums. The focus is on the International Bank for Reconstruction and Development (World Bank), its recently created affiliate International Development Association (IDA), and the economic programs of the United Nations.

Regarding the World Bank, U.S. policymakers encouraged more flexible approaches to loans such as lengthening of grace periods and maturity dates. (190, 206, 207) Following the Bank's report on the need for much larger IDA resources, U.S. Representative to the United Nations Adlai Stevenson urged that the U.S. Government should propose at the 1962 IBRD (IMF annual meeting) an increase in the capital of the IDA, which offered credits and "soft" loans to developing nations, from \$1 to \$4 billion over the next several years.

Most industrialized nations were unwilling to go that far, and Kennedy's speech to the meeting only endorsed an increase in its resources in general terms. (190, 197, 201, 204, 205)

Kennedy had early called upon the nation to make the 1960s a Decade for Development, and in an address to the United Nations in September 1961 he designated the 1960s the United Nations Development Decade. The United States thereafter supported U.N. resolutions that implemented an expansion of U.N. development efforts. (185, 188, 189, 191, 197, 200) The Kennedy administration opposed, however, efforts to create a U.N. Capital Development Fund and a United Nations Development Authority as duplicative of U.S. and other existing development programs. (180, 186, 193)

A final issue involved the U.N. Special Fund, which early in 1961 tentatively approved an agricultural research project in Cuba. Although the money for this Cuban project totaled barely over \$1 million, the Kennedy administration opposed the project as part of its attempts to isolate Fidel Castro. Public criticism in the United States also may have made the administration more reluctant to acquiesce in it. Paul Hoffman, Managing Director of the Fund, unsuccessfully tried to convince Department of State officials that the project was designed to help the Cuban people, not Castro. In response to U.S. opposition, Hoffman deferred final decision for more than a year but finally approved the project in early 1963. When Rusk publicly criticized the decision, Hoffman commented on U.S. "stupidity" in the matter, which he did not feel was against U.S. national interests. (179, 182, 183, 184, 195, 196, 198, 199, 202, 203)

#### *Trade and Commercial Policy*

Trade and commercial policy during the Kennedy years focused on multilateral trade negotiations. The administration aimed to expand U.S. exports abroad which, it was anticipated, would result in increased domestic growth and a decline in the growing U.S. balance of payments deficit. These negotiations were hampered by two key factors: suspicions among foreign negotiators at the Dillon Round (May 1961–July 1962) that the United States sought to gain more

than it was willing to give, and existing trade legislation. The peril point provisions in the Reciprocal Trade Agreements Act (208) obligated the President to exempt large numbers of items from significant tariff cuts (below points deemed to be injurious to domestic industry), thereby limiting the President's flexibility in any trade negotiations. The Trade Expansion Act of 1962 was enacted in large part to counteract this limitation by granting the President broader authority to offer tariff concessions.

In spite of this legislation, countervailing forces—powerful business interests and their congressional allies in the textile, cotton, and wool industries—pressured the President to shield their products from foreign competition. (219, 221) In an effort to moderate these forces, President Kennedy early in his administration announced a seven-point program (213) to provide relief for domestic textile manufacturers from foreign competition. This program included passage of a multilateral long-term textile arrangement, which set ceilings on textile imports (223, 249), and serious consideration of an equalization fee on cotton imports. (235, 236, 239) Meanwhile, the wool interests lobbied to secure for itself the same protection that the cotton industry had achieved. (249)

These domestic pressures elicited hostile reactions from Japan, a leading exporter of cotton textiles (235) and the principal target of a cotton equalization fee. Elsewhere, the President's decision to raise tariffs on carpets and glass (245, 247, 248), an important Belgian export, and to impose a tariff on bicycles (250, 252), a major export of the United Kingdom, provoked such a hostile reaction among member nations of the European Economic Community (EEC) that the subsequent increase in tariffs on U.S. poultry exports to the Common Market represented retaliatory action. The resulting "chicken war" (260, 267, 284) further exacerbated existing trading tensions to the point that they contributed to the failure to agree on ground rules for the 1964 Kennedy Round negotiations and on the goal of the General Agreement on Tariffs and Trade (GATT) Ministerial meeting held in May 1963.

At this GATT meeting, the United States proposed that the goal of the negotiations should be an across-the-board 50 percent cut in tariffs. The Europeans, led by the French,

favored a sliding scale approach, referred to as the “ecrete-ment” plan (leveling of peaks), which provided for higher percentage cuts for high tariffs and lower percentages for low ones. (278, 281) They argued that since the United States had the largest number of high tariffs (over 30 percent), a 50 percent cut would still provide significant protection while it would reduce already low European tariffs to the point where they would no longer have any protective effect. This disagreement persisted, and the delegates failed to reach a compromise agreement. By the end of 1963, additional differences over the proper guidelines for the agricultural talks also put the future of the trade negotiations in doubt.

*Economic Defense Policy*

The principal feature of this compilation is the debate within the administration over the nature of East-West trade. The Department of State favored trade with the Soviet bloc as an instrument for nudging the Soviet Union away from its Cold War attitudes. The Department of Commerce and Congress viewed restrictions on the trade as a means of retarding growth of the Soviet economy. President Kennedy decided the issue by favoring more East-West trade than either the Departments of State or Commerce had advocated. (329)

Another issue involved the disagreement between the United States and the United Kingdom over the export of Western technology to the Soviet bloc. In the 15-nation Coordinating Committee on Export Control (COCOM) in Paris, the British resisted adding items to the embargo list. The U.S.-British debate continued in bilateral talks aimed at resolving COCOM list issues. Finally, the Department of State instructed its COCOM representative to resolve these issues by compromise. (297)

President Kennedy offered American wheat for sale to the Soviet bloc and asked Congress to give him discretionary authority to extend Export-Import Bank loans to Communist countries by legislation which President Johnson approved in January 1964. (330) The period ended with U.S.-Soviet trade talks under way. (332)

*Strategic Materials and Commodities Policy*

This compilation deals principally with the management of the U.S. stockpile of strategic materials. President Kennedy stated in his news conference of January 31, 1962, that the stockpile valued at \$7.7 billion exceeded emergency needs by nearly \$3.4 billion worth of strategic materials. He offered to cooperate with a Congressional investigation of the program, and he gave assurances that the United States would do nothing to disrupt commodity prices. The Congressional investigation, however, did not lead to reform of the stockpile program because Congress failed to pass the necessary legislation. (346)

An executive order instituted reform by prescribing the responsibilities of the Director of the newly formed Office of Emergency Planning. (341) The administration also investigated the stockpile program. (349) The report of the Executive Stockpile Committee recommended among other things that the Office of Emergency Planning decide on disposals from the stockpile after consulting with interested agencies, but the Departments of State and Interior both wanted to require their prior approval of any disposals. (349, 350) President Kennedy resolved this dispute by providing for referral of disagreements over disposal policy to him for decision. (353)

The United Kingdom raised the issue of threats to free world oil supplies brought on by demands of oil-producing countries for more earnings and even for ownership and by Soviet exports of cheap oil. The U.S. and British Governments agreed to give political guidance to the oil companies. (336) The United States put off any action to counter demands for more earnings until after the results of oil company–OPEC talks. (355)

The compilation also includes documents on uranium purchases (335, 338), oil import quotas (344, 345, 363), sugar legislation (337, 339, 348), tin disposal (342, 343, 356), the barter program (358, 359, 363), and the International Coffee Agreement (360).

## List of Documents

### Arms Control and Disarmament

No.	Document Description
-----	----------------------

*January 1961*

- |   |   |
|---|---|
| 1 | Record of Actions, 474th NSC Meeting, January 12. NSC Actions 2374–2377 on Polaris program, U.S. arms control/nuclear testing policy, disclosure of classified military information to foreign governments, and foreign intelligence activities. Top Secret. 2 pp. Department of State, S/S–NSC (Miscellaneous) Files: Lot 66 D 95, Records of Action by National Security Council. |

# Arms Control and Disarmament

January 1961

## 1. Record of Actions, 474th NSC Meeting, January 12<sup>1</sup>

NSC Actions Nos. 2374–2380

January 12, 1961

The President presided at this meeting. The Secretary of the Treasury and the Director, Bureau of the Budget, participated in the Council actions below. The Attorney General and the Chairman, Atomic Energy Commission, attended the meeting and participated in NSC Actions Nos. 2375, 2377 and 2378. The Administrator, Housing and Home Finance Agency, participated in NSC Action No. 2378. The Acting Director, U.S. Information Agency, attended the meeting.

ACTION  
NUMBER

SUBJECT

2374.	<u>SCOPE OF OPERATIONAL CAPABILITY OF THE POLARIS PROGRAM</u> (Memo for Special Assistant to the President for National Security Affairs from Secretary of Defense, same subject, dated January 10, 1961) Noted and discussed the President's approval at the recommendation of the Secretary of Defense that, as an exception to the general policy of the Department of Defense of not placing POLARIS missiles on cruisers, the POLARIS program be extended by the installation of 8 missiles on the nuclear-powered USS LONG BEACH, as indicated in the reference memorandum distributed at the meeting. NOTE: The above action, as approved by the President, subsequently incorporated in the revision by the NSC Planning Board
-------	---

<sup>1</sup> NSC Actions 2374–2377 on Polaris program, U.S. arms control/nuclear testing policy, disclosure of classified military information to foreign governments, and foreign intelligence activities. Top Secret. 2 pp. Department of State, S/S–NSC (Miscellaneous) Files: Lot 66 D 95, Records of Action by National Security Council.

of NSC 6021 (circulated as NSC 6108, “Certain Aspects of Missile and Space Programs”).

ACTION  
NUMBER

SUBJECT

2375. CODIFICATION OF U.S. POLICY ON ARMS CONTROL AND U.S. POLICY ON NUCLEAR TESTING  
(NSC 112; NSC 5906/1, paragraph 52; NSC Action No. 2215-c)  
Noted the President’s request that the Secretaries of State and Defense, in collaboration as appropriate with the Chairman, Atomic Energy Commission, expedite the preparation of the subject codifications in an effort to complete them during the next week.  
NOTE: The above action, as approved by the President, subsequently transmitted to the Secretaries of State and Defense and the Chairman, AEC, for appropriate implementation.
2376. DISCLOSURE OF U.S. CLASSIFIED MILITARY INFORMATION TO FOREIGN GOVERNMENTS AND INTERNATIONAL ORGANIZATIONS  
(NSC Action No. 2125-b)  
Noted the President’s request that the Secretaries of State and Defense expedite the preparation of the statement of policy on the subject pursuant to NSC Action No. 2125-b in an effort to complete it during the next week.  
NOTE: The above action, as approved by the President, subsequently transmitted to the Secretaries of State and Defense for appropriate implementation.
2377. FOREIGN INTELLIGENCE ACTIVITIES  
(NSC Action No. 2367; Memo for NSC from Executive Secretary, same subject, dated January 9, 1961, SPECIAL LIMITED DISTRIBUTION ONLY)  
*a.* Discussed the views of the Principals of the Joint Study Group regarding the Group’s report, as consolidated by the Director of Central Intelligence (transmitted by the reference memorandum of January 9, 1961); and took the following actions with regard to the recommendations of the Joint Study Group:  
(1) Concurred in Recommendations Nos. 3, 4, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 19, 20, 25, 26, 27, 28, 29, 32, 33, 36, 37, 38, 39, 40, 41, 42 and 43.

[Here follow Actions 2378–80.]

February 1961

2. Memorandum of Conversation, February 21, among  
Wohlstetter, Wiesner, Owen, and Stern<sup>1</sup>

February 21, 1961

SUBJECT

Briefing for Mr. Acheson on Safety and Stability of Nuclear Weapons

PARTICIPANTS

Mr. Acheson  
Mr. Wohlstetter  
Dr. Wiesner, President's Science Adviser  
Mr. Henry Owen, S/P  
Dr. Marvin Stern, Assistant Secretary of Defense for Research and Engineering  
(Strategic Weapons)  
Colonel Dodge, Office of Assistant Secretary of Defense for R&E  
Mr. Millar, EUR/RA

Dr. Stern began by saying that he had been studying safety and stability of strategic nuclear delivery systems in the U.S. The problems he encountered were serious but they would be even more so in the case of nuclear weapons deployed for the support of NATO.

Top level command and control systems can be eliminated relatively easily by an enemy. Only a few weapons would be required to take out the top echelon in Washington, Omaha and Norfolk, and thus theoretically to prevent the "Go" signal ever being given to US strategic forces. Yet he has found that the military are not worried about the possibility of military inaction. They reason that aircraft commanders will know what to do as loyal Americans. They will know that a war is on and will proceed to attack. (Dr. Wiesner interjected that this discovery of potential elimination of top command is made annually and that the usual remedy is to advocate several million dollars worth of computers, etc). If General Powers speaks perfectly frankly, he will say that it is most unlikely that we will be caught completely flat-footed. Our Intelligence would have alerted us to the possibility of attack and he would say *[text not declassified]*.

There are two practical disadvantages to the foregoing pragmatic concept according to Dr. Stern. First, the haphazard military response based on uncoordinated action of lower echelon commanders is not

---

<sup>1</sup> Safety and stability of nuclear weapons. Top Secret. 5 pp. Department of State, Central Files, 711.5611/2-2161.

likely to be effective since many targets will be missed. Secondly, there is a danger that a nuclear accident might be misinterpreted by an aircraft commander as a sign that the US has been attacked. Lincoln Air Force Base, for example, is only 40 miles from Omaha. If there were a nuclear accident at the airfield adjacent to SAC Headquarters, an aircraft commander on alert status at Lincoln AFB might so misinterpret a mushroom cloud visible from his base.

Dr. Stern found in the course of a recent six months study that there is a serious danger of nuclear accident. He cited the following examples:

a. On January 24, 1961 a B-52 flying over Goldsborough, North Carolina, lost a wing. This aircraft was carrying [text not declassified] weapons, each with safety devices. As one of the weapons fell out of the aircraft, lanyards tripped on [text not declassified] safety devices which then moved into an armed position.

b. On inspection of [text not declassified] weapons in a storage depot, Dr. Stern himself found one with at least one of the safety devices in the armed position.

c. There is a Nike-Hercules Battery [text not declassified] with 50% nuclear warheads and 50% HE warheads. There was an inadvertent launching of one of the missiles which fortunately was armed with an HE warhead.

d. A Matador [text not declassified] was inadvertently launched and all the safety devices moved into the armed position. Fortunately it only had a training warhead.

e. The warhead detonated off one of the Jupiter missiles [text not declassified] although there was no nuclear explosion.

In addition to such mechanical failures, he also mentioned human failures attributable to what he described as idiots and super patriots. He cited the example in Seneca, New York, where a service man at a depot screwed together two [text not declassified] of a warhead thus closing all of the circuits. It would have exploded immediately if it had had a [text not declassified] in it. Dr. Stern concluded this brief summary of the possibility of accidents with the observation that the situation is at least as bad in the NATO area.

There is one fairly elementary measure that has been taken in the U.S. to increase safety and stability which could be applied in the NATO area as well. As a part of the "Go" signal, [text not declassified] is transmitted to airborne bombers which can be applied [text not declassified] on the weapon. Unless this [text not declassified] the weapon (presumably newer types with such an adaptation) will not function. Furthermore, provisions have been made for alternative command posts. Thus a 2 or 3 star General is continually airborne over Omaha. Similar arrangements have been made for the communications cruiser Northampton which will be at sea until relieved.

Mr. Wiesner then cited a number of specific problems in the NATO area involving the additional factor of US custody.

a. *[text not declassified]* F-84Fs are on continual ground alert which means take off within five minutes. We are violating the law by keeping the *[text not declassified]* of the weapons which are hung on these two alert aircraft. The US maintains custody by having one US officer adjacent to a telephone, in the *[text not declassified]* pilot's ready room. There is a fence around the 2 aircraft and 4 *[text not declassified]* guards outside the fence. Within the fence is one US service man maintaining custody of the two weapons. It is clear that if *[text not declassified]* were so minded they could take off with these weapons on board the two aircraft.

b. *[text not declassified]* Mr. Wiesner pointed out that in addition to other problems there is a four-hour communication delay.

c. *[text not declassified]* We have programmed F-100s for *[text not declassified]*. They have or will receive Nike-Hercules which will be in an alert posture (fully armed at all times). These weapons also have a ground to ground capability. (My recollection from a talk at SETAF is that the range is 120 miles—JYM)

Dr. Stern said that an awareness of the problem of command and control in the US had led to the interlock-permissive link, device and arrangements for "raising the threshold of command" in the case of SAC and CINCLANT which have been described above. These same principles could be applied in NATO Europe. Dr. Wiesner said that the existence of *[text not declassified]* tactical nuclear weapons deployed in Europe constitute a highly unstable situation because of the reasons cited above. Their presence have a deterrent effect to be sure, since both sides are using extreme caution, but the situation is a little like putting a stick of dynamite in one's house in order to be conscious of the danger of fire.

Mr. Wohlstetter said existing control procedures should be changed and one way of increasing control would be to have the host countries also possess a "Go" code so that two would be necessary to authorize delivery.

Dr. Stern mentioned the incident of the Congressman finding the US "key" hanging on the wall of a control room to illustrate the fallibility of the "two key" theory.

Dr. Wiesner said that in conclusion it was clear that the US military have been operating illegally. President Eisenhower allowed dispersal to pass out of civilian hands and into the hands of the military. Thus Mr. Holifield is partly right in his concern and should not be regarded entirely as an obstructor. The Administration is in for a bad time from the JCAE. The President should be concerned with this problem and no doubt will be. Dr. Wiesner added incidentally that we seem to be

following legal procedures in the case of Honest Johns in Turkey and the UK Thors.

Mr. Acheson asked what nationality an airborne general in NATO should be, referring to the example of the SAC officer. The consensus was that it would not make any difference since physical control measures such as the [text not declassified] on the warhead could be devised to require inputs from several sources if desired. Mr. Acheson indicated that he was interested in further information on command and control. Dr. Stern said that up to this time he had been talking mostly of accidents.

Dr. Wiesner said in conclusion that his own opinion was that the use of tactical nuclear weapons in Europe was not feasible since it was bound to lead to escalation. Mr. Acheson had to leave for the White House at this point.

Mr. Owen asked a few more questions and was told that it would be perfectly feasible to arrange physical control of weapons which would require “Go” signals from SACEUR, the US and the host country and Mr. Wohlstetter said that possibly after countries had reflected more they would require some control of this kind.

March 1961

3. Letter from Fisk to McCloy, March 2<sup>1</sup>

March 2, 1961

Dear Mr. McCloy:

We submit herewith the final report of the Ad Hoc Panel on the Technical Capabilities and Implications of the Geneva System. All members of the Panel except General Loper have concurred in this report in full. While General Loper concurs in the first six sections of the report, he has not concurred with Section VII and will submit his comments to you separately. Dr. York concurred in the report in substance on the basis of an earlier draft, but he has not as yet had an opportunity to review the final report. The various members of the panel participated as individuals and not as representatives of their respective organizations.

Dr. J.B. Fisk, Chairman  
Dr. Nano A. Bothe  
General Austin Botts  
Dr. Harold Brown  
Mr. Spurgeon N. Keeny, Jr.  
Dr. Richard Latter  
General Herbert Loper  
Dr. J. Carson Mark  
Mr. Doyle Northrup  
Dr. Wolfgang K.H. Panofsky  
Dr. Frank Press  
Dr. Herbert Scoville  
General Alfred D. Starbird  
Dr. Herbert York

## Attachment

### INTRODUCTION

This report attempts to compile the technical material which has bearing on the broader questions of policy formulation in connection with the Geneva Conference on Cessation of Nuclear Tests.

We are submitting this report with the earnest desire that policy decisions on our future course be made with full *understanding* of the technical and related military considerations but with the realization that this is not a problem where positions should be *controlled* by the technical issues.

Policy on an arms limitation measure such as the test ban question is dependent on many technical, military, and political factors. Among these factors are:

1. The importance of the military considerations to all sides. These considerations must be analyzed for each of a variety of assumptions as to the response to an arms limitation agreement.

2. The technical means of verifying violations. Analysis of this question will naturally involve a mixture of well-established as well as speculative scientific information. In particular, we note that technical means of detection and of evasion are subject to change.

3. The unilateral technical and non-technical intelligence means of discovering violations.

4. Cost of the control operations.

5. Cost of evasion of a control system.

6. The judgment as to the degree of control which would “deter” a violator from evasion or make evasion relatively unproductive.

7. The degree of access provided by the control measures.

8. Growth potential of a control system to future arms limitation functions.

9. The relation of the negotiations to domestic and world opinion.

These and further purely political factors must be balanced with the risks or gain involved and thus form the basis of progress in this field.

This report deals with questions 1–5 in the above tabulation in relation to the proposed ban. Even under the restriction to these technical-military issues we meet questions where the results depend on over-all military policy. In such cases, we have attempted to give answers under alternate military assumptions. The report is divided into the following sections:

- I. *Capabilities of the Unilateral U.S. Long-Range Nuclear Test Detection System*

1. Present Capabilities

2. Programmed Improvements

### 3. Contributions of Other Intelligence Sources

## II. *Capabilities of the International Control System to Monitor a Nuclear Test Ban Agreement*

### 1. U.S. Proposed International Control System

- a. Atmospheric tests
- b. Underwater tests
- c. Underground tests
- d. High altitude tests
- e. Anticipated contributions from other intelligence sources

### 2. Cost of the U.S. Proposed Control System

### 3. Possible Control System Modifications

## III. *Estimated Changes in the Control System Capability from Future Research*

### 1. Changes Resulting from the Seismic Research Program

### 2. Changes Resulting from the High Altitude Research Program

## IV. *Present and Projected U.S. and Soviet Nuclear Weapons Developments*

The weapons developments are analyzed under various conditions as to test cessation and possibilities of evasion.

### V. *"Nth" Country Nuclear Weapon Developments*

### VI. *The Cost of Evasion*

A final section evaluating the impact of nuclear weapons development on U.S. and Soviet military weapons systems under a nuclear test ban as compared with continued unlimited testing is still under consideration by the Panel and is not included in this report.

## I. *Capabilities of the Unilateral U.S. Long-Range Nuclear Detection System*

### 1. *Present Capabilities*

The U.S. Long-range detection system consisting of acoustic, seismic, electromagnetic, and radioactivity detection components is presently deployed around the USSR and its satellites. This system has a 60 to 90 per cent probability for detecting and identifying nuclear explosions of 5 KT or greater conducted within the USSR and China on the surface or in the atmosphere up to 10 km altitude. For explosions occurring between 10 to 30 km it may not be possible to collect samples of radioactivity required for identification.

Underground nuclear explosions greater than 5 to 10 KT (Rainier coupling) in the USSR and 10 to 20 KT (Rainier coupling) in China can be detected, but not identified, with 60 to 90 per cent, or greater, probability. The system cannot identify underground explosions.

Underwater explosions (depths of about 500 feet) of  $\frac{1}{2}$  to 1 KT near the USSR and 1 to 2 KT near China can be detected seismically with 60 to 90 per cent probability. The probability of identification is uncertain.

The present system has essentially no capability for detecting high-altitude nuclear explosions (above 30–50 km).

Since the present system was designed to detect and identify atmospheric explosions carried out in the USSR, its capabilities for explosions outside the USSR and in other environments are limited. Atmospheric nuclear explosions as large as a few hundred kilotons or more might be missed if conducted in areas remote from the present detection system. Megaton explosions at extreme altitudes would not be detected.

## *2. Programmed Improvements*

The U.S. nuclear test detection system is currently being expanded to improve its capability to detect explosions in China, at high altitude and in space, and in the atmosphere of the Southern Hemisphere. By 1965, it is programmed to have the following improved capability.

a. 60 to 90 per cent probability of detecting and identifying atmospheric nuclear explosions (below 10 km) of about 5 KT in the USSR and China and of about 20 KT outside these areas.

b. 60 to 90 per cent probability of detecting underground nuclear explosions of 1 to 2 KT (Rainier coupling) in the USSR and China and a small probability of identifying large earthquakes.

c. 60 to 90 per cent probability of detecting underwater explosions near the USSR and China of 0.2 to 0.4 KT.

d. Substantial capability of detecting high-altitude unshielded nuclear explosions of 5 KT at altitudes between 30 km and about 105 km above the earth.

The capabilities in b. and d. above are based upon the assumption that the present estimated research results actually materialize in the next three years for the VELA program of the DOD.

## *3. Contributions of Other Intelligence Sources*

During the past twelve years other intelligence sources have made a significant contribution to the detection and acquisition of information on Soviet nuclear weapons test activities. This contribution has included:

(a) Alerting the US unilateral nuclear test detection system (NTDS) to the general location and timing of test preparations.

(b) Obtaining information from other sources on tests detected by the NTDS.

(c) [*text not declassified*]

During this period the intelligence community has no evidence that the Soviets have endeavored to conceal completely the geophysical

signals produced by Soviet tests. However, the Soviets have made an obvious attempt to maintain a high degree of security in test operations.

Although there has been no specific experience in detecting very high-altitude or space tests, a variety of intelligence sources can detect major Soviet missile and space launchings and high vertical firings with a high degree of probability from present test ranges, and a good probability from any new ranges in the USSR.

Intelligence sources were able to detect test-related naval maneuvers and logistical preparations for Soviet underwater tests and furnished collaborative information subsequent to these events. It is quite probable that future tests of this nature would be similarly detected and reported, particularly if the test site were located distant from the USSR.

*[text not declassified]*

## II. *Capabilities of the International Control System to Monitor a Test Ban Agreement*

### 1. *U.S. Proposed International Control System*

The U.S. proposed international control system is based on the report of the 1958 Conference of Experts. It consists of 170 control stations (21 in USSR, 14 in U.S. and 1 in U.K.) located about 1700 km apart in aseismic, and 1000 km apart in seismic regions. In addition, some control stations and 10 ships are equipped to detect underwater explosions. For the detection of high-altitude explosions, Technical Working Group I of the Conference on the Discontinuance of Nuclear Weapons Tests recommended the inclusion at control stations of specific ground-based instrumented earth satellites. Solar satellites were to be included if deemed necessary.

The U.S. proposed phasing for installation of the system requires half of the control stations installed in the USSR, U.S. and U.K. in 2 years, the remainder of the stations installed in the USSR, U.S. and U.K. in 4 years, and the worldwide system completed in 6 years. The recommendation of TWGI on the high-altitude detection system have as yet not been made a specific U.S. proposal. However, according to U.S. estimates, the Argus satellite system can be put up in 2 years, the far earth satellite system and the solar satellite system in 4 years.

After 6 years the capability of the system will depend upon the countries which participate and the agreed phasing for the high-altitude component.

Based on quite limited and uncertain information, the capability of the system has been estimated for the time periods, 2, 4 and 6 years (assuming all countries participate) after initiation of the system to be as follows:

a. *Atmospheric Explosions* (Surface to 10 km Altitude)

Table 1 summarizes the probability of detecting and identifying explosions of 1 and 5 KT set off in the atmosphere below 10 km altitude in USSR.

TABLE 1

Yield	2 years	4 years	6 years
1 KT	5–50%	15%–90%	same
5 KT	10–80%	60%–90%	

It should be noted that this average capability was estimated from predicted acoustic noise levels at control post locations selected in the USSR primarily on the basis of their being favorable seismic sites. The resulting degradation of performance from colocating the acoustic technique with the seismic results in an overall system capability in the USSR which is only about the same as that of the present unilateral U.S. detection system.

The range of probabilities in Table 1 corresponds to the limits in the capabilities of the system in going from the worst to the best area for detection in the USSR.

For explosions above 10 km the system will have an uncertain chance of obtaining a sample of radioactive debris required for identification. Its capability will depend upon whether sampling aircraft can reach the radioactive cloud.

At the end of six years it is expected that the worldwide system will have a capability similar to that in the USSR in other countries. There will, however, be a lower capability over certain large ocean areas. In these areas there are cases where it will only be possible to detect and identify 20 kiloton nuclear explosions with a probability of 60 to 90 per cent. The capability for detecting explosions occurring between 10 and 30 kilometers in these ocean areas may even be considerably less and identification as nuclear may not be possible.

b. *Underwater Explosions*

After the 6-year period the control system will be able to detect with high probability, underwater nuclear explosions of 1 KT and greater when set off in the deep ocean. A similar capability (not including certain large ocean areas remote from Phase I installations) will exist after 4 years. The system will have little probability for detecting explosions less than 20 to 100 tons when set off in some regions of the ocean.

Identification of an underwater explosion will require inspection of the site of the event. The explosion site can be located within an area less than 75 square kilometers if three stations observe the direct

hydro-acoustic signals, but the area may be as large as 7500 square kilometers if only reflected signals are detected at only three stations. For explosions conducted so that radioactive debris reaches the surface, inspection will have a high probability of success if undertaken within a few days after the event. Inspection can be made quite difficult and possibly ineffective by conducting the explosion at such a depth that radioactivity does not rise to, or near, the surface or by conducting the explosion under the polar icecap or in remote areas where adverse weather conditions extend the time for initiating inspection.

### *c. Underground Explosions*

There is no known way to identify an underground nuclear explosion by its seismic signals alone. Seismic control stations can only identify some earthquakes. A seismic event which is not identified as an earthquake by control stations could be suspected of being a nuclear explosion. Inspection of the site of the suspected event will be necessary to determine, if possible, the cause.

Table 2 summarizes the capability of the control system to detect and identify underground seismic events in the USSR. The identification capability of the Geneva system in phase IA, (10 stations in 2 years) exceeds that of the present U.S. unilateral system. However, the corresponding detection capability for events in certain unfavorable locations is comparable in phase 1. While identification requires new close-in stations, detection can use data from distant stations. The restrictions imposed by spacing criteria on the locations of the initial stations in the USSR may not permit optimal location in order to obtain minimum background noise. Therefore, the estimates in Table 2 conservatively assumed station noise levels in the USSR about 5 times as great as those at the quietest stations in the U.S. unilateral net. If optimal location can in fact be obtained within the agreed grid, there will be substantial improvement. If the stations are relocated to optimize identification and detection, the improved results in Table 4 are obtained even though noise levels are still assumed to be about 5 times as great as those at the quietest stations in the U.S. unilateral net. If, under these circumstances, sites with background noise comparable to the best stations in the unilateral U.S. net can be found, there will again be a substantial improvement.

If China is not in the control system at the end of 6 years, the number of unidentified events in the USSR will be increased by 10 to 30 per cent.

If the Soviet proposal of 15 stations in the USSR is accepted, the number of unidentified events in the USSR is increased by less than 10 per cent.

After 6 years, if China is in the system, there will be between 26 and 68 unidentified events per year in China above magnitude 4.75.

In the U.S. there will be between 120 and 165 events above magnitude 4.75. However, the numbers for the U.S. may be too high by a factor of 2 if more recent seismicity estimates prove correct.

It should be noted that these estimates are based on the average number of earthquakes per year. The number of earthquakes per year may fluctuate by a factor of two or so from year to year. The number of unidentified events can be expected to fluctuate by the same factor.

Identification of an event which is not identified as an earthquake will require inspection of the site of the event. Inspection can only be undertaken if the event is located (detected). Location accuracy may be within an area of about 200 to 500 square kilometers for an interior continental event and within an area greater than 500 square kilometers for a coastal event.

It is presently impossible to determine quantitatively the capability of on-site inspection to identify a clandestine underground test. However, there is a possibility, with imagination and thorough inspection, that such tests can be identified. This possibility of identification depends to a large extent on the persistence of the inspection team. If the team has some reason—possibly evidence either from the seismic network or from intelligence—that will indicate that a test had taken place in the area, it would then have the motivation required to perform a thorough, persistent, and exhaustive investigation, thus substantially increasing chances of identification.

Although through conventional intelligence there will be some chance of being aware of a possible violation, unless the event is detected by the system, inspection of the site and obtaining a radioactive sample as physical proof of a violation will not be possible.

d. *High Altitude Explosions* (above 30–50 km)

The capability of a control system to detect high-altitude nuclear explosion depends on the competition of the signals from nuclear explosions in space with the background noise signals. The direct radiation signals from a nuclear explosion in space are well understood, but knowledge of background noise signals is based on incomplete experimental information and theoretical considerations. The capability of a high-altitude detection system is limited by the statistical fluctuations of the background noise as well as by possible unexpected short-time noise signals. The occurrence of a detected signal (even when detected on more than one instrument) can only be a strong presumption of a nuclear explosion, rather than positive identification.

The development time for a reliable detection system can be shortened at the expense of system capability.

Table 3 presents recent estimates of the capability of a system for detecting high-yield explosions which might be achieved for various

time periods. The estimates apply to a system whose capability has been degraded over potential capabilities in the interest of system simplification and reliability. Two years have been added to the time estimated for the U.S. unilaterally to achieve the system as an estimate of the effect of internationalization of the system.

TABLE 2  
CAPABILITIES OF GENEVA SYSTEM (1) (2)

	2 years	4 years	6 years
Number of Unidentified Seismic Events Above (3)			
(a) Magnitude 4.75 (20 KT Rainier Coupling)	70–75	53–70	30–60
(b) Magnitude 4.35 (5 KT Rainier Coupling)	190–195	170–190	130–180
Detection Limit (4)			
(a) Equivalent Yield—Rainier Coupling	4–16KT(5)	0.9–3.3KT	6–1.8KT
(b) Equivalent Yield—Rainier Decoupled (6)	1200–4800KT	270–1000KT	180–540KT

(1) This table assumes station background noise levels about 5 times as great as those at the best stations in the US unilateral net.

(2) The numbers in this table are from a Rand study based on somewhat different assumptions on relative seismicity of the USSR and on station locations than those used in a similar [text not declassified] study. As a result the numbers are lower by about 25 percent in most cases than the [text not declassified] numbers but still within the fundamental uncertainty of “at least a factor of 2 up or down” which has been agreed between Rand and [text not declassified] to apply to all such numbers.

(3) The range of numbers in the tables expresses the uncertainty in the assumed noise conditions at the control stations and may vary by a factor of at least 2 up or down depending on the year selected.

(4) The detection limit refers to the minimum yield which can be located with 50 per cent probability when placed at the most unfavorable positions relative to the control posts.

(5) This detection limit depends on where stations are installed. In particular, this limit could be considerably improved, perhaps to 1–5KT by locating stations for detection.

(6) The full decoupling factor of 300 was assumed without regard to feasibility and cost of constructing the required cavity.

TABLE 3  
CAPABILITY FOR HIGH-ALTITUDE DETECTION SYSTEM RECENT ESTIMATES

Yield	2 years		4 years		6 years	
	100 KT	1 MT	100 KT	1 KT	100 KT	1 MT
Limit of detectable range— in kilometers					Capability dependent results of VELA research program.	
a. Unshielded	10 <sup>6</sup>	3 × 10 <sup>6</sup>	6 × 10 <sup>7</sup>	2 × 10 <sup>8</sup>		
b. Shielded (100–200 lb shield)	—	10 <sup>5</sup> – 10 <sup>6</sup>	10 <sup>6</sup>	3 × 10 <sup>6</sup>		
Capability for Detecting Explosions behind the Moon	None		Uncertain		Possible with solar satellites	
Other Limitations	Regions between control stations extending up to several hundred kilometers not covered. The 46 Phase I control posts will not provide coverage of high altitude explosions over considerable portions of the earth where no Phase I control posts are scheduled.		(1) Regions between control stations extending up to several hundred kilometers covered only by satellites.  (2) No solar satellites.		If solar satellites are included, the required shielding weights are increased to several thousand pounds.	

The capabilities expected after two and four years are shown separately in the Table. It is assumed that after two years only the Argus satellite and ground-based instrumentation in the U.S., USSR, and U.K. could be operative in the control system. It is assumed that at the end of four years, the ground stations could be increased in number and the remaining five to six earth satellites put in orbit. Improvement in the system capabilities beyond that predicted for the four-year period depends upon the use of solar satellites and on background measurements which at present have not been carried out. It is not possible to say whether the system will improve or worsen as a result of future information.

*e. Anticipated Contributions from Other Intelligence Sources*

Intelligence cannot be expected to provide advance warning of the time and precise location of a clandestine Soviet nuclear test. However, it has a strong capability to delineate areas within which such tests may be held and a poor-to-good capability to detect test preparations and to collect information about the event subsequent to its occurrence. Detection of preparations and collection of data on the occurrence of Soviet clandestine nuclear tests will be more difficult than in the past when no legal restraints against testing were in effect. Soviet attempts to evade the treaty would undoubtedly require tests in environments less susceptible to detection, i.e., underground and high-altitude/space.

*[text not declassified]*

Many intelligence sources have a good capability to detect Soviet space and high vertical missile firings which might serve to alert the treaty system for possible nuclear tests.

Present intelligence capabilities to detect tests in the atmosphere and underwater, particularly with respect to tests distant from the USSR are quite good. The latter situation would deny to the Soviets the advantages of their extremely effective internal security system.

Soviet officials planning an illegal, clandestine test will not know the precise extent and nature of intelligence detection capabilities. In view of a wide scope of intelligence detection possibilities and the uncertainty which they interject in Soviet evasion planning, the violation will undoubtedly assume a greater capability of intelligence than it does in fact have.

*[text not declassified]*

*2. Cost of U.S. Proposed Control System*

*a. Control Post System*

Table 4 shows numbers derived by an approximate prorating of the costs of central post. Headquarters and Regional Offices, Airborne Operations and Communication costs into the phasing pattern agreed

at Geneva. While the total installation and operating costs are based on extensive cost studies, the cost of each phase has not been examined in detail and the costs shown should be used only for a general idea of rate of expenditure during installation.

TABLE 4  
GROUND SYSTEMS COSTS  
(\$ in millions)

	Installation by Phases				Total Instal- lation	Total Annual Opera- tion
	IA	IB	II	III		
Hq. & Reg. Off.	16	8	32	24	80	38
Control Posts	260	130	520	390	1299	229
Ships	29	–	–	–	29	37
Air Sampling	36	–	142	–	178	35
Communications*	45	23	91	66	225	63
	<u>386</u>	<u>161</u>	<u>785</u>	<u>480</u>	<u>1811</u>	<u>402</u>

\* Assumes use can be made of existing national communications networks.

#### b. *Satellites Systems*

Costs of satellite-based detection systems, derived from TWG I considerations and subsequent studies, are listed in Table 5.

TABLE 5  
TOTAL SATELLITE SYSTEM COSTS  
(\$ in millions)

	<u>Initial Costs</u>	<u>Annual Operations</u>
ARGUS	14	10
FAR EARTH/SOLAR	100	80
Launch Facilities	100	34
Tracking & Data Acquisition	<u>20</u>	<u>8</u>
	<u>234</u>	<u>120</u>

Thus, the total cost of ground-based and satellite-based control equipment would be about 2 billion and the total annual operating cost would be \$500 million.

### 3. *Possible Control System Modifications*

a. It appears possible by slight, and possible politically acceptable, changes in the control system proposed by the U.S. to improve substan-

tially its capability for identifying earthquakes. The changes are, first, the dropping of the requirement on spacing of the control stations (1700 km in aseismic and 1000 km in seismic areas) imposed by the 1958 Conference of Experts; and second, the possible addition of 3 or 4 more stations into the USSR. If the 21 control stations in the USSR are relocated so that most of them are concentrated within the highly seismic areas of Kamchatka, Karafuto and the Pamirs and only a few stations are spread on a wide grid over the USSR for the purpose of locating small seismic events wherever they might occur within the USSR, then it has been estimated that the improved capability shown in Table 6 might be achievable.

Since the distribution of seismicity in the USSR is quite uncertain, further research may reveal a few other highly seismic areas which will also require some stations if the capabilities in Table 6 are to be achieved. This contingency can be met in part by maintaining the right to relocate stations as new data are required. It might also be necessary to increase the number of stations—perhaps by adding another 3 or 4.

TABLE 6  
*Capabilities Relocated Geneva Control System* (1) (2)

	2 years	4 years	6 years
--	---------	---------	---------

Number of Unidentified Seismic Events Above (3)			
(a) Magnitude 4.75 (20 KT, Rainier coupling)	56–62	14–20	14–18
(b) Magnitude 4.35 (5 KT, Rainier coupling)	160–170	46–60	46–60
Detection Limit			
(a) Equivalent Yield—Rainier coupling—	1.4–5.5 KT	1.3–4.8 KT	.5–1.4 KT
(b) Equivalent Yield—Decoupled (4)	420–1650 KT	390–1440 KT	150–420 KT

(1) This table assumes station background noise levels about 5 times as great as those at the best stations in the U.S. unilateral net.

(2) See footnote (1) to table II.

(3) The range of numbers in the tables expressed the uncertainty in the noise conditions at the control stations.

(4) The full decoupling factor of 300 was assumed without regard to feasibility and cost of constructing the required cavity.

b. The system capability for detecting high-altitude nuclear explosions would be enhanced by requiring pre-launch inspection of all space vehicles. There are many obvious political difficulties and some

technical difficulties which would have to be overcome. Pre-launch inspection of the space vehicle might require disassembly of the vehicle in order to detect the presence of fissionable material. In addition, in order to assure that all space vehicle launchings were actually announced for inspection, this system would presumably require a system to detect rocket launching unless a unilateral intelligence capacity was adequate and acceptable for this purpose.

### III. *Estimated Changes in the Control System Capability from Future Research*

Expected results from the moratorium research program (Project VELA) are heavily dependent on the form and degree of support at the top levels of Government. The present forecast of results is based on the assumptions:

a. The budget for seismic research under Project VELA is restored to its original level and for high-altitude research the budget is increased to the original level recommended by ARPA.

b. Approval is given to fire the planned underground nuclear explosions presently scheduled under Project VELA.

If either of these assumptions is not met, improvements will be much less likely and, for some aspects of the control problem, impossible.

#### 1. *Changes Resulting from the Seismic Research Program*

The capability of the system to detect and identify nuclear explosions depends on the following: (1) the number of unidentified earthquakes of a given magnitude; (2) the yield of nuclear explosions which corresponds in amplitude of signal to a particular magnitude; and (3) the probability of success and number of on-site inspections. In this context, the following estimates of the change of the performance of the control system have been made:

a. The seismic research program will remove many of the uncertainties which are presently involved in determining system capability. With reference to the capability described in Table 6 for a Geneva system with station relocation, it is reasonably possible that new seismic information obtained in two to three years will reduce the equivalent yield above which a given number of events will remain unidentified by a factor of about three. Some techniques are already foreseen wherein this might be accomplished.

b. Unmanned stations would result in a great deal of improvement in detection and identification of explosions. With a grid spacing of 200 km detection capability is about 10 tons. Identification capability for such a network is probably limited by natural events which are similar to explosions. Assuming 95% limit to identification capability,

this system would leave 60 unidentified events with equivalent yield greater than 150 tons. Location of epicenters would probably be better than 100 square km.

c. Many suggestions have been made for improvement which will be tested during the research program. This includes use of long waves, improved first motion criteria, depth of focus determination and other techniques which are difficult to evaluate at this early date but offer the possibility of major improvements. Experience gained in the operation of the Geneva network can also lead to improvements.

d. Progress in on-site inspection now offers the possibility of using aftershocks, precision epicenters and focal depth determination to localize the suspicious area to better than 50–100 km<sup>2</sup> and identify earthquake aftershocks by their greater depth. This improvement depends on the rapidity in reaching the suspicious area.

e. Degradation by improvement of decoupling beyond the factor of 300 is possible. Factors of 2–10 have been estimated for further decoupling. Confusion of the explosion source to simulate earthquakes is a remote possibility.

Table 7 gives rough estimates of improvements (with respect to Table 6) following a 2–3 year research program. Realization of the capability would require subsequent installation of appropriate hardware.

## *2. Changes Resulting from the High Altitude Research Program*

The primary outcome of the high altitude research program will be more complete information on background noise signals which interfere with detection. This information will allow more certain evaluation of the control system. It is not known whether the system capability will be better or worse, but in view of the conservatism of Table 3 it is more likely to be better. For example, ground-based techniques will probably cover completely the low altitude regions. A second outcome of the research program will be some new detection techniques. Two new ones are already promising, namely, the VLF phase shift method and the detection of the radio signal from x-ray shields. Others are still somewhat speculative. Finally, more effective x-ray shields, and possibly other concealment measures, might be found.

TABLE 7  
ESTIMATED CAPABILITY FOR DETECTION AND  
IDENTIFICATION IN USSR AFTER 2–3 YEARS RESEARCH  
PROGRAM

	Reasonably Possible
Detection	
About 20 control posts, relocated	½ KT

Identification	
About 20 control posts, relocated Plus ocean bottom seismographs (1)	
(Yield above which 60 unidentified events)	1½ KT
Detection	
Augmentation by unattended stations	
200 KM grid	10 Tons
Identification with unattended stations	
(Yield above which 60 unidentified events)	150 Tons (2)
Degradation beyond decoupling factor of 300	2–10
Confusion of source, earthquake triggering, etc. as to misidentify explosion	
	?

(1) Based upon only one ocean bottom measurement. 1½ KT identification will only be achieved if all installed stations have capabilities comparable to this measurement.

(2) Although theoretically this net would permit identification in excess of 99 per cent, a limitation of 95 per cent identification has been assumed to cover conservatively the case of seismic events which may have characteristics of explosions.

IV. *PRESENT AND PROJECTED U.S. AND SOVIET NUCLEAR WEAPON CAPABILITIES*

The present and future capabilities of the U.S. and the USSR in the nuclear weapons fields have been summarized as a function of the yields obtainable for different [illegible in the original] weight classes in Tables 8 and 9. In addition the respective capabilities in various specialized types of weapons, i.e., clean or radiation types, are also included. Extrapolations into the future have been made on several different assumptions which are compatible with various situations resulting from a nuclear test agreement, e.g., underground testing below a threshold, space tests, and several types of Soviet evasion.

The past tests of the Soviet Union and U.S. appear in Column I of the U.S. and Soviet tables respectively. Items presently scheduled for stockpile in the U.S. are listed in Column II. In Column III of each table are given the expected improvements possible in the U.S. and in the Soviet Union if testing is prohibited but laboratory experiments (hydro-nuclear tests) are permitted up to a nuclear energy release of 1 ton. In Column IV are listed the expected advances by each country with unlimited testing and in Column V with testing everywhere except in the atmosphere. It is expected that under both these latter situations the potential future weapons development in the two countries would tend to converge to the same final achievements. It should be pointed

out, however, that there could be considerable differences between the U.S. and the USSR in the rate of achievement of those capabilities, with specific times depending on their relative state now (and in some areas of development we have no specific information on the relevant situation for the Soviets), on the effort available, and on the experience with particular kinds of tests involved.

The remaining columns do not correspond for the two countries. For the U.S., Column VI represents achievements which could be made using legal tests which would be below the underground threshold. This is a seismic magnitude of 4.75, which corresponds to 20 KT with Rainier coupling, but represents considerably higher yield for decoupled experiments. It has been assumed that partial decoupling would then allow experiments up to 150 KT to be carried out. In Column VII are listed the developments which could be achieved under a high altitude threshold arrangement, i.e., about 1 KT.

Columns VIII, IX, and X represent what the Soviets would be able to accomplish by clandestine testing, that is, with evasion to an extent which would not be detected by the Geneva system. These three columns represent different levels of evasion involving different parts of the Geneva system and different efforts at evasion. Column VIII and IX assumed tests underground up to 1 KT and 5 KT. Column X allows experiments up to 50 KT, which would require decoupling, either partial or full, for the experiments in the range of 10's of KT and Column XI adds to this the possibility of evasion in outer space with experiments up to 200 KT.

In a situation involving no testing, there is an additional effect (not allowed for in the tables of this summary) deriving from espionage. As time passes and particularly as U.S. items go into production and deployment, some U.S. developments may become known to the USSR and in these cases the Soviet capability would converge beyond [illegible in the original] U.S.

Each column contains the yield, or other features which characterize that class of weapon which one might be able to achieve in a particular weight. Where relevant it also lists the materials (oralloy or reactor product) required. There is also a sub-column having to do with the number of tests required and their yields in order to achieve that capability. A time is given in some cases which represents a compounding (not necessarily addition) of the design time for experiments and the analysis of the data before the next experiments, with the time necessary to carry out the experiments, involving the construction of decoupling holes, launch of heavy payloads, etc. The times given correspond to the time at which the weapon design and testing could be completed. Additional time to reach initial stockpile will depend on development procedures and may be anything from two

years down to zero depending on how much the country involved is willing to commit the weaponization procedures before completing development.

The present and currently planned U.S. stockpile weapons can, of course, be established with a high degree of confidence, and in many cases longer range extrapolations of U.S. capabilities are reasonably reliable since these developments are based on already tested principles. Development of weapons in the various weight classes depends in varying degrees on testing, as shown in Table 8 and discussed later in this section. While no tests of [text not declassified] the [text not declassified] research is sufficiently advanced to give confidence that this class of weapon can be developed. [text not declassified] This can probably be done by calculation and hydronuclear experiments (maximum yield 1 ton). [text not declassified] The details on the number of tests required and time to achieve these or other advanced weapons are subject to large uncertainties. In this connection, it should be remembered that major advances often come from surprises and therefore do not permit sound forecasting.

In the case of Soviet weapons, the uncertainties are much greater, but at least in the larger yield categories the long-range detection system has permitted reasonably reliable activities of the minimum weights for the yields obtained in Soviet tests. [text not declassified] There is no evidence from any source [text not declassified]. Extrapolations into the future are subject to major uncertainties and are perforce based largely on U.S. weapon design principles. For instance, whether the Soviets could in fact reach the high performance indicated in Column X of the Table for [text not declassified] the figures given are based on the assumption that this experience is about the same as that of the U.S. It is known that the Soviets are continuing a vigorous weapons development program; but, although the Soviets could have conducted clandestine tests, intelligence does not support the thesis that the Soviets have in fact violated the moratorium.

## I. SPECIFIC WEAPON CLASSES

[text not declassified]

*Surprises:* It is by now trite to say that the greatest advances in the course of further nuclear weapons testing and design may come from surprises which by their nature, cannot be predicted. That testing can produce new ideas or invite attention to the significance of certain effects or new techniques is obvious from a history of such occurrences over the past fifteen years. [text not declassified] would probably not have been recognized or accepted without full scale testing. Limiting the scale or type testing may slow down or preclude the discovery and exploitation of new ideas. No matter how small the scale of testing,

some developments of usefulness not now foreseen will probably be found and exploited by the tester.

*[text not declassified]*

## V. "NTH" COUNTRY NUCLEAR WEAPONS DEVELOPMENTS

### INTRODUCTION

In considering possible "Nth" Country nuclear weapon developments, one must take into account technical and scientific capabilities, motivation, availability of test sites, test environments, and possible delivery vehicles for operational employment of nuclear weapons. These factors are considered in the discussion below for France, Communist China, and "other countries".

In the following it is assumed that there is no wilful communication of weapons know-how, or gift of fissile material for weapons purposes, by the nuclear powers to the non-nuclear ones.

In the first place, it should be noted that the principal difficulty in starting a weapons program is in acquisition of fissile material. This might be done either through gifts, its own production, or diversion from its peaceful nuclear power program. *[text not declassified]*

So far as developing advanced fission weapons is concerned, one can expect that a limitation to underground tests (space testing would presumably not be available to nth countries for a very long time) would not be very severe. Such a limitation might slow down development and make it more expensive. *[text not declassified]*

It is important to point out that in contrast to the situation at the start of the U.S. effort, there now exists in unclassified form a great deal of information important to the design of nuclear weapons. For example, the size, weight and yield of several U.S. designs have been released. Experimental techniques in hydrodynamics and neutronics have been described *[text not declassified]*. Neutron cross sections for all relevant materials are available. Finally, the calculational procedures in hydrodynamics, neutronics and radiation transport have been published, and computers to perform these calculations can be purchased.

*[text not declassified]* It is questionable, but not necessarily impossible, for them to succeed.

Thus, limitation to non-atmospheric testing would *[text not declassified]*.

### FRANCE

*[text not declassified]*

Underground test sites are available in Metropolitan France, and in the Sahara (pending the outcome of the Algerian problem). From the standpoint of the technical capabilities of the various detection

systems, French ability to evade detection would range from poor in Metropolitan France to fair in the Sahara. [*text not declassified*] In view of the high risk of detection, it is believed unlikely that the French Government would attempt evasion. However, it would probably continue overt testing as long as it is politically feasible.

#### COMMUNIST CHINA

China has the scientific and technical capability to develop nuclear weapons, light and medium bombers for delivery, and many possible test areas. China also is presumed to have a strong desire for such development.

[*text not declassified*]

China's capability for evasion is high, both from a technical and intelligence standpoint [*text not declassified*]. It is doubtful that China would consider herself bound by a treaty which she did not sign.

#### OTHER COUNTRIES

There are, of course, many other countries who have an actual or planned reactor capability which could produce plutonium for weapons. The most likely candidates are Israel, the UAR, Sweden, West Germany, and India. None have existing or planned delivery capabilities for large weapons. With the exception of West Germany's active gas-centrifuge development program, none are planning U-235 facilities and therefore are not in a position to stockpile gun-type weapons for many years.

Israel and the UAR have the strongest motivation for nuclear weapon development. Both are developing reactor facilities—Israel with considerable French help, the UAR with some Soviet and perhaps West German aid. Sweden is waiting the outcome of the Geneva negotiations before deciding to embark on a weapons program, [*text not declassified*]. India officially deplores nuclear weapons, but a demonstrated Chinese Communist capability may substantially change this position.

All of these countries except India have a poor to fair capability to evade detection from the technical standpoint, while for India it may be fair to good. [*text not declassified*]

The expense of decoupling would be a major factor in the consideration of all of these countries, and would be particularly important in the case of India and the UAR.

All of these countries, with the possible exception of the UAR, have the technical knowhow to design simple, implosion-type fission weapons which could probably be stockpiled without nuclear testing. These non-tested devices would be very large and heavy and none of these countries presently have a delivery capability for such a device.

While these countries would prefer an actual proof test, they would probably be willing to forego this since the principles are fairly well established by US, USSR, and UK successes. The development of advanced types of fission weapons or TN devices without tests is unlikely by these countries. This may not be a major factor in the security posture of these countries since the availability of a few nominal yield weapons would be the most critical factor.

#### VI. *The Cost of Evasion*

Any control systems, such as the ones described in Sections I–III of this Report will have natural limits of detection and identification. In addition, a determined violator can take specific measures which will broaden the range over which tests can be carried out and still escape detection by technical means. Such methods of evasion are:

- a) Small underground shots below the detection threshold followed by cover-up operation.
- b) Decoupled or partially decoupled underground events using the “large hole”.
- c) Tests in space beyond the capabilities of a detection system.
- d) Tests in space requiring specially deployed shields to escape detection.

Each of the evasion tactics imposes a penalty on the violator in the terms of one or more of the following: financial cost, stretched out time scale and/or reduced test effectiveness. In addition, there exists the risk of suspicion arising out of conventional intelligence.

Evasion costs have been analyzed only in a preliminary way since by necessity they are based only on studies.

##### 1) *Test effectiveness*

Underground clandestine operations including decoupled shots would not differ materially from our previous underground experience in the range of diagnostic methods which could be applied.

Space tests restrict the diagnostic tools which can be used but are still adequate for weapons development by measurements of yield and limited diagnostics.

##### 2) *Cost—Underground*

Table 10 gives the size of cavity required to achieve full decoupling and partial decoupling to the extent indicated. The specific case of a test for 50 KT in a overdriven sphere 400' in diameter at a depth of 2000' has been analyzed in some detail under a variety of site conditions. These conditions would give a decoupling factor of about 75.

Holes sufficient to decouple a 3 KT explosion exist. Although larger holes have not been excavated, it is considered possible to construct a

750 feet diameter hole in salt (sufficient to decouple 90 KT). The feasibility of larger cavities is uncertain.

In the case of a hole of sufficient size for complete decoupling, holes are almost certain to be re-usable to some extent. Contamination by the debris prevents re-use in less than six weeks. If radio-chemistry is considered desirable, the total number of shots in a given cavity may be limited. In the case of an overdriven cavity re-usability is less certain and subject to the same constraints as in the fully decoupled case.

In round numbers the cost of a 50 KT test program might be roughly \$7,000,000 per shot assuming three shots in a given hole. We might estimate that in the 50 KT neighborhood the decoupling operation increase costs by about a factor of 3–5.

If the yield is sufficiently small that the event would not be inspectable even without decoupling, the need for clandestine operation will increase costs much less, possibly by a factor of 2.

### 3) *Cost-Space tests*

Tests in space are in themselves a means of evasion; their difficulty and cost is directly dependent on the type of control they are to evade. With a ground-based control system, the evader, if he is to avoid all possibility of detection, is forced to distances of roughly  $10^6$  kilometers, which is a distance not involving large flight times; with the far-earth satellite system, an evader is forced to distances near  $10^8$  kilometers where flight times and vehicle requirements are much more substantial. Evasion with the use of shields, which again complicates the problem of evasion, might reduce these distances to  $10^6$  kilometers.

Using U.S. cost estimates, the cost to prepare for a space test in the  $10^6$  to the  $10^7$  kilometer range is roughly \$100 million, with a cost of \$10–12 million per additional launching. Actual test costs would depend on the reliability obtained, i.e., the number of launches required per successful test and the launch sites required. Costs to conduct one megaton test beyond  $10^8$  kilometers depend on detailed test requirements but may not be much larger than the shorter range costs unless waiting times are objectionable.

### 4) *Time delays*

Table 10 in the Appendix gives the construction and cover-up time scale for a 50-kiloton decoupled, pre-shot construction program; times under the various conditions vary from 2 to 5 years, after the initiation of preparation, assuming U.S. conditions. The delays in small clandestine tests not requiring decoupling are small.

The delays involved in space tests depend partially on vehicle availability and reliability; present USSR vehicles are adequate for space tests under the conditions considered. It has been estimated that

TABLE 10  
Table of yield in kilotons of test shots which can be placed in a cavity of a given size.

Sphere	Depth of Burial				Decoupling Factor
	Volume	Diameter	1000 Ft	2000 Ft	3000 Ft
	$1.9 \times 10^4$ cu yds	100'	[text not declassified]	[text not declassified]	[text not declassified]
	$1.6 \times 10^5$ cu yds	200'	[text not declassified]	[text not declassified]	[text not declassified]
	$1.3 \times 10^6$ cu yds	400'	[text not declassified]	[text not declassified]	[text not declassified]
	$4.2 \times 10^6$ cu yds	600'	[text not declassified]	[text not declassified]	[text not declassified]
	$1.9 \times 10^4$ cu yds	100'	[text not declassified]	[text not declassified]	[text not declassified]
	$1.6 \times 10^5$ cu yds	200'	[text not declassified]	[text not declassified]	[text not declassified]
	$1.3 \times 10^6$ cu yds	400'	[text not declassified]	[text not declassified]	[text not declassified]
	$4.2 \times 10^6$ cu yds	600'	[text not declassified]	[text not declassified]	[text not declassified]

space tests would stretch a test program out in time by a factor of two after the initial development program which might last 2–4 years, assuming long waiting times for vehicle travel and depending on the complexity of the evasion tactic required.

5) *Summary*

a. Underground evasion tactics will not restrict test diagnostics. Space tests will restrict diagnostics somewhat but are adequate for weapons development.

b. Cost in yield ranges requiring large-hole decoupling space tests are increased roughly a factor of 3–5. Small clandestine underground tests can be carried out without substantial cost penalty. Space tests increase costs by a factor of 3–10 depending primarily on reliability.

c. Time delays in clandestine tests requiring hole decoupling are 2–5 years. After construction holes might be reusable. Time delay in the space tests stretch a program out by possibly a factor of two after an initial development program of 2–4 years.

VII. *IMPACT ON U.S. AND USSR WEAPONS SYSTEMS*

A. *INTRODUCTION*

A nuclear test ban will place limits on both U.S. and Soviet nuclear weapons systems. An analysis of the significance of these limitations on the relative military positions of the two countries involves assumptions as to the extent of the limitations actually imposed by a ban and the nature of the military problem.

Among the large variety of possible responses to the outcome of the treaty negotiations, we have focussed on the following three:

---

	TREATY	USA	USSR
Case I	No test ban	Unlimited testing	Unlimited testing
Case II	Total test ban	No testing	No testing
Case III	Total test ban	No testing	Maximum evasion possible technically under Geneva System

---

*Note:* (The Nth country problem is not considered in this section)

From the strictly military point of view, the most conservative approach to the test ban problem rests on the comparison of the relative positions of the U.S. and the USSR assuming, on the one hand, unlimited testing (Case I) and, on the other hand, a test ban with no further testing by the U.S. but with maximum Soviet evasion (Case III) technically feasible under the Geneva System. Attention has therefore been

focussed on comparing Case I and Case III, realizing that Case III is the maximum possible risk rather than a certain development. It must, of course, be recognized that the conduct of tests in a clandestine manner would generally involve political risks and be more expensive and would retard progress both as a result of the physical circumstances required (discussed in Section 6) and the extreme security precautions involved to avoid detection by conventional intelligence. Such factors are difficult to evaluate in quantitative terms.

Although most weapons now in U.S. stockpile have not actually been proof tested, they are straightforward extrapolations of tested devices. In a weapons test ban, additional extrapolations will have to be made in the physics to correspond to engineering changes dictated by altering weapon environments and military requirements. Many of the changes of this kind now foreseen can be made with full assurance that the weapons performance will be as predicted. However, if over a period of ten or more years many of the weapons design developments were carried out in the absence of experiments involving nuclear explosions, substantial doubts might arise about weapons performance. With changes in personnel and loss of experience, some of these doubts might also apply to the "older" weapons designed in a period of testing or immediately thereafter, but not tested in exactly their stockpiled configuration. The relative effect of this factor depends on which alternatives are being considered.

The discussion which follows concentrates on the characteristics of specific weapons systems. There also has been an attempt to indicate where some of the unknown possibilities may lie. It must be pointed out, however, that in all weapons technology one of the most important considerations in further developments is a possibility of the appearance of actual surprises. In general, we believe that as far as yield to weight improvement is concerned, surprises are very unlikely in the strategic weapons beyond the developments predicted in Section IV. There could be considerable surprises in weapons effects of various kinds. Finally, in the area of tactical nuclear weapons, where the room for invention is large, the possibility of important surprises is correspondingly great.

The following military areas have been considered: (1) Strategic systems, (2) AICBM, and (3) Tactical Systems.

## B. STRATEGIC SYSTEMS

### 1. General

The effectiveness of the strategic weapon systems depends not only on weapons design factors such as yield-to-weight ratio, and materials requirements, but also on the delivery system design factors such as accuracy (CEP), reliability and vulnerability to enemy attack as well

as level of intelligence on enemy targets and enemy defence capabilities affecting penetration.

In addition to these technical questions, the problem is complicated by the differences in the impact of a test ban on a *deterrence* strategy as compared with a *counterforce* strategy.

It is difficult to evaluate the U.S. requirements for a *counterforce* strategy for nuclear weapons (even if it is conducted in a preemptive manner) since its effectiveness depends on firm and precise knowledge of the location of a very large proportion of Soviet strategic delivery vehicles. We do not now have this knowledge on Soviet missiles; and, even if increased intelligence capabilities through space or other means improves our knowledge of Soviet targets, the mobility of the Soviet strategic force presumably will also have increased by that time. Also, the U.S. will develop [text not declassified] thus, future Soviet counterforce strategy, if possible at all, must include extremely difficult new methods for determining the location of mobile U.S. systems, or very much larger force levels.

A *counterforce* strategy would emphasize attack on hard and mobile targets in addition to soft targets such as airfields. For attacks on hard and mobile targets an increase in yield is equivalent to a reduction in CEP or an equivalent increase in the number of weapons delivered on target as given by the following table: (For an area attack on mobile targets whose exact location is not known, such as Polaris, CEP is not important).

Yield increased by a factor	Equivalent reduction of CEP	Equivalent increase in number of weapons delivered on target
2	20%	1.6
3	30%	2.0
4	40%	2.5
10–20	50%–60%	5–7

It must be emphasized that, unless one is certain to take preemptive action and has accurate intelligence, increases in yield would not permit nearly as great a decrease in over-all force size as implied by the figures since such a reduction in force level would substantially reduce the ability of the system to survive an initial enemy attack and thereby decrease its second strike capability. In fact, if there is a question as to whether a sufficient force will survive an initial enemy attack to provide a deterrent, increases in yield would permit no reduction in force level and an improvement could only be found by increased force levels.

In a *deterrent* strategy, there is a requirement for a minimum number of delivery systems (missiles or aircraft) to survive any enemy attack and penetrate enemy defenses. Survival depends on such factors as hardness, readiness, reliability, mobility and secrecy. Decrease in warhead weight at a given yield has contributed to the mobility of deterrent systems. Increased mobility is at present of greater value for a deterrent strategy to the U.S. than to the USSR since secrecy of the USSR deterrent force has a similar effect as mobility on the U.S. force. This may decrease in value, however, depending on improved intelligence measures, including the Samos system.

In a *deterrent* strategy, an increase in the yield of a warhead at a given weight would in principle increase the effects from both blast and fallout against urban areas and industrial complexes more than against hard or mobile targets. However, these relations have significance only in the case of relatively small yields and levels of attack. In the case of blast damage, warheads of present yields delivered with the CEP's of existing systems would so completely over-kill the population and overdestroy the floor space of urban area targets by blast and fire, that further increases in yields would produce little additional damage. Similarly, probable attack levels during the period in question would result in such extremely high casualty levels from fallout with existing yields that further increases in fallout would produce only small increases in casualties in the surviving population.

The problem of accidental detonation or unauthorized use of nuclear weapons remains a matter of continuing concern. Prevention of such events involves both technical and non-technical problems. Some, but not all, of the technical devices that can substantially improve the degree of control without sacrifice in readiness can be incorporated into weapons without testing.

## 2. *Unlimited Testing (Case I)*

In the event that the U.S. and USSR both undertake unlimited testing, both are likely to achieve eventually (though not necessarily at the same time) comparable yield-to-weight ratios in the weight classes in which they are interested. The nuclear technology of both countries is sufficiently advanced that in the 1965–1970 time period, weapon yield [*text not declassified*].

In the case of a *counterforce* strategy, the increases in yield possible with unlimited testing would probably have the effect of reducing the counterforce capabilities of both the U.S. and the USSR. While the increase in yield for very large weapons [*text not declassified*] through testing would tend to improve counterforce capability somewhat against a static enemy force, this would be more than compensated by the increased mobility resulting from the substantially improved yield-to-weight ratio for the USSR in [*text not declassified*] and from the proba-

ble development of more mobile ICBM systems than they now have. However, the Soviets already have a larger degree of invulnerability as a result of their general secrecy. Therefore, the Soviet counterforce problem might be increased in difficulty by an even larger factor by the U.S. development of warheads in [text not declassified]. In addition, some members of the Panel seriously question whether such systems are desirable from the point of view of safety.

In general, improvements in missile technology can be achieved by ordinary engineering measures, but are aided substantially by decreases in warhead weight. [text not declassified]

The effectiveness of a strategic system is also determined by its ability to penetrate enemy defenses. In the case of strategic missiles, penetration through enemy AICBM's is aided by decoys, radar camouflage, maneuvering targets and multiple warheads. The use of multiple warheads which make the AICBM problem even more difficult than it is at the present time is strongly dependent on warhead weights. In addition, the use of a smaller weight warhead in a given system would permit the inclusion of additional decoys. [text not declassified] In this case, the potential of a non-nuclear kill by AICBM would become dominant. In any event, miss distance is not at present the determining parameter in the AICBM problem for the U.S.

Further testing will probably reduce costs to maintain a given strategic posture. The amount of reduction depends greatly on the posture desired and the cost reduction achieved may vary from a negligible to a substantial proportion of system cost.

In summary, continued testing would make a counterforce strategy more difficult through increased mobility and survivability of the second strike force. Continued testing could increase deterrence by adding, through lowered weapon weights, a factor toward achieving survival and penetration. This would be an essential factor to the U.S. only if our deterrence becomes marginal and [text not declassified] becomes the factor which makes the difference between a marginal and non-marginal deterrence. There is disagreement among members of the panel as to the likelihood of such a situation occurring.

### 3. No Further Tests (Case II)

If nuclear weapons of importance to strategic systems were stock-piled without further nuclear tests but after extensive laboratory tests, it is believed that the U.S. would have some initial advantage over the USSR in the yield of warheads [text not declassified].

As time passes and particularly as U.S. items go into production and deployment, some U.S. developments may become known to the USSR and in these cases the Soviet capability would converge toward that of the U.S.

With this spectrum of warheads, which could be stockpiled without test, the U.S. and the USSR would appear to have and to be able to maintain a very strong deterrent strategy by intelligent planning of delivery systems. However, such a deterrent position could in principle be unbalanced in favor of either party by the appropriate combination of difficult developments in ASW Air Defense, AICBM systems, or shortening to 15 minutes or less the time in which intelligence information can be available on the position of a large fraction of the mobile systems.

It is not possible to evaluate the adequacy of a counterforce strategy in terms of these weapons for the inherent reasons discussed above.

#### 4. *No Further U.S. Testing and Maximum Soviet Evasion (Case III)*

If there is a treaty barring tests and U.S. activities were limited to hydro-nuclear tests while the USSR evaded the treaty to the maximum extent possible by testing up to 50 KT underground with big-hole decoupling and up to 200 KT in outer space, there would still not be any significant developments by either country in weight classes [*text not declassified*].

In summary, under a test ban obeyed by the U.S. but evaded by the USSR to the maximum extent technically possible under the Geneva system, the preemptive counterforce capability of the U.S. would eventually be about the same as under the condition of unlimited testing. Consequently, the deterrent capability of the USSR would also eventually be about the same under these two conditions. On the other hand, the counterforce capability of the USSR would eventually be improved and the deterrent capability of the U.S. correspondingly degraded as compared with the condition of unlimited testing. The extent and significance of this change depends on how marginal U.S. deterrence is considered to become and how important very small warheads [*text not declassified*] are considered to be to assure survival of mobile systems.

#### 5. [*text not declassified*]

#### C. AICBM

Developments of AICBM techniques can also be regarded either as aiding counter forces (in case one intends a first strike and wants to defend against a retaliatory force) or as a pure defense (which depends on having a better AICBM than anyone now conceives of). An AICBM system could perhaps be considered more seriously as a pure defense in a situation where one has an agreed upon and observed limit on the number of missiles (at a rather low number).

Further nuclear tests have a bearing on the AICBM problem in the following areas:

- 1) Decreased warhead and missile weight and cost.

2) Possibilities of increased kill radii [*text not declassified*] and of using nuclear blast as a means of sorting out decoys.

3) The problem of “blackout” effects from a nuclear burst on AICBM radar and communications.

[*text not declassified*]

2. *The possibility of using nuclear blast as a means of sorting out decoys.*

Studies made on the use of nuclear blast in sorting out decoys are not encouraging. There exists the possibility that with additional theoretical work and nuclear tests [*text not declassified*] can be developed, (presumably both by the U.S. and USSR) in a period of four years or more. Tests are such that concealed underground testing is possible in the development phases of the device proper. Speculations concerning the effect predict large kill radii. However, for this improvement to be useful the decoy problem must be solved. [*text not declassified*]

3. *Special effects.*

The understanding of how radars, communication system, etc., behave when nuclear explosions take place at high altitudes is an important part of the AICBM problem. In principle, radar difficulties can be gotten around by going to higher frequencies to overcome the effects of blackout. Furthermore, the U.S. presumably knows more about such effects from the experimental point of view than do the Soviets, who are not known to have had any high altitude shots over 50,000 feet.

Some experiments in this area could be carried out clandestinely although with some risk of detection, until a high altitude control system is established, but probably not afterwards.

Beyond the “blackout” problem the main interest in high altitude tests focusses on better understanding of re-entry phenomena, study of the state of ionization of debris in a vacuum, study of magnetic trapping phenomena, etc. Whether such studies will have significant bearing on the AICBM problem is not clear.

4. The USSR has tested a number of warheads suitable for AICBM application. [*text not declassified*] without tests. Further development could be carried out by clandestine outer-space tests.

5. In summary, the present problems critical to the solution of the AICBM problem are not in the nuclear explosion field. It is unlikely that any good solutions will be found. Improvements in nuclear weapons would become very significant only if new inventions are made which reduce drastically the cost of target acquisitions, target tracking and data handling.

#### D. TACTICAL WEAPONS SYSTEMS

1. Tactical nuclear weapons are defined as ammunition for defensive and offensive systems whose primary purposes are the conduct

of operations, (ranging from very small use of force to large operations), short of a strategic exchange between the primary contestants. The weapons cannot be defined as to yield, size, methods of delivery or effects, but only as to purpose. Tactical nuclear systems can be considered in the role of a "deterrent" strategy to discourage enemy actions (either nuclear or non-nuclear) short of a strategic exchange. Alternatively, tactical nuclear weapons can be considered in the role of a "counterforce" strategy for actual use in large or small quantities on either a broad battlefield or in isolated limited engagements. While there exist strong differences of opinion as to whether nuclear weapons can be employed in many cases without escalation into general war, stated basic national policy at present is that main but not sole reliance should be placed on nuclear weapons. No attempt has been made here to judge this issue; however, conclusions depend significantly on the policies adopted.

2. *[text not declassified]*

In view of the number of possible theaters and areas within a theater where nuclear weapons could be used tactically, there are situations where stockpile limitations could become significant, even aside from competition while other requirements (Air Defense, ASW, and advanced strategic systems) or other possible production limitations.

*[text not declassified]*

3. It should be noted that the possibilities for further development and inventing of nuclear warheads for tactical weapons systems are substantial. The possibility of important surprises is correspondingly great. Current and proposed warheads are *[text not declassified]*.

4. *Unlimited testing.*

In the event that the US and the USSR both undertake unlimited testing, both would probably eventually, though not necessarily at the same time, achieve *[text not declassified]*.

With unlimited testing, it should eventually be possible to reduce the requirement *[text not declassified]*.

Such developments would provide the military commander with small, light-weight weapons systems whose warhead produces prompt incapacitation of troops within a well-defined radius of the explosion and without the attendant material damage and residual radiation associated with presently available nuclear warheads.

The rapid fall-off of radiation dose with distance might permit in certain tactical situations elimination of enemy troops with comparative safety to friendly ones, if the position of the latter is known, at separations where blast weapons would make this selectivity impossible. The penetrating nature of the radiation also would allow neutralization of such hard items as tanks or pillboxes. Such strong points could be

attacked by conventional nuclear weapons only by exploding those quite near the target, with risk of fallout and certainty of blast damage over a wide area which could include friendly troops or existing structures.

5. *No Further Tests.*

If nuclear weapons of importance to tactical systems were stockpiled without further tests, the US would have a wide range of yields, [text not declassified].

By hydronuclear experiment involving energy releases up to about a ton of high explosive equivalent and calculations, the US (and the USSR) could make substantial improvements in [text not declassified].

In some cases it would not be possible to design warheads of optimum size and weight for specific future weapons systems. Planned weapons systems for tactical warfare have not made full use of advanced low-yield warheads which have been designed but have not yet reached stockpile.

It should be noted that changes in requirements and tactics take place only after the deployment or even the use of such weapons in the hands of troops.

6. *No Further U.S. Testing and Maximum Soviet Evasion.*

If there were a treaty barring tests and U.S. activities were limited to hydronuclear experiments, while [illegible in the original] the [illegible in the original] even to the extent of 1-kiloton, experiments, the USSR could achieve all foreseen nuclear weapon developments in the [illegible in the original] and medium yields (up to 20–50 kilotons) relevant to [illegible in the original] warfare, while U.S. nuclear weapon developments would be limited to those improvements possible with laboratory experiments and calculations. This would mean that the USSR could, over a period of time, achieve the limits in economy of conventional fission weapons and thereby more than compensate for any relative deficiency in the availability of fissile material. However, the US, by that time, could have made large inventory of fissionable material, such of which would be available for tactical weapons.

[text not declassified] In this situation, the US would be at a disadvantage relative to the USSR in the field of tactical nuclear weapons. This disadvantage would be of importance in tactical situations such as the following:

1) Possibility of extensive use of nuclear weapons in multiple engagements requiring the deployment of [text not declassified].

2) The enemy is able to force a situation in which friend and foe are closely “diffused” so that large nuclear warheads cannot be used, but where a large number of small nuclear warheads can be effective.

3) The lethal radius must be sharply defined and material damage is to be avoided.

The US would, however, have a large inventory of fissionable material available in the 1965–70 time period. The Soviets would therefore still have to consider the possibility of U.S. response with those nuclear weapons to which Soviet tactics might be vulnerable, as well as the possibility of escalation of nuclear warfare outside the existing geographical boundaries or even into strategic war.

The panel members did not reach a consensus as to how important specific problems of this nature would be in the over-all picture of limited war tactics. In particular, no consensus was reached as to the degree of latitude available to the US to balance its strength and weakness by selection of alternative tactics.

#### AMENDMENTS TO SECTION VII

##### RISK PANEL REPORT ON U.S. AND U.S.S.R. WEAPONS SYSTEMS

The following changes and additions to Section VII are submitted as representing the views of the undersigned.

*Page 3—End of first full paragraph:*

*Add the following:*

For such an attack yield is important since there is a direct relationship between yield and the area effectively covered.

*Page 3—End of paragraph following the tabulation:*

*Add the following:*

However, the quantitative increase required would be determined by the effectiveness of the force expected to survive the attack. Thus, if the yield of the surviving weapons had been increased by a factor of four much smaller initial and surviving forces would be required.

*Page 4—*

*Omit the first full paragraph and substitute the following:*

A major effect expected of a deterrent strategy is the creation of casualties from fallout which may be measured in terms of total fission yield delivered by surface bursts. In this case the yield of the individual weapon makes little difference as long as the total fission yield is substantially the same and the distribution pattern is sufficient to cover the major population centers. As in the case of the counterforce strategy, a certain minimum surviving force is essential. One of the several yardsticks by which the effectiveness (and thus the essential strength) of the surviving force may be measured is the total yield deliverable by that force. If the strike second capability is marginal, individual weapon yield assumes considerable importance whether the deterrent strategy is based primarily on floor space destruction from fire and blast, upon the effects of fallout or both. Unfortunately, without accu-

rate intelligence as to the enemy's first strike capabilities, a measure of the actual margin of safety is impossible. A realistic approach to a greater margin of safety without increased numbers of delivery vehicles, and thus a significant increase in system costs, is an improvement of the effectiveness of each weapon.

*Page 5—First full paragraph, 2nd sentence:*

*Delete the parenthetical phrase, [text not declassified].*

*Page 6—*

*The 2nd and 3rd full paragraphs should be combined in the Summary and should read as follows:*

Further testing will certainly reduce costs to maintain a given strategic posture in the long term. The amount of reduction depends greatly on the posture desired and the cost reduction achieved may vary from a negligible to a substantial proportion of system costs. Continued testing would make a counterforce strategy more difficult in increased mobility and survivability of the strike second force. Continued testing could increase deterrence by adding, through lowered weapon weights, a factor toward achieving survival and penetration, or through higher weapon yields for a given payload by loading greater effectiveness to the surviving force. These factors would become essential if our deterrence becomes marginal. Aside from their contribution to cost reduction for the maintenance of a given strategic posture, these factors assume importance in relation to our ability to accurately appraise the margin of safety of our deterrent system. Accordingly, continued improvement of yield/weight ratios adds a factor of safety to compensate for our lack of intelligence concerning the enemy's capabilities. On the other hand, if our intelligence as to his capabilities is accurate, these factors assume importance in relation to a counterforce strategy.

*Page 7—First full paragraph:*

*Revise as follows:*

*[text not declassified]*

*Page 7—8th line from bottom:*

*Rewrite the sentence beginning with "Specifically" to read as follows:*

*[text not declassified]*

*Page 8—First full paragraph:*

*Revise to read as follows:*

In summary, under a test ban obeyed by the United States but evaded by the USSR to the maximum extent technically possible under the Geneva System, the attainment of an effective, preemptive counter-

force capability, if at all feasible, would require a much larger U.S. force structure than would be needed under the condition of unlimited testing. The deterrent capability of the USSR would remain about the same under these two conditions since the Soviets could apply their improvements in the lower weight classes to increased mobility and survivability in either case. On the other hand . . .

*Page 9—Last full paragraph:*

*Revise to read as follows:*

[text not declassified] It is particularly pertinent to observe that, although a nuclear stalemate seems to be approaching and is likely to remain for a considerable period, it must not be conceived as a static stalemate. It is essential that all promising avenues of research which might break the stalemate to our advantage, particularly in the AICBM area, should be vigorously pursued. The nation that can develop an effective anti-missile defense, even in the face of countermeasures, will be well on the way to achieving strategic superiority.

*Page 11—Second full paragraph:*

*Add the following phrase:*

However, it would not be to the advantage of the national economy to adopt this solution.

*Page 13—Second full paragraph:*

*Omit the first three sentences and substitute the following:*

[text not declassified]

*Page 13—Final paragraph:*

*Add the following sentence:*

Here, again, a large inventory of materials is not a desirable substitute for economy in their use.

*Page 14—Omit the penultimate paragraph and substitute the following:*

Assuming a continuation of production at approximately present levels, the United States will have a large inventory of special nuclear materials in the 1965–70 period. The adequacy of these prospective supplies to deal with the threat and potential capabilities of the Sino-Soviet Bloc in the area of tactical warfare, whether local or general, or indeed in any other area, cannot be judged independently of basic national policy with respect to the use of nuclear weapons nor the military force structure maintained as a consequence of that policy. In any case, as regards both strategies and tactical uses, the military value of the available materials may be appreciably enhanced by taking full advantage of weapon technology now available and greatly enhanced by improvements possible with future testing. If a cut-off of production

is negotiated and adequately monitored it may be assumed that both sides will endeavor to make maximum use of the materials available. In this case the advantage will rest with the side employing the most advanced technology.

Analysis of the three general cases considered in this report indicate that under Cases I and II, equivalent technologies may be developed by both sides in due course [*text not declassified*]. From the strictly military standpoint, therefore, Case III is most advantageous to the USSR and most disadvantageous to the United States.

Amb. Dean

Min. Stelle

*S/S*

Mr. Grant

*Secretary Rusk* noted that the President had indicated a serious interest in seeing what could be accomplished in getting an agreement in the nuclear test conference. The Principals had the task of putting Mr. Arthur Dean, the U.S. Representative to the Nuclear Test Talks, in a position both to protect American interests and to get agreement with the Soviets if this is possible. Secretary Rusk remarked that it would be important to find points of agreement genuinely satisfactory to both sides since we know there are many areas where this will be impossible. He then commented on the relevance of the nuclear test conference to disarmament, recognizing that while the history of disarmament had not been encouraging, our people and others hoped for the limitation of armaments at lower levels. Many dangerous problems were involved in disarmament; one was the tendency of democracies to disarm at the drop of a hat. Secretary Rusk nevertheless felt it might be in our interest to accept an arms control measure if it could be done at this time. Secretary Rusk then asked Mr. McCloy for his views on the nuclear test conference.

*Mr. McCloy* remarked that while everything had not been irrevocably decided with respect to seeking agreement in the nuclear test conference, the President had recognized that his request for postponement of the opening date of the negotiations implied that the U.S. intended to negotiate in good faith. Mr. McCloy further noted that considerable progress had already been made in the Geneva negotiations and that it would be unwise to strike out in a new direction in the negotiations.

Interdepartmental discussions had been held on the issues in the negotiations and four issues which had been unresolved after these discussions should be cleared up at this meeting. After disposing of these issues there could then be a report by Dr. Fisk on the contents of his panel's report. Mr. McCloy noted that the final version had become available only that morning but that then he had felt it necessary to parallel the efforts of the Fisk Panel by proceeding with a review of the U.S. positions in the conference. He had, of course, been aware of how the work of the Fisk Panel was proceeding. Finally, Mr. McCloy reported, considerable progress had been made in coordinating our positions with the British, who had a delegation here under the leadership of David Ormsby-Gore.

Mr. McCloy then turned to the first item on the agenda, namely, the question of *Safeguards for the Seismic Research Program*. In explanation, Mr. McCloy said that the U.S. would like to detonate certain nuclear devices in its seismic research program, but that the U.S. proposals for proving these shots were not weapons tests had not been accepted by the Soviet Union. After reviewing prior U.S. safeguards proposals, Mr. McCloy proposed that the Principals adopt as a U.S. position the unilateral opening for inspection of devices of obsolete design. Mr. McCloy noted that the agencies had in the past generally accepted the proposal he was making and he suggested that the Principals now adopt this approach and agree on a unified approach to Congress.

*Secretary McNamara* stated that he concurred in the proposal.

*Chairman Seaborg* stated that he concurred, but added that legislation was obviously necessary before this proposal could be implemented. AEC support of this proposal was on the understanding that the Administration would be very careful to keep in close touch with the Joint Committee on Atomic Energy on this question. Chairman Seaborg further remarked that the Administration should separate the weapon connotation from the devices used in the seismic research program. He felt some things might be done to the nuclear devices used so that the device could not be called a weapon but rather a nuclear explosive.

*Secretary Rusk* agreed with both points.

*Chairman Seaborg* observed that it would be desirable for the Joint Committee to be consulted before the Administration's position on safeguards became frozen. Another thought had also occurred to the AEC. Even if it agreed to the new U.S. safeguards proposal, the Soviet Union might later claim that the U.S. nuclear shots were, in fact, weapons tests. It therefore might be a good idea to have a competent neutral or a United Nations representative involved in the safeguarding operation so that this individual could certify the nuclear shot was not a weapon test.

*Mr. McCloy* said that he was worried about the proposal to involve a neutral since this might increase our difficulties with respect to the Nth country problem. He felt it might be considered strange that we could not show a nuclear device to the French, for example, but that we could show this to a neutral representative. Furthermore, the idea of declassifying the design of nuclear devices to be used in the research program had been repudiated because, among other things, it would involve showing the design to non-nuclear powers.

*Secretary Rusk* remarked that the Soviet Union had its own concept of which nations were neutrals; for example, the Soviets might not think of Switzerland or Sweden as neutral. He then asked whether *Mr. McCloy* would give some thought to this suggestion by *Chairman Seaborg*.

*Mr. McCloy* agreed that he would, but he thought this question of neutral or UN certification was a bridge we might cross when we come to it. Possibly if the U.K. said that the device was not a weapon, the Soviets would not have a very strong argument.

*Dr. Wiesner* said that since the nuclear devices in question were clearly obsolete, he failed to see how the question of weapons testing would arise. *Chairman Seaborg* replied that some of the devices to be used in the research program had not been exploded in the particular yields which were specified for the program; this might raise some question as to whether these devices were new weapons.

*Mr. Allen Dulles* stated that CIA had no objection to the proposal concerning disclosure of nuclear devices to be used since the Soviet Union had nuclear weapons which were much more sophisticated than the devices it was proposed to show the Soviets.

*Dr. Wiesner* remarked that the Soviet Union may object to the decoupling shots proposed for the research program on grounds that these shots would teach us how to evade the test ban agreement. There was some validity in this since a country which had not tried out decoupling would have to proceed very slowly and cautiously if it tried to evade the agreement in this manner. While he concurred in the proposal for unilateral disclosure, *Dr. Wiesner* wished to note that the decoupling shots were a weakness in the U.S. position. *Chairman Seaborg* noted that the decoupling shots were also for the purpose of learning whether these shots could be detected.

*Secretary Rusk* noted that the proposal for safeguarding a seismic research program could be taken as agreed and suggested that *Mr. McCloy* describe the next item on the agenda.

*Mr. McCloy* then turned to the question of *Peaceful Uses of Nuclear Explosives*. He proposed that the U.S. agree to give the Soviet Union the right to look at any devices which we use in our Plowshare program.

This of course would mean that we would have to use obsolete devices unless we were willing to open more advanced devices to Soviet scrutiny. We would resist the idea of giving the Soviet Union blueprints, but we would give the Soviets a chance to look at the devices. Mr. McCloy said he understood that a MARK 11 device could be used for some aspects of Plowshare but that this was not the device which the AEC would like to use. This proposal would limit the development of the Plowshare program and therefore the AEC would prefer to retain the “black box” concept of safeguards for this program.

*Secretary Rusk* inquired how much interest the Soviet Union had shown in the negotiations in the use of nuclear explosives for peaceful uses. *Mr. Stelle* and *Mr. Spiers* replied that the Soviet Union had shown no interest at all beyond tabling a treaty article on peaceful uses to counter an article which the U.S. had submitted. The Soviets considered that their acceptance in principle of peaceful uses detonation was a concession to the West.

*Secretary Rusk* then turned to the other Principals for their views.

*Secretary McNamara* stated that he concurred in Mr. McCloy’s proposal.

*Chairman Seaborg* stated that he would also accept Mr. McCloy’s proposal but he believes that an upper limit on the number of shots in the program during an agreed time period, as proposed by the State Department, was not necessary. *Dr. Wiesner* remarked that there might be a radiation problem for which reason a ceiling on the number of shots would be useful.

*Mr. McCloy* agreed that the U.S. need not propose initially an upper limit on the number of shots but should rather wait until we hear from the Soviet Union on our revised proposal.

*Mr. Dulles* said that he had no objection to the proposal.

*Mr. Bundy* inquired whether Plowshare was a sensitive issue with the Joint Committee. *Chairman Seaborg* replied that it was but that the more important question for the Joint Committee was that of opening of nuclear devices to inspection. *Mr. McCloy* concluded discussion of this item by expressing his feeling that the AEC had made a considerable concession in the interest of achieving an agreement in Geneva.

Mr. McCloy then turned to the next item on the agenda: the question of *Numbers of On-Site Inspections*. Mr. McCloy reviewed the history of the negotiations on the number of on-site inspections and stated that he now wished to propose that the Principals adopt a position calling for 10 on-site inspections annually in the territories of each of the original parties with an additional on-site inspection to be added to the quota for each 5 eligible seismic events beyond 50 and with a ceiling of on-site inspections to be set at 20 for each original party. Mr.

McCloy felt that this proposal would mean no significant change in the U.S. position if estimates of the number of seismic events in the U.S.S.R. were correct. Mr. McCloy stated that the scientists had not been able to tell him that any one specific number was the correct number of on-site inspections; while 20 on-site inspections had considerable merit, there was no magic in that number. The Soviet Union was able to argue that our quota number was just as political a figure as the Soviet proposal of 3. Furthermore, the U.K. had in a sense pulled the rug out from under us since Prime Minister Macmillan had told Khrushchev that a number of on-site inspections (which we thought to be something like eight) would be an acceptable quota. Mr. Ormsby-Gore had been very appreciative of the escalator proposal and felt that he could sell it to the U.K. government. *Mr. McCloy* felt that it was important that the position with which we returned to Geneva reflect a fully agreed Western position. The difficulty was that the number of 20 was looked on by some Congressional leaders as essential. Mr. McCloy concluded by recommending that the Principals adopt the escalator proposal with a ceiling of 20 and a floor of 10 and remarked that he felt that the security of the country would not be impaired by a quota number of something less than 20.

*Mr. Arthur Dean* stated that there had been two days of very constructive talks with the U.K. and complete agreement had been achieved on the positions which Mr. McCloy was now presenting to the Principals. Mr. Dean felt that if the Soviet Union sensed any disunity between the U.S. and the U.K. on the quota question, the Soviet Delegation would hammer at this point with the result that the importance of the other moves we were making would be downgraded. Mr. Dean believed that under the escalator proposal we would generally get the number of inspections which we wanted in any case. As to the ceiling of 20, this was a political fact of life unless we sought to repudiate a number which we had already tabled. *Secretary Rusk* commented that the key point on this proposal in his judgment was whether the Administration could take the treaty to the country in the sincere conviction that the control system agreed upon was genuine and not a sham. He then asked the other Principals for their views.

*Secretary McNamara* stated that he preferred to hear the views of others before commenting.

*Mr. McCloy* said he felt the proposal he was making constituted a substantial deterrent to Soviet violation. He further stated that it was his understanding that Dr. Kistiakowsky, after consideration of scientific factors involved, had concluded that 10 on-site inspections in the Soviet Union would be an acceptable deterrent.

*Dr. Wiesner* pointed out that there would be an intelligence contribution which would help us on this problem and that we would also

have unilateral capabilities for distinguishing between natural events and explosions. Dr. Weisner believed that one clandestine nuclear test would not be significant in changing U.S.-U.S.S.R. nuclear weapon capabilities. With something like 20% sampling, it was unlikely that a series of tests could go undetected. *Dr. Fisk* remarked that his committee had examined the question of how many unidentified events would occur in the Soviet Union and had concluded that there would be something like 70 to 75 unidentified events greater than 20 KT yield in the Soviet Union annually. This assumed control posts only in the 3 original parties and assumed no decoupling. This number would be cut in half if the entire world-wide Geneva system were installed.

*Chairman Seaborg* felt that the question of the number of on-site inspections was the most important part of the whole treaty. It was the most important safeguard we had against Soviet violation. In this connection, he shared the concern expressed by Secretary Rusk about the support of the American people for the treaty. Chairman Seaborg also understood that there was a scientific basis for the U.S. proposal on the number of on-site inspections. Utilizing certain analytical techniques, the number of really unidentified events in the U.S.S.R. could be reduced to about 20. If the escalator proposal were to be put forward, Chairman Seaborg believed the upper limit of 20 inspections should be deleted.

Mr. Bundy inquired whether Chairman Seaborg's comment concerning 20 suspicious events meant that there would be a one-for-one inspection of the really suspicious events with our present proposal for 20 inspections in the Soviet Union. *Chairman Seaborg* agreed that this was so and felt that because of this the treaty could be acceptable to the American people. *Mr. Stelle* remarked that the U.S. had already, in fact, suggested this proposal in Geneva when we had proposed that 20% of all located events be inspected. The difference was that we had not suggested a floor of 10 inspections. The Soviet Union had already rejected this proposal.

*Dr. Wiesner* said that he personally would like to hold to the flat number of 20 on-site inspections if the UK would go along with us. *Secretary Rusk* inquired whether the Soviet Union had provided us with any data as to the numbers of unidentified seismic events. *Dr. Wiesner* and *Mr. Keeny* said that the Soviet experts had agreed with seismicity figures which we had given them. *Secretary Rusk* commented that he had thought the escalator proposal would result in about 20 on-site inspections being carried out in the Soviet Union annually.

*Secretary McNamara* said that because of the fact that in some years there were many more than 100 seismic events in the Soviet Union, he felt it would be desirable to have a cumulative upper limit. In this way, we could take care of the years in which the numbers of earth-

quakes greatly exceeded the number of 100 by accumulating on-site inspections which we might not wish to use in the low seismicity years.

*Dr. Wiesner* stated that he had talked with Mr. Ormsby-Gore and had told him of his belief that the U.S. should stick with the 20 on-site inspections; he had also been told by certain Soviet scientists that if everything else were agreed in the treaty there might be no problem with 20 on-site inspections in the Soviet Union. He was somewhat surprised, therefore, that Mr. McCloy and Mr. Dean had received different impressions from the British.

*Mr. Dulles* said he would not comment on this proposal except to say that he felt his agency could be of some help in the problem of deciding which events to inspect. This would depend on the amount of work involved in an attempt at clandestine testing. For example, if large amounts of earth movement were necessary for a decoupling shot, intelligence might be able to pick up this activity.

*Secretary Rusk* concluded that the question of numbers of on-site inspection was such a sensitive one that, regardless of whether agreement could be reached among the Principals, it should be discussed with the President. This was generally agreed.

*Secretary McNamara* added that the Principals should speak to the range in frequency of seismic events so that the whole picture could be seen. *Dr. Wiesner* remarked that he felt the method of sampling seismic events was a tremendous deterrent and that a one-for-one inspection of seismic events was not necessary.

Mr. McCloy then turned to the last item on the agenda: *High Altitude*. He remarked that in 1959 a committee of U.S., U.K. and U.S.S.R. experts had set up a theoretical control system for monitoring outer space. Mr. McCloy proposed that the Principals adopt a proposal for a full ban on weapons tests at high altitudes and in outer space and install the experts' control system to monitor this environment. This system would be installed in phases, and components could be changed by agreement among the original parties. He felt that joint U.S.-U.S.S.R. cooperation in putting in a control system for monitoring outer space could be a way of advancing our common knowledge. Mr. McCloy said he had concluded that we would not be losing very much by agreeing to a ban on weapons tests in outer space.

*Secretary McNamara* said he was not clear as to what kind of research program would be carried out in connection with the outer space monitoring system. *Mr. McCloy* replied that the U.S. and U.S.S.R. would cooperate in putting up a satellite system and establishing ground equipment; the data derived from this and from our own research would be made available to the U.S.S.R. We would expect to obtain similar data from the U.S.S.R. *Dr. Wiesner* remarked that a research program for outer space monitoring would not involve nuclear detona-

tions. Mr. Nitze inquired whether it was not true that the Soviet Union could evade a test ban agreement in outer space. In this connection *Dr. Fisk* noted that the capabilities talked about in the control system proposed by the experts was detection out to a distance on the order of 1 million kilometers for unshielded detonations. *Mr. McCloy* added that he understood that it would require about a year to get a nuclear device out to this distance for a test. *Secretary McNamara* then stated that he would concur in Mr. McCloy's proposal.

*Secretary Rusk* inquired as to the feasibility of the control system suggested by the experts. *Dr. Fisk* replied that it was within the state of the art but that the components required did not exist at the present time. There was no further objection by the other Principals to Mr. McCloy's proposal.

*Secretary McNamara* then stated that he would like to raise two questions which he thought the Principals ought to discuss. The first was how we could disengage from the Treaty in the event of certain actions by other countries. The second was how we could disengage from the present moratorium on tests. *Mr. Spiers* replied that in the case of the first question there was a duration clause in the treaty which provided that the U.S. could withdraw from the Treaty in case it was not being fulfilled. Of relevance, also, was a phasing provision which required installation of control posts on a world-wide basis on a specified schedule. On the second question, *Mr. McCloy* believed that the President did not wish to set a date for discontinuing the moratorium but that he did contemplate a resumption of tests if it became apparent that the Soviets were stalling on reaching an agreement. *Secretary Rusk* stated that it was the position of the Department of State that the moratorium should not be continued indefinitely if agreement were not reached. *Secretary McNamara* said that he strongly felt the moratorium should not be extended indefinitely and he wondered whether it were possible to plan in advance on how the moratorium could be broken off in the event of failure to agree on a treaty. *Dr. Wiesner* felt that such a plan in existence at this time would torpedo the conference. *Mr. Dean* remarked that as far as a plan for presenting the revised Western position was concerned, he anticipated about two weeks of detailed presentation at the end of which time the new western position would be fully exposed to the Soviet Union.

*Secretary Rusk* inquired how much of a lag there would be between the signal to go ahead with preparation for nuclear shots and the time of detonation. *Chairman Seaborg* and *Gen. Betts* replied that tunnels were ready and that approximately 3 to 6 months would be required for installing instrumentation and making final preparations. *Secretary Rusk* then stated that it seemed to him there was great merit in standing on statements which the President had previously made on this ques-

tion of the relation between the effort toward agreement and the resumption of tests. He felt that how we handled a break in the moratorium would depend on developments in the conference since disputes over specific issues would have to be handled in different ways.

*Mr. McCloy* said that it would be very difficult to work out a plan now that would be worthwhile. Further developments in the conference would be of great importance in determining what we do. He had, however, given thought to this matter and had certain ideas as to what should be done.

*Secretary McNamara* then said he would pose the question in a different way: would we in fact resume tests if agreement in Geneva were not possible?

*Mr. Bundy* said that in any event, this would be a poor time to make the decision. *Secretary Rusk* said he had supposed the U.S. would resume tests if agreement in Geneva could not be reached. *Mr. Bundy* said that he felt *Secretary Rusk's* suggestion of staying within previous statements by the President on this question was wise and should be followed by the Administration. *Secretary Rusk* asked that a paper be drawn up compiling the statements by the President on this question.

*Secretary McNamara* inquired what we expected from France in connection with this treaty. *Secretary Rusk* replied that there was a phasing provision in the treaty which called for world-wide installation of a control system and that this envisaged nearly universal adherence to the treaty. *Mr. Spiers* stated that the objective had always been to obtain a world-wide system, to be installed in phases. It had been felt that by making common cause with other nuclear powers, we could put pressure on other countries to join the treaty. Otherwise there was little we could do so stop Nth countries. *Secretary McNamara* then inquired whether France could test for four years if its presence as a member of the treaty was not required until Phase II. *Mr. Stelle* replied that under U.S. proposals, the Control Commission could invite France to join the treaty at any time; if the French refused to join, the duration clause of the treaty could be invoked. While this problem pertained to France, it also pertained much more importantly to China. *Secretary Rusk* asked that *Mr. McCloy* draw up a paper specifying the conditions under which the U.S. could withdraw from the treaty.

Referring to certain other issues in connection with the nuclear test conference, *Chairman Seaborg* commented that there should be a tightening up of the provisions pertaining to participation of "other side" nationals in special flights and on-site inspections teams. He felt that at least one-half of the personnel on such special flights and inspection teams operating in U.S.S.R. territory should consist of U.S.-U.K. nationals, rather than leaving this open as had been suggested. *Chairman Seaborg* also questioned whether the U.S. representative in

the Control Commission should be given authority to change the treaty obligation as regards phasing of the control system and installation of components within phases. Furthermore, he felt it would be dangerous for the U.S. delegation to attempt to determine whether the Soviets were interested in combining other arms control measures with the nuclear test ban agreement, as had also been suggested. *Secretary Rusk* replied that the staff would work on these problems in connection with further preparation by the Department of State of instructions for the U.S. delegation. As far as the authority of the U.S. representative on the Control Commission was concerned, that person would act in accordance with the wishes of the U.S. Government and subject to Constitutional processes. *Mr. Dean* remarked that on the question of Soviet interest in other arms control measures in connection with the test ban agreement, it was envisaged that negotiations with the Soviet Union might still go on even if the U.S. broke off the moratorium. This, therefore, would not prolong the moratorium.

Secretary Rusk then asked Dr. Fisk to summarize the report of his committee. *Dr. Fisk* said that the report had been agreed to except for the last chapter which concerned the difficult question of what could be said of the effect of a test cessation on our military posture. This last chapter had been drafted to indicate that there was a spectrum of opinion on certain matters. Gen. Loper had not agreed to the last chapter and would submit a separate comment. Dr. Fisk then briefly reviewed the report, pointing out that there were varying views within his committee as regards the importance of very light weight strategic weapons and the importance of seeking further improvements in the technology of tactical nuclear weapons.

*Gen. Loper* stated that he wished it known that he had dissented from the last chapter of the report because he felt that it had not dealt with the problem of cost effectiveness, a matter which could be handled and which was of great importance to the national economy. *Secretary Rusk* expressed his appreciation to Dr. Fisk for the work he and his committee had done.

*Mr. Bundy* then inquired as to the timing of further actions in connection with the nuclear test conference. He remarked that he understood there was a certain urgency attached to seeing Congressional leaders and he inquired whether the Fisk Report should be made available to Congress.

*Mr. McCloy* replied that he had not addressed himself as yet to the problem as to what dissemination to make to the Fisk Report. *Chairman Seaborg* remarked that it did not seem to him that we could look for favorable legislative action if Congress could not review the Fisk Report.

After some discussion, the Principals agreed that the President should be consulted as soon as possible in regard to further action to

be taken in preparing for the resumption of the nuclear test talks, and particularly on the unresolved question of numbers of on-site inspections.

The meeting adjourned at 6:40 p.m.

---

## **5. Notes on Telephone Conversation between Cleveland and Rusk, March 14<sup>1</sup>**

March 14, 1961

### TELEPHONE CALL FROM MR CLEVELAND

The Sec returned the call and C reported on his talks with the President and Bundy. The Pres had seen Stevenson's cable and wanted to know about the Indian res and asked if we could take it. C said he would look at it and consult with the disarmament people and give him an answer. (Conversation around me and I missed a bit here.) C said when he called back that he thought the best thing at this point would be to go ahead with the cable to Stevenson—not make a deal on the Indian res at this stage but work out a symbolic res ourselves. Use part of the Indian and Canadian res and give credit to all the drafters. C explained to the Pres and Bundy there has been a reluctance around town particularly at the Pentagon and at State to separate the symbolic from the real. We should find a way of agreeing with the Russians and underdeveloped countries about the definition of Utopia. Then we say o.k. we agree on that and then let's see what to do next. The Sec said he thought our res did that. C thinks we won't get away with it. The Sec asked about the parliamentary position. C said Stevenson is talking with Gromyko about a deal on what we will do in the GA on disarmament and S feels we should give an answer—stick to the instructions at the WH now or go beyond the Indian res. C thinks we should go ahead on this cable and have another saying we can't go along with this but we will work something out in the course of the GA. C thinks it will be o.k.'d at the WH. The Sec thinks we should get an instruction out to Stevenson.

**6. Telegram 1703 to USUN, March 14<sup>1</sup>**

March 14, 1961

RE: Disarmament

Confirming our meeting March 12, following are instructions on handling disarmament in relation to resumed GA:

1. Approach should be made to Gromyko in New York based on our willingness to agree in advance on GA resolution containing following points:

(a) Preamble would make clear that resolution is based on statements by representatives of US, UK, USSR and France regarding resumption of disarmament negotiations;

(b) Resolution would welcome announced intention of four powers to reconvene 10-nation Committee on Disarmament with certain officers of Conference as might emerge from negotiation on point 2 below;

(c) Resolution would welcome announced intention to resume disarmament negotiations in this body on or before August 1, 1961 in Geneva.

2. Re composition of forum, we would prefer as first bargaining position to stick with 10-nation forum already agreed by four Foreign Ministers in 1959. In probable event no agreement could be achieved on simply reconfirming 10-nation forum, we would be prepared accept either of following arrangements in this order of preference:

(a) Ten nations plus two other nations, presumably Mexico and India, each of whom would designate distinguished citizens to serve as Chairman and Vice Chairman-Rapporteur, respectively. They would be officers of conference, but would not vote or participate in substantive debate.

(b) Same as (a) but with three officers rather than two.

3. In explaining date, both to Gromyko and later generally to UN delegations, you might well make clear our view that, as other delegates will appreciate, formal negotiating conference approached with serious intent requires great deal of informal advance discussion among parties to it. Any attempt to set date for formal negotiations unrealistically early should be read as intention merely to make propaganda rather than progress. FYI. Our intention is to have bilateral talks with Soviets in early summer, in full consultation with UK, France, Canada, and Italy for our part. You may indicate to Gromyko intention to discuss disarmament informally with Soviets in first instance, but there should be no repeat no discussion this procedure with other delegations in

---

<sup>1</sup> Guidance on handling disarmament issue in General Assembly. Secret. 4 pp. Department of State, Central Files, 600.0012/3-1461.

New York and no repeat no implication substantive disarmament discussions will take place in UN channels. END FYI.

4. Re QUOTE principles UNQUOTE or QUOTE directives UNQUOTE, we would prefer relatively simple statement merely defining general purpose of negotiations to be conducted in agreed forum. Something along following line might do (these clauses would follow QUOTE welcoming UNQUOTE clauses in para. 1 above):

(a) Declares that objective of further negotiations should be development of program for achievement of secure and peaceful world in which there is complete and general disarmament under effective international control, agreed and reliable procedures for just settlement of disputes without resort to force, and effective arrangements for maintenance of peace in accordance with principles of Charter of United Nations;

(b) Urges parties concerned to seek and to implement in shortest possible time widest area of agreement that can be defined on measures directed toward foregoing objective;

(c) Urges further that parties concerned should not cease their efforts until full program for achievement of this objective has been agreed for submission to General Assembly for consideration.

5. Existing resolutions which have been filed in General Assembly (Canadian, Indian, etc.) might be handled by including in resolution on date and forum paragraph which would take note of all resolutions filed in 15th GA on this subject, and commend them to scrutiny of new agreed disarmament forum.

6. Following points FYI not for discussion Gromyko.

7. When disarmament is discussed in public, in connection with above resolution or otherwise, it is our thought that we would do so in context of following closely related subjects, further investigation of which we are now undertaking:

(a) US position at nuclear test ban talks Geneva, of which you will be fully apprised.

(b) Possible US proposal, in general terms at first, regarding nature of international agency which will be required to administer and control program looking toward general disarmament. We will be working further on this here.

(c) Possible US proposal to revive active discussions in establishment of UN force under Charter Articles 43 to 47.

(d) Possible US proposal for special UN commission to consider establishment regional machinery in order to avert arms races in such areas as Africa and Latin America. President Eisenhower's proposals on Africa in this regard (second point of his African program in GA address of Sept. 22, 1960) appear to have been greeted with deafening silence by nations which are nevertheless anxious for disarmament talks among big powers. Seems useful to have disarmament talks pro-

ceed among smaller powers concurrently with discussions of disarmament by big powers in major Geneva forum.

Would welcome your views on para. 7.

8. We have advised UK, French, Canadian and Italian Embassies here re approach set out in paras 1 through 5 above and will undertake inform NATO at appropriate time.

**Rusk**

---

## **7. Nusup 1083 to Geneva, March 15<sup>1</sup>**

March 15, 1961

Following instructions are for guidance of USDEL at Conference on Discontinuance of Nuclear Weapon Tests resuming March 21.

1. *Objective.* Objective is to determine as early as practicable whether treaty along general lines called for by United States positions is negotiable with USSR, and if so, to conclude negotiations rapidly on this basis. While seeking agreement, USDEL should also build basis which will permit maximum flexibility for future US actions in event of failure to agree.

2. *General Tactics.* Our tactics in initial stage should be designed to present to Soviets and to world, fully and persuasively, new US proposals on test ban treaty and attendant commitments with view to determining whether an agreement can be reached on the basis of those proposals. Accordingly, in early meetings of resumed negotiations US representative should place on conference record in form suitable for subsequent public scrutiny detailed explanation of position and its rationale. Full account of US positions should be made public through press briefings as positions are tabled in conference. USDEL should make clear its expectation that early response to these proposals will be forthcoming from SovDel. Informal consultations should be held as appropriate with Soviet Del.

3. *Specific Positions.* USDEL should submit new proposals as follows:

---

<sup>1</sup> Conference on Discontinuance of Nuclear Weapon Tests: guidance for USDEL. Confidential. 9 pp. Department of State, Central Files, 397.5611-GE/S-1561.

(a) *Safeguards for seismic research program.* USDEL should propose removing the requirement from our present position which calls for joint contribution of nuclear weapons to a pool. USDEL should also offer to permit inspection by original parties of detailed drawings or blueprints of the devices used as an aid to the actual inspection of device. Pertinent data obtained from the seismic research program would be published. USDEL should make clear that implementation of this proposal on the part of the US is subject to Congressional authorization. USDEL may further inform SovDel that when safeguards arrangement for the research program can be agreed and Congressional authorization obtained we would expect to begin and carry out a program which the US may deem necessary to ascertain system capabilities or potential for improvement with Sov participation but with no right to veto any part of the program.

(b) *Moratorium.* USDEL should modify present proposal by stating that since research program will be extended to three years (including a three-month review period) moratorium should be correspondingly lengthened to coincide with length of research program. Moratorium will be effective on date of signature of treaty. USDEL should point out, as appropriate, that US hopes treaty can be concluded in near future and that research program will begin at same time but that US may wish seek agreement that seismic research program begin before signature of treaty. Towards end of research program, during review period, original parties should consult to determine whether or not the moratorium should be continued and/or whether the threshold should be changed. USDEL should make clear parties regain freedom of action at the end of the research program as regards further obligation below threshold.

(c) *Number of control posts.* If initial attempt to obtain agreement on basis dropping two posts from Phase IB in USSR (for total of 19) is not successful, USDEL may agree that total of 17 control posts will be installed in territories of Soviet Union, including one on Soviet island. Two posts will be located in the European part of Soviet Union and 14 in Asian part of Soviet Union. Number of posts in North American territory of United States will be reduced from 11 to 10. Six control posts will be established on US islands. Condition for modifying our original proposal should be that control posts which we previously proposed be located just within national borders of US and Soviet Union will be located in adjoining countries in later phase. Phasing of installation of control posts should be: USSR: Nine continental posts plus one island post to be established in Phase IA (0–2 years after treaty enters into force); seven continental posts to be established by end of Phase IB (0–4 years after treaty enters into force). US: Six continental posts plus six island posts to be established in Phase IA; four continental

posts in Phase IB. Number and phasing of control posts for UK will remain as previously described, but we would be ready to follow any arrangements satisfactory to UK on posts in Australia and Africa requested by USSR for Phase I. On-site inspections will begin as soon as events can be certified eligible for inspection which will, in any event, be no later than the end of Phase IA.

(d) *Number of On-Site Inspections.* USDEL should initially reaffirm previous US proposals for number of on-site inspections (i.e. 20%–30% formula and flat number of 20). US proposal of twenty annual on-site inspections in USSR should be buttressed by appropriate technical argumentation; Soviet proposal of 3 inspections should be attacked as entirely inadequate deterrent in light of frequency of seismic events in USSR. At discretion of USDEL, fallback position may be introduced as follows: USDEL should propose that the minimum annual quota for each original party will be 10 inspections, but after 50 seismic events in any one year above seismic magnitude 4.75 have been located by application of the criteria as eligible for inspection in the territories of any of the original parties, one additional inspection will be added to the quota for each increment of five located events. Total number of on-site inspections which may be carried out annually on territory under jurisdiction or control of an original party shall not exceed 20. In presenting this proposal USDEL should point out it combines advantage of fixed number, as advocated by Soviets, with advantage of adjusting number according to actual frequency of seismic events. Treaty language, including provision for Control Commission review of number of on-site inspections, will be sent in separate telegram.

(e) *High Altitude.* USDEL should propose that treaty provide for discontinuance of nuclear weapons tests at high altitude and in outer space. Control system shall include equipment suggested by high altitude technical working group. Treaty shall provide for installation during first phase of high altitude equipment in control posts, of Argus satellite, and of far earth satellites recommended by high altitude technical working group. USDEL should point out that additional research (e.g., background measurements in outer space) will be required to confirm estimates of capabilities specified by high altitude technical working group. US prepared to carry out such research independently and through control system and hopes USSR will do likewise. Purpose of research should be to ensure high altitude detection capability at least as great as that indicated by TWG-I experts. USDEL should introduce specific treaty language to be sent in separate telegram. Study being made to determine whether present treaty language adequate to allow for parties' being released from high altitude treaty obligation in event subsequent research shows control system will fail to meet estimates of capability made by TWG-I experts.

(f) *Composition of Control Commission.* USDEL may state that it is prepared to accept 4-4-3 control commission contingent on agreement on control system which is reliable, rapid, and effective and which in its day-to-day tasks as regards, at the very least, the original Parties operates largely independently from control commission participation.

(g) *Peaceful Uses of Nuclear Explosions.* USDEL should state that US will drop "black-box" method of preventing peaceful detonations from being used for military purposes. US adheres to alternative method of full disclosure of internals of devices used and will permit examination by original parties of detailed drawings or blueprints of devices used, as an aid to actual inspection of device. USDEL should also seek inclusion of provision authorizing Control Commission, with assent of original parties, to prescribe alternative safeguard procedures for peaceful uses explosions.

(h) *Parties to the Treaty.* USDEL authorized drop reference to "authorities". Specific treaty language to follow in separate telegram.

(i) *Budget and Finance.* USDEL should propose that conference accept idea of unanimity of original parties in voting on total amount of budget; we would not accept veto of individual items of budget. This conditioned on understanding that annual contribution of US and USSR would be equal, while UK contribution would be smaller. Also, if 4-4-3 Control Commission composition adopted, voting on financial questions other than total budget must be by simple majority vote to avoid giving Sov bloc de facto veto.

5. *Other Issues.* USDEL should generally adhere to existing US positions on following matters except for modifications noted:

(a) *Nationality of Inspection Teams.* As fallback position to be used at USDEL's discretion, proposal may be made to add prohibition on service on teams by nationals of countries allied with host country and to drop requirement that teams in original party territory be exclusively "other side" nationals. On this and following item USDEL may state it prepared agree neutrals might serve on inspection teams and special flights. Numbers of neutrals would be subject for discussion at present negotiations provided that neutrals may not comprise more than 50% of team or flight.

(b) *Nationality of Control System Specialists on Agreed Special Flights.* As fall-back position to be used at USDEL's discretion, USDEL may propose adding prohibition on service by nationals of host country allies and dropping requirement that specialists on flights over territories of original parties must be "other side" nationals.

(c) *Chiefs of Control Posts.* These should not be nationals of host country or ally. In original parties, "other side" rule shall apply. USDEL should consult with DEPT concerning use of following amendment if

negotiating situation indicates its introduction would be helpful: Except in regard to official reports to Administrator of data collected from instruments at post, host country deputy could independently present views to control organization headquarters on administrative procedures, management, and general activities of post.

(d) *Seismic Research Program*. Should be of three years duration including review period but unchanged as regards content, especially number and purposes of nuclear shots. (See safeguards section for other aspects.)

(e) *Criteria for On-Site Inspection*. The USDEL should continue to reject as technically unsound Soviet proposal that event must be located within 200 square kilometers area to be eligible for inspection.

(f) *Phasing of Installation of Complete System*. Present schedule should be adhered to for all components. USDEL should, however, introduce language to extend Article XIV, Annex I, to allow Control Commission, with consent of each of original parties, to postpone, add to, or refrain from establishing any of components of control system in Phase I, as presently provided for Phases II and III.

5. More detailed instructions will be despatched as required on foregoing and ancillary issues.

Rusk

---

## 8. Nusup 1095 to Geneva, March 20<sup>1</sup>

March 20, 1961

Following FYI excerpts relating nuclear tests from uncleared Mem-Con Secretary-Gromyko conversation luncheon March 18:

Secretary: BEGIN VERBATIM TEXT The US Govt is very serious with regard to the negotiations on the discontinuance of nuclear tests and hopes that an agreement can be obtained that will be in the interest of all parties concerned and will not affect their security. END VERBATIM TEXT.

Gromyko: BEGIN VERBATIM TEXT As to the question of nuclear tests, the Soviet Union has made very many concessions but has not seen a similar attitude on the part of its negotiating partners. Frankly

---

<sup>1</sup> Excerpts of Rusk–Gromyko conversation on question of nuclear tests. Secret. 2 pp. Department of State, Central Files, 397.5611–GE/3–2061.

speaking, the Soviet Government has gained the impression that its negotiating partners have been trying to be shrewd and to obtain an agreement that would be detrimental to Soviet interests. As the US knows, the Soviet Union has not been testing. Furthermore, there are instruments today which can detect any nuclear explosion in the world. Mr. Gromyko said that he did not know whether the Secretary wanted to discuss the details of this particular problem. For his part, he did not insist on such a discussion but would be prepared to discuss these questions if the Secretary desired. In any event, Mr. Gromyko said, one should realize that if there should be no agreement, the Soviet Union would not be the only one to stand a loss. Such a development would harm everyone and, most of all, peace and the world situation at large. END VERBATIM TEXT.

UK briefed Washington.

## **9. Supnu 1428 from Geneva, March 24<sup>1</sup>**

Geneva, March 24, 1961

From Dean. Following represents purely speculative analysis on our part as to why, before hearing any of our proposals, the Soviets should have demanded a tripartite administrator since they must know we could not in any event accept what constitutes an absolute veto on working of control system as a part of the treaty.

Possibility one: Because of strong elements of public opinion currently expressed in the US rpt US that either a further moratorium or a successful test ban treaty was in the best interests of the United States they may have decided to face us with a known impossible condition in the hope that we would seize this as a break point and thereby put the onus and responsibility on US for terminating the treaty negotiation; or

Possibility two: They may have put it forward merely for delay or for the purpose of inducing us to be more forthcoming on the number of on-site inspections, staffing, etc.; or

---

<sup>1</sup> Soviet proposal for tripartite administrator. Confidential. 2 pp. Department of State, Central Files, 397.5611-GE/3-2461.

Possibility three: They may have put it forward with the intent of using any flat US rejection as the occasion for Soviet termination of negotiations. This possibility seems on the fact of it remote, but conceivably they might be seeking for a way to merge the test talks with general disarmament negotiation and might, therefore, be ready to break off the talks on an issue on which they were fully prepared to stand in wider disarmament negotiations; or

Possibility four: They are probably au courant with the general thinking that any system of control worked out in the test ban treaty would probably be used as precedents in general disarmament negotiations. Since they may insist on a tripartite control system in general disarmament negotiations they may not have wanted us to use the 4–4–3 formula with a single administrator as a precedent in such negotiations. If it develops that they really want a test ban treaty, they may ultimately come to the single administrator in that treaty, but insist that it cannot constitute a precedent in the GCD negotiations and might make their agreement on a single administrator in the test ban treaty contingent upon a satisfactory tripartite administrator in the GCD negotiations.

Tsarapkin's attitude continues completely non-committal, but on surface friendly and cordial and he apparently wants to give appearance that he personally wants to see test ban treaty successfully concluded. His conduct, however, provides no helpful clue as to which, if any, of the above alternatives is near the mark.

Possibility five: That they have no firm idea as to what they will eventually do about the issue in these negotiations but merely felt uncomfortable with having accepted a single administrator in the face of their position on the SYG.

In view of our inability to determine what motivates Soviet proposal for tripartite administrator, we intend to handle our replies on subject with great caution, focusing on the point that our offer of parity in the control commission gives the Russians every protection of their interest they require and makes it unnecessary as well as undesirable for them to stick on their tripartite proposal.

April 1961

10. Memorandum from Battle to Swank, April 21<sup>1</sup>

April 21, 1961

*The Secretary's Remarks to the Disarmament Consultants*

The attached copy of the Secretary's remarks, as delivered to the disarmament consultants on April 14, is referred for approval.

The Disarmament Administration plans no distribution of the Secretary's remarks, except for one copy to Ambassador Stevenson.

**L.D. Battle**

**Attachment**

SECRETARY OF STATE—DEAN RUSK

*Comments to Consultants on Disarmament Problems*

*New State Auditorium—Friday April 14, 10:15 A.M.*

Mr. McCloy, ladies and gentlemen: Jack, I was surprised to discover there were still four deans left at Harvard. They are most welcome. Let me say to you gentlemen that we are extremely grateful to you, all of you, about half of whom I find are old friends, for coming here to give us some emergency help on this very serious question we have in front of us. I'm going to speak very simply and very quickly if you don't mind. This is Pan American day and the President is going down to the Pan American Union in a few minutes to make a speech and I have to join him for that. I'll come back later for questions when we have a chance. I'm reminded a little bit of the story told by a Princeton colleague who reminded us that when a Royal Statistical Society was first organized in England in the middle of the last century, their first coat of arms was a large sheaf of wheat, loosely gathered by a ribbon, on which was a latin motto which translated "Let others thresh it out." Incidentally, their professional pride got the better of them and they changed the motto a little later.

---

<sup>1</sup> Transmits copy of Rusk's April 14 remarks to the disarmament consultants. No classification marking on Battle memorandum. Remarks are Confidential. 12 pp. Department of State, Central Files, 600.0012/4-2161.

I'm not going to speak officially today in a sense because I don't know what our official policy is going to be in these matters until you people tell us and Jack McCloy tells us. I would like to make some personal comments. The first is, whatever your particular assignment may turn out to be, and whatever the subject you are working on in connection with disarmament, in the background is the fact that "disarmament" is merely another way of looking at the entire range of American foreign policy in all of its complexities and all of its agony. Disarmament is not a subject which we can pursue off here on this trail while the rest of the world is grappling with its problems out there in the great jungle. To the extent that we extract disarmament we lose reality and we come up again, as Government's have done so often in the past, with proposals in the field which we ourselves don't believe and which others don't accept as creditable.

I think we can assume that the reduction of arms is a fundamental objective of American foreign policy. We would for many reasons like to be able to reduce the arms burden, to limit the arms race and in this way find some way of reducing tensions. I will not take your time at the moment to talk about the cost of arms, but it staggers the imagination even to begin to dream about some of the things that the human race could do if this burden were lifted. I think we have to face these days, perhaps more than ordinarily, the possibility that arms themselves are a primary source of tension. When long range missiles loaded with hydrogen war heads are in position and ready to go, I think in a special sense we can say these days that arms are an independent source of tension, regardless of the other political problems with which we have to grapple. But there is no question, I think, about the readiness, willingness, of the United States to disarm if given half a chance. Indeed I would suppose that most of my adult life, and that holds for you, too, I have been living with the consequences of the weakness of those who were willing to keep the peace. I won't review that sad record, but between the two world wars this country was almost completely disarmed; some of our finest soldiers in world war II spent 17 years as first lieutenants in a country which neglected its armed forces. When I was called to military service in December, 1940 as a reserve officer, more than a year after the war in Europe had started, we had 190,000 men in our army. After world war II when we demobilized so precipitately and suddenly, I have the awful feeling that we subjected the leaders of the Soviet Union to intolerable temptation and that our weakness was one of the reasons why the Soviet Union did not join wholeheartedly in the spirit of the United Nations. We almost had it made in 1945, and I feel that the United Nations could well have handled all of the issues which arose except those in which the Soviet Union played the role of rogue animal.

We have to think hard about what we mean by disarmament: under what circumstances we move for disarmament, how military posture relates to our total position in the world, and how we move step by step as rapidly as we can toward a tolerable world order. The path of disarmament negotiations almost certainly is going to be long, tortuous and complicated. It could be dangerous. My guess is that it is important for us not to rely upon esoteric gimmicks but to relate our disarmament programs to the total effort of our foreign policy and try to keep policy and strength, or policy and reduction of arms, closely in line with each other. There are going to be many technical and organizational questions to be faced. Even one of the most minimum necessity, such as an effective inspection system, is going to be extremely difficult politically to achieve, technically costly to install, and will present us with a great many problems of the sort that you will be working on.

I must say it is puzzling to me to how we relate an effort in the disarmament field to the political situation in which we find ourselves at the present time. We are in a period of vast and dramatic change all over the world. Were there no communists about, we would be in a period of instability for reasons we need not go into now. But in this period of change the Sino-Soviet bloc is moving with great energy, with great skill and sophistication and with substantial resources, to pursue what they call their historically inevitable world revolution. Anyone working on disarmament should, I think, read the statement of the 81 Communist Parties of December 1960, and the Khrushchev speech of January 6, 1961. Efforts in the disarmament field have to occur against a background of continuous Sino-Soviet pressure in Laos, against the UN in the Congo, in the Western Hemisphere, specifically in Cuba at the moment, in Viet Nam and in other critical points around the world. Sharp pressures on Berlin are just over the horizon. A new pressure is not yet exposed to public view,—I don't know whether you know it or not, I picked this up—but the Viet Cong rebels in Viet Nam, for example, are now engaged in a systematic attempt to liquidate by assassination the government officials of South Viet Nam. This is going on at the rate of 40 a week—local administrators, school principals, government officials throughout that society, meaning an annual loss rate of about 2000 officials per year. This is an attrition rate that's very hard to sustain.

What does that mean for disarmament proposals? We in this country occupy the junior hemisphere. If we are to retain freedom for ourselves and freedom of action in our policy, there may be critical times when it will be fundamental for us to project our forces across the vast oceans into the great majority hemisphere which contains most of the earth's people and most of the earth's resources. We are allied

with more than 40 nations in different parts of the earth, in groupings of nations whose main purpose it is to keep the peace. These are not nations caught up accidentally in a fight between Washington and Moscow. You know we have almost no bilateral issues with the Soviet Union. If we were to try to make a list of the things of which we are arguing with the Soviet Union directly about in terms of national interest it would be a very short list indeed. The gap between Washington and Moscow, the tensions between Washington and Moscow, turn upon what we and others are afraid that the Soviet Union, the Sino-Soviet bloc, is going to do to someone else. In a certain sense we are the third force, we are the great stabilizing factor of security for reasonable men in parts of the world where they are under very serious pressure and threat of attack.

Then too, we have some serious problems out in the so called non-western parts of the world. What a pity it would be if the new nations of Africa should find themselves caught up in an arms race, even a minor league arms race, of the sort which has been developing in Latin America over several decades. The diversion of their resources and military effort would be a great pity under present circumstances, at a time when they need all of their resources for maximum economic and social development, for education and for the removal of sickness, ignorance, and misery. Yet when we talk with them, about the possibility of removing conflict to stabilize the arms position among themselves, we find that they are inclined to reply; "but my neighbor is getting arms from someone else," or we find them coming to us and saying: "well now, we want some arms from you; if we don't get them from you, we'll get them from the Soviet Union" or we hear them saying to us: "look, you people haven't been doing much about disarmament, these are prestige matters, you must not deny to us what you people in the white world obviously consider to be great elements of national dignity and power; therefore, if you disarm we will, but until you do, we won't." These are problems I think are important, because if these continents—if Africa, if Latin America, if Southern Asia, if the Middle East—get caught up in arms races stimulated and supported by the great powers, then we face some very serious and complicated problems.

Now, there are elements of common interest on which we might be able to build. I would suppose both we and the Soviet Union could agree that the prevention of a catastrophic nuclear war undoubtedly is a mutual interest of us both. Perhaps—we could agree, I'm not sure, that progress towards sound means of settling grievances and disputes is in the general interest. But this turns upon whether we are in an irreconcilable conflict or whether through national interest or other considerations it is possible to get some of our problems settled. I must

say that this morning I'm not particularly optimistic because we have problems in Laos, in Cuba, and in the Congo, and in other places which make us take very seriously indeed the communist manifesto of last December 1960 and other evidence we have of their determination to move forward. Nevertheless, we must do our best, because the stakes are extremely high. If we can find ways to move toward a reduction of arms realistically, honestly, with no disturbance of our own relative position in terms of supporting the institutions of law and order and peace and in supporting the free world, then we must of course do it. We hope we can somehow get started. Not by running up a flag of general and complete disarmament, but by getting started on some specific steps on which we can build later progress. This is one of the reasons why I incline to put the greatest importance on these nuclear test ban talks in Geneva. Because, although it is not a significant major step in disarmament *per se*, it would get us started on procedures of inspection and control; it would get us started in breaking down the secrecy which has made it so difficult to move ahead in this field, and this would be a very useful first start indeed. There may be other ways in which we can take some first steps, and we need to explore those in every way we can.

I suppose you might find it a little surprising for the Secretary of State to appear to be so negative on the subject of disarmament. I think what I'm trying to say is that this is not a subject which can be dealt with in front of a cheering crowd in a football stadium. One may get the impression that we feel under great pressure from world public opinion to jump aboard the bandwagon of general and complete disarmament. Let me say here that world public opinion is important, and that world public opinion at the present time appears to favor general and complete disarmament. But neither world public opinion, nor history, will forgive the United States if we act irresponsibly in this era of our history in dealing with the construction of a tolerable world of order in relation to the threats with which we are now confronted.

The United States Disarmament Administration has produced some materials which I cannot here critically examine. I can tell you, and you can see from my remarks how true it is, that we are desperately looking for constructive and good ideas on this subject. And we hope that we can put together proposals which are first class, which are creditable, and which are realistic. I think it is time for all governments to pull back a bit from the sort of rounds of talks through which we've been going, since at least 1920, and to see if we can't find some proposals which we can put forward with real commitment, real conviction, and with our own determination to see them through. I hope that we can somehow get out of a position which we ourselves even consider to be false. I would also say that we should not, I think, be cynical—that

is you gentlemen and ladies should not be cynical—about the attitude of your own government in this field simply because you see that we are going in for a larger military budget this year. In our discussion groups we can expose in detail a little bit more about what we have in mind. When we talk about increasing our conventional arms we look upon that as a move toward stabilizing the situation, as a move toward reducing tensions, as a move toward reducing temperature, and as a safety factor which can be very important in this disarmament field. We hope that we will not be drawn into protracted and meaningless bickering and negotiations with other governments. We are determined not to make unwise concessions. But, on the other hand, we are determined to move forward if we can move forward realistically and with real promise. Because again, to wind up where I started: there is nothing, I think, in our foreign policy effort which would be more satisfying to the American people to discover a way to reduce this burden of arms in a world which was beginning to find a way to settle its disputes by other means.

We can't wait until that world of order has come fully into being. We must do what we can, working at it, hard, continuously, and with conviction, dedication, and honesty. But it is going to be complicated and, because it is complicated, we have called together some of the best minds in the country to help us work it out. We are grateful to you and I'll be seeing you again before you get through with your deliberations.

Thank you very much.

May 1961

11. Memorandum from Belk to Bundy, May 15<sup>1</sup>

May 15, 1961

The paper immediately following on "Weapons Custody and Use" is a brief version of the longer paper sent to you by Mr. Seaborg. The paper is primarily a chronological history of the subject. The AEC appears to believe that it should continue to have custody of nuclear weapons and has chosen this rather poor way of saying it. The President should be briefed on this subject soon, but I should hope that someone would present the issues to him in a clearer way than does this paper. Is this a subject for the morning meeting?

Sam Belk

WEAPONS CUSTODY AND USE

*Maintaining Civilian Control*

Legislative history of the Atomic Energy Act of 1946 was the question of civilian versus military control of atomic energy. The Act authorized the President to deliver fissionable materials or weapons to the armed services and to authorize the armed forces to produce weapons. Under peacetime conditions the development, production, and custody of nuclear weapons would remain with the AEC. In August 1950, however, some non-nuclear components were transferred to bases in the UK and in the next two years more were moved to U.S. vessels and overseas bases under DOD custody. On April 6, 1951, President Truman authorized the transfer of [text not declassified]. AEC Chairman Dean considered this as the "end of the Commission's civilian responsibility over a portion of our war reserve of atomic weapons."

*Breakdown of AEC Custody*

By the spring of 1953, AEC had transferred [text not declassified] to military custody. Since these non-nuclear components would be of no use if nuclear components were not readily available, President

<sup>1</sup> Transmits paper on "Weapons Custody and Use." No classification marking on Belk memorandum. Attachment is Top Secret. 4 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, AEC General, 11/60-11/61.

Eisenhower, on June 20, 1953, on the recommendation of the National Security Council, authorized transfer of nuclear components equal in number. Requests from DOD up to October 1954 would have employed about 45 percent of the stockpile, and as a result DOD would control approximately half of the national stockpile. Therefore, in December 1954, Mr. Strauss recommended to the President that, rather than transfer custody from AEC to DOD, AEC retain “custody” of the dispersed weapons. However, the Commission agreed with the Secretary of Defense that custody should be transferred to DOD, and the President authorized the transfer not only of atomic but also thermonuclear weapons. The Commission opposed the transfer of thermonuclear weapons and on August 20, 1955 the President directed that AEC retain custody of all dispersed weapons with a yield of [text not declassified]. Transfers were made under a set of Interim Principles jointly approved by AEC and DOD, but problems arose frequently regarding (1) assignment of AEC “custodians” and (2) the necessity for loading complete atomic weapons in aircraft. Final agreement on procedures, June 4, 1956, permitted AEC-designated military “custodians” and the loading of “complete” atomic weapons in aircraft.

#### *Emergency Transfer and Use*

The issue of automatic transfer of the entire stockpile to military units under emergency conditions was settled by a Presidential directive of April 4, 1956 authorizing such transfer, and implemented by a Memo of Understanding developed by AEC and DOD, effective June 1, 1956. This transfer policy raised more sharply than ever before the importance of defining national policy on their employment.

NSC policy provided that in event of hostilities the U.S. would consider nuclear weapons as available for use as other munitions, and that the U.S. could not afford to preclude itself from using nuclear weapons even in a local situation.

[text not declassified]

#### *Peacetime Operations Involving Atomic Weapons*

Although AEC recognized the necessity for use of war-reserve weapons for operational readiness it was concerned about an inadvertent atomic explosion and recommended using training shapes for exercises and maneuvers. JCS study of the matter concluded that the use of war-reserve weapons was essential to the maintenance of acceptable readiness standards; that safety features were adequate; and large-scale procurement and use of trainers and shapes was unnecessary and undesirable. AEC finally recommended that the problem be presented to the President for decision; i.e. the problem of the degree to which war-reserve weapons might be used in exercises not directly related to operational readiness. The President approved the original DOD

proposal on November 26, 1960, which included a reporting procedure to the AEC.

*Transfer and Dispersal: The Last Stage*

The decision in the spring of 1956 marked the end of any concerted effort on the part of the Commission to invoke the principle of civilian control. Increasing requests from DOD for relaxing control on nuclear weapons, resulted in changes in the existing dispersal agreement, and a revised Presidential directive reduced the JCS reserve stockpile in AEC custody to such a low level that it was necessary to revise the emergency transfer agreement of 1956. The revised memorandum, approved by the President on February 3, 1960, eliminated the requirement for automatic transfer and assigned responsibility for such transfers to the JCS or higher authority. The Presidential directive setting the number of weapons to be transferred in fiscal year 1960 and fiscal year 1961 left less than 10 percent of the national stockpile in AEC control.

<sup>1</sup> Conveys draft reply from President Kennedy to Prime Minister Macmillan to Khrushchev on disarmament. Secret. 4 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, General, April–May 1961.

### Attachment

Dear Mr. Prime Minister:

Your helpful letter of April 27, 1961, shows that we have drawn similar conclusions from the recent behavior of the Soviet delegation at the Geneva nuclear test ban talks. I, too, have come to believe that the Soviet Government will not change its position unless Chairman Khrushchev can be persuaded that the alternative to a satisfactory treaty is the ultimate resumption of tests with the consequent damage to prospects for disarmament which that would mean. I propose to exert every effort to persuade him that a fair and reliable agreement is in his interest and in ours.

In my communications with Mr. Khrushchev regarding a possible meeting I shall refer to the need for a close examination of the test ban problem along the lines you suggest. I would not wish, however, to single out the test talks as the primary object of my discussions with him. I therefore do not believe we should address letters to Mr. Khrushchev on this subject prior to my meeting with him.

If I fail to reach any understandings with Mr. Khrushchev and if by that time the position that the Soviets have maintained in Geneva has not substantially changed, I believe the United States should be ready to resume nuclear tests for both seismic research and weapons development. I am now engaged in a thorough review with my advisers of the significance of carrying out nuclear detonations in the various categories. Pending this review I am not prepared at this time to suggest either the timing or the character of such tests. Presumably a seismic research explosion could be prepared within a shorter period of time than any really significant weapons test series. Any nuclear explosion would, of course, be underground and an announcement would be made that we had no intention of resuming atmospheric or underwater tests.

The essential thing for us is that the United States be in a position to exercise the freedom of action which has been reserved by my government since December 1959. I naturally hope very much that our two governments will be able to support each other's position.

I believe that if this country does not conduct a test prior to the resumption of general disarmament negotiations in August of this year, the difficulties of our doing so thereafter would be much increased. These are only my preliminary thoughts as I have indicated. I shall, of course, communicate with you the results of my thinking on the basis of our review and I would appreciate receiving your own.

I believe that the question of the security of the free nations of the world is the paramount consideration for us to bear in mind in connec-

tion with the resumption of tests, but I am also impressed with the increased erosion of our own position which has been based upon adequate systems of control and inspection as a concomitant of measures for arms control and reduction. The interminable continuation of the moratorium through the indefinite extension of the test ban negotiations seriously undermines that position. Not only is our position in the test ban rendered less credible through such delays, but our ability to press the principle of inspection in connection with other disarmament measures is impaired. These implications are in addition to those which rise from the recent Soviet line of attack on the effectiveness of the UN and indeed upon any international peacekeeping machinery. I think all these considerations point to the need for our taking a definite position without further attenuations, always assuming that, let us say, by the middle of June, we have not received any indication of a substantial change in the Soviet attitudes.

Finally, I am glad to say that I believe we approach these decisions in a strong position because of the good record at Geneva to which the close cooperation of our delegations has so much contributed.

Sincerely yours,

---

### 13. Telegram 2888 from Moscow, May 24<sup>1</sup>

Moscow, May 24, 1961

Geneva for FECON. In conversation with Khrushchev last night he brought up question of test ban negotiations and said they were not going to retreat from their position on tripartite control. The reason for this was that control posts would be merely spying organizations. If we accepted their proposals on general disarmament then they would accept any kind of controls. When I said in this event there would be no treaty he said that if we resumed testing they would do the same. He said in any event a ban on testing was not of such great importance and would not constitute disarmament. I remarked that surely both of us had an interest in preventing the spread of atomic weapons. He replied that the French were already testing. I said he must know that French tests were very primitive and that they did not have real atomic capability. He agreed. I said that apart from the spread of atomic

---

<sup>1</sup> Khrushchev's views on tripartite control. Confidential. 3 pp. Department of State, Central Files, 397.5611-GE/5-2461.

weapons I thought it would be a great pity if these negotiations failed as such failure would certainly have a very serious effect on general disarmament negotiations. I said I thought full disarmament might be possible if we could create a system of enforceable world law but I did not think they were ready for this and that in the meantime much could be done in the field of reducing danger of surprise attack and war by inadvertent war. K neither agreed nor challenged this position.

Making clear that I was expressing purely personal view, I said I had always thought they had made mistake in not accepting our proposals for a ban on tests in the atmosphere, sea and outerspace. I said that on recent trip to US several scientists had told me they were convinced that in view great cost atomic weapons no country could afford to develop real atomic capability without tests in atmosphere. While I gathered all scientists did not agree with this, K must know what tremendous expense was involved in creating atomic capability and I could not imagine any country doing this without certainty of knowledge weapons would work. K replied that we had almost reached agreement on test ban when US had reopened matter of underground tests. He said they were not conducting any tests and asked me to believe him. I replied I did believe him but not all of our people would. He said the reason was that he did not intend to create tactical atomic weapons. These would be enormously expensive and would serve no purpose since their strategic atomic weapons could accomplish the purpose far better. It would also mean dissipating their atomic material. He admitted that Malinsovsky was pressing hard for tactical weapons and he assumed Pentagon was doing same to President. He said that at military parades they showed some tactical weapons but these were only prototypes and about all they had. He also said they had no atomic weapons in East Germany and had no need for them since they could be fired from Soviet Union.

I said we already had tactical weapons and although they could possibly be improved by underground tests this was not of major importance. K replied that if we tested they would do the same and implied they would carry out atmospheric tests by saying that they had prepared plan for weapon which would cut the requirement for fissionable material in half but could not be sure it would work until it had been tested. This would enable them to double the number of their atomic weapons. When I said this seemed of little importance since we both had enough already to blow up the world, he said he agreed.

In discussing disarmament he said they had formed high opinion of McCloy when he was in Germany but then he had gone with private firm and succumbed to possibility of making money from arms sales. I replied that nothing could be more absurd. I said that Mr McCloy

had worked for a salary and had no personal interest. On contrary, his wide knowledge of problem had opposite result. K shrugged his shoulders and said this was what they believed.

I said it would seem a tragedy if we should revert to polluting the air with atmospheric tests. Although he did not in any way commit himself, I gained the impression K was somewhat intrigued by idea of limited test ban and by argument which I advanced that this would lead to improved atmosphere talks on general disarmament.

I intend to inform only British and French colleagues and request every effort be made prevent leak.

Mr. Armitage (part-time)

Amb. Matthews (part-time)

*USSR*

Foreign Minister Gromyko

Ambassador Menshikov

Mr. Dobrynin

In conversations at the Ambassador's Residence in Vienna following the President's luncheon for Khrushchev the Secretary and Soviet Foreign Minister Gromyko turned to a discussion on disarmament. The Secretary referred to the so-called bilateral disarmament talks at Washington beginning June 19 to be continued a few weeks later in Moscow. He thought that perhaps an agreement could be reached on proposals regarding particularly the forum for broader disarmament discussions.

Gromyko said that he had made to Ambassador Stevenson a number of reasonable proposals as to composition and the Secretary pointed out that Ambassador Stevenson had made some reasonable proposals on our side as well.

Gromyko referred to the fact that the US was always talking about control. He said that Mr. Khrushchev had spoken at length of Soviet willingness to accept control of disarmament in the UN General Assembly session last fall. Not a single other delegation had made any mention of this proposal. The Secretary said that this question could be discussed endlessly on a purely theoretical basis. Mr. Gromyko knew as well as he that nobody would disarm during the next few years. He said that perhaps if everybody were really disarmed then the question of controls would be a simple matter. In this connection he wanted to say frankly

---

<sup>1</sup> Soviet troika proposal. Secret. 8 pp. Department of State, Central Files, 397.5611-CJE/6-361.

that the US was very taken aback by the Soviet position in the resumed nuclear text negotiations in Geneva. Without replying directly to the Secretary, Mr. Gromyko entered into a history of disarmament discussions and negotiations over the past 15 or 16 years. He said that there had been endless discussions of partial measures of disarmament and they had led to absolutely no results. All Soviet proposals for measures in this field had been rejected on the grounds that they would change the balance of power in favor of the Soviet Union. It was now time to tackle general and complete disarmament instead of starting up a new round of discussions of partial measures which could go on for another 10 years.

The Secretary then said that in view of the many years that had passed he wanted to ask Mr. Gromyko frankly why the Soviet Union had rejected the Baruch proposals. After some personal references to Mr. Baruch, Gromyko said that those proposals were calculated to ensure a continued US monopoly of atomic weapons. The Secretary said he thought this had been one of a number of other mistakes and that the Soviets could have easily accomplished the almost complete disarmament of the United States, instead of prodding us into rearming. Gromyko asked what they should have done and the Secretary replied that they should have left Greece alone, left Berlin alone, and left Korea alone. He then went on to say that when the rest of the world did not know what was going on in the Soviet Union this was a deterrent to disarmament. In fact, he said, the Soviet Union could not maintain its policies of military secrecy and also achieve disarmament. These two policies—and he was willing to grant that the Soviet Union really wanted disarmament—were incompatible. There was some discussion of post-war developments in this field including a reference to Roosevelt's statement at Yalta that American troops would be maintained in Europe only a couple of years after the war. At the end of this discussion the Secretary said he saw only two roads to disarmament. The first would be by the prior settlement of political problems which might create possibilities for a broader disarmament agreement. The second would be disarmament on a step by step basis with full verification and control at each step. Gromyko interjected that one of the United States' principal allies, Chancellor Adenauer, had repeatedly said and even said in a letter to Chairman Khrushchev that no solution of political problems was possible unless there was first progress on disarmament. The Secretary resumed saying that he had followed disarmament questions carefully since 1925. For nearly 30 years one disarmament conference after another had taken place. They seemed to him ceremonial like the mating dance of the goonie birds in the Pacific Islands. He felt it was time to be realistic about this problem. The immediate action was the conference in Geneva. He repeated that we

were skeptical about the regression in the Soviet position there. In the broad field of disarmament this was a simple matter but it was a vital test. If the Soviets were serious about disarmament they would really try to come to an acceptable agreement in Geneva.

Mr. Gromyko then referred to the US adoption of the Russian word “troika” to describe the new Soviet proposals. The Secretary interjected that the troika had appeared in twelve different places now. Mr. Gromyko resumed, saying troika was a good word and a good idea. The Soviets felt that this proposal was no more than adequate to protect the Soviet Union’s natural rights. They were only asking for one-third, not two-thirds. They had a right to one-third. Any decisions adopted under the troika proposals against Soviet interests—or indeed against US interests—would be excluded. He said flatly that they were not going to deviate from this proposal. He did not want to use the word “demand” which was too strong but the Soviets were very firm on this. There was a question of the test bans negotiations, and the UN or any other international organization. If the troika proposals were adopted the US would be even better off than the USSR because the other one-third would side more often with the US than with the USSR. The Secretary commented that the real question was whether or not one-third should have a veto. Gromyko replied that if there were no veto the Soviet proposal would not make sense. The Secretary said that if adequate investigations of seismic events were not agreed on, a nuclear test ban would become improbable. Gromyko replied—after some uncertainty as to whether he had said two or three—that three investigations would be acceptable, subject of course to the agreed seismic indicators; against this the US was proposing 20 investigations (Mr. Nitze interjected 20 or 30 indicating he was matching Mr. Gromyko’s reference to “2 or 3”).

The Secretary said that the Soviet troika proposals were a real block to any progress in the disarmament field. If they were maintained, it would be a waste of time even to discuss disarmament since no disarmament would be possible if any one country could block any real inspection. Gromyko then cited as a precedent, President Roosevelt’s proposal of a veto in the UN Security Council. The Secretary confirmed that the US continued to accept a veto of the kind contained in the UN Charter. However, he pointed out that this was really limited in its original concept to considerations involving the use of force and the possibility of war. Gromyko replied that if the whole world were capitalist perhaps the question of the veto would not arise. However, the Socialist bloc does exist. The Secretary said that even if there were a disarmament agreement the first Soviet veto would bring it to an end since this would be an automatic signal to all the other parties to start to rearm.

Gromyko then said that in the present circumstances general and complete disarmament was the only way out. The Secretary asked him if he were sure that general and complete disarmament was a real policy of the USSR which they were ready to put into practical effect. He asked further what the Soviets would do, for example, with the Poles, the Czechs, or Hungarians if they had no arms. (At this point there were some side talks between Gromyko and Menshikov during which the latter said the Secretary's statement implied Soviet domination of Eastern European countries.) Gromyko replied that what happened in Poland, Czechoslovakia, and so forth, was a question that they would decide for themselves. Of course there were treaty commitments between some of these countries just as there were between the US and their allies. The Secretary said that he had just been wondering about this question. Certainly, he observed, an early result of disarmament would be the self-determination of peoples. Gromyko replied that the Soviets were always ready for self-determination. However, he believed he saw in the Secretary's remarks the roots of a wrong approach. The Secretary's idea would not help. He then said (rather as an after-thought) that it was possible that the Americans had some doubt about the behavior of its present allies after general and complete disarmament.

The Secretary then asked when the USSR had adopted the troika idea. Was it only two years ago? Gromyko replied that everybody gets wiser in time or should get wiser. He said that the Soviets' experience with the UN operation in the Congo had made them realize the importance of this proposal. He then went on at some length as to the long years of US domination of the United Nations by a mechanical voting majority. Referring to the fact that the composition of the UN had changed, the Secretary said he would have understood the troika proposal better if it had been made in the late 1940's. Gromyko replied that the Soviets had not made it at that time because they thought the United States would behave better in the UN and operate on a basis of reconciling the views of the wartime allies on all major problems. President Roosevelt's veto proposals for the UN Charter represented a very realistic approach. However, the United States since that time has invalidated many provisions of the Charter and emasculated the Security Council.

Gromyko said the UN arrangements had been worked out by compromise so that there would be no direct collision of interests. It was the deviations from UN principles that had caused trouble. The Secretary suggested that it might be helpful to hear the views of each side concerning the course of events since the adoption of the Charter.

Mr. Gromyko said the Charter was good, though some provisions were vague. The Soviets did not wish to place themselves in a position

where on all matters substantively affecting their interests they were outvoted. Nor would they want to put the US in that position. The US would also be better off under a troika arrangement.

The Secretary said this arrangement would run against every principle of arbitration and conciliation. Gromyko said they did not want arbitration. Nothing said about the Security Council or in the General Assembly halls would convince them that any arrangement would produce impartial voting. Always, even in the International Court of Justice, voting reflected the state of affairs in the world. Arbitration and conciliation, therefore, were not solutions to the problem and would not help.

The Secretary expressed regrets that the preceding Administration had not gotten a test ban agreement before the Soviets invented the troika. Gromyko said the US should have accepted before the Soviets became wiser.

The Secretary said he was pessimistic regarding the troika and doubted whether the other two-thirds, as the Soviets term them, would see a solution in it. Gromyko said that the two-thirds was the formal side of the question. The substantive side was that any international body would not take decisions that relate to the security interests of all countries without unanimity. There were two sides to the troika proposal: the three-sided arrangement plus unanimity of the most powerful countries. The US wants an order by which it could impose its decisions on the Soviet Union. Gromyko asked how he could convince the US that this was not possible.

Mr. Nitze reminded Gromyko that disarmament was a question which affected the vital interests of our countries, and we are thus dealing with the question of whether and how an agreement can be made effective and how its implementation can be insured at each stage.

Gromyko said that one could adopt a paper agreement but not contribute to a solution. You must seek agreement with the USSR; this is the way of solution. We do not want to take decisions against you. You must reconcile your interests with ours. Under President Roosevelt one proceeded from this assumption. If the two powers were not able to reconcile their interests, it was better not to have a decision.

Ambassador Thompson suggested that there was a vast difference between important political decisions where it might possibly be granted that no great power could let others tell them what to do. Applying this to disarmament was somewhat like the following analogy: Two men have revolvers and decide to give them up. They must be able to check whether another revolver is not hidden under the vest of the second party.

Gromyko said the Soviets are aiming at this purpose. General and complete disarmament—if a treaty was concluded, then all pockets could be examined. Even trousers could be taken off.

Mr. Nitze asked how you get through the intermediate stages. Gromyko said they did not propose GCD like a rocket shot. They had done their best to set out the stages with controls. Until complete disarmament was reached, there naturally would not be complete control. The degree of control would be in accordance with the degree of disarmament. Control would be in accordance with the steps being taken.

Mr. Nitze said the test ban could be viewed as a first step in which we could see how controls would work out. Ambassador Matthews said he concluded Gromyko was pessimistic regarding disarmament. Gromyko replied he was pessimistic regarding the US position on disarmament. There was a question of the horse and the cart, and the Soviets proposed that the two go together.

The Secretary said he wished to understand how the troika administration would actually work. Suppose we have an agreement regarding the number of inspection posts and the number of on-site inspections. The machines record a seismic event, say in Reno, of a magnitude above the 4.75 threshold. If the inspection teams say that they should go to Reno and this inspection would be within the agreed number, is it the Soviet view that the US Administrator on the troika could say, "No, you cannot go to Reno?" Gromyko said that if the inspection was in the quota of say three per year, it would be carried out according to the provisions on which understanding had been reached. It would be up to the scientists to agree. There would be a question regarding other inspections.

The Secretary said for the moment we were talking about the number of agreed inspections. If the scientists have to agree unanimously, then we get the same problem all over at a different level. However, if there was an acknowledged seismic event above the 4.75 threshold, on what question do the Soviets consider it necessary for the country being inspected to have reservations? We would already have agreed to the necessity for the inspections. Gromyko replied that the functions of the administrative body were not precisely determined. As far as the agreement on the quota of inspections, if the scientific instruments agree on the need for inspection, then it must be examined.

Mr. Nitze said suppose the US scientists think the event not up to the 4.75 threshold, the Soviets and other (perhaps British) scientists say the event was above the threshold. Can the US Administrator veto inspection teams going to Reno? Gromyko said the administrators should agree; it can't be done automatically. The Secretary wondered whether this was not a formal requirement. We both assume that we would not be testing if the agreement were signed. Can't we be reasonably relaxed regarding inspection? We would not expect anything to be found in Reno, and the Soviets would probably not expect

anything to be found in Kiev. Why prevent inspections? Gromyko said if there were disagreement among the scientists, then the administrative body should decide according to the administrative rules, that is, the troika. Why build in advance such an abundance of doubts? He asked the Secretary directly, do you think we are exploding atomic weapons now? The Secretary replied that we have no evidence that the Soviets are testing, but that it is very difficult to prove a negative proposition. Gromyko stated vigorously that the Soviets think that the US is sure the Soviets are not testing.

The Secretary said underground testing is more a problem than atmospheric testing. We could probably work out an atmospheric agreement without much difficulty. Gromyko said the best solution would be to prohibit all kinds of testing. The Secretary said we would like to work toward it; 4.75 seems to be the practical limits right now. If scientists can reduce this to zero, so much the better. You and we understand that these things go to the heart of our national concerns. It is somewhat easier for the Soviets since they can go all around the US on busses and check up. He remarked in jest that the Soviets have fewer busses. We did not in any case have to have US inspectors, and inspectors of other nationalities, say Swiss, would be checking solely on the presence or absence of an explosion.

Gromyko said even without an agreement it is possible to detect all testing. An agreement would make everybody more confident. Why should the US in advance suspect violations? The Soviets considered such stress on voting and the veto an undue concern.

Mr. Nitze said one must assume these matters affect the vital interests of our countries, and both countries had an acknowledged interest in having inspections. Then we could invite Soviet inspectors and they invite ours, and both would be serving their national interests.

The Secretary said underground testing was not now detectable. The US wanted to be sure the Soviets stop if we stop testing. He made the next adversion just in case it presented a problem for the Soviets. Were there, he asked, particular areas which the Soviets would not want to have examined? If so, we could probably work out some way to handle this problem. He hoped this was not an obstacle to Soviet agreement, but he gathered that this was a far-reaching political issue for them.

Gromyko said the Soviets would resume testing if the US did, and other countries would also. He emphasized that the Soviets would not lose more than we by resumption. Everybody would lose, but he replied the Soviets were not more interested in a testing agreement than was the US. The Secretary and Gromyko agreed that each other's scientists would be asking for more money in case of resumption.

Ambassador Thompson said that with regard to the question of suspensions, it was a factor for the US that we had to take the agreement

to the Senate, and to successfully defend it, it would have to be an agreement without loopholes. The Secretary said this was the problem expressed in the second degree, the first degree was what we can recommend ourselves to Congress. He did not want to review history, but since 1945 we think there has been a long stretch of agreements that have not been observed. Our problem of mutual trust is not a new one. Neither of us can put its basic interests in the other's hands. We need assurances, and we think that an effective inspection system could contribute to mutual trust.

Gromyko asked where was that other Hammarskjold that could be objective? The Secretary said that here we were talking about a more limited question, regarding the troika applied to inspection administration. Gromyko said the situation was "most complicated." The Secretary said Gromyko understood our political system and would understand that a signature of a treaty would absorb the energies of the Administration in getting passage of the agreement. Gromyko replied that especially regarding foreign affairs matters the Administration could convince Senators.

The Secretary said that we regretted the prospect that this issue might turn up as a major problem in the field of general disarmament, even should we all agree to go far down the road toward disarmament. Gromyko said we should proceed on disarmament even without a testing agreement. Disarmament discussions should not be conditional on this question of testing, although the situation would be quite different if a testing agreement were signed.

Mr. Nitze asked how one could be optimistic concerning the outlook for broader disarmament if we could not solve the easier problems? Gromyko agreed that we should solve the testing agreement, but if we could not, it was the Soviet position that general disarmament discussions should go forward. Mr. Nitze asked whether the troika proposal would not cut across other disarmament proposals. Gromyko said that they had formulated proposals for our examination. He again stressed that if tests were resumed, the Soviets would not lose more than the US. Everybody would lose, but he repeated that the Soviets would not lose more.

Later in the conversation, Gromyko said the time might come when the US would regret it did not accept the troika. The Secretary expressed his doubt, but said he had become reluctant to become categorical as he had gotten older.

The Secretary said that he took it that we were on dead center regarding nuclear testing. Gromyko nodded and said that "It is a very complicated situation." The Secretary said that we had gone quite a way to meet the Soviet points of view and up popped the troika. Gromyko said they wanted to correct their mistakes. Maybe they should

have raised the troika before. He said it would not damage the US but would protect their own interests. They could not have agreements that permitted arbitrary decisions, and he thought that the US had too great suspicions of the Soviet Union.

The Secretary said our distrust did not begin to match Soviet distrust for an impartial administration. Gromyko retorted that there was no such being. Was Hammarskjold one? He had been pushed by the US and Western powers to demonstrate his lack of impartiality. The Soviets think the two powers should try to reach agreement together. It was more important for the US to agree with the Soviet Union than with Hammarskjold. Now the US has an agreement with Hammarskjold but not with the Soviet Union.

Ambassador Thompson expressed the opinion that the Soviets had made a real misjudgment regarding Hammarskjold. They think Hammarskjold made judgments for the sake of the US, when he actually made them for what he believed to be the purposes of the UN. This did not really affect the proposition that no great power would allow the imposition of a decision affecting its vital interests.

Gromyko said the Security Council took good decisions on the Congo. It would have been better if they had been carried out. Lumumba would not have been killed, he was not a Communist. Who did not let the decisions be carried out? Without the backing of the Western powers Hammarskjold could not have acted as he did. The US may consider that some matters can be solved without the understanding of the Soviet Union. The Soviet Union does not think so. Perhaps some problems could be postponed. Such a situation is not normal. One cannot rely only on a majority. This might change to the US disadvantage. The troika is not so bad as the US considers.

---

## 15. Nusup 1257 to Geneva, June 8<sup>1</sup>

June 8, 1961

For Dean from McCloy. As per our telecon today there follows text of a draft letter I have prepared for the President outlining course of action re test ban talks and forthcoming disarmament negotiations. As I indicated in telecon, President's statement of today somewhat

---

<sup>1</sup> Draft presidential letter outlining course of action in test ban talks and disarmament negotiations. Secret. 9 pp. Department of State, Central Files, 397.5611-GE/6-761.

alters the practical timing of the program. Hope to consult with President first of week and then I will communicate with you. We are considering advisability of renewal of proposal re banning atmospheric tests in accordance with Thompson's suggestion and are preparing treaty language. We would appreciate having you transmit language which you feel embodies the cautions contained in your SUPNU 1640.

BEGIN VERBATIM TEXT:

(Verbatim text attached)

QUOTE. The conversations with Mr. Khrushchev in Vienna have made it clear that there is at the present time no prospect of any change in the Soviet position regarding either a nuclear test ban or general disarmament. These conversations have now affirmed at the highest level the determination of the Soviet Union to press the concept of a veto on inspection as well as on all aspects of any international peace-keeping machinery, including the functioning of the United Nations. This fact poses some very important decisions which must be made promptly if we are to avoid a substantial erosion of the U.S. position in all of these areas.

The first field in which decisions must be made is the Geneva test ban negotiations. In these negotiations I feel that we have gone the limit of what would be either possible or appropriate in the way of concessions to the Soviet position. Any further concessions at this time, I feel, would not advance the conclusion of a satisfactory agreement. In fact, I feel they would prejudice it.

The Soviet position in the negotiations raises for decision now the question of whether the United States should resume nuclear tests when tests of material importance to the national security can be prepared and programmed.

I am well aware of the arguments which can be made against a decision to resume testing. In spite of any efforts to prepare world public opinion, the nation which first announces the resumption of nuclear tests will incur a certain onus. The resumption of nuclear tests will make it increasingly difficult to prevent the proliferation of nuclear capabilities to other powers which do not now possess such a capability. There is even the possibility that the resumption of tests by the United States will give the U.S.S.R. a chance to overtake the United States in fields of technology in which we now lead, by giving the U.S.S.R. the opportunity to test free from the trouble and risk which would attend a clandestine test and from the political onus of being the first to resume.

Notwithstanding these considerations, however, I recommend that you do make the decision to resume testing with tests of material importance to the national security. Under the present condition the United States is at a dangerous disadvantage. Because of the closed

nature of Soviet society we have no assurance that they are living up to their announced moratorium; while they can be sure that we are living up to ours. The United States cannot permit itself to be kept indefinitely in a situation in which it denies itself the possibility of tests which might result in a major improvement in its military position without any assurance that the U.S.S.R. is under a similar inhibition.

The consequences which might ensue if the U.S.S.R. is engaging in clandestine testing while the United States refrains from testing over a period of time are serious. In my judgment they outweigh the danger to the position of the United States, if the U.S.S.R. is not engaging in clandestine testing, from a resumption of testing by both sides which might permit the U.S.S.R. to catch up to the United States in fields of technology in which we now lead. As long as the present condition exists of a moratorium which is enforceable against the United States but not against the U.S.S.R., the U.S.S.R. is under no pressure to come to an agreement involving any inspection. By permitting this condition to exist, the United States jeopardizes before the world the credibility of its long-held position that it will not restrict its freedom of action in the field of weapons without effectively verified agreements.

For these reasons, I recommend that the United States prepare for a series of tests of the maximum military and scientific value. In this connection, my suggestion would be that we should undertake no prior announcement of our tests. We have, heretofore, given prior announcement but this was a carry-over from the period of concern over "fall-out."

If you agree with these conclusions, I recommend that Ambassador Dean be recalled from Geneva. This is the clearest way of indicating to the U.S.S.R. and to the world that we regard the present Soviet position as non-negotiable. The United States should not move to recess the negotiations but the American delegation and the negotiating schedule should be substantially reduced.

At the time Ambassador Dean returns, the United States should issue a declaration, with the concurrence of the United Kingdom and, if possible, of France, which declares our intention to desist from testing anywhere in the sensible atmosphere, on the earth's surface, on the ocean or under the ocean and which invites all nations to join in this declaration. This declaration would be conditioned upon no other country's engaging in testing in these environments in a manner or to a degree which might prejudice the security of any declaring country.

At the time of this declaration, the United States should state that, as for testing elsewhere, we consider ourselves entirely free to take any steps which the security of the free world and the United States demanded. We should also state that such testing as this involves would be undertaken on our own soil and in such a manner as to

remove any general hazards to health. We would be prepared at any time to cease testing if the Soviet Union would be willing to execute the treaty along the general lines that we have tabled at Geneva.

Until we had actually tested, or our determination to test was well understood, we should not agree to shift the test ban negotiations into the comprehensive negotiations now scheduled for July 31 of this year. The Soviets undoubtedly wish to merge the talks and to have the United States go into the July 31 talks with the present uncontrolled moratorium still in effect for the purpose of making it increasingly difficult for the United States to resume its freedom of action with respect to testing and we should resist this effort.

With regard to the comprehensive disarmament talks, I recommend that we enter into the bilateral exchanges as planned on June 19. We should there state our proposals for the composition of the Commission to deal with the comprehensives, avoiding any agreement which would compromise our objection to the concept of the troika either in those negotiations or in any other disarmament or peace-keeping measures.

We should press for the inclusion in the principles to be adopted for the July 31 negotiations an acceptance of the concept of the rule of law in international disputes which involves a true acceptance of the principle of international arbitration, the extension of the jurisdiction of the International Court, the application of international sanctions by impartial tribunals not subject to veto. Corresponding principles would be applied to the control and inspection of disarmament obligations.

We would state in these negotiations and publicize throughout the world that we repudiate the thought, inbedded in the troika concept, of two-power rule. We should expose the fallacy of the introduction of the neutral bloc veto, as it is an empty facade to hide a two-power rule of the world. The veto in the hands of a group of neutral countries is meaningless.

We should be prepared to present a plan that would envisage a full disarmament program which was combined with the development and use of international institutions designed to verify and enforce a compliance of the obligations assumed.

It would also embody our concept of how peace and order would be maintained in a disarmed world through international peace-keeping machinery. The plan would condition progress from one stage to another on the basis of the results achieved and the confidence generated in earlier steps.

The comprehensive negotiations could also include, if the Soviets were prepared to discuss them, steps calculated to reduce the chances of war by accident, surprise or miscalculation. They might also include

certain steps of a somewhat limited but perhaps significant nature that could be verified by reciprocal inspection without the intervention of international authority.

These recommendations require that the United States engage in a program of public opinion preparation and diplomatic persuasion on a scale different from what has hitherto been attempted. This activity will begin with a response to the Soviet Aide-Mémoire, drafting of the declarations with respect to testing and with a White Paper on the Geneva talks. END VERBATIM TEXT. UNQUOTE.

**16. Circular telegram 2042 to certain diplomatic missions,  
June 17<sup>1</sup>**

June 17, 1961

On June 19 at first meeting bilateral disarmament talks with Soviets, US will propose Ten Nation Committee be doubled to include India, Japan, Pakistan from Asia; Tunisia, UAR, Nigeria from ME and Africa; Mexico, Brazil, Argentina from LA; Sweden from Europe in addition to present Ten (US, UK, France, Canada, Italy, USSR, Poland, Rumania, Bulgaria, Czechoslovakia).

Underlying rationale is that if present composition Ten Nation Committee is to be broadened, as USSR has suggested, additional members should be more nearly representative world at large and not rpt not selected on basis sole criterion neutrality, which would tend imply additional countries would be acting en bloc as arbiter between East and West. We believe neutrals themselves would not wish be placed in embarrassing position. U.S. recognizes wide spread interest disarmament problem throughout world and, therefore, believes it most appropriate to invite most significant countries from different geographic areas of the world outside NATO and Sov bloc to participate in future disarmament negotiations.

Request action addresses approach appropriate level Foreign Office June 19 to inform them along lines expressing hope invitation will be accepted if Sovs agree our proposal.

---

<sup>1</sup> U.S. proposals for bilateral disarmament talks with Soviets. Confidential. 2 pp. Department of State, Central Files, 600.0012/6-1761.

FYI. Sovs may not agree this proposal or may engage in horse trading as regards individual countries. However, we consider important and necessary that countries we proposing be informed. END FYI.

**17. Telegram 5919 to certain diplomatic missions, June 19<sup>1</sup>**

June 19, 1961

McCloy-Zorin talks on disarmament began 3:00 p.m. in Washington. After amenities McCloy stated purpose to lay ground work for renewed attempt to reach conclusions at forthcoming conference dealing with comprehensive disarmament which agreed will be held later this year. Should attempt to settle here composition and general framework conference. Talks here are continuation Stevenson-Gromyko talks where in time available agreement had not been reached either as to forum or basic principles which were to guide conference. McCloy suggested that consistent with conversations which have already taken place we have frank exchange of views, that talks be private to permit easy exchange with minimum of formality. We have no plans brief press formally or otherwise but would advise press and public of results of discussions at their conclusion. Shall have to answer inquiries but hope do so without getting into substance.

Zorin stated Sov government pays much attention to these bilateral talks since their success and achievement in sense of disarmament program would contribute improvement relations two countries and international situation. During Stevenson-Gromyko talks it was agreed question of disarmament must be considered in essence not merely as regards composition of organ for negotiation.

McCloy referred to question of jurisdiction participants these discussions. Cannot do more at this stage than make joint recommendations to those who have been associated with us. Have no authority to determine either composition or framework in manner binding on others. Cannot substitute this meeting for negotiation contemplated later in year, but can do what is necessary prepare way for meaningful work by larger group. This does not mean we cannot go beyond forum

---

<sup>1</sup> Readout of McCloy-Zorin talks on forum for future discussions. Confidential. 6 pp. Department of State, Central Files, 600.0012/6-1961.

question; US will also have proposal re principles. May make progress faster by dealing first with procedural aspects.

Zorin affirmed Sovs did not imagine this meeting could be substitute for conference. Agree can work out recommendations for conference. Are not going try conclude some kind agreement just now. We must however reach some kind agreement on essence of program and on body to be created. Re press, USSR wants approach talks in same way as McCloy. Want sincere exchange not propaganda battle. Talks should not be confidential but private. Participants may want to give views to press especially to correct any distorted reports but SOV do not seek public discussion. In this meeting we should first speak of essence of disarmament program, in keeping with GA resolution of November 20, 1959, and later deal with organ for resumed negotiations.

McCloy stated wanted set before Sov colleagues today for their convenience US views on forum. Have suffered in past from lack continuity in forum. Recalled agreement Four Powers establish 10-Nation Group from which USSR withdrew last June. Although this forum not ideal US quite prepared continue with this committee. Hoped USSR would consider seriously its advantages, especially continuity and fact this only forum which thus far has full acceptance NATO countries concerned. Hoped Sovs would seriously reconsider position this forum in interest expeditious progress.

Recalled procedural variation this forum which Stevenson had suggested—introduction of chairman and perhaps other officials of committee from nations not already represented. Stated even this had not been yet accepted by all concerned but would probably be easier of adoption than any other variation of original committee.

If Sovs could not agree these proposals, and he hoped they would, and we had to proceed to reconstitution of committee US would propose addition of 10 States chosen on basis size, character, military strength, geographical distribution and population. These would be invited not as representatives of any bloc but in their own right and in their own capacity. Countries we would suggest as additions are: Asia—Pakistan, India, Japan; Latin America—Mexico, Brazil, Argentina; Africa and the Middle East—UAR, Nigeria, Tunisia; Europe—Sweden.

McCloy stressed again however our recommendation that 10-Nation Committee not be altered.

If none of these three suggestions acceptable US would be prepared to accept UN Disarmament Commission as forum for negotiations.

McCloy then introduced and circulated following draft statement of principles:

BEGIN VERBATIM TEXT.

The purpose of the negotiations should be to seek the widest possible area of agreement on measures leading to the objective of controlled universal disarmament accompanied by the institution of reliable procedures for the peaceful settlement of disputes and of effective arrangements for the maintenance of peace in accordance with the principles of the charter of the United Nations. Efforts should continue until a full program for achieving this objective has been worked out and agreed.

Such agreement should ensure that disarmament will proceed in such a manner that at no time would its progress adversely affect the security of any State; that disarmament will proceed as rapidly as possible through stages containing balanced, phased and safeguarded measures, with each measure being carried out in an agreed and specified period of time; that compliance with all disarmament obligations is effectively verified through the entire process; that transition from stage to stage will take place upon decision that all agreed measures in the preceding stage have been fully implemented and verified and that any additional verification arrangements required for measures in the next stage are agreed; and that progress in disarmament is accompanied by measures to strengthen institutions for maintaining peace. END VERBATIM TEXT.

By way explanation McCloy stated we want afford future negotiations maximum flexibility. Have emphasized objective is widest area of agreement possible. If we can achieve first steps, second steps or final steps we want negotiations to be free to take all or any of them that can be achieved. Stressed we feel improvement in peace-keeping machinery and peaceful settlement disputes is concomitant of disarmament; they are inseparable. Emphasized necessity controls throughout disarmament process. Said by universal we mean universal in depth as well as area. We do not condition any advance in disarmament field to improvement peace-keeping machinery for there may be number of things we can do that would not require such advance or indeed would not require any substantial international structure in way of control to support them. Some relatively simple reciprocal measures, for example, might be of great importance in relieving tensions and building confidence for the taking of further steps. We do feel, however, shall not be able advance entire way unless our peace-keeping machinery and methods resolving disputes keep pace with advance of disarmament. US prepared go any lengths achieve these purposes and willing discuss these or other suggestions re framework.

Zorin quoted Stevenson-Gromyko parallel UN statements March 30 and stated must consider questions in order agreed in New York—first matter of general and complete disarmament and then forum. Should not begin with secondary question of forum but with main task. Proposed text of communiqué for this meeting though saw no

need for these as regular procedure. Text agreed with minor changes. Next meeting to be held Tuesday afternoon. Embassies of NAC countries here being informed of above. Interpretive comments will follow for use in informing NAC and foreign offices addressed.

## 18. Telegram 5878 to Certain Diplomatic Missions, June 30<sup>1</sup>

June 30, 1961

Paris pass TOPOL. Eleventh session McCloy-Zorin talks—June 30 p.m. Zorin gave lengthy recapitulation SOV position as it had been expressed in previous sessions, stressing again that best way to proceed would be to consider specific proposals on general and complete disarmament, that GCD is only way to remove danger war and that SOVs remain ready accept any controls US asked for if we accept SOV program for GCD. Zorin noted US position we would not proceed to consider specific plans without presence allies. SOVs were not trying substitute present exchange of views for future multilateral negotiations, but without rapprochement US-USSR views future negotiations would simply mark time. No other country will reproach us if we increase common ground on disarmament as result present talks. US June 19 proposal does not indicate that for US implementation of GCD is main task of future negotiations. Reference to “widest possible measures agreement” too vague. US seems reject concept of single treaty and is unprepared agree on specific time limits for individual stages and for whole program. If US ready accept time limits for specific measures why not add them up and set limit for whole program?

SOV fears US objective is to switch attention from GCD to isolated measures which will involve control over armaments. Re US proposals on forum, these do not represent “businesslike” approach. Zorin concluded however that exchange of views had been “not without use” in spite of fact US had failed to give clear answers to many key questions.

McCloy reiterated US purpose in present discussions and said our purpose when we reconvene in Moscow July 17 will be to continue to seek agreement on statement of task as well as on date and forum for

---

<sup>1</sup> Readout of eleventh session McCloy-Zorin talks. Confidential. 5 pp. Department of State, Central Files, 600.0012/6-3061.

resumed negotiations. Reaffirmed US readiness to enter into multilateral negotiations on substantive aspects of specific plans after July 31. US will not undertake discussion specific plans either here or in Moscow. US hopes that when sessions resume Moscow SOVs will agree to join in drafting statement of framework, since US believes it is possible to overcome present difficulties and reach agreement on statement of principles. McCloy reiterated however that US would be prepared to move to multilateral negotiations even if it is not possible to agree on principles. McCloy then turned to issue of "single treaty" which he felt was fundamental issue of principle, stating we had moved toward SOV position in June 19 statement. US is quite prepared to work out one treaty providing for total disarmament and development peace-keeping institutions which must accompany complete disarmament. However we do not want to abandon possibility implementing measures of disarmament as they are agreed without waiting for agreement on total program. Invited SOVs to agree on draft directive which would accord equal importance to both objectives: early implementation of measures which can be quickly agreed upon and a total treaty. US will not accept terms of reference which prejudice possibility early progress in disarmament and we continue hope SOVs will accept terms of reference which explicitly allow for possibility implementing less than total disarmament while efforts toward comprehensive agreement continue. McCloy concluded with three questions:

1) Do SOVs agree or disagree that future negotiations can work out initial measures as well as full treaty and that these initial measures could be put into effect even before total program agreed;

2) Is USSR prepared incorporate in agreed statement of task language which will include possibility reaching agreement on full disarmament as well as on early implementation of less than full disarmament while work is proceeding on total treaty;

3) If not, is USSR prepared resume multilateral negotiations whether or not we can agree on this principle.

Zorin concluded by replying McCloy questions as follows:

1) SOVs do not exclude possibility achieving agreement on some separate measures which will be helpful reduction tensions, danger of war, citing Irish and African proposals at last GA as examples. However these could not be substitute for work on treaty for GCD or be allowed divert attention from this main task;

2) SOVs referred to formulation in Indian resolution of November 15, 1960, stating that if US prepared to work on both full treaty and initial measures without prejudice to former, perhaps we could find common ground in pertinent language contained in Indian resolution which could create basis for agreement; wondered whether US could accept that language or perhaps whole resolution;

3) Unless we can reach agreement on statement of task it would be senseless to convene multilateral negotiations. No purpose in moving to broader forum if US and USSR could not agree on main questions.

Meetings recessed until July 17 Moscow.

**Rusk**

July 1961

19. Telegram 305 from Moscow, July 28<sup>1</sup>

Moscow, July 28, 1961

Deliver Baker, D/O by 9:00 a.m. 1. Zorin has asked for session Friday a.m. in order formally to introduce statement of principles transmitted Dept Embtel 304. Two meetings have been tentatively set for tomorrow. We plan limit our comments to welcoming Sov willingness after all this time to discuss principles and to note that if Sov draft had been introduced at outset of our sessions Washington, we would probably be ready to start formal multilateral negotiations by now or the near future.

2. We believe Sov submission this statement substantially improves Sov position and undercuts our argument that Sovs have blocked way to multilateral negotiations by refusal to discuss principles. Furthermore Dept will recognize Sov draft will have great appeal in U.S., and with exception 2 or 3 major points with our allies. Accordingly we believe Sov move creates new situation which will require prompt decision concerning our tactics.

3. We believe there are 3 broad courses of action we can follow, each of which has clear advantages and disadvantages which will be apparent to Dept. They are:

A. To submit minimum number of amendments to Sov document which if accepted would make it acceptable to us as a basis for resumption multilateral negotiations;

B. Propose recess July 31 for further review by govts of present situation and that we reconvene, perhaps on less formal basis, in New York week or ten days hence; or

C. Without offering amendments, recapitulate major differences between Sov statement of principle as it now stands and our own and propose that we move directly to multilateral negotiations to which both competing statements would be referred. We might in this instance wish to submit further revision of our own statement of principles.

4. On balance we are inclined to favor starting with alternative (A). Consider it unlikely this would lead to agreement but likely to lead to alternative (C) on most favorable basis. If Dept authorizes amendments suggested this message we would present them to Sovs on Saturday.

---

<sup>1</sup> Bilateral disarmament talks: Soviet intention to introduce statement of principles. Confidential. 5 pp. Department of State, Central Files, 600.0012/7-2861.

In putting them to Sovs we would point to promptness our response and ask Zorin for immediate indication whether US amendments constituted basis for agreement by Sovs. In light that response we would then either indicate we willing to stay to end of week to wrap up statement or suggest that since prospect agreement dim we move to multilateral forum without agreed statement principles. If Sovs reject our amendments outright we would make summary recapitulation of our position, state we propose return to Washington to consider next steps and then move to call meeting of D.C. after Labor Day. Amendments we would suggest are as follows:

A. First and second introductory paragraphs, no change.

B. Third introductory para insert after word "today" the following: "and that early measures leading toward this goal be worked out in detail and agreed upon in the shortest possible time." Change "sides" to "states". Delete "general and complete" in last phrase.

C. In numbered para 1 delete "of general and complete disarmament" and insert after words "world in which" the following: "all disputes are settled by reliable procedures without resort to force and in which".

D. Substitute the following for para 2: "General and complete disarmament should include:

(A) The reduction of all national forces and military establishments, including bases, of all states to agreed levels as required for the purposes set forth in para 3.

(B) The reduction of all armaments to agreed types and quantities as required for the purposes of para 3 and the destruction or conversion to peaceful uses of all other armaments including weapons of mass destruction and means for their delivery and conventional arms.

(C) The reduction of expenditures for military purposes for all states to amounts necessary for the purposes of para 3.

(D) The cessation of manufacture of armaments except for the types and quantities agreed as necessary for the purposes of para 3."

(E) Revise para 3 to read as follows: "After total and universal disarmament has been completed, each state should have only those forces, armaments and military establishments as agreed to be necessary to maintain internal order and protect the personal security of citizens and to support and provide agreed manpower for a UN international security force."

(F) In numbered para 4 delete the phrase "general and complete". Revise 2nd sentence to read as follows: "Transition to a subsequent stage in the process of disarmament should take place upon verification of the implementation of measures included in the preceding stage and a determination that any additional verification arrangements

required for the next stage are agreed, and when appropriate, are ready to operate."

(G) Delete "general and complete" in para 5.

(H) In numbered para 6 delete "of general and complete disarmament". Substitute "depend upon the requirements for verification of the" for "correspond to the extent, scope and nature of". In 3rd sentence substitute "during and after the implementation" for "under the conditions". In 4th sentence delete "the so-called". In final sentence insert "as necessary" after "free access".

(I) In para 7 insert as 1st sentence: "Progress in disarmament should be accompanied by measures to strengthen institutions for maintaining peace and the settlement of international disputes by peaceful means." Substitute "during and after the implementation" for "under the conditions". Insert "the principles of" after "in accordance with". Substitute "United Nations" for "Security Council". Insert "national" before "contingents" and delete "of police". Delete final two sentences.

(J) Substitute new para 8 as follows: "States participating in the negotiations should seek to achieve and implement the widest possible agreement at the earliest possible date. Efforts should continue without interruption until agreement upon the total program has been achieved, and efforts to insure early agreement on an implementation of measures of disarmament should be undertaken without prejudicing progress on agreement upon the total program and in such a way that these measures would facilitate and form part of that program."

(K) No change paras D and E. Dept will note implications para E for Berlin situation.

Request Dept instructions soonest. McCloy may have further views tomorrow but USDEL requests Dept proceed on basis above USDEL recommendations.

**Thompson**

**20. Telegram 308 from Moscow, July 28<sup>1</sup>**

Moscow, July 28, 1961

McCloy has reviewed and agrees with recommendations contained Embtels 305 and 307 and wishes emphasize need speed in presenting amendment proposals to Sovs if we wish avoid interminable continuation discussions here. We are setting meeting for Saturday afternoon and request instructions in time to offer amendments at that session. McCloy wishes return Washington soonest in order make report on full import conversation with Khrushchev, ninety percent of which devoted to Berlin. If necessary he plans return leaving deputy to carry on after Monday or Tuesday.

In addition amendments set forth refelts, McCloy has reservations re explicitly recalling language from Res 1378 expressing belief primacy of GCD.

Also request Dept views further two amendments: (1) In first sentence para 4 insert “with each measure and stage carried out” before “within specified time limits”. (2) In first sentence para 6 add “as would provide firm assurance that none of the parties would violate its obligations” after “international control.” Next sentence would then read “The extent of control would depend upon the requirements for verification of the disarmament measures carried out in each stage”.

**Thompson**

---

<sup>1</sup> Bilateral disarmament talks: request for additional guidance and McCloy's travel plans. Confidential. 1 p. Department of State, Central Files, 600.0012/7-2861.

**21. Telegram 295 to Moscow, July 28<sup>1</sup>**

July 28, 1961

For McCloy from the Secretary. Note indication Moscow 308 your desire return to Washington soonest. Request your return for consultations departing Moscow if at all possible by evening July 29.

I have given careful consideration to the three broad courses of action mentioned in your message 305 in the light of our general situation vis-à-vis the USSR, Berlin, and our Allies at this time. I agree fully with your assessment that in the light of the latest Soviet move indicating willingness to discuss principles we cannot now abruptly terminate talks or propose an immediate move to a multilateral forum without further efforts to reach agreement upon principles. As to the time and venue for continuation of the discussions, however, I am inclined to favor, on balance, the second of the alternatives you suggest, namely a recess for further review by governments of the present situation and a proposal to continue the present discussions in New York in about 10 days.

A number of factors have influenced my thinking in reaching this conclusion. One is the importance I attach to your very early return for a report to the President and to me on your discussions with Premier Khrushchev. I think that both public opinion around the world and indeed even the Soviet leadership itself would consider this reasonable. Since, as you indicate, our further efforts to reach agreement with the Soviets on a draft of principles are more likely than not to be unsuccessful, it would be unfortunate, I think, to terminate the talks there in your absence lest their failure be attributed in part to some alleged downgrading of the significance we attach to them as evidenced by our recalling you. I also consider it is particularly important at this time to proceed on the basis of exceptionally full allied consultations in this matter, and consider that a period of a week or ten days for this purpose would be highly useful in gaining their full understanding and support for the amendments or redraft of the US paper which we may wish to put to the Soviets in response to their latest move. I consider, too, that having conducted discussions in Washington and Moscow during June and July as previously agreed, a move of your discussions to New York looking toward follow-up action in the United Nations would be preferable to prolongation of discussions in Moscow over a period we cannot predict with complete accuracy if we embark

---

<sup>1</sup> Disarmament talks: proposed recess. Confidential. 4 pp. Department of State, Central Files, 600.0012/7-2861.

upon this new phase of discussions there. My present thinking is that in the absence of agreement upon forum and principles we should move to substantive discussion of our specific plan in the UNDC around August 29.

On basis these considerations, I suggest that you proceed along following lines:

1. You should propose on July 29 recess in talks on that date for further review by governments of present situation and propose that present discussions be resumed in New York on August 10. You should cite as one of reasons for recess that you are being recalled to Washington for consultation.

2. You should seek Soviet agreement on continuation of existing privacy arrangements as regards present discussions during recess, and should seek agreement upon joint communiqué of essentially procedural character.

3. You should make no statement at conclusion of talks or en route to Washington beyond announcement you are coming to report to the President and SECSTATE.

4. You should seek opportunity prior to conclusion of talks to make points suggested para 1 your message and to outline on basis existing instructions more obvious defects Sov draft. You should not, however, make commitment at this date to submit specific amendments to Sov draft, since we desire to consult Allies and since it may prove more desirable to redraft US paper to incorporate acceptable positions Sov draft and thus keep negotiations focused on US paper.

5. In order avoid awkwardness of your meeting personally with NAC at time prior to report to President at which meeting you would be unable refer to your discussions with Khrushchev, request Fisher consult informally in Paris with NAC on course bilateral discussions to date.

**Rusk**

## 22. Telegram 333 from Moscow, July 29<sup>1</sup>

Moscow, July 29, 1961

At McCloy's request, informal session was held with Zorin at FonOff this morning to advise Sovs of instructions as set forth Deptel 295, in order that Zorin would be prepared respond our proposal for recess at scheduled afternoon session. McCloy made clear that although Sov statement of principles did not repeat not give us much encouragement, US wished give situation full consideration in order determine best way reaching understanding and to allow consultation with Allies. Taken together with Pres's desire for first-hand report on Sochi trip, we had been instructed propose recess to Aug 10 in New York. Expressed regret at tardiness Sov principles proposal, which if introduced earlier, might have allowed resumption negotiations by this time.

Zorin expressed regret at fact it now appeared impossible bring talks to successful conclusion in Moscow where in fact we had only met for one week. Stated our comments re lateness of Sov proposal was self-serving statement, attempting to shift blame for further delay to Sovs. Sovs had gone more than halfway to meet us and could claim that if we had accepted Sov position on scope talks at outset meetings in Wash, we would have made real progress toward agreement. Sovs had tabled flexible document on forum which omitted numbers and names of new states, but US had put no views in writing this subject. However, Sovs cannot repeat not fail take into account legitimate desire of Pres for first-hand report on Khrushchev visit, and since Sovs cannot repeat not negotiate with themselves, they must take US wishes into account. Said would report US proposal and personally believed there would be no objection. On personal basis he inquired re reason for Aug 10 date and wondered whether not repeat not better to start again in Sept, which would give both sides more time for breathing spell. If we resumed early Sept, we could reach agreement on forum and basic principles during first week before start of GA and multilateral negotiations could commence before and continue on during Assembly.

McCloy said he knew no repeat no reason for specific date and expected US could be flexible this matter. Suggested brief pro-forma communiqué which might refer to fact that date and place for resumption could be announced later. McCloy said he had not repeat not meant try shift responsibility for present situation on Sovs since initial

---

<sup>1</sup> Soviet reaction to recess proposal. Confidential. 2 pp. Department of State, Central Files, 600.0012/7-2961.

misunderstanding of scope talks could have been honest one on both sides. US prepared credit Sov good faith this respect if they will credit ours. US conception was founded on general tenor conversations at UN in March.

McCloy stated he would seek instructions re our agreement to date in early Sept.

Moscow, July 31, 1961

Re Supnu 1722. My suggestion for revival atmospheric and underwater ban based on assumption we would at some stage decide resume testing or at least free ourselves from present moratorium. Continue to believe that at such time damage to our position in world opinion could be mitigated if not offset by new dramatic appeal for atmospheric and undersea ban. Whether this could best be done by unilateral US action or action in conference or in UN matter of judgment best tactics but would think advantage in having British act with us. Were Soviet playing our cards in this matter they would attempt mobilize opinion well in advance by diplomatic approaches to other countries, organization of public demonstrations, frequent reiteration in public statements of appeal not expose world to fallout, etc. Do not see why we should not employ same tactics. Appears likely that if Soviets resume testing they will test in atmosphere and attempt place blame on us. Do not agree that this proposal unlikely to appeal to world opinion which has shown many signs of concern over fallout dangers. Unless as sufficient public pressure built up, not entirely excluded that Soviets could be brought to agree.

24. Memorandum from Dean to Bundy, August 4<sup>1</sup>

August 4, 1961

MEMORANDUM FOR THE WHITE HOUSE

SUBJECT

Possible public announcement by United States that we would be willing to forego any tests in the atmosphere without the right of inspection or control if the Soviets would do likewise

I attach a memorandum for the President about which you and I spoke on the telephone.

**Arthur H. Dean**  
*Chairman, U.S. Delegation*  
*Nuclear Test Ban Talks*

**Attachment**

SUBJECT

Possible public announcement by United States that we would be willing to forego any tests in the atmosphere without the right of inspection or control if the Soviets would do likewise

As of the present time, it is planned that Ambassador Dean should return to the nuclear test ban conference at Geneva on August 23, after first having conference with the President who is announcing that he is asking him to return.

The nuclear test ban item has been inscribed on the agenda of the United Nations General Assembly at our request.

The various embassies are engaged in explaining to the governments to which they are accredited, the provisions of the nuclear test ban treaty as proposed by the United Kingdom and the United States at Geneva on April 18, 1961.

---

<sup>1</sup> Transmits memorandum on disadvantages of a public announcement regarding atmospheric tests. Confidential. 5 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, Test Ban General, 4/61-8/61.

A public relations program has been undertaken to explain this treaty and why it constitutes the best answer to the ending of further nuclear testing.

Efforts will be undertaken to persuade the delegations from other countries that the position of the United States with respect to the nuclear test ban treaty is a sound and fair one and every effort will be made to enlist their support on the basis of this treaty.

While it is realized that a unilateral announcement by the United States that it is willing to forego further testing in the atmosphere if the U.S.S.R. will also agree puts us in a favorable light as far as our willingness to stop testing is concerned, from a practical standpoint, it has at least three disadvantages.

These disadvantages are: Based on conversation between Mr. McCloy and Mr. Khrushchev, Mr. Khrushchev will attempt to downgrade the currency of our offer by stating not only will the Soviet Union agree not to test in the atmosphere without effective inspection or controls but that it will also agree not to test in outer space, on or under the ocean, or below ground without inspection or control. Somewhere in their reply they will probably denounce us for wishing to include decoupling shots in our seismic research program during the proposed three-year moratorium on underground tests yielding below 4.75, and again repeat the charge that in our proposal we are not in any way obligated to continue the moratorium on such tests or to reduce the treaty threshold below 4.75 without regard to the actual outcome of the seismic research program. It is believed that they already intend to carry on an attack on our proposed treaty and on the proposed three-year moratorium because so far we have not been willing to bind ourselves by treaty language as to what we would do at the end of the three-year period with respect to the treaty threshold.

Consequently, it is believed that an offer on our part not to test in the atmosphere without inspection or controls may not only give the Soviets an opportunity to denounce our present request for inspection and controls as unnecessary from a scientific standpoint and as constituting only espionage but it will also confuse our friends and retard our campaign to get them to support us on the treaty. Those who do not wish to antagonize the U.S.S.R. will naturally not support us on the provisions of the treaty if we are willing to compromise on much less by our announcement with respect to atmospheric testing.

As you know, President Eisenhower proposed to Premier Khrushchev on April 13, 1959 that we suspend nuclear weapons tests in the atmosphere up to 50 kilometers while the other treaty provisions were being resolved.

On April 23, 1959, Premier Khrushchev replied that such a proposal was a "dishonest deal" and that they were "for the cessation of all

types of nuclear weapons tests—in the air, underground, under water, and at high altitude.”

I am informed that on the present state of our knowledge, there is a “good possibility” that we could pick up and detect nuclear detonations in the atmosphere yielding from one to five kilotons.

With respect to nuclear detonations on the ocean and occurring in the Northern Hemisphere, I understand we have only a fair chance of detecting them.

With respect to nuclear detonations under the ocean, I understand, as of the present time, we have little or no capability of detection.

With respect to nuclear detonations on the ocean south of the equator, there is little possibility that we could detect them. The status in underground testing is known to you.

All of the foregoing is, of course, based upon the present state of our knowledge.

Some of the reporting telegrams from the embassies which have been explaining the nuclear test ban conference to the governments to which the Ambassadors are credited, have been reporting that some of them find it difficult to understand why we attach such importance to the possibility the Russians might violate the test ban agreement and that they consider our emphasis on need for control and inspection as exaggerated and that a more generous show of confidence would give us greater protection than our current attempts to achieve an elaborate system.

It is, of course, difficult to explain what the Soviets might achieve by further undetected testing because of security reasons. It is also difficult to explain the necessity for the large number of control stations around the earth, the need for the number of annual on-site inspections and the need for setting up the proper criteria for inspection and the need for having objective inspection teams.

Consequently, whatever public advantage might be gained by making the offer not to test in the atmosphere would, I believe, be more than offset by withdrawal of support for the treaty and might tend to confirm what appears to be a latent belief that our present treaty control system is too vast and too complex.

Therefore, I would urge that no announcement with respect to suspension of tests in the atmosphere be made until after we have completed our presentation before the United Nations General Assembly and have taken the vote thereon.

---

**26. Memorandum from Bundy to Seaborg, August 8<sup>1</sup>**

August 8, 1961

The President strongly agrees with your proposal that a plan be prepared showing the different kinds of preparations the Atomic Energy Commission could take for a resumption of tests, and he has asked me to send you this memorandum suggesting some of the things which it would be helpful for him to have clear in his mind as he considers the general problem.

We have two objectives: the first is to be ready to move promptly toward a resumption of militarily useful tests at such time as the President may decide to order them. But our second objective is to have as little public attention as possible given to any such preparations, especially during the period between now and the close of the UN General Assembly, in November or December. They obviously cannot have all that we want here, and the question is how to get the best arrangement, on balance.

My guess is that what we are dealing with essentially here is a public relations problem, and some things which look big in a technical sense may be relatively quiet in a public relations way. I therefore

---

<sup>1</sup> Resumption of tests: Standby AEC plan requested. Secret. 2 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Testing, 7/16/61–8/9/61.

suggest that you prepare a pretty detailed picture of the specific things that would need to be done and the specific time lags which they entail. We might then sit down with Pierre Salinger and Ed Murrow and see if we cannot work out together a program that it would be sound to submit to the President for comment.

Of course, you and I understand that all preparations would be stand-by preparations, and that the President does not at present wish to be in the position of requiring such preparations to be taken. The initiative is coming from you, as a matter of prudent forward planning.

Will you let me know as soon as you are ready to sit down on this one?

**McGeorge Bundy**

## **27. Memorandum from Bundy to President Kennedy, August 8<sup>1</sup>**

August 8, 1961

### **SUBJECT**

*The NSC Meeting on Nuclear Tests*

The main business of this meeting is the presentation and discussion of Panofsky's report. Since you have heard the report, and copies have been in circulation to all those present, Jerry Wiesner and I are asking Panofsky to begin with a brief summary. Our suggestion is that you may wish to press the discussion in three directions: the prospects of better intelligence, military implications of various postures on testing and non-testing on each side, and political discussion of the elements to be weighed in any decision to resume or not to resume.

In all of this discussion it seems important to concentrate attention on limited time span. No one really knows what may be possible five or ten years from now, either in the gathering of intelligence or in the design of weapons—even the political situation may be changed long before that by extensive Red Chinese testing. And at the shorter range, there is no one who sees much net advantage in the resumption of testing before the end of 1961. The real question that remains is whether

---

<sup>1</sup> Background information for meeting with the NSC on nuclear tests. Top Secret. 4 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Testing, 7/16/61–8/9/61.

you will wish to test, on balance, early in 1962, or whether the decision can be put over for as much as a year or two beyond that date, if it seems politically desirable.

### 1. *Intelligence*

The report itself comments on what we can and cannot know about Soviet testing, and not much can be added. But one interesting question is whether intelligence will allow us in the future—with [*text not declassified*]<sup>1</sup>—to identify a really large-scale Soviet clandestine test program. The point here is that clandestine testing is not an absolute matter—different amounts of testing imply different risks at different stages of our own intelligence capability. Allen Dulles is probably the best witness here.

### 2. *Military Aspects*

The paper from the Joint Chiefs is very bad, but you have a new memorandum from Max Taylor which is much more significant, and since others will not have heard his argument, it may be useful to ask him to comment. In essence his contention is that specific characteristics of U.S. military strategy place a particular premium for us upon improvements in both strategic and tactical weapons. He implies that the Soviets have no parallel need, and in this respect I myself think his paper is subject in a measure to criticism that one can generally apply to estimates from professional soldiers on weapons development: they tend to think in terms of what we can do while minimizing what the enemy can do with the same opportunity.

One other basic point in the military area is that of timing. The JCS and General Taylor ask for prompt resumption at once unless there are overwhelming political arguments against it. But the whole argument of the Panofsky panel indicates that a temporary delay would not be of critical importance. This issue deserves to be sharpened. As far as I myself can make out from the papers, the most valuable new weapon we are likely to get within a year of the resumption of tests is a [*text not declassified*]<sup>2</sup> but I find nothing that tells me just how important that is.

Still on the military side, there are two weapons about which much nonsense is spoken: the neutron bomb and the AICBM. The scientists appear to think that tests are not needed for either one in the next year or two, but the military argument appears to assume the opposite.

More generally, you may wish to have criticism of the JCS report as a whole. For example, the JCS says: “there are many points in the report which are considered to be inaccurate or which express opinions and military judgments with which the JCS do not agree.” This is a strong statement and one does wonder whether it can be substantiated.

One further technical question is what can be learned by laboratory experiments with nuclear yields up to one ton of TNT equivalent as opposed to the present ten-pound limit. This was Seaborg's suggestion, and at your instruction I have asked that special attention be given to it.

### *3. Political*

The politics of testing obviously have two great aspects: the national and the international. I doubt if you need any help on the national side. On the international side, you may wish to ask McCloy and Dean to comment—in supplement to the able report which the State Department has presented. In particular, we may want some discussion of the possibility of taking up a stand against “fall-out testing” at some later stage, in an effort to distinguish atmospheric from underground tests. You have a powerful memorandum from Dean raising questions about this possibility, which still seems attractive to many of us.

### *Conclusion*

While you probably will wish to reserve any definite judgments and decisions until after this meeting, it may be useful to give all concerned a clear sense of your thinking. In particular, the military need to understand the political reasons for playing out the test ban negotiations both at Geneva and at the UN. If you are persuaded by Seaborg's sensible argument about test preparations, you may be willing to authorize work at Nevada as early as the end of the UN session. (or, of course, sooner if you felt the advantages outweighed the disadvantages.) You may also wish to ask for more detailed assessment of some of the special possibilities like laboratory tests and new anti-fall-out proposal, before reaching further decisions.

Finally, it occurs to me that whatever way you choose to move on testing, General Eisenhower can be a powerful ally. His advisor, Dr. Kistiakowsky, believes that the Russian are champing at the bit in the hope that we may test, thus opening the way for them. If you decide not to test, support from Ike will be invaluable at home, and if you decide the other way, his voice as a man of peace will be important abroad.

**MCG. B.**

**28. Memorandum from Gen. Lemnitzer to McNamara,  
August 9<sup>1</sup>**

August 9, 1961

SUBJECT

Joint Declaration on Disarmament (U)

1. At the meeting of the Committee of Principals on 3 August 1961, the proposed “Joint Declaration on Disarmament”, dated 28 July 1961, was considered. After the meeting, there remained 4 major unresolved issues.

2. The decision with respect to each issue can have grave implications for national security. Accordingly, the Joint Chiefs of Staff regard it as essential that their views be considered by the Principals in the resolution of these issues.

3. The following two issues were previously considered and recommendations were forwarded to the Secretary of Defense on 28 June 1961.

*ISSUE:*

a. Should the cessation of production of fissionable materials for use in weapons be contingent upon prior implementation of measures for the reduction of armed forces and armaments?

*RECOMMENDATION:* Yes.

*REASON:* A number of specific conditions which must accompany a “cut-off” are not attainable in today’s political atmosphere or within today’s technology. Satisfactory progress in the implementation of measures affecting force levels and armaments could assist in bringing about a political climate in which the more sensitive disarmament measures could safely be negotiated: and the interim would provide time to achieve necessary technological capabilities for control. (See Appendix A for more detailed reasoning.)

*ISSUE:*

b. Should it be proposed in Stage II, that states accept an obligation not to be the first to use weapons of mass destruction, including nuclear and CBR weapons?

*RECOMMENDATION:* No.

*REASON:* The US is, and should remain, free to use nuclear weapons if placed in a position of individual or collective self-defense. The proposal should not be made even for CBR weapons because it would

---

<sup>1</sup> Joint Declaration on Disarmament. Secret. 3 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament.

open the door to inclusion of all “weapons of mass destruction” including nuclear weapons. (See Appendix B for more detailed reasoning.)

4. The other two issues concern matters which were incorporated in the 28 July 1961 paper without referral to the Joint Chiefs of Staff.

*ISSUE:*

a. What specific language should be used in proposing force level reductions in Stage I?

*RECOMMENDATION:* The language approved by the Joint Chiefs of Staff in paragraph 1, page 5, of the Enclosure to their memorandum to the Secretary of Defense, JCSM-440-61, dated 26 June 1961, subject, “Recommended US Disarmament Negotiating Proposal”.

*REASON:* The recommended language would ensure that force levels of the USSR and Communist China are reduced to the existing US level, and verified, before implementation of reductions to the agreed 2.1 million level would begin. (See Appendix C for more detailed reasons.)

*ISSUE:*

b. Should it be proposed, in Stage I, that limitations and prohibitions be placed upon weapons designed to counter strategic nuclear weapons delivery vehicles?

*RECOMMENDATION:* No.

*REASON:* It ignores current military strategy upon which all plans and programs are based and presumes a hypothetical strategy which has not been adopted. (See Appendix D for more detailed reasons.)

For the Joint Chiefs of Staff:

**L.L. Lemnitzer**

*Chairman*

*Joint Chiefs of Staff*

**29. Letter from Seaborg to Bundy, August 10<sup>1</sup>**

August 10, 1961

Dear Mac:

Enclosed is a discussion paper on the question of test readiness. It is intended to provide a basis for our discussions with Pierre Salinger and Ed Murrow which you propose in your letter of August 8.

In brief, the paper: (1) describes the present limited state of readiness at NTS; and (2) identifies specific preparations which could be made prior to a decision to resume testing and ranks these activities in order of the degree of risk of public disclosure.

The main thrust of the paper is contained in the Summary, Table I thereto, and the section immediately following entitled "Increased Readiness Position". However, the "Background" and the "Present Readiness Position" sections contain information helpful in fully appreciating the problem. I would suggest you glance over them as your time permits.

This paper is an essential companion piece to the AEC and DOD letters of July 19 and 28 to Secretary Rusk and Mr. McCloy, copies of which you have. Because our readiness studies afforded a second closer look at the time schedules indicated for a "short-term" test program, it now appears very doubtful that all—or even a substantial portion—of the 13 events identified for the short-term program could be completed within the time scale initially estimated. And, this situation won't change appreciably unless specific preparations are undertaken at the test site: procurement and physical activity at the site itself and not device availability are the principal limiting factors. What has happened is this: The sensitivity of even talking about test readiness caused us to limit the discussions to a relatively few people in the Washington Headquarters. Now, as we have commenced to consult our field organization, the many details upon which a test series must finally be based are being uncovered. By analogy, the situation might be compared with the relative simplicity of an architect's conceptual drawing as distinguished from the problems which develop when detailed engineering design is commenced. This, it seems to me, is all the more reason for taking some concrete steps toward readiness at the earliest practical time. We must keep in mind that our experience in underground testing is limited and plans to confine testing to the under-

---

<sup>1</sup> Response to request for information on test readiness. Discussion paper not attached. Secret. 2 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Testing, 8/10/61–8/30/61.

ground—while offering some operational and distinct international policy advantages—introduces a whole new dimension in pre-test preparations.

If the President could be assured that a meaningful test series could be conducted on relatively short notice, he could be provided a much greater degree of flexibility in dealing with the broader policy questions he must decide. He does not have that flexibility now with our present state of readiness.

I am prepared to sit down with you at any time and I would hope that this could be within the next day or two.

Cordially,

Glenn T. Seaborg

---

### 30. Letter from Gilpatric to McCloy, August 10<sup>1</sup>

August 10, 1961

Dear Mr. McCloy:

Since the Principals' meeting on August 3, the Defense Department has reviewed the unresolved items in the July 28 disarmament proposal. There were, as I recall, four of them:

1. *Force levels.* The Defense Department is willing to agree to the following force-level subparagraph in paragraph C of Stage 1:

“(a) Force levels shall be limited to 2.1 million each for the U.S. and U.S.S.R. and to appropriate levels not exceeding 2.1 million each for all other militarily significant stages. Reductions to the agreed levels will proceed by equitable, proportionate, and verified steps.”

At the present time, as you know, the United States is at a substantial disadvantage on the conventional side. Any substantial cuts in United States force levels will seriously affect our presence throughout the world. For this reason, it is important (a) that this provision in the document be construed to require verification of actual force levels very early in the process, and (b) that the words “equitable” and “proportionate” be construed to mean small United States reductions as

---

<sup>1</sup> Disarmament proposal: DOD review of unresolved items on force levels, linkage, AICBM, first use, and test ban. Secret. 3 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament.

compared with large Soviet reductions as the 2.1 million levels are approached.

2. *Linkage*. The linkage problems appear in paragraphs D and E of Stage 1.

a. With respect to paragraph D, the Defense Department agrees to the elimination of the bracketed language (which called specifically for reduction of conventional arms prior to a production cut-off or transfers to non-weapons purposes). In this connection, however, I should like to emphasize our concerns about the cut-off provision. I fully agree with the Joint Chiefs of Staff with respect to three matters: (1) The United States advantage in fissionable materials is not as pronounced as the figures may imply. This is so mainly because of greater United States requirements for ASW and tactical weapons and because of the United States need to consume relatively larger amounts of material to achieve smaller warheads. The United States advantage could be eliminated in a relatively short time if the Soviets were to continue to produce while we abstained. Adequate verification of the cut-off, therefore, is essential. (2) The Soviet Union, by testing, can be expected both to develop a full spectrum of nuclear weapons which require very little fissionable material and to improve their weight-yield ratios. There must be assurance, therefore, that the Soviets are not testing. (3) Our stockpile depends on a continuous supply of tritium. The production of tritium must not be cut off.

It is our understanding, incidentally, that the phrase “agreed *initial* quantities” will appear in subparagraph (b) of paragraph D to ensure that the transfers of fissionable materials to non-weapons purposes are small. Anything more than this would require stripping existing weapons, an effect which we assume is not intended before Stage II.

b. In paragraph E a link of some kind is required, however. There should be language there emphasizing that reductions in delivery vehicles—for practical purposes an irreversible step—should not proceed in the absence of real progress in the area of quickly reversible reductions in conventional forces. We do not insist that the “link” be that the conventional cuts must have been *completed* (which is the purport of the present bracketed language), but we do believe that there must be language explicitly ruling out reductions on the nuclear side *before* reductions on the conventional side. The general language at the beginning of the document, referring to “balance” and the like, is not sufficient, in our opinion, to ensure that the United States will have a right to retain an adequate nuclear “equalizer” for superior Sino-Soviet conventional forces. We therefore propose that the subparagraphs of paragraph E be introduced by the following language:

“The following measures shall proceed concurrently with those in paragraph C above relating to force levels and armaments:”

3. *AICBM*. We agree to the following change in the first sentence of paragraph E (a):

*"Strategic nuclear weapons delivery vehicles in specified categories and agreed types of weapons designed to counter such vehicles shall be reduced to agreed levels by equitable and balanced steps. . . ."*

We agree to the same change elsewhere in the document where reduction in strategic weapons delivery vehicles is mentioned.

4. *No first use*. On the question of no-first-use-of-nuclear-weapons in Stage II, the Defense Department wants this provision removed from the paper. The no-first-use-of-*any*-weapons provision in Stage I conveys the thought in so far as the thought is acceptable. There should be no suggestion, especially at this time, that nuclear weapons cannot be used in defense against a conventional attack. In so far as CBR weapons are concerned, the Defense Department is willing to have CBRs referred to (along with "nuclear" and "conventional" armed force) in the no-first-use-of-*any*-weapons provision in Stage I. Paragraph G (a) might read:

*"States shall reaffirm their obligations under the U.N. Charter to refrain from the threat or use of any type of armed force—including nuclear, conventional or CBR—contrary to the principles of the U.N. Charter."*

5. *Test ban*. We have been told informally that there may be a fifth issue—that the test ban may be introduced into the document. This point was not raised before the Principals and it obviously is a major change. Since we have not had the opportunity to explore its implications (for example, mere inclusion of the provision could seriously affect United States' freedom of action with respect to resumption of testing), we will not comment on it here. We assume that neither this nor any other substantive changes will be introduced into the document without further consultation.

Sincerely,

**Ros Gilpatric**  
*Deputy*

**31. Letter from Stevenson to Bundy, August 11<sup>1</sup>**

August 11, 1961

*RE: Disarmament*

Dear Mac:

I told you I would discuss the McCloy draft of July 28 with Mr. Matteson. I find he is out of town. Hence I am passing the following comments along to you, not knowing where else to send them.

I enclose a copy of the document with some suggested changes, which I think are for the most part self-explanatory and of little importance.

1. Paragraph (a), page 7. My feeling is that the figure on force levels of 2.1 million is too high and could well be reduced to at least 1.9 million.

2. On the basis of what little I know, I would cast my vote against linkage in Section E, page 9. I am afraid it is vulnerable to attack as requiring all measures of control before any measures of nuclear disarmament.

3. I wish it were possible to include some definition of "indirect aggression and subversion" in paragraph (b) at the foot of page 10.

4. I think Stage III is vague and visionary, but I have not attempted to rewrite it. However, in paragraph (b) on page 14 I think the clause "including weapons of mass destruction and means for their delivery" should be deleted. If, as I assume, there is some thought that such weapons might be retained for the UN peace force, this would appear to be in conflict.

As to the handling of disarmament in the United Nations, in view of the prolongation of bilaterals into September, I would envision a series of steps somewhat as follows:

1) After the bilaterals in New York break down, the United States would ask for inscription on the agenda of the General Assembly. Timing will be critical, as I assume that the Soviets will try to beat us to the punch.

2) A speech by the President at the outset of the General Assembly, including as a principal initiative the United States program for general and complete disarmament in a peaceful world, and unveiling this plan.

3) The United States proposes in the General Committee that all items on disarmament be referred to Committee 1. There will doubtless

---

<sup>1</sup> Views on handling disarmament issue at U.N. and comments on McCoy's July 28 draft. Confidential. 2 pp. Kennedy Library, President's Office Files, Disarmament, Test Ban Negotiations, 4/28/61–3/62.

be other disarmament items, including several carried over from the previous session.

4) In Committee 1 we would say that the subject had been debated enough and offer a resolution referring both plans (US and USSR) to the Disarmament Commission.

If it was inconvenient to certain members for the Disarmament Commission to meet concurrently with the General Assembly, it could be adjourned after a couple of meetings to resume after the General Assembly.

I had hoped to give the President a more elaborate discussion of disarmament as I see it, but I think this hurried letter includes at least the bare bones of my views. The procedure in the Assembly, of course, must remain tentative pending developments.

Sincerely yours,

**Adlai E. Stevenson**

---

## **32. Memorandum from Dean to McCloy, August 11<sup>1</sup>**

August 11, 1961

SUBJECT

U.S. Disarmament Plan

While I realize that the President in his speech of July 25 on the West Berlin situation has alerted the country to the possibilities of that situation, Congress is being called on for additional appropriations, bombers scheduled for deactivation are to be kept in active service, draft calls are being increased, National Guard regiments are being alerted, I, nevertheless, believe the President, in person, should make a major speech on disarmament, tied in to his speech, dated May 25, on the peaceful uses of outer space, at the United Nations General Assembly during its first week, commencing September 19.

In addition to outlining the disarmament plan, which we are now clearing with the United Kingdom, Canada, Italy and France, and later with the NATO countries, I think the President should make certain

---

<sup>1</sup> Thoughts on U.S. disarmament plan proposal. Confidential. 4 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, General, 8/61.

specific offers with respect to the reduction in armaments. These statements will, of course, have to be cleared with the Allies and NATO will have to be alerted to them so that there will not be cries of anguish or misunderstanding, and so there will be no misunderstanding about our ability to carry out our commitments to Canada, to NATO, to SEATO, and under our mutual security pacts with Japan, Korea, the Philippines, Australia and New Zealand.

Mr. Foster's panel is meeting today and plans to meet all next week and will probably come up with some specific proposals for armament reduction no later than Tuesday, the 22nd of August.

The use of these specific proposals in the President's speech would have to be cleared by the Secretary of State and you, with the Department of Defense and the Joint Chiefs, and as mentioned above, with our Allies and NATO, and by the President himself before any decision can be made to use these specific reductions in the President's speech. These specific reductions may involve a basic change in strategy and may cause great heart burning in the Department of Defense and Joint Chiefs of Staffs and NATO.

It is my understanding that we have agreed to notify NATO some two weeks in advance of what we propose to present to the United Nations General Assembly. If this is so, we would have to get the August 11, 1961 draft of the Joint Declaration on Disarmament: A Program for General and Complete Disarmament in a Peaceful World cleared here in the department, cleared with our Allies, cleared with the Department of Defense and the Joint Chiefs and cleared by the President by approximately September 1. I'm not sure how specific our agreement to clear anything with NATO is and we must be careful that the substance of what the President proposes to say in a dramatic speech on disarmament would not have been leaked prior to the time he makes his speech. Careful thought must be given as to how subdivision (d) of Stage I, that is, the reduction of strategic nuclear weapons delivery vehicles, is to be explained to the NATO Council. Fundamentally, of course, this really involves a basic change in NATO strategy—the question is, Should we present the paper blandly without explaining this or should we be very careful and very explicitly explain what it precisely means? This is a very important decision.

We must, of course, get the final comments of the United Kingdom, Canada, Italy and possibly France to the draft of August 11, 1961 after the President has made his decision with respect to the one remaining matter not as yet cleared with the Department of Defense and the Joint Chiefs.

As you are now scheduled to meet with Mr. Zorin in the Bilaterals in New York starting September 5 in an effort to agree upon principles before setting up a Multilateral meeting and a forum and with a number

of those invited to be agreed upon, I would assume that your meeting with him would not be concluded before September 9, or possibly not until Tuesday, September 12, or one week before the scheduled opening of the UNGA. Since you will have to obtain agreement on the forum and the place for holding the Multilateral negotiations and the assent of those who are to be invited, I would assume that the Multilaterals would not be scheduled to meet until the end of the UNGA session, or at least not until after General Assembly discussions on disarmament. This, of course, raises the question as to how extensive the negotiations are going to be before the Disarmament Commission, or before the UNGA, or before the Security Council, the organization preparation, the handling of this work in the United Nations, and who is going to carry the burden of this work.

As you know, I am presently scheduled to go back to Geneva on the 23rd of August and I would assume I would be returning about September 8 or 9, or possibly one or two days earlier.

Pursuant to paragraph 6 of memorandum from McGeorge Bundy, dated July 28, referring to memorandum of decision, dated July 27, I am working on a proposed draft Presidential speech on disarmament.

While naturally I sincerely hope there will be some progress at Geneva, I think we should be outlining now what our course will be with respect to nuclear test negotiations if there is no agreement at Geneva. In other words, I think we should be planning now on requiring parties in a certain stage in carrying out the disarmament plan to agree to a nuclear test ban treaty. I don't think we should postpone our thinking on what we will do if this eventuality happens until I return from Geneva. This will have to be discussed with the Department of Defense and the Joint Chiefs, and possibly a meeting of the Principals unless the President himself wishes to decide this matter.

It is my understanding that when the Joint Declaration was first drawn up, it was assumed that a nuclear test ban treaty would have been agreed to at Geneva and would have been signed prior to the time the Joint Declaration on Disarmament was submitted. At the present time there is a serious question as to the validity of this assumption and, therefore, the disarmament plan ought not to be silent on the subject of nuclear testing.

I still hope it will not be necessary for the President to put forward the proposal about our not testing in the atmosphere. The Soviets could conduct important tests of electro-magnetic effect, yielding approximately one kiloton in the atmosphere which we could not detect, and very important and useful information can be obtained in tests yielding about one kiloton or less. Underground tests may take much time to prepare, may be costly and while we may be able to prove out weapons underground, we may not be able to prove out the effects of AICBM

or ICBM's except in the atmosphere. Consequently, if we announce that we won't test in the atmosphere until we find that the Russians are testing in the atmosphere, they may get very far on these low yield tests before we find out they are testing at all.

I further suggest that no announcement be made with respect to the resumption of testing until at least the end of the UNGA session. I realize, of course, that if any statement does have to be made with respect to our freedom to resume testing, the suggested statement with respect to not testing in the atmosphere becomes very important from the standpoint of assuring people against radioactive fallout.

---

**33. Memorandum from McCloy to President Kennedy,  
August 11<sup>1</sup>**

August 11, 1961

SUBJECT

United States Disarmament Plan

1. Attached (Tab A) is the new United States disarmament plan. It is agreed within the Government except for the one issue indicated below. The only issue outstanding at this time with the Allies is that indicated in paragraph 3 below.

2. Attached (Tab B) is a concise explanation of the new plan. The plan is the result of extensive consultation—first with a group of task forces from outside the Government; then with the various interested departments within the Government; and finally with the four Western Powers (the U.K., Canada, Italy, and France).

3. With the exception of France, which prefers not to be associated with any disarmament proposal at this time, the paper has the strong support of the other members of the Western Five and is regarded by them as a major advance over past U.S. proposals. France has reserved its position, although having made certain comments—both favorable and unfavorable—on specific elements of the paper. The French objection to inclusion of the section on reducing the risks of war by accident,

---

<sup>1</sup> Transmits copy of new U.S. disarmament plan and advises the President on outstanding clearance issues. Secret. Disarmament plan is not attached. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament.

miscalculation, and surprise attack (page 9 of the paper) is based on a concern that the USSR could use such proposals to embarrass the West in the Berlin crisis, perhaps by seeking to engage us in discussion of a Rapacki-type Central European zone. I recognize the point the French make but I am not inclined to think that the presence of this section is apt to increase the already substantial probability that the Soviets will bring forward again the Rapacki Plan. As I think the section adds something to our plan, I would retain it.

4. The single remaining issue within the Government is the Defense Department recommendation that the delivery vehicle measures be linked to the concurrent implementation of the measures dealing with reductions in force levels and conventional armaments. Arguments pro and con are given in the explanation paper in Tab B. The Defense position is given in the Defense letter of August 10, 1961 and the JCS comments in the memorandum of August 9, 1961 (both attached in Tab C).

5. As soon as you have made a decision on this remaining issue, we intend to submit the paper to the Allies for their final review and to the North Atlantic Council for discussion. After that—and with any non-substantive presentational changes which might be made—the paper will be ready for presentation in the General Assembly. The paper is now in a format designed both for presentation in the General Assembly and for negotiation in a multilateral forum. With regard to its presentation in the General Assembly, I strongly recommend that you present the plan yourself in a major speech on disarmament at the General Assembly.

6. A reference to a nuclear test ban has not been included in the disarmament plan because of previous concern that such a reference would play into the Soviet effort to merge the test talks with the general disarmament discussions. We have only recently raised this point informally with Defense for reconsideration. Defense prefers to study this question further before commenting. I urge that a reference to a nuclear test ban be included in the paper. In order to make the point that the U.S. continues to hope the USSR will sign the test ban treaty without waiting for general disarmament agreements, I suggest the following language be inserted in Section C on page 6 of the paper:

“(a) States that have not adhered to the agreement to prohibit the testing of nuclear weapons shall do so.”

Other paragraphs in Section C would be relettered accordingly.

7. I understand that Ambassador Stevenson will be commenting to you shortly on the marketability at the U.N. of the recommended U.S. disarmament plan. I would appreciate the opportunity to discuss with you any substantive comments he might make.

**John J. McCloy**

**34. Telegram 1387 to Geneva, August 15<sup>1</sup>**

August 15, 1961

Dept agrees your suggestion contained SUPNU 1733 for proposal to formalize procedure for consulting on threshold question at end of moratorium period. Proposal along lines you suggest should be worked into statement on moratorium.

Dept wishes lay basis for best possible US position to deal with expected Sov attack on our moratorium position in forthcoming GA, which Sovs probably count upon as being vulnerable enough to avoid GA focusing to its disadvantage on Sov position on administrative council and inspection quota. Accordingly opening statement which USDEL is drafting for first session should include review of development of moratorium idea, pointing out how Sovs accepted threshold treaty concept and themselves proposed moratorium. Statement should stress that combined threshold treaty-moratorium-research program proposal was constructive and imaginative way to surmount impasse reached due on the one hand to US unwillingness on principle accept treaty obligation not to test in areas we knew beyond shadow of doubt were out of reach of Geneva control system and on the other to Sov unwillingness contemplate changes in Geneva control system despite its recognized inadequacy to police total test ban.

USDEL should state that if this solution to problem no longer acceptable to Sovs (as is indicated by their attack on moratorium), US prepared consider with SOVDEL methods of immediately extending control system to lower threshold level or entirely to eliminate threshold. Statement should stress that US objective is and has always been ending of all tests under adequate control and that moratorium arrangement or threshold treaty for its own sake is not US objective. USDEL should reiterate US view of interrelationship among 1) number of control posts 2) number of inspections, and 3) level of threshold. USDEL should refer to possibility relocating present number control posts to provide for greater density in seismic areas as one method which might improve capability for detection and identification underground events. (Dept assessing effect of widening of spacing in aseismic areas on system capabilities with respect high altitude detection). With such relocation present threshold of 4.75 could no doubt be lowered. If stations were relocated and additional stations included in system, level of threshold could be lowered, probably to level envisaged by

---

<sup>1</sup> Negotiating guidance on threshold question at end of moratorium period. Secret. 4 pp. Department of State, Central Files, 397.5611-GE/8-1161.

1958 experts. Adding sufficient unmanned seismic stations to Geneva network is another possibility and would allow for complete elimination of any threshold and possibly aid in reducing number of inspections needed.

If Sovs prepared examine such solutions to underground test control problem, US fully prepared to negotiate changes in treaty which might eliminate threshold. If Sovs unprepared, however, contemplate any change in present control system which their scientists as well as ours know to be inadequate for identification small underground tests, Sovs and not US must bear responsibility for preventing achievement comprehensive treaty from outset. US prepared to consider any alternative proposals which Sovs might make in this connection in order demonstrate to Sovs and to world that it is prepared exert utmost efforts to reach earliest possible comprehensive agreement barring any and all nuclear weapons tests. Short of Sov willingness reconsider its position on controls, however, threshold treaty and limited moratorium arrangement to allow for further research program seems to US to be best solution present situation. Nevertheless we are willing listen to any better ideas which Sovs might have and which are consistent with objective of agreement on cessation of all nuclear weapons tests under system of effective international controls, which Sovs have espoused as their objective since the beginning.

We are also considering tabling text of amendment to treaty which would require lowering of threshold at end of moratorium period and incorporate same provision as to feasibility and basis for right to terminate we now have in provisions for outer space even though some scientists continue somewhat pessimistic about overcoming decoupling problem. If we do not make such moves however neutralists resolution calling for end to all testing regardless of agreement on controls may receive substantial vote in general visceral reaction all testing is bad.

Above will be discussed tomorrow or Friday with President. Request USDEL comments soonest.

**Rusk**

**35. Memorandum from Rusk to Bundy, August 17<sup>1</sup>**

August 17, 1961

**SUBJECT**

Ambassador Stevenson's comments on July 28 draft of Disarmament Negotiating Proposal

I have reviewed Ambassador Stevenson's comments on the July 28 draft of the disarmament negotiating proposal in light of the changes since made and reflected in the August 11 draft of that proposal. My comments follow the order of Ambassador Stevenson's comments to you:

1. Initial reduction to a force level of 1.9 million rather than the present level of 2 in the proposal would increase the amount of disarmament in stage I and thus would improve the saleability of our proposal in the General Assembly context. However, I question whether we should change this figure without further study of its military implications.

2. I agree with Ambassador Stevenson's comments on the linkage in Section I, page 9, of the July 28 draft and share his view that its inclusion would make our proposal vulnerable to attack. While this linkage has been modified to some extent by the changes made in the August 11 draft of the negotiating proposal, I nevertheless believe that the language proposed by the Department of Defense (footnote on page 8 of the August 11 draft) is an unnecessary qualification. It would be misinterpreted by the Soviet bloc and probably be misunderstood by many of the non-aligned states without commensurate gain in terms of protecting our security interests.

3. I doubt the advisability of attempting at this time to spell out or further define the phrase "indirect aggression and subversion". The language as it appears is generally understood and an effort to further define the terms might better be left to a general disarmament negotiation. If challenged in the General Assembly debate on this issue, we could parade again the Communist record to exemplify the meaning we attach to the words.

4. I agree with Ambassador Stevenson's suggestion that in paragraph (b) on page 14 of the July 28—and also August 11—draft the clause "including weapons of mass destruction and means for their delivery" be deleted. The question as to whether weapons of mass

---

<sup>1</sup> Stevenson's comments on July 28 draft disarmament negotiating strategy. Confidential. 2 pp. Department of State, Central Files, 600.0012/8-1761.

destruction should or should not be retained for the United Nations Peace Force and/or for remaining national forces is a matter upon which agreement would have to be reached in the course of negotiations.

5. The suggestions which Ambassador Stevenson has made with regard to handling disarmament in the United Nations seem generally sound. We are currently engaged in a more detailed formulation of the tactics which might be adopted to best achieve our purposes.

6. These comments have been checked with Mr. McCloy's office and are consistent with his recommendations.

**Dean Rusk**

### **36. Memorandum from Komer to Bundy, August 17<sup>1</sup>**

August 17, 1961

#### SUBJECT

Disarmament Issues

1. *Test Ban Issues.* Dean will either pass out or circulate at meeting a draft telegram explaining his new proposals. USDA has been in touch with Defense on these, so they will not come as a surprise.

You should probably also discuss British proposal that test ban talks be continued through UNGA discussion so as to avoid technical issues being shifted to less satisfactory forum. British position makes much sense here.

I think less of other UK proposal that at last minute US/UK might suggest a comprehensive treaty (in lieu of threshold plus moratorium) if Soviets will accept our treaty draft. Note Geneva delegation's objections on last page of SUPNU 1722 attached. Dean's idea of promising not to test again if the scientists come up with something in three years is a better gambit.

2. *Disarmament Package Issues.* Real question here is whether we want to make a big disarmament splash at the UN—and whether USDA program is a suitable vehicle. If one looks at it as a political document, not a draft treaty, I would argue that it has sufficient new features (e.g.

---

<sup>1</sup> Discussion paper on disarmament issues. Secret. 3 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, General, 8/61.

acceptance of GCD, elaboration of peace-keeping machinery, substantial though vague first stage reductions in nuclear weapons and delivery vehicles, etc.) to serve this purpose. Whatever its weaknesses, it is far more solid than the Soviet GCD plan with which Khrushchev has made so much mileage over past two years.

3. *"Linkage"*. If USDA program is being put out primarily for political impact, it would be weakened by explicit "linkage" of conventional and nuclear delivery vehicle reductions. DOD's case may be sound in principle but we seem adequately protected by the fine print at the beginning of the program which calls for disarmament to proceed by balanced phases which at no point adversely affect the security of any state. To omit explicit mention of "linkage" does not prevent us from raising it later in the wholly unlikely event of serious negotiations. Can't President simply rule that if we ever get into such negotiations he will then hear argument, and that omission of linkage language at this point will be without prejudice to DOD case.

4. *Timing*. The fact that we have only four weeks before UNGA lends urgency to getting program approved pronto. Allies need it for final review. We have also promised NATO Council at least two weeks to study and comment on it. On this score, McCloy apparently does not want to go to Paris to present paper to NATO, but many of us think he should.

We also need enough time to develop and get moving big propaganda effort, if we decide to publicize new disarmament initiative as a major peace move. Attached is latest version of guidelines prepared by Public Affairs Working Group—note that *key item is Presidential speech introducing program at UNGA* (see Page 3). Rusk and Ed Murrow need a push on this too—no point in expending Presidential capital if we don't have adequate follow-up.

5. *Foster Panel Report*. I gather Panel draft will be ready by beginning of next week. From preliminary look it is more imaginative and far more concrete than vague USDA "Heads of Discussion" program. However, let me underline again the great difficulty we would have in getting adequate DOD and other agency review, much less clearance from allies, for a radically new program of this type before UNGA opens. Moreover, it is essentially a bilateral US-USSR program, which will not sit well with our allies. Third, I do *not* believe it possible to get USSR to agree to divide its territory into zones and then permit us to decide at random in which zone to make inspections. In other words, I suspect plan is not, in fact, negotiable with the Soviets. While it nonetheless might be surfaced now, much depends on whether it could be fitted in as an elaboration of the existing USDA program. Even if not used now it could still be of major value as the sort of thing we might propose once both sides get GCD out of their systems. At this

point, however, isn't best line for us to appeal to the multitude by outbidding Soviets on GCD plus "peaceful world"?

6. *Stevenson's Comments*. Haven't seen yet, but gather only substantive proposal is to reduce in first stage to 1.9 million men instead of 2.1 million. This would be more dramatic, but it is awfully late in the day to get DOD all in a lather again. Moreover, since USSR has stopped its force cuts at around 3 million, and US itself is going up, even a cut to 2.1 million looks good now.

RWK

---

### 37. Supnu 1741 from Geneva, August 17<sup>1</sup>

Geneva, August 17, 1961

Re Nusup 1387. US Del is, of course, most anxious that West be in strongest feasible position during UN GA debate on test ban and, as our recent telegrams have indicated (Supnu 1722 and 1655), we are fully aware that possible test resumption loophole involved in threshold-plus-moratorium arrangement gives Soviets their best line of attack against Western proposals. Therefore we have always recognized that eventual move to undercut Soviet attack along this line deserves consideration.

Even apart from pros and cons of any such step, however, immediate problem seems two-fold: first, whether return of Ambassador Dean to Geneva would be best occasion for moving away from threshold, and second, whether in any case, formula indicated reftel would be most satisfactory approach.

Re timing, it is still our strong feeling that present over-all Western position is quite strong, that Soviets are also somewhat vulnerable for having first suggested moratorium, and that small moves on removal of administrator, appointment of neutrals to inspection teams, and spelling out of consultation procedures at end of moratorium will all gain considerable world attention as further evidence of Western flexibility, ingenuity and sincere desire to bring about successful conclusion of talks. To bring forward proposal outlined reftel would only mean reopening of possibly detailed negotiations with SovDel on one

---

<sup>1</sup> U.S. posture on threshold-plus-moratorium arrangement. Secret. 4 pp. Department of State, Central Files, 397.5611-GE/8-1761.

issue at time when Soviets have made it clear they are not prepared for any serious negotiations, and in way which could distract focus away from cardinal issue like troika rpt troika and towards Soviet allegations that West seeks to use excessively broad controls for espionage.

We believe that, if move is made at all, it could best be done in connection with UN GA. There could either be direct Western offer, in initial speech opening debate on this subject, to consider ways of achieving comprehensive treaty immediately; or there could perhaps be indication of US willingness to accept some sort of compromise plan worked out by third powers which might involve, among other things, Soviet abandonment of troika and Western elimination of threshold. Member of SovDel indicated informally several weeks ago that even if West dropped threshold, Soviets would not give way on other demands, and if USSR held to this position, then Western move to comprehensive treaty could provide GA with dramatic proof of Western reasonableness and desire for treaty against Soviet obduracy.

Re substance, we feel that objective of any new move on threshold, whether now or later, would be essentially to remove basis for Soviet attack on Western position on grounds which would undoubtedly have substantial appeal to much of world public. In this light, there would seem to be little point for us to exchange one disadvantageous position for another. Although our present weakness derives from moratorium problem we have strong case to counter Soviet espionage charges that control system set forth in Western draft treaty is fundamentally same collection of limited measures as recommended by 1958 experts and accepted by SovGovt. To move along lines suggested reftel would indeed deprive Soviets of charge that West is seeking loophole for test resumption, but would make possible new accusations re Western espionage intentions.

Although Soviet scientists in May 1960 were contemplating seismic research improvement program in USSR, they did not rpt not even then specifically acknowledge inadequacies of Geneva system, and entire record of meetings of TWG.2 rpt TWG.2 shows lengths to which they went to defend complete adequacy for all types of underground tests of control recommended in 1958. This is line SovGovt. has also steadfastly maintained, and we would anticipate difficulty in gaining much understanding or sympathy in GA for our explanations of technical inadequacies of Geneva system to justify demands for expanded controls in face of Soviet citation of US Govt. acceptance of Geneva report on August 22, 1958.

Foregoing line of reasoning would indicate that whenever US might make offer to abandon threshold, proposal should be relatively free of strings in order to remove vulnerability in present US position without

creating new one. This would not, of course, exclude effort to obtain defeasance provision focussed on whether undergrown control capabilities live up to 1958 assessment. Such proposal could either be made when offer to drop threshold announced or, if threshold is to be retained, offer could follow lines suggested penultimate paragraph reftel.

When and if proposal made to end threshold, we would also not exclude very generalized reference to relationship of control to threshold tied to observation that we might wish to suggest certain possible technical changes in system in USSR, such as relocation of some control posts, which would increase confidence in effectiveness of system at outset under comprehensive treaty, even prior to implementation of research program. To sum up USDel reaction, we believe:

1. Present position is strong enough to stand on prior to GA.
2. Small moves contemplated for when Ambassador Dean returns will be adequate for moment in gaining favorable world attention to Western approach.
3. Postponement of move on threshold until GA debate on test ban will enhance chances of obtaining major quid pro quo for Western move or, alternatively, of demonstrating negative nature of Soviet position even more dramatically.
4. Impact of move away from threshold will be substantially reduced or lost if it is linked to demand for expansion of control system.

**38. Memorandum from Dean to McCloy, August 18<sup>1</sup>**

August 18, 1961

SUBJECT

Presidential Announcement re Resumption of Testing

With respect to the decisions reached in the President's office yesterday afternoon, it would be my strong recommendation that no announcement either with respect to the resumption of testing or prepa-

---

<sup>1</sup> Possible announcement on resumption of testing. Secret. 1 p. Kennedy Library, National Security Files, Subjects Series, Nuclear Testing, 8/10/61-8/30/61.

ration for the resumption of testing be made while I am in Geneva or during the forthcoming session of the UNGA.

I see no objection to the President privately giving whatever instructions as may be appropriate to the agency authorizing them to make the necessary preparation for the resumption of testing. I would, in fact, recommend that such an order be given provided it is made explicitly clear it does not constitute any authorization for the resumption of testing. Following the termination of the forthcoming session of the UNGA, I would then recommend that serious consideration be given to a statement by the President that we are now reaffirming full freedom of action with respect to the resumption of testing.

While I realize that there has been considerable discussion about not making any announcements just prior to the time we make a particular test, it has occurred to me that if no public announcement is made shortly before a test occurs possibly there might be leakage in the press or other means of communication. It might therefore be deemed desirable to continue the policy of making a public announcement just before each test occurs. This is also consistent with our policy of openness. If we were to make a test without a prior announcement and the Soviets were to proclaim to the world that we had tested, I believe that on balance, we would lose in the public opinion race.

---

### 39. Memorandum from Seaborg to the File, August 23<sup>1</sup>

August 23, 1961

The purpose of this memorandum is to record some personal and tentative thoughts with respect to a plan for the announcement of a decision to resume nuclear weapons testing—if the President should find it necessary to make this decision; and for the subsequent conduct of such tests, including seismic research and peaceful uses detonations using nuclear devices.

The object of the plan is to minimize adverse public reaction both at home and abroad, even though I believe the President has succeeded in shifting the burden of responsibility for the success or failure of the talks to the Soviets.

---

<sup>1</sup> Personal thoughts on possible Presidential announcement on resumption of testing. Secret. 3 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Testing, 8/10/61–8/30/61.

The plan is based on a premise: nuclear weapons testing is a defense activity and as such does not impose upon the President an obligation to disclose the actual conduct of specific individual tests. Rather, I believe the United States must have the choice to disclose or conceal defense activities, including nuclear weapons testing, depending upon whether disclosure is in the interest of our national security or inimical to it. While there may be practical reasons for the announcement of specific tests—such as the need for international cooperation from seismic research stations throughout the world—this is a matter of choice and not of duty.

I should also note that the plan deals not with the decision *per se*, whether or not to resume testing, but rather with the announcement of the intention to resume and the announcement of specific tests as they may be held.

I would assume that if the President decides to authorize the resumption of nuclear tests he would honor the commitment made by former President Eisenhower on December 29, 1959, that, “Although we consider ourselves free to resume nuclear weapons testing, we shall not resume nuclear weapons tests without announcing our intention in advance of any resumption.”

However, I do not believe that there is a corresponding obligation to announce each individual test even though we might elect to do so under particular circumstances.

If no progress is made with the Soviets following Mr. Dean’s return to Geneva, or if other developments should urge a change in our present posture, the President might wish to pursue the following course. State publicly:

1. That the United States has exhausted all efforts to reach agreement with the Soviet Union on an adequately safeguarded nuclear test ban treaty;

2. That the United States is, accordingly, *making preparations* for the resumption of testing of nuclear weapons;

3. That the United States will *conduct* weapons tests *whenever* it finds that it is in our national interest to do so;

4. That such tests will be conducted in the underground where the explosion will be fully contained so that there need be no fear of radioactive fallout;

5. That the United States will also conduct nuclear seismic research detonations and peaceful uses explosions with nuclear devices;

6. That the conduct of nuclear weapons tests is a defense activity and that there will be no further announcement of the conduct of individual tests if disclosure would appear to be inimical to our national security; and

7. That even though the United States will now make the essential preparations for the conduct of nuclear weapons tests, and will conduct them at sometime in the future if it is in our national interest to do so, the United States, nevertheless, stands ready, as it has for the past

three years, to enter into an adequately safeguarded treaty with the Soviet Union.

Thus, under the foregoing plan the policy decision with respect to the probable resumption of testing would be announced, but there would be no corresponding obligation to announce the conduct of individual tests.

No doubt the conduct of underground nuclear activity at Nevada would become known. It would be assumed that such activities involve nuclear weapons testing—since under this plan the President would have announced our intention for probable resumption. It would not be known specifically whether such tests involved seismic research or peaceful uses explosives, or were actually nuclear weapons tests, or perhaps a combination of all three; the difficulty of knowing would be enhanced by the fact that all three categories could be used to give seismic information. Specific knowledge as to the category of nuclear explosion would be known only to a relatively small group of people on a need to know basis, each of whom would have the necessary security clearance carrying with it a statutory obligation to safeguard the information.

There would be considerable speculation at first, but with a consistent policy of “no comment” based on the principle that nuclear weapons tests are defense activities, curiosity should decline and nuclear tests activities should come to be accepted in the same category as other secret defense activities. This plan would require the special cooperation of nearby universities with seismic detection equipment, but this could be arranged possibly by means of specific contracts for participation in the seismic program.

Glenn T. Seaborg

---

**40. Letter from Seaborg to Bundy, August 30<sup>1</sup>**

August 30, 1961

Dear Mac:

As I indicated to you on the telephone, I had reduced to writing my thoughts on a plan for announcing the resumption of testing—

---

<sup>1</sup> Thoughts on conducting a meaningful series of tests. Secret. 2 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Testing, 8/10/61–8/30/61.

should the President find it necessary to make such a decision. Actually, the plan is essentially the one that you and I talked about on one or two occasions recently, the last being on August 17, when we met with the President. There was some reference to such a plan at this meeting.

I don't believe the development that we talked about on the telephone this evening necessarily changes what I consider to be the merit of this plan. It may affect the timing, however.

You also inquired how soon we would be able to commence, and from the way you phrased your question, I had the impression that you were more or less hoping that the answer would be that we could commence rather soon—primarily for strategic and not necessarily for technical reasons. There are certain things that we could do rather quickly—say in one or two weeks. For example, we could fire [*text not declassified*]. On such short notice, however, these would have to be on a “go, no-go” basis—indeed, this would be the only purpose of the test since adequate diagnostic instrumentation could not be implaced and made operative in time.

[*text not declassified*]

I would like to stress again, however, the penalty which we would pay if we proceed on this basis. The events that I have described above and others I have not mentioned have the advantage of early readiness, but the disadvantage of interfering with subsequent tests which are far more important. As you know, there are only a limited number of underground sites now available. It is for this reason that I would suggest that consideration be given to a planned and coordinated program in accordance with the capability indicated in my letter to the Principals (Secretary Rusk) dated July 19, 1961. This program was carefully coordinated with the Department of Defense and could be commenced in about four or five weeks.

In connection with the subject of readiness, I suggest you might wish to refer back to my memorandum of August 10. I think the discussion there is still relevant in helping to understand the problems that are involved in preparing for, and conducting a meaningful series of tests.

Cordially,

Glenn T. Seaborg

**41. Telegram 1404 to Geneva Nusup, August 31<sup>1</sup>**

August 31, 1961

Confirming Stelle-Spiers telecon, you are authorized to proceed with Monday session. As Chairman you should make first statement, referring to SOV announcement, recapitulating in most effective possible way history US efforts to achieve agreement and forbearance with regard resumption testing, and read White House statement contained NUSUP 1401 into record. You should then, before Tsarapkin has opportunity to speak, state that SOV attitude re conference appears make it pointless to continue on business as usual basis and that US proposes conference recess as of today pending UNGA completion its scheduled consideration test issue. You should not propose specific date for resumption. However your statement should not give any indication or convey impression that US is taking any initiative to terminate conference.

Our expectation is that Tsarapkin will announce SOV withdrawal from conference and we believe it important that US be on record prior to such SOV statement with proposal for recess so that SOVs bear responsibility for termination conference as well as for resumption testing.

We are taking this matter up urgently with UK Embassy here and you should be in contact with UKDEL Geneva.

**42. Notes on Telephone Conversation between Stevenson and Rusk, August 31<sup>1</sup>**

August 31, 1961

The Sec returned the call and S said he just heard from IO that there was some move emanating from McCloy's office to try to persuade the Pres to make a statement re the resumption of testing. He wanted personally to say this is a big mistake. This is not a blow; it is a bonanza. The Sec said it was gone over very carefully at NSC and with the Congressional leadership and it was decided no. Then a reference was made by one of the agencies because they were getting so many questions and the Pres said we decided that this a.m. We don't expect to say anything for a week or so in any event. Meanwhile we will think about S's suggestion of taking it into the SC. S asked if there were any reaction. The Sec said not a staffed-out reaction. One of the problems is we want to see whether there is not going to be a major problem in the SC coming up this week end about something else. S said then perhaps not an announcement Saturday. The Sec thinks it unlikely and told S to go ahead to Libertyville. S hopes before McCloy changes the Pres' mind we will not cancel out the benefits we have derived. The Sec said it is not from him. He is sure we are safe on this point through Labor Day and that is a minimum. S asked if that included anything about preparation and the Sec said yes.

<sup>1</sup> Stevenson's views on a possible Presidential statement on resumption of testing. No classification marking. 1 p. Department of State, Rusk Files: Lot 72 D 192, Telephone Conversations.

## September 1961

### 43. Notes on Telephone Conversation between Rusk and Cleveland, September 1<sup>1</sup>

September 1, 1961

The Sec asked if he saw the Niact from Leopoldville about the talk with Linner about Katanga. C said no. It's 509. The Sec thinks this attitude of Linner's is unacceptable particularly when he talks about taking action there to throw out Belgians working there on various administrative jobs. He is not playing completely clear with the SYG because he does not want his hands bound too tightly. He is not a sovereign state and we have a lot at stake. C thought it was extreme in Katanga even though there was provocation. The Sec said to look at it and he thinks we should have a serious talk. He is not the responsible party here and we have a tremendous stake here—we expect to be kept informed and expect the SYG to be informed. If you can mask it in a friendly way, fine.

C said they have a memo in the last stages of production on UN angles of the testing thing. ASchlesinger talked with C and said he was talking with the Pres about it and the Pres was interested in the SC and wanted to see what kind of a resolution it would be. S asked Stevenson to draft it. C asked S to stay in channels and he agreed. We will have a res and the memo will recommend that we immediately launch it on a contingency basis but do so by consulting with the Br and Fr in the next day or so. The other part of this problem is if we make too much of a decision about testing which is to start preparing and maybe announcing this and make a statement that we are going to test and get in the same category as the Russians, this would cause difficulties for our UN ploy. The Sec said he has misgivings on it. C thinks we can go ahead unilaterally and still get world opinion mobilized against the Russians if we do it right. The Sec is worried about getting over the week end. We may need the SC for Berlin. C said that is not inconsistent. The Sec said not really but it might appear we were trying to overdo it if we took two at the same time. C did not seem to agree. The Sec said he would be glad to see him later.

**44. Telegram 1171 from Paris, September 1<sup>1</sup>**

Paris, September 1, 1961

In view of press reports suggesting imminence US counter-decision to resume testing, from vantage point here it would seem advisable to draw maximum benefits from Soviet-Communist embarrassment and relatively favorable position US-UK have enjoyed for past several months to refrain from immediate decision (or at least announcement decision) to resume testing. In view concern various parts world over testing, including exaggerated concern over health effects noticeable unsophisticated countries, we wonder if it would not be wise to play to maximum this situation in light forthcoming Belgrade conference non-engaged states and General Assembly consideration US-inscribed topic for next two months before any decision announced US follow suit further atomic tests.

**45. Telegram 428 to USUN, September 2<sup>1</sup>**

September 2, 1961

Paris pass USRO For Disarmament Del. In bilateral disarmament discussions with USSR to be resumed Sept 6 in New York USDel should continue be guided by instruction contained Deptel 137 to Moscow of July 14, rptd info Paris 274, London 209, Rome 125, Ottawa 38, Geneva NUSUP 1327, New York 64, with amendments as follows:

1. *Framework*: Substitute revised statement of principles follows:

QTE 1. The goal of negotiations is to achieve agreement on a program which will ensure that (a) disarmament is general and complete and war is no longer an instrument for settling international problems,

---

<sup>1</sup> Guidance for September 6 disarmament discussions with Soviets. Confidential. 6 pp. Department of State, Central Files, 600.0012/9-261.

and (b) such disarmament is accompanied by the establishment of procedures for the peaceful settlement of disputes and effective arrangements for the maintenance of peace in accordance with the principles of the United Nations Charter.

2. The program for general and complete disarmament shall ensure that states will have at their disposal only those forces, armaments, facilities, and establishments as agreed to be necessary to maintain internal order and protect the personal security of citizens and to support and provide agreed manpower for a UN peace force.

3. To this end, the program for general and complete disarmament shall contain the necessary provisions for:

(a) Disbandment of armed forces, dismantling of military establishments, including bases, cessation of the production of armaments as well as their liquidation or conversion to peaceful uses;

(b) Elimination of stock-piles of nuclear, chemical, bacteriological, and other weapons of mass destruction and cessation of the production of such weapons;

(c) Elimination of means of delivery of weapons of mass destruction;

(d) Abolishment of organizations and institutions designed to organize the military effort of states, cessation of military training, and closing of all military training institutions;

(e) Discontinuance of military expenditures.

4. Disarmament should be implemented in an agreed sequence, by stages until it is completed, with each measure and stage carried out within specified time limits. Transition to a subsequent stage in the process of disarmament should take place upon a review of the implementation of measures included in the preceding stage and upon a decision that all such measures have been implemented and verified and that any additional verification arrangements required for measures in the next stage are agreed and, when appropriate, ready to operate.

5. All measures of disarmament should be balanced so that at no stage of the implementation of the treaty could any state or group of states gain military advantage and that security is ensured equally for all.

6. All disarmament measures should be implemented from beginning to and under such strict and effective international control as would provide firm assurance that all parties are honoring their obligations. The scope of control would depend on the requirements for verification of the disarmament measures carried out in each [illegible in the original] control over and inspection of disarmament measures carried out in each [illegible in the original] implementing control over and inspection of disarmament. An International Disarmament Organization including all parties to the agreement should be created

within the framework of the United Nations. During and after the implementation of general and complete disarmament, the most thorough control should be exercised. The International Disarmament Organization and its inspectors should be assured of unrestricted access without veto to all places as necessary for the purpose of effective verification.

7. Progress in disarmament should be accompanied by measures to strengthen institutions for maintaining peace and the settlement of international disputes by peaceful means. During and after the implementation of the program of general and complete disarmament, there should be taken, in accordance with the principles of the United Nations Charter, the necessary measures to maintain international peace and security, including the obligation of States to place at the disposal of the United Nations agreed manpower necessary for an international peace force. This force should be used only for purposes consistent with the Charter of the United Nations and should be subject to arrangements which will ensure that it will not be used for purposes of one state or group of states as are contrary to the Charter and that it will be able to perform the functions assigned to it.

8. States participating in the negotiations should seek to achieve and implement the widest possible agreement at the earliest possible date. Efforts should continue without interruption. [illegible in the original] the total program has been achieved, and [illegible in the original] to ensure early agreement on and implementation of measures of [illegible in the original] disarmament should be undertaken without prejudicing progress on agreement or the total program and in such [illegible in the original] these measures would facilitate and form part of that [illegible in the original] UNQUOTE.

USDEL should not accept or propose changes of substantive nature in above text without referral to Dept.

2. *Date*: USDel should propose resumption of multilateral disarmament negotiations after UN General Assembly and should suggest January 23 as suitable time.

3. *Tactics*: USDel should seek to emphasize informal character of meetings by increased use of small informal drafting sessions in place of on the record presentation of prepared speeches. No firm terminal date for discussions should be set at this time but USDel should indicate to Sovs US hope reach agreement prior to UNGA. In absence agreement US should seek clear definition remaining issues by that time. Department considering possibility your handing Sov Aide-Mémoire which will-establish record.

FYI

Our willingness to resume bilateral disarmament talks in New York will help maintain our posture of reasonableness. However, since

the Soviets are now in a highly vulnerable propaganda position we should not repeat not make any undue or unnecessary concessions in order to achieve agreement on principles. The pressure is on the Soviets to make a basic change in their position and we should stand essentially on the same statement of principles as have been previously given to the Soviet Union or on the above modified version which contains only minimal changes of a non-fundamental character. In the present context of Berlin and Soviet testing an agreement on principles would tend to confuse public opinion and be a sham rather than reality. If the Soviets make fundamental concessions, we of course will have to review the situation.

Re forum, our four proposals make excellent record. While we will have to refer to all, delegation should emphasize Disarmament Commission, or 5–5–10 as sub-committee of D.C., as best and most stable kind of arrangement.

<sup>1</sup> Possible U.S./U.K. statement urging Soviets to end atmospheric testing. Secret. 3 pp. Department of State, Central Files, 700.5611/9–261.

Text of draft statement follows:

QTE In order to protect mankind from the increasing hazards of atmospheric pollution, the President of the United States and the Prime Minister of the United Kingdom propose to Chairman Khrushchev that their three Governments agree, effective immediately, not to conduct nuclear tests which take place in the atmosphere and produce radioactive fallout.

They urge Chairman Khrushchev to cable his acceptance of this offer and his immediate cessation of further atmospheric tests. They further urge that the United Nations Disarmament Commission be convened not later than September 9 to record this agreement in formal terms. They sincerely hope that the Soviet Union will accept this offer, which remains open for the period indicated.

They point out that the United States and the United Kingdom are prepared to rely upon existing means of detection and are not suggesting additional controls or control organization with regard to atmospheric testing. But they reaffirm once more their serious concern that a nuclear test ban treaty, applicable to other forms of testing as well, be promptly agreed, as proposed by their two governments at Geneva, in order to take a significant step toward an end to the unfortunate competition in nuclear weapons. UNQTE.

**48. Letter from Amb. Caccia to President Kennedy,  
September 5<sup>1</sup>**

September 5, 1961

Dear Mr. President,

The Prime Minister has asked me to pass on to you the enclosed message about Nuclear Tests. This was of course despatched before I had told him of your decision of this afternoon and of the announcement which has been made. After being informed, he spoke to me on the telephone and said that he thought that you might all the same like to know what had been in his mind as a result of a discussion of this problem with his colleague earlier in the day.

Yours sincerely,

**Harold Caccia**

**Attachment**

Dear Mr. President,

I have been thinking further about the position on Nuclear Tests following your initiative which led to our joint declaration last Sunday. So far I think that we have done very well and have gained a big propaganda advantage. Now the question is how to keep this advantage and exploit it.

I presume that on Saturday, September 9, or shortly thereafter, we shall get some sort of Soviet refusal of our suggestion. No doubt the Russians will try to confuse the issue so far as possible, perhaps by suggesting an uncontrolled ban on all Tests or by saying that there should be progress in Disarmament as a whole rather than on particular aspects. Do you think that immediately after such a Russian reply we might jointly put in a resolution to the United Nations calling on all nations to agree to end Tests in the atmosphere? I suppose that the Russians might then propose an amendment including under-ground Tests, but we should have to weigh this risk against the obvious advantage of getting a resolution such as I have suggested.

Alternatively if such a resolution seems to have too many snags, are there any statements which we could make to help to hold world opinion in our favour?

---

<sup>1</sup> Transmits September 5 letter from Prime Minister Macmillan on possible next steps with Soviets following joint declaration. Top Secret. 3 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan–Kennedy, 1960–1961.

I should be very interested to hear your views. I think that we gained greatly from the prompt action that we took last week at your suggestion and it will be equally important that our reaction to the Russian reply to our message should be prompt.

With warm regards,

Yours sincerely,

**Harold Macmillan**

---

**49. Telegram 1235 from Paris, September 5<sup>1</sup>**

Paris, September 5, 1961

Reference: Deptel 1290. Per reftel met with Dixon last night and we agreed, best tactic would be to see Couve this morning. I have just come from talking with him. I began by saying to Couve that the British and ourselves have been in discussion with the Soviets in Geneva on nuclear testing and controls, that the recent USUK statement proposing the cessation of in-atmosphere testing came from that association. Since having issued the statement, however, we have discussed the matter further and we are now aware that the Soviets in their reply might seek to take advantage of the fact the French were not party to that statement. Further, since General de Gaulle will be having a press conference today we feel it important that if he discuss the matter, he associate himself with our point of view and, in any event, not take a point of view opposed to US. Couve doubts that de Gaulle will bring up subject in his press conference. However, a question on it may be asked. Couve seemed quite confident that de Gaulle would take positive point of view associating himself with the USUK statement. He seemed equally as confident that he would not take a position against our statement. I pointed out possibility that Soviets may charge us with bad faith and with having the intention of having French conduct tests for us. Couve said he aware they might do this but it would be obviously absurd. French plan no in-atmosphere tests at any time in foreseeable future and probably not until they are ready to do H-bomb testing, which, according to Couve, is a long way off. They plan some underground tests next spring.

---

<sup>1</sup> U.S.-U.K. statement: French disassociation. Secret. 2 pp. Department of State, Central Files, 700.5611/9-561.

To explore Couve's thinking and as far as possible, de Gaulle's, I suggested it might be understandable if de Gaulle is bit disturbed France left out of USUK note. Couve said absolutely no, they understood why note was sent. He thought it good idea to have sent it.

Couve concluded by assuring me our views would be presented to de Gaulle.

Dixon saw Couve about 10 to 15 minutes after I talked with him. In turn, I have just talked to Dixon when he returned from Quai. Dixon tells me Couve said de Gaulle could not associate himself with USUK proposal because, after all, some day French may want to have in-atmosphere tests. Further, the need to impress the neutral nations meeting at Belgrade has no particular appeal to de Gaulle. Couve believes most likely event is de Gaulle will not raise subject nor comment upon it if it can be avoided. Of course, we will not know until his press conference. In reply to whether or not we should try to see him, Couve said not a chance, de Gaulle busy reworking his statements he intends make press conference.

The foregoing is at variance with my meeting with Couve. Dixon was kept waiting and we agree that during that time Couve very likely talked to someone close to de Gaulle, if not de Gaulle himself. Incidentally, this highlights the difficult situation in which Couve so often finds himself.

**Gavin**

50. **Special National Intelligence Estimate, SNIE 11-11-61,  
September 7<sup>1</sup>**

September 7, 1961

IMPLICATIONS OF THE SOVIET RESUMPTION OF  
NUCLEAR TESTING

THE PROBLEM

To estimate the motives for the Soviet decision to resume nuclear testing, and its implications for Soviet foreign and military policies during the months ahead.

THE ESTIMATE

*The Motivations for Testing*

1. The Soviets have, as time passed, had increasing technical motivations for further nuclear weapons testing; for example, tests related to development of antimissile defenses; tests of high-yield, and low-yield, light-weight devices; tests directed toward economy of fissionable materials and improving yield-to-weight ratio; and perhaps tests in new areas of development. Of these, the one relating to antimissile defenses has probably been the most urgent. There is not yet enough information on the new Soviet test program to determine what technical purposes it is designed to serve. It is very unlikely that any developmental tests could result in operational Soviet weapons in time to affect Soviet military capabilities during the next few months. On the other hand, proof testing of possible stockpiled but untested weapons might be considered desirable at this time. If the Soviets engaged in clandestine testing during the moratorium, some of the current tests would be designed to exploit the results achieved.<sup>2</sup>

2. These technical and military requirements, which Khrushchev has said were being pressed by the Soviet military leaders, were thus a major factor of increasing weight on the side of resumption. During the period beginning in the early spring of 1961, Soviet lack of interest in negotiating a nuclear test ban agreement was evident. At that time, the Soviet leaders probably believed that the US would soon resume testing, taking upon itself the onus for doing so and at the same time

---

<sup>1</sup> "Implications of the Soviet Resumption of Nuclear Testing." Secret. 4 pp. Washington National Records Center, RG 330, OSD/ISA Files: FRC 64 A 2382, 350.09.

<sup>2</sup> The likelihood of Soviet clandestine testing was last estimated, well before their resumption of overt testing, in SNIE 11-9-61, "Possibility of Soviet Nuclear Testing During the Moratorium," dated 25 April 1961, SECRET.

freeing the Soviets to test. However, by July or August it appeared that the US had not decided upon early resumption of tests, and the Soviets had to decide whether to proceed themselves without the benefit of prior US resumption.

3. In addition, developments in the world political situation, and particularly manifestations of firmness in the Western stand on Berlin, almost certainly played a major role in the decision to resume tests at this time. The USSR in its Berlin tactics has regularly kept open the options of unilateral action and negotiation, hoping that its threats to act alone would eventually induce the West to agree to concessions. Instead, Moscow has been confronted by new Western military preparations and a diplomatic stance which has offered little encouragement to these hopes. In response, the Soviets have since mid-summer undertaken a succession of demonstrative military actions intended to increase the pressure for concessions or, failing these, to manifest such strength and determination as to dissuade the West from forcibly opposing unilateral steps when they finally came.

4. When such measures as the Air Show display, the suspension of troop reductions, and the supplementary defense budget all failed to produce a significant change in the Western attitude, the resumption of nuclear tests must have appeared as a more forceful means of demonstrating Soviet military strength and political toughness. Thus, when pressing military incentives to test came to be supplemented by important political ones, the decision was reached—probably in late July—to proceed with the tests for which contingent test site preparations had for many months been underway.

#### *General Implications of the Soviet Announcement*

5. The resumption of nuclear testing at this time was clearly intended to raise the level of fear and anxiety in the world in general, and to create a powerful impression of the strength and ruthlessness with which the Soviets intend to pursue their objectives. We believe that the timing of the move reflects and dramatizes the turn by the Soviets to an openly militant and increasingly risky phase of tactics in relations with the West. Renewed testing accords with other recent demonstrations of Soviet military strength and of the Soviet determination to increase it.

6. The Soviets probably hope the Western leaders will take the move as an earnest of Soviet determination to carry out their intention to change the status of West Berlin. They appear to have decided that the only way to induce the West to accept the main lines of the Soviet position is to launch upon a course of action demonstrating Soviet willingness to face the danger of eventual East-West conflict as the alternative.

7. We believe that the Soviets will follow up this announcement with other threatening measures. In this connection, they will probably soon detonate a high-yield thermonuclear device—perhaps at a higher yield than they have previously tested—and possibly a missile-delivered warhead. They may materially augment Soviet forces in East Germany, and deploy troops along the East-West German border or along Western access routes to Berlin. The Soviet leaders may in addition take measures to prepare the Soviet populace for the possibility of war. In general, we expect the Soviets to be harsh and uncompromising in their attitude toward the West, in the hope of compelling early Western negotiation over Berlin on terms acceptable to themselves.

8. The Soviets have always reinforced their appeals for peaceful solutions of East-West disputes with reminders of their military strength. At the present juncture, as the decision to test nuclear weapons eloquently bespeaks, they are shifting the emphasis from persuasion to intimidation. They may reduce the acceptability of Soviet policy to many in the world, and tend to deflate their claims to reasonableness. But it will probably also frighten many neutral and some Western spokesmen to put pressure on the US to make concessions, as the party in the dispute more susceptible to the influence of popular opinion. Thus, while almost certainly anticipating a generally unfavorable reaction to the resumption of nuclear testing, Moscow may also have expected even greater neutralist anxiety over war and a rising clamor for East-West negotiations. The outcome of the Belgrade conference would tend to justify such an expectation.

9. The Chinese Communists, who have almost certainly pressed the Soviets not to conclude a test ban, will welcome the Soviet test resumption as a manifestation of aggressiveness in the struggle with capitalism. They will also regard this move as an opportunity to press anew their demands for Soviet assistance to the Chinese nuclear program, since the end of the moratorium may weaken one of the arguments with which the Soviets have justified their reluctance to satisfy these demands. We do not believe, however, that the Soviet resumption of nuclear testing indicates any increase in Moscow's willingness to assist the Chinese nuclear program.

#### *Timing of the Announcement*

10. Apart from these broad considerations, there remains the question of the reasons for the precise timing of the announcement. The fact that the statement was made just two days prior to the convening of the Belgrade conference probably reflected Moscow's belief that the conference intended to declare its strong opposition to a resumption of nuclear testing by either side. Thus the Soviets probably thought it was preferable to make the announcement beforehand, rather than

after their decision had, in effect, been formally condemned. The Soviets probably also believed that the desired effect on neutralist opinion— anxiety and clamor for East-West negotiations—would be enhanced by the use of “shock” tactics on an assembly of major neutralist leaders, and that much of the negative effect could be counteracted by lobbying at the conference. Finally, the Western decision to present new positions at the test ban talks in Geneva in late August may have advanced the timing of the announcement of the decision to resume testing. Knowing that the forthcoming UN General Assembly would be likely to consider the test ban problem, and aware that the new Western positions would be favorably received by responsible neutralist opinion, the Soviets may have decided that the sooner the question of the moratorium became academic, the less they ultimately stood to lose from their decision to break it.

---

## 51. Memorandum from McGhee to Rusk, September 13<sup>1</sup>

September 13, 1961

### SUBJECT

Anticipatory Action Pending Chinese Communist Demonstration of a Nuclear Capability

### *Problem:*

To consider early action we might take to minimize the impact on US and free world community interests of a first Chinese Communist explosion of a nuclear device.

### *Discussion:*

If Communist China could detonate a nuclear device as early as 1961, as has been estimated,<sup>2</sup> we should consider now what actions should be taken in anticipation of the event, instead of later in reaction to it. The initial impact will be primarily psychological with secondary political and military efforts deriving from it. This establishes the psychological field as and deserving immediate attention.

---

<sup>1</sup> Anticipatory action pending Chinese Communist demonstration of a nuclear capability. Top Secret. 6 pp. Department of State, S/P Files: Lot 67 D 548, S/P Chron 1960–1961.

<sup>2</sup> According to one unagreed estimate it might even do so in 1961 (WIE 13–2–60).

It is envisioned that Communist China is likely to get at least one type of psychological dividends from its explosion: (1) Many Asians are likely to raise their estimate of Communist China's current and future total military power relative to that of their own countries and the capabilities in the arms of the US; and (2) they are likely to see the accomplishment as vindicating claims that the Communist method of organizing a [illegible in the original] state's resources is demonstrably superior. Both reactions are likely to contribute to feelings that communism is the wave of the future and that Communist China is, or soon will become, too powerful to resist.

It will not be possible to prevent the [illegible in the original] to Communist China of such dividends, but it may be possible by advance action to reduce them.

All things are comparative, and Communist China compared first of all with the other countries of Asia. If another, but non-Communist Asian state detonated a nuclear device first, a subsequent and a consequently [illegible in the original] anticlimactic Chinese Communist explosion would not carry a comparable implication of Communist superiority or make quite as [illegible in the original] impact as [illegible in the original] fast China's growing power.

According to one estimation India's nuclear program is sufficiently advanced so that it could act [illegible in the original] have [illegible in the original] enough fissionable material to produce a nuclear explosion. While we would [illegible in the original] to limit the number of nuclear powers so long as we lack the capability to [illegible in the original] the [illegible in the original] eight to predict that First Asian one be India and then China.

Nehru was quoted as saying, upon his arrival in Belgrade August 31 and to [illegible in the original] evident of the Soviet decision to resume weapons tests, [illegible in the original] against nuclear tests at any time in any place." The same day an official spokesman in Delhi was quoted as making the latest exaggerated statement: "We are against all tests and explosions of nuclear material except for peaceful purposes under [illegible in the original] conditions." Given the context and taken together, these statements suggest that it would be difficult to get Nehru to agree to any proposal for an Indian nuclear test in the near future, and that the chances of its acceptance would depend upon the extent to which it met rather narrow criteria.

Nevertheless Nehru might be brought to see the proposal as being in India's interests. If accepted and implemented, it should help forestall Communist China's using nuclear blackmail against India; reduce its ability to frighten neighbors of India whose security is important to that country; and minimize the usefulness to the Communist Party of India of a demonstrated Chinese nuclear capability which otherwise

could be cited as evidence that communism, as practiced in China, is superior to India's mixed economy.

Preliminary exploration within the Department (with officers in FE, S/AE, NEA and INR) has elicited concurrence with the idea, [illegible in the original—Latin] that it would be desirable if a friendly Asian power beat Communist China to the punch, and it has turned up no likelier candidate than India.

But officers have raised a number of reservations and doubts besides those alluded to already: (1) India might require considerable technical assistance in order to explode a nuclear device before Communist China does; (2) there appear to be legal [illegible in the original] to the supplying of such assistance by either the British or ourselves; (3) we are not good at keeping such things covert, whereas the explosion could be expected to have utility only in proportion as it appeared to be an Indian accomplishment; (4) there probably would be considerable difficulty in finding a practical peaceful use for such an explosion, and fall-out from it would be open to the usual and valid objections, including ones related to the fears which could arise or be created among an ill-informed and partly superstitious populace; (5) alternatively meeting the requirement of "controlled conditions" for an experimental explosion might present problems; (6) Pakistan could be expected to resist most adversely to an Indian explosion which might subsequently be exploited against it, and to be highly resentful of any outside instigation and assistance, known or surmised; and (7) an Indian explosion would provide the Chinese Communists basis for urging that the USSR increase its assistance to the Chinese Communist nuclear program.

The idea has also been discussed with Ambassador Galbraith, who is strongly opposed to any US approach to Nehru. He thinks the chances are roughly only one out of fifty that Nehru's reaction would not be the negative one that we are seeking India as an atomic ally. He sees the calculus of prospective benefit inherent in the one chance as outweighed by the harm implicit in the other forty-nine. He also thinks his British and Canadian colleagues would be unwilling to make such an approach to Nehru. Ambassador Galbraith recalled that Dr. Wiesner is expected soon to take a trip to Pakistan, when he might also visit India. He said, in this connection, that he would at most be willing that Dr. Wiesner, in the course of conversations with Dr. Bhabha, Chairman of the Indian Atomic Energy Commission, raise the matter of the prospective Chinese Communist nuclear explosion and ask what effect if any it will have on India's program in the atomic field. Presumably any further initiatives in the matter, if the idea germinated in Dr. Bhabha's mind and bear fruit, would have to come from the Government of India, when we could decide what the US response should be

within the framework of something more concrete than we now have to work with. (Dr. Wiesner, incidentally, might now be able to resolve some of the technical and legal doubts raised in the foregoing discussion.)

While nothing else would have as much prophylactic value as a prior atomic explosion by a free-world Asian state, a covertly-conducted information program might achieve some effect in reducing the psychological impact of the first Chinese Communist nuclear explosion. Assuming as we do that the Chinese Communists are fully committed to acquiring nuclear capabilities, publicity about their program probably would not have important effect on their [illegible in the original] or race of progress. It might provide them with an argument with which to press their Soviet ally to give increased assistance, but this would seem unlikely to weigh heavily among the factors considered by the Soviets in determining where their own [illegible in the original] is the matter lay.

A covertly-waged informational program might be used to [illegible in the original] and drive [illegible in the original] points of which the following are illustrative:

(a) India [illegible in the original] nuclear deployment programs [illegible in the original] have been detected rather as peaceful uses of atomic energy.

(b) Observers are puzzled by the [illegible in the original] of the Chinese Communists, who have been engaged in an effort which started in 1950, thus far to explode a nuclear device of their own. Since several other powers pioneered the way, [illegible in the original] requirements for producing such an explosion have been widely [illegible in the original]. Communist China has scientists, including ones [illegible in the original] abroad, of requisite capability; the essential new materials and suitable testing areas.

(c) It accordingly can only be speculated that Communist China (1) has organized its effort poorly, or (2) realizes that nuclear weapons are not ones which will contribute to realization of its expansive aims [illegible in the original] since world opinion, which will condemn all aggression in proportion as it can be identified as such, will tolerate aggression with nuclear weapons even less than aggression by conventional armed forces.

*Recommendations:*

1. That you authorize appropriate officers in the Department to explore with other agencies and the White House representatives who have expressed an interest in the general idea, the matter of Dr. Wiesner's sounding out Dr. Bhabha.

2. That, regardless of the decision on or [illegible in the original] of (1), you approve in principle the proposal for covert dissemination

in media throughout the Far East of suitable material designed to reduce the impact of an initial Chinese Communist nuclear explosion, authorizing FE and S/AE to explore it with CIA and to have it put into effect if exploration discloses that it would appear useful and feasible.

---

**52. Memorandum of Conversation, September 14, between McCloy and Zorin<sup>1</sup>**

September 14, 1961

SUBJECT

US-USSR Bilateral Talks on Disarmament (No. 22)

PARTICIPANTS

*USSR*

V. A. Zorin  
Gen. A. A. Gryzlov  
A. A. Roshchin  
I. J. Usachev  
B. P. Krasulin  
S. A. Bogomolov  
R. M. Timberbaev  
V. N. Zherebtsov

*United States*

Mr. McCloy  
Ambassador Dean  
Mr. Spiers  
Mr. Matteson  
Mr. Akalovsky  
Mr. Popper (USUN)  
Major Gen. Smith (USAF)  
Mr. Sonnenfeldt  
Capt. Freeman  
Mr. O'Boyle

*Mr. McCloy* opened today's session by referring to the statement made by Mr. Zorin at the 21st Bilateral Talks Meeting, September 13, 1961, that the United States had failed to comment on the Soviet draft joint statement of July 27. In refuting this charge Mr. McCloy referred to the records, and pointed out that he had commented on the paper

---

<sup>1</sup> U.S.-U.S.S.R. bilateral talks on disarmament (No. 22). Limited Official Use. 6 pp. Department of State, Central Files, 600.0012/9-2861.

during the sessions held in Moscow on July 28 and 29, and again on September 6 when he had made an extensive paragraph-by-paragraph comparison of the U.S. paper of September 6 with the Soviet draft of July 27.

Mr. McCloy then introduced a suggested text for the preambular portion of the Joint Statement of Principles, calling attention to the fact that our text followed closely language proposed by the USSR on July 27. Mr. McCloy also handed the Soviet Delegation a memorandum summarizing the substantive positions set forth by the U.S. in the course of the current bilateral exchange of views.

In reply, *Mr. Zorin* thanked Mr. McCloy for the clarification of the items he had mentioned, as well as the additional documentation Mr. McCloy had presented. Mr. Zorin noted that he could not comment yet on this material but hoped to do so shortly. He then expressed regret that the U.S. presentation of such documentation was so late in light of the approaching date set for the convening of the United Nations General Assembly.

Mr. Zorin then proceeded to review the Soviet draft of July 27, reiterating such previously made points as the need for a single treaty covering both disarmament and nuclear testing, the need for reference to foreign bases, the need for the establishment of an overall time limit and Soviet insistence on "troika" type administration for international armed forces. During his remarks Mr. Zorin said it was most necessary for the USSR to know the U.S. position on these points in greater detail in order to ascertain whether or not there could be a basis for a Joint Statement. To accomplish this, he said, he felt it advisable to consider very thoroughly the dangers inherent in the international arms race. In this connection he said that the USSR believed that the most important part of Resolution 1378 (XIV) was the general and complete disarmament portion and he could not understand U.S. omission of this point in its draft.

Continuing, *Mr. Zorin* said that his second point was that the USSR had already made the Soviet position a matter of record; that all means of warfare should be destroyed and that the retention of certain type armaments for military forces must be only for the purpose of assuring internal security. This too, Mr. Zorin stated, was regarded as an essential element of a general and complete disarmament program.

Taking as his next point the scope and measures to be included in the Joint Statement, Mr. Zorin noted that the USSR wished to emphasize that it did not advocate the abandonment of all national security forces but that the USSR did want the elimination of delivery vehicles and foreign bases. The USSR sees such bases as actual threats to other nations but the U.S. documentation fails to cover such an important issue. On the contrary, Mr. Zorin continued, the U.S. has expressed

the idea that such bases can be utilized to provide training areas for international forces.

The next point Mr. Zorin spoke about was the determination of the order of general and complete disarmament measures. The USSR feels it necessary that there be agreement on the subject of implementation timeliness and does not believe it impossible to designate a fixed final time limit in which complete and general disarmament can be effected. Without such a time limit, it would be impossible to verify the implementation of treaty provisions.

The major Soviet concern, Mr. Zorin then observed, was solution of the control problem. The USSR wanted controls to be strict and effective for each step. However, control must not go beyond disarmament measures, for if it does it becomes the collection of intelligence. Such excess, the USSR feels, would defeat the end of control measures, and, consequently, the USSR must be certain this will not become possible.

Next, discussing paragraph 7 of the Soviet draft, Mr. Zorin said it was designed to provide measures to keep international peace and security under general and complete disarmament by strict compliance with the provisions of the United Nations Charter, which provides for the placing of contingents at the disposal of the United Nations Security Council. As both the U.S. and the USSR had agreed that neither side should be allowed to gain an advantage on the other, Mr. Zorin continued, this could be accomplished by making the administration of international armed forces subject to the “troika” arrangement advocated in the Soviet draft since the method outlined is designed to protect the interests of all states.

Referring to the last two paragraphs of the Soviet Draft, Mr. Zorin stated that he felt world conditions today required both sides to refrain from any actions that would tend to heighten the danger of conflict, and every effort should be made to assure cessation of actions that might contribute adversely to the international situation. Accordingly, he desired to urge the American representatives to analyze thoroughly the proposals sponsored by the USSR, and thus enable both sides to develop a mutually satisfactory Joint Statement. If the U.S. after such study might wish to amend or suggest revisions of the document, the USSR would gladly consider such matters and cooperate accordingly.

Responding to Mr. Zorin’s remarks, *Mr. McCloy* stated that he believed his earlier comments had covered much of what Mr. Zorin had said today, but that the U.S. would review the Soviet statement and perhaps have further ideas later. However, Mr. McCloy continued, he would now comment to some extent on the points raised by Mr. Zorin. Mr. McCloy said that he felt the USSR delegation had selected unfairly only one aspect of Resolution 1378 and had neglected to men-

tion that the U.S. had suggested reference to all the provisions of Resolution 1378. He then expressed his personal opinion that it was more important in his estimation to achieve peace with justice rather than general and complete disarmament alone. Furthermore, Mr. McCloy observed, the idea regarding a single treaty was not mentioned in the Resolution, which was an expression of general hope that a disarmament program could be implemented. The United States, Mr. McCloy continued, felt it was of vital importance not to delay the entire program's progress because of one single item. It was more important, he believed, that the two groups endeavor to make progress so as to offer the world hope that disarmament might be accomplished.

Commenting next on what weapons should be available after disarmament, Mr. McCloy stated that if Mr. Zorin's objection was to the absence in the U.S. draft of reference to "small arms," that was an attempt to negotiate details, and he doubted if this was what the United Nations intended the two groups to do. Mr. McCloy pointed out that no line of distinction had been made regarding what constitutes small arms and that it involved such possibilities as squirt guns in Berlin as well as tanks in Hungary.

Mr. McCloy next discussed the use of the word "all" in reference to the disbanding of armed forces, and explained that we felt it was more properly descriptive of what the situation should be. However, he said, there was no need for that one word to stand in the way of a mutual agreement.

Referring to Mr. Zorin's comments on foreign bases, Mr. McCloy said that the U.S. position favored abandoning all military establishments including bases regardless of whether such bases were foreign or local installations. However, he wished to know if Mr. Zorin meant bases in the same sense that the U.S. did. For example, Mr. McCloy asked, what was the Soviet position regarding bases in a taken-over area? The U.S. position, Mr. McCloy observed, can be readily identified on this subject. International forces might have to have bases at some future date and, therefore, negotiations on this specific point at the present time do not appear to be essential to disarmament discussions.

Commenting next on the subject of time limits, Mr. McCloy stated that the U.S. position on this point was more realistic than that proposed by the Soviet delegation, since the former provided needed opportunity to examine progress at each and every stage. Existing documentation, he pointed out, clearly outlines in detail our reasons for advocating this position. Mr. McCloy then acknowledged that inspection as recommended by the United States could present problems for both countries. However, Mr. McCloy continued, he could see no justifiable reason for the U.S. not demanding authentic verification. The U.S. does not want or intend to engage in clandestine operations, but we do insist

on mutual trust and confidence. Weapon reduction, he said, demands adequate inspection to assure compliance.

Referring to the USSR position on the administration of international armed forces, Mr. McCloy stated that we do not agree with the Soviet concept of the world being divided into three groups. This “troika” theory, he continued, is in basic opposition to the idea of effectiveness since it permits the veto to be applied to the United Nations Armed Force. The U.S. is convinced, he said, that the “troika” is a negation of the concept of an international armed force designed to assure peace. Thus, Mr. McCloy added, serious negotiation on disarmament depends upon a clear realization that the “troika” idea is an obstacle to progress in any disarmament discussions.

In response to Mr. Zorin’s contention that the U.S. statement failed to prohibit nuclear weapons, Mr. McCloy remarked that in the Khrushchev-Sulzberger interview the former had deprecated commitment against the use of nuclear weapons. Regarding paragraph 7, Mr. McCloy strongly opposed the attitude that nothing could be done to eliminate or solve the difficulty it presented.

In reference to the last two paragraphs of the Soviet statement, Mr. McCloy said that the U.S. preamble covers the points in question since it was not conceivable that the USSR had any desire to increase world tensions. The U.S., he added, has stressed the obligation of acknowledging international agreements and our affirmations on the subject are both realistic and sound.

Referring to Mr. Zorin’s remark that it was regrettable that the United States had not made known its position earlier in view of the scheduled convening date of the United Nations General Assembly, Mr. McCloy said he did not like to attach blame to the situation, and for that reason would not make any countercharge as to where blame should be placed. Rather he thought it more proper that both sides now discuss what would be the proper approach to the United Nations regarding the report on the results of the Bilateral Talks.

In reply *Mr. Zorin* said he appreciated Mr. McCloy’s extensive coverage of his request for U.S. position clarification and felt that progress had resulted from today’s exchange of views. Mr. Zorin then stated he could not agree with all of Mr. McCloy’s statements, especially his comment on Mr. Khrushchev’s reported remark on nuclear weapon usage. He added that the hour did not allow any more detailed reply at this time, and suggested adjournment with selection of the next meeting to be determined by further consultation between delegations.

September 16, 1961

Verbatim text. Disarmament Item. We have been considering how best to handle disarmament item in 16th GA. Department assumes no repeat no agreement be reached in bilaterals on either forum or principles. On basis this assumption we request Mission's comments on following tentative views:

1. Would not be our purpose seek obtain GA endorsement of US disarmament plan despite increased attractiveness over our preceeding plans it should have for GA membership. To do so would appear pure propaganda move and tend discredit plan as serious negotiating proposal we intend it be. Believe therefore new plan which we expect circulate following opening GA address should be used as illustrative and in support of effort get GA agreement to basic principles on which plan based. We considering for tactical reasons as well as educational purposes early introduction omnibus resolution containing principles on which we have been seeking Soviet agreement and our proposal for forum based on 5-5-10 as subgroup Disarmament Commission.

2. We anticipate Soviets will seek agreement their proposed principles and also put forward their 5-5-5 or possible 5-5-3 proposal for disarmament forum. Our estimate is that there will be compromise effort by Indians and other along lines last year. Believe, however, Soviet insistence on troika concept and improved position we in as result our new proposal will put Soviet in position inability agree compromise proposal. If this proves to be right, even if US unable agree compromise, we would be in better position than last year.

3. Despite proposal we would make for forum comprised of 20 states as sub-group of DC, throughout disarmament discussions we would expect to indicate willingness as alternative to have detailed discussion disarmament plans and proposals in DC itself. Willingness utilize this large forum should help counter possible moves to call for world-wide disarmament conference. We would expect outcome of committee debate probably be resolution perhaps along lines Canadian resolution of last year. We would hope Canadians and others would be prepared submit resolution along lines contained A/C.1/L.255/Rev. 1.

4. Draft of suggested omnibus resolution follows:

---

<sup>1</sup> Strategy for handling disarmament issue at 16th U.N. General Assembly. Confidential. 4 pp. Department of State, Central Files, 600.0012/9-1661.

QUOTE: *The General Assembly,*

A.

*Conscious* of its responsibilities under the Charter for disarmament;

*Recalling* the terms of its resolution 1378 (XIV) of 20 November 1959, which called upon Governments to make every effort to achieve a constructive solution of the disarmament problem and which expressed the hope that measures leading toward the goal of general and complete disarmament under effective international control would be worked out in detail and agreed upon in the shortest possible time;

*Disturbed that*, despite agreement in the common goal of general and complete disarmament under effective international control, disarmament negotiations have made little progress;

*Welcoming* the proposals for general and complete disarmament which have been placed before it by the Government of the United States and of the Soviet Union, and [illegible in the original] other proposals submitted during the deliberations of the 16th General Assembly;

*Believing* that the goal of disarmament negotiations is to achieve agreement on a program which will ensure that a) disarmament is general and complete and war is no longer an instrument for settling international problems; and b) such disarmament is accompanied by the establishment of reliable procedures for the peaceful settlement of disputes and effective arrangements for the maintenance of peace in accordance with the principles of the United Nations Charter:

1. *Recommends* that the program for general and complete disarmament be based on the following principles: (Include US statement of principles or summarized version thereof).

B.

*Deeming* it essential that negotiations for general and complete disarmament agreement under effective international control be resumed at the earliest possible time;

*Recognizing* that all states have a deep interest and concern in disarmament negotiations;

*Recognizing further* that:

(a) Those states most directly affected by disarmament should participate, to the extent practicable, in disarmament negotiations, and

(b) That there should be appropriate geographical representation in a disarmament forum,

*Recommends* that the Disarmament Commission appoint a sub-committee comprised of: Argentina, Brazil, Canada, Czechoslovakia, France, Hungary, India, Italy, Japan, Mexico, Nigeria, Pakistan, Poland, Roumania, Sweden, Tunisia, USSR, UAR, UK, and US.

*Further recommends* that this subcommittee undertake as a matter of the utmost urgency, the negotiation of a disarmament agreement which could serve as a basis for world-wide agreement among nations on general and complete disarmament under effective international control. UNQUOTE.

#### 54. Telegram 794 from USUN, September 18<sup>1</sup>

September 18, 1961

Paris pass USRO. Twenty-third session US/USSR disarmament talks.

1. McCloy opened meeting with eulogy to Hammarskjold. Zorin responded saying while Soviets differed with US re SYG office and Hammarskjold's personality, he wished associate himself with McCloy's remarks in view fact human being lost life.

2. Zorin continued Soviets carefully studied US fourteenth draft joint declaration and found it acceptable with exception final sentence paragraph six. Reiterated Soviet opposition to "control over armaments" and suggested deletion that sentence. Emphasized importance agreement on joint text at this juncture and expressed hope US, if it desired lessening international tensions, would accept deletion and agree on joint document.

3. McCloy noted substance sentence in question important part US position and reiterated US view verification would ensure not only compliance with reduction commitments but also that agreed levels are not exceeded and that there are no clandestine activities. Questioned wisdom of apparent agreement glossing over this important difference and inquired whether Soviets envisaged further study this problem or wished US abandon its position this point.

4. Zorin stated Soviets could not abandon their position either and pointed out that although rest of text did not fully reflect Soviet position, they recognized US met them on number of points and they willing make this "compromise" for sake "major political considerations". Zorin also stated both sides would of course be free make statements

---

<sup>1</sup> Readout of 23d session U.S.?U.S.S.R. disarmament talks. Confidential. 2 pp. Department of State, Central Files, 600.0012/9-1861.

or submit documents in GA with elaboration their respective views and interpretation various problems. Said sentence in question spelled out something which should be negotiated in context specific plans rather than discussed in abstract; only in connection with specific measures could it be decided whether control should be limited to measures themselves or should go beyond them.

4. McCloy re-emphasized importance substance sentence in question and suggested he discuss problem with SECSTATE and other interested officials as well as allies with a view to giving Zorin answer perhaps tomorrow morning. Zorin agreed but stressed urgency in view GA opening tomorrow PM and expressed desire get reply tonight, if possible. Stated problem simple since no new language suggested and document, if agreed, could be forwarded to GA with addition only two or three communiqué-type introductory sentences. It was agreed next meeting would be eleven thirty a.m. tomorrow unless McCloy could meet tonight.

5. Prior to formal meeting Zorin indicated informally Soviets would like suggest editorial changes in text such as omission of “the principles of” in references to UN charter and substitution “international disarmament organization”. Stated however that if US could not accept them this would not be obstacle to agreement provided US could agree to deletion final sentence paragraph six.

Stevenson

**55. Memorandum from Gen. Lemnitzer to McNamara,  
September 29<sup>1</sup>**

September 29, 1961

SUBJECT

Nuclear Testing In the Atmosphere (U)

1. The Joint Chiefs of Staff consider that there is an urgent military, requirement for accelerated weapons development and effects information that can only be satisfied by nuclear tests in various environments,

---

<sup>1</sup> Recommends U.S. resumption of atmospheric nuclear tests. Secret. 4 pp. Washington National Records Center, RG 330, OSD Files: FRC 65 A 3464, Atomic 400.112, June–September 1961.

including the atmosphere. National security requires that our weapons development programs be pursued aggressively without the handicaps of self-imposed restrictions on the manner of testing new concepts. They further consider that careful scientific analyses establish that world-wide radioactive contamination resulting from such tests would be insignificant. By using the same careful procedures of analysis and prediction employed in previous nuclear tests in the atmosphere, control of local fallout can be accomplished without hazards.

2. Because of the potential political impact associated with US initiation of resumption of atmospheric testing, the Joint Chiefs of Staff have previously recommended initial resumption of testing in environments which would preclude atmospheric contamination. The resumption of atmospheric testing by the USSR changes the political implications formerly associated with this question and compounds the military urgency for US resumption of such tests.

3. The Soviet accelerated test program will obviously lead toward significant improvements in their strategic nuclear capability. However, the presently authorized US underground test program is tailored primarily to the slow expensive development of small tactical weapons and is incapable of meeting all requirements for larger weapons. Although the proposed test series following NOUGAT contains some reduced yield tests of strategic weapons, they are limited in number, and the program is unduly slow in meeting the present Soviet challenge.

4. The security of the United States depends to a large extent upon our ability to assure superiority in nuclear weapons and our ability to employ them effectively. Although some progress can be made in developing nuclear weapons by underground tests supported by laboratory experimentation and theoretical analysis, only very limited information can be obtained in the vital field of nuclear weapons effects.

5. The present U underground test program, as opposed to atmospheric testing, has some advantages; however, its inherent disadvantages and limitations exceed these advantages. There appears to be a finite yield limitation which cannot be exceeded in underground testing. Pretest operations are inherently time consuming and costly. Tests in the atmosphere offer the greatest opportunity for obtaining significant diagnostic and effects data for the devices or weapons fired.

6. Resumption of atmospheric testing is simply justified for several reasons. Various scientific panels appointed by the President, e.g., the Panofsky Panel, have recognized that important surprises in both weapons effects and development are possible through testing. Although it is not certain that surprises with important military implications will occur if atmospheric testing is resumed, it is certain that only the nation which conducts tests has a chance to discover and exploit these surprises.

7. In addition to the search for the unknown, there are critical kinds of known deficiencies. Weapons effects measurements are urgently required in several areas:

a. The damaging effect of electromagnetic pulses upon [illegible in the original] and electronic equipment.

b. The disrupting effect of nuclear detonation on radar and communications.

c. The high altitude and outer space kill ratio of nuclear [illegible in the original] warheads against re-entry bodies.

d. The determination of the effects of the new tactical type enhanced radiation and all-fusion [illegible in the original].

The potential impact of such weapons effects information is profound. There are few elements of modern military operations which are not vitally dependent upon swift and reliable operation of communications and other electronic equipment. The development of an effective AICBM system would strengthen or weaken enormously the US strategic posture, depending upon which nation achieves such a capability. Information in these critical areas can only be obtained to the degree of accuracy and completeness required by atmospheric testing.

8. It has been stated that world-wide fallout resulting from atmospheric testing presents a real hazard to the population of the world. In considering such charges the Joint Chiefs of Staff note the insignificant increase over normal background radiation which has resulted from such tests. In addition, responsible agencies have calculated that if atmospheric testing equal to that of the combined total of US and USSR tests in 1958 were continued annually, the radiation dosage world-wide would gradually increase until equilibrium (radioactive decay equal to amount injected) was reached at 30% of normal background. This is equivalent to the increase in cosmic ray radiation in moving from Washington D.C. to Denver, Colorado. In the judgment of the Joint Chiefs of Staff this slight increase, when compared to normal variations in radiation background, can only be considered insignificant.

9. Upon completion of the current USSR atmospheric test series, it can be anticipated that there will be a renewal of Soviet offers for a test moratorium and renewed test ban negotiations. The Joint Chiefs of Staff consider it vital to the security of the United States to pursue atmospheric testing irrespective of whether or not the Soviets propose a nuclear test ban.

10. In consideration of the above, the Joint Chiefs of Staff recommend that:

a. The resumption of nuclear testing in the atmosphere be approved without delay.

b. Preparations be undertaken immediately at all sites necessary to conduct required tests.

c. Government officials refrain from making public statements concerning the alleged adverse effects of the world-wide fallout resulting from current USSR tests in order to retain maximum flexibility of decision regarding US resumption of atmospheric testing.

d. Regardless of possible overtures by the Soviet Union towards another test ban moratorium at the completion of their current tests, no agreement be made which would preclude the United States from conducting a planned series of atmospheric nuclear tests unless an effective inspection and control system is implemented and properly functioning.

11. It is requested that you inform the President of the views of the Joint Chiefs of Staff on resumption of nuclear testing in the atmosphere.

For the Joint Chiefs of Staff:

**L.L. Lemnitzer**

*Chairman*

*Joint Chiefs of Staff*

October 1961

56. Letter from Seaborg to Rusk, October 7<sup>1</sup>

October 7, 1961

Dear Mr. Secretary:

Recent cables from the U.S. Delegation to the United Nations (refs. ET is 968, 990, 1011 and 1044) raise important questions regarding the nuclear testing issue. These cables also pose various possibilities with regard to resolutions being introduced at the current U.N. General Assembly discussions.

I would like to comment on the questions posed. The U.S. has already observed a lengthy moratorium without controls. During this 34 month period we have had no way of knowing whether or not the Soviets have tested clandestinely. Even if they have not done so, they have demonstrated quite clearly that they can readily agree to an uncontrolled moratorium, and when ready to test be adequately prepared to do so effectively, whereas we have been and would be constrained by the dictates of our open society to limit our preparations.

I do not think it desirable that the U.S. propose substantive changes in the U.S.-U.K. resolution of September 23, 1961, which set forth our readiness to cease tests provided that there was a signed treaty which included provisions for an international control system. The lessons of the past three years should not be lost to us and the point that we have learned them should be put forth to the world.

A moratorium with negotiations for a specifically limited period may be appealing to many nations in the U.N. However, we should not be led into thinking that any adopted time limit would not be extended and re-extended until the Soviet Union found it to its interests to break off the moratorium. At the end of any agreed time period we would be placed in the position of having to reject an extension of negotiations or of breaking off such negotiations.

In view of the above comments, I would hope that any Department guidance sent to the U.S. Delegation in New York would reflect a position of definite and specific opposition to any resolution or appeal which urges reinstitution of an uncontrolled moratorium. This position should be the same for an unlimited or limited duration moratorium, with or without negotiations.

---

<sup>1</sup> Seaborg's opposition to reinstitution of an uncontrolled moratorium. No classification marking. 2 pp. Seaborg, Journal, Vol. 2, pp. 225-226.

With regard to moratoria on atmospheric testing only, I realize that the political problems are complex; however certain considerations must be borne in mind.

The comprehensive nature of the current Soviet tests has given them an important relative advantage. The President has urged that rapid progress be made in our own test program. But, at best, the rate of progress is much slower underground than would be the case if atmospheric tests were included in the program; certain unforeseen difficulties in our present series have emphasized this fact. Furthermore, high yield tests, tests for determination of various important weapons effects, and tests to prove out complete weapons systems cannot be accomplished underground.

In our opinion, these factors clearly constitute strong reasons for retaining the President's power to initiate atmospheric testing should he deem it necessary in the interest of national security.

I would urge a Principals' meeting at a very early date to further explore these problems in order to make recommendations to the President. Therefore, I am taking the liberty of sending a copy of this letter to Secretary McNamara.

Sincerely yours,

*Chairman*

---

## 57. Telegram 1123 from USUN, October 7<sup>1</sup>

October 7, 1961

Nuclear testing. Following is draft of proposed statement for President which was discussed with Dept this morning:

"Since the Soviet Union resumed nuclear weapons testing in the atmosphere on September 2, it has detonated eighteen fallout producing nuclear devices. Some of these devices have released energy equivalent to millions of tons of TNT.

Because these explosions result in pollution of the atmosphere I joined with Prime Minister Macmillan on September 3 in proposing that the Soviet Union agree with our governments not to conduct

---

<sup>1</sup> Transmits draft Presidential statement on nuclear testing. Confidential. 2 pp. Department of State, Central Files, 700.5611/10-761.

nuclear tests which produce radioactive fallout. The Soviet Union rejected that offer.

The Soviet test series threatens to intensify competition in the development of more and more deadly nuclear weapons. Thus these tests increase the possibility of ultimate disaster for all mankind.

The time for action is perilously late. Soviet testing tilts the balance of military advantage. Unless Soviet tests are halted, the United States will be forced, however reluctantly, to begin testing in the atmosphere in order to preserve its own security and the security of its Allies.

Therefore, for the safety of our own generation and the health of generations to come, I invite the Soviet Union, first, immediately to discontinue all nuclear testing and, second, to conclude within thirty days a treaty prohibiting all nuclear weapons tests, under effective controls.

The draft treaty prepared by the United States and the United Kingdom after two and one-half years at the conference table in Geneva should serve as a basis for this treaty.

The United States would wish to know within a week whether the Soviet Union agrees to adopt this procedure. If it does not, the United States will be obliged to press forward with tests in all environments, including the atmosphere, as may be necessary for its own safety and the safety of the free world.”

Ambassador Dean and Popper prepared proceed to Department at any time for discussion this matter.

**Stevenson**

---

**58. Letter from Gilpatric to President Kennedy, October 9<sup>1</sup>**

October 9, 1961

Dear Mr. President:

In our letter to you of September 30, 1961, we outlined the basis for a proposed U.S. nuclear test program. In that report we informed you of the data which is needed and which can only be obtained through atmospheric testing. We now believe it is important that we

---

<sup>1</sup> Seeks approval of a comprehensive test program. A proposed test schedule is attached to the letter. Secret. 11 pp. Washington National Records Center, RG 330, OSD Files: FRC 65 A 3464, Atomic 400.112, October 1961.

further describe the experiments which are urgently required and recommend that you grant approval to prepare for a comprehensive test program. You will note that our greatest deficiency in effects data lies in those related to determining the vulnerabilities of our ICBM systems and sites, and those phenomena affecting the design of AICBM systems and hardening of warheads to secure penetration of enemy defenses.

Some of the less complicated tests can be conducted in a few weeks, while the more complex ones require up to two years for preparation. An extended period of time is required to complete the series because preparation was limited during the moratorium while the United States was negotiating in good faith. It is also important, in this context to make *[text not declassified]*. To accomplish this it is obvious that preparations must have been instituted about two years prior to resumption of testing. If we continue our unilateral restrictions or agree to a moratorium on atmospheric tests, we will have permitted the USSR to obtain a technological gain of several years and obtain information which will be denied us without atmospheric testing.

It is fallacious and dangerous to our national security to assume that we have reached a favorable plateau in nuclear weapons development, and that extensive efforts in nuclear testing are no longer required. On the contrary, from past experience we know that nuclear testing has enabled our scientists to make extraordinary progress, not only in weapon technology but in the discovery of previously unknown and unsuspected phenomena. We believe that similar gains can be made in the future.

The current nuclear test series being conducted by the USSR is a clear demonstration of their determination to improve their military posture and must be considered as the culmination of a continuing vigorous and aggressive weapons development and systems test program. In contrast, during the voluntary test moratorium started at the end of October 1968, the United States, acting in good faith, conducted no nuclear tests of new weapons and no nuclear tests to study effects phenomena associated with nuclear detonations or to prove stockpiled weapons. The currently authorized tests, with yield and environmental limitations imposed by underground testing, do not permit the Atomic Energy Commission and the Department of Defense to pursue all aspects of a dynamic and effective test program.

The critical need for effects data vital to the national security lies in the weapons effects area that relate to ICBM and ICBM site vulnerabilities. The importance of these effects was not recognized early enough before the onset of the moratorium to instrument for their measurement in tests underway at that time. As a consequence, very little quantitative information is now available, and it is to correct this deficiency that atmospheric tests are urgently required. In addition, if

such testing is authorized, weapons development could proceed at a much higher rate and we could accomplish several desirable weapons systems and stockpile weapons assurance tests. To meet these critical needs, programs should be conducted on a high priority and urgent basis to:

a. Obtain the necessary data relative to the vulnerabilities of ICBM systems and to assure that our AICBMs will be effective in a nuclear explosion environment. We urgently need the following weapons effects tests:

(1) [text not declassified]

[text not declassified]

Performance of [illegible in the original] weapons [illegible in the original] are presently in [illegible in the original] or are [illegible in the original] near future. While such tests at full yield are not absolutely required, the tests indicated would give assurance as to the yields of the latest warheads and are tests that could be carried out at early dates. Specific tests are as follows:

<u>Warhead</u>	<u>Yield</u>	<u>Readiness Times</u>
[text not declassified]	[text not declassified]	3–4 weeks
[text not declassified]	[text not declassified]	3–4 weeks
[text not declassified]	[text not declassified]	3 months
[text not declassified]	[text not declassified]	3 months
[text not declassified]	[text not declassified]	Spring 1962
[text not declassified]	[text not declassified]	[text not declassified]

c. Improve weapon technology with particular emphasis on increased yield-to-weight action, greater efficiency of base thermonuclear burn and the development of clean weapons. The present tests in Nevada are contributing to these objectives, but this program is subject to serious limitations. Specific initial development shots which would now be planned regarding overseas tests are as follows:

(1) [text not declassified]

(2) [text not declassified]

(3) [text not declassified]

The first of these tests could be ready in about six months with the remainder being completed in an additional six months. The operations could be conducted as airburst or barge surface shots with both options being desirable. However, all could be conducted as airburst, which in some cases would lead to loss of important diagnostic information.

d. Conduct operational test firings of Polaris, Atlas D and [illegible in the original] (Anti-Submarine Weapon System) systems. These full-scale firings would serve the vital purpose of providing realistic operational training. Psychologically, such firings could have a significant

beneficial impact on the military posture of our forces as well as the forces of our allies. From a purely technical viewpoint, operational test firings to include full-scale detonations of the nuclear warhead have not been required in order to prove proper operations of those complete systems which are now in the inventory.

These full-scale operations can be accomplished with adequate safety and should be considered for inclusion in our program of test firings. Of immediate importance, the following demonstrations are recommended:

(1) *[text not declassified]*

Please note that the tests listed in (a) through (d) above are the most important and should not be construed as a complete listing.

Though a limited amount of valuable data can be secured from the current underground test series with low yield devices, it is being obtained at a relatively slow pace as is characteristic of underground testing. It must also be emphasized that testing underground can neither provide all of the effects data necessary to satisfy defense requirements outlined above nor permit the most rapid and full exploration of high yield weapon technology by the Atomic Energy Commission laboratories.

If it is desired to accelerate the present schedule of operations at the Nevada Test site (NOUGAT) significantly, it will be necessary to use balloon techniques. Under these circumstances the schedule could be modified as follows:

<u>Event</u>	<u>Purpose</u>	<u>Present Schedule</u>	<u>Balloon Schedule</u>
<i>[text not declassified]</i>	<i>[text not declassified]</i>	Early November	Early October
<i>[text not declassified]</i>	<i>[text not declassified]</i>	Mid November	October
<i>[text not declassified]</i>	<i>[text not declassified]</i>	Mid-December	October– November
<i>[text not declassified]</i>	<i>[text not declassified]</i>	Mid February	October– November
<i>[text not declassified]</i>	<i>[text not declassified]</i>	Mid February	December

Similar advances in schedule can be made for some of the less complex tests in the follow-on program.

We believe the best course open to the United States is to strengthen our military posture by conducting a comprehensive test program as indicated above. This will involve atmospheric tests to supplement the current underground test series. Intensifying our test activities is

mandatory if we are to get the maximum technical data as quickly as possible. This will enable the United States to minimize the advantages being gained by the USSR in weapon and effects technology during their current tests. Once the United States resumes atmospheric testing, we must be prepared to stand firm in the face of any propaganda and conduct our test programs as necessary.

If you decide to permit the preparations for the tests outlined in this letter, it is important to recognize that in spite of taking every precaution against it there would be a risk that knowledge of the preparations would become public. In view of this fact and because the preparations would necessarily be on a large scale, it might be desirable to announce in advance that such efforts are underway.

Contrary to the widely publicised statements concerning the hazard associated with the fallout from atmospheric tests, the Defense Atomic Support Agency has conducted extensive studies over the past few years on the world-wide fallout of radioactive materials resulting from atmospheric testing. These studies indicate that, in actual fact, world-wide fallout from past nuclear tests has not produced a demonstrable biological hazard, nor is it expected that any similar future tests would do so. The widespread belief that atmospheric testing is dangerous, arises in part from a misunderstanding of the basic differences between local fallout and world-wide fallout. It has been conclusively shown that the total radiation exposure to important areas of the body from world-wide fallout from all past tests is only 2 to 3% of the radiation exposure all individuals receive from natural sources. This increase is much smaller than the variations in dose that always have been imposed by nature on individuals living in different locales. We agree with the Defense Atomic Support Agency in this matter. As in the past, local fallout problems can be handled by appropriate safety precautions during the tests to insure freedom from danger.

In consideration of the above, we recommend that:

a. Approval be given for the Department of Defense and the Atomic Energy Commission to prepare for atmospheric and high altitude nuclear tests as outlined in this letter at suitable overseas locations, e.g., Christmas Island, Eniwetok, Johnston Island, open water and at the Nevada Test Site. Yield and operational limitations would be imposed as required to assure the health and safety of populated areas.

b. [*text not declassified*]

c. U.S. statements regarding the fallout hazard from atmospheric testing be based on known and proven facts rather than continued propaganda exploitation of the world's exaggerated fear of radioactive fallout from tests in the atmosphere.

d. Pending a decision to conduct the tests recommended, statements to the public should point out that the USSR nuclear weapons

technology may well be overcoming our earlier lead, and the consequent national security need for a United States test program.

Sincerely,

**Roswell L. Gilpatric**  
*Deputy Secretary of Defense*

**59. Letter from Seaborg to President Kennedy, October 10<sup>1</sup>**

October 10, 1961

Dear Mr. President:

The enclosure to the letter of September 20 from Secretary Gilpatric and myself discussed the pros and cons of different environments for testing nuclear weapons. It included recommendations that preparations be made to give an immediate readiness posture for low-yield atmospheric tests in Nevada and a 3-months' readiness posture for large-scale tests at Eniwetok, and that attention be given to the possibility of conducting atmospheric tests through the medium of completely air-borne operations. In my letter of October 7, I pointed out that any appreciable speed-up in our presently-planned program could be accompanied only by going to atmospheric testing.

The present letter will discuss various aspects of testing in the three locations mentioned above, including technical feasibility for various kinds of tests, time scales, costs, etc., together with the possible effect on the schedule of our presently-planned program, should such methods be adopted. A letter of October 9, 1961 from Secretary Gilpatric describes possible tests of mutual interest as well as certain complete systems demonstrations primarily of concern to the Department of Defense.

The earliest possible atmospheric tests of developmental significance are some of those now proposed for the approved NOUGAT Program which could be accomplished from one to two months ahead of the current schedule by using tethered balloons at the Nevada Test Site. (Such tests are, of course, subject to possible delays due to weather.) Balloons are on hand. Rehabilitation of the ground handling equipment and training of the crews are the pacing factors of the steps required to achieve readiness; these steps will take from 10 days to two weeks. Sampling aircraft and diagnostic equipment can be ready within the same time frame.

An advance of as much as four or five months in the schedule for some of the tests in the follow-on program enclosed with my letter of September 19, 1961 could also be accomplished by use of the balloon technique. Toward the latter part of this program, testing could be conducted much more rapidly if not inhibited by the lengthy process of preparing underground sites. The cost of balloon tests is appreciably

---

<sup>1</sup> Technical aspects of nuclear testing at Nevada, at Eniwetok, and via airborne medium. Secret. 3 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Testing, 9/27/61–10/10/61.

less than of those conducted underground, or those utilizing towers, but there is some sacrifice in the technical information attainable.

A speed-up of those tests involving yields too large to be conducted in the atmosphere in Nevada could be accomplished by utilizing an air drop technique over the Pacific, again at some sacrifice in the technical information obtainable. Proof tests of bombs, which do not require extensive diagnostics, could begin in from two to four weeks. Tests of missile warheads or developmental devices requiring the fabrication of drop containers could begin in two to three months. This sort of wholly air-borne operation, which would be conducted from air bases on Hawaii, would require aircraft for dropping the devices, for radio-chemical sampling and for air-borne diagnostics such as "bangmeters," photography and other measurements. We are assured that these aircraft and the necessary manpower are available and require only adequate priority to preempt their use.

This technique could be used for several of the tests in the follow-on program (letter of September 19, 1961). Certain of these tests (e.g., the Pershing and second generation Minuteman warheads) originally planned as low-yield mock-up tests might be conducted at intermediate or full-scale yields. This technique would also permit the introduction of some development testing involving yields so large as not to have been included in the follow-on program. The method would also be applicable to proof testing medium and large-yield weapons not suitable for underground testing.

The cost of such air-borne drop tests is estimated to be from 250 to 300 thousand dollars per event to the AEC, plus comparable DOD operating costs.

For those large-yield tests involving such complex and precise instrumentation as to require a land base, it would be necessary to open up an Island Site in the Pacific. The Eniwetok or the Johnston Island installations could be rehabilitated for this purpose. The former is larger and would permit a greater variety of tests; the latter has an available missile-launching site. To prepare the Eniwetok installation would entail removing tropical growth, rehabilitating buildings, roads, and docks, and reconditioning the utilities and other mechanical support elements. Some minor new construction would be required. As an alternative, it might be possible to negotiate with the U.K. for the use of Christmas Island, which we understand has been kept in standby condition and which has the advantage of not being in the Trust Territory. In any event, such an island operation would require activation of a military task force to furnish adequate logistic support. From four to six months would be required to accomplish all the steps necessary to begin a meaningful test series. Several million dollars would be required for initial rehabilitation of either of our own sites. The

extent of further investment required would depend on the scope of the test series to be conducted. It has been our previous experience that AEC costs alone at Eniwetok averaged about two million dollars per event for an extended series of tests.

In summary, it is clear that acceleration of relatively simple tests, in the present program, can be accomplished by testing on tethered balloons at the Nevada Test Site, that larger-yield proof tests and certain developmental tests can be carried out by a completely air-borne operation within the next few months, but that it will take at least six months and a major operation to open up a Pacific Test Site for an extended development test program.

These three methods of atmospheric testing together with our underground capability would permit flexibility of response to the wide variety and frequent surprises of the developmental program.

I am sending copies of this letter to Secretary Rusk, Secretary McNamara, Mr. Bundy, Dr. Wiesner, Mr. Dulles, and Mr. Foster.

Respectfully,

**Glenn T. Seaborg**  
*Chairman*

## 60. Memorandum from Ball to President Kennedy, October 12<sup>1</sup>

October 12, 1961

### SUBJECT

Memorandum to You from Ambassador Stevenson on Nuclear Testing and the United Nations.

On Wednesday, October 11, the Secretary sent to you for your approval a memorandum entitled “US Position for the General Assembly on the Nuclear Test Ban” which represented the economists on this issue of the Committee of Principals which met Tuesday evening.

Ambassador Stevenson is now aware of the views of the Committee of Principals. He has asked that we forward to you the attached memo-

---

<sup>1</sup> Transmits October 12 memorandum from Stevenson outlining strategy on handling the nuclear testing issue at the U.N. Attached to Stevenson memorandum is a proposed Presidential statement. Confidential. 5 pp. Department of State, Central Files, 700.5611/10–1261.

random in which he accepts those views and urgently recommends that either you or he make an immediate statement offering to sign the present draft treaty on nuclear testing, or to return now to the negotiating talks.

I concur in Ambassador Stevenson's recommendation which I believe, as he points out, would be helpful in our efforts to maximize acceptance of our views in the test ban issue in the United Nations.

**George W. Ball**  
*Acting Secretary*

### **Attachment**

#### **SUBJECT**

*Nuclear Testing and the United Nations*

1. Last Saturday I sent to the White House and the State Department a proposed Presidential statement in which you would have invited the Soviet Union, first, immediately to discontinue all nuclear testing, and, second, to conclude within thirty days a treaty prohibiting all nuclear weapons tests. You would state at same time that the U.S. was going to prepare for atmospheric testing, and if your offer was not accepted within one week, the U.S. would be obliged to start testing when ready.

2. At a meeting in Washington Tuesday, the Committee of Principals decided against using this approach and also against taking any initiative to renew the Kennedy-MacMillan proposal that fall-out testing be banned.

3. On behalf of all the agencies concerned, the Secretary of State has now recommended a new policy under which we would continue to be willing to negotiate a treaty for a controlled test ban, whether for all types of tests or for atmospheric tests only, but in view of the Soviet test series we would not agree to a moratorium on testing during the period of negotiations.

4. I am told that at the meeting of the Committee of Principals it was the consensus that preparations should be made for atmospheric testing, but that such tests could not take place for several months. The proposal that we test in the atmosphere almost at once, for demonstration rather than technical purposes, was rejected—thank god!

5. I think that one more "last chance" challenge to negotiate a treaty within 30 days, with a joint test suspension during that limited period only, would be extremely useful in dealing here with the enthusiasm for the Indian proposal (to ban all tests, with no controls) and with

the skepticism about the U.S.-U.K. resolution (to negotiate forthwith a treaty along the lines of our Geneva draft).

6. However, I am not questioning the decision taken in Washington this week. What I do *urgently recommend* is an immediate statement from you or me offering to sign the present draft treaty or to return now to the negotiation table, either in Geneva or perhaps right here in New York. We would make clear that we were making preparations for further tests of our own; express our regret that Soviet actions make them necessary, as a matter of national security; and agree to stop as soon as a treaty is signed.

7. I am not proposing that we should stop our preparations for testing in the atmosphere. I think we should be completely frank in stating that these preparations are going forward. Indeed, the preparations may themselves serve as some incentive toward getting the Soviets back into negotiations. But since we cannot usefully test in the atmosphere for several months, I think we have everything to gain and nothing to lose by using the intervening time to conduct our educational campaign that stresses (a) our willingness to conclude a treaty, (b) Soviet obstruction and duplicity, and (c) the contrast between Soviet unconcern about the dangers of fall-out tests and U.S. reluctance to follow suit.

8. In summary, these are the reasons why I think a new offer to negotiate a treaty would prove useful:

(a) It will be a further boost for the disarmament initiative you took in your great speech here in the UN and it will show that the United States is supremely desirous of putting an end to nuclear weapons testing, with all its health hazards, its implications in terms of ever more destructive weapons, and its general exacerbating effect on international tensions.

(b) The offer would give us something other than a purely negative line to use as a basis for combating proposals for an uncontrolled, uninspected and unlimited test moratorium. While the present position that test cessation is possible only under a treaty with controls is thoroughly reasonable, it commands indifferent support in the General Assembly. Ninety-six of the 100 members of the UN are innocent bystanders in the nuclear arms race. Fearing that the health and safety of their peoples are jeopardised by continued testing, they are not interested in the rights and wrongs of the situation, or in who tested first. They will make a passionate appeal that the tests be stopped. If we must test for security reasons, it would help to dramatize the earnestness of our effort to avoid test resumption before we reached the point of no return.

(c) Our offer should win votes for our resolution and will moderate criticism we will certainly get for not agreeing to an Indian-type resolu-

tion. More than that, it will improve our standing with respect to other major political issues about to come up in the General Assembly. I need mention only the Chinese representation problem, the problem of the Secretary-General, and, if it comes into the UN, the problem of Berlin. In dealing with those difficult matters, it is surely best for us to appear as an earnest seeker of ways to diminish tensions.

(d) The renewed offer would focus attention on and dramatize our advocacy of a full nuclear test ban treaty with controls; it would greatly assist the process of public education we had intended in any event to carry out here at the UN.

9. In your press conference yesterday, you did indicate U.S. willingness to negotiate for a test ban treaty, and your conviction that a "moratorium" during negotiations is no longer an acceptable procedure as far as the United States is concerned. But the "news" in your statement was the possibility of atmospheric testing. My suggestion for a formal renewal of our treaty offer is to get the public's attention focussed once again on our desire to negotiate so as to stop tests, rather than on the melancholy necessity to continue them.

10. If you prefer to say no more on this subject, I would welcome your authorization to make a statement here, within a very few days, along the lines suggested in this memorandum. One way or the other, a formal U.S. announcement should be made very soon, before the Soviets complete their present test series.

**Adlai E. Stevenson**

### **Attachment**

#### *DRAFT STATEMENT BY THE PRESIDENT*

Since the Soviet Union resumed nuclear weapons testing in the atmosphere on September 2, it has detonated more than twenty fallout producing nuclear devices. Some of these devices have released energy equivalent to millions of tons of TNT.

The Soviet test series threatens to intensify competition in the development of more and more deadly nuclear weapons. Thus these tests increase the possibility of ultimate disaster for all mankind.

There is only one safe and sure way to stop nuclear weapons tests and to stop them quickly. That is to complete a treaty prohibiting all nuclear weapons tests under effective controls.

In the last two years the negotiations at Geneva made significant progress toward such a treaty. The United States stands ready to resume these negotiations for such a treaty today. It will devote all its resources to the quickest possible conclusion of these negotiations. If the Soviet Union would do the same, there is no reason why a nuclear test ban treaty with effective controls cannot be signed within thirty days.

My negotiators are ready now to sit down at the table with Soviet and British representatives for this purpose. Until there is a treaty and tests can be stopped, the United States, as a responsible nation, must prepare and take the actions that may be necessary to protect its own security and that of the world community.

---

**61. Memorandum from McNamara to the Chairman, Joint Chiefs of Staff, October 12<sup>1</sup>**

October 12, 1961

SUBJECT

Weapons Tests Plans and Preparation

Attached is a copy of a letter which has been approved by the President. The letter provides information concerning nuclear tests urgently required to be conducted in the atmosphere and recommends that authority be granted to prepare for the tests.

You are authorized and directed to proceed with preparation of plans on an urgent basis as follows:

a. As first priority, prepare detailed plans for [*text not declassified*]. Possible locations for these tests are indicated in the attached letter.

b. Prepare plans for [*text not declassified*]. The memorandum from the Assistant to the Secretary of Defense (Atomic Energy) to the Departments of the Navy and Air Force, the Chairman, Joint Chiefs of Staff and the Chief, Defense Atomic Support Agency, dated 10 October 1961 is rescinded.

c. Prepare plans for [*text not declassified*].

d. Prepare plans for support of the Atomic Energy Commission as may be required for the weapons development tests indicated in the attached letter.

You are authorized to proceed with preparation for all the tests indicated above to include assembly of equipment and personnel in a manner to minimize the risk of a leak to the public concerning the purpose of such actions. No public announcement is desired. Phrasing

---

<sup>1</sup> Weapons tests plans and preparation. Secret. 3 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Weapons Testing 10/11/61–10/15/61.

of the preparations shall be such that they can be practicably altered or terminated short of execution of the tests.

Planning and preparation for tests will be limited at this time to those indicated in the attached letter. However, in preliminary planning, selection of test locations and other matters, consideration should be given to the possibility of a continuing test program.

Reactivation of a Joint Test Organization is authorized within existing service manpower authorizations, and funds available. If additional resources are required, necessary requests will be made to this office prior to commitments being made.

We are beginning exploratory discussions with the Department of State to determine the feasibility of using Christmas Island for tests as may be desirable. You will be kept informed of the results of these discussions. Christmas Island appears to have many technical advantages for use as an atmospheric test site or staging base.

For each of the plans requested I desire, at the earliest possible date, the following:

a. Information as to how far we may proceed with preparation without serious risk of a leak to the public.

b. Information as to how far we may practicably proceed with preparations and hold pending authority to fire.

c. Copies of the completed plans. These may be provided in outline form.

d. Requirements for resources.

**Robert S. McNamara**  
*Secretary of Defense*

---

## 62. Telegram 913 to USUN, October 13<sup>1</sup>

October 13, 1961

Deptel 566. Disarmament Item. Reftel suggested course of action for handling disarmament item 16th GA on assumption no agreement would be reached in bilaterals on either statement of principles or

---

<sup>1</sup> Handling disarmament issue at U.N. following U.S.-U.S.S.R agreement on principles. Confidential. 5 pp. Department of State, Central Files, 600.0012/10-1361.

disarmament forum. Now that agreement reached on principles, request your comments on following course of action:

1. We would not seek endorsement our disarmament plan by 16th GA for reasons indicated reftel. However we would wish set forth our understanding of agreed principles and extract maximum advantage by explaining key provisions our plan as illustration and embodiment those principles.

2. In order avoid creating illusory impression wider US-USSR agreement in disarmament field than in fact exists and undesirable consequences such impression could have in view present world situation, we inclined not submit joint US-USSR resolution endorsing agreed principles and calling for resumption negotiations as suggested by UK (DEPTTEL 880). In view fact US-USSR agreement on principles we doubt there will be mediation effort by third parties as UK feels, and in any event believe disadvantages US-USSR joint action at this point are controlling. In general, we do not believe that US-USSR agreement on principles should be played up in debate.

3. Regarding disarmament forum we believe resolution advanced Section B our tel 566 still sound. Our thought is that dependent on results consultations with allies we would put forward resolution calling on DC appoint subcommittee of 20 as (1) counter to probable Soviet or neutral resolution calling for less favorable composition and (2) an earnest of our determination get effective consideration disarmament question. We realize problem posed by French opposition any forum other than 10-Nation forum but would hope French recognizing that we could not achieve favorable vote such resolution and in view tactical advantage this proposal could be persuaded remain relatively quiet on 20-nation proposal.

4. We anticipate probable outcome of debate will be resolution referring disarmament question to DC. This would appear to be result in view fact neither side may be able get agreement in Assembly debate on smaller forum. We believe best if resolution referring question to DC were put forward by representative group of nations and would suggest that Canadians, who put forward referral resolution in last GA, might organize group co-sponsors. In initial statements debate, while we would argue for soundness of 20-nation forum proposed in draft resolution, we would continue express willingness have problem considered in broader forum (including DC) which truly representative GA membership.

5. Following text suggested for resolution with alternative Section B referring matter to DC in event res on 20-nation subcommittee (part B Deptel 566) proves not to be feasible:

*"The General Assembly,*

A.

*"Conscious of its responsibilities under the Charter for disarmament;*

*"Recalling the terms of its resolution 1378 (XIV) of 20 November 1959, which called upon Governments to make every effort to achieve a constructive solution of the disarmament problem and which expressed the hope that measures leading toward the goal of general and complete disarmament under effective international control would be worked out in detail and agreed upon in the shortest possible time;*

*"Noting the report submitted to the General Assembly by the United States and the USSR following their exchange of views on questions relating to disarmament and to the resumption of negotiations in an appropriate body (Doc A/4879);*

*"1. Welcomes the joint US-USSR statement on agreed principles for disarmament negotiation included in that report;*

*"2. Recommends that negotiation on general and complete disarmament be based upon those principles.*

B.

*"Deeming it essential that negotiations for general and complete disarmament agreement under effective international control be resumed at the earliest possible time;*

*"Recognizing that all states have a deep interest and concern in disarmament negotiations;*

*"Noting that no agreement has been reached on the proposals for composition of a disarmament negotiating forum contained in the memoranda of the US dated July 29, 1961 (doc A/4880) and of the USSR dated July 28, 1961 (doc A/4887);*

*"1. Refers to the Disarmament Commission the proposals for general and complete disarmament which have been placed before it by the Governments of the United States and of the Soviet Union, and the various other proposals relating to disarmament which have been submitted during the deliberations of the 16th General Assembly;*

*"2. Recommends that the Disarmament Commission meet as soon as practicable in order to consider these proposals and to undertake the negotiation of a disarmament agreement; and*

*"3. Further recommends that the Disarmament Commission appoint such sub-committees as it may deem appropriate."*

6. Question whether Section A and B should be combined or treated as separate resolutions would depend tactical situation and our consultations with Canadians and other Allies.

**Ball**  
*Acting*

**63. Letter from Rusk to Seaborg, October 29<sup>1</sup>**

October 29, 1961

Dear Mr. Chairman:

The Department of State has supported the Atomic Energy Commission in keeping the door open for the resumption of atmospheric testing by the United States, should this become necessary in the interests of national security. We appreciate the difficulties of finding locations suitable for such testing. However, I have noted with concern that, in the event it should be decided that the United States is to resume the testing of atomic devices in the atmosphere, consideration is being given to the possible reactivation of the testing site on Eniwetok Atoll in the Trust Territory of the Pacific Islands. Use of the Eniwetok area would present us with particularly difficult problems.

Since our administration of the Territory is subject to supervision by the United Nations, we are required to defend our actions against hostile attack in the Trusteeship Council and in the Security Council, where the general revulsion against nuclear testing and a strong desire to protect the interests of dependent peoples create an unsympathetic atmosphere for the discussion of this question. We are especially vulnerable to charges that by conducting tests in the Trust Territory we avoid exposing our own continental inhabitants to the dangers involved in proximity to atomic blasts by exposing our Asian wards in the Trust Territory to those same dangers. Such an argument is strengthened by the fact that the people of Rongelap have already suffered some injury as a result of their proximity to an atomic blast in the past.

Another important factor in our thinking is our desire to maintain cordial relations with the people of the Trust Territory, who will probably be called upon eventually under the Trusteeship System to express their wishes as to their future, including the possibility of a continued close relationship with the United States. The unpopularity of nuclear testing among the island people would certainly influence their attitude on this question.

By seizing on the Trusteeship issue, those opposed to our testing would be able to adduce legal as well as political arguments purporting to distinguish our situation unfavorably from that of the Soviets. There is no doubt in our minds that the United States may legitimately conduct atomic tests within the Trust Territory of the Pacific Islands, and

---

<sup>1</sup>Concerns over possible reactivation of testing site at Eniwetok. Secret. 2 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Weapons Testing, 10/16/61–10/29/61.

the United States has taken this position publicly on a number of occasions. It should nevertheless be recognized that a plausible argument may be, and has been, made to the contrary. For this reason, we have constantly been careful not to engage in a detailed legal defense of our right to test in the Trust Territory, since this would merely help to bring out all the arguments to the contrary. I do believe, however, we would face a much more concerted challenge in this respect than we had in the past and would run the serious risk of having the issue brought before the International Court of Justice where the possibility exists that we might be immediately enjoined from such use of the Territory, at least until the matter was finally passed on by the Court.

In view of these circumstances, I believe that we should seek to avoid using a site in the Trust Territory for any tests that may be decided upon. The Department of State would be glad to explore with the Atomic Energy Commission the possibilities of other alternative sites which would not pose the same problems.

Sincerely yours,

**Dean Rusk**

November 1<sup>1</sup>**

November 1, 1961

SUBJECT

Proposed Presidential Statement on Nuclear Testing

A draft Presidential statement is distributed herewith in connection with the November 2, 1961 meeting of the National Security Council.

**Bromley Smith**  
*Executive Secretary*

**Attachment**

**PROPOSED PRESIDENTIAL STATEMENT WITH  
RESPECT TO NUCLEAR TESTING**

With the Soviet Union now drawing to a close its current series of nuclear tests, it is time for every American, and for every friend of freedom, to examine the meaning of these tests in their true perspective. For whatever senseless threats have been made, whatever groundless fears have been raised, whatever irresponsible headlines, rumors and speculation have been circulated, the basic facts remain unchanged. We have not lost our lead in the military balance of power. We have not lost our determination to face any risk in the defense of our vital interests. And we have not lost our desire to achieve a world free from the fear of both nuclear tests and nuclear war.

I do not suggest that we can completely dismiss these Soviet tests as unimportant bluff and bluster. They are important to any thoughtful person, in any country, who cannot help but have new concern for the health of his children and new contempt for such crude and cruel tactics. Presumably these blasts are also important to Soviet military leaders and scientists for testing certain weapons or experiments—and as further evidence on these purposes becomes available, it will be evaluated in the light of our own progress.

---

<sup>1</sup> Presidential statement on nuclear testing. Attached is a proposed Presidential statement. No classification marking. 3 pp. Seaborg, Journal, Vol. 2, pp. 350–352.

But this much can be said with certainty now:

(1) In terms of total military strength, we would not trade places with any nation on earth.

(2) Every potential aggressor knows that the strategic nuclear force which we could bring to bear—even if we had first been struck the most devastating blow he could launch—would still be greater than the total strategic forces he possessed before attacking us.

(3) It is not necessary for us to explode oversized bombs to confirm the hard fact that we have many times more nuclear power and strategic delivery systems—intercontinental bombers and ballistic missiles—than any other nation on earth in a force so deployed as to survive any sneak attack and capable of devastating any nation foolish enough to threaten the security of this nation or any of its allies.

In the absence of a signed and effective test ban treaty with enforceable inspection, our own testing program will proceed on the basis of our own needs. When our responsibilities to free world security require us to test new weapons in any environment, all necessary advance preparations will have been completed. But an actual test series is not undertaken lightly or hastily. Others may test nuclear weapons in the atmosphere for so-called psychological or political reasons—but the United States has no intention of rushing into precipitate atmospheric testing without solid military justification and careful scientific preparation. Others may conduct a series of such tests without taking any substantial steps to safeguard the health of their own citizens, their co-inhabitants of this planet and generations yet unborn—but the United States will conduct no such series without imposing whatever safeguards are necessary to prevent its world-wide fall-out from rising above a mere fraction of that resulting from the current Soviet series.

In short, the United States will undertake atmospheric nuclear tests only when such tests are deemed necessary, in the light of our evaluation of Soviet tests, to maintain the Free World's present superiority in defensive and deterrent strength—only to the degree that the orderly and essential scientific development of new weapons has reached a point where further progress is not possible without such tests—and only within limits that restrict the fall-out from such tests to an absolute minimum.

To sum up: As long as we can keep our heads clear, our voices calm and our powder dry, it will make no sense for the enemies of freedom to attack, or for the friends of freedom to face the future with any spirit other than one of abiding confidence.

**65. Paper, November 2<sup>1</sup>**

November 2, 1961

**THE FOSTER PANEL PLAN  
FOR GENERAL AND COMPLETE DISARMAMENT**

1. The so-called “Foster Plan” for disarmament, now in its 9th revision and under consideration by the JCS, differs substantially from the US plan submitted to the United Nations. It is based on two principles, neither of which is inherent in the present approved US plan.

a. Immediate progress is necessary in the reduction and control of strategic nuclear delivery vehicles, and

b. The degree of inspection will be equitably related to the amount of disarmament achieved through a zonal area inspection system.

2. Instead of the three stages in the currently approved US plan, the Foster Plan has six.

a. *Stage A.* This stage will involve only the US and USSR. At the outset of negotiations, and during each subsequent month for one year, or until Stage B goes into effect, both the US and USSR will deposit with the United Nations 30 medium jet bombers to be destroyed. If negotiations continue beyond one year, the rate will be 15 per month for the second year; at the end of the second year destruction will be discontinued. If agreement on Stage B is not reached by 1 January 1964, the above provisions would be subject to modification or withdrawal (this caveat holds for all stages.)

b. *Stage B.* The measures in this stage will apply to all members of NATO and the Warsaw Pact. It will last two years and will include both disarmament and inspection measures. During this stage (1) the strategic forces (missiles with more than some 200 mile range and aircraft of more than about 33,000 lbs. empty weight) of NATO and the Warsaw Pact, each will be reduced to 1000 vehicles; (2) the location and characteristics of all AICBMs will be declared and such system will be deployed only by agreement; (3) production of a new strategic vehicle will be accompanied by the destruction of an old one; (4) production of fissionable materials for military uses will stop.

Before Stage B begins all NATO and Warsaw Pact countries will divide themselves into 12 zones, and will declare by zone the number by type and model of strategic delivery vehicles, the location of key production facilities for vehicles and fissionable materials, the number

---

<sup>1</sup> “Foster Panel Plan for General and Complete Disarmament.” Confidential. 3 pp. National Defense University, Taylor Papers, Disarmament.

of strategic delivery vehicles aboard ships including submarines, and the location and capabilities of airfields and ports. Inspectors of one side will be stationed at each key production facility of the other side, in all zones, with access to production records. Each side will also be allowed to station inspectors temporarily at all airfields and ports, etc., until inspection gets underway. NATO will choose a zone in each Warsaw Pact country, and the Warsaw Pact a zone in each NATO country. After a zone is selected the host country will identify the location, etc., of strategic vehicles and facilities in the zone. After a zone is selected, no strategic vehicles will be shifted until after the initial inspection; thereafter shifts will be permitted on adequate notice. Each side will be allowed to station inspectors at all key points within the zones chosen, with complete and unimpeded access in the zone. Zones once selected will remain subject to mobile and aerial inspection at any time. After eight months, one more zone in each country will be selected; the process will be repeated once more after 16 months.

c. *Stage C.* Stage C also will last two years and will extend the scope of participation from NATO-Warsaw Pact to Allies of the US and USSR, worldwide. Strategic vehicles will be reduced to 500 each. Mass destruction weapons in space will be prohibited. Nuclear technology will not be passed to countries not now possessing such technology; all states will sign a nuclear test ban agreement.

In this stage quotas will be placed on other weapons, to include tanks, armored personnel carriers, missiles with ranges of 35 to 200 miles, artillery and mortars exceeding 100 mm in caliber, combat aircraft greater than 5500 lbs., naval vessels of more than 500 tons. Quotas in each category will be determined by negotiation. During the two years military forces on each side of the types covered by this provision will be reduced on the order of at least 25%. Production of new weapons in all categories would be limited to a one for one replacement, with advance notification given. Any AICBM systems will be deployed only by agreement. Three more zones in each country would be inspected. Finally, each side would have unlimited access to documents pertaining to budgetary allocations of the other side for military purposes.

Preparatory to, and as a prerequisite for going to Stage D, agreement would be reached on an International Peace Force (IPF), and International Disarmament Organization (IDO), and needed improvements in world law.

d. *Stage D.* Stage D will last two years, will apply to all countries of the world. Strategic forces and other forces will be further reduced. Compulsory military training and refresher training of reserves will be limited. Armaments production will be further restricted, and fissionable material production for weapons will stop and more fissionable material will be transferred to peaceful uses. No new countries will

develop nuclear weapons, and no AICBMs will be deployed except by agreement. Production of CBR weapons will be halted and existing stocks destroyed, provided methods for policing prohibition of CBR weapons have been determined and put into effect.

During this stage the International Disarmament Organization (IDO) within the United Nations framework will be established, and the bilateral inspection organizations of previous stages will be incorporated in this Organization. The IDO will inspect three additional zones in each state that has participated in previous stages and all 9 zones of newly participating states. In addition to IDO, the United Nations Peace Force will be created.

e. *Stage E.* Stage E will last two years, during which all national armaments will be further reduced. The final three zones in each country will be opened to inspection. The United Nations Peace Force will be strengthened.

f. *Stage F.* In this final stage steps will be directed toward a world in which: (1) all national forces will be reduced to agreed numbers required for maintenance of civil order; (2) manufacture of armaments will be prohibited except for use by the United Nations Peace Force and those required to maintain internal order; (3) permanent inspection will be withdrawn and replaced by random inspections; and (4) "the peace-keeping capabilities of the United Nations will be made sufficiently strong and the obligations of all countries sufficiently far-reaching so that they will be able to maintain peace and ensure the just settlement of differences in a disarmed world."

---

## 66. Notes on National Security Council Meeting, November 2<sup>1</sup>

November 2, 1961

Mr. McNamara set forth the Defense Department's conclusion regarding the tests which might be performed and the necessity for each type. He listed the following four groups of tests:

1. Systems tests (proving out existing systems and hardware).
2. Proof tests (proving stockpile items).
3. Development (increase yield; yield to weight).
4. Effects (ICBM warhead, vulnerabilities and AICBM).

---

<sup>1</sup> Resumption of testing, evaluation of Soviet nuclear program, neutron bomb status, test sites, and review of Presidential statement. Top Secret. 4 pp. Johnson Library, Vice President's National Security File, NSC Documents, Testing.

Mr. McNamara stated that the first two categories of tests of which there would be approximately eight shots are presently ready. He pointed out that while certain advantages would accrue from both categories of tests there was no overriding reason to perform these tests at present. With regard to Categories 3 and 4, he stated that the Defense Department felt strongly that these tests should be accomplished. Otherwise the U.S. nuclear program would remain more or less stagnant and such advantage as this country might presently possess would sooner or later be overcome by the Soviets. Approximately 15 shots would be required and initiation of the series could begin in approximately 5 or 6 months. Mr. McNamara concluded by recommending that the testing program be resumed immediately. AEC and State concurred.

Following an introduction by General Cabell, Dr. Scoville presented the CIA evaluation of the Soviet nuclear program.

Dr. Seaborg agreed with McNamara's proposal to initiate testing immediately of Categories 1 and 2. He cautioned, however, that underground tests such as those presently underway cannot compete with an aboveground program, such as the Soviets are now conducting. He discounted the fallout from the U.S. program by forecasting that the entire test program envisioned within the four categories would produce a worldwide fallout of less than one megaton. Even the effects of this fallout could be controlled and limited. In citing the drawbacks of the Las Vegas testing area Dr. Seaborg said that the AEC had come to no conclusion as to where additional tests should be held.

Dr. Brown further discussed a detailed test program for the four categories cited by Mr. McNamara. He reaffirmed Mr. McNamara's statement that Categories 1 and 2 would reap marginal benefits from the military and technical standpoint. Dr. Brown made a strong case for the resumption immediately of a test program in Category 4. He stated that Defense studies in conjunction with AEC indicated that tests could not be resumed for approximately six months even if the decision were made immediately to resume atmospheric testing.

The President inquired as to how long it would take to complete a reasonable test program for Categories 3 and 4. Seaborg replied that a specific time period would be difficult to predict although he estimated that one shot per week would be an optimum rate in order to permit the recording and assimilation of the great volume of data normally obtained. He agreed that the program could be accelerated, but at the same time certain conditions, such as meteorological, at some testing sites might cause delays and it should be expected that 4 to 6 months would be required to complete this program.

Dr. Bradbury confirmed the disadvantages of testing underground, stating that a period of six months is sometimes required before even

the basic data becomes available and even then chemical analysis becomes extremely difficult. He reviewed the conditions at the various test sites and cited advantages and disadvantages of each. He pointed out clearly the advantages to be gained through atmospheric testing.

The President asked Dr. Bradbury about work on the neutron bomb. Bradbury replied that from a technical standpoint there was no such thing at present and he regretted that this notion had become so popular. He admitted that the laboratories were working on a fusion device which would have low radiation and fallout and from this idea has come the popular expression "neutron bomb." The feasibility of the principle has not been fully established, nor has the military usefulness or reasonable size of weapon been determined. The President suggested that Senator Russell be informed of the facts concerning this idea and the state of its development. The President further expressed regret that Senator Dodd had made certain statements about the weapon and the necessity for it—all of which now are clearly without foundation.

The President asked if the Council should consider abandoning the Nevada test site because of test limitations and of objections from residents of California and the mountain states. Dr. Bradbury suggested that Nevada be retained since the site was appropriate for certain kinds of testing, particularly for weapons suspended from balloons. But of the various sites suggested for the resumed program Bradbury offered the opinion that Eniwetok offered the best possibilities.

In response to the President's inquiry about the military requirements for testing, General Lemnitzer briefly confirmed Mr. McNamara's presentation. He asserted that all four categories were important and had been studied and supported extensively by the military although he agreed with the evaluation of the Council that Categories 3 and 4 were more important.

Ambassador Stevenson questioned the wisdom of resuming tests at Eniwetok since this island is not U.S. territory. He expected this fact would invoke criticism that the United States endangers the lives of citizens other than its own. He felt that the U.S. would be criticized further for resuming tests, but felt the criticism could be overcome if the initiation of the tests were handled right and timed right. By timing (with regard to the resumption of a full program for Categories 3 and 4) he hoped that the resumption would begin after the conclusion of this session of the General Assembly. He also expressed the hope that any test program would be compressed into the minimum time period. Mr. Foster observed that in spite of his position on disarmament he was convinced by the presentations that the United States should resume testing. He felt that the reasons and the necessity were clear and valid.

The President said that he did not want to leave the impression that this particular NSC meeting came to the conclusion that the United

States will resume testing. He preferred not to state U.S. intentions or to commit himself to a future course of action. He said that he could agree only to an implication that preparations might begin if in the best judgment testing were absolutely necessary.

Mr. Murrow stated that the reaction of most nations of the world to the Soviet testing was more one of anger than one of fear. He would like therefore not to invoke this same kind of reaction toward the United States. He expressed the belief that the United States should announce its intention clearly not to resume testing at this time. The President replied that such an announcement was not possible. The President then asked that members of the Council review the proposed Presidential Statement. But in view of the number of exceptions taken to the Statement as proposed, the President asked that the Vice President, Secretary of Defense, Chairman of AEC, and Director of USIA remain after the close of the meeting to assist him in the drafting of the new statement.

---

#### 67. Telegram 1139 to USUN, November 4<sup>1</sup>

November 4, 1961

Dept has considered views expressed five power meeting reported New York 1350 re handling disarmament item. USDEL should at next five power meeting convey following response to views expressed and seek allied reactions on following further tactical suggestions re handling disarmament item.

##### *1. Endorsement agreed principles:*

Although Dept still inclined not [illegible in the original] joint US-USSR res endorsing agreed principles, agrees Italian and Canadian point that there be no appearance retreat from agreed principles and UK point that it would be useful have western initiative endorsing these principles to forestall possible revival Indian principles res. Accordingly suggest early initiative in form res sponsored by US or five powers endorsing principles. Believe also early submission western res would help maintain greater degree western control over debate and tactics. USDEL accordingly should seek five power comments on

---

<sup>1</sup> Guidance for next five-power meeting on disarmament. Confidential. 2 pp. Department of State, Central Files, 600.0012/10-2661.

text part A res contained DEPTTEL 913 with view to submission soon as possible.

*2. UN framework:*

DEPT agrees Canadian view that negotiating forum should be squarely in UN framework. Believe move to bring this broad and significant aspect East-West dialogue back into UN useful part of general effort bolster UN. See advantage in body established by GA as opposed group established outside UN by four power agreement which can more readily be dissolved by SOV walk-out. Believe further that western proposal place negotiations in UN would be responsive increasing sentiment smaller powers for such move, and would help dispel any impression SOVS seek to convey that west opposes participation by neutrals.

*3. Forum:*

DEPT considers proposal for 20 nation forum appointed by GA as subcommittee of DC, which includes ten nations which participated in Geneva talks in 1960 and ten others on geographical representative basis has decided advantages. This composition permits west to oppose troika formulation, or any variation resembling troika, on grounds of principle, namely that of geographic representation. US can maintain that if present NATO-Warsaw forum to be reconstituted as world forum it must accord adequate representation to rest of world, and that addition of 10 is smallest number that could meet this requirement. Tactically this proposal also offers advantage of outbidding SOVS on number additional states to be included and of dispelling idea western reluctance include neutrals. At same time it is sufficiently large that considerations of geographic representation would probably preclude addition of exclusively QUOTE neutrals UNQUOTE in sense troika principle envisages.

Given these strong points both of principle and tactics we do not consider it necessary to accept any retreat to 5–5–3 or any other combination approximating troika. You should make clear to UK we believe 5–5–3 proposal smacks too much of troika. We believe French might be able to live with 5–5–10 better than 5–5–3.

Agree fully UK point implied NY 1291 para 1, however, that if GA could reach agreement on 20 specific states it would be preferable have their appointment made

**68. Telegram 1241 to USUN, November 14<sup>1</sup>**

November 14, 1961

Re disarmament, USUN 1574. We are of course fully aware pressures we will face on forum issue in forthcoming GA discussion. Our position in dealing with this matter is weakened by fact that UK, Canadians and Italians are prepared to settle for 5-5-3, that Assembly as a whole is unlikely to endorse any solution which is unacceptable to Sovs since they see principal issue as being to secure earliest resumption of disarmament negotiations, and believe forum question involves only picayune procedural considerations. Difficulties are increased by fact Sovs are aware of these factors.

However we believe issues of principle involved are of great importance, and that our memorandum to Sovs July 29 setting forth four alternative forum proposals gives us strong position which we may not have fully exploited. We do not at all need to be defensive about this position or to fall in with idea that considerations are only procedural.

Furthermore, change in France's position and its support ten plus ten or DC as forum (USUN 1592) most important factor not to be overlooked. Now that France has moved toward our position, we should avoid developments that would re-open breach which has haunted us for months.

From standpoint of expeditious conduct of serious disarmament negotiations, there was no reason for Sovs to refuse continuation of negotiations in 5-power subcommittee in 1957. Addition of such satellites as Bulgaria and Romania has added nothing to wisdom, realism or technical competence of negotiating group. Sov objective in insisting upon establishment 10-nation group was purely and simply one of establishing principle and precedent of NATO-Warsaw parity. Sovs sought in making this change to make our opposition to what was in reality significant issue of political principle and precedent appear as merely petty numbers game on part of West, which was thereby impeding return to disarmament negotiations.

Now once again, for reasons unrelated to utility 10-nation forum for disarmament negotiations, Sovs are seeking to establish new significant and highly unfavorable political principles and precedents by further alteration composition. While privately admitting neutrals will not contribute anything to disarmament (USUN 1578), they attempting capitalize on their willingness add neutrals per se and are seeking

---

<sup>1</sup> Western strategy for countering Soviet tactics at U.N. Confidential. 6 pp. Department of State, Central Files, 600.0012/11-961.

additional victory to one they won in establishment of principle of NATO-Warsaw parity. They now seek to extend parity between Warsaw (8 states) and NATO (15 states) to new principle of parity between Sov bloc (11 states) and states participating in any type of military alliance with US (over 40 states). They would do this by displacing principle of geographic representation in UN bodies and replacing it with Sov concept of a 3-bloc troika world. SOV tactic once again is to characterize Western opposition to these far-reaching objectives of principle and precedent as mere Western rigidity in refusing to accept a minor alteration in the disarmament forum in order to get on with negotiations.

Believe, accordingly, that Western tactic should be to treat and debate forum question as matter of principle, while at same time pointing out US position of four alternate forums is in fact strong both on grounds principle and practicality, and range of proposals offered can be shown meet every legitimate Sov concern both re equality and re inclusion neutral states.

In order strengthen US position and underline principle geographic representation US should be prepared, if US-proposed additions prove unacceptable, register our willingness accept procedure whereby GA (or DC) would elect 10 countries to be added to 10-nation group on geographic basis, namely, 3 LA's, 3 Asian, 3 African and Middle East, and 1 non-NATO, non-Warsaw European.

In approaching problem of forum four US alternatives of July 29 can be used to disprove any impression we are opposed to broadening participation or to inclusion neutral element in negotiations which Sovs will try to make point of issue. We should, moreover, enlist assistance in debate of countries such as Argentina, Japan, Pakistan and others who should be made to realize that acceptance of principle embodied in 5-5-3 or 5-5-5, apart from innate undesirability as further step towards institutionalization of troika in UN, in effect penalizes countries participating in voluntary military alliance with US by ruling out opportunity for them to take part in disarmament talks: this would be step creating precedent of far-reaching significance. The so-called neutral states should be made to realize that under the 5-5-3 proposal the 11 contiguous Sov-bloc states are given greater representation than 50 widely dispersed non-aligned states.

Strong defense and firm stand on these positions probably will throw disarmament issue into full Disarmament Commission, our 4th alternative, since neither Sovs nor French probably prepared in long run refuse to participate in this body. We recognize may be some negative reaction since full DC will be regarded primarily as forum for propaganda exploitation and impracticable for conduct of serious negotiations. We should combat this attitude by pointing out that even

present 10-Nation forum also unwieldy and mainly used as platform for formal speech-making. While same conditions would exist in Disarmament Commission, it would provide umbrella for informal bilateral and quadrilateral negotiations and contacts, which, as past experience demonstrates, is way in which progress, if there is to be any, is made in any case. DC could set up subcommittees, as deemed desirable, for specific functional purposes, and entire machinery of UN could be brought into disarmament negotiation process in meaningful way.

In light of above you should submit as soon as possible, and if feasible before US opening speech on disarmament, US draft res containing Part A as in Deptel 913 and Part B communicated Deptel 566 as amended Deptel 1139. Do not believe Allies can object to our putting forward US position to which they agreed during bilaterals. French of course have indicated (USUN 1599) they would support Part A only if submitted together with Part B. Believe this procedure would put us in favorable tactical position since it would focus debate on our proposal and open way, if necessary, for later shift toward procedure suggested above for electing additional 10 members. Before submitting draft res you should contact reps countries listed in our draft, except members Ten-Nation Committee, and inform them our intention table draft. In approaching them you should recall fact draft contains US proposal of which their govts informed during bilaterals and to which no objection voiced at that time. At your discretion you may omit approaching those countries that appear on both US and USSR lists.

## **69. Memorandum from Battle to Bundy, November 17<sup>1</sup>**

November 17, 1961

Enclosed is a proposed text of a message from the President to Prime Minister Macmillan replying to the latter's letter of November 16. I believe it conforms in substance to the agreement you and Dr. Seaborg reached about the nature of a reply.

---

<sup>1</sup> Conveys a suggested letter from President Kennedy to Macmillan on atmospheric nuclear tests. Also attached is copy of the President's November 21 letter to Macmillan. Top Secret. 6 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Kennedy-Macmillan, 1960-1962.

However, since the proposed reply is a little more forthcoming in response to some of Mr. Macmillan's expressed concerns, you may wish to consider whether the President should review it prior to dispatch.

**L.D. Battle**

*Executive Secretary*

### **Attachment**

November 21, 1961

*Draft reply to Macmillan*

Dear Mr. Prime Minister:

I have read your letter of November 16. I share your sense of the gravity of a decision to conduct nuclear testing in the atmosphere. The sober picture emerging from analyses to date of more than two score Soviet tests warns us however that we may well need to strengthen our nuclear posture. It may interest you to have the criteria which I have provided my defense and atomic advisers in preparing recommendations for me:

1. Tests will be conducted in the atmosphere only if:
  - a. The test will provide information of substantial importance to the national defense.
  - b. The information needed can be obtained in no other way, with reasonable time and effort.
  - c. Atmospheric fall-out is minimized in all practicable ways.
  - d. The military need for the test outweighs the general desirability of avoiding all atmospheric fall-out.
2. Each proposed atmospheric test will be submitted to the President for decision:
  - a. For the present, recommendations will be restricted to tests which relate importantly to weapons development and weapons effects.
  - b. Approval of either proof tests or systems tests can be expected only if there is a convincing demonstration of unusual need in each case.

While no decision has been made to resume atmospheric testing, and of course no specific tests have been approved, our program is being developed under these guidelines. As these studies proceed, I will be in touch with you further regarding the consultations you propose.

Because of the time and effort likely to be required in the preparation of an island test site, we are eager to get underway the necessary work. I accept your suggestions concerning the reconnaissance party. Dr. Seaborg will approach your people to make arrangements for immediate despatch.

## Attachment

November 21, 1961

Dear Mr. Prime Minister:

I have read your letter of November 16th. I share your sense of the gravity of a decision to conduct nuclear testing in the atmosphere. The sober picture emerging from analyses to date of more than two score Soviet tests warns us however that we may well need to strengthen our nuclear posture.

While no decision has been made to resume atmospheric testing, and of course no specific tests have been approved, we are developing a test program and undertaking preparations to be in a position to conduct tests in the event we decide we must. As these studies proceed, I will be in touch with you promptly regarding the consultations you propose. I hope that these consultations will proceed quickly enough to permit us to reach an understanding by the end of the year, and if the idea of a meeting in Bermuda works out, that would be a good time to deal with the matter. Meanwhile, it may interest you to have the criteria which I have now provided my defense and atomic advisers to guide them in preparing for atmospheric tests and in making specific recommendations to me:

1. Tests will be conducted in the atmosphere only if:
  - a. The test will provide information of substantial importance to the national defense.
  - b. The information needed can be obtained in no other way, with reasonable time and effort.
  - c. Atmospheric fall-out is minimized in all practicable ways.
  - d. The military need for the test outweighs the general desirability of avoiding all atmospheric fallout.
2. Each proposed atmospheric test will be submitted to me for decision:
  - a. For the present, recommendations will be restricted to tests which relate importantly to weapons development and weapons effects.
  - b. Approval of either proof tests or systems tests can be expected only if there is a convincing demonstration of unusual need in each case.

Because of the time and effort likely to be required in the preparation of an island test site, we are eager to get under way the necessary work. I accept your suggestions concerning the reconnaissance party.

Dr. Seaborg will approach your people to make arrangements for immediate despatch.

Sincerely,

JFK

**70. Notes on Telephone Conversation between Rusk and Stevenson, November 30<sup>1</sup>**

November 30, 1961

TELEPHONE CALL TO AMB STEVENSON

The Sec referred to last night and S said he was sick about it particularly because of the disarmament business. The Sec asked if there was any more to report. S said no but they will meet on Monday and he hopes to get 1 and 7 and the Sec said fine. S said it is the quantum and to whom and when the Comm should report. S thinks they can settle on the 7—may need a third meeting.

The Sec said he did talk further with the Pres on the Swedish res and we would prefer not to seem to be changing our position at this stage. He understands there will be 13 negative votes and 70 votes for in any event. Does not S think he can handle it by what he says at the time of the voting? The Swedes were wicked to do it without consultation with us. The Sec said the Pres was concerned with the points S raised. The Sec explained in detail including mentioning the fact we may have to go on without de Gaulle on Berlin but we have to have NATO with us. The Sec said if S could come through on this one with us, we will try to. . . . S would like more concert in the future. The Sec suggested having someone on his staff and someone from here like Walner to look ahead through the rest of the items as to how it looks we are going to be voting so we can get at the problems now rather than under pressures of time.

S said he thinks the telegram to Drumright was very good. S said he presented it to Tsiang there and thinks it shook him a good deal. They agreed we can't be a satellite of theirs.

**71. Memorandum from Gen. Lemnitzer to McNamara,  
December 6<sup>1</sup>**

December 6, 1961

SUBJECT

Foster Panel Draft, "Proposed Disarmament Program", Revision 9 (U)

1. Reference is made to the memorandum by the Assistant Secretary of Defense (ISA), I-17133/61, dated 20 October 1961, which requested the comments and recommendations of the Joint Chiefs of Staff on the "Foster Panel Proposed Disarmament Program," and reply to a list of questions related thereto.

2. The Joint Chiefs of Staff recognize the magnitude of the tasks confronting the Arms Control and Disarmament Agency. It is paradoxical that the agency must devise imaginative proposals to meet aggressive Soviet positions without impairing the capabilities of the United States to overcome Soviet aggression. Further, it is inevitable that tense international situations cause a sense of urgency for arms control negotiations. However, this urgency must not become the only basis for an arms control program.

3. In the development of a US disarmament position, the unswerving purposes of the Soviets toward world domination must be kept in mind. Concurrently, the United States must recognize its basic principles against which our actions and proposals must be constantly weighed. This does not indicate inflexibility, but it does indicate the need for well defined limits in disarmament matters. Such limits are not fully recognized in the Foster plan and unless they are established, the United States could move step by step to the position of our opponent. This trend, coupled with an honest desire for success in negotiations, could well jeopardize the security of the United States.

4. The subject proposal is based on the concept that immediate progress is necessary in the reduction and control of strategic nuclear delivery vehicles and that imbalances in other forms of military power would not become dangerous until a considerable reduction had taken

---

<sup>1</sup> JCS views on the proposed disarmament program as devised by the Foster Panel. An appendix is attached containing additional comments on the Foster Panel program. Two additional attachments by McCone and Scoville provide a readout of the 12/18 Department of State meeting on resumption of nuclear testing. Secret. 23 pp. Kennedy Library, National Security Files, Kaysen Series, Disarmament, 12/61-4/62.

place. The Joint Chiefs of Staff do not consider this fundamentally valid. The proposal would trade off our strategic nuclear superiority for virtually no concession on the part of the Soviets. The Foster Panel approach implicitly underestimates the importance of the US strategic nuclear capability to our over-all defense posture and the extent to which it serves to maintain stability and peace.

5. The Joint Chiefs of Staff reaffirm that the United States cannot afford to reduce drastically its nuclear capability until there exists effective means for enforcing international agreements to which it can entrust its security. Moreover, the premature reduction of the US and USSR nuclear capabilities to a status of numerical parity without a corresponding elimination of the present Soviet conventional superiority, could upset the uneasy balance of opposing military power that exists today.

6. Additional comments concerning the proposal and the list of specific questions prepared by the Foster Panel are contained in the attached Appendix.

7. Although the Joint Chiefs of Staff recognise inherent shortcomings concerning the US Declaration on Disarmament, that program is considered more acceptable from a military point of view than the Foster Panel proposal. Accordingly, it is recommended that the Foster Panel proposal be withdrawn and that the current Declaration on Disarmament be utilised as the basic US proposal. Further, it is recommended that attention be directed toward the development of detailed negotiating positions and background papers for the US Declaration on Disarmament. These positions are needed for discussions with our Allies and with the USSR in the event the Soviets suddenly choose to enter into serious negotiations, using the US Declaration on Disarmament as a frame of reference.

For the Joint Chiefs of Staff:

**L.L. Lemnitzer**  
*Chairman*  
*Joint Chiefs of Staff*

## **Appendix**

### *ADDITIONAL COMMENTS CONCERNING FOSTER PANEL PROGRAM*

1. In a memorandum for the Secretary of Defense, dated 28 October 1960, the Joint Chiefs of Staff forwarded a recommended US policy on arms control. At that time, it was pointed out that any proposal with respect to arms control should only be made after careful consideration

of the international situation and its inevitable impact on US military strategy and security policies. This caveat continues to be valid. A paraphrase of the key principles from this memorandum follow:

a. The United States should not make concessions in advance of similar action by the Soviets in hope of inspiring similar Soviet concessions.

b. Should the Soviets enter into any arms control agreement, their probable intention will be to achieve net military advantage over the United States either through the operation of the agreement itself or reduction of Western defense efforts resulting from reduced tension.

c. US objective in arms control negotiations is to enhance national security through balanced, phased, and safeguarded arms control agreements.

d. There should be no major US reductions until all militarily significant States participate in similar reductions and there is a reliable system of inspection and verification.

e. We should never take the position of "appealing" for arms control measures. US eagerness for agreement spells weakness to the Communists.

f. We must strengthen our military posture *vis-à-vis* the Sino-Soviet threat until they have demonstrated sincerity.

g. There must be no restriction on readiness or employment of forces until suitable international controls exist.

h. We must maintain credibility and retain adequate capability to back up our Allies.

i. We must maintain a strategic nuclear advantage until:

- (1) Soviet bloc conventional forces have been significantly reduced.
- (2) Soviet strategic nuclear capability has been reduced.
- (3) There is adequate international peace enforcement.

j. We must not be in such a hurry that national security is compromised.

k. The entire Red bloc should be treated as an entity.

l. There should be no restrictions on research and development.

m. Any agreement should have a "fail safe" feature such that non-compliance by any party would not jeopardize the security of others.

2. Specifically, the United States must be able to maintain, at any stage of disarmament, an adequate response to the entire spectrum of the remaining Sino-Soviet bloc threat; namely, an evident, secure nuclear retaliatory capability and an evident flexible capability for military operations short of general war. In particular, the United States should retain an attitude and posture which would make credible to friend and foe alike its capabilities to fight with or without nuclear

weapons to maintain its security interests. The Foster Panel proposal does not meet these basic criteria.

3. The list of questions prepared by the Foster Panel is based on three assumptions designed to achieve military evaluations of specific features of the proposal. These assumptions are unrealistic. The answers developed therefrom would result in unreliable and dangerous military opinions which would serve no useful purpose. The answers, even if not separated from the assumptions, could be misleading and could place the Joint Chiefs of Staff in the position of tacitly agreeing to a proposal regarding which they thoroughly disapprove. In this sense the military security of the nation could be jeopardized. Further, several of the questions are unanswerable since they relate to future judgments involving not only military but political and economic considerations. Such judgments on precise levels of forces and armaments are meaningful only if developed at a time when the requirements to maintain secure and effective forces are imposed. Then, the international political atmosphere, the nature of the threat, and the national security policy, will dictate the levels of forces and armaments. For these reasons a specific response to each question proposed by the Foster Panel is not provided. However, comments, by Stage, using the questions as a guide, follow.

#### STAGE A

1. The surrender of 30 medium jet bombers was noted by the Foster Panel as being a “gimmick” to show earnestness of intent. Implementation of this measure would create the misleading picture for the American public that some progress was being made in disarmament. This could result in a false sense of security and thereby jeopardize other defense efforts.

2. The Soviets could be expected to point out that there is already an imbalance in long range aircraft in favor of the United States and that this measure merely aggravates the imbalance and is therefore inequitable. Further, they might be the first to label the measure as “deceptive,” pointing out that it is public knowledge the United States had previously planned to phase out the B-47 medium bombers. It is a fact, however, that the worsening political situation has caused the USAF to set aside their plan to phase out the B-47's. Therefore, to surrender these airplanes would be to the military disadvantage of the United States at this time.

3. If it is essential to create an environment of earnestness, it appears that some other confidence-building measure which would not involve early and substantial reductions in military capabilities, could be proposed to achieve this objective. Such measures could be in the category of those designed to safeguard against war by miscalculation, e.g.,

advance notification of major military movements or the exchange of information or limited mutual inspection teams.

## STAGE B

1. It is proposed in this stage to accept numerical parity in strategic nuclear delivery vehicles. Since World War II, the United States has relied on its strategic nuclear capability to deter nuclear attack on the United States. The United States must continue to rely on strategic nuclear weapons as the "backbone" of this deterrent strength. In a speech on 21 October 1961, at Hot Springs, Virginia, the Deputy Secretary of Defense re-emphasized this strategy while at the same time reiterating President Kennedy's determination to improve the US ability to make swift selective responses to enemy attacks regardless of time, place or choice of weapons. This capability cannot be maintained if a measure to reduce strategic nuclear delivery vehicles is treated as an initial measure in isolation from other measures in a comprehensive disarmament program. Basic National Security Policy does not rest upon a concept of "stabilized parity," nor, in the opinion of the Joint Chiefs of Staff, should "stabilized parity" be accepted as a goal of national security policy. It is nevertheless important to note that the Foster Panel proposal to accept numerical parity in strategic nuclear delivery vehicles in advance of reductions in other armaments is incompatible even with any arguable interpretation of the concept of "stabilized parity." It would neither add to stability to accept numerical parity in delivery vehicles, nor would a condition of over-all parity exist in circumstances where a numerical strategic stand-off lends disproportionately large weight militarily and psychologically to Soviet superiority in conventional forces and CBR warfare and to Soviet emphasis on large weapons.

2. The basic concept of the proposed program is that "immediate progress is necessary in the reduction and control of strategic delivery vehicles". There is an implication that the panel believes the existence of these vehicles constitutes the major threat of general war. This concept is not considered valid and any disarmament proposal based on this assumption involves grave danger to the security of the United States.

3. It has been erroneously argued that the United States accepted a form of "parity" when it tabled the 25 September 1961 Declaration on Disarmament. Although various meanings of the term "parity" can be asserted, the Joint Chiefs of Staff, in their consideration of the 25 September plan, never at any time intended to accept the notion of numerical parity. The 25 September plan was based on a concept of "balance," in which many factors other than numerical parity must be taken into account; e.g., geographic, economic, political, and ideologi-

cal. It is unlikely that under the “balance” concept a numerical parity as envisaged by the Foster Panel would result.

4. The effect of a numerical limitation of delivery vehicles on the strategy and military posture of the United States could be profound and adverse. For example:

a. Acceptance by the United States of the parity principle in strategic delivery vehicles might not permit us to make a substantive second strike, thereby making a pre-emptive strike more tempting to the Soviets.

b. A parity compact with the USSR might result in a higher threshold of provocation, which would in turn encourage more aggressive behavior in limited or cold war activities by the Communists, including the CHICOMS. This action would be in fields in which the Communists currently have a higher capability, that is, subversion and conventional forces.

c. A quantitative limitation on strategic delivery vehicles could result in a “quality race” to reduce reaction time, and to increase the effectiveness and sophistication of strategic weapon systems. This would require an expensive mobilization of R&D assets on a “crash” basis. Such a race might well increase world instability and therefore increase the chances of accidental wars utilizing more deadly and ingenious weapons (including CBR).

5. NATO strategy, in itself a critical political issue, would be affected and would have to be altered. Before the sword is shortened, the shield must be reinforced. Neither the burdens of substantial build-up of nonnuclear defenses in Western Europe nor the possibility of the devastation of Western Europe alone in tactical nuclear warfare would be attractive to the important NATO nations directly involved.

6. There are many imponderable factors to be considered in the calculation of minimal acceptable strategic force levels. It is doubtful that a level of 1000 or 500 or any other number can be established without continued and intense military study and judgments involving the impact of technological advances, source and nature of the threat, and the political environment at the time the vehicles are required. Moreover, the need for a precise figure does not seem to be an essential element of this proposal. Such words as “agreed levels” have served in other disarmament proposals and certainly with less risk.

7. The proposed definition of strategic delivery vehicles is based on the range capability of missiles and on empty weight of combat aircraft. Neither this or any other definition will serve the purpose and intent of the Foster Panel. In reality, most vehicles capable of delivering a nuclear weapon are potential strategic delivery vehicles. Therefore, a definition to cover this field will not be helpful. It would be necessary

to designate specific vehicles within agreed categories of systems for reduction, in order to achieve the objective of the panel.

8. Restriction on deployment, production and testing of weapons designed to counter strategic delivery vehicles is not desirable. Effective defensive weapons systems tend to increase international stability, just as it is conceived that hardened or hidden offensive weapons increase stability. Defensive systems are a matter for unilateral decision, not a matter for negotiation.

9. Cessation of production of fissionable materials is acceptable and to the advantage of the United States ONLY if the following conditions exist:

a. Any agreement to cease production of fissionable materials must include an agreement for the implementation of an effective inspection system which must be installed and properly functioning prior to a cessation of production. The consequences of the nearly three year long nuclear test moratorium demonstrate the necessity for adherence to this principle.

b. Any agreement to cease production of fissionable materials must exclude provisions for reduction of the nuclear weapons stockpile except as a subsequent arms control measure.

c. Tritium should be totally excluded from cessation negotiations or agreements.

d. Modernization of the stockpile must not be precluded.

e. A concurrent nuclear test ban, adequately enforced, is necessary if conclusions on the advisability of an agreement on cessation of production are to remain valid.

10. It is realized that the random zonal inspection concept is now being studied by a panel formed by the Arms Control and Disarmament Agency (ACDA). This concept deviates from the previously stated position of the United States which requires verification that force levels and armaments which remain do not exceed agreed limits at any stage. In addition, the subject proposal utilizes an untested random sampling technique developed to be unintrusive. Actually, it could result in procedures which might be impracticable to implement, noting that manpower and logistic problems have received only limited consideration. In fact, it could result in a major invasion into national territories if inspectors were stationed at all key production facilities, airfields, ports and highway centers. It is unlikely that the Soviets would agree to such an invasion. In the present situation, this type of inspection system would be inadequate to provide the degree of control and the security required in the most sensitive areas of arms control. Some reasons for this opinion follow:

a. The proposed inspection plan is geared to detection of evasion on a limited basis and therefore does not cover evasion on a militarily

important scale. The most promising evasion opportunities lie in the organization of secret armament schemes during the early stages of disarmament agreements. The Foster Panel inspection system cannot be expected to operate at maximum effectiveness during this critical period.

b. The Foster plan does not preclude national space rocket programs. The existence of such programs in any form complicates the arms control problem and simplifies the task of evasion. Both the United States and the USSR utilize military type rocket boosters in their space efforts. Thus, the USSR could declare the number and location of "strategic" nuclear delivery vehicles in the designated inspection zone; it could freely permit their inspection, including the ascertainment that they are armed with nuclear weapons. There could exist, undeclared, an additional number of similar vehicles positioned in readiness for firing. However, these would not have nuclear warheads. They could have instrumented or manned system nose cone or have no nose cone mounted. Upon discovery by some inspector exercising his right of unimpeded access, these vehicles would be described as intended for the "peaceful" exploration of space. However, at some contiguous, concealed location, there could exist a supply of nuclear warheads specifically intended for marriage to the vehicles at an opportune and propitious time. No inspection system has yet been envisaged which would ensure, with sufficient confidence, the detection of concealed nuclear warheads. Actually, in the proposed scheme, warheads are exempt from control and inspection.

c. In Stage B, the plan requires the declaration of the number of delivery vehicles by zone at home and in other NATO and Warsaw Pact countries. In addition, numbers and types of vehicles not in any of these areas will also be declared. This would require the USSR to declare X number of vehicles outside these zones, but would not require the naming of the country, e.g., Red China. This would enable the USSR to avoid the proposed inspection system since countries outside the agreement are not subject to inspection. Thus the USSR would be provided a storage site for vehicles above the declared level. In the short period of eight months in Stage B, the Soviets could gain major advantage in this critical field.

### STAGE C

1. In this stage the participation is extended to all militarily significant States in the Western and Eastern blocs, including Red China. This scope of participation is considered essential from the outset of any suitable disarmament program. Ideally, the membership, at the least, would include any nation that is developing a nuclear capability.

2. One of the major defects of the proposal is the underestimation of the necessity to link the reduction of conventional forces and arma-

ments with reductions of strategic delivery vehicles. The Joint Chiefs of Staff maintain that, in accordance with accepted US disarmament principles, there should be a linkage between these two areas so as to provide for balanced progress in both the nuclear and nonnuclear fields, assuring that no nation would acquire an advantage over the United States during the disarmament process. Only by adherence to such an approach will the United States be able to retain an adequate response to the entire spectrum of the remaining Communist threat.

3. The dangers and difficulties in seeking numbers of quotas of non-strategic armaments as the principal criterion for stability are the same as those discussed for strategic vehicles. This approach is further complicated when force levels are excluded from these considerations as in the proposed program. In any event, the use of quotas to effect these reductions would probably be the most difficult to work out and negotiate because of the various weapons involved. It seems percentage-type reductions would be the most manageable once the member nations declared their inventories.

4. The suggested figure of 25% representing total reductions of armaments in this stage is not appropriate. The degree or percentage of such cuts should only be determined, if at all, after an evaluation of the existing strategic and tactical weapons and delivery systems which would be available to support conventional operations. This evaluation is not feasible until some progress has been made in the early stages of this proposal.

5. One of the measures in this stage relates to advance notification of major military movements and maneuvers. As previously indicated in the comments on Stage A, this appears to be a measure more suited for an earlier stage of disarmament, therefore would offer no greater risk here.

#### STAGE D

1. Discussion of measures in this stage are limited by lack of detail in the proposal and lack of a clear picture of the nature of the international environment at the end of Stage C, which the panel considers essential for movement into this stage.

2. It does appear that the United Nations Peace Force, which is to be created in this stage, would be more effective if basic organizational elements of the force were set up in the earlier stages.

#### GENERAL COMMENTS

Throughout the Foster Panel program there are provisions for the withdrawal of participating states. The effect on the United States of a planned withdrawal by the Soviets should be contemplated. These tactics, so recently used in the test ban negotiations, can be expected.

Upon acceptance of the Foster Panel program, the United States could only proceed in good faith. The nature of our open society, public pressures and funding requirements would preclude major contingency preparations for a break in negotiations. The Soviets, on the other hand, could and probably would, make all the preparations necessary to gain the advantage by a deliberate break. The United States, faced with the considerably longer lead time in producing strategic vehicles, would be seriously handicapped in this rearmament race. The disadvantage could be so pronounced that the Soviets might choose to strike while they had a clear nuclear advantage.

**72. Telegram 2050 from USUN, December 9<sup>1</sup>**

December 9, 1961

From Stevenson and Dean. Disarmament. Strongly advise against holding up agreement with Soviets on disarmament forum because of French objections to 5–5–8. French have known for weeks we were heading in this direction. They have been fully informed here at every step, and Dept has been informed of their reservations. French refuse to agree to any forum which is negotiable with the Soviets, and since their objection is not to details such as inclusion or exclusion of a Brazza state but apparently to whole idea of resuming disarmament negotiations at this time, we see no alternative but to press ahead. Recognize desirability maintaining best possible relations with French, but believe if they are informed there is no other alternative, they will ultimately come along.

**Stevenson**

**72A. Memorandum for the Record Prepared by McCone,  
December 21<sup>1</sup>**

December 21, 1961

This memorandum will expand numbered paragraph 5 of Dr. Scoville's memorandum of December 19, 1961, reporting on the State Department meeting.

(1) Mr. McCone requested permission of Rusk that he be permitted to express his views on the question of resumption of nuclear testing, indicating that in doing so he, McCone, was going beyond his responsibilities as DCI, but desired to make his views known because he had been associated with the problem longer than any man in the room, with the exception of Mr. Farley.

(2) Mr. McCone stated that he felt it was of paramount importance to the United States that we maintain our nuclear superiority; it was not advisable, in McCone's opinion, to exchange moral leadership for proper security forces and in this modern day this meant, among other things, nuclear superiority. McCone further stated that if we were to lose nuclear superiority, our loss of prestige throughout the world would be very great—far greater, in his opinion, than the losses we have suffered because of our inferior position in space.

(3) McCone then said that it was very obvious that the Soviets had made a quantum jump in nuclear technology during the period of the three year moratorium, and that the analysis of the Soviet tests indicated a weapons sophistication equal to ours in most areas and superior to ours in some. He pointed out that the United States had made some advances during the moratorium through theoretical laboratory work, but the advances were relatively minor, and this was due to many factors not the least of which was the fact that the AEC weapon laboratories turned their attention to the peaceful applications of nuclear energy, competent scientists drifted into other work, and generally the tempo of weapon development slackened.

(4) McCone then stated that if we did pursue a moratorium policy for another two or three years, we would be awakened at some future time by a new series of Soviet tests which they would proceed with under some excuse or other, and that these tests would evidence a very great advance in weapon technology and a marked superiority of the Soviets over the United States in this critical field. McCone

---

<sup>1</sup> DCI McCone views on resumption of nuclear testing. Supplementing meeting notes of Annex A. Secret. 8pp. CIA Files, McCone Files, Memos for the Record, 11/29/61-4/5/62, Box 2, Folder 1.

forecast that our laboratories would not make such advances as it was simply not in the American tradition to work hard at things unless there was a stated purpose for doing so. McCone made reference to the specific areas of advancement, 58 megaton and 25 megaton devices, the effects test, the improvement in weight yield ratio, as well as the high nuclear efficiency, all of which were indicators of the improvements made by the Soviets during the three year interregnum. McCone stated it still could not be determined whether clandestine underground testing conducted during the moratorium had assisted the Soviet laboratories in making their advances because no scientific means of detection were in existence during the three year period, or are in existence at the present time. With respect to pursuing our developments in the underground, McCone stated that while such a course was possible, recent shots had indicated greater difficulty with underground testing than had been expected, and moreover, he questioned whether we could confine ourselves to such a slow and costly program with our principal adversary free to test in the atmosphere.

(5) It is for all these reasons that McCone concluded that we must proceed with atmospheric testing, accept the political and propaganda consequences, but maintain nuclear superiority.

## **Annex A**

### **SUBJECT**

State Department Meeting on 18 Dec. 1961 to Discuss Position Paper re Nuclear Testing for Bermuda Meeting.

Listed below are the names of those that were present at the above meeting:

#### *State Department*

Secretary of State Dean Rusk

Mr. William C. Foster, Director ACDA

Mr. Philip J. Farley, Special Asst. for Atomic Energy and Outer Space,  
Department of State

#### *Defense Department*

Hon. Robert S. McNamara, Secretary of Defense

Dr. Harold Brown, Director, DR&E, OSD

#### *Atomic Energy Commission*

Dr. Glenn A. Seaborg, Chairman

Brig. Gen. Austin Betts, Director, Div. of Military Applications

#### *White House*

Mr. McGeorge Bundy, Special Assistant for National Security

Dr. Jerome B. Wiesner, Special Asst. to the President for Science and Technology  
Mr. Spurgeon Keeny, Assistant to Dr. Wiesner

CIA

Mr. John A. McCone, Director  
Dr. Herbert Scoville, Jr., AD/SI

### **Attachment**

1. Secretary Rusk opened the meeting by summarizing his views that the probable British position would be a reluctance towards the resumption of atmospheric nuclear tests either by the U.S. or jointly with the British. He felt it was important that, if possible, the U.S. be in a more positive position since any waivering might be exploited by the Prime Minister. He requested a review of the status of the intelligence analysis. The CIA members presented the position that there was general agreement [*text not declassified*]. It was also generally agreed that while the analysis was still in a preliminary stage and would continue for a long time, it was unlikely that such further analysis could change sufficiently to affect the decision to resume testing.

2. The proposed U.S. program was discussed and all concurred that some 20–25 tests could be justified. However, it was agreed that, with the exception of effects tests, no single test was of overriding security importance but it was the sum total which was critical. It was generally agreed that the UK was cool to the US requirements although apparently no real attempt had yet been made to persuade the British. The DCI referred to our views that Sir William Penney, a key adviser to the PM in this matter, was unconvinced by the US arguments, although Dr. Seaborg pointed out that his session with Sir William just prior to his departure indicated that he probably did support the resumption. Mr. McNamara felt that the proposed position paper, which admittedly involved quotes from an agreed joint AEC-DOD study, did not truly set forth the DOD's strong requirement for atmospheric testing. It was agreed that the DOD would prepare such a paper so that their position could be explicit without any dilution by the views of other agencies. Mr. Bundy indicated that the DOD papers which he had seen did not put the case as strongly as Mr. McNamara indicated, in that need for testing to maintain nuclear superiority was not clearly enunciated. Dr. Seaborg stated that he felt that the critical feature was not the present relative status but the rate of progress of the USSR vs. US in a situation where the US was inhibited from atmospheric testing while the Soviets could test at intervals to their liking.

3. Secretary Rusk indicated that the greatest addition to US nuclear superiority that he had seen in the last year was our intelligence on

Soviet missile site information since this type of information did enable us to use our nuclear forces with very much greater effectiveness. Dr. Wiesner indicated that the development of a Soviet ABM capability could be most critical and therefore that the proposed test series (both tests for improving yield to weight ratios and effects) were designed to improve the US position in this connection.

4. Mr. Foster quoted from a draft paper of his group looking into the public relations aspects of US test resumption. This statement made a strong case for test resumption without defending any particular event. He indicated that Mr. Stevenson and perhaps others had the view that the US might afford some reduction in nuclear superiority if, in exchange, the US could assume moral leadership of the world. Mr. Foster did not agree with this view and indicated that various Embassies had been quizzed for possible foreign reactions to the US resumption. While the replies were still incomplete, the general tenor indicated that we might lose if we did *not* resume testing, since many countries were worried by the apparent loss of the US nuclear superiority as a result of the Soviet tests. Mr. Foster was worried about any nuclear developments which might make a major shift in the offensive-defensive balance.

5. Mr. McCone stated that he felt very strongly that it was paramount for the US to maintain nuclear superiority. The Soviets had already in the past three years made a quantum jump in weapons development and that a possible future jump of a similar nature is the most critical problem. US world leadership was in question, and underground tests by themselves could never compete in a situation where the Soviets were free to test in the atmosphere when they pleased. Secretary Rusk concurred in this view and was very skeptical that one could substitute moral leadership for power. Moral leadership could only be had when one had the power position to back it up. Dr. Wiesner indicated that we must not only have the power, but we must make it look to the world that we have this power; therefore, the US tests must be made to look significant.

6. When questioned as to the firmness of the US position on testing, Mr. Bundy indicated that the President was prepared to go ahead with atmospheric testing unless something drastic happened to change this view between now and the actual time for the tests. On the other hand, he did not wish to make such a firm decision now which would inevitably become publicly known. The President was also troubled by the difficulty of being able to point to any single test as crucial to the national security since the more generalized requirement was more difficult to defend. Mr. Farley quoted Mr. McMillan's criteria for resuming testing which were quite rigid.

7. During the meeting there was a discussion of the need for the use of Christmas Island for the US tests. The AEC indicated that this

could be useful for improving the quality of information but not at the expense of any loss of control. The AEC and DOD had prepared a staff paper which gave the minimum conditions of acceptability for the use of this site. Mr. McCone indicated that if Sir William Penney had been strongly in favor of the testing, then the program might have proceeded without any restrictions but in view of his present attitude, it is not certain that this could be guaranteed. Mr. Bundy summarized the US position that we would like to use Christmas Island if the UK would participate actively as a partner in the test series, but that we were not prepared to make any concessions to obtain this use.

8. State, DOD, and AEC were to prepare a revised position paper as soon as possible; CIA need not participate but were to obtain copies for review.

January 1962

73. Letter from McNaughton to Rostow, January 3<sup>1</sup>

January 3, 1962

Dear Walt:

Henry Ramsey said yesterday at the meeting in Jacob Beam's office that you thought someone should have a paper prepared dealing with the wisdom of signing the US-UK test ban treaty. He said that you were referring in particular to the points, in that connection, that I had made in my colloquy with Bill Foster at the meeting which you attended in Bill's office on December 27.

There are two defects in the US-UK treaty which must be distinguished.

The first relates to whether that treaty sets up a system which would provide us with knowledge that a test *has taken place*.

This defect has for years been boiled, fried, poached and scrambled. It is old stuff. The argument is that the inspection system envisioned is actually not adequate to detect with sufficient reliability and accuracy clandestine underground shots. That is, the Soviets might pull some off without our knowing it. Everyone admitted that, from the technical point of view, there had to be some sort of a threshold and that, below that threshold, the detection system could not be relied on. Furthermore, there were many who believed that, even above the threshold, the system was sufficiently unreliable—especially when combined with severe limitations in numbers of on-site inspections and difficulty in carrying out on-site inspections—that the deterrence against even fairly large clandestine underground shots would be too small. In other words, the hardware people do not believe that the so-called Geneva system is much good. The Defense Department has gone along with the treaty, I think, partly because it was not fully aware in the beginning of the defects in the detection system and partly because it was persuaded later on that the patent deficiencies might be more than compensated for by the political (and some military) intangibles emanating from having, in "closed Russia," a number of control posts and on-site inspections.

The second defect is that the treaty, even if it performed according to the most wildly optimistic expectations, would inform us of Soviet

---

<sup>1</sup> Defects in the U.S.-U.K. test ban treaty. Confidential. 4 pp. Department of State, S/P Files: Lot 69 D 121, Atomic Energy-Armaments, 1962.

tests only *after* they had occurred and therefore would permit the conniving Soviets to *get a substantial jump* on a trusting United States. This defect received almost no attention until the Soviets, in September 1961, sprang their atmospheric series on us.

This latter point is the one I was emphasizing at the meeting in Bill Foster's office. It is the point which is relevant to Paragraph A(5) of the "General Themes" portion of the public relations document now being prepared by the Foster Subcommittee. The implication of that paragraph and of the oral statement you made at the last meeting of the Foster group is that our objections to an atmospheric moratorium do not apply to the US-UK all-environments treaty. There is an implication that the US-UK all-environments treaty is OK because it provides for "verification" and that an atmospheric ban (which could be by treaty) is not OK because there is no provision for "verification."

My observations were two.

The first was that our preference for the US-UK all-environments treaty over an atmospheric-only treaty cannot be based on the fact that the former also bars underground tests. If anything, the US-USSR asymmetries are such that (as compared at least with an all-environments ban and perhaps even with no ban at all) it is probably to our *advantage* to have an atmospheric-only ban. It is probably to our advantage vis-à-vis the Soviets to have underground testing permitted while atmospheric is prohibited.

The second observation was that, if our objective is to deter atmospheric tests simply by *knowing when they occur*, we would be in *as good* a position to do that under an atmospheric moratorium or treaty as we would under the US-UK all-environments treaty (in either case, we would know almost immediately and with high reliability when atmospheric tests were conducted); and if our objective is to avoid being *caught with our pants down* by the Soviet Union, we would probably be in a *better* position under an atmospheric-only moratorium or treaty than under the US-UK all-environments treaty (it is more likely that the U.S. will be psychologically prepared to maintain a state of quick-reaction testing readiness under the obviously fragile conditions of an atmospheric-only moratorium or treaty than under the tranquilizing conditions of the US-UK all-environments treaty).

This was all I intended to convey.

I recognize that there are factors cutting in the other direction. For example, it is somewhat less likely that the Soviets would violate a treaty with the long and publicized history and with all of the implementing paraphernalia of the one we have been trying to negotiate in Geneva than it is that they would violate one (say) ginned up on 48 hours notice just prior to the scheduled commencement of our atmospheric series and involving no elaborate physical implementa-

tion. (The analogy here is the formal wedding on the one hand and the elopement on the other; the former is more likely to stick.) Another important factor is that the US–UK all-environments treaty does indeed involve a measure of opening up of the Soviet Union—an item not appearing in any atmospheric-only ban. This point, of course, is not germane to my analysis, but rather involves an apples-and-oranges judgment in which the value of such penetration must be weighed against the considerations that I have outlined.

I was not suggesting that the United States should change its present policy supporting the US–UK treaty. However, I think we should be prepared for that contingency—especially if the Soviet Union uses its head and agrees to sign on the dotted line. (For your information, the Joint Chiefs of Staff have just submitted a paper to the Secretary of Defense pointing out that in their judgment it would be unwise for the United States to sign the treaty now.) Also, although I did not suggest that we should consider pursuing an atmospheric-only treaty, the wisdom and appropriate timing of such a course of action certainly should be studied.

Sincerely,

**John T. McNaughton**  
*Deputy Assistant Secretary*

**74. Memorandum from Kaysen to President Kennedy,  
January 5<sup>1</sup>**

January 5, 1962

1. The problem which confronts you of whether or not to resume testing nuclear weapons in the atmosphere in the near future is in essence one of timing. No one in the government proposes that we unilaterally renounce testing in the atmosphere once and for all. There are those who see a significant political gain in postponing resumption of atmospheric tests for some time, especially if the opportunity so provided is used for positive initiatives in this sphere of arms control and disarmament. The positive argument for the value of such a policy

---

<sup>1</sup> Resumption of nuclear weapons testing: weighing the options. Secret. 4 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Weapons Tests, 12/21/61–1/8/62.

is made by Arthur Schlesinger in his memorandum of 29 December. This memorandum addresses itself to the military disadvantages which must be assessed on the other side of the argument.

2. Harold Brown's and Jerry Wiesner's letters to you of 12 and 19 December, respectively, set forth most of the arguments on both sides. I think the most significant part in Brown's letter lies in his discussion of the individual tests put in the paragraphs at the bottom of page 6 and the top of page 7 which state the framework of military policy within which the assessment of the test series must be made. Brown's argument was:

"How important these advantages are is a matter of individual judgment. The most likely military situation, in the period at which most of the weapons resulting from these tests would become available, is that the U.S. deterrent posture will be maintained by the variety and numbers of our delivery system. At the same time a first-strike capability which would prevent unacceptable retaliatory damage to the United States will be very difficult no matter what we are willing to spend or do (including atmospheric nuclear testing). This argues that failing to reduce warhead weights by factors of two or even five is not likely to make deterrence infeasible instead of feasible, nor will systems made available by these factors of improvement by themselves make pre-emptive attack feasible instead of infeasible.

"There is, however, a broad spectrum of intermediate situations between pure minimal deterrence and a full first-strike capability, and almost inevitably that is the situation in which the U.S. will find itself. If a war ensues under these conditions, the limitation of U.S. civilian damage resulting from Soviet follow-on attacks or as a result of spill-over from Soviet counter-force attacks will depend to a considerable extent on the details of the survivability, penetrability and deliverability of our own counter-force attack. This statement is not intended to gloss over the fact that in a nuclear war civilian casualties would be enormous in any event and that the societies of the countries involved would be catastrophically and perhaps irreparably damaged. There remains the additional fact that damage will depend in detail how much explosive power is delivered, and at what stage of the conflict, on the enemy's nuclear delivery capability. These factors depend upon the quality of the nuclear weapons as well as of the delivery systems on each side. This in turn cannot help but affect the calculations made by each side in determining its own estimate of its military strength and its resulting political behavior."

Within this framework there are two questions to be answered. How important is the extra margin over deterrence which is provided by the capability to strike back at Russian reserve striking power in the event that the Soviet Union initiates an attack upon us? How much contribution will the test series described make to that margin if it is made next spring rather than postponed for a year in the absence of further international agreements or for the duration of any effective agreement?

3. The problem of the margin of strategic striking power beyond what is required for deterrence is one with which you have already wrestled in the decisions on the Defense budget. Although members of your Cabinet and staff differed with regard to this matter, I think certain points on which there was agreement are worth repeating. The Department of Defense argument which justified some striking power beyond that sufficient for what could be called survivable minimum deterrence did not by common agreement indicate just how big this margin ought to be. According to present plans, the size of the margin in the mid-60's will depend on both the missile buildup and the ability of the bomber force to escape an attack and re-group. It is clear that any technical improvements in warheads and consequent improvement in missiles which testing permits will add something to the probable striking power of a force of any given size. But the significance of this addition must be judged in the context of ambiguity which surrounds any attempt to determine just how big this margin should be.

4. Further, Jerry Wiesner's paper suggests that some part of the prospective technological losses from the continued postponement of atmospheric testing can be made up by more intensive exploitation of testing possibilities underground and in space. To the extent that this is so the effect of postponement of testing on our military posture is even smaller. We could further reduce these effects, if it were thought necessary, by a bigger force deployment.

5. The relation of atmospheric testing to the development of anti-ICBM systems deserves a further word. The strongest arguments in favor of resumption of testing in the atmosphere are those that relate to what we may learn from effects tests about the related problems of designing AICBM systems and increasing the penetration capabilities of our own missiles against such systems. Here again there is nothing in the proposed Spring tests that is critical to our knowledge or pending decisions in either area. Our present bearish evaluation of the possibilities of Nike-Zeus and similar systems is made without taking into account which might be learned from tests of the effects of nuclear explosions on radar and the like. Thus the new knowledge will show us chiefly how much less good these systems are likely to be. In respect to penetration and reduction of the vulnerability of warheads to nuclear explosions, most of what needs to be learned can be discovered by underground tests.

Finally, there is the argument that atmospheric testing may lead to the discovery of new phenomena relevant to the AICBM problem. This, of course, cannot be denied, but the military exploitation of any such new knowledge, if indeed it accrues, can be achieved only as a result of a long series of tests over a period of years. The possibility of such new knowledge is an important argument against an indefinite

unilateral abstention from atmospheric testing. It is not however relevant to the problem of evaluating either the risks of mutual abstention from atmospheric testing or the risks of postponing the resumption of atmospheric tests.

6. By postponing testing in the atmosphere we give up two things of some military value. The first is a reduction of an unknown but not very large amount in the size of the margin which our strategic striking force will offer over the minimum survivable force which provides deterrence. Since we are in some doubt as to how big this margin ought to be, the military significance of a reduction in it is small. The second is a slow-down in the growth of our knowledge on the problems of designing AICBM systems, systems which we expect can only reach a moderate degree of effectiveness in the most favorable circumstances. It is the business of the Department of Defense to concentrate their energies on how our military forces would be used in the event of war. It is your responsibility to look at the broader question of how they can be used to advance our national interests on the whole foreign policy front in peace as well as in war, and thus you should weigh the magnitude of this military loss against the magnitude of the political gains which postponement may offer.

Carl Kaysen

---

**75. Letter from Prime Minister Macmillan to President Kennedy, January 5<sup>1</sup>**

January 5, 1962

Dear Mr President—

When we met in Bermuda I undertook to consider as soon as possible with my colleagues your request for us to join with you in preparing Christmas Island for further atmospheric nuclear tests.

I have now discussed this question fully with the Cabinet. We recognised that the programme of tests now proposed seemed, so far as we could judge at present, to fall within the definitions of permissible nuclear tests which you and I made in the autumn. In these circum-

---

<sup>1</sup> Use of Christmas Island for nuclear tests and review of Bermuda talks. Top Secret. 9 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan-Kennedy, 1961-1963.

stances, whether we join with you in preparing Christmas-Island or not, we should feel morally bound to support any decision which you might make to carry out this programme. My colleagues and I therefore agreed that it would be right to make available to you the facilities at Christmas Island which you require, subject, of course, to the conclusion of an agreement on scientific and technical collaboration as well as about the financial and administrative arrangements. As a contribution to scientific collaboration we would wish to place at your disposal certain United Kingdom techniques and experience, for example in observing nuclear weapons tests, which we believe would be of some value.

We made this decision on two assumptions. The first is that we can be satisfied, from the advice of our scientists working with yours, that the programme of tests proposed do indeed fall within our definitions of justifiable tests. From what I heard in Bermuda I do not in fact anticipate any difficulty here. Secondly, as I am sure you would agree, we should expect full consultation before a decision to start tests from Christmas Island is actually made. This is of special importance in the light of the proposals regarding a political initiative which I set out below. We think that in any announcement about the facilities at Christmas Island it would be better to state firmly that we had jointly decided that further tests were militarily necessary rather than saying only that we had agreed to make preparations for tests against a possible decision to hold them. At the same time, however, as you will see from the last section of this letter, we believe that an announcement in these terms should be accompanied by a determined new initiative towards disarmament and that it should indicate that the timing of tests could, to some extent, depend upon Soviet reactions to our proposals. From what you said in Bermuda I believe that you yourself would take into account the general international situation at the time before making a final decision to resume tests and I hope therefore that you will agree with this general approach.

## II

In our discussions the Cabinet considered the probable progress which the Russians in their latest tests have made in the field of anti-missile work, and the danger that without some similar effort on our side we might one day find ourselves at their mercy. Of course at the very moment when we are beginning to work in this field we have to consider that the 100 megaton weapon seems not merely to correspond with Mr. Khrushchev's natural instinct for magnitude but also to have valuable potential military importance and to pose a further difficult requirement for a defence system, at a time when it is not yet clear that defence will be possible even against missiles which must come

much closer to their target before exploding. Even without this complication nobody knows whether either side will really be able to solve the immensely complicated problems of an anti-missile defensive system, towards which these are the first halting steps. Our scientific advisers, you will remember, said that, if it were not a matter on which national survival itself was at stake, they would say that it was impossible. But if, for such a stake, sufficient resources were developed and devoted to it, they could not definitely say that anything should be regarded as impossible. Yet, if we do what we are now contemplating, we shall be entering upon a new phase in this endless struggle, with all that this implies. When one adds to this the thought of the expenditure in money terms which will be necessary—and money terms are merely a convenient method of stating the vast resources, human and material, which are involved—it would really seem to any ordinary person who reflects calmly upon it that humanity is setting out on a path at once so fantastic and so retrograde, so sophisticated and so barbarous, as to be almost incredible. It certainly seems a strange irony, Mr. President, that I should have spent Christmas Day reflecting in what terms and by what arguments I should commend to my colleagues the dedication of Christmas Island for this purpose.

There are three aspects of this problem about which I am concerned. First, if we make these tests—modest in their size, without any serious effect in the pollution of the atmosphere and adding little from this point of view to the harm already done—undoubtedly the Russians will continue not only with preparing but with carrying out their next series. We shall later be forced to do the same; and so this contest will continue more or less indefinitely, each side trying to get the lead. But so heavy will be the expense, and so vast the claim upon resources, that I greatly fear the end may be what has nearly always been the end in these armament races—one side or the other, when it thinks it has the moment of superiority, will be tempted to put the issue to the test. The second point we ought to consider is whether there is any real justification on technical grounds for believing that an effective anti-missile system could be developed. For our small island, of course, there can be none; for if even eight or nine missiles of the present size were to get through there would be little left of us. For you or for the Russians the situation is a little different because of the sheer size of the territory. Nevertheless, I would imagine that with all the counter-measures, the decoys, the electronic devices and all the rest of it, it must be very doubtful indeed whether a defence system can be achieved which will provide the minimum protection. Thirdly, there is the position of all the other countries. If the test programme of the Great Powers goes on there is no hope of dealing with what you call the Nth country problem. Some countries will develop powerful

systems, probably the Chinese and eventually the Germans—and, of course, the French. Nothing can stop them if the Great Powers go on. Others will develop nuisance systems—but they will be very formidable nuisances. And if all this capacity for destruction is spread about the world in the hands of all kinds of different characters—dictators, reactionaries, revolutionaries, madmen—then sooner or later, and certainly I think by the end of this century, either by error or folly or insanity, the great crime will be committed.

These are thoughts, Mr. President, about which I feel that you and I should ponder a little further. I ventured to put some of this to you in our short talks in Bermuda and it was because you were so responsive to the motives that lay behind that I am encouraged to send you this further analysis.

### III

In Bermuda we covered a wide range of subjects. Apart from those mentioned in the Communiqué—Berlin, Nuclear Tests, the Congo, the European Common Market—we touched on a number of other points of almost equal importance. These included Laos and Viet-Nam and the general position in the Far East; the confused and always uncertain situation in the Middle East; Africa, where almost equal dangers may follow “Colonialism” persisted in too long or abandoned too soon; the future of the emerging States like Ghana; and the likely development of the United Nations in its present form and under its present influence.

Running through all these discussions there was one common thread. All of these problems in their different ways reflect the great division which has dominated the world since the end of the second world war. At every point and on every issue is the contest between Communism and the Free World, each struggling to contain the other and to attract the support of the so-called unaligned nations.

The more I reflect on all these problems the more I am led to the conclusion that none can be satisfactorily dealt with singly. But if, on the other hand, there could be some genuine improvement in the underlying malady from which humanity suffers, fairly rapid solutions of the particular problems would follow. In recent years there have been two attempts to break through the deadlock which seemed at one time to present some hope. The first was the Geneva negotiations for the abolition of nuclear tests, and the second was the series of efforts, including the interchange of visits between statesmen on both sides of the Iron Curtain which led up to the Summit meeting in Paris in 1960. Both these attempts ended in failure. Looking back, I think one must agree that the major blame for both these failures lay with the Soviet Government although the Allies were not wholly free from responsibility. For instance, I am personally convinced that an agree-

ment at Geneva could have been reached on the basis of the abolition of tests above the threshold. That would have given us the enormous advantage of the introduction of at least an elementary system of inspection and control in a field where from its very nature the Russian suspicions or accusations of espionage were less plausible.

Similarly, the Summit meeting in Paris was the culminating point of a long and carefully prepared sequence of events, all of which seemed to afford some expectation of a genuine *détente*. Yet it not only failed, but broke up in a disorderly and discreditable way, in which we had to carry some of the blame. At the time no-one seemed able to understand the excessive importance which Mr. Khrushchev attached to the U-2 incident. But I am inclined to think now that there was more connection than we then believed between Geneva and Paris. Mr. Khrushchev may have felt a genuine sense of shock at the discovery of how much we knew about the positions of their large rockets, on which they were depending so greatly. This in turn may have affected their attitude in Geneva and, combined with the remarkable success of the United States with nuclear submarines and Polaris missiles, may have led to the Russian decision to carry out their recent tests, on the preparation of which they had of course been long engaged.

At any rate, whatever the cause, the only two big diplomatic attempts which promised any success proved a disastrous failure. There is however this degree of comfort to be drawn from what followed. Mr. Khrushchev originally announced his decision to sign a peace treaty with the East Germans as long ago as November 27, 1958. At the time of my visit to Moscow in February, 1959, he deferred this threat; and, although he renewed it after the Paris *debacle*, he is still showing some degree of moderation by refraining from implementing it even at the end of this year. I know there are some who say that this springs, not so much from a desire to appear reasonable towards the Western Allies and the world at large, as from his unwillingness to entrust dangerous decisions to Mr. Ulbricht and his friends. However that may be, we have been given a breathing space; and I know that it is your intention, in spite of all the difficulties inside the Western Alliance, to make full use of it.

The difficulty, as we all know, is to decide what to do. The somewhat sombre thoughts which I have developed can have no purpose unless they are intended to lead to at least some proposals for finding "a way out" of the maze in which we are set. It may be that there is no way out. It may be that we are condemned, like the heroes of the old Greek tragedies, to an ineluctable fate from which there is no escape; and that like those doomed figures we must endure it, with only the consolation of the admonitory and sometimes irritating commentaries of the chorus, the forerunners of the columnists of to-day.

On the other hand, it may be that even those who cannot accept so pessimistic a view would feel it wiser to avoid any attempt to bring about a dramatic change of events and to rely upon “something turning up” and somehow postponing at least for a period a fatal crisis. All my life there have been two views about the best way of dealing with this sort of problem. I can remember these arguments before the first war; they were of course in full flush between the wars; and they are still subject to much debate. One line of argument suggests that we should keep patiently at work trying to chisel away the excrescences which deface the body politic of mankind, and hope by this method to remove one by one the major dangers, whether local or general, arriving eventually at a point when an effective all-round settlement can become practical politics. The other view has been that there are moments in history when it is better to take a bolder choice and put a larger stake upon a more ambitious throw. A similar dispute has gone on recently between those who would wish to narrow and those who would wish to widen the discussions on Berlin. Chancellor Adenauer and his friends, after some hesitation, seem to have come down upon the side of narrowing any negotiation so as to deal only with access and the minimum amount of recognition of the D.D.R. required for practical purposes, thus avoiding such larger issues as the Oder-Neisse Line or the ultimate future of Germany. General de Gaulle, on the other hand, has seemed to argue that without a general *détente* over a wide field any limited agreement on Berlin is hardly worth the paper it is written on.

All these arguments of detail must not be allowed to obscure the basic fact that the balance of power and continued peace in the world is maintained by the deterrent power of the United States and the United Kingdom on the one side against that of the U.S.S.R. on the other. The future of the uncommitted world, which tries to remain neutral on this great issue is, in fact, dependent on the outcome. This lays a very great responsibility upon our two countries and I know, from our talks in Bermuda, that you feel as strongly as I do the overriding need to find some way of breaking the deadlock between East and West. On the one side we have the problem of Berlin, on which we are now trying to find a basis for an understanding, and on the other the grim problem of the nuclear race, a new phase of which is opening before us and threatens to exhaust the resources of both sides.

We cannot tell at present how the Berlin exploration will go but at least we have a plan of campaign designed to test out the possibilities of agreement. We shall know in the next few weeks or months what prospects there are on this and it will certainly affect our whole approach to the question of relations with Russia. But in the meantime I believe we should make a supreme effort to make progress in the

field of disarmament and nuclear tests, in which we at present have not worked out an effective plan of campaign. My idea is that you and we might agree upon a scheme of policy designed to give new impetus to the disarmament negotiations and to unlock the present log-jam. With great respect I would propose the following procedure and I beg you to consider it carefully and sympathetically.

#### IV

It has been agreed between us and the Russians that there will be an 18-power conference on Disarmament beginning in the middle of March. We must build on this. But there is no doubt that this rather unwieldy, heterogeneous group of countries is not likely to achieve results unless it is given impulsion and leadership by the main nuclear powers. My idea would be that you and I, who, are in the lead on the Western side, should take the initiative and invite Mr. Khrushchev to concert with us, before this committee meets, on the best methods of ensuring that practical progress is made. We might, for example, propose a conference of the Foreign Ministers of the three nuclear powers (perhaps joined by the French) backed by scientific as well as official advisers to meet before the opening of the Disarmament Commission in order to discuss the possibility of working as a team for its success. The purposes of this three (or four) power meeting would be:—

- (1) to reconcile our desire for adequate control over disarmament with the Soviet fear of espionage;
- (2) to try to determine rapidly the conditions in which a permanent abolition of nuclear tests could be agreed;
- (3) to discuss measures for ensuring greater security for the two sides pending an agreement on controlled disarmament;
- (4) to issue a joint declaration to implement the Irish resolution passed at the last session of the United Nations Assembly which enjoined nuclear powers not to relinquish control of nuclear weapons or to transfer knowledge relating to their manufacture to non-nuclear powers.

In proposing this meeting I suggest that we should make a declaration that we intend to make the success of the Disarmament Conference a major plank in our foreign policy, that we will take personal responsibility for the conduct of the negotiations and perhaps that we or our Foreign Ministers will personally attend the first meetings of the Commission.

If you should agree that a programme along these lines was desirable the next question would be how to present it both to our own public opinions and to the Russians. So far as I can judge opinion in the United States, there has been a very natural inclination to resume tests following the large-scale Russian tests. Yet, I would also think that there will be a growing feeling of despair if nothing can be done

to stop the present drift in the world. As regards my country, while our partnership with you in all this goes right back to the days of the Second World War and is highly valued, a decision to resume tests and to make British territory available for the purpose will not be readily understood unless it is accompanied by some public indication that we were making a new move to influence events. For that reason I would want to be able to announce at the same time the broad lines of this proposal and the decision to make available facilities at Christmas Island. On the other hand, if we are to achieve anything practical with the Russians, we must not handle this as a matter of public statement only but must approach Khrushchev direct and make it clear to him that we have a genuine desire for his co-operation in checking the nuclear arms race. Moreover, it would be important not to give him the impression that by a proposal of this kind we were seeking to avoid the issue of Berlin on which as we well know he is determined to achieve some settlement. My suggestion would be, therefore, that in addition to a public statement of our intentions, we should make a private communication of a rather more detailed kind to Khrushchev urging him to co-operate with us in a genuine effort to give impetus to the Disarmament Commission's work and to join in a meeting of Foreign Ministers of the nuclear powers on the lines described above. The purpose of the private approach to Khrushchev would be to indicate that we were genuinely concerned to save humanity from the threat and the wastage of a new competition designed to provide immunity against nuclear attack, a competition which we believe would almost certainly be fruitless and which could distort the whole economic life of the world.

It would be necessary of course to inform General de Gaulle and Dr. Adenauer of what we had in mind and perhaps to invite the French to take part in the initial approach to Khrushchev.

I suggest that we could meet the need to carry public opinion with us if we could make public statements on the following lines shortly after our approach to Khrushchev. We would say that:—

(a) in our view the present technical situation justifies and indeed requires the West to make a further series of nuclear tests for purely military reasons. For this reason the United States and British Governments have decided to make preparations for such a series in various places including Christmas Island;

(b) We recognise that further tests by the West may be followed by more Soviet tests and so the cycle will continue indefinitely. Nevertheless, we see no justification here for abandoning our present plans but we are deeply concerned at the situation in which we find ourselves and for the future of mankind if a halt to the nuclear arms race cannot be called;

(c) [illegible in the original] before determined to make every effort [illegible in the original] and are making proposals [illegible in the original] of which we can give a priority [illegible in the original] the result of our proposals will be both [illegible in the original] the nuclear powers to stop testing altogether is the first move towards general disarmament.

If you agree with the above, I think the first step is to set up machinery for urgent discussion between our two countries on the programme envisaged and on the technical problems involved. This could include not only the question of tests and a disarmament programme but also, perhaps, of measures to ensure greater security in Europe and possibly elsewhere, including anti-surprise attack measures (notification of major military moves, observation teams, etc.) and, if we can overcome the doubts of the French and the Germans, limitation and inspection of armaments in specified areas not limited to particular countries. I would like David Ormsby-Gore to take this on for us with such assistance as he requires. After that we should have to try to bring the French in and perhaps other allies; all this in preparation for the 18-power Disarmament Commission's work. As there is very little time I would hope that we could get on with this work straight away.

As I said, all this will be affected by the progress of the discussions on Berlin. If the probe is unsuccessful and we have to hold a negotiation in a bad atmosphere, we in the West will not be in a good situation. But, as you told me in Bermuda, this would not be the end of the attempt to reach an understanding with the Soviet Union and it might be that the approach which I am proposing on disarmament would help us in making a new move to negotiate with the Russians on the serious situation which would then have arisen in Germany. If, on the other hand, the Berlin explorations go well and seem likely to lead to a negotiation between Foreign Ministers on that subject, there again general prospects might be improved by the other initiative and we could perhaps link the two negotiations with one another. We might possibly envisage a Summit meeting later on, to conclude a series of agreements covering these two major problems and thus pave the way to a general improvement in East/West relations.

It is, of course, easy to do nothing or to do nothing in particular. But, on the whole, it is not the things one did in one's life that one regrets but rather the opportunities missed.

With warm regards,

Your very sincerely,

**Harold Macmillan**

**76. Report of Foreign Weapons Evaluation Group, January 16<sup>1</sup>**

January 16, 1962

Prof. H.A. Bethe, Chairman

Dr. Hans A. Bethe, Cornell University

Dr. John S. Foster, Lawrence Radiation Laboratory

Dr. R.H. Goeckermann (last meeting only), Lawrence Radiation Laboratory

Dr. Kenneth Street (last meeting only), Lawrence Radiation Laboratory

Dr. J. Carson Mark, Los Alamos Scientific Laboratory

Dr. R.W. Spence, Los Alamos Scientific Laboratory

Dr. George A. Cowan, Los Alamos Scientific Laboratory

Dr. Walter Goad, Los Alamos Scientific Laboratory

The group met three times (in November, December, and January) to consider AFTAC data and evaluation of the Soviet devices tested in their fall 1961 series.

The Soviet development tests showed a highly sophisticated nuclear weapons technology. [*text not declassified*]

*1–5 Megatons*

Twelve of the Soviet tests fall in the yield range from 1.5 to 5 MT while there are none between 6 and 25 MT. Thus their interest in the lower megaton range has continued but this yield range now corresponds to lower weight, [*text not declassified*]. Their interest may be connected with some missile development.

Of the 1–5 MT tests, JOE 96 (2.9 MT), 97 (4.6 MT), and 112 (5.1 MT) gave radiochemical data [*text not declassified*] and can be treated on this basis. JOE 87 (1.6 MT), 89 (2.3 MT), and 104 (2.7 MT) appear to be proof tests of 1958 devices. Also JOE 80 (4.7 MT) is very similar to JOE 70 of the 1958 series, and this test can be compared [*text not declassified*].

At least two other tests, i.e., JOE 86 (2.0 MT) and 91 (1.5 MT) appear to represent modest but significant improvements over Soviet 1958 tests of the same yield range. [*text not declassified*]

Still in the 1–5 MT class, JOE 96 (2.9 MT) and JOE 97 (4.6 MT) and 112 (5.1 MT) provided debris which markedly differs from that obtained from the shots, discussed above. In addition, the isotopic ratios for [*text not declassified*].

<sup>1</sup> Soviet development tests. Secret. 9 pp. Washington National Records Center, RG 330, OSD Files: FRC 69 A 2243, 58 AWT USSR Tests, 1961–1965.

This series of Soviet devices is impressive also in other respects which do not depend on the weight estimate. *[text not declassified]*

### *25 Megatons*

The 25-megaton test, JOE 106, presents similar difficulties to the [illegible in the original] as the series 96 (2.9 MT), 97 (4.6 MT) and 112 (5.1 MT). *[text not declassified]*.

### *50–100 Megatons*

The Soviet 58 megaton device (JOE 111) *[text not declassified]*.

### *Sub-Megaton*

Four of the Soviet tests, 93, 94, 108 and 116 were in the sub-megaton range with yields between about 0.3 MT and 0.85 MT. *[text not declassified]* Some part of this increase could probably be realized with confidence without full scale test, but it would seem unlikely that such a change would be made to the full extent indicated without additional tests. The 1961 Soviet series of tests does not include any devices with weights in the neighborhood of *[text not declassified]*. The Soviets would need additional tests if they want to match U.S. technology in this low weight range.

### *Fission Devices*

The analysis of the small kiloton tests indicate that a substantial portion of these devices was boosted (over half of these tests for which debris was collected show evidence of boosting). This marks a considerably increased Soviet interest in boosting and from these tests a variety of boosted fission devices are now available to them. Several of the tested devices gave boosted yields of a few kilotons *[text not declassified]*. These may be associated with an interest in tactical weapons. In two instances the yield appears unusually high (75 KT). *[text not declassified]*

### *Summary*

In summary, we find that the Soviet test series includes various impressive devices. Their advanced experimentation in the yield range from 1.5 to 5 MT should have given them very solid knowledge of the functioning of thermonuclear weapons. *[text not declassified]*

The panel commends the effort to obtain close-in diagnostic data on staging of Soviet devices from an aircraft. It is recognized that success in such a hazardous operation depends upon a combination of favorable weather conditions, accurate forecasts of shot location and time and faultless performance of complex airborne equipment. Nevertheless, staging information on future Soviet thermonuclear tests is of such importance that all possible effort should go into improving

the quality of the measuring equipment, calibrating it on U.S. tests and operating it on possible future Soviet tests at Novaya Zemlya.

**77. Memorandum Prepared by British Embassy, January 19<sup>1</sup>**

January 19, 1962

*NUCLEAR TESTS*

The United Kingdom Cabinet, after thorough consideration, decided on January 18 that Her Majesty's Government are willing in principle to agree to the use of Christmas Island on the following basis.

2. The Cabinet fully understood and were highly gratified by the desire of the President of the United States to avoid any formula declaring in terms that the United Kingdom and United States governments have decided to make tests. The Cabinet were also pleased that the President of the United States is taking the possibilities of an initiative on disarmament so seriously. The Cabinet considered that the British and American positions on this are very close together and the Cabinet are now prepared for work to begin on the Christmas Island Agreement. A draft of this Agreement is being sent to Her Majesty's Embassy and it is assumed that work would go ahead simultaneously in Washington on this Agreement, on the form which the disarmament initiative might take, and on the wording of paragraph C of the draft announcement.

3. Her Majesty's Government can broadly accept the revised form of paragraph A of the draft announcement, that is the amendment suggested by the United States Government so as to make the first sentence after the word "factor" to read "would justify the West in making such further nuclear tests as may be necessary for purely military reasons". However Her Majesty's Government would prefer the whole of paragraph A now to read as follows:—

---

<sup>1</sup> Agreement on use of Christmas Island. Top Secret. 3 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Weapons Tests, 1/16/62–1/22/62.

"It is the joint view of the United States and the United Kingdom Governments that the existing state of nuclear development, in which the recent massive Soviet tests are an important factor, would justify the West in making such further series of nuclear tests as may be necessary for purely military reasons.

The United States and United Kingdom Governments have therefore decided that preparations should be made in various places, and as part of these the United Kingdom Government are making available to the United States Government the facilities at Christmas Island."

4. The above formula, unlike that proposed in the annex to the Prime Minister's message of January 16 to the President, will immediately prompt the question "Who will make the final decision?". The Prime Minister anticipates this question being put to him in Parliament, and no doubt to the President in his press conference. The Prime Minister feels sure that the President would agree that the answer to this should be obscured so far as possible and that reference should be made to the continuous close consultation on both scientific and political aspects which would continue all the time. So far as Her Majesty's Government are concerned, it would be a great help if it could be said that this consultation will include an Anglo/American Technical Committee to advise both the Prime Minister and the President on the scientific aspects so that they could be satisfied that the very similar formulae which they put out last autumn were really met. If the President were pressed as to what he would do if Her Majesty's Government disagreed about the military necessity for tests, he could perhaps say that such a dispute was surely impossible in view of the Joint Statement and close consultation. If the Prime Minister were pressed on the same point he would say that of course if both Her Majesty's Government and the United States Government agreed that further tests were after all militarily unnecessary, so much the better. But having reached agreement in principle as to the moral justification for making further tests, neither Government would stand in the way of the other if, in the end, it felt that further tests were militarily necessary. Meanwhile there would be close consultation between the two governments.

5. Once the formula for paragraph C of the announcement has been worked out, the two governments will, of course, have to consult together again about the timing of the announcement as a whole. Her Majesty's Government agree that paragraph B of the draft announcement can be omitted if the United States Government prefer. Then work could start on Christmas Island just as soon as the draft agreement has been concluded.

**78. Memorandum from Wiesner to President Kennedy,  
January 25<sup>1</sup>**

January 25, 1962

In recent discussions and correspondence relating to Christmas Island and the resumption of atmospheric testing, there has been frequent mention of new initiatives in the field of disarmament prior to the scheduled starting date for our atmospheric nuclear test series, but there has been little explicit discussion of what such initiative might be beyond the proposal of an atmospheric test ban treaty.

I would like to suggest that consideration be given to two more comprehensive proposals which I believe would have greater political appeal than an atmospheric test ban proposal. If either proposal were acceptable to the Soviets, we would accomplish a major step forward in the disarmament effort.

With regard to nuclear testing, it would be possible to take a significant new initiative on the complete test ban treaty by restating our inspection requirements in a fashion which would in large measure satisfy expressed Soviet fear of espionage in connection with inspection while not significantly reducing the degree of confidence we could place in the Geneva System. The size of the inspection quota has been the key issue in the Geneva negotiations. We have called for an annual quota of 20 inspections while the Soviets have called for an annual quota of only 3 inspections. In an effort to accommodate the Soviet position, we offered last Summer to reduce the quota on a sliding scale to as few as 12 inspections if future data on the frequency of earthquakes permitted. In a new proposal, we could offer to accept the Soviet number of 3 inspections to cover all of European Russia and almost all of Siberia. We would reserve the balance of our 20 inspections (or a minimum of 12 with the sliding scale) for use in the relatively small, remote areas in south central and far eastern Siberia where most of the earthquakes in the Soviet Union actually occur. In return for this major move to meet Soviet objections to our inspection proposals, we could ask the Soviets to support the other elements of the test ban treaty we have tabled in Geneva.

Although the possibilities of using the localization of earthquakes to simplify the inspection problem was not recognized until last Summer, the fact that most earthquakes occur in limited areas of the Soviet

---

<sup>1</sup> Proposed expansion of U.S. disarmament initiatives. Secret. 3 pp. Kennedy Library, National Security Files, Subject Series, Nuclear Weapons Tests, 1/23/62–1/26/62.

Union has long been recognized by seismologists. For example, the 1960 RAND study on the capabilities of the Geneva System estimated that the seismicity of the Soviet Union is divided approximately as follows: Kamchatka-Kuriles-Sakhalin Island—62%; Pamire area—30%; and the remainder of the Soviet Union—8% (of which half is in the Caspian Sea area). It is significant that these areas of high seismicity are very remote, isolated areas of little real security interest to the Soviet Union. While these numbers would appear to justify only 2 inspections for the remainder of the Soviet Union, I have suggested 3 in keeping with the Soviet proposal since the percentages are not known with great precision and since I believe a number less than 3 would be difficult to utilize without running the risk of exhausting the quota too early in an annual inspection period. A similar localization of earthquakes exists in the case of the United States, where the seismicity was estimated by RAND as follows: Aleutian Islands—43%; Alaska—40%; California-Nevada—16%; and the remainder of the U.S.—1%. I have attached a rough map showing how inspections might be divided between various regions in the USSR and U.S. under this plan. I am confident that, if this approach were deemed a useful initiative, it would be possible for our seismologists very quickly to delineate these regions accurately and to break down the quota in a fashion that would adequately cover the uncertainty in our knowledge of the location and frequency of earthquakes.

A much more comprehensive initiative would involve the so-called Foster Plan for comprehensive disarmament. This plan represents a substantial step beyond any previous comprehensive disarmament plan proposed by the Soviet Union or ourselves in that it sets forth specific disarmament measures and associated inspection requirements. Although under active consideration, this plan has not been agreed to within the U.S. Government. However, I believe that with your support existing disagreements between the Department of Defense and the Disarmament Agency could be resolved by about two weeks of hard work. I am confident that we could have the proposal ready for private discussions with the USSR prior to March 1. If this were accomplished, we would have a fairly detailed proposal built upon the principles of your U.N. speech. This proposal would be exciting to the world and realistic enough to provide the basis for meaningful discussions if the Soviet Union is interested.

Finally, the two proposals could be linked, if desired, with the complete test ban becoming part of the first stage of the Foster Plan.

I believe that by making either of these proposals, we would take an important initiative which would receive wide support here and

abroad whether or not the Soviets reacted favorably. If the Soviets accept our initiative, we will have made a great gain for world peace.

**Jerome B. Wiesner**

#### *Minutes of Meeting on the Status of U.S. and Soviet Nuclear Tests—February 2, 1962*

At the request of the President, representatives of the AEC, CIA, and DOD presented a status report on U.S. and Soviet nuclear tests. This report constituted a summary and up-dating of information previously presented to the President.

U.S. and Soviet capabilities in higher yield nuclear weapons as of the completion of the 1958 test series and as of the completion of the proposed U.S. atmospheric test series in the Spring of 1962 were compared in the following table:

---

<sup>1</sup> Status of U.S. and Soviet nuclear tests. Top Secret. 11 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Weapons Testing, 497th NSC Meeting, Keeny Report.

U.S./U.S.S.R. TN CAPABILITIES

Weight Class (lb.)	AFTER		AFTER	
	1958 TESTS		1961/62 TESTS	
	U.S.	U.S.S.R.	U.S.	U.S.S.R.

[text not declassified]

In discussing the present Soviet capabilities as reflected in the above table, the following points were made by the CIA representative:

[text not declassified]

In discussing the significance of the proposed U.S. atmospheric tests on the status of U.S. nuclear weapons capabilities, the AEC representative made the following points:

(1) [text not declassified]

In reviewing the 17 tests which were originally proposed by the Seaborg Committee for inclusion in an atmospheric test series (see Chart B), the AEC representative pointed out that, in order to minimize the number of atmospheric tests, it was now planned to conduct [text not declassified].

With regard to the possibility of conducting larger yield tests underground, it was stated that tests of a few hundred kilotons could certainly be conducted underground although at greater cost than in the atmosphere and with some time delay. It was also noted that if there were sufficient incentive, it would probably be possible to test as high as 1 MT underground. [text not declassified].

The AEC representative reviewed [text not declassified] in the present series and summarized the principal objectives of [text not declassified]. These include [text not declassified].

[text not declassified] The two experiments were hastily broadened to obtain data on a broad range of phenomenon including radar and communication blackout. However, the instrumentation was not good and the data obtained was incomplete. While general information was obtained on radar and communications blackout, the data did not include close-in observations of radar blackout by the fireball. Nevertheless the [text not declassified] was increased as a result of this test in an effort to minimize the radar blackout. There was general surprise at the extent of the visual and the atomic phenomena associated with these tests. In addition, in the late Summer of 1958 the U.S. conducted the ARGUS experiments which involved the firing of three small yield weapons at altitudes of a few hundred miles in the South Atlantic. These experiments were initiated in an attempt to determine if electrons could be injected onto the earth's magnetic field as a possible AICBM weapon, a concept that was subsequently shown to be marginal at

best. Although the experiments produced useful scientific information they were poorly instrumented and produced generally inadequate data for the purpose of understanding effects.

The DOD representative described in detail the two proposed high altitude effects tests. These tests will obtain data in two different high altitude environments on the nuclear blackout of radar and radio communications and on the vulnerability of weapons to various nuclear effects. Particular attention will be given to the observations of the various forms of interferences with normal radar reception which can result from a nuclear explosion. These effects (see Chart G) which were described in some detail are very difficult to calculate. To date, there is no information on the exact extent of the radar blackout caused by the nuclear fireball itself, although it is certain this will be very evident. The study of the vulnerability of nuclear weapons to nuclear effects will [illegible in the original] on the effect of neutrons. It was noted that this latter effect could also be studied to a considerable degree in underground experiments.

[*text not declassified*] There is also some uncertainty as to the nature of the effects since this will depend on the extent to which the weapon debris is ionized and, if it is, on how it interacts with the earth's magnetic field. The different effects that might occur in this test were discussed (see Charts 1 and 3). It is actually anticipated that the effects from this test will involve a combination of the effects discussed in these two extreme cases. [*text not declassified*]

With regard to the problem of proof tests of weapons in stockpile, the AEC and DOD representatives stated that the weapons already in stockpile had either been tested in their present configurations or in similar forms from which extrapolations could be made with confidence. In the case of the Minutemen warhead, [*text not declassified*]. However, the designers and the AEC had certified this design with essentially the same confidence that they had in weapons that had been tested in their [illegible in the original] configurations. The DOD representative indicated that if systems tests were undertaken they considered that a complete systems test of [*text not declassified*] would be most useful. The DOD indicated that it was proceeding with planning for these tests, and if a decision to carry out atmospheric tests was made, it would recommend that these systems tests be included in the series.

Prior to the status report on U.S. and Soviet nuclear tests, the CIA representative briefed the President on the intelligence on the Soviet underground test at Semipalatinsk that had been detected earlier in the day (2 February); and it was decided that a public announcement should be made by the AEC.

**80. Memorandum from Gen. Lemnitzer to President Kennedy,  
February 16<sup>1</sup>**

JCSM-127-62

February 16, 1962

**SUBJECT**

Joint Chiefs of Staff Views on Resumption of Nuclear Testing (U)

1. The Joint Chiefs of Staff consider that there is an urgent military requirement for an accelerated program of nuclear tests in various environments, including the atmosphere. The security of the United States depends to a large extent upon our ability to assure superiority in nuclear weapons and our ability to employ them effectively. This requires that our weapons development programs be pursued aggressively without handicaps of self-imposed restrictions on the manner of testing new concepts.

2. The basic objective of the nuclear test program is to increase the military capability of US forces. In order to achieve this objective, full-scale nuclear testing in various environments is needed to permit:

- a. Further development of advanced nuclear weapons.
- b. Better understanding of the effects of nuclear weapons.
- c. Proof testing of complete nuclear weapon systems in operational environments.

3. Although progress can be made in developing advanced nuclear weapons by underground tests supported by laboratory experimentation and theoretical analysis, only limited information can be obtained in the vital field of nuclear weapons effects. Then, too, there appears to be a finite yield limitation which cannot be exceeded in underground testing. Testing in the atmosphere offers the greatest opportunity for obtaining significant diagnostic and effects data for the devices and weapons fired. Additionally, complete weapons systems tests cannot be conducted in an underground environment.

4. Our knowledge of certain weapon effects phenomena is extremely limited. The areas of principal uncertainty are the effects, particularly at high altitudes, which are pertinent to our missile defense, and to radio propagation and radar blackout; the effects in the oceans which are pertinent to fleet operations and antisubmarine warfare efforts; and the effects including both electromagnetic pulse and blast on hardened underground sites. The areas in which information is notably deficient include:

---

<sup>1</sup> JCS views on resumption of nuclear testing. Top Secret. 7 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Weapons Testing, 497th NSC Meeting.

a. *Effects of the high intensity electromagnetic pulse generated by a nuclear detonation.* We know this phenomenon exists. In the conduct of previous nuclear test series, certain detrimental effects of the EM pulse were noted but often not explained. For example, instrumentation cables were fused or melted at considerable distances from the detonation. Spurious signals were acquired, often destroying records and sometimes even equipment. We now have insufficient data to determine specific effects against our command-control, communications, and weapons systems. However, the possibility that vital elements of our defensive and offensive weapon systems may be paralyzed or destroyed by an enemy attack is a matter for investigation at the highest priority. One test is now planned to investigate this phenomenon in the spring of 1962. If we discover that our cabling for our command and control systems is highly vulnerable to specific yields from particular heights of burst, then we may be able to proceed toward a solution. Resulting actions could include: redesign and shielding of all important land lines systems; redesign and hardening of the communications and control systems of our missile launch sites; and the introduction of new, less vulnerable communication and control systems. Until we have adequate data, it is difficult to fully evaluate the extent of the impact upon our own capability. It is imperative that we not underestimate the potential effect that this knowledge by the enemy could have on our deterrent posture. The control and weapon systems supporting our nuclear deterrent posture may have serious technical flaws.

b. *The phenomenon of electromagnetic blackout.* Again, we know that this phenomenon exists. Certain of our tests at high altitude indicate that radio communications and certain radar equipment may be seriously degraded and in some cases rendered ineffective for some hours after a detonation. We now have insufficient data to determine the extent to which this effect may be used against the United States to paralyze essential elements of our warning, command and control systems or to degrade our anti-aircraft or antimissile systems. The limitations of our knowledge emphasize the high degree of risk which may be involved. Two tests are now planned to investigate this phenomenon in the spring of 1962. Resulting actions could include: changes in communication and radar frequencies; the multiplication of our radar sites and techniques. Again it is imperative that we not underestimate the potential effect that knowledge of these effects by the enemy could have on our deterrent posture. Conversely, our knowledge and use of these effects might so degrade enemy defenses that our own deterrent capability could be greatly enhanced.

c. *The phenomenon of weapon system kill.* There is reason to believe that the use of nuclear weapons will be the most effective means of countering the threat of enemy ICBM systems. Blast, thermal radiation,

X-rays, and neutron flux may individually or collectively provide the mechanisms for the “kill” of enemy missiles. The degree to which any one of these effects may be of importance will depend upon the yield, detonation altitude, and CEP of the counterweapon and upon the degree of hardening of the enemy weapon. US knowledge of the magnitude and relative importance of these effects suffers badly from the paucity of experimental data. The evaluation of our defensive systems and the hardening of our own warheads and bombs against Soviet defenses are dependent upon such knowledge. Three of the tests planned for the US tests in the spring of 1962 will provide data on weapon kill effects and still other tests will be used as data sources if they are properly instrumented. It is known that the Soviets have a vigorous AICBM program and several of their recent tests can best be explained as efforts to enhance both their ICBM and AICBM capability. What measures we might take to prevent a degradation of our military posture will be dependent to a large degree on the information we obtained from our own planned tests. Some hardening against neutron heating is being incorporated in the warheads for POLARIS, ATLAS and TITAN. Also, a basic research program on warhead hardening has been proposed by the Defense Atomic Support Agency (DASA) to the Joint AEC-Department of Defense Warhead Vulnerability Board and action has been started to carry out this program.

5. Development tests are important, since they will have a decided impact on the military capability of the nation. The purpose of nuclear weapons development is to provide this country with a stockpile of reliable, safe and efficient nuclear weapons, discriminating in effect and flexible in application consistent with military objectives. From development tests we could expect an increased yield-to-weight ratio that would basically permit delivery of higher yields for a given weight or allow for delivery to greater ranges of a given yield weapon by missiles and aircraft. Specifically, missile warheads of small weight will lead to smaller, more mobile, more serviceable missiles and will allow for better penetration through enemy defenses. New types of tactical weapons, including [*text not declassified*]. Frequently, in the past, new concepts or ideas of great value have developed from the effort to fulfill specific weapon needs. In this regard, the Joint Chiefs of Staff consider that the Atomic Energy Commission should be encouraged and permitted to explore new weapons technology at the maximum possible pace and be permitted to conduct the required nuclear testing with minimum restrictions as to the amount of testing.

6. The Joint Chiefs of Staff consider certain actions of the United States to be of paramount importance if the military confidence in our weapons, which comprise our current deterrent posture and operational capability, is to be maintained. Specifically, the primary weapons

and weapon systems which comprise the major elements of the United States offensive and defensive military power should be mated and tested under operational conditions and in realistic environments. It is a matter of grave concern to the Joint Chiefs of Staff, the operational commanders of the Armed Forces, and to the organizations which support them, that plans involving national defense and survival should be dependent upon the validity of mathematical computations and indirect applications of components when positive proof is immediately available. A number of weapons have reached stockpile configuration only as a result of testing separate devices, component parts, shapes and laboratory experimentation, and, since entry into the stockpile, have been subjected to extensive modification and retro-fit. Many types of weapons now in the stockpile and included in war plans designed to accomplish US wartime objectives have never been completely tested in their war reserve configuration under those severe environmental conditions which will be experienced by the whole system, or delivered by the weapon systems designed to deliver them. For example, the warhead for the POLARIS, one of our primary strategic missile systems in being today, has not been tested in its present war reserve configuration. *[text not declassified]* example of the technical problems that lessen our complete confidence in the new sophisticated weapons of our arsenal. Firing of complete operational missile systems could and should be integrated into over-all cold war planning so as to enhance not only our military posture in international negotiations but to increase our own level of confidence in the total reliability of our systems. Successful tests of two of our SIOP operational missile systems, ATLAS and POLARIS, would permit the United States to operate from a position of demonstrated strength and readiness.

7. In recommending the resumption of atmospheric testing, the question of fallout was considered. It has been stated that world-wide fallout resulting from atmospheric testing presents a real hazard to the population of the world. In contrast to these widely publicized opinions concerning the hazard, the Defense Atomic Support Agency has determined from extensive studies over the past few years that world-wide fallout from past nuclear tests has not produced a demonstrable biological hazard nor is it expected that any similar future tests would do so. By using the same careful procedures of analysis and prediction employed in previous tests in the atmosphere, control of local fallout can be accomplished without hazard.

8. The Joint Chiefs of Staff do not advocate the resumption of nuclear testing simply because of the recent Soviet tests. Nevertheless, the fact that the Soviets have completed these tests has accelerated the military requirement for resumption of testing. The full impact and military significance of the recent Soviet test series cannot be completely

evaluated until the final technical assessment of all Soviet tests has been made. At the present time and for the near term, the strategic long-range nuclear delivery capabilities of the United States vis-à-vis that of the Soviets are clearly in favor of the United States. However, there is good evidence that the Soviets, in recognition of this imbalance in relative strengths, are striving for weapons systems that could in the future, provide them with a military advantage. It is apparent that the Soviets have achieved advances in nuclear weapon technology beyond that which was commonly anticipated. Since no less than 45 tests were exploded by the Soviets during the recent series they have now at their disposal a mass of experimental data on weapons design and weapons effects which can be utilized during the next two or three years to greatly enhance the capabilities of their weapons systems. Preliminary information now available indicates that the 1961 nuclear test series has given the Soviets increased confidence in current weapons systems, advanced their weapon design significantly, added greatly to their understanding of thermonuclear weapon technology and contributed vital weapon effects knowledge. From the strategic viewpoint, Soviet progress in nuclear weapon technology will give the USSR increased confidence in their over-all military capability and their national power.

9. The Soviets can be expected to conduct further testing as required. They have already laid the political ground work for resumption of testing by their statements that US testing will force them to resume testing for national security reasons. Furthermore, their intransigence on the nuclear test moratorium issue indicates their unwillingness to limit their freedom of action in this respect unless a comparative strategic advantage in nuclear weapons can be obtained. The Joint Chiefs of Staff are confident that past Soviet behavior makes it patently clear that US self-restraint concerning atmospheric nuclear tests will not prevent the Soviets from further atmospheric testing.

10. In summary, the Joint Chiefs of Staff position for resumption of nuclear testing in all environments is based on the fact that the survival of the United States and its Allies may well depend on our ability to:

a. Obtain the critical effects data which could affect our:

- (1) Radar warning systems.
- (2) Radar guidance systems for our strategic missiles and aircraft.
- (3) Communications with our National Command Posts and Retaliatory Control Systems.
- (4) AICBM's effectiveness.
- (5) ICBM's survivability for retaliation.
- (6) Delivery of ASW nuclear weapons.

b. Maintain the credibility of all of our nuclear deterrent forces ranging from our strategic ICBM systems and our air and submarine

defense systems, down to the smallest battlefield tactical weapon. This credibility cannot be totally meaningful without each system having been completely proof tested and fired by operational crews.

c. Attain a strong posture with which we can increase our capability to execute the strategy of "controlled response".

11. Our security and that of the Free World requires that we maintain a substantial nuclear superiority over the Soviet Union and the Communist Bloc. Early resumption of atmospheric testing, in the face of Soviet nuclear advances, will be required in order to maintain US nuclear superiority. In view of the above, the Joint Chiefs of Staff reaffirm their position on:

a. The necessity for resumption of full-scale nuclear tests as soon as practicable.

b. The military necessity for conduct of the presently proposed series of tests.

c. The necessity for not agreeing to any treaty which would limit the conduct of future US nuclear tests unless an effective inspection and control system is implemented and properly functioning.

d. The need for greatly augmented research in new weapons technology.

12. Appendix A contains a list of tests that the Joint Chiefs of Staff consider to be the most important from a military point of view.

13. In the event consideration is given to additional tests, Appendix B contains a list that the Joint Chiefs of Staff consider to have important military significance and would contribute to the over-all security of the nation.

For the Joint Chiefs of Staff:

*Chairman*  
*Joint Chiefs of Staff*

**81. Memorandum from Bundy to President Kennedy,  
February 19<sup>1</sup>**

February 19, 1962

**SUBJECT**

Notes on Atmospheric Testing for Use with Gaitskell

The military justification for atmospheric testing is as follows:

1. The Soviet tests of 1961 showed significant advances, especially in effects testing and anti-missile technology.

2. While there is no immediate danger, it would not be safe to accept a further series of Soviet tests if we make no progress in the meantime.

3. Only some form of inspection and control can give us proper assurances against a repetition of the events of last fall.

4. Thus, until such agreement is reached, we have no choice but to maintain a lively development program of our own.

5. The particular object of this program is to ensure the continued effectiveness of the strategic deterrent.

6. For this purpose, three kinds of tests are important:

a. Confidence tests which will allow us to be sure that our designed warheads and weapons systems really work. The Russians did many of these, but they are the least important part of our own series and do not in and of themselves justify a resumption of testing.

b. Development tests—these are important because they allow us to deliver the same effective yield with a lighter warhead and thus permit adding to our missiles decoys and other penetration aids which will guarantee effectiveness even in the face of an anti-missile system.

c. Effects tests. These are the most important of all, because they will tell us things we do not know about the effects of nuclear explosions high in the air. This knowledge is essential if we are to have real confidence that something we don't know may not be used against us in anti-missile systems.

In summary, no individual test in and of itself can be said to justify the resumption of testing, but a posture of non-testing is simply untenable, in straight military terms, as long as the Russians retain an uninspected freedom to repeat the operations of last year. In addition, Gaitskell, like Stevenson, will be impressed by your account of the careful and repeated consideration which all aspects of this matter

---

<sup>1</sup> Background information for meeting with Gaitskell. Secret. 9 pp. Kennedy Library, National Security Files, Subject Series, Nuclear Weapons Testing, 2/17/62–4/4/62.

have had—the intelligence, the military balance—the exploration of possible alternatives like an atmospheric test ban agreement.

McG. B.

## Tab A

### *The President's Review of the Atmospheric Testing Problem*

1. The President has not had a more difficult decision—or one to which more careful study has been given. The following are indications of this:

a. the results of Soviet tests have been reviewed by a first-rate panel under Hans Bethe, and the President has had repeated briefings with the help of critical comment by such men as Wiesner and the careful English expert, Sir William Penny. It is plain that the Soviets have made substantial progress, and it is agreed that if we do not test and they go on to a further series, they may make very significant advances relating to anti-missile weapons systems.

b. the tests proposed for this series have been reviewed repeatedly, in the same critical fashion, and the President will restrict them to those which are genuinely relevant to maintaining the effectiveness and credibility of our nuclear deterrent. While no one test in this series is decisive, each of them will be authorized only if the President is convinced that it is militarily and technically a serious contribution to deterrence. The tests proposed are described at Tab B.

c. the President himself has repeatedly sought for a reasonable alternative to test resumption, and it is with deep disappointment that he is facing the conclusion that he has no alternative—unless and until there is a big change in the Soviet position. Some of the questions that have been studied at the President's direction are listed below together with the conclusions that have been reached so far:

(1) *Why can't we say that we will prepare for testing, but not actually test unless the Soviets take to the air again?*

This is at first sight an attractive option, because many—though not all—of the experts contend that a technological stand-still agreement today—even after the Soviet tests—would be safe enough. Unfortunately, an unpoliced moratorium is not safe for us—even if we keep our laboratories as ready as possible. As Sir William Penny told the President and Mr. Macmillan at Bermuda, first-rate scientists in an open society simply will not keep their minds on problems that can only be attacked if and when someone else breaks an agreement—nor can a large technical establishment be kept fully alert and active on

any such contingency basis. Thus it will always be open to the Soviets, using French or Chinese or Israeli activities (or even our own underground testing) as an excuse, to prepare another series of tests and set them off when they feel ready. A second surprise of this sort would not only be dangerous technologically; it would shake the confidence of our own people—and our Allies—in our good sense. It would thus be open to the Soviets, by a simple resumption of testing, to strengthen the Goldwaters and the Walkers quite a lot.

In other words, there is no half-way house between an inspected and controlled arrangement which would let us stop our weapons research and a reluctant decision to go ahead with necessary research and experiments, including atmospheric tests.

*2. Can we not put off the decision in the hope that real progress will be made at Geneva in March?*

The trouble with this proposal is partly technical and partly political. Technically it is very hard to hold a large task force of thousands of scientific men, with a supporting military team, on a basis of indefinite readiness. It's like arranging to invade North Africa with no D-day.

The political objection is even stronger. If our decisions on testing are governed merely by changes in the negotiating "atmosphere," we put it in Khrushchev's power to control our behavior by unreal but tempting hopes and promises. We have had three years of this, climaxed by the tests of last fall. Short of effective and binding agreements, we must now follow the courses necessary for our safety.

Obviously, March and April are not very good months for test resumption—but really any time is bad, from now on. From the public relations point of view an earlier date might have been better (though not perhaps at the UN). But the series has been set so as to be genuinely useful, and not simply to make a big bang at a convenient time.

We continue to be deeply concerned about disarmament, but we cannot accept a one-sided unpoliced moratorium—we believe, indeed, that such a course would weaken the chance of reviving Russian interest in effective disarmament agreement.

*3. What about fall-out?*

The series has been prepared under guidelines which require that fall-out be minimized and the currently proposed list would have about  $\frac{1}{3}$  the fall-out of the Soviet series of 1961. We are preparing careful and thorough statements of just what this means, as far as scientists can say. There can be little doubt that fall-out has some dangers—but it is equally clear that exaggerated fears have been generated. Our proposed new tests will add perhaps  $\frac{1}{2}$  of 1% to the natural level of radiation in the Northern Hemisphere (very little goes south). This is

about 1/50 of the change you would experience if you moved from Washington to Denver.

Except for the moral problem of inflicting damage on the environment of other nations, the magnitude of the fall-out problem is smaller than that of building roads on which, statistically, many thousands of people will die. If nuclear energy had only peaceful uses, it is doubtful that this kind of fall-out would be such an issue, or would stand in the way of harbor-building, canal-making, and other construction activities. It is not fall-out, but the horror of atomic war which it suggests, that makes the difficulty important. But on this larger scale the fall-out problem has to be measured against the danger of giving the Soviets hope of achieving a decisive advantage.

Still, fall-out is bad, and there will be no attempt to avoid this unhappy fact.

*4. Will testing make it harder to reach understanding with the Soviets on disarmament and other cold-war issues?*

Probably the deepest objection to testing—in the Administration as well as in the country—is that so many hopes have been invested in the test-ban as a means to progress in arms control and in mutual understanding. Many Americans who recognize the new problems created by the Soviet tests, and Soviet intransigence on effective test controls, still hope that we will not “double-bar the door” by tests of our own.

But the strong consensus of our experts on Soviet behavior is that a decision not to test now would *not* improve the chances of real progress. The judgment is that the Soviets would not attribute such a decision to genuine good will, but rather to weakness in the face of “peace-loving opinion.” The strongly dominant view is that the Soviets will move toward a disarmament agreement only when they are persuaded that they cannot have it both ways—and then only when they see that disarmament is less dangerous than the arms race. Thus the probability is that in terms of the Soviet state of mind, a decision to test is now desirable. The decision will not be made on this ground—but it does seem clear that testing will *not* cost us a great chance to make real progress by an act of trust and confidence.

*5. Does this mean that the test-ban treaty is pretty much of a dead duck?*

On our side there is still a real desire to stop atmospheric testing—but it is hard right now to be very hopeful. We ourselves have some questions about the existing treaty draft, although we are reluctant to abandon it. On our side, what seems needed is some safeguard against a repetition of the surprise of last September; the President has ordered studies of this problem. It may turn out that the problem is not techni-

cally very difficult—conceivably surveillance of a few testing grounds and limited rights of reciprocal access to a few developmental laboratories would give substantial assurances, and conceivably the existing treaty could be softened in the area of inspection for underground tests, which no longer seem either as important or as hard to detect as they once did.

But the Soviet Union seems still to resist *any* form of effective inspection and control. Moreover, its interest in the specific problem of the test-ban may have been much reduced by its difficulties with Peking, which has probably made very clear its unwillingness to accept any limitation on its own development of nuclear weapons. We have our own problem, of course, with the French, but this did not bother the Soviets until they began to object on other grounds as well.

In sum, then, while a workable treaty is not hard to design, the prospect of its acceptance seems lower than at any time since 1958, and it is hard to avoid the judgment of Hans Bethe that a test-ban is no longer the most promising first step to disarmament.

*6. Are we then embarked on an unlimited round of test and counter-test?*

No one can give a definite answer to that question. Our own testing will be governed by our need for a secure deterrent. We shall not test this time as much as the Russians did, and our plans for future tests will be governed essentially by the development of our judgment of the relation of tests to the balance of strength.

We cannot tell for certain today which of two opinions is right. One group holds that the technological future of nuclear research is essentially limitless, and it expects that as long as the arms race continues it will be urgently important for the United States to maintain a very large development and testing effort. The other group takes the position that there is a practical as well as a theoretical limit to what nuclear weapons can do, and that at least at the upper levels of yield a stand-off can be maintained with relatively little effort, as long as there is vigilance against any possible breakthrough.

Currently the President inclines to the second view, and if it should prove accurate, the need for further atmospheric tests—*whatever* the Russians do—should be limited. Smaller tactical weapons can, in the main, be tested underground, and the probability is that effects tests in the next few years will confirm our present belief that a secure deterrent is relatively easy to sustain. In any event there will be no testing race merely for its own sake.

McG. B.

## Tab B

### *Brief Description of the Proposed Tests*

The proposed tests fall into three categories:

#### 1. *Confidence Tests*

These are tests of warheads, and probably of two major weapons systems as a whole, designed to make sure that we have what we think we have in our basic new missile systems—especially Polaris and Minuteman. The case for these is the weakest of the three, and probably we would not approve a resumption of testing for this category alone. Many of our technical men believe that such tests are not necessary and that the necessary confidence can be obtained as well or better in other ways.

But it is a fact that the Soviets engaged in very extensive tests of this sort, and it is also a fact that the President's military advisers (McNamara-Gilpatric, the JCS, and General Taylor, independently) believe strongly that our military planning and our basic self-confidence require that we do *some* of this now that the Russians have done a lot. And no less an authority than Hans Bethe has strongly supported tests of the warheads (as distinct from the weapons system as a whole.)

One important subordinate argument in favor of such tests is that as long as the military do *not* have full confidence in these missiles they are likely to want twice as much of everything (this is General LeMay's explicit argument for the B-70 and other things the President has turned down).

#### 2. *Development Tests*

These tests are aimed, essentially, at improving the weight-to-yield ratio of our weapons. This is important not because we need bigger yields or lighter warheads for their own sake, but because the ability to deliver a given yield at a reduced weight is a highly significant element in assuring our ability to penetrate enemy anti-missile defenses. When we can reduce the weight of the warhead, we can add decoys and other devices to increase the probability that the weapon will get through. Thus weight-to-yield improvement is a part of our reply to the hazard of Russian anti-missile development.

#### 3. *Effects Tests*

The most important tests, four in number, relate to effects of atomic weapons. One of these relates to anti-submarine warfare and is of tactical significance for the Navy. The other three relate to the environment of missiles. One is to take place on land, for the purpose of measuring nuclear effects on hardened missile sites. The remaining

two, the most important in the series, are high altitude tests designed to enlarge our knowledge of the effects of nuclear explosions in this environment. The Atomic Energy Commission rates one of these experiments as “vital to the technical evaluation of possible U.S. AICBM systems and of penetration of enemy defenses by our ICBM’s.” The other test is equally significant in its relation to “black out,” the effect which atomic explosions may have on the radar equipment of AICBM systems.

These effects tests will not end our areas of ignorance in this very difficult field, but they should allow us to proceed, perhaps with another series or two, to a full confidence that the Soviet Union will not confront us at some future date with an anti-missile capability that might change the whole balance of power.

---

**82. Memorandum from Wiesner to President Kennedy,  
February 21<sup>1</sup>**

February 21, 1962

I am attaching for your consideration a possible plan which could serve as the basis for a new disarmament initiative involving a nuclear test ban. I believe that this proposal could shift the present unproductive nuclear test ban debate to new ground with much broader significance without abandoning important features of our previous nuclear test ban proposal. Specifically, the plan would include the following measures with appropriate controls: 1) a *complete* ban on nuclear weapons tests in all environments; 2) the cessation of all research and development on nuclear weapons; and 3) a complete cut-off of the production of fissionable material except for agreed quantities to be used for peaceful purposes.

I believe that such a proposal might serve to bridge the gap between Soviet objections to the elaborate control and inspection requirements associated with the rather modest objective of the present U.S. Geneva test ban proposal, which would permit underground testing below a certain “threshold,” and our desire for even more effective protection against possible clandestine testing and protection against covert

---

<sup>1</sup> Plan for new disarmament initiative. Attachment outlines proposal. Secret. 7 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Weapons Testing, 2/17/62–4/4/62.

preparations for the resumption of development testing under the cover of a treaty. By making a new proposal calling for a *complete* ban on nuclear tests coupled with a prohibition on research and development on nuclear weapons and a cut-off of fissionable material production for weapons, we would very substantially increase the content of our proposal and thereby justify a higher level of control.

The attached proposal would essentially retain the control system and the provision for 20 annual inspections contained in the present U.S. draft test ban treaty with the exception that inspections could be conducted against any located seismic events that are considered suspicious. In this connection, it should be noted that the Geneva system could locate events far below the so-called "threshold" of the present U.S. draft proposal, (i.e., down to a fraction of a kiloton) and that the current Nevada tests have shown that on-site inspections would be much more effective than had previously been claimed in some quarters. The access resulting from the 20 annual inspections could be reduced by allocating them within the Soviet Union and the U.S. to those areas where practically all of the seismic activity actually occurs. For example, as I proposed in my memorandum of January 25, it would be possible to restrict the number of inspections within all of European U.S.S.R. and most of Asian U.S.S.R. to 3 and to allocate the remaining 17 inspections to certain small remote areas in south central and far eastern Siberia.

The ban on research and development on nuclear weapons would be implemented by prohibiting all laboratory work in this field. This measure would be controlled by placing permanent inspectors in all weapons laboratories and by maintaining a check on the activities of all scientific personnel previously engaged in weapons work. This measure would complement the test detection system by providing a mechanism to control the conduct of nuclear tests that might not otherwise be detected because of their small size and would prevent extensive preparations for a weapons development test series under the cover of the treaty. A small quota of peremptory inspections would permit detailed inspection of any sites suspected of being clandestine weapons laboratories. These inspections would be selected either on the basis of information obtained by the overt control system or by unilateral intelligence. Given our unilateral capabilities, I believe that the proposed control of laboratories and scientific personnel would probably prevent (or at least seriously interfere with) any attempt at significant clandestine testing or preparations for atmospheric or underground nuclear weapons development tests.

The measures to monitor the fissionable material cut-off would involve the stationing of inspectors at declared production plants, the control of fissionable material manufactured for and used for peaceful

purposes, and a quota of peremptory inspections against facilities suspected of clandestine production of fissionable material. These measures have been studied in great detail over the past few years and were recommended in essentially the form in the attached proposal by the Perkins Panel which reported to the U.S. Disarmament Agency last year. Our intelligence in this area is very good, and I think there is general agreement that the proposed type of control would be very effective.

In summary, I believe that the attached proposal could provide a basis for a significant new initiative, if you should consider it desirable to shift the present unproductive debate on nuclear tests to new ground. I think there is no question that it would find a favorable reception in world opinion. If the Soviets should accept such a proposal, it would clearly be a much more significant step forward in disarmament than the present U.S. test ban proposals.

**Jerome B. Wiesner**

### **Attachment**

#### **Outline of a Proposed Plan to Control the Testing and Development of Nuclear Weapons and the Production of Fissionable Material**

The parties to the Treaty would agree to a complete ban on nuclear weapon tests, to the cessation of research and development on nuclear weapons, and to a complete cut-off on the production of fissionable material except for specified quantities for peaceful purposes. The initial parties to the Treaty would be the U.S., U.S.S.R., and U.K. and all other states would be encouraged to adhere to the Treaty as soon as possible after it came into effect. The Treaty would be of indefinite duration except that any party could free itself of its obligations if after 2 years all members of the NATO and Warsaw Pact had not become parties to the Treaty, or if after 4 years all states deemed capable of achieving a nuclear capability in the foreseeable future had not become parties to the Treaty (or if after 6 years all states had not become parties to the Treaty).

Each country on becoming a party to the Treaty would declare the nature and location of the following facilities within its borders or otherwise under its control: all plants engaged in or capable of producing or processing fissionable materials; all power, research, and dual-purpose nuclear reactors; and all laboratories (and other facilities) engaged in research and development on nuclear weapons. Inspectors would be stationed at all of these facilities to assure that no fissionable

material is produced except for peaceful purposes, that no research and development on nuclear weapons is undertaken at declared laboratories, and that no diversions of fissionable material occur from peaceful applications. In the case of any fissionable material production plants that continue in full or partial operation for peaceful purposes as well as power, research and dual-purpose reactors, the inspectors would have full access to the operation of the facility in order to permit both inventory and physical control of the operation. In the case of laboratories that continue operation in areas other than research and development on nuclear weapons, the inspectors would have sufficient access to these activities to assure that they do not involve work on nuclear weapons.

Each country, on becoming a party to the Treaty, would also declare the names and present location of all scientific and technical personnel who are at present, or who have ever been, involved in research and development on nuclear weapons. The inspection organization would determine on an annual basis by direct questioning the nature of the current activity and the location of employment of all the declared scientific and technical personnel and would obtain from each individual a declaration that he had not been engaged in research and development on weapons during the preceding year.

During the first year, the U.S.-U.K. could on demand undertake up to 3 peremptory inspections in the U.S.S.R. and the U.S.S.R. could on demand undertake up to 3 peremptory inspections in both the U.S. and U.K. in order to determine whether any undeclared facility was in fact engaged in the production of fissionable material or research and development on nuclear weapons. These inspections would be restricted to an area of ten (10) square miles and inspectors would be permitted to go up to the walls but not inside of any facility or structure. Inspectors may take technical samples, photographs, and identify and question personnel entering or leaving the installation. If any evidence pointing to undeclared production of fissionable material production or research and development on nuclear weapons is developed by the inspectors, further inspection would be authorized including full access to the suspected facility. Other parties to the Treaty could be subject to a single peremptory inspection during the first year of their accession to the Treaty. The site of the inspection would be selected by the Western Bloc states in the case of Communist Bloc states; by the Communist Bloc in the case of Western Bloc states; and the Control Organization in the case of non-aligned states.

During the second and each successive year, the U.S.-U.K. could on demand undertake 2 peremptory inspections annually in the U.S.S.R. and the U.S.S.R. could on demand undertake 2 peremptory inspections annually in both the U.S. and U.K. in order to determine

if any undeclared facility were in fact engaged in the production of fissionable material or research and development on nuclear weapons. After the first year of their accession to the Treaty, other parties to the Treaty could on demand be subject to 1 peremptory inspection every two years. The site of the inspection would be selected by the Western Bloc states in the case of Communist Bloc states; by the Communist Bloc in the case of Western Bloc states, and by the Control Organization in the case of non-aligned states.

The Control Organization would periodically collect environmental samples on a broad grid in the U.S., U.K., and U.S.S.R., and in any other country deemed by the Control Organization as having or being capable of having a fissionable material production capability. The findings from this environmental sampling program could be used to select the site of an inspection but would not be a prerequisite for a peremptory inspection.

A technical system for the detection and identification of nuclear tests as described in the U.S. Draft Treaty on the Discontinuance of Nuclear Weapon Tests would be installed progressively on a world-wide basis over a six-year period on the schedule set forth in the U.S. Draft Treaty. It would be permissible to locate the indicated number of control posts within any given country in a manner to optimize the effectiveness of the system in the detection and identification of seismic events.

The U.S., U.K., and U.S.S.R. would each be subject annually on demand to up to 20 inspections of unidentified seismic events. In the case of the U.S.S.R., the 20 annual inspections would be divided as follows: 3 for the area of the U.S.S.R. excluding the region of the Pamirs and the region of Kamchatka-Kuriles Islands and Sakhalin Island; 6 for the region of the Pamirs; and 11 for the region of Kamchatka-Kuriles Islands and Sakhalin Island. In the case of the U.S., the 20 annual inspections would be divided as follows: 4 for the U.S. excluding Alaska and the Aleutian Islands; 8 for Alaska; and 8 for the Aleutian Islands. In the case of other parties to the Treaty, the number of annual inspections will be determined by the formula set forth in the U.S. Draft Treaty on the Discontinuance of Nuclear Weapon Tests. The procedure for selecting events and conducting inspections will be the same as set forth in the U.S. Draft Treaty except the criteria for on-site inspection will be modified to include all located seismic events.

83. Letter from Amb. Ormsby Gore to Rusk, February 24<sup>1</sup>

February 24, 1962

Dear Dean,

I am sending you with this letter the text of a message containing some ideas which the Prime Minister had wished me to put orally to the President. As the President is away, I am sending this message to you and McGeorge Bundy in writing. I should like to emphasize that they are not so much firm proposals as ideas which the Prime Minister would like the President to consider. In the meantime, he would hope that the reply to Mr. Khrushchev could be so worded as not to exclude the possibility of an initiative along the lines he is tentatively suggesting.

Yours sincerely,

David

## TEXT OF MESSAGE

We are in some difficulty over Khrushchev's latest letter about disarmament. So far as the eighteen States are concerned, it seems that with the exception of the satellites and Burma there is a general view that a meeting of eighteen Heads of Government, many of whom have very slender practical knowledge of the problems involved, is not likely to advance the work of disarmament—at any rate not at the beginning of the conference. At the same time our proposal for the meeting of Foreign Secretaries and our determination that we should individually take a personal interest in the work of the commission has been interpreted as a genuine effort to stop what we called the sterile competition, especially in nuclear weapons.

But if we simply repeat our original proposals some people will argue that we are being too negative and not living up to our professed intention to make a new effort with the Russians. We must therefore find a constructive line. One plan would be for you and me to say: "All right, since you won't have the preliminary meeting of the three Foreign Secretaries, for the reasons you have given, we will come to Geneva about March 10 and have a preliminary discussion with you". If de Gaulle wished to come too, all the better. This has the advantage that the meeting of Heads of Government would at least take place

---

<sup>1</sup> Conveys text of message from Prime Minister Macmillan to President Kennedy regarding Khrushchev's latest letter on disarmament. Secret. 4 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan-Kennedy.

before we have to do such tests as we may decide to be necessary. But it has the disadvantage of abandoning our original position to an extent which, in view of the general reception of Khrushchev's proposals, may not be necessary.

A second plan would be to suggest at least the three Heads of Government coming at a later stage in the conference, say in mid-May. But then we would be in the difficulty that we might have wished to do the tests at the very time that we propose to meet Khrushchev. This would give him a chance of calling the meeting off and making a great rumpus.

A third plan has therefore occurred to me. This, which may seem rather a strange idea, is that you might invite Khrushchev to come to Washington at the end of April when I am already due to go there. I would of course postpone my journey to Canada so that we could have a short meeting together first, followed by a day or two with Khrushchev. If, as seems almost certain, we made no real progress, then our tests could still be carried out with no real disadvantage, by announcing the dates immediately after the meeting.

This plan would really trump his card. It would be difficult for him to resist. If he accepted, it would allow us to talk in the light of any work the conference had done, and would let us still maintain the genuineness of our desire to make a real effort before such tests as may seem necessary have to be done. If he refused this offer, we could then stand on our present position and let him do the sulking, even if he went so far as to stop his people attending the conference at all. If he did accept, we could then ask de Gaulle to join us.

What do you think of this?

**84. Memorandum for the Record, February 27<sup>1</sup>**

February 27, 1962

SUBJECT

NCS Meeting, 27 February 1962

1. For testing:  
Rusk, McNamara, Gilpatric, Lemnitzer, Foster, Seaborg, VP.
2. Against:  
Stevenson, Moral and political factors. Equality favors disarmament.  
Peace package.
3. For March shot:  
Foster, VP.
4. Against March shot:  
Rusk, Seaborg (marginal), HA (marginal; picture)
5. USSR acceptance of ban treaty.
  - a. Stop: Rusk, McNamara, Gilpatric, Foster.
  - b. Continue: Lemnitzer.
  - c. Revise treaty: Dean.
6. Timing considered.
  - a. Minimum delay after announcement: Murrow.
  - b. Announce intention, then wait several weeks to see effect at Geneva.

**M.D.T.**

**85. Letter from Amb. Ormsby Gore to Rusk, February 28<sup>1</sup>**

February 28, 1962

Dear Secretary of State,

I am enclosing a copy of the text of the Prime Minister's reply to the President's letter of February 27 about Nuclear Tests.

Yours sincerely,

**David Ormsby Gore**

**Attachment**

February 28, 1962

Dear Mr. President,

I have been asked to pass to you the enclosed text of the Prime Minister's reply to your letter of February 27 about Nuclear Tests.

Yours sincerely,

**David Ormsby Gore**

London, February 28, 1962

**TEXT OF MESSAGE**

Dear Mr. President,

Many thanks for your message about nuclear testing. It is of course very short notice and as you frankly say represents a change of plan. I hope you will understand that [illegible in the original] this before [illegible in the original], which I will do tomorrow morning, Thursday, March 1.

With regard to the [illegible in the original] for the tests, I feel then the need to [illegible in the original] the statement I made in the House of Commons on October 31, conforms with the discuss [illegible in the original] and the communiqué we then issued; and as the programme has been discussed between our experts I will stand by you on this in full. The point about the last two tests is perhaps more difficult to reconcile, but I agree with you on this, that in for a penny in for a pound.

---

<sup>1</sup> Encloses copy of Prime Minister Macmillan's February 28 letter to President Kennedy on nuclear testing. Top Secret. 8 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan–Kennedy.

There will of course be a violent reaction in this country and I think in many parts of the world against this sudden decision and we shall have to face it. Worthy people all over the world are hoping against hope that the conference opening on March 14 will lead to some result and allow us to end what we called this sterile contest. At the same time I see the dangers of waiting. It is rather evenly balanced.

I must plead that you will meet us on two points. First on the date of your announcement. If you make it tomorrow night, March 1, it will be published here on Friday morning, March 2. The House of Commons meets on Fridays, but will not regard it as a suitable day for so dramatic a discussion, and would even suspect it had been arranged so as to avoid a debate until Monday. This is only my private difficulty. But I do feel also that we should give advance warning to the other three members of the Western Five, Canada, France and Italy—the first country being particularly sensitive about decisions of this kind being taken without prior knowledge. We should also perhaps consider informing N.A.T.O. on the morning of the announcement. If you could see your way to a short postponement therefore it would be helpful. The announcement could be either Friday or Saturday morning, and you would only have lost two or three days.

Now as to the contents of the statement. If you wished to put us absolutely straight with world opinion you could say that tests would be resumed on June 1, by which time the Committee of Eighteen ought to report to the United Nations, unless the Russians had signed a test agreement by then. But if this is really too far off for you could we not at least postpone the date from April 15 to say, May 3? That would allow us to argue that we had given two months' grace from the date of the announcement, and we would point out that the Russians could get in touch with us immediately for preliminary talks for a treaty. Even if they did not, there would still be a full six weeks' discussion in the conference itself.

The first alternative would be much the best but even the second would be much easier to defend. We would of course use the argument that after the last moratorium we cannot be dragged along from month to month. At the same time we want to convince people we are giving the Russians a reasonable time to make up their mind. I beg you to consider this. It would make all the difference in presentation throughout the world. I realise the technical difficulties involved but I have no doubt they can be overcome by your experts.

On the wording of your proposed announcement as communicated to David Ormsby Gore there is a further point of importance. We are both committed to making a supreme effort to break the deadlock on the problems of nuclear disarmament, and in the light of this commitment I would not find it easy to open the Geneva conference by tabling

again the draft treaty on a nuclear test ban of April 1961, which we know in advance that the Russians will reject. We have some other ideas which we wish to put to you. They do not, I think, represent any concession of principle and the Russians are likely enough to reject them. They would however represent in the eyes of the world a genuine and fresh effort to break the deadlock.

I am not going to put these ideas forward in detail now for your consideration. What I would ask you is not to shut the door finally in any announcement about the resumption of tests to the possibility of putting forward at Geneva some ideas which are not included in the treaty text of April 1961. With this end in view I would propose that the second sentence in the formula which you gave to David Ormsby Gore (beginning "The United States and the United Kingdom . . . ") should be replaced by the following sentences.

*"The United States and United Kingdom, represented at the outset by their foreign policy chiefs, will present to the Geneva disarmament conference opening March 14 their proposals for a separate comprehensive treaty, with appropriate arrangements for detection and verification, to halt the testing of nuclear weapons in every environment: in the air, in outer space, underground or under water. Alternatively they would be ready to discuss these proposals earlier with representative of the U.S.S.R., if they so desire".*

This would give us all opportunity to consider fresh ideas, and not preclude us from going back to the 1961 treaty text, if that ultimately seemed best.

I should be grateful if you could let me have a message in time for the Cabinet which meets at 11.00 a.m. tomorrow morning (6.00 a.m. your time).

One last point which I am sure you have considered. The Russians may do one of two things. First they may boycott the conference on the grounds that your statement is a provocative action. Secondly, and more tiresome, they may take some action over Berlin which will precipitate a crisis. And we must remember that it is not altogether impossible that Khrushchev really wants to get in touch with us for some constructive purpose.

With warm regard,

Yours sincerely,

**Harold Macmillan**

**86. Telegram 4608 to London, February 28<sup>1</sup>**

February 28, 1962

Eyes only for Ambassador Bruce. There follows text of President's letter to Prime Minister for delivery soonest:

QUOTE February 28, 1962

Dear Mr. Prime Minister:

Thank you for your letter of February 28th. Your understanding and support on the basic issue are a great source of encouragement. On your other comments, I think I understand and agree with most of what you say, and I think I can do something to meet you on nearly all points.

First, we will make the announcement here Friday night, although I fear there will be rumors before that time. We shall have to indicate on Friday morning that a television speech is coming, and probably we shall have to indicate the subject as well, but there will be no announcement of my decision before I talk to the country. While I know this is not perfect from the point of view of your problem with the House, David Ormsby Gore tells me that it should meet much of the difficulty. I agree with you that there should be advance notice to the other three members of the Western Five and to NATO, and unless you object, we shall plan to take care of that here.

The dates which you suggest for the resumption of tests are unfortunately too late from the point of view of our arrangements here, and I think myself that we do not need to give quite so long a time to our Soviet friends. But I think I can say in my speech that we will not test until the latter part of April, and on this basis I would expect that no tests would go off until after April 22nd, which gives a considerable space of time to the Russians.

Your comments on the wording of the announcement are quite in line with my own thinking, and while the language in your message may not be fitting for a speech, I can assure you that I agree with your view that we ought not to tie on tight to the treaty of April 1961. We have firmly decided here that we genuinely want a decent treaty if we can get one, and I am instructing my experts to work at full steam with yours so that we can make a really good offer in the nuclear test ban field at Geneva.

Your last paragraph raises prospects which I know are possible, but I plan to point out in my speech that it will be strange if the Soviets

---

<sup>1</sup> Conveys President's letter to Prime Minister Macmillan on resumption of nuclear testing. Secret. 3 pp. Department of State, Central Files, 700.5611/2-2862.

now refuse to talk, because we ourselves bargained with them on disarmament during their own atmospheric tests, and even reached agreement on the statement of agreed principles.

As for Berlin, I am of the view that we should find a new and better way of talking with them, and I hope to be in touch with you on that soon. And finally, it may be that Khrushchev really wants to talk with us, but I must say I think his last letter is a strange way of showing it. You and I know that when Heads of Government really want to meet, they make their arrangements in other ways—and so does Khrushchev.

With warm personal regards,

Sincerely, John F. Kennedy UNQUOTE

March 1962

87. Memorandum from Kaysen for the Record, March 1<sup>1</sup>

March 1, 1962

SUBJECT

Meeting of the Committee of Principals, March 1, 1962, 2:30 P.M.

PRESENT

Secretaries Rusk and McNamara, General Lemnitzer, Messrs. Foster, Seaborg, Murrow, Wiesner, Bundy, and others, including Haworth, McGhee, Rostow, Fisher, Nitze, Dean, Beam, Kaysen

After a great deal of discussion, Rusk and McNamara indicated they thought an approach to the 30% cut across the board as a first stage proposal applying to the U.S. and the Soviet Union alone was the most promising approach. Foster indicated that he continued to see an advantage in focusing strategic vehicles only for the first stage.

It was agreed that three subcommittees should look intensively with an early deadline (Monday?) on three questions: the plan on the first basis; the plan on the second basis; and the problems of where to have a production cutoff, including the problems of how to specify the reduction.

Bundy and Murrow indicated the importance of making a strong impression and being in a position to counter Russian propaganda proposals. Wiesner and Kaysen emphasized the importance of inspection procedures and of having some specific view on inspection for the conference. Nitze expressed concern as to whether a zonal inspection system was one which Defense could agree on. It was agreed that the report of the inspection subcommittee now in process would be expected on Monday, March 5

<sup>1</sup> Principals Committee discussion on disarmament stages. Secret. 1 p. Kennedy Library, National Security Files, Kaysen Series, Disarmament, Basic Memoranda, 2/62-4/62.

**88. Memorandum from Wiesner to President Kennedy,  
March 6<sup>1</sup>**

March 6, 1962

1. The attached memorandum presents the recommendations of the ACDA as to the U.S. position at the forthcoming Eighteen-Nation Disarmament Conference. The paper has not been reviewed by the Committee of Principals and does not reflect the consensus of the meeting of the Committee of Principals on 2 March on the linkage of strategic and conventional armaments. The paper is not fully responsive to the understanding reached in your meeting with Messrs. Foster and Fisher on 27 February, the approved minutes of which are attached.

2. The paper discusses a large number of problems related to our position at the Conference; however, the basic policy issues involved appear to be the following:

a) Should we propose a specific, detailed proposal for at least the first stages of General and Complete Disarmament at the beginning of the Conference? Although it is our stated policy to seek General and Complete Disarmament as a goal and to present specific proposals at the forthcoming Conference, the leadership of the ACDA appears to have serious reservations about this policy and has therefore had difficulty in coming to grips with concrete proposals in this field. A restatement within government of our policy on this fundamental point appears desirable.

b) Should our plan link strategic and conventional armaments, or should strategic armaments be treated separately? By definition strategic and conventional armaments are linked in any plan for General and Complete Disarmament. Although the ACDA paper does not make a clear cut recommendation on this point, the ACDA (as opposed to the majority of the Committee of Principals) apparently believes that our specific proposal should deal only with strategic vehicles. While it could be argued that the linkage would occur in a second or subsequent stage, these stages are not defined by the ACDA paper. The ACDA's basic argument is that by separating out strategic vehicles, we would freeze our strategic advantage while permitting ourselves and our allies to build up our conventional armaments in order to overcome our disadvantage in this area. Aside from the question as to whether this could be accepted as part of a GCD plan, this proposal raises the serious

---

<sup>1</sup> Review of ACDA's recommendations on U.S. posture at 18-Nation Disarmament Conference for President's March 6 meeting. Attached is a recommended list of questions for possible discussion. Secret. 7 pp. Kennedy Library, President's Office Files, 18-Nation Committee, 3/6/62–11/20/62.

security question as to whether we should reduce our strategic forces without a parallel reduction in the conventional forces in which the Soviets have an advantage. It is by no means clear that we or our allies would in fact make a major effort to build up our conventional forces in the environment of a successful disarmament treaty. From the practical standpoint, linkage avoids the difficult problem of defining the dividing line between strategic and tactical vehicles and would simplify the inspection problem since there would not be large categories of armaments permitted outside of the agreement.

c) Should our plan include a cut-off in the production of armaments or should production be permitted within quotas? Again, by definition, a cut-off in the production of armaments is central to any plan for GCD. Although the ACDA paper does not make a clear recommendation on this point, the ACDA appears to believe that continued production is desirable. Production under quotas would substitute a quality race for a quantity race. The ACDA paper argues that this would have the advantage of permitting us to improve the quality and surviveability of our strategic systems. Although it is not stated in the paper, the ACDA is also very concerned about the economic impact of a production cut-off. Aside from the obvious problem of explaining the concept of continued large scale military production as part of a GCD plan, there is a serious question as to whether a quality race is a desirable objective of disarmament and whether our security would not be better served by freezing armaments at their present level of sophistication. Inspection for undeclared production would be simplified considerably if the production of all armaments were prohibited as opposed to being continued at a relatively high level since any production would constitute a violation.

d) Should our plan contain specific inspection provisions? Although the concept of inspection is central to our disarmament position, the various ACDA proposals for GCD are not coupled to specific inspection plans. The ACDA paper indicates that it is studying various inspection concepts and includes some comments on the zonal approach to inspection, but concludes that we are not in a position to make a specific proposal. There is no indication when we might be in a position to make a proposal even as to our general concept of the inspection process. At the same time, the paper asks for authority to explore the inspection problem informally with the USSR and other countries at the Conference. If our specific disarmament plan is to have any real impact as a serious proposal, it would appear mandatory that it have associated with it at least a general concept of inspection that would balance in some understandable fashion the degree of access required with the degree of disarmament achieved.

3. The ACDA paper presents several variations on alternative plans for the first stage of a GCD plan. The above policy questions are implicit

in considering the merits of the various proposals. Each of the following alternatives would apply to a ban affecting either all major armaments or just strategic vehicles.

One proposal of ACDA (Alternative B) would apply if there were a production cut-off. This proposal would involve a reduction by 30% in each and every type of major armament (or strategic delivery vehicles) e.g., B-52, B-47, Titan, etc. There would be a complete cut-off in production of all major armaments (or strategic delivery vehicles) except for necessary replacement in kind and supply of spare parts. This alternative would also require complete cessation of testing of all new designs or components.

The other ACDA proposal (Alternative A) would apply if production were continued. This would involve the following rather involved formula.

"There would be a dual reduction with respect to strategic delivery vehicles, both by 30% of the total number of such vehicles and by 30% of the total strategic nuclear destructive capability. The following delivery vehicles would be considered as 'strategic nuclear delivery vehicles'; All armed combat aircraft with an empty weight of more than 15,000 kg., and all surface-to-surface and air-to-surface missiles with designed range of more than 300 km. The exact manner of reducing destructive capability has not been worked out, but a preliminary investigation suggests that an adequate criterion might be some function of the gross loaded weight of the delivery vehicles, aircraft and missiles being subject to the same weight formula.

*"Method 1*

Within the agreed limits of allowed levels of vehicles, production of new and improved vehicles would be restricted to 10 percent per year of the inventories existing at the beginning of each year. Since new and improved vehicles would be produced under this alternative, some testing would be required. Production and testing of vehicles for peaceful purposes would be permitted within specified limits and safeguards.

*"Method 2*

Production would not be limited except to the extent that the total number of vehicles and the total destructive capacity of these vehicles, reduced to the extent provided above in Alternative A, be exceeded. Within these limits there would be freedom to vary the mix. To the extent permitted by these limits of production, testing would also be permitted. Production and testing of vehicles for peaceful purposes would be permitted within specified limits and safeguards.

The ACDA proposes that this could be extended to include non-strategic armaments as follows:

"a. There would be a 30% reduction in the total number (and perhaps, simultaneously, in the total gross weight of armaments in

certain of the various categories, particularly in combatant ships) in each of the following categories:

- (1) Armed combat aircraft (between 2500 and 15,000 kg. empty weight);
- (2) Tanks;
- (3) Armed cars and armored personnel carriers;
- (4) Surface-to-surface ballistic and aerodynamic missiles, air-to-surface missiles, and free rockets with range capabilities from 5 to 500 km.;
- (5) All artillery, and mortars and rocket launchers over 100 mm. in caliber; and

(6) Combatant ships with standard displacement over 400 tons of the following classes: Carriers, battleships, cruisers, destroyer types and submarines.

"b. As a further feature and within the above context of a 30% overall reduction, there might be a stipulation that, by mutual agreement, the U.S. would be willing to make a larger cut in some categories of weapons if it were permitted to make a smaller cut in other categories. The U.S. should also be willing to make additional reductions in categories in which it has larger numbers of arms than the USSR, if the USSR would be willing to reciprocate in the categories in which it has larger numbers than the U.S.

"c. Under either of the above alternatives, there are two ways in which production and testing might be limited:

*"Method 1*

Within the agreed limits of allowed levels of weapons, production of new and improved weapons would be restricted to 10 percent per year of the inventories existing at the beginning of each year. Since new and improved vehicles would be produced under this alternative, some testing would be required.

*"Method 2*

Production would not be limited except to the extent that the total number of weapons reduced to the extent provided above in Alternative A could not be exceeded."

4. Rather than deal with the details of the above alternatives at this afternoon's meeting, it would appear most useful to resolve the broader policy issues involved. The following list of questions are suggested as a method of getting at these policy issues:

A. Should we propose a specific, detailed proposal for at least the first stages of General and Complete Disarmament at the beginning of the Conference?

B. Should our plan link strategic and conventional armaments, or should strategic armaments be treated separately?

C. Should our plan include a cut-off in the production of armaments or should production be permitted within quotas?

D. Should our plan contain specific inspection provisions?

E. If we cannot be prepared to make a general inspection proposal by the beginning of the Conference, when will we be prepared to make such a proposal?

**J.B. Wiesner**

## Attachment

### Questions for 6 March Meeting on Posture for Eighteen-Nation Disarmament Conference

The following questions are suggested as a means of getting at the basic policy issues involved in developing our position for the Eighteen-Nation Disarmament Conference:

1. Should we prepare a specific, detailed proposal for at least the first stages of General and Complete Disarmament at the beginning of the Conference?
2. Should our plan link strategic and conventional armaments, or should strategic armaments be treated separately?
3. Should our plan include a cut-off in the production of armaments or should production be permitted within quotas?
4. Should our plan contain specific inspection provisions?
5. If we cannot be prepared to make a general proposal on inspection at the beginning of the Conference, when will we be prepared to make such a proposal?

---

#### 89. Memorandum from Col. Smith to Gen. Taylor, March 6<sup>1</sup>

March 6, 1962

##### SUBJECT

Disarmament Meeting With the President

1. *Background.* The meeting this afternoon will be a follow-on to that of the Principals last week and its purpose is to reach some agreement on the US position to be presented at the 18 Nation Disarmament Conference which begins on 14 March. The basic paper for discussion is one developed over the weekend by ACDA and was not distributed to attendees at the meeting until this morning. (This upset some of the serious disarmers who oppose ACDA's line of attack).

---

<sup>1</sup> Background information for disarmament meeting with President. Confidential. 2 pp. National Defense University, Taylor Papers, Disarmament 2, 1962.

2. ACDA gives as the overall US objective that "the US should seek to develop a policy which results in a reduction in the nuclear destructive capability of the world and also in the prevention of the proliferation of nuclear weapons to an increasing number of countries." Specific objectives include the working out with other nations of a program for general and complete disarmament, to negotiate with the Soviets the widest measure of disarmament possible, to negotiate with the Soviets any arms control measures which would improve the prospect of further disarmament, and finally, to effect favorably the attitudes and actions of both our friends and enemies. The paper lists on page 6-8 the area of agreement we share with our allies at this point. The list shows there is broad agreement on the general approach to the problem.

3. The central issue appears to be whether the US should press for reduction of only strategic vehicles in the initial stages or whether it should propose an across-the-board reduction. Appendix A of the ACDA paper contains a summary of the basic arguments on this point. As presented the paper tends to oppose across-the-board reductions because it would freeze US conventional inferiority, and as noted in the overall objective, ACDA would hope to have us rely more on these forces for deterrence. Given this reasoning ACDA favors a 30% reduction in strategic delivery vehicles without reduction of other armaments. Such a reduction would be proportionate according to the ACDA proposal and would thus permit us to maintain our strategic superiority while building up our conventional forces. A third alternative discussed would allow some trade-off of US strategic superiority for some US conventional superiority.

4. The arguments on these points have become esoteric among the professional arms controllers and they may tend to become so in the discussion this afternoon. Irrespective of reductions in strategic nuclear capabilities it does not seem feasible that the Soviets would willingly permit us to achieve conventional superiority. Their actions in the recent Berlin crisis have shown that if we increase our forces they will increase theirs. Moreover, it seems somewhat incongruous to believe there could be much progress in disarmament in a world so hostile that the major powers believed it essential to expand their military forces.

5. The paper contains a lot of refinements to the three broad alternatives mentioned above. Under certain conditions some modernization would be allowed. Under others all military production would cease.

6. If Mr. McNamara attends the meeting and if he acts as he did at the State Department the other day he may take over the meeting and lobby for the overall 30% reduction figure. If so, the meeting could proceed fairly orderly. If not, it is impossible to predict what might happen.

**90. Memorandum for the Record, March 7<sup>1</sup>**

March 7, 1962

**SUBJECT**

Disarmament Meeting with the President, 6 March 1962

In the course of a two-hour discussion, the following points were made and decisions taken:

1. *a.* With regard to the US position on a test ban, it was noted that we have declared our intention to suggest some modification of the old April treaty. Unhappily it is becoming apparent that there is no feasible way to guard against secret preparations. However, something needs to be done to take into account the President's statement on this subject.

*b.* The modifications which will be proposed will include a compression of the time spread, some guard against secret preparations, and a modification of the threshold of the moratorium. The British will be contacted at once to line them up.

2. *a.* With regard to Foster's latest paper entitled, "U.S. Position on the Forthcoming 18-Nation Disarmament Conference," dated March 3, 1962, Alternative B, page 11, was approved as the overall position, upon the recommendation of Defense, JCS and Wiesner. This decision included an across-the-board cut of all weapons and personnel. Foster himself preferred Alternative A, but was overruled. However, in deference to some of Foster's views, it was decided that, in taking Alternative B, we would support a continuation of arms production for modernization.

*b.* In the discussion, Secretary Rusk stressed the need to improve the political situation before expecting progress in disarmament. His general approach would be to propose a one-third across-the-board cut, along with some reasonable inspection system. He would apply the cut by categories of weapons and weapons systems.

*c.* Foster described the proposed inspection system as being a zonal random sampling. He estimated the personnel initially required as perhaps 2,000. Everybody agreed to stay away from numbers at this time.

*d.* The meeting ended in a debate over a renewal of the offer to ante up a certain amount of fission material for peaceful purposes. Foster wanted us to offer 60,000 kilograms versus 40,000 by the USSR.

---

<sup>1</sup> Read-out of disarmament meeting with the President. Confidential. 1 p. National Defense University, Taylor Papers, T-37-71.

Lemnitzer indicated the Chiefs were opposed to any such proposal, although he himself would go along with an equal offer from both sides. The final word was that we would start off with a 50-50 proposal, with perhaps a willingness to fall back to something like 60-40.

M.D.T.

---

**91. Memorandum from Kaysen to President Kennedy, March 9<sup>1</sup>**

March 9, 1962

SUBJECT

Positions for the Disarmament Conference

1. The ACDA's preparations have advanced on both fronts since Tuesday's meeting. On the test ban treaty, the situation is as follows:

a. Careful examination of the April 18th treaty shows that in order to shorten the period between the signature of the treaty and the beginning of the inspection process, new language in the treaty as such is not necessary. On-site inspection could begin as soon as four control posts are in station. This could be done in about nine to ten months from the signature of the treaty. What is required is that the preparatory commission agree to do the job; this in turn, of course, depends on the willingness of the Soviets to do it. New language in the treaty cannot bring this about. Conversely, if the Soviets are willing to cooperate in the preparatory commission, no new language in the treaty is needed.

b. On the questions of location of the control posts and allocation of inspections by zones, we are now willing to discuss both these matters should the discussions on the treaty advance. Our technicians consider that there is little to be gained by changing the locations of the control posts. The zonal scheme for allocation of inspection has been agreed in principle by all the technically competent people. We could be prepared to discuss it in detail in Geneva within a week or ten days.

c. Inspection for preparation remains a difficult problem. The best proposal that the experts were able to produce was one that combined declarations, either initially or at six-month intervals by the heads

---

<sup>1</sup> Positions for disarmament conference. Top Secret. 6 pp. Kennedy Library, President's Office Files, 18-Nation Committee, 3/6/62-11/20/62.

of governments, that they are not making preparations “for nuclear weapons developmental tests which involve the activation of, or increased activities at, test sites or the gathering of instruments, test vehicles, people, or nuclear devices, at test sites.” This would be combined with a provision for inspection up to four times a year of a declared list of test sites. Treaty language is available for embodying this proposal. Nobody thinks this is a very good proposal from either the point of view of protection or negotiability.

From the point of view of protection, there was an agreement among those technically competent that the best protection against preparations we could get would be the continuation of underground testing in some way. Ambassador Dean felt very strongly that the moratorium on underground testing had become a part of the treaty, that we had re-examined our intentions on this so frequently that we could not change our position on it now. The experts offered a final suggestion something like as follows: The threshold should be maintained and tests under the threshold permitted until the inspection process was in operation. Once the control posts and the inspection processes were functioning, the threshold would go to zero and accordingly all tests would be forbidden. This would have the advantage of keeping the laboratories in some state of activity for the first year in which the treaty was in force. Dean considered this no more negotiable and no more consistent with our previous positions than any other change in the moratorium. Others pointed out, however, that negotiability of this was no less than the negotiability of the proposed declarations on preparations and inspection of named test sites.

The issue remains unresolved; the advice you have gotten from the experts has gone full circle and now says that the maintenance of activity in the laboratories previously declared to be impossible is our best guard against secret preparations on the other side.

d. On the question of the threshold itself, there is agreement that, from a technical point of view, abandoning the threshold would not detract from the security of the treaty and might add to it. We are presently in a position to detect and locate events much below the present threshold, and our ability to inspect them under the treaty would add to the deterrent power of the treaty against the Soviets’ conducting smaller underground tests clandestinely. This conclusion is subject to the assumption that the three-year moratorium on tests below the present threshold embodied in the treaty would in fact turn into a permanent moratorium from our point of view; we could not at the end of three years say that the moratorium had expired and we were proposing to resume tests below the threshold. Arthur Dean agreed that this assumption was the only one that could be made. Your instruction on Tuesday made clear that we do not wish to make any

initial offer with respect to the threshold, but that we should be prepared to discuss it. We are, and we are prepared in particular to try to get additional control stations or additional inspection as a *quid pro quo* for abandoning the threshold.

e. At the moment, the professed positions of the UK are far apart from ours. It is Fisher's and Foster's judgment, after conversations with Ormsby Gore that an indication to the British that we are prepared to discuss dropping the threshold at an appropriate point would satisfy them sufficiently that we would not press their other proposals, such as reliance on national inspection, which is totally unacceptable to us.

2. While there has been considerable advance in thinking about the GCD plan, there has not been as much progress in reducing it to paper. In accordance with your instructions at the Tuesday meeting, ACDA is proposing a plan for a 30 per cent cut, in 3 annual 10 per cent steps, in all armaments. The cut would be measured in both numbers and total weight within defined categories. There is at present no final agreement on the appropriate categories for classifying strategic nuclear delivery vehicles. There are two alternative proposals—one which divides them by range into intercontinental and continental systems and one which divides them by weight into heavy and medium delivery systems. At the moment the Defense Department prefers the first and the ACDA does not yet have a recommendation. The other categories are those which are already defined in the ACDA paper of 3 March.

On the other elements of the GCD plan the ACDA is proceeding according to the results of the Tuesday discussion. There will be no production cut-off in Stage I. We will offer a zonal inspection system in which the amount of inspection will be related to the amount of disarmament. The definition of transition from Stage I to Stage II and the sketch of Stage II are not complete.

3. There are still some undecided issues for your attention. First, on the test ban treaty there is something of a puzzle of how to deal with preparations. The proposed method of a combination of declarations and inspections of a limited number of test sites meets the need for saying something but it offers little useful assurance. The alternative propositions seem both to contradict what you have said in your speech and to present serious negotiating difficulties in Dean's view. Second, the GCD plan is still incomplete although some progress has been made since Tuesday and more may be made in the next several days before the Conference formally begins on Wednesday. The delegation, of course, is departing tomorrow morning, but a sufficient part of ACDA is remaining behind to make it possible for more progress to be made by Wednesday.

Carl Kaysen

**92. Memorandum for the File, March 9<sup>1</sup>**

March 9, 1962

FROM

William C. Foster, Director

SUBJECT

Decisions on Key Issues for Forthcoming Eighteen-Nation Disarmament Conference

At a meeting with the President at 12 noon on March 9, 1962, the following decisions were made:

*I. Arms Control and Disarmament Measures*

1. It has been decided to propose an across-the board cut of 30% in both strategic and conventional weapons in increments of 10% a year over a three-year period. It has been decided not to separate out strategic nuclear delivery vehicles as an initial measure but the President has indicated he will be prepared to hear the Arms Control and Disarmament Agency's position on this issue again at some future time.

2. With respect to strategic weapons this cut is to be both in numbers and in total destructive capability, of which total full loaded weight is a possible yardstick. There has been a decision that the cuts in strategic delivery vehicles are to be in two categories: intercontinental systems and less than intercontinental systems but the precise definitions have not been agreed upon and are to be urgently studied by ACDA. For the purposes of the early stages of the forthcoming Geneva conference it is sufficient that the U.S. representatives be authorized to make the proposal in terms of 30% in numbers and 30% in destructive capability without being precise on the issues of categories and of measuring nuclear capability.

3. In the case of strategic nuclear delivery vehicles we are to proceed on the basis of a production limitation in the first stage in terms of some percentage (perhaps 10%) of inventories existing at the beginning of the year.

4. With respect to armaments other than strategic delivery vehicles there has been a decision on the categories for reduction and a decision that the reduction within certain of these categories should be by numbers as well as by total weight. Nuclear warheads and weapons of

---

<sup>1</sup> Decisions on key issues for 18-Nation Disarmament Conference. Confidential. 4 pp. Kennedy Library, National Security Files, Kaysen Series, Disarmament, Basic Memoranda, 2/62–4/62.

chemical and biological warfare are not included in this proposal because the problems of inspecting stockpiles of such weapons are so great as to place them in another category for the purposes of their reduction and control. However, we would propose that possibilities for reducing and controlling them be studied in an international experts commission as envisaged in the U.S. plan of September 25, 1961. An urgent study is to be made within the U.S. Government of the feasibility of reducing and controlling such weapons.

5. A decision has not yet been made on a possible production limitation in conventional armaments. An urgent study is to be made to determine whether it would be feasible to effect a production limitation comparable to that indicated in 3 above.

6. It has been decided that the U.S. should continue to press the proposal of 2.1 million force levels. The U.S. would be prepared to proceed at least through the first stage in the absence of the Chinese Communists although the possibility of a defeasance procedure (comparable to that in the test ban) should be examined.

7. The U.S. representatives have been authorized to discuss with the U.S.S.R. an inspection system based on sampling techniques perhaps accompanied by progressive zonal techniques.

8. A decision has been made to propose that, contingent on agreement on the cut-off of fissionable material for use in weapons, the U.S. and the U.S.S.R. each transfer 50,000 kg of U-235 to peaceful purposes. There is to be an urgent study within the U.S. Government to determine whether we could agree to a proportional transfer, whereby we would transfer 50,000 kg to the Soviet's 40,000 kgs.

9. It would be expected that with adequate progress in Stage I, the annual reductions to be proposed during the second stage would be the same order of magnitude as the first stage and that it should be possible to impose in addition a more stringent limitation on production of delivery vehicles and other armaments.

## *II. Nuclear Test Ban Questions*

1. The United States will sign the April 18, 1961 nuclear test ban treaty with the three amendments of May and June 1961 and including the proposals of August 1961 if the Soviet Union offers to do so.

2. The United States will not at this time agree to concluding a separate nuclear test ban treaty on any basis other than that envisaged in the April 18 treaty. If the Soviet Union flatly refuses to negotiate on the basis of a control system along the lines of that defined in the April 18 draft treaty, the United States will consider that the President's offer of March 2 has been rejected.

3. If the Soviet Union is interested in negotiating an effectively controlled test ban treaty, the U.S. will indicate our willingness to

negotiate a test ban treaty along the lines of the April 18 draft and should suggest that the conference establish a sub-committee of the 18-Nation committee to consist of the US, UK and USSR in order to conduct such negotiations. Alternatively, we would offer to reactivate the test ban conference itself if the Soviet Union shows any interest in this approach.

4. As appropriate, either in the course of serious negotiations with the Soviet Union or in response to situations which might arise in the 18-Nation Conference, the United States representative is authorized to put forward the following proposals and concepts:

*A. Inspection for Preparations*

The United States would propose an inspection system to monitor preparations. The system would consist of periodic declarations of activities associated with preparations for weapons development tests combined with the right to inspect declared test sites.

*B. Shortening the Time Span Between Treaty Signature and Beginning of On-Site Inspections*

The United States would propose that on-site inspections begin as soon as a sufficient number of control posts are operating. In order to speed up the construction of control posts the United States would propose an active cooperative effort between the US, UK and USSR in order to get control posts installed in the shortest possible time. It may be possible to begin inspections within a year of ratification. We should state that we will have specific proposals to make in this regard, when the treaty is signed.

*C. The Threshold-Moratorium Question*

If there is any serious negotiation on the April 18 draft we will be prepared to eliminate the threshold and make the treaty comprehend all tests from the outset. We would justify this on grounds that arrangements of this kind are no longer acceptable and that we would prefer to ban all tests by treaty obligations, including the right to inspect all unidentified events up to the limit of the quota.

*D. Allocating on-site Inspections by Area*

It is possible to define an aseismic area which includes the greater part of Soviet territory. In order to alleviate Soviet concern about on-site inspections being used for espionage, the U.S. will offer to limit inspection in the aseismic zone to no more than a specified number. An urgent study is to be made of the precise boundaries of the area, the specific maximum number of inspections for this area, and the relationship of these to the elimination of the threshold. If there is a

4.75 magnitude threshold, inspections might be decreased to 1 for every 6 unidentified events. But if the threshold is eliminated there will be need for the full 20 inspections, and probably more.

*E. Number of control posts*

We are presently on record as favoring 19 control posts in the Soviet Union. If serious negotiations were to eventuate, we would be willing to accept 17 posts on Soviet territory. This should not interfere with the additional posts that may be necessary in connection with the elimination of the threshold.

---

**93. Message from Prime Minister Macmillan to  
President Kennedy, March 9<sup>1</sup>**

TEXT OF MESSAGE

March 9, 1962

Dear Friend,

I hope I may be [illegible in the original] to use this less formal beginning.

Thank you very much for the telephone message which you gave to David Gore [illegible in the original] defence policy and the Opposition statements. Please don't worry about it at all. Gaitskell is very respectable and never suggested that you had said anything to him about our defence policy generally. Wilson is perhaps rather less responsible and has a more liberal view of what Winston used to call the "many-sidedness of truth."

As regards the present state of discussions about nuclear tests, I would like just to say how much I have valued our co-operation since the Russian tests last November. Our discussions at Bermuda and our correspondence were, I think, of real help. I must really congratulate you on the great skill with which you argued the case for the decision to resume. It has made a deep impression over here. Of course, people are now hoping that Geneva will produce some result, although I do

---

<sup>1</sup> Present state of discussions on nuclear tests and Berlin issue. Top Secret. 5 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan-Kennedy, 1961-1962.

not think that expectations are foolishly high. Naturally they were encouraged by what you said in your speech on March 2 to the effect that “new modifications will also be offered in the light of new experiences. I would only urge the importance of making a supreme effort now to get a nuclear test treaty agreed with the Russians. We must not only make this effort, but be seen to be making it so as to get the maximum of general support if the Russians unreasonably turn us down. I am, therefore, greatly concerned that we should not be put on the defensive immediately the Disarmament Conference opens.

There is one sweeping proposal which we could put forward if it can be justified by our scientists. It is that we might accept a much simpler treaty based on national detection systems alone, but with the very important proviso that these shall be supported by an international authority (as provided for in our 1961 treaty) but responsible in the main for two primary functions. These would be:

- (i) To collate and evaluate seismic data from all over the world, and
- (ii) to have under its control mobile inspection teams, who could be sent to investigate without hindrance any suspected violation of the treaty in any country.

Our latest scientific advice seems to suggest that this would give acceptable coverage. No doubt your scientists are considering this and I hope means can be found for a rapid joint assessment. If in fact this advance is reasonably acceptable, a treaty on this basis would give adequate assurance of detection of tests, without the more elaborate procedures of the 1961 draft treaty, and it would seem to provide some means of making an imaginative new proposal. Moreover by reason of its simplicity it could come into effect immediately on signing, and would thus eliminate the long preparatory period envisaged in the 1961 draft treaty, which was a matter of much concern to Congress. We could add a proposal for inspection of known proving grounds as a safeguard against secret preparations for tests.

It is very doubtful whether the Russians will accept even this offer because of the provision for inspection teams who could travel without hindrance on the territories of States concerned, but if they were to turn it down it would put them in a very bad position. I would be grateful if you would give urgent consideration to this problem.

I quite understand that it will be very difficult for the scientists to reach an agreed view before Mr. Rusk and Lord Home meet Mr. Gromyko on Monday. I hope, however, that you will authorise Mr. Rusk to leave the way open for a possible change of position, by saying, for instance, that while at present we regard the 1961 treaty text as a sound basis for further discussion, the situation would be to some extent changed if it could be proved that national systems provided an entirely adequate basis for detection.

One point which strikes me as an amateur is that we always assume that the Russians cheat. If they do, it would hardly be worth their while to do so with only one test; for useful results they would need a series. And a series is surely bound to be found out.

I was much interested by what you said to David Gore about Berlin. I look forward with keen anticipation to your new ideas.

With warm regard,  
Yours very sincerely,

**Harold Macmillan**

---

**94. Tosec 55 to Geneva, March 15<sup>1</sup>**

March 15, 1962

Text of President's letter to Macmillan March 10 follows: QTE Thank you very much for yours of March 9. I have already talked with some of our technical people about your sweeping proposal, and we shall certainly be glad to have a further hard look at it. Their first reaction—and this comes from people who are deeply in favor of a workable agreement—is that the lower capabilities of external detection would tend to make for an increased inspection requirement, so that on balance such an arrangement might be less acceptable to the Soviets. But further study may show that they are wrong, and the experts on both sides should certainly study it out.

Meanwhile, I am giving David Ormsby Gore an account of the modifications that have been worked out on our side, including an abandonment of the threshold, and I believe that our 1962 model will show a proper and forthcoming response to our new understanding of what is and is not important.

On Berlin I have indeed been thinking hard and some of the results Rusk will be sharing with Home tomorrow. But I should like also to give you a few private comments which I think should stay out of our two bureaucracies. My view is that we must find a way of making very sure that Khrushchev knows we are willing to work out a reasonable settlement, if it is. This is the old problem you and Home put so well

---

<sup>1</sup> Text of President's March 10 reply to Prime Minister Macmillan's March 9 letter. Top Secret. 3 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Kennedy-Macmillan, 1961-1962.

in Bermuda: he must be given a good smell of the dinner he can have if he leaves Berlin alone, and the problem is how to do it without getting the Germans in an uproar.

My conclusion is that the thing to do is to suggest a written *modus vivendi* with no time limit under which the real situation would go on as it is while all sorts of problems are discussed in a continuing body of foreign ministers' deputies. We are prepared to indicate informally to Gromyko that in that framework we think there could be progress on limiting nuclear dispersal, on technical meetings of the East-West Germans, on declarations of non-aggression, and on boundary stabilization. Some things could be said right away, and other would come out of the continuing discussions. We believe that in this way we can avoid restatements of positions which are in flat conflict on such matters as our troops in Berlin and the formal status of the city. Moreover, if the real situation can be stabilized in a written *modus vivendi*, we think the Russians might be able to have their peace treaty without serious consequences to our own position, though we do not plan to say so directly. And on "respect for sovereignty" we are inclined to argue that time is the best and safest instrument the Soviets have—although if they want to make real and rapid progress all they have to do is fire Ulbricht and put a more civilized man in his place. And finally, I am of a mind to say that if serious progress could be made on this sort of thing, I would of course be glad to go to a meeting of Heads of Government to get it settled.

None of all this is sure to work. If the Russians want a further test of will and strength, they will probably pay no attention, at least at present. But I hope it may tempt Khrushchev if in fact he wants to cool things off for a while. And at least we shall feel that we have done our best to dissuade him from more dangerous courses.

This at least is how my own mind is going, and Rusk is authorized to make quite private explorations in this direction at Geneva. I will let you know what, if anything, he gets back, and meanwhile I should be glad to have your comments and advice. UNQTE.

**Ball**

**95. Memorandum from Bundy to Amb. Ormsby Gore, March 10<sup>1</sup>**

March 10, 1962

The President has asked me to transmit this summary of the current position of the United States Government on the test ban issue at Geneva.

We are willing to accept the Treaty of April 1961, and we are also willing to offer a new version with the following modifications.

To meet new dangers we would like to shorten the time between signature of the treaty and the beginning of the inspection process; this is not a matter of treaty language but of Soviet responsiveness. We would also like to have something on preparations for testing; our view is that there ought to be declarations against such preparations and a right to inspect certain numbers of test sites from time to time.

On the other hand, in the direction of things that may be more acceptable to the Soviet Union, we would propose:

(1) to drop the threshold of test events to zero; we think this is both more acceptable to them and safer for us;

(2) to make certain other changes and modifications which Ambassador Dean has previously been authorized to put forward;

(3) to allocate the agreed number of inspections according to zones defined in terms of natural seismic activity.

In our view, the first public presentation in Geneva should include not only our joint willingness to sign the Treaty of 1961, but our joint willingness to offer these modifications in the light of new experience.

Mr. Lucius D. Battle Executive Secretary Department of State

FROM

McGeorge Bundy

The attached copy of memorandum (Secret) to Ambassador Ormsby Gore is sent to you for information.

The President is sending his own instruction to the Secretary from Palm Beach, but meanwhile he asked me to send this summary to Ormsby Gore, and I have just done so.

---

### 96. Notes on Telephone Conversation between Kohler and Ball, March 11<sup>1</sup>

March 11, 1962

Kohler said about the talks with Gromyko on the disarmament situation in general, they prepared a talking paper which in general the Secretary followed quite strongly and they are telegraphing back. Home was particularly good on the subject. He really got excited and threatened to leave the conference if this kind of business continued. The combination of the Secretary and Home talking to Gromyko with only the interpreters present was effective although inconclusive. Gromyko's reaction by moral indignation claimed that he knew nothing about this and that the report must be wrong. They were doing normal things in the corridor. His attitude generally was defensive. The Secretary and Home continued to press him, however, and while there were no commitments on his part, they think he will be sending a message of importance to Moscow tonight. However, they think it is important that Norstad have the authority to go ahead with his plan in case there is no reaction from the Soviets. Kohler is going back to dictate a telegram so that we will have it in the morning. On the disarmament question the talks were only of a technical nature and agreement was reached on a meeting of the Technical Committee to be held tomorrow, to

---

proceed with this. Possibly Bill Foster or Stillwell from our side; Michael Wright on the British side, and Zorin from the Soviet side. The Secretary touched on the nuclear testing question. This resulted in a somewhat polemical discussion. The Secretary turned it off and said they would discuss it later. All he wanted to do was emphasize the importance of the question. They have some kind of a meeting tomorrow. They have a luncheon engagement for tomorrow with the Russians and will send us a report after that.

(Dictated by Mr. Ball after his conversation.)

**97. Notes on Telephone Conversation between Kaysen and Ball,  
March 11<sup>1</sup>**

March 11, 1962

Kaysen asked Ball if he had talked to Mac about the response to the Geneva inquiry about the treaty. It seems to Kaysen these fellows are trying to pull something. There is a message from the President to the Secretary, Foster and Dean which Beam and Boodby did. He told Ball he might note also TOSEC 2 and TOSEC 6 to Geneva. They contain the President's policy line. After Kaysen talks to Goodby and straightens him out he will get back to Ball later.

**98. Notes on Telephone Conversation between Kaysen and Ball, March 11<sup>1</sup>**

March 11, 1962

Kaysen referred to a cable drafted by Goodby and Beam. Ball asked what was the sense of it. Kaysen replied to say in response to the two questions: Should we sign the treaty now, the answer is yes, if that is what they want. On the other there is no linkage. If we can get something in the trade we will take it. Ball asked if we eliminate the threshold we would take it? Kaysen replied yes, we don't insist on it as trade. The President's message and Mac's memorandum to OG contain the direct leads to these conditions. Ball asked if he would send it out and Kaysen said he would. He will have a check on the draft and he has told Beam he was going to check it with Ball.

Ball said the President was going to call after he gets off the boat.

Kaysen asked if Ball expected a call from the Secretary after his dinner. Ball said he would call the President if anything very exciting comes out of it. After Ball talks with the President, he will call the Secretary.

Kaysen said he would stand by.

**99. Todis 35 to Geneva, March 12<sup>1</sup>**

March 12, 1962

UK idea of declaring that we will rely on national detection systems when scientific developments permit would open door to proposals for atmospheric test ban to be monitored by national systems. Since our position is that Soviet rejection of treaty along lines of April 18 draft constitutes rejection of President's March 2 offer, we believe that

---

<sup>1</sup> Guidance on handling U.K. declaration on national detection systems. Confidential. 1 p. Department of State, Central Files, 700.5611/3-1262.

initial emphasis must be placed on control system envisaged in that treaty. We would therefore not favor adding proposed UK declaration.

Ball

---

**100. Memorandum from Fisher to Kaysen, March 13<sup>1</sup>**

March 13, 1962

SUBJECT

U.S. Position on Disarmament Measures at Geneva Negotiations

The following consists of the basic disarmament positions of the United States, as authorized by the President and as discussed by the Committee of Principals, and the status of current work regarding the further development of these positions.

1. The United States will propose an across-the-board cut of 30 per cent in both strategic and conventional weapons in increments of 10 percent a year over a three-year period. In presenting this position there should be no indication, without further specific authorization by the President, that the reduction of strategic delivery vehicles can be separated from other disarmament measures for the purpose of being negotiated as a separate measure.

2. With respect to strategic weapons this cut is to be both in numbers and in total destructive capability, of which total full loaded weight is a possible yardstick. The cuts in strategic delivery vehicles are to be in two categories: the present thinking is to divide them between intercontinental systems and less than intercontinental systems. To develop the above a paper is in preparation which deals with the definitions of the intercontinental systems and the less than intercontinental systems, including what weapons come under each category. The paper also deals with the use of gross weight as a measure of the destructive carrying capacity of each U.S. and Soviet vehicle to be included in the above two categories. Included in this paper will be tables of what reductions might look like when the double 30 per cent is applied to all vehicles in the above two categories.

---

<sup>1</sup> U.S. position on disarmament measures at Geneva negotiations. Confidential. 4 pp. Kennedy Library, National Security Files, Kaysen Series, Disarmament, Position Papers, 2/62-3/62.

3. Production of strategic delivery vehicles and other armaments would be limited in Stage I to some percentage of the number of vehicles and armaments in the inventories of the U.S. and the U.S.S.R. at the beginning date of Stage I. In preparation is a paper on the limitation on production using 5, 10, and 15 as possible percentages for permitting production of new vehicles. In this connection the Defense Department has been asked to furnish ACDA with planned production rates of all armaments for the next four years and a statement on replacement requirements for existing vehicles and armaments. Also, NASA is being asked to furnish ACDA with planned rates for use of vehicles for peaceful uses and exploration of outer space. The Federal Aviation Agency is being asked to supply certain information in the event we need to make statements regarding the production of aircraft for peaceful purposes. Finally, ACDA is preparing a paper on the extent to which the testing of missiles, aircraft, and other armaments would be permitted in connection with the various schemes for limiting and halting production. With respect to all of the above, all production of new and improved armaments and testing of new and improved armaments would be halted in Stage II. Included in the production study by ACDA will be recommendations regarding the extent to which the same percentage formulas for limiting strategic delivery vehicle production can be applied to limitations on the production of other armaments.

4. On armaments other than strategic delivery vehicles reductions will be according to categories specified in the March 3 Memorandum to the President. Reductions within certain of these categories will be by numbers and by total weight. ACDA is preparing a paper recommending in which categories reductions should be by weight as well as by numbers.

5. Because inspection for the stockpiles of nuclear warheads and weapons of chemical and biological warfare are now considered so difficult these weapons are not included in the proposed reductions of 30 per cent. To deal with these two groups of weapons the U.S. will propose that two international experts commissions be established along the lines indicated in the March 3 Memorandum to the President. ACDA is now preparing papers regarding each of these proposed experts commissions and also ways in which stockpiles of such weapons might be reduced under effective verification.

6. The U.S. should continue to press the proposal of 2.1 million force levels. The U.S. would be prepared to proceed at least through the first stage in the absence of the Chinese Communists although the possibility of a defeasance procedure (comparable to that in the test ban) should be examined. ACDA is completing for government clearance its position paper on the relationship of Communist China to disarmament and the Geneva disarmament negotiations.

7. The U.S. disarmament delegation has been authorized to discuss with the U.S.S.R. an inspection system based on sampling techniques perhaps accompanied by progressive zonal techniques. With respect to the entire matter of inspection ACDA is preparing a paper with details, given current knowledge, on the type of inspection which would probably be required for the various disarmament measures in the U.S. plan. These include inspection for remaining agreed levels of strategic delivery vehicles, remaining agreed levels for other armaments, production facilities (declared and any clandestine) for strategic delivery vehicles and other armaments, production facilities (declared and any clandestine) for fissionable material production, reductions in armed forces, monitoring the testing of missiles, and the establishment of internationally supervised depots for inspection of the destruction of vehicles taken from inventories. DMP #12, rev. 4 can be used to describe verification systems, except for small "a" through "g" on pages 5-6 which have not yet been cleared by defense. Small "a" through "g" can be used if they are made illustrative rather than definite. Appendix B can be used as a basis for presentation of inspection requirements except for manpower requirements given in para. 4, page 6, and except possibly for heavy reliance on aerial reconnaissance mentioned throughout Appendix B.

8. The U.S. will propose that, contingent on agreement on the cut-off of fissionable material for use in weapons, the U.S. and the U.S.S.R. each transfer 50,000 kgs of U-235 to peaceful purposes. ACDA is preparing a paper to determine whether we could agree to a proportional transfer of U.S. 50,000 kgs. to U.S.S.R. 40,000 kgs. of U-235 and what would be the effects of transfers of various sizes and in various other proportions.

9. The U.S. will propose that the reduction of armaments proposed for Stage I be applied in the same general ratio for Stages II and III.

10. ACDA is preparing additional details on other features of the U.S. disarmament plan including: relationship of military bases and missile sites to reductions in strategic delivery vehicles; means by which reductions can be made in weapons of other NATO and Warsaw Pact countries; and extent to which research and development can be monitored.

**101. Message from Prime Minister Macmillan to President Kennedy, March 13<sup>1</sup>**

March 13, 1962

Dear Friend,

I was most grateful for your message of March 10 about Nuclear Tests and Berlin. I have of course kept the paragraphs of your message on the wider issues entirely to myself and Alec Home but I have given the sense of the first two paragraphs of your message to the Minister of Defence and my scientific advisers.

They have now given further thought to the situation, including the argument in your first paragraph. I would like to take up your suggestion that our two sets of experts should study this matter together and I would like to send our team over to Washington as soon as possible starting at working level. Sir William Penney and Sir Solly Zuckerman would follow. If you agree, the more junior group of experts could leave for Washington tomorrow, Wednesday, March 14. Perhaps you would let David Gore know if this would suit you.

I shall send you a message on the wider issues when I have reflected upon them a little longer.

With warm regards,

**Harold Macmillan**

<sup>1</sup> Agreement to bilateral working-level discussions. Top Secret. 2 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan–Kennedy, 1961–1962.

**102. Notes on Telephone Conversation between Fisher and Ball,  
March 14<sup>1</sup>**

March 14, 1962

Fisher said he had not yet seen the cables this morning. Ball asked how it was patched up with the British and Fisher replied they were still crowding us on the warning system. We have given considerable amounts of what the test ban would be. Ball asked if any of this had gotten out, and Fisher said he was explaining this to the Joint Committee this morning. They don't normally leak,—but this idea of our considering abolishing the threshold, etc., when we said we would go along with it. Some of the details were sent last night.

Fisher said one of the things he should think Ball should do was in some way get him off of resisting the British on the test ban and more interested in the ban problem. We have worried on the test ban too much, as has also the British. There has been too much emotional energy put in it. We should be worrying about missiles. The telegram he sent last night is a first-step in an over-all plan.

**103. Disto 34 from Geneva, March 16<sup>1</sup>**

Geneva, March 16, 1962

Further supplementing and as background to Dean-Godber Tsarapkin conversation reported Disto 30, following summary of preceding meeting with UK Del may be useful.

In meeting with Godber at 2:30 March 15, Dean outlined US position on nuclear test treaty as regards threshold, inspection against preparations, the speeding up of installation of controls, and division of inspection quota between seismic and seismic areas. Added US willingness as "last gasp" to offer sign April 18 treaty as supplemented

---

<sup>1</sup> Summary of meeting with U.K. Delegation on nuclear test treaty positions. Confidential. 2 pp. Department of State, Central Files, 700.5611/3-1662.

by three amendments submitted on May 29 and August 30, 1961. Proposal informal US-UK-USSR meeting to put our proposed changes in treaty to Tsarapkin at 5:00 p.m. Proposed if we get clear rejection by Tsarapkin without even request to study proposal before responding, we would then ask Tsarapkin whether he would sign April 18 treaty as amended by proposals of May 29, August 28 and August 30, 1961, and indicate our willingness to do so.

Godber noted that apart from clarification of our willingness sign April 18 treaty, Dean explanation confirmed views of which Godber informed earlier except as regards additional detail on (1) number of control posts; (2) number of inspections and (3) fact we will retain escalator.

Godber said UK “perfectly happy” go along with sounding out Russians on this basis, coming back finally to April 18 treaty. As to what we called the US “last gasp”, UK would hope we had number of additional gasps left in US. Said we were already aware PM’s concern for new approach based on national stations. Said accordingly UK would wish follow up our proposed steps with question to effect that “then what will you sign?” and “are you willing accept any form of international inspection?” said this step essential from standpoint UK presentation to its parliament and people.

Godber repeated interest of UK in system based on national stations for detection supplemented by international verification. Godber said additional steps based on national systems were “first gasp” as far as UK concerned. Stelle pointed out possible trap in any reference now to such possibility since Sovs might seize upon any questions along this line to concentrate thereafter merely upon verification problem and to assume West would accept national (#)<sup>2</sup> for detection.

Godber asked what we should say in plenary about tests. Stelle said we would want to go through exploratory stage outside and then might decide whether propose in plenary establishment of subcommittee. It was agreed to suggest to Tsarapkin meeting at 5:00 p.m. and to give him aide memoire on US proposal.

**Martin**

---

<sup>2</sup> Omission correction to follow.

**104. Letter from Gilpatric to Fisher, March 16<sup>1</sup>**

March 16, 1962

Dear Mr. Fisher:

At the NSC meeting of February 27, it was agreed that if the USSR would sign the April 18, 1961, Nuclear Test Ban Treaty, the United States would cancel the forthcoming atmospheric test program. The Department of Defense continues to support this position.

During the past two weeks, a number of changes in the April 18th treaty have been suggested and some authority to negotiate has been granted. Changes include elimination of the threshold, and a decrease in the number of control posts. These represent substantial concessions on our part. We understand that the United Kingdom considers these moves inadequate and has even raised the possibility of technical adequacy of sole reliance on national systems to monitor against underground nuclear tests.

The net effect of all these moves is, or could be, to degrade seriously our position on what constitutes effective control of a nuclear test ban agreement. Perhaps even more important is the application of a weakened attitude toward control for more significant disarmament measures.

The Department of Defense views with increasing concern the continuing erosion of our position which might lead to cancellation of our planned atmospheric tests in the absence of an agreed treaty with safeguards along the lines previously demanded by the United States. We, therefore, urge that no further relaxation of our stated position take place without full consideration by the Committee of Principals.

Sincerely,

**Roswell L. Gilpatric**  
*Deputy Secretary of Defense*

<sup>1</sup> Concern over possible erosion in U.S. position on nuclear test ban treaty. Secret. 1 p. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, 18-Nation Conference, Geneva.

**105. Memorandum from Brown to McNamara, March 20<sup>1</sup>**

March 20, 1962

**SUBJECT**

Joint US–UK Technical Discussions on Nuclear Test Ban Questions

At the urgent request of Prime Minister MacMillan a group of British scientists led by Sir Solly Zuckerman met with U.S. scientists on Saturday and Sunday, March 17–18. The stated purpose of the meeting was to reach an agreed position on the scientific aspects of nuclear test ban control.

The meeting was a meandering affair touching on numerous scientific questions. It appeared to DOD representatives present, however, that the principal matter of interest to the British was the adequacy of national or unilateral seismic detection systems to monitor an underground test ban agreement. The simplest interpretation of British intent is that they are seeking scientific support for a proposal of a test ban agreement without international controls of the sort which the U.S. has always considered necessary.

In the course of the meeting no technical results were presented by either the U.K. or U.S. scientists to indicate that the problems of underground test detection had been solved.

A decision at this time to enter into a test ban agreement with only national systems for control would be a purely political decision, not warranted by any change of the technical situation.

I recommend that you oppose any move in this direction, in view of:

(a) the continuing need to prevent an imbalance in nuclear weapons development. Though underground testing is limiting, it does allow gains and could be hidden without inspection as a safeguard.

(b) the very bad precedent any treaty based on national systems would set for future disarmament agreements.

**Harold Brown**

<sup>1</sup> Joint U.S.–U.K. technical discussions on nuclear test ban questions. Attached is a draft of the agreed conclusions of U.S.–U.K. discussions. Secret. 4 pp. Washington National Records Center, RG 330, OSD Files: FRC 66 A 3542, Atomic 000.01–400.112, 1962, Box 57.

## Attachment

March 18, 1962

### DRAFT AGREED CONCLUSIONS OF US-UK TECHNICAL MEETING ON NUCLEAR TEST DETECTION

1. That Western unilateral detection systems can currently detect seismic events in the USSR of magnitude 4.75 or slightly less. This will lead on the average to detection of about 125 shallow seismic events per year within the USSR.

2. That the proposed Geneva system is predicted to detect seismic events down to 3.75 magnitude, which implies detection of about 1,000 shallow events per year in the USSR. This system could not be available much before 1965.

3. That improvements of detection by unilateral systems to perhaps magnitude 4.2 in the USSR is a reasonable technical goal for 1965. This, we now believe, implies detection of 300 shallow seismic events per year within the USSR. Among the research areas of particular promise are use of deep hole detection systems and correlation of data from phased arrays.

4. That a unilateral system can currently locate detected seismic events to within a radius of from 10 to 20 km.

5. That, with utilization of data from an improved internal USSR seismic detection system for the purpose of calibrating the external system, the location capability of an external unilateral system might improve to the point where location to within a radius of ten km. or less in seismic areas would be feasible. This conclusion is predicated on the assumption that the USSR data are not falsified.

6. That at present it is impossible unilaterally to identify shallow seismic events in the USSR as earthquakes, excepting at large magnitudes, but that future improvements, in particular ones involving processing of data from large arrays, offer hope of reducing the magnitude at which identification of some earthquakes is possible down to about magnitude five. There does not appear to be any prospect of identifying a given event as an explosion by seismic means alone.

7. That if a unilateral system (for example a non-Soviet system for detecting events within the USSR) is to be used as a basis for initiating inspections, it will be necessary to agree on objective criteria which will determine eligibility for inspection and to establish a mechanism for certifying the eligibility of a given event. Although these problems were discussed no specific proposals have been formulated.

**106. Notes on Telephone Conversation between Bundy and Ball,  
March 20<sup>1</sup>**

March 20, 1962

Bundy said they were drafting on the disarmament thing about which the boss talked to Ball. They don't want to get too many people doing the same thing.

Bundy said he had called Ormsby-Gore and said it was to get away from the argument between us and looking at the fact they won't buy any inspection. To his surprise Gore said he agreed entirely. He is coming in at 12:15 to see the President and they will know more after the President talks with him. Their inclination is to think the object here is to get the US and UK off their relatively low discussion in response to the Prime Minister and get them back in business.

Ball said he told the President this morning the thing that concerned him the most was (he was suggesting the British say how would you think about going ahead with an inspection system but only after an incident) that Rusk would take this as a position and start negotiating from there. Bundy said he did not think we had to do it that way. We can put up other reasons. We can say we are willing to argue with you about technical requirements of different kinds but there isn't much point in this if you are sticking to the position that there can be no position. Ball said the Secretary was clear on this; the cables make this clear.

Bundy asked Ball to tell Beam they were working on the draft, at the President's instructions, and will circulate it later in the morning. They can trade drafts back and forth.

**107. Tosec 95 to Geneva, March 21<sup>1</sup>**

March 21, 1962

Following is text message to President from Macmillan dated March 20 to which President's letter reftel replies

**QUOTE**

I agreed with you after Bermuda that Christmas Island could be made available for your tests with our help. You agreed with me that the Christmas Island tests could not in fact be made without a further effort for a test ban treaty. Khrushchev agreed grudgingly with our procedure but now he seems unwilling to have any form of verification of unexplained events which involves permanent establishments of experts in the Soviet Union or even merely episodic visits. His objections seem to cover even teams of experts who are all neutrals or some of whom are neutrals. If this is really the Russian final position, then I agree that the tests must proceed. But the public still do not realise that this is the position, nor do they understand the difference between detecting a seismic event and verifying whether it is natural or artificial. We have got to bring this point out into the open and make Khrushchev publicly reject all international verification so that the whole world will realise why the tests must go on.

If the scientists agree that the risk may in the future be acceptable, we can perhaps offer the Russians, at least as an alternative to the 1961 treaty proposals as modified, the possibility of no static experts but only periodic visits. If this position is scientifically tenable, we could make this proposal with public advantage. But even if we have to stick to the 1961 treaty we need to force Khrushchev publicly to reject the whole principle of international verification.

From every point of view, the sooner we get the Russians to adopt this position publicly the better. Apart from the desirability of removing the test question from the immediate field of speculations, there would be advantage in clearing the way for possible progress on general disarmament and on other matters where the Russians may be prepared for more serious negotiation. I would suggest therefore that when Mr. Rusk and Lord Home have come home from Geneva towards the end of this week you and I should send letters to Khrushchev on the lines of the attached draft. This will force him to reply and will be seen as

---

<sup>1</sup> Text of message from Macmillan to President Kennedy. Pushing Khrushchev on verification issue. Top Secret. 4 pp. Department of State, Conference Files: Lot 65 D 533, CF 2059.

a final effort to arrange a test ban treaty before going ahead with the tests.

Enclosure: *Draft message to Khrushchev from President Kennedy and Prime Minister Macmillan.* Mr. Rusk and Lord Home have now reported about their conversations with Mr. Gromyko in Geneva during the first two weeks of the meetings of the Disarmament Committee. They have informed us that in discussions about a treaty to ban nuclear tests the Soviet representatives have rejected any form of international inspection or verification inside the Soviet Union, whether by static posts or by visits by international teams. The ground given seems to be that existing national detection systems can give adequate protection against clandestine tests. But whether or not the present state of scientific instrumentation has reached sufficient perfection as to distinguish between natural and artificial seismic disturbances, the treaty cannot be made effective unless at least verification by visit is included in it. For otherwise there would be no alternative, if an instrument reported an unexplained seismic occurrence on either side, between accepting the possibility of an evasion of the treaty or its immediate denunciation. Verification in some form or another is of the very essence of mutual confidence. We hope therefore that the Soviet position has been misunderstood and that you would accept the principle of international verification. In that event, I cannot believe that we can fail to reach agreement about its application in practice and thus lead to a rapid conclusion of a treaty to ban all nuclear tests. If, however, you cannot accept any form of international verification on Soviet territory in any circumstances, then I do not see how tests can be effectively banned. President Kennedy and I would, therefore, have to take the action which flows inevitably from this conclusion. May I express my sincere hope that we may yet hear that you accept international verification at least in principle.

UNQUOTE

**Ball**

**108. Tosec 103 to Geneva, March 21<sup>1</sup>**

March 21, 1962

For Secretary from Acting Secretary. Before you leave Geneva, President desires that you and Home attempt get Gromyko on public record as categorically rejecting international verification for nuclear test ban treaty. Would suggest this might be done by referring to previous Tsarapkin statements to effect Soviets will not accept international verification and express hope that Tsarapkin's position does not reflect official position of Soviet government. You might, in simplest terms, describe key element in US position as being requirement objective international system to verify that ban against testing is being observed. US will not settle for less and will consider any proposal which offers effective international verification.

We note you tentatively planning Thursday speech on nuclear tests. Would suggest you give speech at that time in order allow time Gromyko reaction before you leave.

**109. Letter from Fisher to Gilpatric, March 22<sup>1</sup>**

March 22, 1962

Dear Secretary Gilpatric:

This is in reply to your letter of March 16, 1962 dealing with the US negotiating position with respect to the nuclear test ban treaty. It is true, as you point out, that during the past few weeks the President authorized a number of changes in the April 18 treaty. He reexamined the authority with respect to a possible decrease in the number of

---

<sup>1</sup> Changes in U.S. negotiating position on nuclear test ban treaty. Confidential. 1 p. Washington National Records Center, RG 330, OSD/OATSD (AE) Files: FRC 69 A 2243, 97 USP, Nuclear Test Suspension/Geneva, 1960-1962.

control posts which was granted in August, 1961 and authorized an elimination of the threshold. These decisions were made by the President on March 9, 1962 after a series of conferences in which the Department of Defense was fully represented and in which representatives of the Department of Defense expressed the point of view that the elimination of the threshold was an improvement in our position favoring effective control rather than any degradation of that position.

I fully agree with the opinion stated in the last paragraph of your letter that there should be no substantial changes in our position without full consideration by all the interested agencies represented in the Committee of Principals. You will recall that in the meeting with the British scientists held over the weekend to discuss possible improvements in seismic detection and identification techniques, all agencies constituting the Committee of Principals were represented.

Sincerely,

**Adrian S. Fisher**  
*Acting Director*

---

**110. Notes on a Telephone Conversation between Bundy and Ball, March 22<sup>1</sup>**

March 22, 1962

Bundy said he had just received the Secretary's outline speech and asked if Ball looked at the dispatch with it. Bundy suggested in paragraph 9, although it was a trivial point it might be worth passing on. It is not that there is no valid reason for distorting the detection network. It's that when you locate it outside you need at least as much if not more inspection which is the whole thing that they have rejected. Bundy said he did not think we needed to defend this or worry about the detection thing because it is the inspection thing we are fretting about. He is not sure we've got that point across to Geneva as sharply as the President wanted. Ball said he had read some language to the President which has been telephoned to Foster. The language Ball read to the President was the following which Butch Fisher got over: "The essential element upon which we must insist is that there be an effective

---

<sup>1</sup> Geneva negotiating issues and concerns. No classification marking. 2 pp. Kennedy Library, Ball Papers, Telephone Conversations, Disarmament.

international system for assuring that the ban against testing is being complied with. This means that there must be an international system for distinguishing between natural and artificial seismic events. The April 18 treaty provided for such a system. Last week the United States and the United Kingdom made some modifications of that proposed treaty in a way calculated to meet Soviet objections. I have described these modifications. These proposed modifications were rejected almost immediately by the Soviets on the grounds that international verification was not necessary. This refusal to accept any form of international verification strikes at the very heart of our effort to guarantee the world against the resumption of nuclear tests. The key element in the position of the United States is that there must be effective international verification of the obligation undertaken in any such treaty. The United States will consider any proposal which offers such effective international verification. But the United States will *never* (and the President changed it to *cannot*) settle for anything less." Bundy said that was his point and there was no need to press it.

Ball said he wanted to run through some other things which he had told him on the basis of Ball's conversation with the Secretary tonight.

Ball said first he had seen Gromyko at dinner tonight and Gromyko had shown interest in the *modus vivendi* which he had given him earlier this afternoon; that on the basis of this it was possible he would get down to serious talks on this he might stay longer and get home Monday evening, but that it might run on to Tuesday or Wednesday. He thinks that as far as Berlin is concerned there is no advance. He does not want anybody to get optimistic on the access route business. Gromyko made it clear to him that there is no advance. He thinks they are aiming at a Summit. He doubts very much that they are going to get anywhere. He is making his statement tomorrow on nuclear testing and will have in it a provision along this line. Ball said he had told the President all of this and that they are cabling the whole thing tonight so that we will have something.

**111. Tosec 107 to Geneva, March 22<sup>1</sup>**

March 22, 1962

Following is text of memorandum from Ormsby-Gore to McGeorge Bundy giving Macmillan latest thoughts on the nuclear tests position.

**QUOTE**

It looks as though by the end of this week we shall know the final decision of the Russians as regards international verification, so far at least as Gromyko is competent to give it. The position will presumably become known publicly after the plenary meeting in Geneva on Saturday, March 24. If the Russians still reject the whole principle of international verification then we must accept that the United States tests will have to take place.

In this event, it will nevertheless be important to ensure that public opinion recognises that dead-lock has been reached and that the Russians are being unreasonable. We shall not be able to make these points clearly and dramatically without involving Khrushchev himself, although the chances of his changing his position at that stage will of course be negligible. The question is how best to bring Khrushchev in. There seem to be two possible ways of doing so:—

(a) The President and the Prime Minister could issue a joint statement saying that as the discussions in the nuclear tests sub-committee at Geneva (or in the plenary) had clearly shown that the Russians were not prepared to accept the principle of international verification, there was no point in continuing negotiations for a nuclear test ban treaty. In the circumstances, the plan to test at Christmas Island would have to go ahead. They would add that they were, of course, prepared to resume negotiations as soon as the Russians had a change of heart.

(b) There could be an appeal to Khrushchev to change his view about international verification. If such an appeal is to be made, a joint appeal by President Kennedy and the Prime Minister would be much the best since an appeal by the United Kingdom only would seem an empty gesture and would presumably suggest to the world some difference of opinion between us and Washington. If the President does not like the idea of a joint letter, the Prime Minister would be quite content with a joint statement and he sees that this might seem more dignified and firm but he does feel strongly that we cannot let the occasion pass without some Western statement at the top level to focus attention on the vital question of verification. The Prime Minister

---

<sup>1</sup> Macmillan's latest thoughts on nuclear test issues. Secret. 3 pp. Department of State, Central Files, 700.5611/3–2262.

does not believe that it would be wise even to make an announcement about danger areas in the Pacific before such a statement has been made and time given for the Soviet response.

**Ball**

---

**112. Letter from Amb. Ormsby Gore to Bundy, March 24<sup>1</sup>**

March 24, 1962

Dear Mac,

The Prime Minister has had a talk today with the Foreign Secretary about the latest position on nuclear tests, and he has asked me to let the President know of the following.

He quite agrees that no statement should be issued for the moment. He has, however, asked me to let you see the attached draft of his idea of the sort of statement which will have to be made at some point, preferably jointly but, if necessary, separately.

The Prime Minister is, however, concerned about the proposed timing of the warning to mariners. He accepts that the warning itself is not an order to test, but it is of course generally assumed that the warning will not be issued unless tests will definitely take place. If a further postponement of this warning is impossible, the Prime Minister would certainly have to make a statement in the House of Commons. There is therefore a strong diplomatic argument for postponing the warnings until the last possible date, which I think everyone agrees to be two weeks before tests take place. There is also a very strong practical argument against giving more than the minimum warning. Our experience has been that the longer the warning the more chance that individual pacifists and neighbouring governments (Japan and New Zealand, for example) will organise demonstrations, send protests and generally create a most awkward local situation. Both the Prime Minister and the Foreign Secretary feel strongly that the warning to mariners ought not to be issued more than the minimum two weeks before tests are resumed and certainly not in the course of next week.

---

<sup>1</sup> Macmillan's thoughts on a proposed statement outlining Soviet non-acceptance of verification and his concerns on timing of warning to mariners. Attached is a suggested draft statement. Top Secret. 5 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan-Kennedy.

I need hardly say that the Prime Minister realises that the text of the enclosed draft would almost certainly have to be modified to take account of developments.

Yours sincerely,

David Ormsby Gore

### Attachment

#### Text of Draft

Mr. Rusk and Lord Home have now reported about their conversations with Mr. Gromyko in Geneva during the first two weeks of the meetings of the Disarmament Committee. They have informed us that in discussions about a Treaty to Ban Nuclear Tests the Soviet representatives have rejected any form of international inspection or verification inside the Soviet Union, whether by static posts or by visits by international teams to verify unexplained events which would otherwise be assumed to be nuclear tests.

This is a point of cardinal importance to the United States and the United Kingdom. From the very beginning of the negotiations on a nuclear Test Ban Treaty, they have made it clear that an essential element of such a treaty is an objective international system for assuring that a ban on nuclear tests is being observed by all parties. The need for such a system was clearly recognised in the report of the scientific experts which was the foundation of the Geneva negotiations. For nearly three years this was accepted by the Soviet delegation at Geneva. There was disagreement about details, but the principle of objective international verification was accepted. It was embodied in the Treaty tabled by the United States and the United Kingdom on April 18, 1961, which provided for such a system. Since the current disarmament meetings began in Geneva, the United States and the United Kingdom have made further efforts to meet Soviet objections to the April 18 treaty. These efforts have met with no success as is clearly shown by the recent statements of the Foreign Minister of the Soviet Union, who has repeatedly rejected the very concept of international verification. There has been no negotiation on this point in Geneva; the Soviet Union has flatly refused to change its position.

The ground given seems to be that existing national detection systems can give adequate protection against clandestine tests. But whether or not the present state of scientific instrumentation has reached sufficient perfection as to distinguish between natural and artificial seismic disturbances—and we do not think that it yet has—the Treaty cannot be made effective unless at least verification by visit

is included in it. For otherwise there would be no alternative, if an instrument reported an unexplained seismic occurrence on either side, between accepting the possibility of an evasion of the Treaty or its immediate denunciation. Verification in some form or another is of the very essence of mutual confidence.

This principle has so far been rejected by the Foreign Minister of the Soviet Union, and there is no indication that he has not spoken with the full approval of his Government. If Chairman Khrushchev were to give any clear indication that he had reconsidered the position and was ready to accept the principle of international verification, then it is hard to believe that agreement could not be reached about its application in practice. This in turn could lead to the rapid conclusion of a Treaty to ban all nuclear tests. The President and the Prime Minister therefore earnestly hope that Chairman Khrushchev will send the necessary instructions to Mr. Gromyko in Geneva. If, however, the U.S.S.R. cannot accept any form of international verification on Soviet territory in any circumstances then it is hard to see how tests can be effectively banned. The Governments of the United States and United Kingdom would in this case have no alternative but to conclude, with sincere regret, that their most recent efforts to obtain a workable Treaty to ban nuclear tests have failed, and accordingly to carry on with the final stages of preparation for the test series scheduled for the latter part of April.

---

### 113. Secto 107 from Geneva, March 25<sup>1</sup>

Geneva, March 25, 1962

Eyes only for President and Acting Secretary from Secretary. Tosec 141 consider essential notice to mariners should be so timed there can be no possibility of asking for further delay because ships are already loaded or have left ports, or because there is not adequate time to take necessary precautions, etc. While we recognize giving of mariners notice will create certain complications, do not think we should agree to such postponement or it will not be possible either (A) to make statement with respect to resumption, or (B) to have initial tests carried out promptly. In any case, think we should be careful to use distinctions

---

<sup>1</sup> Rusk concerns re notice to mariners, verification issue semantics, and joint statement. Secret. 2 pp. Department of State, Central Files, 700.5611/3-2562.

set forth in Geneva experts report of 1958 with respect to basic difference between ability to detect and ability to identify, and that we should not confuse detection and identification in a single phrase “verification.”

Soviets have rejected both international headquarters system at Vienna, any control posts as envisaged by experts report on its own territory and any ability of international headquarters to launch on-site inspections in order to identify unidentified events. Consequently, in lieu of phrase “verification” would use “detection and identification.”

So far as we are aware, Soviet Union has not adduced any scientific evidence which would repudiate Geneva experts report of 1958 and even though there has been some improvement in ability of distant instrumentation with respect to detection, there has been no improvement with respect to ability to identify events as natural or artificial. Purpose of on-site inspections is not to verify the fact that an explosion has occurred, but to identify what kind of an explosion it is.

Do not believe that the joint statement should under any circumstances be predicated upon any assumption, expressed or implied, that USSR delegation at Geneva has not been speaking with the full authority of its own government in view their specific rejection of international headquarters, sufficient number control posts on its territory and adequate number of on-site inspections, especially since we have agreed to make treaty full and comprehensive. Do not think we should indicate that mere acceptance of principle of international inspection and control would lead to rapid conclusion of treaty to ban all nuclear tests. Think our statement should be definite and positive and should not afford Khrushchev any opportunity of saying he had not previously understood our position or that he is willing to waive some minor negotiating points so that we will not then be free to test. If it be assumed that the USSR is preparing to test and definitely does not want a nuclear test ban treaty, which all of the evidence here would appear to support, we must not be placed in a position of indefinite postponement, for if we do not make the decision to test at this time in all probability we will not be free to make it for a long time to come. Further joint statement should not say that we would have no alternative but to conclude to test, but rather should be definitive that we have made the decision and have instructed that the final stages of preparation be carried out so that the tests can go forward on schedule.

Would prefer, of course, that this be joint statement, if any statement is required. But if after extending every consideration we cannot get joint statement without further loopholes, believe we should carefully consider advisability of separate statements.

**Rusk**

**114. Memorandum from Bundy to Rusk, McNamara, and Seaborg, March 26<sup>1</sup>**

March 26, 1962

The President today reviewed the question of the notice to mariners in the light of the arguments advanced by the British and the counter arguments presented through his staff, and with the further advantage of a direct interview with General Starbird. In the light of these discussions, the President has now ruled that the notice to mariners should be issued on April 4th; and I have asked Ambassador Ormsby Gore to report this view to Her Majesty's Government.

Ambassador Ormsby Gore's first reaction is that this is a reasonable response, and I am inclined to expect that the British will go along with this date.

SecDel MC/48

March 26, 1962

## SUBJECT

Disarmament Discussion

## PARTICIPANTS

*United States*  
The Secretary of State  
Mr. William C. Foster

*United Kingdom*  
The Earl of Home  
Sir Michael Wright  
Mr. A.C.I. Samuel

---

<sup>1</sup> Disarmament discussion. Confidential. 3 pp. Department of State, Central Files, 600.0012/3-2662.

*Lord Home* opened with questions concerning the Secretary's proposed speech. He first asked why we put early emphasis for conference action on cuts in major weapons systems such as nuclear delivery vehicles, tanks, etc. We responded that these had greatest capacity for destruction, would have greatest immediate effect in turning down the magnitude of possible destructive wars and were less numerous and therefore, presented an easier verification requirement.

He next questioned why we could not accept a continuous process of disarmament rather than a Stage 1, Stage 2, Stage 3. It was explained that a 30% cut was a radical cut; the adjustments and the risks assumed thereby would be substantial and not precisely unpredictable. Therefore it was desirable, so to speak, to have the opportunity of reviewing the bidding when the first important changes had been made in relative power relationships. The period between stages should provide this.

It was further pointed out that while the United States had not reached a final decision, it was possible that after further study we might be able to agree that the 30% cut be first applied bilaterally to the U.S. and the USSR. We have previously indicated to our allies that we are willing to apply such a cut in military forces in this manner down to 2,100,000 each in the US and the USSR.

A question was then raised as to possible separable measures which could be usefully negotiated in the informal committee of the whole. In Secretary Rusk's proposed speech some of these are listed, particularly having to do with surprise attack. However, there are other separable measures which might well be discussed. These will be developed later but are perhaps not usefully set forth in this speech. Such separable measures might include: non-transfer of nuclear weapons or know-how; a non-aggression pact between NATO and Warsaw Pact countries; and already underway in nuclear test ban treaty discussions.

The test ban treaty negotiation was then discussed at length. Lord Home asked why, since we had offered in September to accept a moratorium based on existing systems of detection, we were unwilling now to do the same particularly as it was felt that means of detection and identification had been improved? We stated that in the first place detection of these required a number of inspection stations around a large part of the Soviet Union and also required air sampling flights near to Soviet borders and perhaps over the Soviet Union. Air sampling from outside the Soviet Union would give no hard evidence as to location of tests and left the real possibility of denial of such tests having taken place. It would be difficult, if not impossible, to develop adequate evidence based on existing systems. There also would be the political difficulty of getting acceptance of any such treaty from the U.S. Congress. Members of important cognizant committees there believe that important advances have been made by the USSR and that

the US should be unwilling to take any chance on a further change in our relative position in the field by possible cheating on the part of the Soviet. The U.S. has, nonetheless, expressed its willingness to accept a test ban treaty across the board with adequate detection, identification and location systems.

Sir Michael Wright stated at considerable length that he believed there had been great improvement in detection and identification systems which should allow us to omit control posts on Soviet territory. He stated that he believed that our American scientists appeared to agree with this appraisal in discussions with British representatives here last week.

Foster expressed some doubt that this was a correct appraisal in view of his conversations with the same scientists. He also expressed doubt that the Swedish seismologist who was here had accepted the thought of possible breakthroughs which would allow the elimination of control posts while still retaining the ability to detect, identify and locate and thus be able to obtain convincing proof of a violation. Our scientists have indicated that the Swedish seismologist agreed with them. British scientists visiting Washington had stated that while there was possibility of an improvement in these systems over the coming years, improvements did not yet exist in a way to be able to supplant requirements set forth in the so-called 1958 Geneva system.

In the course of this discussion, Mr. Green called Lord Home and asked whether the afternoon heads of delegation meeting could be raised to ministerial level. Lord Home agreed he was willing to attend although Secretary Rusk would not be able to, nor would Minister Segni of Italy. However, it was agreed the meeting would be attended by Minister Green and Lord Home, by Mr. Foster for the U.S. and by Mr. Russo for Italy. In view of possible emphasis on the test ban discussion, the U.S. suggested that Doctors Wiesner and Hayworth attend.

Lord Home brought up briefly with Secretary Rusk the question of British problems with British Guinea and asked as to the possibility of U.S. assistance in this regard.

There was also a brief discussion of problems connected with the official British position on the admittance of Red China to "competent associated UN organizations" which it was agreed would be deferred to later discussions in Washington in view of U.S. feeling against this opening wedge.

**116. Memorandum of NSC Discussion, March 28<sup>1</sup>**

March 28, 1962

SUBJECT

Memorandum of Discussion at National Security Council Meeting, called for the purposes of receiving reports from Secretary Rusk.

IN ATTENDANCE

President, Vice President, Secretary of State, Sec/Def, Secretary of Treasury, Attorney General, Acting Chairman of Joint Chiefs, DCI, Foster and about 20 others.

The report was as follows:

*1. Nuclear testing*

As reported the Soviet Union will not accept inspection within their own territory. They were brutally frank on this point claiming internal inspection was primarily for espionage. Gromyko stated that even one man can do them great damage. Therefore Rusk concludes that there is no chance for a test suspension agreement. The Soviets have no room for negotiation. Gromyko stated that they have developed instruments to detect and identify nuclear explosions in any environment in any place in the world and he assumes U.S. has same but will not disclose them, therefore concludes purposes of our insisting on inspection obviously for espionage.

As discussion proceeded the non-nuclear countries became impressed with our arguments. They recognized the espionage claim as entirely false and apparently understood the need for inspection. The meeting gave Rusk an opportunity to clearly explain the problems of detection and identification. Neutrals indicated that if a secret vote were taken, the vote would be about 12 to 5 in support of our position. However the issue was an internal political issue with many of them, therefore they could not speak out. However, the neutrals' position considerably modified as the conference carried on. Further indoctrination must be undertaken of the 8 neutral nations of the conference, both at Geneva and in their respective capitals and also with other neutral countries at their capitals or at the U.N. State developing plans for this by producing literature, visual aids, etc.

Rusk expects suggestions to postpone starting our tests. There are no real arguments. There never will be a good time to conduct tests.

---

<sup>1</sup> Soviet positions on nuclear testing, disarmament, and Berlin. Secret. 5 pp. CIA Files, Meetings with the President, 12/1/61–6/30/62.

Rusk therefore hopes we will not under any circumstance be influenced into postponing our decision. Rusk says that he sees no reason to postpone the commencement of tests and therefore strongly recommends that we do not accept the arguments that are advanced or may be advanced for postponement.

## *2. Disarmament*

The Soviet has stated positively that they will not permit the inspection of retained arms. They will only permit the inspection of discarded arms. Gromyko says that we can expect Soviet attitude on the inspection of disarmament to be infinitely more difficult than their attitude on inspection for testing. Hence, Rusk is in no way sanguine or hopeful over progress on disarmament. However Rusk indicated there was a possibility of some agreement in areas of surprise attack and outer space and the restrictions on the diffusion of weapons to third countries. This, he indicated, would present us a problem with NATO as Gromyko is insisting that weapons not be turned over to third party nations or to international organizations. Gromyko was particularly anxious about Germany and apparently interested in discussing a nuclear policy with the two Germanies quite outside of any other disarmament undertaking. Rusk interprets this to mean that the Soviets are so concerned over Germany that they wish to treat them in respect to nuclear armament outside more comprehensive agreements which might possibly break down at some future time or even during the period of negotiation.

William Foster stated that the neutralists had obviously moderated their views and he attributed this to Rusk's persuasive handling of the situation. He also felt a slight advance was made in the areas indicated above though offered no particular hope for a disarmament understanding.

The impression was gained from statements both public and private that the Soviet arms strength may be less than we think or that they have led us to believe. A statement was made that our proposed 30% reduction would create an imbalance because the U.S. forces were greater now than the Soviet forces. Also contribution of 50,000 kilograms of fissionable material to an international agency would create an imbalance.

NOTE: Some neutrals reported that 50,000 kilograms represented the entire Soviet resource of U-235.

In a private conversation Usachev, principal Soviet disarmament treaty expert, said that the Soviets had concluded that U.S. is stronger than the USSR. In another conversation it was mentioned that our missile capability exceeds theirs and for this reason they can not take a chance on the type of disarmament proposals we are advancing. All

of this had led our delegation to suggest a review of all available hard intelligence on Soviet military capabilities.

ACTION: I was asked by the President and Rusk to order a check of all information on Soviet strength and I have agreed this would be done as promptly as possible.

### *3. Berlin Situation*

No move of substance was made; however there was a definite change in mood as the talks went on and it was obvious that the Soviets wanted to continue talking on a bi-lateral basis. It was pointed out that when the conference opened the Berlin issue was raised by Rusk and other U.S. representatives. However, towards the close of the conference the Berlin issue was always raised by the Soviet side. There was no flexibility in the Soviet position which would permit searching for a *modus vivendi*. However there seemed to be some interest in an agreement which would provide international authority over the corridors and other access routes but these were coupled with the granting of authority to East Germany which would be unacceptable to us.

Gromyko denied any knowledge of any interference in the corridors through the distribution of chaff and the registering of flights and other problems in and around Berlin. During the discussions Gromyko made no threats, he made no positive statements concerning Soviet course of action, and he would not permit an impasse to develop. Obviously he wished to keep Berlin in the conversation.

One point I would like to have checked: Apparently both Rusk and Lord Home were embarrassed because of sudden emphasis on the distribution of chaff in the corridors for it now turns out that the Soviets have carried on chaff exercises for the last several years hence the violent protests of both Rusk and Home were of no particular purpose. I would like to know promptly whether we have reported these incidents prior to the last week or two.

**John A. McCone**

**117. Note from Amb. Ormsby Gore to President Kennedy,  
March 30<sup>1</sup>**

March 30, 1962

Dear Mr. President,

I have been asked by the Prime Minister to pass to you the enclosed message about Nuclear Tests.

Yours sincerely,

**David Ormsby Gore**

Following is text of Macmillan letter of March 30:

QUOTE

Dear Friend,

Now that the situation is a bit clearer I have been looking again at your message of March 20 to which I have sent you a direct answer although, of course, David Gore has been discussing the position with you and your office. As you know, I fully agreed with the points which you made in your second paragraph. Now the situation has clarified so far as Geneva, Rusk, Home and Gromyko are concerned. The curtain has fallen on this act. The question is what we are to do next.

In your message of March 20 you suggested that it might be appropriate in the second act for one or both of us to communicate with Khrushchev. Our purpose would be at the best to persuade him at the last moment to accept the principle of international verification on which everything turns. At the worst we should put ourselves in the best posture before the world, especially the neutrals, when tests have to be resumed. Many people seem to think that the Russians do not treat Foreign Ministers with the same respect that you and I do, that Khrushchev settles everything and that no deal can ever be done except with him direct. On this plan both of us or one of us might communicate with Khrushchev asking him once more the simple question which Rusk and Home have been putting over and over again to Gromyko, namely whether he will accept the principle of international verification on the spot of doubtful events. Alternatively, we could issue a joint statement on the lines of the draft which I sent to David Gore some days ago and which I think he discussed with you.

---

<sup>1</sup> Transmits Prime Minister Macmillan's March 30 message regarding possible letter to Khrushchev on nuclear tests. Attached is telegram 5349 to London conveying text of Macmillan letter. Top Secret. 4 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan-Kennedy.

We could play the hand either way but I think we must do something more both for our own consciences and for the public opinion of the world before the time runs out. As I understand it, we have about 30 days before the first test and whichever way we play it, I think timing will be important. What do you think?

Perhaps you would allow David Gore to talk to you about this and then we can have a further interchange by message or telephone.

With warm regards,

Harold Macmillan

**118. Memorandum of Conversation, March 30, among Rusk, Foster, and Amb. Ormsby Gore<sup>1</sup>**

March 30, 1962

SUBJECT

Letter from Prime Minister Macmillan to President Kennedy—March 30, 1962

PARTICIPANTS

Sir David Ormsby-Gore, British Ambassador

The Secretary of State

Mr. William C. Foster, Director, Arms Control and Disarmament Agency

The Secretary opened the conversation by stating that he had asked the British Ambassador to come in to discuss, in a preliminary way, our reactions to the Prime Minister's letter.

The Secretary stated that he had not had a chance to discuss this in detail with the President but wanted the Ambassador to know of our preliminary reaction. Quite frankly, the Secretary said, certain parts of the Prime Minister's suggested course of action in connection with another appeal to Khrushchev on the termination of tests was inconsistent with the position which the President had taken and which the Secretary on behalf of the U.S. had taken in his talks with Gromyko and others in Geneva. It was quite clear that from every viewpoint as

---

<sup>1</sup> Discussion of Macmillan's March 30 letter to Kennedy. Top Secret. 2 pp. Department of State, Central Files, 600.0012/3-3062.

far as the Executive Branch and the Congress were concerned, no agreement with the Soviets on termination of tests was acceptable except under an agreed Treaty which provided for adequate inspection and control. The Secretary said he had made quite clear, both privately and publicly, as had others at Geneva, that while we were willing to eliminate the threshold on underground tests, the necessity for control posts and for onsite inspections was as clear as ever and no radical scientific breakthroughs reducing the necessity for inspections had been revealed either by the British or American scientists. If certain new ideas were aggressively followed up it is conceivable that control posts on Russian territory might after some years of development of these ideas become less necessary through radical improvements in identification capabilities. Such a breakthrough would however detect many more suspicious events than do present seismic instruments so that to check so many additional events there would be required many more on-site inspections. The Soviet representatives at Geneva had flatly rejected any inspection whatsoever on Soviet soil. Gromyko even went so far as to state that the Soviet Union would not allow even a single person to undertake such a mission on their soil.

The Secretary stated that in view of this flat position there seemed no likelihood that Khrushchev would accept any adequate treaty. It was dangerous therefore to suggest that by his accepting the principle of verification just before the date of proposed tests the United States and the United Kingdom would be willing to postpone the tests pending further development of that concession. The President had in his press conference of March 29th repeated his sincere desire to terminate all tests on the basis of a satisfactory treaty. It therefore appeared to the Secretary that any further appeal might indicate weakness in the President's position and would not be tolerable from the viewpoint of the US public and in fact, from that of our allies around the world and even neutrals who depend on US strength for their security.

The Secretary said he would of course discuss the Prime Minister's letter in detail with the President.

April 1962

**119. Memorandum from Kaysen to President Kennedy, April 5<sup>1</sup>**

April 5, 1962

SUBJECT

Disarmament Problems

1. The Principals' Meeting revealed that there are a number of important areas in which we are still not prepared to define our position concretely in a draft treaty. One way of dealing with this problem is to table the treaty draft in general terms and work on the details later. This has obvious dangers. It puts us in a poor position in Geneva. It raises the possibility that we will be negotiated into positions we do not want, if the delegation at Geneva has to face negotiation without clear instructions.

2. The most important issues that still need resolution are the definition of categories of weapons and the relation of these categories to the schemes for reducing armaments; the nature of the limitations to be placed on the production of armaments; the defining of the conditions of transition between stages; and the extent to which we explicitly propose a great many study commissions as part of the treaty. In addition there are a number of minor problems which need to be dealt with. The whole draft treaty outline needs to be rewritten before we offer it in Geneva.

3. There still is no agreement on the categories of weapons and the question of whether reduction should be by categories or by types. This question is most important in respect to strategic delivery of vehicles. The categories presently proposed by the ACDA are agreed to by no one else.

It has been suggested by Jerry Wiesner that we combine reduction by types with production by categories assuming that production is allowed only during the first stage of the treaty as proposed in the draft. Bob McNamara has had a favorable initial reaction to this idea but he wants to consider it further (see attached example for an illustration of how this works).

---

<sup>1</sup> Disarmament problems. Secret. 4 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, 18-Nation Conference, Geneva, 4/1/62-4/11/62.

It is clear that the dangers of going to Geneva with this point unspecified and leaving the definition of categories to negotiations are very great. Each side will try to get the boundary line between the categories drawn so as to favor the kind of weapons it desires. It is hard to be certain that any position not carefully considered beforehand is in fact tenable. One advantage of the Wiesner proposal is that it makes the definition of categories much less important than it would be under a system in which reduction was by categories rather than by types.

4. There is now general agreement on certain aspects of a proposed cutoff of production. We have to have one in order to have real disarmament. We think it undesirable to have it in the first stage because of the danger that the treaty may never get past the first stage. Production in the first stage should be limited so that there may be some phase down of present levels to a cutoff. However, there is as yet no agreement as to what limitation should be placed on production in the first stage and how it should be defined. Here, again, it appears undesirable to delay too long indicating the degree of limitation we propose in our treaty draft and even more danger in simply leaving the matter open for discussion at large in Geneva.

5. The present draft treaty does not specify whether or not anyone should have a veto over the transition from Stage I to Stage II or indeed what method should be used to settle disagreements as to whether the undertakings of Stage I had been met by all the parties. Further, no definite position was taken on the relation between the staging process and the number and list of states who are parties to the treaty. In particular, it is not made clear whether adherence of China is a condition of transition to Stage II. Further, it is not made clear whether we propose to make Stage I simply bilateral between the U.S. and the Soviet Union or whether we propose to include NATO and Warsaw Pact countries.

6. The present draft of the treaty provides for commissions to study the problems of nuclear weapons, radiological weapons, chemical and biological warfare, surprise attack, military expenditures, and setting up a peace force. Foster and Fisher take the view that we are tied to these commissions because of the declaration of September 25 which mentions them. Wiesner points out that we give to these problems more importance than they are worth by featuring the commissions so prominently in our draft treaty and, further, we convey the idea that we don't really know what we want to do. If these studies were referred to in an annex perhaps these tasks of the International Disarmament Organization would be in a more appropriate respect.

7. It would seem desirable, after hearing the Principals tomorrow, to appoint a drafting committee representing the interested agencies

and require them to get as far forward in a week or ten days as possible, and then report back to the Principals who, in turn, would report to you. If you suggested that each of Rusk, Foster, McNamara, the Chiefs, Wiesner, and Bundy name a representative to the drafting committee, this would get matters further forward in a week than ACDA alone.

**Carl Kaysen**

*EXAMPLE*

This shows how you might reduce by types but produce by categories. Assume that the initial figures are as shown and that all four weapons fall in the same categories. If you had 15 per cent per year reduction in each type, and 5 per cent per year as a production allowance for the whole category, making for a net reduction of 10 per cent per year for the total number in the category, you would have the result in the table, if you choose to use the production for Minutemen and Polaris.

	<u>Beginning</u>	<u>45% reduction</u>	<u>15% production</u>	<u>End</u>
B-47	100	45	—	55
B-52	100	45	—	55
Minuteman	50	23	30	57
Polaris	<u>50</u>	<u>22</u>	<u>30</u>	<u>58</u>
	400		60	225

On the other hand, if you had reduction by categories the end figures would be highly sensitive to the category boundaries; in the example above they are less sensitive to the category boundaries.

### **SUBJECT**

Issues for Discussion at Meeting on April 6, 1962

Following the discussions with the President on March 6 and March 9, certain major issues concerning the U.S. disarmament program were left to be resolved at a later date.

At the urgent request of the U.S. Delegation in Geneva, ACDA has been preparing a draft "Outline of Provisions of a Basic Treaty on General and Complete Disarmament in a Peaceful World." Copies of the drafts of a Preamble, Stage I, Stage II, and Stage III have been forwarded to the various departments and agencies concerned. It is intended that decisions reached at the subsequent meeting with the President, on April 6, will be forwarded to Geneva for the use of the U.S. Delegation and will be incorporated in the Outline Treaty. However, the Outline Treaty itself will be the subject of subsequent inter-agency consultation in the immediate future.

The basic structure of the U.S. proposal is a cut during the first stage of 30 percent (in increments of 10% a year for three years) in nuclear delivery vehicles and major conventional armaments. It is proposed that strategic nuclear delivery vehicles be reduced not only in numbers but also in destructive capability. The following are a series of questions upon which decisions are reported or must still be made in order to make further progress possible in drafting the "Outline of Provisions of a Basic Treaty on General and Complete Disarmament in a Peaceful World." They have been discussed at a meeting of the Committee of Principals on April 5, 1962. The issues which are presented are covered somewhat more fully in the attached copies of letters to the Secretary of Defense (Tabs A and B) and in Tab C.

### *1. Method of Reduction*

#### **ALTERNATIVE A.**

Reduction by *categories* of armaments of which the following would be offered as illustrative and in the first two of which (the "strategic

delivery vehicles”) the reductions would be by “destructive capability” as well as by numbers:

(1) Armed combat aircraft over 30,000 kg. (DOD would have this figure 40,000 kg.) empty weight, all missiles with over 5,000 km. maximum range, all submarine-launched missiles and all air-to-surface missiles with ranges over 300 km.

(2) Armed combat aircraft between 15,000 kg. and 30,000 kg. (DOD would have this figure 40,000 kg.) empty weight, all missiles (other than submarine-launched missiles and air-to-surface missiles) with between 300 and 5,000 km. maximum range.

(3) Anti-missile missile systems.

(4) Surface-to-air missiles other than anti-missile missile systems.

(5) Armed combat aircraft having an empty weight of between 2,500 and 15,000 kg.

(6) Surface-to-surface and air-to-surface aerodynamic and ballistic missiles and free rockets having a range of between 10 km. and 300 km.

(7) Tanks.

(8) Armored cars and armored personnel carriers.

(9) All artillery, and mortars and rocket launchers having a caliber of 100 mm. or greater.

(10) Combatant ships with standard displacement of 400 tons or greater of the following classes: aircraft carriers, battleships, cruisers, destroyer types, and submarines.

#### ALTERNATIVE B.

Reduction by *types* of armaments narrowly defined.

#### 2. *Limitations on Production of Armaments.*

It has been decided that some limitation should be placed upon production of strategic armaments and those categories of non-strategic armaments to be reduced in Stage I. It remains to be decided what method will be used in determining these limits. The magnitude of the limits on production, under whatever system is decided, will be determined at a later stage.

A. If the Alternative A method of reduction (by categories) is adopted, production within the agreed categories and within the reduced levels of numbers (and, in categories (1) and (2), of destructive capability) will be subject to agreed limitations. ACDA believes that the agreed production limitations for the U.S. and the U.S.S.R. should be equal and based on a percentage of the inventory in each category of whichever state had the smaller inventory, in terms of numbers and, where germane, in terms of destructive capability at the beginning of each step. DOD wishes to examine the latter concept further.

B. If the alternative B method of reduction (by narrowly defined types) is adopted, production would be limited by categories such as those contained in Alternative A. As in the other alternative, the kind and amount of limitation would be as agreed. In this connection, the limitation on production becomes somewhat more than a limitation on production, it also becomes a limitation on the freedom to vary the mix within the categories. While, theoretically, this alternative leads to simultaneous reduction and production of the newer and more desirable weapons systems, this incongruity could be handled by allowing a nation to escape some "type" reductions by charging them against "category" production allowance. Thus if a nation had 50 Polaris missiles and was required by Alternative B to destroy 15 of them, it need not destroy the 15 but could credit the 15 against its total production quota of strategic nuclear delivery vehicles applicable to Category (1) of paragraph 1A.

### *3. Elimination of Armaments Intended for Reserve Forces.*

The Soviet draft treaty of March 15 contains a proposal that in Stage I "Conventional Armaments and Equipment Intended for Reserve Forces Shall also be Destroyed". It has been suggested that this Soviet proposal might provide the U.S. an opening whereby we could establish a foundation for advancing the concept of general parity between the U.S. and U.S.S.R. in major non-strategic armaments. This would be done, presumably, by also proposing in our outline treaty that armaments intended for reserve forces would be eliminated by the end of Stage I. It remains to be decided whether or not the U.S. should make such a proposal and if so exactly in what context the proposal should be made. (See Tab B.)

### *4. Destruction of Nuclear Delivery Vehicles During Negotiations.*

The U.S. in proposing only a 30 per cent reduction in strategic nuclear delivery vehicles and in permitting production which would allow Minuteman and Polaris missiles to be substituted for B-47 bombers, is vulnerable to charges of insufficiency in dealing with the threat posed by strategic nuclear weapons. To help offset charges of this nature, it has been suggested that we might propose to begin the reduction of certain strategic delivery vehicles during the negotiations. This could be done by having the U.S. deposit in UN designated hands, a certain number of long-range strategic nuclear delivery vehicles and then propose that those vehicles would be destroyed if the Soviets would reciprocate with an equal number of long-range vehicles. This process would continue at a designated rate for a designated time period as long as negotiations were being conducted. It is proposed that the Committee should consider whether or not such an offer should be made, when it might be made, and who should make it. If the

Committee believes that such a proposal is worthwhile, then it should consider what category or type of vehicle should be used, how many should be destroyed each month, and how long the process should continue. (See Tab C)

---

**121. Message from President Kennedy to Prime Minister  
Macmillan, April 6<sup>1</sup>**

April 6, 1962

David Gore and my people have worked through the Joint Statement and made a half-dozen minor changes, which seem to meet the special worries of both sides, without changing the basic thrust of the document. This will be coming to you through David, but for your convenience I send it along after this message by our private wire. I hope it will seem all right to you.

I feel some diffidence in commenting on your letter to Khrushchev, but if it is to be understood that the letter is fully agreeable to both of us, I should like to suggest the omission of the phrase “by on the spot inspection” in the next-to-last sentence. I also wonder whether we ought to go quite so far as to call it “a good chance” in the same sentence. Perhaps “a real chance?”

I think I ought to comment also on your helpful message of April 5, T183/62. If Khrushchev should change his tune on verification, I quite agree that it would give us new hope, and that we should work hard to see whether we cannot move from his new position to some workable agreement. But I do not think I could undertake to hold up our own tests on the ground of such a change alone. Neither do I believe that his acceptance of inspection should lead us to give up our long-standing view that control posts on Soviet territory are needed for a really effective treaty. I shall certainly be willing to have this problem continuously and carefully reviewed, but in the light of the agreed position of our scientific experts, it does look to me as if the alternative were between control posts and a much expanded system of inspection. And as between these two, I believe even Khrushchev

---

<sup>1</sup> Thoughts on proposed statement and U.K. letter to Khrushchev. Attached is a draft U.S.–U.K. statement on nuclear testing. Top Secret. 6 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Weapons, Joint U.S.–U.K. Statement on Nuclear Testing 4/10/62, 3/62–4/62.

would prefer the control posts. I mention these matters only to avoid the possibility of a troublesome misunderstanding in the event of a forthcoming response from Khrushchev.

On the other hand, I quite agree with you that if Khrushchev merely asks for a Summit without accepting verification, then we should stand firm. If he accepts verification and then asks for a meeting, then I think we should look closely at the exact language and timing of his response and of the proposed Summit Meeting before we make a decision—but on the whole, at the moment I think this an unlikely result.

What concerns me, more generally, is that without significantly changing his real position, Khrushchev may try to give the impression of a reasonable attitude in these last days. It seems unlikely that he will sit still and let us pin the verification issue on him without attempting some maneuver. It seems to me essential therefore that our own position be such that it plainly requires a real change and not merely an appearance of change on his part. Otherwise, it would be an easy matter for him to entangle us in another prolonged and unpoliced moratorium, to be broken at his will.

On balance, as we come down to the wire, my own belief is that we will probably have to go ahead with the current series of tests, which will evidently be followed or accompanied by further Soviet tests. Yet I also think that during and after these two sets of explosions there may be new chances for agreement on a test ban. Behind the problems of inspection and verification there are the still more difficult questions of the Chinese and the French, but I for one do not think of these next days as the very last in which we shall have a chance to work for progress in this field.

Thank you very much for your message to the Dowager Duchess, which I have delivered with pleasure. I find this new method of communication very helpful, and I am able to endure the suspicion it arouses among Ambassadors and State Department officials with equanimity and even pleasure.

**John F. Kennedy**

Joint Statement follows:

## Attachment

### Joint US/UK Statement on Nuclear Testing

Discussions among ourselves and the Soviet Union about a treaty to ban nuclear tests have been going on in Geneva for nearly a month. The Soviet representatives have rejected international inspection or verification inside the Soviet Union to determine the nature of unexplained seismic events which might be nuclear tests.

This is a point of cardinal importance to the United States and the United Kingdom. From the very beginning of the negotiations on a nuclear Test Ban Treaty, they have made it clear that an essential element of such a treaty is an objective international system for assuring that a ban on nuclear tests is being observed by all parties. The need for such a system was clearly recognized in the report of the scientific experts which was the foundation of the Geneva negotiations. For nearly three years this need was accepted by the Soviet delegation at Geneva. There was disagreement about details, but the principle of objective international verification was accepted. It was embodied in the Treaty tabled by the United States and the United Kingdom on April 18, 1961, which provides for such a system. Since the current disarmament meetings began in Geneva, the United States and the United Kingdom have made further efforts to meet Soviet objections to the April 18 treaty. These efforts have met with no success as is clearly shown by the recent statements of the Foreign Minister of the Soviet Union and of their representative in Geneva, Mr. Zorin, who have repeatedly rejected the very concept of international verification. There has been no progress on this point in Geneva; the Soviet Union has refused to change its position.

The ground given seems to be that existing national detection systems can give adequate protection against clandestine tests. In the present state of scientific instrumentation, there are a great many cases in which we cannot distinguish between natural and artificial seismic disturbances—as opposed to recording the fact of a disturbance and locating its probable epicenter. A treaty therefore cannot be made effective unless adequate verification is included in it. For otherwise there would be no alternative, if an instrument reported an unexplained seismic occurrence on either side, between accepting the possibility of an evasion of the Treaty or its immediate denunciation. The opportunity for adequate verification is of the very essence of mutual confidence.

This principle has so far been rejected by the Foreign Minister of the Soviet Union, and there is no indication that he has not spoken with the full approval of his Government. We continue to hope that Chairman Khrushchev may reconsider the position and express his

readiness to accept the principle of international verification. If he will do this, there is still time to reach agreement. But if there is no change in the present Soviet position, the Governments of the United States and the United Kingdom must conclude that their efforts to obtain a workable treaty to ban nuclear tests are not now successful, and the test series scheduled for the latter part of this month will have to go forward.

---

**122. Letter from McCone to Foster, April 6<sup>1</sup>**

April 6, 1962

Dear Bill:

In connection with matters at this morning's meeting, I hope that you are giving very careful consideration to the question of our position vis-à-vis the Soviets under a disarmament program with neither side restricted in the maintenance of facilities for the fabrication and assembly of military equipment. By maintaining factories intact, either idle or at a very low level of production, arrangements could be planned in a controlled society to bring the plants up to maximum production in a minimum time. I can readily envisage such a plan involving substantial inventories of fabricated and assembled components and a periodic training of personnel. This to me represents serious dimensions of the problem.

I observed this as a distinct possibility when I was in Russia two years ago and, in fact, discussed it with Professor Emelyanov and others. From them I gained the impression that under their system of central government control of both factories and workers, it would be quite possible for them to get the production lines going on an all-out basis in a very minimum time. In fact, they were unable to answer my question as to how we could protect ourselves against just such contingent planning on their part.

By contrast, our society does not seem to have the capability of doing these things. As you will recall when we were required to start up reserve plants after the outbreak of the Korean War, it proved to be both a laborious and time-consuming undertaking. I was disappointed in those days to find idle aircraft, engine, tank, and armament

---

<sup>1</sup> Military production facilities. Secret. 2 pp. CIA Files, Job 80B01285A, ER Files, DCI Chron, 1/1/62-12/31/62.

plants, which had been maintained for years to provide instant mobilization potential, not usable until large amounts of money had been spent and a great deal of time consumed in re-equipping, modifying, etc.

One might argue that this need not happen in our society but it does and you must find some way in your negotiations to safeguard us against such a disadvantageous position. This is a problem not dissimilar from the problem of safeguarding against secret preparation for further nuclear testing.

Sincerely,

John A. McCone  
*Director*

---

### 123. Draft Notes of Committee of Principals Meeting, April 11<sup>1</sup>

April 11, 1962

PRESENT

Rusk; Foster, Fisher, Gathright; Gilpatric, McNaughton; Lemnitzer, Dale Smith; Seaborg, Haworth, Cavanaugh; Wilson; Wiesner, Kaysen, Keeny

1. *Mr. Rusk* called on *Mr. Foster* to present the major issues. *Mr. Foster* first referred to the difference between ACDA and the other agencies concerned on the question of reduction by categories versus reduction by types as a mode for defining how arms reduction takes place. The ACDA view that reduction by categories was preferable rests on two grounds: (1) it was desirable for us to have a large capacity to improve the mix of our armaments, especially our strategic delivery vehicles; second, there are problems of clear statement involved in describing reductions by type. Since in fact some types might increase in numbers during the first stage describing the plan of reduction by type might be misleading and appear to be deceitful. *Mr. Foster* gave an example in terms of Polaris involving the very large increase over the period. *Mr. Rusk* then stated that the problem of the mix of strategic

---

<sup>1</sup> Discussion centered on arms reduction, fixed launching pads, armaments for reserve forces, civilian controls, replacement production, and B-47 concerns. Secret. 5 pp. Kennedy Library, National Security Files, Kaysen Series, Disarmament, Basic Memoranda, 2/62-4/62.

delivery vehicles was so important that it could not simply be turned loose for each side to play with, but would necessarily become a subject of negotiation and agreement in the event of any real prospect of a treaty. He asked Mr. Gilpatric to comment on the question of whether the Defense Department would prefer the situation in which changes in mix were constrained by agreement to one in which they were free. *Mr. Gilpatric* answered that he much preferred to stay with a known mix or to stay near a known mix than to leave the possibility of large unforeseen changes in the mix open. He further added that with respect to production during Stage I the actual amount of production was a secondary matter. What was important was that minimum necessary to keep production capacity alive. *Mr. Foster* asked for clarification on this point. *Mr. Gilpatric* re-stated his remarks with emphasis. He said that the Defense Department was satisfied with the relative mixes prevailing now or those expected to prevail in the next year, that the Defense Department prefers to negotiate and to inspect in terms of knowns rather than unknowns. *Dr. Wiesner* affirmed his agreement with this argument and added that discussion in terms of type is simpler and clearer than discussion in terms of categories. *Mr. Foster* denied that either mode of discussion was simple. He raised the question of whether it was not much easier for the Soviet Union to increase production quickly than for the U.S. and referred to a letter from Mr. McCone to him on this subject. He also emphasized the importance to us of a choice in production. *Mr. Rusk* asked whether it might be possible to get Dean license to explore the consequences of the two formulae, but this point was not followed up. He then noticed that the smaller the production allowance, the simpler the negotiating problem, and asked whether Mr. Gilpatric's statement did not imply that we could accept a small production allowance. *Mr. Gilpatric* agreed. There was some general discussion on what was meant by small, and it was agreed that this meant a figure well under 10% per year, although no one was prepared to settle on a figure at that moment. It was agreed that it would be appropriate to transmit this sense of small to the negotiators. *Mr. Kaysen* pointed out that relevant to any given rate of arms reduction and any given production allowance, reduction by types constrained, a possible shift in mix much narrower than would reduction by categories. *Mr. Foster* asked whether the security of the US would be safe if the possible change in mix were narrowly constrained. *Mr. Gilpatric* answered yes, as did *Dr. Wiesner*. *Mr. Foster* again re-stated his question. *Mr. Gilpatric* responded that it was better to hold fast to what we know are our five-year program and our intelligence estimates of what the Soviets are doing than to embark on a speculative game of playing for a shift in mix which the Joint Chiefs could play. *Dr. Wiesner* suggested that, since all the principals except for Mr. Foster preferred reduction by types to reduction by categories,

the draft treaty outline be presented in this manner and that the reduction by categories be presented as alternative language. *Mr. Foster* declined to accept this suggestion and said that he intended to present it as it presently stood. *Mr. Rusk* agreed that both sides should be presented to the President.

2. Next topic discussed was the problem of fixed launching pads and related facilities (Pages 7–11 versus Alternate language, pages 1–2)

*Mr. Foster* indicated that it was the ACDA view that inclusion of this item as proposed by DOD would create difficulties in negotiation and might lead to discussion of overseas bases and similar other items, and he asked for the views of the DOD and the Chiefs of Staff. *Mr. Gilpatric* indicated that the Chiefs of Staff agreed with ACDA that it was too soon to put this item in, but that the Secretary of Defense, Harold Brown and he felt that it should be not in the way it is presented in the DOD alternate draft. *General Lemnitzer* indicated that the Chiefs were uncertain about whether this language would apply to Polaris. *Dr. Wiesner* pointed out that the Polaris was already included as a type of armament subject to reduction. By including missile pads along with missiles we were closing a loophole that has been serious from a security viewpoint. *Mr. Marengo*, speaking for the CIA, indicated that the Agency strongly endorses the Secretary of Defense's viewpoint both from the point of view of the ease of inspection and verification and from the point of view of security. It was a mistake to concentrate on the missiles alone and fail to deal with missile pads. The fact that we had only one missile, and we believed the Soviet Union had several. He argued for inclusion of missile pads with missiles. *Mr. Rusk* asked *Mr. Gilpatric* what his judgment was. *Mr. Gilpatric* said he thought it should be in, and it was so concluded.

3. The next item brought up was armaments intended for reserve forces (Alternate language, pages 8 and 9 (Annex A)). *Mr. Foster* stated the ACDA position that we should get rid of them in Stage I. *Gen. Lemnitzer* thought that this was impractical because of the impossibility of defining what reserve armaments were. *Mr. Rusk* asked whether the logistics backup of armaments for active forces wasn't a variable which could be stretched or compressed. *Mr. Gilpatric* indicated that he shared the Chiefs' view that this was a difficult item to deal with. No doubt it would be offered by the Soviet Union, but he thought it better to deal with it on a negotiating basis than to deal with it in our treaty draft. On *Mr. Gilpatric's* indication that he would prefer to see it removed from the draft, *Mr. Rusk* so concluded.

4. The next item brought up was the question of whether civilian members in military establishments should be subject to defined controls. After a brief discussion, it was agreed to retain this provision in the draft treaty.

5. The next item brought up was the treatment of replacement production in Stage II. (page 43, 4a). The question was whether the treaty should specify production of parts required for maintenance, or should also allow for replacement in kind on a one-for-one basis. *Mr. Gilpatric and Gen. Lemnitzer* both argued against replacement in kind and it was agreed that the language should speak in terms of limiting production to parts required for maintenance of the agreed level of armaments. The final question raised was of location by categories of the B-47 assuming that the categories scheme was used (page 8, 2b). *Mr. Gilpatric* raised this question. After a brief discussion, it was reserved for further consideration by ACDA.

#### 124. Telegram 5441 to London, April 12<sup>1</sup>

April 12, 1962

Eyes only Ambassador Bruce. Following is a message from Prime Minister Macmillan to the President which was passed to him by Ambassador David Ormsby Gore.

QUOTE April 11, 1962

Dear Friend,

Our joint approach to Khrushchev about nuclear tests has gone well here and I think our public position in the world generally is now pretty good. I am very grateful for all your patience in working this out. I fear, however, that there is still one point which disturbs me.

In your message to me of February 27 you mentioned an addition to the series of tests proposed which you described as a pair of "systems tests" to show whether all the components of Polaris and Atlas work together. In my reply of February 28 I said that these two tests represented a difficulty but that I agreed with you that they could be included in the programme.

I am afraid, however, that when I said this I had not fully understood what was involved. I only realised when we received the detailed list of proposed tests towards the beginning of March that these two tests might mean full operational testing of ballistic missiles armed

---

with nuclear warheads. I am told that this is in fact the case although you have not given final authority for the firing to be made.

I must confess that I am worried about this. In the first place, I wonder if nuclear warheads are really necessary for full operational testing of the missile systems. My scientists advise me that, given the appropriate instrumentation, the missile systems could be satisfactorily tested with the nuclear component replaced by dummy or non-nuclear material. The nuclear warheads themselves could be proved elsewhere. Secondly, missile systems are fallible and there is always the possibility of an accident, however unlikely that might be. But the most important difficulty seems to me the strong possibility that if the United States fires missiles across and into the Pacific with nuclear warheads, which are exploded, the Russians, will follow suit. I am really concerned lest something that you or we do should open up a new and particularly dangerous field of competition in this perilous nuclear world. The position will of course be quite different if the missiles are fired without their warheads, but I do feel that it would not be right to make these particular nuclear tests and I ask you to reconsider the matter. It seems to me that the Russians are bound to find out what has happened and to inform the world and it would be hard to sustain the case in public.

I am sorry to seem in this way to be going back on what I had agreed but as I explained I did not at once understand the full significance of what you proposed.

With warm regard,  
Yours sincerely,  
Harold Macmillan

125. Table, April 12<sup>1</sup>

April 12, 1962

*ALTERNATIVE METHODS FOR REDUCING ARMAMENTS  
STARTING WITH U.S. STRATEGIC SYSTEMS IN MID-1963*

The examples below begin with the planned numbers for U.S. strategic systems in mid-1963. They involve the single category of aircraft having an empty weight of 40,000 kilograms or greater and missiles having a range of 5,000 kilometers or greater.

A. Reduction by Types and Production by Categories.

	Mid-63 Inventory	-30% Reduction	+10% Production	-10% Compensating Reduction for Production	Resulting Inventory after 3 yrs.
B-52	630	-189		-119	322
Atlas	130	- 39			91
Titan	90	- 27	55		118
Minuteman	150	- 45			105
Polaris	190	- 57	64		197
Total	1190	-357	119	-119	833
Vehicles					

B. Reduction and Production by Categories.

B-52	630	-357		-119	154
Atlas	130	0			130
Titan	90	0	55		145
Minuteman	150	0			150
Polaris	190	0	64		254
Total	1190	-357	119	-119	833
Vehicles					

Note that in both cases the production allowance has been used in the same way.

<sup>1</sup> Comparative methods of reducing armaments. Table is an attachment to an April 12 memorandum from Kaysen to President Kennedy on disarmament issues. Secret. 1 p. Kennedy Library, National Security Files, Kaysen Series, Disarmament, Basic Memoranda, Memorandum to the President 4/12/62.

**126. Letter from Seaborg to President Kennedy, April 12<sup>1</sup>**

April 12, 1962

Dear Mr. President:

The purposes of this letter are to confirm the schedule of nuclear tests proposed for the atmospheric testing program, to obtain your approval to implement the program, and to obtain your approval for the expenditure of the special nuclear materials to be expended in the test series.

The proposed atmospheric nuclear test program of 26 events, plus two contingency items, is submitted as Enclosure 2. The justification for all events has been furnished to you or your staff in previous correspondence, as shown in Enclosure 3.

The program proposed in Enclosure 2 is considered firm as of this date; however, it must be recognized that flexibility to add, substitute, or otherwise modify the program must be retained if maximum information is to be accrued from the test series. Also, in view of the extremely compressed schedule of events, it should be noted that the execution of certain shots may extend into July. While no major changes to the program are foreseen at this time, I shall, if the need arises during the execution of the series, request your approval of any such changes.

Please note that Enclosure 2 lists two contingency items. Devices are being readied for these contingency events, but will not be fired unless experimental results show this to be necessary. In any event, the contingency items will not be detonated until after your staff has been notified.

The Commission is satisfied that adequate precautions are now planned by Joint Task Force Eight for all air drop events in the vicinity of Christmas Island and for the rocket-launched, high-altitude tests to be conducted from Johnston Island. The Commission has reviewed the operational plans for the test program from the point of view of our responsibility for over-all public health and safety for all of the proposed tests, except the system test of the ATLAS (ANGEL FIRE). Detailed discussion of the plans for the ATLAS system test is planned in the near future. Safety aspects of the remaining proposed systems tests—ASROC and POLARIS, as well as ATLAS—are currently being studied by the Department of Defense; we will consider these further when this study is completed by DoD.

---

<sup>1</sup> Atmospheric testing program issues. Secret. 2 pp. Kennedy Library, National Security Files, Nuclear Weapons Testing, 4/5/62–7/30/62.

In order to conduct the atmospheric test program, consisting of the DOMINIC events in the Pacific and the SMALLBOY event in Nevada, it will be necessary to expend [*text not declassified*].

I wish to call to your attention the Department of Defense POLARIS and ATLAS systems tests included in the series; the ASROC test could also be considered a test of this type, although its major purpose is to obtain effects information. There is a finite, though not predictable, probability that one or more of these tests may malfunction to the extent that the missile will have to be aborted prior to fulfillment of its mission—in which case the warhead, with its special nuclear materials, would probably be lost by burial deep at sea. The materials expenditure authority requested above does not take into account such malfunctions, but includes only those materials considered necessary for satisfactory execution of the nuclear detonations of the test program. I do not plan to request your authorization for additional materials in event of such a malfunction, but will assume authorization for the materials involved from your approval of this letter. You will, of course, be advised of any systems mishaps.

Respectfully yours,

**Glenn T. Seaborg**  
*Chairman*

**127. Memorandum from Battle to Bundy, April 27<sup>1</sup>**

April 27, 1962

The Secretary thought it would be useful if the President could have a preliminary assessment of world reactions to the US resumption of nuclear atmospheric tests when he speaks with Prime Minister Macmillan on Saturday morning. With that end in view, this morning he asked Ed Murrow and Roger Hilsman to prepare the enclosed papers on the subject. The USIA paper concentrated primarily on Free World press reaction. The INR paper is more analytical in its approach. There

#### **SUBJECT**

World Reaction to the US Resumption of Nuclear Atmospheric Tests

#### *Abstract*

1. This preliminary analysis has been prepared in response to your request this morning. For the most part, the tests have had the kind of impact we thought they would. Friendly and allied countries have shown an understanding of the reasons for the tests and have supported their resumption. Reactions in key non-aligned countries such as India, the UAR, and Indonesia have been more restrained, even, than anticipated. Moscow has been careful not to overplay the subject to the point where it would logically have to break up the Geneva talks, inhibit its own future testing, or limit US-Soviet discussions on Berlin.

2. Reaction to the tests has been influenced by (a) the fact that Moscow first broke the moratorium; (b) a recognition that the US had to resume testing in order to maintain nuclear equality with the USSR; (c) the fact that the US decision was taken reluctantly; and (d) the prior explanations which US representatives made to foreign governments.

3. Opinion leaders throughout the world continue to express concern about the ultimate consequences of the vicious circle of testing. In this respect, both the US and the USSR are held responsible.

4. Japanese reaction has shown significant restraint, in general, coupled with a discernable growth of awareness of the importance of tests to the military position of the Free World.

5. The position of the US in the eyes of its allies in the Far East can be expected to have been enhanced by the tests as a demonstration of military preparedness.

6. Cairo's reaction has been controlled and comparatively mild, influenced probably by current discussions over possible US aid.

7. Pakistan has made little or no comment, probably because of its desire not to antagonize Moscow on the eve of the Kashmir debate in the UN.

8. Ghana has sharply criticized the tests and will probably continue to do so in order to publicize its forthcoming "Ban the Bomb" conference in June.

9. There is no evidence that the Soviet Union will alter its fundamental stand on the issue of a nuclear test ban. It will probably continue to argue for the adequacy of national means of detection, though it may seek to make some minor concession—perhaps adding some sort of international commission to its November 28, 1961 proposal—in order to capture neutralist opinion.

10. A special informational effort may be required to distinguish between the limited fallout from the US tests and the fallout from the Soviet tests which is now occurring in the northern hemisphere. Japanese concern, in particular, can be expected to increase.

#### *FAR EAST*

The US position in the Far East has been enhanced among its allies, who see in the US resumption of testing a new demonstration of military preparedness. The non-aligned nations, on the other hand, maintain a "plague on both your houses" attitude of helpless regret. In the special case of Japan, no significant shift in relations with the US is anticipated.

So far, there is extraordinarily little blatantly, double-standard criticism of the new US tests among Asian leaders. Although such criticism may increase as the tests progress, prior US Government efforts—including the President's speech, diplomatic representations and the Western position at Geneva—appear to have had a strong positive effect.

*Japanese Reaction Relatively Restrained*—Despite Japan's high sensitivity to nuclear testing, early reactions, on balance, have reflected a significant degree of restraint. There have, of course, been demonstrations before the US Embassy, student sit-down demonstrations, and other communist and leftist protest activities. The government has protested both verbally and in writing. Nonetheless, awareness of the importance to the free world of these US tests has grown measurably. Critical newspapers are taking note also of Soviet intransigence; communist-line anti-bomb groups have made at least a gesture toward neutralism by requesting that the USSR refrain from resuming tests. While the forthcoming Upper House election campaigns may be exerting a restraining influence on one hand, May Day and communist agitation will be working in the other direction. As the tests continue, Japanese concern regarding fallout can be expected to increase; at the same time, the government may take a more scientific and less emotional attitude toward protective measures.

*Public Reactions Negative in Non-aligned Countries*—The press and other public media in Cambodia, Indonesia, and Burma will undoubt-

edly react negatively. Sihanouk's private view, however, has been that the US decision to resume testing was understandable in terms of the Soviet resumption. No high Indonesian official has yet been publicly critical, although this may follow as much from an appreciation of the US role in the West New Guinea issue as from realistic assessments of the merits of the US case. The official Burmese position is one of deep regret for the US actions, especially since they would have an adverse effect on the deliberations of the Disarmament Committee (of which Burma is a member). The Singapore Government's anti-test posture was assumed publicly to deny local political advantage to the opposition.

*US Allies Support Test Resumption*—The smaller US allies in the Far East uniformly agree that the tests are necessary. The Thai Foreign Minister, for example, said that free world security, including that of Thailand, depends upon US forces. The Philippines Foreign Office called the US resumption of tests a "painful necessity" over which "nobody can possibly rejoice" for the purpose of deterring aggression and preventing the danger of Soviet nuclear supremacy. Similar views have come from South Korea and South Vietnam. In Taiwan, a Foreign Ministry spokesman expressed the hope that US tests will compel the Soviet Union to abandon nuclear testing as "an instrument to intimidate and blackmail the free world." Australia, New Zealand and Malaya all firmly back the US.

The fallout issue has been specifically mentioned only in New Zealand, where the government assured Samoan and other island people under its jurisdiction that they will not be endangered, and in the Philippines, where the Civil Defense Administrator said there would be no danger to the country from fallout.

#### AFRICA

Resumption of testing is not expected to have any damaging effect on US relations with Africa.

*Ghana Sharply Critical*—As expected, reaction has been sharply critical in Ghana, where the government-controlled press accuses the US of torpedoing the Geneva talks. The Ghana Government has appealed to the US to discontinue the tests "in order to clear the atmosphere for the negotiations. . . ." Although admitting that it was the Soviet Union which first resumed testing, the government has criticized the US more sharply than it did the Soviets last September. The government will probably continue to play up the tests in order to publicize its forthcoming "Ban the Bomb" conference scheduled for Accra in June.

*Nigerian Leader Publicly Supports US Tests*—In contrast, Prime Minister Balewa of Nigeria has publicly stated that he thought the US was justified in resuming testing because of the need to maintain a balance

of forces. Although privately-expressed reactions along these lines were expected from some of the more moderate African leaders, sympathetic statements in public were not expected. Balewa's statement, however, may encourage other African leaders to indicate publicly their understanding of the need to resume tests, although the general tenor of the response is still expected to be one of regret and mild criticism, if perhaps not as strong as initially expected.

#### NEAR EAST AND SOUTH ASIA

*US Allies Stress Soviet Responsibility*—In their commentary on the US tests Greece, Turkey, and Iran put stress on Soviet responsibility for the US decision to resume testing. The Turkish government is apparently placing unusual emphasis on this theme. In addition to giving a detailed justification of the US resumption of testing, the Turkish radio went beyond its customary policy of non-provocation toward the Soviet Union by sarcastically rebutting the Soviet official reaction to US testing.

*Pakistan Silent*—There has been no reaction so far in Pakistan to the test resumption. Pakistan is more intimately concerned with the domestic issue of Kashmir and would not wish to antagonize the Soviet Union just prior to a UN debate on Kashmir.

*Indian Reaction Moderate*—The reaction in India presently appears to be much less vocal and critical than might have been expected. This moderation probably stems from two main factors. First, there is a recognition that the test series derives directly from last fall's Soviet series. Second, the Indians have been well-prepared for the series and thus there has been no opportunity for a reaction marked by shock and haste.

Prime Minister Nehru expressed concern on April 24 in Parliament over the increasing danger posed by fallout and, more importantly, his belief that turn-about testing increases the threat of a world-encompassing war from which no one could completely escape. However, he carefully noted that the agreement to halt tests had been broken by the Soviet Union. Newspaper comment appears to have been generally moderate though far from approving, probably reflecting the Prime Minister's subdued treatment. However, the *Hindustan Times* has sharply questioned the need for the tests, stating its belief that the United States enjoys superiority in nuclear weapons over the USSR, and has called attention to the location of the tests, noting that the areas to be affected by fall-out include the non-white, under-developed countries.

*UAR and Iraq Condemn the Tests*—Reactions from the Arab world to the resumption of US testing have varied in intensity. As expected, the earliest adverse reactions have come from the United Arab Republic

and Iraq. The UAR delegate at the current Geneva Disarmament Conference protested the resumption, calling it a tragedy. In Cairo, newspaper editorials and radio broadcasts have condemned the tests. But the reaction is a controlled one and possibly will not be carried further than a statement from President Nasser condemning the resumption, such as he made against the USSR last September. This relatively mild UAR reaction is conditioned by the current improved state of relations with the United States and the US announcement giving advance notice of the tests. Initial unfavorable reaction in Iraq will probably be supplemented by increasingly vituperative attacks on the United States. Iraqi officials have been adamantly unreceptive to recent US attempts to explain the reasons for conducting atmospheric tests.

*Other Arab States More Moderate*—Reactions from other Arab nations may be expected to be unfavorable but moderate, particularly those from Jordan, which is heavily dependent upon US financial support. Saudi Arabia and Lebanon, as well as Jordan, have recently indicated sympathy for the US position on testing; they cannot afford, however, to break Arab unity by expressing positive approval or active support. Similarly, the new transitional Syrian Government would publicly express opposition to tests, although it has already indicated a favorable disposition toward the US role in the defense of the non-communist world.

*Israel Regards the Tests as Inevitable*—Initial Israeli reaction, as given by the official radio, expressed anxiety about where the nuclear arms race may lead, but was not critical of the US test resumption. In fact, it regarded the US action as having been a foregone conclusion after the Soviet violation of the test moratorium.

### SINO-SOVIET BLOC

Soviet propaganda reaction to the US resumption of atmospheric testing was prompt and voluminous. Following already established lines, Soviet propaganda pictured the US action as an aggressive act likely to exacerbate international tensions, and charged that the US tests would cause unprecedented amounts of radioactive fallout upon underdeveloped countries of the free world (nothing was said about fallout over bloc countries).

*Moscow Avoids Pressing the Issue Too Far*—However, Moscow has avoided overplaying the subject, and is apparently unwilling to press the issue to the point where the USSR would logically be called upon to break off the Geneva disarmament talks, or to the point where the US-Soviet discussions on Berlin and Germany would be adversely affected or the Soviet Union's own testing would be inhibited. As predicted, the USSR did not walk out of the Geneva disarmament conference. Immediately prior to the start of the US test series, Soviet

leaders avoided direct comment on the forthcoming tests. Khrushchev in his April 20 interview with Gardner Cowles of *Look* magazine and Gromyko in his April 24 Supreme Soviet speech both discussed the test-ban issue, but both avoided substantive discussion of the US resumption of atmospheric testing.

*Soviet Union Will Resume Tests*—Both Khrushchev and Gromyko have formally stated that the Soviet Union would respond to further Western tests in any environment with tests of its own. When the Soviet Union begins its own tests, it will probably continue to attempt to blame the US for the nuclear arms race, using the arguments that the Western powers have carried out more tests than the USSR and that Soviet testing has been in response to Western aggressiveness.

*Position on Test Ban Unchanged*—There is no evidence that the Soviet Union will alter its fundamental stand on the issue of a nuclear test ban. It will probably continue to argue for the adequacy of national means of detection, though it may seek to make some minor concession—perhaps adding some sort of international commission to its November 28, 1961 proposal—in order to capture neutralist opinion.

*Bloc Reaction Uniform*—Thus far there have been no significant divergences in bloc propaganda on the US resumption of atmospheric testing. Communist Chinese and Albanian propaganda commentary has generally followed Soviet lines, though with a greater degree of verbal asperity. In one instance, Peking used the testing issue as a lead into a general editorial criticizing the Kennedy administration in a manner which Moscow has avoided.

## LATIN AMERICA

The limited reaction thus far in Latin America to US resumption of nuclear testing is unfavorable, as expected. However, no basic changes in the foreign policy orientation of any Latin American countries are expected, and no sizeable segment of the population is expected to be turned against the United States. Moreover, the generally adverse reaction has been modified by friendly support in Mexico and Panama.

*Favorable Reactions in Mexico and Panama*—Mexico's official reaction, not yet received, is expected to be adverse. However, an April 27 editorial in the newspaper *Atisbos* recalls that the Soviet Union broke its promises on atmospheric testing while the US kept its word and did not test during the futile talks in Geneva. *Atisbos* declared that the US must recover the time Russia won or "admit defeat before a struggle and leave the civilized world at the mercy of communism and Soviet imperialism." Nevertheless, it is expected that the Mexican Communist Party will attempt to link the resumption of atmospheric nuclear testing to its planned protest of President Kennedy's scheduled June visit.

Reaction from Panama came in the form of an April 27 television commentary on the resumption of nuclear tests in which Russia was condemned for its contempt of world public opinion and its attempt to arouse fear with 50-megaton explosions. If the Russians were allowed to continue in the nuclear field alone, the Western world would perish. The US had to resume nuclear testing without delay.

*Brazil Officially "Regrets" Test Resumption*—The Brazil Foreign Office in an April 26 note expressed "regret and apprehension" over the policy of atmospheric testing followed by the nuclear powers despite the General Assembly's resolution. Brazil reiterated her intention to continue to call for cessation of these tests. The Brazilian Foreign Minister authorized the Brazilian UN delegation to make a formal statement regretting the US resumption.

*Cuba Initiating a Fear Campaign*—Havana's initial reaction stressed US "disrespect" for the disarmament conference now in session and US disregard of official and popular protests. Subsequently, an April 26 broadcast began a terror campaign stressing the danger of fallout over areas north and south of the equator and calling the test resumption an attempt to intensify the cold war and to frighten peoples fighting for "national liberation." An *El Mundo* editorial emphasized popular fear and considered the USSR justified in testing new types of nuclear weapons if the US persists in its tests. In Latin America generally, the communist press may well attempt to link the US with the Soviet-caused fallout now beginning, even though the fallout will occur mostly in the northern hemisphere.

#### WESTERN EUROPE

*US Resumption Believed Inevitable*—Western European reaction to US resumption of nuclear testing has fallen into the predictable pattern. There is universal concern over the biological effects of radiation and regret that tests are being undertaken. However, the fact that the Soviets first broke the moratorium and the deliberate manner in which the US decision was taken helped to convince the overwhelming majority of noncommunists that US resumption was inevitable. As a result, reaction has been limited and mild.

*US Explanations Accepted*—The reasons given by the US Government for renewing tests are generally accepted. Prior explanations to the various governments were particularly effective in forming opinion. Statements by President Kennedy indicating delay in making the final decision, the offer to desist if the USSR would agree to an effective control system on testing, and assurances that fall-out would be kept as small as possible also significantly influenced the reactions.

*USSR Blamed*—That the US Government made the decision most reluctantly was generally accepted. In fact, much sympathy was

expressed in groups in the center and to the right with the soul-searching the President was assumed to have undergone. These groups have placed the blame for the situation squarely on the USSR. Groups on the left, however, have tended to blame the USSR and the US jointly while deploring the renewing of the nuclear arms race and expressing apprehension about the effects on the Geneva disarmament talks and the possible establishment of an effective test ban.

*Demonstrations Have Had Little Impact*—Demonstrations against US testing so far have been limited almost exclusively to Communist-inspired and pacifist groups and have been fewer and less emotional than was expected. Nowhere have they materially affected governmental attitudes. Western European Communist attacks on the US have not been of the anticipated severity partly because of the expectation of resumed Soviet tests.

*Official and Public Reaction Nearly Identical*—There is so far little difference between the official and the public attitudes expressed in the various Western European countries. Spain and Portugal were most sympathetic to the US action, while the Finnish Government stated it opposes tests regardless of which power undertakes them. Canadian Prime Minister Diefenbaker issued a statement confined to decrying the failure of Geneva disarmament talks to achieve a solution which would enable nuclear powers to dispense with further testing.

ROA/-1-62

#### INITIAL FREE WORLD PRESS REACTION TO OPENING U.S. ATMOSPHERIC TEST

##### *Highlights*

1. The initial U.S. atmospheric test was given heavy press play and evoked substantial editorial comment. Although disapproval, dismay, regret and concern were freely expressed, the general tenor of free world press comment was mild and was marked by a tolerant understanding of the U.S. position as well as frequent moral support for U.S. action. None of the available comment has approached the level of anger and reproachment loosed against the Soviet Union at the time it broke the test moratorium.

2. Free world press comment—with few exceptions—exhibited a complete awareness of U.S. rationale for beginning its test series and placed a large share of the onus for the current situation on the Soviet Union. The one common and overriding concern of the free world's

press was the specter of a never-ending nuclear arms race which could lead only to disaster for the world.

3. The Japanese press—in marked contrast to current leftist-led demonstrations—continued to take a balanced approach to the question of U.S. tests. While making it clear that U.S. testing could never be condoned, comment emphasized that it was the Soviet Union which broke the test moratorium and has refused to accept international inspection. In Japan the primary fear was that an uncontrolled nuclear arms race would develop as a result of continued testing by either the U.S. or the Soviet Union. Comment from Nationalist China, South Korea, and the Philippines supported the U.S. decision.

4. Western European press comment generally expressed regret over the U.S. test but was clearly sympathetic with the U.S. view of its need for further tests and openly critical of the Soviet Union for its previous tests which broke the moratorium. Fear of a nuclear arms race was prevalent and particularly strong in Sweden.

5. From the Near East the limited comment available indicates that the U.S. was supported by the press in NATO/CENTO countries, while the Arab press was mildly critical of U.S. action. Published statements of leaders in India and Ceylon suggest that U.S. tests were “deplored,” but no severe criticism of the U.S. was included in these releases.

6. African press comment is mixed. There is a tendency to denounce U.S. testing within the context of disapproval of all nuclear testing. A few comments acknowledge some justification for U.S. action without giving up a strong opposition to all testing.

7. Skimpy comment from the Latin American press takes the line that U.S. testing is unfortunate but President Kennedy had no choice after the Soviets tested.

#### WESTERN EUROPE

The great majority of Western European media accepted the current nuclear tests by the US as an “unavoidable necessity” in order to safeguard its strategic and security interests. Moreover, the US was generally thought to have done all it could to avoid a resumption of tests, and failing this, to keep them below the danger-point of fall-out. Conversely, the leadership of the Soviet Union rather than that of the US was held responsible for the current series as well as for the new nuclear armaments race that may follow. Public opinion appears to be conditioned not only to the present US testing but also to a subsequent Soviet series of nuclear tests. Whatever concern was expressed centered on the period following the anticipated two rounds of testing and vented itself in suggestions for a new moratorium or a summit meeting. Criticism of the US action was confined to several of the leading socialist papers and, in a few instances, to the independent press.

The reason most often advanced in support of the US decision to test was that the Administration had "to restore the balance of power" and provide nuclear equality. Some papers went so far as to suggest that it would have been "irresponsible if the leading power of the West had not taken measures" to ensure this equality, in the absence of any controlled test ban agreement. The US decision was widely interpreted as necessary "to meet the military threat from Communism on any level anywhere in the world."

Many media concurred that the President had done everything in his power to delay the tests and that the US and UK had gone as far as possible in narrowing the differences precluding an agreement at Geneva. Papers also pointed out that the US had given plenty of advanced warning and made its preparations "in complete openness." In several instances the public was reminded that the Americans had "announced that virtually no radioactive fall-out will result from their tests."

While the US was thus largely exonerated, the USSR incurred criticism on three counts. Firstly, the unilateral and sudden break of the moratorium by the Soviets last fall was considered as having set in motion a chain reaction. The atomic blasts in the Pacific were considered "a logical consequence of the Soviet explosions in Siberia." Secondly, the Soviets were blamed for their intransigence at the Geneva conference. Thirdly, their pretensions to be the champions of disarmament were in reality only a pretext to hold on to their advantages in nuclear armament and deprive other countries of opportunities for similar development.

Some dissent to this prevailing view was expressed in major Socialist papers. The latter were inclined to argue that the reasons advanced by the US were not sufficient to justify a resumption of testing. The blame for the rotation of the "vicious circle" was laid equally to the US and the USSR and "their pretenses of assuring their security." In a few instances the US was charged with having made "unnecessary demands" in the question of international control of tests so that it could go on testing once an impasse had been reached at Geneva. At least one major non-Socialist paper argued that the plan of the eight neutrals could have been accepted by both super-powers and made the renewal of tests unnecessary.

Although support or at least acceptance of the US decision was widespread, there was a growing anxiety as to ultimate consequences of a renewed nuclear arms race. Concern was also registered as to the immediate consequences of US test resumption on negotiations in other critical areas such as Berlin where the situation seemed encouraging. Recommendations ranged from a new moratorium immediately after "Americans and Soviets have done with the series of tests" to the call

for a summit meeting. Media took some hope for such possibilities from the fact that US-Soviet contacts on issues other than nuclear testing had not been broken.

#### SELECTED QUOTES

##### *Unavoidable Necessity*

*The Times*, London, conservative

"Whether the next round of nuclear tests is followed by a test ban or by another phase of nuclear stalemate, the United States is giving an unmistakable lead to its Western allies in making ready to meet the military threat from communism at any level anywhere in the world."

*Der Tag*, Berlin, pro-government

"It would be irresponsible if the leading Western power would not have taken measures to insure nuclear equality, in the absence of any controlled test ban agreement."

*Goeteborg Handels och Sjöfarts Tidningen*, Goeteborg, conservative

"The Soviet Union has. . . left the Western Powers with no choice but to try to keep pace with the Russians."

*Nouvelle Gazette*, Charleroi, liberal

"The President could not permit the Soviets to profit from their experiments last fall, and he had to prevent them from basking in a dangerous nuclear superiority complex, which could have prompted them to commit a folly condemning all of humanity."

##### *Differences Between US and USSR Tests*

*Gazzetta del Popolo*, Turin, independent

"We deprecate US explosions as we deprecated the Soviet explosions but we would not be honest if we were to confuse the different responsibilities of the respective decisions."

*Helsingin Sanomat*, Helsinki, independent

"Preparations for the Novaya Zemlya detonations were made in complete secrecy, while the three atomic powers were negotiating on a test ban agreement and after they had agreed on a suspension of tests for the duration. . . . The United States, again, has made its preparations over several months in complete openness and has also made public the conditions under which it will cancel the tests. . ."

*Daily Telegraph*, London, conservative

"No decision could have been made with greater reluctance or been preceded by so much searching debate, and President Kennedy would be the last to ignore the impact on world opinion."

*Soviet Responsibility*

*Morgunbladit*, Reykjavik, conservative

"By violation of the three year nuclear test moratorium last fall, the Russians deliberately started a new nuclear testing race."

*Corriere della Sera*, Milan, independent-conservative

"Public opinion of the non-communist world will realize that responsibility for the rupture of the nuclear truce falls on the USSR which first resumed tests last fall."

*Daily Telegraph*, London, conservative

"The Americans insisted on an extremely small measure of international control as the basic condition of a ban. But Khrushchev refused to accept any form of international inspection even by neutrals. . . . But if the present clash is not to lead to a further acceleration of the arms race it is imperative to draw a line on nuclear testing."

*Sueddeutsche Zeitung*, Munich, left-center

"There is much at stake, and the US does not again intend to be exposed to the danger of being hindered in its weapons development by an uncontrolled moratorium. Washington has a well-founded fear that the Soviets would not hesitate to violate a second moratorium to gain a nuclear advantage—with all the dangers to peace that this would entail."

*Criticism of US*

*Avanti*, Milan, socialist

"The arguments put forward first by the USSR and now by the US are not convincing."

*Le Peuple*, Brussels, socialist

"Easing of tension is indivisible, and one cannot negotiate on the one hand and brandish H-bombs on the other. The effect upon the Geneva disarmament conference also threatens to be deplorable. Even more disastrous will be the effect upon the non-aligned nations."

*Arbeiter Zeitung*, Vienna, pro-socialist

"The mediation attempts of the neutrals have made it clear that America is creating conditions at least concerning the control of atmospheric nuclear tests which are not really indispensable and which evidently aim at Soviet rejection. It is apparent: America wants to carry out the test series in order to overcome the advantage which the Soviet Union achieved through its fall megatest series."

*Recommendations*

*Journal de Charleroi*, socialist

"The only reasonable solution lies in a summit meeting which could produce a new peaceful international climate."

*Le Monde*, Paris, independent

"In all capital cities, conviction is above all expressed that a quest for a nuclear test ban agreement is more necessary than ever, and hope that such agreement will become easier once Americans and Soviets have done with the series of tests which both have begun."

*Daily Telegraph*, London, conservative

"For the moment President Kennedy has taken the initiative and it would be well if he made it clear once again that these tests were meant not only to catch up with Russia, but to come to terms with it."

#### FAR EAST

Initial reaction from the Far East to U.S. resumption of atmospheric testing, while indicating widespread fear that renewed Soviet testing will follow, shows a large measure of support of the U.S. The action is generally recognized as a painful necessity imposed by U.S. responsibilities to the free world to maintain a nuclear capability at least on par with the Soviets. The Philippine press notes that the greatest hazard to be reckoned with is Soviet superiority in nuclear weaponry and not the immediate hazard of nuclear fallout. The resumption of testing by the U.S. was generally accepted as inevitable; however, rather widespread optimism was observed that the conclusion of the series could witness an earnest attempt by both sides to reach agreement on a permanent ban on testing. On the dissenting side, a Reuters release from Singapore quotes an official Singapore Government statement noting: "Non-nuclear countries like us feel it is all pointless, both in terms of insuring better relations between the two major powers and from the point of view of resuming these tests."

Heavy Japanese media reaction initially has displayed a balanced approach to the U.S. tests, assessing carefully both the U.S. test rationale and the Soviet role in the U.S. test resumption. Editorialists generally have agreed that President Kennedy sincerely desired to avoid testing and agreed to do so only because he considered it a military necessity. At the same time they have tended to agree that a large share of the responsibility for the U.S. resumption lies with the Soviet Union because of the latter's failure to accept a minimum of international inspection. The press has made clear, however, that it cannot condone the U.S. tests. The unique Japanese revulsion against all forms of testing, the fears of a nuclear arms spiral, and the doubt that the tests really are needed for free world security, have combined to prevent any possible condonement of the U.S. tests.

#### PERTINENT QUOTATIONS

*Philippines*

*Philippines Herald*, Independent, Manila, April 26:

In the Western world, there is actually greater approbation than disapproval of the U.S. tests. The U.S. decision to resume nuclear testing

was made reluctantly and only after every effort had failed to melt Russia's obduracy on the matter of concluding a foolproof test ban treaty with the West. It is now, in fact, generally believed that Russia's refusal to agree to international inspection is due to its desire to resume its own nuclear tests and to its determination to maintain secrecy of behind-the-Iron-Curtain military operations and activities.

That protest should continue rising around the world is only too understandable. The threat from radioactive fallout is always present and could have, for certain areas, if not for the entire world, the gravest implications, indeed. But against this threat must be reckoned the much greater threat to all mankind, should Russia be permitted to keep its gains and add up on its advantages in the nuclear weapons race.

*Manila Times* editorial, Manila, April 27:

The Soviets had tried, after completing their own tests last year with the explosion of a 50 plus megaton bomb, to bring world public opinion to bear on the Americans to stop them from following suit. The Soviet propaganda strategy, however, failed to achieve the desired effect even in the uncommitted countries, while America's allies in the cold war were more inclined to approve than otherwise.

But world public opinion may, without prodding from any quarter, yet be mobilized against nuclear testing, whether by the U.S. or the Soviet Union or any other nuclear power. The hope is that after the U.S., which is merely replied in kind to the Soviet experiments, has completed its current series, the Russians may decide to meet the West halfway on a workable disarmament plan and pave the way to an agreement to end all nuclear testing.

*Malaya*

*Straits Times* editorial, Kuala Lumpur, April 26:

Mr. Kennedy has had the choice of letting the Russians secure a nuclear lead, or bringing down upon himself the obloquy of a world which failed to prevent the Russian tests and failed to secure a test ban agreement. Mr. Kennedy in fact is given no choice.

When the U.S. and expected Russian counter series are over there may be an opportunity . . . of returning once more to the problem of a permanent ban. If by midyear Russian and American scientists and defense chiefs reach some sort of finality in their testing there will be a chance worth seizing.

*Singapore*

Singapore Government statement, April 26:

We regret very much that the United States should have resumed testing because it will only start a chain reaction of tests on both sides. . . . Nonnuclear countries like us feel it is all pointless, both in terms of insuring better relations between the two major powers and from the point of view of resuming these tests.

*Nanyang Siang Pao* editorial, Singapore, April 27:

American authorities have indicated they are prepared to listen to a barrage of attacks from the Eastern camp while awaiting whatever

criticism that may come from neutralist nations. But no matter what justification the U.S. may advance for resumption of its atmospheric tests, the Soviet Union will certainly have stronger reasons to conduct a series of similar tests.

. . . . In all fairness, one might say that while the U.S. atmospheric tests resumed at risk of alienating world sympathies, it is difficult to apportion blame on anyone when it is considered that the U.S. action was provoked deliberately by the Soviet Union and that Moscow is likely to do the same thing.

### *Japan*

*Asahi*, neutral, Tokyo, April 26:

Our appeal is about to be disregarded. This is extremely regrettable. It is not that we have forgotten about the Soviet's sneak blow last fall, and we are aware that the U.S. was saying until the very last moment that it would not test if the Soviets would accept the principle of international inspection and conclude a nuclear test ban agreement. We also know that Gromyko's address immediately before Kennedy's order to resume testing flatly rejected the idea of progressive zonal inspection to which great hopes were attached by many nations. We are aware of all these facts and yet we cannot bring ourselves to agree with the current decision to resume tests.

The main objection is that, regardless of what country carries them out, the tests themselves are evil. They pose issues transcending the question of whether they violate the principle of the freedom of the seas or the effects on the fishing industry.

It is not impossible that the U.S.S.R. might change its attitude at the last minute and agree to the principles of international inspection. The U.S. resumption poses a grave threat to the peace of the masses of the world. It will mean immeasurable political and moral loss for the U.S. Is it not the necessity to secure more firmly the moral strength that the U.S. enjoyed since the U.S.S.R.'s sudden resumption last fall.

*Mainichi*, neutral, Tokyo, April 26:

The U.S. finally decided to resume testing and this is most regrettable. This will put an end to the test ban negotiations now going on, and the Soviets will resume their own tests, and the U.S. will be made an object of world accusations for the time being. . . . Why was the decision made, and why has world opinion been so powerless in stopping the U.S. from resuming testing? Kennedy's March 2 address made it clear that the present test were decided upon out of military considerations.

Another reason may be found in the nature of world opinion itself. The U.S. Government leaders seem to think that world public opinion demanding the halt to the tests has not been truly fair. . . . When the Soviets suddenly resumed testing and threatened the world with a 100-megaton bomb, neutral nations at Belgrade and at the U.N. showed only lukewarm reactions without coming up with effective conclusions. As a consequence their position as the guardian of world conscience was greatly weakened. . . . We think that the only way to stop this

vicious circle of nuclear testing is for the Soviets to accept the principle of international inspection to which it had once agreed.

*Yomiuri*, neutral, Tokyo, April 26:

The excuse used by the U.S. and the U.K. [to resume testing] is that the U.S.S.R. cannot be trusted, and they say that the U.S.S.R. cannot be trusted because it broke the moratorium last fall. But the Soviets did not conclude a gentlemen's agreement; it was a unilateral declaration and breaking on its part. So this fact alone is a little weak as the greatest reason for resumption. Of course, the U.S.S.R.'s breach is outrageous and it must shoulder moral responsibilities, but why is it necessary for the U.S. to imitate the Soviet Union and to stand on the same moral level with the Soviet Union. It serves only to degrade the U.S.'s position in trust. . . . It appears that the world must face a limitless vicious circle.

### NEAR EAST AND SOUTH ASIA

Extremely skimpy reaction so far to U.S. resumption of nuclear testing has found support for the U.S. in the NATO/CENTO countries and was mildly condemnatory of the U.S. in the Arab states and South Asia. Prospects for the Geneva talks were seen to be grim.

#### *Blame*

NATO/CENTO countries laid full blame on the Soviets for their earlier resumption. Egyptian media pointed out that while each camp was blaming the other, both were equally to blame. Radio Israel said the U.S. was no more to blame than the Soviets.

#### *Consequences*

The USSR was generally expected to resume testing now. The climate at Geneva was expected to deteriorate and prospects for overcoming differences were believed to have dropped very low. World tension was thought to have increased.

#### Quotations noted:

*Al-Akhbar* (Cairo): "Each of the two camps is accusing the other of hating peace and preparing for war. Both are emphasizing in passionate words their own love for peace; but the world is fed up with words . . . and seeks. . . some sincere action for the sake of peace."

*Le Progres Egyptien* (Cairo): "Whatever the motives which inspired Washington's decision to undertake its series of tests and whatever the justifications, this American decision cannot facilitate an agreement at Geneva. The climate will now deteriorate rapidly, especially if Moscow puts its threat into effect and tries armaments of a new kind."

Baghdad Radio (quoting Communist *Al-Bilad* of Baghdad): "The nuclear tests are no less dangerous to us than to other peoples of the

world. . . . The policies of other liberated states will be dealt a blow as a result of the United States' nuclear tests."

*Wahdah* (Damascus): "What is the difference with respect to human values between 1962 A.D. and 1962 B.C. if this fighting continues between states?"

Jerusalem Radio (Israel): "When the Soviet Union resumed its nuclear tests last September, there was no room for doubt that the United States would be compelled to follow suit. The Soviet Union resumed its tests while nuclear test ban talks were in progress in Geneva. The United States did the same."

*Kathimerini* (Athens): "The two Western powers (US and UK), after resumption by USSR of A-testing last September, cannot possibly hold to the status of 1958 and respect a tacit agreement. Because they can no longer have confidence in the Soviet Union. Any superiority in A-tests, especially in the field of missiles, could overthrow the nuclear balance now existing between East and West."

Ankara Domestic Service: "Moscow's reaction to the resumption of tests has been as strong as it is unjustified. . . (Moscow) has completely forgotten that last September Soviet Russia held a series of tests while negotiations were going on."

Tehran Domestic Service: "The new American tests in the earth's atmosphere are of great importance from a military point of view because they will prove US superiority over Russia."

*Amrita Bazar Patrika* (Calcutta): "It is more than likely that the first U.S. explosion on Christmas Island will signalize the disbanding of the Geneva Conference."

*Rozana Hind* (Calcutta): "If the U.S. test explosions are made, the Soviet Union will surely follow suit. This will lead to a new nuclear test race which will sabotage the Geneva Conference and endanger the health of the people."

#### AFRICA

Limited available African comment is mixed. While there is denunciation of the U.S. resumption, there is also some restrained approval coupled with regret for the necessity of the tests.

In North Africa, *Moroccan* comment has linked French nuclear testing in the Sahara with the Russian and American resumed testing, and charged that the new United States testing has opened the door for an "unrestrained" atomic race. The Provisional *Algerian* Government's press service has reported that U.S. tests have been condemned by all "peace-loving" nations.

In West Africa, *Nigerian* Prime Minister Balewa said the United States has the "backing of my government," in its renewed testing. He

argued at a news conference that after Russian testing no one had a moral right to condemn tests by the United States which sought only to maintain the balance of power essential to preserve peace. He reiterated, however, his government's disapproval of testing in general, viewing tests as, "a bad thing for the whole world."

Two days before the tests began, *Ghanaian* media concentrated on a denunciation of all testing. The opposition *Ashanti Pioneer*, however, has blamed the USSR for the U.S. step.

Constant news and editorial coverage in *Ethiopia* held out hope for a test ban until shortly before testing by the United States was resumed, repeating the demand of Ethiopian Minister of State for Foreign Affairs Ato Ketem Yifru that Ethiopia ". . . wants no nuclear tests anywhere."

### SELECTED QUOTATIONS

#### MOROCCO

*Al Alam* (pro-government daily):

"The resumption of testing reopens the door to the East and West to display all their bombs in an unrestrained race of the atom for war uses instead of peaceful ones. Whatever may be the political factors in the United States which dictate this course, such experiments damage world peace.

"The whole world will react with the same indignation it showed several months ago over the Soviet tests."

Moroccan Ambassador to the United States;

"Quoted in the *Washington Post* (April 26) as saying that the United States tests resulted from a "vicious circle" started by French tests in the Sahara in 1959. He said the Russians had used this as an argument for their resumed tests and the American tests were a, "logical development."

#### ALGERIA

*Algeria Presse Service* (published by the Ministry of Information of the Provisional Algerian Government):

The bulletin said (April 26) that the resumption of nuclear tests by the United States, "has been violently condemned by all peace-loving nations."

#### NIGERIA

Nigerian Prime Minister at an April 26 press conference:

The United States test resumption "has the backing of my government."

"The balance of power between East and West must be kept if there must be peace. After Russia acted, nobody had a moral right to

prevent America from carrying out tests. This, of course, does not change the attitude of my government to nuclear testing generally. We are opposed to it because it is a bad thing for the whole world."

#### ETHIOPIA

*The Ethiopian Herald* (official government daily) April 20:

"Given the moderating influence of the uncommitted world, however, a hybrid form of a test ban plan, accommodating the views of all on this vital matter, is always possible."

#### GHANA

*The Ashanti Pioneer* (independent but censored) April 25:

"Where lies the blame (for testing today)? If Russia had agreed to the terms of open inspection of arms internationally, so that no secrecy could prevail, if the Russians sincerely welcomed disarmament, that was the safest ground they could have trod and we plead for a second thought of the plan." The paper added that no plan was as fair and just as that of the United States offered at Geneva.

*Radio Acera* April 23:

(In a long editorial on the Bertrand Russell proposal for neutral ships to enter the test area), "History will mark out the efforts of men of good will to restore sanity in a world virtually gone lunatic and quench the nuclear fire which threaten to raze our universe to the ground."

*Ghanaian Times* (government) April 23:

"The world is in danger of destroying its own foundation and burying itself under the debris of its shattered structure."

#### LATIN AMERICA

Latin American reactions have been slow, mild and rather understanding, with the exception of Cuba. Regretting that the nuclear race is on again, two leading dailies (*Estado de São Paulo* and *El Comercio*) recalled that it was the Soviet Union who broke the moratorium, leaving President Kennedy no alternative. A statement from the Brazilian Foreign Ministry simply expressed disapproval of all nuclear tests. The Cuban agency *Prensa Latina* is following the Soviet line.

**BRAZIL:** The Foreign Ministry issued a statement on April 25 recalling that it had "expressed the regret and apprehension of the Government of Brazil" when "the Soviet Union carried out thermonuclear tests last October, and when President Kennedy on March 3 announced that the United States intended to resume tests of the same type in the near future." The note stated that "Brazil receives with disappointment the report of the first explosion in the new series of US thermonuclear tests" and that "Brazil will not cease to call for prompt suspension of these tests."

---

*O Estado de São Paulo*, dean of the Brazilian press and the country's most influential daily, said on April 26: "The tests would not have been resumed if the USSR had listened to the appeals of the West—and also of the really non-committed neutrals—to accept the basic principle of inspection. . . . Yesterday's explosion in the skies of Christmas Island and all following tests are amply justified by the explosions of last September and October in Nova Zembla, when the Soviets surprised and defied the world, breaking the so-called nuclear moratorium overnight. At least the North-Americans are not violating anything."

*PERU: El Comercio*, one of the country's largest and most influential dailies, said on April 25: "The Soviet Union with its powerful explosions of last year tried to gain the upper hand in this field. Russia has forced the United States to continue the dangerous race."

*CUBA: Castro's news agency, Prensa Latina*, said on April 26: ". . . The device was dropped from a plane of the so-called Strategic Air Command. This mode of experimenting is similar to the method used for the first and only time in world history, in August 1945, during the administration of Harry S. Truman, when atomic bombs were unleashed on the Japanese cities of Hiroshima and Nagasaki—considered to be non-strategic objectives—causing the deaths of tens of thousands of persons."

May 1962

128. Memorandum from Raskin to Bundy, May 7<sup>1</sup>

May 7, 1962

SUBJECT

The ACDA paper entitled "The Economic and Social Consequences of Disarmament"

The paper prepared by ACDA on the economic and social consequences of disarmament makes a good argument for the position that the United States will be able to utilize its resources now used for defense for alternative purposes in case disarmament is achieved. A variety of economic methods are outlined for putting resources to work in both the private sector (tax cuts) and the public one (urban renewal, education, natural resources, health services, Social Security). The report outlines the possibility of increased expenditures on foreign aid.

The paper also touches on structural adjustments which will occur in certain industries. For example, Washington, California, certain New England states, New Mexico, Utah, Alaska, Hawaii, are rather heavily dependent on defense expenditures, and would be dislocated economically to some extent. As a result, the report suggests that programs will have to be undertaken in these particular areas to allow for easier conversion than would otherwise occur without planning.

For a variety of reasons, basically because the paper is an answer to an inquiry from the Secretary General, there is no discussion of the difficult political and educational problems involved in reconversion. An important element in the disarmament process is the psychological one of making people understand that individual defense interests will not fall to pieces economically in the event of disarmament. The only real way this can be proven to the defense groups is to get them interested and involved in the planning process for disarmament.

One specific way of doing this is through the involvement of the CED, that wonderful syndical organization which did an excellent job after the second world war, preparing a prosperous peace-time economy, psychologically, politically and economically. I have spoken with Mr. Foster, an active participant in CED, about the possibilities

---

<sup>1</sup> Views on ACDA's paper on the Economic and Social Consequences of Disarmament. No classification marking. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, 18-Nation Conference, Geneva, 5/62-6/62.

of getting them interested in problems which have to do with economics of disarmament. I suggested that the CED undertake research and proselytizing on the question of economics of disarmament. He agreed and will urge the CED to undertake such action this weekend.

It is unfortunately the case that ACDA is not doing anything of significance in a substantive or research way with respect to the economics of disarmament. At present, ACDA has one person who I understand is competent on this question. His name is Kiefer, a political economist, who is in the Foreign Service. As you know, the ACDA table of organization calls for an Assistant Director in Charge of Economics. This position as yet has not been filled, nor is there anyone on the staff level working in the agency on these questions except Kiefer. Yet, the strong implication of the report prepared by ACDA suggests that a group within the government should be working, research- and planning-wise on questions which have to do with the economics of disarmament—as well as stimulating other groups outside the government to work on these same questions. This has not been done by ACDA, and beyond my discussion with Foster no plans exist for such an undertaking.

Thus, what is a difficult but manageable problem,—the economics of disarmament—becomes unmanageable and almost insurmountable, because the economic interests directly involved do not think and plan ahead in any rational fashion. The natural result, of course, is that people then think that disarmament is impossible for parochial economic reasons and work against it as a national security policy.

May 31, 1962

**SUBJECT**

NIE on Soviet Nuclear Weapons Stockpile 1962–64

1. The “billboard” effect of this NIE is that the Soviets, in the US estimate, are about 4–5 years behind us in their thinking on a suitable nuclear strategy, but their planning may not evolve along the same lines that ours has.

2. The major divergency in US and USSR thinking concerns tactical nuclear weapons. The Soviets apparently will not have, by 1964, incorporated low yield (fractional kiloton) nuclear weapons into their inventory; the lowest yield we credit them with is 3 KT. (Chart, p 32). Since 1958 the Soviets nevertheless have emphasized more the use of nuclear weapons in support of field forces (p 13). Furthermore, the indications are that this emphasis will increase in the future (p 27). Thus at a time in which US planning calls for a decreased emphasis on tactical nuclear weapons, Soviet thinking is calling for an increased one. The implications of these divergent trends have not yet been fully explored. They should be; hopefully the study on tactical nuclear weapons will do so. Also, if the Soviets find they cannot fight using large yield tactical weapons because of fear of self-inflicted damage on USSR troops, our possession of low yield weapons could possibly give us a step in escalation not open to the Soviets. This also should be looked at.

3. Other points of interest in the NIE are:

a. Soviet military policy places a high priority on preparedness for general war, which the USSR planners assume would commence in most cases with massive nuclear attacks on the homelands of the opponents. They do not conclude that this exchange would necessarily decide the outcome of the war (p 6).

b. By mid 1962 it is estimated the Soviets will have 800–1200 aircraft delivered nuclear weapons; 35–50 operational ICBM launchers (100 ICBMs); 350 MRBM and IRBM launchers (1000 IRBMs and MRBMs); and 35 missile launching submarines (100 SLBMs). (p 11)

c. Considering all factors, the Soviets will have between 2000 and 3000 nuclear weapons to support theater forces, with a total yield between 70 and 130 MT (p 17).

---

<sup>1</sup> Evaluation of NIE on Soviet Nuclear Weapons Stockpile. Top Secret. 2 pp. National Defense University, Taylor Papers, WYS Chron File, July–September 1962.

d. The general trend in yields of weapons for Soviet offensive delivery systems will be upwards (p 22).

e. By mid 1964 the Soviets are estimated to have 150–275 operational ICBM launchers; 450 IRBM/MRBM launchers; 35 SLBM submarines. About 700 missiles for long range attack thus will be added to the Soviet forces (p 25). (Note: This means evidently that the Soviets will have some 1900–2000 ICBMs, IRBM/MRBMs, and SLBMs by mid 1964 plus 800–1200 aircraft delivered weapons.)

f. Soviet nuclear testing indicates continued interest in the development of nuclear weapons for air defense purposes. It is estimated that the Soviets could deploy an AICBM for defense against missiles of 50–500 n.m. in 1963–64, and against ICBMs 1963–66. Both systems will almost certainly employ nuclear warheads (p 28).

g. The NIE makes one reference to the Soviet planned use of CW weapons (p 13).

4. Soviet use of nuclear weapons for defense against missiles and aircraft—as well as our own—raises the real possibility that the first use of nuclear weapons in any limited conflict may be in an air defense role. Would the US be willing to have its conventional missile and aircraft offensive capabilities rendered ineffective by nuclear weapons without using such weapons in return? Would the Soviets? The effects of these possible developments on possible escalation of the conflict is another area worthy of exploration.

W.Y.S.

June 1962

130. Memorandum of the President's Decisions, June 20<sup>1</sup>

June 20, 1962

MEETING ON NUCLEAR TESTS

1. The President announced his objective of completing the current series of tests by 20 July although recognizing the possibility of slip-pages due to weather and other causes.

2. The President concurred in the view that the highest priority should be accorded the Starfish and Blue Gill test shots.

3. The President approved the following test shots and target dates:

Starfish Prime (1.4 MT at 400 Km) —4 July  
Blue Gill Prime [*text not declassified*]*—19 July*

It is understood that weather conditions may cause some slippage in this schedule and that Blue Gill Prime may be as late as 26 July.

4. The President is reconsidering the necessity for conducting the Urraca test shot ([*text not declassified*] at 1300 Km), which could not be conducted earlier than 4 August under the most favorable circumstances, and will decide this matter shortly.

5. The President took note of the decision of the Department of Defense not to press for the inclusion of the Kingfish test shot [*text not declassified*] in this test series.

6. The President reviewed the schedule proposed for the remaining tests to be conducted at the Nevada Test Site. He authorized two tests that had previously been approved for readiness planning only—Little Feller 2 ([*text not declassified*] surface) and Johnie Boy (500 Tons-shallow underground).

7. The President approved the following test shots and target dates:

Sedan (100 KT—underground cratering) —6 July  
Small Boy ([*text not declassified*] surface) —8–18 July<sup>2</sup>  
Little Feller 2 ([*text not declassified*] surface) —9 July  
Johnie Boy (500 Tons—shallow underground)—12 July

---

<sup>1</sup> Decisions on various aspects of nuclear testing. Top Secret. 2 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Weapons Testing, 4/5/62–7/30/72.

<sup>2</sup> This test should be as late as possible consistent with safety requirements and allowing for weather; it should not be later than the last test in the Pacific, unless unusual weather delays require a short overrun.

8. The President deferred authorization at this time of Little Feller 1 [*text not declassified*] surface) proposed for 24 July if it cannot be held before Blue Gill Prime. He will decide this matter at a later date when the schedule appears more firm.

**McG. B.**

July 1962

131. Memorandum from McNaughton to Nitze, July 3<sup>1</sup>

July 3, 1962

SUBJECT

Test Ban

There was a meeting this afternoon at ACDA in which we discussed the three papers that Captain Foster gave you this morning. The following consensuses were reached:

1. *Atmospheric Test Ban*. There is general agreement within the Government favoring an atmospheric test ban and that it is all right to hand an edited version of the draft you have to the British on Thursday. I added DOD caveats about outer space and underwater testing; on Lee Haworth's suggestion, all reference to the possibility of extending the proposal to underground was deleted. It was also understood that the annex, relating to detonations for peaceful purposes, would not be handed to the British. Butch Fisher agrees to have a revised atmospheric test ban draft to us by July 6 so that we can send it to the Chiefs. One thing which troubled me with respect to the atmospheric ban was the ambivalence of some of the people about the importance of underground testing. Several of us tried to make it clear that approval of the atmospheric ban was based on the assumption that underground testing would continue; others insisted on separating the issues as if they were not connected.

2. *Comprehensive Test Ban*. It was agreed that no paper would be handed to the British representing a comprehensive test ban treaty draft. It was agreed, however, that the issues would have to be discussed with the British—the extent to which “national” systems can satisfy the detection requirement, and the manner in which we get the requisite on-site inspections. There was a small explosion when it became apparent that ACDA was in the sixth revision of a comprehensive test ban treaty draft and had showed earlier versions to the British. However, the point was made that the paper and the principles underlying it would have to be considered by the various agencies before it could be handed even to the British.

3. *Detection Capabilities Memorandum*. It was agreed that Frank Long's memorandum discussing detection capabilities and suggesting the possibility of a system of twenty to thirty high-quality stations, could be handed to the British on Thursday.

John T. McNaughton

---

132. Telegram 378 to London, July 17<sup>1</sup>

July 17, 1962

Please pass soonest following message from Secretary to Lord Home in reply to latter's note of July 15 rptd septel:

QTE I am happy to have your report about agreement among the scientists on the new findings produced by the VELA project research efforts. We also are hopeful this can lead to important developments in the nuclear test ban negotiations.

We are still in the process of working out basic positions and language for a possible new draft treaty. While we are proceeding as rapidly as we can with our consultations within the US Government, I am very doubtful that we would have a draft treaty available for submission to the Conference during the time that you and I will be in Geneva.

The operating plan we discussed with your Delegation representatives who came to Washington earlier this month was designed to give us time to assess the new data more carefully, to consult with Congress and to make sure that the language we would put in a draft comprehensive treaty would in fact provide adequate assurance of a control system which would protect our interests. Ambassador Dean has now informed the Conference that we will present this data and he indicated fairly clearly that we will not have a new proposal ready before the technical data has been laid before the Conference and its significance explored.

I agree with your identification of the prime political questions to be faced and look forward to discussing them with you when we meet in Geneva. Our present thinking is that the number of on-site

---

<sup>1</sup> Text of Rusk letter to Home on Geneva issues. Top Secret. 2 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Secretary Rusk's Conversations with U.K. Officials, 1961-1962, Vol. 1.

inspections and the number of detection stations depend to an important degree on technical judgments not yet formulated within our Government.

I hope you will understand our position here. We are doing our best to produce a treaty based on the latest technical evidence. We have not, yet, however, taken the basic political decision that modifications should be made in our previous position as represented in the April 18, 1961 treaty draft. Until we have arrived at a judgment on this question, all our discussions must be, for our part, tentative and exploratory. UNQTE.

**Rusk**

**133. Letter from Rep. Holifield and Sen. Jackson to President Kennedy, July 25<sup>1</sup>**

July 25, 1962

My dear Mr. President:

The Joint Committee on Atomic Energy held an executive session on July 19, 1962 to review the latest developments in the field of detection and identification of nuclear explosions and on July 23, 1962 to be briefed on the current status and future plans regarding the nuclear test ban.

The Committee very much appreciates the cooperation of the responsible officials in the Executive Branch who participated in the hearings and particularly Mr. William Foster, Director, Mr. Adrian Fisher, Deputy Director, and Mr. George Bunn, General Counsel, of the Disarmament and Arms Control Agency, who have been most diligent in keeping the Joint Committee informed on a current basis of developments within the Agency's jurisdiction.

We have noted that in your press conference on Monday, July 23, you indicated that you expected to reach a decision by the end of this week as to any changes in the United States' position on the test ban negotiations. In order that you and your staff may have the flavor of the Joint Committee's discussion of these problems, we are transmitting a copy of the transcript of the hearings separately to Mr. Bundy.

---

<sup>1</sup> Concern regarding U.S. negotiating stance on the test ban talks. CIA Files, DCI, ER Subject Files, Congress.

We are setting forth below our personal views based on these hearings and long experience with previous changes in U.S. scientific data and political positions on the test ban:

1. We believe any decision on a change in position should carefully take into account the recent Soviet announcement that the USSR would resume testing. It would seem prudent to believe that the Soviets will reject everything until their coming series is completed. It would also seem prudent for the United States to await the results of the Soviet test series before placing ourselves in a position whereby we would not be able to test.

2. Based upon the testimony at these recent hearings and previous extensive hearings, there does not appear to be any significant change or breakthrough in the technical capabilities of detecting and identifying clandestine nuclear weapon tests. Despite the relatively large amount of technical data obtained in conjunction with our current test series coupled with other analysis, it is evident that our knowledge is too preliminary in nature to constitute the basis for any political change in our negotiating position at Geneva. Both the ARPA press release of July 7 and Dr. Ruina's statement to the Joint Committee on July 19 stated that the results to date were of a "preliminary" nature. We believe it is very necessary that all data be carefully checked and rechecked in view of past serious errors.

We know from past experience that scientific findings, whether they are called preliminary or final, are not immutable. The hearings held by our Committee over the years corroborate the fact that scientists have had to change their position consistently because of new developments that scientific research has given us. As we know, there are a number of recent classic examples in this field.

Our major cause for concern is the danger that, because of certain preliminary scientific findings, we will make a radical change in our approach to an agreement on a nuclear test ban—that radical change being to give up our insistence upon a true international control system of detection and inspection, including international control stations on Soviet territory.

There could be nothing more dangerous than to make a hasty change in a fundamental principle of arms control because of a preliminary scientific finding.

3. Notwithstanding the many and extensive concessions made by our negotiators during the past three and one-half years, the USSR remains adamant in its refusal to permit internationally manned stations and realistic inspection of significant events in the USSR which are essential to an adequate control system. We believe the idea that our negotiators must continue to make major concessions is unrealistic.

4. In his testimony to the Joint Committee on July 23, Mr. Foster discussed the various alternatives under consideration. Certain significant omissions were made, including:

a) The previous U.S. proposal of a joint U.S.-USSR coordinated research program for improving technical capabilities of detection has apparently been dropped. We would certainly hope that our negotiators will not retreat from the position that current technical know-how is still inadequate and continued research is required. In this connection, adequate attention must be given to the possibilities that concealment techniques may also advance.

b) There was no indication of any means of surveying Soviet territory to determine anomalies as shown by the GNOME shot.

Please be assured of our continued interest in these problems and our desire to be of assistance to you and your advisors in determining that action which is best for the United States and the Free World.

Sincerely yours,

**Chet Holifield**  
*Chairman*

**Henry M. Jackson**  
*Chairman, Subcommittee on Military Applications*

#### 134. Memorandum for the Record Prepared by McCone, July 26<sup>1</sup>

July 26, 1962

##### ATTENDED BY

Secretary Rusk, presiding; McNamara, Lemnitzer, Nitze, McNaughton for DOD; Foster, Fisher for Disarmament; Bundy, Wiesner, White House; Rostow, State; Murrow, USIA; Seaborg, AEC; McCone, CIA

Foster outlined in broad terms the proposed atmospheric and comprehensive treaties.

Rusk raised questions concerning the tentative nature of technical data. Wiesner supported data as dependable and stated scientific findings will improve with time and not retrogress.

---

<sup>1</sup> Discussion of atmospheric and comprehensive treaties by Committee of Principals, July 26. Secret. 4 pp. CIA Files, Job 80B01285A, DCI Memos for Record, 4/9/62–8/21/62.

McNamara raised two unknowns: (1) The level of threshold of any system and the number of unidentified natural events all of which related to the risks of a treaty with imperfect verification and second, the amount of weapon advance that the Soviets could make by operating below the threshold which he placed at about 14 KT.

Seaborg answering the second question stated that great developments could be done under 14 KT [*text not declassified*] (a) Development of small tactical weapons; (b) [*text not declassified*]; (c) [*text not declassified*]; (d) Partial but incomplete information on weapons effects. Underground technology has advanced; results have improved.

Foster questioned whether the USSR would run the risk of being caught by cheating. Comprehensive treaty was entered. This was supported by Wiesner.

McNamara stated that nevertheless we must weigh the risk even if the Soviets cheated at half the indicated threshold or 7 KT.

Seaborg then advanced strong argument of maintaining underground testing to preserve the vitality of the laboratories. He was joined by Haworth.

Rusk then asked the question of "do we all agree that our interests are served by stopping testing, if all parties stopped and the suspension can be verified?" There was no dissension.

Rusk then reporting on Geneva, stated that (1) there was an atmosphere of expectancy of a major change in U.S. policy because of the Vela announcement; (2) We must not put out proposals for propaganda purposes as this hurts us rather than helps us. (3) We must be prepared to live with any proposal we put forth. (4) Unfortunately, each new meeting creates an expectancy that the United States will come forward with new offers or new concessions.

Rusk therefore summarized the two main approaches: (1) A comprehensive treaty tabled complete with the indicated number of inspection stations; their locations and the number of on-site inspections and the full explanation of the reasoning. (2) Recognized the Soviet attitude of forbidding on-site inspection and therefore while we want a comprehensive treaty, this basic issue must be resolved with the Soviets first and therefore we proposed to start with an agreed atmospheric treaty which would include outer space and underwater tests and would depend entirely upon a national detection resources and no inspection would be required in the territories of the other party.

McCone reviewed briefly the history of several such proposals previously made in 1959 and 1960 and therefore stated that he felt an atmospheric ban would not be agreed to by the Soviets.

Foster, Rusk and Bundy felt previous offers had been linked with other agreements for research or for the installation of control posts

and that we at no time had made a straight offer to suspend atmospheric tests with no conditions.

NOTE: A review of history indicates that this is correct except that in 1959 President Eisenhower in writing to Macmillan actually made an atmospheric test suspension offer free of other entanglements. Murrow indicated that it might be a good idea to repeat our position and McCone agreed.

Rusk then reported on Gromyko talks indicating a rising concern on the part of Gromyko over proliferation, stating that both U.S. and USSR have a common interest against proliferation. Gromyko complained about our plans for multilateral (NATO) forces interpreting them as a device to proliferate weapons to several countries including West Germany. Rusk encountered some difficulty in disabusing Gromyko of this but felt he finally succeeded.

McCone then discussed question of whether atmospheric suspension and a continuation of underground testing would halt proliferation, stating that all nations who wished to develop a nuclear capability could do so with underground testing. Wiesner joined in this viewpoint. It was the consensus that this was probably true but nevertheless was worth a try. Rusk then brought up the question of our policy on insisting upon on-site inspection as a part of the comprehensive treaty. He asked if anyone in the room felt that we could proceed with a comprehensive treaty that provided zero inspection. No one felt this would serve our interests and would involve dangers that we should not accept. Therefore, Rusk concluded that unless the Soviets waived their position in opposition to on-site inspection we are simply not in business with respect to a comprehensive treaty. All agreed and it was agreed that this would be reported to the President at the meeting on Friday.

Bundy emphasized that the new technical findings as he understood them did not permit a treaty with no on-site inspections. Others concurred. There was complete unanimity on this point. It was the most important point made at the meeting.

McNamara then raised the question of the two risks or dangers faced by the United States: (a) Risk to the U.S. if the Soviets beat the system and cheat. What will they accomplish and what will that mean to our security. (b) Risks to the United States if we do not make a Treaty, continue testing with the result that there will in all probability be a continual proliferation of weapon capabilities. He mentioned specifically West Germany, Italy, Israel, Japan, and India, pointing out that all now have reactors and hence were producing plutonium. [It was agreed that an appraisal as proposed by McNamara should be made.] Wiesner took this occasion to press for a comprehensive treaty, proposed an assessment of risks and urged that the atmospheric treaty

be used as a fall-back position if the Soviets continue to oppose on-site inspection.

Bundy then stated that as a matter of policy we are to continue underground testing in Nevada until we have a comprehensive treaty. There is no intention to stop the AEC and DOD from further underground testing; indeed, a new series of underground tests has been approved by the President.

McNamara then raised the question of continuing preparation for atmospheric testing in the event of a suspension. Bundy and Rusk stated that we must maintain readiness for further atmospheric testing even though agreement is reached to suspend atmospheric testing as we must anticipate a circumstance under which the Soviets would suddenly confront us with a series and would abrogate a treaty in order to proceed. It was agreed that maintaining a state of readiness would be difficult; that a great many things could be done secretly so that the lead time for a test series would always be at a minimum. All agreed that such a procedure should be followed as a matter of policy. Rusk proposed that State and DOD work jointly in this area.

In summary, it appeared to me that the meeting was unanimous that we should not engage in a comprehensive treaty without provisions for detection stations on Soviet territory and if necessary on-site inspections, taking into account Vela results. Under no circumstances should we agree to a treaty which did not provide proper verification and this called for some on-site inspections. All agreed that an atmospheric ban depending on national detection resources was satisfactory. All expressed very great concern over the proliferation of weapons and equated this danger to the risks of Soviet clandestine cheating on any comprehensive treaty. Finally, there was unanimity in the views which should be presented to the President.

NOTE: Since Khrushchev as recently as yesterday repeated his adamant objection to on-site inspections, it appears that a comprehensive treaty is futile. From my four years' experience with this negotiation, I feel a proposal for an atmospheric ban alone will be rejected by the Soviets and therefore question whether the Geneva conference will meet with any success at all.

The meeting then dealt with two or three other disarmament issues as set forth in the papers, on which there was no disagreement.

**John A. McCone**  
*Director*

**135. Memorandum of NSC Meeting, July 27<sup>1</sup>**

July 27, 1962

## ATTENDED BY

The President, Vice President, SecState, Foster, Murrow, Bundy, Wiesner, Etc., etc.

1. Rusk reviewed the comprehensive and atmospheric treaty indicating fewer number of stations required in Soviet Union and only 12 on-site examinations. However, Soviets still say no on on-site inspections, therefore number not negotiable and if we put forward a number the neutrals will attempt to reduce it by negotiation. Rusk referred to Congressional problems and other difficulties of a comprehensive treaty. In this connection the Soviet stations would be manned by nationals but with an international observer.

2. Rusk therefore turned to alternate proposal of atmospheric ban with no on-site inspections as a starting point with an understanding that we and the Soviets would work towards the comprehensive agreement when we reached an understanding on the inspection posts on Soviet territory and the on-site inspection problem.

3. The President raised the question of justifying 12 on-site inspections and also expressed concern over an atmospheric ban which the Soviets might accept effective January 1, 1963, and leave us in a difficult position if they demonstrated very important technological advances in their forthcoming tests.

4. There was an extended discussion of the proposed 25 world-wide station lay-out with five posts in the Soviet territory as contrasted with the original Geneva program of 180 stations with 19 in the Soviet Union. Wiesner stated the new system was not as good as the old Geneva system, based on old technology.

5. The President emphasized, and all agreed, that we must have on-site inspection even though the number might be reduced. He then asked what would be a satisfactory treaty. Wiesner responded that he thought something in the order of six to nine on-site inspections would be satisfactory.

6. McNamara spoke of the high threshold, indicating possibility of Soviet clandestine testing under 14 kilotons. Seaborg answered the

---

<sup>1</sup> Discussion of Soviet refusal to allow on-site inspections and Geneva negotiating strategy. Secret. 2 pp. CIA Files, Job 01676R, DCI Files, ER Subject Files, NSC etc, 7/1/62–7/31/62.

President's questions on this subject in the same way as he did in yesterday's Principals Meeting.

7. McCone stated that the Rusk proposal for atmospheric ban and the reasons for it were almost identical to President Eisenhower's proposal to Khrushchev by letter on April 13, 1959, which McCone read. McCone further stated that in his opinion continuing underground testing by one or more nations would not foreclose proliferation of weapons among other nations, indicating West Germany, India, Japan, Israel, and others could proceed with their developments using the underground techniques.

8. McNamara spoke of the comparative risks to our security versus loss of security and safety if other nations acquire nuclear weapons. President ordered a study made of these relative risks.

9. The President seems to favor stopping all testing because of the danger of proliferation and spoke of the technological advances as being infinitesimal.

10. There was an extended discussion of negotiating technique and it was decided to bring Arthur Dean back this week end for conferences Monday and Tuesday.

11. Rusk repeated United States position that we must have on-site inspection and if the Soviets continued to refuse, there was no possibility of reaching agreement on a comprehensive test ban.

**John A. McCone**  
*Director*

---

**136. Memorandum for the Record Prepared by McCone, July 27<sup>1</sup>**

July 27, 1962

Dr. Edward Teller called at my home at 1:30 on July 27th; expressed concern over the possibility that we were going to enter a moratorium of a test suspension without reasonable means of verification.

I discussed at some length the two risks, one being the loss of our nuclear superiority if we stopped and Russia proceeded clandestinely; the other being the dangers inherent in nuclear proliferation. I told Dr. Teller that there was no danger of our entering an agreement which

---

<sup>1</sup> Meeting with Dr. Teller regarding verification issue. Secret. 1 p. CIA Files, Job 80B01285A, DCI Memos for the Record, 4/7/62-8/21/62.

would suspend all testing unless reasonable means of verification were agreed upon.

Dr. Teller then spoke of the enormous developments possible as a result of the breakthrough in the [*text not declassified*] experiment. I told Dr. Teller I did not feel that the true significance of this breakthrough was understood and that he should be sure Seaborg and Dr. Harold Brown fully appreciated this fact and brought it to the attention of their superiors and to the President.

**John A. McCone**  
*Director*

---

**137. Memorandum of Discussion Prepared by McCone, July 27<sup>1</sup>**

July 31, 1962

Dr. Northrup stated he was in difficulty because of criticism of his handling of newly developed information on seismic detection, and this concerned him because he followed the procedures that he and Dr. Romney had followed for many years. Northrup pointed out that although he was responsive to General Rodenhauser, who in turn reports to General Breitweiser, who in turn reports to General LeMay and the Secretary of the Air Force, nevertheless traditionally he had always consulted directly with all sections of the Executive Branch of the Government, and had testified regularly before interested committees.

Indications of improved detection capabilities was controversial and hence he had gotten in bad. Northrup left me with the impression that recent technology improves our seismic capability and therefore reduces the number of stations and probably the number of necessary on site inspections, without increasing the hazards. However, I was left with the impression that Northrup felt that Mr. Foster and Dr. Long in testifying before the Joint Committee and others had seized upon the improvements and had not mentioned the fact that the same scientific information proved an increased ability to deceive the system; and furthermore that the unknown geological phenomena proved that the direction finding capability of the seismographs was not as great

---

<sup>1</sup> Meeting with Dr. Northrup on seismic detection technology. Secret. 2 pp. CIA Files, Job 80B01285A, DCI Memos for the Record, 4/7/62–8/21/62.

as was thought and this raised a question as to the effectiveness of on-site inspection. Dr. Northrup stated that although all of his actions were known to Mr. McNaughton, apparently they irritated General LeMay, but more particularly General Breitweiser, who ordered General Rodenhauser to remove Northrup, assigning him to the position of chief scientist, and placing a Colonel in charge of AFTAC. This resulted in an indication that five key people would resign; hence the order was rescinded by General Breitweiser and Northrup was ordered reprimanded. Also Northrup was ordered not to give any information outside of the Air Force without General Rodenhauser's approval. Later an exchange between Rodenhauser and Mr. Fisher removed this injunction and resulted in an arrangement where AFTAC and ACDA could work together but that General Rodenhauser and General Breitweiser wished to be informed of the requests made of AFTAC for information and the information which would be given.

The sense of Northrup's decision was that he felt AFTAC was an extremely important national facility, that information developed by it must be made known currently and accurately and fully to many departments of government, that he had acted in a traditional and established manner and with the knowledge of Mr. McNaughton, and that he felt he should continue to do so if AFTAC was to serve various departments of government, most particularly CIA, in the future as it had in the past. He therefore hoped that he could find some way to remove the injunction placed upon him which in effect confined him so that he could now only respond to communications placed formally through "Air Force channels." I told Northrup I would go into the matter and try to straighten it out as CIA must have complete access to AFTAC.

**John A. McCone**  
*Director*

**138. Letter from President Kennedy to Macmillan, July 27<sup>1</sup>**

July 27, 1962

Dear Mr. Prime Minister:

I am asking David Ormsby-Gore to send you this message over the week end so that you can know just where we stand in our discussion in the relation between our new technical data and the test ban effort.

I think your technical people and ours are agreed that the new data have two principal technical meanings. First, they substantially reduce the number of unidentified events with which the system will have to cope. Second, it appears that our ability to detect shocks at a distance has been substantially improved. These developments, in combination, may permit a number of modifications in our proposals. The one thing which they clearly do not justify is a complete abandonment of on-site inspections.

The data now available, while encouraging, have not been examined in sufficient detail, and their relation to various kind of risks have not been sufficiently analyzed for us to be ready yet to say just how many on-site inspections would now be necessary. The number is clearly going to be lower than it has been in the past, but I could not today defend a particular figure against neutrals on the one hand, and critics of all test ban proposals on the other. Thus we have it in mind not to propose a new fixed number of on-site inspections at this time. We think it better to emphasize that the adamant Soviet opposition to all on-site inspection is the real stumbling block. We would indicate that if the Soviet Government will change its position on this point, we would be glad to enter the most serious discussion of the appropriate number of inspections.

With respect to control stations, my thinking is that it should be possible now to adopt a system of some twenty-five stations, world-wide, of which five would be in the Soviet Union. These systems would be internationally monitored and coordinated, but nationally manned and controlled. Subject to some further technical analysis in the next few days, we are hopeful that such a system would give us adequate protections, in the light of the balance of risks involved in this whole great subject. This matter of balance of risks, indeed, is what I find more and more on my mind. As we have often said to each other, we have to consider the consequences of not having a test ban as well as the risks of having one.

---

<sup>1</sup> Possible modification in proposals on test ban. Top Secret. 4 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Kennedy–Macmillan, 1962, Vol. III.

At the same time that we indicate the possibility of modifications in the comprehensive treaty, we are considering the possibility of a strong appeal for an atmospheric test ban, to include underwater and space tests as well. We think there may be real appeal in urging that possibility as well as the possibility of a properly controlled and inspected comprehensive treaty. In terms of world opinion, atmospheric fall-out may be more important than the arms race itself. On the other hand, in terms of the great problem of nuclear proliferation, a comprehensive treaty still seems better to me. Thus my tentative opinion is that we may wish to press both proposals at once.

At the same time, in order to emphasize and win support for our purpose of non-proliferation, we would consider pressing for a worldwide agreement which would ban the transfer or acquisition of nuclear weapons or nuclear technology to individual nations not now in the act.

We are still considering the problem of timing which is presented by the Soviet announcement of a new test series. (There is another related problem in the fact that the completion of our own high-altitude tests has been delayed for an indeterminate number of weeks by the failure of yesterday.) We do not think we should foreclose the possibility of supplementary tests, in case the Soviet series should produce extraordinary surprises. On the other hand, we wish to make clear that this series does not in and of itself lessen our interest in seeking agreement. Probably we shall need to have some reservation in our position to cover this difficulty.

One further point has become clear to us in these studies. If we get a test ban agreement at all, either comprehensive or atmospheric, we shall still be faced with the possibility of a sudden surprise by Soviet breach of the treaty. Inspection of preparations no longer seems a very hopeful prospect, and the logical alternative is to maintain our own test readiness. Indeed, Ambassador Dobrynin has suggested this possibility to some of our people. In this context we would wish to consider with you the possibility of maintaining Christmas Island, on a purely stand-by basis, as a part of our proper posture under a safeguarded test ban. I should be glad to have your personal view as to whether this possibility is worth exploring.

I have asked Arthur Dean to come back here at once, so that I can review these matters with him before reaching firm conclusions of my own. Meanwhile I hope very much to have your own comments on this general line of thinking. May I add in ending that I have written most frankly and that in this period before a final decision, I am very eager not to have these elements of our thought move outside the closest circle. May I therefore ask that if you wish to consider any of

these matters with your advisers, you avoid indicating just what my own current thinking is.

Sincerely,

**John F. Kennedy**

## August 1962

### 139. Memorandum for the File Prepared by McCone, August 2<sup>1</sup>

August 2, 1962

On Monday, July 30th, at 5:00 o'clock an NSC meeting was held for the purpose of discussing Geneva test suspension negotiation procedures.

In attendance were The President, the Secretary of State, the Secretary of Defense, the Vice President, Mr. Bundy, Mr. Murrow, Dr. Seaborg, Dr. Hayworth, Mr. Foster, McCone and a number of others.

Secretary Nitze and Commissioner Hayworth reviewed four papers prepared jointly over the weekend by Defense and AEC on the gains to be made from continued testing, the dangers from extensive weapon development by the Soviets through clandestine testing and steps required to maintain a state of readiness for further testing should a treaty be suddenly abrogated. Also a paper on the proliferation of weapons. Copies of these 4 papers were made available to me and are on file. The sense of this discussion was that if the Soviets cheated under a threshold of a treaty for a period of 5 years, they would have made some progress. In the opinion of Dr. Hayworth it would not have been progress that would have been so vital that it would have affected the balance of nuclear power; furthermore we could undoubtedly catch up in a year or two if we maintained some vitality in our laboratories. No one expressed grave concern over the danger of cheating if reasonable verification procedures were made a part of the treaty.

Mr. Foster then raised the question of negotiation procedures through this meeting and the following meetings and there was considerable difference of opinion as to whether we should table a comprehensive treaty, whether we should indicate a revised pattern of control stations at this time, whether we should indicate a reduced number of on-site inspections or alternatively whether we should first proceed to propose a comprehensive atmospheric treaty with no inspection.

Ambassador Dean favored the former; Secretary Rusk the latter. During these long exchanges considerable information was developed on just what the new seismic technology had revealed with respect to the number of natural events in the Soviet Union, the capabilities of

---

<sup>1</sup> Readout of NSC meeting on Geneva test suspension negotiation procedures. Secret. 2 pp. CIA Files, Job 80B01258A, Meetings with President, 7/1/62-12/31/61.

a detection system of 20 stations and the attitude of the neutrals at Geneva.

The meeting was adjourned until the following day.

**John A. McCone**  
*Director*

---

**140. Personal Message from Prime Minister Macmillan to  
President Kennedy, August 1<sup>1</sup>**

August 1, 1962

Dear Friend,

I was very grateful for your letter of July 27 and for your frank statement of your views about tests.

As you know, my own view is that all nuclear tests should be abolished and as I explained at Bermuda last year I do not believe that we should be worse off if this were to happen. Whatever your and our scientists may say, I believe that we could really detect any significant series of Soviet tests if they tried to cheat.

However, I quite realize that you do not entirely share this view and that anyway Congress would not accept it, at least at the moment. So I agree that there would now be advantage in offering both the atmospheric ban, as you suggest, and also a comprehensive treaty which at this stage would not need to specify the exact number of inspections.

I am looking into the question of Christmas Island but I should think that we would not find it too difficult to keep the installations on a care and maintenance basis, as indeed we have been doing in recent years. I am looking into this further and if the treaties were tabled we would certainly consider doing as you suggest. Of course, the question of re-activating Christmas Island in the event of the Russians cheating would have to be discussed between the United States and British Governments of the day.

---

<sup>1</sup> Views on atmospheric ban, comprehensive treaty, and use of Christmas Island. Top Secret. 2 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan–Kennedy, 1961–1962.

I have not discussed your letter with anyone except David Gore who is here on leave and with Alec Home. So these are just my own personal thoughts.

With warm regards,

Yours sincerely,

**Harold Macmillan**

---

**141. Memorandum of Conversation, August 8, between Rusk and Dobrynin<sup>1</sup>**

August 8, 1962

SUBJECT

Test-ban Agreement

PARTICIPANTS

Anatoliy F. Dobrynin, Ambassador of the U.S.S.R.

Georgi M. Kornienko, Counselor, Embassy of the U.S.S.R.

The Secretary

Mr. Philip Valdes, EUR/SOV

The Secretary said he hoped Ambassador Dobrynin's government could give serious thought to moving on a comprehensive test-ban treaty. We would like to move on one, and we think there are possibilities of narrowing the gap. We frankly do not understand Soviet preoccupation with espionage, but if this is a genuine preoccupation, our representatives can work out arrangements that cannot possibly involve espionage. Khrushchev indicated, he pointed out, that our two countries know enough about each other to destroy each other. We cannot move without, for example, on-site inspection, but he cannot see why the amount of such inspection which would be necessary to avoid recurring waves of suspicion should cause difficulties.

Ambassador Dobrynin asked if, after our studies, we really believe national means are not enough. This, he said was the crucial question. The Soviet Government believes it, and Soviet scientists believe it.

The Secretary said that instruments have been improved, but beyond a certain range our instruments cannot differentiate between

---

<sup>1</sup> On-site inspection concerns. Confidential. 2 pp. Department of State, Central Files, 611.6112/8-862.

earthquakes and tests. If the Soviets have instruments that can, they should advance them at Geneva. We do not say you do not have such instruments, but if you do, let us know.

Dobrynin said the Soviets have no explanation for our insistence on on-site inspection other than espionage. He noted that after Vela we said we could differentiate between earthquakes and tests up to 3,000 miles.

The Secretary said we did not say we could do so comprehensively across a series of events. He noted that the Soviets have a large number of observers in our country.

Dobrynin demurred, suggesting that if we counted this sort of thing on each side, we would be on the leading side.

The Secretary said he hoped the Soviet Government would take another look. If it turned out they cannot or will not move on this, why not consider the possibility of an atmospheric ban, on all but underground tests. This would not be entirely satisfactory, but would take account of the major concerns.

Ambassador Dobrynin replied that Soviet policy is in favor of banning all tests, and there is no change in Soviet policy on this.

The Secretary commented that it looked, then, as though there is not going to be an agreement, and there will be continued testing.

Dobrynin observed that the majority of countries oppose testing.

The Secretary agreed that they did, and said that the Soviets will not accept public opinion on on-site inspections, and we will not accept it on an agreement without inspection. He said he wished Ambassador Dobrynin would transmit his urging that the Soviet Government take another serious look at the comprehensive treaty, and if this is not acceptable, at an atmospheric treaty.

---

#### 142. Disto 727 from Geneva, August 16<sup>1</sup>

August 16, 1962

Paris pass USRO. Dean, Fisher and Wiesner met privately August 15 with Kuznetsov and Lachs in Dean's hotel room for completely informal exchange on test ban problems. Each side spoke freely and

---

<sup>1</sup> Geneva negotiations: readout of informal exchange with Soviet delegation on on-site inspection issue. Secret. 3 pp. Department of State, Central Files, 700.5611/8-1662.

relatively frankly so that we now feel sure that there is no misunderstanding of position in either direction.

US side explained carefully why we consider on-site inspection essential to any agreement on test ban which includes underground environment. We explained need for verification measures which could furnish some degree of confidence not only to US officials but also to members of Congress and American public. We stressed that we were not seeking perfection or 100 percent elimination of risk, but had to feel assured that there would be some small opportunity through random sampling under inspection for dealing with some of unidentified events which would be turned up by any worldwide detection system.

Kuznetsov made it crystal clear that Soviet Government considers on-site inspection problem to be entirely political. It was not question of divergence of views between Soviet and American scientists, and he even implied agreement to idea that there would be some number of unidentified events every year. However, as practical matter in present political situation, Soviet Union just would not be willing to give US any assurances other than those obtainable from system of control posts alone. He, therefore, repeatedly, urged us to assume this allegedly small degree of risk because no other solution of test ban problem was presently possible. Insisted international supervision would change essential character of nationally manned detection stations and was not acceptable.

Impression of inflexible Soviet position only hardened under further questioning. Kuznetsov was explicit in saying that no amount of semantic tinkering with terms of 8-nation memo to create Soviet obligation to issue invitation for on-site inspection on every occasion when commission might request such invitation would be acceptable. Invitation was matter which had to be left solely and entirely to unfettered discretion Soviet Government. In addition, when Wiesner offered to send scientists to Moscow to clarify situation on technical level or to discuss significance of random sampling arrangements with Soviet statisticians, this was also turned down on ground that this could not have relevance to political decisions which had to be sole basis of present position.

Since there was not repeat not slightest Soviet feeler for negotiation on this issue, it appears that USSR is presently more willing to accept continuation of arms race in nuclear weapons (with all implications which this has for third countries, which we discussed) rather than to make any compromise in its adamant opposition to obligatory on-site inspection. Several references were made to possibility of changed circumstances in next few years, including potential developments in identification of seismic events by long distance instrumentation which might make us more willing to consider test ban without inspection.

Short of that, however, no hope was held out on new basis for agreement, and we believe that this must be accepted as fact of Soviet policy which is not likely to change, however we may choose to play this subject for political and propaganda purposes at this conference or elsewhere. Partial test ban, for all environments except underground, was never discussed during conversation.

Am lunching with Kuznetsov Saturday. Godber (UK) leaving for London with Wright (UK) in charge.

## September 1962

### 143. Record of Action, 504th NSC Meeting, September 6<sup>1</sup>

NSC Action 2456

September 6, 1962

#### *Results of 1962 Nuclear Test Program to Date and Tests Proposed for Remainder of Program*

a. Discussed a draft Department of Defense-Atomic Energy Commission letter, dated September 6, to the President advising him of the status of current preparations for continuing the high altitude tests in the Johnston Island area and requesting his approval for certain modifications and additions to the test program in Operation DOMINIC.

(Note: The Atomic Energy Commission and the Department of Defense subsequently revised the draft letter and formally submitted it to the President. The President approved the recommendations contained therein.)

b. Noted the President's directive that the schedule proposed in the above-cited letter was subject to revision to accommodate the next MERCURY launching, and that he expected the Department of Defense, the Atomic Energy Commission and National Aeronautics and Space Administration to maintain constant coordination in this respect.

c. Noted the President's directive that the usual "Notice to Mariners" closing the test area be issued through regular channels at the appropriate date. Noted also the President's decision that any announcement or statement describing or explaining the continuation of the current test series would require White House approval prior to release.

---

<sup>1</sup> Results of 1962 nuclear test program to date and tests proposed for remainder of program. Secret. 1 p. Department of State, S/S-NSC (Miscellaneous) Files: Lot 66 D 95, Records of Action by National Security Council.

**144. Letter from President Kennedy to Prime Minister Macmillan,  
September 7<sup>1</sup>**

September 7, 1962

Dear Prime Minister:

I have just completed a careful review of the plans for completing our atmospheric test series, which as you know was interrupted in mid-summer by a failure at the launching pad in Johnston Island, with substantial damage to the immediate installations.

In reviewing the proposals, we have been faced with a number of new considerations. One is the quite unexpected magnitude of the deposit of high energy electrons in addition to the Van Allen Belt. This experience has led us to a drastic downward revision of the planned yields for high altitude tests.

We have also been reviewing the results of the earlier atmosphere series in Christmas Island and have reached the conclusion that very promising technical developments affecting yield-to-weight ratios should be followed up promptly, and accordingly we plan not more than four additional atmospheric tests, to be carried out by air drops near Johnston Island, along with the resumed high altitude tests.

The total number of tests thus authorized is seven, three at high altitudes and four by air burst from aircraft drops. I am reserving decision on an eighth test which would be at a high altitude, with a yield which might affect the radiation belts and is not yet adequately calculated.

None of these tests is proposed for Christmas Island, but I do wish to let you know that this is our general plan, well before public announcement which is now expected to be made early in the week after next.

Our object here is to complete the interrupted series, and to include a modest number of additional tests which I hope will have the effect of making it much easier for us to avoid atmospheric testing for a substantial time after November. That may allow us to make further progress along the lines of the exchange we have just had about a test ban (on this latter subject we are still working out our proposed answer to Khrushchev and will be in touch with you shortly).

The total fallout from the resumed series should be on the order of 15% of that involved in our earlier tests this year, and it will remain

---

<sup>1</sup> U.S. atmospheric and underground nuclear testing schedule. Top Secret. 3 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Kennedy-Macmillan, Vol. II.

true that our whole series has very much less radioactive fallout than the Soviet tests in the two series which they have conducted.

Our current plan is that these last tests will be conducted beginning about 30 September and ending early in November. Our impression is that Soviet tests will continue through approximately the same period of time, and thereafter there may be a renewed opportunity for some agreement, in a situation in which no atmospheric tests are going forward.

Our underground testing program is now scheduled to continue routinely. I want you to know quite privately that I am prepared to interrupt this program for a limited time if at any point that appears to be a useful step in getting forward toward a test ban agreement. We have just received your Government's request for the inclusion of a British underground test at Nevada, and I am sure that as long as our own testing underground continues, there will be no difficulty in scheduling such a test for you. A proper diplomatic answer will be coming back to you on this last point through the usual channels.

**145. Memorandum from Gen. Decker to McNamara,  
September 10<sup>1</sup>**

JCSM-732-62

September 10, 1962

SUBJECT

Review of US Disarmament Policy During the Recess in the Geneva Conference  
(U)

1. The US Arms Control and Disarmament Agency (ACDA) plans a re-examination of US positions on disarmament matters during the recess in the Geneva Conference, 8 September to 12 November 1962. The Joint Chiefs of Staff are concerned that this review may be oriented more toward developing more negotiable and politically expedient proposals than toward a comprehensive reassessment and clarification of US disarmament policy which would strengthen the US position at Geneva.

2. a. This concern of the Joint Chiefs of Staff is based primarily on a trend of the past two years which, if allowed to continue without

---

<sup>1</sup> JCS views on review of U.S. disarmament policy during the Geneva Conference recess. Secret. 3 pp. National Defense University, Taylor Papers, Disarmament 3, 1962.

thorough consideration of possible military implications, could place the United States in a highly disadvantageous situation. While the Soviet position on disarmament has remained practically unchanged since June 1960, the US position has been in a constant state of evolution, generally moving towards accommodation of Soviet views. This trend is outlined in Appendix A.

b. By contrast, the Soviet positions clearly reflect an effort to gain military superiority over the United States.

c. Although the test ban treaties, as tabled, do not fully reflect the recommendations of the Joint Chiefs of Staff and mark a considerable retreat from the previous US position of 13 April 1961, the United States has moved in Geneva to convince conference participants that the United States has tabled a final position and that pressures for further accommodation should be directed to the Soviets. The Joint Chiefs of Staff consider that a firm stand should also be taken with respect to general disarmament.

d. As a concomitant to the foregoing, all agencies of the Department of Defense should endeavor to resolve their differences of view in order to arrive at strong, cohesive positions from which to urge and vigorously to defend assumption by the United States of a firm stand in disarmament negotiations. In this connection, there have been noted several divergencies in regard to disarmament issues. Examples of these divergencies are included in Appendix B. This recapitulation has been made only for the purpose of portraying a situation which has tended to lessen the impact of military considerations on disarmament policy.

3. Another major reason for concern is the tendency on the part of ACDA to develop and put forth negotiating positions concerning US disarmament measures before the basic proposals have been thoroughly evaluated and correlated. On occasion, the United States has become virtually committed to a proposal before its feasibility or advisability could be determined (e.g., new test ban treaties based on "Technical Breakthroughs" and progressive zonal inspection concept) or before its relationship to the over-all US position could be fully considered.

4. The Joint Chiefs of Staff agree that the recess can be advantageously employed by re-examining US positions on disarmament matters. However, they believe that this review should have as its primary objective a comprehensive reassessment and clarification of US disarmament policy, followed by a strengthening of arguments therefor. They further believe that "accommodations" or concessions to the Soviets are neither necessary nor desirable and will only convince neutrals and the USSR that, if they goad and wait, the United States gradually will give in. Also, existing doubts will be confirmed in other nations

as to the validity and sincerity of the original US positions and as to the US determination to hold its position in the face of Soviet intransigence.

5. The Joint Chiefs of Staff recommend:

a. That the Secretary of Defense urge the Secretary of State and the Director, ACDA, to devote the main effort within the US Government during the recess toward comprehensive reassessment of US policy, clarification of just what each US disarmament measure is intended to encompass, and development of solid arguments in support of US agreed positions.

b. That proposals, such as listed in Appendix A, intended to facilitate negotiations be resisted unless the proposals clearly do not have adverse implications for the military security of the United States.

For the Joint Chiefs of Staff:

## SUBJECT

Non-diffusion: Approaches to Adenauer and de Gaulle

I talked with several people on the German and French desks about the question you posed this morning.

GER believes that the odds are in favor of a positive German reaction to ACDA's suggested approach. As far as the Germans are concerned, this scenario has a distinct advantage over the earlier ones in that it takes non-diffusion out of the Berlin and German contexts and puts it into the broader one of disarmament. Moreover, since the Germans do not believe that early agreement, or for that matter any agreement, is possible on such an arrangement, they would not be inclined to look at this move as one which would really inhibit future West German nuclear developments. This subject apparently has been discussed with the Germans and an official nod was given to a possible approach of this kind in a recent exchange. I have asked the Situation Room to get me the pertinent messages.

The French picture is somewhat different. The French Desk feels there is a 50–50 chance of a favorable de Gaulle reaction. This is based on an assumption that by according the French nuclear club membership, and therefore removing France from the group of nations subjected to the non-diffusion restrictions, the proposition might be attractive to de Gaulle.

**David Klein**

## SUBJECT

Nuclear Diffusion Discussions

1. Attached are the records of the two most recent conversations which Secretary Rusk had with Ambassador Dobrynin on this subject. His earlier conversations with Mr. Gromyko in Geneva in July add nothing to this record. In addition, there are: a talking paper still in draft form, produced jointly by ACDA and Defense, which shows what Rusk would say, and also the lines along which a piece of paper would be drafted; and several pieces of paper by ACDA which indicate the approach they would take to the problem, and the areas of their agreement and disagreement with DOD.

2. I talked to the Secretary again on the telephone this afternoon and indicated your desire to talk with him on the subject. He will be

here in Washington until 4:00 p.m. on Saturday, 22 September. After 6:30 p.m. he will be at USUN at the Waldorf.

In my conversation, I told the Secretary that you were concerned both about the question of talking to our allies and whether we had to try to get agreement with them before talking to the Soviets, and the question of discussion within the Government and with the Congress and the attendant political problems that might raise. Ros Gilpatrick has indicated that the Defense Department would go along with this proposal, but the Chiefs object to it strenuously. If possible, Bob and Ros would rather fight with them another time than now.

3. The heart of the problem, in my own judgment, is that Secretary Rusk feels he has to give a piece of paper to the Soviets. He may be perfectly correct that if he is to give a piece of paper to the Soviets, he must first give it to our allies. Otherwise, the Soviets could always use the piece of paper with Kroll, or someone like that, as evidence of our bad faith. However, it is not clear that more cannot be said to Gromyko or heard from him before pieces of paper are passed. Chip Bohlen shares the view Mac and I hold, namely, that we should [*text not declassified*].

4. As of the present moment, we think that the Germans would not be unfavorable to the proposed agreement, since the Soviets have for long pressed for special language concerning Germany, to which the Germans have always objected. The major change in Dobrynin's last communication was his apparent willingness to do without a special reference to Germany.

On the other hand, the French remain the French—nobody thinks it is better than even money that they would be willing to be involved. I myself would guess that the two cables from Paris contained in your reading book this morning (Paris 1400 and 1406) point in the other direction.

Carl Kaysen

**147. Memorandum from Conger to Brubeck, September 27<sup>1</sup>**

September 27, 1962

On September 26 a letter was sent from Mr. Foster to the Secretary of Defense, summarizing developments to date regarding a possible international agreement on the non-diffusion of nuclear weapons, and giving this agency's recommendations on such an agreement.

A copy of this letter is attached for the Secretary's information.

**Attachment**

Dear Bob:

As you know, there have been recently several informal discussions and exchanges of memoranda regarding a possible international agreement on the non-diffusion of nuclear weapons. Specifically, within the past two weeks we have sent to the Department of Defense the following papers: 1) a copy of a memorandum to the Secretary of State from me, dated September 13, 1962, enclosing a draft memorandum to the President, draft letters to the heads of the Governments of the United Kingdom, France, and the Federal Republic of Germany, and a draft declaration on non-diffusion; 2) a memorandum for the Committee of Principals, dated September 18, 1962, containing revised versions of some of the above-mentioned documents sent to Defense on September 13; 3) a draft Minute, which might be transmitted to the Soviet Foreign Minister, further clarifying the United States view on a multinational nuclear force, sent to Defense on September 19, 1962; and 4) copies of a memorandum from the Secretary of State to the President outlining a course of action for the United States to follow in attempting to negotiate a non-diffusion agreement, dated September 21, 1962, and which was sent to Defense on September 22, 1962.

The purpose of this letter is to request that the Department of Defense and the Joint Chiefs of Staff continue to give active consideration to the various papers mentioned above, particularly the memorandum to the President of September 21, 1962. The course of action outlined in the memorandum, including three attachments, is directed toward the formal submission to the Soviet Union and other countries by the United States of a declaration on the non-transfer of nuclear weapons.

---

<sup>1</sup> Transmits copy of letter from Foster to McNamara on status of non-diffusion issue for Rusk's information. Attached letter from Foster to McNamara is dated September 26. Confidential. 4 pp. Department of State, Central Files, 397.5611-GE/9-2762.

The prevention of the further diffusion of nuclear weapons among individual nations has been a national security and foreign policy goal of the United States for some time. It is incorporated in the United States disarmament proposals of September 25, 1961, and of April 18, 1962. The United States voted for the Irish Resolution, passed unanimously by the 1961 session of the United Nations General Assembly, which called upon all states to secure an international agreement on the non-transfer and non-acquisition of nuclear weapons.

As a result of recent conversations between the Secretary of State and the Soviet Foreign Minister and Soviet Ambassador, the United States should consider pursuing an agreement with the Soviet Union and other countries on the non-transfer of nuclear weapons which would not preclude the possibility of international nuclear weapons arrangements of a truly multinational nature of the type which might be developed within the NATO framework. A non-transfer agreement which would not preclude the possible development of a NATO multinational nuclear force and which would not in any way call into question existing custodial arrangements for the storage and deployment of United States nuclear weapons would be in the interest of the NATO alliance as well as in the national interest of the United States. It would be in the interest of NATO with respect to the defense of the countries in the alliance, with respect to the maintenance of international peace and security generally, and with respect to the strengthening of countries in the West and elsewhere believing in free and democratic institutions and individual liberty. In negotiating a non-transfer agreement with the Soviet Union and other Communist states, the United States would seek the active participation and support of the NATO countries, especially the United Kingdom, France, and the Federal Republic of Germany.

To my knowledge, the Department of Defense has no planned arrangements for the deployment or transfer of nuclear weapons which a non-transfer agreement of the type proposed in the memorandum to the President would preclude. If any such arrangements are being considered it would be important to have them discussed at this time, before negotiations for a non-transfer agreement proceed further.

The draft declaration on non-transfer is one which would not require any special international verification machinery. There would be little incentive for the Soviet Union to want to violate clandestinely the terms of a non-transfer declaration. If a violation occurred, it would be more likely to be done openly than not. The United States can have a high degree of confidence that the Soviet Union would comply with a non-transfer agreement because it is in Soviet self-interest not to spread nuclear weapons capabilities among other states, including states allied with it.

It would be helpful if I could receive by the close of business on Wednesday, October 3, comments of the Department of Defense and the Joint Chiefs of Staff on the memorandum and enclosures sent to the President on September 21, 1962. No meeting on this is planned at the present time, but I shall keep you informed of any developments.

Sincerely,

**William C. Foster**

October 1962

**148. Report of Foreign Weapons Evaluation Group Meeting,  
October 4<sup>1</sup>**

October 4, 1962

REPORT OF THE FOREIGN WEAPONS EVALUATION  
GROUP MEETING OF 2-3 OCTOBER 1962

1. Up to date, the Soviets have detonated about 30 nuclear devices in the current series. Almost half of these are thermonuclear devices which range from sub-megaton to 30 megatons in yield. Of these thermonuclear tests, approximately one half are in the 3-6 MT range in contrast with the Soviet 1961 series when half of the thermonuclear tests were in the 1½-3 MT range. The cumulative yield of the Soviet 1962 tests amounts to 130 MT which compares to *[text not declassified]* the US DOMINIC series. The rate at which Soviet tests have been conducted is comparable to the high rate in the Soviet 1961 series. Debris has been collected and at least partially analyzed on approximately two-thirds of the 1962 tests permitting a preliminary assessment of the Soviet series.

2. For the first time, electromagnetic pulses were observed at relatively close distances from the test site (600-1200 km). The internal evidence from these observations, and especially comparison with calibration observations at 600 to 900 km give interpretable data *[text not declassified]* (observations at 1200 km and more are difficult to interpret). These observations give a very important new tool for the establishment of the design of the Russian devices. We are only at the beginning of exploiting this new tool in our interpretation.

The interpretation depends also on the height of burst. Tests at an altitude of 10,000 ft and higher give clear records, tests at altitudes much below 10,000 usually contain spurious signals arising from the reflection of the KM signal from the ground.

*[text not declassified]*

*[text not declassified]* The fact that a relatively simple and straightforward interpretation of this device appears to explain the observed data does not preclude the possibility that the device was indeed much more complex.

---

<sup>1</sup> Discussion of current series of Soviet detonations. Top Secret. 5 pp. Kennedy Library, National Security Files, Bromley Smith Safe, Drawer 1, Bethe Report, 10/4/62.

4. [text not declassified]

It appears from preliminary analysis that these may represent older, i.e., pre-1961 Soviet designs.

6. Two of the thermonuclear tests were sub-megaton, namely 400 KT and 160 KT in yield. [text not declassified]

7. The analysis of the Soviet 1961 fission devices was not completed until after the last meeting of this panel, it is therefore appropriate to include a summary of them in this report. In the Soviet 1961 series there were 16 tests of fission devices for which debris was collected and analyzed. [text not declassified] Of the unboosted fission devices tested in 1961, the majority bear strong resemblance to devices previously tested in 1957 and 1958. One test was of an oralloy device which may have been either a gun assembly or a large spherical implosion device.

8. Of the approximately 15 fission devices tested by the Soviets in the 1962 series, debris has been collected and analyzed on approximately 10. Only two of those show presence of a boost and all have tuballoy tampers. This appears to be a marked distinction to the 1961 series in which considerable effort was given to boosting and to the elimination of the tuballoy tampers.

Evaluation Group*

November 1962

**149. Memorandum from Gen. Taylor to McNamara,  
November 10<sup>1</sup>**

JCSM-877-62

November 10, 1962

SUBJECT

Nuclear-Free or Missile-Free Zones (U)

1. In a memorandum, dated 25 October 1962, the Assistant Secretary of Defense (International Security Affairs) requested the advice of the Joint Chiefs of Staff as to the military impact of a US initiative to propose nuclear-free or missile-free zones in various areas of the world. The views of the Joint Chiefs of Staff regarding proposals for nuclear-free or missile-free zones in Latin America and Africa were submitted in JCSM-828-62, dated 26 October 1962, subject as above. This memorandum provides their views on proposals for such zones anywhere in the world.

2. In assessing the military impact of the establishment of a nuclear-free or missile-free zone, it is of paramount importance to recognize the basic difference between the strategic posture of US military forces and that of Soviet forces.

a. With two exceptions (discussed below), the Soviet strategic striking forces are confined to the geographical limits of the Soviet Union. This concentration of strategic striking power in the Soviet heartland is not a posture adopted by free choice; rather it is a posture forced on the Soviet Union by two prevailing conditions: first, a lack of bases or base rights anywhere in the world beyond the perimeter of the Sino-Soviet Bloc, and second, Soviet distrust of both Communist China and certain of the European satellites. The two exceptions noted above are the Soviet missile and bomber forces now in Cuba and the Soviet missile submarine force. The threat in Cuba, it now appears, is about to be liquidated. The Soviet missile submarine force, deployed in the Atlantic and Pacific Oceans, is at present a relatively minor threat, although in time it probably will assume greater proportions. Even these missile submarines, however, are obliged to operate from bases in the Soviet Union itself.

---

<sup>1</sup> Military impact of U.S. initiative to propose nuclear-free or missile-free zones worldwide. Secret. 5 pp. Washington National Records Center, RG 330, OSD Files: FRC 69 A 926.

b. The strategic posture of US military forces is markedly different. The United States is not a continental but a world-wide power. US strategic striking forces are based, not only in the United States, but around the entire periphery of the Sino-Soviet Bloc. There are US nuclear striking forces, of one kind or another, deployed in Alaska, the Atlantic Ocean, Western Europe, the Mediterranean Sea, North Africa, the Middle East, Guam, and the Pacific Ocean. Furthermore, there are many other locations where the United States has, or could obtain in an emergency, base rights for the operation, support, or staging of nuclear striking forces.

3. Two highly important advantages are achieved by the United States in having its strategic striking forces deployed world-wide. First, in the matters of strike-timing (time from launch to target) and resultant warning times, the United States has a great advantage over the Soviet Union. Second, in the matter of targeting complexities, the Soviet Union, faced with a world-wide system of priority targets, is at a distinct disadvantage.

4. Application of a nuclear-free concept in any part of the world (other than the homelands of the United States and the Soviet Union) would work to the disadvantage of the United States. We would be forced to pull back our nuclear striking forces from the area involved, and we would have to relinquish base rights for the operation, support, or staging of nuclear striking forces. The Soviet Union on its part would have to sacrifice nothing.

5. If the nuclear-free concept were extended to one part of the world after another, eventually the United States would be forced into the necessity of maintaining all of its land-based nuclear striking forces in the continental United States. With less area in which to disperse (and with other factors being equal), these forces would then be more vulnerable than those of the Soviet Union. This would be a disastrous reversal of the situation existing today.

6. In connection with the preceding paragraph it is pertinent to note that, as Soviet nuclear capabilities grow during the years ahead, the question of relative vulnerability will become increasingly important in assessing whether or not the United States retains a strategic advantage over the Soviet Union. If we do not retain an advantage, our national objectives for general, limited, and cold war will have to be radically altered.

7. In addition to impairing the effectiveness of US strategic striking forces, establishment of either a nuclear-free zone or a missile-free zone would gravely affect the tactical capabilities of US forces. Conventional land power has thus far been the principal instrument of Communist aggression; both the Soviet Union and Communist China continue to maintain large armies. One vital counterpoise against this might is the

ability of US ground, sea, and air forces to employ tactical nuclear weapons, including missiles. A denuclearization proposal would be intended to reduce world tension and foster peace. However, in those areas of the world accessible to Red armies, denuclearization by limiting the tactical prowess of US forces would decrease the existing deterrent to Communist aggression and would thereby increase tension. Not only would it invite attack, but it increases the incentive for enemy use of tactical nuclear weapons against defenders unprepared to respond in kind. Thus, the proposal, if adopted, would weaken our deterrent, reduce the number of alternatives available to the United States in the event of attack, and increase the opportunities for Communist miscalculation of our intent and resolution.

8. Still another adverse effect of the establishment of a nuclear-free or missile-free zone would be a reduction in our flexibility of operations in peacetime. An important element of US strength is our ability to project our power overseas as desired and as needed. Occasional visits by US naval and air forces to allied and neutral countries are useful as a demonstration of continued US strength and purpose. The presence of such forces in an area of potential disorder can also be highly effective in stabilizing the situation. Establishment of a nuclear-free or missile-free zone would seriously inhibit such operations by US naval and air forces in the area involved. Consequently, US ability to influence the trend of events in that part of the world would be diminished.

9. Establishment of a nuclear-free zone would not have the same military impact as establishment of a missile-free zone. A nuclear-free concept would probably exclude all types of nuclear weapons: bombs, antisubmarine weapons, projectiles, demolition charges, AND missiles. (All long-range offensive missiles can be presumed to have nuclear warheads; otherwise they would be of little consequence.) On the other hand, a missile-free concept would undoubtedly exclude all offensive (nuclear) missiles and might or might not exclude nonnuclear missiles, such as surface-to-air and air-to-air missiles. In any event, a nuclear-free concept would be more damaging to the US military position than a missile-free concept.

10. In conclusion, the Joint Chiefs of Staff believe:

a. That because of a basic difference between the US and Soviet strategic postures, application of a nuclear-free or missile-free concept in any part of the world would be far more damaging to the United States than to the Soviet Union.

b. That the principal adverse effects of a nuclear-free or missile-free concept upon the US military position would be:

(1) Severe degradation of US strategic striking power relative to that of the Soviet Union.

(2) Serious reduction in the tactical capabilities of US forces and a consequent decrease in the US deterrent to Communist aggression.

(3) Impairment of US flexibility of operations in peacetime.

c. That a nuclear-free concept would be more damaging to the US military position than a missile-free concept.

d. That the United States should oppose and certainly should not initiate any proposal for the establishment of a nuclear-free or missile-free zone in any area of the world.

e. That if forced to negotiate on this issue, the United States should agree to the establishment of a nuclear-free or missile-free zone only in the context of a broader arms control agreement in which the Soviet Union makes equivalent concessions.

11. It is recognized that this memorandum has discussed only in general terms the military impact of a nuclear-free or missile-free concept. The precise effect of a specific proposal for a nuclear-free or missile-free zone would depend upon (1) the terms of the proposal (*inter alia*, the area involved and the categories of nuclear weapons or missiles excluded); (2) the extent to which the nuclear-free or missile-free concept has already been applied in other parts of the world; (3) the current status of US base rights in the area involved; and (4) the extent to which current US military plans for cold, limited, and general war depend upon our ability to operate, support, or stage nuclear or missile forces in the area involved. Because of these many variables, in the absence of a specific proposal it is not possible to discuss with any exactitude the military implications of the application of a nuclear-free or missile-free concept in various areas of the world. However, the Joint Chiefs of Staff are prepared to provide, if and when required, their estimate of the military impact of any specific proposal.

For the Joint Chiefs of Staff:

November 12, 1962

## SUBJECT

Discussion with Dr. Teller—12 November 1962

Dr. Teller had breakfast with me on Monday morning, November 12th.

We reviewed at some length the results of our nuclear testing program. [*text not declassified*]

Dr. Teller said that practically all of the work could be conducted in the underground, [*text not declassified*]. Finally we must, according to Dr. Teller, test the completed devices in the atmosphere.

Dr. Teller felt that the laboratories had at least a year's work before they would be prepared to do anything significant in the atmosphere. He felt the Soviets would need a year or even more. He further expressed the thought that the most recent Soviet series did not expose any new techniques or breakthroughs. [*text not declassified*]

With respect to the value of a 100 megaton warhead, Teller made the point that if an anti-ballistic missile defense was successful, it very probably would not be able to interdict an incoming nuclear warhead at altitudes above 50,000 or 60,000 feet. He pointed out if this was the case, the 100 megaton explosion at 60,000 feet would be devastating to vast areas (although not to hardened bases); therefore it was concluded that there is a need for warheads of this yield.

Teller asked my advice as to what to do. I suggested that since we could take no constructive action for a year he had better confine himself to talks with Government officials and responsible authorities and not project the issue into the public press by making speeches, television appearances, etc., at this particular time. I assured him that our policy was under careful review and that he, as well as others, would be consulted before decision is reached.

**151. Telegram 525 to Djakarta, November 13<sup>1</sup>**

November 13, 1962

Brazil has introduced resolution in GA recommending Latin American countries negotiate arrangements for nuclear free zone in Latin America with provisions for verification to insure arrangements being observed. We intend support this resolution. We believe that in area like Latin America, where nuclear weapons not deployed, arrangements worked out among states concerned for denuclearized zone with adequate verification to insure zone indeed remains free of nuclear weapons could be important contribution to overall efforts prevent wider dissemination such weapons. FYI Carefully formulated resolution also offers vehicle to stimulate action which could prevent reintroduction Soviet nuclear weapons in Cuba. END FYI.

As reported USUN's 1746 repeated Djakarta 31 and being repeated Karachi and Geneva, Indonesia also considering introducing resolution urging powers in region of Asia and Pacific Ocean to secure agreement on denuclearization that region. We are opposed to UN resolution calling for such zone. Embassy Djakarta requested approach Foreign Office soonest to express strong hope Indonesia will not repeat not introduce resolution. Following arguments may be drawn upon:

1. Unlike situation in Latin America where there is wide support for denuclearized zone, many states in Asia and Pacific area oppose nuclear free zone for their region. UN should not suggest nuclear free zone in any area where there is such wide disagreement on question among states concerned. Resolution in this situation devoid of meaning. Question is one for states themselves to work out.

2. Basic distinction must be drawn between nuclear free zone in Latin America and such zone in Europe or Pacific where nuclear weapons now deployed and where military balance would be changed. This is problem which can be solved only in general disarmament context. It is not, as in case Latin America, problem of preventive disarmament of area where nuclear weapons do not exist. As in Europe, Soviet nuclear striking power must be taken into account in considering problem nuclear weapons in Asia. Accordingly, this problem must be considered as part of general disarmament problem, and not, as in Latin America, as matter of declaring area "off limits" to nuclear arms race. Problem in Asia, as in Europe, is task of general disarmament negotiations to alleviate and, if possible, resolve.

---

<sup>1</sup> U.S. support for U.N. General Assembly resolution on nuclear free zone in Latin America. Confidential. 3 pp. Department of State, Central Files, 600.0012/11-1262.

3. Although Chicoms have paid lip service to idea of nuclear free zone for Asia and Pacific, they are actively working on nuclear development and clearly have no intention renouncing their efforts or entering into any agreement involving necessary effective verification. Chicoms are determined go ahead with their efforts to produce nuclear explosion as first step toward some kind of nuclear capability despite grave economic difficulties and despite fact such capability would be long way in future after first explosion. Chicoms therefore not sincerely interested in objectives Indonesians seeking in proposed resolution.

4. Net result of resolution would be put pressure on Free World to denude itself of nuclear defenses in Asia and Pacific and render Asian nations more vulnerable to Chinese Communist aggression. Chicoms have history of aggressive action in Asia and right now are engaged in aggression against India in violation all principles subscribed to by Chicoms in long series of public pronouncements and promises to other nations of Asia. Obviously impossible for India and other states in region to agree to nuclear free zone in absence sincere Chicom agreement since result would only be to advantage Chicoms.

5. Most fruitful steps which could now be taken in interest of reducing dangers posed by nuclear armament are those involving nuclear test ban. To divert attention and effort from work towards such measures would be disservice to cause of nuclear disarmament.

USUN may wish draw on foregoing in discussions with Pakistan Delegation in New York. If Indonesians do introduce resolution, Department will consider advisability approaching GOP in Karachi in order discourage support for Indonesian proposal. Given present coolness between U.S. and Pakistan because of U.S. military assistance to India, premature representations in Karachi against Indonesian proposal might have opposite from the desired effect.

**152. Memorandum of Conversation, November 30, between Rusk and Mikoyan<sup>1</sup>**

November 30, 1962

LA Atom Free Zone

*The United States*

The Secretary  
The Under Secretary  
Ambassador Thompson  
Mr. Davis, EUR  
Mr. Kamman, Interpreter

*The Soviet Union*

First Deputy Premier A. Mikoyan  
Ambassador Dobrynin  
Mr. Kornienko, Counselor, Sov. Emb  
Mr. Chistov  
Mr. Vinogradov, Interpreter

At a working luncheon for Soviet First Deputy Premier, Anastas Mikoyan, the Secretary turned the conversation, about dessert time, to a serious discussion of problems by remarking that the President thought some progress had been made in yesterday's conversation at the White House. Mr. Mikoyan responded he was very gratified if the President believed some progress had been made. He was under the same impression. He had been on the point of asking the President at the end of the discussion whether they had made any progress but decided not to do so. He, himself, however, felt we had achieved some progress and was glad that the Secretary had mentioned it.

The Secretary said we were seriously interested in the proposal for an atom free Latin America. In the long run this might provide mutual assurance which would give a feeling of security to these countries. In addition, we were interested in the words of Chairman Khrushchev who had spoken of measures against surprise attack, such as observers in key seaports, airports and rail centers. It was not clear to us whether Chairman Khrushchev looked on these measures as part of a complete package in the disarmament field or whether they were measures valuable in themselves which should be taken up immediately without waiting agreement on general and complete disarmament.

Mr. Mikoyan said he would not dwell on the history of disarmament negotiations. He thought disarmament was an important issue on which we should reach agreement. The arms race laid a very heavy burden on the Soviet Union and on the United States. For many years we have been conferring together. The Soviet Union had shown maximum flexibility, but they did not know where the United States and Western countries were moving. Though he did not wish to dwell on

---

<sup>1</sup> Discussion of Latin America atom-free zone. Secret. 3 pp. Department of State, Secretary's Memoranda of Conversation: Lot 65 D 330.

history, he wanted to mention missiles. First, the Soviet Union had agreed to destroy all missiles in the first stage of disarmament, but since the United States had certain apprehensions, it had made the Soviet position more flexible. Chairman Khrushchev then said a certain number of missiles could be retained during the first stage. However, up to now no counter-proposals had been made by the United States.

Mr. Mikoyan then referred to the Secretary's statement about United States interest in an atom free Latin America. He commented that the Brazilian proposal had been a good one in its first draft. But now it appeared that while the Latin American countries could not have atomic weapons on their territories, the United States could have on its bases in those countries. The Soviet Union could not support such a proposal, which is based on "what is bad for you is good for me". If, however, the proposal concerned all Latin American countries—in other words, if the United States would not have nuclear weapons in those countries—perhaps the Soviet Union could support the Brazilian resolution. He had the impression that Cuba would also favor it if the United States made clear, for instance, that no atom bombs would be in the Panama Canal Zone, and perhaps elsewhere. This would solve the problem of Cuba not having atomic weapons if other Latin Americans also did not. Mr. Mikoyan concluded he would like to touch on other things.

The Secretary responded he would like to come back to the Latin American atom free zone proposal. The Secretary commented that perhaps there was some misunderstanding and that our positions were not too far apart. If such an arrangement could be made, we would not expect to have nuclear weapons in Guantanamo, in the Panama Canal Zone or our base in Trinidad. However, this could not apply to Puerto Rico because it was part of the United States and we were not talking about an atom free United States. We would suppose that such an arrangement would ban atomic weapons from all existing and possible future bases, though he had nothing concrete in mind in speaking of future bases. Furthermore, we would expect that the Panama Canal Zone and Guantanamo would be subject to exactly the same kind of inspection as the rest of Latin American countries. The Secretary said, however, he would like to make one point quite clear. The prohibition against nuclear weapons would not apply to transit through the Panama Canal. For instance, we could not accept a prohibition on shipment through the Panama Canal of atomic weapons from the East Coast to our West Coast. The Secretary observed that when the Cubans responded to the LA atom free zone proposal, they had introduced elements which had nothing to do with an atom free zone. The Secretary concluded by saying he thought we needed to discuss this matter further; our two positions were not so far apart.

Mr. Mikoyan disclaimed knowledge of the details but expressed the opinion that basically the Cubans were in favor of this proposal. He said that he would report the Secretary's observations to Chairman Khrushchev, after which the Soviet Union would make a report.

**153. Memorandum of Conversation, November 30, between Rusk and Mikoyan<sup>1</sup>**

November 30, 1962

Measures Against Surprise Attack

*The United States*

The Secretary

The Under Secretary

Ambassador Thompson

Mr. Davis, EUR

Mr. Kamman, Interpreter

*The Soviet Union*

First Dep. Premier Anastas Mikoyan

Ambassador Dobrynin

Mr. Kornienko, Counselor, Sov. Emb.

Mr. Chistov

Mr. Vinogradov, Interpreter

The Secretary said that it was our impression that we could make more progress than we have on other things. Referring back to the second point which he had made at the beginning of the conversation, he expressed the view that perhaps measures of surprise attack were something on which we could move. Mr. Mikoyan had expressed alleged Soviet concern about an attack on Cuba and we had shown our concern about missiles in Cuba. Perhaps if certain measures against surprise attack were adopted, these would take care of our mutual concerns.

Mr. Mikoyan said he had had limited experience in diplomatic negotiations. He had had no intention of evading the Secretary's second question; he had not forgotten it. He did want to make clear that Moscow favored denuclearized zones. He referred back to the Soviet proposals made first in 1955, against the danger of war suddenly breaking out. If there were a warning system, this would help for it was impossible to attack without calling up troops, moving rail transports, deploying planes at major airports. If this control existed there could be no surprise attack. Of course, it could be said missiles could be launched and, therefore, they had proposed their abolition in the first stage of disarmament as part of the package plan.

---

<sup>1</sup> Discussion on measures against surprise attack. Secret. 2 pp. Department of State, Secretary's Memoranda of Conversation: Lot 65 D 330.

The Secretary referred to the complexity of general and complete disarmament and said we had been wondering whether it would not be worth while to take some steps now, i.e., pre-stage one. Perhaps this could be characterized as a kindergarten stage. Mr. Mikoyan protested that a kindergarten was for children and we were adults, to which the Secretary responded that perhaps we could borrow something from children.

Mr. Mikoyan said that if he understood the Secretary correctly, the Secretary thought the prospect for general disarmament was dim, perhaps hopeless, and in despondency the Secretary was bringing up separate items.

The Secretary responded he saw the proposal in three kinds of separate steps: First, there was complete and general disarmament, which was filled with complex problems which cut across the entire range of our relationships. Second, there was the ban on nuclear testing and on this we hoped agreement could be reached. Third, there were some steps which might be separated out from the disarmament package. For instance, the Latin American atom free proposal was one of these steps; the agreement on non-transfer of nuclear weapons was another. The Secretary agreed these were not disarmament steps in the strictest meaning of the word, but they were preparatory steps which might lessen tensions and aid to peaceful stability.

Mr. Mikoyan did not make a direct reply to the Secretary and at no time during the rest of the conversation did he refer back to this question.

<sup>1</sup> Discussion of nuclear test ban and non-proliferation issues. Secret. 5 pp. Department of State, Secretary's Memoranda of Conversation: Lot 65 D 330, December 1962

Ambassador Thompson  
EUR—Richard H. Davis  
Mr. Kamman, Interpreter

Mr. Kornienko, Counselor, Sov. Emb.  
Mr. Chistov  
Mr. Vinogradov, Interpreter

### 1. *Nuclear Test Ban*

Mr. Mikoyan picked up the Secretary's reference to the nuclear test ban and observed the Soviet Union had made a number of proposals. The Soviets had learned last summer that American and British scientists had proposed that sealed boxes could be used to detect underground tests. This would eliminate the need for "on ground" personnel. These sealed boxes would be placed in earthquake zones in neighboring states provided their governments agreed. Soviet scientists had agreed with the conclusions of their fellow-American-British scientists on the feasibility of such a system.

The question had been asked, Mr. Mikoyan continued, how one could guarantee that these sealed boxes would actually be set up in the Soviet Union. This was a difficult question to ignore. Chairman Khrushchev had told Sir Frank Roberts sometime ago, and the day before yesterday Ambassador Soldotov in London had said to Lord Home that during the construction of these stations and for the delivery of these sealed boxes, foreign observers could be present. They could also be present when the boxes were removed. But they would not tolerate foreign observers as spies. There could be no cameras, perhaps portholes of planes would have to be covered up—just those things which were necessary, of course—but the Soviet Union would not separate underground from other tests. All other kinds of explosions can be easily detected. These automatic devices in sealed boxes can easily detect any underground test. It was now up to the American side to decide whether it wished an agreement.

The Secretary said we will be discussing these matters further but he must state that these black boxes do not distinguish between earthquakes and possible underground tests. Mr. Mikoyan interjected that the British and American scientists had said they did. The Secretary responded that we had urged a meeting of the scientists to ascertain the true facts, to which Mr. Mikoyan responded they had already met.

The Secretary pointed out that British and American scientists had not concluded that these devices could detect the difference between earthquakes and underground nuclear tests. The scientists' conclusion had addressed itself to the question of whether unmanned boxes could substitute for manned stations. The Soviets asserted the devices could detect underground tests. The United States could not say whether the Soviet Union has such instruments or not, particularly when they had orbited two men within 5 kilometers of each other in outer space. What is needed is to have our scientists meet and determine the facts. We would hope that they might find it possible to agree. This, however,

is not a policy question but a matter of fact. It was a question of whether both sides can have assurance that an agreement was being carried out.

Mr. Mikoyan replied, yes, that is the question. If the scientists find it possible to agree, then the question moves into the sphere of political policy.

## 2. *Non-proliferation*

For example, the Secretary continued, one aspect of NATO-Warsaw Pact relationship was the question of the non-transfer of nuclear weapons. This question too had been touched on in his conversation with Gromyko and he thought we were coming to a point where we could speak about this in precise terms. The Secretary expressed the hope that he would see Ambassador Dobrynin before going to the NATO Ministerial meeting in Paris. Some progress had been made on this subject over the past year and the Secretary had talked with certain of his colleagues in other governments, but only in general terms. He emphasized that reaching agreement on this question could be an important step.

Turning again to the nuclear test ban, the Secretary observed that the attitude of Peiping was important. If the Chinese would not cooperate on the test ban or a non-proliferation agreement, then there could be no agreement. He noted there had been certain articles published in *Jen Min Jih Pao* in Peiping which indicated Chinese opposition. He asked Mr. Mikoyan if he had an impression whether or not the Chinese would cooperate. The Secretary expressed the personal belief that the United States and the Soviet Union have a common interest to prevent the proliferation of nuclear weapons regardless of the political or ideological system of other states.

Mr. Mikoyan replied, the United States does not recognize China and yet the Secretary was asking him. He could only speak on behalf of the USSR interest, not China. This question should be addressed to the Chinese. Mr. Mikoyan continued, we should decide on our own positions. He then asked the Secretary whether he understood him correctly to say that if China opposes these two proposals there could be no possibility of agreement.

The Secretary answered the two proposals were somewhat different. In the case of the test ban, there was a provision in the treaty that the signatories could elect to free themselves of their obligations if someone else tests. As regards a non-transfer agreement, the proposal which he and Mr. Gromyko had been discussing began with two important paragraphs. First, it was proposed that the four existing nuclear powers agree not to transfer to national governments or to help national governments obtain nuclear weapons. The second paragraph provided that non-nuclear powers would agree not to receive or to manufacture

nuclear weapons. If there was a government capable of manufacturing nuclear weapons and refuses to sign this agreement, then it is hard to see how the agreement would have meaning. For instance, we assume the Soviet Union would be greatly concerned if Germany refused to sign. On our part, we would be greatly concerned if China, or indeed any one of twenty other countries capable of developing atomic weapons, refused to sign.

Mr. Mikoyan observed he was not a specialist in this matter, but he was apprehensive that this proposal might provide a loophole through which nuclear weapons could come under some other flag, such as an international body. Through this the Germans may have access to nuclear weapons. This the Soviets cannot accept. Even now the West Germans (Strauss) are saying don't give us nuclear weapons in our own hands, since we will have access to them through NATO. If this proposal is designed to provide a by-pass, it would not be acceptable to the USSR.

The Secretary replied that Mr. Mikoyan was correct. This was a key issue. The United States was prepared to agree on no transfer, either directly or indirectly, of nuclear weapons to national governments, but we must be absolutely clear on what we mean. We must discuss this more, as we believe it has real possibilities. The United States is not interested in increasing the number of governments who have nuclear weapons. We have had differences with our friends in Paris. We consider the point made by Mr. Mikoyan a serious one and we will want to be more precise and have further discussions in detail with Ambassador Dobrynin.

Mr. Mikoyan responded that he understood the United States as a country did not want to increase the number of governments who have nuclear weapons, but, he asked, can the United States withstand pressure from its Allies to transfer to national governments or to a supranational body these weapons? In case war should break out, the Soviet Union would use nuclear weapons in the interest of its Allies but it would not give weapons to them.

The Secretary remarked that we must be clear on what we are talking about. Both the USSR and the USA have nuclear weapons in direct support of our Allies, though the warheads remain in our hands and cannot be used without our consent. This does not prevent us from consulting with our NATO Allies to the greatest extent possible about the deployment and use of nuclear weapons. The Soviet Union could also consult with its Warsaw Allies. This would not prevent an agreement being reached. The United States does not want other governments to be in a position to use nuclear weapons by their own decision.

Mr. Mikoyan concluded his remarks by saying he understood that the Secretary would continue his talks on this subject with Ambassador Dobrynin.

December 1962

155. Letter from Rusk to Couve de Murville, December 12<sup>1</sup>

December 12, 1962

Dear Maurice:

You will recall our brief conversation, during your last Washington visit, about the non-transfer of nuclear weapons. I got the impression from you that, if our German friends saw no great difficulty, you felt that France might be able to participate in some arrangement on that subject. A recent talk with our colleague Gerhard Schroeder encourages me to take this matter up with you in more precise terms.

From our point of view, there are three main objectives in our mind. The first and dominant element is our desire to throw some obstacles across the path of a Chinese nuclear development if possible. Frankly, I believe the chance that Peiping would agree not to obtain nuclear weapons is a remote one. Nevertheless if the three Western powers and the Soviet Union could propose a general agreement, the Soviets might be able to use the proposal as pressure in Peiping, disagreement between them on the subject could benefit the West, and, as a minimum, Peiping would have to bear the responsibility for no progress. I cannot overemphasize the dismay with which we face the prospect of a Red China armed with nuclear weapons, in light of the impact on the rest of Asia and of our own security responsibilities in the Pacific and Far East. I am quite sure that the Soviets take little comfort from the same prospect.

Our second purpose is to devise a means for diverting the Soviets away from special arrangements with regard to Germany. If we have an offer which is open to them, provided they can obtain Peiping's adherence, we are in a strong position to shrug off any effort to connect non-transfer of nuclear weapons with Berlin or German issues on a discriminatory basis.

Third, we are concerned about the likelihood that more and more nations will develop nuclear weapons during the next decade unless some action is taken to prevent it. I am quite certain that it is in the interest of those possessing nuclear weapons not to have the number expanded if it is possible to prevent it.

---

<sup>1</sup> Approach to French on non-diffusion proposal. Secret. 2 pp. Department of State, Conference Files: Lot 65 D 533, CF 2200.

I am attaching for your consideration a proposed draft declaration on this subject. Obviously, much turns upon precise understanding of what is meant by the language referring to direct or indirect transfer. I am also enclosing a draft minute of interpretation indicating what would not be prohibited under our language; it seems to me that we must be completely clear on such matters when or if we talk with the Soviets about precise proposals.

Schroeder told me that he thought that if it were quite clear that the adherence of Peiping was a *sine qua non* to an agreement, he thought the Federal Republic would be able to sign. I do not wish to speak for him, however, because he did not have a specific text in front of him and I am not certain that the matter had been discussed in their Cabinet.

It would be my suggestion that you, Home and I consider the matter since the three of us would be involved in paragraph one of the proposed declaration. If we can agree, we can consult the Germans and then proceed with the Soviet and other governments. Paragraph two would need the adherence of many governments if the declaration is to achieve its purpose. Certainly we would not be interested in a formal agreement which did not include Peiping.

Cordially yours,

Dean Rusk

---

## 156. Draft Non-Transfer Declaration, Undated<sup>1</sup>

Undated

### DRAFT NON-TRANSFER DECLARATION

Desiring to promote international peace and security,

Desiring, in particular, to refrain from taking steps which will extend and intensify the arms race,

Believing that the creation of additional national nuclear weapons forces will jeopardize these ends,

Recalling that General Assembly Resolution 1665 (XVI) urges all states to cooperate for these purposes,

---

<sup>1</sup> General and complete disarmament under effective international control. Confidential. 2 pp. Department of State, Conference Files: Lot 65 D 533, CF 2200.

Reaffirming their determination to achieve agreement on general and complete disarmament under effective international control,

1. The Governments of France, the United Kingdom of Great Britain and Northern Ireland, the United States of America, and the Union of Soviet Socialist Republics solemnly declare that they will not transfer any nuclear weapons directly, or indirectly through a military alliance, into the national control of individual states not now possessing such weapons, and that they will not assist such other states in the manufacture of such weapons;

2. The other signatory Governments solemnly declare that they will not manufacture nuclear weapons and that they will refrain from acquiring directly, or indirectly through military alliances, national control of any nuclear weapons, and that they will not seek or receive assistance from other states in the manufacture of any such weapons;

3. This declaration, which shall be deposited with the Government of \_\_\_\_\_, shall be open to signature by all Governments. It shall remain in effect indefinitely, subject to the right of any signatory to be relieved of its term if another signatory fails to observe them or if any other Government takes action which signatories have declared they will not take;

IN WITNESS WHEREOF THE undersigned, duly authorized, have signed this declaration.

DONE AT \_\_\_\_\_, this \_\_\_\_\_ day of \_\_\_\_\_, one thousand nine hundred and sixty-two.

---

**157. Letter from Dean to Rusk and Foster, December 28<sup>1</sup>**

December 28, 1962

Dear Secretary Rusk and Mr. Foster:

I enclose four copies of a memorandum which you may wish to turn over to the scientists for appropriate analysis.

If you approve I would also suggest a copy be sent to the President for his information.

Sincerely yours,

**Arthur H. Dean**

---

<sup>1</sup> Transmits a December 27 memorandum on possible solutions to a nuclear test ban treaty. Also appended is a January 3 note from Brubeck to Swank seeking approval to send copy of Dean memorandum to Bundy for President's use. Secret. 9 pp. Department of State, Central Files, 700.5611/12-2862.

## Attachment

### MEMORANDUM BY ARTHUR H. DEAN WITH RESPECT TO POSSIBLE SOLUTIONS FOR A NUCLEAR TEST BAN TREATY

1. In the immediate aftermath of Cuba and the Chi-Com attack on India there would appear to be little likelihood of the Soviet Union's agreeing to any effective number of internationally supervised detector stations on its territory equipped with proper and modern instrumentation, to their location in quiet areas or to the training of the USSR nationals on such stations.

2. There would also appear to be little likelihood that they would agree to any meaningful-on-site inspections by an international commission of unidentified events. To get Soviet acceptance the invitations would either have to be "invitational" in accordance with the Eight-Power memorandum or would be in accordance with Ambassador Lall of India's proposal that the commission would first ascertain whether an invitation, if issued by the commission, would be honored so that if the answer to the query were in the negative no invitation would be issued and therefore there would be no breach of the treaty.

3. The proposals with respect to having two or three automatic stations on Soviet territory, according to Sir Solly Zuckerman, offers endless possibilities for argument as to the size, the equipment and location of such stations and the manner in which their data would be recorded, reported and processed. While this scientific work was going on the Soviets would in effect be demanding a further uninspected and uncontrolled moratorium with respect to seismic events.

In order to meet the projected USSR unilateral proposal that all further testing underground be stopped on an uninspected and uncontrolled basis, the following program is put forward for examination:

I. The scientists be asked how effective a set of stations in quiet locations with modern instrumentation would be if such stations could be located in Japan, Korea, Formosa, the Philippines, India, Afghanistan, and possibly Poland, by the United States and could be manned by the United States with appropriate number of local nationals.

II. If the answer of the scientists would be that such a set of stations might be more effective in detecting, locating and identifying seismic events than a relatively few automatic stations on Soviet territory plus some larger number of automatic stations on the territories of countries contiguous to the Soviet Union, and if the scientific possibilities of such a system of stations would permit the detection, location and identification of all significant seismic events, the United States might be willing to say the following:

A. The United States will not ask for an international supervisory commission or for internationally supervised control posts manned by nationals on Soviet territory and will not ask for obligatory on-site inspections.

B. The United States will announce unilaterally that it will not test in the atmosphere, under water or in outer space or underground as long as it has no evidence satisfactory to it that the USSR or any other state is not testing in any one of these environments.

C. If the United States receives evidence satisfactory to it which leads it to believe that the USSR or any other state is testing in any one or more of these environments, then the United States reserves the full right to take any and all action as it may deem fit and proper with respect to the question of whether or not it will resume testing.

The foregoing proposal would seem to have the following disadvantages:

(1) It is not a treaty and does not obligate the Soviet Union.

(2) There will be no internationally supervised but nationally manned detection posts on the territory of the Soviet Union.

(3) There will be no right of the commission to make obligatory on-site inspections of unidentified seismic events on the territory of the Soviet Union. This program is based upon the premise which must be carefully examined by the scientists that by the setting up of our own stations in nearby countries with proper equipment and properly manned, despite the fact that there are no properly placed detection posts on the territory of the Soviet Union and no right of on-site inspection of unidentified events, we can do as reasonably good a job as we would with internationally supervised but nationally manned posts in the territory of the Soviet Union.

(4) There will be no right to make on-site inspection of unidentified events on the territory of the Soviet Union. But even with some 8 to 10 detection posts with modern instrumentation and possibly located on the territory of the Soviet Union the problem of location and identification will still be great, and even if the USSR were to agree to having the commission make its own decision with respect to on-site inspections there is no assurance that the Soviet Union would in fact cooperate in actually permitting the commission to carry out these on-site inspections effectively and efficiently.

(5) If the decision as to whether on-site inspections were to be left to a group of 17 scientists from each of the countries which are parties to the treaty, if the scientists thought that their declaration there was an unidentified event which needed on-site inspection might lead to the denunciation of the treaty, then the fear of making such a political decision, or the pressures which might be put upon them not to do so, might lead them not to ask for the right to make on-site inspections for certain unidentified events. If so, the actual request to make an on-site inspection might never arise.

Advantages:

(1) We design, equip and locate the stations.

(2) We operate them ourselves.

(3) We make our own decision as to whether there is an unidentified event and whether we have the right to resume testing and do not have to convince scientists from the non-aligned countries. Out of the eight nations, India and Burma are close geographically to Communist China and [text not declassified].

The Chi-Com attack on India and the rift between USSR and Chi-Com remain to be appraised. The relationship of the UAR and the USSR is well-known.

(4) [text not declassified]

(5) [text not declassified]

(6) [text not declassified]

(7) Even if the Proposed system has scientific disadvantages it gives the United States certain moral advantages and arguments with the non-aligned nations as against either (a) a policy of agreeing to any uninspected and uncontrolled moratorium on seismic events following the unilateral declaration of the Soviet Union against testing, or (b) being forced by world opinion to agree that we will discontinue further underground tests without any provisions for detection posts or on-site inspections on Soviet territory or without any clear right to resume testing if we find violations.

(8) It gives the United States control over the location and manning of the posts and control over the decisions.

If the program is handled in a highly objective scientific manner the fact that you do not have non-aligned nations concurring in the decision that there has been either a nuclear test or an unidentified event will be largely overcome.

If the foregoing proposal were cleared as satisfactory to the scientists it would of course have to be cleared with Senator Russell of Georgia and with the Joint Atomic Energy Committee in view of the statements that have been made with respect to the proposed treaty and with respect to resident supervision of the international commission at nationally manned detection parts in the territory of the Soviet Union.

#### 158. Memorandum of Conversation, December 28, between Dobrynin and Harriman<sup>1</sup>

December 28, 1962

##### SUBJECT

Nuclear Testing

##### PARTICIPANTS

Ambassador Dobrynin USSR  
W. Averell Harriman

During a conversation at dinner at the Soviet Embassy, Ambassador Dobrynin expressed optimism that an agreement on the ending of nuclear testing could now be reached since Mr. Khrushchev had accepted the principle of on-the-ground inspections. The difference now was only how many.

---

<sup>1</sup> Khrushchev acceptance of principle of on-the-ground inspections. Confidential.  
1 p. Department of State, Central Files, 700.5611/12-2862.

January 1963

159. Aide-mémoire, January 10<sup>1</sup>

January 10, 1963

The Soviet Government to which considerations of the U.S. Government on non-proliferation of nuclear weapons were transmitted at the request of Secretary of State Dean Rusk, appreciates such step of the U.S. Government which it had taken in a preliminary and confidential manner before the discussion in the NATO Council. The Soviet Government has studied these considerations with all attention and would like, on its part, to give its view on this important question.

We understand the situation in such a way that the U.S.S.R. and the U.S. are in agreement in principle as to the necessity of preventing, in the interests of reducing risk of thermonuclear war, further proliferation of nuclear weapons. It is important that an agreement on this question should lead precisely to this aim and should not create possibilities for actual proliferation of nuclear weapons among other states under this or that pretext.

I. The American draft declaration speaks of the commitment on the part of the U.S., U.S.S.R., Britain and France "not to transfer any nuclear weapons—directly or indirectly through military alliances—into the national control of individual states not now possessing such weapons" and of the commitment not to render assistance to these states in the manufacture of nuclear weapons. The direction this wording gives corresponds in general to the aim which was meant in the course of the Soviet-American exchange of opinion. More attentively thus one should see to it that the aim of non-proliferation of nuclear weapons among non-nuclear states is achieved in practice. But here we have several essential remarks to make in connection with the U.S. proposals.

At present there are two main nuclear powers—the U.S.S.R. and the U.S. A certain nuclear potential has been created by Britain. Some types of nuclear weapons are possessed by France. Judging from the mentioned text and commentaries on it the American draft does not prevent the U.S., Britain and France from placing nuclear weapons in the custody of units of "a multinational defense force" within the framework of NATO. In this way through the NATO machinery is

---

<sup>1</sup> Soviet Government views on American draft declaration on non-transfer of nuclear weapons. Secret. 8 pp. Department of State, Presidential Correspondence: Lot 77 D 163, More Pen Pals, 1963.

allowed *actual* equipment with nuclear weapons of forces of the non-nuclear states of this military bloc and, above all, of those of the FRG which has the largest forces assigned to the NATO command and which especially seeks after nuclear weapons.

Reservations to the effect that nuclear weapons could not be deployed or used on the basis of national decision of any government not now possessing such weapons scarcely change the state of things because after all he commands the weapons who has them in his hands. Obviously no systems of paper or verbal control would provide adequate guarantee that, for instance, the FRG which openly expresses territorial claims to neighboring states and which takes a manifestly hostile position toward the GDR, the Soviet Union and other peaceful states would not commit to action nuclear weapons even if it had received them on the so-called “multinational basis” when it considers the moment appropriate for realizing its plans of revision of the results of World War II.

For the Soviet Union these or those agreements within the NATO concerning nuclear weapons cannot serve as guarantee of its interests. And even those people in the West who set hopes on such agreements could be reminded of the perfidy committed not once in history by German militarist circles against peaceful nations. A striking example of that is the policy of the Hitlerit Germany which broke one international agreement after another and then unleashed World War II.

It is not difficult to see that the realization of the provisions, envisaged in the American draft declaration and in the commentaries on it would, in practice, mean further drifting away from the position of non-proliferation of nuclear weapons to the position of their *actual* proliferation, i.e. to the transfer of them into the hands of those who now do not have such weapons, and into the hands of West Germans as well. But this corresponds neither to the interests of security of both our powers, nor to the interests of the entire world.

It was more than once said by the American side that the U.S. also took into account the danger of growing expansionist tendencies in the policy of the FRG and the necessity to contain such tendencies. The U.S. Government, and governments of other Western countries as well, more than once stressed that the Paris Agreements allowing in certain framework arming the FRG, at the same time set up restrictions for it in this field, especially with respect to weapons of mass annihilation and that in this sense the Soviet Union’s interests were even taken into account. The Soviet Government criticized the Paris Agreements pointing out that they opened gates for restoration of militarism in Western Germany.

But in fact the U.S. Government is going further and further away even from the principle of military restrictions for the Federal Republic

of Germany declared by the Western powers in the Paris Agreements and more and more often one can hear talk in the NATO about "equal rights" for the FRG in military matters including nuclear armaments as well. Unfortunately, this is reflected in the American draft in question.

The Caribbean crisis indicated how thin is the line which in the present international situation separates humanity from catastrophe of rocket-nuclear war. Isn't it clear that peoples and states may find themselves on the edge of abyss if militaristic and revanchist forces of Western Germany manage to acquire in fact, by whatever means, possession of nuclear weapons.

The Soviet Government deems it necessary to stress with all possible clarity that transfer of nuclear weapons to West German military forces disregarding the means of its realization would change the already existing situation in Europe in the field of armaments and would affect vital interest of the Soviet Union and other peaceloving states. The world would face a new series of dangers and a grave international crisis. One cannot but see that in this case the nuclear arms race would be even more intensified accompanied by more aggressive attitude on the part of West German militarism and by growth of dangers for the European peace, and it would be difficult in such case to find ways and means to turn the arms race downward. The U.S.S.R., naturally, cannot reconcile itself to such situation and would be obliged without delay to undertake all ensuing measures.

2. If both sides begin to transfer their nuclear weapons to others, it is difficult to say when the movement in this direction will stop and whether there will remain any obstacles whatsoever against non-restricted dissemination of nuclear weapon in the world.

In the opinion of the Soviet Government—and this point of view of ours is well known to the U.S. Government—an indispensable element of an agreement between nuclear powers should be an obligation of non-transfer of nuclear weapons to the troops of non-nuclear states also in case when those troops make part of multinational armed forces of military alliances. This would be real non-transfer of nuclear weapons, indirectly as well. Thus the point is that in military blocs nuclear weapons should be only with the troops of the nuclear powers. The access to such weapons of military personnel of other countries should be completely excluded disregarding the fact whether it means permanent or temporary or even episodic access, such as rotation of guards, watches etc. Indeed today one needs only several minutes if not seconds to unleash total war.

And reaching such accord would give necessary effectiveness to the agreement on non-proliferation of nuclear weapons.

3. The American draft seems to allow a possibility to exchange information on the manufacture of nuclear weapons and to exchange

those weapons themselves among the U.S., Britain and France as nuclear powers that are allies in NATO while the U.S.S.R. actually would assume commitment not to transfer such information or weapons to its allies. This would be inequality in commitments. Exchange of such information or nuclear weapons among the U.S., Britain and France would lead to increase international tension and to change the balance of power, to which the U.S.S.R. cannot agree. Hence it is necessary that corresponding provisions of the agreement on non-transfer of nuclear weapons and information on their manufacture cover also the relations among nuclear powers themselves.

4. In the question of non-proliferation of nuclear weapons and in other international questions the Soviet Union cannot speak in the name of other socialist states which themselves set forth their position. So far as the People's Republic of China is concerned—as a result of the U.S. policy it has been deprived of a possibility to take part in the work of the U.N. and negotiations on disarmament including the questions related to nuclear weapons. That is why it is the U.S. that bears the responsibility for the consequences of such situation.

5. From Mr. Rusk's explanation one might get an impression that the U.S. makes the solution of the question of prevention of nuclear armament of the two German states dependent on the achievement of global agreement on non-proliferation of nuclear weapons and accession to this agreement of one or another country. Seeking after achievement of general agreement on the non-transfer of nuclear weapons the Soviet side at the same time considers that if achieving comprehensive international agreement is protracted then regardless of such agreement commitment must be formally reaffirmed and fixed in an appropriate agreement on non-arming with nuclear weapons of the two German states.

6. As is seen from Mr. Rusk's explanations, the American side stands for the right to deploy its nuclear weapons on the territory of countries—members of NATO even if now there are such weapons in those countries. In other words what is meant here is expansion, as compared to what exists now, of the sphere deployment of American nuclear weapons, in Europe included. It does not correspond to the line for reduction of rocket-nuclear bases which has been brought about now by life itself as one of the most important tasks persistently demanding its solution in the interests of securing peace.

It is true Mr. Rusk spoke of giving the same opportunity to the Soviet Union. But the Soviet side proceeding from the task of lessening international tension does not strive for this. And in general such development would not facilitate normalization of the situation in Europe. On the contrary this might make the relations between NATO and Warsaw Treaty Organization even more acute.

7. The Soviet Government is ready to continue to search for a mutually acceptable agreement which would prevent further proliferation of nuclear weapons in the world. One cannot permit such situation when, using the words of a prominent American journalist, as time passes, even Paraguay can trigger world thermonuclear war. And this is where it would lead if necessary measures are not taken. To prevent such development is in the interests of both the Soviet Union and the United States which shoulder special responsibility for the destinies of universal peace.

---

**160. Message from Prime Minister Macmillan to President Kennedy, January 13<sup>1</sup>**

January 13, 1963

My Dear Friend,

You know, I was very glad to hear that you have time to have private talks with the Russians about the [illegible in the original] of nuclear tests. This has now become public knowledge and on reflection I think it would be very useful if we could be associated with you in the talks. If that is agreeable, perhaps this could be after the first meeting. We have been so much together in all this that I feel it would be held to be quite natural for our cooperation to continue as before. I hope you will agree.

With warm regard,

**Harold Macmillan**

**161. Message from President Kennedy to Prime Minister  
Macmillan, January 13<sup>1</sup>**

January 13, 1963

My Dear Friend

I entirely agree that we should stick together on the test ban and I am asking Rusk and Foster to concert most effective way of arranging this at first meeting tomorrow. Our first thought is that we might move from talks between co-chairmen to informal consultation among the three members of test ban subcommittee but Rusk or Foster will discuss details with David Gore tomorrow and in this connection I venture the hope that David may be given this assignment on your side.

Sincerely

**John F. Kennedy**

<sup>1</sup> Nuclear testing: on-site inspections. Two attachments provide a listing of Soviet fixed seismic stations and Foster's comments on automatic seismic stations and procedures for on-site inspection. Secret. 14 pp. Department of State, Central Files, 700.5611/1–1663.

US

William C. Foster, Director, ACDA

Charles C. Stelle, Deputy U.S. Representative, ENDC

James E. Goodby, ACDA/IR

Alexander Akalovsky, ACDA/IR

Referring to Mr. Foster's comments at the previous meeting, *Fedorenko* stated that there were over 70 seismic stations in the USSR located with the aim of studying the seismicity of the Soviet Union. These stations participated in the international exchange of data. He then handed Mr. Foster a list of these permanent stations noting that there were 73. The Soviet Government, *Fedorenko* stated, agreed that data from these stations, or those of them designated for this purpose, would be sent to an international center in a uniform manner.

*Mr. Foster* said that this information would be helpful and that, in turn, he would be more specific on certain matters in which he knew the Soviet Union had an interest. He then proceeded to read the statement entitled, "Suggestions for Automatic Recording Seismic Stations within the USA" and promised to give the Soviet side a copy of the statement the next day. Noting that there would be some symmetry as well as some asymmetry between the Soviet Union and the U.S. in respect to automatic seismic stations, Mr. Foster stated that the suggestions for automatic seismic stations within the USA were presented solely for the purpose of suggesting stations which might function satisfactorily within the USA. They were not meant to have any implication with respect to the key item in the negotiations—the number of on-site inspections—and had no implication as to the number or location of automatic seismic stations the USA would want to have in the USSR.

*Fedorenko* inquired how the US understood the quota of on-site inspections to be affected by the considerations relating to the location, number and operation of automatic seismic stations.

*Mr. Foster* replied that the data supplied by these stations would have several effects. One would be to provide additional information about seismic waves which would help reduce the number of unidentified events.

Mr. Foster recalled the demonstrated willingness of the US to reduce the requirements for on-site inspections as technology improved and stressed that there was a direct relationship between the degree of information we had about such things as travel time and the ability we had to reduce the number of unidentified events. He also emphasized that there was a relationship between the number of unidentified events and the size of the quota of inspections.

*Fedorenko* rejoined that the explanation he had just heard was general and wondered whether Mr. Foster could give specific values so that the problem could be understood more precisely. *Mr. Foster*

doubted that there was an exact quantitative relationship between the various parameters he had mentioned and added that political judgments of course came into play.

*Fedorenko* then inquired whether the US had anything to say about automatic stations on Soviet territory.

*Mr. Foster* said that he did not have that information today but could say that three stations would not be enough. He reiterated, however, that there would be a certain symmetry between the situation in the US and the situation in the Soviet Union.

*Mr. Foster* recalled that he had raised certain questions at the previous meeting which needed clarification as concerned on-site inspections. Although the Soviet Government was familiar with much of what he was about to say about US views on these matters, *Mr. Foster* did wish to repeat these views to give them emphasis and also to elicit Soviet thinking. *Mr. Foster* then described the US position on the selection of events for inspection, the criteria for selection of events, conduct of on-site inspections, the size of area eligible for inspection and the composition of teams. *Mr. Foster* undertook to provide the Soviet side with a paper containing the points he had just made.

*Tsarapkin* then recalled that *Mr. Foster* at the previous meeting had said that the points he had just covered had a bearing on the on-site inspection quota. He inquired what it would take to decrease the on-site inspection quota as regards these particular factors. *Mr. Foster* responded that since 1959 the Soviet Union had never accepted more than three on-site inspections while the US had halved its requirement for on-site inspections. He felt that it was time for some response from the Soviet Union with respect to its views on both on-site inspections and the matters which he had just been discussing. It would be futile to agree on an on-site inspection quota if such agreement could be blocked by other elements in the inspection procedures.

*Mr. Foster* stressed that the US wished to have a test ban agreement which would endure and this meant that the treaty would have to contribute to the confidence of the parties to it. The US hoped to work together with the Soviet Union in a mutual effort to stop tests and to turn down the arms race. At this point, *Mr. Foster* mentioned that some time in the next few days the US would undertake an underground nuclear test at the proving grounds in Nevada. He noted that this was part of the series begun last year and did not signify that a major new test series was beginning. This underground test was scheduled to take place some time ago and it was anticipated that some others would also take place in the coming months in the event a treaty was not signed. The fact of this test did not lessen the interest of the US in continuing to negotiate with all possible speed an effective test ban treaty.

*Fedorenko* replied that Mr. Foster's reference to the US moves with respect to on-site inspections was a subjective opinion. There had been no change in the essence of the US position since the US still related the number of on-site inspections to unidentified seismic events. The fact that the previous quota of numbers suggested by the US had no foundation was evidenced by the fact that the US had decided to cut its suggested quota in two when it concluded that its original propositions were untenable.

Furthermore, the US failed to evaluate at its proper worth the important decision of principle of the Soviet Government, which had accepted the idea of on-site inspections, although its last position, the November 28, 1961 draft treaty, did not mention on-site inspection. There was no reason to say, therefore, that the Soviet Union had not changed its position.

Fedorenko then said that in the course of three meetings, the Soviet side had tried to talk about the specifics on the questions for which the meetings had been arranged. The US side had expressed its position only in general terms and it now appeared that this restrained attitude on the part of the US was because the US wished to continue nuclear weapons testing. How could this be reconciled with what these talks were supposed to do? The Soviet side did not think that the continuation of nuclear tests by the US showed a desire by the US to reach an agreement. Fedorenko wondered how sincere the US was in its desire to reach agreement. Were these negotiations to be used as a cover for the continuation of nuclear tests? The meetings had been going on for 3 days and no sign of forward movement had been seen. A proposal had been made to move the meetings to Washington. Fedorenko professed puzzlement as to what this meant and thought the announcement read by Mr. Foster was in contradiction to the understandings of the Soviet and US governments, with respect to the problem of a test ban.

*Mr. Foster* assured Fedorenko that the US was completely sincere in its efforts to reach a test ban and that these discussions were not a cover for a continuation of tests. The US had always said it would stop tests whenever an effective agreement could be achieved and the US continued to adhere to this. In the absence of an acceptable agreement, the US would continue to test at intervals as was required by its national security. The information about the underground nuclear test by the US had been given to the Soviet side because the US wished the Soviet Government to know in advance that a test would be held. The US, he reiterated, was ready to stop all such tests any time an effective agreement could be reached.

Concerning the points he had previously made on questions relating to on-site inspections, Mr. Foster pointed out that the US had had no response on these proposals, either here or in Geneva. He thought

the differences between the two sides had shrunk somewhat since the talks began, particularly on the question of the location of automatic seismic stations. However, three on-site inspections and three automatic seismic stations in Soviet territory would not be enough to build confidence in the treaty. Illustrating just one problem with the number three for on-site inspections, Mr. Foster observed that it would be necessary to keep one on-site inspection almost until the end of an annual period. This would leave only two on-site inspections for the rest of the year. The United States had taken cognizance of improvements in technology to reduce its on-site inspection requirements; the US accepted the fact that limitations could be placed on the exercise of on-site inspections to meet Soviet concerns about intelligence gathering and security areas. The US desired to move forward along the lines indicated by the previous exchange of communications between the two governments. Mr. Foster added that the US did appreciate the Soviet Union's acceptance of on-site inspections.

*Tsarapkin* then intervened to repeat the comments made by *Fedorenko* previously about the US continuation of nuclear tests. He said that the present Soviet position must be compared with its November 28, 1961 position and in comparison with that time the Soviet Union had made a significant step forward. Two to three on-site inspections were enough and the Soviet Union would not let inspectors go to the Soviet Union 8 to 10 times per year. *Tsarapkin* then said that Soviet scientists had considered the question of where automatic seismic stations should be placed in US territory, taking into account the activities of seismic zones in the US and with the understanding that 3 such stations would be enough for the entire US. The locations proposed by the Soviet scientists were: one in the Augusta-Columbia area in South Carolina, one in the Santa Fe-Albuquerque area in New Mexico, and one in the Spokane-Richmond area in Washington. *Tsarapkin* stressed that 3 automatic stations in each the US and the USSR would be completely sufficient as a supplement to national manned stations.

*Mr. Foster* said that the US side would examine these proposals and discuss them later with the Soviet side. He then noted that the two sides disagreed with respect to numbers. As to on-site inspections, two or three was not acceptable and if this was the Soviet ultimate position we should know it as soon as possible. With regard to automatic stations, two or three was also insufficient, though perhaps not to the same degree as in the case of inspections.

In the concluding discussions *Mr. Foster* stated that he would have to be in Washington on Thursday and could therefore not participate in a meeting on that day. He asked that the Soviet side let him know what the decision of the Soviet Government was with respect to a meeting in Washington and with respect to inclusion of the UK in the discussions.

*Fedorenko* then said that both of these matters were under study. The Soviet side would be glad to meet in New York on Friday. Mr. Foster declined to set a time for the next meeting in the absence of a Soviet reply on the questions of locale and UK participation and it was agreed he would be in contact with *Fedorenko* Thursday to find out whether he had response on the two matters.

January 17, 1963

In accordance with Mr. Foster's suggestion at the meeting yesterday, I am forwarding to you, at his request, an outline of his remarks at that meeting dealing with the questions of automatic seismic stations and procedures for on-site inspection.

**Alexander Akalovsky****Attachment**

The following outline of U.S. views on inspection procedures is set forth in the hope that the U.S.S.R. will also present its comments on this matter.

*1. Selection of Events for Inspection*

The U.S.-U.K. would select events certified, on the basis of agreed criteria, by the Executive Officer of the Control System as eligible for inspection in the U.S.S.R., and vice versa.

*2. Criteria for Selection of Events*

Executive Officer would certify events as located and unidentified in accordance with agreed objective criteria which would be essentially location criteria, although depth of focus, deep ocean, and aftershock-foreshock elements in these criteria would eliminate many events.

*3. Conduct of on-site Inspections*

If the quota has not been exhausted, the host government would not interpose objections to inspection. The team would be promptly dispatched to the location of the event to be inspected. The team would search for radioactive debris or other evidence of a nuclear explosion by means of lowflight aerial inspection and intensive ground inspection, including drilling if necessary. The duration of the inspection would depend on the conditions at the site and the operations required. Transit to the site could be subject to safeguards of the kind already described by both sides. Operations at the site would be monitored by observers from the host country and handled in accordance with any arrangements reached with regard to particularly sensitive areas from the standpoint of national security.

*4. Size of Area Eligible for Inspection*

In 1961, the U.S. proposed 200 or 500 square kilometers. That proposal called for 19 internationally manned superior multi-compo-

nent seismograph stations in the U.S.S.R. Technical progress has been made since 1961 but it remains true that the fewer the stations close to the epicenter the poorer will be the ability to locate the epicenter. Consequently, the number of automatic seismic stations and their location has a direct effect on the size of the area eligible for inspection. With stations on either side, and given the locations of existing seismograph stations, an area larger than 500 square kilometers would almost certainly be required, probably on the order of 700–800 square kilometers, or approximately 15 kilometers in radius.

### 5. *Composition of Teams*

The U.S. proposed in 1961 that for inspection in the U.S.S.R. 50% of the team would be composed of U.S.–UK nationals and the other 50% of nationals of countries not associated with either side, with the team to be headed by a U.S. or U.K. national. For inspections in the U.S., 50% of the team would be U.S.S.R. nationals and 50% nationals of countries not associated with either side, the leader of the team being a Soviet national.

We would also accept the formula of the August 27 U.S.–U.K. draft treaty; the Executive Officer selects team members on a broad international basis, but *excluding* host countries nationals.

The following suggestions for automatic recording seismic stations within the U.S.A. are presented solely for the purpose of suggesting stations which might function satisfactorily within the U.S.A. They are not meant to have any implication with respect to the key item in the negotiations—the number of on-site inspections—and have no implication as the number or location of automatic seismic stations the U.S.A. may consider as necessary in the U.S.S.R.

It is assumed that with respect to automatic recording seismic stations there would be some symmetry as well as some asymmetry between the U.S. and the U.S.S.R. Specifically, one can expect the character of the equipment to be more or less the same, the provisions for data collection to be more or less the same and at least some approximate similarity in the utilization of the automatic recording stations although here there may well be differences depending upon the character of the manned seismic stations in each country which would affect the judgment as to possible symmetry or asymmetry. This paper, which is at least partly for illustrative purposes, considers possible stations for the U.S. and possible locations for automatic recording stations.

### *Equipment*

The assumption is that each of the automatic recording stations will contain within it a three-component short period seismometer,

something at least comparable to the normal Benioff, and also a three-component long period seismometer. There will be provisions for timing and for calibration. A first assumption is that the data recorder would have data storage for two or three months although this should be a negotiable point since either a shorter storage period or a longer one may turn out to be more practical. In the United States it would seem reasonable to make the assumption that 110 volt AC electric power can be brought to any site for an automatic recording station.

The U.S. would be willing to discuss the noise levels for various parts of the United States and would be agreeable to construction of sites for recording stations that would be agreed upon.

To reduce noise levels it may be advantageous for some or all of the recording stations to have seismometers in deep holes. The extent to which these techniques become important and necessary depends largely on the number and placement of these automatic seismic stations. Stations in quieter locations might not need these techniques, while other would benefit from them.

#### *Location of Recording Stations*

The continental United States is relatively well covered either by quite superior Geneva-type seismic stations newly installed under Project Vela or by relatively good "standard stations" with fairly new equipment paid for by the U.S. Coast and Geodetic Survey under its Standard Station Program. Consequently, it seems probable that the major use of automatic recording stations in the U.S. will be to validate the data coming from national manned stations. This, in turn, suggests that a most probable location for the automatic stations will be adjacent to some of the already existing U.S. manned stations. This permits taking advantage of the work which has already been done by U.S. scientific groups in locating low noise sites and gives direct validation of the data from these manned stations.

Assuming ten recording stations for the entire U.S., it seems reasonable that seven of them would be in the central part of the country, i.e., excluding Alaska. If so, the following tentative suggestions are made as to sites which might be of interest to the U.S.S.R. Delegation: Baker, Oregon; Tonto Forest, Arizona; Vernal, Utah; one of the better of the California Institute of Technology stations; McMinnville, Tennessee; two stations in the East, for example, Palisades, New York; and Weston, Massachusetts.

In Alaska one obvious location would be at College, Alaska, to monitor the manned U.S. Coast and Geodetic Survey Station already there. Two additional locations might in this case be separate from a manned station and might be out on two of the Aleutian Islands to give more close in monitoring of the earthquakes there. If the U.S.S.R.

showed an interest in this area, the U.S. has much information about seismic noise levels, availability of electric power, etc. A particularly important item here would be the accessibility of the station to rapid transportation to ensure that data could be picked up fairly quickly. In fact, since courier-inspectors would be going to the automatic stations to pick up data at intervals as long as a couple of months, efficient transportation arrangements are of real importance.

It is quite probable that U.S.S.R. technical groups would like to have some automatic recording seismic stations in Mexico and Canada. If so, the U.S. should be willing to assist in obtaining sites and agreements for such stations and to help in efficient pick-up of the data if this would be helpful.

*Specific Data to be Forwarded from U.S.A. Manned Seismic Stations on a Routine Basis to an International Commission*

From some of the U.S. stations, for example the Geneva-type stations, it would seem quite reasonable to forward copies of all of the data taken by these stations. The data in this instance are in a variety of forms, including films, photo paper and magnetic tape and it should be quite straightforward to make arrangements to send copies of the records regularly, i.e., daily or every other day, or at other appropriate intervals. However, some of the stations within the U.S. are involved in experimental research programs and hence have a variety of specific seismic instruments, many of them varied in use from day to day. For these stations it would probably not be reasonable to ask them to send all data.

As two examples of the problem, the first concerns the station network operated in Southern California by Dr. Frank Press of the California Institute of Technology. The network involves 20 stations of some variability of noise level as well as variability in the degree to which the stations are maintained. The most reasonable procedure would seem to be to suggest that data be sent routinely from two of the stations, specifically, data from a standard three-component short period Benioff instrument and from a standard three-component long period instrument. Data of the same sort from the other stations of this network could then be preserved and made available on an "on call" basis whenever requested. Data from experimental seismometers in the same network would presumably not be involved in the data forwarding operations.

A second example concerns the Columbia University station operated under Professor Jack Oliver at Palisades, New York. Oliver has numerous seismometers of different sorts under study at this station. It would probably be unreasonable to expect him to send data from all of them. Again, a reasonable suggestion would seem to be that

a standard three-component short period seismometer and another standard three-component long period seismometer be designated as the two instruments from which data should be routinely forwarded to the International Center. In the process of preparing a specific list of proposed U.S. stations from which data would be forwarded to a Commission it would be necessary both to make definite arrangements with these stations and also to agree on what specific instruments were to be involved.

<sup>1</sup> Nuclear test ban issues. Two attachments provide a listing of proposed locations in U.S.S.R. and in U.S., including noise levels, for automatic seismic stations. Secret. 12 pp. Department of State, Central Files, 700.5611/1–2263.

not by the initiative of the Soviet Union. *Tsarapkin* added that if there were leaks the Soviet Union reserved its freedom of action.

*Mr. Foster* said he realized that *Mr. Gromyko* had said no "technical" matters should be discussed in these talks but it was difficult to evaluate the effectiveness of a verification system without having more information about it; it was also impossible to judge the appropriate number of on-site inspections and automatic recording stations. Observing that exchanges had already taken place on numbers and locations of national detection stations, *Mr. Foster* gave the Soviet side a list of locations in the Soviet Union where the US would like to have automatic seismic stations established (attached). *Mr. Foster* also gave the Soviet side a list of US locations for automatic seismic stations with data on noise level in each of those locations (attached). *Mr. Foster* noted that the Baker-Oregon station as previously suggested by the US was close to the Spokane-Richland area suggested by the Soviet side and was probably a quieter site. Moreover, the Augusta, Georgia-Columbia, South Carolina area requested by the Soviet side was quite a noisy site and the Soviet Union might wish to substitute for this station a station at Weston, Mass., which was a quiet site. The Albuquerque, New Mexico, station requested by the Soviet side was a quiet location and would suit the purposes quite well. It could be substituted for the Tonto Forest, Ariz., station.

*Mr. Foster* pointed out that peripheral stations would also be of great importance in properly monitoring any agreement.

*Tsarapkin* commented that *Mr. Foster* continued to insist on going into technical details and to argue that on these technical details depended the numbers of automatic stations and the on-site inspection quota. Soviet agreement to 2 or 3 on-site inspections was an expression of its good will and was an effort to overcome US internal difficulties. The figure 2-3 named by the USSR fully answered the desire of the US to have some on-site inspections as a deterrent. The Soviet Union had not specified 2 or 3 on-site inspections as a basis for bargaining but rather as a basis for agreement since the Soviet Union was in principle against even a single on-site inspection. The Soviet Government had opened the way to an agreement. It was a sad fact that all the previous negotiations had been a chain of lost opportunities and *Tsarapkin* hoped we would not lose another opportunity to reach agreement.

As for the locations of automatic seismic stations on Soviet territory, *Tsarapkin* stated that 10 such stations were not necessary. The Soviet Union would be prepared to discuss the parameters for these automatic stations as soon as agreement had been reached on the locations for automatic stations in the US, USSR, and other nuclear powers and on the quota of 3 on-site inspections. The Soviet Union had no prepared

recipe for these parameters. However, it was clear that there was no need for 10 automatic stations either on Soviet or on US territory.

Tsarapkin then said that the previous comments and questions of Mr. Foster had been sent to Moscow and were under study there. The views of the Soviet Government on these matters would be given later but it would be premature to discuss these technical questions now since this would only make agreement more difficult.

The purpose of automatic stations was to give assurance that the tremendous network of national seismic stations had been operating correctly. To do this, 3 stations in areas named by the Soviet Union was enough, especially when stations around the USSR were considered.

*Sir David* said that the UK approach to automatic seismic stations was different from the Soviet approach. The UK and the US attitude was related to the scientific advice that the two governments were given. The UK and US were not in a position to ignore their scientific advice. The UK knew of no Western or Soviet seismologist who would say that all seismic events could be identified by national networks. He wondered what the Soviet Government's objection was to increasing the number of automatic stations since one advantage of such stations would be to increase the capability of the control system. The UK believed that 10 automatic seismic stations would cause no security problem for the Soviet Union and that these stations would help identify and locate seismic events.

*Tsarapkin* answered that automatic seismic stations had been suggested not for the purpose of detecting and identifying seismic events but rather to check on national networks of seismic stations. The Soviet side was sure that 3 automatic stations was enough, taking into account the peripheral stations.

*Mr. Foster* noted Tsarapkin was placing too great an emphasis on just one aspect of automatic stations, whereas such stations could also help in locating events and reducing somewhat the number of unidentified events. Also, they might help reduce to a certain extent the area which would have to be inspected. He then said that he felt there were four important elements to consider in the verification system we were talking about. These were: 1) number of on-site inspections; 2) character and procedures for carrying out on-site inspections; 3) the number of automatic recording stations and national seismic stations; 4) the location and quality of all such stations.

The Soviet side had said that one of the important things to discuss was the number and location of automatic stations. The US therefore felt the Soviet Union should consider whether an adequate number of automatic seismic stations was not in the interest of both sides.

The verification system was an integrated structure in which any ineffective element would have an effect on the whole system. There

was a scientific, as well as political, necessity for on-site inspections and, as President Kennedy had stated in his letter to Premier Khrushchev, 2 or 3 on-site inspections would not be acceptable. The number should be such that all parties to the agreement would have confidence in it. The US must know the general parameters of the inspection system since only by knowing what the general approaches of the two sides were could joint recommendations be made to the principals.

The US hoped for a quick agreement but it would be unhelpful if in these talks agreement was reached on a quota of on-site inspections which we later found out could not take place. The Soviet Union's 2, 3 or 4 on-site inspections and the US's 10, 9 or 8 on-site inspections left a narrow gap. Perhaps this question should be put aside so that we could see if the other matters could be worked out. The US needed to understand the general outline of the entire verification system so that on-site inspection numbers could be talked about within a more specific range.

*Fedorenko* repeated the Soviet position that national detection systems were entirely adequate, noting that the US had been able to register all tests on the territory of the Soviet Union. This proved that national systems of control were enough. There was no need for any scientific meeting to prove this.

The data from national stations could be sent in a uniform manner to an international center. The Soviet side, incidentally, agreed with its US colleagues that there was no need to send data from all national detection stations. As for the automatic seismic stations, this was a Western idea which the Soviet Union accepted not of necessity but to meet the desires of the US and to overcome difficulties in the way of agreement.

The Soviet Union had adopted a political approach in meeting the desires of the West and it had also taken a scientific approach in that these automatic stations would be a means of checking national systems. If the task of the automatic seismic stations were taken as one of duplicating the work of the national systems, it would be impossible to determine the number which should be located on the territories of the nuclear powers. Three automatic stations were completely sufficient to serve as a check on national networks, taking into account the fact that there would also be stations on the periphery of the US and of the USSR.

Finally, on the question of on-site inspections, *Fedorenko* stressed that the USSR had taken a political approach in solving this problem since until recently the Soviet Union had not accepted on-site inspections. Soviet agreement to 2 or 3 inspections a year on Soviet territory was exclusively for the purpose of removing the difficulty in the way of ending all nuclear tests. *Fedorenko* thought the Soviet side was

entitled to hope that this move by the Soviet Government would be properly appreciated.

Fedorenko noted that Mr. Foster had earlier referred to the statement of Mr. Gromyko who had said that technical details should not be the task of this meeting. The task was to come to an understanding on the basic questions of the locations of automatic seismic stations and the quota of on-site inspections. This task corresponded to the understandings reached in the exchange of letters between the President and Chairman Khrushchev.

Fedorenko then asked whether Mr. Foster had talked to the President and whether he could say what the results of any such talks had been. Specifically, how did Mr. Foster view the prospects for the work here in Washington?

*Mr. Foster* replied that he had seen the President and that the President believed there had been some progress made in clarifying the situation with respect to a nuclear test ban agreement. Mr. Foster said the President had recalled that in his letter of December 28th he had said that two or three on-site inspections would be unacceptable and had inquired whether the Soviet Union had given a response to the questions Mr. Foster had put to Mr. Fedorenko. The President felt that the conditions under which on-site inspections would be carried out were very important and constituted a requirement with respect to the acceptance of any quota. Mr. Foster said the President had suggested that in view of the small difference between the two sides on the on-site inspection quota, this question might be put aside in order to see if the other conditions of an agreement could be generally determined. Mr. Foster emphasized that the US was not attempting to determine all the technical details but rather was interested in knowing more about the general conditions of the verification system. The President continued to hope that the negotiations could be further advanced, particularly as a result of the Soviet acceptance of the principle of on-site inspection.

Mr. Foster said that because of the deep desire of the US to move forward toward an agreement, the US government had considered how automatic seismic stations could be helpful in a test ban agreement. The US believed it had made a significant finding in its determination that a combination of national seismic stations and automatic recording stations could be helpful.

*Sir David* then commented that the fact that a Soviet underground explosion had been detected did not prove much since the yield of that explosion, it was understood, was about 50 kilotons. As far back as 1958, it was known that events of that size could be detected. The magnitude of the events being talked about was something under 5 or even 2 kilotons yield. Even above seismic magnitude 4.0, UK scien-

tists could not positively identify all events as either earthquakes or explosions. For its part, the UK had to take these facts into account in its approach to these problems.

*Fedorenko* repeated his assertion that national means of detection and identification were quite sufficient.

He then asked whether Mr. Foster could say more specifically about the work of the meetings in the near future.

*Mr. Foster* replied that since the US had still not heard Soviet views on procedure and arrangements for carrying out on-site inspections, this should be one of the matters discussed in the near future. He reiterated that the gap with respect to the inspection quota should be left aside for the moment. Since the US had also mentioned something today about automatic recording stations and their noise levels at various locations in the US, perhaps the Soviet side might wish to comment on this and also on the locations suggested for the Soviet Union.

*Tsarapkin* replied that the Soviet Union was not opposed to a discussion of questions of the kind raised by Mr. Foster previously. The Soviet Government, however, did wish to come to an agreement and this was why it proposed the order for the discussions that it had already suggested. The procedure suggested by Mr. Foster would lead to an impasse. As soon as the two sides had agreement on these questions in their pockets, they could immediately proceed to a discussion of the things mentioned by Mr. Foster and resolve them without any difficulty. The Soviet Government thought it would help progress toward an agreement, if agreement could first be reached on the basic questions of the on-site inspection quota and the numbers and locations of automatic seismic stations. If the two sides could agree on these two questions, the remaining technical questions would be the cause for frustrating agreement.

Frankly speaking, *Tsarapkin* said, the reason the US insisted on the priority it did was that it hoped to increase the number of on-site inspections and the number of automatic seismic stations. The Soviet Union, however, would not go further than the number of on-site inspections and the number of automatic seismic stations which it had stated. If the US wanted agreement, both sides should record agreement on 2–3 inspections and 2–3 automatic stations. Technical discussions had frustrated an agreement for almost 5 years and now the talks seemed to be back in the old rut.

*Tsarapkin* stressed that the Soviet proposal for 2 or 3 on-site inspections were made purely to facilitate an agreement. If this fact were not appreciated properly, hope for an agreement would fade away. He repeated that the Soviet Union would not go beyond the proposals it had made.

If the Western powers were trying to avoid a discussion and decision on the basic issues, the question arose whether there was any sense in carrying these negotiations further. Perhaps it would be better to transfer the talks to the Committee of Eighteen right now. Today's meeting had shown once again that nothing was being accomplished and so the question of returning to Geneva inevitably arose.

*Mr. Foster* replied that the Soviet Government had known from the beginning that 2 or 3 on-site inspections was not acceptable to the US Government. The questions the US side had been asking were not purely technical but were also political in nature. The questions had been asked because it was necessary that the US know a dependable agreement could be reached. *Mr. Foster* added that he had been surprised that *Tsarapkin* appeared to be issuing an ultimatum. The US was prepared to go to Geneva at any time, although we had hoped that we could move here more expeditiously.

*Sir David* added that he was amazed at *Tsarapkin's* statement. The UK agreed that two "basic questions" cited by the Soviet side were two of the most important questions to be settled. It was not a negotiation, however, to say that the West had to agree to the Soviet figures. There was no need for *Tsarapkin* to come to the US to talk about figures which had already been rejected by the President of the United States.

*Sir David* repeated that the West had to pay attention to its scientific advice. The Soviet Union had to take this fact into account if it really wanted an agreement.

*Tsarapkin*, speaking in English, said that what he had previously stated was that if the US avoided a decision on the basic questions, which were the subject of the letters between President Kennedy and Premier Khrushchev, in such a case the question arose whether it would not be better even now to transfer the discussions to the Committee of Eighteen.

*Mr. Foster* replied that there was a number "x" which the two sides might agree upon. However, was "x" of any value if the political conditions were such that the on-site inspection could not be carried out? So far, in 5 meetings, the US side had asked whether the general procedures as outlined by it were such as to cause any problems for the Soviet Government. There had been no answer to this question, and therefore it was impossible to say what the "x" should be. *Mr. Foster* felt that the discussions had moved the two sides closer to an understanding on the numbers and locations of automatic seismic stations; he hoped the same sort of understanding could be reached on the number of on-site inspections, which was the more important issue of the two, although both were integrated parts. *Mr. Foster* reiterated that, as the President had told *Mr. Khrushchev*, 2–3 on-site inspections were unacceptable.

*Tsarapkin*, again speaking in English, said he wished to stress that the difference between the two sides was that the US had an "x" for automatic seismic stations and for on-site inspections. For the Soviet side there was no "x" at all, the numbers acceptable to the Soviet Government were the ones mentioned by it. Now the US was trying to draw the talks into a technical jungle and it appeared that the hope of reaching agreement was fading away.

*Mr. Foster* replied that the "x" he was talking about was a very small unknown and that before one decided that the meetings were of no value one should have a response from the USSR on the various parameters mentioned previously, and these were not technical details. He hoped the two "x's" could be placed in the context of other things generally understood, and observed that the various heads of state might be better able to determine what the "x" should be than this group.

It was agreed that the next meeting would be held at three o'clock Wednesday, January 23, 1963, in Mr. Foster's office. The meeting adjourned at 7:00 p.m.

<sup>1</sup> Continuing discussion of on-site inspections and automatic seismic stations. An attachment provides data on noise levels in locations proposed by Soviets for installation of automatic seismic stations. Secret. 8 pp. Department of State, Central Files, 700.5611/1–3163.

Charles C. Stelle, Deputy US Representative, ENDC  
James E. Goodby, ACDA/IR  
Alexander Akalovsky, ACDA/IR

As the first order of business, *Tsarapkin* handed Mr. Foster and Sir David copies of a paper specifying the noise level at the three locations proposed by the Soviet Union as sites for automatic seismic stations in Soviet territory. *Tsarapkin* mentioned that the three areas were relatively quiet and therefore suitable for the emplacement of automatic seismic stations. He then suggested that agreement be recorded immediately on the number and location of automatic stations.

Mr. *Foster* replied that this information was helpful and that the U.S. side was happy to have it. It did appear that the sites would be the kind of quiet locations which would be helpful for operation of automatic seismic stations. This was a good start but the U.S. had mentioned ten or perhaps as few as seven locations in Soviet territory which would be desirable for the installation of automatic seismic stations. Moreover, the U.S. would need data concerning the capabilities of the Soviet national seismic detection network. With this kind of information it would perhaps be possible to reduce the U.S. requirements to seven automatic stations in Soviet territory.

Mr. *Foster* also mentioned press reports to the effect that Soviet scientists had designed an automatic seismic station. Such designs would be of help to the U.S. and would help further the negotiations. For its part, the U.S. would be glad to tell the Soviet Union about its work on automatic seismic stations.

*Tsarapkin* said that the U.S.S.R. had furnished data on the locations of automatic stations and the noise levels at these locations not just to satisfy the technical curiosity of the United States but to promote agreement on the main questions, i.e., the quota of on-site inspection and the number and locations of automatic stations. The U.S.S.R. saw no obstacle to agreement now and it had stated its position to the Western side.

Despite the great concession which the Soviet Government had made to meet the West, the discussions were just where they began, *Tsarapkin* asserted, and the Soviet side was entitled to hear an answer from the U.S. on the cardinal problems of these negotiations.

Mr. *Foster* reviewed the moves that the U.S. had made with respect to on-site inspections and automatic seismic stations. He emphasized that it was not U.S. intent to dwell on technical points but it was a fact that the U.S. approach must be based on what the best scientists said was necessary for adequate verification. He stressed that the Soviet proposals concerning the number of on-site inspections and automatic stations were not adequate. Mr. *Foster* regretted that *Tsarapkin* had again said that all that could be discussed was what had already

appeared in the correspondence from Chairman Khrushchev to President Kennedy. The U.S. did not consider this position to be in the interests of developing a mutually acceptable agreement.

*Tsarapkin* inquired whether this was all Mr. Foster could tell the Soviet side. Mr. *Foster* replied that he thought that this was a good deal. He then reviewed what the Soviet side had produced in the negotiations. This consisted of a list of 73 seismic stations, change in the location of one automatic seismic station in the U.S. and noise levels for three automatic stations in the U.S.S.R. at locations proposed by the Soviet Union.

*Fedorenko* then launched into a lengthy prepared statement. He said that Mr. Foster seemed to forget the great concession on inspection which the Soviet Government had made. He went on to recall that these meetings had been made possible by an exchange of letters between Chairman Khrushchev and President Kennedy. There were very specific tasks before the negotiations, in which connection the initiative of the Soviet Union and the head of the Soviet Government personally was to be taken into account. That initiative could hardly be overestimated and should not be submerged in technical discussions. Evidently, there were reasons why the U.S. was unable to reach agreement with the U.S.S.R. now. Perhaps this had something to do with the nuclear weapon test which Mr. Foster had said had been postponed.

Prior to these discussions, it had not been possible to make progress towards a test ban agreement since there was a fundamental difference between the U.S. and the U.S.S.R. on the question of detecting and identifying underground nuclear weapon tests, for which the Soviet Union saw no need for on-site inspection. This view was shared by the majority of UN members. Fedorenko claimed that the Soviet Government had been told by the U.S. that if only the Soviet Union accepted the principle of on-site inspection, all difficulties in the way of agreement would be removed. He then referred to a press conference held by President Kennedy on August 1, 1962 and said that President Kennedy had stated that what the U.S. needed was acceptance by the U.S.S.R. of the principle of on-site inspection.

The Soviet Government, Fedorenko continued, had taken such statements into consideration and had done everything to find a way out of deadlock and into quick agreement. The latest new effort by the Soviet Government resulted in the decision to meet the position of the United States on the question of on-site inspections, even though the Soviet Government believed there was no need for such inspections. Moreover, the Soviet Government agreed to the establishment of automatic seismic stations on the territories of the nuclear powers and neighboring states. All this was reflected in Chairman Khrushchev's letters to the President.

When President Kennedy had proposed these informal meetings in New York, the Soviet Government had agreed and had assumed that the U.S. Government was ready to reach agreement, taking into account the fact that the Soviet Government had met the U.S. position. In this connection, Fedorenko said that the agreement of the Soviet Union to postpone the resumption of the Eighteen Nation Disarmament Committee sessions from January 15 to February 12 should be viewed in the light of that situation.

Fedorenko continued that in these talks the U.S.S.R. had done everything to reach speedy agreement. The Soviet Union had taken into account American desires concerning the location of automatic seismic stations on Soviet territory. In Central Asia, the Soviet Union had agreed that a station could be placed in the vicinity of Samarkand instead of at Kokchetav. In the Far East, the Soviet Union had agreed to Seymchan instead of Yakutsk. Data on noise levels at these places had also been furnished the United States. The Soviet Union had also suggested locations within the United States for emplacement of automatic seismic stations. Fedorenko went on to say that the Soviet Government had found it possible to satisfy the position of the U.S. Government on the key question of on-site inspections. The Soviet Government had agreed that such inspections could be conducted, within a certain quota, not only in the seismic zones but also in the aseismic zones as requested by the United States.

Fedorenko said that regretfully these meetings had led the U.S.S.R. to believe that the U.S. had no desire to put an end to tests. If there was such a desire on the part of the United States, there must be a desire to get agreement on basic questions. Unfortunately, however, the U.S. wanted to put these questions aside and talk about details.

Fedorenko said that the U.S. argued that the quota of on-site inspections was interrelated with other issues. The U.S., however, had failed to say what this interdependence was. As for the Soviet Union, it did not see any interdependence. To be sure, the U.S. position had changed in some respects but not for the better. On some questions, the U.S. was receding from earlier positions. Ambassador Dean had said that two to four on-site inspections annually would be sufficient for the U.S. Now the U.S. said it had to have 8 to 10. Previously, the U.S. had said that 200 to 500 square kilometers would be the size of the area eligible for inspection. Now the U.S. demanded 700 to 800 square kilometers.

In the course of these negotiations Mr. Foster and, to a certain extent, Sir David, had placed before the Soviet side demands that either the U.S.-U.K. views on these points be accepted or the U.S. and the U.K. would not discuss what the U.S. itself had called cardinal questions. The Soviet Government and its head personally regretted that these

negotiations had taken such a turn. Achievement of a test ban agreement would be of great importance in stopping the nuclear arms race, in safeguarding the health and lives of the present and future generations, in improving the international atmosphere, and in helping to solve other world problems, including general and complete disarmament.

In accepting the idea of bilateral talks the Soviet Government had hoped that it would be possible to solve the basic problems before February 12 and report to the Eighteen-Nation Disarmament Committee that the way to a test ban was open. Evidently, this would not be possible. The Soviet Union, therefore, was compelled to interrupt these discussions and transfer them to the Eighteen-Nation Disarmament Committee, which would reconvene on February 12.

Noting that he had to leave soon, *Sir David* pointed out that the Soviet statement only confirmed what Mr. Foster had said concerning the moves made by the Soviet Union in these negotiations. Fedorenko had returned to the substance of Chairman Khrushchev's letters and had confirmed that the only new things mentioned by the Soviet side had been a list of manned Soviet seismic stations, noise levels at three locations in the Soviet Union, and modification in the location of one of the three automatic stations the Soviet Union wanted to have in the U.S.S.R. It was clear that Mr. Tsarapkin had no authority to negotiate in a way which would permit the two sides to come together on the main points. Under these conditions, it was very difficult to make any progress.

*Fedorenko* rejoined that *Sir David* had only repeated what Mr. Foster had said previously. As to the authority of Mr. Tsarapkin, this was within the competence of the Soviet Government and the Soviet side knew better what his authority was than did *Sir David*. Tsarapkin added that this was merely a fantasy of *Sir David's*.

Mr. *Foster* said that he would not attempt to respond to everything in the lengthy statement just read by Fedorenko. Obviously the U.S. disagreed with it sharply on a number of points. As one example, he quoted what President Kennedy had said in the August 1 Press Conference:

"We first have to have an acceptance of the principle [of on-site inspection]. Then, as the scientific information is made available, a conclusion could be reached as to what would be the appropriate number of on-site inspections."

Mr. Foster thought this was exactly what, among other things, would be negotiated in these discussions.

The U.S. was eager to get an agreement to end nuclear tests. This could not be achieved, however, by the method of making statements of "this far and no further." Mr. Foster regretted that the Soviet Government had concluded that these talks were no longer useful and had decided to transfer the discussions to Geneva without further exploration of the integrated parts of a verification system.

Concerning the point about interdependence of elements in a verification system, Mr. Foster said he thought it was obvious that unless the inspection could take place under acceptable conditions any on-site inspection quota would be meaningless.

As to the size of the area eligible for inspection, Mr. Foster recalled that the 200 to 500 square-kilometer area had been made possible by hypothesizing the existence of a fairly elaborate international control system. While the U.S. was prepared to return to that kind of a system, it had attempted to meet the Soviet position on the form of a verification system. The larger area eligible for inspection was one result of this attempt to approach the overall Soviet position.

Mr. Foster stated that the U.S. looked forward to continuing the discussions in Geneva and was, of course, quite prepared to do so. The Soviet decision to terminate the current discussions would of course be a disappointment to the President since he had hoped that progress could be made in these private talks.

Mr. Foster then asked Fedorenko what he thought the press could be told about the termination of the discussions.

*Fedorenko* suggested that if the U.S. considered it necessary it could say that the meetings had been suspended, that no agreement had been possible, and that negotiations would continue within the framework of the Eighteen-Nation Disarmament Committee.

It was agreed in the end that each side would reserve the right to explain its own position as it found necessary.

The meeting adjourned at 5:15 p.m.

As agreed previously, the participants in the talks will attend a luncheon to be given by Amb. Fedorenko tomorrow, February 1, 1963.

**165. Memorandum of Conversation, February 9, among Rusk, Alphand, and Greenhill<sup>1</sup>**

February 9, 1963

SUBJECT

Non-proliferation of Nuclear Weapons

PARTICIPANTS

*U.S.*

The Secretary

William R. Tyler, Assistant Secretary, EUR

John C. Guthrie, Director, SOV

*France*

Herve Alphand, French Ambassador

Bruno de Leusse, French Minister

*U.K.*

Dennis Greenhill, British Chargé

The Secretary said he wished to report on the conversation he had had with Soviet Ambassador Dobrynin February 7. Dobrynin had given him Russian language texts of the notes handed the German and French Ambassadors in Moscow on the Franco-German Treaty. There was no discussion of these notes, Dobrynin taking the position that they spoke for themselves.

Dobrynin then turned to the subject of the non-proliferation of nuclear weapons, and the Secretary handed Messrs. Alphand and Greenhill copies of notes made on Dobrynin's oral demarche on this subject. (Copy attached). The Secretary asked that these notes be treated as confidential. The Secretary then said he had made the following informal remarks to Dobrynin. The third paragraph of the attached notes represents the current situation insofar as U.S. weapons are concerned. We do not yet know how the multilateral force will be set up, however, and the U.S. cannot speak for the U.K. and France, both of which possess nuclear weapons. With regard to the third paragraph on page 2 of the attached notes, the Secretary had told Soviet Foreign Minister Gromyko at Geneva that we drew a distinction between the multilateral force and the proliferation of national nuclear capabilities. The President had spoken to the same point at his press conference on

---

<sup>1</sup> Non-proliferation of nuclear weapons: readout of Rusk-Dobrynin discussions. Secret. 4 pp. Department of State, Central Files, DEF 18-6.

February 7. We reject the idea that there is any deception being practiced in our discussions of a multilateral force. With regard to the Soviet reference to Canada, our arrangements with Canada are similar to those we have with many other countries in NATO and have nothing to do with the proliferation of nuclear weapons. In the next to the last paragraph, we would not object should the Soviets make arrangements with their allies similar to those we contemplate making with ours.

On this point the Secretary commented that while he had not so stated to Dobrynin, he regarded this Soviet statement as the emptiest threat of all. The Secretary continued that since December he had seen Dobrynin socially as well as once or twice in the office where the subject of non-proliferation had been mentioned, and noted that Dobrynin had spoken to him most recently earlier in January.

The Secretary regarded his comments at that time as having been made without instructions.

He asked Alphand and Greenhill to report the foregoing to their governments to see what conclusions they may have. He said that he had no idea as yet whether the Soviets would reach an agreement with us on the basis of our own clarification concerning non-proliferation but believed it would be helpful for the three of us to concert our views on this subject. The Secretary opined that the result will turn on whether we can make arrangements whereby it would be impossible for a nonpossessor of nuclear weapons in NATO to give a national order to fire such a weapon. He told Ambassador Alphand that he would like to have Paris' views on the two papers he had handed the French Foreign Minister in Paris in December. If the French Government thinks we should proceed with the Soviets on this subject, then we could discuss the question of methods. The French Ambassador noted that he had asked his government for comments on the Secretary's papers three times already. Mr. Greenhill said that he had nothing recent from London on the subject but that he knew Lord Home accepted the papers handed him by the Secretary in December and would have only minor amendments to offer.

The Secretary concluded by pointing out the President's concern over the probable acquisition of a nuclear capability, however rudimentary, by the Chinese Communists and said that Chinese adherence to an agreement was a *sine qua non*. If the Chinese would adhere, he felt that the West Germans could do likewise. Ambassador Alphand remarked that the type of agreement the U.S. was seeking would not prevent the Chinese Communists from acquiring a nuclear capability. The Secretary replied that even if the Chinese Communists refused to adhere to the agreement, this would still mean that the Soviets could not then seek any special arrangements over Germany.

**166. Memorandum from Wiesner to Fisher, February 12<sup>1</sup>**

February 12, 1963

While the principal issue in the present test ban negotiation is the number of on-site inspections in the Soviet Union, we all agree that there are a substantial number of unresolved additional issues which would determine the effectiveness and manner of operation of the treaty. During the course of our recent discussions, however, I have become increasingly concerned that we do not in fact have a clear position on many of these important issues. I believe that it is essential that we develop specific positions on all of the elements of treaty as soon as possible in order to avoid any impression that we are not seriously interested in obtaining a treaty. I hope, therefore, that the paper you are preparing for Thursday will cover all of the elements of the treaty in sufficient detail to permit actual preparation of a treaty. Furthermore, since some of these issues cannot be finally resolved until they are cast in treaty language, I would urge you to prepare a new treaty draft in keeping with the present position as soon as possible.

Among the issues that we must resolve immediately, if we expect to pin the Soviets down as to the form of treaty within which we are negotiating a quota of on-site inspections are the following:

(1) *Automatic Unmanned Stations (black boxes)*. Should automatic unmanned stations in the Soviet Union be included as an element in the treaty? If it is decided that automatic unmanned stations in the Soviet Union will be a part of this treaty, the following points will have to be covered in the treaty:

- a. Number of stations;
- b. General location of stations;
- c. Criteria for precise location of stations;
- d. Nature of seismic equipment in stations;
- e. Provisions for maintenance of security of the stations;
- f. Access rights for installation and maintenance of station and retrieval of data.
- g. Rights and procedures for telecommunication links, if any, at stations; and
- h. The mechanism by which information from the “black boxes” would be employed in the decision process to undertake an inspection.

(2) *Selection of Events for Inspection*. Will the U.S.–U.K. and Soviet Union select locations for on-site inspection on the basis of any seismic information they claim is adequate to determine a location or must

---

<sup>1</sup> Resolving problems in the test ban negotiations. Confidential. 3 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Testing 3, 12/62–8/63.

this determination be subject to certain seismic criteria as has been the case in the past? Will the seismic evidence on which selections are made be subject to any sort of review by the Commission or its scientific staff?

(3) *Procedures for On-Site Inspection in Countries Other than U.S.-U.K. and USSR.* If the U.S.-U.K. and USSR pick the locations to be inspected in each others territory on the basis of information from their own national systems, what procedures will govern inspections in other countries that may become parties to the treaty (NATO-Warsaw Pact and neutral countries)?

(4) *Conduct of On-Site Inspections.* The following points on on-site inspections must be covered either in the treaty or its annexes:

- a. The specific sequence of events by which an inspection will be carried out including the time limits on each phase of the operation;
- b. The specific size of the area to be subject to inspection;
- c. The nationality of the inspection team;
- d. Size of the inspection team;
- e. Mechanism by which inspection team will be provided photographic coverage of the area in question, (i.e., will it be supplied by host country or by the inspection team itself)?

(5) *Excluded Areas.* What specific provisions, if any, are proposed to permit exclusion of on-site inspection of installations which are claimed to be of a sensitive nature? Among the possible points are:

- a. Limitations on size of excluded areas (can an entire on-site inspection be denied);
- b. Notification procedure (timing relative to on-site inspection procedures);
- c. Effect on quota.

(6) *Functions of the Commission.* In view of the reliance on national systems rather than on international systems, what are the specific functions intended for the international Commission and international staff?

(7) *Atmospheric, Underwater and Space Testing.* Will information on possible atmospheric, underwater, and space testing be handled by national systems in a manner analogous to seismic data and what function, if any, will the Commission and international staff have on these problems?

(8) *Peaceful Uses.* What procedure will govern the certification of nuclear detonation for peaceful purposes?

(9) *Definitions.* What will be the definition of a nuclear explosion or nuclear test for the purpose of the treaty?

(10) *Withdrawal.* What provisions for withdrawal will the treaty contain in the event that non-signatory powers test nuclear weapons? (The most recent tabled treaty draft would permit either side to withdraw if either France or China test).

Jerome B. Wiesner

**167. Memorandum from Gen. Taylor to McNamara, February 16<sup>1</sup>**

JCSM-136-63

February 16, 1963

**SUBJECT**

US Position Regarding a Nuclear Test Ban Treaty (U)

1. This memorandum responds to a request by the Assistant Secretary of Defense (ISA), I-21111/63, dated 14 February 1963, to provide comments on the Arms Control and Disarmament Agency (ACDA) position paper, dated 14 February 1963, subject as above. It is understood that the Committee of Principals will meet with the President on 16 February 1963 to discuss this matter.

2. In the opinion of the Joint Chiefs of Staff, there are certain cardinal principles which must govern any nuclear test ban treaty. These are:

a. That the treaty should incorporate a detection, identification, and inspection system adequate to insure the highest feasible probability of discovering treaty violations.

b. Testing which could not be detected by the control system should not be prohibited by the treaty.

c. Withdrawal procedures should be simple.

3. The ACDA position paper recommends that the United States be prepared to negotiate a precise (though unspecified) quota of on-site inspections which would constitute a "reasonable deterrent." As ACDA has correctly noted, the effectiveness of the deterrent, and hence the degree of assurance of Soviet compliance, is a function of more than the number of on-site inspections. However, under the ACDA proposal the US detection and verification capabilities would be further circumscribed from previously held US positions by the following:

a. Reduced capability to distinguish seismic events because of a less sensitive detection system than previously proposed.

b. A higher threshold than formerly, below which explosions could not be detected.

c. An unspecified number of on-site inspections, presumably lower than any number in previous US proposals.

4. ACDA has also proposed US positions which would make on-site inspection unnecessarily difficult by requiring a seismic epicenter to justify each inspection, by unduly delimiting inspection areas and

---

<sup>1</sup> JCS concerns regarding ACDA's paper on the "U.S. Position on the Nuclear Test Ban Treaty." An attached appendix provides an item-by-item comment on the ACDA paper. Also attached is a table showing nuclear weapon capabilities of particular countries. Top Secret. 10 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, General, 2/15/63-2/28/63.

duration and by leaving major logistics arrangements for the inspecting team to the inspected country. The combined effect of these limitations would so reduce the deterrent value of the treaty as to create a serious risk of Soviet evasion.

5. ACDA contemplates a seismic system having a threshold of about magnitude 4.0. Below that figure there would be what amounts to an unpoliced moratorium. Much significant technical and military progress can be made by low-yield testing below the threshold of this system (paragraph 1 to the Appendix hereto). The Joint Chiefs of Staff reaffirm their view that any test ban agreement should authorize testing below the detection threshold.

6. In conclusion, from a national security viewpoint, the Joint Chiefs of Staff are gravely concerned by proposed departures from principles which should govern any nuclear test ban treaty (paragraph 2, above). First, it has not been demonstrated that the system provides a reasonable chance for detecting evasion.<sup>2</sup> Second, in effect an unpoliced moratorium would exist below the threshold of detection. And third, prohibition from withdrawal from the treaty for three years would be counter to our interest if we found the implementation of the treaty unsatisfactory.

7. The Joint Chiefs of Staff believe that the current ACDA proposal should be modified to align it with the principles considered essential for an adequate nuclear test ban treaty.

For the Joint Chiefs of Staff:

*Joint Chiefs of Staff*

## **Appendix**

### *JCS COMMENTS ON ACDA RECOMMENDATIONS FOR US POSITION REGARDING A NUCLEAR TEST BAN TREATY*

#### *Detection Systems*

1. ACDA recommends basic reliance for detection and, where possible, identification to be placed on a national detection system (US & UK) which could begin operation immediately after any treaty was signed. It is highly desirable that this be unclassified.

---

<sup>2</sup> See page 6, Appendix hereto, and Annex B to the attachment to ISA memorandum, I-21111/63, dated 14 February 1963, subject as above.

*Comment*

a. *Detection System.* The US Air Force Technical Applications Center estimated in its study dated 11 February 1963 that it would be possible to establish an unclassified system with seismic detection capability comparable to the AEDS (about 4.0 seismic magnitude) in 30 months. In six months an interim system having a detection capability of about 4.2 seismic magnitude could become operable. The number 4.0 on the seismic scale represents a detection threshold of about 11–22 KT in alluvium, 2 KT in tuff, 1 KT in granite, and perhaps 50–100 KT decoupled. A 4.2 detection threshold would permit undetected tests of several times those magnitudes.

For the final unclassified system comparable to the AEDS, AFTAC estimates an average of 170 shallow events can be anticipated in the USSR yearly, of which 20 can be identified as earthquakes by first motion. There will be about 150 events AEDS cannot reliably identify as earthquakes, of which 75 will be found to have depth indications of varying reliability. There will be no indicators of natural origin of the event for the remaining 75. All 150 events will be suspicious. In determining which of these events should be investigated by means of on-site inspection, criteria such as geography, nearness to population [illegible in the original] remoteness, [illegible in the original].

It would not, however, be justifiable to eliminate any events on the basis of these criteria from consideration for inspection or from consideration in determining the number of inspections required. The reason is that these events remain inherently suspicious and that these criteria would be of substantial value in determining the likelihood of an event being a nuclear explosion only if the unrealistic assumption were made that the Soviets were not attempting to evade. If the United States, for example, were to consider events in the Arctic above suspicion because testing there would present unusual difficulties, this fact would constitute an invitation to the Soviets to test in the Arctic without fear of detection. The Joint Chiefs of Staff cannot concur in the use of subjective criteria to reduce the number of events considered to be suspicious.

b. *Threshold.* Recently little consideration has been accorded underground testing below the capabilities of detection systems to detect. Tests beneath the threshold can provide significant technological advances beneficial to the nation that tests.

The AEDS detection capability is approximately 4.0 seismic magnitude. It is probable that, under a test ban agreement much more stringent than ACDA envisages, tests could be conducted in the low KT range without fear of detection.

The importance of low yield testing has been pointed out by DOD and AEC in July, 1962, and again more recently. The consensus was

that most of the important scientific principles involved in weapons can be studied effectively below 3 KT. These include:

- (1) Development of primaries for low-weight, two-stage systems (such as Minuteman);
- (2) Development of low-yield tactical systems;
- (3) Tests of integrated primary, bomb case, and sparkplugs for two-stage devices;
- (4) Development of very cheap, relatively clean weapons requiring only [illegible in the original];
- (5) Possible development of all-fusion weapons requiring no fissionable material and having many military applications;
- (6) Tests of hardened primaries as well as measurements of their vulnerability to prompt radiations;
- (7) Some important weapons effects experiments which can be performed underground.

With a limitation of 10 KT, development can be carried considerably further. For example, tests under 10 KT can lead to specific weapons such as low yield weapons for either tactical, air defense or anti-submarine warfare use; most primaries could be completely developed underground; mock-up larger weapons tests, utilizing these primaries and secondary "sparkplugs," could lead to major advance in thermonuclear weapon technology.

c. *Use of Classified Data.* ACDA would require establishment of epicenters by means of seismic data submitted to an international commission. This would preclude use of supplementary data derived from the AEDS unless the AEDS were declassified and would preclude the use of unilateral intelligence information in selecting precise areas to be inspected. In the 30 months before an unclassified detection system could attain the seismic capability of the AEDS, the United States would be particularly hampered. It is considered essential that the United States be able to demand inspection of a suspicious event without being obliged to prove an epicentric location on the basis of unclassified, inherently less accurate, criteria. Declassification of AEDS remains distinctly undesirable because it would not only create political problems and compromise intelligence collection facilities but also permit the Soviets to have precise knowledge of US [illegible in the original] that [illegible in the original].

*Summary.* The national system described above has never been fully coordinated with the JCS or DOD. It would offer less comprehensive coverage than would be provided by the "national stations internationally supervised" proposed by the United States in August 1962 and less than the internationally manned stations on Soviet soil. The Joint Chiefs of Staff reaffirm their view that any test ban treaty proscribe only those tests which the detection system is capable of detecting.

*On-site Inspection Quota**2. On-site Inspection Quota*

a. ACDA recommends: The United States should be prepared to negotiate a precise (though unspecified) quota of on-site inspections. ACDA asserts that national detection systems supplemented by unmanned seismic stations, considerations of geographical factors, and unilateral intelligence would reduce the number of suspicious seismic events to the point where “a quota of on-site inspections within the number range now being considered by the US will constitute a substantial deterrence to clandestine underground testing.” In support of this view, ACDA claims there would be “a good probability of detecting at least one of a series of tests interspersed among a group of natural events.”

b. Comment: The JCS have never approved a reduction below 12–20 inspections. This number was based on a ratio of 20% of suspicious events. The United States has already committed itself publicly to acceptance of 8–10 on-site inspections, and it is understood ACDA is prepared to fall back to 5 or 6 inspections. These figures are inconsistent with the ACDA concept of a “reasonable deterrent” which requires that there be a fair expectation of detecting violations. AFTAC probability calculations indicate there would be small likelihood of selecting for inspection even one of a series of detectable clandestine tests. Any number of inspections [illegible in the original] which the [illegible in the original].

Moreover, for on-site inspections to be of any use it is necessary to have workable terms and conditions for their conduct. Any control commission must not have authority to limit or prevent inspection. A party must be able to request inspection without seismic evidence of a specific epicenter in order that national intelligence may be used as a basis of decision to request inspection. An inspection team must be logistically self-sufficient, permitted to persist in inspection for a period possibly as long as six months, and so manned and equipped that it could have at least a fair probability of finding evidence of a well concealed clandestine test. The ACDA position shows little appreciation of the physical and technical difficulties involved in making on-site inspection an effective procedure.

*Exclusion of Sensitive Defense Installations**3. Exclusion of Sensitive Defense Installations*

a. ACDA recommends: A party could exclude from inspection especially sensitive defense installations located within the area to be inspected.

b. Comment: A denial of inspection on security grounds is tantamount to a veto and would vitiate any inspection provisions if the

desired area is of appreciable size. When coupled with other limitations on our detection and verification capabilities, e.g., limited capability to distinguish between earthquakes and nuclear explosions, inability to detect below seismic threshold and limited inspection quota, this provision would so degrade the deterrent value of the treaty as to create an unacceptable risk of Soviet evasion. However, if exclusion from access is limited to very small areas, the restriction would not affect inspection. For instance, access to an installation could be denied if [illegible in the original] permitted. [illegible in the original] sufficiently close to ascertain whether or not a nuclear test has been conducted. Even if complete inspection were permitted, one side might not take undue advantage of the right because of fear of retaliation in kind.

#### *Size of Inspection Area*

##### *4. Size of Inspection Area*

a. ACDA recommends the outward limits of the size of the area to be inspected would be 500 square kilometers where the number of reliable reporting stations do not make good travel time calculations available, and where available the area would be 300 square kilometers.

b. Comment: AFTAC estimates a two-thirds probability of an epicenter falling within a 700 square kilometer area if the epicenter is located by well distributed stations. Consequently, the area proposed by ACDA would by itself commit more than half of any inspections undertaken of the sites of actual nuclear explosions to failure.

#### *Countries Not Party To Treaty*

5. a. ACDA Recommendation: The US should not insist France and China be initial parties to the treaty but withdrawal procedures should be included.

b. Comment: It is probable that certain states not now negotiating in Geneva nor intending to negotiate must eventually be parties to the treaty if there is to be an effective test world-wide test ban. This includes both France and Communist China. Any treaty must incorporate simple, uncomplicated withdrawal procedures for termination in the event a state, not a party to the treaty, is found to have conducted a nuclear test. The treaty should also contain a provision which recognizes that timely inclusion of certain states is an essential condition of a test ban treaty. It is noted that ACDA suggests we explore with the Soviets a nonwithdrawal clause effective for three years from the [illegible in the original].

**168. Memorandum from Col. Smith to Gen. Taylor, February 18<sup>1</sup>**

February 18, 1963

**SUBJECT**

Probabilities and a Nuclear Test Ban

1. During the discussions of the last week on a nuclear test ban treaty, the statistical experts at ACDA began playing down the importance of developing a thorough detection system by pointing out what was to them an acceptable probability of discovering a violation by random selection of seismic events. Once the probability train had been let out of the station, however, everyone got on board. The result is that it now seems, from a statistical viewpoint, that our proposed overall detection and inspection system is unsound. Before explaining some implications of this conclusion, let me explain briefly how the conclusion was reached.

2. In the discussion Friday with the technicians, Secretary McNamara said that there are four probabilities that must be considered before we can determine our ability to detect tests. They were defined as:

- a. P1 is the probability of detection of the event.
- b. P2 is the probability that the test will be selected from other events.
- c. P3 is the probability that the area selected for the on-site inspection includes the test site.
- d. P4 is the probability that the nuclear test will be detected if it falls within the inspected area.

3. Subsequent to the meeting, Mr. Barber of ISA drafted a paper presenting his views on the test ban. He began by setting out the four probabilities and promising to look at them in turn. He did not carry through on his planned approach, primarily because he said P4 depended not only on inspection procedures but also on Russian willingness to help us in our inspections. His overall conclusions were that 6–8 inspections annually were satisfactory, because “we want a few good inspections, not a lot of clumsy ones.”

4. At TAB A, I have used the data in Mr. Barber’s paper to show that for 5 inspections annually under fairly conservative assumptions we would have 1 in 100 chances of discovering a violation, and that for 6 inspections under fairly liberal assumptions, we would have only

---

<sup>1</sup> “Probabilities and a Nuclear Test Ban.” Secret. 2 pp. National Defense University, Taylor Papers, WYS Chron, January–March, 1963.

3 in 100. It seems to be that neither case would be very convincing to the US public. Either our data or our inspection criteria must be changed.

*5. Implications*

The low probabilities of actually proving a violation have in part been foreseen by some. Thus we hear the technical argument that even if the Russians cheated by testing underground, they could not alter the military balance. If this assertion is true (and I am not certain by any means that it is), then it vitiates the need for any inspection system and, in turn, substantiates the Soviet argument that inspections are needed more for political than technical reasons.

6. Our main objective in pressing for an inspection system has been that it would establish the "principle of inspection". If with this objective we set up a poor system, we will have set a poor precedent. It would be preferable to consider an unpoliced moratorium with a high readiness to test than a poorly inspected test ban and a high level of complacency.

W.Y.S.

---

**169. Todis 806 to Geneva, February 18<sup>1</sup>**

February 18, 1963

Following instructions cleared as result of meeting of interested principals with President February 18.

You should indicate to Kuznetsov in private meeting that US has several specific points to make on substance of a test ban treaty.

1. US proposes that on-site inspections be carried out within an agreed upon time sequence and under an agreed procedure with inspections in USSR of seismic events designated by US and UK, with US-UK selection of events, and conducted by 70 percent US/UK nationals and 30 percent nationals from non-NATO and non-Warsaw Pact nations with provision for an equal number of USSR observers. (FYI: Present thinking is that the Inspection Team should include fourteen US-UK technical experts plus the number needed for support and drilling operations, if the latter are required. The drilling operations will require an additional number of people depending upon the area,

---

<sup>1</sup> Negotiating instructions on substance of a test ban treaty. Confidential. 6 pp. Department of State, Central Files, DEF 18-3 SWITZ (GE).

etc. END FYI.) Chief of team would be US or UK national. In designating seismic events for inspection in USSR, the US–UK would submit seismic data from four seismic stations to establish location of event, which it may want to inspect together with a statement that it could not identify the event as natural in origin under criteria contained in para 3 of Article VIII of August 27, 1962 comprehensive treaty draft. USSR would be responsible for supplying all heavy transportation equipment, e.g., helicopters, trucks, for inspection in USSR. Reverse procedures would apply for inspections in US or UK.

2. Review of scientific problems in determination of locating epicenter indicates area can be reduced to an area of 500 square kilometers specified as an ellipse with a semi-major axis of a maximum of 15 kilometers.

3. In USSR the US would supply sealed recorders and certain sealed instruments for the automatic recording stations which would be built according to specifications agreed to by US, UK and USSR and for which USSR would have certain responsibilities for maintenance. Sealed recorder would be picked up and checked by non-Soviet personnel maximum of eight times a year. Data from these stations would also be recorded outside the station by a recording device identical to the one within and this data obtained outside would be picked up and transmitted regularly, e.g., once a week by Soviet personnel to International Commission for use there and for transmission to other side. Reverse situation pertains for such stations in US. US proposes seven such stations be located in US and USSR.

4. US, after further study of question of on-site inspection quota, believes that if the procedures for on-site inspection, along the lines indicated, are acceptable to Soviet Union and can be agreed on in more detail the US would accept a quota of seven on-site inspections annually on the territories of the US and the USSR.

5. US in making these proposals hopes they will be acceptable to Soviet Union and negotiations for drafting treaty can proceed without delay.

We have notified foregoing to British Embassy to inform UK FONOFF. Subject to FONOFF approval, these proposals can be notified to USSR at your meeting on Tuesday, 10 am as joint US/UK views, such approval to be notified to you by your UK colleague in Geneva. In absence of such notification these proposals should be put forward as US proposals.

You should emphasize that the US does not intend to confirm its proposals publicly until there are indications of moving toward an agreement.

Following are additional instructions on the conduct of on-site inspections for use as appropriate.

Discussion is in terms of US-UK requesting an inspection in Soviet Union; obviously same procedure would apply in reverse case.

1. US-UK would submit seismic data to International Commission regarding unidentified seismic event no later than 60 days after event had occurred. Data must be sufficient to locate event, i.e., must include clearly measurable arrival times from four stations, and must include a statement from US-UK that the data do not indicate the event has been identified as natural in origin using criteria specified in treaty.

2. Soviet Union would have seven days in which to present any supplementary information regarding event. Any other data not previously available, such as data from automatic recording seismic stations, must also be submitted within seven days; longer time may be permitted by mutual agreement, due to emergency situations.

3. US-UK would decide within seven days from the receipt of the extra data whether to designate the event for an on-site inspection. The designation would include the location and a description of the area to be inspected as well as the manner in which the inspection team planned to arrive at the port of entry.

4. Soviet Union would have five days in which to notify the Commission of its arrangements for receiving the inspection. Soviet transportation would be used to take the team to the site of the inspection team's headquarters.

5. The Soviet Union could exclude from inspection a building located within the area to be inspected, which the Soviet Union explained, in a report, must be excluded on the grounds it was a sensitive defense installation. An abuse of the exclusion provision would be considered a violation of the terms of the treaty.

6. The maximum size of the area to be inspected would be 500 square kilometers specified as an ellipse with a semi-major axis of a maximum of 15 kilometers.

7. Composition of surface inspection teams for Soviet Union would be 20 persons, including 14 US-UK nationals as technicians and 6 nationals from non-NATO and non-Warsaw Pact countries selected by Commission on recommendation of administrative officer. Chief of team would be US or UK national. Soviet Union would have number of observers equal to total number of inspection team.

8. Inspection team would have maximum of six weeks to complete its surface inspection including low level helicopter flights; this could be delayed by mutual agreement. If drilling was considered necessary, notification of this need would be given within five weeks from start of inspection, would include provision for additional persons, to be agreed upon, and must be completed within a specified time period (FYI: Time period under consideration for drilling is 3-6 months. END

FYI) from the time of arrival of the drilling equipment; such equipment must arrive by end of sixth week from start of surface inspection.

9. Report of inspection team would be made no later than 30 days after team had completed its inspection.

## **170. Memorandum for the Record, February 19<sup>1</sup>**

February 19, 1963

### **SUBJECT**

Meeting of the Principals Re Nuclear Testing, 10:30 a.m., February 18, 1963

### **PRESENT**

The President, Secretary McNamara, Secretary Gilpatric, General Taylor, Mr. Nitze, Mr. Bundy, The Vice President, Mr. Fisher, Mr. McCone, Mr. Wiesner, Secretary Rusk, Secretary Ball, Mr. Hayworth

(From hand-written notes prepared by DCI)

Rusk opened discussion of paper. McNamara agreed about 60 suspicious events a year—6 or 8 to 10 provide sufficiently high probability to foreclose a significant test.

McCone—Report on intelligence.

Fisher—Explained Annex B. McNamara says table not good.

Taylor—Four areas of doubts—i.e. signals area, find spot, reach conclusion.

President—How big a test can be run—Fisher 4.2 at outset, later 4.0 and possibly 3.8. Indicated 30 KT—McNamara and Wiesner 10/20 KT. Columns on Page 10 about agreed position and treaty should be defended on basis of the lower limit of system.

Thompson thought numbers serious. Sovs. never go above 5—areas important—Rusk does not wish to open up numbers.

Fisher—area problem—500 circular/300 elliptical.

---

<sup>1</sup> Readout of Principals meeting on nuclear testing. Attached is a February 18 McCone-drafted rebuttal paper on ACDA's paper on the U.S. and the test ban treaty. Also attached is a February 17 memorandum from Fisher to the Committee of Principals' members transmitting a copy of the revised ACDA paper (not attached). Secret. 4 pp. CIA Files, Job 80B01285A, McCone Files, Meetings with President, 1/1/63–3/31/63.

President—Rusk—Fisher—Wiesner—on question of black box—  
Wiesner says 0, AEC—0. Rusk—stay with?

Withdrawal clause.

Taylor—under threshold—firing weapons—training reliability.

### **Attachment**

With respect to the proposed test ban treaty, the U.S. position as outlined in the ACDA dated February 17 represents a departure in many respects from positions taken previously by interested parties in the Administration and in the Congress, including myself.

Paper accepts principle adopted about a year ago of total suspension, thus eliminating the threshold. The rationale is that testing over the threshold would be too risky because a series of tests would be detected and anything less than a series would not be meaningful. Secondly, there is a connotation that such testing would not affect the balance of power from a nuclear standpoint.

I feel the Soviets could conduct a series of underground tests by careful planning by the use of a number of geographic locations and if they choose to do so, results obtained would be meaningful with respect to their nuclear weapon know-how. I believe this can be done without danger of detection from the system proposed or from other sources including Attaché reports or clandestine resources.

With respect to the value of such tests to the USSR and to ourselves, it is difficult for me to reach a conclusion that some benefits of a military nature are not possible, or further improvement in weapon technology. The National Laboratories

In other areas our position seems to lack realism. De Gaulle has announced a program and will not, in my opinion, be deterred and our estimate of the time required for him to develop satisfactory war-heads for ballistic missiles would be at least 1970 or later, not 1965.

The Chinese Communists, likewise, have informed Sir Harold Caccia they are pursuing a program, that they will not be deterred and therefore we can expect tests from that country at some time in the future.

## Attachment

### SUBJECT

U.S. Position for a Test Ban Treaty

Attached is a revised paper containing recommended U.S. Position in the Geneva test ban negotiations for discussion at a meeting of the Committee of Principals with the President at The White House on Monday, February 18, 1963, at 10:30 a.m. The paper contains annexes A, B, C, D. Annex C, entitled "An Elaboration of the Procedure for Conducting an On-Site Inspection," is not attached. It is not needed for the February 18 meeting. It will be circulated later.

### 171. Telegram 3127 from New York, February 25<sup>1</sup>

New York, February 25, 1963

To Disarmament Del for Foster from Dean. RE: Arms Control. Fol is letter you requested with non-essential words eliminated:

#### QUOTE

Oyster Bay, N.Y.

February 23, 1963

Dear Mr. Foster:

You advised me by telephone on Saturday morning February 23, 1963 that at a recent plenary meeting of the 18 Nation Disarmament Conference at Geneva, Deputy Foreign Minister Kuznetsov of the USSR had stated in substance, that at a meeting between himself and myself in the fall of 1962 in New York, when we were both representing our respective governments at the United Nations (where I was Chairman of the US delegation to the 18 Nation Disarmament Conference and a member of the US delegation at the 17th UN General Assembly) I had stated that the US was willing to accept three automatic stations on

---

<sup>1</sup> Transmits text of February 23 letter from Dean to Foster regarding Dean's conversation with Soviet Deputy Foreign Minister Kuznetsov in New York on number of automatic stations on Soviet territory. Confidential. 9 pp. Department of State, Central Files, DEF 18-3 SWITZ (GE).

the territory of the Soviet Union and three on-site inspections of unidentified events by the International Commission to be set up under the proposed draft treaty to supervise the cessation of nuclear weapon tests.

Deputy Foreign Minister Kuznetsov is mistaken. I never at any time agreed or suggested three automatic stations or three on-site inspections on USSR territory.

In all of the plenary meetings and meetings of the Subcommittee on the Cessation of Nuclear Testing and meetings between myself as Co-Chairman of the conference and Deputy Foreign Minister Kuznetsov, Deputy Foreign Minister Zorin or Ambassador Tsarapkin and in the First Committee of the General Assembly I carefully and painstakingly referred to the fundamental necessity of the USSR accepting the principle of on-site inspection (which the USSR had flatly rejected on November 28, 1961 after previous acceptance) and the US-UK requirements for (a) an appropriate number of internationally supervised, nationally manned and instrumented detection stations on the territory of the USSR and (b) an equally appropriate number of obligatory on-site inspections by teams appointed by the executive officer of the International Commission after certification of an unidentified event by the executive officer under the treaty pursuant to Article VIII of the draft treaty banning all nuclear weapons tests (ENDC/58) and that there was to be the unquestioned and unmistakable right to make an appropriate number of on-site inspections of otherwise unidentified events as set forth in Article VIII, subdivisions 6 and 11.

Under instructions of the Department of State I never at any time in Geneva or New York or elsewhere except as hereafter specified, made any mention of the number of detection stations or the number of on-site inspections of unidentified events we would accept under the treaty we proposed on August 27, 1962. We were doing our level best, by adducing objective scientific information, to get the USSR to accept the principles of nationally manned detection stations under appropriate international supervision and of objective on-site inspection.

Until they did that there was no point in discussing numbers and we did not.

Sometime late in October, 1962—I can supply the exact date if that is important—I had a short conversation in New York with Deputy Foreign Minister Kuznetsov in which I emphasized the extreme importance of the non-poliferation of nuclear weapons and of working out an adequate, workable and effective nuclear test ban treaty.

He asked, if we could accept two or three detection stations and two or three invitational on-site inspections on their territory, and I replied “*emphatically no*”, but that if they would accept the theory of

properly instrumented, internationally supervised detection stations and obligatory on-site inspection they would find us reasonable.

The day after our election day he asked me for an appointment. Alex Akalovsky of the State Department and I went to see him and Mr. Timerbaev at their headquarters on 62nd Street, New York.

Based on the July 7, 1962 announcement of the US Department of Defense, I stated to Deputy Foreign Minister Kuznetsov that with improved instrumentation and trained personnel, and with a system of internationally supervised but nationally manned detection stations, there would be fewer unidentified earthquakes in each year. But I said that we still could not identify a nuclear event positively by distant instrumentation alone, that we ought to be able to solve to our mutual satisfaction the problem of so-called espionage occurring on “on-site inspection trips” by the international commission personnel, that there would have to be a reasonable scientific relationship between the number of unidentified events and the number of annual on-site inspections in any one year and that this would have to be reviewed on the basis of scientific evidence.

I referred specifically to our proposal at the 23rd subcommittee meeting on August 9, 1962, and to our proposed treaty of August 27, 1962 (ENDC/58) and to my statements in plenary in Geneva on September 4, 1962 that the number of control posts would be substantially fewer than the 21 or 19 control posts we had proposed in the past.

I then repeated what I had said there, that if we can work out the question on obligatory on-site inspection to our mutual satisfaction there should be no difficulty in reaching agreement on the number of nationally manned, internationally supervised detection posts to be accepted by each of the nuclear powers, parties to the treaty. And that these two features, nationally manned, internationally supervised detection stations and reduced number of detection or control stations represented, in our August 27, 1962 draft, significant changes from the United Kingdom-United States 18 April 1961 draft treaty.

Mr. Kuznetsov rejected the scientific relationship between the number of annual on-site inspections and said national detection systems were entirely sufficient both to detect, locate and identify all nuclear events and that no international supervision of detection posts or on-site inspections were necessary.

I explained that “appropriate international supervision” meant the physical presence of international supervision personnel at each of the detection stations on the territory of the Soviet Union.

He read out loud to me, in English, a memorandum from Chairman Khrushchev demanding a maximum of two or three automatic stations on their territory and not over two or three invitational on-site inspec-

tions. Or at least the language sounded so hedged it wasn't clear, as he read it, whether the inspection teams to be appointed by the executive officer under the treaty (Article VIII, subdivisions 6 and 11) would have the unquestioned right to make an inspection of an unidentified event or not.

I told him this was unacceptable to us.

He said that I had, in an earlier conversation, said a "small" number of nationally manned but internationally supervised stations and a small number of on-site inspections.

Even though they had not accepted the principle of obligatory on-site inspection, I decided the time had come to be specific about what "small" meant. I reminded him that their scientists had earlier claimed there were not over 60 unidentified events per annum in the Soviet Union whereas ours had said there were many more than that, but on the basis of one inspection for five unidentified events, if their scientists were correct, we had said we would take twelve on-site inspections but that if ours were right, we would want a maximum of twenty on-site inspections with one more than twelve for each five additional unidentified events above sixty and up to one hundred.

I said we could reduce the figure of twelve, previously mentioned, somewhat because of our Vela Research Programme and the Scientific criteria set forth in the draft treaty but nearer to the vicinity of eight to ten than to two or three, the figure he mentioned.

I said further I had no authority whatsoever to accept three automatic stations or indeed any automatic stations, as to the efficiency of which I was not advised, and that we wanted nearer ten nationally manned but internationally supervised detection stations with a reasonable amount of international supervision.

He said this was out of the question. I then said and repeated that the two or three stations or two or three on-site inspections he mentioned was equally out of the question. I asked him to adduce objective supporting scientific evidence as to the ability of national detection stations to identify nuclear events which he said would only prolong the discussions and was not necessary.

He again urged me to accept two or three stations and two or three inspections and I told him frankly we could not accept this and he said he wanted to be equally frank and they would never agree to anything like eight to ten detection stations or on-site inspections.

There can't possibly be any misunderstanding about this because the discussion as to numbers was very clear and explicit.

I then entered into a discussion of where earthquakes, according to Soviet statistics, occurred in the Soviet Union.

I said, according to their statistics, most of the earthquakes took place under the ocean south of the Kamchatka Peninsula and on that

peninsula, in the Pamir region, west of Outer Mongolia and in the region of the USSR northeast of Turkey, with the rest of the earthquakes being scattered.

I said we would be glad to have our scientists consider with their scientists the possibility of dividing, on the basis of accepted scientific evidence, the USSR into seismic and non-seismic areas and the placing of most of the detection stations in quiet areas calculated to produce the best detection, location and identification results, and that I thought our scientists and theirs could prorate the detection stations in their territory so that only a few would be in the heartland of the USSR. And if they conducted no nuclear events we could probably also prorate the number of on-site inspections in like manner.

He again indicated very clearly they would only accept two or three automatic stations for the entire USSR territory, so the question of prorating was uninteresting.

I again said we were willing to explore all aspects of the problem scientifically but his statement as to numbers was quite unacceptable. I was very clear on this.

He said “then there can be no agreement.”

I said, if there were only two or three on-site inspections with twelve months in the year, there would really only be one—as we could never be without any—and if we used one, there would always be a great debate whether we could really use the remaining two, and then I stated the number of on-site inspections would have to bear a reasonable relationship to the number of unidentified events in any year and that it would probably have to be a minimum of around eight to ten and that the number of two or three was completely unrealistic and not in accordance with the scientific criteria set out in the draft treaty (ENDC/58).

I also make it quite clear that I had no instructions about automatic stations and that I was highly skeptical of the so called Pugwash reports with respect to such stations as there were no trained US seismologists at this conference.

He then asked for an earthquake map of the USSR on the basis of the Soviet earthquake statistics I had mentioned.

I reported the conversation to the Department of State and stated clearly that I had urged him to accept a number of internationally supervised and properly instrumented and located detection stations nearer to eight to ten than the two or three which he had demanded.

Subsequently on instructions from the Department of State, I sent to him a map of the Soviet Union, divided up into earthquake and non earthquake areas, based on official Soviet statistics, but we had no further conversation in New York and other than the debate in the

First Committee which resulted in Resolution XVII 1732 A and B, the subject was not taken up again.

Upon my return to Geneva on November 20, 1962 to December 21, 1962 I continued to expound the American position, all of which is reflected in the verbatim records.

On January 20, 1963, I told Ambassador Tsarapkin and Mr. Voronshov we would have to have a minimum of eight to ten internationally supervised detection stations and an equal number of obligatory on-site inspections.

I have never at any time or at any place reduced these figures.

I would hope that you can place this letter in the record of the Geneva Conference.

Respectfully yours,

Arthur H. Dean

**172. Addendum to December 20 Report of NSAM 205 Committee,  
February 27<sup>1</sup>**

February 27, 1963

**ADDENDUM TO THE 20 DECEMBER 1962 REPORT OF THE  
NSAM 205 COMMITTEE**

**CONCLUSIONS**

On 14 and 15 February 1963, the Foreign Weapons Evaluation Group (Bethe Panel) reported on the analysis of Soviet 1962 tests in the 100 to approximately 1,000 KT range and of the two high-yield devices tested in December 1962. After review of this information, the NSAM 205 Committee has concluded that while the Soviets have somewhat extended their capabilities in the sub-megaton yield range, the advances made are not of major significance in terms of their

---

<sup>1</sup> Concludes that Soviet advances in sub-megaton yield range are not of major military capability significance. Two attached tables provide a listing of additional December Soviet tests and yield-to-weight ratios on the sub-megaton yield tests. Top Secret. 4 pp. Kennedy Library, National Security Files, Meetings and Memoranda Series, NSAM 205, Box 339.

military capabilities. The analyses on the whole do not appear to alter the basic conclusions in the 20 December 1962 report of the NSAM 205 Committee.

DISCUSSION

*I. The 1962 Soviet Test Series*

From 20 December to 25 December 1962, the Soviets conducted 9 additional tests at the Novaya Zemlya site (see Table I). Five of these tests had yields of less than 100 KT, two were between 1 and 2 MT, one was about 6 MT and one was 26 MT. The very low yield events previously reported as JOEs 121, 122 and 123 (27, 28 and 31 July 1962) are now no longer considered by the Joint Atomic Energy Intelligence Committee to have been definitely of nuclear origin.<sup>2</sup> The totals of confirmed nuclear tests for the Soviet 1962 series from 1 August to 25 December 1962 are: 66 tests of which 35 were less than 100 KT, 11 were between 100 and 1,000 KT, 14 were between 1,000 and 10,000 KT and 6 larger than 10,000 KT. (This may be compared with the Soviet test series of 1961 which consisted of 44 tests: 24 small-yield tests, 6 thermo-nuclear tests between 100 and 1,000 KT, 12 between 1,000 and 10,000 KT and 2 larger than 10,000 KT.)

TABLE I  
1962 SOVIET NUCLEAR TESTS  
20 December–25 December 1962

DATE	NAME	YIELD (KT)	ENVIRONMENT	LOCATION
20 Dec.	JOE 178 <sup>3</sup>	10	Atmosphere	Novaya Zemlya
22 Dec.	JOE 179	30	Atmosphere	Novaya Zemlya
23 Dec.	JOE 180	—	Atmosphere	Novaya Zemlya
23 Dec.	JOE 181	—	Atmosphere	Novaya Zemlya
23 Dec.	JOE 182	1,200	Atmosphere	Novaya Zemlya
24 Dec.	JOE 183	1,900	5,000 ft.	Novaya Zemlya
24 Dec.	JOE 184	26,000	11,500 ft.	Novaya Zemlya
25 Dec.	JOE 185	Prob. <40	Atmosphere	Novaya Zemlya
25 Dec.	JOE 186	5,800	5,000–10,000 ft.	Novaya Zemlya

<sup>2</sup> As the result of dropping these three events, JOE numbers listed in the 20 December report (from JOE 124 on) should be re-numbered; JOE 124 becomes JOE 121, JOE 125 becomes JOE 122, etc.

<sup>3</sup> Revised JOE numbers which resulted from dropping of events on 27, 28 and 31 July 1962 as nuclear tests.

## II. Soviet 1962 Tests in the Sub-megaton Yield Range

Evaluation of Soviet tests in the 400 to 1,200 KT range indicates considerable progress in thermonuclear technology. In JOE 163 the Soviets, for the first time, tested a device [*text not declassified*] previous Soviet devices in this weight class. However, analysis of all the sub-megaton tests points to a reluctance on the part of the Soviets [*text not declassified*].

In tests around 200 KT the Soviets still show no evidence of attempts [*text not declassified*] though these 200 KT devices may have had slightly lower weights than were seen in previous Soviet thermonuclear tests [*text not declassified*] they do not appear to represent important technological advances.

Yield-to-weight ratios for the sub-megaton yield tests are shown in Table II.

## III. High-Yield Tests on 24 and 25 December 1962

The two high-yield tests which have been carried out since previous analyses appear to be somewhat different in design than previous devices in the same yield classes. The analysis of the 26 MT device is particularly difficult since it contained appreciable amounts of unburned themonuclear fuel and does not permit any precise reconstruction of the design of the device. However, neither it nor the 6 MT device appear to involve any radical advances in weapon technology.

TABLE II  
YIELD-TO-WEIGHT RATIOS DEMONSTRATED IN SOVIET  
1962 LOW-YIELD THERMONUCLEAR TESTS

## March 1963

### 173. Disto 1129 from Geneva, March 1<sup>1</sup>

Geneva, March 1, 1963

RE Fisher-Foster telcon March 1. Following is text of portion of statement made today by Foster in plenary dealing with Dean-Kuznetsov conversations in NY:

"The Soviet delegation has alleged in presenting its position on on-site inspection that Ambassador Arthur H. Dean suggested as acceptable two to four on-site inspections annually at some point during informal discussions with Minister Kuznetsov in New York last autumn. This is not the case. Here is the record.

"On October 30, Ambassador Dean, accompanied by Mr Akalovsky of the US delegation, called on Minister Kuznetsov in New York. The conversation centered primarily on current General Assembly matters, and the test ban problem was discussed briefly and only in general terms. Minister Kuznetsov reaffirmed the position held by the Soviet Union at that time, denying the need for on-site inspection and stating that such inspection was unacceptable to the Soviet Union. Ambassador Dean stressed the US desire to engage in serious negotiations on a test ban. He further expressed the view that some mutually satisfactory arrangement to cover cessation of testing in all environments, while providing assurances against clandestine tests underground, should be possible. In this connection he said that the United States had in mind a small number of on-site inspections but did not mention any specific figure. Thus, the Soviet claim that Ambassador Dean offered two to four inspections on October 30 is inaccurate.

"They met next on November 7, at Minister Kuznetsov's initiative at the Soviet mission in New York. Again Ambassador Dean was accompanied by Mr. Akalovsky. Reading from a prepared text and stating that he was acting on instructions, Minister Kuznetsov reviewed the Soviet position on the test ban—a position which still excluded any on-site inspection on USSR territory.

"Ambassador Dean re-emphasized the US position that on-site inspections were necessary and that their number was related to the number of unidentified events. He also said that because of the progress achieved under the Vela Research program, the United States might

---

<sup>1</sup> Partial text of Foster statement on Dean-Kuznetsov conversations. Official Use Only. 3 pp. Department of State, Central Files, DEF 18-3 SWITZ (GE).

be prepared to accept something like eight to ten on-site inspections, and eight to ten nationally manned control posts under international supervision. Ambassador Dean observed that ninety percent of the territory of the Soviet Union was aseismic and suggested the possibility of subdividing Soviet territory into seismic and aseismic areas. He remarked that U.S. scientists believed that if two control posts were located in the aseismic portion of the heartland of the Soviet Union, and eight in the seismic areas, only very few inspections might be required in the aseismic areas.

"After the meeting Mr. Timerbaev, a member of the Soviet mission who also attended the meeting, approached Mr. Akalovsky to check Ambassador Dean's remarks about the number of nationally manned stations and on-site inspections. Mr. Akalovsky referred Mr. Timerbaev to what Ambassador Dean had said, with Mr. Timerbaev repeating the number eight to ten on-site inspections and Mr. Akalovsky confirming the accuracy of his account.

"Consequently, there are no grounds for doubt as to the numbers mentioned by Ambassador Dean, and this makes subsequent claims by Soviet representatives that, on the 30th of October Ambassador Dean had in fact mentioned the two to four figure, quite surprising. Both United States participants in these meetings confirm the facts which I have just given you.

"Nevertheless, it is of course possible that there might have been some misunderstanding, if this was the case we deeply regret it. But from the text of President Kennedy's letter to Chairman Khrushchev of December 28, 1962, there could have been no misunderstanding that eight to ten on-site inspections was the US position."

**Tubby**

**174. Letter from Macmillan to President Kennedy, March 16<sup>1</sup>**

March 16, 1963

Dear Friend—

I was very glad to get your message about the whole problem of the nuclear forces.

The more I think of it, the more constructive I believe our Nassau declaration was. In whatever form our plans ultimately emerge, the spirit in which they were launched has undoubtedly been more and more understood as the weeks have passed. I was very glad too to have a chance of seeing an old friend, Livvy Merchant, and to hear from him some account of his journeys. I left Alec Home to discuss some of the problems with him in detail.

With the signature of the technical agreement between our countries arising from Nassau, the foundation of one part of our work will be well and truly laid. Nor do I think it will ever be abandoned by any Government here. After long experience I have found that we are all of us apt to say things when we are not in authority which we do not feel either willing or able to carry out when we succeed to responsibility.

But thinking so much about all these matters has led me, and I expect you, to turn back to another part of this nuclear problem, far more constructive in reality; for it might open the path to something better for the world than merely building vast forces which if not used are wildly expensive, if used are wholly destructive to mankind, and which at the best keep a kind of uneasy peace by a balance of horror. So, after much thought, I am impelled to write to you to give you my ideas about the question of nuclear tests and the possibility of an agreement to ban them.

You and I both remember well the background of our meeting at Bermuda. Then the agreement, which had seemed in our grasp two or three years before, when we had a moratorium—informal but nevertheless very welcome to the world—had been frustrated by the massive Russian tests in the previous autumn. How far Mr. Khrushchev made these for internal political reasons, or how far he wished to frighten and impress the neutral and unallied world with his power, is only a matter for speculation. But it was certainly a great shock to us all.

---

<sup>1</sup> Securing a test ban agreement: past and present realities and suggestions for a satisfactory conclusion. Top Secret. 13 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan–Kennedy Correspondence, Vol. IV.

When we met in Bermuda in December, 1961, I had the feeling that you were as anxious as I to avoid having to reply with another series of tests, American and British—yours of course on a far greater scale than ours. I remember well the discussions and the difficulty of getting any very clear picture from the experts. Incidentally, the more I discuss this problem, the more I find that we laymen talk about the technical aspect and the experts always tell us that it is a political problem. Perhaps there is some lesson to be drawn from this.

At Bermuda, we resisted the temptation to hold a new series on political grounds as an answer to the Russians, although we were, with some difficulty, persuaded that it was necessary to do so on military grounds in order to protect the vital interests of the Western Alliance. This was the theme of our announcement at Bermuda. It was on this basis that I was able to persuade my colleagues and Parliament to give their consent to the joint operation and to the use of Christmas Island.

All the same in the Christmas atmosphere of that year I felt impelled to write to you an inexcusably long letter to set out my thoughts and feelings.

After some exchange of messages, we decided to accompany our announcement of tests by a rather novel approach to the question, which made a considerable impression, in both our countries. We sent joint letters to Mr. Khrushchev on February 7, 1962, followed by two sets of letters in broadly similar terms a week and ten days later. The point, you will remember, was that although the Western tests had to be made, we hoped that this series would be regarded as the end of a definite round and that we should all try to concentrate on the Disarmament Conference about to open in Geneva—to this body the subject of the Test Ban had been transferred at the request of Russia. We both promised to take a personal interest in this and to try to bring matters to a head whenever the moment seemed right. The words that I used to Mr. Khrushchev on February 25 were:—

“As I told you in my letter of February 14, I am also very ready to take part personally in these negotiations, when it seems that the presence of Heads of Government can be of positive value. Two situations might arise in which this method might be fruitful. The first is if the Conference is making satisfactory and definite progress. In such a case a meeting of the Heads of Government might well serve to consolidate what had been achieved and to take a further step towards an actual agreement.

The second situation is one in which certain major and clear points of disagreement have emerged which threaten to hold up further progress. In that case the Heads of Government should perhaps meet in order to try to break the deadlock.”

On February 24 you sent a message to Khrushchev in which you said:—

“The Heads of Government should meet to resolve explicit points of disagreement which might remain after the issues have been carefully explored and the largest possible measure of agreement has been worked out at the diplomatic level.”

The fact that both Dean Rusk and Alec Home went to Geneva for the opening Conference to start it off was intended to underline the importance which you and I attached to the meeting.

During recent months the negotiations have made considerable progress. The Russians have now publicly accepted the principle of inspection. It is true that they seemed to accept this three years ago; but they had afterwards very definitely rejected it. They have now accepted it definitely, and have also accepted three annual inspections. The West has moved down from twenty inspections to seven. So, from the man in the street's point of view, the two sides have come a great deal nearer. Indeed, to the layman, we would seem so near that it would be almost inconceivable that the gulf could not be bridged. There are, of course, a number of other points to be settled in connection with these inspections, so as to ensure that they are a reality and not a farce. But I do not feel that the Russian refusal to discuss them until the number is settled means that they will use these points as a way of bringing the negotiations to an end. If they were to do so, after an agreement on numbers had been reached, they would be in a very bad posture before the world.

I have wondered in my own mind and tried to find some answer to the question as to why Mr. Khrushchev suddenly moved forward on the inspection issue. So long as he stood upon the principle that any form of inspection involved espionage, he had at least a logical position. We may think it ridiculous; but it is in conformity with the well-known Russian sensitiveness to contacts with the outside world and with the almost Oriental xenophobia which has been traditional in Russia whether Tsarist or Communist. But, having abandoned this position, it is difficult to argue that three inspections do not endanger security while four, five, six or seven might. I wonder perhaps whether there was some real misunderstanding in his mind over this, and whether he somehow got it into his head that if he moved on the principle, you would accept a quota of two or three. Mr. Khrushchev, like an old elephant, has a very tenacious memory. For example, in conversation in Moscow in 1959 when this matter was first under discussion I casually mentioned various figures for annual inspections, from twelve down to three, as an illustration of my general argument in favour of a test agreement. Since then he has affected to regard this chance observation as a substantive proposal by the British Government. Of course he should know that it was not. But that is the way he has learned to think—or double think. Similarly, something must

have happened recently to explain Khrushchev's apparently genuine mood of exasperation and distrust. However, whatever may be the explanation, that is the position, and there now appears to be a deadlock based upon the question of number.

What, then, are we to do? Of course, there are very strong arguments for doing nothing. Strong logical arguments, strong political arguments. But this is not the spirit in which you, who carry the largest responsibility, before God and man, have faced your duty, nor that in which I have tried to do the same. I have a feeling that the test ban is the most important step that we can take towards unravelling this frightful tangle of fear and suspicion in East/West relations—important in itself and all the more important for what may flow from it. All the same, strictly it is the Russian turn to move. They have come from nothing to three; you have come from twenty to seven, and it is up to them to make a bid. If they want a Treaty they can get one—and, it will be argued if they do not want one, why negotiate at considerable risk? Why is it that the West always have to move? Why is it that all the concessions seem to come from us? And so on. Then of course there are quite strong groups of opinion who are really in favour of tests. Some scientists think it is a pity not to know all you can know. It seems almost restrictive and reactionary not to blow things up to find out what would happen when they go off. Others are very fearful as to whether in some way or another important lessons might be learned by the Russians from a clandestine series of disconnected tests. I assume that this is the old question of yield for weight, which may have some bearing upon the development of the anti-missile missile in its most sophisticated form. On the other hand, there are equally strong bodies of opinion that feel that from a purely scientific point of view on the figures we are discussing there is not very much more danger in the smaller number of inspections than in the larger one.

I have just been reading a short account of this whole story from the beginning, and I am impressed by the fact that whenever we seem to get near a solution somebody finds out a new scientific theory. The big hole was itself a good example of this, and in that hole are likely—unless we are careful—to be buried the hopes of mankind. All the same, the arguments against moving can be powerfully put forward, and I have no doubt are very strong politically with you. To those that I have mentioned can be added that if we do sign a Test Ban the French and the Chinese will stand out and so in the end we may not be so very much further on. Finally, it is alleged that there is not very much pressure on either side to start a new series of tests.

However, since it seems to take a couple of years or more to evaluate one set of tests and to make the necessary preparation for the next, this lull may prove very deceptive. We may within a year or

two be faced with the same situation which confronted us in 1961 in Bermuda. Apart from avoiding the practical difficulty that hangs over us in the near future, I am sure you will agree that we would gain enormously if this Treaty could be made. First, it would stop the contamination of the atmosphere. We have been thinking so much about the underground tests that we tend to forget the injury done by atmospheric testing. While it might not stop the Chinese and the French tests altogether, it would certainly drive them both underground, which is a good thing from this angle. Secondly, I am quite sure that it would have a very considerable effect upon some countries which may be hesitating about what to do. For instance, Sweden, India and Israel, and other countries which will be almost bound to enter the nuclear race unless they can find an excuse not to do so. Thirdly, the effect on the world of an agreement solemnly entered into by our two countries with Russia would be enormous. It would give a tremendous new sense of hope. We could probably succeed in giving a new impetus to the Disarmament Conference and might also give a lead on other fronts.

It would be a great gain, of course, if Sweden, India, Israel and the rest would undertake not to test; but I have a feeling that if we get the test ban agreement, there would be another prize just as important to be secured. We ought to be able simultaneously to get a non-dissemination agreement; an undertaking, that is, from non-nuclear countries not to accept nuclear power at the gift of others, for their sole use, and from nuclear powers not to give nuclear weapons or knowledge to non-nuclear countries. To me this seems the real key to the German problem; one which gives a good deal of anxiety both to the Russians and to us, and, to be fair, to many Germans; who are genuinely anxious lest in due course they or their successors will be forced to become a nuclear power. It is quite true that Germany is bound by all kinds of agreements and undertakings. But these could easily be represented by a bad German in the future as the modern counterpart of Versailles. We know—only too well—what might follow from all that way of thinking. Indeed, speaking frankly, the most attractive part of clause 8 of the Nassau Agreement is that it may give the Germans a sense of participation without incurring these dangers. But I feel that a test agreement accompanied by a non-dissemination agreement would serve to underline clause 8 if we are able to bring clause 8 into operation, and anyway would be effective in itself. No German could then say that Germany had been forced into this abnegation in a period of weakness just after the war, when the present treaties or agreements were made.

On the contrary the Germans could claim with pride that, with other great States, Germany had entered into this undertaking as a contribution to the solution of one of the gravest problems which

confronts the world. At the same time, this is a prospect which must appeal equally to the Russians. The countries of the West have, thank God for it, decided to rebuild their bridges with Germany. We have tried to forget about the two wars and the Hitler persecutions and all the rest. This is true of your country and mine, and to be fair, of the French. All this is good. But then, without being cynical, we all have an interest, because the Germans are our Allies against the Communists. The Russians both hate and fear the Germans. They hate them, inspired by the cruel memories which we have decided to blot out; they fear them as an efficient, hard-working, brave and determined people. Nor can they fail to be conscious of the pressure which they put continually upon German patience by the obstinacy with which they enforce to the division of Germany. For all these reasons, then, I think the tests ban, followed by adherence of other countries not to test, accompanied by a non-dissemination agreement which was reasonably well supported, would have a profound effect in removing the present state of tension in the world.

Of course whatever agreement is made, the Russians might be able to evade it and we might not be able to catch them. From our point of view, if there are some twenty-five unidentified events of Magnitude 4 or over annually in Russia then of course with seven inspections we have nearly a one in four chance of catching them out; with five we have a one in five chance, and with only three we have one in nine. Naturally, if they make a definite series, we have a better chance of finding them out. There is also the possibility that they might so arrange the tests at the end of the year that we would have exhausted our right of inspection. However, this and other difficulties might be got over in negotiation, not merely by splitting the difference between seven and three but by some arrangement to carry over unused inspections to an agreed extent, from one year to another. Since our machines, whether operated overtly or covertly, will continue to improve we are likely to need fewer annual inspections as time goes on, and an arrangement of this kind for carry-over of inspections might be one way of allowing ourselves enough inspections at first without over-ensuring for the future.

So much for the chances of our catching them if they cheated. However I am bound to say that I think they would be at great risk if they did cheat after signing the Treaty. Although they might have no moral inhibitions in breaking their word, I think they would be abashed at being publicly shown up before the world; and, what is more important, they would lose the great benefits of a non-dissemination agreement, with all that this implies in Central Europe.

So we come to the problem of how we are to renew the negotiations with a view to bringing them to a satisfactory conclusion. Looking

back to our declaration in 1962 I am bound to say that I feel myself under an obligation to act in accordance with what I then said. Certainly in my statement, which perhaps went further than yours, I undertook to do something about it in either of two situations, one of which is now approaching.

There are various possibilities;

(a) I can see the disadvantage in merely offering five inspections through the Geneva negotiators with no certainty that this would be accepted. A rejection would be very bad politically for you, although not so much for me.

(b) I can see the dangers involved, although I think the advantages might well outweigh them, in simply suggesting that we all three should meet and try to settle the matter. If the West then offered five and Khrushchev stood out, our position might not be very dignified, but it would not be ignoble.

(c) We could summon a Conference on the understanding that the conditions of the inspections were first brought near to a conclusion, so that we should only have to settle the final steps to be taken on these together with the question of numbers. But it would still be a risk.

(d) Or, if it was better for you, I could write to you and Khrushchev either privately or publicly or both, suggesting that we should all meet at Geneva. If he refused, it would be a great disappointment and we should not get the agreement, but again it would not be discreditable.

(e) Before suggesting either jointly or separately a conference of the Heads of Governments, we might make some further soundings.

In this connection, I still feel there is something queer about Khrushchev's move towards accepting the principle of inspection. There may have been some genuine misunderstanding in his mind, or perhaps some misunderstanding or misrepresentation by those Russians who reported to him what they picked up in Geneva. Possibly therefore you could send some personal message to Khrushchev on this matter or perhaps some emissary such as Averell or even your brother Bobby who would both clear up any misunderstanding and find out whether there was a chance of settling round about five or by some juggling with the numbers, including the conception of bisques and the limit for any one year, coupled of course with what I think could be made very attractive to Khrushchev, the non-dissemination aspect.

Some of my telegrams report that he is supposed to have lost interest in the nuclear test ban but if that is so, it may well be because he has not had the non-dissemination aspect sufficiently impressed upon him.

I am sorry to inflict so long a letter on you, but I feel this very deep personal obligation upon me and it is one which in some form

or another, I must discharge, before it is too late. I do not, as you know, want to trouble you on the telephone but I would be very glad to hear first from you either through David Gore or by teleprinter message, and then perhaps we could have a talk to clarify any outstanding points.

I am sending this letter to you through David who is fully conversant with all our ideas and whom I know you trust as much as I do.

Yours very sincerely

**Harold Macmillan**

April 1963

175. Memorandum for the Record, April 4<sup>1</sup>

April 4, 1963

SUBJECT

Meeting with the President—4:30 p.m.—4 April 1963

1. Reviewed with the President the Far East missions. Sought his approval of the 5412 recommendation of April 4 to which he agreed.

2. The President asked me my estimate of when the Chinese might explode a nuclear device. I told him that we had had a group of consultants study all possible intelligence and we were inclined to believe it might take place somewhat earlier than we had heretofore thought and, indeed, it was possible a device might be exploded late this year or some time early next year.

3. I reviewed all items in the three attached memoranda covering various discussions and observations on my Western trip. The President asked that I give him a statement on the cost of the supersonic plane and submit any ideas that I might have as to a proper and reasonable contracting procedure which would be fair and equitable and would get the job done before the British-French plane comes into being. He specifically asked that I give him a copy of paragraph 5 of my memorandum on discussions with others on my Western trip.

4. There followed a long, informal discussion on a number of matters including nuclear test ban. I told the President that Eisenhower had expressed opposition to the present treaty as he understood it because of inadequate verification, the threshold, etc. I told the President that I, too, was concerned about the treaty for these reasons and furthermore it did not accomplish the President's own objectives as outlined in his recent press conference because the Russians could no longer handle the Chinese situation and we and the British could no longer handle the de Gaulle situation, and hence the proliferation problem. The President seemed to agree, and restated that he did not think we were going to get a treaty anyway.

---

<sup>1</sup> Readout of meeting with President: Chinese nuclear capability, supersonic plane issues, nuclear test ban concerns, French bilateral relations, economic issues, European security issues, and U-2 shoot down contingency plans. Secret. 2 pp. CIA Files, Job 80B01285A, McCone Files, Meetings with President, 4/1/63-6/30/63.

5. We discussed in some detail the de Gaulle relationships. I reiterated my previous position, urging that we try to find a solution to the impasse with the French. The President read with considerable interest the debriefing report on Archduke Otto.

6. I showed the President photographs of the A-12.

7. Informally discussed problems of economic growth, tax reductions, Federal deficits and the debt structure. I told the President I had not gone into these matters in depth; however, I noted that our debt stood at about \$260 billion 15 years ago when our Gross National Product was on the order of \$250 billion to \$350 billion and personal savings were at a minimum, whereas at the present time our debt is on the order of \$300 billion against a Gross National Product of \$375 billion and savings are \$1.5 trillion, therefore the debt did not worry me but the constant deficit did, and the outflow of gold also worried me.

8. With respect to the outflow of gold, I indicated the opinion that the largest single item was in support of our overseas forces and their families which total a million Americans in Europe alone, and added to that were probably ½ million travelers annually who went to Europe primarily to see their sons and families who were deployed overseas. I then urged consideration of a more drastic plan than the Merchant plan and suggested placing total responsibility for the defense of Europe on the shoulders of Europeans through a Western European Alliance, and that we sell this Alliance missiles, nuclear warheads, etc., and concurrently withdraw from Europe. The President did not indicate approval of such a plan but did indicate that we might reduce our forces to two Divisions. I told the President that I felt the gold problem was our most serious one and that steps must be taken to curtail it. I said that I felt the non-competitive position of our labor in a great many industries was a contributing factor. I pointed out the frequency of situations where American manufacturers, contractors or those involved in service such as contractors, shippers, etc., were losing out to Europeans because of wage and salary differentials unfavorable to the United States.

9. The President mentioned a contingency plan for Cuba in the event a U-2 was shot down. I told him McNamara and I had discussed this and were to meet within a week with Secretary Rusk.

**176. Notes on Telephone Conversation between Rusk and Bundy,  
April 11<sup>1</sup>**

April 11, 1963

The Sec said he was getting ready to call the President and Bundy said he hoped he would. The Sec. said if the Soviets would accept our piece of paper on non-transfer as a basis for negotiation it looked as though the French would play. This would seriously change the situation and the Sec. said he thought he might try this on Dobrynin tomorrow. Bundy asked the Sec. if he had seen the outgoing and the Sec. said he had. Bundy said the answer must be cleared at the Presidential level.

The Sec. asked how things were back here and Bundy said they looked pretty good, the general effect was healthy. The Sec. said the French were laying themselves out. They discussed what had appeared in the press. Bundy said he had discussed with Tyler the Berlin thing. The Sec said he had just talked to Ball on this. Sec. said he hated to see us turn back on something, adding he wanted to see the state of the commitment. Bundy said Gilpatric thinks it is clear. The Sec. said it was cleared with him and Bundy said it was cleared with Anderson. Bundy said we ought to have a look at it next week.

---

**177. Notes on Telephone Conversation between Rusk and Bundy,  
April 11<sup>1</sup>**

April 11, 1963

The Sec said the President wondered whether we should change the letter to Macmillan in view of the small amount of progress on the non-transfer point, adding he had had a discussion with Home in Paris. The Sec asked if the letter had gone to Macmillan. Mr. Bundy said it

---

<sup>1</sup> Discussion of response to Macmillan on non-diffusion issue with the Soviets. No classification marking. 1 p. Department of State, Rusk Files: Lot 72 D 192, Telephone Conversations.

hadn't but they had sent to Macmillan the President's comments. They might offer another reservation on the language. His own feeling is that the letter in current form says they are both important. There is nothing in the letter that says we couldn't make progress with the Soviets on non-diffusion. Mr. Bundy said the letter to the PM had not been sent; the Pres and the PM had talked on the phone instead. The Pres said he didn't mind the draft letter to Khrushchev. The PM they could educate any time. The Sec said he didn't see that the non-transfer point was involved in the Khrushchev letter and he read from it. Mr. Bundy said the Dept came in with a draft to Macmillan & the President hadn't had a chance to see it. They discussed the Thompson letter and Bundy said that had gone. They mentioned then that Mr. Foster had all the papers and it was left that they would turn their hand to this in the morning.

**178. Memorandum of Conversation, April 12, between Rusk and Dobrynin<sup>1</sup>**

April 12, 1963

SUBJECT

Nuclear Non-proliferation

PARTICIPANTS

*US*

The Secretary  
Ambassador Thompson  
Mr. Hillenbrand

*USSR*

Anatoly F. Dobrynin, Ambassador of  
USSR  
Georgi M. Kornienko, Counselor,  
Embassy

After discussing several aspects of the Berlin question with Ambassador Dobrynin (covered in separate memorandum of conversation), the Secretary said he would like to turn specifically to the question of nuclear non-proliferation. Here was a point in which a genuine common interest existed between the Soviet Union and the United States and indeed the United Kingdom and France. On purely theoretical grounds no nuclear power could be interested in any other power's

---

<sup>1</sup> Nuclear non-proliferation issues. Secret. An attached copy of the draft non-transfer declaration with an appended minute provides additional information on the declaration. Confidential. 10 pp. Department of State, Secretary's Memoranda of Conversation: Lot 65 D 330.

becoming a nuclear power. On purely practical grounds, looking ahead fifteen to twenty years and seeing the prospect of as many as ten to fifteen countries coming into possession of nuclear weapons, the prospect for peace was not good. An element of unpredictability would be added. We therefore have a common interest in avoiding nuclear proliferation.

It was against this background, the Secretary continued, that he had talked with Gromyko at Geneva and urged that the Soviet Union and the United States concentrate specifically on the question of non-diffusion of nuclear weapons on a national basis, that is concentrate on governments which could develop national capacities on their own. We believe that we should concentrate on this central point and not try to solve all related matters. If agreement were reached on this point, it would make further steps possible in the disarmament field. With reference to the Western Alliance, the Secretary said that he had pointed out to Gromyko that we did not have in mind the transfer of nuclear weapons directly or indirectly through this Alliance. But he had also pointed out to Gromyko that the expression “directly or indirectly through a military alliance” might lead to misunderstanding and would require further discussion. With this in mind we had drafted a declaration on nuclear non-transfer of two paragraphs and had also appended a clarifying minute to explain what would or would not be covered. Our language is illustrative but serious and does not necessarily cover all of the points we would like to discuss at the time of the declaration. However, there are enough points in the minute to show that our stress is on the extension of national capabilities. We believe this to be not just another piece of paper but an arrangement that would actually prevent the proliferation of weapons on a national basis.

Ambassador Dobrynin asked whether the Secretary had discussed the declaration with the French and the British and whether they had agreed to it. The Secretary said we had given them copies but that he was not acting as their agent today. He did want to say, with a full sense of responsibility, that if the Soviets felt that our paper provided a basis of negotiations, the Allies would take this as a very serious step and we could take up the subject with them. We could not commit them today, the Secretary added, but he was encouraged to find out if the Soviets did consider the paper as a basis for negotiations.

After Dobrynin had carefully read the paper which the Secretary had handed him (text attached), the Secretary observed that some of the discussion in the West over the past few years on nuclear matters, and the increase in consultation among the Western powers on this subject, was due to the change brought about in the nuclear situation when in 1956–57 the USSR had made clear that it was targeting a considerable number of nuclear weapons on Western Europe to be

delivered either by bombers or by missiles. This brought the question to the forefront in the thinking of Western European governments. The Soviets had stressed the point either to visitors in Moscow or during visits of Soviet leaders to the West, emphasizing that one or more countries would be destroyed. It was only natural for the countries threatened by nuclear weapons to want to know something more about them. Thus the increase in the discussion of nuclear problems in the West was the direct result of the developments which he had mentioned in the nuclear field.

Furthermore, the Secretary went on, he sincerely asked the Soviet government to believe that we ourselves are opposed to placing nuclear weapons in the hands of national governments and national forces. This is a matter of our interest. We have pursued this policy even though some of our Allies have disagreed with it. There is nothing in the background which cuts across this most elementary policy of the US government. Although the Soviets may have expressed concern from time to time with regard to something which has not yet come into being, this is US government policy. What he was saying today, the Secretary pointed out, was not our answer to the recent Soviet note on the multilateral force. We would deal with this in due course, but Ambassador Dobrynin would not be surprised to hear that we disagree with many points in the Soviet note. The Secretary said he did have one immediate comment. The note mentioned the multinational as well as multilateral force. The former was mainly the British V-bombers and US Polaris submarines. These were the principal elements along with the coordination with other elements which might have related missions. The multinational force does not change the existing situation as far as the spread of weapons is concerned. Our view is that this is also true of the multilateral force. The key point about the latter is that national governments will not be able to employ it on a national basis by their own decision or that of their armed forces. The main objective is to prevent the spread of national nuclear capabilities. We are not interested solely in one, two or three countries but on a world wide basis. After all, countries not allied either with the US or the USSR may be planning to acquire nuclear capacities. Hence we think that a four-power agreement along the lines of the declaration would be great progress.

After some discussion of Berlin at this point (covered in separate memorandum of conversation), Dobrynin commented that the main point about the non-transfer declaration proposed by the US is that to which Gromyko had objected previously. Dobrynin said he had also made the same point in an earlier conversation and his government had likewise had done so in a note some months ago as well as in its recent note. This was not purely a matter of propaganda but the way

the Soviet government felt. The US was actually beginning the proliferation of nuclear weapons. Chairman Khrushchev had welcomed President Kennedy's remarks regarding US policy on non-proliferation, but what has been going on since last summer is the actual proliferation of nuclear weapons. Without even speaking of Germany, a country like Italy which has not had nuclear weapons will now have them in the so-called multilateral units. The policy of the USSR is to have no nuclear weapons except in national units of the USSR. The US has had the same within the NATO framework. This the Soviet Union could accept. But when the US speaks of so-called multilateral teams made up of countries who do not now possess nuclear weapons, this is a new and dangerous step. It marks a real difference in quality. In a year or two the situation will further change and then there will be proliferation. Dobrynin repeated that the multilateral force would put the control of nuclear weapons in the hands of other countries which did not have them now. He recalled that before the Paris Agreements in 1954, the Western countries had claimed that they were going to prohibit the Germans from having all sorts of weapons, even heavy conventional armaments, but in a few years this was pushed aside. The Germans had complained that they were not being given equal treatment. Now they have the biggest army in NATO, and where were the Paris Agreements? Now the first step in satisfying West German nuclear demands was to be the multilateral force. This was only the beginning, the Soviets felt. The US was on a dangerous path on which it could not stop. The Germans would always try to bring about changes. The first step would be to change the rule of unanimity to decision by majority and thus eliminate the US veto. The only solution would be for the USSR and the US to keep their monopoly. This was the basic position of the Soviet government. The US-proposed declaration, Ambassador Dobrynin continued, dealt with everything except the multilateral force or the multinational force. He could only note the reservations in the minute, and felt that the US was really proposing nuclear proliferation both quantitatively and qualitatively.

The Secretary said he would try to distinguish the two things. From the quantitative aspect, the question of disarmament applied to both sides. The USSR had built up a substantial nuclear force requiring a substantial nuclear force on our side. It appeared from a recent Khrushchev speech that important decisions had been made to allocate a considerable amount of new resources to military purposes. The question of quantity should be grappled with in the disarmament context. In this sense, quantitative proliferation needs serious attention.

On the qualitative side, we were opposed to putting other governments in a position, not merely on paper, to hold and employ nuclear weapons. We have no arrangements in mind towards this end. This

was an important point which the Soviets should remember. Dobrynin commented that this was where the US and the USSR differed. The Soviets could not see how a development could be prevented over the years which would lead to real control of nuclear weapons in the hands of the members of the multilateral force. The Secretary said we were sure that this would not happen with respect to the NATO countries. But there were also other countries which would move towards possession of nuclear weapons in the next ten years or so unless there were some such agreement as we had proposed. Dobrynin said he was not so sure about the NATO countries. Unless, the Secretary continued, we can combine a NATO arrangement with a larger agreement, the question will get out of control. Dobrynin observed that the multilateral force was a process of proliferation. The Secretary responded that we were quite certain that this was not so as far as NATO was concerned.

Dobrynin said that when he looked at the post-war history of West Germany, recalling for example statements made by Mr. Dulles in 1954 and how the Germans now had the strongest army in NATO, he could only wonder where we would be in five years. The Secretary commented that he did not want to go over the whole history of the post-war period, but it was a fact that the West Germans had not begun to arm until after the East Germans had started. The East Germans had been permitted to begin arming one year before the West Germans over the protests of the Western powers. Dobrynin injected that he could produce a list. The Secretary observed that if the Soviets maintained twenty divisions in East Germany, we could not maintain that many in the Federal Republic. Dobrynin said the Soviets were prepared to withdraw from East Germany anytime the US was prepared to withdraw from the Federal Republic.

The Secretary stated that we would have no objections if the Soviets were to make arrangements within the Warsaw Pact similar to those we were proposing to make within NATO. Dobrynin responded that the Soviets did not want this. The Secretary said he wanted to ask the Soviet government to study the draft declaration against the background of his statement to Ambassador Dobrynin. The latter said he would of course refer the text to his government, but he was sure that it would be found unsatisfactory. He inquired as to what we understood by the term "minute" to be attached to the declaration. Ambassador Thompson said it was a document intended for purposes of explanation. Referring to the text of the draft non-transfer declaration, the Secretary noted that Gromyko had raised the point about using the device of an Alliance to achieve something indirectly. The Secretary recalled that he had told him that it was not our intention to transfer nuclear weapons through a military alliance to national control. But since the expression "indirectly through a military alliance" does not

carry a full explanation on its face we must be clear what it means. It would therefore be important to append a minute to avoid misunderstanding. Dobrynin said he could recall what Gromyko had said about indirect transfer. He had been against precisely what was going on in connection with the multinational and multilateral force, although what the US proposed to do had not been very clear at the time. The Secretary said the issue was the ability of national governments to use their own national forces to launch nuclear weapons. He recognized that there might be political reasons why the Soviet Union did not want other NATO countries to consider themselves part of an Alliance which has nuclear weapons at its disposal. However this question of national nuclear capacity was so important that it was worth taking hold of the particular point and stopping that at least. We were prepared to enter into an agreement on this. Dobrynin said there were no specific political reasons for the Soviet position. The USSR was against proliferation in any Alliance.

The Secretary observed that President Kennedy had already clarified the point that these arrangements would be in no way separated from the responsibility of the United States. Dobrynin injected that the fact was that other countries would possess nuclear weapons. The Secretary responded that no other country would come into their possession. Dobrynin repeated that they would have possession. The US might not be in a position to be fully responsible. The USSR already felt that the West Germans were exercising a strong influence on US policy, for example in the negotiations on Berlin and German problems. This influence would increase in years to come. One read that the Germans would be paying one-third of the cost of the multilateral force. They would try to acquire a decisive voice. The Secretary said that if he really believed this he would sign the agreement today so that in five or ten years from now the governments would be bound. What the Soviets fear would then not be possible. Dobrynin said that the fact was that through a rather complicated scheme the US was going to give other countries nuclear weapons. Who was proliferating? You or we?

The Secretary observed that the Soviets should look at the alternative. It was either this arrangement or no arrangement. The security of the Soviet Union and of the US demanded the arrangement. Dobrynin merely repeated that the Germans would be tempted to acquire nuclear weapons. The Secretary pointed out that they would sign paragraph two of the declaration. Dobrynin said that he did not know whether they would sign. The Secretary responded that he thought that they would sign. He thought that a lot of countries should sign, for example the Chinese. Dobrynin commented that the Soviet Union had no multilateral force with the Chinese. The Secretary asked whether the Chinese

would sign. Dobrynin said he did not know, but the Soviets were not proposing a multilateral force to them. However the US was inviting the USSR to do this. If the US continued, the Soviet Union would have no alternative but to do the same for its friends.

The Secretary said he wanted to suggest that this subject was one of importance both to the US and the USSR. It should be discussed seriously on this kind of basis and not get caught up in public exchanges of notes. Dobrynin observed that the Soviet note dealt with the general subject and contained some of the same ideas that he had expressed, but the Soviets had not published their previous discussions. However, the whole subject was out in the open and was being discussed in the Western press. The Secretary observed that a curious thing about the multilateral force was that those who criticized it in the West were those who wanted national nuclear forces. Dobrynin said this merely illustrated that those who wanted this would press for more tomorrow. The Secretary noted that the Soviet criticism of the multilateral force was for opposite reasons. The fact was that those who want national nuclear capacities tomorrow should be pinned down by a signed agreement today. The multinational force was not really involved in the issue, the Secretary added, despite the rude comments on it in the Soviet note.

After a brief discussion of Berlin at this point, the Secretary said he did hope that Ambassador Dobrynin would urge that his government give serious attention to the draft declaration against the background of the Secretary's statement. We are seriously interested in avoiding proliferation of nuclear weapons into national hands. There is no question about President Kennedy's central purpose on this question.

#### *DRAFT NON-TRANSFER DECLARATION*

Desiring to promote international peace and security,

Desiring, in particular, to refrain from taking steps which will extend and intensify the arms race,

Believing that the creation of nuclear weapons forces by additional states will jeopardize these ends,

Recalling that General Assembly Resolution 1665 (XVI) urges all states to cooperate for these purposes,

Reaffirming their determination to achieve agreement on general and complete disarmament under effective international control,

1. The Governments of France, the United Kingdom of Great Britain and Northern Ireland, the United States of America, and the Union of Soviet Socialist Republics solemnly declare that they will not transfer any nuclear weapons directly, or indirectly through a military alliance, into the national control of individual states not now possessing such weapons, and that they will not assist such other states in the manufacture of such weapons;

2. The other signatory Governments solemnly declare that they will not manufacture nuclear weapons and that they will refrain from acquiring directly, or indirectly through military alliances, national control of any nuclear weapons, and that they will not seek or receive assistance from other states in the manufacture of any such weapons;

3. This declaration, which shall be deposited with the Government of \_\_\_\_\_, shall be open to signature by all Governments. It shall remain in effect indefinitely, subject to the right of any signatory to be relieved of its terms if another signatory fails to observe them or if any other Government takes action which signatories have declared they will not take;

IN WITNESS WHEREOF the undersigned, duly authorized, have signed this declaration.

DONE AT \_\_\_\_\_, this \_\_\_\_\_ day of \_\_\_\_\_, one thousand nine hundred and sixty-\_\_\_\_\_.

### **Attachment**

#### *MINUTE FOR POSSIBLE USE IN DISCUSSION WITH DRAFT NON-TRANSFER DECLARATION*

The United States is proposing for consideration a declaration dealing with the non-diffusion of nuclear weapons. The principal operative sentence of this declaration, insofar as the nuclear powers are concerned, reads as follows:

“The Governments of France, the United Kingdom of Great Britain and Northern Ireland, the United States of America, and the Union of Soviet Socialist Republics solemnly declare that they will not transfer any nuclear weapons directly, or indirectly through a military alliance, into the national control of individual states not now possessing such weapons, and that they will not assist such other states in the manufacture of such weapons.”

This language is meant to make more precise the third point in the message from the Foreign Minister of the USSR which states that: “There should also be excluded the transfer of nuclear weapons through military alliances to those states which do not possess them, i.e., the transfer of such weapons in an indirect manner, irrespective of whether or not the national armed forces of these states are component parts of the armed forces of any military alliance.”

The US draft declaration applies the following test to actions respecting the disposition of a nuclear weapon in connection with a regional arrangement: Such actions are prohibited if they would give to any state which is a member of the regional arrangement and which does not possess nuclear weapons the ability to make a determination to use these weapons on the basis of its national decision alone. A few illustrations may suffice:

1. The declaration proposed by the U.S. would prohibit the U.S. or the Soviet Union from placing nuclear weapons under the control of units of national forces of nations in the NATO or Warsaw Pact which do not now possess nuclear weapons even though those units are assigned to the NATO or Warsaw Pact command structure.

2. The declaration proposed by the United States would not prevent the United States or the Soviet Union from deploying nuclear weapons in support of the forces of member nations which are assigned to the forces of the NATO and Warsaw Pact, respectively, even though these members do not themselves have such weapons. The arrangements would be such that the U.S. and USSR, respectively, retain control over the weapons so that they could not be deployed or used solely on the basis of the national decision of any government not now possessing them.

3. The declaration proposed by the United States would not prevent the U.S. or the USSR from placing nuclear weapons in the custody of units of a multinational defense force within the framework of NATO, or Warsaw Pact defense forces, respectively, if weapons could not be deployed or used on the basis of the national decision of any government not now possessing them.

4. The declaration proposed by the U.S. would not prevent the U.S. or the Soviet Union from entering into multinational consultative procedures with respect to the deployment and use of nuclear weapons with countries not now possessing such weapons.

5. The declaration proposed by the U.S. assumes adherence to the declaration by all potential nuclear states or authorities. It would not become operative until both the United States and the USSR were satisfied that such adherences had been obtained, and until both had ratified it pursuant to their constitutional processes.

**179. Note from Smith to Rusk, April 13<sup>1</sup>**

April 13, 1963

Mr. Secretary:

The attached message from the Prime Minister is now being transmitted to Palm Beach.

When you have read this, would you call me so that we can work out an expeditious way of getting your views to the President today?

**Bromley**

TEXT OF MESSAGE

Dear Friend,

Thank you very much for your message of April 11 sent after our telephone conversation. It seems to me that we are now very close on wording. I accept the substance of your change to my paragraph 6 but I think that the order of this paragraph ought to be changed a little in consequence. I attach for your consideration a suggested redraft which incorporates your new wording.

I also entirely accept the idea of including the reference to a quota in paragraph 5 of my draft which would now read as you suggested.

I hope, therefore, that we can now agree the text of the joint letter on the above basis. There remains the question of delivery. On the whole I think that the draft as it now appears is sufficiently arresting in tone to make Khrushchev realise that it is a genuine attempt to break the deadlock and not just a propaganda move. I therefore doubt if we need send emissaries at all at this stage; the Ambassadors could deliver the letters (I suppose acting jointly). When they do this I suggest that they might indicate that the “very senior representatives” mentioned in paragraph 6 of our letters could be special envoys or could be our Foreign Ministers. Thus we should be offering Khrushchev a number of options; he would have little procedural excuse for not accepting one of them.

---

<sup>1</sup> Transmits copy of April 13 message from Macmillan to Kennedy conveying Macmillan’s suggested changes in proposed letters to Khrushchev. Appended to Macmillan’s message is the redraft of paragraph 6. Top Secret. 5 pp. Department of State, Presidential Correspondence: Lot 66 D 204, Macmillan–Kennedy, 1963.

If we can agree the texts and the instructions in time I would hope that we might get our Ambassadors in Moscow to deliver these messages on April 15 or 16. As you know, the Geneva meeting reconvenes on April 17 and with the Neutrals in their present mood I would like to get our message to Khrushchev before then. If we look like having to think a bit more about the precise instructions to the Ambassadors I would hope that we might at least be able to instruct Kohler and Trevelyan in the next two days to warn the Russians that they expected important messages and would like to know if they could see Khrushchev personally next week.

With warm regard,

**Harold Macmillan**

### **Attachment**

#### *PROPOSED REDRAFT OF PARAGRAPH 6*

We should be interested to hear your suggestions as to how we are to break out of this. For our part we should be quite prepared now to arrange private tripartite discussions in whatever seemed the most practical way. It would be our hope that these discussions would bring the matter close enough to a final decision so that it might then be proper to think in terms of a meeting of the three of us at which a definite agreement on a test ban could be reached. We are very ready to discuss the best method of reaching this position. For example, our chief representatives at Geneva could conduct discussions on the questions which remain to be settled. Alternatively, or at a later stage, President Kennedy/Mr. Macmillan and I would be ready to send in due course very senior representatives who would be empowered to speak for us and talk in Moscow directly with you. We would hope that by one method or another we would get to a point at which we, who bear the ultimate responsibility for decisions on this matter, would have clearly before us the major problems which might remain to be settled. It is of course obvious that a meeting of the three of us which resulted in a test ban treaty would open a new chapter in our relations as well as providing an opportunity for wider discussions.

**180. Memorandum of Conversation, April 17, among members of Committee of Principals<sup>1</sup>**

April 17, 1963

SUBJECT

Nuclear Test Ban Treaty Meeting of Committee of Principals

PARTICIPANTS

*Department of State*

The Secretary of State, Chairman  
Mr. Raymond A. Garthoff

*ACDA*

Mr. William C. Foster, Director  
Mr. George Bunn, General Counsel  
Mr. James E. Goodby, Reporting Officer

*White House*

Mr. McGeorge Bundy, Special Assistant to the President for National Security Affairs  
Dr. Jerome Wiesner, Special Assistant to the President for Science and Technology  
Mr. Carl Kaysen, Deputy Special Assistant to the President for National Security Affairs  
Mr. Spurgeon Keeny, Office of the Special Assistant to the President for Science and Technology

*Department of Defense*

Mr. Robert S. McNamara, Secretary  
Mr. Paul H. Nitze, Assistant Secretary of Defense for International Security Affairs  
Mr. Arthur Barber, Deputy Assistant Secretary of Defense for International Security Affairs (Arms Control)  
General Maxwell Taylor, U.S.A., Chairman, Joint Chiefs of Staff  
Captain J. Ryan, U.S.N., Office of the Special Assistant for Arms Control, Joint Chiefs of Staff  
Captain Elmo Zumwalt, U.S.N., Office of the Deputy Assistant Secretary of Defense for International Security Affairs (Arms Control)

*Atomic Energy Commission*

Dr. Glenn Seaborg, Chairman  
Dr. Leland J. Haworth, Commissioner  
Dr. George M. Kavanagh, Assistant to the General Manager for Disarmament  
Mr. John S. Kelly, Director, Division of Peaceful Nuclear Explosions

*Central Intelligence Agency*

Mr. John McCone, Director

*USIA*

Mr. Edward R. Murrow, Director

---

<sup>1</sup> Nuclear test ban treaty issues. Secret. 9 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, Committee of Principals, 3/61–11/63.

*Mr. Foster* commented that he had circulated a list of amendments to the draft test ban treaty of March 23 and he gathered that these changes had been generally accepted. There had been one further amendment suggested by Dr. Wiesner to make it clear that additions to the list of manned seismic stations could be made without the unanimous consent of the permanent members. This was acceptable in principle to ACDA and treaty language would be drafted to take care of this point. The only remaining unresolved issue related to the conditions under which nuclear explosions for peaceful uses would be carried out.

*Secretary Rusk* then remarked that the present discussion, he assumed, was based on a continuation of the policy attitude that a test ban treaty was in the interest of the United States. He felt that from time to time the Principals should pause and ask themselves whether there was any change in that underlying premise. The Secretary observed that there was no reason to think that the Soviet Government was trying very hard to get a test ban treaty at the present time. There were perhaps two reasons for this. The first might be related to the recent Soviet decision to step up its nuclear rearmament; the second might relate to Soviet attitudes towards Communist China. Despite this apparent lack of Soviet interest the Secretary presumed that the US should continue to work at getting a satisfactory test ban treaty.

*Secretary McNamara* replied that while the Joint Chiefs of Staff had always had questions about the test ban treaty, especially over the absence of a threshold and the possibility of undetected tests by the Soviet Union, he knew of no evidence which had turned up in the last 90 days which would change the basic US attitude towards a test ban treaty. He continued to think that the risk to the United States without a test ban treaty was greater than with a test ban treaty. The present situation called more for a reassessment of tactics, especially regarding public statements. It was questionable whether it was in the national interest to do as much public talking as we do about the test ban question. The result, he felt, was that Congressional opposition to a test ban treaty was mounting.

*General Taylor* said that the Joint Chiefs of Staff believed that a treaty without a seismic threshold would be unsatisfactory and would not be conducive to the promotion of the national interest. He was not certain whether the President had taken a final decision on these matters and, of course, did not intend to take issue with decisions already made.

Referring to Secretary McNamara's comment about public statements *Mr. Foster* said that he believed that criticism of the Administration's position on a test ban certainly could not go unanswered. As people understood our position better, they were more ready to stand up and be counted in favor of the Administration's efforts to secure a treaty. Referring to General Taylor's mention of the threshold, Mr.

Foster said the advantage of the present treaty was that the Soviets could not know just what the threshold was and would consequently have to be extremely cautious. At the same time, the treaty gave the United States the right of inspecting events of any seismic magnitude. These two factors constituted a powerful deterrent against cheating in the low yield ranges.

*Secretary Rusk* commented that the extent of the public discussion of the test ban issue so far had succeeded in identifying the range of issues which were up for debate. The fight should be made, however, for an agreement which was concrete and not hypothetical. *Mr. McCone* agreed; adding that the number of influential people against a treaty would be fewer if there were a completed instrument before the Senate.

*Secretary Rusk* went on to say that while we should not stop talking about the test ban question, we should stay within the present position we have and not get into the field of conjecture. In some degree, those who were currently opposed to the efforts to secure a test ban treaty took this position because they felt the US had been trying too hard. This was more a criticism of technique than of substance.

*Mr. Foster* then raised the problem of presenting a common Administration viewpoint to the Congress. *Secretary McNamara* agreed that we should not let the record get distorted. *Dr. Wiesner* added that what was needed was testimony from people who could speak from the broad perspective. *Secretary Rusk* agreed with this and noted that the staff level witnesses before Congress were simply not competent to pass judgment on the basic questions of national security which were involved in the test ban issue. He suggested that there was a need for better organization in presenting the Administration's viewpoint. *Mr. Bundy* agreed and said that he would like to meet with a principal counselor from each of the agencies to discuss this problem. This was agreed.

*Dr. Kaysen* noted that part of the problem of presenting the case for a test ban was that there was so much uninformed comment about it. He wondered if it would be possible to get into the public domain a comparison of where the US and USSR stood in their respective nuclear weapons programs. *Mr. McCone* said that this was being examined but that this was naturally an extremely sensitive subject. *Secretary Rusk* also cautioned against the hazard of being dragged into divulging more information than was really necessary or desirable. He concluded that what was really involved in the present discussion was what the President says to Congress about a major problem of policy. Any Executive Branch witness before Congress must in all honesty describe what the problems are and how they are being taken into account. There is an obligation to explain why the course that is being taken is the course of wisdom. But the President could not speak to Congress

through the medium of a debate among people who worked for him. Responsible people would have to go to Congress to present a balanced picture.

Turning to the question of the annex on explosions for peaceful purposes, *Mr. Foster* noted that AEC felt the present provisions of that annex would inhibit the Plowshare program in a very serious way. *Mr. Foster* also noted that the purpose of discussing this subject in the Committee of Principals was not related to any desire to have a draft treaty tabled in the immediate future but was rather related to the need to have an agreed draft which could be used as necessary. The feeling in ACDA, which he understood was shared by Secretary Rusk, was that this was not the time to table a test ban treaty. ACDA felt that the treaty should not be put forward until there was some sign that this would do some good in the negotiations.

*Chairman Seaborg* then reviewed the Plowshare program. He stated that there were two reasons for bringing this matter to the attention of the Principals. First, there were many very useful projects which could be accomplished by the use of nuclear explosions and which could not be accomplished in any other way or only at a much greater expense. There were literally dozens of projects of this nature which had come up in the past few years. The potential of this program had expanded beyond what he had earlier envisaged. Second, it had to be recognized that not very much could be accomplished in the Plowshare program under the present draft treaty annex. The revelation of the designs of nuclear explosive devices would mean that only very obsolete gun-type devices could be used in the program. Consequently, the AEC, on the assumption that the US would want to make progress in the Plowshare program, had examined various possibilities for safeguarding this program from misuse. The idea which appealed most to the AEC was that of an agreement on a limit, say 50 kilotons, on the yield of any Plowshare explosion and on a limit, say five or six or perhaps even three or four, explosions which could be carried out in any one year. The AEC could accept all of the present Annex II except for one sentence which called for both internal and external inspection of devices used in the Plowshare program. In order to conduct a successful Plowshare program it would be necessary to use the most advanced clean devices and these could not be shown to the Soviet Union. We now were within reach of devices which would be suitable for carrying out the wide variety of projects contemplated under the Plowshare program. *Chairman Seaborg* added that he was fully aware of the difficulties inherent in this suggestion; the Soviets obviously could use this as a means of conducting weapons experiments. *Dr. Wiesner* stated that experiments of the kind contemplated almost certainly would contribute to weapons development. Concerning the attitude of Con-

gress towards the AEC plan, *Chairman Seaborg* felt that it would be difficult to obtain a law to permit revelation even of designs of obsolete devices. On the other hand there were many people in Congress who strongly supported the Plowshare program.

As an instance of one of the important projects which the present annex would eliminate, *Chairman Seaborg* mentioned that he had just learned within the hour that a Soviet scientist now visiting on the West Coast had stated that the Soviet Union had conducted an underground nuclear explosion for the purpose of discovering transuranic elements. The chances were extremely high that this would be the means by which the next transuranic elements would be discovered. At the present time, however, our most advanced devices did not yield a high enough neutron flux. This was the kind of experiment which he hoped could be conducted under the Plowshare program. In response to *Secretary Rusk's* request for other examples of the type of projects which would be carried out under this program, *Chairman Seaborg* mentioned the following examples: excavations, extracting oil from oil shales, mining, scientific experiments, a canal through the Isthmus of Panama, a harbor at Point Barrow, a canal across the Aleutian chain, and deepening of the Bering Straits. To develop the devices necessary to do such projects would require some years.

*Mr. Foster* said that he did not wish to pass on the technical points but he wished to note that there would be a problem in selling this idea to Congress and in negotiating it with the Soviet Union. If this program was as good as we thought it was, presumably the Soviet Union would also want to do it and would accept the unanimity provision of the treaty.

*Mr. Nitze* pointed out that signatories other than the three permanent members would also have the right to conduct explosions under this annex. He wondered whether this was in our interest. After some discussion it was agreed that this point would be examined to see whether a barrier to weapons development by Nth countries could be built into the treaty.

*Dr. Wiesner* observed that there was an inconsistency in saying that we would not worry about a few 50 kiloton thermonuclear explosions by the Soviet Union under guise of peaceful uses but that we were concerned about the possibility of undetected small yield underground tests. Moreover, the area of clean devices was the very area where weaponeers would like to test.

In response to a further question by *Secretary Rusk*, *Chairman Seaborg* said that by the time the treaty was signed he was hopeful that there would be advanced devices which could be used in the Plowshare program.

*Dr. Wiesner* thought that despite the attractive program outlined by *Chairman Seaborg* it was probable that we would have to put off

this program in order to get a test ban treaty. *Mr. McCone* said that he felt that the elimination of the latitude we now have in conducting a Plowshare program could be a factor tending to inhibit Senate acceptance of a test ban treaty.

*Mr. Foster* recalled that the provisions in the present annex were essentially the same as those contained in the draft treaty that we had tabled on April 18, 1961. *Secretary Rusk* said that the first question that would be asked of us in an international forum was whether the Plowshare proposal was really a proposal for a weapons development program. *Chairman Seaborg* thought that with the type of safeguards the AEC had in mind this question could be satisfactorily answered. *Mr. McCone* felt that it was not possible to have both a treaty and a Plowshare program. *Secretary McNamara* agreed with this but *Chairman Seaborg* felt this assessment was an overstatement because the type of safeguards proposed by AEC would go some distance towards allaying concern that we were proposing a weapons development program.

*Mr. Nitze* wondered if we could not postpone a decision on this. Should it become necessary to circulate a treaty text at an early date we could include a provision saying that explosions for peaceful purposes could be carried out either (1) with unanimous agreement of permanent parties or (2) in accordance with an annex which could be left for later negotiation. There was a parallel for this in the August 27 draft test ban treaty.

*General Taylor* asked whether deleting the sentence concerning revelation of external and internal design was an obstacle. *Mr. McCone*, *Mr. Bundy*, and *Mr. Foster* agreed that this would be a fatal obstacle in negotiations. *Chairman Seaborg*, however, said that he could not accept the idea that there would be no treaty if we took the route which he was suggesting.

*Secretary Rusk* then inquired whether inspection of surrounding instrumentation would tend to limit weapons development. *Chairman Seaborg* replied that it would. *Secretary Rusk* suggested, then, that we should further examine ways of limiting weapons development by means other than design disclosure, for example, by prohibiting diagnostic instrumentation. *Mr. Foster* agreed to look into this but thought it was like trying to marry the unmarried.

*Secretary Rusk* then commented that while there was surely a risk in a continuation of nuclear testing, there would be even more risk in having no treaty but in lagging in our nuclear weapons development. He hoped that no one was being held back in planning and preparing for nuclear weapons tests by the fact that we were negotiating for a test ban treaty. *Secretary McNamara* thought that more could be done and *Chairman Seaborg* agreed but said that Defense and AEC people were, in his opinion, doing an effective planning job. *Secretary McNamara*

*mar*a thought that weapons effects tests were probably the most important type of test but that not enough energy was being put into this. *Chairman Seaborg* replied that in this connection he felt there might be some value in establishing a weapons effects laboratory.

*Mr. Foster* then noted that at one time we had said that it was impossible to keep weapons laboratories active in the absence of testing but that we were now saying that this could be done. He wondered what the present thinking was on this question. *Chairman Seaborg* thought that a great deal could be done and referred to a memorandum that he had written on this subject.

*Secretary Rusk* said that it should be borne in mind that the Soviet Union is building up its armaments. *Secretary McNamara* thought that this could be consistent with a desire for a test ban treaty. The United States had much more fissionable material than the Soviet Union and the Soviet Union might wish to narrow this gap which of course could be done even without further nuclear testing.

Concerning preparations for further nuclear testing, *Chairman Seaborg* and *Secretary McNamara* agreed that there ought to be a date and a budget set for another nuclear test series. As to the location of an atmospheric series, *Chairman Seaborg* said he wanted it known that the AEC felt Christmas Island was vastly superior to Johnston Island for this purpose. *Mr. Bundy* said it was his impression that the AEC did not want to accept the kind of conditions that we were likely to have to accept if we used Christmas Island. In conclusion *Mr. Foster* said he believed he had secured the information he wanted about keeping laboratories active during a ban on nuclear testing.

---

## 181. Actions Taken at Committee of Principals Meeting, April 17<sup>1</sup>

April 17, 1963

### ACTIONS TAKEN ON AGENDA ITEMS

#### 1. *Explosions for Peaceful Uses*

The Committee decided that Annex II (Explosions for Peaceful Uses) of the draft nuclear test ban treaty of March 23, 1963, should be

---

<sup>1</sup> Decisions made on explosions for peaceful uses and on tabling the draft treaty at Geneva. Secret. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, Committee of Principals, 3/61–11/63.

re-examined to determine whether any means could be found to avoid disclosure of the designs of nuclear devices used in the Plowshare Program. ACDA is undertaking this review in consultation with AEC and other interested agencies.

*2. General discussion of the adequacy of the text and the timing of the tabling of the test ban treaty at Geneva*

The consensus of the meeting was that the text was adequate and that a test ban treaty was still in the national interest of the United States. General Taylor entered a reservation concerning the absence of a seismic threshold in the test ban treaty. It was the consensus that there was no immediate need to table the draft treaty in Geneva in view of the current negotiating situation.

*ADDITIONAL POINTS OF INTEREST*

1. It was agreed that a principal counselor from each of the agencies would meet to discuss the problems concerning presentation of the Administration's position on a test ban before Congressional committees.

2. It was agreed that the treaty would be examined to see whether treaty language could be drafted which would exclude states not now possessing nuclear weapons from detonating nuclear weapons under the guise of a Plowshare program.

3. Secretary Rusk expressed the hope that the United States was not being held back in its planning and preparations for future nuclear weapons tests by the fact that negotiations for a nuclear test ban treaty were underway.

4. Secretary McNamara and Chairman Seaborg agreed that weapons effects tests required emphasis in planning for future nuclear test explosions; Chairman Seaborg thought there might be some value in establishing a weapons effects laboratory. Chairman Seaborg and Secretary McNamara agreed that it would be helpful to establish a budget and a date for a future atmospheric nuclear test series.

5. Chairman Seaborg stated that AEC felt that Christmas Island was vastly superior to Johnston Island as a site for nuclear test operations in the Pacific.

6. In response to Mr. Foster's question about keeping weapons laboratories active during a test ban, Chairman Seaborg thought that a great deal could be done and referred to a memorandum which he had written on this subject.

SUBJECT

(U) Report of the Foreign Weapons Evaluation Group

1. Attached is copy number 32 of the 15 February 1963 Report of the Foreign Weapons Evaluation Group, also referred to as the Bethe Panel Report. Initial instructions on the handling of this type of report were issued by the White House in National Security Action Memorandum No. 193, dated 3 October 1962. This memorandum is attached and should remain an integral part of the Bethe Panel Report. Attached also is a copy of Memorandum for All Holders of the Foreign Weapons Evaluation Group Report of 14 and 15 February, dated 8 March 1963.

2. The sensitivity of the data contained herein is emphasized. Previous instructions pertaining to the handling of Bethe Panel Reports apply. Accordingly, it is requested that a record be maintained of all persons having access to the report, or the information therein, and that access be on a strict need-to-know basis.

<sup>1</sup> Report of the Foreign Weapons Evaluation Group. Two attachments provide a copy of the February 15 report and an amendment to the report, dated March 8. Top Secret. 11 pp. Washington National Records Center, RG 330, OSD/OATSD (AE) Files: FRC 69 A 2243, 99 USP, USSR Weapons Evaluation (Bethe).

pairs of shots were conducted within a half-hour of each other. On the last day (25 December) two tests were conducted only 6 minutes apart, and on 23 December there were three in a half-hour period. The first two of these were only two minutes apart, and although some fresh debris was collected, it was impossible to separate the debris or the acoustic signals from these near simultaneous events so that of these, it is merely known that the total yield was probably not more than a few tens of KT. In addition, several of the tests of this late December group were less than 100 KT; that is to say, in the low yield group that the Soviets have usually conducted near their site at Semipalatinsk. One of the December tests, JOE 178, would appear to have been a dud; at least the yield was rather small and there is [text not declassified]. Some of the other small yield shots may be of this nature but they have not been examined as yet.

Altogether, the late series added 5 tests less than 100 KT, 2 between 100 and 1000 KT, 2 between 1 and 2 MT, 1 about 6 MT, and 1 at 26 MT. The totals for the 1962 series from August to December are consequently: 66 tests of which 35 were less than 100 KT, 11 between 100 and 1000 KT, 14 between 1000 and 10,000 KT, and 6 larger than 10,000 KT. (This may be compared with the Soviet series of 1961 which consisted of 44 tests, with 24 small yields, 6 thermonuclears between 100 and 1000 KT, 12 between 1000 and 10,000, and 2 larger than 10,000 KT.)

The report of 7 December was concerned only with the Soviet tests above a megaton. The present report is mainly concerned with the devices of intermediate yield (100 to ~1000 KT), although reference is made to the two larger devices of the December series. It has not yet been possible to complete the analysis of the large group (35 tests) of lower yield devices.

The devices considered here are, consequently, [text not declassified] suitable therefore for tactical or short-range applications or possibly for use with light missiles or conceivably multiple warheads. As discussed in earlier reports, nothing can be said on the basis of evidence available as to the specific nature of the applications the Soviets may have in mind for these devices. It may be noted that in 1962 the Soviets considerably increased their attention to devices in this intermediate range, although they have not yet given it the concentrated attention that we have directed to this class of device.

The report is divided into several sections: II. on the devices between 500 and 1200 KT, III. on those around 200 KT, IV. on the large yields fired in December, and V. on the general topic of developments

in the basis of analysis of the performance of Soviet thermonuclear devices.

## II. YIELDS FROM 400 TO 1200 KT

In this yield range considerable progress was observed. There was some progress in thermonuclear technology, and the Soviets tested [text not declassified].

[text not declassified]

[text not declassified]

## III. TESTS AROUND 200 KT

In the fall 1962 series four Soviet nuclear explosions were detected that had measured yields in the neighborhood of 200 KT. These were JOEs 139, 167, 176, and 177. The radiochemistry of these shots resembles most closely the earlier Soviet shots JOE 63 and JOE 72 (in 1958) and JOE 115 (in 1961), [text not declassified].

## IV. HIGH-YIELD DEVICES IN THE DECEMBER SERIES

### a. 26 MT, Possibly 13 MT (JOE 184)

1. This device is compared with other Soviet shots in the 13–30 MT range (JOEs 106, 144, 147, 148, and 156). [text not declassified]

2. [text not declassified]

3. [text not declassified]

### b. 6 MT Test (JOE 186)

This device appears as a follow-on to the Soviet tests JOEs 96, 97, 112, 136, and 137. [text not declassified]

## V. THERMONUCLEAR FUEL EFFICIENCY AND FISSION-FUSION SPLIT

In the past, estimates of thermonuclear fuel efficiencies have been based largely on the ratios of heavy element products. The amount of Be-7 (made by deuterons reacting with Li-6) has been used in conjunction with the estimated fuel efficiency to infer the fission-fusion split. [text not declassified] attention has been given recently to the amount of Li-6 found in the debris as a supplementary measure of efficiency.

In addition the relationship “Be-7 per thermonuclear reaction” vs. efficiency has been reviewed both theoretically and experimentally (based on data from US tests) and some changes have been made in the interpretation of this measurement. [text not declassified]

[text not declassified] The newly available Li-6 data constitute a useful additional criterion of thermonuclear fuel efficiency. A more thorough review of these changes is planned and the results will be incorporated in later evaluations.

VI. SENSITIVITY OF THE REPORT

We have been enjoined by a Presidential memorandum to caution each person having access to the report that it contains particularly sensitive information and is to be protected accordingly.

**183. Telegram 2720 from Moscow, April 24<sup>1</sup>**

Moscow, April 24, 1963

Khrushchev was not unfriendly, but relatively subdued throughout conversation, only infrequently displaying characteristic animation.

---

<sup>1</sup> Meeting with Khrushchev: agriculture, Kennedy-Macmillan letters, issues related to securing a nuclear test ban agreement. Secret. 10 pp. Department of State, Central Files, POL UK-USSR.

We began with mention of his recent vacation, in response to which he embarked on disquisition about this being a good year for Soviet agriculture, although spring had come so late. Referring to “nonsense” written in Western press about “crisis” in Soviet agriculture, he said, among other things, that Soviets would develop their agriculture as they had their industry. He paid tribute in familiar terms to highly capitalized US agriculture and said Soviets were making large investments in livestock-raising, chemical-fertilizer and herbicide production.

When Kohler noted resemblances between rural Ohio of his boyhood and contemporary Soviet agriculture, particularly difficulty of getting farmers to use modern methods, Khrushchev said this was one of their principal difficulties, because they were trying to accomplish it on “democratic” basis and had to convince peasants. He added they were satisfied and that process was going well. He also referred to difficulties Soviets saw in prospect having to reduce sown area as productivity rises and to plans for increased livestock-raising in north-western USSR. Khrushchev then asked what there was to discuss other than agriculture.

Kohler replied that President and Prime Minister had given to Ambassadors identical instructions and identical letters which they wanted to have handed to Khrushchev personally in order to emphasize their personal interest in trying to find a way to enter into serious negotiations directed toward nuclear test-ban agreement.

Trevelyan added Prime Minister had asked him to say that this was not a propaganda effort, but a genuine attempt to find a way to break the deadlock at Geneva. PriMin thought this approach was the best way to emphasize his seriousness and to find a way to solve at least one important East-West problem. The letter contained practical proposals designed to accomplish this.

Khrushchev thanked the Ambassadors and said Soviets would study letter. However, he had lost hope of reaching agreement on this question. He had concluded that US and UK were playing with Soviets. When he sent President his letter agreeing to two to three inspections, he was sure that matter was solved. But then Soviets were given cold shower. In *Giorno* interview, he had said Soviets were thinking about withdrawing their offer of two to three inspections. It had turned out that this offer was not enough for Western partners, who insisted on enlarging upon it in such fashion as to give them opportunity for spying on Soviet territory. He could not permit this. Soviets are ready to sign agreement based on national means, which are sufficient.

Khrushchev then asked how many inspections we offered in letter, and whether we accepted Soviet offer of three. He demanded to know what sort of fool he should be if he were to permit espionage organizations to enter Soviet Union. Gromyko told him on side letter did not accept three, but mentioned seven.

Trevelyan said letter did not set out specific number, but rather represented attempt to find best possible procedure to solve problem.

Khrushchev said it was not a matter of procedure. When Soviets offered inspection, West wanted to expand upon this and deploy inspectors so as to encompass half the USSR. Soviets had offered three inspections as symbolic inspections and not ones of substance. Then West would want to fly around country, and go wherever it pleased. But Soviets are masters of their own land and these are things only they can do. There was a lack of seriousness in such an approach.

Trevelyan repeated this was a very serious approach.

Sukhodrev then began translating Macmillan-Khrushchev letter. When he reached words "than annual quota would permit", Khrushchev said, "we won't agree to that". Sukhodrev continued translating. When he reached words "disposed of", Khrushchev said, "then there will be no agreement".

When Sukhodrev had finished, Kohler explained that, by very senior envoys, President had in mind either special envoys or the Secretary and Lord Home.

Trevelyan said British were ready for either variant.

Khrushchev said he had stated more than once that Soviets wanted agreement very much. But on these conditions, there could be no agreement. Soviets could not agree to such conditions. They did not want to have their representatives on our territory and did not want Western representatives on their territory. He was cursing himself, because it had been his initiative to make offer of three inspections "and that had ruined everything". Initially, they had believed national means alone were enough. Then the scientists began to talk about two to three automatic stations. It was on this basis that he had approached President. "I made a fool of myself". Soviets could not agree. It had been a mistake to offer two to three inspections as symbols. West had then built upon this in such a way that McCone could have his representatives on Soviet territory. He could not make such proposals to USSR Government; let him make them to his wife if he liked (this clause was not translated). Soviets are masters of their country and will not let anyone crawl around in it. National means were sufficient. West knew whenever Soviets conducted tests whether they were in atmosphere, above ground, or underground. Underground testing was very expensive and Americans could do it if they wanted to. Soviets had only done one, to show Americans could detect it.

(During translation, Kohler interjected to say that this was one good reason for concluding agreement; tests were indeed very expensive.)

Khrushchev continued that, if their military and scientists proposed atmospheric tests, they would allow them to make them. Such tests

were cheaper. But Soviets were not now testing and would sign an agreement that they would not test. Why wouldn't West believe them? They were honest people. But Soviets would not agree under conditions we had set. He was ready enough to meet President and PriMin. There might be some use in that, but there would be no agreement on nuclear-testing on these terms.

Kohler said he hoped Khrushchev would give further consideration to proposal. He would see that a serious method of proceeding was proposed here. We wanted to find ways to do this privately in order to reach agreement on this subject. He and Trevelyan were not experts to discuss substantive issues here, but they hoped that people with a high degree of knowledge in these matters could discuss it.

Trevelyan said he wished to support Kohler's statement. These letters represented real, serious and honest attempts to find agreement. We must find a way out of the deadlock and consequently hoped that serious study would be given to this proposal.

Khrushchev said that he would carefully study the document and there would be a reply in due course, but he could not pretend that he had not understood the essence of it and he saw no possibility of giving the answer we expected. He had been negotiating with the West for nearly eleven years, ever since Stalin died. He had met with President Eisenhower, with Dr. Adenauer, with PriMin Macmillan, President Kennedy, and President DeGaulle. Where had it all led? The West did not want serious talks. It did not want to talk seriously about Europe. He asked, who was interested in maintaining the state of war with Germany, and answered, only the revanchists; the West was being led by the nose by West Germany. The real crux was not nuclear tests but the German question. The German question was the knot, which, if it could be cut, could improve everything. He asked what did the British, French or Americans want in West Berlin, and said that they were there in the interests of West Germany; not the German people, but Adenauer, who wanted to heighten tension. He said the Soviet Union would be patient but he did not know what it would lead to. The West must understand the danger.

Khrushchev said that this (i.e., nuclear tests) was not the important issue. It had no significance in reducing tension or limiting armaments. It was simply a humane or moral question. He said that the Soviet Union wanted an agreement on nuclear tests but the West wanted him to permit them to send their spies into his country. "We won't let you", he said that he had the impression that the West was not yet conscious of the need for agreement and did not really want one. He said that all this correspondence (indicating the messages) was motivated by some domestic reason. We had exchanged opinions thousands of times without result. Did they want him to bring out the old Soviet docu-

ments, write them out again and send them as his answer? He said there was nothing new in the documents. The only new thing was proposal for meeting of senior representatives or foreign ministers, but this was not new either; they had met before. He said he would not agree to inspections, he would not put agreement at the expense of his country's interests. There should be equal rights on both sides. No right of inspection for the Soviet Union in the West and no right of inspection for the West in the Soviet Union.

Kohler said that he did not want to deflect attention from the problem but wished to remind Chairman that President and Prime Minister had made this approach with serious intentions. It was true that problem had been discussed for many hundreds of hours but in that time, as President had said, considerable progress had been made. Positions had moved closer and were now very close. President believed that an agreement would have considerable effect as first step towards increasing trust and reducing tension. Also from a practical point of view, there were perhaps ten to twenty countries capable of developing in the near future their own nuclear capabilities and they would do so if they were not confronted with a nuclear test ban agreement. United States also approached the question of Germany with full seriousness. Both sides had same interest in peace and security in Europe; they differed on methods of achieving it. President's desire for agreement is genuine. He hoped Khrushchev would consider it seriously. Messages contained a number of new things: question of procedure and pooling of inspection quotas over a number of years. President and PriMin would like to have benefit of Khrushchev's views.

Khrushchev interjected to say that the quota proposal made it worse, it was going further away from a solution. "We reject it."

Kohler said that President proceeded from principle of full equality on both sides, as he had said to Mr. Khrushchev at Vienna.

President would not expect Soviet Union to do anything which he was not prepared for United States to do.

Trevelyan said that West was making serious attempt to reach an accord. Their proposals were made not because of domestic considerations but in hope of reaching accord and of proceeding subsequently to other accords.

Khrushchev said that he could only repeat that they would study document and give a reply. Soviet Union would like an agreement but not on these conditions; it could only agree on the basis of no inspections. It would be discussed in the government whether to renounce or retain the offer of two to three inspections, but if they did keep their word on this, they would not go a mite further. He asked that this be conveyed to the President and Prime Minister both of whom he held in high regard. He said that he saw no possibility of further concessions,

which would be concessions to Goldwater and the “madmen”. (During translation Kohler interjected, “I can assure you President is in charge”. Khrushchev replied, “I don’t doubt it”). Khrushchev said most Soviets could do would be to keep to the offer of two to three inspections; personally he thought they should take it back as the Americans had done. He said an agreement would not restrain other countries from making tests; perhaps it might be a very small restraining factor. It would not restrict the Soviet Union in the arms race. Disarmament was needed to do that. They no longer needed tests to develop nuclear weapons; Soviet scientists and military men were not putting forward any claims. As for other countries, they would say you tell us we must not make tests when you have already accumulated a supply of nuclear weapons, and Soviets would have no answer. A disarmament agreement on other hand would solve whole problem. It was probably time to stop the disarmament talks which had been going on for two years. Tsarapkin scratched about and there were no results; he was not justifying his expenses. If there was no basis for agreement, there was nothing to be done. They must submit to fate.

Kohler said that the Ambassadors appreciated time Chairman had given them. They would faithfully convey what Khrushchev had said to the President and Prime Minister. He had hoped Chairman’s response would be more positive and forthcoming. He hoped that after further consideration of the proposals, it still would be. Perhaps after a second look, a more encouraging answer could be made.

Trevelyan said he would still ask Khrushchev to approach proposal in a positive way.

Khrushchev said he could not give any encouragement. The document was politely phrased but contained nothing positive. He said he would reply after careful study of the document but unfortunately there was no basis for assuring Ambassadors anything could come out of it on these conditions. Perhaps Representatives or Foreign Ministers would meet, but if they had instructions based on these conditions there was no reason to believe they would reach agreement.

Kohler said US and UK had no intention of publishing the letters nor even of saying they had been delivered. He then presented a draft statement to be made to the press, simply indicating Khrushchev had received Ambassadors at their request, naming other participants, and saying: “Questions related to banning of nuclear weapons tests were discussed.”

Khrushchev agreed and said Soviets would follow the same line. Dept repeat as desired.

**Kohler**

**184. Telegram 2727 from Moscow, April 25<sup>1</sup>**

Moscow, April 25, 1963

Reftel represents record our conversation with Khrushchev as agreed between Davies and Murrell and approved by me.

Trevelyan, who was unable review record last night, has asked that following changes be made.

(1) Para eleven, last sentence to begin: "Well, Soviet Government could take back," etc.

(2) Para 18, sixth sentence, delete "initially" and "had," so sentence will read: "They believed national means alone were enough."

(3) Para 30, delete from second sentence: "It could only agree on the basis of no inspections."

I have accepted changes (1) and (2). Trevelyan is aware my intention inform Dept that he is making change (3), but that, since our notes show Khrushchev made this statement, I prefer let it stand in our version of record.

**Kohler**

May 1963

185. Memorandum from Kaysen to President Kennedy, May 20<sup>1</sup>

May 20, 1963

Mr. President:

Attached is a background paper on the high yield nuclear weapon situation for your 11 o'clock meeting tomorrow. The DoD would like to go ahead with the development decision. AEC has so far been cool. Note that if developed for B-52 delivery, which is what the DoD recommends, the weapons would be available by about 1967.

C.K.

**Attachment**

*HIGH YIELD NUCLEAR WEAPONS (50–100 MT)*

*BACKGROUND PAPER*

The United States, both within the DOD and the AEC, has been considering large yield weapons for at least ten years, but because of the anticipated large size and weight the early delivery concepts were based on the use of ships for delivery to or near harbors, for detonation at sea in deep water to generate tidal waves or large areas of fall-out. With further development of nuclear warheads and improvement of understanding of relevant nuclear effects, other possible approaches have emerged.

During the Eisenhower administration plans for development of [text not declassified] were considered and the decision made not to pursue development of weapons with higher yields [text not declassified]. At that time the objective was to provide for a large yield bomb to be delivered from high altitude. Subsequently because of the improvements in Soviet defenses against high flying aircraft, it became necessary to develop [text not declassified]. The JCS quotes a penetration probability of the Soviet Union [text not declassified].

---

<sup>1</sup> Provides background information on the high yield nuclear weapon situation and general Defense and ACDA views. The attached background paper discusses feasibility of U.S. developing large yield weapons based on new technology. Top Secret. 6 pp. Kennedy Library, National Security Files, Kaysen Series, High Yield.

The JCS, in reviewing the value of a large laydown bomb, have concluded that a valid military requirement exists for a limited number of very high yield weapons. The rationale being that the numbers and hardness of Soviet targets are increasing, that gains are to be made against imprecisely located targets, and finally that psychological and political advantages would accrue. As a consequence of these considerations, the JCS have recommended that we proceed immediately with the development of [text not declassified] compatible [text not declassified]. On 6 March 1963, the Deputy Secretary of Defense, in a letter to the Chairman of the AEC stated a DOD tentative decision (subject to Presidential approval) to proceed with the development of such a bomb and inquired as to maximum yield, time to stockpile, and costs of development and production under the assumption of no nuclear tests.

[text not declassified]

An improved bomb based on new concepts and atmospheric tests could be provided perhaps a year or two later. The costs would be greater perhaps by \$20–\$30 million than indicated above because of the additional costs of nuclear tests but the yield might be doubled.

The expected effects of [text not declassified] can be summarized as follows:

#### *Crater Dimensions*

Radius—[text not declassified]

Depth—[text not declassified]

#### *Expected Areas of Severe Damage*

Industrial Urban Complex (6 psi)—[text not declassified]

Hard Targets

300 psi—[text not declassified]

3500 psi—[text not declassified]

#### *Fallout Area*

Area to at least 2000 roentgens integrated dose (500 roentgens is median lethal dose) would be [text not declassified].

#### *Electromagnetic Effects*

Unknown.

In addition to the possible development of large yield bombs the relevance of very large yield warheads for missiles has been studied. In this case, the controlling factors are the available payloads in the present and projected military booster program. [text not declassified]

Because of the great problems posed for defensive systems to discriminate between decoys and the warhead at altitudes above the re-

entry altitude, thought has been devoted to the value of exploding sufficiently large warheads prior to re-entry. [text not declassified] Therefore, we have concluded that unless a larger booster is programmed, large warheads for missiles do not require development.

In the event it is decided to proceed with any very high yield development, with or without test, it must be recognized that a development program of this scope will not escape public attention. The development of [text not declassified] is likely to become known. Inherent in the preparations for testing very high yield devices are certain actions that are being taken now that might reveal our interest in very high yield weapons. For example, [text not declassified] These activities, either collectively or independently, may result in public disclosure of our development interest in very high yield weapons.

However, there is need for the AEC to develop the necessary high yield technology to provide the inputs required in the decision-making process with respect to booster characteristics. In addition, the effects of such large explosions require further evaluation. The AEC should be encouraged to continue the development of concepts appropriate to these objectives and, as nuclear testing policy permits, test them. In addition, the DOD will continue experimental and theoretical work on the effects.

**186. Notes on Telephone Conversation between Rusk and Kaysen, June 9<sup>1</sup>**

June 9, 1963

Sec. said text on page 10 is different from the quoted section in the telegram (draft of President's American University speech). K. said he noticed and can change it to make it conform exactly. Sec. said the language that went to Moscow leaves wide open these three might be doing it personally. K. thinks it better to send text to Kohler and use "representatives re high level discussions." Sec. said OK. Sec. said on matter re who does it—Harriman will be back in the morning, however, one or two of Sec's colleagues question whether Harriman is the one to do it especially in view of follow-up and we don't want to get ourselves pinned to a name at the moment. K. said Pres. was very eager to say somebody yet it is clear from text that they have come off from a name. The only problem might be in seeking Russian agreement we may be pressed for a name. Sec. said he doubts they will stick on that. Sec. said in sending message to Kohler remind him that no flat and final commitment can yet be made on name.

**187. Memorandum of Decisions, June 19<sup>1</sup>**

June 19, 1963

MEMORANDUM OF DECISIONS AT THE MEETING ON TEST  
PREPARATIONS, ETC., ON JUNE 18, 1963

1. Discussed the President's wish, expressed to Chairman Seaborg, that he did not want any activities undertaken prior to, or during, the

---

<sup>1</sup> Decisions made at test preparations meeting, June 18: yield size; Plowshare announcement; overseas atmospheric tests; improvements at Johnson Island; and site preparation for an upcoming nuclear test. Secret. 2 pp. Kennedy Library, National Security Files, Subjects Series, Nuclear Weapons Testing, 1/63-7/63.

forthcoming talks in Moscow in July, the disclosure of which would prejudice the possible success of those negotiations or adversely affect the posture of the United States. Agreed that the President's injunction extended to certain other activities in addition to the test preparations and that such activities should also be reviewed.

2. Noted that certain underground events now scheduled to take place before September 1 are of a size and type that would probably draw the attention of and probably cause a reaction by the Soviets.

3. Tentatively agreed that no event with an estimated yield of 50 KT or over should be scheduled prior to September 1. The Atomic Energy Commission will immediately review the impact of this decision on the laboratories and report to the White House what problems this decision would raise.

4. Agreed that the proposed pre-event and post-event PLOW-SHARE announcements now pending with the Press Secretary should not be issued. The regular routine short-form announcement will be issued by the AEC following the event.

5. Reviewed the memorandum for Chairman Seaborg, dated June 13, 1963, prepared by the AEC General Manager, on the subject of "Overseas Atmospheric Test Preparations," and agreed that, by careful management, the scheduled work as set forth in the memorandum can continue with only a small increase in the present low-noise level through July, and that no real problem is anticipated until late August.

6. Agreed that the naval airport improvement program provided an adequate cover story for the improvements at Johnston Island.

7. Agreed that the site preparation for the SCHOONER event could go ahead without causing any difficulty even though the SCHOONER event itself has not been authorized.

8. Noted that the major event tentatively planned to take place in Alaska is under restraint and that this matter is under review in the Department of Defense pending the development of a recommendation for the White House. Meanwhile, appropriate personnel of the AEC, the Interior Department and the Army Corps of Engineers should be notified that no approval exists for this event and there should be no public discussion of or field preparations for this event.

9. Discussed the problem of getting a tentative decision on the 1965 weapons stockpile and agreed that a meeting should be held this week in an effort to reach a procedural solution.

*PRESENT:*

McGeorge Bundy, Special Assistant to the President for National Security Affairs

Carl Kaysen, Deputy Special Assistant to the President for National Security Affairs

Glenn T. Seaborg, Chairman, Atomic Energy Commission  
Gen. A.P. Luedecke, General Manager, Atomic Energy Commission  
Gerald Johnson, Assistant to the Secretary of Defense (Atomic Energy)  
Spurgeon Keeny, Office of Science and Technology  
Charles E. Johnson, National Security Council

**188. Message from President Kennedy to Macmillan, June 21<sup>1</sup>**

June 21, 1963

You will have heard that we have evidence of a second suspicious event in the Semipalatinsk area. While our people are still reviewing the evidence, it is hard to avoid the conclusion that we face an increasingly high probability that Khrushchev has ordered low-yield atmospheric tests. This probability faces us with a problem in preparing for the Hailsham-Harriman mission, and I would value your comments. If further studies or further evidence confirm the present probability, it will be hard for us to avoid a public statement, and indeed our hand may be forced at any time by leaks. Moreover, there is a question whether we should not say something to the Russians on this matter. We might look quite foolish if we should send Hailsham and Harriman without any public statement or private communication on these matters, in the light of these probabilities.

In a most tentative way, two possibilities have been suggested here: the first is that we might put out a quite low temperature statement in which we might tacitly accept possible tests at these low yields as parallel in a measure to our own underground testing. The second is that we might equally quietly suggest to Khrushchev that if he would agree to defer these events, we could make a similar arrangement with underground testing for a limited period. The first alternative has the disadvantage of seeming to sanction atmospheric testing. The disadvantage of the second is that it implies something like the old unpoliced moratorium, which is discredited here. I have not made up my own

---

<sup>1</sup> Notes second suspicious event in Semipalatinsk area and invites Macmillan's comments on Hailsham-Harriman mission. Top Secret. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Test Ban Correspondence, 3/63-6/63.

mind between these courses, and I am hoping that some better idea may emerge.

Meanwhile, we shall be discussing this question Saturday morning here before my departure, and if you have any suggestions I should be very grateful if I might have them before three o'clock your time.

---

**189. Message from Macmillan to President Kennedy, June 22<sup>1</sup>**

June 22, 1963

Message begins

Thank you for your message about the further suspicious in the Semipalatinsk area. Our experts will not be able to complete their examination of the evidence till Monday, but we must clearly reckon with the possibility that the Russians may be conducting a series of low-yield atmospheric tests.

As you say, our hand may be forced by leaks. I doubt whether the Soviet Government will make a statement. I think it is unlikely that anything will slip out here and I trust you may be able to control what gets out with you, although I know the difficulties. If we fail to control the leaks we may then have to make a statement in advance of the Harriman-Hailsham mission. If so, I regard it as very important that it should be in the nature of a reaction to whatever leak there is, and should keep the temperature down. We might for example say that "signals had been registered consistent with the possibility of low-yield atmospheric tests. This possibility only increased the importance of a test ban agreement and of the Harriman-Hailsham talks."

I hope however that we can avoid even such a mild statement so near the Moscow meeting.

I am also not sure of the wisdom of a special private message to Khrushchev, in advance of the talks. If, as I sense, he is wavering it might push him in the wrong direction. If, however, we regard the evidence for low-yield atmospheric tests as absolutely certain, I would not object to a message telling Khrushchev that we know of these tests, that we are for the time being keeping our information to ourselves,

---

<sup>1</sup> Provides comments on possible Soviet testing, damage control if suspicious events leaked, wisdom of a private message to Khrushchev, and Hailsham-Harriman mission. Top Secret. 3 p. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Test Ban Correspondence, 3/63-6/63.

and that we regard it as important that, until the talks in Moscow have taken place, neither side should conduct any tests in any environment. If we are to do this, I think that we must be very sure indeed of our grounds.

Another possibility, which I am inclined to favour, would be for Harriman and Hailsham to bring up the subject themselves not necessarily at the beginning of their discussions but at a suitable later point. They would of course make it clear that a comprehensive or partial ban would have to cover low-yield atmospheric tests, and, if negotiations looked like resulting in an agreement on the present line, it would be as well for the Russians to know that we have picked up records of events that could be suspected of being small atmospheric explosions. If on the other hand there does not seem any chance of a full-scale agreement, which I would much deplore, and we have to concentrate on a partial arrangement it is just possible that we could try to bargain a limited moratorium on underground tests against a similar moratorium on minor atmospheric tests below a certain threshold. But this needs more thought and discussion before we get into such a complicated field.

It seems to me that the important thing now is to hold the position until the negotiation begins.

# 190. Memorandum of Conversation, June 24, between President Kennedy and German Chancellor Adenauer<sup>1</sup>

#### *Germany*

Chancellor Konrad Adenauer  
 Vice Chancellor Ludwig Erhard  
 Foreign Minister Gerhard Schroeder  
 Defense Minister Kai-Uwo von Hassel  
 Ambassador Karl Heinrich Knappstein  
 State Secretary Carstons  
 State Secretary Globko  
 State Secretary von Hase  
 Counselor Weber (interpreter)

### SUBJECT

Forthcoming Test Ban Negotiations

The President said he would like to say a word or two about the test ban negotiations to be held in Moscow next month. He was not too optimistic that any great results would come from these talks. Recent discussions on the subject with the Soviets had been quite negative of results. This lack of optimism was shared by Governor Harriman and Lord Hailsham. Nevertheless, we wished to have the responsibility for a failure of these talks placed on the Soviets rather than on ourselves. As concerned the number of inspections, Kusnetsov had received the impression somehow from Arthur Dean that we would be prepared to accept a total of three inspections a year. This appeared to be some misunderstanding on the Soviets' part, possibly owing to language difficulties. In any case, Khrushchev was now offended and had apparently withdrawn his offer of three inspections. The President said that he felt the real problem for Khrushchev was the attitude of the Chinese Communists and the Soviet inability to bring them along on a test ban. We might be faced with a new situation if the Chinese exploded a nuclear bomb in the next year or so. Meanwhile, an effort must be made in this field and we would do our best.

<sup>1</sup> Forthcoming test ban negotiations in Moscow. Secret. 2 pp. Department of State, Central Files, POL 7 US/Kennedy.

The Chancellor said he considered the President's thinking on this to be correct.

The President added that there was a possibility the Soviets might be getting ready to test again; we had received some indications to this effect. But even if they did so, there were technical reasons why we would not wish to conduct further tests at this time. (After the translation, the Secretary said it should be made clear that from the technical standpoint we were perfectly capable of conducting further tests but there were "technical reasons" why we would not do so at this time.)

Mr. Louis Marengo, Assistant to the Deputy Director

*USIA*

Mr. Donald M. Wilson, Acting Director

*NASA*

Mr. John A. Johnson, General Counsel

*Secretary Rusk* opened the meeting by asking Mr. Foster to summarize the developments leading to the proposals under consideration and the content of the proposals. *Mr. Foster* began by pointing out first that the proposals were in response to NSAM 239. He reviewed the history of the Russian position on reductions in strategic delivery vehicles, pointing out that the Gromyko proposals of last fall did represent a substantial change and that we had been at every opportunity since attempting to get them to elaborate on the Gromyko proposal and that there had been some elaboration in a recent Co-chairmen's meeting in Geneva.

*Mr. Foster* then pointed out that the purpose of today's meeting was in his opinion not to get an agreement on either of the two proposals under consideration but rather to determine whether there was any virtue in pursuing either one of these further. In addition, he felt it appropriate that an attempt be made to decide what sort of guidance Mr. Harriman should have for the Moscow meeting with respect to the Gromyko proposals and the question of reductions in strategic delivery vehicles. *Mr. Foster* then outlined the main features of the Separable First-Stage proposal, and followed this with a brief outline of the Gradual Approach.

*Secretary Rusk* then asked Secretary McNamara if he had studied the proposals and if he had any comments. *Secretary McNamara* replied that they had had some consideration in the DOD but he had not had an opportunity personally to study them in great detail. He strongly favored the Gradual Approach. He felt that the proposal for 50 to 75% reductions had several disadvantages. First, it reduced the credibility of the West's nuclear deterrent and this would especially be the view of our NATO Allies. While he did not share their views regarding the role of strategic forces as a deterrent in all respects, he did agree that these proposals would be undesirable in that there would be a reduction in credibility. Secondly, Secretary McNamara felt that the proposals would result in a wasting of the West's superior nuclear power without our getting any substantial compensating reductions in Soviet superior

conventional strength. Thirdly, he felt that the inspection provisions, particularly those for a 50% reduction, were inadequate to give us the protection we require. Fourthly, he saw no advantage as compared with our presently tabled proposal. In particular, he did not see that there would be any reduction in risk of war as a result of the proposals, and suggested that in fact the risk might increase and that the slight reduction in damage that would result from implementing the proposals would not compensate for the increased risk. He reiterated that he leans strongly toward the Gradual Approach, and favored some confidence building measures such as the recently negotiated "hot-line" agreement.

*Secretary Rusk* then queried Mr. McCone on the reliability of our intelligence. *Mr. McCone* expressed concern about relying on intelligence as a substitute for agreed inspection. He was particularly concerned about the 50% reduction proposal. He then reviewed the intelligence techniques that might be relevant in the event of implementation of such proposals, and concluded by pointing out that they were inadequate to provide sufficiently accurate knowledge of retained levels of armaments. He added that we presently know nothing of Soviet missile reload capability and little about missile manufacturing facilities. He pointed out further that existing intelligence techniques may be perishable and that in addition they can be deceived. *Mr. McCone* then pointed out that there were certain to be differences in the Soviet declarations of their forces and in our estimates of them and that the resolution of these differences would require some compromise of our methods. He added that public and congressional pressure can also lead to an undesirable compromise of methods. Finally, he pointed out that we could certainly not do as well intelligence-wise as we had in Cuba and that we were uneasy about our knowledge of armaments there. In summary, he felt that we must have an acceptable means of verifying retained levels.

*Secretary Rusk* asked if Mr. McCone's remarks applied specifically to big missiles and *Mr. McCone* replied in the affirmative. *Secretary Rusk* then asked if there was any evidence of camouflage by the Soviets. *Mr. McCone* replied there was not, though he cited a conversation with Khrushchev in 1959 wherein Khrushchev claimed that we could not know the numbers of their missiles because they could successfully hide them in canyons. *Secretary Rusk* then asked Mr. McCone if there had been any hints from defectors and *Mr. McCone* replied in the negative.

*Secretary Rusk* then asked for General Taylor's comments regarding the proposals. *General Taylor* stated that he concurred with Secretary McNamara and had nothing to add. *Mr. McCone* said he also concurred with Secretary McNamara.

*Secretary Rusk* then asked for Dr. Wiesner's views. *Dr. Wiesner* said that he saw no reason for abandoning our present treaty and making drastic proposals without evidence of Soviet interests. He suggested, however, that our intelligence capabilities had changed and that he thought it might be possible for us to modify the inspection provisions of our present Treaty Outline. He also pointed out that we now felt that differences of plus or minus 15% in the number of missiles either side might have been not very significant. Regarding the question of verification of remainders, he agreed with Mr. McCone in the case of very deep reductions but felt that 30% and possibly 50% reductions might be safe relying only on inspection of factories and of the weapons destroyed. Because of uncertainties regarding the numbers of missiles, he indicated a preference for discussing reductions in terms of absolute numbers rather than percentages. He concluded by remarking that he thought it would be desirable if Mr. Harriman could explore with the Russians general disarmament measures in addition to a test ban.

*Secretary Rusk* then asked Dr. Seaborg for his views. *Dr. Seaborg* replied that he had nothing to add. *Secretary Rusk* then asked about the report he had read to the effect that we were considering cutting our fissionable material production program by \$1 billion. *Secretary McNamara* replied that the DOD had been examining their needs for fissionable materials, but that the examination was not completed and the news reports were premature. He believed that we are reaching a point where we can stabilize weapons' requirements, and that one of the plans they were considering would lead to a cut in the AEC production of materials for weapons by a factor of two. He said that he would like to discuss this with Dr. Seaborg, who agreed to do so. *Secretary McNamara* then said that it was likely there would be some kind of reduction, and that he had received a paper from the Chiefs on that subject.

*Secretary Rusk* then suggested the possibility of our continuing discussions with the Russians not on the basis of specific agreements, but rather on a basis of continuing consultation in which each side would report on the steps it was taking relevant to disarmament. He then raised as an example the question of what difference it would make to us if the Soviets were to announce to us that they were taking ten divisions out of East Germany. He also argued that it would be unfortunate if we received no reciprocal response from the Soviets to a reduction in fissionable material production.

There followed a discussion of our estimates regarding intelligence on Soviet missiles, in which Mr. McCone concluded by remarking that there was a possibility that a reduction by categories scheme could leave us in a situation in which the Soviets might have enormous destructive power concentrated in a relatively small number of missiles.

Returning to Secretary Rusk's remarks regarding a unilateral Soviet decision to reduce their strength in East Germany, *Secretary McNamara* suggested that we might respond not by reducing our forces but rather by seeking to take advantage of the Soviet reductions, in this instance by a buildup in NATO strength since with such reductions on the part of the Soviets the possibility of a conventional balance in Europe would seem more plausible to our Allies than under existing conditions.

*Secretary Rusk* pointed out that he felt that with such reductions on the part of the Soviets there would be no realistic chance of new buildup in NATO. *Mr. Foster* disagreed with Secretary McNamara on the question of the relationship of risks and reductions in forces, pointing out that he felt that reductions of the kind proposed would lead to both a reduction in the risk of war and in the destructive consequences if war should occur. He then indicated that he was under the impression that we had been making substantial progress in redressing the conventional imbalance. *Secretary McNamara* agreed that we had made substantial progress but that we were still clearly behind. He reiterated his objections to the proposals and indicated he felt we would be giving up a substantial part of our superiority in the strategic nuclear capability.

*Mr. Foster* then discussed the Gromyko proposal as being a possibly serious concession on their part, indicating that a move in that direction might well be appealing to the Soviet Union. *Secretary McNamara* wondered why the Soviets would not be willing to cut conventional forces. *Dr. Wiesner* then pointed out that the proposals under discussion were in response, he thought, to DOD views in which it was indicated that the DOD had a preference for not reducing conventional forces.

*Mr. Foster* pointed out that under the proposal calling for 75% reductions in armaments, there would be a considerable ability to check on retained levels by means other than intelligence, but that the 50% proposal was based on the assumption that our intelligence, coupled with inspection of production and quantities destroyed, would be adequate. He indicated that he was puzzled by Mr. McCone's lack of confidence in our intelligence regarding big missile launchers. He pointed out that in building our forces we relied on intelligence—he did not see why we could not rely on intelligence in going the other way. *Secretary McNamara* replied that in building forces we did so with a 100% safety factor. He then reviewed Soviet and US positions relating to reductions in strategic and conventional forces pointing out that the present proposals seemed to be a move toward Soviet desires to reduce strategic delivery capability before dealing with conventional armaments, and he could not see why the Soviets should not move from their position towards our's on this subject. *Mr. Foster* cited the Gromyko proposal of last fall as a move from their previous position and a move

towards our's. He also indicated the Soviets had expressed preference for reduction by categories. *Secretary McNamara* then asked the question, "Weren't the Soviets, in their position, simply asking to retain their advantages?" *Mr. Foster* agreed that this might be true but also suggested that they may have other motivations in making their proposals.

*Dr. Wiesner* pointed out that our present position had inspection provisions in it that appear to be unacceptable to the Soviet Union. *Secretary McNamara* again raised the question as to why we should be willing to accept the change in strategic balance which the Separable First-Stage would lead to without the conventional balance being affected.

*Mr. Fisher* then reviewed some of the discussion at the Deputies' level pointing out that it had appeared that the conventional imbalance was not as great as had previously been thought to be the case and that, accordingly, proposals of the kind under consideration had seemed acceptable. *Secretary McNamara* and *General Taylor* dissented, pointing out that they felt there had been no significant change in the estimate of Soviet conventional superiority. *Mr. Fisher* then pointed out that there appeared to have been no satisfaction with the idea of equal percentage cuts in conventional armaments in the light of the superiority on the part of the Soviets in reserve armaments. He indicated that it was not clear by what mechanism the DOD wanted to redress the conventional imbalance. *Secretary McNamara* said this could be done by applying the same percentage cuts to conventional armaments as would be applied to strategic armaments. *Mr. Fisher* indicated that he thought there has been no acceptance of that idea on the part of the DOD. *Secretary McNamara* again raised the question as to why we are considering disturbing the existing balance and indicated that the DOD would prefer to accept 30% reductions across-the-board and then greater reductions later.

*Dr. Wiesner* pointed out that he felt that the ACDA proposals were a response to DOD pressure and that *Fisher* was explaining how ACDA was trying to respond to what it thought were DOD views. *Mr. Nitze* reacted that his position has been that he felt that it was worthwhile to explore various alternatives.

*Mr. Fisher* pointed out that there had been a weakening in the Soviet position, and the question was whether we should disregard this and stick with our present position, or alternatively explore whether our interests could be served by a move in the direction of the Gromyko proposal. He reiterated that 30% reductions applied to conventional armaments might have a worse impact on us than on the Soviets because of their superiority in reserve armaments and that limitations on force levels might not be an effective way of dealing with this Soviet superiority.

*Secretary McNamara* replied that in that case we must come up with a more precise conventional plan. He reiterated his opposition to the Separable First-Stage proposal, making two arguments. First, the Soviets were ahead in conventional forces, and second, that the Soviets had proposed emphasizing reductions in strategic delivery vehicles and this automatically caused him to question whether it was in our interest. *Mr. Fisher* replied that the Separable First-Stage was in part based on the assumption by the staff that the conventional confrontation is not really in such imbalance, particularly as one looked at it, as one should, from a NATO-Warsaw Pact basis rather than on a purely bilateral basis, and that under such circumstances the response to the Gromyko proposals and the cuts suggested might be better than none at all.

*Secretary Rusk* pointed out that there seemed to be two major obstacles to any agreement. One was Soviet unwillingness, or perhaps inability, to do anything about areas of confrontation such as Laos, and two, Soviet unwillingness to accept significant inspection procedures. He felt that if the Soviets were really serious about disarmament they should respond affirmatively on these points. He then raised the question regarding the political considerations involved in a transition from Stages I to II, and in particular asked what would be the political prerequisites to collapsing both stages into one. He wondered if it was feasible to do this if the necessary political prerequisites could be made.

*Mr. Foster* suggested that the major problem was time required for building up the necessary international institutions. *Dr. Wiesner* suggested that it might be more reasonable to consider collapsing Stages II and III into one. *Mr. Nitze* said that these had been looked into right after the Cuban crisis.

*Secretary Rusk* expressed concern that Khrushchev holds in his hands the possibility of forcing unilateral disarmament by the US, in that such would probably be our response to any concerted relaxation of Communist pressure that might occur in Southeast Asia, Berlin and elsewhere. *Secretary McNamara* said he was concerned that Khrushchev had *not* arranged for any such relaxation, and then pointed out that the Separable First-Stage plan under consideration would allow the Communists to keep up the pressure in Southeast Asia, Berlin and elsewhere and at the same time to maintain superior conventional forces. *General Taylor* questioned how the plan would affect the confrontation between the two Alliances, particularly in Europe. *Mr. Foster* pointed out that, with respect to the question of participation, it was felt that a bilateral agreement might be more negotiable, but that the possibility of participation of other states was left open.

*Mr. Fisher* discussed the threat to Europe by Soviet IRBM's and the threat to the Soviet Union from NATO forces based in Europe and indicated that the development of the proposal was based on the

assumption that it would be necessary to consider its effect on the total confrontation. *General Taylor* raised the question as to whether there would be consultation with our Allies before surfacing any such proposals. *Mr. Kaysen* pointed out that with respect to the question of building up of our forces that the degree of consultation with our Allies was somewhat obscure. *Mr. Nitze* suggested that in his view the Germans and the French might be justified in looking to their own forces for security in the event such a plan were surfaced.

*Secretary Rusk* asked *Mr. Foster* to enumerate the issues on which there was authorization for discussion with the Soviets. *Mr. Foster* did so calling off the following: B-47/Badger deal; the cut-off of fissionable material production and transfer to peaceful purposes; exchange of military missions; announcement of maneuvers prior to their taking place; controls on expenditures; and a prohibition on the placing of weapons of mass destruction in orbit. *Mr. Fisher* added nuclear free zones, and *Mr. Foster* qualified this indicating in particular the question of a nuclear free zone in Latin America. *Mr. Harriman* raised the question of an African free zone.

*Secretary Rusk* observed that *Mr. Harriman* had a great deal to talk about with the Soviets. He indicated that if pressed by the Soviets on the question of the Gromyko proposal *Mr. Harriman* might indicate that the strategic delivery problem was under study but that we should seek to find out how the Soviets proposed to deal with conventional forces. *Secretary Rusk* then observed that conceivably we might go to 50% reductions in Stage I. *Secretary McNamara* agreed with this, but *Mr. Foster* raised the question of whether 50% reductions across-the-board would be acceptable with China not a party to the agreement. *General Taylor* raised the question as to why we could not deal with absolute numbers of armaments to be destroyed rather than with percentages. *Mr. Foster* observed that this had been tried before but unsuccessfully.

*Dr. Wiesner* suggested that we should look to see how much inspection would be necessary for reductions of 30 and 50%. He felt the requirements might be quite different from those in our present Treaty Outline. *Mr. McCone* asked him to elaborate. *Dr. Wiesner* said that at the 30% level and perhaps even at the 50% level, it might be possible for us to depend on inspection of plants and armaments destroyed only. He also questioned whether we could not change our position with respect to continued production of armaments during the First Stage. He felt that we should modify our presently tabled Treaty Outline to bring it into agreement with our present thinking on these subjects. He felt that in view of the discussion, the old Treaty Outline would be a more desirable basis for analysis and modification than a Separable First-Stage. *Mr. Nitze* argued that we should abandon the

present Separable First-Stage, as it currently is not acceptable, but that we should continue to look for a Separable First-Stage that might be acceptable.

*Secretary Rusk* again raised the question of a continuous spectrum of small increments of disarmament as contrasted with a proposal involving large discrete stages. *Mr. Kaysen* asked *Secretary McNamara* whether his views would be the same regarding a reduction scheme that might involve, say, 50% cuts in strategic systems coupled with 30% cuts in conventional armaments, as they would be with respect to schemes involving strategic delivery vehicles only. *Secretary McNamara* replied affirmatively. He added that he was concerned that we were spending a disproportionate amount of time on proposals that might be of propaganda value and not enough on smaller measures that might prove practicable. He felt that there was too much distrust between the US and the USSR at the present time to consider measures involving such drastic cuts as 75% and that we were wasting our time in such considerations. *Mr. Kaysen* suggested that we should raise the question as to what are the minimum stakes required to get into a serious disarmament game. He observed, if the minimum price involved 75% reductions that perhaps we were not prepared to pay that price at this time. He suggested perhaps it was part of *Mr. Harriman's* job to get a better feeling for what that minimum price might be.

*Secretary Rusk* observed that in the last two years we have added 25% to the DOD budget and wondered whether or not any of the factors that had influenced us in arriving at those increases had changed. *General Taylor* observed that there had been no change. *Secretary Rusk* wondered whether the increases in the US defense budget might have led to a greater interest on the part of the USSR in disarmament. *General Taylor* observed that he thought they had; that the increased economic burdens of high defense expenditures would be an added incentive for the Soviets to move towards disarmament.

*Mr. Nitze* observed that there had been some changes in the last couple of years. In particular, there had been at least a partially favorable resolution of the Cuban problem, some degree of relaxation in the Berlin crisis, and the growing split between the USSR and China, which might make it possible for us to do things now that could not have been done two years ago.

*Mr. McCone* expressed concern about the evidence of long term plans on the part of the Soviet Union to go ahead with the build up in military strength. In particular he expressed concern about indications that Soviets were going ahead to increase their fissionable material production capability while we were talking about cutting back on ours. *Dr. Wiesner* expressed the opinion that this was understandable considering our very great superiority.

*Secretary Rusk* asked if a look could be taken at the damage that might be done to the US by 15 to 20 Soviet missiles each with a 50 MT warhead. *General Taylor* indicated that this could be done. *Secretary McNamara* observed that as a first approximation one might expect two million deaths per weapon.

*Secretary Rusk* suggested that a draft be made of instructions for Mr. Harriman for response to any Soviet query regarding our reaction to the Gromyko proposals. He then adjourned the meeting.

---

## 192. Paper, July 9<sup>1</sup>

July 9, 1963

### *POINTS TO BE EXPLORED WITH THE RUSSIANS*

1. An indication of the degree of Soviet concern over the Chinese Communist nuclear weapons program.
2. An exchange of estimates concerning the problem of the Chinese Communist ability to detonate a nuclear device.
3. Evidence of the Soviet concern over the ability of the Chinese Communists to use the racial issue to split the International Communist movement, especially in the underdeveloped countries.
4. Indications of the Soviet concern over the economic costs of their advanced weapons program, specifically those involved in the development of anti missile missiles.
5. Indications of the Soviet desire to shift additional resources into the agricultural sector.
6. By discussions of the virgin land program, an exploration of crop yields and deficiencies in the Soviet agricultural program.
7. The Soviet needs for short-term agricultural assistance in such fields as feed grains or chemical fertilizer, as against long range alleviation of the agricultural problem by the development of synthetic fibers, additional fertilizer plants, etc.
8. The Soviet attitude toward their future role in areas close to the Chinese Communist sphere of influence, such as Southeast Asia.

---

<sup>1</sup> "Points to be Explored with the Russians." Attached is a list of points for discussion with the President. Secret. 2 pp. Library of Congress, Manuscript Division, Harriman Papers, Test Ban Background III.

9. The Soviet ability to restrain the North Vietnamese from accelerating their operations in Laos.

10. The Soviet willingness to use the leverage which they obtain by the presence of Prince Souphanouvong's family in Moscow.

### **Attachment**

#### *POINTS FOR DISCUSSION WITH THE PRESIDENT*

1. If a limited three-element test ban is obtainable, should it be signed, or should it be deferred for a summit signature? As a possible alternative, could it be initialed and held for signature later?

2. In discussing other matters, how far should the question of trade be explored?

3. The possibility of civil aviation links may arise. The PanAm New York-Moscow route is currently in abeyance. Can its activation be discussed?

4. During the war we offered to exchange with the Russians order of battle intelligence concerning the Germans. Could we make a similar suggestion with respect to nuclear and other advanced weapons intelligence concerning the Chinese?

5. Assuming that the Soviets are concerned by the cost factor in their advanced technology, would there be any value in offering US-USSR cooperation in outer space and specifically on the moon flight? The objective would be to reduce the expenditures on both sides.

---

### **193. Telegram 233 from London, July 12<sup>1</sup>**

London, July 12, 1963

From Harriman. 1. Full US and UK teams met for one hour this morning. After some discussion of pace of business in Moscow during which Harriman made plain his desire to start as early as possible, group moved on to test ban treaty. It was agreed we should discuss comprehensive treaty with Soviets at least long enough to make plain it still our preferred goal. If Soviets are at all responsive we should

---

<sup>1</sup> Harriman's discussions with Hailsham on negotiating tactics in Moscow. Secret. 1 p. Department of State, Central Files, POL 7 US/Harriman.

arrange for technical discussion on issues of identification and need for and nature of inspection.

2. Next considered three environment treaty. (A) Hailsham raised number of questions on Aug. 27 treaty. (B) In particular, he commented on articles on peaceful uses and withdrawal on Harriman's insistence that we present our already agreed text, Hailsham withdrew questions. It was recognized that Sovs might raise similar questions in which case we must be prepared to discuss them. After further discussion, Hailsham acknowledged that his instruction was to agree to whatever US and SU agreed on three element test ban.

3. Hailsham raised question of possible usefulness of upper threshold above which identification presumably easy. Harriman skeptical this approach, pointed out that only if Sovs raised unacceptable idea of moratorium was it desirable consider quota of underground tests. Hailsham again urged usefulness of identification threshold. It was agreed to explore this with UK on technical level. It was also agreed to work out draft paper on need for inspections and possibility of inspections without espionage, should it prove useful to hand to Soviets.

4. During course of discussion, Hailsham's positions were erratic and subject to correction from staff.

5. Afternoon meeting also held; reported separately.

**Bruce**

#### 194. Telegram 234 from London, July 12<sup>1</sup>

London, July 12, 1963

Ban from Harriman. Accompanied by Bruce, I called on Home this morning. After going over understandings reached with Hailsham, Home made following points:

1. He suggested non-dissemination should be discussed if possible prior to non-aggression pact. I agreed.

2. When he raised MLF, I replied that we would strongly defend proposed MLF as conforming to non-dissemination.

---

<sup>1</sup> Harriman's meeting with Home to review decisions reached with Hailsham. Secret. 1 p. Department of State, Central Files, POL 7 US/Harriman.

3. He considers non-aggression pact to be reasonable in that legally it would not necessarily represent formal recognition of East German regime. When I pointed out German sensitivity, he agreed that we should object to it with Soviets and explore other possible formulae which have been previously proposed, including manner in which status quo in and access rights to West Berlin could be protected.

4. He readily agreed that every effort should be made to obtain a test ban, untied to any non-aggression arrangement on which of course no commitment could be taken without consultation with NATO Allies.

#### 195. Telegram 236 from London, July 12<sup>1</sup>

London, July 12

Ban rpt Ban From Harriman. In afternoon meeting between US and UK teams discussion centered on matters to be raised in Moscow other than test ban.

Harriman referred to his conversations with Macmillan and Home, stating had been agreed make test ban first order of business, with nondissemination and NAP to follow in that sequence.

Re nondissemination, Hailsham asked for US views re form of and conditions for agreement this subject.

We said US attached no particular importance to form, but with respect contents of agreement that might affect MLF stressed importance consultation with FRG. Also indicated we would explain to Sovs that MLF would not, in our view, violate principle of nondissemination.

UK pointed out MLF still only a concept not yet agreed to by all concerned, and therefore was not an existing entity to be given up in return for nondissemination agreement.

It was agreed if Sovs made MLF an issue, US and UK should not change position in Moscow but go back to their capitals.

Re NAP US said we could explore and discuss matter with Sovs but make no commitments without discussions with our NATO partners, particularly Germany. In discussions with Soviets we should indicate

---

<sup>1</sup> Harriman's continuing discussions with UK colleagues on Moscow agenda. Secret. 2 pp. Department of State, Central Files, POL 7 US/Harriman.

we cannot accept ratification of division of Germany or reduce in any way our position in Berlin. In fact we should attempt to improve latter. A nonaggression arrangement could take one of several forms but since we would be merely exploring, we need not discuss various mechanisms now. It should prove possible to avoid problem of recognition of East German regime.

We said in view of Berlin situation, where we might be compelled use force to protect our rights against Soviet encroachments, we must be careful re language on use of force.

UK said do not attach too much importance to recognition through form of arrangement but felt provision for consultation would pose substantial problems in this connection.

We hoped keep NAP separated from test ban. UK thought we should use argument any test ban agreement between US, UK and USSR should not be subject to veto by fourth parties, which would be case if connected with NAP.

We thought it important not to let Soviets conclude we so keen for test ban we would make concessions on NAP. UK pointed out US/UK not in position deliver NAP by selves.

It was agreed any NAP must include guarantee of Berlin access.

We concluded NAP discussion by saying we would explore and discuss problem with Soviets but make no commitment without consulting our Allies.

Referring to Spaak-Khrushchev conversation, we said we prepared explore surprise attack measures as far as Sovs prepared do so. Exploration would be in general terms along lines US working paper on this subject. It was agreed staff would prepare list of positions in this area and Soviet reactions to them in negotiations thus far.

Hailsham raised question duration Moscow talks, expressing fear lest discussion surprise attack measures unduly prolong them. Harriman thought we would stay in Moscow week or ten days. Surprise attack measures could be discussed and agreed upon in terms of general principles with specifics to be referred possibly to Geneva. UK agreed.

We said might wish also explore possibility of agreement not place bombs in orbit, to which UK observed they could only applaud.

As further measure which might come up in Moscow, we mentioned cut-off production fissionable materials for weapons purposes. UK agreed but stressed their agreement dependent on proviso US-UK barter arrangement would be taken into account.

If Soviets indicated desire reduce military expenditures, Harriman said we prepared look into possibility Separable First Stage involving reduction strategic delivery vehicles, but purely on exploratory basis since anything more would require specific authority from Washington.

**196. Unsigned Memorandum to McNamara, July 16<sup>1</sup>**

JCSM-543-63

July 16, 1963

**SUBJECT**

Views of the Joint Chiefs of Staff on the Khrushchev Test Ban Proposal of  
2 July 1963 (U)

1. In connection with Under Secretary Harriman's visit to Moscow, and in view of Khrushchev's speech in East Berlin on 2 July 1963, the Joint Chiefs of Staff have considered the desirability of a nuclear test ban treaty which prohibits tests in all environments except underground.

2. The Joint Chiefs of Staff previously concluded in JCSM-463-63, dated 22 June 1963, that a comprehensive test ban proposal which did not permit testing to continue below specified detection and identification thresholds and which did not provide adequate means of on-site verification, would not be compatible with national security. In the case of a limited test ban which permits underground testing, the requirement for on-site verification is no longer applicable. While there are definite limitations on detection and identification possibilities in the atmosphere, underwater, and outer space, any attempt to incorporate thresholds in a limited test ban treaty under which testing would be permitted would probably so complicate it as to make it impractical. In particular, such provisions could give rise to endless argument with limited possibilities of objective determination, and to a situation in which the Soviets could possibly test above the threshold without our being able to prove that an infraction had occurred. Accordingly, it is believed that the specification of detection and identification thresholds for a limited test ban should not now be undertaken, despite the fact that clandestine testing would be possible under these circumstances.

3. With such a treaty, violations would have to be verified by national means without entry into the Soviet Union. Consequently, the obtaining of convincing evidence sufficient to prove that a violation had occurred could be difficult. Even if the evidence of violation proved to be conclusive in the opinion of the United States, a question of major importance would be how the United States could use such evidence to justify a decision to withdraw from the treaty. The recent US reaction to evidence of Soviet atmospheric tests in June 1963 illustrates the types of difficulties which can be expected in cases of suspected violations

---

of a limited test ban. Except in the event of a flagrant violation, a degree of ambiguity probably will always exist.

4. With these considerations in mind, the Joint Chiefs of Staff have developed the following criteria to evaluate from a military point of view a limited test ban which would prohibit testing in all environments except underground:

a. Abstention by the United States from all testing except underground must have no significantly adverse effect upon the relative military strength of the United States and the USSR. In this respect, the USSR must not possess an advantage of significant military importance in nuclear technology at the time of treaty ratification.

b. Progress which the USSR might make through clandestine testing in the atmosphere, underwater, and in outer space should have no significantly adverse effect upon the relative military strength of the United States and the USSR.

c. US underground testing must proceed at a rate which will insure continued progress in nuclear technology in order that the United States might maintain or improve its capability relative to the USSR.

d. US readiness to test in the atmosphere must be maintained in order that the United States might react quickly should the Soviets resume such testing or should the United States wish to withdraw from the treaty if its continued application should be judged contrary to the national interest.

e. Reasonable evidence available to the US Government of testing in the atmosphere, underwater, or in space will be accepted as prima-facie evidence of a treaty violation and the United States must be willing to withdraw from the treaty on the basis of such evidence.

f. Procedures for withdrawal from the treaty should be uncomplicated and capable of execution without undue delay.

5. Having established these criteria, the Joint Chiefs of Staff have applied them in the evaluation of a treaty of the type which Khrushchev appears to have proposed. They note first that the United States, under the proposed treaty, would be denied important testing in the following areas:

a. Very high-yield (10–100 MT) technology.

b. Certain nuclear effects phenomena, including electromagnetic (EM) pulse, related to the survivability of hardened dispersed fixed-based missiles.

c. The reliability of penetration systems.

d. The design criteria and reliability of highly effective and economical ballistic missile defense systems.

e. Tactical nuclear weapons effects.

The United States would also be deprived of the ability to use standardized tactical nuclear weapons for training exercises and development of effective tactics and techniques.

6. The USSR, on the other hand, even with no cheating, would incur fewer disadvantages than the United States under the proposed

limited test ban. Because of previous experience, the USSR may not need to test in these nuclear effects areas requiring atmospheric testing to the same degree as the United States. Specifically, in the fields of very high-yield (10–100 MT) technology, medium-yield ground and KM pulse effects, and ballistic missile penetration and defense systems, the Soviets probably possess knowledge not yet required by the United States.

7. In addition, the USSR could further effect possible disadvantages of the treaty by clandestine testing, although at same risk of detection. Specifically, it is estimated that the Soviets could conduct tests of the following kinds with a reasonable confidence that their violation would be unnoticed or, if suspected, could not be proved adequately to provide a basis for abrogation of the treaty:

- a. Occasional tests at altitudes between 10 to 50 KM at yields up to 20 KT over remote regions of the southern hemisphere.
- b. Low altitude atmospheric tests up to 5 MT up to 10 MT altitude.
- c. Underwater tests at kiloton yield.
- d. An occasional very high-yield test in outer space.

8. As a result, if the Soviets were to exploit to the fullest extent the opportunities for clandestine testing in all environments, they could make progress unmatched by the United States in the fields of:

- a. Very high-yield technology (10–100 MT).
- b. Ballistic missile defense and penetration effects.
- c. Subkiloton tactical weapons effects.
- d. ASW effects.
- e. Military training exercises with standardized small-yield weapons.
- f. Increased confidence that stockpiled weapons will meet expectations in the combat environment.

Accordingly, the judgment of the Joint Chiefs of Staff is that there is reasonable doubt that the proposed treaty would meet either criterion 4 a or 4 b, above.

9. Both the United States and the USSR could conduct much important testing underground. However, progress in nuclear weapons technology will probably become, in time, more dependent upon integrated tests in which the relationship between the weapon design and the effects in the combat environment is investigated. Consequently, the pressure to supplement underground testing with an occasional system test in the combat environment will probably increase. Unless the United States is able to select and use a test site where megaton yield devices could be detonated underground, under the proposed limited agreement, it would be restricted in achieving significant improvements in high-yield (up to 10 MT) weapons and in conducting critical effects tests bearing on survivability of hardened facilities.

10. In light of the foregoing, the Joint Chiefs of Staff conclude that:

a. The United States would have an initial advantage in underground testing because of more experience in this environment than the USSR. Continued underground testing at a sufficient rate could keep the weapons laboratories active, retain key scientific personnel, and provide progress in some areas of nuclear weapons technology.

b. A limited test ban treaty of the type considered has fewer objectional features and entails fewer risks than the comprehensive test ban treaty now under consideration upon which the Joint Chiefs of Staff last commented in JCSM-449-63, dated 13 June 1963.

c. Nevertheless, there are significant military disadvantages to the proposed treaty. To a degree difficult to establish, it could continue the USSR lead in very high-yield technology. In addition, there are significant opportunities for cheating which, if exploited, could provide military gains to the Soviets that would be denied to the United States. The test ban would deny the United States the opportunity to conduct important atmospheric effects tests and to eliminate some uncertainties in the survivability of our hardened, fixed-based second-strike force and to conduct training exercises with tactical nuclear weapons.

d. Unless the Soviets flagrantly violate the treaty, it is probable that withdrawal or abrogation would be made difficult by the need for the following:

(1) Sufficiently firm agreement among the US experts that a violation had occurred to warrant acceptance of the fact and further action.

(2) Sufficiently clear and usable evidence to establish proof of violation before world opinion.

(3) Sufficient proof of the security impact to warrant withdrawal from the treaty despite friendly and neutral pressure to overlook violations.

11. In summary, it is the judgment of the Joint Chiefs of Staff that:

a. A limited test ban treaty similar to the type proposed by Khrushchev would be militarily disadvantageous.

b. The precise extent of the military disadvantage is difficult to assess.

c. In view of the foregoing, there must be overriding nonmilitary considerations favoring such a treaty for it to be in the national interest.

For the Joint Chiefs of Staff:

**197. Telegram 154 from Moscow, July 16<sup>1</sup>**

Moscow, July 16, 1963

From Harriman. Harriman and Hailsham met with Khrushchev in latter's Kremlin office from 3:00 to 6:20 pm July 15. Harriman accompanied by Kohler, Fisher, Kaysen and Akalovsky. Hailsham accompanied by Trevelyan, Wilson, Zukerman and Weeler. In addition Khrushchev, Sov group included Gromyko, Zorin, Tsarapkin and Sukhodrev.

Before actual conversation began, Harriman handed Khrushchev letter from President.

Khrushchev opened saying as host he wished greet visitors and welcome their arrival Moscow. Said believed in their good intentions. People awaiting results of these meetings not only because they burdened by military expenditures but primarily because such expenditures limited their economic resources and thus shortened their lives. In final analysis, accumulation of armaments had throughout history led to war and destruction of human beings, including those accumulating armaments. Thus he believed in this enlightened era of development of science and technology, we must abandon war as means of solving disputes and resolve differences by peaceful means. Modern era not one of colonialism, when countries could be seized by means of war. Today, both robbers and those robbed in equal position, since both would be annihilated in nuclear war. Consequently, he welcomed good intentions displayed by President and Macmillan. (Here Khrushchev made slip of tongue and referred to President as President Eisenhower, for which he apologized profusely.)

Khrushchev continued he understood task of those assembled was prepare such documents as would enable President and Macmillan sign agreements on test ban, NAP, disarmament, and German peace treaty. If US/UK wished additional agreements, Sovs were prepared consider them. Jokingly, he remarked his list of topics was rather short and perhaps all of them could be settled before dinner.

Gromyko interjected since there were four topics and four hours remained until dinner, each topic could be allocated one hour.

Khrushchev said Gromyko had whispered to him translation President's letter. Thanked for letter and President's good wishes and asked Harriman convey to President his gratitude and respect. Also thanked for good wishes conveyed by Hailsham on behalf Macmillan. Said Sovs nourished hope test ban agreement would be signed; if no success

---

<sup>1</sup> Readout of Harriman/Hailsham discussions with Khrushchev on July 15. Secret. 20 pp. Department of State, Central Files, DEF 18-3 USSR (MO).

could be achieved in reaching comprehensive agreement then, to use President's words, it appeared no particular difficulties existed with respect three-environment ban. Also, Sovs believed AFNAP should be concluded; NAP would be good addition to test ban, addition peoples waiting for.

Khrushchev noted President in his letter recommended Harriman. Said he held Harriman in high esteem and happy to see him again. Observed he and Harriman old acquaintances and recalled his offer make Harriman his assistant; however, Harriman had not yet entered his duties.

Harriman commented if these meetings fully successful, question might be reopened. Khrushchev said Villa he had offered Harriman still waiting.

Harriman observed villa only one of enticements of Khrushchev's offer.

Khrushchev replied this was basis of deal which had been made.

Khrushchev said in order not waste time, he wished state right away Sovs would not agree to any inspection, even 2 or 3 they had accepted before. Sovs wished comprehensive test ban, but on condition there would be no inspections although they still agreed to black boxes. Question of inspection was outdated, and there was no point arguing about it. Therefore, such questions as modalities, number of inspections, etc., also fell by wayside. Stressed Sovs would not agree even to one single inspection. As to three-environments ban, it involved no inspection. Sovs agreeable discuss it and if US-UK prepared sign such ban Sovs also ready to do so.

Harriman, referring to President's letter, said we had come here with high hopes and our objective was provide greater assurance of peace. Said could not help recall how 22 years ago he and Lord Beaverbrook had come to Kremlin discuss with Stalin how to win war. Now he and another, but equally esteemed UK colleague were here discuss progress towards peace. He also could not but think of difference between Kremlin of those days, when it had been dark and very carefully guarded place, and Kremlin of today with its gardens full of children at play, which was indicative of great changes.

## II.

Recalling Khrushchev's mentioning Eisenhower's name, Harriman observed latter had been symbol to Americans and, he believed, also to Sov people of cooperation for victory over enemy. Noted Eisenhower had visited Moscow in 1945.

Khrushchev said Sovs had indeed cooperated very well with Eisenhower and there had been no conflict with him during his tenure as

Supreme Commander. On this point, Sovs in agreement with Harriman since they, just as he, held Eisenhower in high esteem. True, later Sovs and Eisenhower diverged, but that was on completely different grounds.

Harriman referred to President's words that he wished move toward cooperation for peace, and observed if success could be achieved in these talks that would be good augury for future. Referring to prolonged meeting between Khrushchev and Hailsham this morning, Harriman facetiously remarked he assumed all problems had been settled there, and he wished be informed where he should place his signature. Seriously, however, he wished stress President's desire reach comprehensive test ban covering all four environments. Fact there was misunderstanding between two sides re identification underground disturbances, question over which their respective scientific communities in disagreement. Noted two distinguished scientists had come from US and two from UK, and suggested they meet with Sov scientists to explore further their differences of view. If USSR had some new method of identification, that would be helpful; however, there had been no change in advice President got from US scientists, who saying inspection required for identification. Harriman believed no use discuss this point here as both sides knew they in disagreement. However, he believed useful make progress towards three-environment ban. President agreed to such ban, which would be, as Khrushchev suggested, without inspection, as first step toward comprehensive ban and without prejudice to inclusion underground environment in future.

Harriman continued US believed three environment test ban would be very valuable as it would overcome fears world had of danger to future generations from atmospheric tests if such tests carried out to great extent. Also, such ban would give hope to world that progress toward disarmament being made. Therefore, if Sovs maintain position that no inspection permissible, US prepared discuss three environment ban. However, Harriman wished underline what President said in letter, viz., US had no espionage intentions in connection inspection. At same time, Harriman saw no real value in long argument on this point, and repeated US agreed on three environment ban.

Hailsham said had not much to add to what Harriman had said, but wished say Prime Minister preferred comprehensive ban; however, PM believed three environment ban would be better than none and therefore agreed to such ban. Hailsham said he had only one additional comment, namely, that it would be useful for scientists of both sides to meet and discuss problems at hand with view to developing program of existing national systems, purely national if need be, as there was difference between two sides in this area. It would be useful if scientists of all three parties met and developed appropriate research program

and thus contributed to narrowing differences. Scientific discussions could take place without prejudice to talks among those present here or to any agreement they might reach. Stressed UK would be happy to sign three environment ban.

Khrushchev said Sov viewpoint was very well known as test ban negotiations had been going on five or six years. Sovs even earlier proposed agreement on basis national means of control. A draft had already been prepared, but then US/UK raised problem of underground tests and thus whole thing was scuttled. Said he [there] was nothing new in US/UK argumentation on this point and expressed view if discussion this problem were to be resumed, both sides would use same vocabulary in their comments as before. That would be of no use and could only protract these discussions. Therefore, this problem should not be raised at this time; three environment ban should be signed as there were no differences there. Of course, Sovs would like sign comprehensive ban, but US/UK apparently not ready do so yet.

As to Harriman's assurances re espionage, Khrushchev said it was hard to believe them. This reminded him of cat saying he would only eat mice and not bacon lying in room. He would not trust such cat, as it would undoubtedly snatch bacon when there was no one in room. In any event, this question should not be discussed now; it would be resolved in due course.

Khrushchev saw no need for discussions among scientists, since we now talking only of three environment ban. In these circumstances, scientific discussion would be only polite exchange of views without any concrete basis.

Khrushchev then handed Harriman and Hailsham Sov draft three environment ban, and draft NAP. (Septels). Recalling Harriman's remark re long Sov-UK meeting this morning, Khrushchev commented he had not yet coordinated texts with UK but was sure UK would support them. Suggested US/UK study documents and comment thereon, so that these negotiations could be concluded successfully. Asked Harriman and Hailsham whether they wanted read documents first or sign them without reading.

### III.

When Hailsham commented precise treaty language was something for lawyers to work out, Khrushchev said lawyers spoke same way whether they spoke for prosecution or defense. Harriman had kinder heart as he was not a lawyer; that was why he, Khrushchev, wanted Harriman as adviser. Hailsham remarked perhaps he could serve as adviser for USA, to which Khrushchev said best investment was in USSR stock and Hailsham had better hurry up buying it.

Harriman said did not wish argue whether or not there should be inspection, but wished point out that if Khrushchev kept someone in

room, cat would not eat bacon and thus espionage fears would be eliminated.

Khrushchev said cat would eat bacon as soon as man in room turned his head away: He knew what cats were like.

Harriman recalled US/UK had tabled on August 27, 1962 proposal for three environment test ban, and handed copies to Sovs. Said in case Gromyko had forgotten, that document was somewhat longer than Sov paper and covered some points we wished discuss.

At this point, Khrushchev, Gromyko and Zorin exchanged among themselves comments in Russian on US draft. Gromyko pointed out to Khrushchev US draft contained provision for explosions for peaceful purposes, to which Khrushchev said this was different proposition. Zorin pointed out absence reference to France.

Hailsham observed one question to be raised, although there were other points which must be discussed too, was reference in Soviet draft to France, which not represented here. Did not see how French adherence could be secured. As to body of text, said wished reserve his views. Pointed out he authorized negotiate three environment test ban agreement to be signed by governments in more formal way.

Khrushchev believed no discussion should be held in specific terms at this time. Suggested US, UK study drafts and discuss them in foreign ministry, and then return here at later date. Hailsham agreed, but noted he talking only of test ban. Repeated France not represented here, and said he had hoped return home with prepared document to be ratified by governments. Since France absent here, he did not see how that could be done.

Khrushchev reiterated US/UK should study drafts, inform their governments and perhaps ask for instructions, and meet at foreign ministry for discussions in course of which he was sure issues would become clearer.

Hailsham agreed Sov draft should be studied with same care as had been applied in its preparation, but expressed hope Sovs would study US/UK document as well.

Turning to NAP, Hailsham said this raised political problems and suggested Harriman might wish comment on this point.

Khrushchev agreed Sovs would study US/UK document carefully.

Referring to test ban, Harriman hoped question of France could be discussed and perhaps agreed upon now. US was hopeful come to agreement on at least three environment test ban and discuss this matter with France later. Inclusion of France now only raised difficulties. As only three parties represented here, would be very embarrassing for US discuss document without French being present.

Khrushchev said Sovs fully understood this and saw no difficulty of agreement among three nations present. However, we must deter-

mine our attitude re France, which was nuclear power and US/UK ally, and must take its position into account. He agreed it would be tactless settle this question in absence French. Said reference to France had been included in Sov draft to indicate France's position should be taken into account. But Sovs did not make this an immutable condition; i.e., they did not say no agreement was possible without France.

Hailsham expressed gratification at Khrushchev's remarks.

Harriman asked whether it could be assumed reference to France would be deleted.

Khrushchev replied it evidently would. Recalled his remark Sovs had included reference in order focus attention on this problem, and reiterated this was not precondition for agreement and Sovs did not say they would not sign agreement if France did not sign. However, Sovs reserved their position in event nonadherence by France.

Hailsham said would appreciate it if Khrushchev clarified his remarks re reserving Sov position with respect France. Believed if agreement reached on treaty, it would be binding on three parties present, but hoped and thought France must adhere, and the three must persuade it to do so. However, did not see what guarantees he could give in this respect, and said this exceeded his instructions.

Khrushchev agreed test ban would be binding on three and said he not calling for any guarantees. However, Sovs must take account of France and might return to this question later. Said there would be no reservation re France in text of treaty, but could not give any indication of nature of Sov reservation. This would also depend on what type of tests France would conduct, i.e., whether underground or atmospheric. Even US and UK, who France's allies, probably did not know what France would do. Reiterated there would be no reservation in treaty text.

#### IV.

Harriman noted there were other nations in world, not only France. In his statements, Khrushchev had referred to President's June 10 speech. Harriman wished draw attention to one particular passage in that speech, namely, to President's statement that test ban would place nuclear powers in position to deal more effectively with further spread of nuclear arms. Quoted relevant sentences, and expressed hope there would be chance of discussing non-diffusion after test ban had been agreed. Pointed out this was not a condition in any sense, and US prepared go ahead with test ban. France—which was a problem—was not only problem; there were other countries to which non-proliferation might apply.

Khrushchev agreed there were many problems in the world. Yet France was nuclear power and was conducting nuclear tests. Other

countries, while they very possibly might become nuclear powers, were not such powers at this time.

Harriman agreed France was special case, but inquired whether Khrushchev could perhaps inform him re situation in respect CPR.

Khrushchev looked around table and asked where CPR was. Suggested Harriman go to Peking, provided of course he could get a visa.

Harriman recalled his last conversation with Khrushchev, in which he had said it was Mikoyan's fault he could not get a visa. Khrushchev said he supported Mikoyan on this score as he did not wish Mikoyan to deal with matters which were none of his business. This was a socialist society, where tight rules of conduct applied; it was not a wishy-washy capitalist society.

Harriman said he wished concentrate on test ban but also explore non-dissemination. If three-environment test ban were agreed, we believed no country could acquire nuclear capability without atmospheric testing. However, if adherence of as many countries as possible could be obtained to a non-dissemination arrangement, that would be a great step beyond three-environment test ban.

Khrushchev said Sovs prepared discuss non-dissemination. Sov position on this question was known, and USSR prepared negotiate and sign agreement on that basis.

Hailsham referred to Khrushchev's suggestion three-environment test ban be discussed in foreign ministry, and said he would be happy to do so. However, there were two types of problems involved here. Some were those of drafting, to be dealt with by lawyers; others were political, to be discussed between people with authority. He therefore wished ask how latter problems should be dealt with after both sides had studied each other's documents.

Khrushchev believed US/UK could sit down with Gromyko and start formulating main provisions of agreed document. If any questions should remain unresolved with Foreign Minister, then there could be meeting with him.

Hailsham and Harriman agreed.

Khrushchev then turned to NAP. Said Sovs attached great importance to such pact because if, as appeared likely, agreement on test ban was reached—and such agreement undoubtedly would be of great significance—there still would remain many skeptics. There had already been conducted sufficient number of tests and it was hardly necessary continue them. There was adequate basis for further build-up of forces and for continuing production nuclear weapons. Thus, arms race would not be stopped and war would not be ruled out. Test ban would only satisfy public opinion that no further contamination of atmosphere would take place. This would be big thing indeed, and

he did not wish minimize its importance. However, those who wished see complete security for peoples, who were opposed to aggression by one group of states against another, would not be satisfied. This why Sovs proposed NAP. Said he had read in Western press about difficulties re GDR, which not recognized by NATO countries. Believed this problem could be referred to lawyers to develop language which would eliminate such difficulties. In short, Sovs did not wish ship recognition of GDR through NAP. GDR was quite well off whether or not it was recognized by NATO countries. Such recognition would not change a thing. After all, Russian Czar had not recognized US for 26 years, and US had not recognized USSR for 16 years. Czar had been foolish, and US had not shown abundance of wisdom either. But if West wished follow same course, that was all right with him; that would only indicate capitalism had out-lived itself and was unable be realistic. Thus, recognition was not Sov goal; only goal of NAP was create stable world and consolidate peace. True, NAP would yield little in terms of specifics, but would bring great moral satisfaction.

Khrushchev continued that although this was not a new question, as it had been raised by Sovs before, he wished suggest that military budgets be frozen at levels of, say, 1963. He believed this would be reasonable and would give to peoples hope that governments were at last showing common sense and doing something to arrest arms race and not add fuel to fire.

## V.

In addition, he wished return to proposals made at one time by US/UK, but which had been rejected by their sponsors as soon as USSR accepted them. Specifically, he meant establishment of control. Sov had suggested establishment control posts to rule out possibility of surprise concentration of forces for surprise attack purposes. Sovs had proposed establishment control posts at railroad junctions, air-fields, ports, and major roads within certain agreed zones. Such posts would be for purpose of preventing nations from concentrating forces in given areas for purposes of surprise attack. This was field where Sovs agreed to inspection. Sovs prepared accept Western inspectors in return for establishment Soviet inspection on Western territory.

Harriman wondered whether missile bases would be included.

Khrushchev replied in negative. Said missiles and their launching pads were stationary and therefore could not be concentrated. Missiles were a disarmament problem, whereas he was speaking of control, and these were two different matters.

Khrushchev then suggested that also for the purpose of eliminating danger of surprise attack, agreement should be reached now on establishing control over present levels of forces in GDR and Western Ger-

many, so as to come to agreement on balance, or equilibrium, of forces in those areas, which, in turn, would also prevent surprise attack. Moreover, such measure would generate confidence.

Khrushchev said he was not raising question of German peace treaty, because it affected many countries, including countries outside NATO and Warsaw Pact. It was much broader problem and he did not wish raise it here. However, he believed everyone understood that so long as German problem existed in present form, i.e., so long as there was no peace treaty, this problem would be source of tensions and obstacle for negotiations on general and complete disarmament. Reiterated he not raising this problem here, but merely wished to point out its significance.

As to other questions he had raised, he did not wish stimulate their discussion here and now. Those problems could perhaps be discussed later. However, people who adhered to positions of peaceful coexistence would experience great relief if NAP were signed, control posts were established, and military budgets were frozen. He thought Harriman and Hailsham would agree with him that qualitative change had occurred in interest displayed by two sides in German peace treaty. After GDR had established control over its borders, including its border into Berlin, he believed West became considerably more interested in peace treaty in order to stabilize West Berlin situation. Point was that GDR now completely controlled all of its borders. It was stable, and peace treaty would not change anything from standpoint its security. On other hand, peace treaty would entail change in Berlin; it would bring about stabilization. This matter was of concern to Germans, but such stabilization would be appreciated everywhere. As to German reunification, Khrushchev believed Harriman and Hailsham were experienced people and knew that division of Germany was not on national but rather on socio-political basis. He compared situation to US/British relations during Revolutionary War, when British people had been in both places but one group had felt subjugated and fought for its rights. Point was that GDR was socialist, whereas West Germany was capitalist. Related anecdote current during Russian civil war, according which reds and whites were saying they differed only on one minor point which could be easily resolved, namely, on land problems. Whites were saying they needed land to bury reds and reds were saying they needed land to bury whites. Problem had been resolved by chasing whites out of country and thus in effect burying them. This was how issue between GDR and West Germany could be resolved at some future time. However, two Germanys should not be pushed against each other as that would result in world conflagration.

Harriman referred to Khrushchev's suggestion for freezing military budgets and said he believed Khrushchev wanted reduce military

expenditures. Wondered whether Khrushchev had anything in mind on this point, or whether he thought some agreements could be possible which would bring about such reduction.

Khrushchev said he agreeable to exchanging views on this subject, but had no specific proposals to offer. However, if Harriman interested in this matter, perhaps something could be worked out.

Harriman pointed out he had only suggested this matter be explored, and had not meant specific agreement.

Khrushchev said he understood this and commented he had also raised some questions for exploration purposes.

Harriman observed test ban could lead to other limitations, or at least to thoughts of other limitations.

## VI.

Khrushchev said he had another idea. If agreement were reached on reducing military expenditures, Sovs could agree, on certain conditions, to place orders in West for amount of reduction. He could not say what that amount would be, but main point was to channel resources to peaceful purposes. As he had already told Hailsham this morning, Soviet economic situation was excellent, and even in absence of any agreement they were going cut down expenditures for missiles. USSR had quite enough missiles and its general staff was quite satisfied with situation. Of course, military would go on and on with their demands unless one curbed their appetites. In fact, only today had his military suggested that since expenditures for missiles were going to be reduced, expenditures for general armaments should be increased. There were many smart alocs in any country who applied such logic.

In any event, whether or not agreement on this point was reached, Harriman and Hailsham would hear from his report this coming fall that USSR would invest huge sums in agriculture and chemical industry. USSR had accumulated sufficient savings for this purpose. Khrushchev said he was mentioning this so that Harriman and Hailsham should not think he was appealing to them for help because USSR was lacking funds. Time had long since gone when West could expect such a thing. Now USSR had sufficient funds to cover expenditures for all armaments and for development of peaceful economy.

Harriman referred to Freeman's current visit to USSR and hoped Khrushchev would see him.

Khrushchev replied did not know how long Freeman would stay, but said would be happy to talk to him.

Continued that now situation between USSR and West unequal in one important respect. US was applying 227 kg chemical fertilizers per hectare, whereas Sovs applied only 70. Thus, Americans wiser and Sovs

more foolish. However, here wisdom was not measured by amount of brains, but rather by amount of dollars available. USSR was now in position start massive development chemical industry for production chemical fertilizers. 5.8 billion rubles would be allocated for this purpose and whole problem would be resolved in five to six years. USSR would have same amount of chemical fertilizers as U.S. Khrushchev noted UK used even more fertilizer per hectare, namely, 787 kg. For this reason, yield of grain per hectare was also higher in UK than in U.S.; it was 27 to 30 centners in UK versus 16 or 17 centners in U.S. West Germany used even more fertilizer per hectare, 1,137 kg per hectare and its average yield was 35 to 40 centners. For time being, Sovs were setting US level as their goal, because USSR was also a vast country and had a great deal of arable land. If USSR raised its yield by five or six centners per hectare, it would be in position offer grain to U.S.

Harriman commented facetiously that would be a good thing.

Khrushchev agreed, but said that reality of this problem lay in fact that 19 billion rubles would be invested this year in construction and development of industry; 21 billion rubles would be invested next year. Every year, investment would be raised by 1.5, 2, 2.5 billion rubles and the further investments went the greater progression of increase would be. Thus, if additional two billion rubles were added to fertilizer industry every year, level of development of industry in other fields would not drop but rather increase. Point was that one gained two rubles for each ruble invested.

Harriman commented USSR was getting capitalist.

Khrushchev retorted USSR was getting not capitalist, but rich. USSR prospects were very bright, disarmament or no disarmament, but it would take five to six years to complete this program. At end that period, USSR would have problems similar to those US now facing, i.e., it would have agricultural surpluses 996 and might then reduce its crop lands. USSR had invested 5.2 billion rubles in development virgin lands, and return had been eight to nine billion rubles. Thus, all investments had been amortized and, in addition, agricultural machinery for those lands was still there. However, he believed investment in fertilizer industry was more effective than investment in virgin lands. By investing in fertilizer industry problem would be easier to resolve for in order to develop virgin lands nation-wide campaigns and large scale transfer of population were required, whereas in case of fertilizer industry one could build plants just in certain locations. USSR had all resources necessary for construction such plants. Khrushchev said he had been preparing his report and this was why this problem was so vivid in his mind.

However, this would be only first part of program of development chemical industry. Next steps would be development plastics and artifi-

cial fiber industries. He believed some ten billion rubles would have to be invested in those fields. Sov objective was produce sufficient quantities of artificial fiber and footwear so as to be able cut prices in half. While food and housing were now cheaper in USSR than in US, and medical care was free, clothing was cheaper in US. But USSR would deprive US of that advantage.

Harriman remarked the more Sovs prosperous the more we applauded.

Khrushchev assured Harriman there was no need fear peaceful competition. Of course capitalists were always on look-out for gain, but days of colonialism had passed.

Hailsham commented US and India, both former UK colonies, were now prosperous and remarked in jest this was all because of UK.

## VII.

Khrushchev laughed and said it was UK who had reared them.

Harriman said Khrushchev's remarks very encouraging and he very happy hear them.

Khrushchev said he also very happy and noted he had completed work on his report just last Saturday.

Harriman thought next order of business was discussion with Gromyko of three environment test ban. Commended US/UK draft treaty, noting it longer and more imposing and thus would have greater impact on public opinion.

Khrushchev said he had already stated Sovs would study US/UK draft. Final text could take best parts from both drafts, particularly as two drafts oriented in same direction.

Harriman said that in all seriousness he wished discuss, before he left for home, what would happen when CPR exploded its bomb. He did not expect settle problem but wished exchange views on it.

Khrushchev said would be glad talk to Harriman, but believed it not useful discuss what might happen somewhere. He would rather suggest that questions of mutual interest be discussed. Correlation of forces would not change for as Harriman knew that to explode bomb was one thing and produce weapons another. France knew it and UK knew it too. Enormous investments were required in this field and so far—he said he wished stress quote so far, unquote only US and USSR had been capable of accumulating nuclear weapons. Fortune being, US and USSR were more or less equal. He did not wish belittle anybody, but this was question of economic might.

Harriman commented he had read Sov newspapers and had noted CPSU was particularly concerned re Chinese views on nuclear war. This raised question of what would happen if and when Chinese got

nuclear weapons in their hands. Soviet concern about Chinese attitude was particularly evident in Soviet newspaper article he had seen when he arrived here.

Khrushchev agreed Sovs had differences with Chinese on this question. However, he said life went on and their Chinese friends would surely understand Soviet position more realistic and offering better prospects.

Harriman said that if this matter was of concern to Sovs they could not object to it being of even greater concern to US.

Hailsham hoped Chinese would take Sovs view on this question.

Khrushchev commented Hailsham was capitalist, and capitalists were happy to see these differences.

Harriman recalled that Stalin had had no liking for Mao.

Khrushchev said Harriman should ask Mao about Stalin; Mao did not like Stalin either. Khrushchev said he had worked with Stalin for a long time and knew his weaknesses and strengths. But now USSR had lived ten years without Stalin and things were going all right.

Harriman remarked he did not wish discuss Stalin's personality and had mentioned his name only because subject of China had come up. In any event, he agreed with Hailsham's remark re Chinese.

Khrushchev said he had talked to Mao and their views on Stalin were in agreement. He then laughed and said Harriman wanted him expelled from party because people could say Khrushchev was being supported in his views by capitalist Harriman. He quickly said, however, he was only joking; he appreciated this support of Soviet view. He did not know who was richer, Eaton or Harriman, but nevertheless Eaton had received Lenin peace prize. Likewise, while he had nothing in common with Pope John XXIII he respected him as human being and he thought Pope John would enter in history as first Pope who displayed realism. Pope John and himself were antipodes, but in struggle for peace Sovs welcomed all people regardless of their beliefs, race, or political convictions.

Hailsham thanked Khrushchev for opening his thoughts in such generous manner. Said sure his PM would also appreciate this and be impressed. Said would be happy hear Khrushchev's views on any subject though he not in position discuss those matters which affected third countries. He was impressed with what Khrushchev had said, particularly about his striking plans for economic development. Hoped trade and exchanges in cultural, scientific, and other fields would develop, because he believed that would strengthen peaceful coexistence between peoples of two countries. Said did not believe difference between capitalism and communism was most important thing now, but thought time would show.

## VIII.

Khrushchev said of course two sides poles apart in their sociopolitical views. However, one matter affected equally everybody regardless of their class or political views, and that was question of war or peace. Therefore both sides should engage in quest for peace. As to trade, Sovs had for long time been in favor of that. UK should convince US not to impede development of world trade. It was US who had stopped Germans from selling pipe to USSR. He had reliable information that it was US Ambassador to USSR, Kohler, who had recommended this course of action and unfortunately US Govt had accepted that recommendation. This was secret he could now reveal. This was bad advice, but he, Khrushchev, could not object to this since Kohler was in service of US Government. Of course if one asked Kohler about this now he would not say, but Harriman could check later at State Department. However, this act by US had done no harm to USSR. He, Khrushchev, could only express thanks for freeing him of obligation to place orders in Bonn. USSR produced enough pipe by itself.

Harriman commented he would report to President that Khrushchev held Kohler in high regard.

Khrushchev agreed but suggested Harriman look up Kohler's telegram in State Department and be referee. Said Kohler knew this was true and offered produce Kohler's telegram if latter denied his responsibility. State Department knew facts of this matter, and President must know them too.

Khrushchev continued Sovs did not need trade, but were against trade being used for cold war purposes. Some people said they wanted reduce tensions but at same time they spoiled air. He could understand if that were done by Congress because there were many madmen there. But when Ambassadors do this, then Sovs became concerned.

Harriman said he hoped Khrushchev's remarks re Kohler were joke, or else if Khrushchev serious he would have to speak in Kohler's defense.

Khrushchev replied if Harriman wanted he could take it as joke.

Kohler said since he had been in question he wished point out that Marshal Sokolovski was one Khrushchev should blame for this, because Sokolovski had written book indicating Sov intentions re pipe.

Khrushchev said he had never read Sokolovski's book. He would have to stop being Chairman if he spent time reading books by generals who, having passed their retirement age, were reminiscing in books. He did want to say, however, that Sokolovski had been very good as staff officer. In any event, if Kohler played on Sokolovski's pipe he had put himself in a pipe. Here US thought it could put a needle in USSR but it failed. At time this happened, UK and Sweden had sug-

gested increase their quota but planning committee proposed that no pipe be ordered in 1963. He, Khrushchev, had said to committee it would be awkward cancel orders but Kohler helped him out of predicament.

Hailsham expressed hope Sovs would buy UK ships. Khrushchev agreed provided prices were right. Said Sovs had bought tire plant from UK which he had seen in Dnepropetrovsk and which was very good. Thus Sovs bought lot of things from UK.

Hailsham said Khrushchev could be assured UK wished trade of suitable kind and wished Sovs good use of UK products.

Khrushchev said he believed trade was first sign of neighborly relations. He who did not want trade wanted war. Since time immemorial whenever trade stopped that meant war, and whenever war ended that meant trade. Sovs did not want US to sell anything to them; what they wanted was that US abolish its discriminatory law or else there would be no confidence.

Harriman commented if progress on questions mentioned today were made then this certainly would not be beyond realm of possibility or would at least be discussable.

Khrushchev said on basis his info he believed it difficult expect anything progressive from US at this time. So many things were done in US which everybody saw that they should not be done. E.g., Harriman was coming to USSR, but US at same time issued its captive nations resolution. Was there any wisdom here? Of course not. Four years ago, during his visit to USSR, Nixon had been frank on this point. He had said that he, Khrushchev, surely did not think he was so stupid as to sign such law if it depended only on him. Nixon requested that this not be given to press, and he, Khrushchev, had kept his word. However, Khrushchev remarked, he had digressed from subject matter under discussion.

Harriman said he glad Khrushchev had raised this matter and disposed of it so well.

## IX.

Khrushchev said all this needling was no good. Recalled his boat trip with Nixon, during which he had told latter to look at Sov people along river and see what kind of slaves they were. Harriman should also take boat trip and see changes in Sov life.

Hailsham said he was glad see Sov people prosperous and happy; we had been looking very carefully at them. However, Khrushchev should not underestimate generosity of American people. He, Hailsham, was half American himself. He remembered that during war English people used to say that Germans could destroy them but there was US on other side of ocean.

Khrushchev agreed US had rendered assistance during war.

Hailsham hoped there would be similar cooperation again.

Khrushchev complained US had stopped cooperating after war. Said if only measures discussed here could be implemented and if only US abolished its discriminatory law, even without actual trade, that would deprive cold war warriors of things they clinging to.

Harriman referred to hot line agreement as something which had already been achieved; it was not big step but was important.

Khrushchev agreed this was not big step.

Hailsham expressed hope there would be more such agreements.

Khrushchev again accused US/UK of renegeing on their past proposals in disarmament field, to which Hailsham replied UK Government sincerely wanted disarmament and believed one step should follow another and thus we could move ahead. This was something President Kennedy had also advocated in his speech.

Khrushchev said this was correct. Sovs held very high opinion of President's June 10 speech. It was wise statement and it demanded great deal of courage. However, one could see no deeds following words as yet.

Harriman suggested Sovs should produce deeds.

Khrushchev laughed and said this was good division for labor: Sovs should produce deeds, and US should produce words.

Harriman pointed out US here to produce deeds and thought next step was work with Gromyko to develop language reflecting our intentions.

Khrushchev thought language to be developed should be such as would sound well. Thought agreement on substance was already there.

Hailsham agreed.

It was agreed meeting with Gromyko would take place July 16, 3:00 p.m.

There followed some discussion of communiqué, agreed text of which transmitted septel.

**Kohler**

**198. Telegram 183 from Moscow, July 18<sup>1</sup>**

Moscow, July 18, 1963

From Harriman and Fisher. Following detailed report on status of test ban negotiations covers both plenary and drafting committee sessions:

Present state of test ban negotiations with reference to preamble and six articles of August 27 draft is that drafting committee meeting on preamble tomorrow. Drafting committee reached agreement on the following language for Article I which principals found satisfactory. Begin verbatim text with bracketed language indicating areas where no agreement:

**Article I**

1. Each of the parties to this treaty undertakes (except as provided in Article II) to prohibit and prevent the carrying out of any nuclear weapons test explosion and the carrying out of any other nuclear explosion at any place under its jurisdiction or control:

A. In the atmosphere, above the atmosphere, in outer space, or in territorial or high seas; or

B. In any other environment if such explosion causes radioactive debris to be present outside the territorial limits of the state under whose jurisdiction or control such explosion is conducted.

2. Each of the parties to this treaty undertakes furthermore (except as provided in Article II) to refrain from causing, encouraging, or in any way participating in, the carrying out of any nuclear explosion anywhere which would take place in any of the environments described, or have the effect proscribed, in paragraph 1 of this article. End verbatim text.

Soviet rep objecting strongly to Article II. We will trade off Article II for agreement on Article III along lines of following text. Begin verbatim text: It is the anticipation of the parties that this treaty shall remain in effect indefinitely and shall be adhered to by all states, particularly those states that could be in a position to carry out an explosion prohibited by this treaty. If a party determines either that another party has failed to observe the terms of this treaty or that any other state has taken action which the parties have bound themselves herein not to take, the party will be free to reconsider its position. It is hereby understood and agreed, however, that the party may not withdraw from the treaty without first both consulting the other parties

---

<sup>1</sup> Status of test ban negotiations following plenary and drafting committee sessions. Unclassified. 3 pp. Department of State, Central Files, DEF 18-3 USSR (MO).

to the treaty and giving notice of at least 60 days. Such notice is effective only if given no sooner than 60 days and no later than 120 days after the determined date of the failure or action upon which the withdrawal is based. End verbatim text. This article just handed to Soviet rep today and due to situation mentioned in contemporaneous reporting telegram may be subject to some further negotiation.

Soviets have indicated acceptance of principle of old Article IV but have expressed a desire to reverse the order of the reference to original parties and vote of all of the parties in paragraph 2. We propose however to negotiate for simple majority of all parties including all original parties in order to make amendments easier for future plow-share program if developments make such amendment desirable.

Soviet representatives have indicated acceptance to Article V but have offered to have agreement signed in Moscow and Soviet Union as depository. They did not insist on depository issue when we indicated we would be prepared to accept either UN, a neutral, or US, UK and USSR as joint depository, the latter being more probable of acceptance. Have left open when and where signed.

Sovs have as yet indicated no objection to Article VI dealing with authentic texts, but due to future French problem who may be offended if we leave French language out and equally offended if we put French language in without their being party, we are contemplating attempt finesse problem by having duplicate original texts in Russian and English in fact but having no treaty article on the subject.

Although Gromyko may hold up agreement on details pending disposition of NAP issue, appears we can reach agreement on test ban after withdrawal matter finally settled.

Kohler

**199. Telegram 184 from Moscow, July 17<sup>1</sup>**

Moscow, July 17, 1963

Following full report of discussion on test ban and NAP at plenary session Wednesday, July 17, which you may find useful. Session lasted from 3 p.m. to 6 p.m. In addition to Harriman there were present

---

<sup>1</sup> Full report of test ban discussions at plenary session, July 17. Secret. 3 pp. Department of State, Central Files, DEF 18–3 USSR (MO).

on US side Kohler, Kaysen, Fisher, Tyler, McNaughton, Long and Akalovsky.

Harriman suggested principals receive report of Test Ban Drafting Committee, which had met at 11 a.m. (composed of Tsarapkin plus five; Fisher plus McNaughton and Akalovsky; and Darwin). Tsarapkin reported that committee had agreed to postpone work on preamble pending discussion by principals, and to work on article one, implementing agreement of principals on Tuesday. Draft on article one was worked out containing but one disagreement, namely, US/UK exception for peaceful purposes by way of cross reference to article two. (This draft of article one being cabled separately.) Fisher concurred in Tsarapkin report on drafting committee work.

Harriman what next. Gromyko suggested acceptance of Soviet proposals to eliminate all reference to peaceful uses and withdrawal. Harriman said that US must have withdrawal clause and that it is more important than peaceful uses. Though withdrawal clause quote absolutely essential unquote, could be worded differently from US/UK draft. Could call it quote duration clause unquote. Could phrase it positively. Harriman read, as example, of positive approach: quote It is the anticipation of the parties that this treaty shall remain in effect indefinitely and shall be adhered to by all states, particularly those states that could be in a position to carry out an explosion prohibited by this treaty. Unquote. He said that it would then go on to deal with how a state might have to reconsider under certain circumstances. He offered to hand Gromyko an illustrative draft, making clear it was a US draft since UK had not had chance to approve it.

Gromyko asked for draft, saying it might narrow differences.

Harriman gave it to Gromyko and Hailsham (Hailsham had in fact seen it before meeting and had suggested change which Harriman rejected.)

The remainder of paragraph is contained in separate Harriman/Fisher cable on test-ban details. (Embtel 183).

Gromyko said that substance same as former US-UK position. Hailsham noted that every contract had limits stated or implied. New clause was especially good because it limited right to withdraw. He noted that both sides had stated reservations: USSR re France, US re China. These reservations cannot be secret. Better impact on public opinion to have duration clause with limits like this on right to withdraw.

Gromyko said often contract omits reference to duration of withdrawal. He then asked Harriman's attitude toward peaceful uses—was US willing to drop article two? Harriman said if Gromyko accepted withdrawal article, he believed US could drop peaceful uses article.

Gromyko asked if he understood statements made before correctly, that US Senate might object to absence of withdrawal clause. Harriman said that this was understatement. Answer is yes. That it would be more difficult. It might be impossible. Gromyko said we should study the situation and return to the peaceful uses and withdrawal articles tomorrow. Hailsham interjected that difficulty in UK Parliament would not be absence of withdrawal clause in treaty but would be any secret understandings regarding withdrawal. Principals agreed to return to these two matters tomorrow.

Harriman suggested discuss preamble next. Hailsham added that might discuss identity of depository of treaty. Harriman, on this matter suggested UN, a neutral or all three original signatories. Gromyko referred to Tuesday offer to have USSR the depository and to have treaty signed in Moscow. He noted that Antarctica Treaty deposited in US. But said would not force USSR on US and UK, it did not affect fundamental interests; was only politeness.

Discussion shifted to preamble. Harriman said he wanted the preamble to include the points in the US/UK treaty draft but was willing to discuss this. He said that US/UK willing to accept number of points in Soviet preamble with certain amendments. Specifically, first, in Soviet second paragraph, words quote including nuclear weapons unquote should be deleted: preceding words quote all kinds of weapons unquote covers nuclear weapons. Second, in second paragraph, after quote general and complete disarmament unquote should go words quote in a peaceful world unquote. And, lastly, if GCD is to be mentioned, should add quote progress in disarmament should be accompanied by measures to strengthen institutions for maintenance of peace and the settlement of international disputes by peaceful means unquote. He stated that inserts came from US/USSR agreed statement of principles of 1961.

Gromyko said he disliked amendments to Soviet preamble/in Soviet draft, disarmament mentioned only quote by the way unquote; USSR mentioned it only to relate test ban to GCD. US changes would introduce conditions for GCD. Harriman said we have inherited custom of linking disarmament to peacekeeping machinery. If Gromyko dislikes linkage, need not refer to GCD at all and omit reference to both GCD and peacekeeping machinery. Gromyko said that omission of GCD would be a pity, that USSR did not think of mention of GCD as being a condition to test ban. Harriman suggested that drafting committee might work out language. Hailsham agreed, suggesting special committee of quote political unquote specialists. Harriman said no, use same committee. Gromyko agreed to referral to drafting committee, with instructions to keep language simple to meet needs of public opinion.

Harriman noted that rest of test ban (except controversial articles two and three, on peaceful uses and withdrawal) had been referred to drafting committee. After some mild levity, test ban portion of meeting ended.

Gromyko shifted to non-aggression pact when Harriman expressed desire to get communiqué to President in time for Wednesday press conference. Gromyko asked Western representatives for comments on NAP draft and said quote in passing unquote that degree of optimism which could be expressed in this communiqué and future ones depended on progress which would be made on NAP. Stressed importance Soviet Government attached to NAP.

**Kohler**

---

## **200. Telegram 186 from Moscow, July 17<sup>1</sup>**

Moscow, July 17, 1963

From Harriman. Gromyko accompanied by 10 advisers, including Zorin, Tsarapkin, Mendelevich, Novikov, and Roshchin. Hailsham accompanied by Trevelyan, Wilson, Zuckerman, Darwin, and Wheeler. Harriman accompanied by Kohler, Kaysen, Fisher, McNaughton, Long, Akalovsky.

Gromyko opened suggesting there be no chairman and discussion be informal without strict procedures. Said since he had started speaking first, wished used opportunity he had given himself and invite US and UK comments on test ban and NAP drafts Sovs had given yesterday.

Harriman suggested US/UK and Sovs draft test ban treaties be reviewed article by article. Noted, however, preamble should be left aside until body of treaty agreed.

Hailsham expressed agreement with procedure suggested by Harriman.

Gromyko had no objection, but pointed out if any participant wished address himself to more than one article at same time, there should be no rigidity re procedure.

Harriman and Hailsham agreed.

---

<sup>1</sup> Readout of meeting with Gromyko delegation. Secret. 12 pp. Department of State, Central Files, DEF 18-3 USSR (MO).

Gromyko said since drafts were Soviet papers, he wished stress Sovs believed necessary discuss both drafts presented by USSR, i.e., test ban and NAP. As to order of discussion, it depended upon participants and they free discuss what they wanted.

Harriman said US not prepared discuss NAP today, as we had not studied draft. All we prepared discuss today was test ban. Pointed out this was how he had understood Khrushchev yesterday. Commented there was no relationship between drafts on two subjects, they contained no over-lapping provisions, and we not prepared discuss at this point anything but three-environment test ban. Thought this procedure had been agreed in principle yesterday.

Gromyko said that of course if US/UK not prepared discuss NAP today—he understood Sov proposal required internal study and discussion—then he had no objection to discussion test ban today. Stressed, however, both drafts must be discussed in due course in light considerations voiced by Khrushchev yesterday.

Harriman said there were number of questions mentioned yesterday which we would like discussed later; we would later discuss NAP just as other matters raised yesterday by Khrushchev, Hailsham and himself.

Gromyko then suggested group discuss subject which everybody prepared take up today, i.e., test ban.

Gromyko continued if no objection he wished comment on US/UK draft test ban given Sovs yesterday. Said would comment in general terms rather than on specific language; believed once agreement was reached on substance there would be no difficulty deciding on specific wording. Sovs proceeded from premise Sov draft met objective to be achieved, but nevertheless he wished state Sov attitude toward some of main points in US/UK draft.

Gromyko noted US/UK draft provided for nuclear explosions for peaceful purposes, which indicated US/UK believed three-environment test ban should leave room for such explosions. Sov view was no need for such provision. Agreement would be limited in scope as it would allow underground explosions, including those for peaceful purposes. To provide for explosions for peaceful purposes in any environment would mean another limitation of treaty coverage, and would result in one limitation being superimposed on another. This would detract from value of agreement in eyes of peoples. Therefore Sovs believed no provision for explosions for peaceful purposes should be included. Hoped US/UK would take Soviet view into account and not insist on inclusion that provision.

Turning to withdrawal clause in US/UK draft, Gromyko said Sovs believed such clause should not be included in treaty. Sovs did not

deny any party could and should have in mind hypothetical situations which could lead to certain consequences, and this of course applied to USSR as well. Wondered, however, why one should refer to this in treaty and, so to speak, relish this possibility. This would also detract from impact of treaty on public opinion and make negative impression on peoples. Did not believe US, UK, or USSR, or any other state that might accede were interested in this. Importance of agreement should be strengthened rather than weakened, and this why Sovs believed provision for possible withdrawal should not be included. Hoped US/UK would take Sovs views into account and not insist on its inclusion.

Hailsham remarked Harriman should be first to comment on Gromyko's statement, but said he also wished express certain views either now or later. He understood views expressed by Gromyko and thought they clearly must be taken account of. He wished express his views on Article 1 Sov draft and also compare US/UK and Sov drafts.

Harriman preferred hear all comments Gromyko might have before replying.

Hailsham agreed.

## II.

Gromyko observed US/UK draft provided for ban of tests in three environments but also contained, in para 1.B. Article 1, for prohibition of explosions in any other environment if such explosions caused radioactive debris to be present outside territorial limits of state under whose jurisdiction or control such explosions were conducted. Believed intent this language to prohibit underground tests with venting and consequent spread of radioactivity, and said Sovs had no objection to including it in treaty.

Gromyko said Sovs also agreed to inclusion para 2 US/UK draft Article 1 under which parties would undertake not to cooperate with other states in carrying out nuclear tests.

Turning to Article 4 US/UK draft, Gromyko noted it required unanimity for approval amendments to treaty and said Sovs had no objection to such procedure.

Re US/UK draft Article 5, para 3, Gromyko said Sovs also agreed to inclusion language providing for entry into force after ratification.

Gromyko then referred to Khrushchev's remarks re France yesterday and said had nothing to add. However, wished point out that in agreeing, for reasons indicated by Khrushchev, to having no specific reference to France USSR proceeded from premise that if France should continue testing after agreement signed Sov Govt would have to examine situation resulting therefrom. Repeated Sovs agreed have no direct reference to France in agreement.

Gromyko continued that although he not sure to what extent this should be included in treaty, he wished state Sovs prepared extend hospitality and proposed that treaty be signed in Moscow. Thought inclusion reference to this would not contradict and in fact was in full accord established international practice. Also, since these negotiations taking place in Moscow, USSR thought it would be appropriate if Sov Govt were depository government.

Gromyko said USSR Govt would do its utmost to further agreement on three-environment test ban and NAP. Therefore he wished use this opportunity express hope that each of participants should not argue over subsidiary matters or be carried away on matters of procedure. Rather, they should reach agreement on three-environment test ban and NAP.

Gromyko said these were Sov basic views on both US/UK and Sov test ban drafts though when agreement was reached on content of treaty, it would be easy cloak that agreement in appropriate specific language. Opined it should be possible agree at next or one of next meetings on text including some provisions from Sov draft and some from US/UK draft. Said did not intend at this time give any specific language for treaty and dot all eyes and cross all tees; repeated agreement on language should be easy once substance agreed. Stressed fact Sovs prepared accept some of US/UK provisions in their present form or almost unchanged, and hoped this would be duly appreciated.

Hailsham said he sure principal thoughts should come from Harriman however, wished thank Gromyko for his business-like and useful approach to business at hand. Stressed seriousness and sincerity which UK approaching present task and said he stating this on behalf HM govt and UK Del.

Hailsham continued he wished make two comments which perhaps would only be footnotes to what Harriman would say. Re explosions for peaceful purposes, Hailsham noted Sov draft provided for cessation only of weapons tests and therefore permitted such explosions. Thought this point must be clarified. Also pointed out US/UK draft provided for such explosions only by unanimous consent of original parties. If Sovs did not wish explosions for peaceful purposes, they had safeguards under this provision.

Re withdrawal clause, Hailsham said he sympathized with Gromyko's views and agreed it hard to talk about divorce in entering marriage. However, Khrushchev yesterday and Gromyko today had said they would examine the situation with respect to France; others may also have problems in circumstances of concern to them. As lawyer, he wished point out that if parties do have such considerations in mind, it better formulate circumstances now even though this may be difficult. Pointed out US/UK draft provided for notification and in absence such provision there would be danger of sudden withdrawal.

Hailsham thanked Gromyko again for his careful and extremely helpful considerations; Gromyko's agreement to some provisions from US/UK draft saved him from need for comment on some points in Sov draft. However, he wished to raise two points re Sov Article 1 which were perhaps matters of drafting. Sov draft said quote on high seas unquote, but he thought correct wording should be quote under high seas unquote. Another point was that since concept of outer space still lacking precise definition it would be better use term quote above atmosphere unquote instead of quote outer space unquote.

Harriman said he first wished assure Gromyko US approaching matter in exactly same spirit as Gromyko and Hailsham. US wanted reach agreement. Appreciated frankness with which Gromyko had expressed his objections and also acceptance some of US/UK provisions. Said would speak with same frankness and friendly spirit.

### III.

Re explosions for peaceful purposes, which proved for in Article 2, US/UK draft, Harriman noted Gromyko seemed be concerned about impact such provision on public opinion. Pointed out US/UK article divided in two parts: first part permitted use nuclear devices for peaceful purposes if unanimously agreed by original parties, while second referred to more involved formula which had not been tabled. Wondered whether Gromyko would object to retaining first proviso or whether he objected to both first and second. Observed that on basis his reading Sov press he had been led believe Sovs had some ideas re peaceful uses nuclear devices in developing their country. Also noted there had been great deal of discussion in international press of possible values such uses. Asked again whether Gromyko objected to provision for nuclear explosions for peaceful uses if it related only to first proviso in Article 2 US/UK draft. Added US public opinion had imaginatively speculated about some areas where nuclear explosions could be of some value. If no explosion were to be undertaken without approval by all original parties those concerned about such explosions might be protected. Noted he not entirely abandoning second proviso in Article 2 US/UK draft and wished talk about it, but thought it might be easier abandon second proviso if Gromyko would agree to first proviso.

Gromyko said Sovs were not proceeding on basis narrow considerations; they not concerned about whether explosions for peaceful purposes would be conducted with or without Sov approval, which would be required under first proviso. Sov view was provision for explosions for peaceful purposes would weaken agreement and detract from its importance, and this was what Sov Govt guided by. Therefore, he hoped US/UK would not insist on inclusion provision for such explosions.

Harriman said wished underline what he had already said, namely, that public opinion in US had developed considerable hopes re peaceful uses nuclear devices since such uses could open values for mankind not only in US but also elsewhere in world. We were under impression this true of USSR too. If provision of this kind was included, although its wording might not be exactly same, we believe subject would be left open. While some might be disappointed, mankind would not be cut off from future use nuclear devices for peaceful purposes. In absence such provision mankind would be precluded from enjoying possible benefits; at least that was how many people would consider this. Harriman also noted under US constitutional procedure two-thirds vote required for approval treaties in Senate and said we believe omission certain provisions would make more difficult for President obtaining such approval. Expressed hope Gromyko would give consideration to our views.

Re withdrawal clause, Harriman said he impressed by Hailsham's statement on this matter and wished associate himself with it. As Hailsham suggested, he would await Gromyko's consideration how unforeseen contingencies should be covered in treaty. Gromyko himself had indicated reservation if France should test in atmosphere. Harriman comment his govt would feel differently re withdrawal provision if Sovs could assure US that CPR would adhere in some reasonable time or that it would not become danger to mankind, which might necessitate, much as we would regret it, resumption tests by US to improve weapons for defense and deterrence. Observed he had mentioned China just as Gromyko had mentioned France.

Harriman continued he appreciated Gromyko's remarks re article 1 and his acceptance certain language from US/UK draft of that article. Agreed with Hailsham re definition of testing and thought perhaps some misunderstanding existed in connection reference to quote any nuclear weapon test unquote. We had in mind some more precise language. Noted US/UK draft Article 1 based on assumption article 2 would be accepted, but thought even if there should be any consideration of abandoning Article 2, Article 1 might require clarification. However, if there should be no such consideration or if only first proviso Article 2 were to be retained, Article 1 should also be made more precise to cover all nuclear explosions. Said this matter could be discussed in detail at some other time in order clean up text. Believed parties in substantial agreement on Article 1, particularly if Gromyko accepted broader definition nuclear explosions.

Re Article 4, amendments—Harriman appreciated greatly Gromyko's acceptance US/UK proposal amendments should be approved only if there was agreement among three original parties. Expressed doubt, however, Gromyko very clear on other contingencies provided

for in US/UK draft article 4. As far as US concerned it prepared discuss and negotiate this matter, i.e., two-thirds vote by other parties, which was to take account of future signatories. Said US did not wish place too much emphasis on this point.

Harriman thanked Gromyko for accepting US/UK Article 5, pointing out ratification clause necessary under US constitutional procedure. Noted Gromyko's proposal or mentioning USSR as depository govt. Did not wish comment on this now but suggested perhaps some neutral country could be selected which would be mutually acceptable to three original parties. As to place of signing believed that should be very easily arranged after we found out who would sign for our countries, and suggested leaving this matter open for time being.

#### IV.

Referring to Hailsham's comments on Sov draft, Harriman said if he had followed them correctly he wished associate himself with them. Believed some of them had been taken care of by Gromyko's acceptance of some language from US/UK Article 1. Suggested this matter be left aside until Sov suggestions re Article 1 put on paper. Believed matters like this should be dealt with in drafting committee or some such appropriate group.

Agreed with Gromyko perhaps some progress could be made in this connection if development specific language were based on agreement in principle with respect relevant points. Suggested each group designate representatives to participate in drafting committee. Believed large measure of agreement existed, except re withdrawal and explosions for peaceful purposes. Stressed importance withdrawal clause to US but agreed go over peaceful uses, noting, however, some satisfaction should be given to people placing high value on peaceful uses of nuclear devices.

Gromyko stated could not give any assurances re CPR in course discussion this matter or any other matter. This was clear from Khrushchev's remarks and underlying reasons should be quite understandable. Also wished to point he saw no analogy between France and CPR as France already nuclear power. Harriman had rightly said to Khrushchev France was a special case.

Re explosions for peaceful purposes, Gromyko said even if someone attached significance to this matter, he wished point out we speaking of three-environment test ban which did not cover underground environment and therefore question of explosions for peaceful purposes could be decided by each party itself. Said Sovs objected to inclusion provision for peaceful explosions not because USSR had special interest in leaving it out. If it had such interest USSR would have accepted first proviso US/UK Article 2, but it hadn't. Sovs believed

such proviso would detract from importance of agreement and hoped US/UK would not insist on its inclusion. Sovs believed this provision not only unnecessary but also harmful.

Re withdrawal clause, Gromyko said did not wish repeat himself. Sovs did not wish have such provision so as not to reduce importance of treaty. As to French problem, he had already explained Sov point of view. Each state had its own considerations, but better not include any provision. Omission such provision would be better from stand-point of all, US, UK and USSR.

Gromyko said if Article 2 re peaceful uses omitted, perhaps might be useful make language Article 1 of Sov and US/UK drafts more specific.

Re amendments, Gromyko believed what he had said made Sov attitude sufficiently clear. He proceeded from premise US/UK language clearly stated amendments should be adopted under rule of unanimity of three original parties. As to whether any language re voting procedure for other parties should or should not be included that could be discussed.

Gromyko agreed with Harriman broad area of agreement existed. Thought Hailsham would agree with this too. Urged US/UK drop two provisions Sovs believed should be omitted. Had no objection to creation drafting committee.

Hailsham referred to withdrawal problem. Noted Gromyko had suggested each party put own construction on agreement and, although this not very clear, make that construction public. That would be better than nothing at all. Hailsham noted he had spent most of his life in Parliament, which not same as US Congress but similar in many ways. Said he knew how difficult obtain agreement of Parliament to treaties, as there was always opposition. Doubted test ban agreement would be attacked in Parliament as strongly as in US Congress, which reflected many shades of opinion. However, believed agreement should not leave gaps opposition could use in criticizing treaty; hidden rocks of this kind were dangerous. Hailsham continued he did not mind saying that rather than have no agreement he would have agreement defective in this respect. However, he knew he would be subjected to criticism if he agreed to exclusion withdrawal clause. It clear from what Sovs and US had said they would have second thoughts about France and China. It was true France and China were not on equal footing now and US would not consider them as such so long as CPR did not test. However, once CPR tested US would regard it and France as being on same footing. Therefore, he saw force in Harriman's arguments. Observed did not see UK withdrawing from test ban agreement.

Re peaceful explosions, said this problem somewhat academic to UK as it had no intention engage in them. Gromyko's statement three-

environment ban would open way for peaceful explosions did not meet point as in big experiments or engineering projects there would be venting.

## V.

Harriman said he readily agreed with Gromyko re yesterday's discussion of France. He agreed there was difference between France and China since France was already nuclear power. We accepted Sov concern re France, and if Hailsham agreed we would tell USSR we would talk to France but we could not give any guarantees. Thus we understood Sov reservations in case France failed to accede or if it undertook further testing in atmosphere. Stressed withdrawal clause of really great importance to US but observed that as Hailsham had said it conceivable each party could list its reservations and omit withdrawal clause. However, that would create great problems with US Senate. He sure many more reservations might be found by Senate during consideration of treaty and some of them could be quite distasteful to USSR and some other people in world. However, this was price we paid for our democratic form of govt. Therefore, he wished urge Gromyko consider including some suitable provision for withdrawal. Language must not necessarily be US/UK proposed language but to meet our purposes formula should be broad enough to cover all our reservations, particularly testing by China. This latter reservation was not only one we had but language should definitely be sufficiently broad to cover commencement of testing which required for CPR to become nuclear power through her own efforts. We did not envisage, however, mentioning any country by name.

Hailsham agreed UK would try induce France to adhere. He had no doubts about this, but did have doubts as to degree of influence which could be exerted.

Gromyko observed Hailsham knew best characters of members his family.

Hailsham said many members his family most charming but quite difficult.

Gromyko thought most charming people are the ones who are the most difficult.

Gromyko continued he wished draw attention to fact Sovs had accepted number of US/UK provisions. Hoped US/UK would also consider points made by USSR. Re Hailsham's reference to opposition UK Parliament, believed most difficult see Labor Party opposing three-environment test ban.

Noted, however, there would be opposition of both sides of aisle if treaty were not sufficiently business-like. Appreciated Gromyko's kind and helpful approach to these discussions, as well as his accept-

ance drafting committee. Believed drafting committee should examine article 1 and other articles where problems existed. Wondered whether Gromyko could state exact extent Sov reservation re France as that would influence his own thinking.

Gromyko replied could not add much to what Khrushchev had said yesterday. Briefly, if France did not adhere and continued testing, then Sov Govt would examine situation in light of these facts. Hoped, however, that if agreement reached on test ban and NAP US and UK Govts, as France's allies, would succeed in persuading France it in its best interests to become party to the treaties.

Hailsham thanked Gromyko and said would do everything possible in this respect. Inquired re Gromyko's reaction to his suggestion for program work drafting committee.

Gromyko agreed drafting committee should work on points where substance agreed. Voiced hope US/UK would approach consideration Sov views on two outstanding questions with same attentiveness and understanding as applied by Sovs in considering US/UK draft. That would open prospects for three-environment test ban. At same time wished point out NAP should be discussed at one of next meetings. Drafting committee could meet tomorrow at ten or eleven, while another meeting of principals could be held at three PM tomorrow.

Hailsham agreed and believed that except for two points of contention sides could prepare whole text of treaty. Observed he did not attach great importance to question of depository.

Harriman also agreed drafting committee meeting tomorrow. Said wanted concentrate on test ban at this time. As to other questions wished point out not only question which had been tabled must be discussed but also other matters raised by Khrushchev, Hailsham and himself. Such discussion could be held after fruitful discussion of test ban concluded.

It was agreed drafting committee meeting eleven AM and principals meeting three PM July 17.

**Kohler**

**201. Memorandum of Conference with President Kennedy,  
July 18<sup>1</sup>**

July 18, 1963

## OTHERS PRESENT

Secretary Rusk  
Secretary Ball  
Ambassador Thompson  
Mr. William Foster  
Mr. Bundy  
Mr. Smith

Prior to the arrival of the President, the group discussed Harriman's reports and his request for instructions on several points. The comment was made that the Moscow delegation had "pact fever" and needed to be slowed down.

The President participated in a discussion of the three proposed versions of the withdrawal article (see attached paper). Mr. Bundy said that Ambassador Thompson, as well as the others present, agreed that the Soviets want a test ban agreement. Hence, if we wait, the Russians will accept what we want.

Mr. Ball said he doubted we could obtain Senate approval of the agreement if it contained the withdrawal clause proposed by the Russians. He felt that a withdrawal provision so broadly phrased would lead Senators to conclude that the treaty was illusory and that the commitment meant nothing if it could be denounced for reasons not connected with the test ban treaty at all. He added that when the Soviets resumed testing in 1961, their justification of their action was approximately the same as that proposed in the withdrawal clause.

The suggestion that Senators go to Moscow to sign the agreement led to several comments that many Senators would want to attend a signing ceremony.

The Harriman instructions were revised to reflect a more affirmative position on trade between the USSR and the West.

The President agreed to see Senator Pastors and to telephone Senator Anderson in an effort to reassure them about the course of negotiations and avoid their taking a position in opposition to the treaty before the negotiations had been concluded.

---

<sup>1</sup> Discussion of Moscow telegrams and revised instructions for Harriman. Secret. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, Test-Ban Negotiations, Harriman Trip.

There followed a discussion of how to deal with the position of the Joint Chiefs of Staff. The President asked that the military disadvantages of the treaty be listed so that we would be in a better position to deal with opposition to the treaty based on military grounds. A suggestion to hold a Committee of Principals meeting with the Chiefs was not approved.

The instructions were amended to reflect the decision that Harriman was not authorized to agree to any summit meeting without further instructions from Washington.

In response to a question about the arms control plan which Khrushchev had mentioned to Harriman, Mr. Foster said the simplest way to describe what the Russians were talking about was to recall the Norstad plan. The proposal involved static control posts and did not involve the thinning out of military forces. It did involve a kind of neutralized zone, often described as the Rapaki plan.

In connection with the Khrushchev proposal on reduction of military budgets, the President authorized the addition of a sentence, later approved by Secretary McNamara, which stated that if there is no increase in international tensions, it is our current expectation to put forward a 1964 military budget in the same range as that submitted for 1963.

## **202. Telegram 211 from Moscow, July 18<sup>1</sup>**

Moscow, July 18, 1963

At Soviet request, Thursday's session started at 4:30 p.m. instead of usual 3 p.m. In addition to Harriman there were present on US side Kohler, Kaysen, Fisher, Tyler, McNaughton, Long, Akalovsky and Cash. Harriman gave Gromyko text of President press statement of July 17 on current talks, which Gromyko said he had already read in Russian. He felt it reflected "guarded optimism." Harriman observed that when President makes public statements on matters of this kind he addresses himself primarily to the US Senate where he had to get

---

<sup>1</sup> Meeting with Gromyko: Discussion centered on Kennedy's July 17 statement, Khrushchev's July 2 statement and the importance to Soviets of non-aggression pact. Secret. 4 pp. Department of State, Central Files, DEF 18-3 USSR (MO).

sixty-seven votes. Harriman noted drafting committee had made some progress on preamble of test ban agreement but we still had some difficulty with paragraphs 2 and 3. Suggested dropping second paragraph of preamble.

Gromyko, changing subject, said he wished to say a few words on NAP. He expressed his apprehension that not all participants in present meetings were aware of importance of subject or of significance which Soviet Union attaches to it in connection with these talks. Soviet evaluation of its importance stemmed from statement made July 2 by Khrushchev in Berlin. Khrushchev had repeated this statement to Western representatives when they had met with him here in Moscow. Gromyko said he had also done his best to emphasize importance his government attaches to NAP which would be of benefit for all peoples and would favorably influence international situation. He could not of course agree that provisions which referred to an entirely different subject, i.e.: free access to Berlin, should be added to NAP text. Said he believed this was so evident that he felt "somehow embarrassed" to have to talk about this at any length. He said these matters so different that impossible raise them in same document or make one dependent on other. To say NAP contingent on clause re free access to Berlin, which part of German peace treaty problem, only complicated matter. He felt that in this exchange of views, the three powers should make every effort to make progress on both test ban and NAP which should be signed simultaneously, and said wished stress simultaneous this would have a very favorable effect on the whole international situation. He wished again to express hope that Western representatives would adopt more sober approach in evaluating importance of NAP, and be more objective in evaluating Soviet proposals. He asked whether Western representatives had any additional considerations to add to what was said yesterday.

Harriman said that Khrushchev vs Berlin speech had been certainly noted by US. He supposed that Gromyko had read statements which had been made by US and UK leaders in several capitals that on any nonaggression agreement affecting NATO we intended to consult with our allies and supposed the Soviet Government would be doing the same. He said we were on record internationally that we are not rpt not authorized negotiate on behalf our allies. We were here to listen, explore, and report back, with view of obtaining views our allies. We were prepared to take note of our discussions this subject by some language in a communiqué, and could do nothing beyond this. We could not get authority from thirteen other member states to negotiate for them. He was aware of the importance which the Soviet Union attached to NAP, and had taken note of this.

Hailsham said UK Del had noted and was aware of importance Soviet Union attaches to question of NAP. His government had noted

the Khrushchev speech as well as what he had said at meeting earlier this week, also what Gromyko had said on subject. All this had been passed on to London. However we are here to negotiate test ban agreement and do not have authority negotiate on behalf allies. Have in fact promised not to do so. If we did it would make it less rather than more likely that we would eventually get their acceptance. Said he certainly went along with what Harriman had said and would not fail inform British Government of Soviet views. Could whole-heartedly accept Harriman's suggestion re communiqué.

## II

Gromyko responded we would evidently have to continue discussion this subject at the next or one of the next meetings because the Soviet Government does attach great importance to this matter.

Harriman said would be well for Soviets understand why US and UK Dels instructed as they are. Had come in accordance with communications between Khrushchev, President and Prime Minister concerning test ban, not on NAP. First had heard of Soviet wish connect TB with NAP was in Khrushchev July 2 speech. Ready discuss and make progress with test ban. Soviet Union has of course full right take up other matters but we unable do more than record fact been discussed and indicate in friendly spirit would raise matter with our allies.

At this point Gromyko turned abruptly from NAP and asked if Harriman had views re article re withdrawal. Inquired if by chance Harriman could now agree not include such clause. Harriman said not only unable change position but Washington had advised withdrawal clause absolutely essential to obtain Senate ratification. If clause not included Senate would adopt reservation which would cause Soviet Union more difficulty than withdrawal clause. Since "withdrawal" apparently has unpleasant connotations for Soviet Union, could refer this clause as "duration" rather than "withdrawal" clause. Harriman's earnest hope was Soviets could accept language along proposed lines.

Gromyko said amendment changed little in clause. Regretted US should still feel necessary include such provision. However, Soviets could perhaps provide language for this article to meet US position. Said proceeding on understanding that peaceful uses clause dropped. At this point read text Soviet version withdrawal clause which sent separately. Gromyko stated hoped this text would prove acceptable to all as Soviets had put forward in attempt facilitate agreement. Felt lack reference to "violators" helpful, as not casting doubts on anybody's intentions. Right of withdrawal simply exercise of every state's sovereignty. Had also taken into account US-UK expression of need for advance notice. As text might require additional study, discussion of it might be postponed until tomorrow.

Harriman said at first blush Soviet proposal seemed very interesting. However wished reserve formal comment until further study and Washington's reaction which would be sought soonest. Re Gromyko's understanding peaceful uses clause dropped, said would cover this point after receipt Washington reaction.

Hailsham said grateful for Soviet spirit of accommodation and would refer text London for earliest possible comment.

In response Hailsham question concerning preamble, Gromyko said felt not so bad and would certainly wish retain reference to "general and complete disarmament." Did not understand why such general reference was problem as went no further than UN resolution. Would ask Harriman reconsider.

Harriman said general and complete disarmament usually linked with "peaceful settlement of disputes." Had been discussed long and agreement reached. Would not now like undo. Our version seems quite harmless and would be more satisfactory to US. Hoped Gromyko might agree. Phrase "all kinds of weapons" includes nuclear weapons and therefore unnecessary single out nukes.

Returning abruptly to NAP, Gromyko said raising matter again because felt there was insufficient awareness importance Soviets attach this matter. If US and UK could make step forward and conclude NAP would improve whole international situation. Could see no reason for restraint. Understood consultation necessary but wished know attitude US and UK Governments.

Harriman expressed full understanding importance Soviets attach this matter and stated this why had suggested treatment in communiqué after agreement to Soviet proposal on press statement (which sent separately) was agreed meet 3 PM tomorrow. Drafting committee meeting 11 AM.

**Kohler**

**203. Telegram 223 from Moscow, July 19<sup>1</sup>**

Moscow, July 19, 1963

Today's session began at 3 PM with same US group as yesterday.

Gromyko opened by asking for US-UK views re Soviet withdrawal clause submitted yesterday.

Harriman said had prompt reply from Washington which indicated Washington insisted reasons for withdrawal be related to topic under discussion, i.e., nuclear explosions. "Extraordinary circumstances" might be almost anything and therefore phrase should be replaced with "any nuclear explosion has occurred in prohibited environments." Also said his instructions were add to Soviet draft provision for statute of limitations. Gave Sovs language (contained Embtel 208, para 3.) Pointed out reason for addition was to prevent parties from justifying their withdrawal on grounds nuclear event in distant past. Distributed revised draft and hoped US proposal would help Soviets since it in fact limited reasons and opportunities for withdrawal and also limited time within which such action could be taken. Stressed it essential from US standpoint, particularly in order get Senate approval, that withdrawal be related to nuclear explosion. Re nine-month notification period, said it could be either lengthened or shortened if Sovs desired.

Recalling Gromyko's link between inclusion withdrawal clause and elimination article 2 re peaceful uses, Harriman said he instructed US prepared, though with reluctance, drop peaceful uses clause to conform Sov wishes. Pointed out, however, this on understanding Sovs would accept withdrawal clause with US suggested changes.

Noting US would have minor changes of purely drafting nature for article 1, Harriman expressed view withdrawal clause appeared be final problem to be settled.

Hailsham said had received communication from London less precise and categorical than Harriman's but which permitted him accept for British delegation US amended text. Said withdrawal clause must refer to nuclear explosions since this was test ban treaty. Supported arguments Harriman had made on this point and hoped US text could be accepted by Soviets. Argued this was in Soviet interest as restrictive rather than expansive. Said had no particular opinion concerning specific duration statute of limitations. Felt amendments likely have favorable effect on world public opinion. Concluded by saying British accept US amended text.

---

<sup>1</sup> Meeting with Gromyko: U.S.-U.K. views on Soviet withdrawal clause. Secret. 5 pp. Department of State, Central Files, DEF 18-3 USSR (MO).

Gromyko said Sovs generally opposed to inclusion withdrawal clause, reiterating his previous arguments re bad effect on public opinion. Pointed out if states guided by supreme considerations of their own were to decide to withdraw, they would merely exercise their sovereign rights. However inappropriate point finger at some state, though unnamed, as possible violator. Yet to facilitate agreement, particularly in view US requirements in Congress, Sovs had agreed to inclusion withdrawal clause, but clause must be acceptable to both Soviets and U.S. Hoped US would take account of Sov position as well.

Said today's US suggestions in effect represented US-UK old formula pointing at violator and thus included what Sovs believed undesirable mention in treaty. Reiterated if some state concluded certain phenomenal event occurred compelling it to withdraw, such state would be absolutely free to do so and explain reasons therefor. No one could restrict this right of states. Thus Sov formula took account of US position while at same time met Sov needs and thereby enabled USSR agree to inclusion withdrawal clause.

Gromyko then distributed text TB draft treaty reflecting their position at this point which he said could be basis for agreement, but noted this on assumption there would be simultaneous agreement on NAP. (Text of TB draft being analyzed.)

Harriman stated US could not accept Soviet draft withdrawal clause without changes had indicated. Stressed again this essential requirement and not whim. Said would study Sov test ban text and Sovs should study his remarks re withdrawal clause as this of primary importance to U.S.

Gromyko asked US-UK study Soviet TB text. Said Sovs had taken into account US position re withdrawal but US should not make this article unacceptable to USSR. Both sides should take account of each other's positions.

Harriman said wished point out he had been instructed US would not accept Sov language for withdrawal clause. In sharp reaction, indicated importance of issue to US, stressed that Sov should give it serious consideration and intimated issue might be breaking point.

Gromyko commented he had no doubts Harriman had received instructions but Harriman should not ask USSR to accept US position. If only one side were to make concessions that would be very bad and not only in this context. Said Sov withdrawal language did not expand reasons for withdrawal, but gave states right make appropriate decision and explain its motives. It difficult expect harmonious solution this problem if one side were to say its conditions must be accepted. Each side should make efforts meet halfway. Harriman denied US adopting a take it or leave it approach; all the US asking Soviets was give consideration to its views. Urged Sovs take US views most seriously

for reasons explained earlier. Pointed out nothing Gromyko had said changed US positions. Hope agreement on this vital matter could be reached at the next meeting.

Hailsham said wished take full account Sov position but was not sure understood it fully. Soviets recognized French problem and US concerned about another power. Said UK less concerned re both countries. US suggested clause takes account both problems. Main contention now is whether “extraordinary circumstances” should be more specifically defined as US proposed. Hailsham had not yet understood what Sovs find objectionable in US draft which merely defined what “extraordinary circumstances” refer to. Suggested should not pursue matter indefinitely at this time but should consider carefully before next meeting. Requested US draft be carefully studied.

Gromyko reiterated if parties desired agreement they should make effort meet halfway, as this standard procedure in negotiations. Therefore he did not like it if anybody told him here is my position, accept it or there will be no agreement. This would not be right in any negotiations. Sov Govt desired agreement and both Harriman and Hailsham had recognized Sovs had met US-UK position on some points.

Re Hailsham’s request for clarification Sov difficulties with US US suggested changes for withdrawal clause, Gromyko repeated argument re undesirability of referring to possible violators. Also repeated Sovs had taken account of US difficulties in Congress and put forward formula they believed would enable states to withdraw and state their reasons therefor. Sov formula did not restrict such freedom but at same time it did not weaken treaty by mentioning possible violators. Contended Sovs had no one-sided interest in this matter and believed Sov formula was in full accord with international public opinion. Hoped these views and Sov language would be studied further.

At this point, Gromyko said main difficulty, and he wished stress it was the main difficulty, in these negotiations was question of NAP. Suggested conversation so far had given sufficient food for thought for next meeting and believed group could adjourn to meet tomorrow at 11 a.m.

Harriman wished make few comments before adjournment. Said Gromyko in explaining his objections U.S. formula had indicated belief our wording referred to one of the three as possible violators. We understood this objection in context our original language but wished to point out nuclear explosion referred to in new US suggestion could be set off by anyone outside the three; indeed we did not believe any of the three would conduct a nuclear explosion in environments proscribed. Harriman then said Sovs might object to phrase “prohibited environments” in the US suggested amendment; if this were case US prepared replace phrase with something like “three environments

described above." Thus word "prohibit" which might have odious overtones to Sovs, would be eliminated. Perhaps Gromyko would consider this possibility.

Harriman thanked Gromyko for stating frankly his difficulties with US suggestions and said would make effort meet them assuming Sovs would accept inclusion reference to nuclear explosions in place extraordinary circumstances. Said did not ask for immediate reply and hoped Gromyko would study problem.

Gromyko responded Harriman's remarks changed situation but little. Hoped US would study Sov language objectively and was sure US would find it quite suitable to all.

Hailsham asked if he understood correctly Sov position to be that any attempt to define circumstances as relating to nuclear event would be objectionable even if language were found which would not imply violation.

Gromyko said, "Yes, indeed!"

At end of meeting in response to question by Hailsham, Gromyko summed up his position. It undesirable to have direct reference to violation or to nuclear explosions. It is better to use broader language, which would cover explosions. Of course all of us would understand that this is what is referred to. Although it goes without saying, any state could exercise sovereign right to withdraw. We have no intention of carrying out nuclear explosion and we believe you have no such intention.

Hailsham said would give matter careful thought. Most important overcome this particular difficulty. Preamble not so important as treaty itself.

Was agreed next meeting would be at 11 a.m. tomorrow with no drafting committee meeting beforehand.

**204. Telegram 224 from Moscow, July 19<sup>1</sup>**

Moscow, July 19, 1963

From Harriman and Fisher. At drafting committee meeting today US tabled a “package deal” involving the following elements based on those elements believed to be acceptable in Soviet original draft. The text was offered as a package and ad referendum to principals.

Begin verbatim text. The Governments of the Union of Soviet Socialist Republics, the United Kingdom of Great Britain and Northern Ireland, and the United States of America, hereinafter referred to as the “Original Parties,”

Proclaiming as their principal aim the speediest possible achievement of an agreement on general and complete disarmament under strict international control in accordance with the objectives of the United Nations which would put an end to the armaments race and eliminate the incentive to the production and testing of all kinds of weapons, including nuclear weapons,

Seeking to achieve the discontinuance of all test explosions of nuclear weapons for all time and determined to continue negotiations to this end, and desiring to put an end to the contamination of man’s environment by radioactive substances,

Have agreed as follows: End verbatim text.

The Soviets also refused agree to the proposal that article IV be amended to provide for simple majority of all of parties after all original parties had approved. US reserved positions for plenary. Soviet indicated they would not consider dropping article VI and US indicated they would agree to article as previously offered. US indicated that might be necessary to make technical drafting change based on Deptel 237 explaining difficulties of possible ambiguities. Did not table language then but at plenary tabled following language which believed to meet possible ambiguity at least as well as language suggested Deptel 237 which open to same ambiguity and which involved less change qte to prohibit and prevent the carrying out of any nuclear weapons test explosions, and the carrying out of any other nuclear explosion, at any place etc. Unquote Believe the placing of commas around the phrase qte and the carrying out of any other nuclear weapons explosion unqte makes it clear the subsequent language applies to both nuclear weapons test explosion and other nuclear explosion. At same time suggested conforming language of paragraph 2 of article

---

<sup>1</sup> Text of U.S. tabled “package deal.” Unclassified. 2 pp. Department of State, Central Files, DEF 18–3 USSR (MO).

one by having it read qte the carrying out of any nuclear weapons test explosion, and the carrying out of any other nuclear explosion, anywhere etc unqte. Matter referred to drafting committee for next meeting. Soviets also introduced complete treaty text purporting to include compilation of all positions to date in treaty form. Text now being analyzed. In view of fact that Soviets had already accepted article V of our proposal did not recommend amending accession clause as though recognition problems could be handled other way. Soviet acceptance of US, UK and USSR as joint depository will facilitate this problem.

Kohler

---

**205. Telegram 239 from Moscow, July 20<sup>1</sup>**

Moscow, July 20, 1963

Saturday session began at 11 AM with same US group as on Friday.

After an exchange of pleasantries, Harriman asked if Gromyko had a solution to our problems.

Gromyko replied he had asked yesterday that we give thought to Soviet formulation which they felt should be acceptable to all parties.

Harriman said he had thought over Soviet proposal and re-read yesterday's record particularly Gromyko's final summary in answer to Hailsham which stressed elimination all direct reference to "violation" and "nuclear explosion." Prepared meet Soviets half way re "violation" if Soviets can agree to refer to "nuclear explosion." Soviets have said preferred broader language which would cover explosion but this language so broad and sweeping would give impression treaty illusory and would fail give it dignity in eyes of world. Harriman had also been advised that withdrawal must be related to occurrence of nuclear test in order obtain Senate ratification. If withdrawal not so related, Senate would pass reservation causing great difficulty. Question is how to deal with this problem. US, UK and USSR all want treaty and therefore hoped Soviets could accept our language.

Gromyko asked see text.

---

<sup>1</sup> Meeting with Gromyko: resolving the finer points of acceptable language. 7 pp. Department of State, Central Files, DEF 18-3 USSR (MO).

Harriman said text same as yesterday's except "prohibited environments" changed to "three environments previously described."

Gromyko said this very minor change.

Harriman responded was improvement compared with our original text which had referred to "violation."

Gromyko admitted some improvement but still insisted very minor. Said yesterday Harriman and Hailsham had said Soviet formula broader than desired. Had pointed out formulation implied state could base its decision to withdraw from treaty on considerations far broader than those contained in treaty itself. Gromyko said he had gone into great detail yesterday in attempt explain matter but to preclude any possibility misunderstanding wished propose another version this article based on wording "related to the contents of the treaty" (sent septel).

Harriman expressed appreciation Soviet efforts find new language. Would have consult Washington before expressing opinion.

Gromyko, switching to English, said wished also state Soviets prepared accept language in preamble referring to general and complete disarmament in conformity UN purposes as suggested by US.

Harriman expressed gratitude and asked if Soviets had given further thought to Article 3. If Soviets would agree drop their language we could withdraw our proposal concerning "by means of effective treaty provision."

Gromyko asked to hear text and following then read to him in both English and Russian: "Seeking to achieve the discontinuance of all test explosions of nuclear weapons for all time and determined to continue negotiations to this end and desiring to put an end to the contamination of man's environment by radioactive substances."

At this point Hailsham said Russian text was improvement.

Harriman then asked about treaty title.

Gromyko said felt perhaps better specify in title ban on nuclear weapons tests as this would have more favorable psychological effect on public opinion which considers this treaty as applying to nuclear weapons. Denied that this matter of principle or of any special interest to Soviet Union.

Hailsham asked whether subject should be "treaty for ban nuclear weapons tests."

Gromyko responded that might be better.

Harriman said the US believed wiser specify in title three environments covered by treaty, so as not to create confusion in public mind. However, if Sovs preferred no reference to environments he would ask for Washington's reaction. While matter not substantive, if of such

psychological importance that unless Sovs could accept reference to three environments today, it would have to be referred to Washington.

Gromyko contended Sovs had no special motives re this matter, but believed from public opinion standpoint, particularly from standpoint those unfamiliar with fine points of problem, better concentrate in title on main point as scope of treaty determined by its contents so that no one would have any doubts re what was intended.

Harriman reiterated this not question of substance, only of public reaction, but would refer to Washington.

Hailsham did not believe UK Del would find any difficulty re preamble or title and therefore did not wish prolong discussion these matters. Re withdrawal language suggested by Sovs today, believed it represented substantial improvement over previous Sov text, and thanked Gromyko for having been able find such wording. Since Harriman was to refer to Washington, he thought he too should reserve his position until he communicated with London. However, personally he believed new Sov language was substantial improvement and therefore he did not wish minimize Sov effort.

Harriman then referred to article I noting it had been tentatively agreed in drafting committee and recalling subsequent US suggestion language para 2 should conform to para 1. However, article I in Sov draft treaty received yesterday contained some new language causing US certain difficulties; we would like preserve language tentatively agreed in drafting committee, with one modification he had indicated.

Gromyko said Sov draft treaty was composite text including article I with certain changes which Sovs believed should be acceptable to US/UK.

Harriman reiterated brand new language in that article caused difficulty.

Hailsham said new Sov language para 1-b, Article I, unintelligible. He could not understand it because purpose previous wording was to add to treaty coverage additional environment, i.e., underground explosions with venting. As he understood, Sov addition meant such tests should also be prohibited under future comprehensive ban; however, if there should be comprehensive ban it would cover all environments, including underground and therefore difficult understand why this clause necessary. Underground explosions with venting would automatically be covered in comprehensive treaty. Wondered whether reason for lack of clarity Sov addition perhaps lay in translation problems.

Gromyko believed there was no problem of translation. Point was that according to para 2, which had been proposed by US/UK, there were tests in a very special category, i.e., not fully underground and

not fully in any of other three environments. Para did not deal with underground explosions as such but with vented underground explosions. Therefore, Sovs believed it should be clarified in treaty how this particular problem would be settled in future. Since question of such special tests had arisen it would be better, perhaps for political reasons, to include Sovs suggested language. He could see no demerits but only merits in that language, since it would strengthen the treaty without predetermining anything in future. While addition was not major, Sovs believed it useful.

Hailsham understood Gromyko's remarks to mean comprehensive treaty would override limitation set forth in para 1–b. If that was so, he saw no difficulty in accepting Sov suggested addition but wished clarify what it meant.

Gromyko said such understanding could be correct, provided future agreement covered all four environments including underground. On other hand very specific situation would arise if future agreement covered only underground tests and not such tests as might be regarded as half underground and half atmospheric.

Hailsham said he had no objection in principle to addition, but believed improved language should be found. Believed this was only point of substance he wished to raise as other differences between US and Sov versions were purely matter of phraseology and UK could accept either version. If there were any differences in substance two versions, he wished respective sides tell him what they were. He could not see any problems of substance.

Harriman pointed out problems did arise. All these matters had been discussed in Washington for many months, but now we were faced with some brand new language. We believed treaty should stand by itself and should not deal with what might happen in future, possibly in some other form. Thought underlying Sov addition was included in preamble clause expressing hope comprehensive ban would be achieved. Since Sov addition could cause difficulties in Washington and had no clear object but only complicated matters, we wished ask Sovs remove it. New Sov draft also presented some difficulties of drafting nature, but since those might be due to translation or punctuation they should be referred to drafting committee. Hoped Sovs would remove this complication and agree refer to drafting committee Article I for final editing to make language as clear as possible to all.

Addressing himself to Hailsham, Harriman stressed these articles had been studied at length in Washington and each of phrases had definite meaning to conform with objectives we believed should be covered.

Gromyko asserted could not understand nature Harriman's doubts and requested clarification. Wondered where Harriman saw drawbacks

in Sov addition. He could well understand articles had been studied for months in Washington, but addition had been proposed not to weaken treaty but only to clarify it. Wondered whether Harriman's doubts lay in belief Sov suggested language prejudged solution of question of future explosions of this kind.

Harriman said there were two points he wished to make clear. First, Sov addition meant rewriting of this para from what had been agreed in drafting committee. This para had been carefully drafted to cover all contingencies and without study one could not answer what problems addition would create. That was why he had suggested drafting committee study problem to see that all requirements and situations were covered. Second, there was matter Hailsham had spoken about, i.e., reference to future treaty. It was unusual to speak in text of one treaty of what some other treaty should cover. Reiterated this treaty should stand by itself and should not prejudge what should be covered in other. Language calling for achievement comprehensive test ban appropriate for preamble and indeed was already contained therein. We believed quite unusual have substantive part of treaty covering points of some future treaty not yet in existence. Certainly, when we came to comprehensive treaty we must be clear what should be covered and make sure no loophole would be left, but to prejudge this now would only complicate rather than clarify situation. Reiterated hope Sovs would remove their addition particularly as added nothing to present situation.

Gromyko had no objection to drafting committee studying this language and attempting agree on it. He now had clearer understanding Harriman's doubts but believed they not justified. Sovs did not believe their additional language would prejudge future settlement this problem for there were only four environments and thus in comprehensive treaty one could add only one environment, i.e., underground. However, if Harriman believed present Sov suggested language in some degree prejudged nature future treaty then perhaps language could be used indicating that provision para 2 would be in effect until this problem was settled in future agreement, without speaking of nature of settlement.

Harriman observed effect would be same whether language included or not.

Gromyko commented this was not matter of substantive but Sovs believed better include such language.

Hailsham said he was impartial on this point.

Harriman suggested attempt be made find some language which would be clearer from standpoint our objectives. In any event matter must be carefully studied. Opined principal reason for Sov suggested addition was propaganda rather than substance. If addition was to be

made purely for public opinion reasons we might consider it. However, we wished obtain Washington's reaction to this matter, as Washington believed Article I had been settled.

Re articles II and III new Sov draft, Harriman said they under study by legal experts, and Washington had somewhat different language for them. However, did not believe any points of substance or principle were involved and therefore suggested they be referred to drafting committee as well.

Hailsham believed this was purely matter of language. While of course one could read different meaning into Sov and US versions he personally could put his name under either.

Gromyko agreed no matters of substance were involved.

Harriman noted Article IV new Sov draft (withdrawal clause) was one that created greatest difficulty. As to Article V that draft there appeared to be no problems.

**207. Memorandum from Ball to President Kennedy, July 22<sup>1</sup>**

July 22, 1963

## SUBJECT

Proposed Nuclear Offer to De Gaulle

An offer of nuclear assistance to General De Gaulle to induce him to sign a test-ban agreement would, in my judgment, be generally interpreted as a departure from our announced policy of discouraging independent national deterrents. You stated this policy eloquently to the European people in your Frankfurt speech.

To depart from a policy of this importance is a major step with far-reaching implications. Before you finally decide on this new course, I urge that the decision be thoroughly examined and tested against all possible consequences. I am encouraged in venturing this admonition by the views that David Bruce has put forward in his telegram this afternoon (Deptel 491 of the Mum series). Bruce vigorously argues against a nuclear offer to De Gaulle.

Whether or not General De Gaulle would accept an offer from us if we decide to make one is a matter of speculation. It would, I think, depend to a considerable extent upon the conditions that we attach. But, without regard to the General's reaction, the mere fact of our making such an offer would itself raise serious problems in our relations with other nations.

I foresee so many difficulties in the new line of policy we are considering that I feel obliged to call to your attention some of the implications as I perceive them.

This memorandum will consider three questions:

First: Is it desirable to make a nuclear offer to De Gaulle?

Second: If so, what should be the form and conditions of that offer?

Third: What should be the timing of our offer?

## I.

## SHOULD WE MAKE AN OFFER TO DE GAULLE

*A. Arguments in Favor*

The arguments that have been advanced in favor of offering nuclear technology to the General are, as I understand them, the following:

---

<sup>1</sup> Proposed offer of nuclear assistance to de Gaulle. Secret. 12 pp. Department of State, Central Files, DEF 18-8.

1. We can hope to persuade General De Gaulle to sign the test ban only if we give him the technology he would otherwise derive from testing. If we do not do so, he will refuse to sign the treaty, continue to test, and thus give the Soviet Union an excuse for withdrawing from the agreement.

2. The French have been working on a nuclear deterrent since 1955. It would be unfair for us to seek to prevent them from perfecting their deterrent through testing, especially since we have helped the British.

3. Khrushchev already recognizes France as a nuclear power, and since he has not shown interest in a non-dissemination agreement, he can hardly complain if we help the French gain greater nuclear competence.

4. We have already crossed the line of showing our willingness to help France by offering De Gaulle the same deal that we offered the British after Nassau.

Even stated in this partial and elliptical form, these arguments have weight, and they should not be casually dismissed. If this was all there were to it, we would seem well justified in making a nuclear offer to France. But a decision of this gravity must be balanced against the totality of its consequences, and if that exercise were carefully undertaken I am confident that the dangers and disadvantages would show themselves as substantially outweighing any possible benefits.

*B. Arguments Against Making Offer*

1. *It is wrong to assume that continued French testing would necessarily disrupt the test-ban treaty.*

There is little basis for believing that, if, after a test ban is signed, De Gaulle were to set off a nuclear explosion, the Soviet Union would withdraw from the test-ban agreement. Such a contention assumes that the Soviet Union does not want the agreement in the first place and, once it was signed, would seize the first excuse to abrogate it. But the impression of Averell Harriman and the others in Moscow is quite the contrary. They feel that the Soviet Union very much wants the test-ban agreement.

I recognize that it is hazardous to try to assess Khrushchev's motivations. There is, however, reason to believe that he has two purposes in mind:

1. He genuinely wants to prevent nuclear dissemination, presumably because he wants to keep the deterrent out of Chinese and German hands.

2. He would like to use the test ban as a means of mobilizing sentiment against the Chinese, particularly in the LDC's where he is engaging in an internecine struggle for control of the national Communist parties.

If these are, in fact, the Soviet Union's motives, there is no particular reason to think that Khrushchev would opt out of the agreement simply because France tested. One has to consider the world climate in which such a test would occur. If, as seems probable, almost all the nations of the world will promptly sign the test-ban agreement, the French action would be likely to induce a widespread and hostile outcry. No doubt the Soviet Union would play a leading role in the jeering section, but I think it highly doubtful that it would abandon the advantages of appearing on the side of peace by destroying the agreement.

After all the USSR would have great difficulty in persuading the world that the French bomb tests were of a nature that "jeopardized the supreme interests of its country", as the present draft treaty specifies. And Mr. Khrushchev has made it perfectly clear that a French bomb holds no terrors for him (as a German bomb might).

Nor do I think that a French bomb test would bring public censure on the United States or the other nations of the Western alliance. The rotten eggs would fall, with considerable precision, on France—particularly if we continue to make clear that we oppose the spread of national nuclear deterrent.

2. *Our offer to help France would create difficulties with the USSR.*

But if the Soviet Union would probably accept a French bomb test without destroying the treaty, I do not believe it would stand still while we provided France with the technology that testing would otherwise provide. I think we could expect vehement charges of bad faith, and that these charges would find wide credibility around the world.

Moreover—and this is of great importance—our assistance to France would almost certainly increase Chinese pressure for similar assistance from the USSR. If a principal object of the test ban treaty is to frustrate China's ambitions to become a nuclear power, we would seem to be running the wrong way with the ball.

3. *An offer to De Gaulle would create a potentially dangerous problem in our relations with West Germany.*

The most serious hazards that might flow from our helping De Gaulle—or from our even offering to help him—would be in connection with our relations with Germany. Over the years ahead, Germany will provide the focus of danger for our European policy. As I have written to you before, the clearest lesson of the between-wars period is that the Germans can become dangerous if they are (1) isolated, and (2) given a sense of grievance.

In helping the French, we would be in the position of assisting De Gaulle's clearly announced ambition to gain a preferred status for France in Europe and the Atlantic world. At the same time, by expecting them to sign the bomb-test treaty we would be asking the Germans to

join in a self-denying ordinance condemning them to a permanent non-nuclear status—in other words, to a status of permanent discrimination.

The Germans would be unlikely to derive much comfort from the argument that De Gaulle would put his deterrent force at the service of the West. In view of his past relations with NATO, this is not very persuasive.

The risk of an offer to De Gaulle at this time is, of course, magnified by the fact that, with the departure of the Chancellor in October, Germany is moving into a new and much less certain political era. The spectacle of the French military and French scientists working with Americans on an exclusive basis could be a festering source of grievance that might get worse over time. For I think it quite unrealistic to assume that, if we provide France with limited technology in order to enable the French to avoid bomb tests, we will abruptly cut off our nuclear cooperative relationships with France immediately thereafter. Much more likely, we will be inaugurating a nuclear relationship not unlike that which we presently have with Great Britain. Over the years I think this will become increasingly less tolerable to the Germans.

*4. It would cause dismay and reassessment in other member countries of the Alliance.*

For the other Western Europeans, as well as for the Germans, our offer to assist De Gaulle with nuclear technology at this time would, I think, tend to undo much of the achievement of your European trip.

Many of our European allies would interpret such a move as indicating that we did not mean what we said when we spoke out against national nuclear deterrents. They would regard it as proving that the General had adopted the right tactics in his treatment of America, that we are susceptible to blackmail, and that the most effective way to deal with the Anglo-Saxons is to be beastly to them.

No matter how carefully we explained our action, I fear it would be regarded in Europe as a sign that the United States was turning away from its policy of partnership with a united Europe in favor of bilateral deals with the man who has done the most to disrupt progress toward European unity.

These reactions could be expected not merely from Germany, but from Italy and the Benelux. In fact, I think we should take a careful reading as to the possible effect on the policies of the new Italian Government during this highly critical period.

*5. It would harm our position with the LDCs and the rest of the world.*

If, at the time of signing the test-ban agreement, we simultaneously assist an ex-colonial power in its efforts to enter the nuclear club, we will destroy a part of the moral advantage we might otherwise obtain from the test ban. In fact, our action is likely to be misunderstood and

resented particularly by the less developed countries who will see some hypocrisy in our seeking a test ban in order to halt nuclear proliferation while at the same time assisting another nation to achieve nuclear capability.

6. *Harmful consequences will flow from the offer, whether or not it is accepted.*

In making a nuclear offer to De Gaulle we risk considerable damage to a variety of vital interests—whether or not the General buys what we offer. The mere fact of our tendering assistance—taking into account that the Soviets presumably do not wish to be pressured into making a similar offer to the CHICOMS—will indicate that the Western white nations are willing to share the bomb with other Western white nations—but not with people of different color. The CHICOMS would be likely to make a propaganda field day out of this.

7. *It is not in our national interest to encourage a French deterrent.*

Nevertheless—in spite of all of these dangers—I think we could afford to absorb the discontent of the rest of the world with our nuclear offer if it were clearly in our interest that France should become an effective nuclear power. It seems to me, however, that the facts are quite the contrary.

Why, after all, is General De Gaulle interested in having nuclear weapons? He has made it crystal clear that he regards a nuclear weapons system not as something to be placed at the service of the West but as an instrument of specifically national interest. He does not think of a French national deterrent as a supplemental force to be used alongside the American force; he sees it rather as a force he can employ in the event that the United States chooses not to use its force when he thinks French interests require it. He has recognized quite candidly that, as a supplement to the American force, the *force de frappe* is unnecessary, but he wants to be able to enforce French policy in the event that French policy is contrary to our own. In other words, he desires an independent force primarily *for the purpose of being able to frustrate American policy* when he chooses to do so.

Under these circumstances we cannot expect that De Gaulle will be prepared to put his nuclear force in NATO even to the extent to which we and the British have committed our nuclear forces. The General has made clear that he regards NATO as an American creature, and, even if he were to agree to the Nassau formula, he could be counted upon to give a peculiarly Gaullist interpretation to the phrase “supreme national interest”. Can anyone doubt that he would withdraw that force whenever it suited his special purposes, as he has already withdrawn the French fleet or as he withdrew most of the French army to serve in Algeria?

But if it is against our national interest for De Gaulle to have an independent deterrent, it is even more clearly against our national interest for us to help him achieve it. As David Bruce has pointed out with great clarity in his telegram, there are compelling reasons for us not to hasten the day of De Gaulle's becoming even a minor nuclear power. And the more the General is faced with delay and mounting cost, the more will be the pressures on him to play a cooperative role in the Alliance.

There is, moreover, a further reason favoring delay. If we do not help the French now, I think it likely that, if and when the British Labor Party comes to power next year, they will begin to phase out the British deterrent, which could relieve the ultimate pressures for nuclear capability in other countries. But they will probably not feel able to do so if we are actively helping France.

#### WHAT SHOULD BE THE CONDITIONS OF A NUCLEAR OFFER?

If—in spite of the foregoing considerations—it is decided that the U.S. should make a nuclear offer to De Gaulle, I think it essential that you make clear from the outset that the offer is not for the purpose of facilitating De Gaulle's ambition to achieve a nuclear capability he is free to use at will for his own special national interests. At the minimum the offer should be unequivocally conditioned on at least as firm terms of assignment as were employed with respect to the British Polaris.

The present draft of the proposed letter to General De Gaulle does not make this point clear. It provides merely that we "would be willing to explore alternative means by which the necessary technical information could be made available for your program."

De Gaulle has repeatedly emphasized that he is not interested in building up NATO, and he has already rejected the Nassau deal. Under these circumstances it would not be unreasonable for him to interpret this language as suggesting that, at long last, we were ready to help him develop his program on the terms in which he has conceived it—as a specifically French deterrent.

Under these circumstances I think it likely that, if we do not make ourselves clear and precise from the outset, he will feel—or at least pretend to feel—when he learns our true intention, that the perfidious Anglo-Saxons have tried to do him in again.

There is another serious danger in not making clear at the outset what we have in mind. I would assume that, at the time a message is sent to De Gaulle, you will simultaneously be in touch with Adenauer—and probably with Spaak, the Italians, and the Dutch. In order to justify our nuclear offer to France, we must emphasize to them from the very beginning that our technology will be provided only on the condition that De Gaulle puts his force at the service of the West through NATO.

Yet you cannot say this to the others without at the same time saying it to De Gaulle.

Under the circumstances, I think it essential—if it is decided to go ahead—that we make quite clear in the initial letter the general conditions we have in mind. It would be far better to have De Gaulle reject the offer out of hand, than to upset our other partners by leading them to suspect that we might be prepared to help him on his own terms.

### III

#### WHAT SHOULD BE THE TIMING?

The present draft letter to De Gaulle has been prepared on the assumption that it would be promptly sent so as to reach the General prior to the conclusion both of the test-ban treaty and of his press conference on the 29th. The apparent assumption is that De Gaulle, in conducting his press conference, might thus be led to tone down any denunciatory language directed at the test-ban treaty.

I would not pretend to know whether an approach to De Gaulle during the coming week might persuade him to change his tune on July 29. He has already made clear to the world that he intends to continue testing in order to perfect his independent national deterrent, and he is unlikely to change that line until a bargain is in hand—although an approach now might induce him to lower his voice.

But I think there are good reasons why we should not be too hasty.

If we make clear in our initial letter that we expect the General, as a *quid pro quo*, to assign the *force de frappe* to NATO, we shall be more likely than not to receive a negative reply, and it is possible that De Gaulle would tee off on this offer in his press conference as he teed off on the Nassau offer on January 14.

On the other hand, if we send him the type of “come-on” letter now suggested, we may evoke a blander reaction on July 29, but we run the risk of a more violent attack when De Gaulle finds out what we are really up to.

Timing is important not merely in relation to the world effect of a test-ban treaty but also in relation to the process of Senatorial ratification. In this connection we should consider whether it is better to risk a rejection of the treaty on July 29 or a more angry attack a week or two later after De Gaulle has ascertained the conditions we have in mind. In any event, I doubt if it would be possible to postpone all reaction from the General until after ratification was completed.

As between the alternatives of an immediate ambiguous approach that might blunt the edge of De Gaulle’s words on the 29th and a franker disclosure of what we have in mind, I should certainly recommend the latter. But I do not believe that an immediate approach in either

form is a good idea. I would, instead, prefer David Bruce's suggestion that we merely inform De Gaulle at this point what we propose to do in Moscow, withholding any suggestion that we might meet his needs for technology. The General would no doubt speak his mind on July 29, but I do not think that his rejection of the treaty would come as much of a surprise to the world.

Meanwhile, other voices will be heard. I think, in fact, we can look forward to a rising pitch of gratification as the world waits for the conclusion of the treaty, and immediately after the treaty is concluded I think we can expect most of the nations of the world to queue up in order to establish their peaceful intentions by becoming early signers. In such an environment of expectation a dissenting French voice will lose its resonance in the manner of the Cuckoo's as Spring wears on. And it will become increasingly difficult for De Gaulle to maintain his obduracy—particularly since he is likely to be under substantial pressure from the African members of the French Community as well as from his European neighbors.

At that time—hopefully—we might find a feasible occasion for organizing our other European allies in a common approach to the problem of the French deterrent. Certainly it would be far better to work toward this objective than to try to capture the Gaullist citadel with only our Anglo-Saxon partner to keep us company.

**George W. Ball**

---

**208. Telegram 271 from Moscow, July 22<sup>1</sup>**

Moscow, July 22, 1963

Today's session began 3 pm with same US group as last meeting. Fisher began by reporting proceedings drafting committee this morning.

After some discussion various points in Article 1 tentative agreement reached on following:

(1) Sovs accepted inclusion of qte to prevent unqte following qte to prohibit unqte in para 1; (2) US/UK accepted language para 1.a subject to minor editorial changes; (3) in para 1.b, add after qte con-

---

<sup>1</sup> Readout of July 22 meeting with Gromyko. Secret. 5 pp. Department of State, Central Files, DEF 18-3 USSR (MO).

ducted unqte qte it is understood in this connection that the provisions of this subparagraph are without prejudice to the conclusion of a treaty resulting in the permanent banning of all nuclear test explosions, including all such explosions underground, the conclusion of which, as the parties have stated in the preamble to this treaty, they seek to achieve. Unqte; (4) Sovs agreed make language para 2 conform to language para 1.

Re (1) above, there was no discussion.

Re (2) above, Gromyko expressed concern US language did not cover underwater explosions in inland waters. Harriman and Hailsham said neither US nor UK intended conduct such explosions; assumed Sovs had no such intentions either and accepted Sov language.

Re (3) above, there was lengthy discussion in course of which Gromyko's main point was that since para 1.b in effect created a special category of explosions it should be made clear that such explosions would be covered by any future comprehensive treaty. Harriman and Hailsham said intention was have all types nuclear explosions, including those referred to in para 1.b, covered by any future comprehensive treaty. Harriman pointed out, however, that Washington's preference was to reflect this intention in preamble rather than body of text, saying para 3 preamble could be appropriately modified for that purpose. Gromyko countered preamble already agreed and such solution would only complicate matters. Suggested brief recess so that principals could consult advisers. During recess US/UK developed language which Sovs accepted with minor drafting changes. Harriman stressed language subject to Washington's approval.

Re (4) above, there was no discussion.

Gromyko then proposed turn to Article 4 ("withdrawal" clause). Asked if any comments on Sov proposal.

Harriman said thought matter could be handled without changing Russian text simply by agreeing to difference English translation Russian terms, i.e., substitution qte subject matter unqte instead of qte contents unqte and qte extraordinary events unqte instead qte extraordinary circumstances unqte. It was agreed these new translations would be English text with Russian text remaining unchanged.

Harriman then raised problem of qte peaceful uses unqte. Said although this not rpt not now rpt now mentioned in treaty, he had discussed matter with Khrushchev yesterday. Khrushchev had spoken of great new Sov projects concerning canals and reversing flow of river. US had considered possibility of new canal across Isthmus Panama. Such projects might involve qte peaceful uses unqte. Under terms of article on amendment this might be possible by agreement all original parties. Harriman stated merely wanted make record clear that any

one of the parties who wished in future use atomic energy for peaceful purposes might raise matter in this fashion. Gromyko agreed saying Sov position on peaceful uses had been stated in context treaty under negotiation, without prejudging issue for future. Harriman said would now be able say amendment could be requested and Sovs agreed consider it without prior commitment.

Concerning amendment, Gromyko inquired whether would be two-thirds or simple majority. Harriman said preferred simple majority which would make it easier for USSR, US and UK to accomplish what they wished. Gromyko said had no objection to simply majority. Harriman suggested, and Gromyko agreed, include in para 5, Art 5, reference to withdrawal notices.

Gromyko said next wished discuss situation which would be created if French refused adhere treaty and continued test. In this event Sov Govt would wish re-examine situation. This serious matter and he hoped US and UK efforts persuade France adhere would be crowned with success. Add Sov Govt reserved right issue formal statement concerning France at appropriate stage progress this treaty.

Gromyko said wished again point out Soviets proposing in all seriousness return to subject of NAP. Would like recall Khrushchev statement re importance this subject and his remarks re favorable consequences which would ensue from signing such pact. Trusted no one would deny that 3-environmental TB treaty does not constitute disarmament or even beginning of disarmament although of positive significance. But simultaneous conclusion both TB and NAP would certainly have definite positive effect and lead to international détente. Would also create more understanding among states and more favorable atmosphere for study other question, particularly German question and settlement situation West Berlin. Said did not know whether others ready this meeting say anything new re UK and US position re NAP, but in accord Soviet Government position must emphasize again importance attached NAP in combination with TB.

Harriman said wished postpone discussion France until three principals meet privately later. Gromyko agreed. Harriman stated we fully recognize seriousness which Soviet Government attaches NAP and yet at loss how deal with other than in communiqué saying we prepared take matter up and discuss with respective allies who of course would be affected.

Gromyko regretted Harriman had said little new. Said there was evidently still belief NAP would yield income or dividends to Soviets but this was not case and was not reason they pursuing it. NAP would be useful for everyone in easing international tension and benefitting cause of peace.

## II

Hailsham stated UK delegation had no doubts re importance Soviet Government attaches this matter, was particularly anxious achieve détente. Problem was how far could go without exceeding instructions or causing NATO allies feel we had negotiated this subject behind their backs. Emphasized could neither go beyond instructions nor negotiate behind allies' backs. Said had put down language which might be used in communiqué and which Harriman had seen. At this point Hailsham handed Soviets text contained Emb's 248. Hailsham said felt this language would assist purposes Soviets had in mind and create favorable atmosphere in which further discussion could take place.

After looking at text Gromyko remarked that it not only showed no positive attitude toward NAP but on contrary even cast doubt on expediency its being discussed. Added was certain positive Soviet reaction to this language had not been expected. Every state was free to consult its allies. Soviets were proposing not consultation with our allies regarding expediency NAP discussion, but that understanding be reached on necessity of concluding NAP and in combination with TB.

Hailsham responded was difficult carry matter much further at this time in view instructions from President and Prime Minister. Would carry matter as far as possible and would seek instructions. President's and Prime Minister's instructions not based on lack of desire conclude agreement. Point is that allies would react strongly to any attempt on our part to prejudge outcome of discussion. Any such action on our part would be counterproductive and would reduce chances agreement eventually being achieved. Not a word of what Soviets had said would be overlooked. President's and Prime Minister's instructions had been based on desire avoid resentment of allies but within limits these instructions willing go far as possible.

Agreeing with Hailsham, Harriman emphasized that anything that appeared to our allies as if we were settling matters behind their backs would create difficulties. Necessary get agreement all NATO partners or nothing could be done. Anything having appearance pressure would be counterproductive. Promised go forward in good faith. Had studied and liked text UK just distributed. Felt "desirability" was asset rather than liability.

Harriman recalled President and Prime Minister had written Khrushchev early in June concerning TB discussion and this was basis for presence UK and US delegations in Moscow. Was only shortly prior delegations' departure for Moscow that Khrushchev had made East Berlin speech re TB and NAP. Therefore US and UK delegations empowered negotiate TB but nothing else. Hoped could conclude TB and proceed in orderly manner to give fullest consideration to discus-

sion nonaggression between our respective allies or between USSR, US, and UK again if authorized by allies negotiate for them. Was certain world would be very disappointed if at this stage after rather protracted negotiations announcement agreement on TB could not be made. Felt such announcement would create favorable atmosphere for further developments. Trust no thought TB would be held up.

Gromyko said had nothing to add to what had previously said on this subject. Suggested adjournment plenary with three principals continuing meeting in private.

On Hailsham's suggestion, was agreed drafting committee would meet tomorrow 10 AM to prepare clean draft TB treaty as presently agreed.

After agreement on language today's communiqué, was agreed plenary would meet again 3 PM tomorrow.

## **209. Telegram 274 from Moscow, July 23<sup>1</sup>**

Moscow, July 23, 1963

From Harriman. Subsequent to regular meeting this afternoon (July 22), Harriman and Hailsham met with Gromyko privately.

Harriman referred to Gromyko's remarks re France in larger meeting commenting he had wanted to raise subject himself. Said President anxious get France to join in agreement, but this delicate situation. Believed he would get word from President re this and other matters before meeting with Khrushchev. Said he aware of importance Sovs attach to French problem and wondered whether Gromyko believed useful add to withdrawal article language in same sense as contained first sentence US draft withdrawal clause submitted earlier. Quote and it is expected (or hoped) that treaty will be adhered to by all (or other) countries unquote. Suggested Gromyko give consideration to this, as such language would indicate all three would work together in getting other countries to adhere. Said we hoped as many countries as possible would join. We believed language would be helpful as indication belief

---

<sup>1</sup> Readout of Harriman/Hailsham private session with Gromyko on French issue and signing considerations. Secret. 6 pp. Department of State, Central Files, POL 7 US/Harriman.

of the three that all states should adhere. Gromyko said would study but remarked his first impression was that usefulness such addition doubtful.

Harriman inquired whether Sovs believed the three should work on other countries together.

Gromyko replied in affirmative but noted France was special case, as it was nuclear power although perhaps not very important one.

Harriman reiterated he would probably get something from President before seeing Khrushchev. Said other question he wished raise was signing. If Sovs ready sign TB and then go to work in sincere manner on nonaggression problem, he prepared discuss with Gromyko how US proposed signature of test ban. Since TB treaty required ratification by Senate, US would bring a few Senators along.

Gromyko said prepared hear Harriman's views any time. As to nonaggression pact, when TB treaty text completed—he hoped tomorrow—he would report situation to his govt in following manner: TB treaty had been agreed at this level but US/UK reps were not ready now to agree finally on NAP and had suggested language for inclusion in communiqué. Sov Govt would then consider situation in this light, but he did not know what decision would be reached. However, he wished stress importance Sovs attached to NAP. Rightly or wrongly, Sovs were certain that everyone represented here would benefit from nonaggression pact. As to TB, it would also have certain importance though not very great, if it were not accompanied by NAP.

Harriman observed no use discussing procedure for signing until Sovs ready sign TB. Position of US Govt was clear there was no connection between TB, which affected all nations of world, and nonaggression arrangements affecting Europe. TB would create atmosphere which he believed, although he could not make any commitment, would make easier get agreement on other matter. Could not see how NAP could be negotiated here, as agreement on that subject would, at best, require long negotiations which would put it on ice and be embarrassing to all. If the two matters had any connection, that would be another matter but they were different, except perhaps in sense of reduction of tensions. Harriman assumed Sov Govt ready sign test ban ASAP, and, if so, he would be prepared discuss procedure for signing. Expressed hope Sovs would not object to our bringing Senators, noting Gromyko was accustomed to having them around. We were thinking of bringing one Senator from each party to attend but not to participate in signing. Reiterated no use discuss this until Sov Govt made up its mind.

Gromyko said had nothing to add except that he wished stress Sovs sincere in stressing importance of NAP.

Harriman said Gromyko should not think we minimize this matter; we would take it in sincere spirit.

Hailsham said PM felt present political conjuncture should be used to promote rapprochement. TB could usher in further tension reducing arrangements but he did not believe NAP would be easy to sell to allies. At same time, if TB were signed public opinion in Western Europe would be very favorably impressed for that would be first time agreement of such importance reached. That true particularly of public opinion in UK, but also in France, Germany, Italy. Indeed signing of TB document would have public opinion effect out of proportion with intrinsic value of test ban, which admittedly not very great step towards disarmament. But psychological impact would be very great.

Harriman observed impact might be even stronger than in case of Austrian treaty.

Hailsham referred to suspicions existing among allies re Harriman mission and stressed US/UK must show to allies that they keeping their word. He was sure it would be easier convince allies re non-aggression arrangements if US/UK proved their good faith. Strongly urged Gromyko not be disappointed if both TB and NAP were not signed at same time, but to consider this as step towards objective Sovs regarded so important. Reiterated great importance of TB with respect public opinion. Expressed confidence there would be chance getting agreement on that and other matters. Pointed out if this opportunity were missed for reaching agreement, there may be no other chance. UK believed this agreement would lead to other one and further agreements.

Gromyko referred to FRG pronouncements it would not use force to change borders and De Gaulle's position on German borders. US and UK of course know each other's position on this matter but they also appeared be against use of force. Thus on principal point of NAP, i.e., non-use of force for solving outstanding problems, there should be no doubts among anyone as to point frequently raised by some people and groups in FRG, as well as France, that problem of GDR recognition would arise as a result of NAP, he wished point out recognition was separate problem, relating to form of NAP. As Sovs understood situation, it should not be very difficult resolve problem of form.

## II

Hailsham expressed view question of form was possible to resolve.

Harriman commented Khrushchev had given US very important ammunition in discussing this question when he said form could be referred to lawyers. Pointed out Germans were emotional about this matter as it related to reunification. As to De Gaulle, he did not know exactly what his problems were but noted De Gaulle had gone farther than anybody with respect to Oder-Niese. In any event, De Gaulle would be very difficult if something were done behind his back. Gro-

myko had talked to Spaak who was on record as being in favor of nonaggression arrangement.

Gromyko commented proposed language for communiqué placed conditions even on discussion of NAP.

Harriman observed the more fluid we remain the better chances would be of getting allies along.

Hailsham said his position very positive but would not wish put it in communiqué. Suggested communiqué include reaffirmation by the three that they would not use force in settling outstanding issues. Anything more than that would create great problems. Referred to French apprehensions re US/UK working very closely together, which at least in part due to fact that British and Americans spoke same language.

Gromyko wished Harriman and Hailsham understand Sov position. Sovs believed reference in communiqué not enough, they believed agreement should be reached here. However, proposed language for communiqué did not even reflect positive attitude towards NAP.

Hailsham wanted assure Gromyko UK positive. Perhaps language could be strengthened, but should not create impression of agreement.

Gromyko wondered whether Harriman and Hailsham would state their own positions in this informal conversation.

Hailsham said UK would favor arrangement, provided they were relieved of certain things. PM wanted bring about situation where such arrangement could be signed, but that could not be done here and now.

Harriman commented this had not been area his primary concern for quite a while as he had been dealing in Far Eastern Affairs. However, he knew people in Washington were concerned about attitude of France, to whom we were committed. Did not wish to be negative but we would support concern expressed with respect effect on unification. Thus language would have to be found which would be satisfactory not only to those present here but to others as well. However, US had consistently sought relaxation of tensions. Referring to his remarks re Berlin in earlier meeting, Harriman said there was concern as to what would happen if suddenly the East Germans stopped access to Berlin. For this reason, we would probably raise this question. At same time pointed out Washington very keen use favorable atmosphere to have it permeate into all European countries, both those belonging to NATO and Warsaw. Thus, only thing he could say was that we would take our work constructively to bring about and expand constructive results.

Gromyko said since Harriman brought up West Berlin and Germany, he wished say that to link access to NAP would mean burying NAP. Harriman and Hailsham were familiar with progress in US/USSR, as well as occasional US/UK talks on general question of German

peace treaty. Idea of pact was involved there and was one of questions US/USSR believed should be resolved in connection with German peace treaty and settlement West Berlin problem. However, since now there were practically no negotiations on that subject, Sovs were attempting convince US/UK that it would be useful resolve NAP in connection with TB. There was no point discussing logical connection between test ban and NAP, but Sovs believed NAP would be useful from standpoint improvement international relations. One step, i.e., TB would also be useful from that standpoint because otherwise Sovs would not have suggested it in Khrushchev Berlin speech. However, two steps would be better.

Hailsham said TB could be signed quickly, whereas he was certain NAP would take long time. TB would help get others with respect NAP. He understood Sovs did not want access to West Berlin to be included in NAP. However, if Sovs could do or say something outside which would give real assurances to people, re access, that would be of great help.

Harriman hoped Gromyko would study our suggestion re communiqué, while we would proceed as energetically as possible with allies. Stressed chances would be better if TB were signed than if it were held back. Pointed out everybody regarded TB as standing on own feet; if TB were connected with something else it would get involved in lengthy negotiations, even though such negotiations might be successful.

Hailsham said wished ask before breaking up when Sovs intended make statement re France Gromyko had referred to in larger meeting.

Gromyko replied that had not yet been decided but would be done at appropriate time.

Harriman said we interested in what Sovs had in mind.

Hailsham recalled Khrushchev had said Sovs would examine situation in case France should set off nuclear explosion, but Gromyko had said something different today.

Gromyko said Sovs would state at some point before treaty entered into force that if France engaged in certain actions Sovs would have to examine situation. However, he did not have text of such statement.

**Kohler**

**210. Telegram 295 from Moscow, July 23<sup>1</sup>**

July 23, 1963

From Harriman. At Gromyko's suggestion Harriman, Hailsham and Gromyko met privately after regular session.

Gromyko opened by commenting that as far as TB Treaty concerned, progress had certainly been made. Inquired whether Harriman and Hailsham had any views to add to what they had said on NAP yesterday.

Harriman said Washington felt language for inclusion in communiqué as proposed by Hailsham was about right. View in Washington was that more general that language the better chance for agreement. Gromyko had been right in mentioning certain countries we might have trouble with. Gromyko knew that DeGaulle had a personal reaction to this matter. Harriman assured Gromyko we would move as fast as possible after agreement on TB for we would not sign communiqué unless we willing proceed with energy. Stressed President took very seriously Sov concern re France's adherence to Test Ban Treaty, and hoped get little more details by time of his next meeting with Khrushchev. Pointed out this was indication of President's attitude that there was now rpt now opportunity of making progress in as many directions as possible. Certainly US wished good will emanating from TB agreement to be spread to as many countries as possible, including NATO and Warsaw Treaty members. However, we hoped Sovs would help US in that endeavor by accepting language on lines Hailsham's suggestion, which had been approved by Washington.

Hailsham stated there were definite limitations in his instructions, and they had been confirmed by Prime Minister publicly. However, having spent this time in Moscow he deeply convinced about sincerity Sov proposal and importance Sov Govt attached to it. PM would also be impressed favorably but he certainly would not wish him, Hailsham, say anything on this publicly or in communiqué. Hailsham did not know what PM would say in public after he reported to him. In any event, would report to PM fully and conscientiously and PM would take counsel with Cabinet. Reiterated PM would not wish him say anything publicly unless there was definite agreement between other two parties present here, which was doubtful.

---

<sup>1</sup> Further private discussions with Gromyko on non-aggression pact considerations, acceptance of test ban treaty, and possibilities for reducing future tensions. Secret. 5 pp. Department of State, Central Files, POL 7 US/Harriman.

Gromyko said that as he himself had stated repeatedly, and as Khrushchev had also said, Sovs attached great importance to that. Sovs understood situation as follows: US/UK not prepared at this time finalize solution this problem and referred to need for consultations with allies. In this connection, he wondered whether he understood correctly that US and UK Govts were prepared review this question and expressed readiness continue discussion this question and seek understanding.

Harriman and Hailsham replied in affirmative.

Gromyko asked whether idea of NAP was thus acceptable.

Hailsham said it was understanding that, as Khrushchev had said, it would not involve recognition and that we could not be committed publicly before consulting allies. Remarked, however, he had read NAP draft and believed it would be a positive step. He could not commit PM but latter would consider matter with allies and colleagues.

Harriman said Hailsham's remarks, if he understood them correctly, stated what he understood was view his govt. US would consider matter promptly, consult with allies, and then see how to proceed. Assured Gromyko President wanted goodwill prevailing in these talks to spread over Europe. In addition to what he had said re nonaggression, he wished state US wanted do everything possible to obtain adherence by France to TB Treaty. As to nonaggression, there had been recent statements by FRG personalities reflecting more flexible attitudes. Harriman said he was personally encouraged but would not want predict DeGaulle's attitude. Said would report to President and felt certain President would attempt reach understanding to carry through what Sov Govt had in mind, which he understood to be reduction of tensions and development of good feeling among all European countries.

Gromyko confirmed this was Sov goal. NAP would assist in reducing tensions. Moreover, it would facilitate taking a number of further steps, including steps in disarmament field and above all with respect to German problem, to relieve tensions and increase confidence between our states. Wished stress again Sov belief absence of NAP would considerably weaken TB treaty. US/UK could not deny TB was not disarmament; it was not even beginning of disarmament and could not therefore be regarded as disarmament step. TB would only assist to certain extent in creating favorable atmosphere from standpoint of broader disarmament problem.

Gromyko continued he understood from Hailsham's and Harriman's remarks that US/UK Govts were ready make progress re NAP and intended consult their allies. Taking this into account, Sov Govt prepared not link directly signing of NAP with signing of TB. Sov Govt prepared not to make one contingent upon other. Sovs hoped this

would be duly appreciated by US and UK. Sovs trusted statements by US/UK responsible representatives that their govts would make every effort to consider positive solution of NAP. Gromyko then referred to language suggested by Hailsham for inclusion in communique and said Sovs not fully satisfied with that text. Therefore, they proposed somewhat modified text which they believed should be acceptable to US/UK. Handed text, and expressed hope agreement could be reached on that portion of communiqué.

Harriman appreciated position expressed by Gromyko. He understood importance Sov Govt attached to this problem. Sovs took our word in good faith and we gave it in good faith. As to TB, while technically it may not be very important it would be hailed by everyone as it would relieve apprehensions of world about contamination of atmosphere and be indication of even more important understandings to come.

Hailsham thanked for Gromyko's statement, commenting it was helpful. Observed that in addition to reporting to PM he would also have to make speech in Parliament in which he would express in reasonable way this gratitude; this, without formal statement by govt, would assist in achieving objective Gromyko had in mind.

Gromyko explained last paragraph suggested text could be expanded by including mention of some questions raised by participants in these talks, but Sovs could accept para both in its present form and in expanded form. Believed para would be useful to all. Did not wish suggest proposed text be discussed now as US/UK might want study it and perhaps consult capitals. Text could be discussed tomorrow.

Hailsham said text would have to be sent to London and Washington and we would see what we could say about it.

Gromyko recalled Harriman had referred yesterday to procedure for signing of TB treaty and wondered whether he still wished discuss it.

Harriman said if Sovs agreed TB treaty could be initialed by participants in these talks and then SecState would come here to sign. SecState would be accompanied by Senators, perhaps one from each party. This would lend more dignity to signing ceremony and would give Senate sense of participation, which very important for well known reasons. While not instructed do so, he wished say personally that there were certain influences in Senate which were not very helpful and therefore it was important that President handle Senate with care and dignity. This was important not only from international standpoint but also from US internal standpoint. Khrushchev had remarked President's June 10 speech had required great deal of courage, and there were some developments within US which even raised tensions.

Harriman continued he would go to report to President and Senate and a few days or a week later SecState would come if Sovs had no objection. President believed such procedure would greatly help in getting approval of treaty in Senate. Harriman said President wanted him stress he did not wish delay signing for one day, but suggested procedure would help him in giving recognition to role Senate is supposed play in international commitments under US Constitution. Added President anxious get not only two-thirds in Senate but maximum possible because of great effect of treaty on world public opinion.

Gromyko thanked and said would inform his govt. This question involved level and timing of signing; it would be considered and he would inform US/UK of Sov Govt views. Believed initialing acceptable and inquired when this could be done.

Harriman thought it could be done tomorrow.

Harriman and Hailsham believed treaty should be released together with communiqué, simultaneously in all capitals.

Gromyko thought perhaps better publish treaty with delay of say one day after initialing treaty and publication of communiqué. Such procedure would build up public interest in treaty. Noted that if initialing to take place tomorrow he had in mind text of communiqué would be agreed by then.

Harriman pointed out danger of leaks and expressed strong preference for simultaneous release communiqué and text. Believed would get Washington reaction to Sov proposed text for communiqué tomorrow, but noted did not know whether agreement could be reached at that time.

Gromyko suggested tentative agreement be made that initialing should take place either tomorrow or day after.

Harriman expressed preference for initialing treaty and releasing both communiqué and treaty text tomorrow, if agreement reached.

Hailsham agreed, pointing out it becoming increasing difficult resist press inquiries re status of talks.

**Kohler**

**211. Telegram 333 from Moscow, July 25<sup>1</sup>**

July 25, 1963

From Harriman. At Sov request, meeting today was postponed first to 4 and then to 4:30 pm.

Before meeting actually began, Gromyko handed Harriman a letter in reply to Harriman's letter delivered this morning. After familiarizing himself with contents of Gromyko's letter, Harriman asked for private meeting and Gromyko and Hailsham agreed.

Harriman opened private meeting stating he had hoped wording of his letter would be satisfactory to Sovs. Pointed out problem was that of getting votes in Senate; since there was [garble] a China lobby Gromyko's letter would make situation even worse. Suggested Gromyko take his letter back and we could perhaps modify language of ours so as to provide for right to object by any of depositaries to adherence in specific cases. To have Gromyko's letter in our possession would make our position in Senate impossible. Suggested change in his letter to Gromyko which would make regime Sovs considered as vacuum bound by the treaty but would not require Sov recognition thereof. Again asked Gromyko to take his letter back and offered modified his own. Pointed out if he took Gromyko's letter would have to write similar letter re CPR; thus we would be exchanging letters back and forth and might damage favorable spirit which we had developed in these talks with Gromyko's assistance.

Gromyko said did not quite understand how he could take his letter back since it set forth Sov position as it has always been. As to Harriman's offer change his own letter, said frankly Sovs not very interested in substance that letter; it stated US position, while Sov letter stated Sov position. Sovs did not deny US right its position. If Harriman were to take his letter back he would take back his own, because his letter was in reply to Harriman's.

Problem at hand had been discussed orally and US itself had suggest that no formal understanding in writing was being sought but only the common interpretation of issue. However, no such interpretation could be achieved because as far as USSR was concerned it could not recognize legitimacy of ratification for access by Chiang. Sovs believed it would be reasonable if US had similar attitude but they did not know how US would act; in any event, that was US own business.

---

<sup>1</sup> Private meeting with Gromyko: non-exchange of Harriman/Gromyko letters, Soviet objections to unrecognized regimes ratifying the treaty, treaty adherence issues, limited nature of test ban treaty, and Harriman's statement to the Senate. Secret. 8 pp. Department of State, Central Files, DEF 18-4.

Pointed out he was speaking of Chiang and suggested there be no letters, noting it had not been USSR who had initiated letters. Suggested both sides agree they had different understanding on this matter. There were different kinds of non-recognition, one of them being a diplomatic non-recognition. For example, USSR did not recognize diplomatically Franco or present regime in Portugal but it did recognize them as existing govts. As to Chiang Sovs did not recognize him not only diplomatically but they also did not recognize him even as existing. This was substance Sov position. Evidently US had different attitude toward Chiang but Sovs had their own. Certainly Sovs could not tell US what it should do.

Harriman said if Gromyko gave him his letter he would have to write him that under no circumstances would US accept Red China's accession. It had been Gromyko's statement regarding Chiang of yesterday which had caused so much difficulty in Washington. Recognizing Gromyko's points re difficulties which would arise if all three depositories were required accept accession and ratification, we had developed in our letter procedure which we believed should meet Sov view. However, when Gromyko specifically objected to govt which had great support in US that created great difficulty. Reiterated he anxious not spoil good atmosphere in these talks by receiving this positive letter. Wondered whether Gromyko completely understood his suggested change in his own letter, noting we said non-recognized country or regime would not have to deposit ratification with all depositories but would still be bound by treaty obligations; thus Sovs could continue not to recognize that country just as we would not recognize some country or regimes. Observed that normally he would have discussed draft his letter with Gromyko before transmitting it but since we had believed treaty would be initialed today we had drafted our letter assuming it would be satisfactory. Said prepared to take back his letter and regard it as draft.

At this point both Harriman and Gromyko took back their respective letters.

Hailsham believed Gromyko had a point. Noted if a country's ratification was accepted such country would become party to treaty and would be voting under treaty provisions for amendments. This was difficult matter and it applied to both sides. Suggested it might be simpler merely to say that non-recognized country could declare itself bound by treaty, but in such case it would not have right to vote as it would not be party to treaty. Reiterated Gromyko had a point as one could not have unilateral ratification without country in question automatically becoming party to treaty.

Harriman pointed out problem involved only special cases noting there were some cases where we could not object. E.g., Outer Mongolia

would not be objectionable just as Franco was not objectionable to USSR. Appreciated Gromyko's frankness in stating his point of view but pointed out US suggested language created a way out for Sovs.

Hailsham said if Chiang were to send his ratification to Sovs they could send it back but if Chiang made a declaration Sovs could merely say they didn't care.

Gromyko said did not understand why US wished had a text, because Sovs did not wish to write more and could not write less than what was contained in their letter. As to Harriman's suggestion change wording his letter, specific contents of that letter were of no interest to USSR. In fact he, Gromyko, could turn his head away and take any letter from Harriman. Harriman's letter was attempt make USSR recognize legitimacy Chiang's adherence. Reiterated Sovs did not wish say anything more in their letter than already there—although they could—but neither could they say anything less. As to Hailsham's idea that countries could become bound by treaty without accession, he could only repeat Sovs position. In any event Hailsham's suggestion not much different from US position. Asserted exchange of letters was to US disadvantage but commented that perhaps there was some misunderstanding in this whole affair.

## II

Harriman assured Gromyko reason for our letter was not our desire to promote Chiang in this treaty. Pointed out there would be only limited adherence if only those recognized by Sovs or US could adhere. Washington wanted to make treaty all inclusive. While he did not want mention any names because Sovs might be insulted, there were some countries or regimes we object to. However, if CPR, even though we did not recognize it, were to adhere we would not object just as Sovs apparently would not object to Spain or Portugal. Reiterated Washington wished as broad adherence as possible. Commented we had never expected Sovs would react so violently in this matter although of course we had heard very strong Sov pronouncements at UN. Stressed again treaty would not be all inclusive unless it provided for accession by non-recognized countries or regimes. Observed US was prepared close its eyes to many things we did not like and had hoped Sovs would do the same. We did not believe accession would enhance a country or regime, as they had their standing, whatever it was, even without accession. Requested Gromyko's help in resolving problem under discussion, reiterating it never occurred to US Sovs would react as violently as they did.

Hailsham observed Harriman's remarks placed problem in different light. Perhaps US could write letter saying if a country or regime not recognized by US deposited its ratification with USSR, US would

accept adherence but would not recognize deposits thus if US concerned about securing accession to treaty by CPR or East Germany they could deposit with USSR and would be bound without recognition of deposit by US.

Harriman interjected we wished universality for treaty and wanted be able say all could adhere if they wished and this was understood between original parties.

Hailsham noted if bilateral recognition of deposits were required that would raise issue of concern to Gromyko. Believed no Soviet reply would be necessary to such letter from US and suggested arrangement would limit number of cases to a handful.

Harriman said perhaps this was true. Since it was our desire universality of treaty non-recognized country or regime could deposit with depository recognizing such country or regime and if copies of instruments were accepted by other depositories, such country or regime would become party. On other hand, if any of three depositories refuse accept ratification respective country or regime would not become party. For example if Outer Mongolia deposited its instruments with USSR and we accepted copies of those instruments it would become party, although of course that would not mean our recognition of that country. On other hand if we sent back those instruments Outer Mongolia would not become a party.

Hailsham noted such an arrangement would give each original party veto power re accession by countries not recognized by it.

Gromyko commented perhaps there was some degree of misunderstanding in this matter, although he was not sure. In any event suggested procedure could not satisfy Sovs. Pointed out any written reply from Sovs could not be different from what he had given Harriman earlier because Sovs regarded US letter as attempt to obtain from USSR indirect recognition of legitimacy of that regime, something USSR could not do. If this was a misunderstanding perhaps what he was about to say would eliminate it. What Sovs could accept was following. They could agree, but not in writing, that if Chiang sent his ratification to USSR, it would not repeat not be accepted; US would probably accept but Sovs would welcome it if it did not. Sovs stated they would not recognize legitimacy of this accession, whereas US would probably take opposite stand and from US standpoint this accession would be legitimate. If this should happen, Sovs would not make any statement re legality or illegality of US act—that, Gromyko said, could be stated already now. Sovs would limit themselves to present explanation and would not make any statement at time of US acceptance Chiang's ratification. Reiterated Sovs would not make at that time any statement disputing legality or illegality of US action.

Harriman said this was helpful. However, without naming any country there might be countries which would create similar situation with US. Therefore, we had to make a similar reservation.

Gromyko said perhaps there was really some misunderstanding here and hoped his further remarks might clear it up. Said that if for example US said it unwilling recognize adherence by GDR (Harriman interjected we wanted its adherence but without prejudice to recognition problem), US would not recognize legality of Sov action but USSR would accept GDR's adherence and would regard GDR as party to treaty. Thus situation would be reversed. Gromyko said of course US had right to reserve its position re any such situation but suggested that no statement be made at time of its occurrence.

Harriman said he not in position agree without first communicating with Washington. Said would get in touch with Washington if this was the best Sovs could do.

Gromyko said nothing should be said in writing but he could state officially that USSR could not recognize as lawful act accession by Chiang. Sovs recognized US held different position on this point but would not make any statement re legality or illegality of US acceptance Chiang's ratification; Sovs would simply refuse accept those instruments.

Hailsham commented this would apparently cause another 24 hour delay in initialing treaty. Said UK Govt had not been consulted by US on this matter and he was angry because he liked to be consulted. Said he did not wish to have anything to do with any letters or drafts.

### III

Harriman admitted he had not informed Hailsham of letter until after it was delivered. Unfortunately, there was not time account desire get decision this afternoon.

Gromyko reiterated that from Sovs standpoint any act by Chiang in joining treaty would be unlawful. Sovs recognized US position on this point different but would limit themselves to this clarification. Sovs would not challenge US action in accepting Chiang's ratification, and no statement at all would be made at time of such acceptance.

Harriman said Gromyko should understand that in such case US reserved privilege and right to take same position with respect to any govt or regime not recognized by it.

Gromyko said he recognized such right, though of course US and Sov positions re certain countries were different.

Harriman asked whether Gromyko could state his reservation in general terms, without mentioning specific names.

Gromyko said he willing have Harriman use qte x unqte in place of specific name, but noted he had privately explained what qte x unqte

stood for. Commented however mention of specific name was better because this limited number of cases involved.

Harriman suggested Hailsham might also wish get in touch with Prime Minister on this matter.

Hailsham said would do so.

Harriman then said wished raise another point. Stated we all recognized test ban was only first limited step although a very good step. Khrushchev himself had said that test ban was not disarmament, would not limit production nuclear weapons, and would not eliminate war. Gromyko had also expressed views in course these discussions. However, some people, who were either for or against TB treaty, might say that TB treaty, and specifically its article I, made use of nuclear weapons illegal. If this question were raised by such people we would have to say that test ban treaty placed no limitation on use of nuclear or conventional weapons in self defense, a right inherent in Article 51 of UN Charter. Harriman said had been requested to indicate this to Gromyko. At same time he wished stress we took test ban very seriously as a step of tremendous psychological importance and as a step in cooperation to develop peaceful world.

Gromyko looked baffled and said TB treaty dealt with prohibition of nuclear tests in three environments. Of course it was not a prohibition of nuclear weapons or weapons in general, although USSR was in favor of general and complete disarmament. Said scope of treaty was self explanatory.

Harriman then suggested a brief recess to consult with advisors.

After recess, Harriman said problem was what he could say to Senate on question of accession. Perhaps he could say that if a govt or regime is not recognized by all three original parties such govt may deposit its ratification with depositary or depositaries which recognized it and other one or two depositaries need or need not accept ratification or copy of ratification. However, in any event this would not change obligation depositing regime had undertaken with depositary. In other words, whatever obligation such country had it would have them to US and Sovs did not have to recognize it, and the reverse would be true in case of countries US refused to accept.

Gromyko commented he had spoken at length on this subject and had tried set forth Sov understanding of problem and Sov position as concisely as possible. Said he not in position draft or edit Harriman's statement in Senate. Recalled he had told Harriman that Sovs reserved their position but would not make any statement challenging legality US action in accepting instruments of ratification. Sovs limited this statement to one regime they didn't recognize; Harriman could say "x" but Sovs had concrete conception of that "x". As to how Harriman would word his statement in Senate that was up to him.

Harriman noted he had not asked Gromyko to edit his statement in Senate. He was only explaining to Gromyko what he would say so that Gromyko would have opportunity to object if he wished.

Gromyko said in such case he must state following. Sovs had set forth their position re Chiang. From Sov standpoint, and Sovs speaking only for themselves, any attempt or act by Chiang to adhere to treaty would be illegitimate as USSR did not recognize existence any such government. Therefore Sovs would not accept Chiang's instruments of ratification and would not consider them to be legitimate. However Sovs recognized US held different position, even though they believed US wrong on this score. If specific situation should arise, i.e., if the US should accept Chiang's instruments, the USSR would make no statement beyond what it had stated now. US would evidently regard such act as lawful but Sovs would not. If US made no statement challenging Sov position, USSR would not make any statement either; Sovs would limit themselves to what had been said today.

Harriman noted Gromyko had said he, Harriman, could insert "x" although he knew who "x" was.

Gromyko said Harriman could of course do so.

Harriman said wanted make clear Sovs should recognize our right as well.

Gromyko said they did.

Harriman said publicly we could say that Sovs had reserved their position re any regimes they did not recognize.

Gromyko observed Harriman had used "regimes" in plural, but Sovs more reasonable, using singular.

Harriman said would communicate with Washington and did not know what reaction would be. Wished however ask why Gromyko thought we were trying pull trick re Chiang. Pointed out our only purpose was make sure we could get Senate support for treaty.

Gromyko said US could reserve its position re certain countries and Sovs reserve theirs. He had set forth Sov position in specific terms in these private discussions. Sovs did not deny US right recognize certain actions as legal, but US should not challenge Sov right to regard certain actions as illegal.

Harriman agreed.

Thereupon larger meeting began, which reported septel.

**Kohler**

**212. Telephone Conversation between Bundy and Kaysen,  
July 25<sup>1</sup>**

July 25, 1963

Bundy repeating: In the case of unrecognized regimes anybody in this category may deposit with any one depository which in turn may send to the others if the others accept the binding accession. But nobody is bound to accept the notification that a deposit has been made. But if there is non-acceptance then the obligation between the depositor government or regimes is not clearly made valid.

Kaysen: Now in the case of . . .

Bundy: Wait a minute. Are you still reading?

Kaysen: Yes. Essentially I am paraphrasing—In the case of such a refusal there will be no further comment by the depositor or by any other party. It is the nature of the understanding—(Do you hear me?)

Bundy: Yes.

Kaysen: —that Harriman is perfectly free. The English language of the text explains this understanding (garbled).

Bundy repeating: It is the nature of the understanding that Harriman will use it to defend it.

Kaysen: (garble)

Bundy: Hold the line. Is that the whole shooting match on that.

Kaysen: That is the whole shooting match. There are two other things.

Bundy: Wait a moment. Have you done anything on 320?

Kaysen: Yes. (garble) There is no problem on that.

Bundy: You think that will be O.K.?

Kaysen: Yes.

Bundy: They are not going to fight on it?

Kaysen: (garble)

Bundy: If you will hold the line I will clear this now.

Kaysen: The third point, Mac, is that we are ready to go tonight (garble)

Bundy: Are you still talking?

---

<sup>1</sup> Guidance on issue of unrecognized regimes depositing instruments of ratification, timing of acceptance of agreement, and return travel plans. No classification marking. 3 pp. Kennedy Library, National Security Files, Kaysen Series, Disarmament, Harriman Mission, Records/Action.

Kaysen: Yes. I said if you will clear this, we are prepared to go tonight (garble)

Bundy: Please hold the line.

Kaysen: I will hold.

Bundy: Go ahead.

Kaysen: O.K.

Bundy: Now what are your times?

Kaysen: (garble)

Bundy: At 10:00. When will you make the text available to press for filing?

Kaysen: (garbled)

Bundy: Yes. But when will you actually hand them over. Pierre needs to know.

Kaysen: As soon as we can (garble)

Bundy: O.K. We will do the same here. Embargo it for 10:00 Moscow time.

Kaysen: Right.

Bundy: Just a minute.

——— pause ———

Bundy: It doesn't affect recognition.

Kaysen: That's right.

Bundy: So that we could accept an unrecognized state with no change.

Kaysen: That's right.

Bundy: Correct.

Kaysen: (garble)

Bundy: That's alright.

Kaysen: (garble)

Bundy: When are you coming back?

Kaysen: (garble)

Bundy: He has one more task. We know.

Kaysen: (garble)

Bundy: We are sending you a jet.

Kaysen: [illegible in the original]

Bundy: Saturday [illegible in the original] but right after that.

Kaysen: Yes, definitely Saturday. Averill says. . . . .

Bundy: What we want you . . . I think the President wants Averill at Hyannisport Sunday.

Kaysen: Yes. Perhaps I might go along, Mac.

Bundy: Good.

Kaysen: (garble)

Bundy: How are you?

Kaysen: (garble)

Bundy: What?

Kaysen: (garble)

Bundy: Alright.

Kaysen: (garble)

Bundy: Great work.

**213. Harriman's Personal Notes on Meeting with Gromyko,  
July 25<sup>1</sup>**

July 25, 1963

After an hour and a half of private discussion, Harriman took an intermission and called for the US Delegation to assemble.

He then read over what he said was the oral understanding which Gromyko was willing to give him, but saying it was clear that the Soviets were unwilling to agree that an exchange of letters or memoranda would be helpful.

There was then discussion among Harriman, Fisher and McNaughton about the words in which the understanding should be explained.

Harriman returned to the restricted meeting with Fisher. After some 20 to 30 minutes of further discussion, the general meeting resumed. Harriman stated that he, Mr. Gromyko and Lord Hailsham had arrived at an understanding of the interpretation of Article II, but he would have to go back to Washington to get authority to accept, and therefore would suggest that we meet again tomorrow at the usual time and issue the usual communiqué.

While the restricted meeting was resumed, Kaysen suggested to Kohler that it would be desirable to call Washington and get authority immediately to accept an oral understanding. He suggested that the Embassy be alerted and begin to make arrangements for the call. Kohler

---

<sup>1</sup> Oral understanding with Gromyko, telephone call to White House, U.S. ready to initial. Secret. 3 pp. Library of Congress, Manuscript Division, Harriman Papers, Test Ban 12, Post-Trip.

agreed that this would be a good move if of course Harriman was ready to take it, and pointed out that the call could probably be made faster from where we were—Spiridonovka Palace.

He left the room, sought out one of the Soviet officials, and arranged for the call to be made, should we want it.

As Harriman finished speaking, Kaysen suggested to him that we make a call to Washington and that the Soviets were ready to place the call for us from Spiridonovka. There was a brief interchange, and Harriman agreed.

At 7:00 pm, Harriman, Akalovsky and Kaysen went to an office in which an interpreter was placing the call. Harriman sent Kaysen back for Hailsham, saying he wanted Hailsham standing by to testify to the understanding, if this appeared desirable. When Hailsham appeared, Hailsham, Harriman and Kaysen agreed on language expressing the substance of the Gromyko/Harriman understanding.

At first, Kaysen in placing the call asked for Bundy. On the first try, the New York operator reported that there was no such person. On the second try, Kaysen merely asked for the White House switchboard and succeeded in getting the White House operator. The following exchange then took place:

"Mr. Bundy's office."

"Alice? Is Mr. Bundy there? It's Mr. Kaysen."

"Why, no—he's in the Situation Room with the President."

"Well, Alice, see if you can get him out."

Mr. Bromley Smith then came on the line and repeated what Bundy's secretary had said, pointing out that the President was talking to the Prime Minister on the telephone.

At Kaysen's urging, he got Bundy on the phone. Bundy, on hearing a brief explanation, went back and apparently asked the President to interrupt his telephone call for the news from Moscow. Kaysen then read Bundy the substance of the oral understanding as agreed by Hailsham and Harriman. Kaysen read this to Bundy twice.

Bundy left the phone again, and returned, saying, "Okay—when will you initial it?" Kaysen responded, "Arrangements will be the same." Bundy again consulted the President and asked what time the embargoed text and communiqué would be available for distribution to the press in Moscow. After Kaysen's response, Bundy said the President would want to see Harriman at Hyannisport on Sunday, and Kaysen invited himself to the meeting.

Bundy closed the conversation by saying, "Great—good luck!"

We then went back to the meeting room. Harriman asked Gromyko, "Where are the copies of the Treaty we are to initial?"

(NOTE: Above read and OK'd by Harriman, but he added last paragraph—hbs.)

---

**214. Telegram 347 from Moscow, July 26<sup>1</sup>**

Moscow, July 26, 1963

RE Our 333. At 4:30 pm opening July 25 plenary session Harriman said understood everything agreed to except letter Gromyko had given him in reply to that he had given Gromyko. Gromyko's reply made situation worse. Hoped could have private talk with other two principals so as to arrive at some understanding on this subject. Asked if plenary might be adjourned for this purpose. Gromyko agreed.

Upon resumption plenary after private meeting reported our 333 Harriman said he would like to consult Washington by telephone. Gromyko agreed.

Upon returning from telephone conversation with Washington Harriman stated he had just received clearance to agree to oral understanding reached with Gromyko in private meeting re application para 2 Article III and therefore US prepared proceed initial and subsequently sign and ratify in accordance with our constitutional provisions. Wished thank Gromyko for clarity with which he had expressed Sov position.

Gromyko stated he wanted thank Harriman for his efforts and understanding Sov position.

Harriman said he had told Washington that initialing would proceed with texts of treaty and final communiqué to be distributed, embargoed for release 10:00 PM, Moscow time.

Gromyko said he agreed with these arrangements with comment that this was a type of embargo he did not oppose.

Ambassador Trevelyan speaking on behalf Hailsham said texts should be given out at 8 PM.

Harriman said he felt texts should be given out immediately as communications to US were so slow.

Gromyko said he also wished thank Hailsham for his understanding.

---

<sup>1</sup> Successful conclusion to negotiations realized. Secret. 2 pp. Department of State, Central Files, DEF 18-3 USSR (MO).

Hailsham responded he in turn wished thank Gromyko and say he was glad to have been able to participate in this very important conference.

At 7:15 PM formal texts of the treaty were distributed.

Then, after removal from conference table of mineral water bottles doors were opened and hordes of photographers swept in.

In response reporters' question, Harriman said felt treaty very important step forward. Gromyko said hoped would be basis for further steps. Hailsham said many good things could follow.

In reply persistent questioning as to why meeting had lasted so long, Gromyko said it was end result that important.

At this point meeting broke up.

Kohler

## 215. Letter from Gen. Taylor to Rusk, July 27<sup>1</sup>

July 27, 1963

Dear Secretary Rusk:

In anticipation of Congressional hearings on the limited test ban treaty just negotiated in Moscow, the Joint Chiefs of Staff feel the need of your counsel and that of the Department of State in order to reach a thorough understanding of the implications and consequences of the implementation of this treaty. We recognize that the military considerations falling within our primary field of competence are not the exclusive determinants of the merits of a test ban treaty. In addition, important weight must be given to less tangible factors such as the effect upon world tensions and international relations. Here we sense the need of your help and that of your colleagues in the Department of State.

To be specific, I am inclosing a list of questions the answers to which will have an important bearing on the position which the Chiefs will take in the hearings before the Senate. It would be deeply appreciated if you would provide us the response of the Department of State

---

<sup>1</sup> Requests Department of State assistance in preparation for Congressional hearings on test ban treaty. Attached is a list of political questions JCS would like to have answered. Top Secret. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, Test Ban, Congressional Relations I, 5/63-7/63.

to these questions, preferably in writing, so that we can study the text in detail. Thereafter, we would hope to have the opportunity of conferring with you and possibly with other officials of the Department in order to reach a full comprehension of the non-military factors bearing on this treaty.

We are hoping to finalize our study of the treaty by August 14, 1963, a date chosen in relation to an estimate of the time of initiation of Congressional hearings.

Sincerely,

**Maxwell D. Taylor**  
*Chairman*  
*Joint Chiefs of Staff*

### **Attachment**

#### *POLITICAL QUESTIONS*

1. What are the political advantages to the United States of the proposed treaty? In particular, to what extent will it reduce world tension, restrain the arms race, and accentuate the split in the Communist Bloc?

2. An atmospheric ban was proposed by President Eisenhower in 1959 and by President Kennedy and Prime Minister Macmillan in 1961. The limited treaty has been tabled since 27 August 1962 in Geneva. The Soviets have rejected all of these. Why do the Russians want this treaty now? Do you interpret the Soviet action in signing the treaty as indicative of a basic change either in Soviet goals or in the spectrum of means by which they are prepared to pursue their goals?

3. To what extent and in what ways is it considered that the proposed treaty will help stop proliferation? What pressures are the Soviets considered in a position to exert on Red China to keep her out of the nuclear club? In view of the stated attitude of the French that they will not participate in any test ban arrangement, what inducements or pressures, if any, would we consider to gain French participation? Is it conceivable that the US and the USSR might unite to enforce nonproliferation using whatever means necessary?

4. Is it considered that there are advantages of a military or security nature which the United States will derive from this treaty, or must it be justified on other grounds?

5. What would be the international political implications if the US at this stage were to reject the treaty?

6. The draft treaty provides that a party may withdraw if it decides that "*extraordinary events* related to the subject matter of this treaty

have jeopardized the *supreme interests* of its country". What does the State Department visualize as *extraordinary events* within the intent of this treaty?

7. If Soviet cheating is detected, will it be possible for the US to convince the world of their guilt without declassifying US detection system or intelligence? Is there ground to fear that world doubts or disbelief might prevent our action to abrogate?

---

**216. Summary Record of NSC Standing Group Meeting No. 11,  
July 30<sup>1</sup>**

July 30, 1963

Under Secretary Harriman reported on his negotiations in Moscow along the lines of his reporting telegrams.

There was a general discussion of the various problems involved in obtaining Senate ratification of the limited test ban treaty. All agreed on the importance of providing to the Senate committees military views of the treaty. It was decided that in view of General Taylor's absence from Washington no effort should be made to obtain military views in advance of the formal JCS paper, which is scheduled to be delivered to the President August 14th. This paper will summarize the Chiefs' views in the light of certain information which they have requested from the State Department and from the government scientific community.

Dr. Seaborg suggested a poll of Nobel Prize winners in the belief that there would be a heavy majority supporting the test ban treaty. Other suggestions were made as to how to make public the views of scientists favoring the treaty. This effort is called for because of the prominence of Dr. Teller whose reservations about the treaty have received wide public attention.

**217. Memorandum from Barnett to Sullivan, July 30<sup>1</sup>**

July 30, 1963

**SUBJECT**

Duncan Wilson's Report on Moscow Test Ban Negotiations

Duncan Wilson, Superintending Under-Secretary, Northern Department, Foreign Office, and I were colleagues at Bob Bowie's Harvard Center in 1959–60, where we both worked on aspects of Communist China, his mainly economic and mine mainly military and nuclear.

Wilson invited me to spend July 28 with him in the country. He was quite frank in what he had to say about what happened.

Mr. Wilson said that the Soviet motive in bringing the negotiations to a successful conclusion was one part anxiety about the Chinese, one part desire for budgetary savings, and one part real desire for relaxation of East-West tension.

He said that he understood Moscow's intention to be to get all of the Communist Bloc countries to sign the agreement thereby advertising to the world Peking's isolation.

Lord Hailsham went to Moscow with hardly more than a couple of hours of briefing. His indifference to the need for preparation dismayed both Wilson and Trevelyan. Solly Zuckerman's views were often helpful, but he supported them with weak political, rather than the stronger scientific arguments for which he had some authority.

Throughout, Hailsham was deplorably "elephantine" and it took all of the efforts of his delegation, Wilson said, to neutralize his amateurism.

In contrast to the modest preparations of the small U.K. delegation, the U.S. delegation had, it appeared, concentrated on talks for all of the preceding full month. The delegation itself, moreover, was formidably effective. Fisher and McNaughton were both experienced treaty draftsmen.

Carl Kaysen, by virtue of his position in the White House, brought to the conversations something which the U.K. delegation could not match. Bill Tyler's knowledge of the whole range of European and Soviet affairs was also invaluable.

---

<sup>1</sup> Duncan Wilson's report on Moscow test ban negotiations. No classification marking. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, Test Ban-General.

London had understood that Governor Harriman would be accompanied by a small team and planned accordingly. It was stunned by the power of Governor Harriman's team.

Governor Harriman's conduct at the negotiations was impressive. Throughout, he was master of the discussions, handling the talks with correctness and force. His restraint concealed a capacity for toughness and even anger. With his knowledge of the Russian, the Chinese, the European, the American and the strictly nuclear elements in the problem at hand, Harriman, according to Wilson, was the great man of the meeting.

Notwithstanding the admiration he expressed for Governor Harriman, Wilson said that he had to admit that Gromyko's performance was the most "professional".

August 1963

**218. JCS Statement on the Three-Environment Nuclear Test Ban Treaty, August 12<sup>1</sup>**

August 12, 1963

*STATEMENT OF POSITION OF THE JOINT CHIEFS OF STAFF  
ON THE THREE-ENVIRONMENT NUCLEAR TEST BAN TREATY*

1. Upon receiving the final draft on the three-environment nuclear test ban treaty recently negotiated in Moscow, the Joint Chiefs of Staff began a comprehensive review of the terms of this treaty in order to determine what effect its ratification would have on the security of the United States. In this review, they deliberately set aside all considerations of former positions taken on other occasions on the subject of a test ban treaty and focused their attention on this particular treaty at this particular point in time. As a base of departure for their appraisal, they first established certain criteria to assist them in evaluating from a military point of view the acceptability as to content and timing of a limited test ban treaty which would prohibit nuclear test explosions in all environments excepting underground.

2. It was the judgment of the Joint Chiefs of Staff that four criteria or conditions would have to be met for a limited test ban treaty to be compatible with the national security. First, the United States should not accept limitations on testing if the Soviet Union had or could achieve a significant advantage in any militarily important area of nuclear weapon technology which, under the treaty, could not be overcome by the United States. Second, recognizing that the USSR could be expected to take advantage of any reasonably safe opportunity for clandestine testing, the Joint Chiefs determined that a test ban treaty could be accepted only if successful cheating would have no seriously adverse effect on the relative balance of military power. Third, it was considered important that withdrawal from the treaty should be uncomplicated, allowing the United States to withdraw without undue delay upon acquiring reasonable evidence of a treaty violation or in the event our national interests were imperiled. Fourth, if the conditions of criteria one and two were not completely met, the treaty must convey adequate compensatory advantages elsewhere.

---

<sup>1</sup> Notes concerns, but supports Treaty ratification. Secret. 8 pp. Library of Congress, Manuscript Division, Harriman Papers, Test Ban 15, Post-Trip.

3. As a closely related matter, but not as a criterion for the treaty itself, the Joint Chiefs of Staff noted the importance for the United States, if it embarks on this treaty, to continue underground testing at a rate to insure continued progress in nuclear technology. They were equally impressed with the need for the United States to maintain the readiness and the determination to resume atmospheric testing promptly. Finally, they believed that account must be taken of the dangers of relaxed military effort by the US and our allies; hence, that ratification of the treaty should be accompanied by evidence of a clear intent to maintain and improve the military posture of the West.

4. Having determined the foregoing conditions of acceptability, the Joint Chiefs of Staff then undertook to measure against them the specific terms of the three-environment test ban treaty drafted recently in Moscow. To assist them in their deliberations, they consulted with those officials who have particular responsibilities and competence in this field. These were officials from the Office of the Secretary of Defense, the Department of State, the Atomic Energy Commission including field laboratories, the Central Intelligence Agency, the Arms Control and Disarmament Agency, the President's Special Assistant for Science and Technology, and from technical agencies of the military establishment.

5. With regard to the current relative position, the Joint Chiefs of Staff reached the following conclusions:

a. Evidence indicates that the USSR is ahead of the United States in the high-yield [*text not declassified*] technology, in weapons effects knowledge derived from high-yield nuclear explosions and in the yield/weight ratios of high-yield devices; that the USSR is about even at the intermediate range [*text not declassified*]; and that the USSR lags somewhat behind the United States at yields less than about [*text not declassified*].

b. In the antiballistic missile field, there is evidence that the Soviets are further advanced than the United States. However, development of the US system does not depend on atmospheric testing and hence this treaty will not significantly influence any imbalance that may exist.

c. In the field of tactical nuclear weapons, particularly in the field of very low-yield weapons, the United States is probably ahead in the quality and diversity of systems although the superiority in quality may be questioned since the USSR may have conducted very low-yield tests which were never known to us.

6. It is important to emphasize that the superiority under discussion in the preceding paragraphs refers essentially to technological superiority. It does not take into account such superiority as derives from numbers of weapons, variety of delivery systems and the magnitude of nuclear plant and stockpile. Hence, technological superiority is only one aspect of the net superiority which must take into account all of these factors. As to net superiority in ability to inflict damage on the

enemy, the JCS consider that the US at present is clearly ahead of the USSR in the ability to wage strategic nuclear war, and is probably ahead in the ability to wage tactical nuclear war, whereas the Soviets have developed a substantial mid-range ballistic missile capability.

7. Considering the foregoing to be a reasonably accurate statement in broad terms of our present position relative to that of the USSR, the Joint Chiefs of Staff then considered what the effects would be if the proposed test ban treaty should go into effect and both sides faithfully observe its provisions. They concluded that the United States would not be able to overtake the present advantage which the USSR probably has in the high-yield weapons field, whereas the Soviets, by underground testing, probably could retrieve in time any lead which we may presently have in the low-yield tactical field. Both sides could achieve an ABM but one with less desirable characteristics than would be the case if additional atmospheric tests were conducted.

8. There are other disadvantages which apply in varying degree to both sides. For example, knowledge of weapons effects is incomplete at best and although knowledge could be gained from underground testing, knowledge which only testing in the prohibited media could provide would be denied. Also, there would be no opportunity to conduct environmental tests of current weapons or of those which might be acquired in order to verify their performance.

9. Such disadvantage as might accrue to the United States under conditions of honest fulfillment of treaty conditions would be further aggravated if the Soviets successfully should cheat by illicit explosions in the atmosphere, underwater, or in outer space. By cheating, they might carry out investigations of weapons effects in the field of ballistic missiles, ballistic missile defense, ASW, and high-yield technology (the latter only if the testing were done in outer space). However, the dangers of detection and the cost and difficulty of testing in outer space would tend to impose severe restrictions upon such clandestine testing. Other clandestine tests in the atmosphere or underwater, depending upon their size, would involve a fairly high probability of detection by our conventional intelligence or our atomic energy detection system. Moreover, the Joint Chiefs of Staff consider the resulting progress which the Soviets might make clandestinely to be a relatively minor factor in relation to the overall present and probable balance of military strength if adequate safeguards are maintained.

10. The Joint Chiefs of Staff believe that the withdrawal provision requiring 90 days notice following a unilateral US decision provides a satisfactory means of escape in case we believe our national interest is being threatened. They are impressed, however, by the possibility of an abrupt abrogation by the Soviets, followed by a comprehensive series of atmospheric tests.

11. Recognizing the foregoing disadvantages and risks, the Joint Chiefs of Staff believe that they can be reduced through certain safeguards. These safeguards include:

a. The conduct of comprehensive, aggressive, and continuing underground nuclear test programs designed to add to our knowledge and improve our weapons in all areas of significance to our military posture for the future.

b. The maintenance of modern nuclear laboratory facilities and programs in theoretical and exploratory nuclear technology which will attract, retain and insure the continued application of our human scientific resources to these programs on which continued progress in nuclear technology depends.

c. The maintenance of the facilities and resources necessary to institute promptly nuclear tests in the atmosphere should they be deemed essential to our national security or should the treaty or any of its terms be abrogated by the Soviet Union.

d. The improvement of our capability, within feasible and practical limits, to monitor the terms of the treaty, to detect violations, and to maintain our knowledge of Sino-Soviet nuclear activity, capabilities, and achievements.

12. Having considered the technological and withdrawal aspects of the proposed treaty and the safeguards we should take, the Joint Chiefs of Staff then took note of the effect of the treaty in the broad field of international relations and of world-wide military strategy. They recognized that considerations of nuclear technology and weaponry were not the sole determinants of the merits of the treaty; that if it would contribute to a further division of the Sino-Soviet Bloc, this result would be a major political achievement with important and favorable military implications. If this treaty attracts signatories representing the vast majority of the nations of the world on both sides of the Iron Curtain, it should make an important contribution toward the restraint of the further proliferation of nuclear weapons and the reduction of causes of world tension. Both of these advantages, if achieved, should contribute to the fundamental objective of the US armed forces, namely the deterrence of war and the maintenance of peace on honorable terms. These possibilities are of such importance to the United States that they offset the foreseeable technological disadvantages noted above.

13. In conclusion, the Joint Chiefs have reached the determination that while there are military disadvantages to the treaty, they are not so serious as to render it unacceptable. In the past, the JCS have not regarded as important the attainment of weapons in the [*text not declassified*] range from which the United States will be debarred by the treaty. They feel that the types and numbers of megaton yield weapons available to us now or in the future (up to [*text not declassified*]) could give us an adequate capability in the high-yield weapon range. Under the

treaty, both sides could make about the same technical progress in the ABM field although the Soviet may possess nuclear blackout information not available to the United States. If the Soviets are to catch up with the United States in the low-yield field, particularly in numbers, they will be subjected to a major additional expenditure of national resources which are already under heavy strain.

14. The broader advantages of the test ban treaty have led the Joint Chiefs of Staff to conclude that it is compatible with the security interests of the US and to support its ratification. If we can contribute to a further division of our enemy, that advantage will compensate for foreseeable fluctuations in nuclear technology. The most serious reservations of the Joint Chiefs of Staff with regard to the treaty are more directly linked with the fear of a euphoria in the West which will eventually reduce our vigilance and the willingness of our country and of our Allies to expend continued effort on our collective security. If we ratify this treaty, we must conduct a vigorous underground testing program and be ready on short notice to resume atmospheric testing. We should strengthen our detection capabilities and maintain modern nuclear laboratory facilities and programs. Finally, we must not for a moment forget that militant Communism remains committed to the destruction of our society.

15. Having weighed all of these factors, it is the judgment of the Joint Chiefs of Staff that, if adequate safeguards are established, the risks inherent in this treaty can be accepted in order to seek the important gains which may be achieved through a stabilization of international relations and a move toward a peaceful environment in which to seek resolution of our differences.

219. Addendum to December 20, 1962, Report of the NSAM 205 Committee, August 15<sup>1</sup>

August 15, 1963

CONCLUSION

On 27 June 1963, the Foreign Weapons Evaluation Group (Bethe Panel) reported on the analysis of the Soviet fission weapon tests conducted during 1962. After reviewing this information, the NSAM 205 Committee has concluded that while the Soviets have improved their capabilities in small, lightweight boosted fission weapons, the advances made do not significantly alter their military capabilities nor does this new information appear to alter the basic conclusions in the 20 December 1962 report of the NSAM 205 Committee.

In summary, as a result of Soviet fission weapons testing in the last 2 years, they have available improved nuclear warheads for tactical and defensive purposes. Although it is not possible to determine which warhead may be designed for use in their anti-ballistic missile system, a suitable low yield fission warhead is undoubtedly available to them if required. However, none of the warheads on which we have information [*text not declassified*]. Furthermore, we have seen no evidence of low-yield clean devices which might minimize self blackout or which might be used as radiation kill weapons in tactical situations, but such developments might be difficult to identify from debris analyses. Although the Soviets now probably have warheads for tactical or possible ABM use of the order of 100 lbs. weight, there is no evidence that they have very small devices, i.e., [*text not declassified*] less than about 13" diameter, although such tests could have escaped detection. Finally, with the possible exception of JOE 85 which was apparently a rather poor design, we have no evidence of the Soviet development of small implosion devices using very little or no plutonium equivalent. Such devices could be particularly useful to the Soviets in light of their estimated relative shortage of plutonium.

DISCUSSION

Thirty-five Soviet fission weapon tests were detected between 1 August and 25 December 1962, 26 at Semipalatinsk and 8 at Novaya Zemlya. Of these fission tests, 9 events had yields between 15 and 35 KT and 26 events were of 10 KT or less.

---

<sup>1</sup> Implications of Soviet fission weapons testing. Top Secret. 3 pp. Kennedy Library, National Security Files, Meetings and Memoranda Series, NSAM 205, Box 339.

Of the 35 low yield tests, debris has been collected and analyzed from 30 of these events. For several of these, the debris sample is so poor that no reliable evaluation can be made. For the remainder of these events, the samples are of sufficient quality to permit a reasonably reliable appraisal of the performance and character of the test devices.

Eight of the fission tests involved low efficiency, unboosted fission devices, with tuballoy tampers. The large number of unboosted tests is surprising since such devices hardly seem worthy of development at this stage of the Soviet weapons program. Some of these devices may have been used in effects or operational tests. Three other unboosted devices were without tuballoy tampers and appear to be an extension of similar tests in previous series to lower core efficiencies and thereby possibly to smaller dimensions.

Seven of the 1962 tests were of boosted, composite devices without tuballoy tampers. Four of these closely resemble devices tested in the 1961 Soviet series. The other three devices had indications of a very small boost, but the interpretation of these three tests remains somewhat obscure.

The most significant development in fission weapons was a set of very small, boosted weapons without tuballoy tampers. [*text not declassified*] In this family of fission weapons, the yield has been varied from about 2 KT to 15 KT. Without boosting, an even lower yield could be obtained. This series of tests has provided the Soviets with a very flexible and useful, lightweight fission weapon [*text not declassified*].

Finally, five of the 1962 low yield tests appear to have involved thermonuclear failures or, perhaps, in one or two cases, thermonuclear mockups. That they were intended to be thermonuclear tests is indicated by the excess [*text not declassified*] Li-6 found in the debris. In two of these tests the cause of the failure was probably in the secondary stage.

August 21, 1963

**SUBJECT**

Events Leading up to the Harriman Moscow Mission

1. The first public word that negotiations were to be undertaken in Moscow on the test ban issue was given by the President in his 10 June American University speech. Following a paragraph in the speech in which he stressed the need to continue seeking agreement on a treaty to outlaw nuclear tests, the President announced that he, Prime Minister Macmillan and Chairman Khrushchev had agreed that high level discussions would begin shortly in Moscow looking toward early agreement on a comprehensive test ban.

(The President also announced that the United States did not propose to conduct nuclear tests in the atmosphere so long as other States did not do so. He said such a declaration was no substitute for a formal binding treaty; he hoped it would help achieve one.)

(Neither of the decisions was widely known around the government prior to the speech. The decision to negotiate evidently came as a result of the President's private exchanges with Khrushchev and Macmillan; the moratorium statement was made in part because of our belief that the Soviets were going to initiate another atmospheric series in the near future while we would not be ready until the summer of 1964.)

2. By 13 June it had been decided that Harriman would be the US negotiator. (There had been some thought of sending McCloy.) Further, by that date a Sub-Principals Group had been established under the Committee of Principals to discuss arms control problems that the President could discuss on his trip to Europe later in the month, and Harriman could discuss in Moscow. General Wheeler represented the Joint Chiefs of Staff at the Sub-Principals Group meeting of 13 June. Other individuals present included Mr. Foster, ACDA; Ambassador Thompson; Dr. Wiesner; Mr. Nitze; Mr. Kaysen; Mr. Harriman; Mr. Fisher; and Mr. McGeorge Bundy. According to an informal memorandum of record of the meeting, the following items were considered as principal negotiating material for Moscow:

- a. A comprehensive test ban.
- b. A non-diffusion agreement.

---

<sup>1</sup> "Events Leading up to the Harriman Moscow Mission." Top Secret. 3 pp. National Defense University, Taylor Papers, WYS Chron, April-September, 1963.

- c. A partial nuclear test ban agreement.
- d. A non-aggression pact.

3. Of these alternatives, the DOD view was that we should push the non-diffusion pact, with inducements and sanctions. (Barber of ISA was strong for this idea as a vehicle to get the government off the comprehensive test ban wicket; the Stennis Committee had supported the JCS objections to it.) The non-diffusion proposal was thus the one discussed in greatest length at the meeting.

4. It was Ambassador Thompson who brought up the partial test ban. He, along with Secretary Rusk, had evidently talked to Ambassador Dobrynin about it. They had told him the US was ahead in tactical nuclear weapons; the Soviets could catch up by by accepting an atmospheric treaty which would help to stop Nth countries from getting nuclear weapons. We could have a tacit understanding that the US would not go ahead with underground tests unless we decided the Soviets had overdone theirs. (If we did say this to the Soviets—and I have one MR which reads that Thompson had already said it, and another which states we could say it—it is most significant, and could explain pressures to go slow on underground testing: It could also explain any Soviet reluctance to move to the next step. They must view the safeguards problem as a low blow.)

5. In the 13 June meeting, Ambassador Harriman was not optimistic about the coming exercise in Moscow. In the discussion on the non-diffusion pact, he said that we should not make the trip if we expected the Soviets to turn us down or, alternatively, we should look at the trip as a propaganda exercise. He also commented that of these other issues he had always considered the test ban “merely a star on the stage of events.” Other people at the meeting were even more pessimistic about the value of a partial text ban, believing that it would have no real effect on non-diffusion, its major objective.

6. In a conversation with Spaak on about 14 June, Khrushchev mentioned the possibility of reaching some agreement on a partial nuclear test ban. Spaak reported this both to the US and to NAC.

7. On 2 July in his East Berlin speech Khrushchev made an offer for a limited test ban in these terms:

“Carefully analyzing the situation, the Soviet Government, prompted by high responsibility for the destinies of the peoples, declares that since the Western powers obstruct the conclusion of an agreement banning all nuclear tests, the Soviet Government expresses its willingness to conclude an agreement banning nuclear tests in the atmosphere, in outer space and under water.”

“We have made this proposal before, but the Western powers frustrated an agreement by advancing supplementary conditions that envisaged large-scale inspection of our territory.”

8. It was after receipt of the Khrushchev public offer in East Berlin, which Khrushchev linked ambiguously to the non-aggression pact, that the Harriman mission took on added significance; the partial test ban issue got considerably more serious attention.

USIA  
Mr. Wilson

Referring to recent discussions in New York, *the Secretary* recalled that he had informed Gromyko that while there appeared to be agreement in principle on refraining from placing weapons of mass destruction in orbit, the question of form was a difficult and complex matter. He had told Gromyko that the Soviet draft of a joint declaration looked too formal.

The Secretary then stated that from the standpoint of the matters before the Committee of Principals the question of the form of an arrangement appeared bracketed by two considerations. On the one hand, we were not thinking of a treaty or formal agreement. On the other hand, we were not likely to avoid a General Assembly resolution whatever we might think about it.

In the Secretary's view, the rate and pace of agreements with the Soviet Union (in the absence of resolution of such issues as Laos, Vietnam, and Berlin) presented a problem. If we moved too rapidly on less significant matters, we might be creating either the illusion of progress or the impression that we were blind to more important issues. Nonetheless, there was some point in finding particular matters on which agreement could be reached. These might include a consular agreement, improved communications with our Embassy in Moscow, implementation of the civil air agreement, and the sale of wheat. We needed to consider how fast we should move on a particular matter or series of matters.

With respect to the matter before the Committee, the Secretary believed that the simplest way to handle it would be through a General Assembly resolution accompanied by parallel declarations of the two countries. He noted that the Joint Chiefs were concerned about the possibility that a resolution might be amended. The Secretary believed that if the U.S. and Soviet Union had agreed to the text, we would have no difficulty in turning aside unacceptable amendments. He asked for Mr. Foster's comments.

*Mr. Foster* thought the Secretary's concern about the limits of the form which an arrangement might take was proper. He noted, however, that there was a greater "public education" value in the case of some

forms than others. One Senator had commented that a chief value of the test ban treaty was its educational value.

Whatever the form of the arrangement, Mr. Foster believed that it should not be entered into precipitately. There had as yet been little opportunity to sound out the Hill, but he was aware of concern that we were rushing into something. All indications were that Congressional consultations could be accomplished readily, but their importance should not be minimized. Consultations with other countries were also necessary.

Noting that the arrangement would not include provision for inspection, Mr. Foster emphasized the importance of an opportunity for review and withdrawal. Although the Joint Chiefs were opposed to accepting inspection in this case, we did not want to lose the right to it. These matters might present difficulties with the Soviet Union, which would want a more permanent arrangement.

Mr. Foster noted the preference expressed by the Joint Chiefs for the term “weapons of mass destruction” instead of “nuclear weapons”. He wished to hear discussion of this matter.

With respect to the form of an arrangement, *Mr. Nitze* stated that if only declarations of intentions were involved, the question of a way out was not as important. That was why Defense would feel easier with parallel declarations or a joint declaration.

*Gen. Hamlett* agreed that this was the Joint Chiefs’ view.

*The Secretary* pointed out that a General Assembly resolution was not binding. He then pointed out that if we used the term “weapons of mass destruction”, this would be interpreted as meaning nuclear weapons plus something else. However, the Joint Chiefs intention seemed to be to leave open the question of interpretation.

*Dr. Wiesner* said that he had initially thought the term was used since it was broader than “nuclear weapons” and might cover BW-CW, but he understood that there was concern about leaving the way open for orbiting anti-missile systems. That was, in his view, not a likely possibility. He pointed out that one of the basic considerations involved in the arrangement was that the number of orbiting objects would be relatively small. If 100 to 500 objects appeared in orbit, there would be a reason to worry. Once you made it legitimate to place in orbit large numbers of defense satellites with nuclear weapons, you took away the one check on the arrangement.

*Amb. Thompson* thought that if this question were opened up, the Soviets would want to cover both nuclear weapons and other weapons of mass destruction.

*The Secretary* stated that putting some nuclear weapons in orbit would really involve withdrawing from the declaration.

*Gen. Hamlett* said that the term "weapons of mass destruction" was broader than nuclear weapons. The Joint Chiefs had wished to reserve the right to place small nuclear weapons in orbit. He recognized, however, that if we reached that point, we would be withdrawing from the arrangement. However, another problem with referring to "nuclear weapons" was that there might be some misunderstanding concerning our propulsion developments.

*Dr. Wiesner* said the only one that might be affected was Project ORION which was ambiguous. In any case, no one took ORION seriously. ROVER was not ambiguous.

*Mr. Palfrey* agreed that there was no problem respecting ROVER. We should be careful not to prohibit our own development efforts.

*Mr. Fisher* noted that ORION was prohibited by the test ban treaty.

*Amb. Thompson* commented that we would need to tell Gromyko that we will work something out.

*The Secretary* said that Gromyko wanted something as close to a formal agreement as possible but that he would tell Gromyko we have too many constitutional problems to take on a formal agreement at this time. The Secretary wished to be sure whether or not Defense was requesting that we leave the way open for small nuclear weapons in orbit.

*Mr. Nitze* said that Defense had not thought that it would present much of a problem to leave this open. In our previous statements, we had referred to "weapons of mass destruction". However, no one had a clear idea of why we needed to leave the interpretation open. The point Defense was making was simply that the main concern was weapons of mass destruction and there seemed to be no reason to tie our hands on other weapons.

*Dr. Wiesner* thought it would be hard to define if we tried to exclude some nuclear weapons. He did not think "weapons of mass destruction" could be defined in a way that would distinguish between hitting a city with 20 small AICBM's and one large ICBM.

*Mr. Barber* asked why a definition was necessary.

*The Secretary* said that the term "weapons of mass destruction" would be generally understood to include all nuclear weapons. If we were asked whether this were the case and if we said anything but "yes", we had better not go into the arrangement at all.

*Gen. Hamlett* said he thought the Secretary was right.

Turning to the question of withdrawal, *the Secretary* said that we might put in our declaration some language which would take off from the withdrawal clause of the test ban treaty. We might say that "The U.S., of course, as in the case of the test ban treaty, reserves the right to terminate if it determines that extraordinary events, related to the

purpose of the declaration, have jeopardized our supreme interests." He questioned a reference to "technological advance" in one of the drafts, commenting that it seemed to him to imply that when we had developed a system, we would put it up.

*Mr. Fisher* pointed out that the reference to "technological advance" was more related to the possible need for additional assurance at a future time. Additional assurance might also be needed if we got substantial disarmament. Our relaxed approach to this matter might change.

*Amb. Thompson* said he had told Dobrynin that we would need some withdrawal provision. Dobrynin had said something along the lines of the test ban withdrawal clause might be worked out.

*Mr. Chayes* cautioned that we did not want to parallel the test ban treaty too closely. If we did that, it would be difficult to explain why we didn't want a treaty.

*Mr. Foster* commented that we might come back to a treaty before we were through.

*Mr. Nitze* asked why a termination clause was needed in a declaration of intentions.

*Mr. Fisher* responded that it was desirable to have something in the public record.

*The Secretary* then suggested language along the following lines: "The U.S. Government will keep in close touch with developments, and if the U.S. decides that extraordinary events require that it change its view, it will inform the General Assembly." The General Assembly might review the matter in four years time.

*Mr. Nitze* noted this implied a General Assembly resolution and asked whether that was what the Secretary wanted.

*The Secretary* replied affirmatively and said that it would be accompanied by declarations.

*Dr. Wiesner* asked whether the GA resolution came first and then our declarations?

*Mr. Chayes* asked whether the declarations would simply be the statements made in connection with the debate?

*The Secretary* said that the resolution might be sponsored by other countries and that we would make our statements with respect to the resolution.

*Mr. Foster* said that it would be recognized that the U.S. and the Soviet Union were behind the resolution.

*The Secretary* said that if we wanted Mexico and they wanted the Czechs, everyone would know, but we needed to negotiate with the Soviet Union a jointly acceptable resolution, with an agreement between the U.S. and Soviet Union not to accept amendments.

*Mr. Gardner* said he thought such an agreement was possible.

*The Secretary* recalled that in his talks with the Soviets he had mentioned parallel declarations, but he was not sure they should be parallel.

*The Under Secretary*, who had joined the meeting, said he had just talked with the President about this matter and that the President was dubious about anything that looked like two agreed statements or like an executive agreement. The President thought a GA resolution would avoid Congressional problems. It could be put forward by other states. He had asked whether we could control the text.

*The Secretary* said that the meeting had been moving in the direction of the President's position. The text of the resolution would have to be agreed to by the U.S. and Soviet Union. We didn't exclude the possibility of an agreement at some time but couldn't buy one now.

*Mr. Chayes* said we would need to avoid two identical statements in connection with the resolution.

*Mr. Johnson* asked whether in the U.S. declaration, Amb. Stevenson would not simply repeat what we had already said.

*Amb. Thompson* noted that we would need language to get out if necessary.

*Mr. Marengo* asked whether the Soviets would agree not to debate other uses of space.

*The Secretary* said it was his impression that they would agree not to do this, that they appeared to be tacitly accepting reconnaissance activities, and that this was now less of a problem. They seemed to be undertaking such activities themselves.

*Mr. Marengo* said that had been CIA's only problem.

In response to a question by the Secretary, *Mr. Gardner* said that the Mexicans and Canadians were likely to introduce a resolution whether we did or not.

*Mr. Nitze* said an effort should be made to coordinate with the Soviet Union to have better control over the UN debate.

*The Secretary* reaffirmed the need for a jointly agreed text.

*Mr. Johnson* suggested that we should also exchange statements prior to their presentation.

*Mr. Nitze* noted that the intent of this would not be to have the wording the same but simply to coordinate them.

*Gen. Hamlett* wondered if the Congress might not regard this as an agreement.

*The Secretary* thought this would not be the case, that we were just showing the Soviets in advance what we planned to say.

*Mr. Fisher* thought the Congress might consider it advantageous for us to see in advance what the Soviets were going to say.

*Mr. Nitze* thought we might inform the Congress that the resolution was not an obligation.

*The Secretary* cautioned against using the “no obligation” argument since that would be picked up by the Soviets. However, the type of obligation reflected the type of arrangement. A GA resolution was a GA resolution and nothing more. We were starting at the bottom of the ladder of “obligations”, and we would see how far up we would ultimately go.

*Mr. Nitze* asked about the status of other limited measures, in particular observation posts.

*Mr. Foster* said that the JCS report on observation posts had been received, but there had not as yet been an opportunity to review it.

*The Secretary* commented that there seemed to be less chance that the Soviets would want to move on observation posts without linkage to other measures. The chances seemed somewhat higher that, despite the MLF, the Soviets might move on a non-dissemination agreement.

---

## 223. Record of Committee of Principals meeting, October 8<sup>1</sup>

October 8, 1963

### CONCLUSIONS RESPECTING U.S. APPROACH TO AN ARRANGEMENT AGAINST PLACING WEAPONS OF MASS DESTRUCTION IN ORBIT

1. Under present circumstances, a General Assembly resolution would be the most acceptable form of an arrangement against the placing in orbit of weapons of mass destruction. The text of such a resolution would have to be acceptable to the U.S. and Soviet Union, and amendments not acceptable to either would be rejected.

2. Statements supporting the resolution would be made by the two countries. The statements would not be identical, but they would be exchanged in advance of presentation.

3. The U.S. statement would include language designed to provide a basis in the public record for re-opening the question of verification

---

<sup>1</sup> Conclusions reached on U.S. position regarding weapons of mass destruction in orbit. Top Secret. 1 p. Kennedy Library, National Security Files, Departments and Agencies Series, ACDA, Disarmament, Committee of Principals, 3/61–11/63.

at a future time should it become desirable to do so and for withdrawing if necessary.

4. "Weapons of mass destruction" would have to be interpreted as including all nuclear weapons. The U.S. could accept specific reference to nuclear weapons should the Soviet Union prefer that approach.

---

**224. Memorandum of Conversation, October 10, between Rusk and Gromyko<sup>1</sup>**

October 10, 1963

SUBJECT

*Disarmament*

PARTICIPANTS

*US*

The Secretary  
Under Secretary Ball  
Governor Harriman  
Ambassador Thompson  
Assistant Secretary Tyler  
Deputy Assistant Secretary Greenfield  
Mr. Akalovsky

*USSR*

Mr. Gromyko  
Mr. Semenov  
Ambassador Dobrynin  
Mr. Zamyatin  
Mr. Zemskov  
Mr. Kornienko  
Mr. Sukhodrev

*The Secretary* said his view was that the efforts towards a solution of the disarmament problem could be compared to advance of infantry. When infantry advanced and encountered a pocket of resistance it worked on that pocket but the advance continued in the other sectors. In this connection, the Secretary recalled the US proposal for mutual destruction of B-47's and "Badgers". The US had proposed this because we believed it was better to destroy sophisticated weapons which were

---

<sup>1</sup> Disarmament issues. Secret. 5 pp. Department of State, Central Files, DEF 18.

becoming obsolete in the military establishments of our two countries than to disseminate such weapons to the underdeveloped countries.

*Mr. Gromyko* wondered whether this would not look like destruction of weapons which were too expensive to maintain.

*The Secretary* agreed that *Mr. Gromyko* might have a point here but noted that we were proposing a rate of destruction which would be faster than the rate of obsolescence. He reiterated that both of our countries would reach a stage of development of sophisticated weapons where we would not want to see those weapons get into the hands of others.

*Mr. Gromyko* asked whether the Secretary was advancing this idea as a method which could be applied to armaments in general or only to a specific category.

*The Secretary* commented this proposal had two advantages in our view: 1) it would not require broad inspection because all that would have to be verified would be that a certain specified number of designated armaments had been actually destroyed, and 2) this would be useful from the standpoint of our concern about the possibility of such weapons being distributed to other nations. The Secretary thought that perhaps other weapon classes could be handled in the same way, although he did not know. This matter could be studied. As to our proposal regarding B-47's and "Badgers", if these aircraft should become obsolete in five years for example, why couldn't we destroy them in three years? That would give us some disarmament and would also be beneficial in other respects. For instance, it was interesting to note that the cost of one supersonic bomber was equivalent to the cost of maintaining a whole university in an underdeveloped country; consequently, it would be nonsense to give such bombers to the less developed countries.

*Mr. Gromyko* commented that if, for example, five hundred bombers were destroyed but one hundred rockets were built in their place, where would that lead us?

*The Secretary* agreed we ought to work on the problem of rockets as well, but pointed out that rockets without bombers would still amount to less armaments than if we had both. He also reminded *Mr. Gromyko* that the United States was prepared to discuss the question of nuclear delivery vehicles across the board. We had proposed in Geneva that all major armaments be reduced in stage one by thirty per cent. If the USSR felt that this was a strategic problem, we were prepared to discuss it.

*Mr. Gromyko* said that perhaps the most realistic approach to disarmament was that of general and complete disarmament, because such an approach would avoid the problem of balance and/or correlation

of forces. We would begin at some point and end at zero, so that the only problem would be to keep the balance during the process. Of course he realized that all this would take some time.

*The Secretary* said that in theory we agreed that total disarmament was our goal but pointed out that we must start somewhere and move ahead.

*Mr. Gromyko* said this was true, but those steps must be part of a whole and agreed program, so that everybody would know what would happen tomorrow.

*The Secretary* observed that he had reviewed the disarmament proposals which had been made since 1920. All of those proposals had bogged down in technical problems which arose as soon as one tried to match one weapon against another. As far as our proposals for the destruction of bombers was concerned, he could confide to *Mr. Gromyko* that our military believed that their destruction would result in a strategic disadvantage to the United States. However, the Government view had prevailed and we had advanced the proposal. Perhaps the military in the Soviet Union felt the same way as ours. *The Secretary* then said that as far as other weapons were concerned, perhaps we could find some which would lend themselves to a similar approach.

*Mr. Gromyko* inquired whether this meant that the Secretary was mentioning bombers only as an example.

*The Secretary* replied he had mentioned bombers because we had fully analyzed this problem. We could study whether this approach could be applied to some other weapons and perhaps we could find some additional weapon classes which would lend themselves to a similar treatment.

*Mr. Gromyko* then asked whether this approach could, in the US view, be applied to any bombers or only to a specific type.

*The Secretary* said we had proposed B-47's and "Badgers" because we believed that they balanced. He did not know whether this approach could be applied to all bombers and said that this matter would have to be studied.

*Mr. Gromyko* then raised the question of bases, noting that when the Soviet Union referred to nuclear delivery vehicles in stage one it also mentioned bases, a subject which the United States was reluctant to discuss.

*The Secretary* suggested that *Mr. Gromyko* ask his Defense Ministry how many bases the United States had abandoned in the last fifteen years. He thought *Mr. Gromyko* would be amazed when he heard the figure. *The Secretary* remarked that if this job should be too big for the Soviet Defense Ministry he would give *Mr. Gromyko* the figures.

*Mr. Gromyko* commented that perhaps the United States had abandoned weak bases and kept the strong ones. He said he had raised the

question of bases because it had been a sensitive spot in the relations between our two countries since the war, although sometimes both the US and the USSR refrained from mentioning it.

*The Secretary* suggested that Mr. Gromyko should note that the US had supported the Iranian commitment not to have any missiles stationed in Iran. We had done so because we knew the Soviet sensitivity on this point.

*Mr. Gromyko* said he appreciated this statement and commented that the Soviet Government had guessed that this was so, even at the time the Iranians had made their commitment, although of course the Soviet Union could not be completely certain at that point. He wished to point out, however, that while the United States was perhaps abolishing land bases it was building sea bases.

*The Secretary* rejoined that the Soviet Union was building submarine upon submarine.

*Mr. Gromyko* asserted that Soviet submarines remained in closed seas.

# National Security Policy

January 1961

## 226. Memorandum Prepared by Boggs, January 5<sup>1</sup>

January 5, 1961

### SUBJECT

Discussion at the 473rd Meeting of the National Security Council, Thursday,  
January 5, 1961

Present at the 473rd NSC Meeting were the President of the United States, presiding; the Vice President of the United States; the Secretary of State; the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present at the Meeting and participating in the Council actions below were the Secretary of the Treasury and the Director, Bureau of the Budget. Also attending the Meeting were the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Chairman, Atomic Energy Commission; the Under Secretary of State for Political Affairs (Merchant); Assistant Secretary of State Gerard C. Smith; the Deputy Secretary of Defense (Douglas); Assistant Secretary of Defense John N. Irwin, II; the Secretary of the Army; the Assistant to the President; the Special Assistants to the President for National Security Affairs, for Science and Technology, and for Foreign Economic Policy; Mr. Huntington Sheldon, Central Intelligence Agency; the White House Staff Secretary; the Assistant White House Staff Secretary; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the Meeting and the main points taken.

### 1. NATIONAL SECURITY COUNCIL INTELLIGENCE DIRECTIVES

Mr. Gray said he wished to bring up first a matter which was not on the formal agenda. The Joint Study Group on Foreign Intelligence Activities, composed of representatives of the Director of Central Intelli-

---

<sup>1</sup> Discussion at 473d National Security Council meeting on intelligence directives. Top Secret. 13 pp. Eisenhower Library, Whitman File, NSC Records.

gence, the Secretaries of State and Defense, the Director, Bureau of the Budget, and the Special Assistant to the President for National Security Affairs, had submitted its report and was now preparing a list of recommendations on which the Principals had agreed, as well as a list of recommendations which had not been concurred in. A question had arisen whether a revision of the NSCID's would be necessary as their provisions affect the authority of the Secretary of Defense in the intelligence field. At the present time, the NSCID's refer to the Military Services, not to the Secretary of Defense. The suggestion had been made that the Secretary of Defense be given authority by amendment of the NSCID's to proceed with reorganization of military intelligence within the Department of Defense.

Secretary Gates said this matter would affect the next Secretary of Defense. The first issue involved in the report of the Joint Study Group was the one Mr. Gray had mentioned, namely, the question of amending the NSCID's. Another issue, however, was also involved, namely membership on the U.S. Intelligence Board. The report by the Joint Study Group recommended that the Secretary of Defense and the Joint Chiefs of Staff rather than the Military Services be represented on the USIB. Secretary Gates was in favor of this recommendation but understood the Military Services were opposed. Mr. Dulles said he was also opposed to this recommendation. Secretary Gates said this matter affected the NSCID's since the organization of the USIB was covered in the NSCID's.

The President said he had been told that about [text not declassified] was being spent for the intelligence function in the Department of Defense. He believed we were not good administrators if we could not perform this function at less expense. He also believed that we were not doing everything that could be done to implement the concept of integrated strategic planning unless military intelligence could be placed under the Joint Chiefs of Staff. He was unable to understand why the antiquated system of separate intelligence organizations for each Military Service was retained.

Mr. Dulles pointed out that the Military Services at the present time had the personnel, the competence, and the background in intelligence. Until this situation was changed, he would rather deal with representatives of the Military Services, who know intelligence, than with the representative of the Secretary of Defense, who would not have the experience, the personnel, and the background judgment required. When organizational changes were made so that the representative of the Secretary of Defense had competent collectors and analysts working for him, then Mr. Dulles would not disagree with the recommendation for a change in the membership of the USIB, but at present, he repeated, the change suggested would merely result in putting on USIB representatives with inadequate intelligence support.

The President believed that the Services should collect battlefield intelligence but did not see the necessity for strategic intelligence in the Services. He wondered what intelligence officers in the Services could do to get information from the center of the USSR and correlate it with intelligence on the rest of the world. He said when he supported the establishment of the Central Intelligence Agency in 1947, he did it on the basis that the function of strategic intelligence should be in CIA and that duplication should be eliminated. General Lemnitzer felt that the acquisition of technical intelligence, e.g. information about enemy nuclear submarines, required officials who know nuclear submarines. The Services would be very much concerned if they were not represented on USIB. The President believed that the information referred to by General Lemnitzer was battlefield intelligence, whereas the discovery of the shipyards where nuclear submarines are being constructed was the business of CIA. He did not see why four intelligence services should attempt to find out where the submarines were made. He believed it was the function of CIA to acquire strategic intelligence. General Lemnitzer believed that each Military Service was working on a different intelligence target.

Mr. Gray pointed out that a substantive discussion of the material in the Joint Study Group report seemed to be underway. The President said that perhaps the membership of USIB could not be changed at once but that a different type of intelligence board could be organized once military intelligence within the Department of Defense was reorganized. Secretary Gates did not agree that the membership of USIB could not be changed immediately. A Defense representative on the Board could do his homework in the Pentagon and bring the Defense position to the Board in the same way a Defense representative on the Planning Board reports the Defense position. The President felt that changes in the membership of USIB must be correlated with changes in the military intelligence organization. Mr. Gates said that thus far intelligence has not been affected by reorganization of the Department of Defense. Mr. Dulles said when changes were made in the organization of military intelligence, there would be a reason for changing the membership of USIB, since there would then be one high-ranking official who knows intelligence representing the Department of Defense. The President said that there would in any case remain the need for technical intelligence gathered in connection with the normal deployment of forces.

Mr. Dulles said the figure of [text not declassified] had been mentioned occasionally as the sum spent by this government on intelligence activities. He wished to point out, however, that this figure included support of the radar station at Thule, support of SAMOS, etc., all of which were really early warning functions.

The President said he had read a summary of the report by the Joint Study Group. He felt that up to now we had not accomplished all it was possible to accomplish in integrating all our intelligence activities. Secretary Gates said there was no review in the Department of Defense of intelligence requirements. General Lemnitzer said the JCS agreed on the need for Defense review of intelligence requirements.

Secretary Gates believed the policy question before the Council now was, how far would this Administration wish to go in reorganizing intelligence during its last two weeks in office. The President said he felt a directive on agreed matters could be issued and that he could pass on to his successor his views on other intelligence questions. Mr. Dulles said he would like to see the matter of the pictorial center worked out soon.

The President then remarked that soon after Pearl Harbor, he was engaged in an operation which required him to have certain information which he was unable to obtain from the Navy, i.e. the strength the Navy had left in the Pacific. The President also noted that the U.S. fought the first year of the war in Europe entirely on the basis of British intelligence. Subsequently, each Military Service developed its own intelligence organization. He thought this situation made little sense in managerial terms. He had suffered an eight-year defeat on this question but would leave a legacy of ashes for his successor.

Mr. Gray said language would be prepared to permit agreed recommendations from the report of the Joint Study Group to be put into effect.

The President pointed out that in military history a single man usually dominates the intelligence service of a country at any given time. He felt that a strong central position with respect to intelligence was necessary. The Joint Chiefs of Staff should not be required to consult individually each of the Services, as well as CIA, in formulating their strategic plans; they should have their own intelligence service.

The National Security Council:

*a.* Discussed the question raised by the Secretary of Defense as to revising the National Security Council Intelligence Directives in the light of the recommendations relating to the military intelligence organization within the Department of Defense and to the membership of the U.S. Intelligence Board, submitted on December 15, 1960, by a Joint Study Group on Foreign Intelligence Activities, composed of representatives of the Director of Central Intelligence, the Secretaries of State and Defense, the Director, Bureau of the Budget, and the Special Assistant to the President for National Security Affairs.

*b.* Agreed that the Secretary of Defense should submit his recommendations for appropriate revisions in the NSCID's directive to the

authority of the Secretary of Defense over the military intelligence organization within the Department of Defense in consonance with the Defense reorganization Act of 1958.

c. Noted that the recommendations of the Secretary of Defense pursuant to *b* above, together with the views of the Principals of the Joint Study Group regarding the Group's report which are being consolidated by the Director of Central Intelligence, would be considered at the next NSC meeting on January 12, 1961.

NOTE: The actions in *b* and *c* above, as approved by the President, subsequently transmitted to the Secretary of Defense and the Director of Central Intelligence.

[Here follows discussion of U.S. Policy on the Panama Canal and an intelligence briefing on developments in Cuba, the Congo, Ethiopia, Algeria, Laos, and China. The briefing was treated as two items.]

#### 5. POSSIBLE DEFICIENCIES IN THE U.S. POSTURE FOR LIMITED MILITARY OPERATIONS

(Memo for NSC from Executive Secretary, subject: "Capabilities of Forces for Limited Military Operations", dated June 18, 1958; NSC Action No. 1934; Memo for NSC from Executive Secretary, subject: "U.S. and Allied Capabilities for Limited Military Operations to 1 July 1962", dated September 28, 1960; NSC Action No. 2317-c; Memo for NSC from Executive Secretary, subject: "Possible Deficiencies in the U.S. Posture for Limited Military Operations", dated December 30, 1960)

Mr. Gray explained the background of this subject to the Council and called upon General Lemnitzer to make a presentation. (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another copy is attached to this Memorandum).

General Lemnitzer recalled the study on limited war (transmitted to the Council on September 28, 1960) which had dealt with hypothetical situations in five areas—Berlin, the Taiwan Strait, Iran, Southeast Asia, and Korea. Contingency plans of some magnitude had been prepared for possible operations in these key areas. The JCS had prepared a report on possible deficiencies in the U.S. posture for limited military operations, pursuant to NSC Action 2317. The JCS report had first made certain overall comments on studies of this nature: (1) limited war studies are not a valid basis for programming or decision-making; (2) the adequacy of forces to cope with any one limited war situation depends on prompt action to initiate partial mobilization, augment existing lift capabilities, expand the war production base, and waive financial limitations; (3) the U.S. overall capability for general war would not be unacceptably degraded by participating in one of these limited operations. In fact, it could be argued that one limited war

situation would increase U.S. readiness for general war because of the measures which would be taken to meet the limited situation; (4) any weakness in the U.S. posture is due to acceptance of calculated risks pertaining to the balance of forces and their supporting elements; (5) the early use of relatively small military forces in limited war situations would be more effective than the subsequent use of much larger forces; (6) many factors others than the purely military factors affect our limited war posture.

General Lemnitzer then summarized the comments by the JCS on the specific possible deficiencies in our limited war posture. With respect to airlift, a resumption of hostilities on the scale of Korea would result in a shortage during the first twenty days but after that airlift would be adequate. Two actions to improve airlift had been taken since the date of the limited war study: (1) funds for purchasing additional C-130's had been made available; and (2) additional allocations had been made to the Civil Reserve Air Fleet. General Lemnitzer pointed out that terminal facilities constituted an extremely important factor in airlift. With respect to sea lift, the JCS had concluded that our capabilities were generally adequate, although there might be some shortage in the first sixty days of hostilities.

Turning to military logistics base plans, General Lemnitzer noted that specific guidance had been issued last March but there had not been time for its full implementation. If this guidance is implemented, our capability to support limited war situations should be improved in the near future without degrading general war readiness. The Army has problems connected with the availability of units, the modernization of equipment, and the maintenance of readiness for general war. The Navy is unable to fulfill certain mobilization plan objectives connected with modern conventional weapons and ammunition. The Air Force is generally ready for limited war operations, having distributed its assets around the world near possible limited war areas, with the striking force, of course, remaining in the U.S. The Marines have problems with reserves and with reconstituting reserve stocks.

General Lemnitzer then summarized the JCS comments on Southeast Asia. Limited operations there, he said, were handicapped by logistical limitations stemming from lack of communications, lack of transportation, and lack of port and terminal facilities. Furthermore, the existing facilities were extremely vulnerable to disruption and are inadequate to support sustained operations. These limitations, however, have been offset to some degree by countermeasures. The Pacific Command has recently been augmented by an airborne battle group and an aircraft carrier. Equipment has been pre-stocked in the Pacific area. Periodic mobility training exercises are planned. The Air Force modernization program will improve our limited war capability in the

Pacific. We now have authority for overflights in the Pacific area. Other corrective action which is, or could be, taken will enable us to use additional bases and improve strategic signal communications and strengthen over-the-beach supply methods.

In concluding, General Lemnitzer said that most of the problems adverted to in the limited war study were not new. Additional funding would alleviate many of the deficiencies pointed out in the study but in the light of total requirements, not all of the deficiencies could be remedied at once.

The President said this was the kind of report he could understand. Secretary Herter said the JCS report was very encouraging, especially as regards airlift. However, Secretary Herter felt he must take exception to Paragraph 9 on Page 6 of the JCS report. This paragraph indicated that indecision and lack of clear-cut policies could contribute to starting a conflict we desired to avoid and then went on to say "a pertinent example is the recent conflict of judgment between the Department of Defense and the Department of State concerning the proper implementation of U.S. policy in Laos." General Lemnitzer said this paragraph appeared in the JCS report because the JCS thought that last August when Kong Le rebelled, the U.S. should have built up the Phoumi forces. At that time the State Department embarked on a course of building up Souvanna Phouma. This issue was not settled and as a result Kong Le had several months in which to build up his forces. Secretary Herter replied that the Phouma government became the recognized government of Laos and therefore the government with which the U.S. had to deal. Moreover, our allies supported Souvanna Phouma and were opposed to Phoumi. We had been successful in continuing military assistance to Phoumi even when he was a rebel against the recognized government. Moreover, we had worked constantly to shift power from Souvanna Phouma to Phoumi and had finally succeeded. If the U.S. had armed Phoumi last August, it would have been arming rebels against the recognized government.

The President said the word "indecision" must be eliminated from the JCS report. No agency of the government had the right to say that another agency was indecisive and did not know what it was doing. It was proper to say that the problems were such that decisions could not be made immediately but dereliction of duty should not be imputed to another agency. The President said that even now we did not know what we could do about Laos because of the attitude of our allies. The Joint Chiefs of Staff were correct from the military point of view in stating that it was better to use small forces promptly than to use larger forces later but the question of when small forces can be used involved a political judgment.

General Lemnitzer said the JCS had experienced for some time a feeling of frustration about Laos. The President asked to whom the

JCS report was made. Secretary Gates said the report was made to him and would be a part of the NSC files. The President said the criticism in the report of another government department must be removed.

Mr. Gray noted that the JCS report spoke of allied cooperation in sea lift but made no mention of such cooperation in airlift. General Lemnitzer said it had been proved in the Congo that the U.S. has the only real airlift capability. The President agreed that we should plan on allied assistance in sea lift. He said that if we could not get cooperation from our allies, we were foolish in attempting to establish a collective defense posture in peace time.

Secretary Gates said he had not, during his tour of duty in the Pentagon, noted any deficiencies in our limited war capabilities. The JCS had never pointed out any deficiencies to him. The President said he would like to see two divisions redeployed from Europe to the U.S. He believed these divisions were too much on the front line in Europe. He said that the Secretary of State should brief the Secretary of State-designate on the situation in NATO and on the desirability of inducing the European countries to do their full share with respect to the support of ground forces.

Mr. Gray referred to a draft Record of Action which had been distributed at the meeting. Mr. Stans felt the word "improving" was rather weak in the light of the JCS report. It was impossible to improve starting from "0". Mr. Douglas agreed. The President suggested that a word should be used to indicate that our limited war capabilities were good now but were still improving. Mr. McCone proposed that the word "substantial" be used for this purpose. The President said our estimate of the situation was that a balanced military program did not require a radical allocation of additional resources to limited war but that some additional improvements would be made in our capabilities for limited war.

Mr. Stans said that Paragraph *c* of the draft Record of Action might give a misleading impression. He believed the phrase "without degrading our capabilities for general war" should be inserted in this sub-paragraph.

The President suggested that General Lemnitzer's summary of the report should be retained in the official minutes of the National Security Council.

Secretary Herter inquired about progress on the limited war study directed by NSC Action 2317-*b*. Secretary Gates said this study was underway but that problems had arisen in connection with formulating the assumptions on which to base the study.

The National Security Council:

*a.* Noted and discussed the memorandum from the Deputy Secretary of Defense on the subject and the report attached thereto from the

Joint Chiefs of Staff (transmitted by the reference memorandum of December 30, 1960); as summarized at the meeting by the Chairman, Joint Chiefs of Staff.

b. Agreed that U.S. capabilities to conduct limited war are substantial and will show a further improvement on the basis of the FY 1962 budget as submitted and other actions taken since the completion in July 1960 of the Limited War Study. Agreed that a balanced military program does not require a radical allocation of additional resources to limited war capabilities.

c. Noted further that planned logistics support capability is, or will be, adequate to meet any one or combination of contingencies without degrading to an unacceptable degree U.S. overall capability for general war, provided in sum they do not exceed the general order of magnitude contained in the Korean contingency plan.

d. Noted that President's directive that the summary by the Chairman, JCS, of the report by the Joint Chiefs of Staff (enclosed with the reference memorandum of December 30, 1960) be included in the official files of this NSC meeting.

NOTE: The above actions, as approved by the President, subsequently transmitted to the Secretary of Defense and the Chairman, JCS.

#### 6. MISSILES AND MILITARY SPACE PROGRAMS

(NSC Actions Nos. 1433, 1484, 1615–c, 1653, 1690, 1733, 1765, 1800, 1846, 1956, NOTE following 2013, 2081, 2118, 2168, 2207, 2208, 2238–b–(9), 2300–g, and 2315; Memo for NSC from Deputy Executive Secretary, same subject, dated December 14, 1960; NSC 6021; Memos for NSC from Executive Secretary, same subject, dated December 30, 1960, and January 4, 1961)

Mr. Gray briefed the Council on this subject (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another is attached to this Memorandum). The President asked how many POLARIS submarines would be operational by mid-1964. Secretary Gates said he believed fifteen would be operational by then and added that almost all of those now approved would be operational by the end of 1964. The President felt that with 540 MINUTEMEN missiles, 320 POLARIS missiles (3/5 of which would be on station) plus ATLAS, TITAN, and our IRBMS, we would be in a good missile position in 1964. At that time we should certainly have enough missiles to destroy the USSR in the event we are attacked. Secretary Gates said he had never at any time been worried about the situation after 1963. In fact, the farther into the future we look, the better off we will be. General Lemnitzer pointed out that in addition to the forces mentioned by the President, a great bomber force would be available. The President said he understood we also had 23,000 megatons. Mr. Gray then pointed

out that the Joint Chiefs of Staff had some problems with the adoption of NSC 6021. He was not clear whether these problems were substantive or procedural. General Lemnitzer said that some statements incorporated in NSC 6021 were actually statements made in 1955. Accordingly, if these statements are now adopted and sent out for implementation, the impression would be fostered that we are just beginning to implement the policy contained therein. The President felt that a policy adopted some years ago could be repeated in a later policy paper if it had been reviewed.

Secretary Gates then read Paragraph 2 of NSC 6021 and pointed out that it could be considered out of date at this time since it referred to the early development of the IRBM program. The President said we might need to note that some of the missiles referred to in this 1955 paragraph were now operational.

Mr. Douglas was not sure that the end of Paragraph 3, which referred to a statement by Khrushchev at the Paris meeting, was entirely accurate. Secretary Gates added that the statement in NSC 6021 appeared to be broader than the statement Khrushchev had actually made. The President disagreed, saying that at the Paris meeting De Gaulle had stated that a Soviet satellite had passed over France seventeen times and might, for all he (De Gaulle) knew, be taking pictures. Khrushchev had replied that he did not care how many satellites took pictures over the USSR. Mr. Gray recalled that the language at the top of Page 3 of NSC 6021 had come from two NSC actions which the Departments of State and Defense had checked against the records last spring. The President had approved that Record of Actions at that time because it had turned out to be a correct statement. The President said he realized, of course, that Khrushchev, if it suited his purposes, would deny saying what he did say.

Secretary Herter said he had certain editorial revisions to suggest in NSC 6021. Mr. Gray said the paper could be referred back to the Planning Board for revision in the light of the discussion.

The President asked whether the Council would meet only one more time during this Administration. Mr. Gray said there would be a long meeting next Thursday. The President agreed and added that no NSC meeting should be scheduled on the 19th.

In response to a question from the President, Mr. Dulles said he had not held a personal briefing for the President-elect during the last three or four weeks. The President asked whether the President-elect had conveyed any distress or disagreement with U.S. policy to the Department of State, particularly as regards Cuba. Secretary Herter said the President-elect had taken no position on our policy and, indeed, had not been asked to take such a position. The Department of State had confined itself to informing the President-elect of developments.

The National Security Council:

*a.* Concurred in the recommendation of the Deputy Secretary of Defense (transmitted by the reference memorandum of December 30, 1960) that NSC Action No. 2207 be revised to provide:

“An operational force objective which specifies the achievement of 540 MINUTEMAN operational missiles by mid-calendar year 1964.”

*b.* Concurred in the recommendation of the Deputy Secretary of Defense (transmitted by the reference memorandum of December 30, 1960) that NSC Action No. 2315 be revised to provide:

“*a.* A total of 19 POLARIS submarines authorized for construction (5 included in the FY 1962 budget submission).

“*b.* Long lead time planning and procurement actions authorized to permit the construction of 5 additional POLARIS submarines (included in the FY 1962 budget submission).”

*c.* Discussed the draft statement of policy on the subject contained in NSC 6021, in the light of the views of the Joint Chiefs of Staff, transmitted by the reference memorandum of January 4, 1961; and referred it to the NSC Planning Board for revision in the light of the discussion at this meeting.

NOTE: The actions in *a* and *b* above, as approved by the President, subsequently transmitted to the Secretary of Defense.

227. Record of Action, January 10<sup>1</sup>

January 10, 1961

The Deputy Secretary of Defense, the Acting Secretary of the Treasury, the Secretary of Labor, and the Director, Bureau of the Budget, participated in the action below.

ACTION

NUMBER

SUBJECT

## 2373. RESERVE MOBILIZATION REQUIREMENTS

(NSC 5420/3; NSC Action No. 2215-c; Memo for NSC from Executive Secretary, same subject, dated November 25, 1960)

Concurred, with the exception of the Secretary of Labor, in a recommendation to the President (as proposed by the NSC Planning Board in the reference memorandum of November 25, 1960) that, because the objectives thereof have been accomplished, NSC 5420/3 be rescinded. The Secretary of Labor dissented on the grounds that the following inherent and fundamental problems requiring administrative action of a high order have still not been resolved to his knowledge:

*a.* A complete review of the capabilities of the Officer Corps of the National Guard and the Reserves, followed by a determined "weeding-out" of incompetent personnel.

*b.* A constant, continuing review of the unit structure of the National Guard and the Reserves, so as to keep the structure coordinated with mobilization plans.

*c.* Continual scrutiny to ensure that there is a qualitative distribution of personnel in accordance with the realistic requirements of the three Services.

NOTE: The above action was subsequently submitted to the President. The President rescinded NSC 5420/3 on the grounds that the policy therein was no longer valid. The President, referring to his comment in NSC Action No. 2342-b, indicated that he was asking the Secretary of Defense to call to the attention of his successor the value of continuing studies along the lines of the three points made by the Secretary of Labor. The Council action and the Presidential decision subsequently transmitted to all holders of NSC 5420/3.

**228. Memorandum Prepared by Boggs, January 13<sup>1</sup>**

January 13, 1961

**SUBJECT**

Discussion at the 474th Meeting of the National Security Council, Thursday,  
January 12, 1961

Present at the 474th NSC Meeting were the President of the United States, presiding; the Vice President of the United States; the Secretary of State; the Secretary of Defense; and the Director, Office of Civil and Defense Mobilization. Also present at the Meeting and participating in the Council actions below were the Secretary of the Treasury; the Director, Bureau of the Budget; the Attorney General and the Chairman, Atomic Energy Commission (Items 2, 4 and 5); and the Administrator, Housing and Home Finance Agency (Item 5). Also attending the Meeting were the Chairman, Joint Chiefs of Staff; the Director of Central Intelligence; the Acting Director, U.S. Information Agency; the Assistant to the President; the Special Assistants to the President for National Security Affairs, for Science and Technology, and for Foreign Economic Policy; Assistant Secretary of State Gerard C. Smith; Assistant Secretary of Defense John N. Irwin, II; Mr. Robert Amory, CIA; the White House Staff Secretary; the Assistant White House Staff Secretary; the Naval Aide to the President; the Executive Secretary, NSC; and the Deputy Executive Secretary, NSC.

There follows a summary of the discussion at the Meeting and the main points taken.

**1. SCOPE OF OPERATIONAL CAPABILITY OF THE POLARIS PROGRAM**

(Memo for Special Assistant to the President for National Security Affairs from Secretary of Defense, same subject, dated January 10, 1961)

Mr. Gray introduced this subject to the Council. (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another copy is attached to this Memorandum).

Secretary Gates remarked that this was a controversial subject on which the Joint Chiefs of Staff had submitted "split papers". Some time ago a program involving the installation of POLARIS missiles on some

---

<sup>1</sup> Discussion at 474th National Security Council Meeting. Top Secret. Polaris program, codification of U.S. arms control/nuclear testing policy, disclosure of classified information to foreign governments, foreign intelligence activities, shelter from radioactive fallout, and rental payments for overseas bases. 25 pp. Eisenhower Library, Whitman File, NSC Records.

six to eight cruisers had been evaluated in the Department of Defense. According to the Weapons Systems Evaluation Group (WSEG) studies, from the standpoint of cost, effectiveness and other criteria, the cruiser was not as effective as the submarine or the mobile MINUTEMAN as a missiles weapons system. Finally, he had accepted the view of the Chairman of the Joint Chiefs of Staff that POLARIS missiles should be installed on one cruiser only; namely, the LONG BEACH. He had informed the Navy that it must absorb the estimated \$58 million cost of installing these missiles on this cruiser; moreover, he had reaffirmed a Department of Defense directive which says explicitly that the larger program for installing POLARIS missiles on cruisers was not approved, the LONG BEACH being the exception to his disapproval of the cruiser program. Secretary Gates added that the LONG BEACH was a nuclear-powered cruiser of great endurance which had cost \$300 million; hence he felt it was almost criminal not to provide this expensive vessel with offensive capabilities. Both he and the Chairman of the Joint Chiefs believed a great deal might be learned from the experiment. He also felt that the experiment was unlikely to expand into a program of equipping six or eight cruisers with POLARIS missiles, even though he admitted that the advocates of the larger program now had a foot in the door. After conferences with the Chief of Naval Operations, he had concluded that the LONG BEACH would not be a "white elephant." In conclusion, Mr. Gates emphasized that he had not approved the expenditure of additional funds on this program and that the installation of POLARIS missiles on the LONG BEACH was an exception to the general principle that such missiles would not be installed on cruisers.

General Lemnitzer added that the LONG BEACH was originally designed as a missile cruiser; that is, it was intended to carry REGULUS II vehicles, which had since been cancelled. The President said he had approved the installation of POLARIS missiles on the LONG BEACH, even though he was skeptical as to the use which would be found for a surface ship carrying eight missiles when a submarine could carry sixteen. He noted that a great many people had become almost hysterical in their praise of any ship that was nuclear-powered. Secretary Gates said the high cost of the LONG BEACH was due, not to its nuclear power plant, but to the fact that it carried the most modern sonar, radar, and other equipment.

Mr. Stans inquired about the relative cost of placing missiles on the LONG BEACH versus the cost of using other missile launching platforms. Secretary Gates said that compared to the mobile MINUTEMAN and the submarine, the cruiser was a great deal more expensive as a missile platform. The President noted that in discussing MRBM's for NATO, we had been thinking of small coastal ships as the launching

platforms. However, he could see the value of the LONG BEACH if it could be stationed in the middle of the Indian Ocean at the right time. Secretary Gates said the LONG BEACH was a very self-sufficient ship.

The National Security Council:

Noted and discussed the President's approval at the recommendation of the Secretary of Defense that, as an exception to the general policy of the Department of Defense of not placing POLARIS missiles on cruisers, the POLARIS program be extended by the installation of 8 missiles on the nuclear-powered USS LONG BEACH, as indicated in the reference memorandum distributed at the meeting.

NOTE: The above action, as approved by the President, subsequently incorporated in the revision by the NSC Planning Board of NSC 6021 (circulated as NSC 6108, "Certain Aspects of Missile and Space Programs").

## 2. CODIFICATION OF U.S. POLICY ON ARMS CONTROL AND U.S. POLICY ON NUCLEAR TESTING

(NSC 112; NSC 5906/1, paragraph 52; NSC Action No. 2215–c)

Mr. Gray briefed the Council on this subject. (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another copy is attached to this Memorandum).

Secretary Herter said he had no disagreement with the desirability of codification in this field but he wondered if sufficient time remained to complete the codification before January 20. He added that the Department of State had submitted a paper to the Department of Defense but the latter had not yet had time to study it. The President wondered whether the project should not be referred to the Planning Board. Mr. Gray said that this was his fall-back position but before falling back to that position, he wondered whether the President might request State, Defense, and AEC to make another effort to complete the codification during the next week. The President agreed that such an effort should be made. Secretary Gates said a Defense paper on the subject was on its way to the State Department. It would be difficult to complete this codification during the next week but he was willing to try.

The National Security Council:

Noted the President's request that the Secretaries of State and Defense, in collaboration as appropriate with the Chairman, Atomic Energy Commission, expedite the preparation of the subject codifications in an effort to complete them during the next week.

NOTE: The above action, as approved by the President, subsequently transmitted to the Secretaries of State and Defense and the Chairman, AEC, for appropriate implementation.

### 3. *DISCLOSURE OF U.S. CLASSIFIED MILITARY INFORMATION TO FOREIGN GOVERNMENTS AND INTERNATIONAL ORGANIZATIONS*

(NSC Action No. 2125-*b*)

Mr. Gray briefed the Council on this subject. (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another copy is attached to this Memorandum).

Secretary Gates said he had experienced a certain amount of difficulty in his own department and with the Atomic Energy Commission in connection with the SD-MICC statement of policy referred to by Mr. Gray. A jurisdictional row was in progress. Mr. Gray wondered whether a directive by the President would help to solve the jurisdictional problem. The President said he believed a little pressure should be applied to this project. Mr. Dulles pointed out that the exchange of intelligence was not affected by the statement of policy referred to by Mr. Gray.

The National Security Council:

Noted the President's request that the Secretaries of State and Defense expedite the preparation of the statement of policy on the subject pursuant to NSC Action No. 2125-*b* in an effort to complete it during the next week.

NOTE: The above action, as approved by the President, subsequently transmitted to the Secretaries of State and Defense for appropriate implementation.

### 4. *FOREIGN INTELLIGENCE ACTIVITIES*

(NSC Action No. 2367; Memo for NSC from Executive Secretary, same subject, dated January 9, 1961, SPECIAL LIMITED DISTRIBUTION ONLY)

Mr. Gray introduced this subject to the Council. (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another copy is attached to this Memorandum).

After indicating that the 43 recommendations of the report of the Joint Study Group on Foreign Intelligence Activities and the recommendations by the Department of Defense for revision of the National Security Council Intelligence Directives (NSCIDs) were before the Council, Mr. Gray turned to the recommendations of the Joint Study Group in the order in which they appeared in the January 9 memorandum of the Director of Central Intelligence on the subject.

The first category of recommendations consisted of those, 28 in number, on which all of the Principals of the Joint Study Group were in agreement. The Council concurred in these 28 recommendations.

Mr. Gray then turned to the second category; namely, 7 recommendations on which the Principals were in substantial agreement with

the exception of dissents or reservations on each such recommendation by single agency head (See Paragraph 5 of the Briefing Note). Recommendations 21, 22 and 23 called for the establishment of a central requirements facility by the U.S. Intelligence Board (USIB). Defense felt that these recommendations should be given further study. Secretary Gates said he had not had time to thrash this matter out with the Joint Chiefs of Staff. He felt that he would personally be able to agree to Recommendation 21 at least, but the JCS felt that a problem was involved concerning the general relation of military influence to operational intelligence. General Lemnitzer said the JCS were not so much in disagreement with the objectives of the recommendation as they were inclined to feel the need for further study in the field. He added that problems as to where the central requirements facility might be located, etc. had been raised. Secretary Gates said the purpose of the recommendation was to remedy the present situation in which intelligence requirements can be issued without being checked in a central clearing house to see whether someone else has the same requirements. Mr. Dulles noted that a great volume of requirements were issued. The President wondered why the JCS objected to this recommendation. He felt finding out the exact requirements in intelligence was the road to efficiency. Secretary Gates said the JCS had lumped Recommendations 21, 22 and 23 together. He believed their dissent was a matter of the details rather than the philosophy. Mr. Dulles suggested that the three recommendations be accepted in principle and referred to the USIB for implementation and consultation with Defense and the JCS. Secretary Gates endorsed this proposal and the Council adopted it.

Mr. Gray then turned to Recommendation 24 which would place on U.S. Mission Chiefs overseas the responsibility for coordinating all overt and clandestine intelligence requirements in their area. Mr. Gray said he suggested granting an exception in instances where State and CIA agreed that the Chief of Mission should not exercise this responsibility. Mr. Dulles said Mr. Gray's exception was acceptable to him. The President agreed.

Mr. Gray then suggested that Recommendation 31 be passed over until Recommendation 29 was taken up. Mr. Gray then turned to Recommendation 34 which would require that military agencies intelligence instructions to components of unified commands be transmitted through the JCS. Mr. Dulles said he concurred in this recommendation, subject to the proviso that it did not include NSA communications to the service cryptographic agencies in the field. General Lemnitzer said this recommendation involved a problem because of the vast volume of requirements in the technical intelligence field. The JCS were not organized for transmission of this vast volume of requirements. He felt there must be some middle ground; perhaps broad operational

requirements as distinct from technical requirements could be transmitted through the JCS. The President pointed out that the recommendation referred to "instructions". Mr. Dulles suggested that the recommendation be amended to indicate that instructions be transmitted through the JCS or as the JCS may direct. General Lemnitzer and Secretary Gates and the President agreed with Mr. Dulles' suggestion.

Mr. Gray next took up Recommendation 37 which would continue the responsibility of CIA stations abroad to coordinate clandestine activities but would relieve CIA case officers of the authority to veto proposed clandestine operations of another agency. Mr. Dulles said he believed this recommendation unnecessary and distinguished between the final decision to approve and the final decision to veto. He said if a military service wishes to appeal the veto of a CIA case officer, the matter would be decided in Washington by the Director of Central Intelligence and the Chief of the Military Intelligence Service. He pointed out also that if a field commander considers an operation essential to the security of his command, he can go ahead with the operation pending Washington's decision regardless of the objection of the CIA case officer in the field. General Lemnitzer said the JCS agreed with this recommendation. Mr. Dulles said he had no further objection to the recommendation.

Mr. Gray then turned to a category of recommendations, two in number, on which there is disagreement but with respect to which the DCI recommends a decision at this time. The first recommendation in this category was No. 16 which called for the issuance of a new NSCID No. 8 establishing a National Photographic Intelligence Center. Mr. Gray pointed out that the Secretary of Defense and the DCI were in disagreement on this recommendation, each feeling that his agency should have responsibility for administering the proposed Center. General Lemnitzer believed the Center should operate under the general direction of the Defense Department because the vast amount of the input would be produced by the Military Services. Moreover, the Military Services would be required to provide training for and would be the principal customers of the Center, which would be especially important in time of war. He recognized the need of other agencies for photographic intelligence and such intelligence would be made available. He gave assurance that the Center would not be removed from Washington if it were placed under the Department of Defense. Vast quantities of photographic intelligence were now being acquired. No photographic center was available at the present time and the Joint Chiefs of Staff wished to avoid duplicate centers. The Chiefs feel that the center could most effectively be operated by the Department of Defense with the participation of CIA. Secretary Gates added that Mr. Dulles had agreed that the Center should be operated by Defense in

time of war but he (Mr. Gates) felt the need of continuity in the quick transition from peace to war which might occur in the future. This problem was not one of intelligence interpretation but was one of management. Every user agency could interpret the intelligence. Secretary Gates added that the existing Center would have to be expanded in the near future.

Mr. Dulles said some misinterpretation appeared to exist on this subject. The present photographic Center was a joint enterprise consisting of 140 CIA officials, 100 Army officers, and a small but competent Navy contingent of 10 and 7–15 Air Force officers. The Center had been a joint operation for five years and had handled mostly U–2 photography under the management of CIA. The President asked whether the Defense suggestion was that the Center be under J–2. General Lemnitzer replied, no, under the Department of Defense. Secretary Gates added, directly under the Secretary of Defense just as NSA is. The President thought the three Military Services should not be separately involved in this Center. Since the basic danger to be detected by the Center is military, he believed it would be satisfactory for the military to give central direction to the operation.

Mr. Dulles said the information obtained through this Center was chiefly military only in the targeting field. Photographic intelligence had tremendous political significance and was a matter of common concern to the Washington agencies. The matter was one which fell within the field CIA was established to coordinate. In its five years of operation the Center had developed a group of career officials who intended to make photographic intelligence their life work. If the Center were placed in the hands of the military, rotation of personnel would be the principle followed, if past practice is any guide. The President felt rotation would be fatal to an operation of this kind. Secretary Gates said that if the Center were placed under Defense, a career staff would be retained and developed. Mr. Dulles said abandonment of rotation was a new idea for the military. He added that the Center had been operated for five years without a leak. Preliminary analysis of photography is made by the Center and information is then disseminated to user agencies. Some of this information is vital to the Department of State. Mr. Dulles felt it would be very damaging to morale to disrupt this going concern at the present time. The President said he would like to inquire into the time element. While some of the information coming from the Center might be vital to the Department of State, he wondered whether it was not the military rather than the State Department which had an instant need for the information. Mr. Dulles said the information developed by the Center was important to the military but was also important to other agencies such as State because of its effect on policy. The President said the information was important

but need not reach State as soon as it reached the military. The information might be needed in a matter of seconds by the military.

Secretary Gates said the Center would be considerably expanded in the future and the operation would be different from the U-2 operation. The President believed that the Center must be operated by an expert career staff. This was a question of management which, perhaps, should be studied before being decided so quickly. If he had to decide at the present time, however, he would say, since the present Center is doing well, let it alone except for its enlargement. He understood that the Department of Defense and the JCS had no complaints about the operation of the Center.

Mr. Stans said one difficulty was that the Air Force was establishing its own Center. Secretary Herter said he understood that the film was processed by the Air Force before it went to the Center. Mr. Dulles said this understanding was erroneous. The film is developed by a private company, which has the greatest competence in this field. This company has been developing this film for five years in the greatest secrecy. The film goes to a special branch of the company and is then flown to Washington. The Air Force gets the film at the same time as the Center.

The President said there should be only one Center and that no Service should establish a separate center. Matters of this kind were placed under CIA by the National Security Act because of their common usefulness. Secretary Gates said Mr. Stans was correct in his statement that the Air Force intended to have its own center. When great masses of photographic data were involved, there was a question of what should be looked at first and how soon. Mr. Gray said he felt the discussion was getting on to very sensitive grounds. The issue was whether there should be a single center or not. The President said there must be a single photographic center. Since CIA was the principal user and collector, he believed the center should be under CIA management as a principle of organization even though the time element still bothered him.

On being called on by the President, Dr. Kistiakowsky said that the existing photographic Center under CIA provided copies of its material without delay to all Services which concentrated on tactical intelligence. The Center does not retain the matter until it makes an exhaustive analysis; it passes it on immediately. Dr. Kistiakowsky felt the existing Center was a revolution in photographic techniques. In a year we would be able to obtain as much information from photographs taken 200 miles above the earth as we were able to get from our best reconnaissance plane in World War II. Operation of the Center required expertise. CIA had taken the lead in managing and developing this Center in the past. Dr. Kistiakowsky felt it would result in delay and

loss of progress to disturb the Center at the present time. From the technical point of view, he would much prefer an expansion of the present Center to a transfer of the Center away from CIA management.

Mr. Stans raised the possibility of joint CIA/DOD management. The President said he disliked divided responsibility. He believed Defense had not shown any unhappiness with the existing Center. While he knew how important the time element was, he believed the present Center should be kept under CIA management and expanded. The DOD should state its requirements for photographic intelligence. There should be a single center and no Service should be allowed to set up its own center. Mr. Dulles pointed out that the draft NSCID No. 8 provided that the Director of the Center would be chosen by agreement between the DCI and the Secretary of Defense.

Mr. Gray then turned to Recommendation 29 which would provide the DCI with a Coordinating Staff. The sole dissent on this recommendation was that of the Secretary of Defense who feels that the DCI should be separated from the CIA without further delay. Mr. Gray also mentioned the views of the Hull Board on this matter (bottom of Page 3 of the Briefing Note). Secretary Gates said the Defense view mentioned by Mr. Gray was the view of the Defense representative on the Joint Study Group. He (Mr. Gates) did not feel that he should comment on the organization of CIA; accordingly, he would take no strong position on this recommendation. The President believed the Defense Department should be interested in getting the best administration possible in this field and therefore should take a position. Secretary Gates said the Department of Defense had taken a position favoring the separation of the DCI from CIA. The President said he had believed for some time that the structure of our intelligence organization was faulty. He thought the Services should confine themselves to gathering combat intelligence while strategic military intelligence should be collected by an organization under J-2. He was convinced that better intelligence would be obtained by a centralized intelligence organization. Such an organization, however, needed to be streamlined.

Mr. Dulles said a great deal had been accomplished in the intelligence field over the past ten years. He believed coordination and cooperation was now better than it had ever been. He noted that no country had succeeded in achieving complete intelligence coordination, not even the U.K. and certainly not Germany under Hitler. Mr. Dulles was compelled to dissent from the Hull Board proposals because they were illegal until the law is changed. The DCI was responsible under the law for intelligence coordination and he could not delegate that responsibility. A body floating in thin air could not be created for the purpose of intelligence coordination until the statutes were amended. He doubted that such a body could accomplish coordination even if the

law were amended to permit it to try. The President said he was convinced that some streamlining of our intelligence organization was needed. The streamlining probably should have been undertaken three years ago rather than at the last minute. Mr. Gray said the recommendation of the Joint Study Group was for a Coordinating Staff under the DCI. If the Secretary of Defense did not wish to press the proposal for a complete separation of the DCI from CIA, then a first step could be taken by adopting the Joint Study Group recommendation. Mr. Dulles said he concurred in the Joint Study Group recommendation. General Lemnitzer said the JCS agreed with the Secretary of Defense; they felt a separation of the DCI from CIA was to be preferred. Mr. Dulles said the objective of the Defense Department would be accomplished to a considerable extent by adopting the Joint Study Group proposal, particularly if Defense would assign a top-level official with real authority to the Coordinating Staff. Mr. Gray said the recommendation was not intended to fix intelligence organization for all time but would be a step forward.

Mr. Gray then proposed that the Council turn back to Recommendation 31 which would establish a management group under USIB. The President wondered whether the Coordinating Staff would not have to manage. Mr. Gray referred to the complicated committee structure under USIB but said no committee was charged with management problems. The Joint Study Group felt the need for a group which would deal with management matters. The DCI had suggested that this function be performed by the Coordinating Staff called for in Recommendation 29, which had just been discussed. The President wondered whether there was a difference between intelligence coordination and management. He felt that two separate bodies might clash. Mr. Dulles pointed out that he proposed a single group, namely, the Coordinating Staff. Secretary Herter suggested that the Coordinating Staff under the DCI be charged with management problems for six months after which the matter could be reviewed.

Secretary Gates referred to a new coordinating board which would be responsible for intelligence planning and estimating. Mr. Dulles felt that Secretary Gates was confusing two things, the membership of USIB and the recommendation of the Joint Study Group for a management group. Secretary Gates said he favored a change in the membership of USIB. He believed Defense, not the Services, should be represented on USIB and that the Defense representative should have a Defense position in the same way he has a Defense position when he comes to an NSC meeting. Mr. Dulles said that as soon as the necessary intelligence reorganization took place in the Pentagon, he would concur in a reorganization of USIB but not before.

Mr. Gray asked whether the Council agreed to give the Coordinating Staff referred to in Recommendation 29 the management function.

The Council, including the President, indicated that it did agree with this proposal.

The President said the job of streamlining intelligence had not yet been seriously tackled. He had received a body blow when he learned that USIB consisted of ten people. Mr. Gray asked whether the Secretary of Defense wished to speak further on the membership of the USIB. Secretary Gates said he had recommended a change in USIB membership and he believed this change could be made at the present time. Accordingly, he had submitted proposed amendments to the NSCID's. The President asked why Defense could not effect the necessary reorganization without the blessing of the Council. Secretary Gates replied that the NSCID's had been adopted by the Council. The President said that the Council was only advisory to the President and that he (the President) as Commander-in-Chief looked to the Secretary of Defense to effect proper organization of intelligence in the Pentagon. The President added, however, that until intelligence in the Pentagon was reorganized, Defense would have to go along with the idea of changing the membership of USIB in phase with changes in Defense. Secretary Gates said he believed the changes he had proposed would force the Department of Defense to do its homework in intelligence. Mr. Dulles said if the Secretary of Defense wanted to assume the task of coordinating Army, Navy, and Air Force views on such a subject as missiles, he would be delighted. He felt, however, that such coordination would consume a great deal of the time of the Secretary of Defense. He believed he had more time than the Secretary of Defense to attempt this coordination. Secretary Gates said that USIB with Army, Navy, Air Force, DOD, and JCS representatives was a discussion board. No Defense position and no ironing out of Service positions was possible. The whole Defense position was turned over to USIB by default. The President said we were groping toward improvement in our intelligence organization. However, he wondered where the Services obtained the information which Mr. Dulles found so important. He did not believe the Services could find out how many missiles the Soviets have. Mr. Dulles said a distorted estimate would result if it were not for all the Services. For example, the Army had a great deal of experience in the amount of factory floor space required for the building for particular numbers of missiles. An acceptance of an Air Force point of view without regard to this Army experience would result in distortion. The President said he was talking about the views of the Secretary of Defense. He believed technical and tactical intelligence should be in the hands of the Services but broad strategic matters were different. He felt a better definition of the responsibility of each Service as to collection was needed, after which coordination should be less difficult. He believed military strategic intelligence should be centralized in Defense or JCS. General

Lemnitzer said intelligence was different from other matters since intelligence estimates were based on a wide variety of information. He pointed out that the proposal by the Secretary of Defense would result in two Defense representatives on USIB, one from the Office of the Secretary of Defense and one from J-2. These two Defense representatives might have a difference of opinion. Moreover, the Secretary of Defense did not have an intelligence staff to help him resolve differences of view. Secretary Gates said he did a great deal of homework on NSC papers before a Council meeting. He believed it should be part of his job to spend time also in resolving intelligence differences. The President said he could not agree more. His inclination would be to put Pentagon intelligence under the JCS and let the latter send one man, not two, to USIB. Secretary Gates said his recommendation involved setting up one intelligence organization in the Pentagon. The President said that, nevertheless, the present system, even if it worked creakingly at present, could not be radically changed until the necessary people were trained. The President, therefore, felt that the language in the Joint Study Group recommendations as to phasing was correct with respect to the membership of USIB. He hoped, however, that the phasing would not require eight years.

Mr. Gray turned next to another category of recommendations, six in number, on which there were differences of view among the Principals and on which the DCI recommends deferral of action. The first recommendations in this category were Nos. 1, 2 and 35 which would require a reorganization of intelligence within Defense and in field commands, with particular reference to the role of the Joint Staff and the unified commands in relation to military intelligence services. The Secretary of Defense approves these recommendations in principle but feels that Recommendation 35 should be deferred until experience is gathered in implementing Recommendations 1 and 2. The DCI objects to Recommendation 1(b)(2), which would require the JCS to coordinate intelligence views within Defense. Secretary Gates said this was a matter of internal directives within the Department of Defense and was related to the discussion just concluded. He felt the matter should be deferred.

The President said he was impressed by Recommendations 1 and 2 but felt that Recommendation 35 should be deferred. Mr. Gray then referred specifically to Recommendation 1 (b)(2). Mr. Stans said that there was no need for three military medical services, three military procurement services, or three military intelligence services. He believed a single military intelligence service should be achieved ultimately and the sooner the better. The President thought this matter would be settled by the reorganization of military intelligence which the Secretary of Defense would undertake. However, he thought intelli-

gence direction by the JCS would have to be phased; such direction could not be accomplished until the intelligence organization in the Pentagon was changed. Secretary Gates said the amendments he had proposed to the NSCID's would permit a reorganization of intelligence in the Pentagon.

At this point Mr. Gray asked the Council to consider the amendments to the NSCID's proposed by the Deputy Secretary of Defense. Mr. Gray explained these proposed amendments.

In connection with NSCID 3, Mr. Stans noted that the Secretary of Defense proposed that Defense undertake the collection of economic information pertinent to the Department of Defense. Mr. Stans thought it would be possible to interpret this provision as including almost any type of information; accordingly, he felt the provision should be eliminated or limited. The President said that Military Attaches would inevitably collect some economic information. If an attempt were made to put intelligence in rigid compartments, some information would be lost. He was ready to admit that the primary responsibility for economic intelligence rested with State and CIA, but he believed the Military Services could not be denied the right to get any information they could obtain. Secretary Gates said his proposal merely updated the language of the existing NSCID, which permitted the three Services to collect economic intelligence. General Lemnitzer pointed out that the Military had to gather certain types of economic intelligence; for example, in order to evaluate Soviet missile capabilities, it was necessary to analyze the floor space of factories. Mr. McCone thought it would be unwise to exclude the Military from economic intelligence activities. Mr. Stans said Budget officials feared that each Military Service would attempt to collect all the economic information it was possible to collect. Mr. Gray pointed out that if the Defense proposals were adopted, Mr. Stans would need to deal only with the Secretary of Defense, rather than the three Services, in attempting to keep intelligence collection within bounds. The President said we should be content with the progress represented by the Defense amendments to NSCID 3. Mr. Stans suggested that the word "directly" be inserted in the provision under discussion so that Defense would collect "economic information directly pertinent to the Department of Defense." Mr. Gates said he would not argue over an adverb and the President approved Mr. Stans' suggestion.

In connection with NSCID 5, the President saw no reason to object to designating the Secretary of Defense as the agent with whom the DCI would negotiate coordination of espionage and clandestine counter-intelligence activities in active theaters of war. He felt, however, that while the JCS should not be held responsible, the Secretary of Defense should lean on them for advice in this field.

Secretary Herter said that the Defense proposals for amendment to NSCID 6 were worded in such a way as to exclude the Department of State, the FBI, and AEC from COMINT and ELINT activities. In response to a question from the President, he indicated that State negotiated international agreements for ELINT stations, for example. Secretary Herter suggested that NSCID 6 might be amended simply by indicating that "only the Secretary of Defense shall exercise or delegate this authority within the Department of Defense." Mr. Dulles concurred in Secretary Herter's suggestion.

Mr. Gray then reverted to the two remaining Joint Study Group recommendations. He said that Recommendation 5 would have military intelligence agencies develop a capability for war-time clandestine intelligence collection, to be carried out under coordination of the DCI. The President said he could speak with the authority of a former theater commander in time of war in saying that the theater commander could not be responsible to anyone but the Joint Chiefs of Staff. Secretary Herter believed Recommendation 5 required further study. The President said that rather than providing for coordination by the DCI, the recommendation might say that the DCI would be kept completely informed. Mr. Dulles pointed out that Recommendation 5 referred to peace-time, not war-time. The President said he was inclined to agree with Recommendation 5, on the understanding that it applied to peace-time activities only. He did not wish to see developed the theory that a theater commander could be interfered with in time of war.

Mr. Gray then noted that Recommendation 18 would have the DCI focus the attention of the intelligence community on counter-intelligence and the security of overseas personnel and installations with periodic reports to USIB. Secretary Herter said this matter was under intense study at the present time. He believed it would be premature to take action on this recommendation until study and research had been completed. The President said the report referred to in Recommendation 18 could be made through channels. Secretary Herter noted that State Department officials did not wish State Department research activities in this field curtailed as a result of a directive for a joint operation. Mr. Dulles said he hoped some action would be taken on Recommendation 18. He believed coordination was important in this field. The recommendation was not meant to upset the research and study already under way. Mr. Gray suggested that the agencies concerned should make periodic reports to the agency heads.

The President said he hoped this Administration would recommend to the new Administration that the Hull Board be kept in existence. Mr. Dulles concurred. The President added that in his view, the recommendation for continuance of the Hull Board should be made to the new Administration by the DCI and the Secretary of Defense

rather than by him (the President) in view of the apparent tendency of the incoming Administration to downgrade the record of the outgoing Administration. Mr. Gray said that in a conversation with his successor, Mr. McGeorge Bundy, he had formed the impression that Mr. Bundy agreed that the Hull Board should be retained. Mr. Bundy's only question about the Board seemed to be concerned with its relationship to the President. The President said a great many relationships which had been working satisfactorily for a long time were now being questioned by people new to the job.

The National Security Council:

a. Discussed the views of the Principals of the Joint Study Group regarding the Group's report, as consolidated by the Director of Central Intelligence (transmitted by the reference memorandum of January 9, 1961); and took the following actions with regard to the recommendations of the Joint Study Group:

(1) Concurred in Recommendations Nos. 3, 4, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 17, 19, 20, 25, 26, 27, 28, 29, 32, 33, 36, 37, 38, 39, 40, 41, 42 and 43.

(2) Concurred in Recommendations Nos. 1, 2 and 30, provided that:

(a) Implementation of Recommendations Nos. 1 and 2 should take place after study by the Joint Chiefs of Staff and in a manner to be established by the Secretary of Defense.

(b) The implementation of Recommendations Nos. 1, 2 and 30 with respect to the organization and functions of the USIB should be taken in phase with the carrying out of the related internal adjustments within the intelligence components of the Department of Defense.

(3) Concurred in Recommendation No. 5, with the understanding that this recommendation did not modify the arrangements in this field under wartime conditions.

(4) Concurred in Recommendation No. 16 and approved draft NSCID No. 8 as submitted, with the provision that the National Photographic Intelligence Center (NPIC) should be under the Central Intelligence Agency; and noted the President's statement that there should be no other center duplicating the functions of the NPIC, and that the military services and other departments and agencies should state clearly to the NPIC their particular requirements.

(5) Concurred in Recommendation No. 18, subject to the deletion of the words "and assign responsibility for periodic reports to the United States Intelligence Board" and the addition of the words "and the agencies concerned should make periodic reports to their agency heads."

(6) Concurred in principle with Recommendations Nos. 21, 22 and 23, and referred them to the USIB for implementation in consultation with the Secretary of Defense and the Joint Chiefs of Staff.

(7) Concurred in Recommendation No. 24, subject to the addition of the words "except in situations with respect to which the Secretary of State and the Director of Central Intelligence may agree do not warrant such allocation of responsibility."

(8) Agreed that, in lieu of establishing the management group proposed in Recommendation No. 31, the functions recommended for that group should be performed by the coordination staff proposed in Recommendation No. 29.

(9) Concurred in Recommendation No. 34, subject to the addition of the words "or as the Joint Chiefs of Staff may direct, subject to the understanding that National Security Agency communications to service cryptologic agencies in the field are excepted from the provisions of this recommendation."

(10) Deferred action on Recommendation No. 35.

*b.* Discussed the recommendations of the Deputy Secretary of Defense (transmitted by the reference memorandum of January 9, 1961), and adopted the following amendments to National Security Council Intelligence Directives:

(1) *NSCID No. 1, paragraph 4-a, 3rd sentence:* Delete the words "with intelligence production responsibilities."

(2) *NSCID No. 2, paragraph 3:* Delete this paragraph and substitute the following:

"3. The Department of Defense shall have primary responsibility for, and shall perform as a service of common concern, the collection of military intelligence information. Owing to the importance of scientific and technical intelligence to the Department of Defense and the military services, this collection responsibility shall include scientific and technical, as well as economic, information directly pertinent to Department of Defense missions."

(3) *NSCID No. 3, subparagraph 7-b:* Delete this subparagraph and substitute the following:

"b. The Department of Defense shall produce military intelligence. This production shall include scientific, technical and economic intelligence directly pertinent to the missions of the various components of the Department of Defense."

(4) *NSCID No. 5, subparagraphs 8-a, -b and -c:* Substitute the words "Secretary of Defense" for the words "Joint Chiefs of Staff".

(5) *NSCID No. 6, paragraph 2:* Add the following words: ", except that only the Secretary of Defense shall exercise or delegate this authority within the Department of Defense."

*c.* Noted the President's conviction that further streamlining of the entire foreign intelligence organization still needs to be accomplished.

NOTE: The action in *a* above, as approved by the President, subsequently transmitted to the Director of Central Intelligence, the Secretary of State and the Secretary of Defense for appropriate implementation.

The amendments in *b* above, as approved by the President, subsequently incorporated in revised NSCID's.

#### 5. MEASURES TO PROVIDE SHELTER FROM RADIOACTIVE FALLOUT

(NSC 5802/1; NSC 5807; NSC 5807/2; Memo for NSC from Executive Secretary, subject: "U.S. Policy on Continental Defense", dated July 14, 1960; NSC Action No. 2300-*e*; Memos for NSC from Deputy Executive Secretary, subject: "Measures for the Passive Defense of the Population, with Particular Regard to Fallout Shelter", dated December 7 and 8, 1960; NSC Action No. 2361; NSC 6104; NSC 6104/1)

Mr. Mason, Administrator, Housing and Home Finance Agency, joined the meeting at this point. Mr. Gray presented NSC 6104/1 to the Council. (A copy of Mr. Gray's Briefing Note is filed in the Minutes of the Meeting and another copy is attached to this Memorandum). In the course of his briefing, Mr. Gray noted that the split in sub-paragraph *h* on Page 6 of NSC 6104/1 had been settled by agreement between the Budget and OCDM Directors. The Financial Appendix treatment of the same point, however, (fall-out shelter in military buildings) still contained a split between the majority version providing for \$30 million a year to be funded by new appropriations and the Budget version which would provide for \$10 million in FY 62 to be absorbed within regular military appropriations.

Mr. Gates said this was entirely a question of money. The Department of Defense feels that this small amount should be included in a supplemental appropriation request rather than absorbed by the Department of Defense. Mr. Stans said his proposal relied on the uncontroverted statement he had made in a previous meeting of the Council that Defense could absorb \$10 million but not \$30 million for this purpose. Mr. Stans felt that \$10 million was adequate to get the program underway. In response to a question from the President, Mr. Stans reported that the new budget had already been prepared but that the specifics of money for shelter in military buildings had not been included. The President said that if perhaps some of the marble columns could be eliminated from new buildings, the \$10 million could be absorbed. Secretary Gates said that adoption of a policy of putting fall-out shelters in old and new military buildings meant that the first step was being taken in a program which would cost a great deal of money. In his view, requests for this money should be incorporated in the national budget, not absorbed in the Defense budget.

Governor Hoegh calling attention to Footnote 1 in the Financial Appendix, pointed out that no funds have to be provided until fall-

out shelter legislation is passed by the Congress. The President believed that in the light of the billions of dollars being spent for other purposes, it would be inconsistent to eliminate all money for construction of fall-out shelters from the budget. The cost of shelters in new buildings would not be great if appropriate changes in design were made. The President, however, was worried about the cost of providing fall-out shelters in existing buildings such as the Pentagon. Mr. McCone said it had cost a great deal to add fall-out shelters to the new AEC building.

In reply to a question by the President, Governor Hoegh said that two feet of earth or sixteen inches of concrete—in fact, eight inches of concrete—provided shielding from fall-out. It would not be expensive to provide this amount of shielding during the initial construction of a building. Governor Hoegh then again called attention to the footnote which indicated that funds need not be provided until Congress passes the necessary legislation.

Mr. Gray called the attention of the Council to the split in subparagraph *i* on Page 7 of NSC 6104/1. This subparagraph dealt with shelters as a condition for federal grant aid and provided for funding from new appropriations. Mr. Stans called attention to the Budget footnote indicating doubt that any specific estimate of cost is feasible and proposing that the cost be absorbed within regular appropriations. As an example, he mentioned the grant-in-aid program for hospitals. Congress regularly raises the budget request for this purpose from \$100 million to \$180 million. Mr. Stans felt the cost of shelters in hospitals affected by the program could be readily absorbed in this sum. The President agreed that hospitals constructed under this grant-in-aid law should be required to make provision for fall-out shelters within the regular appropriations. Governor Hoegh had no objection.

Mr. Gray then turned to the split in subparagraph *j* on Page 8 which would require fall-out shelters as a condition for five categories of federal loans and guarantees. Mr. Mason believed that if shelter in housing was to be required, it should be required in all housing, nor merely in low-cost housing covered by this paragraph. He would like to encourage the building of shelters but he did not want to penalize low-cost housing. Secretary Gates felt the provision in subparagraph *j* might be very difficult to administer equitably. Secretary Anderson agreed, saying that we are singling out people with low income and telling them how they must spend their housing money as a condition for obtaining a loan. Governor Hoegh said that housing was now required to have bathrooms and running water. He felt the requirement that housing have fall-out shelters was based on the same principle. Implementation of a policy in this field would require Congressional approval but submission of the proposal to Congress would show that the Administration means business. Mr. Stans said only the person

who had to finance his house with a government loan would have to build a shelter. The President said he was opposed to this provision because he was an individualist. Mr. Mason said he had no objection to require fall-out shelters in cases where a direct government loan was granted; his objection was to requiring fall-out shelters in cases of government-guaranteed loans.

The President observed that people who had fall-out shelters would, in the event of an alert, be under great pressure to share their shelters with people who do not have them.

Mr. Mason thought that fall-out shelters should be public shelters rather than parts of individual houses. Governor Hoegh pointed out that seven NATO countries now require shelters to be incorporated in new houses. Secretary Anderson said he would have no objection to our adopting a policy of this kind. Secretary Herter believed the Federal Government had no authority for laying down a requirement of this kind.

Mr. Stans agreed with Mr. Mason that shelters might be required in cases of direct federal loans, but that a requirement of shelters would be undesirable in the case of guarantees. Mr. Stans also felt that any proposal for a law to require shelters in all new housing should be dealt with apart from NSC 6104/1. Governor Hoegh felt this was a key provision which should be incorporated in legislation. The President said he could agree with Governor Hoegh's proposal with respect to direct government loans but he did not agree with Governor Hoegh on guaranteed loans. He concluded the discussion by saying that the whole matter of fall-out shelters should be put before Congress once more.

The National Security Council:

*a.* Discussed the draft statement of policy on the subject contained in NSC 6104/1, prepared by the NSC Planning Board as a revision of the report submitted by the Office of Civil and Defense Mobilization pursuant to NSC Action No. 2361-*d* (NSC 6104).

*b.* Adopted the statement of policy in NSC 6104/1, subject to the following amendments:

(1) *Pages 6 and 7, paragraph h:* Delete the brackets and the footnote thereto; change the second sentence to read as follows: "In addition, fallout shelters should be incorporated in selected existing military buildings."; and delete the third sentence.

(2) *Page 8, paragraph j:* Delete the brackets and the footnote, "and guarantees" from the title, and revise the third sentence to read as follows: "Programs which would be affected include: (1) HHFA/CFA—loans for college housing; (2) HHFA/CFA—public facility loans; and (3) HHFA/CFA projects planned under project planning advances must, where applicable, provide for fallout shelters."

(3) *Page 10, paragraph m:* Delete the brackets and the footnote thereto, and substitute the word “continuously” for “fully” in that sentence.

(4) *Pages 11 and 12:*

(a) Delete the figures “16.0” and “80.0” opposite Item *i* and substitute dashes.

(b) Delete footnotes 2/ and 4/.

(c) Revise footnote 3/ to read: “To be absorbed within regular appropriations.”

*c.* Noted the President’s statement that legislation should be sought, as appropriate, to support the principle that all new housing include fallout shelter.

NOTE: NSC 6104/1, as amended by the action in *b* above, subsequently approved by the President; circulated as NSC 6104/2 for implementation by all appropriate Executive departments and agencies of the U.S. Government, under the coordination of the Director, OCDM. The action in *c* above, as approved by the President, subsequently transmitted to the Director, OCDM and the Director, Bureau of the Budget.

#### 6. RENTAL PAYMENTS FOR MILITARY RIGHTS AND FACILITIES

(NSC 6004/1, paragraph 24; NOTE to NSC Action No. 2192; Footnote to paragraph 18 of NSC 6002/1; Memo for NSC from Executive Secretary, same subject, dated January 11, 1961)

The Council concurred in Mr. Gray’s suggestion that the study prepared by the Department of Defense on “Rental Payments for Overseas Bases” be referred to the Planning Board for further consideration.

The National Security Council:

Referred to the NSC Planning Board for further consideration the study on “Rental Payments for Overseas Bases”, prepared by the Department of Defense as a response to paragraph 24 of NSC 6004/1, the NOTE to NSC Action No. 2192, and the footnote to paragraph 18 of NSC 6002/1 (transmitted by the reference memorandum of January 11, 1961).

#### 7. SIGNIFICANT WORLD DEVELOPMENTS AFFECTING U.S. SECURITY

[Here follows an intelligence briefing on developments in the Soviet Union, the Congo, and counterintelligence activities.]

Mr. Gray said that some of those participating in the meeting were about to become statistics. Mr. Gray said the meeting about to be concluded was the last Council meeting of this Administration. During President Eisenhower’s Administration 366 Council meetings had been held. The President had presided over 329 of these meetings, or 89.897 per cent.

The President said his experience with the National Security Council had been a most gratifying one. The Council is a body in which views were frankly and openly expressed. This was due in part, he believed, to the feeling that what was said in the room was secret. He could remember only one occasion when a remark made in the Council room during his Administration had been quoted publicly outside. This was a really remarkable achievement.

Mr. Gates felt sure the other members of the Council would join with him and the President in thanking Mr. Gordon Gray and his staff in performing conscientiously a difficult and painstaking task.

Marion W. Boggs

ESTIMATE OF THE WORLD SITUATION

TABLE OF CONTENTS

I. INTRODUCTION—The Decade of the 1950’s . . . . . Paras. 1–12

A review of the fundamental changes in the structure of world power which occurred in the 1950’s—The drawing of lines between the blocs—The major powers’ reassessment of their military capabilities and strategies—Changes in Soviet leadership and policy—The vast improvement in Soviet military posture—The new opportunities for the USSR in the underdeveloped areas—The imposing position of the USSR at the end of the decade—The relative decline in the US world position.

II. THE COMMUNIST WORLD . . . . . Paras. 13–30

A. Soviet Progress and Policy. . . . . Paras. 13–19

Soviet economic growth and economic power—Soviet belief that the USSR can challenge the US on disputed issues—The peaceful co-existence policy—The basis of the dispute with China.

---

<sup>1</sup> “Estimate of the World Situation”; introduction and report on Soviet progress and policy. Secret. 22 pp. CIA Files, Job 79R01012A, ODDI Registry.

- B. Chinese Communist Growth and Aspirations . . . . .Paras. 20–24
- The growing self-confidence of China—Chinese economic growth and economic problems—The Chinese nuclear development program—Chinese revolutionary élan—The Chinese view of Communist world strategy.
- C. Sino-Soviet Relations and the Future of Communism .Paras. 25–30
- The issues between the USSR and China—Unlikelihood of a clear resolution—Consequences of continuing disagreement—Probability that the USSR will continue seeking to avoid serious risks—Possibility Soviet leaders will misjudge Western will—Probability China will persist in its militancy—Dangers involved.
- III. THE EMERGING AREAS. . . . .Paras. 31–45
- A. The Political and Social Milieu . . . . .Paras. 31–38
- The objectives of the nationalist revolutions—The motivations of the revolutionary intelligentsia—Their wariness of communism and their attempt to carve out their own destinies—Political and social instability in the underdeveloped countries—The enormity of their problems—Tendency toward authoritarianism and socialism—Effect of population growth—Need for outside aid—Danger to the present revolutionary leaders.
- B. International Outlook . . . . .Paras. 39–45
- Outside world viewed largely in terms of local problems—Choice of neutralism by those who thought they could safely choose it—The tendency to compensate for years of Western influence by accepting closer relations with Sino-Soviet Bloc—Likelihood that trend toward neutralism will become stronger—Political consequences for US, including decline of US influence in the UN—Opportunities for Communist penetration and subversion.
- IV. PROBLEMS OF THE WESTERN ALLIANCES . . . .Paras. 46–59
- West faces not only stronger Communist enemy but accumulating crises in the underdeveloped nations—Western assets still very great—Political weaknesses in the West—The condition of Western alliances—The problem in Japan—Weakness of CENTO and SEATO—By contrast, the greater strength of NATO—Military problems of NATO—Divergencies and rivalries within Atlantic community—Impact of colonial problems—Lack of a common view of world situation among NATO members.
- V. THE MILITARY PROBLEM . . . . .Paras. 60–78
- A. The Evolving Strategic Situation . . . . .Paras. 60–65
- Major problem of the 1960's posed by the accumulation of weapons

of mass destruction by the great powers—Each side capable of inflicting enormous destruction upon the other—General nuclear war not impossible, but highly irrational response to international disputes—Problem of assessing risks—Other serious problems posed by strategic situation.

B. Military and Political Implications of the Evolving Strategic Situation. . . . .Paras. 66–78

Existing uncertainty about present and future world military situation—Puzzlement over deterrents—Soviet efforts to improve their military position—Soviet view of strategic situation—The advantages the USSR derives from it—Limited war capabilities—Political and military problems of conducting limited war—Consequences of additional countries acquiring nuclear weapons—Possibility of general war coming about through miscalculation or accident—Pressure for disarmament—Conclusion that decade ahead will be an extremely dangerous one.

ESTIMATE OF THE WORLD SITUATION

THE ESTIMATE

I. INTRODUCTION—THE DECADE OF THE 1950's

1. The past several years have witnessed fundamental changes in the structure of world power. The coming of the space age, the Soviet bid for world leadership, the growth of Communist China toward world power status, the creation of new nations, and the rapid economic growth of some of the advanced countries have greatly altered the outlook for many of the world's peoples. We believe it would be useful, as the decade of the 1960's begins, to survey in a somewhat broader fashion than has been our custom the development of the world situation in the years which have gone by.

2. By the time the decade of the 1950's began, the major convulsions of the postwar years had come to an end. The Chinese Communists had seized control of the Chinese mainland, the colonial powers had relinquished their hold on most of the Near East and South and Southeast Asia, most of the Eastern European governments were in the hands of Communists responsive to Moscow control, and the Communist drive for political power in Western Europe had been curbed. The US had abandoned isolationism and had accepted the leadership of the Western world. Through NATO, the Marshall plan, aid to Greece and Turkey, and an active participation in world councils, the US had asserted its intention to use its economic and military power in the interests of world stability and the containment of communism. The major tests of that intention came in Berlin and above all in Korea; the firm and rapid US response in Korea made clear to all the world that

an attempt by the Communists to acquire territory by open military conquest was unprofitable and dangerous.

3. In retrospect, it can be seen that these US actions of the early postwar period were major factors in creating the conditions which dominated much of the decade. They led to the drawing of lines between Communist and non-Communist territory which could not be crossed by overt military forces without serious risk of retaliation. Thus the Communists were in effect deprived of one tactic for expanding their area of influence; they were obliged to confine themselves to the more devious and time-consuming methods of subversion, guerrilla action, and political and economic warfare. These US actions also gave courage and hope to many nations whose borders were being threatened and whose economic and political weaknesses made them subject to internal and external Communist pressure.

4. The war in Korea, following upon the events in Europe of the late 1940's and upon the Chinese Communist establishment of control in China, also aroused a lively sense of danger in the non-Communist world. There developed a general awareness of the worldwide aims of the Communist revolution. The US response was to rearm itself and to initiate a military assistance program designed not only to bolster countries on the periphery of the Bloc but also to identify unmistakably those areas which the US was taking under its protection. The two blocs became increasingly well armed and committed to the defense of particular areas.

5. The Korean War, also seen in retrospect, pointed up the need for the major powers to reassess their military capabilities and strategies. In that war, the Soviet leaders had avoided overt participation; a major factor in this decision was their recognition of US nuclear superiority and of the threat which this posed to the Soviet homeland and to the entire Communist position in the Far East. Similarly, the US limited its military operations to the area of Korea; a major factor in the US decision was recognition of Soviet conventional military superiority in Eurasia and of the threat which this posed to US allies in Europe and the Near East. Moreover, the US encountered the very great difficulty of bringing its superior nuclear capabilities to bear on a situation in which the enemy's immediate goals were limited and the non-Communist world was anxious not to expand the conflict.

6. The strategic reassessment and the reshaping of capabilities which took place on both sides were to some degree efforts to eliminate the shortcomings which the Korean War had made apparent. On the side of the West, this involved the establishment of NATO force goals to provide a larger ground army in Europe, and the development of a capability for tactical employment of nuclear weapons—both designed to offset Soviet ground superiority. In the USSR, the Soviet

leaders speeded up the development of their air defense capability, the production of strategic nuclear weapons, and the development of long-range delivery capabilities.

7. While these military developments were going forward, various political changes were taking place in the world. The Soviet dictator died and his great personal power passed to a group of his former subordinates; in the course of a few years Khrushchev emerged as the dominant personality. Under Khrushchev's leadership, the Soviet rulers apparently engaged in a comprehensive re-examination of the Soviet domestic scene and of the world situation. As a consequence, there were significant internal changes in the USSR, in the Eastern European satellite states, and in the conduct of Soviet foreign policy. The Soviet leaders evidently recognized that Stalinist rigidity had inhibited progress at home, antagonized the satellite peoples, caused a coalescence among the Western Powers, hindered the exploitation of political unrest in underdeveloped and colonial areas, and created dangerous tensions with the US. To correct these "errors," the Soviet leadership moderated its internal policies by easing police terror and by taking some steps to improve living standards, loosened the reins over the Satellites, began to cultivate a broader range of contacts with the Western Powers, developed a new policy of assistance to underdeveloped countries, and sought to reduce tensions with the US by personal diplomacy.

8. This new Soviet policy was not pursued with thorough consistency, nor did it meet with unqualified success. Loosening the reins over the Satellites and giving encouragement to anti-Stalinist elements in Eastern Europe led to anti-Soviet manifestations in Poland and popular revolution in Hungary. Reassertion of Soviet authority made Hungary a tragic battleground and discouraged other liberal forces within the Communist movement. Similarly, the denunciation of Stalin produced intellectual confusion at home, and the process of liberalization in the USSR was slowed down. Although Khrushchev's personal diplomacy succeeded in reducing international tensions intermittently between 1955 and 1959, no substantial international accommodation took place, and in this situation of stalemate an atmosphere of tension has revived.

9. Nevertheless, this new Soviet policy has greatly strengthened the Soviet world position. Among other things, its appearance coincided with developments in the emerging areas which gave the USSR new opportunities for expanding its influence. Most of the underdeveloped countries have been in a state of social and economic ferment during the past decade. Most of the peoples in these countries were preoccupied with a desire for modernization and self-government. They are less concerned with ideologies than with results, and more

concerned to gain tangible assistance and sympathetic understanding from both world power blocs than to associate themselves with either of them. They have become particularly sensitive to any remnants of colonialism or attempts by the West to influence or to control their domestic and foreign policies. On the other hand, the USSR, through its pose as the defender of Afro-Asian nationalism against "imperialism," as the exponent of disarmament, as the party offended by alleged US provocations and stubbornness, as the example and proponent of rapid economic development, and as an alternative source of immediate and unconditional aid, has gained much influence and prestige.

10. These Soviet gains in the underdeveloped countries coincided with the Soviet achievement of a vastly improved military posture. The USSR's achievements in space vehicles and missiles have not only enhanced Soviet prestige but promise to give the USSR capabilities roughly equivalent in their political and strategic impact to those possessed by the US. Thus, even while it possessed a less advanced economy than that of the US and still had only a toehold among the underdeveloped nations, the USSR had created by the end of the decade an imposing platform from which to challenge the Western position throughout the world. While the US still continues to dispose tremendous power and to wield enormous influence, it has appeared to many of its friends and enemies alike to be faltering in its hold upon that power and in its initiative and resourcefulness in wielding that influence. In the nature of things it was impossible that the US should retain for very long the unique position it occupied at the end of World War II. The world perceives that the US no longer enjoys military invulnerability, overwhelming economic strength, or unchallengeable world power.

11. At the same time, the world power position of the US's European allies had vastly deteriorated from what it was before World War II. These nations had been deprived of control over vast populations, enormous sources of raw material, and far-flung commercial and industrial enterprises. Their ability to move freely and to operate from widely dispersed bases was drastically curtailed. These enormous losses were accompanied by strong nationalist and neutralist tides running against them in their former possessions. In this situation the US-supported economic recovery of most of these states was not matched by a commensurate effort to develop an adequate national defense posture, or to share responsibility in dealing with world problems.

12. These facts signify that the world has entered into a new era. New leaders and new nations are arriving on the scene; there is a new relationship of military power; political and social instability have become epidemic in the southern two-thirds of the world; schisms and heresies have appeared within the Communist camp itself. There is no

longer any question that radical change will occur in the world, but only a question of what direction it will take. The future of the West will depend to a large degree upon the manner in which it mobilizes and employs its political, economic, and military resources to shape and guide the process of change. In the paragraphs below we describe the characteristics of the world situation in more detail and attempt to outline the problems for the future which are implied in this situation.

## II. THE COMMUNIST WORLD

### A. Soviet Progress and Policy

13. There can no longer be any doubt that the USSR is well on the road toward matching the US in many of the indices of national power. In 1950 Soviet gross national product (GNP) was a little over a third that of the US; in 1960 it was nearly half that of the US. During the remaining years of the Seven-Year Plan, the USSR will probably achieve an annual growth rate of slightly less than six percent. By 1965, Soviet GNP will be over half that of the US and about equal to the level which the US reached in 1947. Total investment in the USSR will probably reach about one-third of GNP by 1965, as compared with the present US rate of about one-fifth of GNP. Soviet industrial investment in 1958, measured in dollars, had already exceeded the record US figure, set in 1957.

14. Overtaking the US in total output is a distant prospect. But in more meaningful ways, the economic power of the USSR already compares favorably with that of its chosen competitor. By virtue of complete subordination to regime control, the Soviet economy, despite its smaller size, is presently supporting a military effort of approximately the same size as that of the US. By 1965, production levels in certain basic industrial products will probably approach and in some cases surpass present US records; for example, the USSR has announced and probably will achieve a steel production of 105 million metric tons in 1965, which approximates the US record of 106 million achieved in 1955.

15. There are and will remain certain elements of backwardness. Agricultural production, despite heavy investment, will still employ a very much higher proportion of manpower in the USSR than in the US. The individual Soviet consumer, although he will gain about four percent per year in overall consumption, will still have a standard of living far inferior to that of his US counterpart, especially in housing and in range of consumer choice. Soviet society even by 1970 will not be affluent in the sense of possessing a large service sector in the economy or having available a plethora of gadgetry, consumer choices, and stylistic improvements. Nevertheless, in the decade ahead industry will be expanding so rapidly that by the beginning of the 1970's the

Soviet leaders will be able to confer upon the Soviet citizen benefits considerably beyond those available today. Most important of all, however, the USSR already possesses an economy sufficiently strong and flexible to permit it to assign resources relatively freely and without agonizing self-denials to the major uses of national power—defense, science, and foreign political and economic operations.

16. The Soviet leaders obviously understand that science has become one of the key fronts in the world struggle, not only because of its relation to military and economic strength but also because it is a major element in great power prestige. The scale of the Soviet effort, thanks to a heavy investment in training scientists in past years, is probably now roughly on a par with that of the US in some fields of the basic sciences and in some critical areas related to weapons technology.

17. Soviet progress in the field of rocketry has probably had more effect upon world opinion and upon the world situation than any development of the past two or three years. This progress, together with the earlier Soviet achievements in nuclear weapons development, has created a new strategic situation in the world which will be discussed in greater detail in later paragraphs of this estimate. It is enough here to say that this new military capability is providing the Soviet leaders with a weapons system that is valuable in terms of both political exploitation and military deterrence.

18. The Soviet leaders consider themselves to be in a position of great strength. They probably believe that they now possess, or will soon have, a powerful counterdeterrent to the existing US deterrent force, and that this counterdeterrent will become more and more persuasive in the years ahead. They almost certainly feel that for these reasons they can frequently and vigorously challenge the US on disputed issues. They probably feel that the range of anti-Western actions which they can pursue with little fear of nuclear retaliation is growing, although they almost certainly recognize that they must act with caution lest they provoke the US into precipitate action. The Soviet leaders evidently recognize that a general nuclear exchange could mean the destruction of the fabric of modern society.

19. The “peaceful coexistence” policy of the Soviet leaders is partly the consequence of these cautionary judgments. It is also partly the consequence of the Soviet ideological outlook, which views history not primarily as a contest of military power between states, but as a long-term social revolutionary struggle. The total power position of the Communist world—including but not focusing exclusively around its military ingredient—is viewed as an encouragement and a guarantee of the success of revolutionary forces in the non-Communist states. In the Soviet view the situation especially in the underdeveloped states,

is now such that substantial and continuing gains can be won by vigorous pursuit of all forms of struggle short of war. The Soviets probably also feel that in carefully chosen circumstances they could wage limited war with Communist-supported, or even with Bloc forces, without themselves incurring serious risk of general war. The comparative caution implied in this strategy has led to open dispute between the USSR and Communist China. Before we can estimate the course of Communist policy in the years ahead, we should therefore examine the potential and the aspirations of Communist China.

#### B. Chinese Communist Growth and Aspirations

20. During the past two or three years the Chinese Communist regime has been exhibiting a growing self-confidence. This probably reflected, in part at least, the regime's increasing satisfaction over its political effectiveness within China and over a substantial consolidation of its economic program. In 1959, the second year of the Second Five-Year Plan, Chinese industrial production increased by about 33 percent. Especially dramatic increases were recorded in basic commodities—steel, coal, and electric power. There was also a better balance of product, a more rational distribution of the labor force, and an improvement in the quality of the output. In short, the Communists began to receive the dividends from 10 years of hard and concentrated effort on the expansion of heavy industry. GNP rose by about 18 percent in 1958; then by about 12 percent in 1959 and 10 percent in 1960. Investment in 1960 reached a peak of about one-third of GNP.

21. Despite such impressive gains, Communist China still has a long way to go before becoming a major industrial power. It is still largely an agricultural country with a small industrial base relative to its huge population. Eighty percent of the population is agricultural, and industrial production is less than 10 percent that of the US. Communist China's most serious problem for some years to come will be the lag in food production in the face of an annual population increase of 2.5 percent. In time some amelioration may occur, since a large part of the industrial expansion is directed toward the production of items—tractors, fertilizers, irrigation equipment—intended to support the agricultural sector. As a consequence of population increase and bad crop years in 1959 and in 1960, per capita food consumption in China has actually declined. GNP will probably continue to increase at a rapid rate, investment will continue to be heavy, and per capita consumption may increase somewhat. Any such gains, however, will be realized largely by the urban population, while the vast peasantry continues barely to subsist.

22. The Chinese Communist military establishment continues to improve. A substantial growth in the capacity to produce and assemble

complex military equipment is likely, and a nuclear development program is underway. In a few years, say somewhere between 1962–1964, the Chinese Communists may be able to test a nuclear device and soon thereafter build an elementary nuclear weapon deliverable by medium bombers. By the end of the decade, they could have a 200–500 mile missile with a fission warhead, and they might be able to produce longer range missiles. These dates could be moved forward or backward by increases or decreases in the amount of Soviet aid.

23. The most striking characteristic of Communist China is not its economic progress but its great revolutionary élan. The Chinese Communist leaders are men of intense ardor who are deadly serious about transforming Chinese society completely and irrevocably. They are determined to create a “new Communist man,” indeed even a “new Chinese Communist man,” and to give to the world the benefits of their “constructive contributions” to Communist dogma and social theory. Confident of their own righteousness and orthodoxy and reinforced in that confidence by what they regard as the great achievements of the past decade, they are pushing, not only toward great power status in the world, but also toward at least co-equal status with the USSR in the world of international communism. Indeed, it became clear during 1960 that Peiping was presenting a major challenge to Moscow’s position as the final authority in the Communist movement.

24. This Chinese Communist drive and sense of mission is reflected not only in such revolutionary social changes as the creation of the commune but also in foreign policy outlook. The Chinese Communists’ view of the world situation is strongly doctrinaire, Sino-centric, and—from the Soviet point of view—overoptimistic. The Chinese leaders evidently believe that “imperialism” is on its last legs, that the Sino-Soviet Bloc has surpassed the West in military power and political influence, and that the emerging peoples in Asia, Africa, and Latin America are ripe for Communist revolution, if only they are actively supported to that end. Whereas in recent years the Soviet leaders have preferred—within the general context of belief in the inevitability of a world Communist victory—a comparatively low-risk policy of peaceful competition, the Chinese Communists have urged a policy of greater militancy, even at considerable risk. They probably also find this policy useful in spurring the Chinese people to the sacrifices they are requiring of them.

### C. Sino-Soviet Relations and the Future of Communism

25. The character of Sino-Soviet relations in the years ahead will have a profound effect upon the future of communism and thereby on the world situation. The quarrel with Peiping has put the Soviet leaders in a difficult situation. They cannot condone Chinese contumacy with-

out losing control of the Communist movement. They cannot permit an open break without losing what influence they still possess over the Chinese and without gravely weakening the international Communist movement as a whole. The Soviet leaders would consider an open break calamitous, but we do not believe that they would go so far in trying to avoid it as to surrender to the Chinese position; both the USSR's determination to preserve its supremacy in the Communist movement and Soviet national interest in avoiding serious risk of general war would preclude such a course. We also do not believe that the Chinese would submit fully to the Soviet position; their pride, self-righteousness, and national aspirations are too heavily committed to permit it.

26. The issues between the partners are basic, and will probably not be resolved in any clear-cut fashion. The meetings in Moscow in November, 1960, clearly did not produce a complete agreement, or one which is likely to be lasting. The estrangement seems likely to continue, with ups and downs as new issues arise and temporary solutions are developed, and possibly moving toward a looser connection. If the Sino-Soviet relationship does in fact develop in this way, there will probably be a tendency for recurrent stresses and strains to weaken the Communist world posture and to diminish the effectiveness of world communism outside the bloc. In particular, factionalism would be stimulated in the Communist movement, with parties or factions in various countries tending to identify either with the USSR or with Communist China. The two countries would compete with each other for influence in a variety of arenas, from revolutionary movements to world organizations. A further widening of the Sino-Soviet split, if it should occur, would dim the image of the bloc as a great and growing power center and thus reduce the pressure upon peripheral countries to accommodate to the Communists.

27. The cohesive forces between the USSR and China are strong, and we believe that the two states will not abandon their alliance against the West. The Soviet leaders would be confronted with a most serious dilemma, however, if the Chinese pursued independently such a militant policy as to become engaged in a major war. Caught between a desire to avoid Soviet involvement, with its attendant dangers, and a desire to preserve a Communist state, with its attendant opportunity to re-establish Soviet influence in China, the Soviet leaders might tend toward the latter course. Thus a wider Sino-Soviet divergency would not necessarily lead to a less dangerous world.

28. It is impossible to predict with confidence the course of Communist policy in the decade ahead, particularly in the light of the uncertain future course in Sino-Soviet relations. We believe that the USSR will stick to its present policy of seeking to win victories without incurring

serious risks, and of alternating or combining shows of anger and bellicosity with poses of reasonableness and compromise. We say this largely because we believe that the relationship of power between the US and the USSR will cause the Soviet leaders to desire to avoid general war, and that within the limits which this desire places on their action there will be constantly shifting ideas of the potential risks and gains involved in the various situations which will arise. A danger exists, of course, that in assessing the risks involved in particular situations or proposed courses of action, the Soviet leaders might overestimate their position while underestimating that of the West. In particular, they might misjudge Western will and determination in the face of Soviet threats or encroachments. Such a political miscalculation could lead to the incurring of serious risks without the intention to do so; it could even lead to general war.

29. We believe that China will persist in pressing the USSR for a more militant bloc policy. It will continue its hostility to the US, and as it becomes stronger—especially after it acquires a nuclear capability—it might press its objectives much more aggressively than at present. On the other hand, the Chinese have in recent years assessed risks carefully, and despite their bellicose talk they have refrained from actions which involved serious risk of large-scale military operations. Thus, their militancy has been tempered by some degree of prudence, and this tendency toward prudence might in time become somewhat stronger as they become more familiar with the dangers of nuclear war and as they come to recognize the vulnerability of their developing industrial capacity. On the whole, however, we do not expect a general shift in the Chinese domestic or world outlook for some time to come, and Chinese militancy will continue to create a serious danger of local or general hostilities in the Far East, and even of general war.

30. Over the next decade at least, there appears to be a greater likelihood of flexibility in Soviet than in Chinese policy. The Soviet leadership's desire to prevent a general war, the wider range of Soviet contacts with the outside world, the continuing pressure at home for liberalization, and the growing capacity of the USSR to provide its citizens with a more comfortable life—these factors taken together may tend toward moderation in foreign policy and toward a recognition of some areas of common interest with the West. It is even possible that the Soviet leaders will come to feel that the USSR has little in common with China except an ideology which the Chinese interpret in their own way, and that by 1970 Communist China, with nuclear weapons and a population of almost 900 million, will be a dangerous neighbor and associate.

### III. THE EMERGING AREAS

#### A. The Political and Social Milieu

31. It is one of the key points in the Soviet estimate of the world situation that conditions are favorable for Communist gains in the colonial and ex-colonial areas of the world; there is much to support this Soviet view. The nationalist revolutions in such areas as Africa and the Arab states have been directed largely toward revamping political and social systems in order to modernize societies and to achieve a place in the sun. The Communist revolutions in Russia and China arose from broadly comparable aspirations. Indeed, the system in these countries is widely admired in the newer nations of the world because it has been demonstrably effective in achieving rapid modernization, while the West is associated in their minds with the colonialism which they blame for most of their problems and miseries, both real and fancied.

32. Many of these countries in emerging areas—especially in Africa and the Middle East—are in the charge of revolutionary-minded leaders; in others of them such leaders are making a bid for power. These leaders are members of an intelligentsia who have frequently had an education along Western lines, some of it in military schools, and who have become aware through travel and education—or through observation of the mode of life of Westerners in their midst—of the backwardness of their countries and the poverty of their people. Out of a sense of obligation, frustration, and impatience, they have adopted a revolutionary attitude or taken revolutionary action against the old order—whether it was colonial or indigenous. Despite the Western nature of their youthful training, they tend to be resentful of Western influence and critical of Western methods. They therefore are tempted by Communism insofar as it is anti-Western and an effective method of bringing about rapid change.

33. Nevertheless, the revolutionary intelligentsia are generally chary of embracing communism. Some of them have accepted Communist advisers, economic aid, and diplomatic support, and some have even sided with the Communists against the West. But, for the most part they do not wish to accept all that now goes with the Communist ideology—the goal of a classless society, wholesale social reorganization, Soviet interference in or dictation of domestic policy, complete identification with the Soviet Bloc in international politics, and exclusion from Western economic aid and technical assistance. Moreover, many of them have become aware of their own nation's history—in some cases a distinguished history—and they see themselves as national figures capable of resurrecting some features of that past and binding them into the new fabric being created. Thus, they see them-

selves, not as capitalists, Communists, or exponents of any other borrowed ideology, but as nationalists carving out their own destinies and selecting from the past and from other societies the elements with which to fashion new states and new societies of their own.

34. There are, of course, wide variations within the emerging world, not only as among major areas—Latin America is quite different from Africa—but even within major areas. There are wide diversities of all kinds in social structure, degree of advancement, extent of revolutionary feeling, degree of pressure upon available resources, extent of implantation of Western institutions, and cultural backgrounds. Whereas Latin America is Christian, is predominantly Western in language and culture, and has a long history of independence, Africa is a melange of languages, religions, and cultures, and is only now emerging from foreign domination. Even within a continent such as Latin America, there are societies which have passed through a major social revolution and others which still possess small social elites and a large mass of illiterate and poverty-stricken peasants and tribes.

35. There is, however, a large common denominator in the underdeveloped world. This is the political and social instability which is either manifest or dormant and which arises from the rapidity with which knowledge is growing and from the revolutionary manner in which large numbers of people are reacting to the changes in the world around them. Nearly all the nations of the underdeveloped world—whether in Southeast Asia, South Asia, the Middle East, Africa, or Latin America—are beset by problems springing from population growth, lack of development capital, rising popular expectations, internal political strife and competing ideological pressures, lack of political prowess and administrative and technical competence, and an inadequate sense of national identity. While some states, especially those barely emerging from tribalism, as in Africa, suffer more intensely than others from these assorted ills, even states such as India and the more advanced Latin American countries confront several of them to a most serious degree. Many states have adopted strongly socialist methods; some have held to constitutional methods of government with only the greatest difficulty; some have thrown out bloody dictators only to acquire equally distasteful successors; some have taken halting and others more dramatic steps toward the establishment of democratic governments.

36. In states confronted by these enormous problems, the tendency toward some blend of authoritarianism and socialism seems likely to continue. Revolutionary leaders attempting to deal with backwardness, tribalism, feudalism, corruption, economic pressures, and ineptitude often have no alternative but to stifle political opposition. Western states which set store by economic individualism and political freedom will probably be increasingly shocked by methods which will be

adopted, but in the eyes of local leaders Western standards of political and economic conduct are likely to be irrelevant to the problem. Revolutionary leaders are likely to expect the West to judge them more by what they are trying to do than by the manner in which they are doing it. If the West does not understand and help them, they will tend to rely more and more heavily upon the Communists, until a point is reached when they can no longer extricate themselves from the Communist embrace.

37. Of all the problems confronting these nations that of the relation between population and economic growth may be the most difficult. Indeed, population growth is a grave world problem, with present rates making for a doubling of the world's population every 35–50 years. In 1930 the world population was two billion; today it is three billion; in twenty years it will probably be four billion; in forty years it may be six or seven billion. Growth is most rapid in the underdeveloped areas, where nearly everywhere it exceeds two percent a year. Ten years ago almost no nation had a population growth rate of three percent; now such rates are not uncommon and there is no reasonable prospect that they can be significantly reduced in the next decade, whatever means might be tried. These increases impede capital formation in the areas where it is needed most, since increases in production simply go to keep alive the larger numbers of unproductive old people and children. In some cases total GNP grows while per capita GNP falls. Standards of living are declining in some countries at precisely the time when the revolutionary leaders now in charge must begin to meet the expectations which have arisen in their own and in their fellow countrymen's minds.

38. The problem of maintaining standards of living and even that of satisfying to a degree rising economic expectations probably can be met with substantial infusions of outside aid and with the execution of national development programs. However, even if these countries received outside aid in massive quantities, they would still confront the grave political and social problems of backward and uprooted societies. Indeed, these problems will inhibit both the receipt and proper use of needed economic assistance. The present revolutionary leaders must surmount this great complex of problems if they are to sustain the nationalist character of their revolutions; if they fail, they may be replaced by Communist leaders ready to use Draconian methods and determined to impose permanent totalitarian institutions.

#### B. International Outlook

39. If, as we suggest above, the emerging countries will be preoccupied with their own problems, their attitudes toward the outside world will be determined largely by the way in which they feel the outside

world impinges upon these problems. These countries and their leaders will not be concerned so much with ideological, moral, and cultural considerations as they will with manipulating outside influences in order to protect themselves or to advance their particular interests. The two great powers are likely to be viewed largely in terms of the threat or succor which they will afford.

40. Some of the emerging states have clearly aligned themselves with one or another of the two great powers. Many of these are states on the periphery of the Sino-Soviet Bloc—Iran, Pakistan, Thailand, South Vietnam, and South Korea—and their leaders have aligned themselves with the US in order to obtain that military and economic assistance which they hoped would enable them to keep any domestic enemies at bay and to stand up against pressures from their powerful neighbors. Cuba alleges similar reasons for aligning itself with the USSR.

41. In general, however, those who thought they could safely do so have chosen neutralism, and indeed some of them have made quite a profitable thing of it. In their desire to achieve and maintain national independence they have sought to avoid commitment to either side, and they have recognized the value to both sides of their not falling under the domination of the other. This has permitted some of them successfully to seek economic assistance from both and some others to seek assistance from one side by suggesting that they might appeal to the other. Nevertheless, many of these countries, in the course of their colonial or semicolonial history, have been subjected to Western influences and institutions and have therefore come to feel that “neutralism” requires a pronounced reaction away from these influences and some closer relationship with the Sino-Soviet Bloc.

42. This trend has been accelerated by increased Soviet willingness to compete with the West in providing economic assistance and diplomatic support. Bloc economic assistance overall is still considerably less than the US equivalent, but the USSR in particular can substantially enlarge its program. Moreover, the USSR has some advantages over the US in carrying out aid programs; it can move more quickly and without regard to a variety of politically-imposed restrictions which characterize US activities. On the other hand, as Soviet aid becomes more commonplace and taken for granted, the USSR is beginning to encounter some of the criticisms and problems which the US has faced in its foreign aid programs.

43. We believe that if the present trend toward neutralism is not reversed, it will become so strong that it will draw away from the West some of those nations now associated with it. This might come about through revolutions in some of these countries—for example Iran or South Vietnam—with seizure of power by nationalist-neutralist forces;

it could occur because existing regimes might decide to seek the supposed benefits and safety of neutrality; it could come about because these nations might decide that the US was becoming inferior to the Sino-Soviet Bloc in military power and therefore would no longer be willing or able to support them.

44. The neutralist posture of these countries seems to us likely to produce in the decade ahead some most serious policy problems for the US. Aside from the probability of withdrawal from Western association and attempts to balance Western with Soviet or Chinese influence, there will be continual pressures for economic aid and political support, for denunciations of colonialism, for concessions on disarmament, and for further Western retreat from positions of predominance or influence. The US position in the UN will probably become increasingly difficult, particularly since many of these countries—including such influential members as India and the UAR—now appear to believe that the UN machinery has been used by the major Western powers and especially by the US as an instrument of national, and hence in their view “imperialist,” policy. For this reason, the idea of revising the UN charter and proposals to bring in Communist China have received widespread sympathy among the emerging nations. Their numbers are now so great that when their views become more crystallized—as now seems unavoidable—the hitherto predominant Western influence in the UN will be greatly reduced.

45. It is obvious that neutralism as a principle is fundamentally incompatible with the Soviet objective of a Communist world. Nevertheless, neutralism may often provide Communists with opportunities for penetration and subversion. Particularly in the areas of the new states, the Communists will seize upon rivalries among nations and tribes, upon the need for economic and technical aid, and upon the naivete and weaknesses of inexperienced leaders. Hence the problem for neutralist states is to keep out of Communist clutches. Nevertheless, insofar as the new and underdeveloped nations can overcome their problems, they may take on a strength and stature which will enable them to maintain their neutrality against Communist pressures.

#### IV. PROBLEMS OF THE WESTERN ALLIANCES

46. Western statesmen are faced with enormously more complicated problems than they had to face ten years ago. Whereas then one could think of military containment in terms of defining vital areas or lines of demarcation between the Communist world and the Free World, or even providing economic aid and diplomatic support in order to achieve political containment, the West must now contend not only with stronger, more flexible, and more dangerous enemies, but also with crises in the southern two-thirds of the world. These

crises, as we have seen, arise only partly from Soviet and Chinese Communist machinations; many other factors are at work, such as the natural growth of population, knowledge, communication, and human aspirations, and the social dislocations that accompany rapid change.

47. The West has substantial and growing assets. The Western European economies, especially those in the Common Market area, are booming. Rates of economic growth in France and West Germany are about as high as in the USSR, averaging around six or seven percent per annum since 1950. In the UK and the US growth rates are somewhat lower, averaging around three or four percent; at the moment, the UK economy is in danger of stagnation, while that of the US has markedly slowed down. Nevertheless, the Western economies are for the most part highly advanced and flexible, and they respond to trade and fiscal policies designed to adjust them. The greater emphasis in the Western economies upon private capital, and upon the allocation of resources through the market place, makes it more difficult for them than for those of the Communist countries to concentrate upon the development of national power; however, in times of emergency they can readily be made to serve that objective.

48. Likewise, the major Western Powers, with their systems of alliances, overseas bases, and worldwide deployments of ground, naval, and air forces, possess enormous military power. Grave problems exist with respect to strategic doctrine, weapons systems, and the political application of military power. These we discuss below (Section V), but even with the deficiencies and gaps which are generally recognized this military power of the West is great and widely respected.

49. Moreover, despite the anticolonialism of many of the world's peoples, the Western powers still wield great influence in many areas of the emerging world. English and French are still the *linguae francae* of Africa, the Middle East, and Southern Asia; they are still the languages of the revolutionary intelligentsia and of the universities. While Western influence has tended to decline in some areas, as for example among the Arab states, it has tended to rise in other areas, as for example in India. The Western, not the Communist, states are still the principal trading partners of most of the emerging nations, and still their principal bankers, investors, and developers. Despite the interest shown by many leaders of the emerging nations in Communist methods of development and in Soviet economic assistance, these same leaders still have borrowed from the West most of their basic concepts of the good life.

50. Nevertheless, the Western countries have grave and continuing problems. Political instability, while becoming epidemic in the southern two-thirds of the world, is still endemic in parts of the northern third. Basically unhealthy political situations exist in Western Europe itself;

Spain and Portugal are restive under personal dictatorships, Italy continues to struggle with finding a parliamentary basis for constitutional government, and France has put its burdens upon one man who holds warring factions in harness through a governmental system created by him and for him alone. On the periphery of Europe, Greece remains poverty-stricken and politically weak, while Turkey is passing through a crisis of regime, the outcome of which can only be surmised.

51. Outside Europe, the condition of the Western alliance system is deteriorating. Japan, by far the most important non-Western nation associated with the system, enjoys a flourishing economy, but is passing through profound political and social changes. Although the rulers of Japan had successfully imposed selected elements of Western society upon a traditionalist society gradually over a period of nearly a century, the impact of nuclear warfare, defeat, and US occupation shook Japanese society to its foundations. In particular, the psychological atmosphere is still overcast with the memories generated by the only two nuclear weapons ever used in war. Today the country, after a decade of US assistance, is seeking, not only to find a way of life common to itself, but to find a satisfactory stance between attractions toward China and the USSR and a desire for protection by the US. In this atmosphere sharply contending political alternatives are being presented to the Japanese people: a radical left which favors neutralism and closer association with the Sino-Soviet Bloc, and a conservative right that is generally disposed to association with the US. It is possible that the existing US-Japanese defense agreement may prove more a token than a reality; in any event the US is likely to have increasing difficulties in the years ahead in carrying out actions under the agreement.

52. The minor alliances, CENTO and SEATO, are floundering. Never a very effective organization, CENTO was gravely shaken in 1958 by the revolution in Iraq and that country's subsequent withdrawal. Iran seems to be almost continuously in a condition of instability, and the British military position and general influence in the Middle East are extremely weak. Moreover, neutralist tendencies have emerged in Iran and Pakistan. SEATO has always been a loose association. It has only one member, Thailand, in mainland Southeast Asia, and the course of events in Laos, Cambodia, and South Vietnam will have a great effect upon Thailand's policy. The continuing failure of the principal members of the organization—the UK, US, and France—to have a common estimate of the situation in, and a common policy toward, the Indo-Chinese states makes it extremely difficult for SEATO to serve as an effective instrument for stability in the area.

53. These problems and weaknesses in US alliances outside Europe put in sharp relief the much greater vigor and strength of NATO. Despite its many weaknesses, NATO has shown itself to be a useful

instrument of Western cooperation, and it has absorbed numerous shocks and crises arising both within and outside the alliance. It bears promise of continuing so to serve and, with some increase of constructive support by its members, even of expanding its utility.

54. But NATO contains centrifugal as well as centripetal forces. Some of these relate to the NATO military program. France's opposition to an integrated force structure is well known, as is France's recurrent removal of NATO-committed forces from NATO command. Most NATO members, of course, maintain forces, and in the case of the US very powerful forces, which they have never contemplated putting under NATO authority in peacetime. The most important of these are the US nuclear-capable strategic forces, and the desire to possess similar forces as a symbol of prestige and as a balance to US power within the Atlantic alliance contributed to the British and French decisions to develop independent nuclear capabilities.

55. Exclusive US control of the major deterrent has troubled Europeans in the past because they feared that the US would brandish it in too bellicose a fashion. More recently many have also become troubled by the opposite fear: that the US could no longer be relied upon to risk nuclear devastation in order to counter Soviet pressures in Europe, and that the Soviet leaders, judging this to be the case, would not be restrained from such pressures. Various suggestions have been made for solving the dilemmas presented by the evolving world strategic situation—nuclear sharing, revision of the mission and armament of the shield forces on the continent, arms limitations in the European area or in special European zones, revised procedures for consultation and decision making. Whatever position may ultimately be taken regarding these suggestions, virtually all of NATO's military concepts seem likely to come under increasing questioning and to be subjected to strong pressures for substantial revision in the decade ahead.

56. In addition to these military problems NATO as an organization confronts various internal divergencies and rivalries which not only sap its capacity to act but shadow the image which it presents to the world. The basic relationship between the US and its European NATO allies is coming under strain, both because of the growing strength and assertiveness of the larger European NATO countries and because of growing European doubts about the future of US policy and US commitments to Europe. Relationships among the European members are also marked by considerable suspicion and jockeying for position—notably as between the UK and its principal continental allies—with the growing economic division of Europe between the Common Market and the Outer Seven countries compounding the mistrust.

57. The harmonization of economic policies among the industrial nations of Western Europe, and of these policies with those of the US, will be a major problem of the forthcoming decade. Should a major recession in the Free World economy occur, there would be danger of resort by the industrial nations to protectionist measures, undermining the pattern of economic cooperation stimulated by the US in the post-war period. In any case, the rapid emergence of Germany as the most powerful nation economically in Western Europe and the relative weakness of the UK complicate the problem of bridging the gap between the Common Market and Outer Seven groups.

58. Another serious problem for the alliance is created by the impact of colonial problems. This issue is at present posed most gravely by the Algerian conflict, which has stirred up anti-Westernism among the emerging peoples and dissension within the alliance. But Belgian and Dutch sensitivities regarding the Congo and West New Guinea problems, the British dilemmas in Nyasaland, Rhodesia, Kenya, and Uganda, and the strong colonialist attitude of Portugal add to the difficulties of individual states and tend to cause tensions among them. Until some of these issues are resolved it will be almost impossible for NATO as a whole to escape reproaches as a protector of colonialism.

59. Apart from these more obvious signs of malaise, there is, we believe, a problem of deeper significance. The world situation is not seen in a common light among the major Western states. This lack of a common understanding is due partly to a failure to communicate, partly to the cultural differences among the Western states, and partly to the inevitable divergencies of interest in many areas. As a consequence, a good many urgent problems are unresolved. When sharp tensions arise over these problems—as in the case of the Offshore Islands and Berlin—a common policy often has to be improvised, while mounting fears impede united action.

## V. THE MILITARY PROBLEM

### A. The Evolving Strategic Situation

60. Despite a widespread feeling that allout nuclear war is unlikely, the problem posed by the accumulation of offensive weapons of mass destruction by the great powers will remain the major problem of the 1960's. Although we have been unable to agree upon an estimate of the size of the Soviet ICBM program (estimates range from 200—or perhaps even less—to 700 on launcher for mid-1963), the Soviet capability even at the lowest estimated figure will pose a grave threat to the US. To illustrate, if one assumes the number on launcher to be 200 and applies reasonable rates of reliability to the missile, the USSR could detonate in the US in the target area some 1,000 to 1,250 megatons. The even greater delivery capability provided by shorter range missiles

and nuclear weapons deliverable by aircraft or submarines and ships poses an additional threat to the US, to US bases overseas, to US allies, and indeed to most of the northern hemisphere.

61. So far as we can see now, if the USSR undertook to deliver such an attack, the US could do little to prevent enormous damage. A US pre-emptive attack—that is, an attack delivered when a Soviet attack was believed to be imminent—would not prevent such damage unless the various types of Soviet missile launchers had been precisely located, and there is doubt that a high proportion could be so located. Antiballistic missile systems of presently unproven effectiveness will probably be available about the middle of the decade, but such early systems almost certainly will not be sufficiently developed or widely-enough deployed to give assurance of destroying or neutralizing more than a small proportion of the missiles which the USSR will be capable of launching.<sup>2</sup>

62. The US, however, will also almost certainly be able to do enormous damage to the USSR, even if attacked first by the USSR. It is true that during the next year or so the vulnerability of US retaliatory forces to a surprise missile attack and the uncertainties regarding the size of the Soviet ICBM force introduce some measure of doubt regarding the extent of the US retaliatory capability. It is very unlikely, however, that even during this period the USSR will acquire capabilities sufficient to give it confidence that it can prevent an unacceptable level of US retaliation.<sup>3</sup> As the decade advances, the US program of maintaining a portion of the US bomber force on airborne alert and of dispersing missiles in hardened sites, aboard submarines at sea, and on railborne carriers should virtually assure the survival of a substantial retaliatory capability. The Soviets are pursuing a vigorous program for developing antimissile defenses, and we estimate that the USSR will

---

<sup>2</sup> The Assistant Chief of Staff for Intelligence, Department of the Army, concurs in the net judgment contained in this paragraph and the succeeding paragraphs that, so far as can now be seen, a general nuclear war would cause enormous damage to all major protagonists and that resort to general nuclear war, under these circumstances, is not a rational course of action. He believes, however, that the intelligence community is unable to adjudge the capability of the US to develop an effective defense against ballistic missiles.

<sup>3</sup> The Assistant Chief of Staff, Intelligence, USAF, does not concur. As previously stated in his footnote to NIE 11-4-60, "Main Trends In Soviet Capabilities and Policies, 1960-1965," dated 1 December 1960, he feels that we are entering a very critical twenty-four month period in which the USSR may well sense that it has the advantage. The Soviet leaders may press that advantage and offer the US the choice of war or of backing down on an issue heretofore considered vital to our national interests.

probably begin to deploy an antimissile system of undetermined effectiveness by the period 1963–1966. The Soviet leaders probably believe that they will acquire a military advantage through protection of selected areas and through complicating the task of Western military planners. They almost certainly consider that the first nation to deploy such weapons will gain major psychological, political, and military advantages. Nevertheless, we believe it almost certain that these defenses throughout the period will remain inadequate to shield large areas of the USSR from widespread devastation.

63. Thus it appears likely that during most of the decade ahead the strategic situation will be one in which both the US and the USSR will possess relatively invulnerable nuclear weapons systems capable of inflicting enormous destruction upon the other. The world must face the possibility that a general nuclear war—brought to pass through accident, design, or miscalculation—would kill many millions of people, destroy the capital accumulation of many decades, render large sections of the earth virtually uninhabitable for a time, and destroy the power of most of the modern nations of the world.

64. This strategic situation does not make general nuclear war impossible, but it does make it a highly irrational response to international disputes. As long as this situation continues, each side will be deterred by fear of the consequences (if by nothing else) from deliberately initiating general war. It is almost certain, moreover, that each side will be deterred from action or policies which involve serious risk of general war. The crucial question is: how will the risks of a given action be judged in the context of circumstances which exist when the action is contemplated? To be more specific: how far will the Soviets—or the Chinese Communists—be emboldened by judging that Western reaction to some Communist aggression will be inhibited by Western aversion to incurring serious risk of general war? To what extent will the Western reaction actually be so inhibited? Such questions as these are likely to be decisive in any sharp international crisis.

65. But apart from the calculation of risks in times of crisis, this strategic situation poses other serious problems for policymakers. How long will it persist? Can either side achieve a clear military superiority? If the situation of mutual deterrence does persist, can nuclear war be prevented from occurring by accident? Can nuclear blackmail be countered? Can nuclear armaments be reduced or eliminated without creating unfair advantage or opportunities for evasion? We do not pretend to offer answers, but only to point out in the paragraphs below some of the military and political problems which we believe this strategic situation has created and will create in the decade ahead.

## B. Military and Political Implications of the Evolving Strategic Situation<sup>4</sup>

66. There is much ignorance and uncertainty among military and civilian leaders throughout the world—in both Communist and non-Communist countries—about the present and future world military situation. This is due in part to security restrictions between governments and even within governments, in part to the complex technical and operational factors involved in modern military actions, and in part to the fact that the destructive potential of modern weapons is unprecedented in human history. Even among the politically and militarily sophisticated, there is considerable puzzlement and disagreement about the deterrent effect of present and future nuclear capabilities, about the probable behavior of states in critical situations, and about the most suitable and effective strategic doctrines and weapons systems to develop.

67. These problems must trouble the Soviet leaders as much as they trouble those of the West. We do not believe that the Soviet leaders conceive the ICBM to be the final answer to their military problems, and we doubt that they have formed definite ideas about their force structure ten years hence or about the precise role they will assign to military power in their campaign to establish world communism. They now see themselves as emerging from a period of strategic inferiority, and they surely consider it a prime objective not to let the US draw ahead once more. As long as the weapons race persists, they will not be content with a strategic equilibrium, or with the progress they have hitherto made in weapons development. Beyond that, they will continue to carry on scientific and weapons research and development programs with a high sense of urgency in order to find new weapons systems and defenses against existing ones. They would do this even without dream of vast military conquests, simply in the interest of defense. But if they developed a weapons system which gave promise

---

<sup>4</sup> The Director for Intelligence, Joint Staff, and the Assistant to the Secretary of Defense, Special Operations, believe that the tone of Section V, especially part B of this Section, compares a dynamic Communist Bloc to a static Free World. While emphasizing the capabilities of the Bloc, it gives little or no credit to the capability or determination of the West to shape the course of events.

For example:

*a.* Paragraph 69 charges “large numbers of people around the world” with acceptance of the Bertrand Russell thesis of preferring Communist chains to nuclear war. The Director for Intelligence, Joint Staff, and the Assistant to the Secretary of Defense, Special Operations, doubt the validity of this assertion.

*b.* Paragraph 72 forecasts Communist political manipulation in crisis situations so as to try to make Western intervention seem “capricious or imperialistic.” Adroitness in the political arena by the West—believed by the Director for Intelligence, Joint Staff, and the Assistant to the Secretary of Defense, Special Operations, to be equally possible—appears to be discounted as a factor for consideration.

of decided advantage over the US, they would certainly seek to gain maximum profit from it.

68. In the decade ahead some such weapons—for example, one providing defense against missiles—may achieve operational status and tend to upset the nuclear missile terror balance we have described. From what we know of Soviet ideas, however, we conclude that during the next five years—and perhaps longer—the Soviet leaders will conceive of their long-range striking capability in terms of deterrence and of employment in a heavy blow should they finally conclude that deterrence had failed, rather than in terms of the deliberate initiation of general war. In their view, a condition of mutual deterrence will provide an umbrella under which they can wage a vigorous campaign, using a wide variety of methods, throughout the non-Communist world.<sup>5</sup>

69. In such a circumstance the Soviet leaders will have substantial advantages. They can create crises and issue threats over comparatively minor matters with a reasonable degree of confidence that one or more of the Western powers will give way because of the risks of general war involved in resisting. In circumstances where they judge the risk is not too great they might engage in military action, possibly with Soviet forces but more probably with other bloc forces or with local revolutionary armed groups. In any case where it appeared that the choice for resisters was one between massive nuclear destruction and compromise of principle (including even surrender of territory), large numbers of people around the world would choose the latter.

70. It is now widely held that, in order to prevent such a paralyzing choice from being presented, it is necessary to have limited war capabilities, so that comparatively minor threats can be countered with appropriate means. But in recent years limited war capabilities in the West have been declining rather than rising. There has been a trend toward the reduction of budgetary allocations for the modernization and mobility of limited-war-capable forces. Two of the US allies, for reasons of national prestige, or because they fear that the US will not always support them, have carried on strategic nuclear weapons programs of their own and have reduced their conventional forces.

71. Even if substantial limited war forces should be available, many of the principles of their political and military use in a nuclear age remain to be developed and to be accepted. It is clear, for example, that only limited objectives can be won by limited means, and that

---

<sup>5</sup> The Assistant Chief of Staff, Intelligence, USAF, does not concur in this paragraph. It is his belief that the evidence of offensive missile and bomber production and deployment shows a definite intent by the Soviet rulers to achieve a clear military superiority at the earliest practicable date.

pursuit of broad objectives or extension of the conflict beyond a well defined area of combat threatens expansion into a major war and poses for both sides the question of undertaking a large-scale preemptive attack on the enemy's homeland. Even when both parties accept limitations upon their objectives and upon the area of combat, the rules of combat within that established area still pose problems. One of these is that of using nuclear weapons for tactical advantage. The use of nuclear weapons in almost any form would greatly complicate both the military and political problem. It would almost certainly confuse the enemy and the neutrals as to the user's real intentions—as distinct from his announced ones—and alienate large and influential sectors of world opinion from the cause of the user, however just it may have been. The Soviets would presumably regard the use of nuclear weapons in the light of the proposition which they repeatedly assert and probably believe—that limited wars would carry particularly great risks of spreading into general war if nuclear weapons were introduced.

72. From a political point of view, there are also questions about the circumstances in which one can intervene with limited forces. As a general rule and as a result of the experience of Korea, the Communist powers will probably try to avoid clear-cut provocations which would permit the West to bring limited war capabilities to bear. They will instead attempt to use situations which are legally or politically anomalous, that is, situations in which they have a defensible color of right for the use of force or in which the political issue has become or can be made to appear so confused as to make Western intervention seem capricious or imperialistic. Much will depend upon the way in which the issue is presented to the world and is handled by both sides. In many circumstances fear of the spread of the conflict into a general nuclear war might be so great that the intervener would find himself severely condemned by large segments of world opinion.

73. A major problem during the next decade is also posed by the probability that additional nations will acquire a nuclear weapons capability. France already has a program underway, and Communist China and Israel almost certainly have started such weapons programs. Other nations might enter the field if only to counter the power and prestige which their rivals or their enemies might gain through the acquisition of a nuclear capability. Even a small increase in the number of nations possessing nuclear weapons will add to the dangers inherent in critical situations as they arise. An increase in the number of states capable of using nuclear weapons—even as a threat—will also increase the chances for irrational and desperate action. At a minimum, the spread of nuclear weapons capabilities will stir up additional political turmoil by encouraging intransigence in their possessors and by encouraging fear and counteraction among those who might consider themselves threatened.

74. Related to these problems of limited war and spread of nuclear capabilities is the problem of preventing miscalculations which might precipitate general war unintentionally. Whenever international disputes arise there is a natural tendency for the parties concerned to place their forces on an alert status and progressively to strengthen the alert by various forms of deployment. In some cases these might be normal precautions and in some cases they might be intended to frighten the adversary, or both. In any case, there is likely to be considerable concern among neutrals and US allies that the US and the USSR will act in too bellicose a fashion, that both the US and the USSR might become so committed that they would be unable to back down and thus would become involved in war, or that the state of alert on one side or both will become so advanced that, fearing a surprise attack, one would take pre-emptive action against the other. As the decade advances and surprise attack against retaliatory weapons systems loses much of its advantage, compelling reasons for launching a pre-emptive attack will no longer exist. Nevertheless, fear of surprise attack will probably persist and might weigh more heavily in the minds of policy-makers than would in fact be justified.

75. Another concern is that general war may come about by sheer accident. The worry here is that with an increasing number and variety of space capsules in orbit or being fired into orbit, with an increasing number of missiles nuclear-armed and on the ready, with strategic air forces airborne and armed with nuclear weapons, with a new and untested ballistic missile early warning system in operation, war could come about through communications failures or anomalies, irrational action by local crews or commanders, or errors in judgment, without either side wishing this to happen. As the decade advances and surprise attack loses some of its advantages, there will no longer be compelling reasons to respond immediately to supposed or actual infringements of air space by presumably hostile missiles or aircraft. Nevertheless, fear of attack might in some circumstances be so great that general war could come about in ways we have noted.

76. In this situation of widespread fear of a general nuclear war, it is natural that the peoples of the world should look to arms control as a means of reducing the danger. Whatever its motivation, the USSR has carried on a many-sided campaign for general and complete disarmament. The Soviet leaders probably are interested in achieving some degree of disarmament, to an extent which would at least slow down or stop developments which might harm their strategic position or increase the danger of accidental war. During the decade, it is possible that both sides will become sufficiently concerned with stabilizing the balance of terror that some limited agreements may be reached. In any case, it is possible that—in order both to achieve stabilization and to

meet world pressures for reducing the danger of war—the two sides will undertake tacit agreements resulting in some degree of arms limitation.

77. Also, the UN is likely to continue to be regarded by its members as an instrument for the prevention of war. If two nations are involved in dispute that threatens to result in a general war which they wish to avoid, the UN might provide a useful forum for airing the dispute and UN action a useful excuse for emerging from the dispute with less than full satisfaction. Moreover, the underdeveloped nations, who are likely to become an increasingly powerful voice in the UN, will almost certainly feel it in their interest to prevent a general war and will therefore exert their influence for the preservation of peace.

78. While there is some reason to expect, therefore, that the UN may play a role in preserving peace, that the present balance of forces will persist or become stabilized, that the limited war concept may be sufficiently capable of development to provide an escape from nuclear blackmail and general nuclear war, and that chances of general war coming about by accident or fear of surprise attack may be reduced, the decade ahead will still be an extremely dangerous one. The Soviets see increasing opportunities for political gains in their new strategic position, in their economic growth, and in the changing situation in the underdeveloped areas. They are almost certain to test these opportunities, and such tests could give rise to serious crises. Berlin and the Offshore Islands exemplify situations in which retreat may become impossible, and civil wars in such areas on the periphery of the Sino-Soviet Bloc as Laos could pose grave questions concerning the objectives and rules for the conduct of limited operations. The world contest in the decade ahead will necessarily be conducted in the shadow of this strategic situation, and it will affect the decisions of statesmen everywhere.

**230. Record of Action, January 19<sup>1</sup>**

January 19, 1961

The Assistant Secretary of the Treasury, the Attorney General, the Director, Bureau of the Budget, and the Chairman, Atomic Energy Commission, participated in the action below.

*ACTION*

*NUMBER*

*SUBJECT*

2395.      *ATTACK WARNING CHANNELS AND PROCEDURES FOR CIVILLIANS*  
(NSC 5513/1; NSC Action No. 1565; Memos for NSC, same subject, dated February 20, 1957, December 3, 1959, and December 14 and 28, 1960; NSC Action No. 2363; Memo for NSC from Executive Secretary, same subject, dated January 17, 1961)  
Adopted the chart on the subject transmitted by the reference memorandum of January 17, 1961.  
NOTE: The above action, as approved by the President, subsequently transmitted to all holders of NSC 5513/1.

*WSEG REPORT NO. 50*

*EVALUATION OF STRATEGIC OFFENSIVE WEAPONS SYSTEMS*

*27 December 1960*

*STATEMENT OF THE PROBLEM*

1. To evaluate the weapons systems and directly related functions which make up the strategic offensive posture of the U.S. in the 1964–1967 period.

*BACKGROUND*

2. The Joint Chiefs of Staff requested, in SM–660–59, an evaluation of strategic offensive weapons systems in the 1964–1967 period, including strategic bombers, air-to-surface missiles, ICBM's, FBM's (submarines and surface vessels), and IRBM's. The study was to be directed particularly towards determining the relative effectiveness of the var-

---

<sup>1</sup> Transmits report on "Evaluation of Strategic Offensive Weapon Systems." Top Secret. 28 pp. Kennedy Library, National Security Files, Subjects Series, WSEG 50, Smith.

ious systems in terms of their reliability, reaction time, responsiveness to control, penetration capability, accuracy, destructiveness, vulnerability and cost. The evaluation was to take into account the various circumstances under which hostilities might be initiated, ranging from surprise attack on the U.S. to conditions of strategic warning which might permit U.S. initiative. The study was to recognize changes in the threat, in the Free World situation, and in military technology which might occur during the period, as well as significant changes or advances that could reasonably be foreseen beyond 1967.

SCOPE

3. The report reviews the characteristics of individual weapon systems, examines the feasibility of attaining their technical goals, their costs and manpower requirements, and evaluates their effectiveness as elements of the strategic posture. The evaluation is based in part on the systems' destruction potential against various types of Sino-Soviet targets, and on some qualitative considerations.

4. The report evaluates in detail only those strategic weapon systems which are competitive for funds in 1964–1967 and which are under complete U.S. control. The systems studied are therefore:

<u>Bombers</u>	<u>ASM'S</u>	<u>Ballistic Missiles</u>
B-47	GAM-77	ATLAS
B-52	GAM-87	TITAN
B-58		POLARIS (SSBN)
B-70		POLARIS (CG)
		Fixed MINUTEMAN
		Rail-Mobile MINUTEMAN

5. The report further examines the degree to which different weapons systems mixes, including the service-programmed mix, offer confidence in successfully carrying out national objectives.

6. Three supporting areas are examined in detail because of their importance to the entire strategic offensive posture: early warning requirements and systems; the command and control structure; and post-strike reconnaissance.

7. Finally, the report relates the possible changes in the Free World and in the threat to the problem of developing strategic offensive capabilities.

ORGANIZATION OF THE REPORT

8. The present document contains the report's summary conclusions. Supporting details are found in the following volumes:

Enclosure "A"—EVALUATION OF PROGRAMMED STRATEGIC OFFENSIVE SYSTEMS 1964–1967

Enclosure "B"—TECHNICAL AND OPERATIONAL ASPECTS OF TACTICAL EARLY WARNING AGAINST ICBM AND SLBM ATTACK

Enclosure "C"—COMMAND AND CONTROL OF STRATEGIC OFFENSIVE WEAPONS SYSTEMS IN THE PERIOD 1964-1967

Enclosure "D"—MANPOWER REQUIREMENTS FOR STRATEGIC OFFENSIVE WEAPONS SYSTEMS

Enclosure "E"—VULNERABILITY OF SUBMARINE-LAUNCHED BALLISTIC MISSILE SYSTEMS

Enclosure "F"—ESTIMATED COSTS OF STRATEGIC OFFENSIVE WEAPON SYSTEMS

Enclosure "G"—WEAPONS SYSTEMS CHARACTERISTICS

Enclosure "H"—THE ROLE OF RECONNAISSANCE IN POST-STRIKE STRATEGIC OFFENSIVE OPERATIONS

Enclosure "I"—CHANGES IN THE FREE WORLD

Enclosure "J"—STRATEGIC IMPLICATIONS OF POSSIBLE CHANGES IN THE NATURE OF THE THREAT

### INTRODUCTION

9. The first three parts of the present paper summarize and interconnect the more significant findings of the Enclosures to this Report. Part One examines the various factors which contribute to an assessment of the relative value of the programmed weapon systems. Part Two discusses some problems that are common to all strategic weapons systems. Part Three summarizes the capabilities of strategic offensive forces in meeting national objectives and discusses the contribution that other means can make to these objectives.

10. In Part Four, the paper sums up the steps that can be taken to improve support of national objectives by the U.S. military posture, and the role of various types of systems in achieving this posture.

### PART ONE: RELATIVE MERITS OF WEAPONS SYSTEMS

11. One of the major aims of this study is to evaluate individual strategic weapons systems as they compare to one another. The elements that are accordingly necessary to this part of the study are system characteristics, costs, responsiveness to control, manpower requirements, penetration capability, and vulnerability. The study also examines some of the potential contributions various systems make to an overall force posture and the possible effects of a mixed force posture on the capabilities of the individual weapon system.

#### *Characteristics of Weapons Systems*

12. Enclosure "G" tabulates the physical and operational characteristics of strategic delivery systems programmed for the 1964-1967

period, with emphasis on those characteristics that affect availability, reliability, survivability, and destructive capability, including accuracy<sup>2</sup> and yield. The Enclosure also estimates the feasibility of attaining the goals established by the Services for these characteristics.

13. In general, it is concluded that the weapons systems under development for deployment in the 1964–1967 period can be operational at the time specified in Service estimates. However, Service estimates for system performance, especially those of accuracy, reliability, and launch schedules, will probably not be fully met initially and will require a period of a few years during which gradual improvements will be made towards meeting specified system operational requirements.

#### *System Costs*

14. Enclosure “F” provides cost estimates for each of the weapons systems considered, based on force schedules provided by the Services. From these costs, Enclosure “A” generates for each system an effective annual cost, based on annual operating costs and amortized initial investment costs.

15. It must be emphasized that the reliability of cost estimates varies: considerable confidence can be placed in estimates of the costs of operational systems of long standing, less confidence in estimates for newly operational systems, and considerably less confidence in estimates of future systems. Results of analyses based on estimates for future systems must be used with caution, for experience has shown that early cost estimates for a new weapon system are almost always substantially lower than the actual costs incurred.

#### *Responsiveness to Control*

16. Responsiveness to control is discussed in Enclosure “C”, where it is shown that there are no significant differences in this respect among the various weapons systems. As discussed in paragraph 42 and following, the principal problem areas in the command structure are associated with the vulnerability of the higher echelons of command.

#### *Manpower Requirements*

17. Manpower requirements and limitations are treated in Enclosure “D”. It is found that none of the weapons systems appears limited merely by the numbers of men required, but all may tend to suffer from a lack of highly skilled technical personnel, a lack which will probably continue through the 1964–1967 period.

---

<sup>2</sup> Geodetic errors were assumed negligible relative to CEP.

### *Penetration Capability*

18. Penetration capabilities of U.S. ballistic missiles are generally assumed in this study to be unity. Penetration capabilities of aerodynamic systems are treated in Appendix "F" to Enclosure "A". The discussion there indicates that for all types of manned bombers there is relatively high confidence that a substantial fraction of a large force of bombers will be able to penetrate successfully at low altitude. If the USSR is willing to expend the relatively large effort required to develop and deploy a sophisticated and expensive low-altitude defense they would almost certainly also develop and deploy an effective defense against high-altitude supersonic aircraft.

### *Vulnerability to Attack*

19. Vulnerability of systems to attack is treated in a number of places in this Report; the results are integrated in Part I of Enclosure "A".

### *Bombers*

20. Bombers, being very soft targets on their bases, must achieve survival either through continuous air alert, or through ground alert with early warning and corresponding quick reaction. Enclosure "B" considers the various uses for early warning and examines the capabilities of the programmed ballistic missile warning system. In addition, the technical feasibility, capabilities, costs, and dates of availability of other possible early warning systems are examined. These systems include line-of-sight radars, over-the-horizon radars, and infrared sensors, in ground-based, airborne, and satellite types of deployment.

21. It is shown in Enclosure "B" that by the time period of this study BMEWS should, with high confidence, provide 10–30 minutes warning of attacks with greater than 2–15 ICBM's launched the short way around on trajectories above 15° from any part of the Soviet Bloc. Appropriately located additional radar stations or other sensors could provide similar warning against missiles with trajectories below 15° or against long-way-around missiles; various systems capable of detecting missiles using these trajectories are presently in the research and development phase, but none is approved for deployment. Although this warning may be adequate for 15-minute ground-alert bombers, the latter will still be vulnerable to attack by SLBM's. Although an SLBM detection system is feasible, it would provide very little useful warning time, the amount depending on the location of the target and the point of launch. The requirement for air alert in the 1964–1967 time period thus depends critically on the magnitude of the Soviet SLBM threat.

### *Hardened Missile Sites*

22. The vulnerability of a hardened missile site is sensitively dependent on the hardness of the site and on the accuracy, yield and

numbers of attacking enemy missiles. Thus, the vulnerability of hardened sites can be evaluated only in terms of the threat; this is done in Part I of Enclosure "A".

23. MINUTEMAN, being a remotely controlled system, introduces the element of the vulnerability of the control center in distinction to the vulnerability of the missile silo. This problem is examined in Enclosure "C", where it is shown that under certain conditions the system can be neutralized more easily by attacking the control centers than by attacking the missile silos.

#### *Mobile Missiles*

24. The relative merits of hardening and mobility are treated parametrically in Appendix "C" to Enclosure "A", which shows the effects of the interactions among silo hardness, extent of deployment of the mobile system, costs, effectiveness, and the nature of the enemy threat (including yield, CEP, and numbers).

#### *POLARIS Systems*

25. The vulnerability of the POLARIS submarine system is considered in detail in Enclosure "E". It is shown there that, unless the Soviets make significant advances in ASW technology and deploy very extensive ASW forces, the POLARIS submarines should be relatively invulnerable either to prolonged shadowing with kill at H-hour or to intensive search and destruction prior to the start of war. With respect to peacetime attrition, it is shown that should the Soviet submarines possess a detection range advantage over the FBM submarine, a small number of Soviet submarines could detect FBM submarines only occasionally, but frequently enough to constitute a threat. While it is unknown whether the Soviets will enjoy this advantage, the potential importance of reducing the noise level of the FBM submarine is great.

26. Although the vulnerability of the cruiser version of POLARIS is not studied explicitly in this report, this subject was treated in WSEG Report No. 47, which indicated that the cruiser is significantly more vulnerable to enemy measures than is the POLARIS submarine.

#### *Relative Merits of Systems*

##### *Method of Approach*

27. Destruction capabilities of U.S. weapons systems are calculated in Enclosure "A" against a variety of potential enemy targets.

28. Comparisons are then made among the various weapons systems, considering all the factors discussed above, on the basis of the number of targets successfully attacked at the 90 percent level of destruction per dollar expended. The relative importance of the factors depends quite significantly on the context of use and the targeting

objective of a weapons system. For the objective of destruction of hardened missile targets, the accuracy and delivery time of a weapon are relatively more important than is the case for the objective of industrial or population destruction. In a context of Soviet initiative, the survivability of a weapon system takes on great importance in comparison to a context of U.S. initiative.

29. Uncertainties in future characteristics and costs of strategic weapons and in estimates of future enemy threats make comparisons significantly only when differences are substantial and relatively insensitive to assumptions.

30. For simplicity in presentation the strategic weapon systems are divided into three groups—surface-to-surface missiles, bombers, and air-to-surface missiles—with comparisons principally within each group. In addition there is a discussion of the role of each group, in view of the capabilities and limitations of the group, and a limited number of intergroup comparisons where pertinent.

### *Principal Findings*

#### *Ballistic Missiles*

31. Ballistic missiles, because of their rapid delivery time and high confidence of successful penetration, appear to be the primary strategic offensive weapons systems in 1964–1967 against known fixed targets where time of delivery is of military importance.

32. The preferred weapon for the strike-first role, where vulnerability to attack is of no concern, appears to be fixed MINUTEMAN, with TITAN being competitive against hard or area mobile targets, or for the production of large fallout effects.

33. In the strike-second role, fixed and mobile MINUTEMAN and POLARIS all have advantages under certain circumstances. This is illustrated in Figure 1, which indicates qualitatively the way preference for POLARIS or fixed or mobile MINUTEMAN changes with the magnitude of the enemy threat and the size of the desired U.S. retaliatory capability. No numbers are shown on the figure, since the preferences depend on U.S. weapons systems costs, the enemy weapon yield and CEP, vulnerability of mobile MINUTEMAN in terms of hardness and deployment, fixed MINUTEMAN silo hardness, and the type of target against which the U.S. is retaliating. However, the following general relationships are apparent:

34. Since TITAN II and MINUTEMAN enter inventory in parallel the question of whether both are required is pertinent. The general superiority of MINUTEMAN—considering its cost, effectiveness, and vulnerability to attack—indicates military justification for TITAN II only where, for certain targets, large payloads are needed in a single

Fig. 1 PREFERENCE FOR POLARIS OR FIXED OR MOBILE MINUTEMAN

- a.* For a given number of U.S. ballistic missiles desired to survive, the larger the number of enemy counterforce missiles the greater the tendency to favor the mobile systems (line A—A').
- b.* For a given Soviet posture the larger the surviving U.S. ballistic missile force desired, the greater the tendency to favor fixed MINUTEMAN (line B—B').

missile to carry sufficient decoys or cluster warheads to overcome enemy missile defenses. An additional justification for the development of TITAN II (at a cost of \$700 million) can be made on the basis of requirements for space exploration or increased knowledge of how to build large missiles with storable liquid propellants.

35. Based on the analyses of Enclosure "A" and WSEG Report No. 47, the cruiser version of the POLARIS system appears inferior to the submarine version and to fixed and mobile MINUTEMAN. The low ranking arises largely because of the small fraction of time on station. Furthermore, it introduces no new element to our strategic forces not already available in other weapon systems. Hence, the installation of POLARIS missiles on cruisers does not appear to be warranted.

36. One improvement gained by the development of the A-3 missile for the POLARIS system lies in the insurance it provides against an

effective ASW system if the USSR develops and deploys one. In addition, the longer range of the A-3 missile will give the FBM system greater operational flexibility and allow it to threaten a larger number of Soviet targets from presently planned deployment areas and, more importantly, according to a DOD program the A-3 missile will carry the cluster warhead primarily for penetrating possible anti-missile defenses.

#### *Manned Bombers*

37. Manned bombers, currently the U.S.'s primary strategic weapon, will continue to be of considerable importance in the 1964-67 period, particularly if high levels of enemy fatalities are desired. No further procurement of B-58's is desirable. The projected B-52 program appears adequate. All procured bombers should remain in the force until operationally obsolescent. Every effort should be made to provide for the survival of a fraction of the bomber force, even going to air alert if reliable tactical warning cannot be assured.

38. The B-70 weapon system appears competitive with the fixed MINUTEMAN system in attacking known fixed targets only if successful delivery of a large number of weapons per bomber to different targets can be achieved. Operational problems associated with this type of mission require considerably more study to establish its feasibility.

#### *Air-to-Surface Missiles*

39. Air-to-surface missiles improve the target destruction capabilities of bombers without large penalties in bomber performance and without requiring large expenditures of funds. When they include a flight profile different from that of other strategic systems they also increase the problems of enemy defenses. With respect to specific ASM systems, certain aspects definitely favor the GAM-77, and others definitely favor the GAM-87. On balance no strong arguments exist either for or against developing the GAM-87 as a replacement for the GAM-77 on the B-52.

40. Analyses of the capabilities of mixed force postures, discussed in Part III, indicate that the specific degree of hardening for the fixed MINUTEMAN system is not of great significance in the capabilities of the overall force, provided a reasonable degree of hardness is achieved and appropriate separation of the silos is maintained.

41. The above analyses also indicate that once an effective basic force level consisting of the more promising weapons systems is deployed, it does not make much difference whether increments of one system or another are added in the retaliatory role. (Enclosure "A", Figure 17).

*PART TWO: COMMAND AND CONTROL, AND  
RECONNAISSANCE*

42. This part examines some problems common to all the weapons systems and also U.S. capabilities for post-strike reconnaissance in the event of war.

*Command and Control*

43. Analyses discussed above show that the U.S. should be able to generate a strategic force which would constitute a retaliatory capability of high confidence, provided that this force could be launched as assumed in the analyses. Enclosure "C" examines the possible vulnerability of the command and control systems which might reduce the effectiveness of the weapons systems. It was found necessary to include in the study the configuration and workings of the national political and joint military command structures and their interrelationships, because the effectiveness of the weapons control systems might be sensitive to them.

44. This examination shows that the maximum warning time that may be available to the President and the higher command structure varies from about 15 minutes for an ICBM attack to zero for an SLBM attack (against which no warning system is presently programmed; see Enclosure "B"). Thus, it appears that the highest levels of authority could not confidently expect any significant warning time to allow for the decision-making and communication processes. Further investigation indicated that the few protected sites available to the top political and military command could be destroyed by a relatively small missile force. In fact, the number of attacking missiles required may be below the threshold of the BMEWS system. Thus, our present vulnerable command structure is not a high confidence system to assure that atomic release or war execution orders will be transmitted to the retaliatory forces.

45. Enclosure "C" examines ways to alleviate the problems without gross modification of the present national political-Joint Military command structure, but none appears promising.

46. To provide a command and control system adequate for both the pre-attack and transattack period requires a composite structure called a "Coupled Command System." It would consist of:

*a.* A high command structure composed of several fixed command centers—generally similar in number, size and function to present political and military high command centers—to perform required pre-attack command functions (Enclosure "C").

*b.* Coupled to these fixed command centers by communications and nuclear burst sensing systems, one or more continuously manned mobile command center with transattack capabilities for authorization

and direction of a retaliatory attack (Enclosure "C"). Manning for this purpose means manning at the level of political and military authority and responsibility commensurate with the decisions and actions that may have to be taken.

47. The two parts of the system would operate under a doctrine delegating command to the mobile system only when conclusive evidence existed that the fixed sites had been attacked and rendered inoperative. This coupled system could raise enemy weapons requirements to interrupt command by factors of several hundreds or more. However, if both fixed and mobile command systems were rendered inoperative, a previously agreed explicit doctrine could assure a politically authorized retaliatory action, even in the face of large-scale enemy attacks designed to prevent it. Military implementation of the coupled command concept and employment of such an explicit retaliatory doctrine would preserve the utility of the coupled command concept should political manning of alternate transattack command centers prove infeasible.

48. This "Coupled Command System" would, among other things, provide the U.S. with a high confidence capability of initiating retaliatory attacks and provide a necessary element for effective decision-making following the initial strikes.

49. Finally, the study concludes that, although all primary modes of communications with the weapon systems are vulnerable to direct enemy attack, alternate modes of communication, either presently available or possible, could give high confidence that the essential signals, once transmitted by higher command, would be received by surviving strategic forces wherever deployed.

#### *Post-Strike Reconnaissance Capabilities*

50. Enclosure "H" examines the capabilities of our strategic forces for post-strike reconnaissance and armed reconnaissance; it studies, in addition, other technically feasible means of carrying out the reconnaissance role.

51. It is concluded that the U.S. strategic forces are oriented towards a "one-shot" war, and that there would be almost no capability for collecting and coordinating post-strike information. Such post-strike information as might be available would be limited, sporadic, only locally available, and not likely to give a reasonably comprehensive picture of the results of the initial bomber and missile attacks; thus, further action based on reliable information would be precluded. The lack of this capability is not due to technology, since techniques are presently available—e.g., photographic—which can be employed. In addition, other promising reconnaissance techniques, including indirect means of damage assessment, probably could be made available.

52. If a command system is developed which can survive an attack (see previous section), post-strike reconnaissance can provide information required for making decisions concerning prosecution or termination of the war.

53. Armed reconnaissance for attacking unknown or movable targets, though attractive in principle, may be of questionable value because of the time involved in the search phase and the difficulty of developing appropriate sensors for location and identification of potential targets.

54. The speed of an aircraft for either armed or direct reconnaissance does not appear to be of great significance. For armed reconnaissance, high speed may well make target detection, identification and attack more difficult; and for direct reconnaissance, the total mission time, though lower for high-speed aircraft, is generally dominated by the interpretation time, except where flash interpretation suffices.

### *PART THREE: CAPABILITIES OF STRATEGIC FORCES*

55. This part summarizes the capabilities and limitations of strategic forces and some of their implications (Enclosures "A", "I", "J").

#### *Protection of the United States from Damage from a Nuclear Attack*

56. In order to assess the capabilities of the strategic forces in minimizing damage to the U.S. in the event of war, a number of Soviet military postures, all of which appeared reasonable, were assumed. It was further assumed that practically all (90 percent) Soviet fixed missile sites were of known location and could be destroyed by the U.S. in an initiative strike. Analyses indicate that, even in the initiative situation, the U.S., if no protective measures are taken, still would suffer very high levels of population fatalities (greater than 75 percent) except in those cases where the USSR did not deploy weapon systems technologically available to her, i.e., the USSR did not deploy mobile missiles, land or sea, and did not deploy systems capable of being launched on warning. In the context of Soviet initiative attacks, the damage to the U.S. could be, as expected, even greater. It is thus concluded that counterforce alone does not appear to be a high confidence measure for preventing unacceptable levels of damage to the U.S. in the event of war.

57. Other complementary measures, that is, active defenses and shelters, for providing protection to U.S. population and industry, were examined to assess their potential value. It was found that fallout shelters properly used could achieve a significant reduction in casualties but would leave the industrial base vulnerable.<sup>3</sup> Active missile

---

<sup>3</sup> The illustrative fallout shelter program studied in Appendix "D" of Enclosure "A" did not fully exploit the potentialities of shelters. Even then, 35–45% of the population could survive against quite heavy Soviet attacks; these same attacks without shelters would result in almost total destruction of the population.

defenses which meet design goals of the NIKE-ZEUS system could provide some protection for population and industry in local areas but not from fallout from nuclear bursts in undefended areas. Shelters and active defenses are thus mutually supporting. These measures hold promise because they could be effective whether the missile was launched from a fixed site of known or unknown location, mobile or fast reacting, and in either an initiative or retaliatory attack.

58. The above measures—direct attack, active defense of the NIKE-ZEUS type, and shelters—appear to be the only ones presently available to defend the U.S. against a nuclear attack. The cost of implementing these measures will probably be in the tens of billions of dollars. However, by employing technologically feasible countermeasures, e.g., cluster warheads, and increasing its missile force, the USSR can maintain a strong retaliatory posture capable of doing great damage to the U.S. notwithstanding implementation of defense measures.

#### *U.S. Retaliatory Capabilities*

59. Examination of the projected Service programs and other illustrative force postures of lesser cost indicates that the U.S. should be able to maintain a strong retaliatory posture even in the face of threats larger by far than any indicated by intelligence estimates.

60. In 1964 this capability is considerably dependent upon the survival and penetration of a reasonable fraction of the U.S. bomber force; in 1967 the retaliatory capability is much less dependent on bomber survival.

61. It can, thus, be concluded that both the U.S. and the Soviet Union should be able to maintain a retaliatory force capable of inflicting great damage, which cannot be neutralized by the other side without a major technological breakthrough.

#### *Implications*

62. This situation, generally referred to as the “nuclear stalemate,” has a number of implications. Among these are the effects on our allies and the development of means to meet enemy aggression no longer deterred by our strategic forces. These issues are explored in Enclosures “I” and “J”.

63. In brief, with respect to our NATO allies, it is becoming increasingly apparent to them that the approaching stalemate situation will make it unlikely that they can continue to count on the U.S. to provide them protection, through the threat of retaliation, from the kinds of Soviet military aggression most likely to occur. This is largely the reason that the idea of national or NATO deterrent forces has been gaining ground.

64. At the same time, there has been an increasing tendency on the part of some of our allies to question the advisability of allowing

on their territory U.S. forces which might make them subject to Russian attack in the event of war with the U.S. In addition, since these governments may be unreliable when subject to intense pressures in a crisis situation, it may be prudent for the U.S. to reconsider the value of deploying strategic weapons overseas subject to bilateral control when their primary purpose is the protection of the United States.

65. Finally, because the range of applicability of strategic forces will diminish with the stalemate, the U.S. must develop strong military capabilities for meeting those contingencies requiring military action for their resolution heretofore considered deterred by our strategic superiority. These forces should have a character that clearly reveals our own intent to limit the scale of conflict.

66. The strategic forces can implicitly support these forces by deterring the enemy from actions that would tend to expand the conflict, even if such actions were favorable to the enemy in their effects on the outcome of the limited war.

#### *PART FOUR: MEASURES FOR IMPROVING U.S. MILITARY POSTURE RELATIVE TO GENERAL WAR*

##### *Prevention of General War*

67. In view of the extremely high levels of population casualties and loss of resources that would result from general nuclear war the most promising means for protecting the country is to prevent the outbreak of the war. Many measures contribute to this end; only those steps clearly required are mentioned:

*a.* Develop and maintain a retaliatory force that clearly can do high levels of damage regardless of how the war starts. This requires not only a sufficiency of weapons properly deployed but also a high confidence that the force can be launched when desired by receipt of proper authorization. This posture can be achieved by deploying a mix of the types of forces (see Enclosure "A") programmed to be available in the 1964–1967 period and by reducing the vulnerability of the present higher command structure.<sup>4</sup> (See Enclosure "C").

*b.* Reduce the threat of use of strategic forces to issues that can be resolved in no other way. This implies that the U.S. with its allies develop and deploy forces to meet local aggression locally, and in such a manner as to minimize the expansion of the limited war into general war. (See Enclosure "J").

##### *In the Event of War*

68. It must be recognized that, however successful the U.S. is in reducing the threat of general war, there can be no assurance that it

---

<sup>4</sup> In developing this secure retaliatory posture, it is important at the same time to insure that the posture may not lead to accidental war.

will not occur. Hence, it is necessary to consider the more promising measures which might reduce the damage to the U.S. to manageable proportions and might allow the U.S. to prevail. Because present technology has provided the offensive with a variety of measures at far less cost and earlier than their defensive countermeasures,<sup>5</sup> there can be little optimism in achieving these results. (See Enclosure "A"). However, the following measures are presently available for improving the U.S. posture.

*A. Improve Direct Attack Capability—(Counterforce)*

69. *a.* Determine location and characteristics of Soviet weapons, i.e., hardness, reaction time, and improve pertinent characteristics of U.S. Ballistic missiles, i.e., accuracy, yield, reliability.

*b.* Develop armed reconnaissance techniques.

*c.* Improve ASW to counter ballistic missile submarines.

*B. Deploy Active Missile Defenses and Fallout Shelters*

70. Active missile defenses and fallout shelters are potentially promising measures for reducing damage to the U.S. Present limitation of active defenses is their reduced effectiveness against technically feasible countermeasures.

*C. Develop a Post-Strike Survivable Command and Control System*

71. A post-strike survivable command structure coupled with information-gathering systems, i.e., a reconnaissance capability, would be desirable to provide the basis for decision for continuing action.

*D. Post-Strike Forces*

72. Other forces and strategic weapons held in reserve would be desirable to enforce termination of the war and to protect the nation during recuperation.<sup>6</sup>

*Post-1967 Measures*

73. Enclosure "G" briefly describes weapon systems that may become available as a result of advances in technology. Although great improvements are anticipated in the ballistic missile field in terms of accuracy, payload and reliability, and some improvement in airborne

---

<sup>5</sup> Defensive measure here means any measure designed to prevent the impact or reduce the effects of nuclear weapons on the U.S., i.e., counterforce, active defenses, and fallout shelters.

<sup>6</sup> The meaningfulness of these measures would depend on the level of damage that the U.S. had suffered.

vehicles, the advances presently envisaged are not likely to break the approaching nuclear stalemate.<sup>7</sup>

74. The role of long-range aircraft is subject to considerable uncertainties. In the role of attacking known fixed targets, missiles, especially, considering likely improvements in missile technology, will probably be superior to aircraft, particularly where speed of delivery is of military importance.

75. Aircraft will continue to be able to perform functions that missiles cannot.

*a.* Reconnaissance—aircraft (and possibly satellites) can perform this important function.

*b.* Attack of poorly located targets and armed reconnaissance—aircraft have this potential capability, but the effectiveness of this capability may be limited by sensor or equipment performance and by the time involved in locating and identifying targets.

*c.* Re-strike capabilities—aircraft can provide a capability for re-striking targets provided proper facilities and weapons are available.

*d.* Maintain a mixed threat—in the event that ballistic missile defenses become effective, the manned aircraft could continue to pose a retaliatory threat.

76. The above appear to be the major military uses for long-range aircraft in the post-1967 period. The B-70 aircraft probably will be able to exploit these capabilities, though other aircraft of lesser performance could probably also do so. The B-70 does, however, provide for an advance in the state of the art with regard to the speed of aircraft which is of technical value and may be exploited for other purposes, e.g., civil aviation.

77. Though a nuclear stalemate seems to be approaching and likely to remain for a considerable period, it must not be conceived as a static stalemate. Technology is progressing too rapidly to believe that the stalemate cannot be broken. All promising avenues of research which might break the stalemate to our advantage should be pursued vigorously. The nation that can indeed develop, for example, an effective active missile defense even in the face of countermeasures will be well on the way to achieving strategic superiority.

---

<sup>7</sup> This stalemate probably holds for satellite systems capabilities in this same time period.

**232. Memorandum from Gen. Lemnitzer to Clifton, March 3<sup>1</sup>**

March 3, 1961

SUBJECT

Development of Counter-Guerrilla Forces

1. As a result of the President's request to the Secretary of Defense that the matter of placing more emphasis on the development of counter-guerrilla forces be examined, I am attaching a copy of the Joint Chiefs of Staff long-range program for developing a sound counter-guerrilla capability.

2. Although the Secretary of Defense has given his approval to my furnishing you a copy of this study, I would like to emphasize that he is receiving his copy simultaneously with the delivery of the one attached and hence has not had time to study in detail, much less to act upon, the program.

**L.L. Lemnitzer**

*Chairman*

*Joint Chiefs of Staff*

**Attachment**

**Memorandum for the Secretary of Defense**

JCSM-126-61

SUBJECT

Development of Counter guerrilla Forces (U)

1. Reference is made to the memorandum by the Secretary of Defense, dated 10 February 1961, requesting the Assistant Secretary of Defense (International Security Affairs) in consultation with the Joint Chiefs of Staff to examine the means for placing more emphasis on the development of counter guerrilla forces.

2. Foreseeing the threat of communist-inspired guerrilla movements, the Joint Chiefs of Staff received approval on 12 October 1960, for the implementation of JCSM-404-60, subject: "Counter guerrilla

---

<sup>1</sup> Transmits copy of JCS memorandum to Secretary McNamara on developing a counter-guerrilla capability. Secret. 5 pp. Kennedy Library, National Security Files, Departments and Agencies File, Spec. Warfare.

Training Provided Under the Military Assistance Program”, dated 15 September 1960. Since the objectives of this program have largely been met or are in various stages of implementation, the Joint Chiefs of Staff consider that the time is appropriate to make further recommendations on a long-range program to counter this communist-inspired guerrilla threat, both with respect to the US Armed Forces and the indigenous armed forces of friendly and neutral foreign countries which have a MAAG or Military Mission.

3. As a basis for recommendations, an examination has been made of the requirements essential to the development of a sound counter-guerrilla capability. This examination has revealed the existence of the following key military components of an effective counterguerrilla program:

- a. Instructional materials.
- b. Schools.
- c. Troop basis of US Armed Forces.
- d. Training of US Armed Forces.
- e. Equipment.
- f. MAAGs and Missions advisory personnel.
- g. Force structure of indigenous armed forces and other internal security forces.
- h. Training of indigenous armed forces and other internal security forces.
- i. US military contingency plans.
- j. Country Team counterinsurgency plans.
- k. Interdepartmental responsibilities.
- l. Orientation of key civilians.

4. The Joint Chiefs of Staff have taken, or are taking, actions as listed below in order to increase the emphasis on counterguerrilla operations.

- a. Acceleration by the Military Services of programs now underway for preparing, publishing and distributing instructional materials on counterguerrilla tactics and techniques.

- b. Inclusion of instruction in counterguerrilla warfare in appropriate courses at Military Service Schools.

- c. Emphasis on existing counterguerrilla courses to insure that quotas are filled and that qualified students, both US and foreign, are being nominated on a basis of need in their present assignments and over-all value to their armed forces.

- d. Establishment by CINCARIB of a course in counterguerrilla tactics and techniques to commence on or about 1 July 1961, and expansion of current training activities of USCINCEUR and CINCPAC to

include courses in counter guerrilla tactics and techniques in order that greater numbers of US and foreign military students of friendly or neutral countries may receive this instruction.

e. Examination of the troop basis of US Armed Forces to insure an adequate capability in all types of units required in counter guerrilla operations or in rendering training assistance to other countries.

f. Inclusion of instructions in counter guerrilla operations in the training programs of combat and combat-support units of the US Armed Forces, as considered appropriate by each Military Service.

g. Continuation of present programs for development of special equipment for counter guerrilla training and operations.

h. Increased emphasis and expansion of the current program which requires that selected US military advisory personnel be qualified or attend an appropriate course of instruction in counter guerrilla warfare, psychological operations, civil affairs, intelligence, counterintelligence or troop information prior to departing CONUS for assignment with a MAAG or Mission in a foreign country with actual or potential insurgency.

i. Review of the force structure of indigenous armed forces in all countries with an existing or potential insurgency threat by MAAGs/ Missions and/or unified commands to insure that appropriate consideration has been given to psychological operations, civil affairs, intelligence, counterintelligence, troop information and public affairs, as well as combat and combat-support units. Appendix A hereto is an estimate based on current information of the friendly and neutral foreign countries in which a communist-inspired guerrilla movement is most likely to develop, and the reasons therefor.

j. Training in counter guerrilla tactics and techniques for indigenous armed forces of friendly and neutral countries in which an actual or potential insurgency threat exists.

k. Review of US military contingency plans to insure that counter guerrilla operations are included, as appropriate.

5. In addition to the military program outlined above, there is a very significant nonmilitary aspect of this problem. A review of case histories reveals that communist-inspired guerrilla movements are the result of long preparation within political, economic and sociological fields. It is essential that US Governmental agencies abroad understand the tactics of this development so that adequate countermeasures can be taken. In this connection there is a need for clarification, both at the Washington and Country Team levels, of interdepartmental responsibilities for advising and assisting indigenous armed forces and other internal security forces in counter guerrilla training and operations. If this is not done, the most effective counter guerrilla military program

that can be devised will not suffice to prevent the development of guerrilla movements. Accordingly, a need exists to educate US personnel in civilian agencies and the civilian agencies of potentially threatened foreign governments in the communist method of developing guerrilla movements. Therefore, the Joint Chiefs of Staff specifically recommend that the following matters be discussed with other US Governmental agencies and agreement reached to:

a. Develop country counterinsurgency plans for all countries with an existing or potential insurgency threat.

b. Extend counterguerrilla training to include training for internal security forces and police in countries having an insurgency threat.

c. Clarify the responsibilities of the various US Governmental agencies in advising and assisting foreign governments in counterguerrilla training and operations, at both the Country Team and Washington levels, to insure that proper emphasis is placed on counterguerrilla training for both military and internal security forces.

d. Educate and orient appropriate US civilian personnel on the nature of the guerrilla threat and how to combat it.

e. Insure that training of all indigenous military or paramilitary forces should be a Department of Defense responsibility. ICA responsibility should be limited to US type city or state police functions.

6. Appendices B and C are forwarded for your information. It is recommended that all three Appendices be forwarded also as attachments to your report on this subject when submitted to the President.

For the Joint Chiefs of Staff:

**L.L. Lemnitzer**

*Joint Chiefs of Staff*

April 1961

233. National Intelligence Estimate, NIE 11-61, April 6<sup>1</sup>

April 6, 1961

PROBABLE INTELLIGENCE WARNING OF SOVIET ATTACK  
ON THE US

THE PROBLEM

To estimate the advance warning of Soviet initiation of general hostilities against the US which could be provided by intelligence, focusing on the period between the present and about 1963.

ASSUMPTION

For purposes of this estimate, it is assumed that during the period under consideration no US-Soviet agreement on arms control or system of mutual inspection will be in effect.

SCOPE

The warning of Soviet attack discussed in this paper is that which intelligence might be able to give prior to the actual launching of an attack. We do not discuss warning which might be obtained from US or allied early warning radar or other tactical detection devices, such as devices to detect ballistic missiles in flight. Nor do we discuss the possibility of obtaining chance warning from sources such as weather stations, military and commercial aircraft, or naval and commercial ships at sea whose primary mission is not warning. The possibility that the USSR might resort to an ultimatum and thus itself warn of attack in the event of a rejection is also excluded from consideration.

The warning estimate is made in the light of our current estimates on Soviet strategy and present and future Soviet military strengths, especially NIE 11-4-60, Chapter IV and Annexes. It takes into account the detailed findings of the Warning Systems Survey Committee of the United States Intelligence Board.

CONCLUSIONS

1. Direct access to the proceedings of the highest level Soviet decision-making bodies is not now available to US intelligence and may

---

<sup>1</sup> "Probable Intelligence Warning of Soviet Attack on the United States." Top Secret. 22 pp. CIA Files, Job 79R01012A, ODDI Registry.

never be achieved. Hence, the warning problem is one of collecting indirect evidence, largely fragmentary in nature, and of interpreting it in order to reach judgments about the USSR's intended course of action. Any warning given by intelligence would be the end product of a process of reasoning from incomplete evidence. It would represent a judgment of probability rather than an unequivocal warning of Soviet intent to attack.

2. If the USSR decided to attack the US, the varied preparations preceding such an attack would almost certainly include some activities susceptible of detection. The number and variety of indications obtained and recognized, and therefore the certainty with which a warning judgment could be made, would be affected by the scale and pace of Soviet preparations, the success of Soviet security measures, and many other variables—including fortuitous elements which cannot be anticipated in advance. Intelligence would evaluate these indications in relation to other concurrent Soviet activities and to the international political context within which they occurred, in an effort to determine whether the Soviet intention were to attack, to threaten, to deter, or to be ready to defend and retaliate.

3. We believe that the Soviets would feel it essential to strike a balance among the objectives of achieving surprise, delivering an attack of great weight, preparing to defend against retaliation, and preparing to recuperate and carry on the war. Many preparations and activities, especially those associated with defense and recuperation, might be detected well in advance of an attack but would be subject to considerable ambiguity as to Soviet intent and as to the timing of a possible attack. Last-minute preparations to launch an attack could permit more specific warning but would be less likely to be available in time.

4. With respect to Soviet preparations to launch intercontinental striking forces against the US, our ability to obtain warning is limited and declining:

*a.* At the present time, there is virtually no chance that intelligence would be able to provide advance warning of Soviet use of ground-launched ballistic missiles in an attack. Intelligence capabilities to derive warning from preparations by Soviet ballistic missile forces may improve somewhat, but given foreseeable obstacles we believe they will remain very poor.

*b.* If the USSR prepared to launch a massive bomber attack—involving, say, 500 heavy and medium bombers and tankers—the chances are better than even that some aspects of an operation of this size would be detected in time to provide a degree of warning before the Soviet bombers arrived at North American radar warning lines. However, intelligence could probably not provide warning if the Soviets undertook a highly secure operation to launch a reduced force of, say, 150–200 bombers and tankers.

c. The chances of obtaining warning from preparations by long range bomber forces will decline, in part because of continued improvements in Soviet security over air operations, but primarily because the growth of Soviet missile capabilities will shift the main strike role away from bombers.

d. We believe that under normal US readiness conditions and surveillance, there is some chance, although small, that a general departure into the open seas of Soviet submarine forces large enough to include all presently operational missile submarines would be detected in numbers sufficient to cause additional alert measures. There would be a fair chance that such forces approaching US coasts could be detected, perhaps a few hours or a day before the submarines reached missile launching points. A prior alert would raise the chances and increase the timeliness of any warning given.

e. US techniques for submarine detection, identification, and surveillance will probably improve, thus increasing the chances of deriving warning indications from the movements of currently-operational types of Soviet missile submarines. On the other hand, warning capabilities would be considerably less against Soviet nuclear-powered missile submarines employing 500–1,000 n.m. ballistic missiles.

5. In a period of international tension preceding a Soviet attack, intelligence might be able to give successive preliminary warnings which would have a cumulative effect. Even if such warnings contained no firm conclusion as to Soviet intentions, they could provide the basis for critical decisions regarding US political, military, and intelligence actions. The last of these might include decisions to undertake exceptional collection measures which could in turn increase the certainty of the warning judgment.

6. Considering all the factors affecting the problem of warning, we believe that in most circumstances of an actual Soviet decision to attack at present or in the near future, intelligence could give warning of increased Soviet readiness, and could infer a *possible* intent to attack, perhaps a few days or more before the attack. Warnings of a *probable* Soviet intent are likely to be given, if at all, only a few hours before attack.

7. There is little prospect over the next few years for any major improvement in the firmness or explicitness of the warnings which might be given. Improvements in intelligence techniques will be offset by a decline in the number and accessibility of dependable military indicators as missiles gain in importance and general Soviet readiness gradually rises. But unless there is a drastic change in Soviet strategic thinking or the Soviets acquire an assured capability to knock out US retaliatory forces in a single missile attack, the possibility of warning from physical preparations will not disappear. Indeed, the limited time

between initial attack and potential retaliation would virtually force the Soviets to undertake various preparations, including those for defense and recuperation, prior to launching an attack.
