8. In the future, however, along with indications of physical preparations, intelligence will have to place additional reliance for warning on the more ambiguous indicators not directly related to physical preparations. The international political context will assume a larger role in the warning problem. Depending on the circumstances, analysis of the political context could strengthen or impede the warning judgment. In some cases, the first preliminary warning of possible Soviet attack might arise from a judgment that the USSR was about to take a political initiative involving great risk of war with the US, or that a crisis was developing in such a way as to prompt the USSR to prepare for war.

## DISCUSSION

### *NATURE OF THE WARNING PROBLEM*

9. The ideal contribution of intelligence to the defense of the US against a Soviet attack would be the communication to US decision-making officials of clear and unequivocal warning that the USSR intended to launch an attack at a specific future time and in a particular manner, this warning to be delivered to decision-makers far enough in advance to permit them to decide upon and take effective counter-measures. To approach this ideal standard, intelligence would need to have prompt and direct access to dependable sources of information on the proceedings of the highest level Soviet decision-making bodies, or at least to their means of transmitting decisions to immediately subordinate echelons. Such access does not exist at the present time and may never be achieved.

10. In these circumstances, which have obtained throughout the period of US-Soviet confrontation, any warning given by intelligence must derive from the collection and evaluation of evidence on Soviet activities and behavior. Given the considerable effort by the USSR to prevent the collection of vital information about its military capabilities and preparations, even indirect evidence of Soviet intentions will always be incomplete. Nevertheless, were the USSR to prepare to attack the US, the varied preparations which would be undertaken would almost certainly yield discrete items of information susceptible of collection by one or more channels of intelligence acquisition. These items of information would not necessarily establish a Soviet intention to attack, inasmuch as they might also be consistent with an intention to threaten, to deter, or to be ready to defend and retaliate. Thus the warning problem becomes one of collecting indirect evidence, largely fragmentary in nature, and of interpreting it in order to reach judgments about the USSR's intended course of action.

11. To cope with the warning problem in these terms, the intelligence community has developed over the years techniques for collecting, evaluating, and correlating indications derived from Soviet activities and behavior. This effort has included attempts to determine what general and specific preparations the USSR might make prior to initiating hostilities, to identify those preparations most susceptible to detection by intelligence, to direct collection assets towards promising sources of information, and to establish special channels for the rapid transmission and dissemination of information which may be pertinent to the warning problem. This effort is guided by the United States Intelligence Board; substantive continuity is maintained by the Watch Committee of the USIB and by its staff in the National Indications Center.

12. Through these mechanisms, a considerable capability for collecting and evaluating information has been focused on the warning problem. A fair understanding of the norms of Soviet behavior has been acquired, and a high degree of expert knowledge can now be applied to the problem of discerning apparent abnormalities which might signify Soviet preparations for war. However, because of the impossibility of predicting in advance precisely what abnormalities would become apparent should the Soviets decide to attack, warning could never be derived automatically from existing or improved mechanisms. It would always be the end product of a process of reasoning from incomplete evidence, and would therefore be a judgment of probability rather than an unequivocal warning of Soviet intent to attack.

13. Such a judgment would rest in part upon a weighing of indications of Soviet physical preparations. These indications might be found in any or all of a wide variety of categories, ranging from specific Soviet preparations to ready the long range striking forces to very generalized preparations to increase the ability of the Soviet productive base to withstand the effects of US retaliation. To date, it is in this area of physical activities that intelligence has best been able to maintain surveillance and to recognize abnormalities in Soviet behavior. Despite the capability intelligence has developed to acquire and weigh evidence of Soviet physical activity, however, any attempt to derive a warning judgment from physical preparations is subject to serious limitations.

14. Physical preparations undertaken some time before the initiation of war would offer the longest potential lead-time for warning, but in most cases only the most generalized conclusions about Soviet readiness could be drawn from them and no conclusions could be drawn as to the pace and timing of the activities. Indications of last-minute Soviet preparations would be much more significant but many of these final preparations would be undertaken so close to the launching of the attack that there would be very little time to obtain the

information, to assess it, and to communicate warning to decision-making officials. Hence, the most specific warning which might be given by intelligence on the basis of Soviet physical preparations would probably be the least timely.

15. In addition to physical preparations, intelligence might acquire evidence of Soviet activities which did not in themselves increase military readiness but which the USSR might undertake prior to the initiation of hostilities. Examples are abnormally heavy censorship measures, changes in clandestine agent operations, urgent and simultaneous recall of key Soviet personnel in Western countries, and unusual restrictions on foreign nationals in the USSR. While such evidence might strengthen the warning derived from analysis of military preparations, it would not provide a convincing basis for warning in the absence of indications of increased readiness to attack. Finally, and most important, there is virtually no single preparation, activity, or combination of these which would establish conclusively that the USSR actually intended to attack.

16. In reaching a warning judgment, intelligence would evaluate physical preparations and other activities in the context of the Soviet political posture. This context has to do with the way in which the USSR is conducting its international affairs at any given time: the vigor of its challenge to the West over various issues, the apparent degree of commitment of the Soviet leaders to various positions, and the political climate in high Soviet and Bloc circles. The political context introduces more evidence but also new complications to the warning problem. Soviet foreign policy initiatives, actions, and positions are themselves often difficult to interpret. The possibility exists that interpretations of the USSR's intentions based on its political posture would impede or confuse the attempt to arrive at a warning judgment based on physical preparations. On the other hand, analysis of the political context can serve to strengthen the warning judgment. This analysis is becoming more important to the warning process as Soviet military capabilities grow and reaction times are compressed, and as the USSR engages the West politically over a wider range of issues and geography.

17. It is evident from the foregoing considerations that any warning given would be neither complete nor unequivocal. The more indications collected and recognized by intelligence, and the more comprehensive the picture of Soviet capabilities and behavior available to intelligence, the better would be the basis for judging the Soviet course of action. But the sum of the available indications and knowledge would almost certainly be inconclusive as to Soviet intentions. Therefore, even under the most favorable circumstances, intelligence could only arrive at a judgment that the probability of Soviet attack was high. Some indication of the form, scale, or time of attack might be ascertained

from the character and pace of Soviet preparations, but here too there would be uncertainty in some respects.

18. Warning can perform a useful function even where attack cannot be predicted with complete certainty. Warnings of lesser degrees of certainty may be given in such a way that they have a cumulative effect. Such successive warnings, even if they did not permit a firm conclusion that the USSR intended to attack, might still provide a basis for critically important political, military, or intelligence decisions. They might be adequate, for example, to justify undertaking diplomatic moves to cope with a developing crisis, placing US military forces at one or another stage of alert, or invoking special intelligence collection measures. Such actions might lead the USSR to change its intentions concerning attack, and this in turn would presumably produce indications which might cause intelligence to modify its previous warnings.

19. The process of warning is complete only when warnings given by intelligence are accepted as valid by decision-making elements of government. Intelligence must be able to earn credibility for its warning judgments. It must therefore make as complete as possible a showing of evidence, including consideration of possible alternative interpretations, to substantiate whatever warning is given. A warning judgment which did not carry conviction to responsible policy officials could be as much an intelligence failure as no warning at all.

#### VARIABLES AFFECTING THE WARNING PROBLEM

20. One of the most important variables affecting the warning problem is the international situation obtaining at the time of a Soviet decision to attack: such a decision could be taken in a period of comparative international calm or in a period of heightened international tension, perhaps occasioned by local hostilities. Other major variables, related in some degree to the level of international tension obtaining, are the level of intelligence alert prior to the initiation of the Soviet attack, the nature of the Soviet preparations, and the nature of the Soviet attack itself. These factors would have bearing not only on the chances of intelligence warning, but also on the specificity and timing of the warning which might be given.

##### *Soviet Decision in a Period of Calm*

21. It is possible to envisage a firm Soviet decision to attack the US, made at a time well in advance of the launching of the attack. A decision of this nature might be made if the Soviet leaders concluded that they had acquired a military superiority over the US so decisive as to permit them to defeat the US without receiving unacceptable damage in return, or if they concluded that the US was planning an eventual attack on the USSR and that their best chance of survival lay

in attacking first. The Soviets' assessment of the world balance of forces at present and over the next few years, as we have estimated it elsewhere, is unlikely to lead them to either of these conclusions.<sup>2</sup> However, they could conceivably reach the former if they achieved some technological breakthrough in a critical military field, and the latter if they acquired intelligence which convinced them that the US intended to attack.

22. A firm decision made well in advance would enable the USSR to take a long period to prepare, probably under conditions of maximum secrecy and possibly accompanied by large-scale efforts to deceive the US as to Soviet intentions. On the other hand, it would give the US intelligence community time to collect a broad range of indicators which might progressively assume a meaningful pattern. Initially at least, such preparations as were detected would probably not have an emergency character and would probably be regarded as a normal development of Soviet military capabilities. At some point in the course of these preparations, however, the Soviet actions might be recognized by intelligence as clearly at variance with normal patterns of activity and development of capabilities. Such recognition might stem from analysis of the preparations themselves, or from the discovery of unusual Soviet secrecy or deception attempts. This would alert intelligence and would cause it to re-examine the accumulated indicators. As the time of attack approached, actions of a last-minute character might be observed which would increase our ability to give warning.

23. We can also conceive of a Soviet decision to attack on very short notice, also in the absence of any external atmosphere of rising tensions. Such a decision might be a desperate attempt at pre-emptive attack, arising from false or misinterpreted information leading the Soviets to conclude that the US was attacking or preparing imminently to attack the USSR. While we doubt that such a circumstance would ever actually arise, we cannot exclude it.<sup>3</sup> Nor can we completely exclude a similar short-notice decision arising from some irrationality within the top Soviet leadership. In cases of this sort, minimal Soviet preparations would ensue and the time available for their detection

---

<sup>2</sup> See NIE 11–4–60, "Main Trends in Soviet Capabilities and Policies, 1960–1965," dated 1 December 1960 (TOP SECRET) paragraph 9. It should be noted that the Assistant Chief of Staff, Intelligence, USAF, dissented to that paragraph. He believes that the evidence of offensive missile and bomber production and deployment shows a definite intent by the Soviet rulers to achieve a clear military superiority at the earliest practicable date. He feels we are entering a very critical 24 month period in which the USSR may well sense it has the advantage. The Soviet leaders may press that advantage and offer the US the choice of war or of backing down on an issue heretofore considered vital to our national interests.

<sup>3</sup> See NIE 11–4–60, "Main Trends in Soviet Capabilities and Policies, 1960–1965," dated 1 December 1960 (TOP SECRET) paragraph 90.

would be very short. The chances of warning might rest heavily on the possibility that the Soviet forces designated to carry out the attack, themselves surprised, would fail to exercise appropriate security measures. Nevertheless, if detected and correctly interpreted, last-minute Soviet preparations for a sudden attack would lead intelligence to communicate any warning judgment with a great sense of urgency.

*Soviet Decision in a Period of Tension*

24. Between the two situations we have just discussed, there is a wide range of considerably more likely circumstances under which a Soviet decision to attack might be taken. These involve Soviet responses to international crises and local conflicts which neither the USSR nor the US originally intended should lead to general war. The Soviet leaders might decide to attack because they believed that an actual or threatened intervention in the USSR's sphere of vital interest could not be countered by limited means. Or they might conclude that the USSR had become engaged beyond retreat in some area where the Western Powers would be prepared to risk general war. In either case, the Soviet leaders might decide that general war and all that it involved was preferable to submitting to a serious reversal and that it would be to their military advantage to attack first.

25. In this situation the decision to attack would be accompanied by some degree of political tension, perhaps a very high degree, which could in itself give rise to preliminary warning. However, the time period over which a crisis reached an acute stage could vary considerably, and this would affect the ability of intelligence to assemble a meaningful pattern of indications. If the crisis developed over a brief period of time, and if Soviet military readiness was already advanced or if the Soviet leaders decided to attack with only minimum preparations, the indications obtained might be few. If, on the other hand, the USSR took a certain amount of time to prepare and position its forces, further and more specific warning might be obtained from the pace and nature of the Soviet preparations.

26. It is also possible that in a local crisis the USSR would decide to engage US or allied forces locally while hoping to avoid general war. This course of action would rest on a calculation that Soviet objectives could be achieved by a limited application of force and that the US would be deterred from initiating an attack on the USSR itself. There would clearly be great danger that such a situation could develop into general war. The Soviet leaders would have to recognize that the US might conclude that expansion of hostilities was inevitable and therefore itself seize the advantage of launching the first attack in a general war. Faced with this possibility, they might at some point decide to launch such an attack themselves. In the given circumstances,

Soviet forces would presumably be close to full readiness and maximum security precautions would be in effect. A certain degree of intelligence and military alert in the US would also obtain. Warning of Soviet intent to expand the local conflict into a general war might be inferred from, among other indicators, those giving evidence of Soviet preparations of a scale, character, or location at variance with those required for the local engagement in progress.

27. The period of rising tension attending an international crisis or local war would in itself constitute warning of an increasing likelihood of Soviet attack, but in such a period intelligence might have its greatest difficulty in attempting to determine Soviet intentions. A period of tension would bring intelligence to a high degree of alertness and perhaps lead it to take exceptional measures to collect information about Soviet activities. In analyzing Soviet activities, intelligence would have to recognize that the USSR might be carrying out military preparations, not on the basis of a firm decision to initiate general war, but for purposes of intimidation or in order to increase its defensive readiness and its ability to retaliate should the US attack. It is also possible that Soviet preparations for war might be undertaken because of a misinterpretation of US policies and actions, by which the Soviet leaders considered that they were about to be forced into general war, against their real desire. The importance of a correct US estimate on this point would be very great, yet it would be particularly difficult to make such an estimate during a period of rising tension.

28. Analysis of the significance of the USSR's political and propaganda activities would be very difficult. Most such activities undertaken preparatory to attack on the US might not differ greatly from those which could be expected in any period of heightened tension. Such activities could in themselves be interpreted as defensively motivated or as part of a war of nerves, and they would thus not establish that the USSR had the intention to attack. However, taken in conjunction with other kinds of indications, they might enable intelligence to give warning with a greater degree of certainty.

#### *Level of Intelligence Alert*

29. One significant effect of a period of tension as it applies to the warning problem would be the effect on the intelligence community itself. Since warning is a product of judgment, there are variable human factors which must be taken into account. Alertness would vary depending on the manner in which the crisis developed, its intensity, and duration. There are many ways in which the alertness and effectiveness of intelligence increases under crisis conditions. For example, field reporting and intelligence analysis become sharply focused on the crisis situation, new sources of information held in reserve for such situations

are put into use, resources of the intelligence community are more closely integrated to deal with the crisis, and intelligence is increasingly disposed to consider whether current evidence indicates hostile intent. On the other hand, in the event of a long sustained crisis involving a high degree of tension, key personnel would be subjected to fatigue and strain. If at one stage or another apparently mistaken warning judgments had been made, undue caution might come into play.<sup>4</sup>

30. Once a crisis situation arises, the volume of reports increases and their reliability on the whole declines, thus confronting intelligence with a large number of ambiguous reports from inadequately identified sources of uncertain reliability. There is also an increase in the number of reports from sources of known reliability, some of which sources come into play as a result of a crisis situation. In these circumstances, communications channels may be overloaded, with resulting delays in the transmission and receipt of information. However, it is not possible for intelligence to suspend judgment until more complete and satisfactory evidence becomes available. Under the pressure of time in a developing crisis, the intelligence warnings given may be less reliable or more tentative.

31. Intelligence could employ emergency collection procedures under conditions of crisis in order to improve the quantity and quality of information available. Special reconnaissance measures could be directed against Soviet controlled territory. Agents held in reserve for such a situation could be activated. Some exceptional measures would provide information, possibly of great value, on Soviet capabilities and readiness, and inferentially perhaps on Soviet intentions to attack. Some measures in this category, in particular air penetrations, could have the effect of increasing tensions or even of precipitating Soviet attack. For intelligence to employ them would require policy decisions; these might or might not permit their use and would in any case cause delay.

#### *Nature of Soviet Preparations and Attack*

32. Because we are without access to Soviet war plans, intelligence cannot know in advance what precise preparations the Soviets would consider essential before launching an attack against the US, or what the precise form and scale of the attack would be. This means that even if intelligence had complete knowledge of all Soviet physical preparations, we could not conclude that when a particular level of

---

<sup>4</sup> It is possible that preliminary warnings would result in US precautionary measures which would lead the USSR to cancel or postpone a planned attack. In this case, what appeared to be a mistaken warning would in fact have been a correct one. Intelligence might have accomplished its warning mission, yet not be able to demonstrate that it had done so.

readiness had been attained the Soviets considered themselves fully prepared for war; conversely, we could not say categorically that because some one type of preparation had not yet been accomplished the Soviets considered themselves unprepared. Beyond this, many specific elements bearing on the character of a Soviet attack and affecting the warning problem could not be estimated with certainty. Examples are: how much of the Soviet military establishment would be alerted prior to an attack on the US? Precisely what delivery systems would be used in what quantity in such an attack? What forces would be allocated to targets in the US as opposed to targets elsewhere? What preparation for defense and recuperation would be undertaken prior to launching an attack? Over the years, however, we have accumulated enough knowledge of Soviet thinking about military strategy to narrow somewhat the range of likely alternatives:<sup>5</sup>

*a.* First, it is clear that the Soviets regard surprise as a military factor of great importance. The USSR would therefore take extreme precautions to prevent the US from learning about a forthcoming attack. Soviet security, already tight, would be intensified and possibly augmented by strenuous attempts to deceive the US as to Soviet intentions and preparations. Many preparations might be dispensed with in the interests of achieving surprise. But in balancing the advantages of various factors, the Soviets will also take into account the great importance of delivering a significant weight of attack, preparing to defend against US retaliation, and preparing for national recuperation.

*b.* Second, Soviet military doctrine envisages a general war as extending beyond the first nuclear exchange, and as including subsequent major land campaigns and naval warfare. The Soviets regard broad military, economic, and human resources as important determinants in the outcome of such a war. Thus in preparation for an attack on the US, the USSR would be constrained to undertake a variety of activities, not directly related to that attack but calculated to preserve vital military and other strengths for phases subsequent to the initial nuclear exchange.

*c.* Finally, in planning an attack on the US the Soviets would have to consider the great variety and widespread dispersal of US and Allied nuclear delivery capabilities. They could not contemplate an attack against US territory alone, but would need also to prepare for coordinated operations against US and Allied overseas nuclear delivery bases and nuclear delivery forces at sea.

---

<sup>5</sup> See NIE 11–4–60, “Main Trends in Soviet Capabilities and Policies, 1960–1965,” dated 1 December 1960 (TOP SECRET) Chapter IV.

33. The variety of preparations undertaken, forces and tactics employed, and scale and weight of attack could range very widely within the broad limits set forth above. The indications obtained by intelligence would consequently vary in frequency, number and kind, and would have to be analyzed in terms of alternative hypotheses as to the precise form and scale of the initial Soviet attack. In many instances, intelligence could probably only point to the various types of attacks the USSR could be preparing to launch, although it might be able to provide a tentative judgment as to the more likely alternatives. Nevertheless, the foregoing discussion serves to illustrate that there is a wide variety of potential sources of warning indicators, any or all of which could serve in combination to provide a basis for the warning judgment.

#### WARNING FROM CERTAIN SOVIET PREPARATIONS FOR WAR

34. In this section we discuss the ability of the intelligence community to derive warning of Soviet attack on the US from various types of preparations the USSR might undertake: preparations for attack by long range striking forces, for clandestine attack, for operations by theater and naval forces, and for air and civil defense, as well as certain other preparatory activities designed to increase the general level of national readiness. In evaluating the significance of these various types of preparations, we must consider not only the ability of intelligence to detect them and the time necessary to recognize and evaluate them, but also the likelihood and timing of their occurrence and their validity as indicators of Soviet intentions. The analysis reflects our judgment that, in preparing for an attack on the US, the Soviets would try to strike a balance among the desirable objectives of achieving surprise, delivering an attack of great weight, preparing to defend against retaliation, and preparing to recuperate and to carry on the war. We regard this judgment as applicable to most circumstances in which the USSR might decide to attack, but as indicated in earlier paragraphs, there are conceivable circumstances which would alter our warning capabilities considerably.

35. In the discussion which follows, we have isolated the various types of preparations and activities the USSR might undertake so that we may assess our ability to derive warning indications from them. This procedure has elements of artificiality. It obscures the interrelationship among all types of indications arising from the likelihood that a very broad range of Soviet preparations and activities would be under way simultaneously, and it disregards the effect of analysis of the political context. In general, therefore, the degree of certainty with which the warning judgment could be made is likely to be greater than that implied by the following assessment of certain types of preparations and activities in isolation.

*Preparations for Attack by Long Range Striking Forces*

36. Our ability to derive warning from preparations by long range striking forces (ground-launched ballistic missiles, long range bombers, and missile submarines) is limited. Furthermore, this ability is declining as the attack role shifts increasingly to ballistic missiles, and as bomber forces increase the security of their operations and raise the level of their peacetime readiness. In addition, the more revealing indications pertaining to long range striking forces would be generated only a short time before an attack. On the other hand, if last-minute preparations by these forces were detected, they would probably be good indicators of Soviet intentions and could provide highly specific conclusions as to the likely time of attack.

37. *Ground-Launched Ballistic Missiles.* At the present time, intelligence has no means of providing advance warning of the use of ballistic missiles in an attack. To approach such a capability, we will have to identify operational units and their means of command and control, and also achieve an understanding of the operational concepts underlying the deployment and state of readiness of these forces. Even if we succeed in these tasks, our warning capability will remain severely limited by the very nature of the ballistic missile weapons system. It is probable that Soviet ICBMs could be ready for firing after preparations lasting a few hours at most, and that these preparations would involve very little movement or other noticeable activity.

38. There is a possibility that medium range ballistic missiles would need to be deployed forward into the Satellites or closer to Soviet borders in preparation for coordinated attacks against Western retaliatory bases and other strengths in areas peripheral to the Bloc. Such forward deployment need not be undertaken by the Soviets, however, and even should it occur it would probably require no more than a day and would be very difficult to detect because of our imperfect knowledge of the present locations of such units, the routes of movement they would employ, and the nature of the prepared launch sites they would require, if any. In sum, there is virtually no chance of obtaining indications of preparations by ballistic missile units at present.

39. *Long Range Bombers.* In any attack on the US at present or in the next few years, it is almost certain that the entire Soviet force of heavy bombers and tankers would be committed to operations against North America.<sup>6</sup> It is probable that some portion of the medium bomb-

---

<sup>6</sup> Soviet operational strength in heavy bombers and tankers, as of mid-1961, is estimated at about 150 aircraft. Medium bombers and tankers are estimated at about 950 in Long Range Aviation and about 380 in Naval Aviation. The Assistant Chief of Staff, Intelligence, USAF, estimates the number of heavy bombers and tankers at about 175 and the number of medium bombers and tankers in Long Range Aviation at about 1,000.

ers and tankers of Soviet Long Range Aviation would also be so committed, with the remainder allocated to targets peripheral to the Bloc. Medium bombers of Soviet Naval Aviation, equipped for the most part with antiship missiles, would probably also participate in initial Soviet operations by seeking out and attacking Western carrier task forces at sea. The levels of training and readiness of these bomber forces have improved considerably in the past few years, but it would probably still require a week or 10 days to bring this entire force of roughly 1,500 aircraft to peak readiness and to accomplish whatever redeployment was necessary prior to attack.

40. If the Soviets engaged in such a maximum effort, it would involve increased and abnormal flight activity, intensified maintenance activities, urgent logistic preparations, and possibly the preparation of special weapons. The Soviets would take strenuous measures to maintain security in these activities. Nevertheless, evidence of such activities would probably be detected in increasing quantity during the days preceding an attack, thus increasing the opportunities for intelligence to derive warning indications from their accumulation.

41. The chances of obtaining indications of the foregoing type remain good at present, although they have been materially reduced over the past year as separate, cross-checkable sources of information on these forces have diminished. Moreover, the interpretation of indications could not always be definite and specific, especially in a time of international tension. (In several past crises, most notably during the Iraq-Lebanon crisis, the Soviets placed their bomber forces on increased alert, presumably as a deterrent to the West and in preparation for the contingency of war.) However, the knowledge that the readiness of these forces was being increased could provide the basis for a preliminary warning which might be given a few days prior to a Soviet attack.

42. Increasing Soviet security has considerably degraded our ability to achieve timely detection of flights to Arctic staging bases, on which intelligence has heretofore placed great reliance for warning of attack on the US. Our expectation that the USSR would stage bombers through Arctic bases in such an attack rests on several considerations:

*a.* Long Range Aviation training exercises frequently involve small-scale flights by medium and heavy bombers from home bases in Western, Southern, and Far Eastern USSR to bases in the Kola Peninsula, the Central Arctic, and the Chukotsk Peninsula. Some bases in these latter areas are apparently maintained for temporary use by bombers of Long Range Aviation; two Arctic bases are known to have nuclear weapons storage facilities.

*b.* The range of the BISON jet heavy bomber is marginal for operations against the US. Refueled BISONs could conduct two-way operations against some targets in the US directly from home bases, landing

at Arctic bases on the return trip, but in most cases this would require the aircraft to employ straight-line routes, to operate at altitudes and speeds calculated to minimize fuel consumption, and to forego evasive maneuvers, low altitude approaches, and other penetration tactics. For operational flexibility and good target coverage, BISONs should be staged through Arctic bases and refueled as well.

c. Given the small size of the heavy bomber force, Soviet delivery of an attack of great weight against the US would require the employment of medium bombers. A few BADGERs of Long Range Aviation are now regularly based in the Arctic; any others employed against the US would need to stage through bases in that area.

43. If the USSR staged a massive bomber attack through Arctic bases—an attack involving the departure from home bases of, say, 500 aircraft including the entire heavy bomber and tanker force and about a third of the medium bombers of Long Range Aviation—it would have to provide for last-minute maintenance stand-downs, deployment to staging bases, and servicing and fueling at staging bases. Based on present Soviet patterns of activity, we believe that at least a day or so would be required for these preparations and movements. The chances are better than even that some aspects of an operation of this size would be detected in time to provide warning before the Soviet bombers arrived at North American radar warning lines. There would always be a chance that the movement to forward bases was a threatening or practice maneuver rather than an attack. The problem of distinguishing between practice maneuver and impending attack would probably be greatest during the winter months, when most Soviet air exercises into the Arctic are conducted. But indications of this sort would produce urgent intelligence warnings, at least to the effect that an imminent attack was possible.

44. There is a possibility that the Soviets would limit their initial bomber attacks on North America to their heavy bomber force plus a few medium bombers. Security might be maximized by launching BEAR turboprop heavy bombers directly from home bases, with only BISONs and BADGERs employing Arctic bases. Intelligence could probably not detect and recognize the activities associated with the launching of such a reduced force of, say, 150–200 bombers and tankers in time to provide warning prior to their arrival at North American radar warning lines. Nor are we in a position to say how many more aircraft than this the Soviets could launch in an attack on the US before the chances of receiving advance warning indications became about even.

45. In support of long range bomber strikes on any scale, there would probably be activities not directly associated with the bombing units themselves which might indicate preparations for attack, perhaps

as much as a few days in advance. These activities could include: intensified Soviet efforts to collect and report worldwide weather data; the imposition of very strict control over air traffic within the USSR, especially along routes northward from Long Range Aviation bases; and perhaps even sea and Arctic reconnaissance flights. Such indications, especially if they occurred within a short period of time, would strengthen whatever preliminary or specific warning might be given.

46. *Submarines.* The Soviets now have in operational units more than 50 submarines capable of being on station off US coasts for brief periods without refueling at sea. About 18 of these are conventionally powered missile-launching submarines believed to be equipped for surface launching of ballistic missiles with ranges up to about 350 n.m., and the remainder are conventional torpedo attack types. In addition, the Soviets probably now have half a dozen or more nuclear-powered submarines whose armament is not definitely known. Virtually all of these submarines are stationed in the Northern and Pacific Fleet areas, where they have direct access to the open seas. The most specific and firmest warning of Soviet attack on the US which might be derived from Soviet naval preparations would stem from the activities of these long range submarines, although indications could also be drawn from preparations by the remainder of the submarine fleet and by surface naval forces.

47. In recent years, Soviet submarines have conducted operations outside of Bloc coastal waters with increasing frequency. There is strong evidence that Soviet submarines have occasionally reconnoitered US coasts, but they have not established a regular pattern of patrols within missile-firing range of US targets. Unless they establish such a pattern, the Soviets, in deciding whether to employ submarines in initial attacks on the US, would have to weigh the risks of premature disclosure of intent against the advantages of additional weight of attack. The deployment itself would require two or three weeks, depending on the routes and tactics employed. This of course would preclude submarine participation in an initial blow if the Soviets made a sudden decision to attack on short notice. But assuming a Soviet decision taken well in advance, or a period of tension in which the Soviets desired to increase their readiness, there is a good chance that they would deploy some portion of their submarines from Northern and Pacific Fleet areas. Given enough time, this could be done gradually so as to minimize the risks of alerting the US.

48. We believe that under normal US readiness conditions and surveillance, there is some chance, though small, that a general departure into the open seas of Soviet submarine forces large enough to include all presently operational missile submarines would be detected in numbers sufficient to cause additional alert measures. There would

be a fair chance that such forces approaching US coasts could be detected by our Sound Surveillance System, perhaps as far out as 400 n.m. Such detection would give rise to an alert, perhaps a few hours or a day before the submarines reached missile launching points. It would cause efforts by ASW forces to confirm the contacts and to establish surveillance, which in turn could lend specificity to intelligence warnings.

49. During times of alert, present US planning calls for additional forward sea and air surveillance. If the US had been alerted prior to Soviet submarine departure from home waters, the chances of detecting the movement of a force of Soviet submarines would be raised. If early detection were achieved, it could have the very significant effect of providing more specific warning information a week or two before the initiation of a Soviet attack on the US.

50. *Future Trends.* Intelligence capabilities to derive warning from preparations by Soviet ballistic missile forces may improve somewhat, but given foreseeable obstacles we believe they will remain very poor. As Soviet strength in ground-launched ballistic missiles grows, intelligence should achieve some identification of units, some understanding of the Soviet operational concepts regarding them, and possibly some capability to monitor their activities. There is a small area of hope that essential patterns of activity may become observable, reflecting various stages of readiness of ballistic missile forces, and that through interpretation of these and other indicators of increasing Soviet war readiness it may be possible to mount extraordinary collection efforts against missile forces at the right time. However, the short reaction times associated with ballistic missile systems could defeat all attempts to detect their imminent employment and to communicate this information in time to provide advance warning.

51. The chances of warning from preparations by long range bomber forces will decline. This trend will result in part from continuation of the trend towards increasing Soviet security in air operations. The utility of bomber redeployment as a short range indicator could be virtually eliminated if the Soviets established routine patterns of fairly large-scale activity at Arctic bases, and there will always be a possibility that heavy bombers need not stage through such bases at all. Most important, however, the growth of Soviet missile capabilities will shift the main strike role away from bombers. The probable Soviet employment of both bombers and missiles in initial strikes between now and at least 1963 may provide some temporary bonus to intelligence collection because of the Soviet requirement to coordinate their preparations.

52. The ability of intelligence to provide warning based on the activities of Soviet missile submarine forces will depend significantly

on the extent to which improved submarines and missiles are introduced into these forces. US techniques for submarine detection, identification, and surveillance will probably improve, thus increasing the chances of deriving warning indications from the movements of currently-operational types of Soviet missile submarines. On the other hand, warning capabilities would be considerably less against Soviet nuclear-powered missile submarines designed for submerged launching of ballistic missiles from as much as 500–1,000 n.m. at sea, which we have estimated could become operational within the next year or so. Moreover, should the Soviets establish a pattern of routine submarine patrols within missile firing range of US targets, there would be very little chance of deriving warning indications from the activities of such submarines.

*Preparations for Clandestine Attack*

53. The USSR could also commit acts of war against the US clandestinely. In an initial attack it could, for example, employ nuclear, chemical, or biological weapons which had been introduced clandestinely into the US or into overseas bases. The ability of intelligence to give warning of an initial attack launched by such means would depend primarily on the possibility that some part of the Soviet clandestine plan had miscarried in a way which would provide disclosure, that some individual privy to the arrangements had defected, or on chance discovery. Discovery that the USSR was attempting to introduce a nuclear weapon into the US or one of its bases would lead intelligence to give its firmest warning of Soviet intent to attack. There is no way to estimate the chances of making such a discovery, since it would be a fortuitous event. On the other hand, we believe that the Soviets appreciate the consequences of disclosure, and that in light of the other means of attack available to them they would be very unlikely to attempt clandestine attack.<sup>7</sup>

54. Similarly, discovery of Communist plans for systematic sabotage of civil and military communications at a given time would provide very significant indications. Clandestine activities of a lesser order of importance, such as minor acts of sabotage on a large-scale, might contribute to our ability to give meaningful warning. We could not be

---

<sup>7</sup> For further discussion, see NIE 11-7-60, "Soviet Capabilities and Intentions with Respect to the Clandestine Introduction of Weapons of Mass Destruction into the US," dated 17 May 1960 (TOP SECRET) paragraphs 2-4, and the footnote thereto by the Assistant Director, Federal Bureau of Investigation, who points out that a Soviet decision to employ this means would depend not only on Soviet capability with overt means to destroy US retaliatory capability; but also the US capability to launch retaliatory forces before their destruction by overt Soviet means.

certain, however, that such activities had been organized in conjunction with an attack on the US.

*Preparations by Theater and Naval Forces*

55. The range of actions needed to prepare the diverse Soviet ground, tactical air, and naval elements for general hostilities is sufficiently broad to provide a good chance of detecting increased readiness of these forces. Moreover, even in a war initiated by a massive nuclear exchange, some advance preparations by theater and naval forces apparently are regarded by the Soviets as necessary to protect those forces for subsequent operations, as well as to insure their readiness for quick action to take advantage of whatever surprise the initial Soviet attacks achieved. The time required to carry out these preparations, however brief, and the advisability of carrying them out before US retaliation destroyed transportation and facilities, argue strongly that some would occur before the first Soviet strikes reached US early warning lines, although the Soviets would make every effort to prevent disclosure of their intention to attack. In drawing conclusions from preparation by theater and naval forces, it would be difficult to distinguish Soviet motivation as between intent to attack the US, to take precautionary steps, or to establish a threatening posture for political reasons. This difficulty would increase during seasonal maneuvers of ground forces and would be greatest in a time of heightened international tension.

56. *Theater Forces.* Knowledge of the activities of Soviet theater forces rests heavily on observation of the forces in East Germany, although we have spotty intelligence coverage on forces within the USSR. Soviet ground and air units in East Germany are maintained in a high state of readiness, and they need not be reinforced prior to initiating attacks. It would probably require very little time for ground units and equipment to disperse from barracks to hastily prepared positions. But we believe the minimum time necessary to prepare all Soviet forces in Germany for wartime employment would be a few days to a week, even assuming a desire to minimize preparations in the interests of surprise.

57. The chances are good that irregularities in the behavior of Soviet forces in Germany would be detected by US and other Western intelligence sources. Recognition of an abnormal situation would depend to a degree on the time of year. It would be more difficult in the spring, summer, and fall, particularly during April, September, and October, when we have become accustomed to expect extensive Soviet preparations for training movements. The annual training cycle would also affect the time necessary for major Soviet ground elements to assemble in forward positions near the West German border. The

required time could vary from a few hours during periods of normal training movement to as much as a week at certain other times of the year. Such a forward assembly of major elements, if it occurred, would give rise to the most specific warning which intelligence could derive from Soviet theater force activities. Preparations by airborne forces within the USSR would also be regarded as highly significant for warning, but our current ability to observe their activities is only fair.

58. *Naval Forces.* The bulk of the active Soviet naval forces, including major surface and submarine elements stationed in the Northern, Pacific, Baltic, Black Sea, and Mediterranean areas, is trained primarily for defense of Soviet coasts and for operations against surface ships. In recent years, anti-submarine warfare has received new emphasis. The necessity for the Soviets to begin carrying out some of these naval missions within a few hours after an initial attack on the US would probably require an inescapable minimum of advance preparations. Moreover, Soviet doctrine calls for the dispersal of naval forces from present concentrations to other bases in the event of war—such dispersal is frequently the introductory phase of major Soviet fleet exercises. While there is thus a good chance of naval preparations, including deployment and dispersal, these could be accomplished gradually and under conditions of great secrecy. They might take as little as a day or as long as two weeks, depending on their magnitude. Considering our total intelligence coverage, including that provided by forward sea surveillance off Soviet fleet areas, the chances of detecting and recognizing such preparations are fair.

59. *Trends.* Our ability to derive warning information from preparations by theater forces will probably decline somewhat, primarily because the present trend toward tightening Soviet security will continue. Coverage of Soviet theater forces in Germany will remain a critical factor. It could be sharply degraded by loss of intelligence access through Berlin or by Soviet measures to curtail the movements of Western military liaison missions in East Germany. If in the future the USSR substantially reduced its German garrison, there might from that time onward be a greater chance of reinforcement prior to the initiation of hostilities. We cannot count on this, however, because the Soviets might still regard whatever strength remained in Germany as sufficient to begin operations without reinforcements. Little change is anticipated in our ability to derive warning indications from the activities of naval forces other than submarines.

#### *Defensive Preparations*

60. In view of the threat posed by Western retaliatory power, the Soviet leaders would also undertake certain defensive preparations, especially in air and civil defense. Preparations of this sort would be

good reflections of tension, but would be equivocal as to whether Soviet intentions were attack, defense, bluff, or deterrence. Because of their precautionary nature, defensive preparations might be poor indicators of the timing of a Soviet attack.

61. *Air Defense.* A portion of Soviet air defense forces, especially radars and fighter units near borders and along airline routes, are normally on alert. At times of tension or alarm, however, Soviet air defense alert forces are augmented—in the past, additional fighters have been placed on strip alert and surface-to-air missiles in the Moscow area have sometimes been moved from hold areas to launchers. At such times, the Soviets also impose more rigid controls over air traffic within the Bloc, and intensify their surveillance of air traffic within and near Bloc borders. We believe that because of the potential effects of US retaliation, there is an excellent chance that intensified air defense measures would precede Soviet initiation of hostilities against the US.

62. The Soviets would probably require at least a few days of maintenance and other preparations to bring their air defense system to maximum readiness, but a fairly high degree of readiness could be attained with little delay. Because of the number of units involved, their widespread locations, and the presence of many of them in areas accessible to Western intelligence coverage, the chances are very good that a general intensification of Soviet air defense measures would be detected. Final alerts and measures affecting civil traffic could be deferred until very late in a surprise attack situation, however, thus limiting to a few hours the time during which warning indications could be obtained.

63. *Civil Defense.* Measures which the Soviets could take to protect population, industrial, governmental, and other assets from the effects of retaliatory attack include the activation of civil defense units, final preparation of shelter, and evacuation of key personnel and possibly elements of the population from likely target areas. Published Soviet civil defense manuals make provision for several courses of action, evidently envisioning different amounts of warning of Western attack:

a. evacuation of some elements of the urban population and other deliberate preparations, assuming a few days or more of warning;

b. declaration of a “threatening situation” and short-term preparations such as readying urban shelters and evacuating civil defense units to the suburbs, assuming a few hours to a day of warning;

c. extremely limited preparations such as rapid movement of the population to urban shelters, assuming a few minutes to a few hours of warning.

64. In the interests of surprise, the USSR might decide to forego civil defense preparations until the last feasible moment, but to carry

out any usefully comprehensive measures a start would have to be made before the initial strikes were sent off. Notification of the populace is apparently to be transmitted by wired public address speakers—at present, we could detect such notice only by the fortuitous presence of a Western observer at the location of one of these speakers when the announcement was made. But unless the Soviets decided to leave the populations of Moscow and other major cities unprotected, there is a very good chance that the effects of such notification on the behavior of the populace would be detected promptly by Western diplomatic, press, and other personnel in the USSR. Information concerning urgent civil defense activities, and especially of the evacuation of key government personnel, would serve to corroborate other warning indications.

65. *Trends.* The risk the USSR would be willing to accept as a result of neglecting some or all defensive preparations would depend in part on the degree of success which the Soviet leaders expected their own initial attacks to achieve. Despite likely improvements in their nuclear delivery capabilities, we believe that in elementary prudence, they would be unwilling in the foreseeable future to forego all preparations to receive a retaliatory blow. If the Soviet doctrinal emphasis on poststrike recuperability is any guide, then as the destructiveness of weapons increases and the interval between attack and potential retaliation decreases, the more essential become advance preparations to reduce initial losses and to protect national strengths, including population. The ability of intelligence to derive warning information from air defense preparations of the USSR will probably decline somewhat as air defense missiles replace fighter aircraft. The future utility of civil defense indicators will depend heavily on whether or not current Soviet programs are stepped up to the point where the civil defense system is normally in a high state of readiness. There is no evidence that the Soviets plan any such step-up.

#### *National Mobilization*

66. If the USSR undertook to mobilize its full war potential a great variety of indications would be obtained. Military measures could include call-up of reserves, retention of conscript classes beyond the time of normal release, activation of additional units, and intensified training programs. Economic and scientific measures would affect weapons development and production programs, allocation of materials and manpower, and utilization of transport. A major mobilization would involve the growing dislocation of Soviet national life over a period of months, during which time intelligence could give warning of progressively greater readiness for war. It is unlikely, however, that the pattern of national mobilization activities would justify more specific warning at any time during this period.

67. In the more likely circumstances preceding Soviet initiation of hostilities, the Soviets might undertake whatever partial mobilization measures were permitted by considerations of time and security. These could include various degrees of strengthening of cadre units, military pre-emption of communications and transport, medical preparations, and many other similar activities. The Soviets, for example, could in a few days call up the necessary personnel to bring all ground force units up to full strength, drawing upon the reserve system which they have maintained and are now expanding in connection with military personnel cuts. Those units normally maintained at cadre strength would require a few weeks' training before they could be considered combat effective. If detected by intelligence, such Soviet preparations would serve to support or confirm other indicators and to amplify a general impression of ominous abnormality. In themselves, however, evidences of partial mobilization would not reveal Soviet intentions and would be only a poor guide to the timing of an attack, since it would always be possible for the USSR to attack with its ready forces.

*Other Preattack Preparations*

68. There is a host of other possible manifestations of Soviet preattack behavior, and we believe that some would be detected by intelligence. Many of these are peripheral to the actual readying of forces for attack, defense, recuperation, and followup military action, but like mobilization activities they could serve to strengthen the warning judgment. The chances are good, for example, that prior to an attack on the US some propaganda manipulation of the Soviet people would be required, if only to moderate the panic which could prevail if the populace, without prior warning, were suddenly ordered into shelters or told to evacuate at once to the countryside. Diplomatic indications which might precede an attack could include high level intra-Bloc meetings, efforts to secure the neutrality of certain non-Bloc nations, or even unusual behavior on the part of Soviet representatives in likely target nations. Intelligence would correlate such indications with evidence of Soviet physical preparations, but they would be very difficult to evaluate, especially in time of grave international crisis.

69. We are uncertain as to our ability to derive warning information from the behavior of Soviet intelligence, communications, and internal security organizations, in part because we lack a guide to likely preattack patterns. Would Soviet intelligence collection activities be stepped up prior to an attack or be held in reserve for postattack use? What technique would the Soviets use in attempting to mask an increase in urgent communications? Would the Soviets attempt to carry out their preparations without sharply restricting the movements of Western observers? We can conclude only that sharply intensified Soviet secu-

—in communications or over Western observers—would reduce our ability to collect information but could in itself provide an input to the warning judgment. These same considerations would apply should the Soviets attempt to jam or otherwise interfere with critical Western communications.

70. Possible Soviet deception attempts could have a similar effect. These could range from diplomatic moves or propaganda adjustments designed to reduce tensions just before an attack to the planting of false reports or communications about Soviet readiness and intent. Such efforts could confuse US intelligence analysis at a crucial moment and impede accurate, timely judgments on other indications. On the other hand, any discovery that deception was being practiced would be regarded by intelligence as evidence of a possible Soviet intention to launch a surprise attack.

#### WARNING FROM A COMBINATION OF INDICATIONS

71. In the preceding section, we have summarized by category the intelligence warning of Soviet attack on the US which might be derived from various Soviet preparations and activities. In any true preattack situation, however, it is unlikely that indications would appear singly; it is probable that we would detect concurrent albeit fragmentary indications in a number of categories. Because we cannot be sure what combination of indications would actually appear prior to Soviet initiation of hostilities, no definite measure is possible of the mutual reinforcement and cross-confirmation derivable from many indications as opposed to a few. However, the degree of certainty with which the warning judgment could be made would increase with the number, variety, and interrelationship of indications detected, recognized, and judged to be valid.

72. The validity accorded to indications by intelligence and by policy officials would depend to a degree on whether or not these indications were plausibly explicable in terms of Soviet courses of action other than an attack on the US. If warning were derived solely from a mixture of indications from, say, Soviet naval dispersal, civil defense, and partial mobilization, it would in theory be no less valid than warning derived from observed preparations of bombers and ballistic missiles. The latter would be more specific and dramatic, but would be less likely to be available in time. The former would be more likely to be timely, but would be subject to greater ambiguity as to Soviet intent. Analysis of indications in all these categories, especially if they occurred in logical sequence, could permit intelligence to give successive warnings with mounting conviction.

73. Considering all the factors affecting the problem of warning, we believe that at present intelligence would detect some evidence of

preparations associated with a Soviet decision to attack. The next stage, the interpretation of this evidence, would be more difficult. We think the chances are better than even that, in most circumstances of an actual Soviet decision to attack, intelligence could give warning of increased Soviet readiness, and therefore could infer a possible intent to attack. But intelligence could almost certainly not give firm warning of such an intention. Warnings of increased Soviet readiness and *possible* intent to attack could be given a few days or more before an attack; warnings of *probable* Soviet intent are likely to be given, if at all, only a few hours before attack.

74. There is little prospect for any major improvement in the firmness and explicitness of the warning which might be given. Over the next few years, intelligence will continue to refine its ability to collect, transmit, and evaluate indications of abnormal Soviet preparations and behavior. These gains will be offset by a decline in the number and accessibility of dependable military indicators as the main weight of the Soviet strike capability moves over to ballistic missiles. But unless there is a drastic change in Soviet strategic thinking or the Soviets acquire an assured capability to knock out US retaliatory forces in a single missile attack, the possibility of warning from physical preparations will not disappear. Indeed, the limited time between initial attack and potential retaliation in a missile exchange would virtually force the Soviets to undertake some physical preparations for defense and recuperation prior to launching the attack.

75. As missiles gain in importance and general Soviet readiness gradually rises over the years, along with indications of physical preparations, intelligence will have to place additional reliance for warning on the more ambiguous indicators not directly related to physical preparations. The political context, already of great importance because of the increasing fluidity of the international situation, will assume a larger role in the warning problem. Depending on the circumstances, analysis of the political context could strengthen or impede the warning judgment. In some cases, the first preliminary warning of possible Soviet attack might arise from a judgment that the USSR was about to take a political initiative involving great risk of war with the US, or that a crisis was developing in such a way as to prompt the USSR to prepare for war.

**234. Memorandum from Rostow to President Kennedy, April 21<sup>1</sup>**

April 21, 1961

## SUBJECT

*The Problem We Face*

1. Right now the greatest problem we face is not to have the whole of our foreign policy thrown off balance by what we feel and what we do about Cuba itself. We have suffered a serious setback; but that setback will be trivial compared to the consequences of not very soon regaining momentum along the lines which we have begun in the past three months.

2. How did we begin? Our central aim has been to bind up the northern half of the Free World more closely and begin to link it constructively to the south. We began by seeking to associate ourselves more powerfully with the constructive aspirations of the peoples in the underdeveloped areas. This was done in the Alliance for Progress; in the foreign aid message; in our position on Angola; etc. We also began the process of tightening the Atlantic Alliance in its military and economic dimensions. Here, too, we have made progress: with the Brentano and Ball trips; with the Macmillan and Adenauer visits against the background of the Acheson report. We have dealt cautiously but firmly with three of the four major enclaves of Communist power Eisenhower left us in the Free World: the Congo, Laos, and Viet-Nam. We dealt with the Congo through the UN in ways which, while annoying some in the north, nevertheless advanced the grand strategy; and we moved on Laos through SEATO in ways which have thus far held European and Asian members of SEATO more or less together and kept the neutrals elsewhere more or less with us. After the SEATO meetings there was an increased international recognition of the problem of Viet-Nam; and if we are thoughtful, I suspect we can deal with this problem in ways which would give us an even more unified Free World position than we have enjoyed in Laos.

3. The action in Cuba has temporarily damaged the grand alliance in all its dimensions.

4. In Latin America we run the risk of posing an almost impossible dilemma for those politicians whose success and collaboration we need most. We began well with the Alliance for Progress. This has real potential, as the meetings in Brazil last week revealed. It is a framework

---

<sup>1</sup> Thoughts on how to get U.S. foreign policy back on track following Cuban setback. Top Secret. 6 pp. Kennedy Library, National Security Files, Meetings and Memoranda Series, Pol Plan 2/11/61-5/61.

within which we can help Quadros and other shaky but hopeful leaders find their feet, and establish a sufficiently firm political base to deal, in time, more resolutely with their domestic subversion and opposition problems. But we cannot confront Quadros openly with the problem of choosing between working with us against Castro or in working with us in his economic development business; and so, also, with the others. An urgent item of business is, therefore, to implement your speech of yesterday in ways which avoid this dilemma.

5. In Asia we have posed a similar and even more dangerous problem for Nehru and other neutrals. Nehru can and will support us in dealing with overt aggression. He may even conceivably work covertly with us in certain circumstances, as perhaps in Nepal. But we have not found the means and the legal basis for dealing overtly with infiltration and covert aggression. The trouble with our Cuban operation was and remains that it was mounted on simple ideological grounds. Given the common law of the contemporary world, those grounds cannot be generally acceptable. If accepted, they would justify any nation which has the military capability and logistical advantage, marching into the territory of a government it does not like. That principle—which the Chinese Communists advocate within the Communist bloc—would be murderous for Nehru if applied in Southeast Asia. We must either do what we must do covertly or find a new overt basis for dealing with Communist strategy. I suspect overt action of a useful kind can be developed on a case-by-case basis; and, as I have suggested to you earlier, the crucial element may be forms of international action on the question of Communist arms shipments.

6. To Europeans our recent action on Cuba seems much like the obsessive reaction of the British on Egypt; the French on Algeria; the Netherlands on Indonesia; etc. We have appeared to move with violence, on a unilateral basis, in an area where historically we had deep commitments and deep emotions. Their anxiety is on three scores:

*First.* Because our prestige appears somewhat to be damaged and our prestige is important to each of them in his own situation.

*Second.* We did not consult with them and they will bear a part of the consequences.

*Third.* Their confidence in our judgment has been, at least temporarily, shaken.

All of this, it seems to me, is reparable, if we do not get further driven in on ourselves with respect to Cuba, and if we resume with vigor the lines of action we have launched with the Europeans, including especially the technique of intimate and candid consultation, which Acheson has proposed.

7. What then must we do? The answer should be in two parts: What we do about policy in general, and what we do about Cuba.

8. *First, policy in general.* I believe we must resume with intensified vigor and perhaps more boldness than we have heretofore envisaged, the lines of action already under way. Specifically,

a. We should work intensively with the British and the Germans in the next month to see if a major breakthrough in the Atlantic Alliance cannot be made on the occasion of your visit to De Gaulle. We have prepared a new working paper on this, which goes beyond the Acheson report.

b. We must push the Alliance for Progress at an accelerated rate. This means not merely getting the \$500 million from the Congress; not merely getting cranked up for work on development plans with the Latin Americans; but also having ready for the June Latin American ECOSOC meeting some commodity agreements. Dick Goodwin is making real progress on this.

c. It is crucial to our strategy in every direction that the India and Pakistan consortium meetings be a major success. These meetings must succeed in order to demonstrate to the Congress that the Europeans will, in fact, contribute to demonstrate to the other underdeveloped areas that a concentration on domestic tasks and good programming pays off; and to stabilize the position in the Indian Peninsula itself, which contains about half of the population of the Free World's south.

d. *Laos.* Assuming that we have a conference on Laos, we must use this occasion to prove that, even with a difficult heritage, British, French and American positions in the Far East can be brought into alignment. We should make a major effort with the French, especially, to come to an understanding. We should permit them to get off their chests all of the accumulated bad feeling about our policy in Laos. We should try to get De Gaulle to assign first-rate people to the conference, instructed at the highest level to seek an accommodation; and we should listen to the French with understanding, if not whole-hearted sympathy. The Laos conference—if it takes place—should be a major exercise in what Acheson means by consultation.

e. *Viet-Nam.* Viet-Nam is the place where—in the Attorney General's phrase—we must prove that we are not a paper tiger. We have a very difficult situation there; but there are advantages. The legal position is clear; the Vietminh have no international right to mount the kind of aggression they are mounting. We should consider urgently whether, since the ICC does not protect Viet-Nam, the United Nations might be forced to face this issue and be asked to provide forces which would effectively monitor the Viet-Nam frontiers which have been used for infiltration. Ambassador Stevenson should be brought in fully on the planning of the Viet-Nam exercise. We should review the counter-insurgency plan as it now exists and perhaps radically raise our sights. We should seize on the British offer to help Viet-Nam and seek

to internationalize the effort to the maximum. We should force Nehru coolly to study the situation and face up to the implications for all of Southeast Asia of Viet-Nam's loss. We must, with all tact, force Diem to face his domestic political problem not merely with his Communist opposition, but with his army which is deeply dissatisfied with his techniques for administering the counter-guerrilla operation. We must bring to bear all the resources—technical, economic, and intellectual—we have to prove that Viet-Nam and Southeast Asia can be held. The ultimate outcome in Laos will substantially depend, I believe, on the Viet-Nam exercise.

f. In the United Nations we should explore with Ambassador Stevenson whether he and the UN people can conceive of any useful way of making the UN, as a body, face up to the problem of indirect aggression; and we must give Stevenson positions which will permit him to rebuild the situation of strength he created in the first three months, which is now temporarily damaged.

9. As for Cuba itself, I have little background and little wisdom. There are, evidently, three quite different threats which Cuba poses, which are now mixed up in our minds and in our policy. There is the military question of Communist arms and of a potential Soviet offensive base in Cuba. If we are not immediately to invade Cuba ourselves, we must decide whether we shall permit Castro, so long as he remains in power, to acquire defensive arms; and we must decide what the touchstones are between defensive arms and the creation of a Communist military base threatening to the U.S. itself. I assume that evidence of the latter would take virtually as a cause of war, although we should bear in mind what the placing of missiles in Turkey looks like in the USSR. Second, there is the question of Cuba as a base for active infiltration and subversion in the rest of Latin America. Here, evidently, we must try to do more than we are now doing, and we should seek active hemispheric collaboration—wherever we can find it—in gathering and exchanging information on the networks involved and on counter-measures. This is, however, essentially a covert, professional operation. The more we talk about it—the more we overtly seek to pressure Latin American nations to join with us—the less likely we shall be able to get their cooperation in doing anything useful. Third, there is the simple ideological problem. Cuba is a Communist state, repressing every value we treasure. But on that ground alone we are prevented by our treaty obligations from acting directly and overtly. On the other hand, we are overtly also committed beyond sympathy to the support of those Cubans fighting for freedom. Here, how we proceed—what is to be done overtly and covertly—is a most searching question. I have no advice to give except this: Let there first be a first-class and careful intelligence evaluation of the situation inside Cuba; of Castro's control

methods; of the nature and degree of dissidence of various groups; of recent trends and their pace; and an assessment of vulnerabilities.

10. As I said to the Attorney General the other day, when you are in a fight and knocked off your feet, the most dangerous thing to do is to come out swinging wildly. Clearly we must cope with Castro in the next several years—perhaps sooner, if he overplays his hand and gives us an acceptable legal and international basis. But short of that, we must think again clearly and coolly in the light of the facts as they are and are likely to be. We may emerge with a quite different approach to the Castro problem after such an exercise, or we may proceed with more of the same. But let us do some fresh homework.

11. In the meanwhile, what we must do is to build the foundation and the concepts, in Latin America, the North Atlantic Alliance, and the UN, which would permit us, next time round, to deal with the Cuban problem in ways which would not so grievously disrupt the rest of our total strategy.

12. As part of this process of getting back on the tracks, I still think you should consider a well balanced speech taking stock of the first hundred days, which would flag the urgent action items across the board, at home and abroad. I attach an extra copy of my memo on that speech.

June 1961

236. Memorandum from Gen. Lemnitzer to McNamara, June 15<sup>1</sup>

June 15, 1961

SUBJECT

Policy Guidance on Plans for Central War (U)

1. With respect to your query of 5 May 1961, concerning introduction of multiple options into general war planning, the Joint Chiefs of Staff are in agreement that the following objectives should be achieved:

a. Greater control of response for the purpose of enhancing military flexibility.

b. Minimizing the likelihood of destruction not directly associated with the objectives of our attacks.

c. Emergence from an initial nuclear exchange with sufficient residual power to impose our will upon the enemy.

d. Survival as a free nation capable of pursuing our national objectives.

e. Maintenance of adequate but not excessive forces.

2. While it is agreed that steps of both a short-range and long-range nature can be taken toward the foregoing objectives, the Joint Chiefs of Staff have serious reservations concerning several aspects of the proposed Basic National Security Policy enclosed as background information in your memorandum of 5 May 1961. The desirable elements of this policy notwithstanding, it is considered that adoption of the policy *in toto* would have a deleterious effect upon our national security. The Joint Chiefs of Staff consider that the adoption or declaration at this time of a policy of controlled response and negotiating pauses in general war to the extent indicated in your enclosure would undermine the credibility of our deterrent and increase the risk of defeat. Moreover, such a policy, in order to be effective, would require both our nuclear capable Allies and the enemy to develop capabilities which would permit them to adopt a policy similar to ours. Additional reservations, as are related to your specific questions, are:

a. The National Strategic Target List (NSTL) and the Single Integrated Operational Plan (SIOP) were designed to fulfill requirements

---

<sup>1</sup> Policy guidance on plans for central war. Top Secret; Restricted Data. 7 pp. National Archives and Records Administration, Record Group 218, JCS Records, JMF 3001, BNSP (5 May 1961), Sec. 2.

under conditions where our national survival is at stake. If the enemy were to launch an all-out nuclear attack against the United States, and its Allies during the current time period, the gross disruption of facilities, military capabilities, communications and control elements, and other national assets imposes an overriding requirement for simplicity of military response which severely limits the optional responses which may practically be planned, however desirable these individually may be under specific but unpredictable circumstances. The ability to defeat the enemy under these conditions must not be lost or equivocated by introduction into the SIOP at the present time or in the near future of a large number of options which would lower our assurance of success and contribute to confusion under the most adverse circumstances ever to confront our nation.

b. Assuming the USSR embarked upon all-out war, the capability of the United States to launch an effective retaliatory effort will depend upon the utmost exploitation of military initiative, adroit timing and effective targeting against the most rewarding targets. This requires intensive training in accordance with a well-conceived plan, which plan must not exceed the capacity of man for its execution. Little margin exists now to permit assessment of enemy intentions, objectives, or capabilities without our losing the military initiative. No procedures, based upon a conjectured intent or response by the enemy, should be accepted which would degrade our existing capability to cope with all-out general war. Nor may the degree or nature of force required to accomplish our objectives be dependent upon the prejudged intentions of the enemy.

c. While a primary objective in general war should be the destruction of the enemy's military forces, it is recognized that a country's war potential is gaged by economic, psychological and political as well as military elements. The possession by the enemy of long-range missile-delivered nuclear weapons system, the paucity of our intelligence regarding certain key military targets in the Sino-Soviet Bloc, and the imposition of the second strike role upon our forces under enemy initiative combine to place us at a military disadvantage, especially in the context of the strategy suggested in the draft Basic National Security Policy. Until our forces are endowed with sufficient invulnerability to permit holding a portion in secure reserve, any limitations imposed upon striking all elements of the enemy's war potential must be responsive to military necessity.

d. *[text not declassified]*

e. *[text not declassified]*

f. Our ability to attack essential enemy military strengths without significant effects against his non-military resources and population is hampered by two principal factors. These are the limitations upon the

degree of selectivity feasible with existing thermonuclear forces, and the considerable collocation of enemy military strengths with enemy non-military resources and population.

g. Controlled response in the face of a nuclear hostile act which may or may not presage an all-out attack requires a strong passive defense posture. The development of civil defense and mobilization plans should be kept abreast of, and adequately responsive to, the requirements of a nuclear war emergency.

h. Significant forces, other than the long-range nuclear strike forces, are required to contribute to the general war deterrent in order to provide flexibility and to conduct essential operations both during and subsequent to an initial nuclear exchange. The draft policy fails to express the need for such forces and a policy for their use.

3. Regardless of the above listed reservations, the Joint Chiefs of Staff consider that there are certain broad courses of action, available at the present time, which will meet a substantial portion of the objectives listed in paragraph 1 above. These courses of action are already in some state of preparation for implementation.

4. Destruction not directly associated with the objectives of our own attacks can be minimized and, in fact, operational plans currently provide for:

- a. [text not declassified]
- b. [text not declassified]
- c. [text not declassified]

In addition to the foregoing, consideration could be given to the use of [text not declassified]. Additionally, the testing, development and production of the neutron flux or pure fusion weapon could greatly enhance our capabilities.

5. Specifically and regarding the first question on near term increase in the latitude of response options, the current variety of options is sizeable, and is larger than would be apparent solely from examination of "numbered" options in the current SIOP and command war plans. In addition, a limited number of carefully planned new options can be provided in the near future. For example, the Joint Chiefs of Staff will insure that in SIOP 63 and command war plans for the same time period all aspects of current flexibility and selectivity are more clearly and specifically identified in plans and provided for in pre-planned execution orders and messages. [text not declassified] It is emphasized that these elements of flexibility are currently available, although greater clarity in their designation and identification will be provided. In addition, new options will be studied and developed to provide alternative assignments to selected and limited elements of [text not declassified] which may be withheld from initial attacks for subsequent

commitment. These options which will be developed to the extent militarily feasible, could be significantly affected by trends in the precision and completeness of our information on enemy strengths, and will include specific reference to the degree of calculated risk inherent in their selection for implementation in an emergency.

6. The retention of, or the capability to reconstitute quickly, a reserve is an indisputable requirement for all types of warfare and is particularly significant in general war. Within current and projected programs, this requirement can be fulfilled to a degree by:

- a. *[text not declassified]*
- b. Continued improvements in planning for use of surviving theatre forces in follow-on and “on-call” roles against targets as required.
- c. Recognizing that substantial elements of forces committed to the initial attacks will survive and be available for subsequent strikes and as such can be considered as an integral element of the required reserve.
- d. *[text not declassified]*
- e. *[text not declassified]*
- f. Using some of the most survivable weapons systems of our nuclear delivery forces as a reserve commensurate with the requirements for initial attack.

7. Measures along the lines indicated in paragraph 6 above can be implemented more effectively to the degree that measures are taken to increase survivability of all our nuclear strike forces. These measures are not limited to qualitative and quantitative improvements in specific weapons systems, but *[text not declassified]*.

8. Detailed procedures for exercising more precise control of our nuclear strike forces will be pursued vigorously in response to the decisions of the President as Commander in Chief of our armed forces and in consonance with the development of approved command and control capabilities and procedures. Precautions should be taken to insure that no measures for control be developed which necessitate time-consuming international or intergovernmental political deliberations or decisions to the prejudice of our military posture. Because, under conditions of general war, the very existence of the nation is dependent upon military success, the exercise of the leadership of the President in his role of Commander in Chief, must override other considerations.

9. It is noted that decisions on questions raised in your memorandum of 5 May would have a considerable impact on future over-all programming actions. In view of budgetary considerations and in light of the fact that no clear cut distinction can be made between general and limited war forces, all facets of the requirements for national defense must be examined in order to ensure the proper application of priorities for meeting the entire spectrum of the threat.

10. A consideration of the above factors would seem to indicate that no definitive action should be taken on this matter until final governmental action is taken on the Basic National Security Policy. In this regard, the Joint Chiefs of Staff reiterate their request to collaborate actively in the drafting of this policy. When the Basic National Security Policy is approved, the actions required to support the policy should be within the context of the normal planning, programming and budget actions. The earliest time for integration of feasible additional options as discussed above, in order to avoid disruption or reduction of current capabilities, will be in the promulgation of SIOP-63 and command war plans covering the same time period.

11. The submissions of the DSTP, CINCLANT, USCINCEUR, CINCPAC, CINCSAC, CINCONAD and CINCAL are attached as Appendices A-G hereto. It will be noted that the views of these commanders are generally in accord with those expressed above by the Joint Chiefs of Staff. The commanders have made differing recommendations concerning means by which the long-range strike force can be made less vulnerable. However, all commanders have noted an urgent requirement for improvement of command and control, communications, and intelligence, particularly with respect to survivability. The Joint Chiefs of Staff consider that all programs designed to achieve these ends should receive continued attention. However, as noted above, they believe that acceleration of these programs should be undertaken only after full consideration of our total defense requirements.

12. Your attention is invited to the fact that the DSTP and certain of the responses of the unified commanders make cross reference to paragraphs of the Joint Chiefs of Staff message which transmitted the requirement to the designated agencies. Paragraph 1 of this message contained general instructions. Part I of this message was a direct quotation of your memorandum of 5 May, and was numbered paragraphs 2 through 6.

For the Joint Chiefs of Staff:

July 11, 1961

SINO-SOVIET AIR DEFENSE CAPABILITIES THROUGH MID-1966  
THE PROBLEM

To examine the scale and nature of the Sino-Soviet Bloc air defense system,<sup>2</sup> and probable trends in its capabilities through mid-1966.

SUMMARY AND CONCLUSIONS

1. The scale of effort presently being applied to the continuing improvement and modernization of the Soviet air defense system is indicative of the high priority assigned to this mission. During the past two to three years, the Soviet air defense establishment has been undergoing a major transition which has significantly improved its capabilities. The principal aspects of this transition are: (a) the extensive deployment of surface-to-air missile sites; (b) the installation of air defense communications and control systems with semiautomatic features; (c) the deployment of new fighters and radars to Eastern Europe and areas near the borders of the USSR; and (d) a consolidation of air defense districts. Other developments include the advent of radars with better detection and height-finding capabilities, and the equipment of interceptors with more advanced electronic gear and armament, including air-to-air missiles. (*Paras. 16-24*)

*Surface-to-Air Missiles*

2. The Soviets now have operational two types of surface-to-air missiles designed for defense against medium and high altitude air attacks. The first of these (SA-1), which has been operational for about five years, is deployed only around Moscow in a massive complex of 56 sites, each having 60 launching positions. This system was apparently designed to counter the massed air raid threat of the late 1940's and early 1950's (*Paras. 25-26*)

3. Since late 1957, the USSR has been engaged in the extensive deployment of a second-generation surface-to-air missile system

<sup>2</sup> Includes defenses against missiles and satellites.

(SA-2), which appears designed to cope with the threat posed by small numbers of aircraft carrying nuclear weapons rather than a massed raid threat. Considering the pattern of deployment, the length of time the program has been under way, and the extent of our intelligence coverage, we estimate that 350–400 sites (each with six launchers) are now operational at about 70 defended areas in the USSR. By mid-1962, the Soviets probably will have deployed roughly 500 SA-2 sites at about 100 urban-industrial areas in the USSR. There is little evidence on possible requirements for defense of field forces, but we estimate that some 80–120 mobile missile units may be deployed by the end of 1963 for the protection of such semifixed targets as major headquarters and logistics centers. We believe that the USSR intends to provide SA-2 defenses for the fixed launching complexes of its long range ballistic missile forces, but we are unable to estimate the level and extent of defenses planned. (*Paras. 27–23*)

4. Deployment of SA-2 sites in the European Satellites has been under way for more than a year. The heaviest deployment has occurred in East Germany where as many as 20 sites may be operational or under construction. Some of these, located on a ring around Berlin, are manned by East German forces; others, which defend important Soviet military targets, are assigned to Soviet field forces. We believe that additional SA-2 sites will be deployed in the Satellites during the next year or two, and that some mobile units may be provided for Satellite ground forces. We have no reliable evidence indicating the deployment of surface-to-air missiles in Communist China, although some deployment may have taken place or be planned for the future. (*Paras. 34–36*)

5. The Soviets have had under development a surface-to-air system (SA-3) which we believe is specifically designed to engage targets at very low altitudes. Although no operational sites have been observed, we believe that this system will probably be available for operational use in 1961. Considering the scale and pace of the SA-2 program, we believe that SA-3 will be extensively deployed within the next three or four years, supplementing existing missile defenses of fixed targets and field forces. (*Paras. 37–38*)

#### *Antimissile Program*

6. To develop defenses against ballistic missiles, the Soviets have had under way for several years an extensive and high priority program which we believe to be directed primarily toward defense against IRBMs and ICBMs. We have no basis for a firm estimate on the date of initial operational deployment of a Soviet anti-ballistic missile system or its effectiveness against the various types of Western ballistic missiles. For political as well as military reasons, the Soviets probably

would wish to deploy antimissile defenses in a few critical areas even if the available system provided only a limited, interim capability. Considering these factors and the present status of the Soviet research and development program, we estimate that in the period 1963–1966 the Soviets will begin at least limited deployment of an antimissile system. We believe that for some years to come, the Soviets are likely to have only a marginal capability under most favorable conditions for interference with US satellites. (*Paras. 40–46*)

#### *Fighters and Other Air Defense Weapons*

7. Although the Soviets are clearly placing heavy reliance on surface-to-air missiles, they continue to maintain large numbers of fighter aircraft and antiaircraft guns in service. We estimate that there are about 11,700 fighters in operational units throughout the Bloc, with about 7,000 in Soviet units. The Soviet fighter force has been considerably reduced in numbers—on the order of 30 percent—by the phasing out of obsolescent equipment. The force has been improved by the introduction of a new generation of radar-equipped interceptor aircraft and the wider deployment of air-to-air missiles. However, its all-weather capability remains quite limited. Inadequate ground-to-air voice communications impose severe limitations on much of the Soviet fighter force; but these limitations are not so severe in those more modern fighter units deployed for the most part on the Western approaches to the USSR. Considering the widespread deployment of surface-to-air missiles, we believe that over the next year or so most of the remaining medium and heavy guns will be phased out of the defenses of static targets in the USSR. Light AAA probably will be phased out in areas where SA-3 is deployed, but will be retained for low altitude defense of other targets. (*Paras. 47–59*)

#### *Supporting Equipment*

8. Some 1,200–1,500 heavy prime radars and 4,000–4,500 auxiliary radars are deployed at nearly 2,200 sites in the Sino-Soviet Bloc. Radar coverage now extends over the entire USSR and virtually all the remainder of the Bloc. Under optimum conditions this system now has the capability to detect and track aircraft at medium and high altitudes within 200–250 n.m. of Bloc territory; under virtually all conditions, the system could detect and track such aircraft within about 135 n.m. Soviet efforts to reduce the vulnerability of their air defense radars to electronic countermeasures have included use of greater frequency diversity and increased power. In developing new radars, the Soviets probably will concentrate on improving present limited capabilities against low altitude targets and against air-to-surface missiles. (*Paras. 60–69*)

9. The most important advance in Soviet air defense communications and control over the last few years has been the development

and deployment of semiautomatic systems with data-handling equipment for rapid processing of air defense information and data link equipment for vectoring interceptors. Similar systems probably are used with surface-to-air missile units. These new systems will have a marked effect in reducing reaction time and vulnerability to saturation, increasing information handling capacity, and improving coordination within the air defense system. (*Paras. 70–72*)

### *Deployment*

10. Air defense weapons and equipment are most heavily concentrated in that portion of the USSR west of a line drawn from the Kola Peninsula to the Caspian Sea, in East Germany, Poland, and Czechoslovakia, and in the southern portion of the Soviet Far East. Concentrations are found at some specific locations outside these areas, especially in the Urals and in eastern China. The approaches to Moscow are by far the most heavily defended area of the Bloc. (*Para. 77*)

### *Civil Defense*

11. About 80 million Soviet citizens over the age of 16 have received some instruction in civil defense and about one-fourth of these have probably received good basic grounding in elementary civil defense techniques. The bulk of the population still lacks adequate shelters, although the USSR has a substantial lead over any of the Western Powers in the construction of urban shelters which could provide some protection against fall-out, debris, and fire. In the past two years, the Soviets have given increasing attention to preattack evacuation of non-essential civilians in the event of a threatening situation, but this program appears to be still in the planning stage. Even with limited warning, the existence of a disciplined organization, the use of shelter, and the widespread knowledge of simple techniques such as first aid would probably reduce casualties considerably, especially among key personnel. However, Soviet civil defense is not prepared to cope with the effects of large-scale nuclear attack. Moreover, it would function extremely poorly under conditions of short warning time. (*Paras. 73–76*)

### *Warning Time*

12. The amount of warning time available significantly affects the capabilities of air defense in various areas of the Bloc. Early warning radar could now give Moscow and many other targets in the interior more than one hour's warning of medium and high altitude attacks made with Western bombers of the B-52 type. Soviet assurance of such detection would be greatly reduced by extremely low level penetrations. The supersonic bombers and air-to-surface missiles now being added to Western inventories could reduce this warning time by as much as 50 percent. Moreover, the more limited early warning time

available in Bloc border areas would reduce the effectiveness of the defenses of even heavily defended targets in such areas. As the speeds of Western aerodynamic vehicles increase, and as Western ballistic missiles become a greater threat, the problem of warning time will become more critical. (*Para. 78*)

*Current Capabilities and Future Trends*

13. The present capabilities of the Soviet air defense system would be greatest against penetrations by subsonic bombers in daylight and clear weather at altitudes between about 3,000 and about 45,000 feet. Under such conditions, virtually all types of Bloc air defense weapons could be brought to bear against attacking aircraft. Most Soviet fighters can operate at altitudes up to about 50,000 feet, and some up to about 55,000 feet, but the capabilities of the fighter force would be reduced considerably during periods of darkness or poor visibility. In the increasingly widespread areas defended by surface-to-air missiles, air defense capabilities would be virtually unimpaired by weather conditions and would extend to about 60,000 feet, with some capabilities up to about 80,000 feet. (*Para. 79*)

14. Despite its recent and considerable improvements, however, the Soviet air defense system would still have great difficulty in coping with a large-scale air attack employing a variety of weapons and sophisticated tactics, even within the foregoing altitudes. At altitudes below about 3,000 feet, the capabilities of the system would be progressively reduced; below about 1,000 feet, the system would lose most of its effectiveness. At present, the USSR has little capability for active defense against very low altitude attacks. (*Paras. 80–81*)

15. The Soviets are making vigorous efforts to counter Western weapon systems. Within the next five years, they will probably introduce improved radars and all-weather interceptors, a surface-to-air missile system designed to counter low altitude air attack, and antimissile defenses. However, they probably will still not achieve a high degree of assurance in coping with a large-scale sophisticated attack by manned bombers. They would probably expect to destroy a significant number of the attackers, but given the increasing complexity of the air defense problem, we doubt they will be confident of the extent to which they can reduce the weight of such an attack. The air defense problem has been radically altered by the advent of long-range ballistic missiles. Barring an unforeseen technological breakthrough, the USSR's air defense deficiencies and uncertainties will sharply increase as ballistic missiles assume a larger proportion of the West's total nuclear delivery capability. (*Paras. 82–83*)

## DISCUSSION

## I. GENERAL

16. The Soviet leaders recognize that an effective air defense system is an essential element of the strong military posture which they wish to maintain, both to contribute to the security of the Bloc and to support their foreign policies. The scale of effort presently being applied to the continuing improvement and modernization of the Soviet air defense system is indicative of the high priority assigned to this mission.

17. The air defenses of the Sino-Soviet Bloc are being adjusted to provide a more efficient combination of fighter and missile defenses for the protection of major population, industrial, and military centers, especially those in the USSR. The air defense forces of the European Satellites, and to a lesser extent those of the Asiatic Communist nations, are coordinated with the Soviet system.

18. During the past two to three years, the Soviet air defense system has been undergoing a major transition which has significantly improved its capabilities against medium and high altitude air attack. The principal aspects of this transition are: (a) the extensive deployment of surface-to-air missile sites; (b) the installations of air defense control systems with semiautomatic features; (c) the deployment of new fighters in significant numbers to Eastern Europe and areas near the borders of the USSR; and (d) a consolidation of air defense districts. Other developments include the advent of radars with better detection and height-finding capabilities and the incorporation of more advanced electronic gear and armament, including air-to-air missiles, into interceptor aircraft. It is probable that operational Soviet defenses will soon begin to include weapons and control systems designed to cope more effectively with low altitude air attack.

19. These trends and developments are the fruit of intensive Soviet research and development in defense systems to counter expected Western air attack capabilities. At present, the highest Soviet priority in air defense research and development is almost certainly being accorded to defense against ballistic missiles.

20. In recent years, the USSR has allocated to air defense forces an estimated one-fourth of the total military expenditures that can be attributed to broad military missions. Soviet expenditures for air defense probably will grow over the next five years even if no deployment of antimissile defenses is undertaken. Production and construction for an operational antimissile system would considerably increase these expenditures, particularly toward the end of the period. Because of the high priority assigned to the air defense mission and the rapid growth of the Soviet economy, we believe that economic considerations will not hinder the substantial programs estimated for Soviet air defense.

## II. ORGANIZATION

21. All Soviet forces deployed for the air defense of the USSR are under the operational control of a single major headquarters, the *PVO Strany* (Air Defense of the Country) which combines ground, air, and naval elements. The Commander in Chief of the *PVO Strany* is *ex officio* a Deputy Minister of Defense and the chief advisor to the Minister and Chief of the General Staff on air defense matters. Administratively, he ranks with the commanders in chief of the ground, air, naval, and rocket forces.

22. The chief components assigned to the *PVO Strany* are the Air Observation, Reporting, and Communication (VNOS) service, the Fighter Aviation of Air Defense (IA–PVO), and the Antiaircraft Artillery of Air Defense (ZA–PVO), the latter component including both antiaircraft guns and surface-to-air missiles. In addition to forces directly assigned, other Soviet forces which can contribute to the air defense mission are also operationally available to this command.

23. Over the past year, the control structure of the Soviet air defense system has undergone a number of changes, which in the main have affected the size and responsibility of the air defense district (ADD).<sup>3</sup> During this period, a number of these were combined with adjacent districts, reducing their number from an estimated 21 to 16. The greater area responsibility given to the ADD commanders reflects the impact of more advanced weapons and equipment—both defensive and offensive—which probably will bring further reductions in the number of air defense districts.

24. The ADD headquarters is charged with the coordination and control of forces in the district actively contributing to air defense. It is also responsible for identification and filtering of tracks and passing air situation data to regional centers in Moscow and Khabarovsk, to adjacent ADD, to subordinate elements, and to other agencies within the district. The district is divided into a number of air defense sectors which perform duties similar to those of the ADD but within their more limited areas. The air defense systems of the European Satellites are organized on the Soviet pattern, and each Satellite functions in much the same manner as another Soviet ADD. The air defense systems of East Germany and Hungary, where Soviet forces are deployed, appear to be under direct Soviet control.

---

<sup>3</sup> The term “air defense district” is used to describe the organizational elements of the air defense system, although only the Moscow and Baku Air Defense Districts have been identified by name.

### III. AIR DEFENSE WEAPONS

#### *Surface-to-Air Missiles*

25. The Soviets now have operational two types of surface-to-air missile systems designed for defense against medium and high altitude attacks.<sup>4</sup> The first of these (SA-1) is deployed only around Moscow in a dense and costly complex of 56 sites, which we believe has been fully operational since about 1956. Each site has 60 launching positions. The chief advantages of the SA-1 system are its ability to handle simultaneously a large number of targets and to direct an extremely high rate of fire against them. However, the limited azimuth coverage of each site (about 54°) makes the system rather inflexible, and in its present configuration it is completely immobile.

26. *The SA-1 system* was apparently designed primarily to counter the massed air raid threat to the late 1940s and early 1950s. Even before completion of the deployment around Moscow, it is probable that concepts of the threat had changed. Moreover, the magnitude of effort involved in deployment of the SA-1 probably also argued against its use in less critical areas.

27. Since late 1957, the USSR has been acquiring a major operational capability with an improved surface-to-air missile system (SA-2) which appears suitable for the defense of both fixed targets and field forces. A typical fixed site consists of six revetted launching positions deployed around a guidance radar and linked by service roads to facilitate loading. Although many of the observed sites clearly represent permanent installations, all operating components of the system are mounted on wheeled vehicles and are capable of independent movement by road or rail.

28. The missile employed in this system is a large, boosted two-stage missile (designated GUIDELINE by US intelligence) with a maximum velocity of about Mach 3.5. Maximum intercept range is estimated at 25-30 n.m. but will vary depending upon type of target, approach angle, and other operational factors. Maximum altitude capability is about 60,000 feet, with some effectiveness up to 80,000 feet, especially if equipped with a nuclear warhead. Based on the manner in which SA-2 launchers are sited, it seems clear that the system is not intended for employment against low altitude targets. Against subsonic targets low altitude capability probably will average about 2,500 feet, but variations in such factors as siting conditions and target speeds could

---

<sup>4</sup> For operational characteristics of surface-to-air missiles see Annex A, Table 1. These and other Soviet missile systems are discussed in greater detail in NIE 11-5-61, "Soviet Technical Capabilities in Guided Missiles and Space Vehicles," dated 25 April 1961. (TOP SECRET)

result in low altitude limits as low as 1,000 feet or as high as 7,000 feet. Against supersonic targets, low altitude limits would be higher. There is some evidence that the Soviets themselves consider that the minimum SA-2 engagement altitude would be about 10,000 feet, but we do not know the circumstances assumed in the Soviet calculations.

29. *The SA-2 system* appears designed to cope with the threat posed by small numbers of aircraft carrying nuclear weapons rather than a massed raid threat. Flexibility and mobility are its chief advantages over the SA-1. In contrast to the massive SA-1 sites, each of which is capable of defending only a limited sector around the target area, each SA-2 site appears capable of 360° coverage. The SA-2 system can, at relatively low cost, be deployed widely for defense of large cities, of small but important fixed facilities, and of forces in the field. The flexibility is obtained at the expense of target handling and rate of fire relative to the SA-1. The SA-2 guidance system can probably handle only one target at a time, but apparently is designed to control as many as three missiles simultaneously. However, the shorter time of flight of the boosted GUIDELINE missile gives the SA-2 system a better capability against high-altitude and high-speed targets and against targets with small radar cross sections. Several SA-2 sites have been deployed around Moscow, supplementing the SA-1 system.

30. *Soviet urban-industrial areas.* The SA-2 is now the basic missile defense system for critical urban-industrial areas in the USSR, other than Moscow.<sup>5</sup> Since mid-1958, more than 150 SA-2 sites have been identified in the USSR at nearly 50 such areas—for the most part, population centers and industrial complexes. Missile defenses have been provided for more than half of the 43 Soviet cities with populations greater than 300,000, and we believe that all such population centers will be defended. SA-2 sites have been emplaced at some smaller urban areas, probably because they contain installations of critical importance, and they have been deployed for defense of naval and port facilities and nuclear production and weapons storage installations. They have also been identified at certain industrial facilities (including primary electric power stations, metallurgical plants, and major oil refineries). Considering the pattern of deployment observed to date, the length of time the program has been under way, and the extent of our intelligence coverage, we estimate that 350–400 sites are now operational at about 70 urban-industrial areas in the USSR.

31. Identification of additional sites and defended areas since the publication of NIE 11-3-60, "Sino-Soviet Air Defense Capabilities Through Mid-1965," dated 29 March 1960 (TOP SECRET), confirms that

---

<sup>5</sup> See Annex B, Figure 2.

the SA-2 deployment program is massive in scale. The accumulating evidence has led to an increase in our estimate of the number of SA-2 sites to be provided, and to modifications in our estimate of the timing of the program. On the basis of current information, we now estimate that the Soviets will deploy roughly 500 SA-2 sites at about 100 urban-industrial areas in the USSR, rather than the previously estimated 350-400 sites at 70-80 areas. The observation during 1961 of sites under construction and the apparently incomplete defense in certain target areas lead us to estimate that the program to provide missile defenses for areas of the foregoing types is still under way. We believe that it will be completed by mid-1962.

32. *Soviet military installations and field forces.* The Soviets have provided SA-2 defenses for nuclear weapons storage installations (as indicated above), and there is evidence that certain missile development centers are also defended by SA-2 sites. We believe that the USSR intends to provide SA-2 defenses for the fixed launching complexes of its long-range ballistic missile forces, but we are unable to estimate the level and extent of defenses planned.

33. Some SA-2 units have been deployed in support of Soviet ground forces in East Germany and possibly in the USSR. The evidence is insufficient to determine the level of defense planned for the Soviet ground forces. Some of these SA-2 units have been observed thus far at fixed installations. However, this missile system is suitable for use with mobile units, all equipment is mounted on wheeled vehicles, and there is some evidence that the Soviet SA-2 units in Germany have conducted training in mobility. We believe the Soviets will seek to provide the field forces with mobile missile defenses for the protection of such semifixed targets as major headquarters and logistic centers. We estimate that such protection could be provided by some 80-120, mobile SA-2 units, and that this program could be completed by the end of 1963. Some may also be allocated to other Bloc ground forces.

34. *Other defended areas in the Bloc.* Deployment of SA-2 sites for defense of European Satellite targets has been under way for more than a year. Missile defenses have been observed in East Germany, Hungary, and Bulgaria, and evidence indicates their deployment in Czechoslovakia and Poland. At least one SA-2 site has been observed in Albania, but there is no evidence as to its operational status. The heaviest deployment has occurred in East Germany where evidence indicates as many as 20 sites, about half of which are probably operational. Eight sites, located on a ring around Berlin, are manned by East German forces. The remainder, which are assigned to Soviet field forces, appear to defend important Soviet military installations such as major headquarters and airfields.<sup>6</sup>

---

<sup>6</sup> See Annex B, Figure 3.

35. We believe that such defenses will have been provided to all the European Satellites by the end of 1963. Observed deployment patterns indicate that missile defenses are being provided for capital cities and for certain other major targets. On this basis, we estimate that about 130 SA-2 sites will be deployed in the European Satellites and manned by their troops.

36. Soviet military relations with Communist China are not as close as those with its Warsaw Pact partners in Eastern Europe. We have no reliable evidence indicating the deployment of surface-to-air missiles in China, although some deployment may have taken place or be planned for the future. If missiles were deployed according to the criteria apparently being followed in the Satellites, this would call for about 80 SA-2 sites for defense of important fixed targets in Communist China.

37. *Low altitude defense.* To reduce their vulnerability to low-level attack, the Soviets have had under development a missile system (SA-3) which we believe is specifically designed to engage targets at very low altitudes (i.e., down to about 50 feet). No operational sites have been observed, but photography at Kapustin Yar in late 1959 revealed a probable R&D site which consisted of four launch pads deployed in a semicircular pattern. A launcher on one of the pads held two missile-like objects about 20 feet long. The SA-3 in its operational configuration at fixed installations probably will resemble this site.

38. We have no evidence on any operational deployment of SA-3 missile defenses, and hence have little basis for estimating the future deployment pattern or the magnitude of a deployment program. However, we believe that the Soviets will seek to provide some defense against low-altitude attack for most of those areas defended by the SA-1 and SA-2. The Soviets will take into account the relative vulnerability of these areas to low-level attack and their ability to bring other defensive weapons to bear. Areas immediately adjacent to coastal waters would probably be regarded as especially vulnerable to low-altitude attack. Judging by the scale and pace of the SA-2 programs, we believe that extensive SA-3 defenses could be deployed for the protection of fixed installations in the USSR in a program of some three or four years' duration, i.e., by about 1965. The extent of SA-3 deployment with the field forces probably will exceed that of the SA-2.

39. *Future developments.* The Soviets probably will attempt to improve their defenses against more advanced aircraft and cruise-type missiles at high altitudes, but we consider it very unlikely that they will develop an entirely new system for this purpose. Rather, we estimate that they will seek to improve the SA-2 by increasing its range to say 30–35 n.m., increasing its effective altitude, enhancing its capabilities to overcome electronic countermeasures, and generally improving

its ability to engage small, fast targets at high altitudes. Research and development work for this purpose may be under way at Sary Shagan or Kapustin Yar, and we believe that significant improvements to the system could begin to appear this year.

*Antimissile Program*

40. Although the Soviets have no present defensive capability against ballistic missiles, they have had under way for several years an extensive and high priority program for the development of such defenses. Photography has revealed a large, elaborate facility at Sary Shagan which we believe to be engaged primarily in antimissile work, and a much smaller but similar facility near the ICBM impact area on the Kamchatka Peninsula. The Sary Shagan complex is one of the major Soviet missile research and development test areas, second only to Kapustin Yar/Valdimirovka in magnitude.

41. The Soviet effort is apparently directed toward development of a terminal intercept system employing an antimissile missile which will probably be equipped with a nuclear warhead. It is possible that the widespread and diverse activities which we have observed represent developmental programs on more than one type of antimissile system. Research and testing at Sary Shagan has been concerned with re-entry of short and medium-range ballistic missiles. However, the fixed nature of the installations and the general progression of activities towards work with longer range missiles leads us to believe that the main effort is directed toward defense against IRBMs and ICBMs.

42. Although there is no firm evidence, we assume that the Soviets are investigating various techniques for discriminating against decoys. It is unlikely that a system deployed in this time period would have a capability against sophisticated decoys. However, the USSR may be developing a system designed to exploit the vulnerability of nuclear warheads to nuclear weapons effects. In this case, the requirement for sophisticated discrimination techniques would be reduced.<sup>7</sup>

43. We have no basis for a firm estimate for the date of first operational deployment of a Soviet antiballistic missile system or of its effectiveness against the various types of Western ballistic missiles. The initial operational capability date will be determined by the nature of the system under development, the status of the testing program, its future progress, and the timing of the Soviet decision to deploy. Considering these factors and the intensive Soviet research and development activities, we estimate that in the period 1963–1966, the Soviets will

---

<sup>7</sup> For a further discussion of these effects see the forthcoming NIE 11–2–61, "Soviet Atomic Energy Program." (LIMITED DISTRIBUTION)

begin at least limited deployment of an antimissile system designed for use against both ICBMs and IRBMs. The earliest of these dates is contingent upon a Soviet decision to assume the high risks of starting production and deployment prior to full system tests, and therefore is considered the earliest possible date. If deployed early in the period the capability of the system against IRBMs probably would be the more thoroughly tested. It should be noted that continuing success in research and development will be necessary if the USSR is to achieve *any* operational antiballistic missile capabilities in 1963–1966.

44. We believe that for political as well as military reasons, the Soviets would wish to deploy antimissile defense for the protection of a few critical areas, even if the available system provided only an interim, limited capability. Beyond this, we cannot estimate the scope or pace of Soviet antimissile deployment program. On the other hand, the high priority accorded to improving Soviet defenses against Western nuclear strikes leads us to believe that the USSR will eventually seek to provide at least some antimissile defense for major population centers.

45. At present, Soviet planning for antimissile deployment probably is preliminary and tentative in nature. It will be affected over the next few years by developing Western missile capabilities and by Soviet antimissile research and development, which may include investigation of unconventional techniques. The Soviets almost certainly will design their first antimissile system in such a way that improved components can be incorporated as they become available. Improvements might include introduction of a better intercept vehicle or better discrimination techniques. Deployment of an antimissile system will impose requirements of a new order for virtually instantaneous, long-range communications. The scope and pace of the deployment program following IOC will be strongly influenced by the system's potential for growth and by Soviet success in realizing this potential.

46. In the course of its program to develop an antimissile system, the USSR could achieve a limited capability to destroy satellites after they have made a number of orbits. However, we believe that for some years to come, the Soviets are likely to have only a marginal capability under most favorable conditions for interference with US satellites.

#### *Fighter Aircraft*

47. As of mid-1961, we estimate that there were about 11,700 fighters in active operational units throughout the Bloc, with about 7,000 in Soviet units. About 4,500 of the Soviet fighters are directly subordinate to Fighter Aviation of Air Defense (IA-PVO) with air defense as their exclusive mission. The remainder, which are in Tactical Aviation, appear to have an air defense responsibility in addition to their ground support role.

48. With the widespread deployment of the SA-2, the Soviets have developed a combination of fighter and missile defenses. They apparently now rely primarily upon missiles for point defense of important targets, and upon fighters for area defense to cover approach routes as well as gaps between missile-defended areas. The Soviets appear to be moving away from the mass employment concept of the postwar years. Developments in communications and control have made possible improvements in Soviet intercept techniques. Another factor influencing the trend toward fewer fighters is the increased kill capability of the new aircraft.

49. These developments have allowed a considerable reduction in Soviet fighter strength. In the past two years there have been large-scale reductions in Soviet tactical fighter units, and the naval fighter force has been completely eliminated. Reductions in the IA-PVO, resulting primarily from phasing out of older aircraft, have been largely offset by transfers from the naval and tactical commands and by the introduction of new interceptors. Reductions in Soviet fighter forces—both tactical and PVO—probably will continue over the next five years. We estimate that the number of operational Soviet fighters will be reduced on the order of 50 percent during this period.

50. The Soviet fighter force still consists largely of day fighters. The obsolescent MIG-15 FAGOT (now almost phased out), three versions of the subsonic MIG-17 (FRESCO A, B, and C), and three versions of the transonic MIG-19 (FARMER A, C, and D), make up about 80 percent of the forces. These fighters appear to have been designed primarily for the interceptor role and therefore have good climb and altitude capabilities. Performance characteristics vary, but they all employ similar gun armament and fire control systems, and are generally restricted to lead-pursuit attack under visual conditions.

51. Since about 1955, the Soviets have been working to improve the all-weather capability of their fighter force. The two-place, twin-engine FLASHLIGHT A (YAK-25), introduced in that year, is the first Soviet aircraft designed as an all-weather interceptor. It incorporates an extremely large airborne intercept (AI) radar (SCAN III) with a range capability considerably in excess of other Soviet AI radars. However, the fixed mounting employed resulted in a poor scanning system, and the potential of this radar was not realized. This, together with the lower performance capabilities of the FLASHLIGHT, probably led the Soviets to limit its production. Considering its characteristics and the other interceptors now available, the FLASHLIGHT appears to be suitable for use in defensive patrols of border areas and for relatively low-level interceptions (1,500 to 3,000 feet).

52. Since 1955, several Soviet day fighters have been modified by the addition of the SCAN ODD airborne intercept (AI) radar, which

has a search range of about five n.m. and a tracking range of about three n.m. These aircraft, the FRESCO D and E and the FARMER B (equipped with an improved SCAN ODD), are considered to have some all-weather capability. However, the limited range of the radar, the continued reliance on gun armament, and the restriction to a pursuit attack, seriously limit the effectiveness of these aircraft under nonvisual conditions. The most recent day-fighter modification, first observed in 1959, is the FARMER E. This aircraft has beam rider missiles and a compatible AI radar (SCAN CAN), with a search range of 7–9 n.m. and a tracking range of 3–5 n.m. FARMER E, thus equipped, represents a considerable advance over the earlier FRESCO and FARMER modifications.

53. During the past year, a new generation of Soviet fighters has appeared in peripheral areas of the USSR and Eastern Europe. At least three new aircraft appear to be involved: FISHBED C (MIG–21), a Mikoyan-designed, delta-wing interceptor, and two Sukhoi designs—the swept-wing FITTER B and the delta-wing FISHPOT B. We estimate that about 1,000 new generation fighters have been produced, of which about 350–450 are now in units.

54. In armament, fire control equipment, and speed (about 1,000 knots at 35,000 feet), these aircraft represent significant advances over the bulk of Soviet interceptors now in service. However, during the past year, we have acquired additional intelligence on the weight, size, and engine performance of these new aircraft. Accordingly their estimated altitude capabilities have been markedly reduced. We now estimate their combat ceilings at 50,000 to 55,000 feet as compared with 60,000 to 62,000 feet last year. Considering the characteristics of most Western bomber aircraft, the Soviets probably regard these altitude capabilities as adequate. They appear to be developing techniques for interception of Western aircraft which can operate at higher altitudes. There is evidence that some Soviet fighters have auxiliary rocket engines.

55. FITTER B and FISHPOT B, are estimated to have a lead-pursuit fire control system with a new AI radar (SPIN SCAN) having a search range of 10 n.m. and a tracking range of 7 n.m. They probably mount 2 or 4 revolver guns and in addition can carry 4 air-to-air missiles. The other new Soviet interceptor, FISHBED C, is probably intended for day or night use in clear weather. It is believed to have infrared sighting equipment in addition to an optical fire control system, and carries both gun and missile or rocket armament. It is probably equipped with a radar which provides range data only. The assignment of FISHBED C to tactical Aviation units suggests a close support function in addition to an intercept role.

56. All of the new fighters now entering service are based on prototypes first displayed in 1956. Since that time, new fighter designs

have been tested in the course of continuing Soviet research and development on supersonic fighters, their armament, and fire control systems. One and possibly two new fighter prototypes, as well as modifications of existing types, were displayed in the 1961 Aviation Day show. Although there is no evidence of their current production, we believe that a new generation of Soviet interceptors will be introduced into operational units within the next few years. The most pressing Soviet requirement appears to be an all-weather interceptor with improved performance and fire control system. Considering Soviet technical capability, such an aircraft could have a maximum speed well in excess of Mach 2, and a combat ceiling of over 60,000 feet. Although research and development in this field will continue through the period of this estimate, the introduction of new Soviet fighters and the extent of their deployment during the middle 1960's and beyond will be strongly influenced by Soviet progress in surface-to-air missiles and by changes in the nature of the threat posed by Western delivery systems.

57. *Fighter production.* Soviet production of jet fighter aircraft has dropped sharply in recent years. From 1950 through 1956, annual production ranged from about 3,000 to about 5,000. Between 1957 and 1959, there was a steep decline from about 1,900 to about 360. Our estimates indicate a slight increase to about 470 in 1960 and somewhat more in 1961. However, there are no indications that new generation fighters will be built in quantities approaching the production rates of the early 1950's. Production difficulties with the newer models and the high cost and complexity of modern fighters may have played some part in this decline. However, the primary causes have been the emergence of significant surface-to-air missile capabilities and changing techniques in the employment of interceptor aircraft.

#### *Air-to-Air Missiles*

58. We have firm evidence on the deployment of air-to-air missiles in the Soviet fighter force and in several of the satellite forces as well. We believe that at least two types are now operational, a beam-rider (AA-1) and an infrared homing missile (AA-2). An all-weather semiactive radar homing missile (AA-3) could also be available, but we have no evidence of its deployment. There is good evidence that the beam-rider missile is employed by AI radar equipped FARMERS, and probably by FITTER B, and FISHPOT B. This missile could also be used by the other Soviet fighters equipped with AI radar—FRESCO D and E, and FLASHLIGHT. The infrared homing missile could be adapted for use by all Soviet interceptors now operational. It probably will be employed by the FISHBED and possibly by the FITTER and FISHPOT. However, we believe that equipping of FRESCOs and FARMERS with AA-2 will be limited. The AA-3, when operational, may replace the

AA-1 on the FARMERs, FITTERs, and FISHPOTs. Soviet development of improved air-to-air missiles over the next few years depends primarily upon the development of new interceptors equipped with suitable AI radar and fire control systems.

#### *Antiaircraft Guns*

59. The Soviets continue to employ large numbers of antiaircraft guns for defense of field forces and fixed targets. These guns range in size from 57 mm to 130 mm. A large percentage employ fire control radars. Proximity fuzes probably are used in some AAA ammunition. European Satellite forces have about 5,000 antiaircraft guns and there are about 4,000 in Communist China, North Korea, and North Vietnam. The number of antiaircraft guns in the Soviet forces has declined over the past two years and there is evidence that this trend is continuing. Considering the widespread deployment of surface-to-air missiles and the announced Soviet force reductions, we believe that most of the remaining medium and heavy guns will be phased out of the defenses of static targets in the USSR over the next year or so. However, a large number of these will probably be held in reserve status near major target areas. Transfer of some of this equipment to other Bloc countries is probable. Light AAA probably will be phased out in areas where the SA-3 is deployed, but will be retained for low-altitude defense of other targets.

#### IV. RADAR AND CONTROL EQUIPMENT

60. We believe that about 1,200–1,500 heavy prime radars, primarily of the TOKEN and BAR LOCK types, and about 4,000–4,500 auxiliary radars are deployed at nearly 2,200 sites in the Sino-Soviet Bloc. Radar coverage now extends over the entire USSR and European Satellite area, with apparent gaps remaining only in southwestern and western China. Arctic area coverage, which has been sparse, is being expanded by deployment of additional radars including the newer types, to existing radar sites, and by activation of new sites. A few patrol vessels fitted with radars of the early warning type are available in each of the four Soviet fleet areas, and some of them are employed as picket ships to extend radar coverage seawards.

61. The very large number of radars employed in the Soviet system provides a high density of coverage, particularly in border areas and around important targets. In deploying successive generations of radars, the Soviets have tended to retain much of the older equipment in service, resulting in a steady growth in the operational inventory. However, in the past year or so, the deployment of new and better radars and the introduction of automated control systems appears to have led to a reduction in the number of radar sites in some areas. We

believe that this trend will continue, leading eventually to a significant reduction in the operational inventory.

#### Early Warning Radars<sup>8</sup>

62. The Soviet aircraft warning system is based upon large numbers of early warning (EW) radars closely spaced throughout the USSR. These radars are of two general classes: the heavy or prime radars (such as TOKEN and BAR LOCK) which provide long-range tracking information, and the auxiliary radars (such as KNIFEREST and SPOONREST) which can track out to medium ranges. Under optimum conditions this system now has the capability to detect and track aircraft at medium and high altitudes within 200–250 n.m. of Bloc territory; under virtually all conditions the system could detect and track such aircraft within about 135 n.m. A new, more powerful, EW radar, TALL KING, has been deployed at several sites, improving detection capabilities against small, high-altitude targets.

63. Maximum altitude capabilities of Soviet EW radars range from 75,000 feet for the TOKEN to well over 200,000 feet for some of the newer radars (TALL KING). Height coverage of Soviet radars will continue to exceed the operational altitudes of Western aircraft during the period of this estimate. Low-altitude detection and tracking capabilities have been quite limited, but in the past two years, the Soviets have effected some improvement by the extensive deployment of SPOONREST and FLAT FACE radars.

#### *Ground-Controlled Intercept Radars*

64. The TOKEN and other heavy radars are also used for ground-controlled intercept (GCI), usually in combination with height-finder radars such as ROCK CAKE or STONE CAKE. Maximum altitude coverage of the Soviet radars used in the GCI role is comparable to that estimated for early warning, but ranges are somewhat less. These vary from about 100 n.m. for the TOKEN to more than 200 n.m. for the newer radars. Several types of radars now employ moving target indicators or other anticlutter techniques, but low-altitude capabilities of Soviet GCI radars are generally quite limited.

#### *Future Developments*

65. To assist in countering the Western air-to-surface missile threat, the Soviets probably will develop long-range tracking radars with improved capabilities against small, fast targets at high altitudes. TALL KING may have been a step in this direction. Improved medium-range

---

<sup>8</sup> For estimated characteristics of Soviet EW and GCI radars, see Annex A and Table 5.

radars may be developed to meet the threat of low altitude supersonic targets. All new Soviet EW and GCI radars probably will incorporate moving target indicators.

*Electronic Warfare*

66. At present, the USSR has an appreciable capability for jamming Western bombing and navigational radars at frequencies up to 10,000 megacycles per second and possibly higher, and especially for jamming at lower frequencies normally used in Western long-range radio communications. Shipboard and ground jamming equipment for use against X-band blind bombing radar is known to exist. The Soviets are also known to have employed electronic deception, including simulation of Western navigational aids, against Western aircraft. Present capabilities probably will be increased by the use of improved techniques and higher power. Toward the end of the period of this estimate the USSR will probably have in operation equipment capable of jamming at all frequencies likely to be used by Western communications, radar, and navigation equipment.

67. For a number of years, the Soviets have sought to strengthen their air warning system against enemy countermeasures. They have engaged in widespread ECM exercises for training of radar operators. In the last few years, evidence has indicated the use of greater frequency diversification, increased power, and other antijamming techniques. These trends probably will continue, but we believe that through 1966, Soviet electronic systems will still be subject to disruption by properly employed techniques.

68. *Passive detection.* We believe that the Soviet air defense system uses passive detection to supplement and extend EW radar coverage against targets outside its borders. A variety of specialized equipment is used for detection and direction-finding (D/F). This equipment can cover most frequencies used by Western communications and radar with good accuracy as to bearing. During 1960 a number of new passive detection sites were activated, and established sites received additional electronic equipment. The Soviets probably will continue to extend and improve this system. Soviet KRUG D/F installations may also contribute to passive detection.

*Detection of Missile Launchings*

69. The development of high frequency ionospheric backscatter radars for detection of long-range missile launchings has been within Soviet capabilities for the last five years. The Soviets have attained a high degree of competence both in the theoretical aspects of backscatter research and in practical applications. Much Soviet work in this field has related to development of new communications techniques, but

the Soviets probably also have used this method for detection of US nuclear detonations and possibly US missile launchings. Its use against missiles could probably provide a limited amount of early warning time, which could be used to alert defenses.

#### *Communications and Control*

70. For ground communications in support of air defense operations, the Soviets will probably continue to use and improve land lines and microwave links. Use of high frequency radio will decrease, but it will be available for special purposes and backup-ionospheric and tropospheric scatter communications may also be developed for use in the air defense system. The old four-channel, very high frequency communications equipment is still used by most Soviet fighters. The Soviets have installed a six-channel set in the newer Soviet fighters, but they have undertaken no concerted replacement program. Inadequate ground-to-air voice communications impose severe limitations on much of the Soviet fighter force; but these limitations are not so severe in these more modern fighter units deployed for the most part on the western approaches to the USSR. There is no indication of the employment of ultrahigh frequency systems for air-to-air and air-to-ground communications. The old Soviet IFF system, which has been in use for more than 10 years is being replaced.

71. The most important advance in Soviet air defense communications over the last few years has been the development and deployment of an air defense control system with some semiautomatic features, including data-handling equipment for rapid processing of air defense information and data link equipment for vectoring interceptors. Beginning about 1956, a Soviet system, similar in concept to the US SAGE system but less complex, was widely deployed in the western USSR. We believe that the ground element of this system has been replaced by a second-generation system, and that an improved semiautomatic fighter control system is being introduced. These new systems will probably be widely deployed in the USSR and possibly Eastern Europe within the next few years.

72. A video data link system has been introduced which is used to transmit the radar display from the radar site to the filter control center for visual presentation. This system is apparently used to supplement the existing semiautomatic system in the dense target areas of the western USSR. It is also deployed in East Germany, Poland, Hungary, Czechoslovakia, and Rumania. We believe that eventually it will be deployed throughout the Soviet Bloc.

#### *V. CIVIL DEFENSE*

73. Civil defense preparations in the USSR are supervised by the Local Antiair Defense of the Country (MPVO Strany), a central agency

subordinate to the Ministry of Defense with staff representatives at regional and local levels. Training the Soviet population in civil defense is the responsibility of the paramilitary mass organization Voluntary Society for Cooperation with the Army, Aviation, and the Fleet (DOSAAF). Since 1955, civil defense training has been, at least in theory, both universal and obligatory. About 80 million Soviet citizens over the age of 16 have received some instruction in civil defense, and some 20 million of these (or 1 adult in 7) have probably received good basic grounding in elementary civil defense techniques such as use of shelters, gas masks, protective clothing, and radiation monitoring equipment. On the other hand, the training program has suffered in many areas from poor instruction, shortage of training aids, and public apathy.

74. The most important deficiency is the lack of adequate shelter for the bulk of the population, although the USSR has a substantial lead over any of the Western Powers. Basement shelters of the World War II type are probably capable of providing some protection to perhaps 15 million city dwellers against radiation and fire. An estimated 2.5 million persons in Moscow, Leningrad, Baku, and Kiev can take refuge in subways, which are probably capable of resisting some overpressure. We presume that the USSR has prepared for the evacuation and protection of key party and government personnel, but we have no evidence on relocation centers. We estimate that detached and tunnel-type shelters and underground bunkers are available for about 2.5 million key personnel. Thus, some kind of shelter is available for about one-fifth of the urban population. Virtually nothing has been done to provide shelter for the rural population.

75. The shelter program appears to have been under reconsideration in the past few years. Some evidence indicates that the program for basement shelters may have been sharply curtailed or abandoned in 1958–1959, and recently there have been increased sightings of detached shelters. In the past two years, civil defense manuals have given increasing attention to evacuation, especially to preattack evacuation of “non-effectives” from likely target areas and their resettlement elsewhere for the duration of a war. However, there is no firm evidence of evacuation drills for the general public, and this program appears to be still in the planning stage.

76. In terms of shelters built and personnel trained, the USSR has made greater progress than any other major power. Even with limited warning these measures would probably reduce casualties by a significant margin. The existence of a disciplined civil defense organization, the use of shelter, and the widespread knowledge of simple techniques such as first aid would probably reduce casualties considerably, especially among key personnel. However, Soviet civil defense is not pre-

pared to cope with the effects of large-scale nuclear attack. Moreover, it would function extremely poorly under conditions of short warning time.

## VI. SOVIET AIR DEFENSE CAPABILITIES

### *Deployment*

77. Air defense weapons and equipment are most heavily concentrated in that portion of the USSR west of a line drawn from the Kola Peninsula to the Caspian Sea; in East Germany, Poland, and Czechoslovakia; and in the southern portion of the Soviet Far East. Concentrations are found at some specific locations outside these areas, especially in the Urals and in eastern China. The approaches to Moscow are by far the most heavily defended area of the Bloc.<sup>9</sup>

### *Warning Time*

78. The amount of warning time available significantly affects the capabilities of air defenses in various areas of the Bloc. Early warning radar could now give Moscow and many other targets in the interior more than one hour's warning of medium and high altitude attacks made with Western bombers of the B-52 type. Soviet assurance of such detection would be greatly reduced by extremely low level penetrations. The supersonic bombers and ASMs now being added to Western inventories could reduce this warning time by as much as 50 percent. Moreover, the more limited early warning time available in Bloc border areas would reduce the effectiveness of the defenses of even heavily defended targets in such areas. As the speeds of Western aerodynamic vehicles increase, and as Western ballistic missiles become a greater part of the threat, the problem of warning time will become more critical.<sup>10</sup>

### *Current Capabilities and Future Trends*

79. The extensive deployment of surface-to-air missiles over the past two years has significantly improved Soviet air defense capabilities. The present capabilities of the Soviet air defense system would be greatest against penetrations by subsonic bombers in daylight and clear weather at altitudes between about 3,000 and about 45,000 feet. Under such conditions, virtually all types of Bloc air defense weapons could be brought to bear against attacking aircraft. Most Soviet fighters can operate at altitudes up to about 50,000 feet, and some up to about 55,000 feet, but the capabilities of the fighter force would be reduced considerably during periods of darkness or poor visibility. In the

<sup>9</sup> See Annex B, Figure 1.

<sup>10</sup> See Annex B, Figure 4.

increasingly widespread areas defended by surface-to-air missiles, air defense capabilities would be virtually unimpaired by weather conditions and would extend to about 60,000 feet, with some capabilities up to about 80,000 feet.

80. Despite its recent and considerable improvements, however, the Soviet air defense system would still have great difficulty in coping with a large-scale air attack employing varied and sophisticated tactics, even within the foregoing altitudes. In addition, the Soviet defense problem would be complicated by the variety of delivery systems which might be employed, including cruise-type missiles, fighter-bombers, and supersonic bombers.

81. At altitudes below about 3,000 feet, the capabilities of the system would be progressively reduced; below about 1,000 feet, the system would lose most of its effectiveness. Thus, at present, the USSR has little capability for active defense against very low altitude attacks. Nor does the present air defense system have any capability against ballistic missiles.

82. We believe that the Soviets will continue to improve the overall capabilities of their large and complex air defense establishment. They are making vigorous efforts to counter more advanced Western weapon systems. Forthcoming major developments will probably include: (a) the initial deployment within the next year of a surface-to-air missile designed to intercept aircraft at very low altitudes and (b) at least limited deployment within the next five years of an air defense system with an undetermined capability against ballistic missiles.

Nevertheless, the Soviets probably will still [illegible in the original] a high degree of assurance in dealing [illegible in the original] a large-scale sophisticated attack by [illegible in the original] bombers, armed with high-yield nuclear [illegible in the original] weapons. They would probably ex-[illegible in the original] destroy a significant number of the attackers, but given the increasing complexity of the air defense problem, we doubt they will be confident of the extent to which they can reduce the weight of such an attack. The air defense problem has been radically altered by the advent of long-range ballistic missiles. Barring an unforeseen technological breakthrough, the USSR's air defense deficiencies and uncertainties will sharply increase as ballistic missiles assume a larger proportion of the West's total nuclear delivery capability.

Annexes

Table 1  
PROBABLE SOVIET DEVELOPMENT PROGRAM FOR SURFACE-TO-AIR MISSILE SYSTEMS<sup>a</sup> (Ground Launched)

Arbitrary Reference Designation	Initial Operational Capability Date <sup>b</sup>	Maximum Effective Altitude <sup>c</sup> (in feet)	Maximum horizontal Range (nm) <sup>c</sup>		Operational <sup>d</sup> Accuracy (CEP in ft.)	Guidance	Maximum Warhead <sup>e</sup> (lbs. and type)	REMARKS
			Speed Class					
			20-30	3.5				
SA-1	1954	60,000 <sup>f</sup> (minimum about 3,000).	20-30	3.5	65-120	Track-while scan/radio command.	500 HE or Nuclear.	Deployed around the Moscow area only. Uses V-301 guided missile. GUIDELINE (part of SA-2 system) may be used in some SA-1 sites replacing V-301.
SA-2	1957	60,000 <sup>f</sup> (minimum altitude about 2,500) <sup>g</sup> .	25-30	3.5	100	Track-while scan/radio command.	400 HE or Nuclear.	Mobile SAM system using GUIDELINE missile. Extensively deployed in USSR; chief advantage is its flexibility in deployment.
We estimate that in the next few years the system could be improved in range, altitude, and ECCM capabilities.								
SA-3	1961	40,000-60,000 . . . Nominal minimum 50	12-15	2	20	Semiactive CW radar homing.	200 HE or Nuclear.	Mobile system: for use with field forces and defense of industrial and communications centers.

Table 1  
PROBABLE SOVIET DEVELOPMENT PROGRAM FOR SURFACE-TO-AIR MISSILE SYSTEMS<sup>a</sup> (Ground Launched)  
(Continued)

Arbitrary Reference Designation	Initial Opera- tional Capa- bility Date <sup>b</sup>	Maximum Effective Altitude <sup>c</sup> (in feet)	Maximum horizontal Range (nm) <sup>c</sup>	Opera- tional <sup>d</sup> Accuracy (CEP in ft.)	Guidance	Maximum Warhead <sup>e</sup> (lbs. and type)	REMARKS
			Speed Class				
SA-4 (AMM)	1963- 1966	Soviets will probably deploy an antimissile missile system during 1963-1966 even if the system provides only an interim limited capability.					

<sup>a</sup> We evaluate this program as “probable” with varying degrees of confidence concerning detailed characteristics. Each missile listed will probably go through various states of development which are not necessarily reflected in this table.

<sup>b</sup> The date when the first operational unit is trained and equipped with a few missiles and launchers.

<sup>c</sup> Maximum altitude is not necessarily achieved at maximum range. Range will vary with the size, direction of approach, and altitude of the attacking aircraft. A limited capability will exist above the estimated altitude.

<sup>d</sup> Accuracy varies with target size, speed, altitude, and range.

<sup>e</sup> Warhead includes the explosive device and its associated fusing and firing mechanism.

<sup>f</sup> Would have some effectiveness up to 80,000 feet, especially if equipped with a nuclear warhead.

<sup>g</sup> Variations in such factors as sitting conditions and target speeds could result in low altitude limits as low as 1,000 feet or as high as 7,000 feet. Against supersonic targets, low altitude limits would be higher. There is some evidence that the Soviets themselves consider that minimum SA-2 engagement altitude would be about 10,000 feet, but we do not know the circumstances assumed in the Soviet calculations.

<sup>a</sup> Unless otherwise noted, performance figures are calculated with internal fuel only.

<sup>b</sup> Combat ceiling is the maximum altitude at which the rate of climb is 500 feet per minute with maximum power and at combat weight. All of the newer supersonic fighters can attain significantly higher altitudes—possibly up to 70,000 feet—using zoom techniques. However, operational capabilities would be progressively reduced above combat ceiling.

<sup>c</sup> Time to climb is calculated on the basis of gross take-off weight with internal fuel only.

<sup>d</sup> In calculating optimum mission, fuel reserves are reduced to permit extended range. Optimum mission with external fuel assumes two wing tanks except in the case of FLASHLIGHT A which carries one belly tank.

<sup>e</sup> These are considered to be maximum loads with internal fuel only, and do not exclude the possibility of other combinations of rocket and missile armament.

<sup>f</sup> FRESCO "E" has performance characteristics similar to those of FRESCO "A" and "B," but is equipped with airborne intercept radar of the FRESCO "D" type.

<sup>g</sup> FARMER "B," "C," and "D" versions are also in operational use. FARMER "C" and "D" have range only radar. FARMER "B" has search and track radar with search/track capabilities similar to those of the FARMER "E" radar.

<sup>h</sup> As the result of evidence acquired during the past year, our estimates of combat ceiling have been lowered by about 5,000 feet in the case of FARMER, and by about 10,000 feet for FISHBED, FITTER, and FISHPOT.

OTHER: Soviet development of improved air-to-air missiles over the next few years is contingent upon trends in Soviet fighter and Western bomber forces and in Soviet surface-to-air missile defenses.

<sup>a</sup> We evaluate this program as "probable" with varying degrees of confidence concerning detailed characteristics. Each missile listed will probably go through various stages of development which are not necessarily reflected in this table.

<sup>b</sup> The date when the first operational unit is trained and equipped with a few missiles and launchers.

<sup>c</sup> Warhead includes the explosive device and its associated fusing and firing mechanism.

<sup>d</sup> Range is here defined as the distance between launching aircraft and target at the instant of missile launch.

<sup>e</sup> Mach 2 plus the speed of the launching aircraft is considered reasonable speed for all the missiles estimated.

<sup>f</sup> Clear air mass is here defined as absence of clouds and precipitation between missile and target. The term is equally applicable to day or night operations. In addition, an infrared system is also degraded by bright background such as white clouds and attack angles close to the sun.

<sup>a</sup> Maximum normalized operational range capabilities are presented. These ranges may be reduced or increased by as much as 25 to 50 percent under some operational conditions. These changes depend upon siting, weather, altitude, alertness of the operator, and a variety of other factors depending on the individual radar and its site.

<sup>b</sup> In determining these ranges, a 25 percent blip/scan ratio was assumed. Range at 25 percent blip/scan ratio is believed to represent probable maximum detection range. Precise tracking, however, would require a higher blip/scan ratio.

<sup>c</sup> These figures represent our best estimate of radar performance as limited by the pulse repetition frequency (PRF). At these ranges, a 60 percent blip/scan ratio would be achieved. Ranges could be considerably greater if the Soviets have evolved techniques for detecting ambiguities in range data and determining true ranges.

<sup>d</sup> For detection and tracking at such ranges, limitations of the radar horizon (if radar were located at sea level), would require target altitudes in excess of the capabilities of currently operational Western aircraft.

## August 1961

### 239. Memorandum from Gen. Lemnitzer to McNamara, August 7<sup>1</sup>

CM-308-61

August 7, 1961

#### SUBJECT

Program Package I

I refer to your memorandum of 20 July 1961, in which you requested my recommendations on all major programs included in Central War Offensive Forces, Program Package I. I refer further to our discussion on 4 August 1961, during which I expressed my views on these programs. My views are confirmed as follows:

1. MINUTEMAN (Hardened and Dispersed)—The MINUTEMAN (H&D) system has great potential for rapid quantitative expansion. The retention of a production base to maintain this potential is important. However, in view of the substantial numbers of other important systems which make up the essential mix of delivery capability in Program Package I, I recommend procurement of no more than 300 additional MINUTEMAN (H&D) in FY 63. Decision as to the ultimate number of MINUTEMAN need not and should not be made at this time.

2. POLARIS—I am particularly impressed by the comparatively high reliability, low level of vulnerability, and versatile retargeting capability of the POLARIS system. I recommend further procurement at a rate of 6 additional FBM submarines per year. Decision on the end number required should be deferred at this time.

3. SKYBOLT (GAM-87)—In my view, the degree of invulnerability possessed by airborne B-52H/SKYBOLT aircraft plus the ability to attack from multiple directions without penetration of Soviet defenses justifies production of this system. This view is based, however, upon three assumptions, the validity of which I have not yet confirmed:

- a. SKYBOLT is now technically ready for production.
- b. Design criteria will be met.
- c. Can be operational by 1965.

Provided these assumptions are valid, I recommend procurement for 7 squadrons.

---

<sup>1</sup> JCS recommendations on "Central War Offensive Forces, Program Package I." Top Secret. 3 pp. National Archives and Records Administration, JCS Records, JMF 7000 General (6 May 61), Sec. 3.

4. MINUTEMAN (Mobile)—During the mid-1960's, it appears to me that mobility will continue to be a most important factor in reducing vulnerability. I recommend procurement of 1 squadron, 10 trains, to provide a base of operational experience should additional mobile MINUTEMAN prove to be necessary.

5. KC-135—Based upon currently available information, a total requirement for 38 squadrons appears to be justified; this number to be adjusted pending outcome of Air Force study of the relationship of KC-135 aircraft to the SKYBOLT system.

6. 465-L Command and Control—I recommend research and development funding at this time. This system should receive further consideration following Air Force study of a survivable command and control system.

7. Airborne alert—In that deficit funding is now authorized, it appears there is no need for further decision at this time.

8. B-47 phase out—In view of the current and foreseeable world situation I consider it unwise to reduce the B-47 force in FY 1963, as is now programmed. Accordingly, I recommend retention of the 13 wing, 52 squadron force level through FY 1963. Subsequent B-47 phase out should be reassessed in one year.

9. TITAN II—TITAN II is the only quickly responsive missile system capable of delivering 6000 pound payloads. As such TITAN II provides versatility of a sort possessed by no other missile system currently being considered. I recommend procurement of two additional squadrons.

10. B-52H—I recommend no further B-52 procurement beyond the 14 wing force now approved.

11. ATLAS, JUPITER, and THOR phase out—The major expenditures for these systems have already been made. These are weapon systems which require Soviet targeting and have a considerable capability. Further, JUPITER and THOR can be retained at minimum cost in U.S. manpower. I recommend decision to phase out these systems be deferred another year.

SUBJECT

Current Status of Soviet and Satellite Military Forces and Indications of Military Intentions

1. *Changes in Capabilities.*<sup>2</sup> In recent weeks the USSR, and to a lesser extent the Satellites, have undertaken a series of measures aimed at several purposes: to display their military strength, to augment that strength, and to demonstrate their readiness to use it if necessary. These moves have included, in the USSR, the display of advanced aircraft and airborne missiles at Aviation Day, the announcement of a supplemental defense allocation of 3.1 billion rubles and of suspension of troop reductions, the subsequent announcement that an undisclosed number of men due for discharge will be retained, the invitation to Western attaches to attend an exercise featuring simulated tactical nuclear weapons, and the resumption of nuclear testing. In the Satellites, East Germany has launched a recruiting drive with a goal of 47,000 enlistments, Czechoslovakia is calling up some reservists and perhaps extending the terms of some personnel, and Poland has announced plans to follow the Czech lead.

---

<sup>1</sup> Transmits memorandum on "Current Status of Soviet and Satellite Military Forces and Indications of Military Intentions." Top Secret. 15 pp. CIA Files, Job 80B0676R, DCI/EA Files, White House, Sep-Dec 61.

<sup>2</sup> A summary of Soviet and Satellite forces in Europe facing NATO is at Annex. For a full discussion and detailed tables of Soviet and Satellite military strengths, see NIE 11-4-61, "Main Trends in Soviet Capabilities and Policies, 1961-1965," Annexes A and B, dated 24 August 1961, TOP SECRET.

2. Of these moves, only those relating to manpower will affect capabilities in the near future. (The increase in defense spending is for unknown purposes, and part of it might serve to raise current capabilities by such means as intensifying military training or establishing alert forces within the bomber fleet.) When the Soviet personnel reduction was suspended, the military establishment totaled approximately 3 million; the extension of service could raise this, by year's end, by a further quarter million (or, if all personnel are held in service, by three-quarters of a million). We believe that this move reflects primarily a desire to improve the quality of Soviet forces by retaining trained personnel. In our view, it is almost certain that there has been no significant reinforcement of Soviet forces in Eastern Europe, or crash programs for re-equipment. Nor do we have evidence that advanced weapons have been deployed westward in recent weeks.

3. The status of the Soviet ICBM program deserves special attention. The USSR is now engaged in the flight-testing of at least one type of second-generation ICBM system. Test firings began early this year, and thus far the firing program has been more intensive but much less successful than the earlier program to develop a first-generation ICBM. Still another vehicle, which may be for space flight or weapon delivery purposes, is also being test-fired from Tyuratam to Kamchatka this year. Based on the chronology and the degree of success to date, we are confident that neither of these new vehicles will be operational as ICBM weapon systems during the coming autumn and winter. You are aware of existing disagreements in the intelligence community regarding current Soviet ICBM strength on launcher. These estimates cover the span from "a few" to 125 as of mid-1961 and are presently under urgent review. Although there has to date been no formal change in the estimates of Soviet ICBM strength contained in NIE 11–8–61, we now believe that our present estimate of 50–100 operational ICBM launchers as of mid-1961 is probably too high.

4. Our estimate was based on the belief that for several years the Soviets had engaged in a relatively steady though deliberately paced program to deploy first-generation ICBMs. On the basis of accumulating evidence of ICBM development and deployment, we now believe that the Soviet leaders recognized the serious disadvantages of their extremely cumbersome first-generation system and proceeded to the vigorous development of a more suitable second-generation system. We now believe that they deliberately elected to deploy only a small force of first-generation ICBMs in 1960–1961, even though they had the capability to deploy ICBMs in considerably greater quantity. During this same period, Soviet propaganda assiduously cultivated an image of great ICBM strength, relying heavily on Soviet space achievements to bolster these claims.

5. If our present view of the course of the Soviet ICBM program is correct, then the USSR has been and still is conducting its foreign policy from a position of less strength in intercontinental striking power than the Soviet leaders have sought to imply. Nevertheless, the present Soviet ICBM capabilities, along with those of bombers and submarines, pose a grave threat to US urban areas, but a more limited threat during the months immediately ahead to our nuclear striking forces.

6. On the other hand, we are more confident of our previous estimate of medium-range ballistic missiles. These weapons give the Soviets a formidable capability against our NATO allies and against our forces in Europe.

7. *Readiness.* Military ground and air activity in the USSR and Eastern Europe presently reflects a normal level of readiness. Naval out-of-area operations are somewhat higher than normal but this is not a greater divergence from normal than has occasionally occurred in the past. Commercial shipping is generally normal. The Soviet troops in East Germany which were deployed in connection with the border action of 13 August have returned to their locations. The two East German divisions which moved from the north to the Berlin area in July-August remain there, suggesting a permanent relocation which may involve some shift in areas of responsibility between the Soviet and East German forces. Intensified training by the East German Air Force suggests that it is being prepared for a greater role in the air defense of East Germany, including policing of the air corridors to Berlin.

8. The Soviet forces in Germany are at a generally high state of combat readiness. Activity is seasonally normal; the arrival of new conscripts has just begun, and the exercise schedule of former years is being followed. Regimental level exercises are now taking place, and preparations for divisional exercises are underway. This training cycle normally reaches its peak in late October-early November, at which time the Soviet forces are in their highest state of readiness. In December, when units return to their garrisons following maneuvers and rotation of troops eastward for discharge normally occurs, this readiness falls off. This drop will be avoided this year if the troops in East Germany are among those whose terms are extended, and if they are held in East Germany.

9. *Intentions.* We have no indications in the present pattern of military activity of actual intent to initiate the use of force. In the future, we do not expect that military activity will provide conclusive evidence of intent to attack, except perhaps late in a crisis situation, since most indications will also be consistent with an intention to deter or to defend if attacked.

10. With respect to intentions, Khrushchev has stated that a Western attempt, after a separate peace treaty, to maintain access by force would

be met with counterforce. We believe him. Despite his reiterations that such a conflict would “inevitably grow” into general nuclear war, we believe that the USSR would seek to keep such a conflict limited and non-nuclear, although it would almost certainly respond in kind to any raising of the stakes which threatened to result in a Soviet defeat.

11. *Possible Future Developments.* We anticipate that, in the coming months, the Soviets will take further actions designed to improve their general military posture, to intimidate the West, and to convince their opponents that they are determined to pursue their objectives in the face of high risks. On the ground in East Germany, they may increase their forces and deploy troops along the East-West German border or along Western access routes to Berlin. They may take measures to prepare their population for the possibility of war. To strengthen the image of Soviet military might, they may detonate a thermonuclear device of considerably higher yield than any they have yet tested. Other possibilities are the detonation of a variety of missile-delivered nuclear weapons—perhaps in the Novaya Zemlya area or in the vicinity of the instrumentation ships which are still at sea in the Pacific. They may stage large-scale Warsaw Pact maneuvers to create an impression of the solidarity of that alliance.

## Annex

### SOVIET AND SATELLITE FORCES IN EUROPE FACING NATO

1. Soviet ground strength in Eastern Europe is 26 combat ready divisions, backed up by 44 combat ready and 27 low strength divisions in Western USSR. Short-range ballistic missiles, capable of carrying either nuclear or conventional warheads, in mobile units, are probably assigned to these forces. The Satellite armies have a total of 59 divisions of varying degrees of effectiveness and reliability. Soviet and Satellite divisions by type are shown in Tables 1 and 2.

2. Soviet forces in East Germany represent a powerful armored force of about 350,000 men, with 10 tank and 10 motorized rifle divisions, well over 5,000 tanks, and supporting artillery and other units. The USSR has the back-up capability for reinforcement and continuing resupply so long as the logistical lines from the USSR are intact. These forces are equipped with dual-capable weapons and carriers. There is some evidence that nuclear warheads are presently stocked in East Germany for Soviet ground forces, although storage sites have not been identified. The Soviets could readily provide tactical nuclear weapons to their forces in Eastern Europe.

3. Soviet Tactical Aviation now has about 175 jet light bombers and 900 fighters in Eastern Europe. The Satellites together have about

125 light bombers and about 2,100 fighters intended primarily for air defense. In the European USSR, there are in Tactical Aviation an additional 75 medium bombers, 325 light bombers, and about 1,000 fighters.

4. The Soviet Navy has some 130 modern long-range submarines (including 21 missile launching ships), 3 cruisers, and about 50 destroyers and destroyer escorts in the Northern Fleet capable of engagement in the North Atlantic, in addition to units in the Baltic and Black Seas. There are about 250 naval medium bombers (BADGERS), the bulk of them equipped with air-to-surface missiles, with these European fleets.

5. Some of the 975 medium bombers of Long Range Aviation and medium and intermediate range missiles of the Rocket Forces are also available to support theater campaigns in Europe. We estimate that the USSR now has a force of medium range (700 and 1,100 n.m.) missiles which approaches 250–300 operational launchers, the majority of which are deployed within range of West European targets.

#### 241. Memorandum from Gen. LeMay to SAFS, September 18<sup>1</sup>

September 18, 1961

##### SUBJECT

(C) Recommended Long Range Nuclear Delivery Forces 1963–1967

1. (SECRET) I have reviewed the proposed memorandum to the President on “Long Range Nuclear Delivery Forces 1963–1967” which was forwarded to you on 29 August 1961, by the Secretary of Defense for comment. In my view, the reductions in certain strategic offensive systems substantially below Service recommended levels for Fiscal Year 1963 procurement are not justified.

2. (TOP SECRET) The general war deterrent strategy set forth as a basis for force level determinations is not clearly delineated. While rejecting the dangers of “minimum deterrence”, the posture counseled largely contradicts that intent.

a. For example, the requirement is recognized for the capability to respond with nuclear attack against the Soviets in case of major assault upon our Allies. It is implied, however, that we should not attempt to

---

<sup>1</sup> Recommendations on long-range nuclear delivery forces, 1963–1967. Top Secret. 3 pp. Washington National Records Center, Records Group 330, OSD Files: FRC 71 A 3470, Misc Budget.

develop the capability to pre-empt in the case of unequivocal strategic warning of impending attack upon the United States itself.

b. This embodies the suggestion that we would be in a less favorable position if we responded to a threat of attack only against the U.S., than if we retaliated to assault upon one or more of our Allies. We would, in fact, be in a far better position in the former case, and could expect Allied contribution to our response.

c. In my judgment, both capabilities are vitally necessary to a viable deterrent strategy and to our collective security commitments; a force capable of either will be capable of both; and such a force is infeasible only if we choose to regard it as such.

d. I am particularly concerned over the implication that we cannot provide required strategic forces except at the cost of resources needed to increase the conventional capability of our theater forces. I have supported conventional improvements with the clear understanding that the strategic posture would not be permitted to weaken, since a strong nuclear deterrent posture is the essential element of military strength which makes a conventional option feasible. This is a fundamental tenet of the new U.S. policy toward NATO which is predicated upon the assumption that in preparing to meet non-nuclear attack in NATO we would not divert resources from "programs to assure an ample and protected U.S. strategic power".

3. (TOP SECRET) In addition, the calculations which underlie the judgment reached on forces give rise to questions on points such as the following:

a. While a range of assumptions are employed, only one basic case is assessed, and that includes a threat of unrealistic dimensions.

b. The enemy attack against the proposed U.S. force appears to have been developed without full regard for optimum programming against all elements of the U.S. and Allied nuclear threat to the enemy.

c. The estimates of the median numbers of enemy missiles appear to comprise an unweighted average between two extreme views in published estimates now in process of significant revision, rather than a median.

d. The assumptions regarding the deployment, hardening, yield and accuracy of enemy ICBMs are not consonant with current estimates, and seriously exaggerate the kill potential of the Soviet hardened follow-on ICBM.

e. The target system postulated omits important elements of enemy capability, obscures the distinction between targets and aiming points, contemplates indiscriminate attack upon enemy population and urban floorspace, and invites unacceptable risk by excluding Communist China and the satellites except for possible defense suppression objectives.

f. The weapon loading of bomber alert forces is significantly overstated.

g. It is stated that the Soviet IRBM/MRBM threat can be most economically attacked intercontinentally. In the face of rapid growth of this threat, NATO will not long exist without suitable countering weapons of its own. A NATO MRBM capability would be both cheaper and more effective.

4. (SECRET) A number of the judgments made on the ability to delay or modify current procurement decisions without impact upon future options are also questioned. The decision on increased MINUTEMAN force levels cannot be delayed beyond the Fiscal Year 1963 Budget cycle without the risk of serious penalties to an orderly, economical and operationally feasible program leading to timely final system installation and check out. Similarly, while there is apparent agreement on Fiscal Year 1963 procurement of additional KC-135 jet tankers, the proposed reductions in future force goals have immediate implications. Future KC-135 levels bear upon production rate, and support for an increase from 9 to 14 per month is required in the Fiscal Year 1963 Budget actions.

5. (CONFIDENTIAL) I am particularly concerned as to the security of sensitive war planning information contained in Sections II and III and the Appendices of the proposed memorandum to the President. The Joint Chiefs of Staff are in agreement that these sections should be removed, retained under close control in the Department of Defense, and not be forwarded to the President.

6. (SECRET) My views as to the levels of strategic offensive forces required are expressed in the Departmental Submission for the FY 1963 Budget. I have discussed the strategic concepts underlying the development of these force levels with the Secretary of Defense on at least two recent occasions. Additionally, the Joint Chiefs of Staff have reached full agreement as to the numbers of strategic weapons which should be specifically procured in the FY 1963 Budget. This agreement should be supplemented by funding of necessary long lead-time items to protect the option to attain the force goals reflected in Departmental submissions, for MINUTEMAN and POLARIS for example, upon possible later determination that such higher levels are required.

7. (CONFIDENTIAL) It is my strong conviction that our requirements for added military strengths in long-range nuclear delivery forces are a matter of the highest priority to the future security of the United States. If this dictates an expanded budget, then I am convinced that it can be expanded with public understanding and Congressional support.

8. (UNCLASSIFIED) This letter is classified TOP SECRET to safeguard details of planning for future force levels of strategic offensive weapon systems.

**242. Memorandum from Gen. Taylor to Gen. Lemnitzer,  
September 19<sup>1</sup>**

September 19, 1961

The President has asked me to pass the attached list of questions to you for transmission to General Power.

He would like General Power to respond to these questions at their meeting tomorrow, September 20th.

**Maxwell D. Taylor**

**Attachment**

1. Attached herewith are a number of questions bearing on the Single Integrated Operations Plan (SIOP) which you may wish to ask General Power at your meeting with him tomorrow. The questions are designed to produce answers to some of the alleged weaknesses of the SIOP which include the following:

*a.* Without engendering dangerous confusion, it is difficult if not impossible to vary the schedule of planned strikes by excluding planned targets, bringing in new ones or stopping the schedule.

*b.* As a result of the inflexibility noted in *a* above, in an escalating situation over Berlin, we could not execute a surprise first strike exclusively against Soviet military targets if we so desired.

*c.* If four weapons are scheduled for delivery on a target and the target is destroyed or the enemy capitulates after two have been delivered, it is not possible to withhold the remaining two.

*d.* If the Alert Force is launched on a false alarm and later must turn back, our strike capability will be degraded for a significant period.

---

<sup>1</sup> Transmits list of questions for General Power's use in his meeting with President Kennedy. Top Secret. 5 pp. National Defense University, Taylor Papers, 33 66 NATO.

2. In obtaining answers to the foregoing, it is important to separate out what controls are available now and what are for the future. This time factor was not clear in the briefing last Thursday. Also, when the point is made that the injection of some forms of flexibility will reduce military effectiveness, we should get some feel whether the reduction is so serious as practically to eliminate the option.

3. If the questions appear to cover the ground which you wish to cover with General Power, I will have them transmitted to him at once.

Maxwell D. Taylor

### Attachment

#### STRATEGIC AIR PLANNING

Question #1. I understand the strategic attack plan now contains 16 "options." I gather the impression, however, [text not declassified]. Is it now possible to exclude [text not declassified] from attack? If not, how soon could you develop a plan which contains such options? Can whole areas, [text not declassified] be eliminated from attack? If so, at what risk?

[text not declassified]  
[text not declassified]  
[text not declassified]  
[text not declassified]  
[text not declassified]  
[text not declassified]

Question #3. [text not declassified] would leave a sizeable number of MRBMs facing Europe.

a. Would the inclusion of these MRBMs in the initial attack so enlarge the target list as to preclude tactical surprise?

b. If so, is it possible to plan an immediate follow-on attack which would strike these targets before the first attack was completed? In particular, would our European land and sea-based air forces be suitable for this task?

Question #4. I am concerned over my ability to control our military effort once a war begins. I assume I can stop the strategic attack at any time, should I receive word the enemy has capitulated. Is this correct?

Question #5. Although one nuclear weapon will achieve the desired results, I understand that, to be assured of success, more than one weapon is programmed for each target. If the first weapon succeeds, can you prevent additional weapons from inflicting redundant destruction? If not, how long would it take to modify your plan to cover this possibility?

*Question #6.* What happens to the planned execution of our strategic attack if the Alert Force is launched and several hours later it is discovered that it has been launched on a false alarm? How vulnerable would we be, and how soon would the U.S. be in a position to attack the USSR?

*Question #7.* After the Alert Force has been launched, how do I know that our remaining forces are being used to best advantage. Are these follow-on forces automatically committed to predetermined targets, or do we have means of getting damage assessments to direct their attacks?

*Question #8.* Given the European situation, some of SACEUR's tactical fighters now scheduled for atomic attacks may be employed for conventional support of ground forces instead. Can other forces take over the responsibility of hitting SACEUR's atomic targets without jeopardizing the success of the plan materially?

---

## 243. National Intelligence Estimate, NIE 4-3-61, September 21<sup>1</sup>

September 21, 1961

### NUCLEAR WEAPONS AND DELIVERY CAPABILITIES OF FREE WORLD COUNTRIES OTHER THAN THE US AND UK

#### THE PROBLEM

To estimate the capabilities and intentions of Free World countries other than the US and UK with respect to the development of an operational nuclear capability, i.e., both nuclear weapons and compatible delivery systems,<sup>2</sup> over the next decade.

(NOTE: In this paper we deal with the potential of certain individual Free World countries and certain groupings of them to develop an operational nuclear capability at present levels of external assistance, the likelihood of their initiating programs, and also the forms such programs might take. Any significant change in the level of external aid would clearly alter the basic estimates in regard to timing, likelihood, and form, contained herein.)

---

<sup>1</sup> "Nuclear Weapons and Delivery Capabilities of Free World Countries Other Than the US and UK." Secret. 16 pp. CIA Files, Job 79R01012A, ODDI Registry.

<sup>2</sup> The words "operational nuclear capability" are used with this meaning throughout this paper.

## CONCLUSIONS

1. The prerequisites to developing a nuclear weapons program are becoming increasingly available to nonnuclear states. Uranium is easier to obtain; many countries are acquiring research and power reactors and are training technicians; information on weapons technology is more widespread. Nevertheless, the inhibitions on deciding to start a weapons program are formidable. At the present state of the art, the most limited weapons program would cost in the hundreds of million dollars and a moderate program of sophisticated weapons and delivery systems would run into the billions. We estimate that over the next several years there will be no technological breakthrough which would significantly alter the complexity and costs of these tasks. Furthermore, decisions on undertaking a nuclear weapons program remain profoundly influenced by psychological, political, and military considerations. (*Paras. 5–15*)

2. France, and possibly Israel, have already made the decision to develop operational nuclear capabilities. Assuming no increase of outside aid, we estimate their program as follows:

*a. France* will almost certainly continue its program, and by 1962–1963, if it overcomes the difficulties shown in the 1961 tests, it will probably have an initial operational nuclear capability using light bombers and compatible fission bombs. Provided France maintains a large-scale effort, by the end of the decade it could have a varied strike capability using aircraft, missiles with ranges up to 1,500–2,000 n.m. with either high-yield fission or thermonuclear warheads, and possibly nuclear-powered missile submarines. Loss of the Sahara testing sites could create major problems for the French. (*Paras. 20–22*)

*b. Israel* has strong incentives to develop a nuclear capability against its Arab neighbors and has received significant assistance from France. With the addition of plutonium separation facilities, Israel could probably produce by 1965–1966 sufficient weapon grade plutonium for one or two weapons a year, deliverable by aircraft. By 1968 Israel could also have its own 200–300 n.m. missiles. Israel's lack of space for testing weapons or missiles imposes a considerable obstacle to its programs. Without a continuation of the scale of aid Israel has received from France, the program would be delayed at least a year or two. (*Paras. 23–28*)

3. We believe that no other Free World country has made the decision to start a nuclear weapons program. Among the countries which might do so in time to produce an operational nuclear capability before 1971 are Sweden and India.

*a. Sweden* is not likely to make a decision before 1963. If it then decided to pursue a weapons program, it could probably explode a

device by 1965–1966, have a weapon deliverable by aircraft a year or so later, and fission warheads for domestically developed 500 n.m. missiles by the end of the decade. (*Paras. 29–31*)

*b.* If *India* decided within the next year or two to start a weapons program, it could have a modest capability, using aircraft and fission weapons, by 1968–1969. A decision by India to initiate a weapons program would probably be made only if the Communist Chinese first exploded a device, and if Communist Chinese foreign policy became more truculent. (*Paras. 32–35*)

4. We believe it unlikely that any other Free World country or possible grouping of countries will initiate weapons programs during the next several years. Even if they were to decide to do so, we believe that none except Canada could detonate a test device for at least 4–5 years after decision and could probably not, on their own, develop the types of weapons and delivery systems suitable to their needs before the end of this decade. (*Paras. 17–18, 36–44, Table II, page 4.*)

## DISCUSSION

### I. GENERAL CAPABILITIES

#### A. *Nuclear Weapons Capabilities*

5. The minimum requirements for the development and production of nuclear weapons include: (a) access to a supply of natural uranium; (b) the ability to separate weapon grade uranium 235 from natural uranium or to extract the plutonium produced in a reactor; and (c) the scientific and technical ability to design and fabricate the weapon. As indicated in Table I, these general requirements can, or could within the period of this estimate, be met by a number of countries. Moreover, as world uranium production and commercial sales of power reactors expand, it appears likely that, in absence of effective international controls, a country without domestic sources of natural uranium will be able to acquire it. It is also likely that any country will be able to obtain reactors which could be used for plutonium production, and could theoretically acquire the technical ability to produce at least a few crude weapons. While a number of countries supplying uranium to others impose restrictions on its use and ultimate disposition, sources which are willing to sell without restrictions are increasing, and some purchasers are reluctant to accede to limitations on use.

6. It is theoretically feasible for a country which has produced weapon grade fissionable materials to design and fabricate a nuclear weapon without testing. However, an untested weapon would be of uncertain reliability unless the producer had been supplied with the detailed design of a previously tested weapon. Hence we believe it highly unlikely that any country would manufacture and stockpile

weapons of original design without first having conducted tests. The finding of suitable test sites would be a very difficult problem for most of these countries. While countries could theoretically conduct nuclear tests underground, such testing would involve a significant increase in costs, considerable time delays, and reduced diagnostic returns.

TABLE I  
SELECTED INDICATORS OF NUCLEAR WEAPON  
PRODUCTION CAPABILITY

COUNTRY	XXX—Major XX—Moderate		X—Small P—Potential	
	Domestic Availability of Uranium <sup>a</sup>	Nuclear Research Program	Nuclear Power Program	Industrial Resources Capacity
France	XXX	XXX	XXX	XXX
West Germany	X	XXX	X	XXX
Italy	X	XX	XX	XX
Belgium	—	XX	X	XX
Netherlands	—	XX	P	X
Norway	—	XX	X	X
Canada	XXX	XXX	XX	XXX
Sweden	XX	XXX	XX	XX
Switzerland	—	X	P	XX
Japan	X	XX	X	XX
India	XX	XX	X	XX
Israel	—	XX	P <sup>b</sup>	X
UAR	P	P	P	X
Australia	XX	X	P	XX

<sup>a</sup> This is a factor of diminishing importance because of the increasing ease with which nations can purchase uranium ore either with or without restrictions on its use or disposition.

<sup>b</sup> See paragraphs 23–24 of text.

7. Between the decision of a country to undertake a nuclear weapons program and the time when the first crude weapons are produced, a considerable time would elapse. This would be true even in the case of a grouping of countries having a joint nuclear research and power program. This time would vary from a few years to a decade depending upon a country's level of nuclear technology, its general industrial and scientific potential, the availability of testing sites and type of testing pursued, as well as the importance and urgency it might attach to the acquisition of such weapons. In most cases, the bulk of this time would

probably be needed to construct and operate the main installations for obtaining weapon grade materials, either plutonium from a reactor or U-235 from an isotope separation plant.

8. As the number of power and research nuclear reactors in a country increases, the potential for producing plutonium will increase, which could reduce the time between decision and the availability of nuclear weapons. However, it is highly unlikely that countries which have not already initiated plutonium production programs could accumulate significant amounts of weapon grade materials in the next several years, given the present restrictions on the use of purchased uranium in many cases, and even more importantly, the absence of plutonium separation plants.

9. Furthermore, the steps between producing a first crude weapon and developing more sophisticated weapons are long and costly. If more than a token capability is aimed at, major isotope separation facilities for the production of weapon grade U-235 would be almost a necessity in view of the disproportionate cost of producing large quantities of plutonium. Advanced weapons development would require extensive testing. Moreover, in the case of a country with a small capacity to produce weapon grade material, testing would consume material which would otherwise be available for weapons production.

10. Assuming that there is a major effort to develop an operational nuclear capability, that outside aid continues at roughly what we believe to be current levels, and that present safeguard measures placed upon both materials and reactors remain effective for the next several years, Table II below indicates the probable time periods that various countries would require to explode a first nuclear device. Actual years are given for France which has already tested, and Israel which may have decided to pursue a weapons program. For the other countries, the time periods estimated are based upon the assumption that the programs will be initiated sometime in the next year or two.

11. These dates and time periods are also based on our estimate that there will be no significant technological breakthrough in the next several years which would significantly alter the complexity or economic costs of developing a nuclear capability. An example of such a possible technological development would be the perfecting of the gas centrifuge process for isotope separation. Compared to present separation methods, this process would require less electric power, be adaptable to small capacity production, and be more easily concealed. An advance of this kind would increase the number of countries which could afford to produce weapons, but would probably not advance the dates suggested in Table II.

TABLE II  
ESTIMATED TIME REQUIRED FOR SELECTED  
COUNTRIES TO PRODUCE A FIRST  
NUCLEAR DEVICE

COUNTRY	FIRST DEVICE <sup>a</sup>
France	4 tested (1960–1961)
Israel	1966–1967
Canada	1–2 years after decision
Sweden	3–4 years after decision
West Germany	4–5 years after decision
Italy	5–6 years after decision
India	5–6 years after decision
Japan	5–6 years after decision
UAR	<sup>b</sup>

<sup>a</sup> In most cases, a first crude weapon deliverable by aircraft, weighing some 5,000–10,000 pounds and with a diameter of 50–60 inches, could be produced in about a year after the first test device if sufficient materials were at hand. In the case of programs which were aimed at a specific sophisticated delivery system (e.g., the French program with its MIRAGE IV bomber—see paragraph 20), the production of more refined weapons would take longer.

<sup>b</sup> The UAR almost certainly wishes to offset Israel's progress towards a nuclear capability. The UAR, however, is so deficient in all the requirements for a nuclear weapons program that it would have to receive substantial assistance in all elements of the program. It could not, on its own, develop a nuclear capability during the period of this estimate.

*B. Delivery Capabilities*

12. An operational nuclear capability requires not only nuclear weapons, but also the ability to deliver these weapons with a reasonable degree of accuracy against potential targets. The specific delivery requirements of individual countries vary considerably, being determined in large part by a country's geographic position and the defensive capabilities of the potential enemy. For example, in the case of Israel the ability to deliver a nuclear weapon several hundred miles by aircraft could be of considerable military significance vis-à-vis Arab countries with little defensive capability. On the other hand, most of the European nations and Canada would require sophisticated and long-range systems to give them a capability against the nearest major Soviet targets.

13. The abilities of the various countries to develop a suitable delivery system, and the probable time required to do so, also vary considerably. All the countries listed in Table I probably could produce or acquire some aircraft delivery capability by the time their first generation of nuclear weapons became available. However, only a few of

these countries will be able during the next 10 years to develop and produce on their own suitable high-performance aircraft, and cruise-type or ballistic missiles. Even the more advanced countries now lacking modern delivery systems would probably require 4–6 years to develop and produce limited numbers of modern bombers or shorter range surface-to-surface missiles (200–500 n.m.), and probably closer to 10 years to develop IRBMs. Moreover, the longer the development of delivery capabilities is postponed—either through lack of decision or capability—the greater the chances that the defensive capabilities of potential enemies would also increase, thus increasing the sophistication needed in the delivery system.

## II. PROBABLE PROGRAMS

### A. *General Considerations*

14. While the above review indicates the overall capabilities of various countries believed capable of developing an operational nuclear capability, it does not answer the question whether they will actually do so. Decisions to go ahead on such a program, or to carry out such a program once launched, will depend upon a complex of considerations both domestic and international. These include in the case of any specific country the nature of its political relations with other states, its estimated military requirements, and general psychological and emotional factors such as the intensity of the desire to increase national prestige, the domestic opposition to the acquisition of nuclear weapons, etc. The economic burden of such a program would in all cases be a major factor to be considered since even a program for a few crude weapons and an unsophisticated delivery system would cost several hundred million dollars. A more ambitious program, involving modern aircraft or missiles with compatible warheads, would require expenditures of up to several billions of dollars. (See Annex A for more details on the costs of various types of weapons and delivery systems.)

15. The weight of the factors mentioned above is not fixed and may change as costs and difficulties change and the political-strategic factors alter. The prospect of an agreement among the major powers for a nuclear test ban, for example, especially if it were viewed as a forerunner to broader disarmament steps, would undoubtedly strengthen forces opposed to the spread of nuclear capabilities. Growing pessimism as to the likelihood of any realistic disarmament agreement could in some cases (e.g., Sweden, India) tend to undermine opposition to the acquisition of a national nuclear capability.

16. Despite these uncertainties, we believe it possible to suggest which considerations will probably have most weight in particular countries, and to indicate their likely course for the next several years

at least. Most countries considered in this paper are unlikely to be able to develop an operational nuclear capability in the period of this estimate, unless a decision is made shortly.

*B. Unlikely Candidates*

17. We believe it unlikely that Belgium, the Netherlands, Norway, Switzerland, Australia, Italy, and Canada will initiate independent nuclear weapons programs in the next few years. For the smaller countries in this group the costs of even a minimum program suitable to their geographic location would be burdensome, even if spread over 8–10 years, and would require substantial increases in present budgets. Such increases would probably necessitate simultaneous cut-backs in high priority economic and other military programs. Even Canada and Italy, despite their considerably greater potential, would feel the economic squeeze of such programs.

18. Moreover, these countries probably do not exclude the possibility that a nuclear capability—if deemed necessary for their defense—may be obtained in time more cheaply and easily from a major ally or friendly power. In most of these countries, moreover, and particularly in Norway and Canada, there is a strong and persistent domestic opposition to the creation of a nuclear capability and to the spread of nuclear weapons. However, at the same time many of these countries will probably continue to improve their overall capabilities in the nuclear field and develop their present peaceful programs with one eye cocked to the future possibility that they may eventually decide to develop an operational nuclear capability independently, or, if political circumstances should be favorable, together with other more advanced powers.

*C. Likely Candidates and Special Cases*

19. Special considerations apply to the remaining countries or groupings with capabilities to develop independent operational nuclear capabilities. France, and possibly Israel have already made the decision to develop such a capability. Other countries—Sweden, India, Japan, and West Germany—have almost certainly not made a decision to develop an independent capability. They have, however, the overall potential and have nuclear and missile activities underway which would facilitate the carrying out of a program to develop an independent operational nuclear capability. Finally, with the continuing trend toward European cooperation and integration in various fields European cooperation in the nuclear military field remains a possibility.

*France*<sup>3</sup>

20. The recent French tests indicate that France is having some difficulty with its weapons development program.<sup>4</sup> Nevertheless, France is continuing to press ahead with the development of an operational nuclear capability. Present plutonium production capacity is sufficient for [text not declassified] fission weapons a year, depending upon the yield, and will probably increase in 1963. In addition, the French have a gaseous diffusion plant under construction which could make weapon grade U-235 available by 1963–1964. The French program aims first at a bomber delivery system, to be followed by a missile system with a range of 1,500–2,000 n.m. If in the next few months France overcomes its apparent difficulties in its nuclear weapons development program, it will probably have an initial operational nuclear capability in 1962–1963 using land-based aircraft, including a few MIRAGE IVs, a supersonic jet light bomber. Present planning also indicates that de Gaulle intends that by the end of the decade France will have a varied nuclear strike capability using aircraft, IRBMs with either high-yield fission or thermonuclear warheads, and possibly nuclear-powered missile submarines.

21. So long as de Gaulle remains in power we see little likelihood of any slackening in French determination to carry through the program. While de Gaulle would probably welcome some external assistance, provided it was made available without military or political conditions, we believe that France is capable of carrying through its present programs without outside help. A successor regime, would probably, be unable or unwilling to carry on the program as vigorously as de Gaulle. As time goes by, however, it will become increasingly unlikely that any successor government, except a radical left government, would wish to abandon the effort.

22. French progress is heavily dependent on continued testing of both nuclear and missile components. Loss of testing sites in the Sahara would create major problems for the French program, the resolution of which would be costly and time consuming. Such a development could lead to basic modification in the French program—particularly after de Gaulle leaves—and could possibly result in greater reliance on multilateral arrangements within NATO.

*Israel*

23. There is considerable evidence to indicate that Israel is engaged in developing capabilities in the nuclear weapons and delivery fields.

---

<sup>3</sup> See SNIE 22–61, “French Nuclear Weapons and Delivery Capabilities,” dated 11 May 1961, SECRET, for further detail.

<sup>4</sup> See RD Annex to SNIE 22–61.

Israel, surrounded as it is by hostile Arab states, has strong incentives to have an operational nuclear capability. It has been receiving substantial help from the French in the nuclear field. Furthermore, Israeli technical abilities are of a high order. While the Israeli program may not now be directed specifically toward an operational nuclear capability, we believe that the Israelis intend at least to put themselves in the position of being able to produce nuclear weapons fairly soon after a decision to do so.

24. Israel is engaged in the construction of a 26 MW heavy water reactor and supporting facilities in the Negev near Dimona. The official Israeli position is that this installation is a necessary forerunner to the future construction of nuclear power stations. However, the Dimona site will also provide the necessary experience to develop a plutonium production capability beginning with the processing of ore, and proceeding through the separation of plutonium. There is also extensive evidence that France has supplied plans, materials, equipment, and technical assistance to the Israelis, and is also training personnel. Israel has also attempted to purchase ore from sources not requiring limitations on the use and disposition of the fissionable material produced.

25. Israel differs from other countries in that its targets are much closer at hand, i.e., the Arab countries, particularly the UAR, and the defensive capabilities of its potential enemies are not great. For this reason, its delivery system needs neither the range nor the sophistication required by other countries.

26. While Israel is not developing any aircraft, it is procuring planes from France. At present the Israelis have the French Vautour II-B, a subsonic jet light bomber, capable of carrying a nuclear weapon weighing up to 5,000 pounds, to a radius of 550 n.m. In view of past political and technical cooperation with France, it is probable that Israel plans to acquire more modern French aircraft suitable for delivery of any future Israeli weapons. The firing on 5 July 1961 of a meteorological rocket, SHAVIT II, reportedly of native construction and design, lends credibility to reports of Israeli efforts to develop an independent surface-to-surface missile capability. SHAVIT II is reported to be a multistage, solid propelled, unguided rocket which reached an altitude of approximately 50 n.m.

27. We estimate that the present Israeli reactor operating at maximum power could produce sufficient weapon grade plutonium for one or two weapons a year by 1965–1966, provided separation facilities with a capacity larger than that of the pilot plant now under construction are available. By 1968, the Israelis could also have a few 200–300 n.m. missiles, but these would require nuclear warheads of refined design. The costs of both a weapons and missile program would require annual outlays which would considerably increase military expenditures over

the current level (\$232 million in 1960). A more serious impediment to the acquisition of an operational nuclear capability is the lack of space in Israel for conducting adequate tests for nuclear weapons or medium-range missiles. Further, the estimated rate of production of weapon grade material is so low that a test program might consume the material as fast as it was produced.

28. It is unlikely, therefore, that even a very limited operational nuclear capability, using aircraft, could be achieved until two or three years after weapon grade plutonium first became available unless the French provide major assistance (e.g., testing facilities for weapons and missiles or weapons designs which would obviate the need for tests). In the absence of major French or other external support, we believe that the Israelis would probably still continue to work toward a limited operational nuclear capability, setting their sights initially on a very few nuclear weapons deliverable by aircraft. They could probably achieve this by 1967–1968, and would probably work diligently toward an operational missile capability at a later date, probably after 1970. Even if Israel should go directly to producing crude fission weapons of original design without any testing, we believe it could not have a weapon before 1966–1967.

#### *Sweden*

29. Sweden has so far avoided making any clear-cut decision in regard to a nuclear weapons program. Military leaders and some conservative political elements, as well as a few leaders of the governing Social Democratic Party (SDP) have agreed that an operational nuclear capability would discourage Soviet attack on Sweden, alone or in connection with hostilities between Soviet and NATO forces. Moreover, basic nuclear research of high quality is continuing, and there are some indications that a facility for plutonium separation is in the planning stage. However, the economic and financial costs, the strong opposition within the bulk of the SDP, and the fact that it will probably be at least several years before enough domestically produced plutonium becomes available even to conduct a test, have all combined to keep a clear-cut decision in abeyance.

30. The present government is likely to remain in power for several years more at least, and it has taken the position that no decision will be made before 1963 on the question of whether or not to direct its nuclear program toward the production of weapons. If at that time the international climate appeared to be calm, especially if positive steps toward disarmament had been agreed upon by the major powers—or there were reasonable hopes that one would materialize—it is unlikely that the Swedes would decide to undertake a nuclear weapons program. In the absence of such reassuring factors and especially if other

countries had already decided to produce nuclear weapons, the pressure to initiate a nuclear weapons program would probably grow sharply. In the event of a rapid degeneration of the international situation, the Swedes might prior to 1963 make a decision to have a weapons program. However, even on a crash basis we believe they could not have enough domestically produced weapon grade material to conduct a test before 1964–1965.

31. Sweden's basic aim in developing an operational nuclear capability would be to command respect for its traditional policy of neutrality. Sweden recognizes, however, that its only potential enemy is the USSR and hence their delivery systems would be primarily for defensive, relatively short-range weapons. Given this aim, the considerable costs involved, and its geographic proximity to Soviet targets, Sweden would probably plan a limited program involving development and production of high-performance jet aircraft and shorter range (200–500 n.m.) missiles with compatible fission warheads. Provided a decision were made to go ahead in 1963, and given Sweden's advanced nuclear research program, its nuclear power program and its industrial resources, we believe it could produce enough weapon grade plutonium to enable it to start testing about 1965–1966, to have a weapon deliverable by aircraft a year or so afterwards, and missile systems carrying compatible fission warheads by 1970.

#### *India*

32. The psychological and political factors opposing any nuclear weapons program continue to be strong in India. The cost and reluctance to divert resources from present economic programs also constitute significant barriers. On the other hand, there is clearly a mounting Indian concern with Communist China's foreign policy, and a growing awareness that probable Communist Chinese progress in the nuclear weapons field endangers India's security, prestige, and ability to maintain a neutral posture.

33. There are indications that India is deliberately improving its overall capabilities in the nuclear field, possibly in anticipation that a future decision to develop an operational nuclear capability may be required. India has three nuclear reactors in operation, one of which—a 40 MW type constructed with Canadian assistance—is capable of producing quantities of plutonium sufficient for about one or two weapons a year. While India has agreed to some restrictions regarding the use of this reactor and the disposition of its fuel, India has indicated its desire to avoid such limitations and is pressing ahead with development of uranium sources which would make it independent of such limitations. A plutonium separation plant is also being designed and preliminary construction has been started with a completion date set

for 1963, although it is unlikely that it will be in operation before 1964–1965.

34. The explosion of a nuclear device by Communist China would greatly strengthen the view in India, particularly in conservative and military circles, that there is a pressing need for an Indian nuclear capability if India is to avoid either bending to Communist Chinese pressure or being forced into a position of outright dependence on Western external support. Even so, we believe India would not decide to devote its nuclear facilities to a weapons program unless its leaders were firmly convinced that no broad disarmament agreements were possible, or that Communist Chinese foreign policy was clearly growing more truculent. Such a decision would probably be more likely if, at the time, Nehru had left the political scene and had been succeeded by a right-wing Congress Party Government. If such a program were launched, the antinuclear voices would continue strong, and if the program appeared to encounter significant snags or involve excessive costs, the program might be cut back, if not actually abandoned.

35. In view of the considerable economic costs, and India's limited technological capabilities in the missile field, any independent Indian effort would be likely to concentrate on the creation of a modest stockpile of plutonium weapons and an aircraft delivery capability. Provided such a decision were made in the next year or two, India could have such a capability sometime around 1967–1968. While India now has the British Canberra bomber with a capability to deliver a bombload of 6,000 pounds to a distance of about 1,400 n.m., the Canberra could not carry internally a bomb with a large diameter and it would take India several more years to develop its own nuclear weapon compatible with the Canberra. However, India would probably expect to be able to procure foreign aircraft with improved nuclear carrying capabilities.

#### *Japan*

36. Given the state of Japan's scientific and technical advancement and its industrial resources, we believe that Japan could probably have its first nuclear device in five or six years, if it decided in the next year or so to embark on a nuclear weapons program, and that it could have its first weapon deliverable by aircraft a year or so later. It could also probably develop missiles with ranges up to 1,000 n.m. in about the same time and compatible fission warheads for such missiles by 1970.

37. It is highly unlikely, however, that Japan at this time has any serious intentions of undertaking a nuclear weapons program of its own. Antimilitary, particularly antinuclear, attitudes remain extremely strong among the populace and susceptible to exploitation by socialists and Communists. The diversion of resources from development and welfare programs would not be politically feasible. There is, moreover,

considerable support for continued reliance on US military support, and doubts in the minds of many that a nuclear capability would promote Japanese security, given Japan's highly concentrated population and exposed geographical position.

38. These attitudes and views could change in the coming years with changing circumstances, e.g., if it became increasingly clear that progress on international disarmament was unlikely, if Communist China detonated a nuclear device, if other countries, notably India, decided to develop nuclear weapons, or if confidence in the US alliance decreased. In such cases, pressures for an independent capability would probably increase. Nevertheless, barring the unlikely return to power of a right-wing authoritarian government, we believe that Japan will not undertake a nuclear weapons program of its own in the next few years.

*West Germany*

39. We do not believe that the West Germans now have any definite plans for developing an independent nuclear capability. The foreign and military policy of West Germany continues to rest on the principle that the country's security against the Soviet Bloc depends on a strong and cohesive NATO in which US power and leadership play the central role. Moreover, the obstacles to initiating such a program are considerable. Treaty restrictions and lack of space for testing constitute hurdles to an independent effort. Furthermore, to undertake a nuclear weapons program in the near future would probably involve serious political dissension both within West Germany, and in the Western Alliance, and act as a provocation to the USSR at a time when the overall West German military strength is still limited.

40. On the other hand, West German interest in improving the strength of West Germany's military forces by acquiring modern weapons, and sensitivity to any indications that West Germany has a second-class military status in the Western Alliance, continue to increase. Moreover, as West Germany continues to grow in strength and importance, such feelings are likely to mount, especially if following Adenauer's departure present Defense Minister Strauss moves into greater political prominence.

41. Since 1957 West Germany has been carrying on a nuclear power and research program as well as research in missiles. Of particular interest is the work which the West Germans have done on isotope separation including the gas centrifuge process. If this latter process bears fruit, the separation of U-235 from uranium ore would be greatly facilitated. West German participation in a joint European space program will also give West Germany a boost in the missile field and help remove what gaps may still exist between itself and other major European countries on this score.

42. We believe that West Germany could detonate a nuclear device in four to five years if it made a decision to have a crude weapon suitable for delivery by large aircraft and could also develop in that period missiles with ranges up to 1,000 n.m. Weapons suitable for missile warheads, or for delivery by such advanced aircraft as the F-104, would probably take several additional years to develop and would require considerable testing.

43. Whether or not West Germany makes such a decision will depend less upon its technical capabilities than upon broader political developments, and the degree of prosperity and security which it derives from its Western Alliances. For the present we believe West Germany will continue to seek the benefits of nuclear capability through cooperation with its allies. Initially, and so long as NATO strategic doctrine remains responsive to what the West Germans believe to be their security needs, they will seek NATO solutions including a multilateral nuclear capability under arrangements which would give the West Germans as much voice as other NATO countries in the use, if not the direct control, of nuclear warheads. If frustrated on these matters, West Germans might look to some form of European cooperative effort to produce an operational nuclear capability. Failing all these, the West Germans might be then tempted to initiate an independent nuclear program, or even to consider some political accommodation with the Bloc. Such a situation, however, is unlikely to develop unless there are fundamental alterations in the concept and nature of the NATO Alliance which are seemingly in conflict with what the West Germans believe to be their basic security needs.

#### *Western European Groupings*

44. Extensive cooperation between France and West Germany, especially within the framework of a larger continental European arrangement, would reduce both the time and economic burden involved in developing independent nuclear capabilities. Moreover, such cooperation would remove or mitigate substantially the major political, legal, and technical obstacles to an independent West German effort. European cooperative action on many levels, especially within the Common Market grouping but also extending outside this group in matters of defense production, and probably space activities, tends to improve the climate for cooperation in this field. Nevertheless, we believe it unlikely that any significant cooperation in the nuclear field between continental European countries will develop during the next several years.

## Annex A

### ESTIMATED COSTS OF DEVELOPING AN OPERATIONAL NUCLEAR CAPABILITY

#### I. GENERAL

1. The cost of attaining any given level of an operational nuclear capability in any given country is subject to so many variables that it cannot be estimated with any real precision. However, it is possible to estimate a rough order of magnitude of expenditure which a prudent planner at the present state of the art would probably have to be prepared to fund, assuming reasonable success in research, development, and production. We estimate that over the next several years there will be no technological breakthrough which would significantly alter the complexity and costs of this task.

2. As indicated below, the initiation fee for the nuclear club would probably vary considerably depending upon the class of membership sought. A minimum program, i.e., explosion of a device, production of a few crude weapons and the acquisition of aircraft able to deliver the weapons, could be pursued with a total expenditure of roughly \$200 million. A much more ambitious program, such as that of the French would probably involve expenditures of at least several billions of dollars.

#### II. HYPOTHETICAL MINIMUM PROGRAM

##### A. *Nuclear Weapons*

3. A minimum capability, e.g., 1–2 low-yield all-plutonium fission weapons a year to be delivered by aircraft (e.g., bombers or modified commercial aircraft) could be obtained in as little as six years with an initial investment of some \$150–\$175 million. The breakdown of costs for such a program would be roughly as follows: \$50 million for research and test facilities; \$50 million for the operation of research and test establishments; and \$50–\$75 million for the acquisition of materials and the construction of the plutonium production and separation facilities. Additional outlays of \$8–\$12 million would be required for each of the 1–2 weapons which could be produced annually.

##### B. *Delivery Vehicles*

4. The actual costs involved in developing or modifying available aircraft would depend upon the sophistication of the delivery system desired. However, if the requirement were only to obtain from others an aircraft big enough to accommodate a crude weapon, the costs would be small. The cost of developing such an aircraft from scratch would, of course, be large.

### III. A MODERATE PROGRAM: THE FRENCH EXAMPLE

#### A. Nuclear Weapons and Warheads

5. According to official French figures, France spent in the period 1946–1960 the rough equivalent of \$1.1 billion on its whole nuclear program, including peaceful uses. We estimate that of this sum about \$900 million has been allocated to such initial investments as research and development test facilities, uranium mines and processing equipment, the construction of reactors and separation plants; the remainder has been used for operating the uranium mines, ore processing facilities, reactors and the chemical separation plants associated with plutonium production. From this program, France has acquired a plutonium production capability sufficient for [text not declassified] weapons a year, the beginnings of separation facilities for U-235, and the ability to produce plutonium weapons at a cost of \$1–\$3 million each. At the same time, France has advanced a significant step toward the level of capability necessary to produce a wide variety of weapons, including thermonuclear types.

6. Provided the French continue to press ahead with a program intended to give them a considerable quantity and variety of weapons sizes and yields, the annual costs will undoubtedly continue to rise substantially over the next decade, especially if testing is pursued under restricted conditions. We estimate that between 1960–1965 annual outlays could average about \$400 million, the bulk of which will probably contribute to a military capability by providing rapid expansion of fissionable material production. Between 1965–1970 the corresponding figure could be about \$600 million, if thermonuclear weapons are developed.

#### B. Delivery Capabilities

7. The French effort in the delivery field has been focused on the MIRAGE IV light jet bomber which is now in production. By 1964–1965 France will probably have 50 such bombers operational at a cost of somewhere between \$200 and \$250 million. In the meantime, however, the main focus of French effort in the delivery field will shift to missiles. The actual outlays for missiles will obviously depend upon the types, sophistication, and numbers sought. Given the indicated French interest in developing a short-range missile, an IRBM, and a “Polaris” type system, the combined costs of such programs could run into the billions of dollars. For example, assuming the intent to have a limited number of operational missiles in each class, and using US programs as rough analogues, the cost for a 300–500 n.m. missile could be about \$200 million for an IRMB, about \$700 million. A “Polaris” system, comprising several nuclear-powered submarines and underwater launched missiles, could cost between \$2.5–\$3.5 billion.

**244. National Intelligence Estimate, NIE 11–8/1–61, September 21<sup>1</sup>**

September 21, 1961

**STRENGTH AND DEPLOYMENT OF SOVIET LONG RANGE  
BALLISTIC MISSILE FORCES<sup>2</sup>****(SUPPLEMENTS NIE 11–8–61)****THE PROBLEM**

To estimate current Soviet operational strength in ICBM's and other ground-launched ballistic missiles with ranges of 700 n.m. or more, to identify present areas and methods of deployment, and to estimate the probable trends in strength and deployment over the next few years.

**CONCLUSIONS**

1. New information, providing a much firmer base for estimates on Soviet long range ballistic missiles, has caused a sharp downward revision in our estimate of present Soviet ICBM strength but strongly supports our estimate of medium range missile strength.

2. We now estimate that the present Soviet ICBM strength is in the range of 10–25 launchers from which missiles can be fired against the US, and that this force level will not increase markedly during the months immediately ahead.<sup>3</sup> We also estimate that the USSR now has about 250–300 operational launchers equipped with 700 and 1,100 n.m. ballistic missiles. The bulk of these MRBM launchers are in western USSR, within range of NATO targets in Europe; others are in southern USSR and in the Soviet Far East. ICBM and MRBM launchers probably have sufficient missiles to provide a reload capability and to fire addi-

<sup>1</sup> "Strength and Deployment of Soviet Long Range Ballistic Missile Forces." Printed in part in the print volume as Document 45. Top Secret. 29 pp. CIA Files, Job 79R01012A, ODDI Registry.

<sup>2</sup> NIE 11–8/1–61 revises and updates the estimates on this subject which were made in NIE 11–8–61: "Soviet Capabilities for Long Range Attack", TOP SECRET, 7 June 1961. [text not declassified] The new estimate is issued [text not declassified] so that the reader can fully appreciate the quantity and quality of information on which it is based.

A brief summary of this estimate, [text not declassified] will be included in the forthcoming NIE 11–4–61: "Main Trends in Soviet Capabilities and Policies, 1961–1966", now scheduled for completion in December 1961. In that estimate, the treatment of ground launched missiles will be incorporated into a summary of the entire Soviet long-range attack capability, including bombers, air-to-surface missiles, and submarine-launched missiles. For our current estimates on these latter elements of the long range striking force, see NIE 11–4–61, Annex A: "Soviet Military Forces and Capabilities", 24 August 1961, TOP SECRET, paragraphs 16–23.

<sup>3</sup> The Assistant Chief of Staff, Intelligence, USAF, does not concur in this sentence. See his footnote following the Conclusions.

tional missiles after a period of some hours, assuming that the launching facilities are not damaged by accident or attack.

3. The low present and near-term ICBM force level probably results chiefly from a Soviet decision to deploy only a small force of the cumbersome, first generation ICBMs, and to press the development of a smaller, second generation system. Under emergency conditions the existing force could be supplemented somewhat during the first half of 1962, but Soviet ICBM strength will probably not increase substantially until the new missile is ready for operational use, probably sometime in the latter half of 1962. After this point, we anticipate that the number of operational launchers will begin to increase significantly. On this basis, we estimate that the force level in mid-1963 will approximate 75–125 operational ICBM launchers.<sup>4</sup>

4. In addition to 700 and 1,100 n.m. missiles now available, the USSR will probably have a 2,000 n.m. system ready for operational use late this year or early next year. The USSR's combined strength in these missile categories will probably reach 350–450 operational launchers in the 1962–1963 period, and then level off.

5. Soviet professions of greatly enhanced striking power thus derive primarily from a massive capability to attack European and other peripheral targets. Although Soviet propaganda has assiduously cultivated an image of great ICBM strength, the bulk of the USSR's present capability to attack the US is in bombers and submarine-launched missiles rather than in a large ICBM force. While the present ICBM force poses a grave threat to a number of US urban areas, it represents only a limited threat to US-based nuclear striking forces.<sup>5</sup>

*Position on ICBM force levels of the Assistant Chief of Staff, Intelligence, USAF:*

1. The Assistant Chief of Staff, Intelligence, USAF believes that the Soviets had about 50 operational ICBM launchers in mid-1961 and that they will have about 100 in mid-1962 and about 250 in mid-1963. In his view, the early availability and high performance record of the first generation ICBM indicates the probability that, by mid-1961, substantial numbers of these missiles had been deployed on operational launchers. Four considerations weigh heavily in this judgment:

a. The continuance of [*text not declassified*] firings of the first generation ICBM;

---

<sup>4</sup> The Assistant Chief of Staff, Intelligence, USAF, does not concur in paragraph 3. See his footnote following the Conclusions.

<sup>5</sup> The Assistant Chief of Staff, Intelligence, USAF, does not concur in paragraph 3 and the last sentence of paragraph 5. See his footnote following the Conclusions.

- b. The feasibility of adapting the type “C” pad—now identified as being deployed in the field—for use with the first generation system;
- c. [text not declassified]
- d. The USSR’s current aggressive foreign policy indicates a substantial ICBM capability.

2. In view of the time that has passed since the first generation system became suitable for operational deployment, now over 18 months, the Assistant Chief of Staff, Intelligence, USAF believes that about 50 operational launchers in mid-1961 is likely, even though the Soviets may have elected to await development of second generation missiles before undertaking large-scale deployment.

3. The Assistant Chief of Staff, Intelligence, USAF believes that the force now deployed constitutes a serious threat to US-based nuclear striking forces.

4. As to the future, the Assistant Chief of Staff, Intelligence, USAF believes that the Soviets will continue to deploy first generation missiles, as an interim measure until the second generation missiles become available. He believes that the Soviets would prefer this approach to acceptance of an inordinate delay in the growth of their ICBM capabilities. Once the second generation system has become operational, which could be in early 1962, he believes that deployment will be accelerated, with first generation missiles being withdrawn from operational complexes and replaced by the new missiles. It is evident from their test program that the Soviets feel obliged to increase the tempo of their efforts. The Assistant Chief of Staff, Intelligence, USAF believes that this sense of urgency, plus the gains realizable from experience will result, in the next year or two, in a launcher deployment program more accelerated than that indicated in the text.

#### DISCUSSION

6. The requirement to revise our estimates on Soviet long range ballistic missile forces stems from significant recent evidence [text not declassified] the 1961 activities at the Soviet ICBM and space vehicle test range has provided information on the new types of ballistic vehicles now being developed and on the pace and progress of the development programs. [text not declassified] the first positive identification of long range ballistic missile deployment complexes, [text not declassified] excellent guidance as to Soviet deployment methods, [text not declassified] useful evidence on the general status and organization of long range missile forces. Therefore, although significant gaps continue to exist and some of the available information is still open to alternate interpretations, the present estimate stands on firmer ground than any previous estimate on this critical subject.

#### *ICBM Development*

7. The test-firing program from the Tyuratam ICBM and space launching rangehead has been much more intensive in 1961, and has

at the same time suffered many more failures, than in any other period in its four year history. Thirty-nine launching operations were undertaken between January and 17 September 1961.<sup>6</sup> Of these, 13 involved either first generation ICBMs or space vehicles using essentially the same booster. All but one of these 13 were generally successful. The other 26 operations involved new vehicles not previously observed in range activities. Of these, only about half resulted in generally successful firings which reached the vicinity of the instrumented impact areas. Of the last seven operations involving new vehicles, however, six have been generally successful. (See Figure 1.)

8. One of the new vehicles (called Category B by US intelligence) is probably a second generation ICBM; the other (Category C) may be a competitive ICBM design or a special vehicle to test ICBM and space components. Both are tandem staged, that is, the upper stage is ignited at altitude as in the case of Titan, rather than at launch as in the case of Atlas and the first generation Soviet ICBM. Our data are sufficient to show that both of the new vehicles are liquid propelled, but not to establish whether the propellants are storable or non-storable. Some aspects of [*text not declassified*] performance of the upper stage of the Category B vehicle are similar to those of the 2,000 n.m. missile, which was tested intensively at Kapustin Yar for some months preceding the Category B operations at Tyuratam. The vehicles fired to a distance of 6,500 n.m. into the Pacific on 13 and 17 September 1961 were probably Category B vehicles. Some relationship seems to exist between the upper stages of the Category C vehicle and Venus probes. Despite this apparent relationship with space vehicles, it was a Category C firing which immediately preceded Khrushchev's remark to McCloy last July, that a "new ICBM" had been launched successfully. No further details are known about the configuration, propulsion, guidance, range, or payload of the new vehicles.<sup>7</sup>

9. The 1961 tests confirm our previous estimate that the Soviets would develop a new ICBM system, and we continue to believe that a major requirement for such a system is a missile which can be more readily handled and deployed than their original ICBM. This belief is supported by a reliable clandestine source who learned, in 1960 or early 1961, that the Soviet leadership desired an ICBM using higher-energy fuel which would require less bulk. In order to be flight tested

---

<sup>6</sup> A more recent launching operation on 19 September 1961, which resulted in a failure, cannot as yet be categorized as to type of vehicle.

<sup>7</sup> We have taken note of Soviet statements concerning a 100 megaton weapon. We do not believe that present Soviet capabilities include a missile warhead with 100 megaton yield or a ballistic vehicle capable of delivering such a warhead to intercontinental ranges. We will examine this matter in fuller detail in an early estimate.

in early 1961, design work on a new missile was certainly underway in 1958. Nuclear tests appropriate to the development of lighter warheads were conducted in 1957 and 1958; the current nuclear testing program may serve further to prove the warhead design.

10. Although the flight-test failures in the first half of 1961 probably set back the Soviet schedule for development of second generation missiles, it is clear from the test range activities that the R&D program has been pursued with great vigor. The recent successes with the Category B vehicle, and the probable firing of such vehicles to 6,500 n.m. after only about 8 months of testing to Kamchatka, suggest that the initial difficulties with this system may now have been largely overcome. Moreover, it is probable that one or both the new vehicles have borrowed components or at least design techniques from proven systems, thereby aiding the R&D program. We believe that the program will continue to be pursued with vigor, and that a smaller, second generation ICBM will have been proven satisfactory for initial operational deployment in the latter half of 1962.

11. Thus we believe that the first generation system will be the only Soviet ICBM system in operational use for the months immediately ahead and probably for about the next year. Despite its inordinate bulk and the other disadvantages inherent in a non-storable liquid fueled system, the first generation system is capable of delivering a high yield nuclear warhead with good accuracy and reliability against targets anywhere in the US. (For a summary of its estimated operational characteristics, see Figure 2.) Test range launchings of first generation missiles (now called Category A) continued from January through July. [*text not declassified*]. These latest Category A firings were normal, [*text not declassified*]. Firings 16 hours apart could reflect the training of operational crews for launching second salvos, but it cannot be determined whether these firings were from a single pad. Accuracy could not be determined, but reliability continued high.<sup>8</sup>

#### *Utilization of Launching Pads*

12. Soviet ICBM capabilities at present depend in part, and in the near future will depend in considerable measure, upon whether or not the deployment complexes now being discovered [*text not declassified*] can be used to fire first generation missiles, or whether they cannot become fully operational until a second generation missile becomes available. The first generation missile is obviously compatible with

---

<sup>8</sup> To date we have no firm evidence to indicate that the Soviets have experimentally investigated the decoy problem in ICBM flights to Kamchatka. [*text not declassified*] We believe that the Soviets can and will provide decoy protection, should they deem it necessary.

massive, fully rail-served launchers similar to those at Tyuratam Areas A and B. But the launchers at confirmed field complexes, whose construction began only in late 1959 or thereafter, resemble the simplified pair of pads at Tyuratam Area C, where missiles are transported to the pad by road and some of the support equipment is mounted on vans. (For artists' conceptions of the launchers at Tyuratam and a layout of the rangehead, see Figures 3–5.)

13. From our examination of the 1961 test firing program, the physical dimensions of various items at Areas A and C, and the requirements for handling and firing the first generation missile, we conclude that the simplified Area C was designed for a new and smaller missile now being test fired. Although it is technically feasible for the Soviets to adapt the rail-based first generation missile to road served launchers of the type at Area C, it would be necessary to redesign much of the check-out, handling, erecting, and fueling equipment. This redesigned equipment would differ from both that at Area A and that designed for use with the new missile. Such action might have been taken as an interim measure if a long delay in the advent of the second generation system had been anticipated well in advance.

#### *ICBM Deployment*

14. [text not declassified] over the past three months, we have positively identified three ICBM complexes under construction. Two are near Yur'ya and Yoshkar-Ola, in a region several hundred miles northeast of Moscow, and the third is near Verkhnyaya Salda in the Urals. The paired, road-served pads at these complexes closely resemble those at Tyuratam Area C. Near Kostroma, in the same general region but closer to Moscow, [text not declassified] we believe this is possibly a fourth complex similar to the others. [text not declassified] Plesetsk, farther to the northwest, [text not declassified] was too limited either to confirm or rule out this location as an ICBM deployment complex. (The locations of presently known and suspected areas of ICBM deployment activities are shown in Figure 9.)

15. The new evidence confirms that the present Soviet deployment concept involves large, fixed complexes, with multiple pads and extensive support facilities. The identified deployment complexes are served by rail spurs which provide their major logistic support. The complexes are highly vulnerable to attack. For example, although the Yur'ya complex is quite large, the entire installation is soft and each pair of pads is separated from its neighbor by only 3–4 n.m. [text not declassified]. For active defense against aircraft, SA–2 surface-to-air missile sites are being installed near the complexes.

16. At Yur'ya, the confirmed complex whose construction appears most advanced, eight launchers in four pairs were observed in various

stages of construction in mid-1961 (see Figure 6). Considerations of logistics and control, together with evidence from the MRBM program and other factors, lead us to believe that eight is the typical number of launchers for this type of complex.<sup>9</sup> Each pair of launchers has checkout and ready buildings which are probably capable of housing a missile for each pad; however, the extent of the support facilities strongly suggests that additional missiles are to be held there to provide a reload or standby capability. The designed salvo capability of the complex is apparently to be eight missiles. There would be at least 5 minutes delay between groups of four missiles if the system is radio-inertial (as is the first generation ICBM) and if one set of guidance facilities is provided for each pair of launchers. A second salvo might be attempted after some hours, assuming the launching facilities were not damaged by accident or attack. Although we have no direct evidence on this matter, we believe it might be feasible to prepare a second salvo in 8–12 hours.

17. On the basis of evidence dating back to 1957 and other more recent information, we have estimated that Plesetsk is an ICBM complex with rail-served launchers designed to employ the first generation ICBM. The installation at Plesetsk (see Figure 7) is even larger than the Yur'ya complex. Although the presence of ICBM launchers has not been confirmed, there are SAM sites, several very large support areas, and numerous buildings, including what appears to be housing for some 5,000 to 15,000 persons. *[text not declassified]* evidence is inadequate to establish the number of launchers which may be at Plesetsk. We believe that the number may be as few as two, but four or more is also possible. An ICBM complex involving this much equipment, investment, and personnel would probably have a reload of at least one missile per pad. Based on Tyuratam experience, we estimate the time to prepare a second salvo at about 16 hours.<sup>10</sup>

18. The new evidence gives a better measure of the timing of some ICBM deployment activities. Based on its size, the extent of its facilities, and its present state of construction, the Yur'ya complex must have been started in the autumn of 1959, concurrent with or very shortly after the start of construction at Tyuratam launch Area C. Yur'ya is probably one of the earliest complexes of its type. Construction and installation of equipment will probably be completed some time early

---

<sup>9</sup> The Assistant Chief of Staff, Intelligence, USAF, believes that this typical number may be larger than eight. He agrees, however, that if guidance facilities are provided for each pair of launchers, the sequence of launching would be as described in the text.

<sup>10</sup> The Assistant Chief of Naval Operations (Intelligence), Department of the Navy, believes that evidence of ICBM deployment at Plesetsk is indeterminate but that, in the aggregate, it points against such deployment.

in 1962. The similar complex at Yoshkar-Ola is many months behind Yur'ya; the evidence is less conclusive with respect to Kostroma and Verkhnyaya Salda, but what can be seen is apparently in the early stages of construction. From the evidence, therefore, we have reasonably firm indications that at least two years were used for the construction of even the simpler ICBM complexes, although this may be reduced to about 18 months as experience is gained.

*Adequacy of Recent Intelligence Coverage*

19. [text not declassified] since mid-1960, our coverage of suspected deployment areas in the USSR has been substantially augmented. [text not declassified] Soviet missile test range installations, [text not declassified] are now known to bear a close resemblance to deployment sites in the field. On the basis of this activity, combined with other information and analysis, we now estimate that we have good intelligence coverage of [text not declassified] more than 50 percent of those portions of the USSR within which ICBM deployment is most likely.<sup>11</sup>

20. Of the five confirmed or possible ICBM complexes [text not declassified] Yur'ya, Plesetsk, and Verkhnyaya Salda were previously suspected [text not declassified]. We previously had not suspected Yoshkar-Ola or Kostroma. [text not declassified]

21. [text not declassified] many previously suspected areas did not contain ICBM complexes as of the summer of 1961. Four areas [text not declassified] remain under active consideration as suspected locations of ICBM deployment activity (see Figure 9). Past experience indicates that some or all of the areas now under active consideration may prove to be negative, and conversely, that deployment activity may now be under way in other unsuspected areas. [text not declassified]

*Probable ICBM Force Levels*<sup>12</sup>

22. We believe that our coverage of both test range activities and potential deployment areas is adequate to support the judgment that at present there are only a few ICBM complexes operational or under construction. While there are differences within the intelligence community as to the progress of the Soviet program to date and the precise composition of the current force, we estimate that the present Soviet ICBM capability is in the range of 10–25 launchers from which missiles can be fired against the US. The low side of this range allows for the possibility that the Soviets could now fire only a token ICBM salvo from a few launchers, located at the Tyuratam rangehead and an operational

<sup>11</sup> [text not declassified]

<sup>12</sup> The Assistant Chief of Staff, Intelligence, USAF, does not concur in the estimate of ICBM force levels. For his position, see his footnote following the Conclusions.

complex, perhaps Plesetsk. The high side, however, takes into account the limitations of our coverage and allows for the existence of a few other complexes equipped with first generation missiles, now operational but undetected.

23. The Soviet system is probably designed to have a refire capability from each launcher. The USSR may therefore be able to fire a second salvo some hours after the first, assuming that the launching facilities are not damaged by accident or attack.

24. The reasons for the small current capability are important to an estimate of the future Soviet buildup. The first generation system, designed at an early stage of Soviet nuclear and missile technology, proved to be powerful and reliable but was probably too cumbersome to be deployed on a large scale. One or more first generation sites may have been started but cancelled. [text not declassified] The urgent development of at least one second generation system probably began in about 1958, and an intensive firing program is now underway concurrent with the construction of simplified deployment complexes. We therefore believe that in about 1958 the Soviet leaders decided to deploy only a small force of first generation ICBMs while pressing toward second generation systems.

25. The net effect of this Soviet decision, together with whatever slippage is occurring in the development of second generation systems, has been to produce a low plateau of ICBM strength. Under emergency conditions the existing force could be supplemented during the first half of 1962 by putting some second generation ICBMs on launcher at one or two completed complexes before the weapon system has been thoroughly tested. However, the Soviets could not have very much confidence in the reliability, accuracy and effectiveness of such a force. In any event, operational ICBM strength will probably not increase substantially until the new missile has been proved satisfactory for operational use, probably some time in the latter half of 1962. Alternatively, the possibility cannot be excluded that second generation ICBMs could be proved satisfactory for operational use somewhat earlier in 1962, possibly as soon as the first simplified complex is completed. After this point, we anticipate that the number of operational launchers will begin to increase significantly.

26. We continue to believe, for the many reasons adduced in NIE 11–8–61, that the Soviet leaders have desired a force of several hundred operational ICBM launchers, to be acquired as soon as practicable over the next few years. In addition to the complexes known to be under construction, it is probably that work is under way on other undiscovered complexes and that the construction of still others is scheduled to begin soon. Taking account of this probability, together with our present intelligence coverage and our information on site activation

lead-time, we estimate that the force level in mid-1963 will approximate 75–125 operational ICBM launchers. The high side of this range allows for eight complexes of eight launchers each under construction at the present time, with four more scheduled to begin by the end of the year; it would require site activation time to decrease to about 18 months by the end of the year; it builds from a present force level of about 25 operational launchers. The low side of the mid-1963 range would be achieved if six complexes were now under construction, two more were begun by the end of the year, and the present force level were only about 10 launchers.

27. As noted in NIE 11–8–61, Soviet force goals for the period to 1966 will be increasingly affected by developments in US and Soviet military technology, including the multiplication of hardened US missile sites, the possible advent of more advanced Soviet missiles which can better be protected, and by developments in both antimissile defenses and space weapons. The international political situation will also affect Soviet force goals, and there is a good chance that the Soviet leaders themselves have not yet come to a definite decision. We have not been able as yet to review, in the light of the new evidence, these and other considerations pertaining to the probable future pace of the Soviet ICBM program. Therefore we are unable to project a numerical estimate beyond mid-1963. Considering the problems involved in site activation, however, we believe that a rate of 100 or possibly even 150 launchers per year beginning in about 1963 would be feasible. To accomplish such a schedule, the USSR would have to lay on a major program of site construction within the next year, which we believe would be detected [*text not declassified*].

#### *Medium and Intermediate Range Ballistic Missiles*

28. [*text not declassified*] confirms the large-scale deployment of 700 and 1,100 n.m. ballistic missiles in western USSR. [*text not declassified*] approximately 50 fixed sites with a total of about 200 pads suitable for launching these MRBMs have been firmly identified in a wide belt stretching from the Baltic to the southern Ukraine. [*text not declassified*] we are virtually certain that there are about 10 additional sites [*text not declassified*]. Taking account of indicators pointing to still other locations [*text not declassified*] we estimate with high confidence that in the western belt alone there are now about 75 sites with a total of about 300 launch pads, completed or under construction. (For known and estimated site locations in this area, see Figure 9.)

29. The new information does not establish whether individual sites are fully operational, nor does it reveal which type of missile each is to employ. [*text not declassified*] approximately three-quarters of the identified sites appeared to be complete or nearly so, some were under

construction, and the evidence on others is ambiguous. Construction has probably been completed at some sites [*text not declassified*] the installation of support equipment and missiles could probably be accomplished relatively quickly thereafter, perhaps in a period of some weeks. Three basic site configurations have been observed, all of them bearing a strong resemblance to launch areas at the Kapustin Yar rangehead (see Figure 8). Any of the three types could employ either 700 or 1,100 n.m. missiles, whose size and truck-mounted support equipment are virtually identical. The sites could not employ ICBMs, but one type might be intended for the 2,000 n.m. IRBM which has been under development at Kapustin Yar.

30. On the basis of the new evidence and a wealth of other material on development, production, training and deployment, we estimate that in the western belt alone the USSR now has about 200–250 operational launchers equipped with 700 and 1,100 n.m. ballistic missiles, together with the necessary supporting equipment and trained personnel. From these launchers, missiles could be directed against NATO targets from Norway to Turkey. On less firm but consistent evidence, about 50 additional launchers are believed to be operational in other areas: in the Transcaucasus and Turkestan, from which they could attack Middle Eastern targets from Suez to Pakistan; and in the southern portion of the Soviet Far East within range of Japan, Korea, and Okinawa. [*text not declassified*] the presence of some sites in Turkestan and in the Soviet Far East, north of Vladivostok.

31. On this basis, we estimate that the USSR now has a total of about 250–300 operational launchers equipped with medium range ballistic missiles, the bulk of them within range of NATO targets in Europe. This is essentially the same numerical estimate as given in NIE 11–8–61, but it is now made with greater assurance.

32. Contrary to our previous view that MRBMs were deployed in mobile units, we now know that even though their support equipment is truck-mounted, most if not all MRBM units employ fixed sites. Like the ICBM complexes, these are soft, screened from ground observation by their placement in wooded areas, and protected against air attack by surface-to-air missile sites in the vicinity. The systems are probably designed so that all ready missiles at a site can be salvoed within a few minutes of each other. Two additional missiles are probably available for each launcher; a second salvo could probably be launched about 4–6 hours after the first. There is some evidence that after one or two salvos the units are to move from their fixed sites to reserve positions. Their mobility could thus be used for their immediate protection, or they could move to new launch points to support field forces in subsequent phases of a war.

33. The Soviet planners apparently see a larger total requirement for MRBMs and IRBMs than we had supposed. While the rate of deploy-

ment activity in the western belt is probably tapering off after a vigorous three-year program, some sites of all three basic types are still under construction. There will therefore be at least some increase in force levels in the coming months. The magnitude of the buildup thereafter will depend largely on the degree to which the 2,000 n.m. system is deployed, and whether or not it will supplement or replace medium range missiles.

34. With the advent of the 2,000 n.m. IRBM, probably in late 1961 or early 1962, the Soviets will acquire new ballistic missile capabilities against such areas as Spain, North Africa, and Taiwan. To this extent at least, they probably wish to supplement their present strength. They may also wish to deploy IRBMs or MRBMs to more northerly areas within range of targets in Greenland and Alaska. Moreover, evidence from clandestine sources indicates that the Soviet field forces are exerting pressure to acquire missiles of these ranges. In general, however, we believe that the future MRBM/IRBM program will emphasize changes in the mix among the existing systems, and later the introduction of second generation systems, rather than sheer numerical expansion. Taking these factors into account, we estimate that the USSR will achieve 350–450 operational MRBM and IRBM launchers sometime in the 1962–1963 period, and that the force level will be relatively stable thereafter.

## SUBJECT

Washington News

1. The McCone appointment is the big news here. I, for one, underestimated the strength of the opposition in the second and third levels of CIA and State. It appears that most of the people involved in intelligence estimates on atomic energy matters thought McCone was highly prejudiced. He also had a reputation, in these circles, as an "operator" whose loyalty to Administration policy was doubtful. So there is a significant problem in working out a pattern of strong cooperation and support for him.

Less important in the long run, but more urgent at the moment, is the unrest in the President's Board of Consultants on Foreign Intelligence. Killian has made noises about resigning, and indicates that he thinks one or two other members of the Board may also withdraw. In part this is because they feel they were not consulted, but more deeply it arises from the fact that several of them—Killian, Gray, and Baker—have had sharp disagreements with McCone in the past. General Taylor has talked to Bobby about this and probably is trying to calm Killian down. I am planning to have a talk with Allen Dulles about it with the same purpose in mind, and I think I can also do something with Baker and the scientific community generally. I have also talked to Joe Alsop, and I think we will get a helpful column from him, aimed in part at this same problem. He thinks it is the best possible appointment and says he will try to say so in terms calculated to encourage sensible scientists and bureaucrats. (I have some doubt whether he will succeed—Joe's feeling is that anyone who is against McCone is a proven follower of twaddley, and I doubt his ability to be gentle with people whom he views in this light—unfortunately his diagnosis is wrong, and some very good men are disquieted.)

2. Bob McNamara has issued planning instructions for the military budget of fiscal '63, and there is one point in it which General Taylor and I think we should call to your attention. Bob has asked the Army to plan on a force level ceiling of 929,000 men for fiscal '63, as against

---

<sup>1</sup> Conveys information on personnel matters; McNamara and the military budget; management of foreign aid; and news from Syria and Berlin. Secret. 3 pp. Kennedy Library, National Security Files, Departments and Agencies Series, CIA General 9/61–11/61.

a level of 1,081,000 toward which the Army is now building, on the basis of the add-ons and call-ups so far authorized in connection with the current crisis. Thus, budget planning emphasizes a very substantial reduction from crisis levels, and in particular it implies that the Reserve units and additional draftees of this crisis are not to be held in a permanent reinforcement of the Army. This bothers us as believers in permanently strengthened conventional forces, but it bothers us even more in terms of possible impact on our Berlin posture. Budget planning figures of this kind tend to leak rather quickly, and clearly this instruction will give the appearance that we expect the crisis to cool off so that the Army strength can be pushed back about where it was when you came in. From some points of view, this may be a good noise, but the matter is one which we think you should consider and decide.

I have talked to Bob McNamara about this, and he understands our concern. His own feeling is that it is better to have planning done on this narrow basis with possible separate additional arrangements later. He sees the point, but he still would prefer not to build larger figures into his budget planning now. He is struggling to get his budget down from \$60 billion to a much lower figure, and he says that if he lets the Army plan for a million men or more, every single item in the military budget will be swollen accordingly. If he later plans for specific additions, he hopes to avoid this fattening factor. His view is that we can meet the problem of [illegible in the original] on the budget ceiling by making it plain that we can add to this figure at any time as planning proceeds. Max and I are not quite persuaded—I think both of us in the end believe that 930,000 men are simply not enough for the world we live in, and that we should do better to recognize this fact and accept its costs.

3. There is an important management decision brewing in the foreign aid field. Dave Bell has been working on the executive order to put the new legislation into effect, and he is coming up against the key question of assignment of responsibility, within the Department of State, for coordination of military and economic assistance. Formally, this must go down through the Secretary of State, but the operating question is which of his subordinates will do the job for him, since no Secretary can find the time for this type of judgment—and, in any event, this is not Dean Rusk's major interest. Bell and I and our respective experts are inclined to press hard for delegation of authority here to Fowler Hamilton. In this case he would act as the Secretary's agent and not simply as the Director of the AID agency, and he would have to show the kind of wider judgment that is implied in balancing political, military, and economic considerations. But of the available senior men in the Department, he seems the best qualified. And, in particular, this seems a better answer than the one the Secretary may

prefer—which is to have the coordination managed directly from his office by a relatively junior special assistant acting in the name of the Secretary. An arrangement of this sort simply would not stick, and the result would be that issues would always be pressed beyond the Department to the White House. Big issues are bound to come to you, but day-to-day matters really should be settled by a man who has the seniority to make decisions stick. The Pentagon is happy to entrust this to Hamilton. Dave Bell is going to try to sell this solution to the Secretary of State, but if he fails, you are likely to find the issue on your desk next week.

4. Chester Bowles and I smoked a peace pipe this week. He is still wholly unclear about his relation to the Secretary and to the Department. With a man who had time to keep a close eye on him, I am now convinced that he could be an effective deputy for certain kinds of work. He really does have a sharp eye for personnel, and he understands better than the Secretary the need for executive energy in the geographical bureaus and other Assistant Secretaryships. The trouble is that he is constantly wanting to make policy, without even knowing, really, that this is what he is doing. And his policy just is not on all fours with your own, and still less with Mr. Rusk's. I recommended to him that he have a wholly frank and clear-cut discussion with the Secretary, but I am not hopeful of the result. Rusk finds it hard to use a Deputy, and Bowles finds it even harder to be a No. 2.

Yet when we turned to talk of empty embassies and how to fill them, Bowles made good sense, and I think his recommendations are well worth your attention. Unless you are planning to keep him in the deep freeze, I suggest that you invite him in for a talk on this specific subject.

5. The news from Syria is far from clear, but the initial sense of the problem, all around the town, is that we should avoid any action whatever. The net consequences for us of any given result are very hard to predict, but any appearance of U.S. interference would almost surely produce damage to our own position.

6. On Berlin, the most important focus of interest is of course the Rusk-Gromyko conversations. You will have heard directly from the Secretary, and we are holding this package to include the memorandum of conversation. There will be more talks here before the Saturday meeting, and if important questions of tactics arise, we will be sure to check with you.

McG. B.

October 1961

246. Memorandum from Maj. Smith to Gen. Taylor, October 2<sup>1</sup>

October 2, 1961

SUBJECT

Sec Def Recommended Long Range Nuclear Delivery Forces

1. In this appendix to an as-yet-unseen basic memorandum, the Sec Def provides the reasoning on long range nuclear delivery forces that leads him to recommend funds in the FY 63 Budget for 100 hard and dispersed Minutemen, 50 mobile Minutemen, 6 Polaris submarines, 92 air-to-surface Skybolt missiles, and 100 KC-135 tankers.<sup>2</sup>

2. Mr. McNamara states that his recommended forces are designed to avoid the extremes of a "minimum deterrence" posture on one hand, and a "full first strike capability" on the other.

a. He rejects "minimum deterrence" because deterrence may fail, and if it does, a capability to counterattack against high priority military targets can make a major contribution to our objectives of limiting damage and terminating the war on acceptable terms. In addition, a "minimum deterrence" posture would weaken our ability to deter Soviet attacks on our allies. (p. 4)

b. He rejects a "full first strike capability" because he considers it almost certainly infeasible; moreover, it would put the Soviets in a position which they would consider intolerable, thus risking an arms race; and finally, it would be too costly in terms of resources needed for other programs. (p. 5)

3. Mr. McNamara "tests" the capabilities of his forces on the assumption that war begins with a well-planned and well-executed Soviet attack (with limited warning) against our forces in a state of normal peacetime alert, and that we strike back after being attacked. He tabulates the percent expected kill of certain types of Soviet targets under such conditions. He then compares the percent expected kill in FY 65 and FY 67 of his forces with the capability provided by *the highest unilateral Service proposals* for the various strategic weapons. He concludes from this that the individual Service proposals run up against

---

<sup>1</sup> McNamara's rationale on long range nuclear delivery forces. Secret. 2 pp. National Defense University, Taylor Papers, 30, T-357-64.

<sup>2</sup> His totals for FY 65 decisions    \$1,987 m  
Req'ments from previous years 6,939 m  
\$8,926 m

“strongly diminishing returns and yield very little in terms of extra target destruction”. His tables show that this is true for urban-industrial areas and population targets under optimistic, median, and pessimistic assumptions about the survival of our forces, but that this is somewhat less true for attacks on military targets under his median or pessimistic estimates. (p. 9–10) The constancy of percentages on urban-industrial and population targets most probably comes from holding back the Polaris submarines in the initial strikes, although this is not stated.

4. The Sec Def draws all his comparisons—cost, force structure, effectiveness—on the basis of the *initial positions* of the individual Services. Yet, as his paper indicates (p. 3), on 11 September the JCS submitted to him their corporate agreed recommendations. (Presumably their recommendations covered all program packages). After listing these recommendations the Sec Def does not refer to, or use, them again. Possibly this was necessary because his paper had been largely developed before he received the JCS corporate views.

a. By considering only the individual Service views, the Sec Def leaves unanswered the question of how much better his forces would look than those recommended by the Chiefs. By analyzing the Service going-in positions—positions that, given Pentagon machinations, are optimistically stated for negotiating purposes—the Sec Def may have inadvertently or intentionally, set up a “straw man.” Admittedly the Chiefs negotiated to reach their position, (in this particular case General LeMay undoubtedly took the lead; he is known to have strong feelings about the necessity for the Chiefs to settle their own differences, and he has well known ideas on strategic forces), but military budgets must be negotiated ones. Force structure planning involves many matters of judgment; it is not a science, and there is room for persuasion, both within the individual Services, and among them, once the problem reaches the JCS. Especially is this true looking to the future today, when any error must be on the conservative side.

b. If the pattern of comparing the Sec Def views with the initial positions of the individual Services continues in the analyses of the other program packages, and if his case is made exhaustively as is the case in this paper, Mr. McNamara will be the uncontested father of the FY 63 military budget proposed by DOD.

November 13<sup>1</sup>**

November 13, 1961

SUBJECT

FY 1963 Defense Budget Issues

Secretary McNamara's tentative recommendations for the 1963 defense budget, summarized in his memorandum to you of October 6, have now been considered by Secretary Rusk, Mr. Bundy, General Taylor, Dr. Wiesner, and Mr. Sorensen, as well as by the Budget Bureau. It is our common judgment that there are four major policy issues which require your consideration at this stage. Stated in crude and over-simplified form, these are:

1. Is the Secretary's program for general war forces (strategic missiles, bombers, etc.) too small—as the military services think—too big—as a number of your staff think—or about right?

2. Should we embark on the development of a new medium-range ballistic missile, which would have major usefulness in Europe—and if so, should the development be pointed toward a sea-based or a land-based missile or both?

3. Does it make sense to commit ourselves in the 1963 budget to the installation of Nike Zeus batteries around certain cities or should we continue to limit ourselves to a program of research and development in this field?

4. Is the Secretary's program for conventional forces (represented for short-hand purposes by his proposal to maintain 14 combat-ready Army divisions in FY 1963) acceptable from (a) military and (b) political viewpoints, or would a 16-division program be preferable, as a number of your staff think?

5. In addition, there is a question of balance as between strategic and conventional forces. General Taylor, among others, thinks that the McNamara proposals are relatively generous on the strategic side and relatively tight on the conventional side, and considers that an improved force structure would result by shifting resources from one field to the other.

In addition to these major policy issues, we will place before you at a later date a number of less significant issues concerning the defense budget. Moreover, as you know, the Defense Department has not yet

---

<sup>1</sup> "FY 1963 Defense Budget Issues." Top Secret. 12 pp. National Defense University, Taylor Papers, 30, T-357-69.

completed its 1963 program for civil defense, so we do not know what issues will arise in that field.

Comments on each of the issues identified above follow.

### 1. *General War Offensive Forces*

Secretary McNamara's proposals are substantially below those proposed by the military departments—for example the Secretary proposes to make commitments in the 1963 budget for 100 Minutemen whereas the Air Force proposed 600 (both figures in addition to the 600 already on order). Moreover, the Secretary's 1963 proposals represent a slackening, rather than an acceleration in the future production rates of Minuteman and Polaris, as compared with the provisions of the 1962 budget. The essential reason for this is the Secretary's belief that we already have on order the main bulk of the strategic deterrent forces we will need in the time period before 1967, and while we need some additional forces of this kind, procurement can be at reduced rates for the next two or three years at least.

The Secretary's proposals have been questioned from opposite points of view.

*Are the proposed forces too small?* The military departments (particularly the Air Force) and the Joint Chiefs proposed larger forces. The adequacy of the Secretary's proposals, however, unlike those of the military departments, is supported by an impressively logical analysis of the relative capabilities of the Soviet and U.S. forces. This shows that his proposals will give us (even under pessimistic assumptions about survival, accuracy, etc.) a capability, after a Soviet attack, to destroy Soviet urban society and to strike heavily against Soviet military installations associated with long-range nuclear forces, thus reducing damage by Soviet follow-on forces. The Secretary's analysis has convinced all of us who have reviewed his proposals that force levels higher than those proposed are not required.

*Are the proposed forces too large?* It seems to most of us that the proposed force levels exceed requirements that can be justified on purely military grounds. The analysis used by the Secretary to demonstrate that higher force levels are not necessary also suggests that lower force levels would suffice, particularly when the more recent intelligence estimates are taken into account. Beyond this, some of the assumptions of the analysis may be questioned; for example, does an adequate deterrent posture require 41 Polaris submarines threatening 200 Soviet cities as proposed, or would not the currently committed 29 submarines threatening about 150 cities suffice?

*Will the proposed forces induce the U.S.S.R. to step up their armament plans?* To some extent, Soviet decisions with respect to their force levels may be influenced by our own force objectives. This raises the question

whether a build-up of our strategic offensive forces beyond those which clearly imply a capability to retaliate against urban areas, would have the effect of influencing the U.S.S.R. also to undertake a major increase in their long-range nuclear strike forces, which they otherwise might not do. This is, of course, a difficult question to analyze with any confidence. Insofar as it may appear significant, the presentation of the defense budget in January could be tailored to stress the slackening rate of the U.S. Build-up.

*Will the proposed forces seem small to the U.S. public?* The Secretary's proposals, if accepted—or any lower Presidential proposals—may require a major effort on the part of the Administration to change what appears to be a fairly widespread national attitude that national security requires ever-increasing strategic missile forces and airpower. For the first time the position will be presented that we are approaching the force levels we need, and that “deceleration” rather than “acceleration” of missile programs is the proper course of action.

*Note on mobile Minuteman.* On the basis of the discussions that have been held, the merits of embarking on the currently planned mobile Minuteman program for 100 railway mounted missiles, at a total development and procurement cost of close to \$1 billion, appear questionable. Substitution of a longer term development program for a more accurate, mobile ICBM, using some of the same guidance and other components of the proposed land-based MRBM system, is being considered. This change, if made, will result in a substantial reduction in the proposed NOA for 1963 for mobile Minuteman, shown at 270 million dollars in the Secretary's October 6th memorandum.

*Note on Skybolt.* Dr. Wiesner raises the question whether the proposed commitment to produce the Skybolt air-launched ballistic missile, (or even to continue its development) is justified in view of the technical difficulties, late availability and debatable military requirement.

## *2. Medium-Range Ballistic Missile*

The Secretary's proposals include starting the development of a high-accuracy, quick reaction, medium range (1000–2000 miles) ballistic missile, capable of being launched from mobile land vehicles or from ships. This missile could meet requirements for a NATO nuclear deterrent force in the period after about 1966, as well as other future U.S. requirements. The Department of State feels that it is highly desirable that the proposed MRBM development explore possibilities for sea-based as well as land-based deployment, since in their view sea-based deployment will fit best with our proposal that NATO develop a common sea-based nuclear deterrent, rather than separate land-based nuclear forces. Secretary McNamara expects to make sure that the sea-

based form is developed at least as rapidly as the land-based, and on this assumption I believe that there is general agreement on the desirability of developing the new MRBM. However, Dr. Wiesner, while agreeing with the objections to land-based deployment in Europe, also raises the questions whether a sea-based MRBM would provide a new capability beyond that available from Polaris missiles or is really necessary in view of the large number of Polaris missiles now planned.

### 3. Nike Zeus

The Secretary recommends a decision to proceed with the deployment of 12 Nike Zeus batteries for protecting 6 cities, at a total cost of about 3.6 billion dollars. This deployment would be completed by about the end of 1967, with an initial operating capability by 1965. Research and development would also proceed on possible improved systems.

The *technical characteristics* of the Zeus system are fairly well agreed, although the first field tests will not be conducted until next summer. It is estimated that the Nike Zeus system as now being developed would be:

*effective* against enemy ballistic missiles not equipped with penetration aids such as decoys;

*marginal* against missiles equipped with minimum (retrofit type) penetration aids such as the U.S. will have in inventory in 1963; and

*ineffective* against missiles with appreciable payload allocation to sophisticated penetration aids.

The U.S.S.R. could, therefore, negate the military effectiveness of Nike Zeus defenses, if they choose to do so, during the time period required to produce and deploy the proposed 12 batteries.

It may be technically possible to develop future systems which are more effective against missiles with penetration aids, although no such system is clearly in prospect at the present time. In any case it appears that such a system could not be developed and deployed prior to about 1970 and would be substantially a new system, not a retrofit modification of the present Zeus system.

The inescapable conclusion would seem to be that for the foreseeable future, attacking ICBM missiles will have inherent technological and economic advantages and tactical flexibility which will continue to make the achievement of an effective active ICBM defense at best a tremendously expensive venture of dubious effectiveness.

Secretary McNamara offers these *reasons for proceeding with Nike Zeus*:

—The Soviet Union may not in fact develop missiles with penetration aids; even if they do, the uncertainty of their decision-making

will have been increased, and they will have to devote resources to this purpose;

—Even limited Zeus deployment could inhibit blackmail from secondary powers, and provide some protection from accidental attack;

—Zeus deployment would help counter future Soviet claims to a successful anti-missile system, which otherwise might have serious political effects both in the United States and abroad. The U.S.S.R. has an active anti-ICBM development program, and we cannot successfully refute any claims they may make.

To some of us, these arguments seem less impressive than the counter-vailing *reasons against Zeus deployment*:

—The Soviet Union must be assumed to have the technical knowledge and resources to develop penetration aids which will make the Zeus marginal or ineffective by the time it is deployed, especially since the limitations of the Zeus system cannot be kept secret in our society;

—The proposed six-city program is not a “stable” objective; presumably once a deployment decision is announced it would not be politically feasible to deny Zeus defenses to other major population centers, and we would be committed to proceed with at least a 29-city, 70-battery program as recommended by NORAD and the Army, at a cost of about 15 billion dollars;

—Zeus deployment at cities would not seem to improve significantly our basic deterrent power, which depends on the survivability of our strategic forces, not the protection of our cities; this also would seem to be the essential protection against any potential blackmail by secondary powers.

—So far as political and psychological effects are concerned, it would seem arguable that the best course is that of honest appraisal: claiming appropriate credit for research progress in what are expected to be successful tests at Kwajalein next summer, but not installing a system which is expected to be overcome before it is deployed—whose installation indeed might instill a false sense of security and result in a strong adverse public reaction as its limitations came to be understood.

The *principal alternatives* to the Secretary’s proposal would seem to be as follows:

It seems clear that in any case (i) the development and full-scale testing of the present Nike Zeus system should be carried to completion, and (ii) aggressive research and development efforts on possible improved systems should be pursued. Since achievement of an effective anti-ICBM defense by either side would have tremendous foreign policy implications in addition to its military significance, it is essential that every promising approach that might lead to a technological breakthrough be vigorously pursued as a matter of highest national security priority.

With respect to the *deployment* of the present Zeus system, the main alternatives appear to be:

a. Proceed with the 1963 actions proposed by the Secretary, which involve primarily long lead-time components, but with no decision or

announcement as to the number of cities that might be involved or the ultimate scope of the program. The program would be presented as "buying a year's time" if production is actually undertaken after consideration of the results of the Kwajalein tests next year. It would be difficult to turn back from deployment once this initial step were taken, since the Kwajalein tests are not likely to yield any unexpected results.

b. Proceed with a token deployment of perhaps one or two partial batteries, with equipment produced quickly on a hand-tooled basis. This has been suggested as meeting some of the psychological and other pressures for deployment of Zeus, and having the advantage of doing so sooner than the proposed production program. This alternative is now under active consideration by the Department of Defense. It is not clear what further action would logically follow such a token deployment.

c. Make a positive decision not to deploy the present Zeus system; explain to the public (U.S. and worldwide) its limitations as well as its capabilities; use the Kwajalein tests to demonstrate our technological progress; and place main emphasis on development of an improved system.

#### 4. *General Purpose (Conventional) Forces*

The Secretary's proposals contemplate that in 1963 the general purpose ground forces would consist of 14 combat-ready regular divisions with supporting units, 3 combat-ready Marine divisions, and reserve forces in a high state of readiness consisting of 8 Army National Guard divisions, of which 2 would be in first priority status, and 1 Marine reserve division. The overall total active duty strength of the Army associated with this proposal would be 929,000.

The proposed ground forces program represents an *increase* over the original 1962 plans of 3 combat-ready Army divisions and of about 60,000 men in the regular Army, as well as a higher degree of readiness in the priority reserve forces. However, the proposals represent a *reduction* below the Berlin build-up of active duty forces of (1) the 2 National Guard divisions now on active duty, which would be returned to reserve status, and (2) a total of 152,000 men—73,000 associated with the 2 National Guard divisions and 79,000 associated with other temporary increases in connection with the Berlin crisis.

Two major questions have been raised about the Secretary's proposals.

First, some who have reviewed the proposals, notably including General Taylor and Mr. Bundy, question whether the proposed size of the conventional forces is large enough.

Second, some, notably including Secretary Rusk and Mr. Bundy, question whether it is desirable from a foreign policy standpoint to propose a reduction in January of the active duty Army forces that have just been built up.

Unfortunately, as Secretary McNamara points out, it has not yet been possible for him to provide for conventional forces the same type

of rigorous logical rationale that he has worked out for strategic forces. Consequently the basis for judgment on these questions cannot be as firm and persuasive.

The Secretary's view essentially is that a portion of the recent increases in Army strength should be regarded as temporary, and the ground forces he is proposing, in conjunction with the recommended increases in tactical air support and mobility of the forces, appear at this time to be adequate to meet our needs. In the 1963 budget, he feels that priority should be given to improving the capabilities of the existing 14 Army divisions by correcting known imbalances in equipment, tactical air support, and mobility. Following the Berlin crisis there appears to be no tactical or strategic requirement for more than 14 active divisions. He has pointed out that the long-term adequacy of the 14-division Army and all other aspects of the general purpose forces problem can be considered again in the 1964 budget if studies during the coming year clearly indicate that a different decision should be made.

The principal doubts that have been expressed concerning the proposed strength of the conventional forces are:

a. Adequacy of the forces for *fighting* in two or more separate local war situations simultaneously. This question involves an assessment of the needs of contingency plans in different areas of possible military action, and of the likelihood that two or more such situations in which we would actually wish to intervene might occur simultaneously.

b. Adequacy of the forces for *detering* the Soviet bloc or others from provoking crises which might require our intervention and for supporting our foreign policy, including the question of whether a larger permanent force level is required to convince our allies to maintain adequate forces of their own.

c. Feasibility of *relying on reserve forces* to augment the projected regular forces in time of crisis. The principal questions are: (1) how frequently situations are likely to arise which will require a call-up of reserves; (2) whether the types of threats that are likely to arise can be expected to be unambiguous or dramatic enough to justify publicly the decision to call up reserves; (3) whether as a practical matter the strength and readiness of the reserves can be maintained through repeated call-ups and demobilizations.

As indicated above, unlike the situation with respect to strategic forces, there is at present no firm and clear rationale for conventional force levels and deployment, against which to judge these opposing points of view. Secretary McNamara has stated he is proceeding to prepare a proposed rationale for the force levels; it will take some time for him to do this—at the earliest it cannot be completed before sometime next spring. In the meantime, it is worth emphasizing that there can be no satisfactory resolution of the question of the desirable size of the conventional forces. The issue may be posed today in terms

of 14 vs. 16 divisions, but when a better rationale is available it might indicate that some entirely different number would be preferable.

The principal doubts expressed with respect to the advisability of reducing the forces by the amount of reserves called to active duty are:

a. *The effects on the Soviets* and the rest of the Soviet bloc. Would the elimination of the reserve forces in the 1963 budget be interpreted as a sign that we are weakening in our will or capability to resist aggression in Europe, Southeast Asia, or elsewhere? Are there important gains to be obtained in deterring future Soviet moves by demonstrating that our response to crises they provoke is a permanent increase in force levels? If so, would the proposed additional 60,000 men have this effect, or would a larger increase be necessary?

b. *The effects on our allies*, especially with respect to our efforts to persuade the other NATO countries to increase their military forces. Would the reduction by the amount of the reserves called to active duty—even though the remaining force represents a 60,000 man increase in the basic 1962 Budget—be interpreted as a weakening in our offer to provide additional divisions to NATO for the Berlin crisis?

c. *The effects on our domestic posture and sense of urgency* regarding the Berlin and Southeast Asia situations. What events seem likely to occur that would provide the basis for a satisfactory public explanation for reducing our ground forces at this time?

If it were desired to provide for larger ground forces in the 1963 budget, Secretary McNamara would recommend planning for 16 active duty divisions, and for 30 to 35 thousand larger troop strength. This might cost in the neighborhood of 165 to 200 million dollars in FY 1963.

##### 5. *Balance between Strategic and Conventional Forces*

General Taylor in particular has raised the question whether the proposed 1963 budget evidences further the intention of this Administration to expand conventional as against strategic forces. General Taylor will comment more extensively on this; however, two observations seem warranted in this regard:

First, the proposed budget provides for a sizeable increase in *both* strategic and conventional forces.

Second, the question whether the relative emphasis between them would be shifted requires a careful and subtle analysis which has not been made by anyone. However, in crude dollar magnitudes, there is a striking shift which would begin in the 1963 budget. It is shown in the following figures from Secretary McNamara's memorandum:

<u>Program</u>	<u>Anticipated NOA (billions of dollars)</u>					
	<u>FY 1962</u>	<u>FY 1963</u>	<u>FY 1964</u>	<u>FY 1965</u>	<u>FY 1966</u>	<u>FY 1967</u>
General war offensive (strategic)	9.3	8.9	8.0	5.6	4.7	4.1
General purpose (conventional)	17.2	18.8	18.9	19.9	19.4	20.0

These figures are far from reliable; for example, they do not take into account possible new technological developments or requirements in the strategic field. Moreover, they do not necessarily indicate a shift in the balance between strategic and conventional forces available at any one time: we buy missiles once and they are available until they become obsolete, whereas we have to pay troops each year. A downward trend in the purchase of missiles is quite consistent with a rising trend in our total strategic strength. (Strictly speaking, of course, it is inaccurate to equate general purpose with conventional forces, since the amounts related to tactical nuclear and dual-purpose weapons are also included.)

What these figures represent in military terms is the possibility of a strategic force rising in magnitude only slowly, and conventional forces built around 14 Army divisions whose costs would gradually rise with increasingly complex equipment.

Nevertheless these figures indicate the possibility of a very substantial change in the apparent budgetary significance of strategic as compared to conventional forces, and if in fact future budgets do look something like those projected here, the political impact might be large.

In closing this memorandum I think I speak for all of us in noting the enormous advances in concept, clarity, and logic which Secretary McNamara has brought to the military planning-budgeting process. The difference between the 1963 budget presentation now before us, and the 1962 budget we all had to work with last winter and spring, is literally revolutionary. There is much more to be done, as Secretary McNamara knows better than any of us, but the improvement in the degree of rationality which can be applied to military planning and budgeting is already tremendous.

December 1961

**248. Memorandum from McGhee to Under Secretary,  
December 5<sup>1</sup>**

December 5, 1961

SUBJECT

Basic National Security Policy

The attached draft represents a major effort of the entire Policy Planning Council during recent months. It attempts a fresh statement of Basic National Security Policy rather than a revision of NSC 5906/1. It seeks to formulate a coherent national strategy embracing all phases of our national effort, taking, as its central theme, the objective of a community of free nations.

It is now circulated for written comment, both as to concept and substance. I realize that it will need to undergo many changes of detail before it can hope to meet general approval. Your preliminary comments would be appreciated by December 15.

It is also proposed that the concept of the paper, not necessarily its substantive detail, might be discussed at the Secretary's Policy Planning meeting. The date of December 12 is suggested.

**George C. McGhee**

**Attachment**

**BASIC NATIONAL SECURITY POLICY**

**SUMMARY**

1. *Introduction.* This paper outlines a strategy, which could provide a sense of coherence and direction to our total effort in the national security field. It is not intended to furnish a complete guide to every policy action, but rather to provide an over-all doctrine which will be relevant to the more important issues we face. Our decisions on these issues are most likely to be mutually consistent and reinforcing if they are based on a clearly defined strategic doctrine.

---

<sup>1</sup> Conveys draft "Basic National Security Policy" paper. Printed in part in the print volume as Document 62. Secret. 85 pp. Department of State, S/S-NSC (Miscellaneous) Files: Lot 66 D 95, BNSP 1961-1962.

2. *National Objective.* Our basic national purpose is to help in the creation of a world environment in which a nation with values and purposes such as ours can flourish. Such an environment will be one in which countries can concert to promote their progress and security, without losing their freedom in the process. That environment can best be described as a “community of free nations”. A sustained US effort toward this end is needed not only to fulfill our positive purposes but also to defeat the Communist attempts to shape in their own image the order which will emerge from the present era of revolutionary change.

#### I. Needed Tasks

3. *Constructive Tasks in Less Developed Countries.* The community of free nations must be one in which less developed countries can progress toward becoming modern societies. We should use all the instruments of national policy—diplomacy, military aid, programming guidance and technical aid, capital assistance, and trade policy—to help them achieve evolutionary modernization. We should give higher priority to this objective than to the promotion of special ties with these countries or to securing their support for our political policies. We should urge other Atlantic countries and Japan to take the same view, and to act vigorously on it.

4. *Defensive Tasks.* The community of free nations must also be made secure against war and aggression. We should meet indirect aggression, the most urgent threat, primarily by strengthening the total capacity of governments under attack to mount effective politico-military programs in defense of their societies.

We should use US forces to defeat direct aggression in such a way as to defeat its purposes with minimum risk of escalation. This will require not only substantial and mobile conventional forces but also a reasonably stable overall strategic situation, i.e., one which is unlikely to degenerate into general nuclear war under the pressure of crises and limited conflicts. We should seek to create such an environment by maintaining an effective, invulnerable, and flexible nuclear striking force and by prosecuting adequate active and passive nuclear defense programs. The same purpose will be served by an arms control policy which looks to feasible stabilizing measures in the near term, e.g., safeguards against war by miscalculation and against nuclear proliferation, as well as to the long-term goal of general and complete disarmament.

#### II. Needed Framework

5. *The Atlantic Community.* To prosecute these constructive and defensive tasks we must mobilize the strength of nations, and groups of nations, which can deploy substantial resources beyond their bor-

ders. The European Community is such a grouping; we should vigorously support the movement toward European integration. A major purpose of US foreign policy should be to work toward an effective partnership between Europe and the US, through institutions of the Atlantic Community. We should seek vigorously to strengthen these institutions and the resulting capacity for common action. This partnership should be capable of embracing Japan in the economic sphere at the earliest possible time.

6. *Other Ties Between Free Nations.* We should, at the same time, seek to develop manifold ties, embracing as wide a range of human activities as possible, which will permit the developed and less developed nations to work effectively together, and which will limit their ability to harass each other or to act with utter irresponsibility. We should work to strengthen bilateral ties, regional associations, and the UN to this end. Such relationships are the warp and woof of the community of free nations.

7. *Relations With Communist Nations.* We should try to manage our relations with the Communist nations so that they will not divert us from constructive tasks in the free world, and so that they will promote long-term constructive evolution in the Bloc. To this end:

We should seek continuing communication with the Soviets, in business-like attempts to avoid crises and reduce the risk of war, and we should promote exchanges and cooperative ventures conducive to useful change in the USSR. When crises erupt, we should seek to resolve them in a way which will restore equilibrium without incurring the increased costs and risks that would be required to alter the existing balance of advantage drastically in our favor.

We should seek contacts, and extend and encourage assistance, designed to encourage helpful trends in Eastern Europe.

We should move toward policies which will place the onus for continued hostility between Communist China and the US more squarely on Peiping and thus mobilize greater free world support in resisting Chinese Communist expansion. We should try to create a political climate in which the Sino-Soviet rift will prosper; we should not go out of our way to make it look as though Khrushchev's preference for negotiation over fighting is a vain one; and we should make clear that the contrary Chinese view, if put to the test, is likely to entail swift disaster.

Our response to the Soviet ideological offensive should center upon projecting and explaining our own efforts to build a community of free nations. We should promote a free world consensus on this central goal. We should not be drawn away from this goal by a presumed need to react to Communist political and propaganda initiatives, but

should seek to keep the focus where it belongs: on our opportunities and affirmative purposes in the free world.

## INTRODUCTION

### Why Have a Basic National Security Policy Paper?

1. This paper is intended to define a strategic doctrine for US national security and to lay out the broad courses of action which seem required for its fulfillment.

2. Such a strategic doctrine may be helpful in different ways:

a. *The President and his principal officers* may find the doctrine helpful in determining which conflicting considerations should have first claim on their attention; in identifying long-term objectives which should be pursued as appropriate, regardless of efforts that might be required for immediate crises, and in ensuring that US responses to such immediate crises are consistent with their long-term policies.

b. *The bureaucracy* will be more likely to conform to national policy in its day-to-day operating decisions, if it is exposed to a clear and authoritative statement of the doctrine on which that policy is based.

c. *Public support* for needed measures to enhance our security, both in the US and other free countries, can more readily be secured if these measures are explained in terms of an over-all doctrine, which defines our long-term goals and sets forth a convincing strategy for their attainment.

3. In each of these respects, Winston Churchill's statement is apposite: "Those who are possessed of a definite body of doctrine and of deeply rooted convictions upon it will be in a much better position to deal with the shifts and surprises of daily affairs than those who are merely taking short views, and indulging their natural impulses as they are evoked by what they read from day to day." This paper is intended to provide that "definite body of doctrine".

4. To meet this need, the doctrine must be sufficiently clear and concise to be readily borne in mind from day-to-day by those concerned. Its strategy must be understandable, appear reasonable and constitute a useful guide to a wide variety of decisions. A doctrine which cannot be remembered in its broad outlines, but must be continually consulted in detail, is not likely to weigh heavily in the making of decisions or in the shaping of attitudes. The doctrine can, then, only treat of broad strategy. Should it seek to do more, the resulting mass of detail would merely blunt and obscure its basic import.

## PART ONE

### OUR NATIONAL OBJECTIVE: A COMMUNITY OF FREE NATIONS

1. Our fundamental purposes as a nation have not changed since they were first set down in the Constitution:

"to form a more perfect Union, establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity."

2. The object of national security policy is to promote an international environment in which these purposes can be best assured.

3. We cannot do this merely by trying to sustain the *status quo*. For half a century such world order as we inherited from the nineteenth century has been breaking up under the impact of new forces. These forces are sufficiently extensive and powerful to ensure that the period ahead will continue to be one of unprecedented change.

4. If these forces of change cannot be contained by an attempt to maintain the *status quo*, neither can they be guided by *ad hoc* and piecemeal attempts to cope with their effect. For we face the challenge not only of a revolutionary age, whose pace and extent dwarfs previous changes in the condition of mankind, but also of Communist nations seeking to shape in their own image the new order which will emerge. These Communist efforts can be met successfully only if we have a clear view of the kind of world order *we* want to see develop.

5. The crux of the matter is thus whether we or the Communists are to organize the new world order. Our actions must be directed toward bringing into being the kind of world order we favor through peaceful and evolutionary means. We should have had such a purpose even if Marx and Lenin had never existed, but the need is the greater and more pressing since their heirs are now trying to impose their version of the future on all mankind.

6. The international order we seek to build must assure two preconditions to fulfillment of our national goal: peace, and freedom from Sino-Soviet control.

A world order which can assure peace must be able to generate enough power and will to deter or defeat attack.

A world order which can be assured against Sino-Soviet control must be able to assure progress by its members sufficient to convince them that their aspirations can be better fulfilled within its framework than without.

7. To discharge these constructive and defensive tasks, this world order must have a hard core of developed nations able and willing to pool their resources for such tasks beyond their borders; and must be able to draw these and the less developed nations together in a network of common ties which will direct their mutually reinforcing efforts to these ends.

8. We thus seek a world order which would be a genuine community of free nations. It would perform the normal functions of a community—i.e., help its members assure their material well-being and pro-

mote their security against outside attack—even though it lacked the organizational apparatus of one. It would enable its members to concert to meet these needs without either forming a super-state or losing their freedom. It would thus be sufficiently flexible in its arrangements to encompass the changing needs and aspirations of all free nations. It would be open to all nations willing to abide by its standards and accept its responsibilities. Its accomplishment would thus be a continuing task—open-ended, in the best sense of that term.

9. In our efforts to build such a pluralistic community, we will be pursuing a goal which commends itself more to most of mankind than the monolithic conformity of Communism. We can tolerate variety in the world; Communism cannot. If we fail of support among free peoples, it will be because we do not effectively articulate our goal, rather than because we are moving in what they consider to be the wrong direction. The community of free nations—should it be achieved—will rest on consensus, not coercion.

10. If we do articulate our goal effectively, we need not expect its appeal to be limited to the non-Communist world. The attractive power of a community whose members are able to assure the realization of their aspirations without losing their freedom should serve to weaken the bonds that now bind peoples under Communist rule to the Bloc. In the long run, changes may be induced in at least some of the Bloc states which would make it possible for them to adhere to the community.

## PART TWO

### NEEDED TASKS

#### Chapter 1: Constructive Tasks in the Less Developed Countries

##### I. Basic Purposes

1. Any effort to build and maintain an effective community of free nations must first of all address the constructive task of helping the members of the community achieve more rapid progress within a framework of interdependence. This task will, by its nature, center on the less developed areas. Politically active and literate groups in these areas have awakened to the fact that their lot can be improved by human effort. They demand that their countries achieve the national status, material base, and human well-being which they associate with a modern state.

2. Governments which try to repress or ignore these pressures are unlikely to survive over the long run. If these pressures cannot otherwise be fulfilled, they will likely lead to revolutionary change under extremist leaders. Some of these leaders may look to Communism, or something like it, for their salvation. Others may turn to foreign

adventures or domestic policies which encourage international anarchy. In either case, progress toward a community of free nations would be retarded. Instead of evolving into responsible members of such a community, the less developed countries would succumb to weakness and instability and become subjects of ever growing great power rivalry—with disastrous results, both from their standpoint and ours.

3. It must be recognized that modernization will not guarantee a successful outcome even over the long term, and may actually lead to increased instability over the short term. This is a risk, however, that we must take. Although modernization will not lead to dramatic improvements in the living standard of the common man, it should provide a basis of hope for all that the future holds promise. A concerted national effort toward modernization can also help cement national cohesion, develop leadership groups with constructive objectives, reward the most vigorous elements of the developing nation, and subordinate sectional and local differences to sound national goals.

4. Whether progress is achieved will depend primarily on the efforts of the less developed countries themselves. Modernization is a complex social, cultural, political, and economic phenomenon, whose main-springs must be found within the developing society itself.

5. External action can, however, make a useful—and, in some cases, indispensable—contribution. The less developed countries need to acquire physical resources, skills and knowledge from more developed countries. The US, Western Europe, and Japan can help to meet these needs. In so doing, they will help to create the ties which bind the community of free nations. Their assistance should permit the launching or acceleration of modernization programs which may be able, in the long run, to go forward increasingly without that help. The US should take the lead in seeking a consensus among other free developed countries as to the importance and nature of the task. The OECD is the place to seek that consensus, although NATO can also play a role in establishing political agreement among the Atlantic countries as to the urgency of the task.

6. The basic point on which to be clear is that the objective of the OECD countries in assisting less developed countries is to help them evolve into viable societies free from external domination—each an integral part of an interdependent community of free nations. Of course, the OECD countries also share other interests with the less developed areas—military, political, and economic. Actions to fulfill these interests must not, however, be permitted to retard the development of the community of free nations.

The varied instruments available to the US and other developed countries should each be directed to our primary purpose. These means are discussed below.

## II. Major Instruments of Policy

7. *Diplomacy.* We should use our normal diplomatic contacts with the governments of less developed countries to encourage them to preoccupy themselves with the modernization process. Through confidential exchanges of ideas and information, and through diplomatic assistance, strong ties should be developed which will provide sinews for the community of free nations. Our industrialized allies should be encouraged along similar lines.

8. *Information and Exchange Programs.* Our information programs should stress the importance of modernization to the less developed countries' survival and progress. They should help emerging elites in these countries to understand the nature and complexity of the development process and how to promote it. US and other OECD programs for the exchange of persons should seek to expose key groups in these countries to the wide range of skills and attitudes which have sparked development in the West. Such exchanges should result in strong national and personal sympathies and ties which can help to bind the community of free nations together.

9. *MAP.* Our military aid program can be helpful in encouraging and enabling the local military to take a constructive part in modernization, e.g. through development and education. We should make a conscious effort to exploit MAP, the US military missions that go with it, and the despatch of foreign military students to the US to this end. A consensus of aims and methods between military leaders and establishments will also contribute to the cohesion of the community of free nations.

10. *Programming Guidance.* The US should provide less developed countries with expert advice and personnel, as requested, in planning effective programs to modernize their societies. It should urge private and international agencies, as well as other governments, to play an ever larger role in the provision of programming guidance. We should demand no monopoly in this field.

11. *Technical Assistance.* The US and other OECD countries should also provide less developed countries with technical help in carrying out modernization programs. We should emphasize projects that will involve as many groups as possible in the modernization process. Here again, other advanced nations have a vital contribution to make and should be encouraged to do so. The wider the participation by free nations, private agencies, and international organizations in the provision of programming guidance and technical assistance, the greater will be the contribution to stronger ties within the community of free nations.

12. *Capital.* External capital should be offered in sufficient amounts and with enough continuity to provide a convincing incentive to less

developed countries to go forward with needed programs and to mobilize fully their own resources in carrying them out. This will require a steadily rising level of capital assistance in the years ahead. A good share of this should come from other free industrial nations, and we should be active in promoting increased assistance by these countries. The US should promote OECD coordination of these efforts, and urge formation of OECD consortia to meet specially large and pressing needs.

Aid programs of the TMP and of the IBRD and its related organs—IDA and IFC—will generally be effectively directed to purposes which make sense in countries with development potential. The US should encourage maximum contributions to the international agencies' programs and maximum recourse to them by the less developed countries.

Outside private investment should be encouraged, not only because of the capital it brings but also because of the exposure of local groups to the skills and attitudes which make up a business class—and the resulting ties which promote interdependence.

US assistance programs should emphasize projects that would assist in the growth of an indigenous entrepreneurial class, which can be the driving motor in further economic development. This will require aid for needed infrastructure in the public sector, as well as new enterprises in the private sector. Pragmatic—rather than ideological—considerations should guide our decisions regarding relative amounts of aid for these activities. We should be careful to avoid giving the appearance of seeking to impose our own patterns of thought and economic activity on less developed countries.

13. *Surpluses.* Provision of US agricultural surpluses to less developed countries can also be an important part of this capital assistance, and should be consciously geared to the promotion of economic development.

14. *Criteria.* The US should urge donor countries to agree in the OECD on realistic criteria for national aid programs, which would encourage and reinforce self-help by the receiving countries. If countries conform to these criteria, they should not be discriminated against because they do not align themselves with us in the cold war or agree with all of our policies. Such discrimination will not alter their views, it will merely slow down their modernization and thus make them more vulnerable to instability and subversion. And the fact of our effort to associate political "strings" with our aid will sit poorly with other less developed countries.

In applying criteria designed to encourage self-help, we should recognize that such criteria will have limited relevance in some countries. These will be countries with out early potential for development

or self-support whose needs must nonetheless be met if disintegration of non-Communist societies is to be avoided.

It is important to bear in mind, moreover that even those countries with development potential fall into different categories, and that the criteria for aid must vary among these categories.

(a) In countries which are still close to the traditional stage, we can hardly insist that applicant governments have comprehensive development programs—much less the means of executing them—at hand. In these countries, we should judge, and provide aid for, elementary pre-development needs on their individual merits: resource surveys, training and education programs, help in creating needed institutions, and capital in such basic fields as agriculture and transport.

(b) In countries which have broken with their traditional way of life but have not yet fully committed themselves to modernization, our object should be to encourage modernization programs of the required scope and effectiveness. We should hold out the prospect of assistance on terms which these countries can realistically expect to meet if they make the requisite effort.

(c) In countries that are fully launched on the process of modernization, we should insist on conformity with strict criteria. Indeed, it is in these countries' interest that we do so.

15. *Soviet Aid.* The OECD countries should not generally be diverted from the carrying out of their own positive programs of assistance by efforts to "counter" Soviet aid. They should recognize that Soviet attempts to subvert less developed countries will best be frustrated by progress in these countries, and they should gear their own aid primarily to promoting that progress.

Efforts to preclude Bloc aid should be limited to a few key and sensitive sectors (such as police, education, and planning) in countries where this tactic promises permanent, rather than temporary, success. In a few cases, US aid may be able to support efforts of countries attempting to avoid overdependence on Bloc aid and trade. Such cases should not set a pattern whereby US aid appears highly correlated with solicitation of Bloc aid offers.

16. *Trade.* Exports are roughly ten times as large a source of foreign exchange for less developed countries as capital assistance. Trade also provides the greatest opportunity to develop permanent, mutually advantageous, and freely accepted ties between peoples and nations. It is the warp and woof of a community of free nations. The OECD nations should accord high priority to measures for giving the developing countries free access to their markets.

The US should eventually be prepared to join Japan and the European Community in reducing their restrictions on certain imports from

the less developed countries on an across-the-board basis. We should not expect symmetrical concessions from these countries. The burden of absorbing increased imports of any given product will be less onerous if it can be shared by all of the major industrial countries. Steps to reduce barriers to imports from less developed countries will have to follow steps by them to free up trade in industrial goods and to concert about their agricultural trade and production. The United States may need to take domestic measures to facilitate adjustment by the industries most affected to an increased volume of imports. It should urge other OECD countries to do the same, as needed.

17. *Commodity Price Stabilization.* The problem of price stability of primary products is no less important than that of the less developed countries' export volume. Fluctuations in export prices of primary producers and the resulting instability in foreign exchange earnings of less developed countries seriously hamper their economic development programs. Only if there is price stability will there be the needed financing and incentive for increased production. Just as nations must face this problem internally, a community of free nations must face it if it is to achieve wide acceptance.

The long run remedy for price instability is sustained growth and economic diversification in these countries. In the meantime, it is essential that the OECD states examine together means for reducing specific commodity price instabilities and for mitigating adverse effects of wide market variations on over-all export earnings of less developed countries.

18. *Change in Culture and Attitudes.* In all of this, one cardinal point should be borne in mind: Although the pace and process of modernization will vary from country to country, its success will hinge in most countries more on a real determination to achieve progress—with all that this involves in the way of effort—risk and innovation—than on any other single factor. A major purpose of our aid should be to generate the change of cultural attitudes which will produce this determination in as wide a range of the social groups in the less developed countries as possible. As these groups come to share our view of the modernization process, a consensus between us on this important front will strengthen the bases of the community of free nations.

Assistance for education can help to generate this kind of change in attitude by opening up new intellectual horizons for tradition-bound groups. Assistance for improved transport, connecting rural areas with modern cities, can serve the same purpose by exposing these groups to modern values and influences. These two cases are cited to illustrate a general policy, which we should constantly seek to devise new ways of applying and carrying forward.

19. *Political Change.* Political, as well as cultural change will be required to promote modernization. One of our major objectives in

providing capital to less developed areas should be to assist and promote reforms, notably in regard to taxation and land tenure, which would weaken the power of tradition-minded elites which resist modernization. The Alliance for Progress is a promising approach to this objective.

We must recognize that, as modern-minded groups become more numerous, they will demand more and more from the traditionally privileged. The latter will, in turn, be increasingly reluctant to make concessions which threaten their positions. It is all the more important to ensure that promising modern opportunities are also open to the more flexibly-minded among the traditionally privileged, so that they too can become identified with the modern order if they wish.

We must expect many abrupt and often immoderate changes as countries thus move toward more modern ways. Due to the less rigid organization of center parties, moderate leaders will be alternately attacked by both extreme left and right and under pressure by both to seek their protection. The course of progress will not be an easy one, but it would be greatly assisted by the emergence of powerful Center political parties, offering modern-minded elements a constructive alternative to more violent extremes. We should use our influence discreetly to help bring this about, where feasible.

## Chapter 2: Defensive Tasks

1. It should be our purpose to shield the constructive task of building a community of free nations, insofar as possible, from interruption and disruption at Communist hands. This means, among other things:

(a) Maintaining and using military strength along the frontiers of the community of free nations, and within the community, to deter or defeat aggression against its members.

(b) A sustained effort to create a stable strategic military environment, which will not automatically dissolve into general nuclear war under the pressure of crises and limited violence.

Efforts to meet these two needs are discussed in Sections I and II, below.

2. The common keynote to these efforts is that they are geared to defensive, rather than offensive, purposes.

3. Given our estimate of Bloc intentions and capabilities, the chances of “winning” the present competition by using or threatening force to roll back the frontiers of the Bloc seem slim. Given our faith in the greater effectiveness and attractive power of a community of free nations, our chances of winning that competition through success in our constructive programs seem good. These programs would tend to be disrupted by military conflict. The gains which we might achieve

through an aggressive military or diplomatic strategy would thus probably be outweighed by the damage such a strategy might do to our basic goals.

### I. Uses of Force

4. Making clear our will to resist any aggressive use of force should, of course, be our first line of defense. Collective security pacts, bilateral treaties, unilateral statements, and token US deployments abroad—all contribute to deterring aggression. But none are likely to have the intended effect unless we are, *in fact*, ready to use defensive force, as necessary.

5. We should beware of enticing arguments for not doing so, e.g., Berlin is “indefensible” or Vietnam is “peripheral.” Circumstances beyond our control have drawn the borders of the free world where they now stand, and in most contested areas we have, either implicitly or explicitly, associated ourselves with its defense. If we draw back, the Communists will be encouraged to test us elsewhere and our allies will be discouraged from resolute resistance to Communist threats and aggressions. We should, however, seek to minimize the commitment of US prestige to defense of positions which are not clearly within the borders of the free world, unless we intend to fight to hold them.

6. *Direct Aggression.* When the threat is one of direct aggression, we should be ready to meet it by despatching US forces, preferably in concert with other free world nations, to the assistance of the country under attack. Deployment of US forces and their supplies overseas should be such as to permit rapid and effective action to this end.

Our aim in such action should generally be to restore a situation comparable to the one which existed before the aggression, and to do this with minimum risk of general nuclear war. The scale and scope of allied military operations should be related to this aim.

Early initiation of use of nuclear weapons would not be consistent with this objective, since there is a significant probability that it would lead to counter-use. Use of nuclear weapons should only be initiated if it is wholly clear that the aggression cannot otherwise be defeated and if a careful calculation shows that it would be possible, should the Communists respond with nuclear weapons, to draw net advantage from a limited local exchange of these weapons.

If nuclear weapons must be used because the aggression cannot otherwise be defeated, the initial use should be limited and selective, geared if possible to the essentially *political* purpose of demonstrating firm intent with minimum risk of escalation. If our political use of nuclear weapons fails to dissuade the Communists from continuing the aggression, nuclear weapons should be used to seek a military decision. We should strike at military targets directly related to the

fighting, on the minimum scale needed to end that fighting. Where consistent with the object of achieving a military decision, nuclear weapons should not be used against the territory of the USSR and Communist China.

We should seek to deter the kinds of Communist counter-use which would lead to rapid escalation. We should make clear that any Soviet attack on Western cities and/or strategic delivery systems would lead us to attack these systems with such force as might be required to destroy them.

7. *Indirect Aggression.* Our national strategy must recognize that the more likely threat to the less developed countries will be that of *indirect aggression*. Local groups, often with clandestine support from abroad, will be used to seek control of a part or all of the country. This type of internal subversion can escalate, through guerrilla revolt, to conventional civil war with foreign involvement. The battlefield of such an attack is the society itself, since that society furnishes most of the resources, motivations and targets of the struggle.

A comprehensive development program calculated to minimize dissidence and meet popular aspirations—starting at the village level, is the best preventive action. Such a program should be mounted, wherever possible, before dissatisfaction reaches the point of unrest.

If indirect aggression nonetheless boils over, our primary response should be to enhance the over-all strength of the government under attack. We should encourage it to use this strength to win back dissident elements supporting the hard-core of rebel leadership. This will require a combination of balanced internal security capabilities (police, dual-purpose armed forces, adequate intelligence).

The US role should be to advise, finance, and train and equip indigenous personnel. We will be better able to perform this role if appropriate emphasis is placed on means of countering irregular warfare in US aid, training, research and development, and other national security programs. We should develop programs which are geared to the problems and tensions of vulnerable societies in their totality, and which seek to bring to bear appropriate politico-military responses through indigenous leadership.

US combat troops should be committed only if they would clearly have a decisive effect in meeting an indirect aggression which could not be contained in any other way. This will rarely be the case. US troops will seldom be adequate substitutes for properly trained and oriented indigenous troops acting under local leadership, in programs intimately related to local conditions. Their introduction will, on the other hand, involve some risk of a counter-productive local response and some danger of escalation—due both to Communist reactions and to the frustrations that would be generated in the US by prolonged

use of US forces in the prolonged, ambiguous, subtle and difficult tasks of suppressing internal rebellions.

Proposals for meeting the threat of indirect aggression by large scale air and/or ground attack on its external source should be viewed with skepticism.

If we cannot successfully meet the aggression on its own terms—i.e., by developing indigenous leadership which can prevail, widening the war will probably not protect the government under attack. If we *can* discharge the task, widening the war may well be unnecessary. Large scale attack on the external source of aggression would, moreover, probably lead to Chinese Communist or Soviet counter-action, with possibilities for escalation that are, quite literally, incalculable. Our effort to build a community of free nations might be greatly slowed, if not wholly halted, by the resulting spreading hostilities.

8. *Role of Other Countries.* In all these actions, we should seek to persuade our major European allies, as well as any countries in the area with the needed capability, to make their full contribution.

The will and ability of less developed countries to make an effective external contribution to such military actions will not generally be great, however.

We should not posit military aid programs or contingency plans on the assumption that these countries will do more than contribute to their own defense.

In increasing their capability to defend themselves, priority should be given to the most urgent threat they face. Where this threat is internal, we should help these countries to develop effective counter-guerrilla and related capabilities. We should not generally burden less developed countries in this category with ambitious military programs to meet direct external aggression, as well. This would merely prevent economic progress needed to meet the internal danger.

A few less developed countries may face an urgent threat of direct external aggression, however. In these countries we should try to build up local armies which could complement our own forces in resisting direct aggression. Even here, we should not press this effort to the point of diverting local resources and energies from needed internal tasks. It is more in our interest to maintain a US military establishment which will be sufficient to meet the external threat than to urge these countries to military programs which might threaten their viability.

We must recognize, of course, that these countries' military programs will only partly be subject to our influence. Where local governments are determined to maintain larger armies than we believe wise, it will still be in our interest to try to help these armies become a force for responsible leadership and effective modernization of the country

concerned, and to orient them generally toward the free world. Such an effort by the US will be especially relevant in the case of African and Latin American countries, which seem determined to maintain the military trappings of sovereignty even if no external threat is at hand. These countries' armies may well play a major role—for better or worse—in their countries' economic and political life; we should not cut ourselves off from them merely because they are wasteful and unnecessary.

It may sometimes help to persuade less developed countries not to mount larger forces than are required if we give them guarantees of prompt and effective US military action in case of attack, e.g., through security pacts. We should not, however, allow ourselves to be trapped in a vicious circle, in which we find ourselves providing aid for still larger forces in order to keep these pacts alive.

9. The threat of aggressive use of force has so far been discussed in terms of Communist action. The problem is more difficult. Forceful change is also sometimes threatened by the threats of non-Communist countries against each other. It might conceivably also be threatened by a desire on the part of one or more of them to fight Communist nations when this was not required for defensive purposes.

A prime object of US policy should be to avoid allowing non-Communist countries thus to trigger hostilities which might either create opportunities for Communist expansion or involve the US in unnecessary conflict. To this end:

(a) We should keep our more hot-headed allies on a tight logistic leash, seek to develop joint command arrangements which would give us a voice in their forces' use, and work out joint contingency plans which would orient these forces to defensive purposes in case of local hostilities.

(b) Regional arms control should be favored, particularly when it is proposed by the countries concerned. Tacit agreement with the Bloc for restraint in shipping arms to troubled areas, e.g., Africa and the Arab countries and Israel, might be helpful. Normal intelligence techniques might be sufficient to ascertain whether such an agreement was being generally observed.

(c) We should try to enhance UN procedures for peaceful settlement of disputes and use them wherever feasible. Stand-by arrangements for sending UN patrol forces to meet emergency needs should be strengthened. We should seek to improve UN command and staff organization, to expand training for UN functions, and to secure earmarking of additional forces for possible service with the UN to this end.

(d) We should focus on situations, e.g., West New Guinea, which might explode into local conflict between free nations, and try to initiate preventive diplomatic action before the event.

All these kinds of action will serve our basic purpose shielding the community of free nations against violence and aggression—no less directly than will our preparations to meet Communist attack.

## II. A Stable Military Environment

1. Our ability to shield the community of free nations from aggression will depend not only on the specific use of force to meet or deter aggression but also on the overall military environment within which such use takes place. Measures to create a stable military environment, i.e., one which will not readily deteriorate into general nuclear war under the pressure of crises and limited conflicts, are discussed below in relation to US military and arms control programs.

### A. Military Programs

2. *Strategic Forces.* The US should give the Soviets no reason to doubt our will to use nuclear striking power, if necessary. We should maintain a strategic force which is:

(a) sufficiently *effective* so that Sino-Soviet aggressive power clearly could not survive its all-out use;

(b) sufficiently *invulnerable* so that its survival need not rest on (i) striking first, (ii) our taking such “crash” measures in a crisis to reduce its vulnerability as the Soviets might consider evidence of impending attack; or (iii) an instant US response to ambiguous evidence of impending enemy attack;

(c) sufficiently *flexible* to be susceptible of discriminating and controlled use against a wide variety of alternative target systems—both in any initial use, and in continuing hostilities in accordance with assured continuity in decision-making.

3. *Non-Nuclear Forces.* A second major element in a stable military environment must be a Free World capability to use force within certain limits without taking actions involving a high probability of nuclear war. The contribution that overseas forces might make to this capability has already been discussed. To this same end, the US should maintain non-nuclear forces in the continental US which are:

(a) sufficiently *substantial* so that they could, in conjunction with foreign forces and US forces abroad, contain aggression short of all-out Soviet or Chinese Communist attack without using nuclear weapons;

(b) sufficiently *mobile* so that they could respond promptly and in needed numbers to two simultaneous threats in distant parts of the world;

(c) sufficiently *flexible* to be susceptible of use—both by themselves and in support of other countries’ forces—in irregular and sub-belligerent, as well as regular, military operations;

(d) sufficiently *ready* so that they could accomplish these purposes without large mobilization of US reserves. We cannot assume that the threats we will have to face will be so infrequent, dramatic, and unambiguous as to make recurring reserve call-ups a feasible or desirable means of meeting them.

4. *Active and Passive Defense.* A third major element in a stable military environment must be sufficient US defense against Soviet nuclear attack to assure, and hence to make clear to the Soviets, that the US Government:

(a) would be able to function and to dispose of its remaining resources in an organized fashion after general nuclear war;

(b) could protect the civil population sufficiently to count on popular support in facing up to the threat of general nuclear war.

*Active* defense of the continental US contributes to these purposes. Few actions would so change the world scene as the development of a genuinely effective anti-ballistic missile capability by either side. Research and development directed to this problem should have high priority.

*Passive* defense programs, including fall-out shelters, should also be carried out as needed to serve the purposes outlined above. It follows from the basic doctrine set forth in this paper that care should be taken not to generate such an undue popular preoccupation with these programs as to divert public attention and energies from other tasks needed to achieve a community of free nations.

## B. Arms Control

5. US policy regarding arms control should have the same basic purpose as our military programs: to create a stable military environment, in which our security can be assured with minimum risk of nuclear war.

6. *General Disarmament.* To this end we should continue to propose a phased program for the achievement of general and complete disarmament.

Such a program must be one that is consistent with our goal of community of free nations. Thus, it must ensure that disarmed nations can pursue legitimate international goals at least as effectively as they do today. And it must equally ensure that the right of these nations to determine their own political, economic, and social system is at least as effectively protected as it is today.

A disarmament policy that satisfies these conditions must seek to develop, parallel to the curtailment and ultimate abandonment of national military power, the growth of international mechanisms, including international force, which will permit international relations

to proceed in such a way that change and evolution occur peacefully and in broad directions consistent with our long-term goals.

7. *Limited Arms Control.* While seeking agreement with the Soviets on such a comprehensive program, we should also press for consciously limited measures designed to reduce the more explosive possibilities inherent in possession of national armaments.

One element of such a limited program should be measures to reduce the risk of war by accident or miscalculation. This should be given very high priority, and actively pursued. Consideration should be given to negotiating on this matter through procedures and in a forum different from that in which more comprehensive and complicated programs dominate the stage, and thus create a highly charged propaganda atmosphere.

A second main purpose of limited arms control should be to reduce the risk of nuclear proliferation to other national governments, e.g., by an agreement between the nuclear powers not to give warheads into the national custody of other countries, and by an agreement to cease production of fissionable materials for weapons purposes, which might also involve nuclear stockpile reductions.

In the long run, other stabilizing measures may also be feasible. As both sides achieve increasingly effective and invulnerable missile capabilities, for example, it may be possible to consider agreements to abate great power competition in missiles and also in the stockpiling of nuclear weapons. Prevention, or at least inhibition, of the extension of arms competition to outer space and celestial bodies could also serve a stabilizing purpose.

Total nuclear disarmament is unlikely of early achievement. So long as we and the Russians alike possess the enormous but somewhat inhibited power of the thermonuclear weapon, however, its sobering effects will continue to obtain in some measure. If we can supplement these sobering effects by other measures likely to inhibit a resort to arms, we may then have the best of an imperfect world, until general disarmament comes about.

### PART THREE

#### A FRAMEWORK FOR NEEDED TASKS

##### Chapter 1: The Atlantic Community and Japan

A community of free nations can only be built if some of its members are willing and able to deploy substantial resources beyond their borders in prosecuting the needed constructive and defensive tasks which have been outlined. Given the realities of power, this will and ability must be found largely in the US, Western Europe, and Japan.

## I. The United States

1. *Economic Base.* A higher rate of economic growth than has been achieved in recent years will be needed to generate an increasing level of resources for US assistance and security programs, to give convincing evidence to other countries of the attractive power of our social and economic system, and to ensure that the US continues to be the leading workshop and trading partner of a community of free nations. Our broad national objective should be to achieve the annual average of 4.2% growth in gross national product agreed on at the OECD in November, 1961. Achievement of this objective will be dependent, in some degree, on government action.

Fiscal, tax, and monetary policies should be such as to permit fulfillment of this growth objective without generating such continuing inflation as would impair public morale, divert labor and capital to uneconomic purposes, and prevent a balance in our international payments. This balance should be sought through policies which will assist, or at least not slow down, progress toward an effective world community—e.g., by seeking to improve the US competitive position, lower world trade barriers, and promote US exports.

2. *Political Base.* Sustained US public support and understanding will also be needed to prosecute the broad strategy outlined in this paper.

This will only be forthcoming if a clear sense of direction and meaningful effort can be conveyed to the American people—a sense which outweighs the effect of particular interests, partisan passions, and traditional prejudices.

To convey that sense, the general strategy that is being followed by the US should be laid before the American people with the same candor as within the executive branch. Specific measures for which public support is being sought should be related to this strategy, in public expositions, wherever possible.

## II. The European Community

3. The resources of Western Europe will only add up to an effective grouping if the separate European nations pool these resources in common enterprises. The beginnings of concerted action to this end are to be seen in the European Community.

4. The guiding rule of our European policy should be to enhance the strength and cohesion of this Community within a broader Atlantic framework.

5. We should encourage any tendency in the Community to extend its integration into the political field. We should not be deterred by fears of a “third force,” which would play the US and USSR off against

each other. The danger that a united Europe will deliberately follow policies that favor the Communists is slight. Much more real is the danger that Europe will be induced by a sense of internal division and external weakness not to react vigorously to efforts to extend Communist influence into the less developed areas. This danger will be reduced in proportion as European strength and confidence is enhanced within an effective Atlantic Community.

6. We should encourage the UK to participate fully in the movement toward integration, both to strengthen that movement and to balance present Franco-German leadership. We should be chary of "special" US bilateral relation with the UK, which might serve as a bar to its full integration within the European Community.

7. We should use such influence as we can exercise on German events to support those German leaders and groups which believe that the European Community should be the main focus of Germany's foreign policy. An increasing absorption in the affairs of that Community will be the best safeguard against a recrudescence of irresponsible nationalism in German national life and policy.

The danger of such a recrudescence may grow as time shows no signs of weakening or eroding Soviet control of East Germany. We should represent to German opinion that the most effective way of moving toward reunification lies in enhancing the strength, stability, and attractive power of the European Community into which East Germany might eventually be absorbed. We should make clear that we do not abandon the goal of reunification as one hoped-for outcome of building this Community. The credibility of this posture will be enhanced by a firm defense of the freedom of West Berlin, and of the Western presence in and access to West Berlin, since West Berlin is a symbol of reunification to German opinion.

### III. US-European Partnership

8. A closer partnership between the US and an integrated Europe within the Atlantic Community will become the more feasible as progress is achieved toward European integration; the US can work more effectively with a single integrated Europe than with several weaker European nations. Despite obvious obstacles, resulting partnership should be capable of embracing Japan in the economic sphere at the earliest possible time.

9. *Economic Base.* If these nations are to engage in undertakings abroad on the scale required to build a larger community of free nations, they must devote increasing resources to this purpose. This means that they will need to take joint—as well as individual national—steps to accelerate their economic growth.

The US should negotiate with the European Community and Japan for drastic across the board reductions in restrictions on trade in indus-

trial goods. This will permit these countries to achieve more effective use of their resources and hence more rapid growth. The benefits of any agreed cuts should be extended to other countries. Attempts to promote freer non-discriminatory trade on a worldwide basis should be prosecuted with utmost vigor; they make a vital contribution to economic health of the free world.

These advanced countries should also eventually seek to concert on steps regarding production, trade, and pricing of the agricultural commodities which they produce in surplus amounts.

Progress along these lines will create an atmosphere in which it will be easier for them to agree on reductions in present restrictions on imports from less developed areas, such as were discussed earlier in this paper.

The European Community, the US, and Japan should also seek to accelerate their growth by coordinating their monetary and fiscal policies. They should work to develop or strengthen international monetary arrangements that make it possible for them to pursue multilateral and non-discriminatory trade. These will include measures to limit destabilizing movements of liquid funds, and arrangements for making effective use of present world reserves. This may require new institutions.

Such monetary and fiscal policies will permit these countries to press forward with expansionist domestic policies without undue fear of generating costly and disruptive imbalances in their international payments.

Over the long run, steps toward still closer US economic association with the European Community may be feasible and desirable. The form that these steps might take cannot now be defined, but the possibility of such closer association should be constantly before us.

10. *Military Base.* The European countries will be more likely to join the US in needed tasks throughout the free world if they have some assurance that their home base will be reasonably secure against Soviet threats and military pressures.

(a) They must believe that adequate nuclear power will be available to deter or defeat all-out attack upon them. We should assure them that US strategic forces will cover targets essential to the defense of NATO Europe and seek to develop with them guidelines and procedures for consultation and decision regarding use of these strategic forces.

This may not, however, be enough. We should, therefore, also be willing to explore with our allies the concept of a multilaterally owned and controlled sea-borne NATO MRBM force, as outlined by the President in his Ottawa speech. Use of this force would be on the basis of

guidelines and procedures agreed to by our allies. In the process of exploring this concept with our allies, we could determine whether sufficient pressures existed to warrant our seriously considering procedures which would permit the force to be used under certain conditions without our consent.

Even if the European countries were unable to agree on decision-making procedures which would make it feasible to establish this force, the mere fact of our having proposed it should help to reduce fears of US willingness to use nuclear weapons in Europe's defense. Even if the decision-making formula were agreed upon and left uncertainty as to whether the force would ever be used, the basic credibility of the nuclear deterrent to Soviet attack would not be affected since the bulk of that deterrent could remain under US control.

It should be recognized that there are grave risks and difficulties associated with proceeding along these lines. The alternative, if European concerns cannot otherwise be met, is probably a growing pressure for the creation of separate nuclear capabilities by individual European countries. This would generate fears and divisions more grievous than any now resulting from the US nuclear monopoly.

We should continue our existing policy of opposing and discouraging any movement in this direction (i) by refusing assistance for the French national nuclear program; (ii) by trying to phase the UK out of its independent strategic program—which stimulates France to wish to follow suit; and (iii) by refusing to deploy additional MRBM's to the forces of individual European countries, since this deployment would tend to evolve into *de facto* national nuclear capabilities, whether or not the resulting forces were committed to SACEUR.

(b) A sound military base for a confident European association with the US must also be one which convinces European nations that they could defeat non-nuclear aggression short of all-out Soviet attack without destroying themselves in the process. They have so far viewed US attempts to lead them in building up an improved conventional capability with suspicion, since they believe that these attempts reflect a US desire to disengage from their nuclear defense. The matter will appear in a different light if the steps referred to under (a) above are also being taken: The Europeans will be more likely to welcome US leadership in a defense policy that will enable them to defeat and survive limited attacks, if they believe that this policy will also deter all-out attack.

US leadership in enhancing Europe's non-nuclear capabilities will only be effective, however, if it involves more than exhortations. Maintenance of substantial US forces on the continent, continuing modernization of these forces, and US participation in cost-sharing arrangements which distribute the defense burden equitably through the alliance as a whole will all be needed.

11. With a secure military base and expanding resources the US and Western Europe should, with Japan as their partner in some cases, be able to cooperate more effectively in meeting the needs of the rest of the free world.

We should continue the effort which the Secretary of State inaugurated at the NATO meeting in Oslo to persuade the other NATO countries that there are no areas peripheral to their vital interests.

This can best be done if there is full and frank consultations with these countries about the best use of our combined resources. We come closest to doing this in our relations with the UK. We should increasingly treat France and Germany, the European Community as it emerges, as well as Japan in certain fields, with the same candor and intimacy. These entities are more likely to act the part of powerful and responsible allies if we treat them as such.

The forum for concerting about *defensive* tasks is NATO. We should be forthcoming in our NATO consultation, and seek to strengthen and extend the use of NATO for this purpose.

The forum for concerting about *constructive* tasks is the OECD. The US should take the lead in pressing for increased consultation in this forum. OECD's organizational arrangements should be sufficiently flexible to reflect the fact that Japan is an indispensable partner in many of these tasks; some of the OECD members are not.

It is essential to continue our efforts to strengthen NATO and the OECD as European integration goes forward. The best way to guard against a stronger Europe becoming a "third force" is to bind it tightly to the US through ever more effective Atlantic institutions.

## Chapter 2: Other Ties Between Nations

1. The community of free nations is based on the sum total of all the manifold ties—private and public, tangible and intangible—which bind its members to each other. These ties make it possible for them to work together with good effect, and limit their ability to harass each other or to act with irresponsibility. The development of such ties cannot be forced, but must flow normally from the development of a consensus of views, the sharing of common ideals and aspirations, and the existence of a true "community" feeling. Such ties can, however, be developed by public and private initiatives, properly timed, where the precondition for them already exists. Bilateral, regional, and world-wide measures to this end are discussed below.

2. *US Bilateral Ties.* We should seek to strengthen bilateral ties between the US and other free countries—whether they are allies or neutral. A wide variety of activities can serve this purpose, aside from the day-to-day conduct of diplomatic affairs, e.g., the Peace Corps,

the people-to-people program, reciprocal state visits, tourism, and the exchanges of people.

3. *Other Developed Countries' Bilateral Ties.* We should encourage other developed nations at the "core" of the community of free nations to maximize their contacts with the less developed nations, on a basis of consent, mutual interest, and self-respect. Concentrations of influence such as the Dutch once exerted in Indonesia and the Belgians in the Congo would thus increasingly be substituted for in a given country by the composite influence of a number of free developed countries.

4. *Bilateral Ties Between Less Developed Countries.* We should urge the less developed nations also to increase bilateral ties among each other, and encourage any tendency among them to pool their sovereignty in larger units. Where disputes between them hinder this process, we should consider remedies: UN action, or an offer of good offices by the US or some third nation or grouping, e.g., the Commonwealth.

5. *Regional Ties.* We should encourage regional ties and groupings among the less developed countries, wherever a significant desire and sound basis for such ties exists. These ties are more often a result, than a cause, of basic drives for regionalism, but initiatives to stimulate or exploit them can sometimes be helpful. Where the possibility exists of formalization of constructive groupings, we should provide incentives in the form of assistance to group enterprises. Within regional groupings, differences between neighbors may tend to become submerged to the exigencies of the group. Groups can thus achieve constructive results which would not be attainable by individual nations. Bilateral relationships are also more intimate and meaningful between members of a group.

6. *Economic Regionalism.* The US should encourage any less developed countries that may wish to do so to form not only political associations but also regional customs unions or free trade areas that conform to GATT criteria. It should support arrangements of this kind, or other regional trading arrangements in the less developed areas, that would lead to the competitive exploitation of larger markets.

7. *OAS.* The OAS is a prime example of a useful regional grouping. After the Atlantic Community, it is the most effective grouping of which we are a member. We should continue to value our membership, and take care that our participation in other groupings does not detract from the attention and energy that we devote to strengthening of the OAS. We should seek to remove or reduce obstacles to its effectiveness; e.g., by working to isolate the Cuban government and Castroist movements in the Hemisphere.

We should support other regional activities in the Americas, such as the Economic Commission for Latin America and the embryonic common market areas under discussion in Central and South America.

8. *Africa*. Here is an area in which closer regional ties could help to minimize some of the more dangerous consequences of Balkanization. We should encourage any tendency on the part of the African states to concert for the peaceful settlement of disputes, arms limitation, and the promotion of improved transport and economic development. We should not exaggerate the likely pace of progress, however.

9. *Asia*. We should also seek increased regional cooperation among Asian countries along the rim of Communist China. We should exploit existing instruments and seek to create new ones to this end.

In the economic field, the Columbo Plan Organization brings many of these countries together with each other and with countries from outside the region in pursuits which they rightly conceive to be in their interest. It is thus a significant force both for regional cohesion and for closer ties between the region and the West. We should support and strengthen it, and also ECAFE, in any way we can.

There is no grouping in the security field which commands such widespread local support in Asia. We should continue to support the two existing regional security pacts, SEATO and ANZUS, so long as they appear to enjoy sufficient acceptance among their members to outweigh any divisive effects which they may have in free Asia as a whole. If possibilities for new and more effective regional groupings in defense of Southeast Asia open up, we should exploit them. We should be willing to submerge SEATO in any such groupings if this would enhance their chances of coming about.

We should also explore the possibility of finding common ground in the economic field, on which to base a Pacific Community, for which the US, Canada, and Japan could provide a nucleus of developed states and around which other states of the area could usefully be grouped, if they wish.

10. Where participation by ourselves or other industrialized nations in these regional groupings is acceptable to the other members, this will help to weave a still tighter web of free world ties. But we should not press. If other free states wish to consider matters of mutual concern without outsiders present, their grouping, if constructive, will still help build the community of free nations.

11. The UN is the most important forum in which closer political ties between developed and less developed free nations are to be sought. It is the only forum in which we and all these less developed nations come continuously together and work toward common goals. It is a continuing means of educating the emerging nations about the facts of international life. It creates international institutions, e.g., the FAO and WHO—which also tend to strengthen the community of free nations.

The UN can thus make a continuing and powerful—if not decisive—contribution to the growth of the community of free nations.

To this end, we should seek to extend the scope and enhance the effectiveness of its activities. We should continue to give vigorous support to the development of its executive function, i.e., the concept of a single and effective Secretary General and the independence of the UN Secretariat.

We should try to persuade the less developed countries that it is in their interest to do the same. The UN is now dependent for its continued effectiveness on these countries' support. Persistent Soviet efforts to hobble the UN can only be frustrated with that support.

It will help to convince these countries that effective UN activities advance their welfare and help them to guard against great power domination if UN activities of direct benefit to them—e.g., UN aid to African education, UN food surplus disposal, UN peace-keeping machinery, and UN activities attendant on the International Development Decade can be pressed forward vigorously. We should seek to do just this.

We should also make a major effort to consult and concert intimately at the UN with the less developed countries about measures that we are taking outside the UN to build a community of free nations. To facilitate this intercourse, we should avoid exclusive or preclusive ties with the Atlantic nations in UN voting or debate. We should try to persuade our European allies that the broad purposes they and we are pursuing jointly in the world will best be advanced by a US posture which thus seeks to attract new nations into the emerging community of free nations—even if it ruffles some European feelings in the process.

12. There is another worldwide forum worth commending. The Commonwealth is a useful and effective tie between some developed members of the free world community and a wide variety of emerging nations in Asia and Africa. It can probably do more to bring some of these diverse and widely separated nations together than any other instrument now available in the free world. We should encourage its continued effectiveness in every way consistent with our support for European integration. We should take care not to urge newly independent members of the Commonwealth to substitute close relations with the US for their Commonwealth ties.

13. The French Community is not yet in the same league but it holds promise. We should act in ways which would help it to fulfill that promise, so long as it seems to rest on a solid base of support among its less developed members.

14. A wide variety of private worldwide forums can also be helpful. It is worth remembering that the community we know best, the United

States, is held together not only by constitutional ties between the fifty states but also by a complex network of non-political ties between private groups in each of these states. We should seek to encourage and bring about similar ties between the wide variety of business, labor, professional, fraternal, philanthropic, and civic organizations that span the free world. The great world religions can serve to bind the community of free nations closer together; they have much in common, and stand out in sharp contrast with the atheistic principles of Communism.

Our ultimate hope is to create, in all these ways, a multilateral framework of world contacts so complex and so strong that it can truly be termed a world community.

15. The success of this US policy will require, however, that the other free nations come to understand and share our goal of creating a community of free nations. The US public posture toward the outside world should be designed to help create that understanding.

US leaders—in their addresses at home and in the UN—should lay out that goal, describe its content and advantage, and make clear how the manifold aspects of US policy are related to its attainment.

Our public information programs should do the same. They should indicate how our effort to build a community of free nations helps to assure the freedom, security and progress of other countries. The US can only prosecute its worldwide policy effectively if “it is so directed,” as Sir Eyre Crowe well said of Britain’s policy before World War I, “as to harmonize with the general desires and ideals common to all mankind and, more particularly, that it is closely identified with the primary and vital interests of a majority, or as many as possible, of the other nations.”

In fact, this identity exists. In trying to build a pluralistic community of free nations, we have a long-term goal which coincides with the interests and aspirations of other peoples. As our public statements and information programs bring this fact home to them, the broad consensus which is the indispensable foundation of that community will tend to be created.

## PART FOUR

### RELATIONS WITH THE COMMUNIST NATIONS

1. Our political posture toward the Communist nations should be geared to our basic purpose: the building of a community of free nations.

2. This posture should, therefore, keep the main focus of free world attention where it belongs: on opportunities in the free world, rather than on the need for reacting to Communist propaganda and diplomatic

initiatives. It should keep free world relations with the Communists in perspective as one element of our concerted effort to build and defend a free world system. And it should encourage evolution in the Communist nations which might eventually permit them to be absorbed into that system.

3. The following sections discuss the implications of these broad purposes for our relations with (i) the USSR; (ii) the satellites; (iii) Communist China, (iv) Communist ideology.

#### I. The USSR

4. The best way to avoid an excessive preoccupation with periodic crises in our relations with the USSR is obviously to avoid the crises.

One step to this end is to build up the military strength to deter them. This has been discussed.

Another step is to address situations within the free world which could lead to crises. For example: the conflict in Angola might, if not alleviated, eventually become the focus of Bloc intervention (as in the case of the Congo) and thus erupt into a full-blown crisis which would engage our resources and prestige. US policy should make a deliberate effort to identify such possible crisis situations and to resolve them before the Communist nations can exploit them.

It will also be desirable to reduce the number of East-West friction points which contribute to crises, where this can be done without prejudice to our national objectives. We should periodically review US positions in international organizations (e.g., ostracism of Hungary) and Western intelligence and propaganda operations from this standpoint.

The most useful way to avoid crises will be to convey a clear understanding of our intentions to the Soviets. We should cultivate a maximum of informal communication with them to this end. We should discuss fully our policy toward the areas and situations in which crises could erupt, so that they will not mis-read this policy as being weak or provocative.

In the long run we might try to work toward tacit understandings as to the ground rules governing our competition with the USSR, if only by making clear the ways in which we are likely to respond to different types of Communist actions. We should bring out the need for both our countries to exercise restraint in the use of their power in weak and unstable less developed areas, in order to keep that competition within manageable bounds. We should try to identify other areas, e.g., inflammatory propaganda, in which mutual restraint might be desirable.

5. When crises do erupt, our purpose in them should be clear and simple: to restore equilibrium as quickly and with as little violence as

possible, and without a net loss for our interests. We should avoid either:

(a) trying to resolve the crises by concessions which would encourage the Communists to believe that crisis mongering is a profitable occupation;

(b) being moved either by rising tensions or by the importunities of our allies or our own public to prolong and extend the crisis in an effort to inflict a dramatic humiliation on the Communists.

6. We should also ensure that crises, when they erupt, do not wholly dominate US policy. These crises would be rewarding for the Communists if they thus decisively diverted our attention and energies from long-term endeavors.

We should also beware of reacting to crises in ways which would jeopardize those constructive endeavors. The recurring temptation to take actions to meet immediate threats which would change the direction of our long-term policies will need to be resisted, if the basic strategy outlined in this paper is to be carried forward.

7. All of this will clearly require vigorous US leadership in shaping Western public opinion during crises. We should make clear to our own and allied peoples the need for both firmness and restraint. We should resist any pressures for a military show-down or a diplomatic “triumph.” We should define our basic purpose—prevention of *forceful* change—and indicate how this relates to our over-all strategy of seeking *peaceful* change in the building of a community of free nations. This will be the easier to do if we have publicly and convincingly rehearsed that strategy before the crisis.

8. It is equally important to avoid being diverted by either false detente or an excessive preoccupation with East-West negotiations.

The best way to avoid the paralysing effects of false detente is to indoctrinate our own and allied peoples in the basic facts of the East-West struggle. We should make clear that this struggle arises out of the nature of the Soviet and Chinese Communist systems. While avoiding making ideology a *casus belli*, even in the propaganda field, we should be wholly clear as to the underlying conflict between ourselves and the Communists, and the fact that it is likely to continue for a very long time.

The best way to avoid the excessive preoccupation with East-West negotiations which periodically seems to sweep over the West is: (i) to avoid over-dramatizing either the likelihood of negotiations’ success or the consequences of their failure, and (ii) to resist pressures for inflating the level of negotiation beyond what is substantively useful.

It will be helpful to this end if we can avoid formal Summit meetings, except where needed business cannot otherwise be transacted.

One such case may be where the full authority of the heads of government is needed to halt a chain of military action and counter-action leading straight to war. This is not to say that it would not be useful to develop further informal contacts and exchanges between the President and the Soviet leadership.

It will also be helpful if we can maintain a posture in negotiations which suggests that they are a businesslike attempt to reduce the risk of war, and do not reflect any basic change in US or Soviet attitudes toward each other. We should stay clear of meaningless camaraderie.

9. Our long-term purpose is to increase the chances of constructive evolution in the USSR, which might eventually move it to participate in the community of free nations.

Change is the law of life, and there will surely be internal change of some kind within Soviet society over time. This is not to say that the change will necessarily be of the kind which we would prefer, or will have any early useful effect on the USSR's external posture. But there is obviously some possibility of this, and that is enough justification for US measures designed to reinforce any civilizing pressures which may be at work.

(a) We should maintain continuing pressure on the USSR to expand exchanges of persons on equitable terms and to reduce restrictions on the flow of information. It may be somewhat difficult for Soviet leaders, like the Japanese Shoguns, to maintain a stable repressive system in the face of widening exposure to outside influence.

(b) We should press for cooperative ventures in such fields as outer space, Antarctica, public health, and peaceful uses of atomic energy. Such ventures might give the Soviets somewhat more of a vested interest in respectability and perhaps even induce some of their officials to think—albeit on a very small scale—in terms of business-like dealings with the West on matters of mutual advantage.

(c) To the extent possible in the existing climate, we should grant to the USSR the position its status as a great power warrants. We should also hold out, by word and deed, the prospect of fuller Soviet participation and influence in the community of free nations if and as the Soviet leaders show a genuine interest and will for such constructive participation. This will not change the basic policy of Soviet leaders now in power, but it may have some moderating effects on their conduct, or that of their successors. It may also make it that much more difficult for the Soviet leadership to persuade its people that any change in the Soviet external posture is precluded by relentless Western hostility.

None of this may do any good. Clearly we do not have such a good chance of success through such efforts that we can relax our efforts in other directions. We cannot expect Soviet society, which is

also Russian society, to lose quickly the hostile and dangerous features that stem from the Communist philosophy and Russian environment. But our effort to build a community of free nations would be incomplete if it did not include some efforts toward this long-term goal.

## II. The Satellites

10. We want the nations of Eastern Europe eventually to become members of the community of free nations. This will hinge largely on an evolution in Soviet policy, which we should seek to encourage—through means that have been outlined. It will also hinge on changes within the satellites themselves; the rest of this Section discusses means of promoting these changes.

11. We should try to widen contacts between the nations of Eastern Europe and the West at every level. Such contacts will bring home in some way, however muted, the message of freedom. That message may encourage these peoples to press their governments, insofar as they safely can, for gradual internal liberalization and for steps toward greater national independence.

12. Western contacts with the satellites will generally depend on the consent of their governments. That consent will hinge, in part, on the nature and apparent intent of the contacts which are being proposed.

These contacts should not, therefore, appear to reflect an intent to create early political changes in Eastern Europe. We should play “liberation” in low key, in order to achieve the wider East-West relations that are likely to promote gradual progress toward this eventual goal.

When occasions arise on which our silence might be misinterpreted, however, we should make clear that the community of free nations is intended, in the long run, to include the peoples of Eastern Europe.

13. Western Europe has a special role to play in all of this. As European integration and economic progress proceeds, its pull and attraction will increasingly be felt in Eastern Europe. We should encourage and assist the Western European nations to exploit any resulting tendency toward closer relations between the two parts of a once united continent.

14. Poland and Yugoslavia offer special opportunities. It is in our interest that Poland maintain some freedom from Soviet control, and that Yugoslavia preserve its present relative independence. We should be prepared to furnish economic aid to this end, and we should encourage Western European nations—perhaps acting through the European Community—to do the same.

15. Albania is a special case. It is in our interest that the break between Albania and the USSR continue. Ultimately, we should hope

that Albania would return to the community of free nations. For the time being, however, our interests would be best served by Albania's remaining a bone of contention between Communist China and the USSR.

16. East Germany is a problem of particular moment.

To indicate that we regard the division of Germany as permanent would be to shake West German confidence in the West and thus perhaps jeopardize effective German participation in the European and Atlantic Communities. On the other hand, it will probably not be possible to insulate ourselves from dealings with the East German regime over the long term.

We should be prepared to do business with the East German regime, as the need arises, on a technical level—much as the West Germans do. We should not grant diplomatic recognition. We should continue to make clear our dedication to German unity and our expectation that it will prevail. But with the passage of time our East German policy should tend to converge with our general European satellite policy.

17. If revolts break out in East Germany or any other satellite, we should bear in mind the defensive goal laid out for our military policy in Part Three of this paper. Our grand design is to build a community of free nations which will expand by its attractive power; we do not wish to jeopardize this design by allowing Eastern Europe to become a battlefield between ourselves and the USSR, unless we are attacked. We should maintain this posture if turbulence erupts in this area, and urge our allies to do the same.

### III. Communist China

18. The chances of promoting a helpful evolution of the Chinese Communist state and its policies through increased contacts and diplomatic dealings appear remote indeed. US efforts to achieve them at this time would invite the rebuffs of the Peiping regime and could lead to harmful misunderstanding of US policy among our friends in Asia.

19. However we do need, as part of our effort to build a community of free nations, to strike a posture towards Communist China which will place the onus for continued hostility squarely on Peiping and thus enhance free world confidence in US leadership and gain firmer support for policies designed to counter Chinese Communist expansion.

By thus holding ajar the door to a better relationship between Communist China and ourselves, we can avoid serving the Peiping regime's interest in convincing the Chinese people that the US is their implacable enemy. Our doing so might also contribute to the emergence of more moderate policies if a deepening of Communist China's diffi-

culties in feeding its populace and building the industrial base for world power should result in a leadership split.

20. Since the present Chinese Communist leadership has a vested interest in having the US appear to the world at large and to its own populace as implacably hostile, we cannot expect it to cooperate with US efforts toward the ends outlined above. That being so, we must place primary reliance on US actions which are unilateral, in the sense of not necessarily requiring a ChiCom response. For example:

(a) Avoiding apparently unnecessary provocations.

(b) Pursuing negotiations with Communist China on specific matters of mutual concern, as needed.

(c) [illegible in the original] to develop a course regarding the UN membership question which would make Communist China's non-inclusion appear to be the result of Peiping's unwillingness to accept specified conditions, rather than US intransigence.

21. The same general purpose of gaining support for a policy in an area where it is unilateral in a dangerous degree, and thus enhancing acceptance of US leadership, will be served by measures which make the position of the US on Taiwan more acceptable to majority free world opinion.

(a) We should use our influence and aid as a means not only of protecting Taiwan through our alliance with the GRC, but also of progressively promoting the timely emergence there of government based on popular consent.

(b) We should work, within the limits which a useful relation with the GRC will allow, for a damping-down of the GRC-Chinese Communist civil war. As a first step, we should consider seeking a major reduction in the garrisons on the offshore islands—on purely military grounds.

(c) We should, at the same time, make plain to the GRC our enduring commitment to sustain and defend a free Chinese government on Taiwan. We should outline our view as to the role such a government can play as an attractive counter to the Chinese Communist regime over the long term.

22. These measures may enhance free world cohesion, but it is unlikely that they will prevent Communist China from continuing to grow in power and from eventually acquiring a nuclear capability.

This growth of Chinese Communist power might be slowed if the Sino-Soviet split widened. There is little we can do to promote that split, but we should at least avoid actions which might have the effect of healing it. We should not go out of our way to make it look as though Khrushchev's preference for negotiation over fighting is a vain one; and we should make clear that the contrary Chinese view, if put

to the test, is likely to entail swift disaster. We should try to avoid giving the Chinese Communists a more effective basis than they now have for seeking Soviet nuclear aid, e.g., by US provision of offensive nuclear delivery systems to Communist China's neighbors or by basing such systems in areas close to mainland China before they are needed to counter a Chinese Communist nuclear capability in being.

We should not, however, become so fascinated with the Sino-Soviet split as to lose sight of the larger prospect. That both states will continue to wax in strength, without waning in hostility toward us. The only effective means of offsetting this prospect will be a continuing build-up of free world strength and cohesion, through our own constructive policies.

#### IV. Communist Ideology

23. We should not be diverted from these positive policies by an excessive preoccupation with psychological warfare. Our best response to the Communists' ideological offensive will be to get on with the building of a community of free nations and to make clear that our policies to this end are compatible with the wish of people everywhere to live, to develop, to do things in their own way—and not in accord with a superimposed pattern.

24. In elaborating this goal and concept, we should seek to undermine the appeal of Communist ideology—in both the free world and the Bloc.

We should oppose the Communist thesis that the nations of the world now find themselves, and will continue to find themselves, in either one of three blocs—Communist, capitalist, and neutral—the thesis that the nations are divided only between those that want to be free and those that would destroy that freedom.

We should meet the Communist contention that unrelenting hostility and conflict are a law of history with the contention that international peace and cooperation would actually exist but for the policies by which the Communist-ruled states exclude themselves from the world community.

We should expose the Communist concept that “peaceful coexistence” is a form of struggle between nations, and substitute the concept that honest coexistence is a framework for genuine cooperation for constructive purposes.

We should not lend the Communists prestige by echoing their talk about a “world Communist movement.” We should speak less of “international communism” and more of the national power complexes behind it. We should stress that the only genuine international movement, in the true sense of that term, is the movement to build a community of free nations.

In all these ways, we should seek to expose to the light of reason the confused thinking on which Communist ideology feeds and to refute the accuracy of Communist claims.

We should, in all that we do or say, accept as hard reality that the problem we face is not one of articulating words and phrases, or even concepts. We best refute the Communists' ideological claim to be the "wave of the future" by denying them further successes in the present and by working toward ever greater free world successes for the future.

Thus the conclusion of this paper reaffirms its beginning, by stressing that the only effective long-term response to the Communist challenge is to press ahead with efforts to build and defend a community of free nations.

---

#### **249. Memorandum from Bissell to Bundy, December 11<sup>1</sup>**

December 11, 1961

##### **SUBJECT**

Report of Counter-Guerrilla Warfare Task Force

1. For some months a task force of senior officers, under my chairmanship, has been discussing how best to ensure an adequate focus within the U.S. Government on the problems of dealing with Communist indirect aggression and subversive violence. The officers on this group have included officials of the State and Defense Departments, the White House, and CIA. They have, however, participated as individuals and have not committed their respective organizations.

2. The result of our effort, unanimously approved by the task force members, is herewith submitted for your consideration. I am also sending copies to General Maxwell Taylor for his comments in his capacity as chairman of the NSC Special Group, the charter of which would be enlarged by the report's recommendations. Copies of the report are also being sent to the State and Defense Departments through their task force participants.

---

<sup>1</sup> Conveys report of the Counter-Guerrilla Warfare Task Force on "Elements of US Strategy to Deal with Wars of National Liberation." Secret. 20 pp. Kennedy Library, National Security Files, Departments and Agencies Series, CIA General, 12/61.

3. I suggest that after soliciting the views of the agencies concerned you might well wish to take the initiative in submitting the report to the NSC for Presidential review of the action recommendations.

#### **ELEMENTS OF US STRATEGY TO DEAL WITH "WARS OF NATIONAL LIBERATION"**

**Report Prepared By**

**Counter-Guerrilla Warfare Task Force**

#### **CONCLUSIONS**

1. Serious Communist intent and capability to press forward with the technique of subversive intervention, often extending to guerrilla warfare in various underdeveloped countries or regions, confront the US with a critical problem which will persist throughout the Sixties.

2. However, despite the clear consensus within the US Government as to the magnitude and urgency of this problem, we are not yet organized to help threatened countries to deal adequately with it. We have at our disposal a variety of potential resources and programs for facilitating the prevention of Communist subversive violence and for repressing active guerrillas, but these have not yet been harnessed by a unifying concept of operations, high level focus on the problem, and greater impetus to the development of programs commensurate to the need.

3. Such policies and programs cut across a wide spectrum of existing agency responsibilities. In particular, they will require concerted and carefully focussed civil and military actions by the State and Defense Departments, AID, USIA, and CIA.

4. But there is no single high-level locus of authority and responsibility within the Executive Branch to undertake this vitally needed concerting of inter-agency resources. There is no present coordinating mechanism, short of the NSC, which is empowered to provide the needed centralized direction of effort, and there is none which is devoting a significant share of its energies to the peculiar requirements of the guerrilla warfare challenge and to its inter-agency program implications. Except for such country Task Forces as have been constituted in specific instances, there are no mechanisms for focussing Government-wide resources on identifying and finding solutions to the unique problems of particular countries. Moreover, present Task Forces

for critical areas have lacked a source of guidance and support on the special problems of preventing and dealing with Communist subversive violence, and they have not always focussed sufficiently on these aspects.

5. Therefore, the most immediate need is for adequate institutional arrangements to ensure continuing focus on and attention to the problem at a high governmental level. Because of its responsibilities in directly related fields and because the agencies chiefly concerned are already represented on it, expansion of the mandate of the NSC Special Group seems the most effective way to carry out this function.

6. New arrangements are also needed to facilitate the stepping-up or reorientation of existing departmental and agency programs to achieve maximum effectiveness in those countries where the need is most critical, and to enable us to anticipate future needs. However, action responsibility for programs to prevent or counter subversive violence should continue to rest with the appropriate departments and agencies. Most of these programs also involve broader objectives. The preventive aspects of our diplomatic, economic aid, overt informational, and certain covert programs on behalf of social, economic, and political progress in threatened countries are inevitably closely related to the totality of US foreign policy toward such countries.

#### *RECOMMENDATIONS*

Accordingly it is proposed that:

1. The NSC Special Group, chaired by the Military Representative of the President, should be given the additional responsibility of providing focus and direction to interdepartmental programs for coping with threats of Communist subversive intervention, actual and potential, in nations and areas abroad which the President considers critical. Where appropriate, the Directors of the Agency for International Development and the US Information Agency would be invited to participate in Special Group deliberations in this field.

2. As a first step, the Special Group should recommend a directive delimiting and defining the new scope of its responsibility, to include the designation of the specific areas where subversive violence or guerilla warfare is either already a major factor (e.g., South Vietnam, Laos, Colombia) or a potentially serious threat (e.g., Thailand, Iran, Bolivia). The designation criteria should be rigorously narrow so as to focus attention and resources on only the few most critical situations.

3. For countries or regions determined by the NSC Special Group to be critically threatened by Communist subversive violence and approved by the President for assignment to its jurisdiction, the Secretary of State in coordination with the department heads should constitute inter-agency country or regional Task Forces in Washington (if

not already in being), charged with the development and review of integrated action programs to deal with Communist violence or its threat in their geographic areas. The Task Forces would normally be chaired by senior State Department geographic officers at the Assistant Secretary level. If the endangered country is in an active US Military Theater of Operations or if the NSC Special Group determines that the military aspects of the country situation predominate, the Defense Department should assume the chairmanship. Members would be formally assigned and regard as primary their duties on the Task Force. Task Forces would report to and be under the guidance of the NSC Special Group on matters bearing directly on Communist-inspired violence.

4. In countries designated as critically threatened, the Country Teams should be charged with developing and forwarding integrated program recommendations and with ensuring effective local coordination in the execution of approved programs to counter the threat. The Country Teams would submit their recommendations and reports through normal channels to the chairmen of the competent Task Forces, who would keep the NSC Special Group informed of plans and progress.

5. The Special Group should also be responsible for focussing increased attention on those aspects of broader US Government programs which generate resources for the prevention or neutralization of Communist subversive intervention, e.g., Military Assistance Program (MAP), Overseas Internal Security Program (OISP), certain specialized military forces and covert action programs. It should interest itself in the following types of problems, drawing on the informational resources and special skills of the various departments and agencies as appropriate:

a. The organization, equipment, funds, doctrine, and techniques required to improve the capabilities of designated threatened countries for internal security and counter-guerrilla measures. This may involve strengthening or initiating OISP activities, reorienting MAP activities to give increased emphasis to the counter-guerrilla training and equipping mission, or the provision of new authority, funds, facilities, personnel and equipment for CIA counter-guerrilla paramilitary operations.

b. Ways in which MAP and MAAG activities in threatened countries, possibly supplemented by AID and CIA capabilities, can help realize the constructive economic and political potentialities of civic action by the armed forces of the countries.

c. The adequacy of current appropriations, fiscal procedures, and enabling legislation to satisfy indicated program needs, with possible requests for new Congressional authority to permit inter-agency transfers of funds and achieve greater flexibility for counter-violence aid programs.

6. While action responsibility for programs related to preventing or countering subversive violence would remain in existing departments and agencies, it is appropriate that the Special Group be authorized to comment or submit recommendations on the particular implications of such programs for the critical problems of deterring Communist subversions and violence, especially for the shorter-term purposes of winning local popular support away from the Communists. The Special Group would provide focus on counter-subversion implications of departmental critical area planning both through its collective guidance to the critical area Task Forces and through the instructions of individual Special Group members to their own area representatives through their respective departmental and agency channels. The Special Group would also review integrated critical area program proposals, prepared by the Task Forces in coordination with the senior US field representative, and would approve them for execution if they fall within existing policy. In the event of inter-agency disagreements, or actions requiring fresh policy determinations, the Special Group members would refer them to their respective principals.

7. Once a critical area inter-agency program had been approved, the Special Group would monitor its execution both through the appropriate Task Forces and through the departmental/agency channels of Special Group members. The main contribution of the Task Forces in the monitoring and review process would be in providing collective judgments, by country or region, on the adequacy of program objectives and achievements in relation to the problems of preventing or countering subversive violence.

8. In view of the sensitivity of covert action programs and the special procedures in effect for authorizing and reviewing them, covert aspects of counter-guerrilla warfare country and regional program planning and execution would be handled through special channels.

9. In considering action programs to counter Communist subversive intervention in designated critical areas, the Special Group and Task Forces should give attention to the possibilities for “offensive counter-measures”, as discussed on pp. 33–43 of this report.

[Here follow the first 32 pages of the report.]

*D. Offensive Countermeasures Across International Borders*

In reviewing the problems, resources, and kinds of action available to us to negate the threat Communist subversive violence in underdeveloped countries, we have hitherto dealt only with programs that affect the causes and manifestations of such violence in the threatened countries themselves. As previously noted, however, the Communist ability to mount and support subversive violence often depends on their control of an adjacent country which serves as a base of operations, a source of logistical and guerrilla troop replacement support, and a

safe-haven for guerrilla forces if the pressure on them becomes too great at the scene of operations in the threatened country. Unless some feasible and acceptable means can be found to retaliate against the Communist-controlled third country from which subversive violence in a threatened non-Communist country is being mounted, we are faced with the patently unjust situation that the physical destruction and human misery stemming from actions to counter the Communist threat will be limited to the soil of the victim. The situation also places us in the militarily and tactically disadvantageous position of being unable to destroy or neutralize the enemy's base and source of strength.

We have generally felt deterred, however, in situations short of declared and formal hostilities between sovereign states, from carrying the military conflict onto the territory of the third country. This, of course, plays into the Communist pretense that violent upheavals in a threatened country are of strictly indigenous origin. Our reluctance to take offensive countermeasures, except for occasional limited and non-attributable covert operations, has stemmed in part from concern lest an escalation and widening of the conflict result, and in part from strictures imposed by US adherence to the doctrine of non-intervention.

The United States (and virtually all other nations) has always historically supported the doctrine of non-intervention in the internal affairs of other nations. It has occasionally been suggested that our vigorous, and often self-righteous, public support of this doctrine inhibits us in efforts to counter Communist subversion and Communist use of violence, especially in the underdeveloped nations, and that we should therefore consider some modification of the doctrine.

The counter argument seems, however, not only to have more support within the US Government but also to have greater validity. It is to the effect that the doctrine of non-intervention, even though universally flouted by the Communists, nevertheless is more valuable to us than to them. The reasoning is that although the open societies of the West are less successful than the Communist societies in practicing covert intervention while publicly adhering to a doctrine of non-intervention, nevertheless the public doctrine does exercise considerable restraint on the Communists. Since it is alleged that the Communists, if unrestrained, would have a vastly greater capability of violent intervention than the West, the conclusion is that the West can well afford to accept a greater restraint on the use of its lesser capability in order to maintain a greater degree of restraint on the Communists' very much greater capability.

This appears to be the reasoning behind what might be described as the cold-blooded case for continuing publicly to uphold the doctrine of non-intervention. A more powerful pragmatic case is simply that this doctrine has acquired such wide respectability and appeal that the

US could not propose publicly to modify or weaken it without paying an unacceptably heavy price. Accordingly, it is probably not worthwhile to debate whether if we threw off some of the restraints we could not develop a capability fully equal to that of the Communists. Realistically, our public commitment to the doctrine of non-intervention has to be accepted as a fact of life.

Taking this as a starting point, however, an ingenious application and extension of the doctrine is proposed. It can be expressed in the following propositions:

1. Since all nations accept the doctrine of non-intervention, the US is going to treat the activities of any nation which incites and supports violence within another nation as a form of aggression morally equivalent to the military crossing of a border.

2. When a situation arises in which this subversive form of aggression is threatened or is being practiced, the US will generally favor the use of international control machinery to halt it, *provided* such machinery can be made to operate with full effectiveness.

3. If, however, in the face of clear evidence that violence is being supported across an international border, the establishment of international machinery to curb this type of aggression is opposed, or the machinery is ineffective, the US reserves the right to employ force (or to support the employment of force) up to at least the same scope and level in defense of the threatened nation.

4. Any such unilateral use of force by the US, or with US support, will be strategically a defensive action. That is to say, its purpose will be to induce a cessation of the subversive aggression to which it is a response.

5. Nevertheless, in taking such action the US will not deny itself (or its friends) the advantage of the tactical offensive, nor will it limit itself to weapons of the enemy's choosing. Specifically, it will feel free to incite and support violence within the aggressor's territory and to use weapons in which it has an advantage, but will endeavor to avoid major escalation of the scale of violence or sophistication of weapons.

In the above form, this doctrine is proposed both as a policy to guide the US response to situations of violence and as a rationale which would underlie the public posture of the US. As a rationale this amounts to an assertion that the US (a) takes the doctrine of non-intervention so seriously that it is going to treat violent intervention as the equivalent of overt aggression, and (b) recognizes the right of any country which is the victim of subversive violence to practice subversive violence in its own defense. It may well be asked whether this is not a justification for a declaration of war by the victim of subversion against the aggressor. It could of course, be just that. But the essence of the doctrine is that, because subversive violence involves the use of force for purposes of aggression but on a scale considerably less than that typical of a declared war, it is necessary to recognize the right of the victim to use force on a similarly limited scale in its own defense. It could well be

argued that unless either this remedy of the unilateral limited use of force or the preferred remedy of effective international policing is available, then the doctrine of non-intervention operates one-sidedly to benefit the nation that undertakes violent subversion. In a situation like that existing between Communist Northern Vietnam and South Vietnam, it would be difficult to justify to what is called "world opinion" a declaration of war by South Vietnam as a response to the guerrilla activity of the Viet Cong within its own borders. A declared war would indeed involve a major escalation of the scale of violence as well as serious danger of a widening of the conflict. Under these circumstances, a persuasive case could be made to the effect that the doctrine of nonintervention should not deny South Vietnam a remedy against this form of aggression.

As an operational policy, this doctrine has important implications for US action in situations of the type to which it is intended to apply:

1. First, it puts a premium on acquiring persuasive proof that subversive violence is being employed in a particular situation. The test set up in this doctrine is that support is being provided and control exercised across a border. The aggressor country in such a situation has always claimed that the violent resistance is a purely indigenous revolution. Persuasive proof will presumably have to take the form of intercepting communications or of prisoners who can be produced in sufficient numbers or of captured boats, trucks, or aircraft. If the support being rendered across the border is in a mild enough form (for instance limited to money payments), it will usually not be worthwhile to try to invoke this doctrine.

2. The most interesting concept in the doctrine is that of the tactical offensive and of independence in the choice of weapons. As to the former, the advantages of carrying the war to the enemy's country are obvious. It is particularly unjust that the population which supplies most of the victims in guerrilla warfare should be that of the victim of aggression while the aggressor's people and lands are untroubled. As to the latter, it is indeed high time that we applied ingenuity to the choosing or the development of weapons which involve no major escalation in the degree of sophistication but in which for one reason or another our friends have a relative advantage in a given situation. For instance, small boat operations may be much easier in certain situations than the infiltration of guerrillas into enemy territory by land. We may be able to develop weapons (other than conventional bombs) that could be used from aircraft with effects having some similarity to those of sabotage carried out by teams on the ground.

Finally, although the doctrine as here stated makes no specific reference to covert activities, it has an important application to them. It would lose much of its value as operational policy unless, in its aspect as a rationale, it became widely known. Accordingly, it must be assumed that, even if not in some official manner announced by the US Government, public expression would be given to the rationale in various ways. This would have two implications. On the one hand,

it would permit the US to support more or less openly certain activities which, without such rationale, can be supported only covertly. In this way, the vague disclosure of the doctrine would permit the realm of covert paramilitary action to be narrowed. On the other hand, the political risks of certain covert actions would be significantly reduced, since a rationale for such actions would have been made known publicly.

Taking these two implications into account, it seems likely that it would still be desirable for tactically offensive actions, those involving the support of violence within the territory of the enemy, to be done in such a manner as to be at least officially disclaimable. The whole reason for limiting the scale and technical sophistication of a paramilitary action taken in response to violent subversion is to avoid escalation. This advantage is lost if an offensive operation against the aggressor is conducted in such a manner as to compel him to regard it as a formal act of war. Unless, therefore, the enormous advantages of being free to employ the tactical offensive are to be foregone, every precaution should be taken to make such acts symmetrical in form, as well as in scale and technical sophistication, to the strategic offensive originally mounted by the aggressor. This would usually require that the acts be disclaimable but, with the proposed new rationale, it is far less important that they be truly covert.

Application of this doctrine to the problems of negating externally-supported Communist inspired subversive violence in non-Communist underdeveloped countries should be actively considered. Apart from the issues of the doctrine of non-intervention and the risks of escalation, however, there are several other factors that should be evaluated before undertaking specific operations against a Communist-controlled third-country base. These factors mainly concern the objectives to be achieved and the likelihood of attaining them without involving ourselves in implicit commitments that are greater than we wish to assume.

Offensive countermeasures are primarily intended as diversionary and harassment operations. They will serve as distractions and nuisances to facilitate achieving a defensive victory elsewhere. The enemy will have to deploy his forces both to contain these outbursts and to assure that any resultant unrest does not become the preliminary to a serious liberation movement. If an area where these activities are taking place explodes in the Communist face, as did Budapest, we will have some quick decisions to make on the pros and cons of exploiting the break, and we should be prepared to do so if it appears advisable. But the concept presumes that the operations will have achieved their purpose of diverting enemy forces from the offensive long before the boiling point of true popular insurrection is reached.

Here perhaps lies the main point of contention of the concept. It can be argued that if the enemy leaders believe there is real likelihood

of their losing territory or being overthrown, the dangers of escalation through their over-reacting to the threat will increase sharply, and the policy of offensive countermeasures will become almost unpredictably dangerous. The other side of this argument is that only a serious danger of losing control of a region will force the Communists to shift significant effort from other activities and that a succession of raids and minor depredations will not gain meaningful ends.

If indeed offensive countermeasures are successful only as diversions, and if the people of the region where they are undertaken cannot hope for the sustained large scale outside assistance needed to push through a successful insurrection, those people are more likely to be sullen than rebellious. A community which rises and fails in revolt loses its leaders and suffers grievously. Once burned they are thereafter twice wary. No matter how unpopular a Communist regime may be we cannot expect much help from the people in fighting it if we do not propose to see that the regime is overthrown. As T. E. Lawrence wrote of motivations in another revolt, "Freedom is a pleasure only to be tasted by a man alive".

Under some circumstances in Communist areas, it may not be practical to count on the measure of local support essential to indigenous guerrillas even though they receive material aid from the outside. Hence, many offensive countermeasures will depend in large part on the work of specially trained men or groups introduced into the aggressor country to operate on a largely self-sufficient basis. While these groups may sometimes work with dissident local elements when such exist, they will have few sources of information once they are in the field. This will place heavy and exacting loads on indigenous intelligence nets already organized and working in the area, and great care must be taken to assure that these nets are not compromised by direct association with the operating groups. The size of the groups committed to operations of this type can vary from the single agent up to whatever point the current risks of sharp escalation will bear.

Whatever the built-in limitations on cross-border operations, however, they may well be advantageous for us. They will offer the tactical values of destroying or disrupting supply lines and logistical installations vital to the Communist guerrillas and of causing some lessening or diversion of the Communist effort. They may also demonstrate to the people of the threatened country that its government, and such friendly non-Communist foreign powers as are supporting it, are resolved to carry the conflict to a successful conclusion and to reduce as far as possible the human and material losses of the friendly population. The psychological and political implications of this effect should reinforce the impact of our other overt and covert development and counter-subversion measures.

The successful orchestration of the total strategy discussed in this report may be expected to win the needed grass-roots popular support, to facilitate the negative aspects of countering Communist subversion and guerrilla operations, and to achieve a viable basis for sound long-term economic growth and social and political development.

---

## 250. Memorandum from Komer to Bundy, December 12<sup>1</sup>

December 12, 1961

McGB:

Here is the report of the so-called Counter-Guerrilla Task Force set up under Bissell following the President's approval of first list of Planning Projects we sent him back last March. The report itself is just so-so, but the important thing from our point of view is the *Action Recommendations* on how to get some movement in this whole critical field.

Though we have long since reached consensus in the town on the importance of dealing with Bloc "indirect aggression"—actual and potential, no one has been assigned high-level responsibility for getting things done. To me, this is the nut of the problem. Hence I took advantage of Walt's imminent departure to press for what I think is the most logical solution, i.e., to tag Taylor and the Special Group with this task. Since it cuts right across inter-agency lines, no single agency has a clear title (State comes closest, but is the least likely to have the necessary steam). Moreover, Taylor is already heavily involved in this problem area, and expansion of Special Group functions builds on a going concern. Walt and I touched base with Taylor; he is in full agreement.

While Task Force is unanimous that this is the proper solution, getting official inter-agency concurrence may be quite another matter. Therefore, the technique we decided on was to have Bissell transmit the report to you so that you could send a chit to the agencies concerned suggesting that we have an NSC meeting on it. We've tried to draft the Recommendations so that they could be issued as an NSAM.

As to the Action Recommendations, I had to do them quick and dirty in order to force everybody's hand and avoid another six weeks

---

<sup>1</sup> Discussion of Counter-Guerrilla Warfare Task Force report and recommendations regarding same. Secret. 2 pp. Kennedy Library, National Security Files, Komer, 11/61–12/61.

of delay. Such matters as the jurisdictional ball park proposed for Taylor and the Special Group and for the task forces may need some redefining (State, for example, may not wholly approve giving Taylor such broad terms of reference). But the main thing was to get humping, and these problems can be worked out in the process of inter-agency review.

The next step is for you to look this over. If you go along, I suggest we send out the attached memo to the town.

**RWK**

### **Attachment**

Your representatives have received a report on "Elements of US Strategy to Deal with 'Wars of National Liberation'" prepared by a task force of senior officials set up pursuant to the President's request last March. It contains a set of action recommendations which the President desires to discuss at an early NSC meeting. He feels that we urgently need some such form of high level coordinating mechanism as that recommended, in order to focus adequate attention on this crucial problem.

Therefore, I propose to schedule this report for NSC discussion during early January.

**McGeorge Bundy**

January 1962

**251. Memorandum from McNamara to President Kennedy,  
January 2<sup>1</sup>**

January 2, 1962

SUBJECT

Reorganization of Army Divisions

Last April, the Chief of Staff of the Army recommended a reorganization of Army divisions. This recommendation served as a basis for the material provided you for your May 25 address to Congress. Since that time, the Army has translated the new concept into detailed tables of organization and equipment. My recommendations for the implementation of the Army's program are set forth here, preceded by a discussion of the proposed reorganization and its resource implications.

*The Proposed Divisional Organization*

The proposed reorganization of Army division (ROAD) is intended to remedy what the Army considers three deficiencies revealed by five years' experience with the current pentomic structure of infantry and airborne divisions. (Armored divisions were little changed in the 1956 reorganization and little change in this division is now proposed.)

First, the current division structure lacks organizational flexibility. There is a single table of organization for each type of division. In contrast the proposed ROAD divisions are to be more flexible. The basic elements of the ROAD divisions are a division base (artillery, reconnaissance, headquarters, and support elements) and four kinds of maneuver battalions: tank, infantry, airborne infantry, and mechanized infantry (equipped with armored personnel carriers). Divisions of various types will be formed by combining varying mixes and numbers of the standardized combat maneuver battalions with the division base. This will permit the tailoring of a division to terrain and mission. Thus, for example, divisions composed largely of infantry battalions could be deployed in Korea where the terrain does not favor tracked vehicle operations, whereas divisions composed largely of mechanized battalions could be used in Europe. Similarly the number of battalions in a division might be as few as six or as many as fifteen depending on mission and availability.

---

<sup>1</sup> Recommendations on implementation of Army reorganization proposal. Secret. 4 pp. Washington National Records Center, Record Group 330, OSD Files: FRC 71 A 3470.

This kind of tailoring of divisions is done currently by deletions and augmentations to standard TOE's. The use of relatively standard division basis and battalions as building blocks in the proposed divisions is intended to facilitate such tailoring.

Within the division, the introduction of a new command echelon, the brigade, to control the maneuver battalions is intended to facilitate the creation of combined arms teams. The battalions are relatively self-contained units logistically and can be shifted from brigade to brigade as the tactical situation requires. This kind of internal divisional tailoring is a wider application of the current practice in the armored division. In the pentomic division, combined arms teams are formed around the battlegroup. However, since the battlegroup has logistical as well as tactical functions, the size and composition of these teams is restricted because of inelastic support capabilities.

Second, the Army considers the commanders' span of control in the current division to be overextended. There is only a single echelon (the battlegroup) between the company and the division. In the pentomic division, commanders control five principal elements (companies for battlegroup commanders and battlegroups for the division commanders). In addition, other units such as artillery, engineers, and armor often increase the number of tactical units reporting to a commander to as many as twelve. The proposed divisions will have in the brigade another echelon of command. Adding a command echelon reinstates the triangular structure of the World War II division (each level of command having three principal maneuver elements). The Army considers that the reduction in the commanders' span of control will improve the combat effectiveness of the division, particularly in non-nuclear battles requiring the close coordination of combat elements.

The divisional commander's span of control also would be reduced by the creation of a divisional support command composed of all the divisional supply and maintenance activities under a single commander. The support command will be organized on a functional basis rather than on technical service lines. This change has been frequently recommended and the concept has been tested in several of the current divisions.

Third, the present division is not as self-sufficient as the proposed division. Tactically, the proposed division has more artillery, armor, and reconnaissance elements in order to reduce reliance on non-divisional troops. In peripheral wars divisions are less likely, especially during the initial phases, to be part of a balanced corps or field Army so that divisions must be more self-sufficient. The proposed reorganization also involves increases in support personnel and equipment to permit a division to be more logistically self-sufficient. The divisions

would increase in strength from about 14,000 men to about 15,500 men to make possible this increased self-sufficiency.

These proposed changes in divisional organization are evolutionary developments from the World War II and Korean division, rather than from the current pentomic structure. While the changes do not reflect a markedly new tactical concept of how the division will be maneuvered in combat, it does reflect an emphasis upon the increased likelihood of peripheral wars and of sustained non-nuclear combat.

Finally, the proposed division, with its brigades and triangular structure, is more like the divisions of our major NATO allies. Similar divisional organization may simplify NATO operations by increasing the comparability of divisions and the interchangeability of divisional units.

#### *Resources for the Reorganization*

In addition to changes in command structure, the ROAD concept proposes substantial increases in the equipment and personnel authorized the division.

For equipment, the Army has estimated that under current logistic guidance and divisional organization, the equipment requirement remaining unfunded after FY 1962 will amount to approximately \$8.0 billion. With the new divisional organization, the Army estimates that this deficit will increase by about 20% to \$9.5 billion.

Most of the increase in requirements is not directly associated with the ROAD organizational changes. Rather they are increases which in the absence of a proposal to reorganize divisions well might have been proposed as additions to current Tables of Equipment.

Furthermore, most of these increases in equipment are not essential to the reorganization of the divisions. There are, of course, exceptions. Adding an echelon of command, for example, generates a requirement for more communication equipment merely to keep intra-divisional communications at its current level.

Finally, there are acceptable substitutes for many of the items for which there are added requirements under ROAD. For example, the deficit under ROAD of 7,600 M-60 tanks would be met by operating an equivalent number of the 10,000 serviceable M-48 tanks now in the Army inventory. In view of the availability of substitute items and the fact that many of the increased requirements are not essential to reorganizing the division, I believe that we will have the critical equipment to permit the ROAD reorganization.

Similarly, it is possible to reorganize divisions within the present planned Army end strength of 960,000 men. The additional personnel (about 2,000 men for each division) will become available partially from reducing the number of non-divisional combat battalions and

brigades, partially from the augmented strength already authorized for the European deployed divisions and partially from the reduction in personnel in training centers as the build-up levels off.

*Recommendations*

The review I have made of the Army's proposal supports their contention that the new divisions would have improved combat effectiveness. The Joint Chiefs of Staff have approved the reorganization and recommended its implementation.

I do not agree, however, with the Army that the reorganization of all divisions should be approved for completion by the end of FY 1963. I am reluctant at this time to accept the reduction in the combat readiness which would result from such a schedule. Furthermore, I feel that field testing during the next twelve months is desirable before the new organization is adopted throughout the Army. Previous reorganizations were preceded by extensive field testing and these field tests have customarily resulted in substantial modifications in the new organizational structure. In a period when there should be a minimum of disruption of the combat ready divisions, it is important to establish that the new organization has the same superiority in the field as it appears to have on paper.

For these reasons I recommend that the 15th and 16th divisions be activated with the new organizational structure. Following the organization and field testing of these divisions, your approval of the reorganization of the remaining active and reserve divisions will be requested.

May I have your approval to activate the 15th and 16th Army divisions with the new organizational structure.

**Robert S. McNamara**

**252. Memorandum from McCone to President Kennedy,  
January 8<sup>1</sup>**

January 8, 1962

Dear Mr. President:

The attached memorandum is in response to your request for further information about the Soviet missile program.

Respectfully,

**John A. McCone**  
*Director*

**Attachment**

**ESTIMATED SOVIET ICBM REACTION TIMES**

There is no intelligence specifically indicative of Soviet ICBM reaction time. The following minimum reaction times for ready missiles, therefore, are based (1) on the assumption that rapid reaction time has been a Soviet objective, and (2) on what is known about Soviet ICBM performance characteristics and launching procedures.

*First Generation ICBM (NIE 11-5-61 Dated 25 April 1961)*

Condition I—Crews on routine standby, electrical equipment cold, missiles not fueled. Reaction time—1–3 hours

Condition II—Crews on alert, electrical equipment warmed up, missiles not fueled. Reaction time—15–30 minutes

Condition III—Crews on alert, electrical equipment warmed up, missiles fueled and occasionally topped. This condition probably could not be maintained for more than an hour or so. Reaction time—5–10 minutes

*Second Generation ICBM (CIA opinion)*

Condition I—Crews on routine standby, electrical equipment cold, missiles not fueled. Reaction time—1–2 hours

Condition II—Crews on alert, electrical equipment warmed up, missiles fueled. This condition could be maintained indefinitely in temperate climatic environment but would be limited to an hour or so under the worst conditions. Reaction time—2–5 minutes.

---

<sup>1</sup> Transmits requested information on Soviet missile program. Top Secret. 4 pp. CIA Files, DCI (McCone) Files, Job 80B01285A, Mtgs w/Pres, 12/1/61–6/30/62.

*THE SOVIET SOLID PROPELLANT PROGRAM*

Our evidence indicates that the Soviets made a decision shortly after World War II to pursue their long-range ballistic missile program on the basis of liquid propellants rather than on large grain solid propellants. This decision was probably based upon several considerations:

1. Their ability to exploit the German World War II ballistic missile program which was based upon liquid propellants rather than solids.
2. They probably did not at that time foresee a submarine launched ballistic missile program.
3. They probably did not foresee a requirement for rapid reaction times which are obtainable with solid propellants or storable liquid propellants.
4. They were probably also aware of the initial greater payload potential for space missions of the liquid rocket systems.

As the Soviet ballistic missile program progressed, they developed an extensive experience with liquid propellants. In the mid-1950's when they were considering a second generation ICBM and a ballistic missile from a submarine, the question of solids vs. liquids probably arose. We believe they probably decided on storable propellants for these roles, thus capitalizing on their liquid propellant experience factor, and perhaps avoiding time delays inherent with developing a completely independent solid propellant program.

**253. Memorandum Prepared by McCone, January 9<sup>1</sup>**

January 9, 1962

BRIEFING OF SENATORS FOLLOWING PRESIDENT KENNEDY'S  
BREAKFAST ON MONDAY, JANUARY 8, 1962

McCone led off the briefings and there were the following subjects, following the attached briefing papers which he had revised prior to meeting, and in the briefings DCI followed the revisions indicated in ink on the attached memoranda.

---

<sup>1</sup> Readout of Congressional briefing on Cuba, Vietnam, and Soviet nuclear missile capabilities. Secret. 3 pp. Attached is a paper on "Soviet Long-Range Ballistic Missiles." Top Secret. 4 pp. CIA Files, DCI (McCone) Files, Job 80B01285A, Memos for the Record, 11/29/61-4/5/62.

The subjects were:

1. Cuba and the military build-up in Cuba.
2. Vietnam.
3. Soviet nuclear ICBM and MRBM capabilities, (4) the comments on recent Soviet weapons tests; (5) summary of the Middle East situation as outlined in the memorandum prepared for the Kennedy briefing, and added comments similar to those included in the memorandum of the Kennedy briefing.

There followed briefings by Secretary McNamara on the defense budget, General Lemnitzer on the South Vietnam planning, Secretary Rusk on Laotian negotiations and the Thompson-Gromyko talks, and Mr. Robertson of the White House staff on the proposed tariff and trade legislation.

There were no questions except a few directed to the President himself. The DCI was not involved in the answering of any questions, however, statements in his briefing were repeatedly referred to by both the Senators in their questions and the President in his replies.

In connection with nuclear testing, the President explained his plans for preparing to proceed with atmospheric testing and emphasized decision had not been made, and would not be made until mid-March because preparations for testing would not be completed until 1 April. He did state, however, that he felt no persuasive argument had been presented for further atmospheric testing except for the purpose of testing weapons systems and ballistic missile systems, and environmental and effects testing. The President seemed to draw a sharp line between tests of this type and those conducted for further improvement in the efficiency, yield, weight, etc., of weapons. He specifically stated that he was not impressed with the need for an improvement in the weight yield ratio or an increase in the yield and constant weight, etc.

**John A. McCone**

Secretary McNamara  
Mr. John A. McCone  
Mr. Howard C. Peterson of the White House Staff  
General Lemnitzer  
Secretary Rusk

### SOVIET LONG-RANGE BALLISTIC MISSILES

I. New information in the past year, providing a much firmer base for estimates on Soviet long-range ballistic missiles, has caused a sharp downward revision in our estimate of present Soviet ICBM strength but strongly supports our estimate of medium range missile strength.

II. We now estimate that the present Soviet ICBM strength is in the range of some 25 operational ICBM's on launchers from which missiles can now be fired against the US, and the increase will be controlled by site construction and will not be significant, during the months immediately ahead. (US Air Force Intelligence, however, estimates the present number of Soviet ICBM launchers at about 75.)

III. The present ICBM force level probably results chiefly from a Soviet decision to deploy only a small force of the cumbersome, first generation ICBMs, and to press the development of a second generation system.

A. ICBM's missiles intensively test-fired during 1961 the 51-1961 vs 11 to 20 per year and 58, 59, 60 (including several firings to about 6,500 n.m.). The second generation ICBM (about 20 firings) is believed to be smaller than the first and could have a launch weight of about 300,000 pounds. Based on the launch pads at the test range, it appears that the new missile is launched from a relatively simple flat pad, with missile assembly and checkout facilities nearby.

IV. However, a little later, after the second generation ICBM becomes operational we anticipate that the number of operational ICBM launchers will begin to increase significantly.

V. We also estimate that the USSR now has about 250 to 300 operational launchers equipped with 700 and 1,100 n.m. ballistic missiles.

A. Most of these are in western USSR, within range of NATO targets in Europe; others are in southern USSR and in the Soviet Far East.

B. In addition, the USSR will probably have a 2,500 n.m. system ready for operational use by early 1962.

C. The USSR's combined strength in these medium range missile categories will probably reach 350 to 450 operational launchers in the 1962–1963 period, and then level off.

VI. Soviet ICBM and MRBM launchers probably have sufficient missiles to provide a reload capability and to fire additional missiles after a period of some hours, assuming that the launching facilities are not damaged by accident or attack.

### SOVIET NUCLEAR TESTING

I. The 1961 Soviet nuclear test series during which (45 tests were detected) proof-tested complete weapons systems, advanced Soviet understanding of thermonuclear weapons technology, and contributed vital weapons effects knowledge. Soviet thermonuclear weapon technology, in particular, appears sophisticated, advanced, and different from that of the West. The 1961 series will permit the Soviets to fabricate and stockpile, during the next year or so, new weapons of higher yields in the weight classes presently available.

II. The *weapons systems tests* probably included short- or medium-range ground-launched and short-range submarine-launched ballistic missiles with yields up to 3 MT.

III. *Weapons effects tests* were apparently conducted under ground, under water, and at altitudes up to 160 n.m. Those at high altitudes will contribute valuable effects information for the Soviet anti-ballistic missile program.

A. In two tests on Oct 21 and 27, the nuclear devices were carried aloft by surface-to-surface missiles launched from Kapustin Yar and detonated at altitudes of 80 and 160 n.m. In both cases, at a time appropriate for interception an anti-missile missile was probably fired from Sary Shagan, the Soviet anti-ballistic missile test center.

B. The purposes of these two tests appears to have been the determination of the ability of radars in the anti-missile system to function in the environment resulting from the nuclear bursts. However it is believed that these tests were not complete anti-ballistic missile system tests.

IV. The *developmental tests* show a concentration on weapons with yields of about 1.5 to 5 MT and suitable for delivery by all Soviet bombers and offensive missiles. Preliminary analysis indicates that in several cases, through a combination of high thermonuclear efficiency, low weapon weight, and economy in fissionable materials, significant progress in thermonuclear weapons design was achieved.

V. The two very large yield tests in the series are particularly significant in that they indicate a high degree of sophistication in weapon design.

A. The 25-MT device which the Soviets detonated had an extremely high thermonuclear efficiency.

B. The 58-MT device probably was actually a 100-MT weapon tested at reduced yield. As tested the device obtained only a few percent of its yield from fission. Weapons of this size and weight could be delivered by the Soviet large bomber, or could be emplaced offshore, but probably could not be delivered against most US targets by any currently operational Soviet ICBM.

---

## **254. Memorandum from Coyne to Bundy, January 15<sup>1</sup>**

January 15, 1962

Enclosed is the draft directive from the President to the Director of Central Intelligence which I discussed with you on January 11.

The draft directive was approved by the Attorney General on January 12, based on a memorandum of analysis (attached) prepared by Assistant Attorney General Katzenbach. The draft directive had been approved earlier by the Secretaries of State and Defense.

It is my understanding from the staff of the Budget Bureau that the Director of the Budget will suggest certain changes in the draft to you. In essence, his suggested changes involve deletion of the phrases which I have bracketed in the draft directive. It is my view that Budget's suggestions are sound. Accordingly it is recommended that the draft directive, as revised by Budget, be submitted to the President for approval at an early date. Mr. McCone is anxious for the directive to be approved and issued prior to his confirmation hearing on January 18.

**J. Patrick Coyne**

---

<sup>1</sup> Transmits draft directive on the responsibilities of the Director of Central Intelligence. No classification marking. 3 pp. Kennedy Library, National Security Files, Departments and Agencies Series, CIA General 1/61-2/62.

*Addendum:*

Because Mr. McCone is out of the City, I have not discussed with him the changes suggested by Budget. If you wish, I will discuss them with him when he returns to Washington tomorrow.

**Memorandum for the Attorney General**

RE

*Draft Presidential Memorandum to Director of Central Intelligence on his duties.*

As you requested, I have examined the attached draft memorandum from the President to the Director of Central Intelligence and I believe that it does not contain any legal problems.

This draft is a revised version which was forwarded by Mr. McCone's explanatory memorandum of January 11th, also attached. The revised version is exactly the same as the previous version which you sent me, except that the following sentence has been added at the end of the first paragraph:

"In fulfillment of this task I shall expect you to work closely with the heads of all departments and agencies having responsibilities in the foreign intelligence field."

Mr. McCone's memorandum explains that the above sentence was added to meet the State Department's fears that the President's memorandum might interfere with its statutory responsibilities. I do not believe that a Presidential memorandum of this type, in either the revised or the previous versions, is intended to or does deprive any Department of its statutory responsibilities.

The memorandum outlines in general terms the responsibilities of the Director with respect to the federal government's foreign intelligence activities, and describes the Director's relationships with the President, the National Security Council, and other governmental organizations and officials concerned with these activities.

The memorandum, in my opinion, is within the statutory authority of the President as head of the National Security Council (50 U.S.C. § 402), and is consistent with the statutory organization and functions of the Central Intelligence Agency, which is under the Council (50 U.S.C. § 403 *et seq.*).

**Nicholas deB. Katzenbach**  
*Assistant Attorney General*  
*Office of Legal Counsel*

**255. Memorandum from President Kennedy to McCone,  
January 16<sup>1</sup>**

January 16, 1962

In carrying out your newly assigned duties as Director of Central Intelligence it is my wish that you serve as the Government's principal foreign intelligence officer, and as such that you undertake, as an integral part of your responsibility, the coordination and effective guidance of the total United States foreign intelligence effort. As the Government's principal intelligence officer, you will assure the proper coordination, correlation, and evaluation of intelligence from all sources and its prompt dissemination to me and to other recipients as appropriate. In fulfillment of these tasks I shall expect you to work closely with the heads of all departments and agencies having responsibilities in the foreign intelligence field.

In coordinating and guiding the total intelligence effort, you will serve as Chairman of the United States Intelligence Board, with a view to assuring the efficient and effective operation of the Board and its associated bodies. In this connection I note with approval that you have designated your deputy to serve as a member of the Board, thereby bringing to the Board's deliberations the relevant facts and judgments of the Central Intelligence Agency.

As directed by the President and the National Security Council, you will establish with the advice and assistance of the United States Intelligence Board the necessary policies and procedures to assure adequate coordination of foreign intelligence activities at all levels.

With the heads of the Departments and Agencies concerned you will maintain a continuing review of the programs and activities of all U.S. agencies engaged in foreign intelligence activities with a view to assuring efficiency and effectiveness and to avoiding undesirable duplication.

As head of the Central Intelligence Agency, while you will continue to have over-all responsibility for the Agency, I shall expect you to delegate to your principal deputy, as you may deem necessary, so much of the direction of the detailed operation of the Agency as may be required to permit you to carry out your primary task as Director of Central Intelligence.

---

<sup>1</sup> Guidance on McCone's responsibilities as Director of Central Intelligence. No classification marking. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, CIA General 1/62-2/62.

It is my wish that you keep me advised from time to time as to your progress in the implementation of this directive and as to any recommendations you may have which would facilitate the accomplishment of these objectives.

John F. Kennedy

---

**256. Letter from Rusk to McNamara, January 20<sup>1</sup>**

January 20, 1962

Dear Bob:

As you know, I share the concern expressed by the President in our discussion with him yesterday, that no action be taken to effect a reduction in our military forces overseas lest this be construed as a willingness on the part of the United States to diminish its military posture during this period of crises. In this connection, I appreciated the prompt action taken by Mr. Nitze and other members of your Department to correct the misimpression that grew out of the recently issued directive to USAFEUR to undertake tentative planning for force withdrawals to begin as early as this February. I am, of course, aware that DOD Fiscal Year '63 budgetary plans do anticipate a reduction in forces, providing international political circumstances permit. Moreover, I presume that there is a point beyond which delay in developing such plans, and more importantly delay in their implementation, creates serious internal administrative problems for the Department of Defense.

Given the foregoing considerations, I believe it would be helpful if we knew present Department of Defense thinking with respect to the alternatives which are open to us in meeting any force reductions which might be contemplated, as well as with regard to the timing of such reductions. In this connection, I would appreciate any information you could give us on the following questions:

1. Under present budgetary plans, how much of a reduction would be required from forces presently in being?
2. What are the alternative possibilities from the Defense Department point of view for effecting such reductions with specific reference

---

<sup>1</sup> Rusk's concerns regarding possible force reductions abroad. Secret. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, Army Reorg. Proposal 12/61–1/62.

to the degree of latitude which we have as between (a) forces overseas and forces in the United States, and (b) forces in the various theaters overseas?

3. For how long a period can we safely put off the decision to reduce our forces without creating unmanageable budgetary and administrative problems for the Department of Defense?

4. Assuming the decision were made not to go through with the force reduction, what would be the budgetary impact and what legislative problems, if any, would we face?

I will be back in Washington by February 1, and would hope we might together then review this situation to see whether we should make some recommendations to the President on the question.

In light of their interest in this matter, I am sending copies of this letter to Mac Bundy and General Taylor.

Sincerely yours,

**Dean Rusk**

---

**257. Memorandum from Kaysen to Bell, January 23<sup>1</sup>**

January 23, 1962

Dave:

The President sent the attached over to McNamara and called him yesterday afternoon. He indicated he would like to have you and Max Taylor talk to McNamara on this subject. When you and Max are both back, perhaps you should concert an initiative.

**Carl Kaysen**

**Attachment**

My attention has been called to the fact that the Army is still planning its strength under budgetary criteria which assume that the Active Army will reach 940,000 by July 1, 1962 and that all reservists

---

<sup>1</sup> Conveys President's request that Bell, Taylor and McNamara meet to discuss Army force requirements. No classification marking. 1 p. Transmits copy of Presidential memorandum to McNamara on FY 1963 Army preparedness and force strength. Secret. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, DOD 1/62-3/62.

will be returned to an inactive status in the time period. As these assumptions are no longer completely valid, I would like your recommendations as to the modified guidance which should be promulgated.

As I understand the situation, we would like to do a number of things which, unfortunately, are not entirely compatible. For example, we would like to return all reservists to an inactive status as soon as possible without having to call on additional reservists. At the same time, for both military and political reasons, it seems advisable to maintain the strength of the U.S. Army in Europe essentially at the present level for some time to come. In the same period, we want strong Army forces in strategic reserve in the U.S. ready for deployment to Europe or to any other threatened area. Finally, we would like to accomplish the foregoing objectives within a Fiscal Year 1963 Active Army strength of 960,000.

In connection with the return of reservists to an inactive status, I was surprised to learn that the now Active Army divisions will not be combat ready until November 15 and December 15, 1962, respectively. At our conference at Palm Beach, I received the impression that a considerably earlier date was possible and had hoped to return the National Guard divisions to a non-federal status by early summer. As a part of the present study, I wish that you would reexamine those readiness dates and see what can be done to advance them.

In summary I would like to be shown the alternatives which we should consider in trying to reconcile the following desiderata:

- a. An early return of reservists to an inactive status.
- b. Maintenance of present U.S. Army strength in Europe.
- c. A strong deployable Strategic Army Force in the United States.
- d. An active Army strength of 960,000 for FY 1962.

Apart from the military and political aspects of these alternatives, I would like also an indication of their budgetary impact.

USSR

SUBJECT

New Emphasis on Strengthening Soviet Strategic Missile Capabilities

DATE OF INFO

Mid-January 1962

APPRAISAL OF CONTENT

2

SOURCE

A senior Soviet official who has provided reliable information in the past (B), from various senior officers concerned with the Soviet missile program.

1. A certain “evolution” has taken place in the policies of Khrushchev and his government. Unable to resolve the Berlin problem to his taste and wishes by means of shouting threats and similar pressures, Khrushchev continues to fight to win time, which he will use for a further frantic missile and atomic arms race.

2. Khrushchev has decided to complete the production of the required number of strategic missiles with nuclear warheads this year, so that when they are added to the means of mass destruction already available, he will have the capability of covering *all* NATO countries and bases with these weapons. Such missiles are already targeted against West Germany and France in large numbers, and to some extent against England, Italy, and the USA; ballistic weapons have been brought to combat readiness. A large number of launching sites targeted against West Germany are located in the Carpathians.

3. A final decision has been made in favor of Marshal of the Soviet Union Kirill S. Moskalenko’s forces (strategic missiles). His headquarters and directorates *will not* be combined with the headquarters of

Chief Marshal of Artillery Sergey S. Varentsov (tactical missiles).<sup>2</sup> Infantry and tanks will no longer receive as great attention and appropriations as was the case last year. Moskalenko's forces will be built up rapidly, and an enormous part of the budget is allotted to them. In the immediate future new units (chast) will be deployed (razvertyvatsya) under Moskalenko's command. It is considered that the tanks and other ground troops' weapons already available in large numbers are sufficient for the present time, and that it is necessary to effect a major shift of the material and technical potential of the country to production of weapons for Moskalenko's forces. This does not mean that the production of missiles and other armament for the ground army will be stopped completely, but its scale will be cut down.

4. The decision has already been made, and has *begun* to be carried out, to release 400,000 soldiers and sergeants. The release of these men was held up several months ago. This demobilization will also result in great savings, which will be applied to strategic weapons.

---

<sup>2</sup> Cf. para 3 of CSDB-3/647, 716 (TCS-9708-61), issued 4 August 1961, for source's comment about the possibility that the commands of Moskalenko and Varentsov would be combined under Varentsov.

---

## 260. Memorandum for the Record Prepared by Maury, January 26<sup>1</sup>

January 26, 1962

### SUBJECT

ONE Comments on Special Report re "New Emphasis on Strengthening Soviet Strategic Missile Capabilities", of 25 January 1962

1. This afternoon I discussed the above report with Mr. Stoertz, of ONE, who expressed the following views:

a. The report is of great significance and seems to provide an answer for a number of important questions that have troubled the estimators.

---

<sup>1</sup> Comments on special report on "New Emphasis on Strengthening Soviet Strategic Missile Capabilities." Secret; Eyes Alone. 2 pp. CIA Files, Job 80B01285A, Mtgs w/ President, 12/1/61-6/30/62.

b. For some time there apparently has been controversy and confusion in Soviet policy circles regarding the allocation of resources as between strategic missiles and other military requirements. In talking to Nixon in late 1959 and in a speech of January 1960, Khrushchev indicated that he was putting most of his eggs in the strategic missiles basket. During this period, there was evidence that Soviet ships were being put in mothballs, Soviet ground forces were being cut back and the production of conventional aircraft was dropping off.

c. In 1961, however, the Soviets seemed to shift in the other direction, giving increased emphasis to conventional forces. This may have been related to the Berlin issue, but in any event, personnel were being retained in service beyond the normal tour and ground force components received considerable emphasis.

d. Now there is evidence that the pendulum is again swinging in the direction of heavy emphasis on strategic missiles. This may be the result of one or more of the following:

(1) The success of recent tests of the Category B ICBM may have convinced the Soviets that this weapon is now sufficiently reliable to justify a mass production program and to receive major emphasis in future Soviet military planning.

(2) Our recently published articles from *Voyennaya Mysl* have reflected a sharp controversy within Soviet military circles regarding the role of strategic missiles. The time appears right for a decision on this issue and, in light of the successful Category B tests, this decision may at last have been made—in favor of the concept of keeping strategic missile forces under a separate command.

2. In evaluating the significance of the report, it seems clear that:

a. The Soviets will not be ready for a military show down until the new ICBM program has been substantially completed.

b. The achievement of the proposed missile capability may be designed to serve political and psychological as well as military purposes (for example, Malinovsky's speech last week reflects the extent to which the Soviets seek to use their missile capabilities to intimidate their adversaries).

c. While source's use of the term "frantic" to describe the current program may be questioned, there is every reason to believe that the Soviets are now engaged in a vigorous missiles program, and current estimates suggest that by mid 1963 they will have 125 operational ICBM launching sites of more than one missile each. However, current estimates hold that this program cannot be completed in time to meet Khrushchev's alleged deadline of "the end of 1962."

3. Mr. Stoertz summarized a number of suggested follow-up requirements to be levied on this source, emphasizing particularly the importance of obtaining actual numbers and rates of production,

number of missiles per launching site, rate of refire, etc. I was able to assure him that all of these requirements had already been carefully spelled out in source's past briefings.

**John M. Maury**

February 1962

**261. Memorandum from CA/PRG to CA/C/PMG, Central  
Intelligence Agency, February 2<sup>1</sup>**

February 2, 1962

SUBJECT

Background of Counter-Guerrilla Warfare Task Force Report

1. For your background information, the following is a brief run-down on the background and genesis of the Counter-Guerrilla Warfare Task Force's Report, "Elements of U.S. Strategy to Deal with 'Wars of National Liberation'."

2. Mr. Robert Komer of Mr. McGeorge Bundy's staff at the White House told me that the idea for a task force on the problems of countering Communist insurgency was discussed by Mr. Rostow with Mr. Bundy early in February 1961, that it was included in a "list of planning actions" prepared by Mr. Bundy, and that it was approved by the President in mid-February, 1961. Mr. Komer believes that this was done orally, without formal record, and that Mr. Bundy notified Mr. Bissell by phone.

3. Mr. Alfred T. Cox told me he believed that Mr. Bissell's Counter-Guerrilla Warfare Task Force was constituted at the initiative of the informal "luncheon group" comprising Messrs. Bissell, McGhee, Rostow and Nitze. He believed that this was done to forestall Defense Department action on the 1 February 1961 Presidential NSC directive which required "that the Secretary of Defense, in consultation with other interested agencies, should examine means for placing more emphasis on the development of counter-guerrilla forces." This directive was communicated to the Secretary of Defense by Mr. McGeorge Bundy on February 3, 1961 as NSAM no. 2.

4. The Counter-Guerrilla Warfare Task Force was established under the chairmanship of Mr. Bissell, with General Lansdale (Defense), Mr. Rostow (White House), and Mr. Ramsey (State) as the other members. Mr. Cox was designated as secretary. The members participated as individuals and did not bind their organizations.

5. According to Mr. Cox, the Defense Department deferred action on NSAM no. 2 pending a report by Mr. Bissell's task force. The Defense Department had, however, in the meantime been acting in this general

---

<sup>1</sup> Background and genesis of the "Counter-Guerrilla Warfare Task Force Report." Secret. 3 pp. CIA Files, Job 8300D30R.

field in response to NSAM no. 56 (June 28, 1961) on inventorying paramilitary assets; NSAM no. 57 (June 28, 1961) on the division of responsibility for paramilitary operations; NSAM no. 88 (September 5, 1961) on Latin American counter-guerrilla training; NSAM no. 110 (October 25, 1961) on FY 1963 paramilitary budgetary requirements; and NSAM no. 114 (November 22, 1961) on counter-subversion training for friendly police and armed forces.

6. There had been other, previous initiatives in the counter-guerrilla field, notably on August 1960 report by a State-JCS Counter-Guerrilla Study Group, but there were no definitive organizational or doctrinal recommendations or decisions.

7. The Counter-Guerrilla Warfare Task Force initially solicited and received written contributions from Defense, State, and CIA, which, at Mr. Foster Collins' request, I attempted to integrate into a single document around March 1961. Mr. James Cross was subsequently taken on as a consultant to redraft the document. Mr. Rostow redrafted Mr. Cross' paper. I redrafted Mr. Rostow's redraft, reorganizing it, strengthening its provisions on covert activities, counter-guerrilla paramilitary tactics, and civic action, and inserting Mr. Bissell's paper on offensive counter-measures. My revision reflected my understanding of the views of Brigadier General Lansdale on his Philippine experience and Civic Action, the views of Mr. Frank A. Lindsay on guerrilla and counter-guerrilla tactics, and the thoughts of Mr. Paul Sakwa on the importance of vitalizing a country's political processes and opening political communication channels for the airing and redress of popular grievances as prerequisites to other reforms. I also incorporated Mr. Henry Ramsey's thoughts on the importance of an effective OISP civil police program to supplement the military counter-guerrilla measures. The sections on Covert Programs were essentially my own. In my rewrite, I preserved as much of Mr. Rostow's language as possible and attempted to conform my various insertions to his rather informal and colorful style. The resulting draft was circulated on 20 November 1961 and was the basis for the final 8 December 1961 version, which added conclusions and recommendations and made some very minor changes in the basic text.

**262. Memorandum from Earman to Deputy Director for Intelligence, Central Intelligence Agency, February 12<sup>1</sup>**

February 12, 1962

The Director asked that the following extract from his memorandum of conversation with the President on Thursday, 8 February 1962, at 5 p.m., attended by General Maxwell Taylor and McGeorge Bundy (part of time) be furnished to you for information and action:

I reviewed the 25 January CHICKADEE report (Subject: New Emphasis on Strengthening Soviet Strategic Missile Capabilities—CSDB-3/649, 186), expressed thought that this report and other fragmentary intelligence led me to believe that our current Estimates on Soviet ICBMs capability might be on the low side and that we were taking the matter under immediate review. *Action:* Discuss with DD/I and Kent or Smith and DD/P what should be done in this regard.

**J.S. Earman**  
*Executive Officer*

INR-62

March 6, 1962

SUBJECT

Comment on the Basic National Security Policy Paper

In response to your request, INR has prepared comments on the draft paper concerning basic national security policy, some of which were reflected in INR comments at the Saturday discussion. Others occur here for the first time. I thought you would be interested both in INR's composite general observations, and in the specific comments made by Offices within INR, chiefly on sections of the paper that deal with regional areas of responsibility.

*Some General Observations*

The notion of a world order based upon a community of free nations sharing, or with the capacity eventually to share, political and social values is appealing—it is even necessary—if one posits as the simple, irrevocable alternative a communist world order.

Nonetheless, with respect to vast areas of the underdeveloped world, neither have we as great a capability as the paper supposes to create a community of values between the West and the new states, nor, failing the achievement of such a community, are these areas quite as vulnerable to organization by the Bloc as the paper supposes. The in-between world is just that. For the foreseeable future, it is susceptible of organization by neither side.

We must, of course, discriminate. History and geography afford relatively impressive opportunities for US initiatives to create a durable community of interests and an expanding community of values in Latin America. These opportunities, with isolated exceptions, are not so obviously available in Africa, the Middle East, and Asia. In these areas, the notion of an order sponsored by the West is either irrelevant (many of these states are so preoccupied with the creation of a viable national order that they find little meaning in the notion of world order) or suspect (since they are still in the throes of disentangling themselves from the remnants of the old world order—the Western colonial system).

---

<sup>1</sup> INR comments on the "Basic National Security Policy" paper. Secret. 9 pp. Department of State, S/S-NSC (Miscellaneous) Files: Lot 66 D 95, BNSP, 1961-1962.

The assertion in the paper that government by consent and respect for individual liberties will play a larger, not smaller, role in the political affairs of non-communist nations in the years ahead bears little relationship to the facts in many parts of Afro-Asia. It could be argued that for the present the trend is exactly the reverse. In any event, one thing seems quite clear. The basic problem which will occupy many parts of Afro-Asia for some time to come is the development within the various states of central power and, with it, the capacity to assemble information and to make and effectuate social decisions.

That these areas are not ready to join the West in a community based on common values does not mean that the Soviet Union enjoys all the advantages. The new nationalism and the balance of weakness in which the impotent quasi-state can preserve a quasi-independence by appealing to either bloc inhibits the Soviet Union from organizing the emergent world as much as the same factors inhibit us.

Moreover, as we recede from the colonial era, intra-regional political disputes increasingly shape a political environment which at once affords and inhibits access of Eastern and Western powers in about equal measure. The Soviets cannot expect to win (unless by subversion) both the Ethiopians and the Somalis, both the Pakistanis and the Indians. We believe, incidentally, that the paper has not emphasized nearly enough the importance of regional disputes as they bear on Cold War competition for ascendancy in the third world.

In this part of the world, our central objective may well be to assure an environment of sustained progress, higher standards of wealth, social justice, individual liberties, and popularly-based governments—but we must expect that in normal course we shall be able to pursue this objective only through indirection. Our immediate strategy must be so to play the game that the communists are not permitted to swing the balance to their favor. If while playing the game we can nudge some of the players toward accepting our values, so much the better. It is a matter of appropriate emphasis.

In fact, appropriate emphasis may be critical. If our prime objective is the creation of a community of values, we are bound to suffer disillusionment. If we are careless in the way we talk about this community of values, we are likely, on ideological grounds, to alienate many with whom viable relations might be maintained on grounds of interest. If we emphasize overly much the use of our resources in aiding those purporting to share our institutions and values, we shall lose the flexibility necessary to maintain sufficient access and influence to offset Soviet advances.

This is not to suggest we repudiate the effort to create a world order based on a community of value. Every approach we make ought, so far as possible, to contribute to this objective. But it is an ultimate

objective. The immediate demand is tactical effectiveness in the period of great fluidity that lies ahead.

*Exploitation of Long-Term Trends in Soviet Foreign Policy—An Alternative Analysis*

We are particularly interested in the main conclusions of paragraphs 18 through 20, which begin on page 124 of the paper. We do not disagree with these conclusions; we do believe the section could be improved by adopting a different analytical approach. We also believe the importance of the subject warrants a more detailed discussion.

We advance what is essentially a neo-containment thesis, but with several innovations. We take note of *one trend* in Soviet policy since Stalin's death which consists to date in a mellowing of Soviet methods and—though basic objectives remain the same—which contains the seeds of a de facto renunciation of imperial goals by Moscow—the heart of the East-West conflict. Domestic conditions in the USSR, the growing conflict between Soviet national interests and those of have-not communist states and parties might further develop this trend and make possible a meaningful and profitable détente with the USSR. But before this occurs, we must meet the challenge of *another trend* in Soviet policy—a new assertiveness based on growing Soviet power and on Soviet perception of political opportunities in the new nations. If we meet this challenge, we will do much to convince the Soviet leaders that pursuit of imperial, revolutionary aims is not in the interests of the Soviet state.

Our long-range goal toward the USSR itself is to effect a change in Soviet policies so as to permit a meaningful stabilization of East-West relations. To achieve this goal our long-term policy should be along dual lines. We should combine a position of strength vis-à-vis future Soviet encroachments with a policy that fosters the emergence of a more accommodating Soviet policy.

Provided, therefore, the US maintains a position of strength vis-à-vis future Soviet encroachments, it could undertake action designed to foster and permit the emergence of a more accommodating Soviet policy, along these lines:

- (a) keep open and develop lines of communication with the Soviet leaders, including exploratory bilateral summit meetings when appropriate;
- (b) stress to Soviet representatives the basic compatibility of US and USSR national interests as opposed to Moscow's representation and pursuance of the interests of world communism;
- (c) seek out agreements on those relatively narrow problems concerning which there already exists a mutuality of interests;
- (d) expand informational and cultural exchanges which will stimulate intellectual free-thinking in the USSR; and

(e) adopt a stance conducive to the further development of Sino-Soviet differences.

*The Sino-Soviet Dispute—A Need For Guidelines*

We would recommend that this section (page 138a, para. 32) be broadened in scope. We see a particular need for basic policy guide lines on this subject.

The draft implies that an open split would be to our advantage but does not state so specifically. We believe it should make this categorical judgment. Though an open split would complicate our foreign policy and might pose new dangers at the outset, we believe the gains to the US of a split greatly outweigh whatever dangers might be involved. It would weaken the over-all thrust of world communism, would weaken communist parties through increased factionalism, would in the long run facilitate the emergence of independent (communist) states in Eastern Europe, would (in the long run at least) encourage the USSR to adopt a more accommodating policy toward the West, and would (in the short run at least) lessen Chinese Communist expansionist capabilities.

US policy regarding the Sino-Soviet dispute prior to a possible open split—i.e., the best manner in which we can help a split occur—should be elaborated. We agree that the best US policy is to avoid direct involvement or direct exploitation. But we also believe that many US actions have an effect on the dispute. In taking certain actions we should try, where a coincidence of other US interests is involved, to maximize Sino-Soviet differences.

We believe that the question of US policy in the event of an open split should be discussed, if only in general terms. In our opinion, the US should publicly adopt a neutral stance, at least initially. But within this formal neutrality, we should:

(a) sound out the Soviets regarding a rapprochement on political issues of mutual interest;

(b) open up free world channels of commerce to Communist China to an extent that will enable it to maintain independence from Soviet bloc trade resources;

(c) avoid seeking political deals with Communist China (the latter would not be likely to be responsive to any such deals, and attempts to achieve them would complicate the development of promising new relations with the USSR);

(d) allow full rein for the schismatic effect of the split on other communist parties and states, particularly in the likely Chinese Communist sphere of influence; and

(e) abstain from military ventures against Communist China.

*Western Europe*

*Are European Security and Tractability Interrelated?*—What reason is there to suppose (as the paper seems to do) that maximum assurances

from the US regarding European security will make the Europeans more tractable on issues affecting other parts of the world?

It might be supposed that insofar as European attention is riveted on the question of security in Europe it is diverted from problems of the less-developed countries. However, European views of the Southern Half are not conditioned by apprehension for safety in Europe, nor by the same apprehensions that we have over communist expansion elsewhere. While relaxation of tensions in Europe might release additional energy for overseas, the direction which that energy takes will not necessarily coincide with the one which we judge best. Indeed, it seems more probable that the same differences in view which now separate us are likely to persist and new ones to develop.

*East German Attraction to the West*—Is there any prospect of the GDR being “attracted” to Western Europe—any more than it already is? If so, how would this improve prospects for Germany’s reunification?

There are no doubt some variations in the degree of affinity which the nations of Eastern Europe feel for Western Europe, but the available evidence suggests that the attraction of Western Europe is already so strong that it can be restrained only by military force. This is especially true in the case of East Germany, where there is no real desire even for independent nationhood; the Berlin Wall is dramatic evidence of the westward pull. While it might be hoped that this situation will eventually be resolved through relaxation of the forcible restraints imposed by the Soviet Union, at present the danger in the situation is that violent efforts will be made to break those restraints, to the profound embarrassment of US policy.

*Total Disarmament is Utopian Hope*—Is it actually our belief that “general and complete disarmament” would be in the US interest? (Para. 37, pp. 52 ff).

It has often been suggested that the elimination or reduction of arms can only follow, and not precede, the elimination or reduction of political conflicts. But, be that as it may, the notion of a totally disarmed world, except for domestic and international police forces, raises a host of disquieting questions. What effect would this have on the balance of power relationships? How would the international force be constituted and controlled, and how would its use be determined? Or, more generally, would not any arrangement simply be the framework within which the struggle for control of this ultimate source of power would go on? What stage of international law and organization would this require, and what are the prospects of reaching it? Do not these and many other questions which the idea raises suggest that “total disarmament” might better be stated as a utopian hope rather than as a practical policy for current guidance?

*European Demand for Nuclear Control May be Tenuous*—Does not the paper exaggerate the extent and intensity of the demand by European

NATO countries for a role in the control over strategic nuclear forces, as well as their demands for a multilateral MRBM force? (Pp. 89b–90, paras. 15–16).

The “political requirement” for sharing with other NATO countries the control of nuclear forces has been the subject of general study in recent weeks, but our researches suggest that the European demand is tenuous. Recent discussions of the problem have reflected a considerable misunderstanding, or lack of information, on the part of the Europeans, which needs to be, and probably can be, dispelled by further consultation. Even now, however, the “European” demand, aside from the current UK and French national programs, boils down to some agitation by German leaders which is not yet a demand and conceivably need not become one. In any case, it is as yet far from clear whether the European anxiety (or the consideration of national prestige) which underlies recent European discussion of the subject can be met by any of the specific proposals (e.g., multilateral MRBM force) presently under consideration. Europe’s concern is still focussed on the adequacy of the NATO defenses to deter, or defend against, aggression in Europe, and the powers’ primary need seems to be for constant reassurance not only that the total military strength of the Alliance is adequate but that especially the strength of the US is totally and irrevocably committed to the defense of Europe.

#### *The Middle East*

*Cross-Purposes With Our Allies*—The paper refers (page 94) to awkward cross-purposes among the major allies with respect to alliance policy toward a number of areas. The Middle East is listed among these areas. We do not believe there are any major cross-purposes among the allies with respect to this area which work to our disadvantage. It is true that the French have a special relation with Israel. However, this relationship probably works to our net advantage since it maintains the military strength of Israel without laying on us and the British the major onus for such action. Nor does it appear that we and the French are at serious odds with respect to British policy in the Persian Gulf. We regard this policy as necessary to assure the continued availability of oil to Western Europe, so necessary for the continued strength of the alliance.

*CENTO—A Different Emphasis*—The paper states (page 97): “Neither CENTO nor SEATO has proved a very satisfying instrument; in CENTO we are not a member and the enterprise is overhung with ambiguity as to how Iran could be defended in a limited war.” Is this statement meant to imply that CENTO is not a “satisfying instrument” because we are not a member, or that CENTO itself, rather than the distribution of Free World forces and the basic strategic factors

involved, is responsible for the difficulties which we face in defending Iran? CENTO has not posed serious problems for us since Iraq left the alliance. Instead of blaming CENTO, we should turn our attention directly to the security and political difficulties in the area that extends from the Bosphorus to India. These difficulties are two in number: (a) the problem of defending Iran, and (b) the problems that arise within the area from the fact that Pakistan is aligned with the West while India and Afghanistan are not.

Because of limitations imposed by geography and the amount of indigenous military strength which it is possible to build in the area, we can expect very little help from Turkey and Pakistan in defending Iran. The problem of defending Iran thus can be solved only through dispositions of US and other Western military forces and arrangements within Iran and in the area. As for the second major problem, as long as we maintain a US-Pakistani alliance we shall continue to feel certain adverse effects in our relations with Afghanistan and India.

#### *Southeast Asia*

*Can Southeast Asia Defend Itself?*—Is it really feasible in Southeast Asian countries which border the bloc (see page 49 of the paper) to attempt to build local forces which have the capacity to deal with both conventional and guerrilla attacks? How long could their conventional forces hold? How effective would they be in complementing our own and Allied forces subsequently brought to bear? Would it not be better to shift primarily to counter-guerrilla training on the theory that harassment of the invaders would be as useful as direct confrontation in a conventional holding operation?

*Should We Favor Allies Over Neutrals?*—In discussing our constructive goal of a community of free nations (page 11 ff.), we confront a problem of our own creation: by treating our allies and the neutralists in essentially the same manner, we reinforce rather than break down the environment of neutralism. Is there some room to consider giving special advantages to our allies, to make their alignment more satisfying to them than possible non-alignment? (e.g. Thailand.)

*Japan's Role*—The critical role of Japan is made particularly complex by its unique position as Asia's only "developed" nation. Our present policies toward Japan's role in contributing to Free World defense are premised upon current realities of the domestic political environment. The underlying rationale is that Japan is already contributing to Free World defense insofar as the present pace of its economic progress plus US base rights and the advantages conferred by the bilateral defense agreement with the US constitute the most useful contribution Japan is capable of making. The evolution in Japanese thinking which would be a prerequisite to interest or participation in military or secu-

ity problems beyond its own national boundaries may well be a long-term proposition. If Japan's present passive role is judged to be inadequate in terms of our long-term policy objectives in Asia, then its leadership must be persuaded that a more active role is necessary despite the domestic political environment. (See following paragraph on *Containment*). The direction and pace of such a reorientation will depend upon Japan's sense of participation in the "hard core" club of northern developed countries; the ability of its leadership to redirect important segments of public opinion; and, in significant part, on US policies designed to broaden the base of mutual security responsibilities in Asia.

*Burden of Containment*—Much of the above applies to that section of the paper which concerns a "network of increased mutual involvement and cooperation" in Asia (para. 34, page 104). We need, somehow, to shift earlier concepts of containment which placed the entire burden on the US for halting communist encroachments. Asians are still happily relying on this concept and even our European allies, who ought to know better, are satisfied to let us carry the ball alone.

*Consultation*—We agree that now is the time to prepare the ground for dealing with the effects in Southeast Asia of the coming Chicom nuclear capability (p. 140), but shouldn't we broaden this approach to deal with many of our other problems in the area as well? Our friends in Asia have complained repeatedly of not being taken into our confidence. Nothing exists in Asia that approaches the exchange of views among the NATO group. What we need is something like a Pacific community intelligence estimates group to explain to them the shape of the future as we see it and broaden their present narrowly nationalist preoccupations.

*Two Dilemmas We Face*—In considering the "Reorientation of Regional Alliances" in Asia (p. 174–5), we are really dealing with two dilemmas: 1) our desire to engage the aid and support of our European allies in the area versus the existing views of Asian nations toward colonialism, neo-colonialism, and big power domination; and 2) the desire to have responsible regional allies firmly on our side versus the desire to make friends with the neutrals. Can we really hope, in the foreseeable future, to have it both ways? Or will the determination to pursue both facets simultaneously be mutually destructive? Take, for example, our dilemma in the West New Guinea dispute.

We suggest that further consideration be given to weighing the advantages and disadvantages of a clear-cut resolution of our twin dilemmas in Asia. How much help can we expect from France and the UK in the Far East and what would it cost in terms of disadvantages in the area itself? How much help can we count on from India, Cambodia, Burma, and Indonesia, and what would be their alternatives (in fact,

not in fancy) should we lessen our support for them relative to that given Thailand, Pakistan, and our other allies?

*Some Comments Concerning Policies Toward the Less Developed Nations*

*The Need to Stabilize Commodity Prices*—In the section of the paper on North-South relationships there is no reference to the need for giving much greater attention to stabilizing the prices of basic commodities. Nearly all well-developed communities have recognized the need of producers of basic commodities, particularly agricultural commodities, to be protected against the vicissitudes of fluctuations in supply and demand. If we are to be successful in building a community of free nations we shall have increasingly to expand this approach to the entire free world. Where our own interests are immediately and significantly concerned, as in the case of wheat and sugar, we have already taken significant steps in this connection. There are also a number of other commodities relating to which we participate in price stabilization efforts. However, these efforts need to be broadened and intensified. In the kind of world in which we exist today we cannot again afford to permit such economic suffering as occurred in Brazil, for example, from the over-supply of coffee during the 1930s.

*An Elaboration on the Setting for Policy*—The setting (Section II B) in which we must approach the formulation of policy toward the less-developed areas includes a number of important factors which are not mentioned in this section. There is, for example, the breakdown in many of these areas of traditional societies. Equally significant in some areas is the legacy of state boundaries left by colonialism. These boundaries were fixed on principles which are now no longer rational. With the removal of colonial control a variety of intra-area disputes have arisen, such as the Pushtunistan dispute, the dispute between Iraq and Iran over the Shatt al-Arab, and the disputes arising out of the fragmentation of the Arabs. The dispute between Communist China and India over the northern border may in some degree be attributed to this factor.

*Criteria for Military Aid*—The paper (pages 67 f.) recognizes that economic aid may legitimately be extended for purely political and psychological reasons. Military aid, however, is to be extended solely on the basis of objective military criteria. While admitting that in the past military aid has not always been tailored closely enough to real needs, there will continue to be instances when we will need to extend some military aid for political and psychological reasons.

## April 1962

### 264. Memorandum from Gen. Taylor to President Kennedy, April 17<sup>1</sup>

April 17, 1962

#### SUBJECT

Scheduled Reduction in Strength of the U.S. Army in Fiscal Year 1963

1. Secretary McNamara's recent memorandum to you, "Release of Reservists Involuntarily Recalled to Active Duty," informs you of the present intention to reduce the U.S. Army to 960,000 by 30 September 1962 through the release of some 110,000 reservists. He indicates that this reduction will not affect the strength of Army combat units in Europe as long as the present crisis persists. However, he considers that it may be possible through a careful screening of support forces to effect some reduction of Army personnel strength in Europe without reducing combat power. Thus, it would appear that the impact of this reduction will fall largely upon our forces in the United States, particularly the Strategic Army Force.

2. You raised this matter previously with Secretary McNamara by a memorandum dated January 22, 1962 in which you asked to be shown the alternatives to consider in trying to reconcile the following points:

- a. An early return of reservists to an inactive status.
- b. Maintenance of present U.S. Army strength in Europe.
- c. A strong, deployable Strategic Army Force in the United States.
- d. An active Army strength of 960,000 for FY 1963.

3. As a decision has now been made with regard to the release of reservists, it becomes a question of how to reconcile the requirements for maintaining the U.S. Army in Europe at approximately the present level while keeping an adequate Strategic Army Force within the planned strength of 960,000. April is the month of no return with regard to the maintenance of the strength of the Army as we should be drafting men this month to replace the departing reservists if the strength of the Army is not to go down. Hence, I suggest that you ask Secretary McNamara to outline his plans and intentions, along with their impact upon the Strategic Army Force in the United States.

---

<sup>1</sup> Provides background information for Kennedy's meeting with McNamara on U.S. Army force reductions in FY 1963. Secret. 2 pp. Kennedy Library, President's Office Files, 94B, DEF 4/62-6/62.

4. I have informed Mr. McNamara that you wish to discuss this matter with him after the meeting with the Congressional leadership today.

Maxwell D. Taylor

**SUBJECT**

Nuclear Superiority of US Vis-à-Vis the Soviet Union (U)

1. In response to your verbal request to me on 6 March to provide you with a memorandum outlining the factors that contribute to nuclear superiority, the following is provided.

2. On 5 October 1961, the Joint Chiefs of Staff submitted<sup>2</sup> a study to the President, as a result of his request, that compared the nuclear delivery capability of the US vis-à-vis the Soviet Union. At that time, the study concluded that the US enjoys a military superiority over the

---

<sup>1</sup> Circulates copy of a memorandum from Gen. Lemnitzer to McNamara on "Nuclear Superiority of the US vis-a-vis the Soviet Union" for their information. Top Secret/Restricted Data. 12 pp. National Archives and Records Administration, RG 218, JCS Records, JMF 2210.

<sup>2</sup> See Enclosure and Appendix to JCS 1924/127.

USSR in 1961 and this superiority will continue through 1963, but that the Soviets in recognition of this imbalance are striving for weapons systems that will, in the future, provide them with a distinct military advantage.

3. This determination was based primarily on the nuclear delivery capability of the US and the USSR. Since the original study was completed, there have been no significant changes in the nuclear delivery capability of either nation that would alter the conclusions of the Joint Chiefs of Staff for the short term. However, in view of the recently completed series of Soviet nuclear tests, it is highly probable that much useful information was obtained that will advance their confidence and competence in the area of nuclear systems development.

4. To compare the US nuclear delivery forces with those of the USSR is a reasonably easy task, but to make a comprehensive evaluation of the relative posture of the two countries requires consideration of many factors. Some of the factors which contribute to the determination of nuclear capability are:

- a. Number of nuclear delivery vehicles.
- b. Quantity and quality of nuclear weapons.
- c. Capability, reliability and accuracy of delivery systems.
- d. Application of technology to military uses.
- e. Intentions.

5. Tab A contains a comparison of the combat ready forces available to the US and the USSR for the periods 1 January 1962 and 1 July 1963. Forces for this comparison include those forces based in the CONUS and those employed overseas which have the capability of striking the Sino-Soviet Bloc. No Allied forces have been included. Soviet forces include those capable of striking the US and US forces overseas. In Tab B are detailed explanations of the forces immediately available to both sides. It will be noted that the US has a considerable advantage in the heavy bomber category and is slightly behind in the medium bomber force both in 1962 and 1963, but in total bomber force, the US is superior in 1962 and will widen this gap further by 1963. In the ICBM category, the US superiority is approximately three to one increasing in 1963 to about four to one. The one category in which the USSR enjoys a decisive superiority is in the field of MRBM's. These do not pose a threat to the US but they are a threat to the Allies in both Europe and Asia. This advantage is partially offset by the US superiority in the fighter bomber category.

6. In the area of nuclear weapons, there is a lack of direct intelligence information on Soviet nuclear weapons stockpile which precludes a definitive appraisal of the Soviet capability as compared to that of the US. Although we have estimates of the Soviet nuclear material stockpile, we have only limited information regarding specific characteristics

of Soviet stockpile weapons. Nevertheless, a Soviet nuclear stockpile can be estimated for 1962 and 1963 using the assumptions that the weapons in the Soviet stockpile will have roughly the same average material composition as those in the US stockpile. In this respect, numbers of weapons are not the primary consideration, if we assume, and the assumption appears to be valid, that each side has sufficient numbers to provide the proper load or loads for each delivery vehicle. Nevertheless, there is one important factor that must not be overlooked. The recent Soviet nuclear tests have allowed them to achieve greater economy in fissile materials while at the same time maintaining high thermonuclear efficiencies. This achievement could ultimately permit the Soviets to build warheads in the range of 50 to 100 MT and therefore, reduce the Soviet strategic requirements or permit the accomplishment of a higher level of destruction of target systems with estimated weapons inventories.

7. In comparing the capability, reliability and accuracy of the Soviet missiles, we have relatively firm evidence on the test range and the test firing program from which we have been able to derive basic characteristics. From these data, we can also derive some of the basic factors affecting performance under operational conditions, including ranges, accuracy and reliability. These data can be combined with other evidence to provide a sense of tempo of the ICBM development program and the degree of success the USSR has achieved. In general, the capability of the Soviet missiles compares favorably to that of the US missiles in range, reliability and accuracy. Consequently, an evaluation of the superiority of either side in the ICBM area would be dependent primarily on the number of missiles available to each side and the concept of employment of such missiles, i.e., would they be targeted against military targets, urban targets or a mix of each. The same is true of the Soviet bomber force.

8. The Soviets are making vigorous efforts to counter Western weapons systems. Within the next five years, they will probably introduce improved radars and all weather interceptors, a surface-to-air missile system designed to counter low altitude air attack and anti-missile defenses. The recent Soviet nuclear tests, in part, were designed to obtain an AICBM capability. However, they probably will still not achieve a high degree of assurance in coping with a large-scale sophisticated attack by manned bombers. Although they would probably expect to destroy a larger number of attacking forces, it is doubtful they will be able to reduce the weight of such an attack.

9. Soviet capabilities in guided missiles and space vehicles rest upon a major national effort in research and development pursued over the past 15 years. The Soviets have concentrated on the development of only a few systems at any one time. With the possible exception of

the first surface-to-air system, deployed around Moscow, there has been no indication that Soviet guided missiles were developed on a "crash" basis. The Soviets now have operationally available about 20 individual missile systems for surface, air, and sea employment. Future Soviet efforts will probably place greater emphasis on development of second generation missile systems. The importance which the Soviets attach to the space program is demonstrated by the assignment of leading scientists to its direction, by the wealth of theoretical and applied research being conducted in the support and by the allocation of resources and facilities to its implementation. A significant achievement in this field has been the development of very powerful propulsion systems and it is estimated that the Soviets will be able to place in orbit about 25,000 pounds sometime in 1962. This progress by the Soviets does not constitute a superiority in the area of weapons and space at the present time, but is indicative of Soviet trends and we can be assured that if the Soviets elect to exploit their technical capability toward developing weapons systems that will narrow the gap between the US and USSR, they will, in fact, do so.

10. Of the factors listed above, probably the most difficult to assess is the intentions of the Soviets. There is no indication that the Soviet national policy precludes an initiative attack. Presumably, the USSR is aware of US policy which rejects preventive war by the US. They could, therefore, make plans to attack the US without strategic warning. An attack such as this, by a minimum force, would have to be carefully planned and executed to prevent a possible pre-emptive attack if the US were alerted through intelligence. As the USSR moves more and more toward a strategic missile posture, the capability to achieve surprise increases. However, the US forces during the period are simultaneously building toward a less vulnerable posture. Since a basic requirement of an initiative attack is to destroy the enemy's capability to retaliate, the Soviet strategic force structure will have to increase accordingly if they intend to exercise the initiative. If the USSR does not contemplate an initiative strategic attack against the US, the requirement would be reduced since all that would be needed would be the requirement to deter an attack by the US. Since national policy of the US in effect provides this deterrence, the USSR requirement for a deterrent posture could be comparably smaller.

11. As opposed to the Soviet requirement for a minimum deterrent force or for an initiative force, the US is faced with the problem of attaining a strategic posture adequate to attack effectively the USSR under many circumstances, including a second strike capability with those residual forces remaining after a Soviet initiative attack. Estimates of forces and weapons required to attain this posture vary widely depending on the assumptions as to how a nuclear war will begin.

Answers to these questions are being sought by the entire military establishment on a continuing basis, in order to keep current the estimates of Soviet strengths, weaknesses and future intentions so that a determination of future forces, weapons and strategy to counter Soviet aggression can be made.

12. From the preceding, we have been able to determine some of the factors that contribute to the determination of nuclear superiority. In order to define "nuclear superiority", we must consider other factors, some of which are less tangible than those mentioned previously. These include national strategy and objectives, force application and national will. When these factors are assessed against enemy ideology and philosophy, then we can make a more meaningful determination of just what is meant by the term "nuclear superiority". Although "nuclear superiority" is difficult to define in one sentence, one such definition might be as follows: "Nuclear superiority is that degree of nuclear capability possessed by one nation vis-à-vis another that, regardless of the level and intensity of conflict threatened or actually inflicted by the enemy, permits the nation possessing this capability to disarm the enemy's nuclear forces, conclude the conflict on favorable terms and to prevail as a viable nation".

13. Since World War II, the over-all national strength and purpose of the US, supplemented by that of its Allies, has successfully deterred the Soviet Union from initiating general war. US success in this regard during the past seventeen years resulted primarily from the fact that US forces have had a clear capability, whether [*text not declassified*] retaliation, to cause unacceptable damage to the Soviet Union and emerge with a superiority in forces and resources which would place the US in a position from which to prevail. While the USSR possesses the capability to damage the Allies and the US severely in general war, it does not possess the capability either in initiative or retaliation, to damage the US sufficiently to permit it to emerge in a position from which to prevail against the US. Analysis, based on the current intelligence estimates of the relative postures of the US and the USSR for the current time period and through 1963, indicates that the US will remain stronger than the USSR. Its total military capability and the economic base supporting its forces give it an over-all military advantage over the Soviets. Comparative analysis of the known and/or estimated nuclear strike capabilities of the US and the USSR, when considered in their entirety, and in relation to their respective capabilities to defend against nuclear strikes makes it doubtful, except through miscalculation or misadventure, that the Soviets will initiate general war either now or through mid-1963.

14. In summary, despite a strong Soviet military posture, the relative strategic balance of forces is in favor of the US at the present time.

By 1963, our strategic force levels and our relatively secure force levels assure for the US a decisive retaliatory capability. However, the results of the analyses obtained from the recent Soviet tests give grounds for serious concern. There are indications that the Soviets have made substantive progress in nuclear technology well beyond that commonly anticipated and there is reason to believe they will exploit this advancement to the fullest extent.

15. Free world security depends on US strategic nuclear capability and it is essential that the US maintain a nuclear superiority over the USSR at least equal to that of the present level. As the capability of the USSR increases, so must that of the US. In this respect, consideration must be given to all aspects of our national posture including an adequate civil defense program. Any relaxation on the part of the US in the effort to maintain a nuclear superiority could result in a deterioration of capability with time to a point where irreparable damage could be done.

# CSAF believes about 75 is the correct figure as of 1 March 1962.

## CSAF believes about 250 is the correct figure.

### There is some evidence, not yet conclusive, that the USSR is showing activity toward acquiring a nuclear delivery capability for tactical fighters. USCINCEUR has expressed a belief, although he has no positive proof, that about one-half of the Soviet fighter-bombers possess a nuclear delivery capability.

#### It is estimated that some in class cruise type missile subs are probably operational now (350 nm cruise missile)

**Tab B**

## NOTE 1—LONG RANGE AIRCRAFT

*USSR Forces*

a. As of January 1961 the main weight of a large-scale nuclear attack against distant targets would be by bombers of Long Range Aviation. The 160 heavy bombers consist of 110 Bisons and 50 Bears and include aircraft fitted as tankers. These are available to all Bison units and about half the Badger units. These can be converted to bombers in a few hours. Within the next year or so virtually all Bears will carry 350 nm ASMs.

b. Medium bombers (BADGERS) are assigned to components other than Long Range Aviation, viz 375 to Naval Aviation. Yields of weapons assigned to these aircraft could vary from 10 KT to 7 MT.

c. It is estimate that, excluding combat attrition, at present the USSR could put about 200 bombers over North America on two-way missions in an initial attack, more than half of which would be medium bombers. The Soviets have a considerably larger gross capability for attacking the United States itself, but to exercise it they would have to employ medium bombers on one-way missions and to use crews who had not had Arctic training. With the advent of Soviet missile capabilities, we regard this use of the medium bomber force in the initial attack as increasingly unlikely.

*US FORCES*—Of the 1308 long range bombers available 1 March 1962, the United States has [*text not declassified*] to strike targets in the Soviet Bloc, carrying [*text not declassified*] weapons or an average of [*text not declassified*] weapons per aircraft. Of the [*text not declassified*] programmed aircraft, [*text not declassified*] are programmed to be on alert and could be launched within 15 minutes.

## NOTE 2—ICBMS

*USSR FORCES*—The figure 10–25 ICBMS indicates missiles on launchers and is concurred in by the United States Intelligence Board except the Assistant Chief of Staff, Intelligence, USAF, believes Soviet ICBM's to be about 75 as of 1 March 1962 and 250 in mid-1963. The Soviet ICBMs for the present and for the near future will be deployed in soft sites. Evidence indicates that there will be no hardened sites by 1963.

*US FORCES*—The 62 US ICBMs in 1962 are ATLAS and TITAN missiles; 30 are soft and 32 are in installations hardened to 25 PSI and above. In 1963, US ICBMs are as follows:

27 ATLAS D—Soft

29 ATLAS E—25 PSI

75 ATLAS F—150–200 PSI

57 TITAN I—150–200 PSI

34 TITAN II—300 PSI

156 MINUTEMAN—[*text not declassified*]

378<sup>8</sup>

\*(20 missiles utilized for training purposes)

#### NOTE 3—SUBMARINE LAUNCHED MISSILES

*USSR FORCE*—The Soviets would probably assign US land targets to missile launching submarines. The number to be deployed depends on the pattern of operations. The Soviets are estimated to have the following number of submarines:

	1962	1963
Z Class 350 nm (2 missiles)	7	7
G Class 350 nm (3 missiles)	18	18
H Class 350 nm (3 missiles)	8	16

*US FORCES*—Of the 80 POLARIS missiles now at sea in operational SSBN's, 48 are on [*text not declassified*]; 16 others are in SSBN's in [*text not declassified*] at Holy Loch; and, 16 others are on [*text not declassified*] at Holy Loch.

In 1963, out of 128 missiles at sea in operational SSBN's, 80 will be on [*text not declassified*]; 16 to 32 will be in SSBN's in [*text not declassified*] at Holy Loch; and 16 to 32 will be on [*text not declassified*] at Holy Loch.

Of the 17 REGULUS missiles aboard, four SSG's and one SSGN, four are on-station at all times. The remainder are in submarines in transit between the operating area and their base, in training, or at their base.

#### NOTE 4—OTHER FORCES

Of the total of 225 light bombers, 130 are overseas in theater areas, either at shore bases or aboard aircraft carriers. The remainder are in the CONUS or aboard aircraft carriers in transit or operating in the vicinity of the CONUS.

Of the total of 2,389 fighter and attack bombers, 885 are overseas in theater areas, either at shore bases or aboard aircraft carriers. The remainder are in CONUS or aboard aircraft carriers in transit or operating in the vicinity of the CONUS.

*USSR FORCES*—The 250 Soviet light bombers are all nuclear capable. The bulk of the Soviet MRBM launchers are in Western USSR, within range of US forces in Europe.

*US FORCES*—US light bombers and fighter bombers consist of the following:

<i>Light Bombers</i>	1962	1963
B-57	48	0
B-66	48	0

CHINESE COMMUNIST ADVANCED WEAPONS CAPABILITIES

*THE PROBLEM*

To estimate the capabilities of Communist China with respect to the development and production of guided missiles and nuclear weapons over the next few years.

*FOREWORD*

In analyzing the evidence on Chinese programs for advanced weapons, we have encountered numerous important gaps and apparent

---

<sup>1</sup> “Chinese Communist Advanced Weapons Capabilities” printed in part in the print volume as Document 81. Top Secret. 30 pp. CIA Files, Job 79R01012A, ODDI Registry.

inconsistencies. The evidence available to us clearly proves the existence of programs in the missile and nuclear fields, but it is insufficient to permit us to reconstruct these programs in the fashion which is possible for various comparable Soviet programs. Similarly, while we have been able to make some judgments about Chinese progress and the time periods during which further accomplishments are likely, we cannot reach firm conclusions on these matters, or predict the year in which deployment of a complete weapons system will probably begin.

In these circumstances, we have considered it useful to present in this estimate a fairly full picture, not only of the evidence and the major problems which it leaves unresolved, but also of the basic scientific and economic resources available to the Chinese Communists for advanced weapons programs. We have sought in this way to establish a base of information to which, in succeeding estimates on these problems, we can subsequently apply new information and further analysis. We expect that, as these Chinese programs proceed, such information and analysis will permit us further to refine the broad approximations and judgments presented in this estimate.

### CONCLUSIONS

1. A program to develop nuclear weapons has probably been under way in Communist China since the early 1950's, and a guided missile program since late in the decade. We believe that in both these programs, the Chinese are aiming at independent capabilities. (*Paras. 12, 24*)

2. From the first, however, Chinese progress in both fields has depended heavily upon Soviet assistance. Our inadequate knowledge of the kind and amount of this assistance is a major source of uncertainty in our estimate. We believe, however, that Soviet aid in these fields was provided at a more deliberate pace than other types of military assistance. Soviet technical assistance was substantially reduced and perhaps discontinued about mid-1960. By that time, Chinese nuclear and missile programs were probably sufficiently advanced so that even a complete halt in aid would not have necessitated their abandonment. (*Paras. 23-27*)

3. China's progress since has rested primarily on native resources, which are extremely limited. Significant gaps exist in a number of research areas basic to advanced weapons development. Efforts in the missile field have up to the present probably been limited largely to copying Soviet missiles. While the size of the missile test center at Shuang-cheng-tzu connotes a very large program and the range is operational, the evidence suggests that this program has been retarded. (*Paras. 13-22, 28-34*)

4. Despite the priorities accorded to heavy industrial and armament plants, we believe that any attempt to mass-produce advanced weapons

would be difficult for China. There is good evidence that the general retrenchment of 1961 affected the military as well as the civil economy, although it is possible that Chinese Communist advanced weapons programs have not been adversely affected. No Chinese missile production facility has been identified, and we doubt that any substantial missile production is under way. We believe that China has no present operational capabilities with missiles, aside from limited deployment of surface-to-air and possibly air-to-air missiles, all procured from the USSR. (*Paras.* 42–55)

5. We have evidence to indicate that the Chinese Communists have mined and concentrated a significant amount of uranium ore and that, with Soviet help, they were constructing a plant for recovery of uranium in 1960. This strongly indicates an intent to produce fissionable materials, but we have no evidence of such production in Communist China. Assuming an accelerated and highly successful program for the production of plutonium since 1960, the Chinese Communists could detonate an all-plutonium device in early 1963. However, in the light of all the evidence, it is unlikely that the Chinese will meet such a schedule. We believe that the first Chinese test would probably be delayed beyond 1963, perhaps by as much as several years.<sup>2 3</sup> (*Paras.* 35–38)

6. Within a year after exploding their first device, the Chinese Communists could probably produce a few fairly crude fission weapons. Another two years or more would be required to develop fission weapons for missile warheads. If the first test should occur in the next year or so, we estimate that toward the last part of the decade the Chinese Communists could have a variety of fission weapons to sup-

---

<sup>2</sup> For the position of the Assistant Chief of Naval Operations (Intelligence), Department of the Navy, see his footnote to paragraph 38.

<sup>3</sup> The Assistant Chief of Staff, Intelligence, USAF, agrees that the Chinese Communists have accorded a very high priority to the development of nuclear weapons (paragraph 12); and that they probably regard an advanced weapons capability as a political and military necessity if they are to achieve the international status they seek (paragraph 11). He also concurs in the judgment that no drastic cutback in Chinese efforts to develop prototype nuclear weapons has occurred, and that sufficient economic and scientific resources are available to the Chinese Communists to support a few, very high priority projects (paragraph 44). He believes the large-scale withdrawal of Soviet technical aid in mid-1960 undoubtedly has retarded the progress of the Chinese Communists weapons program in certain areas. Nevertheless, he considers it likely that sufficient technical and industrial resources are available and are being funneled into the Chinese Communist atomic energy program on a sufficient priority to permit them to detonate an all-plutonium implosion nuclear device by 1963. If the Chinese detonate their first device in the next year or so, it would be within their capabilities to develop and test a thermonuclear device before the end of the decade. Such a device probably would be extremely heavy, and would represent only a token TN capability. Even such a limited TN capability would go far to establish China as a great power and would have profound psychological impact, particularly in Asia.

port many of their military requirements, but only in limited numbers. (Para. 39)

7. We believe that the Chinese would at some point in their program endeavor to produce U-235, but we have no evidence of U-235 production at present. Latest evidence indicates that a facility at Lanchou suspected of being a gaseous diffusion plant has not been completed. If this plant is in fact intended to be a gaseous diffusion facility, it probably could not produce weapon grade U-235 before 1965. The Chinese could probably test an all U-235 or composited device within a year after the activation of a production facility. (Para. 40)

8. Within the next few years, the Chinese could begin to deploy short-range (up to 350 n.m.) surface-to-surface missiles with nonnuclear warheads. Deployment of medium-range missiles almost certainly is keyed to the availability of nuclear warheads; such plans probably look to the second half of the decade. In the absence of Soviet aid, the Chinese will probably not undertake to produce surface-to-air missile systems, at least until the mid-1960's. (Paras. 53-59, 63-64)<sup>4</sup>

9. In more advanced fields—submarine missile systems, IRBMs, ICBMs, antimissile systems, and thermonuclear weapons—China is not likely to achieve independent capabilities during the 1960s. (Paras. 41, 60, 62)<sup>5</sup>

## DISCUSSION

### I. CHINESE COMMUNIST OBJECTIVES

10. The Chinese Communist leaders are determined to establish China as a major world power and as a leader of the Communist Bloc of at least coequal status with the Soviet Union. They regard the Far East as China's particular preserve and are determined to be dominant in that area. In general, Peiping would probably prefer to achieve its objectives by political and economic forms of struggle, rather than by direct employment of Chinese forces. However, Communist China has no compunctions about openly using its military forces to extend its control when it can do so with little or no risk.

---

<sup>4</sup> The Assistant Chief of Staff, Intelligence, USAF, believes that in view of the accuracy (CEP), system cost, the availability of tactical air forces and other considerations, deployment of 350 n.m. surface-to-surface missiles by the Chinese Communists will almost certainly be dependent upon the availability of nuclear warheads. Therefore, while he agrees that the Chinese within the next few years could begin to deploy short-range surface-to-surface missiles with nonnuclear warheads, he does not agree that they are *likely* to do so until nuclear warheads are available.

<sup>5</sup> For the view of the Assistant Chief of Staff, Intelligence, USAF, regarding Chinese Communist thermonuclear weapons capabilities, see his footnote to paragraph 5.

11. Peiping calculates that the achievement of even limited capabilities with advanced weapons would go far to establish China as a great power and would have a profound psychological impact, particularly in the countries of Asia. Moreover, in areas where Communist-supported forces confront those supported by the West, the Chinese Communist leaders almost certainly consider intervention by one side or the other as an ever-present possibility. They probably reason that possession of advanced weapons would support more aggressive Chinese policies in these areas and would tend to deter strong Western responses. Thus, they probably regard an advanced weapons capability both as a political and a military necessity if they are to achieve the international status they seek.

## II. EVIDENCE ON ADVANCED WEAPONS PROGRAMS

12. The Chinese Communist drive to acquire a nuclear capability apparently antedated their efforts in the guided missile field by several years. Since the early 1950's, Communist China has accorded a very high priority to the development and production of nuclear weapons. There is no firm evidence that the Chinese Communists have undertaken to develop or produce bomber aircraft. We believe that Chinese Communist commitment to a large-scale program for development of guided missile capabilities probably dates from the late 1950's.

### *Missile Test Range Activities*

13. Recent photography has confirmed the existence of a guided missile test center in northwest China; its location in this area had been indicated by a considerable body of evidence accumulated over the past two or three years. The evidence indicates that construction of range facilities could have begun in 1957 and almost certainly was well under way in 1958.

14. The rangehead is located about 50 n.m. northeast of Shuang-cheng-tzu on a rail spur off the Urumchi-Lanchou rail line. It is a large, instrumented area, dispersed along a 30-mile stretch of the Etsin River, comprising a surface-to-surface missile (SSM) launch area, a surface-to-air missile (SAM) launch area, a large main support base containing 185 buildings, a smaller support base servicing the SSM and SAM complexes, a large SSM and SAM assembly area, two revetted storage areas, and several smaller housing and support areas. About 40 n.m. southwest of the main support base is a large new airfield with a 13,500 foot concrete runway. Near the airfield are two large communication centers. (See Figures following page 7)

15. The three SSM launch complexes have been arbitrarily designated "A," "B," and "C." Complex "A" appears to be completed and operational. This complex contains two large concrete pads suitable

for firing ballistic missiles served by paved loop-access roads, a control bunker, and a drive-through checkout building. [text not declassified] firings have occurred, probably within the recent past. [text not declassified]. The two pads under construction at launch complex "B" strongly resemble those at complex "A." Excavation for the pads has been completed, but construction appears to have been suspended. Launch complex "C" has one pad and a drive-through building. Construction work appears to be nearly complete, and the launch pad could have been used. However, the operational status of this complex is undetermined.

16. The ranges of the missile systems to be tested from these facilities cannot be determined from the photography. The launch sites are oriented towards the west, and the down-range instrumentation is also in that direction. The desert terrain to the west would allow the firing of surface-to-surface missiles to ranges of up to 1,100 n.m. within Chinese territory. The pads, associated revetments, and support areas in launch complex "A" closely resemble Soviet facilities at Kapustin Yar used for 700, and probably for 1,100 n.m. ballistic missiles. Launch complex "C" bears some resemblance to other Soviet launching facilities at Kapustin Yar; the type of missile associated with the Soviet complex cannot be ascertained.

17. The surface-to-air missile launch area resembles SA-2 launch facilities at Kapustin Yar, although the two SA-2 sites at Shuang-cheng-tzu are more widely separated and the instrumented area is larger. Construction work has been completed on the two sites, but only one is equipped with radar and launchers. One of the launchers has been fully revetted, and partial revetments have been provided around a second. [text not declassified] The support facilities, also built on the Soviet model, appear completed.

18. It appears that Shuang-cheng-tzu airfield was originally intended to provide logistic support for the missile range, fighter protection, and possibly to conduct air-to-surface missiles (ASM) and air-to-air missiles (AAM) programs. [text not declassified] The airfield apparently was designed to handle a large number of aircraft, including the heaviest types, but the limited fuel storage facilities identified do not appear commensurate with a facility of this size. Possible loading hardstands and associated buildings could be intended to serve an ASM program. [text not declassified] It is also possible that these facilities relate to AAM training [text not declassified].

19. The size of the missile rangehead at Shuang-cheng-tzu connotes a very large program. The facilities available at the test center are sufficient to provide a considerable physical capability to carry out extensive missile research and development programs and some troop training. Housing appears adequate for at least 20,000 people. [text not

*declassified*]. But, some of the completed facilities do not appear to have been used for firings. [*text not declassified*] incomplete logistic facilities also characterize the Shuang-cheng-tzu airfield. These facts suggest that what was originally a large, ambitious program for test firing SSMs, SAMs, and possibly ASMs and AAMs has been cut back.

20. Reliable evidence indicates that the Soviets agreed to give a variety of missiles to the Chinese Communists including, we believe, surface-to-surface, surface-to-air, air-to-surface, and air-to-air types.<sup>6</sup> Evidence on activity at the Shuang-cheng-tzu range, indicates that firings of surface-to-surface ballistic missiles have occurred. The ranges to which missiles have been fired cannot be established with confidence, but our evidence suggests that firings have been conducted to ranges of approximately 150 n.m., 300 n.m., 600–700 n.m., and possibly 1,100 n.m. Although there is no direct evidence we believe that firings of surface-to-air missiles have also occurred. There are no indications that air-to-surface or air-to-air missiles have been tested.

21. Evidence on the timing and extent of range activity is inconclusive. [*text not declassified*] available evidence, together with our estimate of the time required for construction and checkout of range facilities, leads us to believe that test firing of missiles on the range probably began in late 1959 or early 1960. Available evidence provides no basis for determining firing rates.

22. The Soviets probably provided technical assistance at least through mid-1960, and the early firings certainly involved missiles of Soviet manufacture. We believe that the range continues to be operational. The activity to date has probably been primarily for the purpose of range orientation, practice firing of Soviet missiles, and possibly test firing of Chinese copies. Some concurrent operational training, at least with surface-to-air missiles, may also have occurred.

### III. FACTORS BEARING ON CHINESE COMMUNIST DEVELOPMENT, PRODUCTION, AND DEPLOYMENT OF ADVANCED WEAPONS

#### *Soviet Assistance*

23. A major factor in the pace of Chinese advanced weapons programs is the kind and amount of assistance provided by the USSR. This factor is also the source of considerable uncertainty in our appraisals, since we have little direct evidence on Soviet assistance in the

fields of nuclear and missile weapons, and must rely primarily upon information concerning other programs and upon deduction from our knowledge of political relations between the two countries.

24. We believe that the Chinese, while seeking as much Soviet assistance as possible, at the same time have aimed at an independent capability in the fields of guided missiles and nuclear weapons. They have in the past, even while enjoying Soviet help, sought to develop native capabilities for the production of aircraft, submarines, and electronic equipment. Until mid-1960, Soviet aid was provided at a high level in a number of military fields. We believe, however, that in the nuclear and possibly the missile field this aid was provided at a more deliberate pace.

25. The withdrawal of Soviet technicians and scientists from China in mid-1960 had adverse effects upon Chinese programs to produce jet fighters, destroyers, and submarines. There is some evidence, although it is less conclusive, that Chinese nuclear weapons and missile programs were similarly affected, and this, plus the serious deterioration of relations between Moscow and Peiping since that time, leads us to estimate that Soviet aid in these fields was also sharply cut back. However, we believe that the nuclear and missile development programs were sufficiently advanced that even a complete halt in Soviet assistance would have caused delays rather than their abandonment.

26. The present state of Sino-Soviet relations indicates that there is little immediate prospect for a return to former levels of Soviet assistance. Even over a longer period of two or three years, we doubt that the USSR would significantly increase its assistance unless Peiping bowed to Moscow's demands for hegemony over the Communist movement or Moscow itself accepted the necessity of reconstituting the Bloc on a new basis allowing for Chinese coleadership. Both these contingencies appear unlikely.

27. We therefore believe that, while the Soviets may still be extending limited assistance and may continue to do so, China's future progress in advanced weapons will be determined primarily by native abilities in utilizing and further developing the information and facilities already received from the USSR. This belief is supported by a recent public statement by Foreign Minister Chen Yi. In January 1962, he told a Chinese Communist audience that "by relying mainly on our own efforts, in addition to international aid, scientific and technical problems in China's economic construction and national defense can be solved."

*Chinese Communist Scientific Resources*

28. Since its inception, the Chinese Communist regime has stressed the paramount importance of placing science and technology at the

service of production. The emphasis on production appears not only in industrial research and development facilities, but also in the Academy of Sciences and in educational centers. Moreover, this philosophy has been imposed on a force of scientific and technical manpower which is grossly inadequate. Only a very few well-trained and experienced scientists, probably about 2,000, are available for research in all fields; of these, probably about 600 received training on the doctorate level in the West. An additional 1,000 doctorate level graduates have returned from training in the USSR in the last few years, but this group has yet to gain significant research experience. The total number of researchers and technicians employed by the Chinese Academy, research facilities, and educational institutions is probably only about 40,000. The comparable figure for Japan is about 300,000; for the USSR, 750,000.

29. Comparatively little fundamental research has been undertaken because of the policy of the regime and the shortage of trained personnel. Instead, the emphasis has been placed on engineering efforts, almost all of which have been concerned with adapting imported devices, equipment, and techniques to the manufacturing facilities of China. Significant gaps are believed to exist in research areas basic to advanced weapons development such as physics, chemistry, metallurgy, computer design, electronics, and supersonic aerodynamics.

30. Until Soviet scientific and technical aid was cut back, Communist China had been making progress under a well-conceived but unrealistically-scheduled 12-year plan to raise its scientific level by 1967. Eleven broad technological fields considered vital to the rapid attainment of economic and military goals were emphasized, including electronics, atomic energy, jet propulsion, automation, and precision instruments, alloy systems and metallurgical processes, and heavy organic chemical synthesis. Although the original goals now appear unattainable, we believe that progress toward them will continue, particularly in areas such as atomic energy and electronics where a limited degree of self-sufficiency has already been reached.

31. The shortage of trained scientific and technical manpower probably cannot be significantly ameliorated for a number of years. The most recent additions of competent personnel have been trained in the USSR. However, beginning in 1957 the numbers of new Chinese students entering the USSR sharply diminished, and we believe that few if any were admitted in the fall of 1961. About 2,000 Chinese students, mostly graduates, who have been permitted to remain in the USSR, probably will complete their courses in the next two years or so. Within about four to six years, China can be producing, in significant numbers, men with good overall technical training, but an additional

period of years will be required for this group to acquire a background of practical experience.

*Missile Research*

32. The resources available to Communist China for missile research are extremely limited. Scientific competence in missile design is restricted to a small group, trained in the US and other Western countries, who are concentrated for the most part at the Institute of Mechanics in Peiping. Since 1956, the Institute has been headed by Dr. Chien Hsuehsen, who played a leading role in the US missile program prior to 1950 and was considered one of the world's leading aerodynamicists. However, there is evidence that the lack of competent juniors, the pressure of administrative duties, the demands of ideological training, and the lack of first rate scientific facilities have combined to prevent the accomplishment of significant research in the field of guided missiles.

33. Considering these severe limitations, we do not believe that the Chinese have as yet embarked on a major program in original missile design. Instead, efforts in the missile field have probably been limited for the most part to copying Soviet missiles. The early development of a native Chinese capability to design, develop, and test a sophisticated missile system would have involved Soviet assistance on a much larger scale than we believe has been provided thus far. It would have required a large-scale program of training and exchange in missile-associated aspects of a large number of scientific disciplines. There is no evidence of such a large program. However, the Chinese probably have undertaken relatively modest research and development programs on a selective basis.

*Aeronautical Research*

34. At the present time, the Chinese Communist effort in aeronautical research and development is in its infancy. The program has been directed primarily toward training the labor forces and the production engineers necessary to build an aircraft industry in the shortest possible time. There is an acute shortage of well-trained aeronautical scientists, and aeronautical research facilities are almost nonexistent. A small aeronautical research effort is under way at the Institute of Mechanics. The Peiping Aeronautical College, founded in 1952 or early 1953, concentrates primarily on the practical training of students in aeronautical engineering and aircraft engine design, and only a few students are retained for advanced theoretical study. We believe that the Chinese aircraft industry will be heavily dependent on foreign research for many more years to come, and that it is unlikely to produce within

the foreseeable future any significant military aircraft with airframes and engines of native design.

*Nuclear Technology*<sup>7</sup>

35. China's efforts in the field of atomic energy and the extent of Soviet assistance through about mid-1960 have been described in detail in a 1960 estimate.<sup>8</sup> The present estimate takes into consideration the withdrawal of Soviet assistance, recent Chinese economic reverses, and new information. Its purpose is to assess the probable timing of the Chinese Communist achievement of certain major objectives, including the construction of uranium metal plants, production reactors and related separation facilities, gaseous diffusion plants, and the fabrication of nuclear devices.

36. As has been previously estimated, we believe the Chinese have mined and concentrated sufficient uranium ore to supply the needs of their atomic energy program. Available evidence indicates that the Chinese, with Soviet help, were constructing a plant for recovery of natural uranium metal prior to the withdrawal of Soviet technicians in mid-1960. Assuming that construction was well along at that time, the plant could have been completed by the end of 1960 and production of uranium metal could have started early in 1961.

37. Production of uranium metal provides a strong indication of intent to produce plutonium, and we estimate that plutonium will be the first material available for weapon fabrication. We have no evidence of Chinese construction of a plutonium production facility. Recent photographic coverage of certain suspect areas produced negative results; the location of a production reactor outside the area of coverage remains a possibility. However, assuming a uranium metal production rate of 30 tons per month—based on our assessment of early Soviet achievement—a 200-ton reactor load could have been produced by about September 1961. Such an amount would be sufficient for a single reactor with an initial power level of about 200 MW. Full-power reactor operation could have been achieved early in 1962. Sufficient plutonium for a single weapons test could become available about a year later.

38. This schedule assumes that the construction of the reactor and chemical separation plant has been in phase with that of the uranium metal plant and that no major difficulties are encountered at any stage

---

<sup>7</sup> For the views of the Assistant Chief of Staff, Intelligence, USAF, regarding Chinese Communist nuclear weapons capabilities, see his footnote to paragraph 5, page 3.

<sup>8</sup> NIE 13-2-60, "The Chinese Communist Atomic Energy Program," dated 13 December 1960 (Limited Distribution).

in the process. With the further assumption that very little additional time would be required for device fabrication, the Chinese could test an all-plutonium device early in 1963.<sup>9</sup> However, we believe it unlikely that the Chinese will meet the schedule implied by these assumptions. If the foregoing series of assumptions proves invalid, the first Chinese nuclear test would be considerably delayed, perhaps by as much as several years beyond 1963.

39. Within a year after exploding their first device, the Chinese Communists could probably produce a few fairly crude fission weapons deliverable by medium bombers. Thereafter, at least two years and probably more would be required for the Chinese Communists to develop more advanced fission weapons suitable for delivery by missiles. Considerable nuclear testing would be involved in this development. Thus, if the first test should occur in the next year or so, we estimate that toward the last part of the decade, the Chinese Communists could have a variety of fission weapons to support many of their military requirements, but only in limited numbers.

40. We believe the Chinese would at some point in their program endeavor to produce uranium-235 for use in their weapons program. Aerial photography of September 1959 revealed a 2,000 foot building in Lanchou which had some of the characteristics of a Soviet gaseous diffusion plant, although no provision for power supply was evident. It was apparent that if a gaseous diffusion process were involved the Chinese would have to add a second building to obtain weapon-grade uranium-235. Overflight photography in February 1962 gave no further indication of provision for an electric power supply or of preparation for construction of a second building. This same photography indicates arrested development at the nearby hydroelectric power station which the Chinese had hoped to put in operation in 1960. Thus, if indeed the Lanchou site were to be a gaseous diffusion plant, the Chinese probably could not produce weapon-grade uranium-235 there before 1965 even if construction of another building were started now. The Chinese Communists could test an all-U-235 or composited device within about a year after the activation of a production facility. We have no evidence of any other suspect U-235 production facility in Communist China.

---

<sup>9</sup> The Assistant Chief of Naval Operations (Intelligence), Department of the Navy, believes that the framework of assumptions on which this time schedule is predicated is logical in the abstract but not yet supported by basic evidence sufficient to lend it estimative validity. In the absence of what he considers to be any evidence pertaining to or indicative of the production of fissionable materials in Communist China and in the light of the relatively elementary state of known nuclear research facilities, he believes that a reliable estimate of the Chinese Communist program in the development of nuclear weapons cannot yet be made.

41. We do not believe that the Chinese Communists could have a thermonuclear weapons capability by the end of the decade.

*Economic Factors*

42. Communist China's drive to industrialize and to become a major military power at the same time has produced an uneven economic development. The Chinese have emphasized heavy industry, and with Soviet assistance have built up the aircraft, electronics, shipbuilding, and armaments industries. Today these industries are generally the most advanced in terms of production technology and skilled manpower. In terms of level of output and variety of product, Communist China's engineering industries are roughly comparable to those of the USSR in the early 1930s and are much inferior to those of contemporary Japan. However, certain industries producing military equipment are approaching the general technological level of similar Soviet industries in the early 1950s, and in some respects are little more than a decade behind other industrialized countries. Communist China's relatively low level of engineering skills and experience render any attempt to create a production capability for advanced weapons—particularly from wholly Chinese resources—a difficult task at a time when the regime has been forced to cut back the heavy industrial sector of the economy.

43. Classified documents captured from Chinese Communist forces in Tibet indicate cutbacks in China's budgeted defense expenditures for 1961 and sharply reduced allocations of materials to the military. The documents reveal low morale and severe food shortages in the armed forces in the winter of 1960–1961, which had been at least partially alleviated by the summer of 1961. They also indicate a poor state of maintenance and supply, rapid deterioration of equipment and high accident rates. These reports provide the first conclusive evidence that the general economic retrenchment in 1961 affected the military as well as the rest of the economy.

44. Although the efficiency of the Chinese Communist armed forces have probably been impaired, it is possible that Chinese Communist advanced weapons programs have not been adversely affected. Even in an economic crisis, resources could probably be found to support a few, very high priority projects—especially those in a research and development phase. Thus, we doubt that there has been any drastic cutback in Chinese efforts to develop prototype nuclear weapons. Similarly, test firing of missiles at the Shaung-cheng-tzu range has apparently continued, although this program does not appear to have reached planned levels. However, the net effect of the accumulated evidence is to cast doubt on the existence of any current program for guided missile production in support of deployment.

*Basic Industrial Skills*

45. *Metallurgy.* The ferrous metallurgical industry is one of the most highly developed in Communist China, and rapid progress has also been made in increasing the output of nonferrous metals and minerals. However, high-temperature alloys used in the manufacture of jet engines must still be imported. For missile engine production, imports of certain specialty steels and refractory metals might be required, depending upon the technical characteristics of the missile system.

46. *Electronics.* Rapid progress has also been made in the electronics industry, which by mid-1960 had grown from a modest group of small-scale enterprises into a large-scale industry consisting of 45 major plants. With Soviet Bloc technical assistance, the Chinese have produced largely from foreign prototypes a variety of military electronic equipment including ground radars, servomechanisms, radio equipment, and navigation aids. With no further Soviet aid, we doubt that at present they can produce all of the components for a radio-inertial guidance system for short-range, and possibly medium-range, ballistic missiles.

47. *Chemicals.* The chemical industry of Communist China has expanded rapidly, but is still grossly inadequate to meet the demands placed on it. It has been heavily dependent on Bloc equipment and technical assistance, and in certain areas suffered severe setbacks with the withdrawal of Soviet aid. There is no synthetics industry of any consequence. The Chinese can probably produce, however, the simpler types of liquid rocket fuels and solid propellants.

48. *Machine Tools.* The machine tool industry of Communist China, aided by the import of production technology and machine tool designs from the Bloc, has rapidly increased production in the past decade (from about 3,300 units in 1950 to 40,000–45,000 units in 1960). The product-mix is limited and heavily weighted with general purpose types, but some prototypes of specialized, modern machines have been built. The absolute volume of specialized tools which would be required to support a sizable production program for a single missile system is not large. But the pace of such a production program would depend heavily on the amount of Soviet assistance which had been supplied, and particularly the quality and completeness of tooling provided. The domestic industry at present probably could, albeit with difficulty, produce the tooling required for Chinese manufacture of relatively simple tactical and short-range missile systems. Any more ambitious program for the production of more complex systems would be gravely handicapped if Soviet tooling were not available.

49. *Aircraft.* Communist China's aircraft industry, largely developed since 1958, is currently limited to the production of earlier model

Soviet jet fighters, small transports, and helicopters. Although information since mid-1960 is lacking, production rates on all types are believed to be low. The extent of Chinese dependence on imported components is not known, but the aircraft industry probably continues to depend on Soviet supply of some key components, such as jet engine parts or materials. Much of the basic technology of producing jet aircraft is applicable and adaptable to missile production.

50. *Shipbuilding*. Communist China has emerged as a shipbuilding nation of considerable potential. The industry currently is capable of producing merchant ships of up to 15,000 GRT, and of assembling the hulls for submarines and destroyers. Some expansion of yards and related industries is continuing. In naval construction, the Chinese depended upon the Soviets not only for technical assistance but also ordnance, electronics, and high performance propulsion equipment. Certain new construction programs of naval vessels were halted following the withdrawal of Soviet aid.

51. *Vehicles*. Except for medium tanks, no vehicles manufactured within Communist China are designed exclusively for military use. The Chinese probably are capable of producing tracked and wheeled vehicles necessary for mounting and transporting ground support equipment for missile systems. However, these requirements would place an additional burden on the Chinese Communist vehicle industry, already strained by the requirements for economic expansion and the ground armaments program. Imports from some source would probably be necessary, although the adaptability of many vehicles would permit considerable flexibility in the type and source of imports.

#### *Operations, Maintenance, and Training*

52. The skilled manpower requirements for large-scale deployment and field maintenance of offensive and defensive missile systems probably present the Chinese Communist leaders with problems equal in difficulty to the initial problems of producing the missiles and associated equipment. The principal factors affecting Chinese troop training are the scale of the deployment program, the technical advancement and complexity of the missile systems, and the origin of the missiles and associated equipment (i.e., whether they are supplied by the Soviets or produced in large measure by the Chinese themselves). The more dependence placed on the USSR for supply of missiles and associated equipment, the more dependent the Chinese are likely to be on Soviet assistance in training and maintenance.

53. We cannot make a precise assessment of the limitations which the manpower and materials needed for training, site construction, and field maintenance may place upon Chinese missile programs over the next few years. But we believe such requirements will be a major factor

in Chinese Communist decisions on force level goals. Chinese problems in this respect would be greatly alleviated by relatively modest Soviet assistance. However, barring a change in Sino-Soviet relations, we doubt that such assistance will be forthcoming.

#### *IV. Production and Deployment of Advanced Weapons*

54. The recently acquired Chinese Communist army documents have provided some measure of current capabilities. According to one document, Marshal Yeh Chien-ying, chief of training for the armed forces, stated in January 1961 that Communist China has “no unconventional weapons” in a context which indicated that he was referring to both offensive missiles and atomic weapons. Reporting to the Military Affairs Committee in April 1961, Marshal Yeh noted that “we still do not have atomic weapons and space ships.” These statements, considered in the light of the available evidence, support our belief that the Chinese have no present capabilities with advanced weapons.

55. In his January 1961 statement, Marshal Yeh also declared that “if there is a war within several (literally, ‘three–five’) years, we will have to rely on the weapons we now have on hand.” This statement implies the existence of programs for the future production and deployment of advanced weapons. There is little evidence as to the present status of such programs. No Chinese missile production facility has been identified, nor, aside from a few SAM sites at Peiping is there any evidence of deployment. However, certain inferences as to Chinese progress to date can be drawn from the evidence relating to the test range and from a consideration of the factors bearing on development and production of advanced weapons.

56. It is apparent that native Chinese capabilities are very limited and that the extent of previous Soviet assistance is a critical factor. The evidence indicates that the Soviets probably agreed to assist the Chinese in acquiring operational capabilities with a family of surface-to-surface missiles of up to 1,100 n.m. range, and with other missile types. Considering the previous pattern of Soviet military aid, we believe that the Chinese probably received some assistance prior to mid-1960 in the creation of an independent missile production capability. We believe that the Chinese Communists would probably first seek to produce short-range (up to 350 n.m.) surface-to-surface ballistic missiles. The relative simplicity of production and the coverage by such missiles of targets peripheral to China point in this direction.<sup>10</sup> Short-range missiles could be fitted with nonnuclear warheads until nuclear warheads became available.

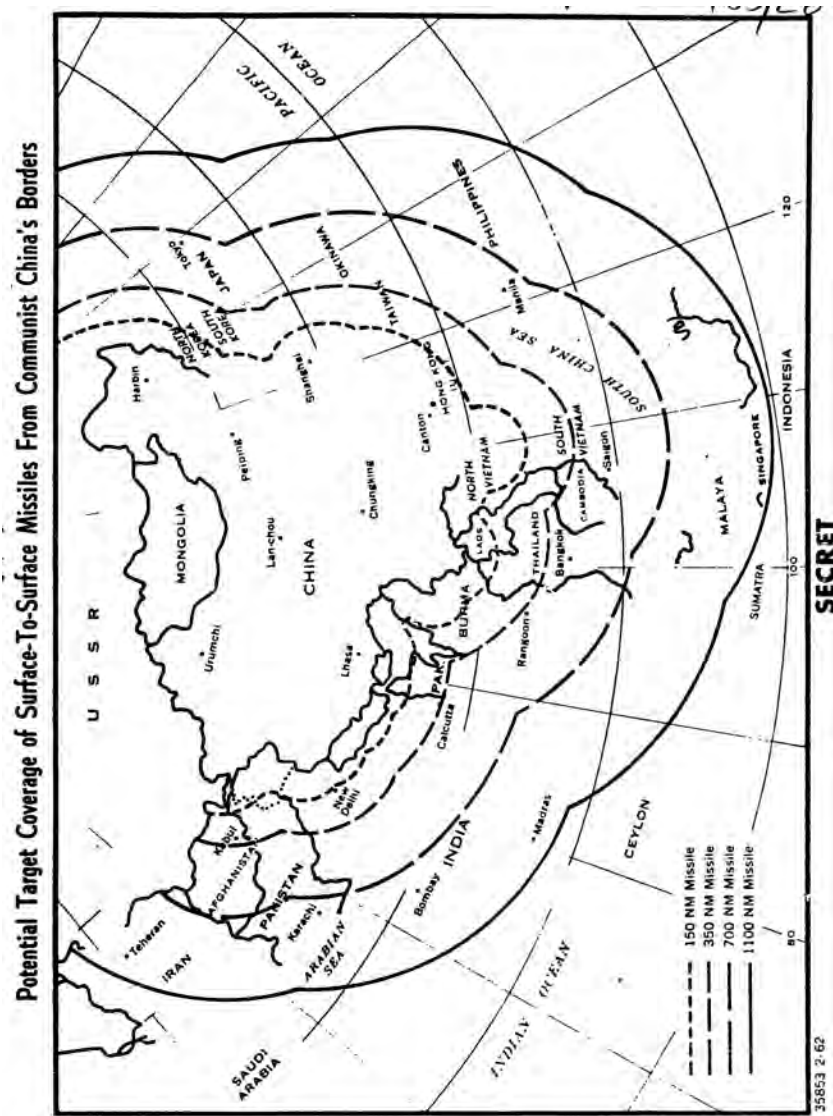

---

<sup>10</sup> See Figure, following page.

MAP

Potential Target Coverage of Surface-To-Surface Missiles From Communist China's Borders

57. Chinese production of Soviet short-range missiles would depend at least initially upon Soviet aid in setting up production facilities and in supplying certain precision parts, principally propulsion and electronic components. The extent of Soviet aid cannot be ascertained. We believe that some aid probably was provided, but not in sufficient quantity to bring the Chinese to the point of independent production prior to mid-1960.

58. Any emerging Chinese production capabilities would have been seriously impeded by the Soviet withdrawal of technical assistance and by the possible stoppage of the flow of critical parts. However, given sufficient priority, these setbacks could be overcome. If so, the Chinese Communists could begin deployment of short-range surface-to-surface missiles within the next year.<sup>11</sup>

59. Without nuclear warheads, medium-range missiles (700 n.m. and 1,100 n.m.) are ineffective against most military targets. Therefore, the Chinese Communists probably do not plan to begin deployment of medium-range missiles in significant numbers before the latter half of the decade. A medium-range missile deployed in this time period would most probably be a copy of a Soviet system, but toward the end of the decade could be an original Chinese design. It is possible that the Chinese Communists might deploy a token force without nuclear warheads somewhat earlier for propaganda purposes and in order to gain experience with the weapon system.

60. There is no evidence that the Soviets have provided the Chinese with any aid in the development of IRBM or ICBM capabilities. Without such aid, progress made in the development of such systems would be the result of native effort including research and development, design, manufacture, and the construction of a new test range suitable for testing such systems. Complete testing of an ICBM system could not be conducted entirely within the boundaries of Communist China.

61. We have no evidence to indicate that the Chinese have taken even preliminary steps in an ICBM development program. Considering the lack of an adequate research and development base and the advanced technological and engineering requirements for ICBM development, we believe that 10 or more years would be required for the Chinese Communists to achieve an initial operational capability with an ICBM system of native design. Development of a sophisticated IRBM system similar to the Soviet 2,500 n.m. SS-5 would be a task of like magnitude, and would require nearly as long a time.

---

<sup>11</sup> For the views of the Assistant Chief of Staff, Intelligence, USAF, on Chinese Communist deployment of short-range missiles, see his footnote to paragraph 8.

*Naval Missiles*

62. There is no evidence of a Chinese Communist program for development of a ship-launched guided missile suitable for delivery of a nuclear warhead. We believe that development of such a capability with submarine-launched short-range ballistic missiles would require about 10 years without Soviet assistance. There is no evidence of Chinese Communist interest in cruise-type missiles, but submarines could be equipped with such systems in about the same time period, and surface ships somewhat earlier.

*Air Defense Missiles*

63. At present, the Chinese would probably have great difficulty in producing the relatively complex SA-2 system without extensive Soviet assistance. Such production is unlikely in the next few years, and surface-to-air missile deployment in Communist China through 1965 is therefore heavily dependent upon Soviet assistance. We think it certain that the USSR supplied the missiles and associated equipment for SA-2 testing in the rangehead area and for limited deployment at Peiping. However, the three sites located near Peiping would clearly be inadequate for defense of the area, suggesting that a planned deployment program may have been halted before completion.

64. The present level of Soviet assistance is not known. If Soviet aid is withheld entirely we believe that, rather than embarking on a native SA-2 production program, the Chinese Communists will continue over the next few years to rely on their sizable fighter force as their primary air defense weapon. We do not believe that the Chinese Communists could develop an independent antimissile capability for many years. The USSR is unlikely to provide antimissile systems to other Bloc countries in this decade.

65. There is no firm evidence of air-to-air missile deployment in Communist China. However, the Soviet Union may have supplied some AAMs to Communist China in 1959 to counter the Sidewinders employed by the Nationalist Chinese. The Chinese may have received the AA-2, an infrared homing type which would require no special airborne radar, and possibly the Soviet AA-1, a beam rider missile. Production of the AA-2 would present no great difficulties, and we believe that the Chinese could have an independent production capability now or at least within the next year or so. However, without Soviet aid, we doubt that the Chinese can produce more complex AAM systems such as beam riders or radar homing types for a number of years.

*Air-to-Surface Missiles*

66. We believe that the Soviets probably agreed to provide ASMs to the Chinese Communists, as well as either BADGER jet medium

bombers (compatible with Soviet ASMs of up to 100 n.m. range) or assistance in producing BADGERs. Recent photography of Wu-kung airfield revealed two BADGERs which they probably received in 1959; we do not believe that any BADGERs have been delivered to China since that time. There is no evidence that ASMs have been provided to the Chinese Communists. We doubt that they will be capable of producing ASMs for a number of years without extensive aid, including entire production facilities. Moreover, if the Chinese are to achieve any significant ASM capability, additional delivery aircraft would be required. Aside from the two BADGERs, they have only 10 obsolete BULL piston medium bombers.

#### *Space Programs*

67. The Chinese have expressed interest in launching an earth satellite, but there is no evidence of such a program. Although the Soviets could easily provide assistance for a token space program, they are probably reluctant at this time to participate in a venture which would add materially to China's prestige. Whenever the Chinese Communists achieve competence with medium-range missiles, they might develop a second stage in order to orbit a small satellite primarily for propaganda purposes. The development of such a space launching system without Soviet aid would be extremely difficult and would require several years. It is possible that the Chinese will produce and launch upper atmosphere sounding rockets in the next few years.

#### *Advanced Aircraft Delivery Systems*

68. Communist China's aircraft industry, largely developed since 1958, is currently believed to be limited to the production of early model Soviet jet fighters, small transports, and helicopters. It is possible that prior to the withdrawal of Soviet technicians in mid-1960, the Communist Chinese received sufficient technical assistance to enable them to produce BADGER (TU-16) jet medium bombers within the next few years. The BADGER's superiority to the obsolete BULL might lead Communist China to produce a small number in order to achieve a more effective nuclear delivery capability. On the other hand, Sino-Soviet relations might improve to the extent that the Soviets would be willing to provide some additional BADGERs to the Chinese. We doubt that they will provide heavy bombers or assistance in making them. Nor do we believe that Communist China is likely to undertake a native program aimed at development of a heavy bomber.

TABLE

ESTIMATED CHARACTERISTICS OF SOVIET MISSILES<sup>2</sup>

	SS-1	SS-2	SS-3	SS-4	SA-2	AA-1	AA-2	AS-1
Initial Operational Capability <sup>b</sup>	1957	1954	1956	Late 1958	1957	1955-1956	1955-1956	1956-1957
Range (n.m.) <sup>c</sup>	150	350	700	1,100	25-30	5	1-4	55
Altitude (ft.)	—	—	—	—	60,000			
Warhead Weight (lbs.) <sup>e</sup>	1,500	2,000	3,000	3,000	400	35 HE	25 HE	3,000
Guidance	All-inertial	Radio track-radio command	Radio inertial	Radio inertial	Track while scan	Radar beam rider	Infrared homing	Beam riding-semi-active homing
Accuracy (CEP)	½ n.m.	¾ n.m.	1 n.m.	1½ n.m.	100 ft.	20 ft.	10 ft.	150 ft.
Propellants	Storable liquid	Nonstorable liquid	Nonstorable liquid	Nonstorable liquid	Solid	Solid	Solid	(against ships) Solid
Speed	—	—	—	—	Mach 3	Mach 1.7 <sup>f</sup>	Mach 2 <sup>f</sup>	Mach 0.8

<sup>a</sup> This table includes Soviet missiles which we believe may have been given to Communist China: the possible transfer of other types is not precluded. The designations SS-1 through SS-4 refer to surface-to-surface ballistic missiles (SSMs), SA-2 to a surface-to-air missile (SAM) system, AA-1 and AA-2 to air-to-air missiles (AAMs), and AS-1 to an air-to-surface missile (ASM).

<sup>b</sup> In the Soviet armed forces.

<sup>c</sup> Maximum horizontal range is given for SSMs, and maximum slant range for the SA-2. Range for AAMs and the AS-1 is given from launching aircraft.

<sup>d</sup> The SA-2 is believed to have some capability up to 80,000 feet; minimum altitude capability averages about 2,500 feet.

<sup>e</sup> Unless otherwise noted, warhead weights are for either an HE or nuclear payload. We do not believe that the Soviets have given nuclear warheads to the Chinese.

<sup>f</sup> Plus speed of the launching aircraft.

**267. Memorandum for the Record, April 25<sup>1</sup>**

April 25, 1962

SUBJECT

Daily Staff Meeting, 25 April 1962.

1. Mr. Bundy presided at the meeting today (in tennis clothes).
2. DefCons—no change.
3. The following matters were discussed:
  - a. Kaysen mentioned that he was not going to the NATO Athens meeting.
  - b. Klein mentioned some Berlin memorandum he had prepared for the President's information, which evidently brought out the fact that the Germans themselves had first taken the initiative some time ago to propose a Peace Treaty. (Legere—you may want to look at this.)
  - c. I told Bundy we had sent him a copy of the McNamara speech. He had flipped through it and thought it was pretty good and passed it to Kaysen for detailed comments. Kaysen's reaction was that it was a very powerful speech and he was preparing a memorandum on it. Bundy asked me what I thought of it, and I told him I thought it was a little too over-powering, that it ought to be fuzzed up at the end to solicit the thoughts and views of the Alliance; further, that the detailed pitch on downgrading tactical nuclears would over-complicate the speech and might result in its not selling the primary points that they wished to put across. Bundy seemed mildly receptive to these ideas. He said yes, the ideas on tactical nukes make some of the people around town unhappy, including General Taylor.
  - d. Bundy announced that he had backgrounded Marquis Childs and talked him into denouncing Sulzberger in today's Post.
  - e. There was a long discussion on how to background the press on our disarmament draft treaty, which I won't go into. Bundy did say that he felt that Dobrynin thinks that arms control is important and, as a result, is a good channel of communication.
  - f. Komer reported that our Ambassador in Burma had come in with a message which analyzed Nu Win's statements to date, and predicted that we are in for a rough time. Komer had several thoughts

---

<sup>1</sup> Readout of White House staff meeting concerning McNamara's upcoming speech; the role of tactical nuclear weapons in U.S. national security policy; Berlin; Burma; and Dobrynin's views on arms control. Secret. 2 pp. National Defense University, Taylor Papers, WH Mtgs.

on how this should be countered, but Bundy said he would like to see a paper on it and think it over.

g. Bundy went into one of his philosophical asides, stating that we really have a large problem in the role of tactical nuclear weapons. The BNSP, of course, touches on this, but he has never been able to determine whether this reflects agreed Government policy, or is a try-on for size.

h. Kaysen said that he had sent the draft NATO communique to Bundy, but that he heard that the State Department wanted to pull out one of the key paragraphs. Bundy said that in that case he would not send it down to the President but would let the State Department complete staffing it out.

4. On the way back from the meeting, I talked to Carl Kaysen. He asked if the Services and the JCS had ever seriously considered the tactical nuclear weapons problem. I responded that I felt that they had considered it but that the discussion between DOD and JCS had never resulted in any meeting of the minds. The DOD staff approach has been to suggest drastic reduction in tactical nuclear weapons which the JCS feels is not feasible, particularly in the NATO context, in the foreseeable future. As a result, the conversations have been a complete stand-off. Kaysen said, well nobody is suggesting that you take all tactical nuclears out, just at division and below. I suggested that if that were so, it would be easy to concentrate on Davy Crockets and not get all confused with all the weapons in the inventory. He agreed and said yes, that was right, of course there is not much point in having a lot of 8" howitzers and Honest Johns rattling around Europe. We didn't have time to pursue the conversation any further, but he said he would talk to Ted Parker and see what he thought about it.

J.J.E.

**268. Memorandum of Discussion Prepared by McCone, April 30<sup>1</sup>**

April 30, 1962

Saturday afternoon at 5:00 o'clock I met with the President, Prime Minister Macmillan, and Secretary McNamara. Mr. Lundahl gave a thorough briefing on the most recent TKH photography, mission 9032. The briefing was very impressive. The President asked whether our recent photography caused a change in our estimates. McNamara answered no, that our '62 and '63 estimates remain. I however took a different position. I stated there were now 76 ICBM launching pads located and there were probably some which we had not located. Some were completed, the majority apparently under construction. I pointed out our mid-62 estimate was 35 to 50 ICBMs on pads and ready to go. I now felt we have to accept the higher figure as the minimum. The '63 figure of 75 to 125, and here we would have to accept the higher figure as the minimum and perhaps raise it. I pointed out this matter was under consideration by CIA.

Lundahl in answer to a question stated that his initial read-out and preliminary report of a CORONA mission required three to four days, but that a complete study required three months.

*Action:* This raises question in my mind as to whether we have in NPIC capacity to handle the load resulting from the planned missions this summer. This should be discussed with Carter, Cline and Sheldon.

After Macmillan left the meeting, I reviewed with the President certain CHICKADEE reports and referred to the December reports from CHICKADEE that the Soviets would place greater emphasis on ICBMs and I thought this was what we were witnessing.

The President expressed satisfaction with the briefing, made some complimentary remarks about CIA reorganization and present operation, raised the question of the scope of responsibility of Kirkpatrick. The meeting lasted about an hour and 15 minutes.

**John A. McCone**  
*Director*

May 1962

269. Letter from Kennan to Rostow, May 15<sup>1</sup>

May 15, 1962

Dear Walt:

In dictating the original draft of my letter to you about your general paper, I included some purple prose on the subject of disengagement which I later struck out, as not essential to the purpose of the letter. Unwilling, however, that any literary flower should blush unseen, I send you this excerpt, from which you will observe the obdurate and unregenerate state of my mind.

Sincerely yours,

George F. Kennan

**Enclosure**

Above all, I could not favor the admission of Germany to NATO and the development of West Germany's resources and territory as a major component of NATO strength. I considered that this would obviously make impossible, for an indefinite time to come, any withdrawal of the Soviet military presence from Eastern Germany and Eastern Europe, and that it was thus in conflict with our stated desire to see a loosening of the Russian hold on Eastern Europe.

All this is diametrically opposed to the concepts expounded in your paper. The paper repeatedly professes an interest in loosening the bonds that now hold the satellite countries to Moscow and even in extending to those countries the "frontiers of freedom." All this, it seems to me, is quite in conflict with those sections of the paper which deal with NATO and the military strengthening of Western Europe. You are pressing for the escape of the Eastern European countries from Moscow's domination, and at the same time you are rigidly denying them any place to go.

I have conducted this argument too long already; and I am reluctant to beat my drum any further. But can you not understand that the Eastern European countries cannot reasonably be expected to associate

themselves with a military alliance directed against the Soviet Union, unless they are willing to stage a dramatic and provocative demonstration of defiance of Moscow on the political and military plane? Is it not clear that to remain passive in the face of such a demonstration is more than could be expected of any Russian government, communist or otherwise? Why do you wish to close the door in Eastern Europe's face, by insisting that there must be no neutral area in Central Europe to which an arrant Eastern European state could conceivably attach itself, and by even making the Common Market as impervious as possible to entry by anyone from the East? Is it not clear that our military policy in Europe binds the Eastern European countries to Russia in the most inexorable manner? Ask any Pole. Ask any Hungarian. And not only does it bind these countries to Moscow, but it denies any place to a country such as Yugoslavia which tried at an earlier date to extract itself from the Eastern bloc. As of today, Yugoslavia has no place to go but to the East; and while this is partly the result of her own leaders' mistakes, our own policies, which afford to Yugoslavia no choice but to join a western military and political alliance, to go East, or to suffer isolation, have contributed importantly to this unhappy state of affairs.

On top of this, we have the dangerous conflict in which we have involved ourselves in our policy toward Germany through just these same contradictions. Is it really not apparent that a policy which seeks the unification of Germany is in conflict with a policy which says in effect that East Germany could be reunited with Western Germany only at the cost of a total military defiance of Russia: a withdrawal from the Warsaw Pact and an association with NATO? Can there be any doubt that this would involve a major displacement of the military balance in Europe, to the disadvantage of the Soviet Union? What gives us the right to pretend that these are trivial contradictions, and that these two policies are theoretically compatible? The failure to face these things finds its expression at many points in the paper; and in this respect I would have to disagree down the line.

SUBJECT

Assignment of Additional Responsibility to the Special Group (CI)

The President has assigned to the Special Group (CI), as provided by NSAM 124, eight countries sufficiently threatened by Communist-inspired insurgency to warrant the specific interest of the Group. These countries are: Burma, Cambodia, Cameroon, Iran, Ecuador, Colombia, Guatemala, and Venezuela; and are in addition to the Group's current responsibility for Thailand, Laos, and Viet-Nam.

BASIC NATIONAL SECURITY POLICY  
PART ONE: PRINCIPLES AND PURPOSES

*Introduction*

1. In order to outline national security policy in Part Two of this paper, it is necessary first to lay out the broad principles and purposes which generate these policies; which determine their relative impor-

tance and urgency; and which should govern their execution and revision in the light of changing circumstances.

Part One has two major elements:

- a. *A definition of the working goal of National Security Policy. (Chapter I)*
- b. *A brief statement of the strategic components of a national policy designed to move towards that goal. (Chapter II). These components are outlined in more detail in Part Two, where specific policy prescriptions and injunctions are to be found.*

## I. THE WORKING GOAL

### A. *The Foundations of National Security Policy*

2. *National Purposes.* Our fundamental purposes as a nation remain what they have been since they were first set down in the Preamble to the Constitution: “. . . to form a more perfect Union, establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity.” Further, the Declaration of Independence committed us to the principle that “. . . Governments are instituted among men, deriving their just powers from the consent of the governed. . . .” This principle has run like a thread throughout the history of our relations with the rest of the world, with a meaning and force dependent on the specific problems we confronted. Its special application in the circumstances we face now and over the foreseeable future is elaborated in this document.

3. *The National Security Objective.* National security policy should aim at promoting and maintaining a world environment in which these abiding national purposes can be best attained—notably an international environment in which it will be possible “to secure the blessings of liberty to ourselves and our posterity.” and thus to maintain a free and independent United States, capable of preserving and enhancing its fundamental values and institutions as a nation and a community of free citizens.

### B. *The Setting*

4. *The Forces at Work.* In our time an environment congenial to our national purposes must be maintained in the face of deep-seated Soviet and Chinese Communist determination to seize and exploit global power, and in a setting where certain other powerful, persistent, and sometimes dangerous forces are at work:

—A rapid increase in scientific knowledge and its applications, which enables man to change, for good or for evil, his physical and ecological environment, and which imposes a high premium on the capacity of nations to innovate and to adjust to innovation.

—In consequence of the pace of scientific change, a revolution in military technology, which has altered drastically the nature and the

results of war, yielded an intense competitive arms race, affected former relationships between economic potential and military strength, and created an imbalance of the offensive over the defensive in the nuclear weapons field.

—A political revolution, marked by the proliferation of ardent new nations at a time when an intensified interdependence requires the nation state to cooperate increasingly with others in order to provide for its security and its economic welfare.

—The revolution of modernization in Latin America, Africa, Asia, and the Middle East, including those underdeveloped areas under Communist control.

—The population explosion which, in many parts of the world, threatens to frustrate the drive for improved standards of individual welfare.

—The revival of economic momentum and political assertiveness in Western Europe and Japan.

—The revolution in modern communications, which has radically increased the speed and sensitivity of political and psychological reactions within and among nations.

Taken together, these forces decree a world setting where power and influence are being progressively diffused within, as well as without, the Communist Bloc; where strong inhibitions exist against all-out use of military force; where the interaction of societies and sovereign nations becomes progressively more intimate.

5. *The Clash*. This environment both conditions and is conditioned by the clash between Western and Communist ideologies and between the interests and objectives of their two principal proponents: the US and the USSR. This clash has many dimensions. In its largest sense it may be viewed as a contest between competing conceptions of how the world community should be organized—how a new world order can be constructed to replace the one which existed before 1914 and which has been shattered by a half century of war and revolution.

This manner of viewing the clash is not abstract: governments and citizens throughout the world assess the trend of forces and events in some such terms, sensing that, in the end, one conception or the other will constitute the framework for organizing the planet. Current diplomacy and popular moods are directly affected by this assessment of the long run outcome of the clash.

The major dynamic elements in the international environment cited above will not automatically determine the outcome: they cut both ways. For example:

—The product of the scientific and technological revolution is available to the Communist as well as to ourselves and, given the capacity

of a totalitarian state to concentrate resources on a narrow front, it is particularly susceptible to selective Communist exploitation.

—The revolution in military technology has strengthened the absolute power of the Communist Bloc, as well as our own. It has provided the Soviet Union with a capacity to assault, directly and swiftly, American territory but it also has generated inhibitions against the use of major force which are inevitably felt by the Communists as well as ourselves.

—Although nationalism and the revolution of modernization in the under-developed areas strengthen the forces making for independent nationhood, they release anti-Western sentiments, racial passions, particularist tendencies of all sorts, and create domestic pressures and turmoil susceptible to Communist exploitation.

—The revival of momentum in Western Europe and Japan has increased the strength of the non-Communist world, but the corresponding increase in assertiveness has set up strains and tensions, and increased also the possibilities of disunity which are capable of Communist exploitation. It is axiomatic, therefore, that the positive purposes of American policy can be achieved only by overcoming the considerable resistance inherent in the forces at work in the world environment; by designing policies which take these forces fully into account, if possible harnessing them for our central purposes; and by countering the persistent Communist efforts to use them to disrupt and destroy the non-Communist world.

### *C. The Threat*

6. *The Nature of the Communist Threat.* Although the Communist threat takes many forms, there are four which are particularly significant:

a. The Communists command now—and will command increasingly—a capacity to inflict severe damage and casualties on the United States and its allies, particularly NATO Europe. Nuclear war itself, whether undertaken rationally, irrationally, or by accident, is therefore, one threat to the American interest; although the safety of the nation and the possibility of deterring Communist aggression require that we be prepared to face nuclear war in defense of our vital interests, and that this fact be universally understood.

b. The Communists might seek to exploit their economic and scientific resources so as to achieve marked military superiority. Even though a margin of superiority would not necessarily lead them to initiate a direct attack upon the United States, it could generate increased aggressiveness, give rise to diplomatic and psychological pressures hard to control and damaging to our interests, and pose a critical threat to contiguous areas, particularly NATO Europe, Japan,

and the Indian Peninsula, on which regions the balance of power in Eurasia evidently depends. Aside from the reasons elaborated in Part Two, Chapter I, the United States should, therefore, maintain forces sufficient to avoid the emergence of such a margin of Communist military superiority.

c. Even without a general shift in the balance of military power, some areas of Eurasia, Africa, or Latin America might come under Communist control. Major losses of territory or of resources would make it harder for the US to help shape the kind of world environment it desires; might generate defeatism among governments and peoples in the non-Communist world; and could make more difficult the maintenance of a favorable balance of military power between East and West. Even though an effective nuclear deterrent can be maintained from an economic and geographic base narrower than that now available to the United States, a substantial reduction of the present area of freedom would have radically unfavorable political and economic consequences for the United States, and would complicate the tasks of defense. The United States continues to have, therefore, an abiding and straightforward interest in maintaining and improving the balance of economic and political power on the world scene which rests in the hands of the free community.

d. Quite aside from its direct or indirect implications for the balance of power the extension of Communism in Eurasia, Africa, and Latin America would represent a threat to the national interest. In conditions of modern technology and especially modern communications it is difficult to envisage the survival of democratic American society or, indeed, an Atlantic Community as a beleaguered island in a totalitarian sea. It is, therefore, in the national interest that the societies of Eurasia, Africa, and Latin America maintain their independence and develop along lines which respect those elements in their own culture and tradition which would limit the power of the state over the individual and are thus broadly consonant with our own concepts of individual liberty and governments based on consent. We do not need societies abroad in our own image; and, in any case, the democratic process must be viewed as a matter of underlying purpose, of degree, and direction of movement, not as an absolute condition. Moreover, our interest does not require that all societies at all times accept democratic values as their aspiration and that they move uninterruptedly towards its achievement. Nevertheless, the nation is legitimately concerned with the balance and trend of ideological forces throughout the world in just as real a sense as it is concerned with the balance and trend of material and military forces.

The policy outlined in this paper is designed, therefore, to achieve the national purposes set forth in paragraph 2 and to minimize—

without sacrificing vital US security interests—the likelihood of a war so destructive as to threaten our basic national structure and institutions; a change in the military balance of power which could markedly affect both the political and psychological balance between East and West; a progressive extension of Communist influence into Eurasia, Africa, and Latin America; or a shift in the ideological environment which would make it difficult to develop in continuity with the basic values derived from our history. It is also designed to accelerate constructive changes in the character and policies of the Communist regimes, to erode the grip of Communism on peoples under its rule and to facilitate their absorption into the community of free nations.

*D. The Opportunity*

7. *Favorable Factors.* This policy aims equally, however, to harness to the American interest the same set of forces which decree the perils we face.

a. Properly exploited, the resources available to us and to our allies should enable us to continue to make the use of military force irrational and unattractive to the Communists.

b. The pluralistic concepts and methods of organization inherent in democratic societies make it easier for us than for the Communists authentically to back the evolution of independent national states and to deal with them on the basis of limited but real areas of overlapping interest. The growth of nationalism and the diffusion of power on the world scene are fundamentally more disruptive forces for the Communists than for ourselves, since their methods for organizing both domestic and international power inherently require centralization and, ultimately, dictatorship if they are to maintain their effectiveness.

c. The underlying aspiration of peoples for forms of political and social organization which protect the individual against the unlimited authority of the state is strong, and rooted in abiding historical, cultural, and religious commitments. If an environment of regular movement forward towards economic progress and social justice can be created, the long-run chances of victory for political democracy—in one form or another—are good. The lessons of experience thus far is that this convergence of abiding impulses to human freedom and rising standards of welfare operates also within societies ruled by Communist regimes; and long run tendencies towards the diffusion of power and a reduction in thrust towards the external world within and from such societies may be expected, if the non-Communist world continues to maintain forces which make Communist aggression costly and unattractive.

d. The technical fact of increasingly intimate military, economic, and political interdependence can, with an appropriate American policy, be made to work for, rather than against, our interests.

In short, while the forces now so strongly at work on the world scene are capable of being captured by the Communists for destructive purposes, they lend themselves at least equally to direction along constructive lines for the building of the kind of world within which our own society could continue to flourish.

#### E. *Our Constructive Goal: A Free Community*

8. *The Long Term Goal.* Our purposes must be given operational substance in the light of this assessment of the threats and opportunities inherent in the forces at work on the world scene. *The operative constructive goal of United States policy is to foster and develop an evolving international community, the members of which;*

*a. Effectively cooperate with and support one another in their areas of interdependence.*

*b. Move forward in their own ways toward political systems based increasingly on consent and individual freedom.*

*c. Yield for their peoples steady progress in economic welfare and social justice.*

*d. Settle their differences by political means or legal processes rather than by armed conflict.*

*e. Increasingly participate in institutions and organizations which transcend the independent powers of the nation-state, where this is useful to achievement of the larger purposes set forth in this paper.*

*f. Move progressively towards a legal order which lays down and enforces essential rules of conduct in interstate relations and provides sure and equitable means for the settlement of international disputes.*

Progress in building a community with these six essential characteristics would reduce the risks both of an upset in the balance of power and of an unfavorable ideological trend among the presently non-Communist nations. Indeed, by moving toward this long-term positive goal we best mitigate these two risks, since only in this way are we likely to get an efficient grasp on the forces which generate these risks.

The creation of a free world community is, evidently a task which will remain unfinished business for a long time. The problems confronted will yield only slowly to sustained effort; and the US influence on the process of its creation can only be marginal. It is, however, a goal toward which even modest progress can contribute substantially to the national interest. It is one way of giving life to our commitment to the United Nations Charter; and the United Nations remains an important means for its implementation.

9. *Prospects and Problems.* This working goal—of an evolving community of nations—proceeds directly from values and commitments deeply embedded in our national style and domestic arrangements,

just as the Communist concept of a world order is linked intimately to the methods used to organize power within Communist states. From our historical origins as a nation we have sought a balance between freedom and law, between individual liberty and individual responsibility for the fate of the community, which would permit our society to solve its problems with minimum intrusion by higher authority. It is in a world organized in this federal spirit that we are most likely not only to avert pressing dangers but also to fulfill the central objective of basic national security policy—to shape the external environment along lines congenial to our abiding national values and purposes. And a foreign policy rooted in those values and purposes is most likely to evoke from our people the sustained attention, energy and resources required for its success.

While this aim harmonizes with our domestic polity and is thus natural and fitting for us, the nations in the world about us generally have not shared our historical experience. Thus, questions may be raised as to the feasibility of progress toward an evolving world community in which nations are moving toward democratic goals and in which they increasingly concert to achieve their common purposes.

To take the question of ideology first: many non-Communist nations are not now organized on lines which can accurately be described as democratic. The attainment of a significant degree of democratic practice depends upon the development of a complex set of preconditions, which are often lacking, in greater or less degree. Nevertheless, there are realistic grounds for hope that many of these preconditions will come into being if these nations can maintain their national independence, make progress in raising their living standards, organize their lives with increasing attention to social justice, and are confronted with effective constraints on the disruptive pursuit of irresponsible national objectives. The economic, social, and political systems that will emerge if these conditions are fulfilled may not appear to be ours; indeed, to survive they must be consistent with the history, culture, and acknowledged goals of each society. What is essential is that the peoples concerned move in their own ways toward governments which are based increasingly on consent and which increasingly respect individual freedom. Obviously the pace and extent of this movement will vary greatly; some nations just emerging into independence and lacking most of the prerequisites to freedom will be under rule which is authoritarian, in varying degree, for a very long time indeed. The preconditions for economic growth are less complex and far-reaching than the preconditions for effective political democracy. Regular economic growth can, therefore, usually be generated at a stage earlier than the emergence of mature democratic political institutions and practices. But the possibility that consent and individual liberties will

play a larger—rather than smaller—role in the political affairs of the non-Communist nations over the years ahead does not seem unrealistic, and US policy and programs should be addressed systematically to this end.

Nor does the goal of a community of increasingly cooperative independent states seem impractical. At the moment nationalism remains a most powerful force. And there are, of course, rifts and deep-seated conflicts within the non-Communist world which make whole-hearted cooperation between some states difficult to envisage and perhaps unlikely over the foreseeable future. However, the members of the free community share a threat to their independence—however dimly realized and hesitantly articulated; and that threat has led many of them to band together overtly against the threat of Communist coercion. Moreover, as indicated in Part Two, Section III of this paper, the fact of interdependence finds expression more broadly in an extraordinary array of bilateral arrangements and international organizations, each—whatever its present worth—proceeding from a recognized area of common interest in the solution of problems which cannot be met on a purely national basis. In holding up the vision of a community of nations cooperating freely for the easier attainment of their own objectives we are, therefore, building on impulses and institutions which are real. The task is one of imparting more vitality and direction to these impulses and institutions.

To develop a willingness to settle disputes and to reconcile conflicting interests without recourse to arms is by no means easy or assured—especially where these conflicts are with Communist states which do not share Western concepts of law. Even within the community of free nations there are deeply felt conflicts over which there is reluctance or refusal to submit differences to judicial decision, arbitration, or even negotiation. And such (usually) intraregional conflicts may persist as a source of danger to the peace for a long time. Nevertheless, the United Nations Charter lays down rules of conduct governing the manner in which nations should act; and the task of strengthening the will to live by that code within the free community does not appear hopeless. Recognizing the imperfections which characterize the present ideological and organizational contours of the non-Communist world, movement towards the goal of a free community does not run against the grain of history: it requires that we support and build on forces already in motion, rather than to invent new forces.

Our actions in support of this working goal must be directed, then, not merely against Communist tactics and strategy but also towards creating, within the limits of our capacity to shape events, the kind of evolving world environment within which our own society can continue to flourish. This would be our purpose even if Marx and Lenin

had never existed, but, because their heirs are now attempting to impose their version of the future on all mankind, the requisite urgency and scale of national effort is the greater. In pursuing this positive purpose, we face a future of shifting crisis, of sustained constructive effort, and of national peril for as long as any of us can peer ahead.

## II. *Outline of A Strategy*

### A. *Introduction*

1. *Need for A Strategy.* To be meaningful, this statement of principles and purposes must not only define a goal but also lay out the means of its attainment. We must frame a broad strategy which will ensure that the wide range of U.S. activities at home and abroad are consistent with this goal. The U.S. ability to influence events is too limited, and the obstacles we confront too grave, for our objectives to be achieved in the absence of such a broad central strategy—clearly defined and thoroughly understood at all levels of the government. Only through such a working strategy can we ensure that the instruments of our power and influence are marshaled on behalf of the measures which should have highest priority, and that our efforts are mutually reinforcing, rather than diffuse or, even, offsetting in their effect. Only in the light of such a strategy can these efforts be presented to our own and to other peoples as interrelated elements of a coherent policy which merits their support.

2. *Objective.* Our working goal of developing progressively the free community comprises three strategic objectives: maintaining the frontiers of freedom; building the community itself; and peacefully extending this community beyond the present borders of freedom. The paragraphs that follow identify the five main components of a strategy to reach these objectives.

### B. *Military Policy*

3. *The Role of Force.* At the center of this community must remain American military power and the will to use it, linked to the power that can be generated elsewhere in the free community, organized so as to cover the full spectrum of force. Given the wide-ranging character of Communist techniques of aggression, U.S. military power and that of our allies must be closely coordinated with other means for the exercise of power and influence: economic, political, and ideological. The international order we seek to build requires now—and for the foreseeable future—an ability and readiness to use force in this wide sense for several purposes, including two which are basic:

—To deter or to deal effectively with the flexible arsenal of Communist techniques of aggression against or within the frontiers of the free community;

—To support diplomatic efforts to protect and advance U.S. and free world interests.

4. *A Stable Military Environment.* We wish to be able to use this force effectively and in such a way as to minimize the likelihood of a large-scale nuclear war, whether initiated by the Communists, originated by us in defense of our vital interests, or arising from local conflicts, armed clashes, and hostile confrontations. This requires on the one hand the existence of ready force, and a firmness and a resolution which will convince the Communists that aggressive actions and heavy pressures are dangerous and unprofitable, and on the other hand a continued restraint which furthers peaceful settlement of disputes and encourages favorable evolutionary trends within the Communist Bloc. To strike a balance between deterrence and seeming aggressiveness, and to back this attitude with the forces needed persuasively to support it, is perhaps the most difficult task confronting the United States today. The key issues of military policy and arms control involved in thus creating an environment which is unlikely to erupt into nuclear war under the strain of crises or the actual use of limited force are treated in Part Two, Chapter I, of this paper.

Besides stability with respect to nuclear conflict, we wish also to create and sustain a stable environment so far as conflict in underdeveloped areas is concerned. The use of force by emerging nations should be discouraged and, if possible forestalled altogether. New nations, often stridently nationalistic, may display the same hostility toward neighbors that for so long characterized European nation-states, and there may be a growing tendency for the stronger ones to indulge this hostility. Our policy should work toward suppressing such misuse of force by making clear to new nations that it would bring them more loss than gain. Our policy should seek to deter local imperialisms of this sort through economic and political means. The effectiveness of these means will depend largely upon how well aware the new nations are made of our ability and will to use force when necessary to keep the peace.

### C. *The Role of Progress*

5. *Progress Within the Free Community.* Within the framework of power designed to protect the frontiers of freedom and to induce processes of peaceful change, a central objective of policy must be to seek to create an environment of sustained progress towards higher standards of economic welfare, social justice, individual liberties, and popularly based governments throughout the free community. The problem is particularly acute in the less developed areas of Latin America, Africa, the Middle East, and Asia. Since the evolving community of independent nations can only be maintained by consent, the emerg-

ing less developed nations must be persuaded that their human and national aspirations will be better fulfilled within the compass of that community than without. Measures required to help assure an environment of sustained progress for the more advanced nations of the free community are considered in Part Two, Chapter III, and for the less developed nations in Part Two, Chapter II.

*D. The Framework of Organization*

6. *The Hard Core.* The missions of force and progress discussed under B and C, above, require that the free community generate a hard core of developed nations (to include the Atlantic Community, and, in somewhat different degree, Japan, Australia and New Zealand) which are broadly committed to this world strategy, willing to concert their resources for these defensive and constructive tasks beyond their borders, and able to draw together with the less developed nations in a network of common ties of mutual advantage for those purposes. The means of building such a hard core and relating it systematically to other areas of the free community are considered in Part Two, Chapter III.

7. *U.S. Regional Interests.* Regional policy problems are dealt with in Part Two under the general headings "Policy Toward the Underdeveloped Areas" (Chapter II) and "The Framework of Organization" (Chapter III). Certain limited, basic observations on the character of the U.S. interest and objectives in particular regions are set down here.

a. *Latin America.* Although the problems confronted by the U.S. in Latin America are a special version of those confronted in other less developed regions, and, although the distance of the region from the borders of the Communist Bloc reduces its vulnerability to certain types of more direct Communist pressure felt elsewhere, the U.S. relation to Central and South America is, nevertheless, peculiarly important. The special status of Latin America derives from the sensitivity of our people to the course of events there, rooted, in turn, in geographic proximity, the length of our historical association, and the scale of our economic interests. The containment of the Communist thrust in Latin America, the maintenance of the independence of the region, and the development there of conditions of reasonable progress and order are required both to fulfill the general conditions of national security policy and to permit a political setting at home in which our people will support the exertion of U.S. power and influence on a world basis. *Within the range of policy outlined in Part Two of this paper for the underdeveloped areas, Latin America enjoys, therefore, a high and urgent priority.*

b. *The Rimland of Asia.* The arc from Iran to Korea represents an area where the balance of power between the Communist Bloc and the free community is so precariously held that with relatively minor exceptions, the free

*community cannot afford an extension of Communist influence without risking loss which would extend far beyond the area immediately affected. The definitive loss of South Korea to Communism, for example, would endanger the orientation of Japan towards the free community; the loss of South Viet-Nam or Thailand would endanger the whole South-east Asian position and place in jeopardy the independence of the Indian peninsula itself. The independence of the Indian peninsula is, like that of Japan, fundamental to the interest in the balance of power in Eurasia. The definitive loss of Iran would endanger the whole Middle East. In Laos and Afghanistan, where Communist influence has gained a substantial but not definitive hold, our object is to maintain buffer states where the influence of the Communist Bloc and the free community are, at least, in tolerable balance. The definitive loss of Afghanistan would severely increase pressure on both the Indian peninsula and Iran; the definitive loss of Laos would severely increase pressure on Thailand and Southeast Asia in general. Behind the screen of Thailand and South Viet-Nam, the U.S. interest is satisfied if Cambodia, Malaya, Burma, and Indonesia maintain their independence without formal military alliance. All these interests are threatened not only by Communist pressures but also by intra-regional disputes, particularly the Kashmir dispute, the Pushtunistan quarrel, and the differences between India and Nepal, which absorb the resources of the countries concerned, twist or thwart efforts to build up common defenses against Communism, undermine programs for economic development, and carry the possibility of violence which could upset stability in the region.*

*Our general objective is to maintain the independence of the states in the region: reduce the present level of Communist influence; mitigate disputes between states of the region; and to assist, as opportunity may offer, in bringing these peripheral nations into closer association with each other and the free community as a whole. This objective, in turn, requires the maintenance both of our position in the Western Pacific and of existing military pacts and relationships which provide bases and a legal commitment of the U.S. to the defense of the area.*

*c. The Middle East. The common border with the USSR and its year-round access to the sea give Iran a position of particular importance; its political, economic and military ties with the U.S. and Western Europe must be strengthened if this can be done without generating counter-productive local reactions. So long as Iran is held, the U.S. interest in the Middle East is that the nations of the region maintain their independence; reduce the present degree of Communist influence; develop along the lines suggested in Part Two: and avoid intra-regional struggles disruptive of the free community and capable of Communist exploitation.*

*d. Africa. As in the case of Middle Eastern nations which do not have a common border with the Communist Bloc, the U.S. interest in Africa is that*

*the newly emerging nations maintain their independence: reduce the present degree of Communist influence: develop along lines suggested in Part Two: and avoid intraregional struggles disruptive to the free community and capable of Communist exploitation.*

8. *The Problems of Priority.* Western Europe evidently has a role of unique importance in U.S. foreign policy. Its uniqueness derives from multiple considerations: it is decisive to the balance of power and we are committed to defend the area on virtually the same terms as the U.S. itself; European resources are essential to the tasks of defense and construction throughout the free community; European political and trade policies will be an important determinant of whether, in fact, an increasingly coherent free community can be created. Beyond these technical factors, the broadly common ideological heritage of Western Europe and the United States is the ultimate foundation for the values of the free community itself. *The maintenance of the integrity of the Western European nations and the transatlantic connection are fundamental.*

The special importance of Western Europe (as well as, in different ways, Canada, Japan, Australia, and New Zealand), immediately raises the question of whether the interests of the more advanced and less advanced nations of the free community are mutually compatible and of the U.S. interest when clashes arise.

Although the interests of the two main sectors of the free community clash at a variety of points, the more developed areas, whether they acknowledge the fact in their current policy or not, share with the less developed areas certain basic interests: (i) that the inevitable end of the colonial era be brought about as peacefully as possible and in a manner which minimizes the possibilities of Communist exploitation; (ii) that the less developed areas generate regular economic growth patterned in ways which lead to enlarging and mutually advantageous trade with the free community; and (iii) that the Communist strategy of out-flanking and isolating the more advanced areas of the free community, by progressive inroads in the less developed regions, be defeated.

*With respect to specific issues where conflict within the free community might require choice or clear-cut priority, the U.S. interest will generally lead us either to support the views of the more developed nations or to pursue a firm national course with respect to such critical military and security issues as: U.S. military policy; arms control and disarmament policy; NATO; and Germany.*

*With respect to residual colonial issues the U.S. interest will generally lead us to support an ending of colonial ties, but continuing ties between the liberated colony and metropole, while seeking to fashion means for the transition which will minimize frictions and opportunities for Communist exploitation.*

*Where marginal conflicts of interest within the free community arise over economic assistance or trade policy, the relative poverty of the less developed nations—and the larger communal interest in their rapid economic growth—will generally make it the U.S. interest to favor the interests of the less developed nations.*

*In the case of regional security issues—such as Communist pressure in Southeast Asia and the Caribbean—it will generally be the U.S. interest to favor those who feel that pressure most directly, while maintaining independence of judgment on appropriate courses of action in the light of our total interests and responsibilities.*

These priorities flow from the basic fact that at the present stage of the free community's development the U.S. is the only true world power. Our ability to influence the course of events is limited, but it extends, in differing degree, into every region. In this sense our role of leadership in building, unifying, and protecting the community is unique. The implications of these basic propositions on the focus of U.S. priorities are elaborated in policy prescriptions which run through Part Two of this paper.

#### *E. The Confrontation with Communism*

9. *The Appeal to the Communist World.* If we hold out to the world the vision of a free community—and grip the real problems of our environment with the techniques it decrees—its appeal will transcend the present non-Communist world. The concepts of independent nationhood, of national interest, and of national culture are living and corrosive forces within the Communist Bloc. The prospect of association with a community committed to respect these concepts should, even in the short run, further loosen the ties that now bind to the USSR the countries of the Communist Bloc. In the long run—in a context where Communism is denied the possibility of expansion and where time and material progress work their mellowing effects—there is a decent hope that changes might be induced in at least some of the Bloc states which would make it possible for them to move towards or even to adhere to the free community; for, if Communism is part of the environment we confront, the secure strength, progress, and national independence of a coalescing community of free nations will inescapably be part of the environment which surround the Communist world. The implications of this perspective for relations with Communist states are examined in Part Two, Chapter IV.

#### *F. The National Base*

10. *The Prerequisites of Foreign Policy.* All these policies require, for their effective execution, a firm base at home: an understanding of what we must do and a will to do it rooted in a substantial political majority of our people; domestic progress which carries forward the

ambitions and hopes of our people; an economy capable of providing the resources for both our domestic and security requirements; a balance of payments position which does not constrain our efforts at home and abroad. The means for maintaining such a national base are considered in Part Two, Chapter V.

*G. The Five Dimensions of a National Strategy*

11. *The Development of Policy.* In the light of the working goal of the national strategy and the foreseeable setting within which it must be pursued, developed in Chapter I, we turn to a more detailed discussion of the five major dimensions of national strategy suggested above:

- Military Policy.*
- Policy in the Underdeveloped Areas.*
- The Framework of Organization.*
- Policy Toward the Communist States.*
- The National Base.*

PART TWO: A STRATEGY

*I. Military Policy*

*A. The Role of U.S. Force*

1. *Force and policy.* The positive and constructive objectives of national policy depend intimately and in a variety of ways on the existence of appropriate U.S. forces and the evident will to use them to protect vital interests of the free community. Now and for the foreseeable future U.S. military policy is a crucial determinant of the fate of the free community because our military strength is proportionately great in relation to our population and command over resources, and because the security of our allies is intimately dependent on our strength and will to exercise it. There is hardly a diplomatic relationship we conduct that is not colored by an assessment of U.S. military power and of the circumstances in which we are likely to bring it into play. In generating this power the motivation of men in the expert employment of weapons of war continues as a responsibility of the population at large. It is brought to and maintained at a fine edge of effectiveness by the nation's military services, which provide a basic source of leadership for present and future generations of military men.

2. *Major Missions.* To sustain the free community, U.S. forces have four major missions:

a. *To deter or deal with a direct nuclear assault against the U.S. or other vital areas.*

b. *To supplement allied and friendly forces in deterring or countering Communist non-nuclear attacks on the free community or in sea areas or on lines of communication vital to its survival.*

c. *To support friendly peoples against Communist or Communist-inspired efforts to undermine their governments and fragment their societies through subversive, paramilitary and guerrilla operations.*

d. *In the event of war to conduct hostilities so as to minimize damage to the U.S. and its allies, preserve their interests, frustrate opposing military forces, and bring about a conclusion of hostilities on terms acceptable to the U.S. and its allies. It is in the interest of the United States to achieve its wartime objectives while limiting the destructiveness of warfare, whether it be non-nuclear or nuclear, local or global; in this sense, it is a goal of U.S. policy that any war be a limited war.*

*For all these missions it should be recognized that effective deterrence has as its basis the evident military capability to prevent a potential enemy from achieving greater gain than loss by using force. While many other factors contribute to deterrence, this requirement for such a capability is constant and must be satisfied.*

3. *Supplementary Tasks. U.S. forces have three other important missions:*

a. *To provide within the free community a sense of security against Communist incursions and Communist political and psychological pressures, including threats of nuclear or non-nuclear attack against the U.S. or its allies.*

b. *To support American diplomatic and other efforts to minimize conflicts within the free community, to work toward peaceful adjustment of disputes and differences, and otherwise to promote U.S. and free world objectives.*

c. *To contribute, both directly and through military assistance and training programs, to the constructive modernization of underdeveloped nations.*

4. *The Special Imperatives of a Nuclear-Missile Age. The nature and consequences of nuclear war conducted with present and foreseeable delivery vehicles call for a military policy which can accomplish the purposes indicated above with a minimum likelihood that we would have to initiate the use of nuclear weapons in order to defend vital interests and, more generally, with a minimum risk of escalation toward general nuclear war.*

*The number of U.S. casualties and the scale of U.S. civil damage consequent on a major nuclear exchange is already great. It will increase with the passage of time.*

*The population of our European Allies is even more exposed.*

*These facts heighten the requirement for a policy aimed at limiting civil damage in the event of a major nuclear war; for generating, so far as possible, adequate non-nuclear defense alternatives; for maintaining—both to deter attack, to influence enemy targeting and to conduct operations—strong flexible, survivable and controlled strategic nuclear forces; and for seeking effectively inspected measures of arms control which would limit mutual powers of destruction while not reducing the free community's relative capacity to deter or to deal with Communist attack.*

B. *The Objective: A Stable International Military Environment*

5. *Objectives of U.S. Military Policy.* The fundamental objective of U.S. military policy which flows from these considerations is to create a military environment which will permit us to:

a. achieve maximum deterrence of deliberate aggression, and especially aggression with nuclear weapons.

b. minimize the likelihood of uncalculated, unpremeditated or unintended nuclear conflicts; to reduce the likelihood of accidents, misinterpretations of incidents or intentions, false alarms or unauthorized actions within any nation (including the U.S. or its allies); and to reduce the possibility that such actions might trigger major nuclear war.

c. deal successfully with aggression in ways which will not readily escalate and, especially, which will not deteriorate into general war under the pressure of crises and limited conflicts.

6. *The Prospects for Stability.* With care and prudence we may thus hope to create an environment which will reduce both the incentives of others to use force in international affairs and the instabilities inherent in an age of nuclear and missile armaments. The rest of this chapter examines the implications of this objective for the design and employment of major elements of U.S. military power: strategic forces; defensive forces; general purpose forces; and anti-guerrilla forces. It also examines arms control and disarmament policy as an integral part of national security policy.

C. *The Threat*

7. *Communist Strategy.* A persistent characteristic of Communist military strategy has been its searching attention to specific gaps—regional and technical—in the defense of the free community. It has been, thus far, an evident purpose of Communist strategy to avoid a direct confrontation not only with U.S. main strength, but with positions of relative strength within the free community of other nations as well. Soviet policy appears to be based on pressure against particular areas of vulnerability (e.g., Northern Azerbaijan, Greece, Berlin, Indochina, South Korea, etc.) and particular types of vulnerability (e.g., the geographical position of Berlin, the inadequate defenses against subversion and guerrilla warfare in Laos and South Viet-Nam, etc.)

8. *Future Threats.* Given foreseeable U.S. nuclear capabilities, including, in particular, our powerful ability to strike second, it is estimated that the USSR will not deliberately take actions which would bring about general nuclear war. There is, nevertheless, always a possibility that the Soviets may miscalculate U.S. capabilities or misjudge U.S. intentions. They may calculate that their growing nuclear strength makes non-nuclear aggression, especially against areas believed to be not vital to U.S. interests, a feasible course of action. They may also

under-estimate the importance attached by the U.S. to particular interests or areas, and initiate action in the belief that the U.S. will not respond. Accordingly, it is a first charge on U.S. military policy to make grossly unattractive and unprofitable a direct Soviet assault on the U.S. or on other vital areas, notably Western Europe. But a major lesson of postwar history is that U.S. and allied policy must also achieve, to the maximum degree possible, a closing off of all areas of vulnerability, if we wish to minimize the number and effectiveness of Communist probes. It is this lesson which calls for the U.S. and its allies to develop a fuller range of military capabilities, capable of covering as much as feasible of the free community, if they are to create a stable overall military environment.

*The major gap in the U.S. and allied spectrum of capabilities lies at the non-nuclear end—both with respect to conventional forces and those whose mission is counterinsurgency. Although the military stance of the free community is basically defensive, the U.S. and its allies also require capabilities for limited overt and covert action in areas under Communist control. Such action must be carefully weighed in the light of particular circumstances, costs, and risks; but the U.S. cannot accept an asymmetry which allows Communist probes into the free community without possibility of riposte.*

#### D. Strategic Forces

*9. Scale and Character of Strategic Nuclear Forces. Attainment of a stable military environment requires strategic nuclear forces sufficiently effective so that Sino-Soviet leaders would expect—without question—the Bloc's present power position to be worsened drastically as a result of a general nuclear war. In assessing the appropriate scale of a U.S. effort designed to meet this requirement it should be borne in mind that the Soviet calculus must take into account not merely relative Soviet strength after a nuclear exchange but also its consequences for the Communist position in Eastern Europe, for the relative power of Communist China, and for the possibilities of maintaining Communist control over the Russian base.*

*To meet the objectives indicated above the U.S. should, for the relevant planning period through the mid-1960's, maintain a sophisticated mix of delivery vehicles so dispersed, hardened, mobile and controlled that:*

*a. the USSR could not count with confidence, despite any technological break-through it might reasonably expect to score, upon neutralizing or blunting a large proportion of U.S. retaliatory power;*

*b. the U.S. could, even under unfavorable circumstances (e.g., an initial Soviet surprise attack), substantially reduce the military capabilities of the enemy.*

*To achieve not only the objectives indicated above, but also greater stability in the international military environment, our U.S. strategic forces and plans*

*for their use should be designed so that they will constitute an element of stability in grave international crises. Thus, our strategic nuclear forces should be sufficiently invulnerable so that their survival and effectiveness need not rest (i) on the U.S. striking first; (ii) on the U.S. taking in a crisis such "crash measures" to reduce these forces' vulnerability as the Soviets might consider evidence of impending attack or as would materially reduce the forces' operational effectiveness; (iii) on an instant U.S. response to ambiguous evidence of impending enemy attack.*

10. *Presidential Control. The planning and design of U.S. strategic forces should offer an increasingly wide range of options, at alternative levels of violence and against alternative target systems, which the President or authorities pre-designated by him could review in advance and choose among in the event. Our strategic forces must increasingly be susceptible of discriminating and controlled use, under centralized military command, in accordance with such high level decisions. Highly survivable command, control, and communication systems should be developed and maintained (i) which provide for authorization by the President, or authorities pre-designated by him in case he is unable to function, of initial use of nuclear weapons under all circumstances, especially including periods of great tension or hostilities; (ii) which ensure, insofar as feasible, that conduct and termination of operations are also continuously and sensitively responsive to political decisions by the President or authorities pre-designated by him. The expectations of individuals about the occasions on which nuclear weapons would be used, and the methods of using them, should not be allowed to narrow to the point that flexibility in execution is in any way reduced.*

11. *General war may come about in a variety of ways (through pre-meditated attack, preemption, escalation, or inadvertence) and may take different forms, dependent upon the time when it occurs, the accuracy of U.S. intelligence estimates, the kinds of targets the enemy chooses to attack, and the capabilities of the U.S. to prevent repetitive or follow-up strikes. To fix in advance a specific pattern for the conduct of operations is virtually impossible, and our targeting plans and command-control system must, as has been indicated, be designed so as to enable the direction of operations by the President and authorities designated by him before or during the conflict. Within these limitations, pre-attack strategic nuclear planning and preparations will be aimed at:*

*a. reducing the strategic nuclear offensive capabilities of the enemy, and particularly his ability to mount repetitive attacks against U.S. and Allied population centers.*

*b. retaining ready, survivable strategic nuclear forces under centralized control for possible selective use against his urban-industrial centers; against other major elements of enemy strength; and for use in other ways which will contribute to c, below.*

*c. facilitating the conduct of negotiations designed to bring the war to an end on terms which are consistent with U.S. interests, as set forth in this paper.*

The prospect of confronting reserve U.S. nuclear forces after any attack may give a potential enemy powerful incentive to refrain from planning or executing unrestricted attacks on U.S. or Allied civil society. Such ready forces, held in reserve and threatening—by their very existence—surviving enemy targets, may also conceivably extend deterrence into the wartime period, and thus destroy the *will* of surviving enemy leaders to pursue unrestricted attacks or to continue the war. Moreover, the goal of ending hostilities on acceptable terms requires that plans and operational decisions preclude the prospect of an unarmed U.S. confronting armed opponents. *For all these reasons, it is essential—whatever the size, composition and effectiveness of U.S. strategic forces—that the U.S. not disarm itself, by expending all ready strategic nuclear forces in initial attacks.*

12. *Optimum Use of Strategic Nuclear Weapons.* A major problem in connection with the design and use of these strategic forces relates to the optimum use of nuclear weapons if we must initiate such use.

On the one hand, since 1945 American policy has ruled out the initiation of nuclear attack on the Soviet Union as a means of bringing the cold war to an end and providing a definite victory for the Free World. Aside from its violation of our moral and political tradition a policy of initiating nuclear war was always shadowed by its consequences for Western Europe; and its rationality on strictly military grounds has been gradually reduced with the Soviet acquisition of medium and long-range nuclear delivery capabilities.

On the other hand, we are committed explicitly to defend the populations and territory of Western Europe, and we have similar though implicit commitments to use nuclear weapons rather than accept major defeat in Asia and the Middle East.

This situation immediately raises the question of whether, if we initiated use of nuclear weapons, a limited use of nuclear weapons with a concomitant risk of escalation of nuclear engagement by the other side would be the sensible course to follow, or whether an initial strike against Soviet strategic nuclear delivery systems would be the optimum course.

At the present time this question—involving complex problems of intelligence assessment and projection as well as evolving military technology—is subject to legitimate debate. The answer may well vary according to circumstances which cannot be foreseen in advance.

13. *Current Policy.* *In order not to foreclose this issue of optimum initial U.S. use of nuclear weapons, it is important to preserve utmost flexibility*

*in our plans and posture. Three propositions warrant special comment in this connection.*

a. *We should try to convey to the Soviets: (i) That we do not intend to mount an initial strategic strike if their forces do not transgress the frontiers of the free community; (ii) that if they do we would strike first under certain circumstances if this was necessary in order to protect our vital interests; (iii) that we are not so prone to mount an initial strategic strike in the event of grave crises or limited conflict as to maximize the incentive for the Soviets to take a pre-emptive action in these contingencies. This is, in effect, the manifold message we have conveyed with respect to West Berlin.*

b. *We must not lock ourselves into plans and assumptions regarding an initial U.S. strategic strike against Soviet nuclear delivery systems, which could play somewhat the same role in a major international crisis that the great powers' mobilization and war plans played in 1914, e.g., create such pressures for early military moves, in order to destroy enemy nuclear forces, as to deny diplomacy the time it needs to resolve the crisis peacefully.*

c. *We have not and should not set an absolute requirement that our strategic forces be able substantially to destroy all Soviet nuclear delivery systems in a first strike. For one thing, such an objective does not appear practical.*

#### *E. Active and Passive Defense*

14. *Active Defense. The prime objectives of active defense systems are to improve stability by:*

- a. *helping to protect U.S. retaliatory forces;*
- b. *preventing the enemy from cheaply and easily wreaking devastation on U.S. population and industrial centers;*
- c. *accomplishing maximum attrition of the attacking force and complicating enemy planning.*

*Attainment of the second of these objectives will present increasing difficulty as the USSR develops more sophisticated weapons systems; hence, the actual level of resources to be devoted to this mission should be reconsidered frequently and thoroughly.*

15. *Passive Defense. Passive defense measures will not preclude the USSR from inflicting heavy damage on the U.S. should it wish to do so. If it were the primary enemy purpose to overcome passive defense measures, there are numerous weapons options available to him. A more reasonable assumption, however, is that the allocation of resources to long-term and costly development of inter-continental weapons systems would not be significantly affected by U.S. measures of passive defense designed to reduce loss of life from nuclear attack. In the light of the various circumstances under which hostilities might be conducted, passive defense has three main purposes:*

a. *To prevent or limit avoidable fatalities or casualties from nuclear conflict not involving massive attack directly upon U.S. population centers. This purpose can be separated into two parts: the first, limitation of casualties and fatalities from blast, heat and other immediate effects of nuclear detonations; the second, limitation of casualties and fatalities from fallout, spreading fires and other indirect effects of nuclear detonations. The first can be accomplished only through a combination of active and passive defense measures; systems to accomplish this on a nation-wide basis are not yet sufficiently efficient to warrant their adoption. The second can be attained by a system of fallout shelters, together with local organization, planning and training to use the system.*

b. *To maintain continuity at all feasible levels of government. This will require particular attention to such tasks as establishing and promulgating lines of succession to official positions; providing for the safekeeping of essential records; establishing control centers and alternative sites for government emergency operations; and providing for the protection and maximum use of essential government personnel, resources and facilities.*

c. *To strengthen, mobilize and plan for the management of the nation's resources in the interest of current and future national security. In this connection, continuing attention must be given to planning, training, stockpiling, research and development, and other preparations necessary to: (i) the stabilization and organized direction of the civilian economy in times of national emergency; (ii) the prompt initiation of post-attack industrial rehabilitation programs necessary to national survival, rehabilitation and recovery; and (iii) the proper organization of remaining human and material resources.*

*These passive defense steps are essential, lest the U.S. socio-economic system collapse or be distorted into an unacceptable form even following an attack of limited scale not directed primarily against our civil society. Sustained effort and public education by the Federal Government will be required for their execution. Care should be taken, however, not to generate unwarranted expectations as to what such programs can accomplish, not to allow these measures to divert public attention and energies from other needed national security tasks.*

#### F. General Purpose Forces

16. *Scale and Nature.* A third major element in our effort to achieve a balanced and stable international military environment should be the maintenance of U.S. and allied general purpose forces adequate, not only to accomplish prescribed general war tasks but also, in situations less than general war, to use force within certain limits to defend allied and friendly peoples and areas without taking actions involving a high probability of nuclear war.

*In determining the scale of U.S. non-nuclear forces needed to meet this requirement, three conceivable types of Sino-Soviet ground-air non-nuclear*

*attack should be considered: (i) major assault, based on full use of forces in being which are deployed or readily deployable to the area under attack; (ii) lesser forms of aggression, at any level up to major assault; (iii) all-out assault, based on full mobilization and use of all manpower and material reserves.*

*U.S. general purposes forces should be strong enough in combination with available allied forces:*

*(i) to frustrate, without using nuclear weapons, major non-nuclear assault by Sino-Soviet forces against areas where vital U.S. interests are involved, long enough—at a minimum<sup>2</sup>—to give the Communists a full opportunity to appreciate the risks of the course on which they are embarked and then to afford diplomacy an adequate opportunity to end the conflict;*

*(ii) to frustrate in sustained combat, without using nuclear weapons and without any time limit, non-nuclear aggression at any level less than major assault by Soviet or Chinese Communist ground and air forces;*

*(iii) to contribute to general war missions in the event of all-out Sino-Soviet attack, so long as this does not significantly interfere with or detract from the general purpose forces' primary missions, which are to deter and deal with conflicts less than general war.*

*In addition, general purpose forces should be able to maintain, without using nuclear weapons, control of required sea bases and sea-areas in the face of non-nuclear naval and air attack against such sea lanes and sea areas.*

*General purpose forces should be increased in quantity and improved in quality (e.g., through modernization of material stocks) as necessary to attain the above objectives. In so doing, account should be taken of the fact that, although the reserve call-up of 1961 was under the then existing circumstances an essential military and political act, we cannot assume the threats we will face will be so infrequent, dramatic, and unambiguous as to make recurring reserve call-ups (except as indicated in paragraph 23) a politically feasible or technically desirable means of meeting the objectives outlined above.*

*U.S. general purpose forces should also be:*

*a. Sufficiently mobile so that they could respond promptly and simultaneously in needed numbers to two substantial threats in areas where such threats can reasonably be expected and where they would directly threaten vital U.S. interests—notably in Europe and Southeast Asia.*

*b. So trained, organized, and equipped as not in any way to be dependent on nuclear weapons in such sustained combat as may be necessary fully to discharge the missions prescribed under (i) and (ii), above, in regard to major Communist assault and lesser aggressions.*

---

<sup>2</sup> That is, in cases where U.S. and allied strength is not sufficient—or could not be made sufficient, with a minor build-up—to permit defense against major assault without a time limit.

c. *Afforded sufficient logistic support (including advance construction and pre-stocking, where feasible, of needed facilities in or near possible overseas combat areas) to permit discharge of the missions indicated above.*

*A longer term, but clearly desirable, objective of U.S. policy would be to create U.S. general purpose forces sufficiently substantial so that they could frustrate, in conjunction with available allied forces and by non-nuclear means, major Sino-Soviet non-nuclear assault against a maximum number of those areas involving vital U.S. interests, without any time limit. Prompt consideration should be given to the question of whether steps additional to those called for in the preceding paragraphs should eventually be taken to achieve this objective, in respect of both U.S. and allied forces. The resources available to the U.S. and its allies in manpower, financial and production terms place this objective within our capabilities. Action to achieve the objective, however, would require difficult political decisions for the people of both the U.S. and its allies. New approaches to this problem should be studied intensively.*

The possibility should be examined that, even with an increase in free world non-nuclear strength within likely limits, U.S. and allied forces might not be able to frustrate major non-nuclear assault in some regions without (or, in the event the opponent were to respond in kind, even with) local use of nuclear weapons, so that the threat of U.S. initial use of strategic nuclear weapons would remain essential to deterring attack on these areas. *The political and military implications of any such conclusion should be the subject of urgent study.*

17. *Contingency Planning. Within the limits of capabilities which exist or are to be firmly planned in accordance with the policy set forth in paragraph 16, contingency plans should exist for a non-nuclear response by general purpose forces to each likely form of Communist non-nuclear aggression short of all-out attack. Preparations should be such as to permit immediate execution of these plans.*

18. *Conduct of Local War. In conducting local war the U.S. should:*

a. *seek to bring the war to a conclusion on terms satisfactory to the U.S., and make clear to the enemy the specific political objectives for which the U.S. is fighting where this will contribute to doing so;*

b. *be prepared to fight locally in direct conflict with Sino-Soviet forces;*

c. *protect the interests of the friendly people involved;*

d. *seek to control the scope and intensity of the conflict to minimize the risk of escalation to general war, recognizing that this may sometimes require controlled and deliberate intensification of the conflict;*

e. *conduct military operations so as to limit damage in the area of conflict and enhance allied solidarity and effectiveness.*

19. *Deployment and Use of Tactical Nuclear Weapons. We can no longer expect to avoid nuclear retaliation if we initiate the use of nuclear*

weapons, tactically or otherwise. Even a local nuclear exchange could have consequences, for example, for Europe that are most painful to contemplate. Such an exchange would be unlikely to give us any marked military advantage. It could rapidly lead to general nuclear war.

A very limited use of nuclear weapons, primarily for purposes of demonstrating our will and intent to use such weapons, might bring Soviet aggression to a halt without substantial retaliation, and without escalation. This is a next-to-last option we cannot dismiss. But prospects for success are not high, and there might be acutely undesirable political consequences from taking such action.

It is also conceivable that the limited tactical use of nuclear weapons on the battlefield would not broaden a conventional engagement or radically transform it. But these prospects are not rated very highly.

Highly dispersed nuclear weapons in the hands of troops would be difficult to control centrally. Accidents and unauthorized acts could well occur on both sides. Furthermore, the pressures on the Soviets to respond in kind, the great flexibility of nuclear systems, the enormous firepower contained in a single weapon, the ease and accuracy with which that firepower can be called in from unattacked and hence undamaged distant bases, the crucial importance of air superiority in nuclear operations—all these considerations suggest that local nuclear war would be a transient but highly destructive phenomenon.

Studies of the use of nuclear weapons, either for battlefield or interdiction purposes, are under way and should be urgently prosecuted. Pending the completion of these studies, tentative guidelines are:

a. *Scale and Nature: U.S. forces should have sufficient tactical nuclear capabilities (i) to deter enemy initiation of tactical nuclear warfare; (ii) to enhance (in conjunction with a manifest U.S. intent to use nuclear weapons, if necessary) the primary deterrent, which is and will continue to be, posed by U.S. non-nuclear and strategic nuclear capabilities, to major or all-out Communist non-nuclear assault; (iii) to be able to use tactical nuclear weapons selectively for military advantage, if circumstances should arise (e.g., at sea or in the air) where we would gain militarily from a local nuclear exchange and where such an exchange would be unlikely to cause escalation; (iv) to permit a very limited use against valid military targets in other circumstances, primarily in order to demonstrate our will to resist aggression.*

b. *Organization and Deployment: U.S. and allied tactical nuclear capabilities should be so deployed, and their command and control should be so organized as; (i) to preserve carefully the distinction between nuclear and non-nuclear weapons; (ii) to ensure that initial use of tactical nuclear weapons—even after non-nuclear hostilities have begun—will take place only on the President's decision; (iii) to ensure that continuing control will be exercised over use of tactical nuclear weapons, within limitations established by the*

President, at as high a level of authority as is consistent with the character of the conflict and the likely grave consequences of a nuclear mistake. In order to accomplish the purposes indicated above and ensure that nuclear weapons are as immune to accidental or deliberate unauthorized use as consistent with their operational effectiveness: (i) High priority should be given to incorporating, as a matter of urgency, all needed and operationally feasible technical safeguards in nuclear weapons specified by the President, in allied and in U.S. hands; (ii) U.S. custodians of warheads in allied hands should be given the training, equipment, and orders necessary to destroy these warheads quickly, and without the cooperation of the host country, if this should prove necessary to prevent unauthorized use; (iii) Periodic review of these arrangements and safeguards and of the state, command and control, organization, and deployment of U.S. and allied nuclear weapons and of their nuclear components should be undertaken to ensure that they are the optimum from the standpoints indicated above.

c. Use: Tactical nuclear weapons should be used in local war only when it is clear that the objectives stated in paragraph 18 would be furthered by, and could not be attained without, use of nuclear weapons. In determining whether this condition exists and, if so, how nuclear weapons should be used, account should be taken of: (i) our ability or inability to frustrate the aggression without using nuclear weapons; (ii) the likely military effects of a local two-way nuclear exchange; (iii) the political effects of such a local nuclear exchange—both locally and worldwide; (iv) the physical effects of the exchange for the country being fought over; (v) the chances of the exchange escalating into general nuclear war.

#### G. Counter-Guerrilla Forces

20. *The Task.* A fourth major element in a stable military environment must be the generation of allied and U.S. forces and policies capable of making the imposition of guerrilla war on nations of the free community unprofitable to the Communists. *Given the preponderant role of local forces in deterring guerrilla war and conducting counter-guerrilla operations it follows that:*

a. *Preventive Action:* Special steps should be taken to make vulnerable nations more aware of Communist tactics in this field and of the civil and military conditions in the free community which make such tactics feasible and attractive. Recognizing the importance of non-military factors in this connection, emphasis should be placed on devising and implementing economic and political—as well as military—programs aimed at preventing situations that could lead to guerrilla warfare. We must identify such areas of potential or current vulnerability in advance; focus the attention of foreign governments and our own instruments of policy on preventive action; and generate the local and U.S. forces, civil and military, capable of dealing with them in the most forehanded way possible.

b. *Crisis Situations: When guerrilla conflict erupts we should seek to mobilize effective local defense, supported by necessary political and economic programs, at the earliest possible stage of the conflict. Our objectives, where appropriate and feasible, should be to: (i) maintain the independence and territorial integrity of the nation attacked; (ii) minimize the scope of direct U.S. involvement, so far as consistent with this objective and our commitments; (iii) minimize the risk of escalation to local conventional or to nuclear war.*

c. *U.S. Programs: The development of hardware, techniques, and tactics appropriate to guerrilla warfare should receive high priority in U.S. training and production programs, as necessary to achieve the purposes set forth under (a) and (b) above.*

21. *The Border Problem in Guerrilla Warfare.* Although main reliance is placed on local dissidents or converts to Communism by guerrilla forces, the conduct by the Communists of guerrilla war sometimes involves the infiltration from outside of key personnel and material, as well as external inspiration and stimulation of the operation. Since it may, therefore, be difficult to conduct successful counter-guerrilla operations where an open frontier with a Communist country exists:

a. *The U.S. should heighten the free community's awareness of the element of international aggression involved in outside support for guerrilla operations, so as to deter border crossings and other forms of support, and to provide a basis for possible sanctions.*

b. *The U.S. should seek to close off open frontiers or to control the flow of supplies from outside the country—a move in which an international presence may sometimes be helpful, although experience to date is not encouraging on this point.*

c. *The U.S. should consider the application of selected, measured sanctions against the aggressor, if necessary to prevent the defeat of the free community nation under attack, in ways which would minimize—but nevertheless confront—the possibility of escalation.*

22. *The Role of Allies.* With respect to allied participation in the deterrence and conduct of guerrilla war, it is U.S. policy:

a. *To generate local forces—through formal alliance arrangements or otherwise—which will deter guerrilla warfare, if possible, and provide time for the mobilization of effective countermeasures, should deterrence fail.*

b. *To rally diplomatic, civic and military support for the nation under attack from the maximum number of nations of the free community, taking into account, with respect to civic and military contributions, the relative political acceptability, in particular regions, of the presence of various of our allies.*

#### H. *Other Missions of U.S. Forces*

23. *Subsidiary Tasks.* The subsidiary missions assigned the armed forces (see paragraph A, 3 above) impose only minor additional special-

ized military requirements, but these must be given particular attention lest they be lost to sight. The accomplishment of these missions depends on a mutual awareness among civilian and military officials of the particular contributions of armed forces can make, and a willingness to offer and to accept those contributions. *This in turn implies an even better reciprocal flow of information, closer liaison, and more cross-education than has sometimes been achieved in the past.* U.S. military forces at home and abroad, because of their size, geographical distribution, and versatile nonmilitary capabilities continue to have great impact in various countries and exert strong influence on all of our political, economic, and psychological policies. This influence should be used to our advantage.

I. *Supporting Programs.* The following programs provide support for all the types of U.S. forces and missions described in this chapter.

24. *Reserve Forces.* With due regard for political and psychological difficulties, the training, equipment, and orientation of reserve forces should be altered to fit them better for:

- a. Manning active defense systems.
- b. Augmenting active forces in contingencies which require rapid but limited mobilization.
- c. Providing reinforcements in the event of protracted local conflicts.
- d. Fulfilling a significant supporting role as a secondary mission in civil defense, when civil defense plans and concepts have developed to the point where specific useful missions can be assigned to reserve units.
- e. Providing additional forces and expanded base for large scale mobilization in major emergencies.
- f. Provision of units to augment or replenish the strategic reserve in the CONUS.

While selected high priority units should be readied to augment or replenish the strategic reserve in the continental U.S. reserve call-ups should so far as practicable be limited to organized units and individuals with the least prior service.

25. *Overseas Bases and Facilities.* Although the development of ballistic missile technology has reduced the need for strategic air and missile bases overseas, the possibility of U.S. engagement in local wars or in anti-guerrilla operations creates a new need for tactical bases, overflight rights, and contingency arrangements. Moreover, requirements for peace-time storage, communications, tracking, and intelligence facilities are increasing.

To meet vital needs the U.S. should maintain an adequate system of overseas facilities for local war, military counter-insurgency operations, gen-

*eral war, and peacetime missions, together with the arrangements necessary for their support.*

*This base structure must be clearly and fully capable of supporting U.S. and allied forces in their preparation for, and conduct of, local war, wherever such war may occur throughout the world. Where local logistic limitations exist which would not prevent optimum deployment of U.S. and allied forces to a country which we would propose to defend in local war, prompt and vigorous remedial action should be taken, e.g., building more transport and other facilities in the host country or pre-stocking existing facilities in or near that country.*

*We should seek to limit dependence on a single base, or a group of bases, and should examine with urgency, in view of the growing nationalist and neutralist pressure on existing U.S. bases, the possibilities of maintaining services essential to U.S. security by acquiring new bases, and by developing new or applying existing technologies, which would reduce our dependence on overseas bases in general. Given the increasing diplomatic and political cost of maintaining base and facility rights overseas, and the pressure that maintenance of such bases and facilities exerts on our balance of payments position, we should make every effort to dispose in whole or in part of outmoded or unnecessary facilities, to hold new requirements to a minimum and, where needed, to secure additional rights to use existing foreign military and civil facilities.*

26. *Military Aid.* This is dealt with in Chapter Two, following.

27. *Research and Development.* To maintain effective deterrence over the full spectrum of force, the free community must prosecute research and development efforts over a broad front. *The U.S. should pursue research and development to maintain a selective superiority in military technology that is increasingly responsive to our political and military objectives. New emphasis should be given to research and development in two fields which have enjoyed less attention than their importance warrants:*

a. *We should give high priority to weapons and equipment designed to improve our capabilities in sustained non-nuclear combat. We should support mutually with certain allies selected non-nuclear research and development for military application in improving such non-nuclear capabilities.*

b. *We should give new emphasis to weapons which will help less developed countries cope with guerrilla and local external threats.*

To these ends, continuing efforts should be devoted to promoting basic scientific research (both within the military and the civilian agencies of government), to uncovering and applying technological discoveries and innovations, (using both governmental and private research and development facilities), and to expediting their translation into military equipment. However, the wide range of possible improvements, the cost of changing models and making adaptations, and the

nation's over-all requirement for scarce research and development resources, indicate a need for focussing more sharply on developments of significant import and for eschewing marginal improvements or those which do not remedy basic defects of existing weapons systems.

*We should also seek, through research and development, to devise new capabilities for limited countermeasures against Communist pressures short of the overt use of substantial force.*

*28. Chemical and Biological Warfare. United States military forces should have a capability to use and defend against chemical and biological weapons. Chemical and biological weapons should only be used in case of direct decision by the President that such use is warranted by the political military situation, except for the use of: (1) existing smoke, incendiary, and riot control agents in appropriate military operations, and (2) riot control agents in suppressing civil disturbances.*

#### *J. Arms Control and Disarmament*

*29. The U.S. Interest in Arms Control and Disarmament.* The fifth and final element in the effort to maintain a stable military environment is our policy toward arms control and disarmament. The U.S. security interest in arms control and disarmament derives directly from the following characteristics of U.S. military policy and of the present and foreseeable military environment:

a. Continuation of existing trends is likely to yield an increasing number of powers which command nuclear capabilities and means of delivery—on the whole a destabilizing factor, contrary to the U.S. interest.

b. The possibility that a nuclear war might result from accident or—more likely—from miscalculation, misinterpretation of incidents, false alarms or unauthorized actions, or failure of communication is large enough to be an important reason for seeking remedial measures.

c. The prospect over the coming years, in the absence of arms limitation, is for (i) continuing U.S. ability to inflict a high level of damage on the USSR; (ii) substantial increase in the Soviet capacity to inflict civil damage on the U.S. in all-out nuclear exchange; (iii) continuing substantial expenditures of resources and scarce talent in efforts to maintain a stable military environment.

d. Since the U.S. does not intend to initiate nuclear attack on nations ruled by Communist regimes except in riposte to prior Communist aggression, the U.S. cannot exploit the technical advantages of unprovoked, secretly planned, and surprise nuclear assault.

e. A persuasive second-strike deterrent can be maintained at lower levels of U.S. nuclear delivery capabilities than at present, without necessarily jeopardizing U.S. objectives, if we are assured that our own reductions in capabilities are matched appropriately by the USSR.

30. *Objectives of U.S. Arms Control and Disarmament Policy.* In the light of these considerations, U.S. arms control and disarmament policy should form a major element of our national policy and, as such, should seek to complement our military policy in enhancing U.S. security by promoting a stable military environment and developing the means of limiting damage should war occur. To this end the following objectives (which are not necessarily listed in order of priority) should be sought:

a. The U.S. should seek to prevent the proliferation of nuclear weapons capabilities to nations not now controlling such capabilities.

b. It should seek to reduce the likelihood of hostilities occurring through accident, miscalculation or failure of communication.

c. It should seek to limit the capabilities of enemy states to undertake aggression against the U.S. and its allies, to reduce the risk of war, and to decrease the destructiveness of war should it occur, through substantial safeguarded reductions in armaments and other measures by the major powers, short of general and complete disarmament.

d. It should, as a long-term goal, seek to promote the political and military conditions under which the use or threat of force as an instrument of national policy would be reduced and finally eliminated, through an agreed total program of general and complete disarmament under effective international controls in a world effectively organized for peace.

Each of these four categories of measures is discussed below.

31. *Steps to Prevent Proliferation of Nuclear Weapons Capabilities.* In order to reduce the risk of nuclear proliferation, emphasis should be placed on seeking not only a safeguarded cessation of nuclear testing but also a safeguarded cessation of production of fissionable materials for weapons purposes and an agreement under which nuclear powers would commit themselves not to relinquish control over nuclear weapons to non-nuclear states. An agreement not to disseminate nuclear weapons should be couched in terms that would not call into question either existing NATO custodial arrangements or any contemplated allied multilateral arrangement.

32. *Initial Measures to Reduce the Likelihood of Accident, Miscalculation or Failure of Communication.* Even if the Soviets do not share the U.S. image of the future of the world in the degree necessary to negotiate major arms reductions programs, they may come to recognize the serious dangers of accident, miscalculation and failure of communication and thus be willing to join the U.S. in limited measures to reduce those dangers. Such measures might include advance notification of military movements, creation of some facility for direct, secure, and instantaneous communication between national military command centers of the two sides, establishment of observation posts and arrangements to reduce the risk of surprise attack, and establishment of an International Commission to Reduce the Risk of War in which the U.S. and the USSR would consider further steps

*to promote stability, reduce tensions, dampen military crises, and minimize the need for hasty military responses. The U.S. should, even before such a Commission is established, urgently seek out opportunities informally to discuss such measures with the USSR to try to alert it to the importance and nature of the problem.*

### 33. Limited Disarmament Measures.

*Limited disarmament measures, though short of general and complete disarmament, might still be substantial and comprehensive. They might include reducing and limiting strategic nuclear delivery capabilities; reducing and limiting conventional armaments and armed forces; and insuring the peaceful uses of outer space. In negotiating limited measures, the U.S. should seek to the maximum possible extent to redress the imbalance in conventional land armaments existing between NATO and the Bloc. Such measures might reduce the risk of war, limit the cost of military programs, and reduce the destructiveness of war, if it occurs.*

### 34. General and Complete Disarmament in a Peaceful World.

*The U.S. should continue to evidence its willingness to negotiate a program and a treaty for general and complete disarmament in a peaceful world.*

*Such a program would involve the reduction and eventual elimination of national military capabilities except those required for maintaining internal order and for an international peace force—to be carried out by balanced, equitable, and safeguarded steps for the concurrent regulation and reduction of both nuclear and non-nuclear armed forces and armaments where appropriate, under effective verification procedures which would be reciprocal or international and would be responsive to the required amount of security dependent on the extent and kind of retained armaments. Parallel to the curtailment of national military power, such a program would promote the growth of more effective means for keeping the peace, including: renunciation of subversion and indirect aggression as instruments of policy, development of the rule of international law, improvement of procedures for settling international disputes, and development of an international peace force capable of effectively protecting all nations against breaches of the peace.*

*Given Soviet attitudes and policies, general and complete disarmament is unlikely of attainment in the near future. The U.S. should: (a) continue to favor such a policy, while underlining candidly its radical implications for international law and effective peace-keeping machinery; and (b) at the same time seek the more limited and feasible arms control measures set forth above.*

### 35. Evaluation.

*In evaluating arms control and disarmament measures primary consideration should, of course, be given to the degree of military risk or military advantage involved. In addition, the following factors should be weighed: the dangers inherent in the continuation of uncontrolled increases in the proliferation of armaments, the possible effect of a proposed measure on the*

*ability of the U.S. to carry out its foreign policy, and its probable effect on over-all Communist policy and on the evolution of the Bloc.*

*36. Inspection and Verification.*

*Adequate verification must accompany arms control and disarmament. There should be effective verification of: (i) destruction of armaments or their conversion to peaceful uses; (ii) cessation or limitation of production, testing, or other specified activities; (iii) the fact that agreed levels of armaments and armed forces are not exceeded. A continuing attempt should be made to devise inspection techniques which would fully exploit technological progress, and the degree of inspection should be related to the technical need and the degree of risk to the national security involved. Some arms control measures conceivably may be assured without formal inspection machinery or may be subject to verification through national intelligence collection capabilities.*

*37. Arms Control and Military Planning.*

*It is essential that U.S. arms control planning and research be integrated with U.S. military planning. Both are directed toward improving U.S. military security, and they will only achieve this objective if they are carried forward in close concert. On the one hand, in proposing an arms control measure, we must take into account its effect on relative military capabilities and support of national strategy. At the same time, military contingency plans, research and development, and programming of armed forces and armaments should reflect an awareness of the extent to which they affect stability in the military environment, the evolution of weapons and doctrine, and the likelihood of unauthorized use of weapons.*

*38. Dissemination of Arms Control Knowledge.*

*The increasing U.S. knowledge and understanding of arms control matters should be disseminated not only to other Western powers but also to the neutrals and to the Soviet Bloc. Informal conferences, consultations, and meetings should be encouraged both within the West and on an East-West basis where we can be assured that U.S. participation will be competent, responsible, and responsive to the national interest.*

*39. Regional Arms Races in Newly Developing Areas.*

*The development of regional arms races for purposes of prestige or external adventures should be discouraged where possible. Any opportunity for tacit or explicit agreements to limit such competition should be fully exploited. We should constantly be alert to means for creating or embracing such opportunities.*

## *II. Policy Towards the Underdeveloped Areas*

### *A. The U.S. Interest in the Underdeveloped Areas*

*1. Direct Interests.* It follows directly from the principles and purposes outlined in Part One that the U.S. has three basic interests in the

underdeveloped areas of Asia, the Middle East, Africa, and Latin America:

—A military interest: that they not fall under Communist control and that we maintain within them the minimum essential military arrangements required for our own security and that of the free community as a whole.

—A political interest: that they evolve in directions which will afford a congenial world environment for our own society.

—An economic interest: that the resources and the markets of these areas are available to us and to the other industrialized nations of the free world, on a basis of mutually rewarding and self-respecting trade.

2. *The Problems of Change*. In addition we have a direct interest that the inevitable processes of change within these regions of the free community take place in as peaceful a manner as possible.

Over the past decade the turbulent forces at work in the underdeveloped areas have been—with the exception of Berlin and the offshore islands—the primary setting for international crisis: Indo-China, Suez, Iraq, Cuba, Algeria, the Congo, Bizerte, Goa, West New Guinea, etc. These crises have been of three kinds, usually in some sort of combination: international crises arising from internal power struggle, reflecting the inevitable domestic political and social strains of modernization; colonial or quasi-colonial conflicts; and Communist efforts to exploit the opportunities offered by these two inherent types of trouble. These crises have distorted relations with our major allies; diverted the free community's attention and resources from major constructive tasks; created dangerous tensions with the Communist Bloc; and obtruded on the effort to build harmonious relations with the underdeveloped areas themselves.

There is every reason to believe that for the next decade—and probably for the next generation and beyond—the management of the Free World's affairs with respect to the underdeveloped areas to the South will remain a critical element in national policy, with fundamental consequences for our relations with Europe and Japan, for the conflict with the Communist Bloc, and for the military and political environment of our own society. A high premium attaches to anticipating such crises and dealing with them in ways which minimize the possibility that they yield results contrary to the national interest.

#### B. *The Setting*

3. *Pressures for Modernization*. What is happening in these areas is familiar enough. They are driven forward by powerful impulses both to modernize their way of life—so as to exploit the potentialities of modern technology—and to assume a role of dignity and authority on the world scene. Politically active and literate groups in many countries

have awakened to the fact that their lot can be bettered by human effort; and they demand that their nations achieve the status, material base, and human well-being they associate with a modern state.

4. *Obstacles.* In responding to these impulses they have been obligated to struggle against the habits, institutions, and structures of power inherited from the past; against the breakdown of traditional societies and deep divisions in the new ones; against serious inadequacies in trained administrative and technical personnel; against rapid rates of population increase that threaten to overwhelm such material progress as they can generate; and against economic dependence on the uncertain prosperity of a single export crop.

5. *Nationalism.* Emerging as many of these nations have from colonial or quasi-colonial status, their political life is shot through with anti-Western sentiments and, often, with a profound sense of racial feeling. They wish to express the new nationalism which dominates their political life by rectifying real or imagined past humiliations and by a new assertiveness in political affairs. Some states seek national satisfaction in the form of regional expansion while others have revived old territorial disputes. Such sentiments and actions compound their problems and raise new barriers to fruitful relations with many developed countries of the West. A growing spirit of nationalism has also emerged in nations which, while independent for many years, are only now breaking up the patterns of traditional social and political power and demanding recognition as modern, independent states.

6. *Communist Appeal.* Confronted with urgent domestic and external ambitions on the one hand, and intractable domestic problems and external restraints on the other, the literate elites are tempted by the possibility that Communist methods of organization may represent a short cut to economic growth, to personal power, and to enhance national status, as well as by the possibility of using Soviet and Chinese Communist support to hasten the satisfaction of national aspirations abroad. Communism thus presents a pragmatic appeal which reinforces its ideological attractions and makes easier the extension of Bloc influence.

### *C. The Objective and Assets of U.S. Policy*

7. *Working Goals.* It is in this setting that American policy, directed to the interests set out in Para. A.1, above, must operate. *U.S. policy must seek both to encourage a concentration of these countries' limited political and administrative energies on the constructive tasks of development, and to encourage and constrain them to seek methods of peaceful change in their domestic affairs and international relations.* If these goals can be fulfilled, the less developed countries should be increasingly able to maintain their independence in the face of subversion and indirect aggression, and to assume a responsible role as members of the free community.

8. *U.S. Assets.* In pursuing these objectives against inherent obstacles and Communist appeals and methods, U.S. policy—while necessarily limited in its impact on the evolution of other societies—has three fundamental assets within the fabric of most developing nations:

—By and large the most vital political elements in these nations seek national independence; the subservience that goes with Communist control is increasingly understood; and the authenticity of U.S. support for national independence is emerging with increased clarity.

—Although in many cases there is disillusionment with the possibility of using Western democratic political methods effectively in the short run, there is a widespread commitment to Western norms of political democracy as a long-run goal, and considerable resistance to a definitive acceptance of totalitarianism—a resistance rooted in national cultures, not merely acquired Western political values;

—There is among important and enlarging groups an authentic desire to get on with the tasks of economic and social development, both for their own sake and as an essential basis for national independence.

9. *Implications for U.S. Policy.* If these assets are to control the pattern of development of the underdeveloped areas, there must be an effective demonstration that the goals of national independence and sustained development are compatible with governments increasingly based on consent and associated in their international relations with the U.S. and the West. *This condition, in turn, requires that the U.S. support and align itself systematically with those groups inside the developing nations which are, in fact, prepared to carry forward the acts of self-help and reform on which the process of modernization depends.* In a number of areas our short and long-run interests have been in conflict, in that groups which promise to maintain independence against the Communist thrust are committed by their vested interests to oppose measures essential for rapid economic growth and political and social modernization. *The resolution of this dilemma (which is a fundamental task of U.S. policy in many parts of the underdeveloped areas) requires that we identify, support, and, if possible, help to unite those elements in the political and administrative structure; in the military; in the commercial, industrial, and professional community; and among the intellectuals, students, and trade unions which are committed to national independence, to economic and social progress, and, within the capacity of each society, to the progressive extension of democratic political practice.*

10. *The Prospect.* The crosscurrents at work within these countries and their inherent instability require that we be prepared to work towards our objectives over very considerable periods of time without achieving cleancut and definitive results. On the other hand, the unformed character of these societies, their turbulence, and their ambitions mean also that it can be difficult for the Communists to effect a

definitive takeover. Despite the success of Ho Chi Minh and Castro in capturing for Communism broadly-based popular movements, analogies based on their techniques or on Communist takeovers in Soviet-occupied Eastern Europe after 1945 may not prove generally relevant—particularly if we are alert to the danger. *Areas which may appear most unpromising to us in the short-run—and which appear to be dangerously impregnated with Communist and other anti-American influence from without and from within—should not be prematurely written off. An underdeveloped society can wallow in a sea of trouble for longer than we might think without coming effectively under Communist control and discipline. We must be prepared to continue to work towards our objectives with poise and confidence, even under quite unpromising circumstances.*

#### D. The Instruments of United States Policy

11. *Available Instruments.* To assist constructive modernization, we should vigorously use the array of instruments available to us—including diplomacy, military force, military aid, information activities, exchange programs of all kinds, help in educational and cultural advancement, people-to-people activities, assistance in economic programming, technical assistance, the provision of capital, the use of surpluses, policy towards trade and commodity price stabilization, and a variety of other actions capable of affecting the orientation of men and institutions within these societies towards their problems. Some of these instruments are wholly at the disposal of the U.S. Government, while others can be utilized fully only with the cooperation of private institutions (such as business enterprises, trade unions, universities, etc.) or through influencing and working with international organizations. Each has its own advantages, drawbacks, and side-effects, which may be as significant as their direct impact. Under these circumstances, it is impossible in this paper to do more than set down broad guidelines for their use.

12. *Orchestration of Instruments.* In view of the variety and complexity of these instruments, it is of crucial importance that they should be closely concerted and coordinated to common ends. A conscious and determined effort should be made to develop and implement for each less developed country, a country plan or system of priorities for the use of these instruments based on:

—A unified and realistic concept of the forces at work within that country and the ways in which these forces can be influenced or motivated, over any period of time.

—A clear understanding of the desired pace and direction of modernization, based on our objectives and on the limits and possibilities set by the particular country's stage of political, social and economic development.

—A realistic understanding of the possible effect of the various instruments of action available to us in promoting our objectives.

—A system for focusing and orchestrating these instruments so that our limited influence is maximized.

*In preparing these programs, the development of the knowledge and the management tools required for this purpose should be a prime charge upon U.S. resources, and needed research should be systematically undertaken to this end.*

#### E. Social and Political Change

13. *Social Change.* In the process of modernization economic, social, and political changes are interlocked in complex ways which U.S. policy must seek increasingly to understand and to take into account. *Although economic change and economic incentives are powerful forces in the total process of modernization, U.S. policy should recognize that success depends decisively on the emergence of politicians, bureaucrats, military leaders, businessmen, trade union officials, and others determined to achieve progress—with all this involves in the way of effort, risk, and innovation—and who are at the same time able to operate effectively within a political system based upon an increasing measure of consent. It should be a prime purpose of U.S. policy to promote that emergence; our economic, cultural, and political programs vis-à-vis less developed countries should be systematically geared to this end. Programs for the exchange of persons and information, on both a bilateral and multilateral basis, should be directed to this goal. Projects and programs to encourage local and foreign private enterprise, properly related to the life and objectives of the host country, should also receive high priority, as a means of serving this purpose. The kinds of assistance in education which are likely to promote the emergence of innovation-minded groups should be pressed. Given the inappropriate character of the educational institutions and values initially built into many underdeveloped nations out of their colonial or traditional past, U.S. educational policy should seek to guide them towards more pragmatic and vocational educational programs and systems, in the spirit of the Morrill Act, which played so important a role in our development at an equivalent stage of our evolution. Measures should be devised which would ensure exposure to appropriate external influence of groups which play a key role in modernization, including the military. These measures might take a variety of forms, ranging from transport to afford tradition-bound rural areas wider contacts with the outside world to programs for making available to businessmen and bureaucrats in the less-developed countries—through travel, reading, and education—some of the skills and the attitudes that will contribute to progress. In all these ways we should seek to promote and enhance the entrepreneurial spirit which is an indispensable component of modernization. It is a practical lesson of our postwar experience that a consensus between ourselves and those who take a serious view of the modernization process within their nations is one of the strongest bases for common action and common perspective on even larger issues, and one of the most important strands on which the community of free nations can be built. The Marshall Plan was carried through by this kind of alliance between Americans and the often small groups of*

men determined to revive their national economies; e.g., the Monnet group in France. *A major immediate objective of our policy towards the underdeveloped areas must, therefore, be to help to identify these men and to support them.*

14. *Political Change.* The fundamental U.S. objective in the underdeveloped areas is, of course, not economic development for its own sake but the maintenance of the independence of these nations and the gradual emergence of reasonably effective and increasingly democratic political systems within them. Economic development is, nevertheless, a crucial component of our policy because these political objectives are unlikely to be attained in the contemporary world without provision to the people of an environment of reasonably steady material progress.

On the other hand, the political dimension of modernization is also critically important to economic development. The central role of economic planning, education, social overhead capital, and public policy towards agriculture, foreign trade and taxation in the development process at its early stage makes the attitudes and capacities of governments directly relevant to economic analysis and aid policy.

The modernization process will inevitably create political tensions and crises. New modern-minded groups will expand as development moves forward. They will make insistent demands for power and influence on those more oriented to traditional ways. The latter may in turn, be increasingly reluctant to make concessions to a program of modernization which threatens their social and political prerogatives. This kind of tension—notably present in Latin America but endemic throughout the underdeveloped areas—poses for American policy extremely subtle problems of timing and emphasis in the use of our influence.

*On occasion it may be in our interest actively to encourage change—even radical change—as it would have been in Batista's Cuba. In other cases it may be to our interest to damp the pressures for change and to seek to move the modernization process forward within the framework of an evidently transient but temporarily necessary traditional or neo-traditional framework—a course which on the whole has thus far appeared wise in Iran and South Viet-Nam. In general our basic orientation must be to the modern, progressive, and popularly-based groups within the underdeveloped areas; however, we must recognize that the rise to power of such groups will be a slow and uneven process, and that we may, on occasion, have to accommodate ourselves to less desirable situations. We must be sensitive to the pace at which power and influence can be transferred to the more modern-minded groups without risking excessive disruption in the underdeveloped societies or—in some cases—Communist exploitation of their domestic tensions.*

15. *The Speed of Change.* In short, while there are suggestive patterns of experience emerging in the process of political and social modernization, there

*are no safe, fixed rules consonant with the complex of American interests except this: In most of the underdeveloped areas we must come to take change—and quite rapid change—as the norm and insure that the United States is in the process of developing rapport and understanding with emerging groups outside the government while dealing effectively with the current government. We should also be conscious of the fact that the built-in bias and habits of our government have, on the whole, tended in the past to make us too slow rather than too quick to respond to and align ourselves with the forces making for change. On balance, our interests are likely to be better served by accepting the risks of leaning forward towards more modern groups than the risks of clinging to familiar friends rooted in the past; although no general rule can govern.*

#### F. Some Broad Aid Criteria

16. *The Uses of Aid.* U.S. economic and military aid are major instruments for achieving the long-term goals discussed above.

They can also render significant short-run support to urgent requirements of national security policy of the United States. Economic and military assistance can be (and have been) used to maintain indigenous armed forces beyond the economic capacity of the country concerned. Although local forces cannot be directly equated with U.S. forces—either with respect to their capabilities or their mobility—it remains the case that without such forces equipped and trained by U.S. military assistance, larger and more expensive U.S. forces would be required to fulfill the security requirements of the free community. U.S. military aid is also used to secure base rights and facilities, to obtain a favorable political or psychological impact, to offset Communist economic penetration, etc. In many instances these considerations will—as is quite proper—influence decisions with respect to the allocation of available U.S. resources.

However, aid given for these short-term purposes may—and frequently does—have undesirable side effects which contravene the longer-term and more important goals set forth above. Recipient governments may use aid to postpone or avoid essential economic reforms, or may distribute it so as to favor influential but nonconstructive groups supporting the government. External aid is a powerful consideration in a weak government; the terms on which it can be acquired and the kinds of men who are judged likely to negotiate successfully for it profoundly affect the contours and policies of such governments. Further, some countries have vigorously resisted joint or international controls over the uses to which aid might be put, and some have threatened to turn, or have turned, to the Communist Bloc when aid was not forthcoming in the types or on the terms they desired. The problem of minimizing conflicts and, where possible, creating a conver-

gence between short-run and long-run U.S. interests in the granting of aid makes it essential that we develop clear aid criteria.

17. *The Need for Criteria.* It is essential, therefore, that we adopt broad criteria for assistance and move within the free community toward a consensus concerning these criteria—a consensus which should include not merely other donors of aid but also significant elements in the leadership of the underdeveloped areas themselves. Once adopted, the United States must hold firmly to these criteria, recognizing that diversions in one instance may quickly become precedents in another. The application of these criteria is likely to require—especially in the early stages of the new policy—a searching re-examination by aid bilateral recipients of their domestic economic policies and both persuasive exposition and firmness by U.S. representatives.

18. *Military Aid.* With respect to military aid, our policy, guided by the over-all requirements of U.S. military strategy, must take account of three factors, in addition to the military requirement of U.S. strategy in the nations or areas involved:

a. The character of the military threat these nations actually and foreseeably confront, and the degree to which their defense is, in fact, contingent on U.S. and allied forces, rather than their own. In areas (e.g., Viet-Nam) where there is a significant guerrilla warfare problem and where U.S. forces in the general area are relatively strong and able to intervene in a timely fashion, first priority in the development of indigenous forces should go to counter-insurgency tasks. Where there is an actual or incipient guerrilla warfare problem, it will not be sufficient to make counter-guerrilla policy an ancillary objective, to be pursued only insofar as it does not interfere with more conventional objectives. In countries which border the Communist Bloc, which face both external and internal local threats, and from which U.S. power is remote (e.g., Iran), conventional as well as counter-insurgency capabilities should be maintained, taking into account political, economic, and military considerations—including the remoteness or closeness to U.S. power. These conventional forces should be designed to cope with incursions, probes, and limited aggressions; to retain their combat integrity in the face of major Communist assault until U.S. and allied forces can be brought to bear; and to operate effectively in close conjunction with such U.S. forces, since their deterrent capability against substantial overt Communist aggression will hinge on an unambiguous link to U.S. military capabilities. Military aid to enhance the ability of less developed countries to undertake general war missions should, with the exception of Greece and Turkey and certain countries which have ASW missions in the Western Hemisphere, have very low priority. This very low priority should be reflected in the nature of our MAP programs. Sophisticated weapons should only be provided where the local country needs them in meeting likely local war threats and is capable of using them effectively to supplement our own plans and concepts in meeting such threats.

b. The potentiality for constructive action by military elements within these societies. Since the vast majority of our military aid goes to less developed

areas, it is essential that military aid programs and U.S. influence with the local military be geared to the maximum possible to our broad objectives relating to modernization. This is particularly true in countries where the major threat comes from within. Consistent with military requirements, emphasis should be placed on training and other programs which ensure that the military assist, rather than hinder, the process of modernization.

c. The appropriate allocation of resources (local and U.S.) as between military and civil purposes. Since there is generally competition for scarce budgetary and other resources in these countries, we should try, where we are in a position to affect decisions by the level of our military aid and the substitutes that we can offer therefor, to ensure that local military programs are not prosecuted on a scale that would threaten the success of economic development needed to ensure the independence, progress, and stability of the country.

The application of the complex criteria suggested under (a)–(c) above, must be worked out on a country-by-country basis, taking into account regional circumstances, the relevant political and psychological factors, and the area requirements of our military plans and concepts. These factors, systematically applied case by case, will in some instances bring about military aid policies more austere in quantity and more directed to civil purposes than in the past. In applying these criteria the political and psychological consequences, favorable and unfavorable, of altering the present scale and structure of local military establishments and US military assistance, should be taken into account. When a higher level of MAP than can be justified on the basis of the above criteria must be temporarily maintained, we should seek to ensure that it contributes to sound modernization.

19. Economic Aid. The appropriate general political standard with respect to aid is the extent to which, by and large, the granting of such aid will tend to encourage, over a period of time, the will of the people and the government concerned to maintain their effective independence in the face of Communist blandishments and pressures, both from without and from within. Aid should not, as a normal practice, be increased or withheld in an attempt to earn more short-term political gains, e.g., to secure “good will” or specific favors.

The appropriate general economic standard is that aid should be granted so as to encourage and reward progress toward modernization—with all that this involves in the way of economic development and social and political progress. There will be times, therefore, when U.S. interests can be more effectively promoted by denying than by providing aid. Wherever possible, an expansion in aid should be related to a demonstration of increased capacity and will to mobilize local resources and to organize effective development programs.

Nevertheless, some aid must be granted defensively: to buy time for nations to weather crises and to keep open the possibility of their development as independent nations. When aid is granted on a basis other than self-help we should seek to ensure that it contributes to longer-term U.S. objectives.

*Thus even economic assistance for political purposes can be designed to promote economic development or to bring meaningful benefits to those groups among whom the Communist appeal is greatest.*

20. *Levels of Economic Aid.* The forces at work in the underdeveloped areas making for more effective mobilization of local resources and increased attention to development problems are gathering strength; and it seems reasonable to expect that the pursuit of our basic objectives and policies in the underdeveloped areas will require rising levels of capital assistance during the 1960's. The U.S. should be prepared to join other developed countries in meeting this need for rising levels of assistance. Until we have achieved and maintained an overall equilibrium in the US balance of payments, it should do this in ways which minimize pressure on the U.S. balance of payments, e.g. by emphasizing the procurement of US goods and services in our assistance programs.

#### G. Differing Stages of Under-Development: The Relativity of Self-Help

21. *Wide Variations.* In applying the criteria outlined above it should be borne in mind that what we call underdeveloped nations range over a wide spectrum; and that the standard of self-help performance that can legitimately be expected will vary with the degree of underdevelopment, as well as with unique local factors.

22. *Broad Categories.* Broadly speaking, it is possible to array the underdeveloped nations in four categories:

a. *In nations touched by the modern world but still close to the stage of traditional society, our aid programs should generally aim, on a project basis, to help provide the basic preconditions for sustained growth: resource surveys; training and education programs; technical assistance; help in creating needed institutions; and fundamental capital in such basic fields as transport, electric power, and agriculture. Nations in this category have a peculiarly high requirement for the development of their human resources, although this requirement remains throughout all stages of underdevelopment. They also require encouragement to focus their new or heightened national ambitions on the concrete tasks of development. Where appropriate, the long term commitment features of our aid legislation should be used for this purpose. Many of the nations of Africa, Afghanistan, Yemen, Laos, Haiti, and Honduras illustrate this category.*

b. *In countries which have broken in many directions with their traditional way of life and have absorbed many of the techniques and institutional forms of modern life, but which either lack the technical capacity to mobilize effectively their assets (e.g., Bolivia), or which have not yet fully committed their political and institutional capacity to the practical tasks of modernization (e.g., Iran), our object should be to encourage—in all the ways open to us—an increased concentration of effort on the process of modernization and an enhanced ability to carry out the process. While many tools of aid policy may be relevant in*

such countries—including, notably, assistance in the design of projects, in administration and in planning itself—a special effort should be made to use U.S. political influence in all its dimensions to focus the attention of the political leadership and elite groups on the concrete business of modernization, as opposed to other objectives. In this process of persuasion, we should be prepared to put forward the possibility of substantial and sustained U.S. economic assistance geared to an effective national development program as an important incentive.

c. Third, in nations which are substantially committed to the process of modernization and prepared to mobilize systematically their assets—human, material, and institutional—to this objective, we should be prepared to organize from our own resources and those of the more advanced nations, systematic long-term assistance programs, controlled by relatively strict criteria. India, Colombia, and Nigeria fall in this small but relatively more advanced group.

d. In nations which have experienced an initial sustained surge of growth, but have developed severe problems of structural imbalance—often coming to rest upon their external payments situation, we should be prepared to provide substantial guidance and assistance in order to permit the growth process to be resumed in more stable balance, but our policy should assume that they will soon be capable of mounting serious development programs financed, over the long term, from their own resources and from external aid granted on a conventional bankable basis, and should seek to hasten this circumstance. Argentina, Venezuela, and the Philippines fall in this category.

#### H. The Residual Problem of Colonialism

23. *The Issue.* A high proportion of the crises in the underdeveloped areas has been related directly or indirectly to the ending of the colonial era. While that era is substantially closed out, this very fact is likely to heighten the pressure for the final removal of colonial enclaves and lead to extreme impatience in the underdeveloped areas where colonialism remains an important unifying issue in domestic politics. Our task is to deal with this problem in ways which will be consistent with our efforts to fashion a free community of interdependent countries, including both developed and less developed nations.

The task is complicated by the fact that we must deal with three widely-differing situations:

—Those in which the metropole is willing to grant independence and is preparing to do so, as in the case with the British in East Africa.

—Those in which the metropole is determined to preserve its colonial domain or protectorate, as are the Portuguese and the South Africans.

—Those where the colonial areas are so small or so fragmented that it is virtually impossible to foresee the development of viable

independent entities. This is the case with many small areas such as the Carolines, the Marquesas, Curacao, Gambia, Basutoland, etc.

24. *U.S. Policy. In these circumstances United States policy should provide for:*

*a. Intimate private consultation with the remaining colonial powers, designed to help them perceive that an orderly transition from the historic colonial relationship to a status acceptable to the local people involved is the only realistic course consistent with their long-run interest and the interest of the free community, combined with assurance of our assistance—and, if possible, the assistance of other allies—in engineering this transition.*

*b. Accelerated efforts, through all available means, to increase the capacity of the peoples within those colonial areas which are potentially viable to rule responsibly when independence is granted.*

*c. Attempts to devise formulae which will permit non-viable areas (including those under U.S. control or trusteeship) greater internal autonomy and a satisfactory form of association with the metropole or with neighboring countries.*

*d. Increased endeavors to use the UN as an instrument for the transfer or sharing of sovereignty and as a tutor in the process of political development.*

*e. Efforts to persuade the more moderate and responsible nations in the underdeveloped world that they should not press for premature granting of independence, but should work constructively with the international community to assure that the independence or autonomy which will inevitably come will not be disruptive of major common interests.*

25. *Taken together, these five elements constitute a policy which underlines the inevitability of the end of colonialism but combines it with patient and affirmative action designed to avoid the kind of chaos which accompanied the Belgian withdrawal from responsibility in the Congo. It requires from us a more forehanded approach with respect to our European allies, our more moderate partners among the underdeveloped nations, and within the colonial areas themselves than we have exhibited in the past. And it means that we ourselves must consider new forms of government for the areas belonging to us or under our trusteeship.*

### III. THE FRAMEWORK OF ORGANIZATION

#### A. Introduction

1. *The goal.* The vitality of the free community will rest substantially, over the foreseeable future, on the inner strength and capacity for progress of the individual nations which comprise it; and the success of our policy will continue to depend significantly on what nations do for themselves and on what we do with them on a bilateral basis. Nevertheless, for reasons set out in Part One, the forces at work on the world scene will increasingly require cooperative international

actions if the security, economic, and political requirements of the free community are to be successfully met.

Chapter II, of Part One, in outlining this concept, indicated the role within it of the several regions of the free community, including the special status in US policy of Western Europe and Latin America, as well as the priority perspective to be applied, on various issues, with respect to the more developed and less developed nations of the free community. This chapter, within those policy injunctions, addresses itself to certain key problems of organization.

The evolutionary process of organization envisaged will meet powerful and stubborn resistance in the form of national pre-occupations, regional disputes, and Communist obstruction.

Nevertheless, in moving towards the organization of a free community of nations, we are pursuing an objective which already has a high measure of *de facto* acceptance rooted in the hard facts of interdependence and are building on an extraordinary range of existing institutions. Although the problems of communal organization and institution-building are world-wide and interrelated, they will, for convenience be examined under six headings which embrace the bulk of the existing international organizations, and which also follow the main lines of the argument of this paper.

—Organizing and protecting the Northern “hard core.”

—Extra-European regional military organizations, designed to hold the balance of power outside Europe.

—North-South economic organizations.

—Indigenous regional economic organizations.

—Worldwide economic organizations.

—The United Nations.

#### B. *Organizing and Protecting the Northern “Hard Core”*

2. *The “Hard Core.”* The first and highest priority mission in creating an organizational framework for the free community is to bind the United States into effective partnership with Europe and in some degree Canada and Japan in the major tasks of defense and modernization within the community of free nations. The balance of power cannot be securely held, in either its military or ideological dimensions, unless the strength and the policies of the more advanced nations, which happen to be mostly in the Northern Hemisphere, are effectively aligned and geared to the essential common enterprises of the free community. Although bilateral negotiations and consultations remain important, this can best be done by building upon existing or developing organizations which bring these nations together.

3. *The European Community.* The United States should support the movement towards European unity for two basic reasons:

*First, as a means of ensuring Western European security in the face of Communist pressures and enticements and, thereby, holding firmly the balance of power in Western Eurasia.* A more united Europe should generate greater force to withstand Communist threats and pressures; greater confidence to withstand Communist enticements; greater progress to withstand Communist attempts at subversion and takeover; greater powers of attraction to the East; and a political and psychological framework for the firm attachment of West Germany to the West, even though a significant portion of Germany is in the hands of the Communists.

*Second, to bring an end to the internecine rivalries among European states that have so long bred weakness and conflict, and to supplant parochial nationalism by political allegiance to a strong united European commonwealth, capable of joining the United States in effectively defending and building the community of free nations.* Such a commonwealth would provide a framework within which European resources and energies might be organized in ways which would permit Europe to share the world-wide responsibilities which have fallen disproportionately on the United States since the Second World War.

4. *The Transatlantic Link.* In the face of the world environment which confronts Europe and the United States, none of these functions can be effectively performed unless Western Europe increases its degree of unity; but none of them is likely to be effectively performed unless Western Europe is also linked in increasing intimacy with the United States and, in some measure, Canada. *The guiding rule of our European policy, therefore, should be not merely to enhance the strength and cohesion of the European community but to do so within the framework of a close and vigorous Atlantic partnership. This requires an intensification of our efforts to strengthen NATO and the OECD.*

5. *Political Integration.* *We should be prepared to encourage, within this Atlantic framework, the tendency in Europe to extend its integration into political affairs. Such integration should take place through the enlarged European Community (including the UK).* The danger that a united Europe linked to the Atlantic Community will emerge as a third force deliberately prepared, for example, to play the United States and the USSR off against each other is relatively slight, so long as vital European interests are protected within the Atlantic Partnership. The essential and difficult task of the United States is to act so that the European countries will believe that their vital interests are so protected. That risk is outweighed by the advantages to us of a more united and purposeful Europe; and these advantages would be intensified if Western Europe moved toward integration politically as well as economically. Since Europe is not likely within the foreseeable future to form a single unified government, the United States must for the time concen-

trate upon promoting closer intra-European associations and fostering those European organizations which seem most likely to form the nuclei of a united Europe.

6. *The Position of the Non-NATO Countries.* A united Europe requires increasingly concerted policy in political, economic, and military affairs. Movement in this direction is complicated by the fact that several of the European states (Finland, Sweden, Ireland, Switzerland, and Austria) are not in NATO, and that Spain, with which we have important bilateral military arrangements, is, for the time being, not politically acceptable to some of our allies as a NATO member. The neutrals will resist political and economic arrangements which appear to infringe on their neutrality. On the other hand, the political life of these nations is crucially dependent on economic relations of the greatest possible freedom and intimacy with the Common Market; and the United States has a stake in the stability of their political life and their being oriented towards the Common Market. *In the short run—while the British negotiations for entry into the Common Market proceed—the dilemma posed by the position of non-NATO countries requires the intensive use of the OECD as a general instrument for economic co-ordination within the Atlantic community. The longer run problem of non-NATO countries' relations with the EEC will have to be faced in the light of the outcome of the UK-EEC negotiation and should be the subject of urgent United States planning and examination of alternatives.*

7. *The U.K. Role.* We should encourage the United Kingdom to participate fully in the movement toward European integration, both to strengthen that movement in all its dimensions and to balance the present Franco-German relationship on which the movement towards European unity has hitherto largely depended. We should encourage the British to view the development of a united Europe within an invigorated Atlantic Partnership as a framework within which the historic natural ties between the United States and Britain are most likely to be effective and constructive. We should look to a reduction in formal arrangements that embody the “special” United States bilateral relation with the United Kingdom, notably those in the field of nuclear weapons. These arrangements serve as a psychological and technical brake on Britain's full integration within the European community and diminish the sense of partnership between Continental Europe and the United States. *The change in the US-UK special political relation should be carefully developed and evolutionary, and should avoid the appearance of an abrupt turn-around. It should be balanced by bringing our relation with the entire European Community as close as possible to that which we currently enjoy with the UK. Until this occurs, some continuing intimate consultation with the UK will be useful and inevitable.*

8. *The German Role.* We should encourage German leaders and political groups to the view that it is through a deep commitment to the European

*community, with its trans-Atlantic ties, that German interests will be best satisfied and Germany will be able to assume an expanding role of responsibility and influence on the world scene. Increasing German absorption in the affairs of that community is the best safeguard against a recrudescence of exaggerated nationalism in German life and policy, and against the remote possibility that the West Germans may seek reunification through a deal with the USSR.*

*It follows, however, that Germany must be treated within the European and Atlantic communities as a full-fledged major partner; and that the West must not abandon its long-run commitment to the reunification of Germany. We should represent to German opinion that the most effective way—and perhaps the sole peaceful way—to move toward reunification lies in enhancing the strength, stability, and attractive power of the European community into which East Germany might eventually be absorbed. The credibility of this posture is dependent upon a firm defense of the freedom of West Berlin, and the maintenance of its viability as a city of international significance, since West Berlin remains a symbol of unification to German opinion.*

9. France. Our objective *vis-à-vis* France is the same as toward the UK and Germany: To encourage that nation to participate fully in the movement toward European integration and Atlantic partnership as a basis for building and defending the free community.

*This objective is most likely to be fulfilled not by direct suasion of the French Government but by the creation of circumstances which make it appear that such a course would serve France's national interest. These circumstances can best be promoted if we hold to our present policy of encouraging and assisting the forces—in France as well as other European countries—that wish to create a European Community and Atlantic partnership, in which France can play a large and leading role, and of using our influence to help deny the possibility of an alternative solution: A loose European grouping which is neither integrated nor tightly linked to the US. In particular, we must give a convincing demonstration that the US intends, in fact, to deal with France and Continental Europe on the same basis as we deal with Great Britain and to subsume the special relation to Britain in the larger transatlantic linkage. In the degree that the forces making for European integration and Atlantic partnership grow in strength, the French Government is likely—either during or after DeGaulle's term of office—to conclude that it can play a larger role in creating a strong Europe by working with than by opposing the trends which these forces have set in motion. Indeed, support for this course is plainly growing in French opinion, as reflected in the MRP resignations, the Assembly walk-out, and increasing press discussion of the advantages of some kind of multilateral nuclear enterprise.*

*It follows that it would be contra-productive to deviate from the policy outlined above, by supporting approaches to political or nuclear problems*

*which are not consistent with our basic goals of European integration and Atlantic partnership, in an attempt to elicit greater support from France. This would merely weaken and discourage the forces favoring these goals, on whose success our long-term policy depends.* The gifted statesman who now heads the French Government might be moved by the unfolding of history but he would not be swayed by concessional changes in US policy, which he would view as a sign of irresolution, any more than he would be swayed by pressures. He respects in others the quality on which he sets most store in his own policy: consistent dedication to long-term objectives and a refusal to be driven off course by the shifting winds of the moment. We will be most likely to secure and maintain his respect, and eventually gain his cooperation, by evidencing this quality in consistent pursuit of the European policy laid down above. He has shown when necessary, that he can accommodate to trends he cannot alter, once he is convinced that this is in his interest and that opportunities are open for him to do so in a way which is consistent with the dignity and prestige of the great country he leads.

*On a basis of mutual respect and within the context of our underlying policy, we should seek as good relations with the French Government as it is prepared to entertain, and we should consult and cooperate with that government as intimately as is feasible. We should make clear, by word and deed, our desire to join France in meeting outstanding problems on an agreed basis, in the framework of the European integration and Atlantic partnership which we, the other continental countries, and much of French opinion supports.* In the long run, this posture is likely to make for sounder US-French relations than one which seeks to influence de Gaulle either by publicly isolating him or by agreeing to courses of action which he and other Europeans would consider an abandonment of our stated basic goals.

10. *The Agenda of the Atlantic Community.* The persuasiveness of our European policy depends on effective movement forward on the major items which are the agenda of the Atlantic partnership—not only the defense of Europe but intensified US-European cooperation in the defense and building of the free community, with all this involves in the way of the political and military policies in non-European areas and intensive consultation in the fields of trade, balance of payments, fiscal and monetary policies, and policy towards economic assistance to the underdeveloped areas. These elements of the US-European partnership are discussed below.

11. *Military.* The countries of Europe will be more inclined to address the larger problems of the free community in major partnership with the United States if they can develop solid assurance that their homeland—which they see threatened by both preponderant Soviet ground forces and missiles—is as secure from Soviet threats and military pressures as the facts of military life now and foreseeably permit.

12. *Basic strategy.* Over a long term future characterized by increasing Soviet nuclear capabilities, this assurance and security can best be maintained by a posture which convinces the Europeans that (i) NATO can deter or deal with non-nuclear hostilities short of all-out attack without initial resort to nuclear weapons; (ii) nuclear weapons will be available to the alliance, as needed, to deter or to deal with an expansion or debilitating prolongation of these hostilities. Each of these requirements is discussed below.

13. *NATO Non-Nuclear Forces.* Despite the resources and manpower advantages NATO has over the Soviet Union and its satellites, and despite its present sizeable resources allocation to military purposes, NATO forces in Europe are, on the whole, inferior in strength to those of the Bloc.

An urgent objective of NATO policy is the strengthening of these non-nuclear forces. NATO requires such strengthened forces to deal with recurring limited crises (e.g., over Berlin) where an immediate resort to nuclear weapons would be judged neither politically nor militarily rational. If those non-nuclear capabilities are not available, the Soviets will be encouraged to a more aggressive policy and allied agreement to a firm response will prove more difficult to obtain when Communist pressures materialize.

In particular, the forces in the Central Region should be strengthened. The immediate objective should be to develop a capability to stop Soviet attack short of a major mobilization of Communist forces, rather than to defeat in non-nuclear action every conceivable element of Soviet non-nuclear strength that might come into play. The urgent goal, therefore, is to create forces in the Central Region of the order of magnitude of MC 26/4. Supporting air will be an important requirement; special attention should be devoted to ensuring that NATO aircraft are so protected, dispersed, and armed as to be ready to discharge their non-nuclear missions instantly and effectively, in the face of non-nuclear attack. It is equally urgent that allied forces be raised to high quality standards. There are many specific deficiencies of a magnitude that not only leave NATO's non-nuclear posture dangerously weak, but also reduce the effectiveness of measures currently being undertaken.

The US should be forthcoming and unremitting in setting forth the factual basis for its judgment of the need for non-nuclear force improvements suggested above. We should, accordingly, provide our NATO allies with more information on nuclear and non-nuclear forces and strategies than we have in the past; and we should do so on a continuing basis. Our presentation should emphasize in a positive manner the benefits which NATO would derive from having adequate non-nuclear strength and should show why alternative policies are less suitable. Our allies cannot be expected to behave as responsible partners unless they are treated as such, within a framework of candid discussion of NATO forces and strategy. The program of discussions should include full treatment of not only the probable effect of non-

*nuclear improvements but also (i) US strategic striking forces, stressing the great strength and operational effectiveness of these forces, and the fact that the plans for their use cover European as well as North American interests; (ii) the role and probable effect of using tactical (interdiction and battlefield) nuclear forces in Europe, conveying our present understanding of the dynamics of nuclear warfare, which suggest that a local nuclear engagement would probably do grave damage to Europe, might be militarily ineffective, and would more likely than not expand very rapidly into general nuclear war. It is essential that our allies understand the limited advantages to them of tactical nuclear warfare if they are to give needed support to the non-nuclear build-up. It is also essential that this discussion be properly balanced by a full exposition of superior US strategic nuclear strength, so that it will not cause our allies to question their security in the period before non-nuclear improvements are achieved.*

The US must evidence its dedication to non-nuclear improvements by deeds, as well as words. We should maintain substantial ground and tactical air forces in Europe. We should be prepared to provide modest military aid to the NATO non-nuclear build-up; with the exception of Portugal, Greece, and Turkey, such aid should not be provided unless it would result in increased allied efforts. We should consider contributing to a multilateral NATO stockpile of non-nuclear military equipment, providing that our allies are willing to make proportionate contributions, and if it seems that this would result in allied force increases that would not otherwise take place.

14. *NATO Nuclear Forces.* Even with a non-nuclear build-up, nuclear weapons will remain central to the security of Europe. If our allies are to feel secure, therefore, their major concerns in the nuclear field must be met in some degree. The US should seek to respond to the allied nuclear concerns set forth below in a way which (i) discourages national nuclear capabilities, since their divisive political effects work against achievement of cohesive European and Atlantic Communities; and (ii) gives maximum assurance, consistent with the foregoing of continuing US participation in the planning and control of non-US nuclear forces and centralized nuclear command in the military field:

(a) In response to allied fears that the US will “de-nuclearize” NATO Europe, by withdrawing all tactical nuclear weapons: We should be prepared to fulfill the substantial programs for development of tactical nuclear weapons in Europe to which we are already specifically committed, if our allies desire to complete these programs. These programs will largely meet present European expectations (except regarding MRBM’s, which are treated later); they will link the conventional defense of Europe to strategic nuclear forces outside the continent; they will help to deter any rational Soviet initiation of tactical nuclear warfare; and they will leave the Soviets sufficiently uncertain about our use of tactical weapons to make massive ground concentrations unattractive. We should stimulate and join periodic allied review of

*these programs to determine (i) whether they are still needed in the light of the strategy outlined above and a changing military environment; (ii) how execution of such programs can be geared to the goal of ensuring that nuclear weapons remain under firm control before and during non-nuclear and nuclear hostilities. We should not assume the costs and risks of expanding these programs in the absence of new and compelling considerations—notably clear evidence that such an expansion is needed to fulfill the above purposes. We should be sensitive to the political implications of discrimination between US and allied forces in the possession of battlefield tactical nuclear weapons and we should make clear that there will be no major withdrawal of such weapons from Europe without full allied consultation.*

(b) In response to allied desires for more information about US strategic nuclear forces and for more participation in the planning and political control of these forces: *We should share information about the nature and intended use of US strategic forces to the maximum extent consistent with US security requirements. We should join in establishing procedures which would afford our allies an opportunity to provide the President with informed political advice concerning the application of agreed guidelines to specific cases and to participate in planning regarding these forces to the extent feasible and consistent with US security.*

(c) In response to allied desires that specific US external forces be available to NATO in wartime, and that targets of direct interest to Europe be adequately covered: *We should maintain the commitment of Polaris submarines to NATO, announced at Athens. The possible commitment to NATO of additional US external strategic forces, including forces earmarked for use against targets which directly threaten Europe, should be the subject of continuing study.*

(d) In response to rising desires for a larger European role in the ownership, control, and manning of major nuclear forces and for greater independence in nuclear matters: *The US should be prepared, if its allies desire to add MRBM's to alliance forces and to participate in their deployment, to assist in creating a multilaterally owned, controlled, and manned sea-borne MRBM force, although it should make clear that it does not believe that an urgent military need for MRBM's exists. The use of such a force would be determined on the basis of guidelines and procedures agreed between ourselves and our allies. Planning for the use of such a multilateral MRBM Force should assume that it would be employed within the NATO framework, in integral association with other alliance nuclear forces. Construction of a force along these lines should not imply, therefore, that the separate defense of Europe was its military purpose or likely effect from a military standpoint.*

*This course may, if our allies believe that control over the multilateral force can be settled in a way which meets their concerns, contribute incentives which would help to postpone or avert the creation of further national nuclear capabilities, notably in Germany, and it might establish a precedent which*

would increase the likelihood of the present UK and French national programs eventually being merged into some kind of multi-national program. This is the more likely to come about if our posture, in the meantime, makes clear that the US is not prepared to assist national nuclear programs, as an alternative means of satisfying allied desires for a greater nuclear role. While responding to allied desires for a multilateral controlled force, therefore, we should continue to oppose and discourage any movement toward a strengthening of national nuclear capabilities in Europe:

- a. By opposing the initiation of additional national programs.
- b. By refusing assistance for the French national nuclear program.
- c. By encouraging the United Kingdom to phase out its independent strategic program in favor of participation in the multilateral program referred to above, and refusing any new commitments for aid to the United Kingdom in maintaining national nuclear and nuclear delivery capabilities.
- d. By refusing to deploy additional MRBM's to the forces of individual European countries, since the deployment would be politically divisive and could tend to evolve into de facto national nuclear capabilities, whether or not the resulting forces were committed to SACEUR.

The creation of a multilateral force may stem pressures for national forces for a time, but the long-term future is more difficult to predict as between (1) the proliferation of national nuclear capabilities including the possibility of Franco-German collaboration; (2) the creation of a European Community nuclear force of modest size; (3) the posture outlined above, with possibly a NATO multilateral force helping to deflect pressures away from both national nuclear forces and a solely European nuclear force. Our objectives, if a choice between these three alternatives emerges, should be governed by the broad policy objectives laid down in the third sentence of paragraph 14.

15. *Partnership in the Free Community.* With a greater sense of confidence in its military security—and of participation in its own defense—Europe should be prepared to enter systematically into an expanded partnership with the US and Canada in meeting the problems of the rest of the free community. To this end, the consultative processes and machinery of the OECD—and, more specifically, NATO which has lagged behind the OECD in this respect—should be strengthened so that the Atlantic nations may come increasingly to have a sense of participation in the making of policy in political, economic, and defense matters, and so that there may emerge the outlines of a broad common policy. The difficulties of identifying and agreeing upon the common interests underlying such a policy will be very great, and should not be under-estimated. Ad hoc meetings among responsible policy-making officials at the ministerial or sub-ministerial level should be encouraged, to permit small groups informally to discuss well-prepared subjects which are really relevant to the problems they are coping with in their capitals. The US should be prepared, in this connection, to consult early and

*in depth with its major NATO partners on major foreign policy matters which we see arising in the immediate future; and we should make our senior officials available for NATO, no less than OECD committees. The US should also study the possibility of changes in the existing NATO international structure, in order to create a mechanism for expressing the common interests of the Atlantic Alliance as a whole. The existing NATO planning group (APAG) can make a major contribution to this end, and the US should work actively to strengthen it.*

16. *Policy Toward Third Areas.* This process of consultation should aim, in particular, at the gradual development of a common perspective on the problems of the free world community in extra-European regions. The European nations tend still to look at Asia, Africa, and the Middle East in the light of certain historic national interests and commitments just as the US, for historic reasons, looks on Latin America and the Western Pacific in special perspectives.

At the present time there are wide and dangerous discrepancies of view among the major Western allies with respect to Southeast Asia. These could split the alliance if in that area we faced an acute showdown with Communist China. Similarly there are awkward cross purposes in alliance policy toward the Middle East, Africa, and Latin America which reduce the over-all effectiveness of the free community's policy in those regions and open up unnecessary opportunities for Communist exploitation.

*A concerted effort must, therefore, be made to align somewhat more closely the perspective of the Atlantic Community on Asia, the Middle East, Africa, and Latin America, if common strategic, political and economic policies are to be executed.*

17. *The Goal.* We should aim to create, out of a protracted effort at consultation and consensus-building, a relationship between the Atlantic Community and the less developed areas of the world which will transcend and encompass the ties between the former metropolises and their erstwhile colonies or areas of special interest. On the basis of that relationship—which would still permit areas of special national interest and involvement—an authentic partnership between the more developed and less developed portions of the free community might gradually emerge.

18. *Economic Relationships.* Joint action in the economic field is needed both to accelerate growth in the Atlantic countries and to achieve a new relationship between the industrialized and the less-developed countries of the free community. The OECD provides a framework for consultation and joint action in the economic field to this end, which must be exploited if the Atlantic nations are to use their full potential in building that community. The OECD should, therefore, be used to promote economic growth, financial stability, and external payments equilibrium and to encourage greater freedom of movement

*of people, goods, services, and means of payment. The net result will be more effective allocation of effort and higher rates of growth, which are needed to fulfill the defensive and constructive tasks outlined in Chapters I and II. To these ends the OECD should be used:*

*a. To expand trade, in concert with GATT, on a multilateral non-discriminatory basis by drastic across-the-board reductions in tariffs and by the elimination of non-tariff obstacles to trade, and to concert on steps regarding production, trade and pricing of surplus agricultural commodities. Progress along these lines will create an atmosphere in which it will be easier to agree on reductions in restrictions on imports from less developed areas. In addition, as has been suggested, the strengthening of economic policy coordination in the OECD, with special regard to trade, will help to convince non-EEC countries that the OECD provides an acceptable alternative to EEC association, at least in the short-term.*

*b. To increase efforts to reduce restrictions on the movement of capital.*

*c. To coordinate monetary and fiscal policies, so that countries can pursue expansionist domestic economic progress without undue fear of generating imbalances in international payments, and to help correct inequities in the burdens borne in common enterprises of the free community as they come to rest on the balance of payments position of particular nations.*

*d. To increase the magnitude and improve the quality of aid to the less-developed countries, to concert on criteria for aid and on the allocation of that aid as between major needs, and to agree on an equitable sharing of the burdens by a variety of means—including the formation of coordinating groups for receiving aid requests of specific countries or regions.*

*e. A particular effort should be made in the fields of (i) exchange of persons; (ii) two-way contacts between civic, business, labor, and professional groups in the Atlantic and less-developed nations; (iii) educational activities of assistance to less-developed countries; (iv) programming assistance to these countries; (v) research on key problems which are important to the development process; and (vi) technical assistance. The projected OECD Development Center should be made a vigorous center for this sort of multilateral work.*

*Action to these ends in the OECD should be accompanied by effective steps toward the same objectives in such other forums as the IBRD, IMF, the GATT, and the UN. A useful division of labor between the OECD and these four wider forums is emerging and this should be encouraged.*

19. *Japan.* The role of Japan in Asia is in many ways similar to the critical role of West Germany in Europe. Although Japan lacks the domestic political base for contributing as much to the defense of the free community as can West Germany, and the trend of voting has been steadily shifting to the left, its denial to the Communist Bloc and its association with the West is a critically important element in US policy. Our concern with Japan is, however, based only in part on our

desire to preserve within the free community a country critical to the maintenance of the balance of power in Asia and on the importance of US bases in Japan and Okinawa. It is also necessary to engage Japanese energies and resources on a systematic basis so that this powerful nation, moving forward at an extraordinary rate, might contribute substantially to the constructive enterprises of the free community—and thus find a role of dignified world responsibility.

*The process of engaging Japan effectively within the free community should advance on several fronts simultaneously:*

- in Asia itself, where we should seek to involve Japan constructively in the development problems of the whole area from Karachi to Seoul;*
- in intimate bilateral relations with the US; and,*
- as rapidly as European resistance can be overcome, in the common enterprises of the north which fall within the work of the OECD, beginning with the coordination of monetary and fiscal policies related to the international balance of payments.*

*Although Japan should develop a special role with respect to aid for the underdeveloped areas of Asia, its participation in assistance to the development process in the Middle East, Africa, and Latin America should also be encouraged.*

#### C. Extra-European Regional Military and Security Organizations and Relationships

20. OAS. In Latin America the OAS provides us with an important regional instrument, with security as well as political and economic functions. Its development should be given a priority which accords with the special importance of Latin America outlined in Part I, Para. 7. *Within the OAS framework we should aim to strengthen a sense of common mission both to accelerate economic and social progress in the Hemisphere and to defend this region from Communist intrusion. The former task requires increased consultation with our Latin American neighbors, greater use of the OAS as a forum to determine policies, and closer attention to its potentialities as an instrument of economic and social development, along the lines already established by the formation of the Committee of Nine. The latter task involves not merely the isolation of Castro but also the development of a pervasive understanding of Communist techniques of infiltration, subversion, and guerilla warfare and the mounting of national, bilateral, and collective techniques to deal with them at an early stage of their germination, a process requiring a more intimate cooperation among the civil and military arms of US policy, on a country basis, than we normally achieve. After a long period of complacency and neglect, the building of the OAS in terms of these constructive and security missions must enjoy a very high and sustained priority in national policy.*

21. Other Areas. Around the whole periphery of the Communist Bloc from Iran to Korea (excepting Afghanistan, Nepal, India and Burma)

the US is now formerly committed to hold the balance of power and to defend the frontiers of freedom. These commitments are incorporated in a series of bilateral arrangements, as well as in CENTO, SEATO, and ANZUS. The problem of effectively sustaining and maintaining these commitments is a difficult one, since it is impossible for indigenous countries, even with considerable US assistance, to match the non-nuclear forces of the Communist powers or to exert any meaningful defense against the nuclear capabilities of the Soviet Union. This places upon the US prime responsibility not only for deterring major aggression but also for supporting indigenous forces against local incursions—a task which, in the case of exposed countries like Iran, places severe demands upon available US forces.

22. *CENTO, SEATO, and ANZUS.* The efforts of the United States to pool the military resources of the area and to provide a feeling of security through regional alliances have not been wholly satisfactory. The opposition of India to CENTO, the failure of the US formally to join the alliance, the defection of Iraq, and the inherent problems of Iranian defense, have left it relatively weak. SEATO has only one member on the mainland of Southeast Asia; and its Asian members regard the presence of Britain and France in the organization as a dilution rather than strengthening of their security, as well as a presence which inhibits ties with other Asian nations.

Evidently fresh attempts to work out the optimum method for defending the free community beyond the reach of NATO—and for providing a sense of security to the peoples concerned—are required not merely in the light of the unsatisfactory status of CENTO and SEATO but also in the light of the shifting nature of the Communist threat; the changing role of US forces in the defense of these areas; changing military technology; and the changing economic and political requirements of the frontier nations.

*Specifically the US should: (i) strengthen the sense of security of Thailand and Iran, on a bilateral basis with respect to overt Communist aggression; (ii) encourage the development of local capabilities in Thailand and Iran to deal with Communist subversion and insurrection; and (iii) while maintaining fully the Manila Pact as the foundation for the US commitment in Southeast Asia and our bilateral ties to Iran, encourage the members of SEATO and CENTO to engage in wider regional relationships and groupings with respect to non-defense matters.*

*With these shifts in stance, the US should continue, when necessary, to support up-dated efforts through CENTO and SEATO, and should seek other more varied and less exclusively defense-oriented channels of communication—bilateral and multilateral—which may serve to increase the concern of the peoples and leaders of this part of the world for their own safety and progress. Although ANZUS has not played an active role in recent Asian*

*crises, it should be supported as an important political-military link; and we should be prepared to respond to Australian and New Zealand initiatives to move closer to the United States in military planning, equipment of their armed forces, intelligence, etc.*

#### D. North-South Economic Relations

23. *Bilateral Ties.* The bilateral arrangements linking the more advanced to the less-developed nations of the free community are the most powerful north-south economic ties now in existence and are likely to remain so for some time. *We should make a deliberate effort when feasible, to convert these bilateral ties with a particular nation—centered on its development program—into a longer range consortium effort, a technique which may prove increasingly fruitful as a means of mobilizing needed resources and of bringing developed and less developed members of the free community into common enterprises.*

24. *Multilateral Institutions.* *In addition, we should seek to strengthen significant multilateral institutions concerned with the north-south economic relationship:*

*a. Particular attention should be paid to commodity stabilization agreements and other measures which link the industrialized and the less-developed nations in efforts to preserve fair and reasonably stable terms of trade.*

*b. A high priority effort should be made to give the Alliance for Progress the working methods and substance it needs as quickly as possible.*

*c. In the OECD Development Assistance Committee unrelenting US pressure must be exerted to expand the participation of European nations in development planning, to expand their membership in regional or international development organizations, and to bring into equitable alignment the contributions to economic development of the more advanced nations, including the smaller countries of the north, in the form of grants, long-term low interest loans, and technical and educational assistance. Its work should increasingly focus on individual country development programs and be linked to the IBRD, particularly in organizing consortium arrangements.*

*d. We should encourage the more highly developed countries of the British Commonwealth to aid those members making the transition from colonialism and to provide technical, educational and administrative assistance to the newly-independent areas.*

*e. Until alternative solid links are created, the US should back the Colombo Plan Organization, and help it develop as a more substantial instrument.*

*f. We should encourage the French to continue their role of providing resources for economic development through the French Community. However, trends in Africa are likely to open the French Community to non-French aid relationships. The sooner the French can find an alternative world role, relating themselves to the underdeveloped areas on a wider basis, the easier it will be for them to accept gracefully the progressive dilution of*

*the French Community—although it is not US policy to press for this dilution. We should also seek to persuade France that a US aid presence in countries with which they maintain preferential relations is, in fact, in their interest since it tends to counter the charges that France is seeking to perpetuate a monopoly position in those countries, a charge which is dangerous to the political future of the moderate African leadership devoted to cooperation with France. We should press the French to widen the range of their relationships with the underdeveloped areas—as they did by their participation in the Indian consortium. With respect to the special trading relations of the French Community to the Common Market, it is a major objective of US trade policy that the Common Market move toward non-discriminatory relations with the underdeveloped areas as a whole. Any alternative to present preferential arrangements should provide at least equal equivalent benefits to the African countries associated with the EEC, if a dangerous set-back to their development efforts and attendant major opportunities for the Bloc are to be avoided.*

#### E. Regional Economic Organizations

25. *The ECE.* The UN Economic Commission in Europe is a holding operation designed to maintain East-West European contacts at a time when Europe is deeply split on military and ideological lines. *The Free World countries in the ECE should intensify their efforts to expand contacts with the Eastern European countries in line with the policy of diluting satellite ties to Moscow outlined in Chapter V, below; and the US should use every opportunity to promote economic contacts and associations, which, on balance, further this purpose.*

26. *ECLA.* In Latin America the further development of ECLA should be encouraged as a counterpart to the north-south relation on which the Alliance for Progress is based. As development proceeds, an expanding range of opportunities for useful self-help functions should emerge. In any case ECLA remains an important source of indigenous stimulus to the Latin American nations in the field of economic development and development planning. Care should be taken that the Castro regime does not succeed in using its position in ECLA as a substitute means for maintaining and establishing contacts in Latin America following its exclusion from OAS activities.

27. *African Institutions.* The UN Economic Commission for Africa is one instrument for encouraging functional regional development transcending the present Balkanized political structure of that Continent, and it should be used to this end. Organizations designed for sub-regional economic cooperation, such as the Afro-Malagasy Union (and its economic subsidiary, the OAMCE), deserve our discreet support. Although progress is likely to be slow, we should encourage the Africans, through their Economic Commission and by other means, to isolate concrete economic enterprises which transcend present national boundaries. We should be prepared, in principle, to support such efforts.

28. *Asia.* In *Asia—with the revival of Japan and the increased vitality of other Asian countries—we should systematically encourage a network of increased mutual involvement and cooperation. In addition, a purposeful policy of increasing de facto bilateral cooperation with and between the countries of the region should be pursued in the whole area from India to Japan. When this movement acquires a certain momentum we may wish to look to the creation of a Pacific Community for which the US, Canada, Japan, Australia, and New Zealand could provide a nucleus of developed states and around which other states of the area could be usefully grouped for constructive purposes.* Such a grouping might, conceivably, absorb the Colombo Plan organization at some future date. ECAFE, in which India holds a strong position, and which exhibits increasing cohesion and practical possibilities, also deserves our support.

29. *The Middle East.* In the Middle East no UN regional organization now exists, principally because of the Israeli problem, on the one hand, and the deep schisms in the Arab states, on the other. *The chronic Iraqi pressure on Kuwait underlines the urgency of trying to move the Arab states toward some form of collective enterprise in the field of economic development, which might permit a portion of the oil revenues of the area to be used for the development of states which lack oil resources. The US should push this and other regional arrangements which promise a constructive solution to some of the economic and political problems of the Middle East.*

#### F. Worldwide Economic Organizations

30. A wide range of economic organizations exist embracing, in principle, virtually the whole of the world; although, in fact, Communist participation is limited in many of them. Four are of major importance to American purposes: the IBRD, IMF, GATT and the UN. In the context of the problems of the 1960's they are likely to take on an increased rather than a diminished importance.

31. *IBRD.* US policy should seek to expand the special role which the IBRD, supplemented by IDA, has to play in the development of north-south relations within the free community. The IBRD's high standards of technical competence and integrity should be used to exert a degree of pressure for effective measures of self-help in the underdeveloped areas, which it is often difficult for the US to exert bilaterally. Moreover, as the IBRD has moved from a project to a country basis in its view of economic development, it should be used increasingly as a major ally of American policy in the mobilization of additional funds for purposes of long-term aid, through multilateral consortia and through IDA. We should encourage the expansion of IDA, partly as a major instrument for increasing the contribution of the relatively smaller nations of the north to development. American policy toward the IBRD should aim at having that organization assume an expanded role of active leadership in mobilizing resources for national development programs over the coming

*decade. To this end we should encourage close cooperation between the IBRD and DAC.*

32. *IMF.* The IMF has acquired an enhanced importance as the expansion of trade within the free community has exerted pressure to economize and to use more rationally the monetary reserves available. Moreover, since our balance of payments has come under chronic pressure, the IMF has become an institution of the most direct interest to the US. *The creation of the IMF special standby resources of \$6 billion and the undertaking that the decisions on the use of the resources will be taken within the framework of the OECD necessitate the maintenance of close working relations between the IMF and the OECD.* Finally, the IMF is likely to play a critical role in guiding the underdeveloped areas in their monetary and balance of payments problems. In the process of economic development these nations are virtually certain to confront, from time to time, periods of structural imbalance which will be reflected in their domestic and international monetary accounts; and the dispassionate guidance of the IMF, in combination with its powers to lend on short term, is an essential instrument of the free community.

In some instances the activities and recommendations of the IMF in the underdeveloped areas have not been related systematically to those of the IBRD and other agencies for development. Recommendations for monetary and balance of payments reform—without closely related measures to increase the momentum of the economy—may produce political crises, the consequences of which fall back not on the IMF, but upon the US and the free community as a whole. *Accordingly, the US should use its position in, and its influence with, the IMF and the IBRD to encourage those organizations to work more closely together and with the underdeveloped areas in meeting monetary crises in ways which minimize decelerating effects on economic growth.* The exercise of such US influence requires a clarification of doctrine and policy within the government on the relation between monetary stabilization and economic growth.

33. *GATT.* The General Agreement on Tariffs and Trade (GATT) is the principal international instrument which the US and other major trading nations use to negotiate reciprocal reductions of tariffs, to minimize other barriers to trade, and to further the conduct of trade on a multilateral, non-discriminatory basis. The number of countries which have become contracting parties to the resulting international trade agreement has grown from 23 to 40, and includes virtually all the major trading nations of the world. *In continuing toward the US goal of expanding international trade through the GATT, the US should engage in negotiations for broad scale tariff reductions on the basis of such authority as the President may secure in the Trade Expansion Act.*

34. *Other Agencies.* With respect to the various United Nations economic and specialized agencies—mainly devoted to forms of technical assistance and

*pre-investment activity—American policy should be pragmatic, supporting an expansion of activities where competence and need have been demonstrated and effecting a concentration of effort on major enterprises, such as the UN Special Fund. The UN Decade of Development provides a context in which these efforts can be accelerated and organized more effectively. The US now contributes about \$220 million annually to the specialized agencies of the UN. AID policy, both in Washington and in the field, should take more systematically into account the manner in which these agencies might contribute more effectively to US objectives as incorporated in our country programs.*

#### G. United Nations

35. *Introduction.* The United Nations is a complex of instruments through which the United States can channel a significant part of its efforts to build a free community. This fact, and the further consideration that the United Nations Assembly and its related activities have evidently moved into a new phase with the sharp expansion in the number of its African members, justifies a fundamental review to determine how we can continue to exercise leadership in the UN in the interests of US foreign policy. In undertaking this review we should bear in mind that:

a. The UN is a point of double confrontation. Here the northern more advanced nations of the free community confront, at once, the southern nations and the Communist Bloc.

b. The range of issues on which the UN has some impact through its debates and decisions is broad. For many of these, the UN can provide not only a place of discussion but also a useful instrument for prosecuting more concretely the policies outlined in this paper—playing in some cases a central, in others an ancillary, role.

c. Most issues brought before the UN are relatively intractable or already require emergency security action, since bilateral or other multilateral peaceful solutions have often been tried and proved unavailing before the issue is brought to the UN.

d. United Nations debates and decisions have an impact in varying ways and differing degrees on major issues of security, colonialism, and economic development; the tone of its deliberations and resolutions is a political fact on the world scene of some weight.

e. The temper of these discussions is determined mainly by actions which take place outside the United Nations itself; they reflect the total relative effectiveness of the free community's policy in both its north-south and east-west dimensions. At the same time, United Nations discussions and decisions, because they have an impact on the problems we face, are one of the factors determining the total effectiveness of the free community's policy. The American ability to continue to lead the United Nations—and to bring it to bear on occasions when it is in

our interest to do so—is thus a function of our total national security policy rather than of United Nations policy narrowly defined; at the same time the existence of the United Nations, the uses to which it can be put by us (and others), and especially our ability to obtain United Nations decisions in our national interest are factors which must be considered in establishing that total policy.

36. *Policy.* In the light of these general considerations, the following appear to be the main implications for United States policy towards the United Nations of the broad strategy proposed in this paper:

a. *Political Stance:* We should attempt to dramatize systematically the three elements in our national policy which tend to bind us to the southern half of the free community: our authentic support for national independence; our willingness to assist serious efforts at economic and social development; our eagerness to press forward with serious efforts at the control of disarmament and other pacific enterprises of substance.

b. *UN Effectiveness.* In keeping with goals (e) and (f), below, we should seek to develop the effectiveness of the United Nations as an institution and thus increase international reliance on multilateral institutions as an alternative to the use of force. To this end, we should continue our efforts to maintain the Office of the Secretary General and the independence of the Secretariat, so that United Nations activities can be competently discharged.

c. *Modernization.* In the context of the Decade of Development we should use the United Nations, where feasible, to promote development objectives in less developed areas, e.g., through United Nations aid to African education, United Nations food surplus disposal, the Special Fund, etc. Such initiative will give a measure of United Nations context to our total efforts to assist the modernization process.

d. *Decolonization:* The United Nations has a varying but significant role to play in each of the three dimensions of the decolonization process detailed in Chapter II. The countries more recently emerged from colonial status, almost without exception, consider the United Nations to be a principal arena in which to speed up the process of decolonization, and to assist new countries in their early stages of independence, and they use it as such. *To moderate the process of decolonization we must act effectively in the United Nations both in terms of policy and in employing United Nations machinery to help preempt the filling of any vacuum which decolonization may leave and which the USSR might otherwise seek to exploit. Because of the impact of decolonization on our basic national interests, we should also encourage our allies from the Atlantic Community to participate in UN activities affecting decolonization and, where necessary, to abandon outdated policies.*

e. *The Dampening of Latent Crises.* In conformity with the precepts of the UN Charter, we should seek by forehanded action to temper conflicts within the free community, whether bilaterally, through the Secretary General,

or otherwise, and to minimize the number of disruptive issues capable of Communist exploitation when publicly debated. Every success of this sort would not only strengthen the free community but also lessen the strain placed on the UN and other institutions. While in the circumstances we were fortunate to have the UN as an instrument through which to deal with the Congo crisis, the fact that the UN had to undertake so complex and precarious an operation reflects a prior failure in the policy of the free community as a whole—notably its northern component.

*f. Peace-keeping Machinery.* We should work to strengthen the UN peace-keeping role by improving its procedures for peaceful settlement of disputes and by making more effective its stand-by arrangements for sending UN observers, patrol forces, and political “presences” to meet emergency needs. In national security planning to deal with existing or potential free community peripheral area problems we should seek to determine where (as in West New Guinea) a UN presence or peace-keeping role could be helpful in achieving our objectives in one or another stage of the problem. Such efforts both reduce intra-free community conflicts and provide a buffer against direct East-West confrontation. We should encourage the tendency on the part of countries in Middle Eastern and African areas, in particular, to seek United Nations assistance in developing regional arrangements for keeping the peace and/or controlling arms competition.

*g. Direct East-West Confrontation.* While the United Nations has an essentially ancillary role on major security issues in conflict between East and West, (e.g., Berlin, Laos, Viet-Nam, and so forth) it can, nevertheless, serve as a safety valve, a buffer (as in the cases of Iran, Greece, and at one point in Laos), and a means of communication. It can serve as a court of world opinion and a convenient point of diplomatic contact and a locus of negotiation to resolve an issue (as in Berlin in 1948–49) when desired by both sides.

United Nations inspection or administration of agreed and limited public order or transit services (such as might be considered for West Berlin) remains a general possibility. Given any kind of overall or regional disarmament agreement, United Nations inspection or administration might assume substantial proportions.

Commitments to the Charter can provide a framework, as in Korea, through which action can be taken to repel a direct aggression. While the technology of modern war has telescoped the time-span within which such action would need to be taken, the United States would undoubtedly again wish to mobilize through the United Nations major diplomatic and possibly military resistance in case of conventional overt Communist aggression and, possibly, even in the case of well-documented covert aggression. The United Nations can also be a place through which cooperation for mutual interests across ideological barriers can be carried forward—as in the Scientific Committee on Radia-

tion, the Committee on Outer Space, and in some of the Specialized Agencies.

*U.S. policy should seek to exploit the potentialities of the UN in the areas of East-West confrontation indicated above.*

*h. Maintaining Positions of Principle in the United Nations. We should be prepared to underline our commitment to policies which are essential to building and protecting the free community, even at the risk of running against current moods and habits in the United Nations. We should stress our unshakeable commitment to provide for the security of our own people and the peoples of the free community by means consonant with the UN Charter; and to reject disarmament proposals that do not provide for effective mutual inspection or other forms of secure assurance. We must press upon the UN the need to avoid a double standard in applying the principle of peaceful change to the strongly felt interests of the north and of the south. If we were ever to adopt a position which did not reflect these essential interests, northern support for the UN—including US support—would be quickly reduced and the life of the UN itself be endangered.*

*i. Means of Exerting U.S. Influence. We should examine carefully present voting patterns, the balance of forces in the Assembly and the Security Council, and the present operations of the Secretariat to determine the best ways of exercising maximum US influence or control over UN decisions and actions; for example, to determine whether our very great influence in the Secretariat now exercised chiefly through informal procedures will continue or whether we will need to seek more formal means to increase our influence; whether Assembly procedures can be improved to our benefit; whether we should now shift more powers back to the Security Council; what steps we can take to insure stable financial support from other countries, etc.*

#### IV. Relations With Communist Regimes

##### A. Introduction

1. *Purpose.* One basic purpose of the national strategy outlined in this paper is to shift the emphasis—both within the government and in the consciousness of our people—from the problem of frustrating attempted Communist incursions to the problem of how to exploit opportunities open to us in building and extending a community of free nations. This strategy rests on the intimate relationship between these two problems and, in particular, on the judgment that a positive and constructive policy towards the free community will diminish the opportunity for Communist action or incursion.

But the positive thrust of this strategy extends to our relations with the Communist nations themselves. For policy towards Communist regimes seeks not only to maintain the frontiers of freedom and build a community of free nations but also peacefully to extend this community beyond the present frontiers of the Cold War. The succeeding sections

consider the implications of this policy for our relations with (i) the USSR, (ii) the European satellites (iii) Communist China, and (iv) Communist ideology. In carrying out this policy, we should bear in mind that the success or failure of Soviet foreign policy is a critical determinant of Soviet evolution and that the defense of the free community is thus perhaps the most important way of inducing changes in Soviet society.

2. *The Situation.* In so doing, US policy towards Communist regimes (and the peoples they rule) must take account of two differing trends, which significantly affect the nature of the confrontation.

On the one hand Communist foreign policy (and particularly that of the Soviet Union) is marked by an assertiveness which derives in part from a consciousness of growing Soviet military and economic power and in part from the continued desire of the Communist leaders to remake the world in their own image. This power-consciousness and assertiveness has manifested itself in continuing political pressures upon the West (notably over Berlin); in demands for recognition of “equality” with the United States; in an extension of Soviet activities as a world power in diplomatic, economic, scientific, and cultural dimensions; as well as in subversive enterprises.

On the other hand, there have been certain changes in Soviet domestic and foreign policy during the post-Stalin period. This trend finds expression in a more realistic appreciation of the consequences of nuclear war and of actions which could escalate into nuclear war; in greater ostensible flexibility in dealing with non-Communist forces; and in sporadic movements towards superficial *détente* with the United States and the West, albeit without any discernible change in underlying Soviet purpose. These limited changes, coupled with a gathering historical trend toward fragmentation within the Bloc and some modest relaxation of internal controls in the USSR and (in differing degree) within the Eastern European regimes, open the way for somewhat wider interaction between the Communist and the non-Communist worlds.

3. *Implications for US Policy.* These trends and developments tend to shape the different (and sometimes necessarily conflicting) directions of US policy.

(a) As long as the Communists and their partisans continue to exert unrelenting pressure upon—and increasingly inside—the frontiers of the free community we must devote a high proportion of our resources and our attention to defending these frontiers. For a sense of security within the free community—and a demonstrated capacity to defend its vital interests—is a minimum condition for its creative development. These requirements for defense, and the political and psychological attitudes they generate, tend to limit the scope for US initiatives

designed to exploit possibilities for diluting the unity and aggressiveness of the Communist Bloc. A consciousness of the two-track policy we should pursue might widen these limits; but they are inherent in the complex character of the confrontation.

(b) On the other hand, the trend toward change within the Bloc may, with the passage of time, open somewhat increased opportunities to try to deal with Communist regimes and the peoples they rule in terms of limited areas in which our national interests overlap with theirs, rather than merely in terms of reaction to their aggressive enterprises. It would be dangerous to assume this trend will automatically work to our advantage; it would be equally unrealistic to ignore its power and its long-run potential for our cause.

## B. *The USSR*

4. *Crisis Avoidance.* Soviet policy remains systematically geared to create and to exploit openings for the extension of Soviet power and influence offered by political unrest, economic sluggishness, diplomatic disarray, and military weakness within the free community. In addition to developing a full spectrum of military capabilities which will make the Communists hesitate to employ force at any level (including guerilla warfare and urban insurrection), we must seek to minimize the emergence of circumstances and situations which permit such Communist pressures and intervention.

As noted in Chapter III, the modernization process in the underdeveloped areas, including the process of disengagement from colonialism, has offered the richest field for Communist exploitation of crises within the free community over the past decade. *A high premium attaches, therefore, in the context of US-Soviet relations not merely to the constructive policy toward the less-developed areas outlined in Section III but also to the timely identification of points of crises and forehanded action to resolve such crises before they lend themselves to Communist exploitation. A systematic effort should be mounted to this end.*

5. *Crises and Pre-Crisis Communication.* To avoid or minimize crises promoted or exploited by the Soviet Union we should seek continuing communications, informal as well as formal, direct as well as indirect, designed to convey to Moscow, when it is in our interest to do so, a clearer understanding of our intentions. Such communications, if they are judged in Moscow to be backed by both military resources and the will to use them, may move the Communist leadership to judge it unprofitable to press as hard as they otherwise would in certain areas and situations.

6. *Ground Rules.* Against the background of such measures and methods, we should exploit any opportunity to work over the longer run toward such tacit understandings with the Soviets regarding the ground rules governing our competition as may be consistent with our national interests. If they are

convinced of our capacity and will to deal with their efforts to extend power into the free community, it may become increasingly possible to make the Soviets feel that they share a common interest with us in the exercise of restraint and in encouraging policies of restraint on nations associated with them.

7. *Crisis Management. When crises with Communist involvement do erupt, our purpose should generally be to:*

(a) *Avoid any net loss for our interests and use the crises, if this can be done within the limitations outlined under (b) and (c), below, for modestly increasing our power position vis-à-vis the Communists;*

(b) *Close out the crises as quickly and with as little violence as consistent with avoiding any net loss for our interests;*

(c) *Avoid being moved either by rising tensions or by the importunities of our allies or of our own public to prolong and expand the crises in an effort to inflict dramatic humiliation on the Communists.*

*Since we must expect a series of crises which the Communists will systematically seek to exploit, it is essential that we not reward this Communist technique by diverting our attention and energies from the long-term policies and enterprises on which, ultimately, the success of the free community and its invulnerability to Communist probes depends. We must, therefore, try to meet immediate threats in ways which, if possible, reinforce the long-term direction of our policy and minimize the diversionary consequences of our reactions to these threats. Thus, the Berlin crisis may be used to help resolve the debate on the role of conventional and nuclear forces in NATO; and the Vietnamese crisis may be used to increase the degree of mutual involvement and support among non-Communist nations in Asia.*

It should be noted that we have generally been at a disadvantage in crises, since the Communists command a more flexible set of tools for imposing strain on the Free World—and greater freedom to use them—than we normally do. We are often caught in circumstances where our only available *riposte* is so disproportionate to the immediate provocation that its use risks unwanted escalation or serious political costs to the free community. This asymmetry makes it attractive for Communists to apply limited debilitating pressures upon us in situations where we find it difficult to impose on them an equivalent price for their intrusions. *We must seek, therefore, to expand our arsenal of limited overt and covert countermeasures if we are in fact to make crisis-mongering, deeply built into Communist ideology and working habits, an unprofitable occupation.*

8. *The Diffusion of Power and US-Soviet Relations.* One of the historical trends which may in time lead to widened areas of US-USSR understanding and common action warrants special policy attention, i.e.,

the diffusion of power and authority away from Moscow, within the Communist Bloc, and away from the US, within the free community. This process presents to both sides the possibility of situations arising in which either a Soviet or an American ally may try to inflame a given situation and thus engage to its own benefit the prestige of the two major powers. *To prevent any such situation from arising and leading to an unsought dangerous direct confrontation should be one of the specific and priority purposes of meaningful US-USSR communication.*

The form of diffusion of power potentially most serious to both the Soviet Union and the US is the spread of nuclear weapons. We have thus far failed to achieve a Soviet-US understanding on the test ban treaty which might have damped the pressure for the extension of nuclear weapons; and evident Soviet interest in further weapons development, together with the attitudes of Communist China and France, make an effective test ban problematic. *Nevertheless, the US-Soviet interest in control over nuclear capabilities of third parties remains a potential area for understanding and agreement in the long run; we should continue to seek a test ban; and other approaches to agreements which would limit the possibility of diffusion of nuclear weapons should be explored.*

9. *The Possibility of a Partial Detente.* For a long time to come it is improbable that mutual awareness of common interests will lead to a cessation of conflict between the US and the USSR. Nevertheless, there may be (and it is in our interest that there should be) agreements on specific issues and, in certain circumstances perhaps, periods in which Communist pressures abate.

We should try to use such periods to build up the habit of meaningful US-Soviet communication, dampen outstanding crises, work toward safeguarded arms control agreements, and move forward with the long-term policies mentioned in paragraph 11, below. While we should welcome temporary and partial accommodations or *détentes* with the USSR, we should not be diverted by them from our long-term strategy. We must seek to indoctrinate our own peoples and the peoples of the free community with a deeper understanding of the issues at stake, emphasizing that while the existence of a Communist regime in the USSR (or China) is not, in itself, an appropriate cause of war, we must be prepared to struggle for a very long time against the attempts of those regimes to impose their systems on other countries. At the same time, we should take account of the playback effects of our statements and actions and seek to avoid unnecessary increases in tensions between the two sides, which will render more difficult the process of communication in crises and non-crisis situations and project to the free community an erratic image of US purposes.

10. *Negotiation.* We must not allow an excessive preoccupation with East-West negotiations, any more than partial *détentes*, to shift the main focus of our policy from the building and defense of the free community. We should, therefore, (i) avoid over-dramatizing either the likelihood that negotiations

*will succeed or the consequences of their failure; (ii) maintain a posture in negotiations which suggests that they are a businesslike attempt to reduce the risk of war, avoiding meaningless camaraderie and gestures which imply a more radical change in basic attitude than the realities of the East-West relationship would justify; and (iii) resist pressures for inflating the level of negotiation beyond what is substantively useful.*

*To maintain this balance, we should seek to avoid formal Summit negotiations of the 1955 variety, except where needed business cannot otherwise be transacted. One such case may be where the full authority of the heads of government is needed to halt a chain of military action and counteraction leading straight to war. And there may be instances in which a willingness to proceed to negotiations at the Summit would help consummate a useful agreement. We should seek to develop more informal contacts and exchanges between the President and the top Soviet leadership which would—unlike Summit meetings—be viewed more as a forum for communication than negotiation.*

11. *Exploitation of Long-Term Trends.* Our long-term purpose toward the Soviet Union is to increase the chance of constructive evolution within that society which might eventually move it to participate in the community of free nations. The natural forces of fragmentation within the Communist Bloc, combined with certain trends within Soviet society itself, make this long-run hope not wholly illusory. On the other hand, the commitment to expansion and the habits and institutions geared to Communist expansion are deeply ingrained; and, therefore, we cannot permit these long-run hopes to lower the level of alertness of our defenses, nor should we work along these lines with any hope of early, dramatic success.

Nevertheless, these historical forces are real enough for us to move in the directions indicated below.

None of this may be productive. Clearly we do not have such a good chance of success through such efforts that we can relax our efforts in other directions. We cannot expect Soviet society, which is also Russian society, to lose quickly the hostile and dangerous features that stem from the Communist philosophy and Russian history. But our effort to build a community of free nations would be incomplete if it did not include some steady, patient efforts towards this long-term goal:

a. *We should maintain continuing pressure on the USSR to expand exchanges of persons on equitable terms and to reduce restrictions on the flow of information, and we should exploit to the maximum opportunities in this field which are open to us. It may be somewhat difficult for Soviet leaders to maintain a stable repressive system in the face of widening exposure to outside influence.*

b. *We should press for cooperative ventures in such fields as outer space, Antarctica, public health, and peaceful uses of atomic energy. Such ventures*

might give the Soviets an expanding vested interest in respectability and perhaps even induce some of their officials to think increasingly in terms of business-like dealings with the West on matters of mutual national advantage.

c. To the extent consistent with our national interests, we should grant to the USSR the position its status as a great power warrants. We should also hold out, by word and deed, the prospect that if the Soviet leaders ever show a genuine interest and will for constructive participation in the community of free nations, this possibility is not automatically precluded. This will not change the basic policy of Soviet leaders now in power, but it may have some moderating effects on their conduct, or that of their successors. It may also make it that much more difficult for the Soviet leadership to persuade its people that any change in the Soviet external posture is precluded by relentless Western hostility.

### C. The Eastern European Countries

12. *The Ultimate Aim.* The basic fact about Eastern Europe is that, beneath the surface of Communist domination, the Communists have failed to win over any substantial proportion of the people to their side. The underlying dissidence of the area and its potential instability constitute a constraint on Soviet aggressiveness and a basis for long run hope that the free community might be extended beyond its present European limits. *We wish to see these nations of Eastern Europe eventually become members of the free community of nations by a process of peaceful evolution.* Leaving aside the possibility of chaotic disruption of the Communist Bloc, generated out of its own dynamics or a major war, the likelihood of their doing so will hinge largely on the emergence of a Soviet policy which would make acceptable to Moscow a protection of Russian security interests by means other than intimate Moscow domination of the inner political life of the presently Communist states. In turn, this result depends on: a conviction in Moscow that the West will remain strong and unified; a continued failure of Communism in Eastern Europe to attract the loyalty of its citizens; a persistence of the historic attraction of Western Europe in the East; and an evolution of Soviet society towards a policy at once less imperialistic and more concentrated on problems of Russian welfare. At best, all of this will, evidently, require time; and the outcome is not pre-ordained. Nevertheless, it is in the U.S. interest to encourage this historical process; and the balance of this section discusses certain limited means for its promotion.

13. *The Policy of Penetration.* *We should try to widen contacts between the peoples of Eastern Europe and the West at every level.* Such contacts will bring home in some way, however muted, the message that history does not inevitably decree that Moscow will forever dominate their lives. That message may encourage those peoples to press their governments, insofar as they safely can, for gradual internal liberation and for steps toward greater national independence.

14. *Relations with the Eastern European Regimes.* Contacts between the West and peoples under Communist rule will generally depend on the consent of their governments. That consent will hinge, in part, on the nature and apparent intent of the contacts which are being proposed. *Our contacts with Eastern Europe should not, therefore, appear to these governments to reflect an intent to create dramatic political changes in Eastern Europe.*

*When occasions arise on which our silence might be misinterpreted, however, we should make clear that the community of free nations is intended, in the long run, to include the peoples of Eastern Europe, and we should not hesitate to articulate our faith that history is on the side of national self-determination in that region as elsewhere.*

*Our contacts with Eastern Europe may also depend, in part, on how strongly the U.S. is criticizing the regime in question. Our experience with Hungary has shown the difficulty, at least in this case, of expanding our cultural, information and economic penetration into a satellite country while simultaneously strongly castigating its government. While we cannot be expected to endorse or applaud these governments, there may be certain occasions when it will be in our long-run interest somewhat to mute official attacks at least temporarily. This balance of interests is a delicate one, but it must be made; its results may well vary from case to case.*

*Moreover, the nature of the contacts themselves must be carefully assessed. In some cases, the interests of the U.S. and the Communist regime clearly converge; e.g., in programs for training young government officials in the West. In other cases, the Communist regimes clearly intend to acquire information while insulating the officials involved from corrupting Western contacts; e.g., in certain scientific and technical contacts. Here again a careful calculus of the net advantage to the U.S. must be made.*

15. *Relations Between Eastern and Western Europe.* Western Europe has a special role to play in this process. As its integration and economic progress proceeds, Western Europe's pull will increasingly be felt in Eastern Europe. *We should encourage and assist the Western European nations to exploit any tendencies toward closer relations with the West among the Eastern Europeans and should, so far as practicable, endeavor to develop mutually supporting programs for peaceful penetration.*

16. *Special Cases Among Communist Regimes.* Within this general framework, our policies toward East European countries should be modulated individually to meet variations in the opportunities to achieve our aims.

a. Poland and Yugoslavia offer special opportunities. *It is our interest that Poland maintain as much freedom from Soviet control as possible; that Yugoslavia preserve at least its present independence; and that both evolve domestic politics and institutions which give enlarged freedom of individual*

*choice to their citizens. We should be prepared to furnish limited economic aid to these ends, and we should increasingly encourage Western European nations to do the same, bearing in mind, however, that both economies are now beyond the stage where substantial aid—except possibly for foodstuffs—is justified.*

b. Albania is a special case, although it reflects a deeper more fundamental situation: the progressive assertion of differing—not to say divergent—interests by the national Communist parties within the Bloc. *It is in our interest that the breach between Albania and the USSR continue. Ultimately, we should hope that Albania would return to the community of free nations. For the time being, however, our interests would be best served by Albania's remaining a bone of contention between Communist China and the USSR, while stabilizing a position of independence in Europe and improving its relations with Italy, Greece, and Yugoslavia.*

c. East Germany is a problem of particular importance. To indicate that we regard the division of Germany as permanent would be to shake West German confidence in the West and thus jeopardize effective German participation in the European and Atlantic Communities. On the other hand, it will probably not be possible to insulate ourselves from dealings with the East German regime over the long term. Such dealings need not preclude ultimate reunification, and might, if effectively conducted, accelerate the process.

*In line with this assessment, we should not grant official recognition to East Germany, nor expect the West Germans to do so. We should be prepared to do business with the East German regime, as the need arises, on a technical level—much as the West Germans do. We should encourage the West Germans to take a more forthcoming and confident view of such relationships between the U.S. and East Germany, and to expand rather than contract their own contacts with the East Germans. We should make clear our dedication to German unity, our expectation that it will come about, and our belief that it can best be achieved by peaceful processes based on the growing attractiveness of association with the free community.*

17. *Uprisings in Eastern Europe.* If revolts break out in East Germany or any other satellite, we should bear in mind that our grand design is to build a community of free nations which will expand by its inner strength and attractive power when combined with the assertion of increasingly nationalist trends within the Communist Bloc. We do not wish to jeopardize this design by causing Eastern Europe to become a battlefield between ourselves and the USSR, unless we are attacked. Accordingly:

(a) *We should refrain from encouraging or supporting armed uprisings, as distinct from peaceful demonstrations, strikes, and similar means of exerting public pressures against Communist regimes.*

(b) *If turbulence erupts in the area, we should maintain a posture of restraint, and urge our allies to do the same, meanwhile exerting all the*

*influence we can muster during such crises to yield less repressive and more nationalist regimes as the outcome.*

*(c) Should a non-Communist or national Communist regime be established we should make a maximum effort short of military action to assist its survival.*

*While these guidelines should govern our actions toward Eastern Europe, we require capabilities which would permit us to choose whether to adopt a more active policy in the event either: (i) Bloc aggression has created circumstances in which we had decided to apply counterpressure in order to halt Communist aggressive armed initiatives in Europe or possibly elsewhere: (ii) forces beyond our control had created such widespread and prolonged chaos in Eastern Europe that an active U.S. role seemed likely to involve less risk of general nuclear war than a passive one.*

#### **D. Cuba**

*18. Basic Considerations. It is our interest that the control of international Communism over Cuba be eliminated and an independent Cuba returned to the OAS.*

Cuba represents a special case of Communist penetration of the community of free nations through the capture of an indigenous and popularly accepted revolution. For the first time, the Sino-Soviet Bloc is openly in a league with a Communist government thousands of miles from its perimeter. While distance and the personality of Fidel Castro present some problems for the Sino-Soviet Bloc, Cuba is a useful and willing instrument of Bloc foreign policy and as such poses a series of potential and active threats to the peace and security of the hemisphere:

*(i) a potential threat as a Communist offensive nuclear base against the U.S.;*

*(ii) a potential threat as a Communist offensive base for limited non-nuclear aggression against Latin American nations;*

*(iii) a current threat as a base for indirect aggression against Latin American nations;*

*(iv) a current threat as an example of the possibility of creating and holding a nation under Communist rule in this Hemisphere, enflaming and strengthening the Communist forces and their allies in Latin American nations.*

*19. Action. Contingency plans should exist against (i) and (ii). Existing efforts to counter (iii) should be pursued at high priority and with great urgency, and contingency plans should exist for action on the basis of OAS resolutions if firm evidence of Cuban involvement in indirect aggression is established. The threat of (iv) increases the urgency of the Alliance for Progress program and of the effort to detach the political movement for progress and reform in Latin America from Communist influence.*

### E. Communist China

20. *The Situation.* The situation of Communist China can be characterized essentially as follows:

a. The Chinese Communists have pursued an internal policy designed to give them, in the shortest possible period of time, the domestic resources required for great power status on the world scene. That effort, which was marked by numerous management shortcomings and which systematically neglected the human incentives and technical requirements for Chinese agriculture, yielded in 1961–62 a major crisis damaging to the industrial and foreign exchange position of Communist China and its military potential, as well as to its food supplies.

b. In the face of this crisis the Chinese Communists are, at the moment, seeking to maintain a position of fully independent authority and leadership within the Communist Bloc. They are in conflict with Moscow on military policy, economic policy, control over other Communist parties, and on basic ideological issues as well.

c. While thus weakened at home and engaged in a deadly serious political struggle with Moscow, they are maintaining their aggressive stance toward the U.S. and supporting pressure on the free community at a number of points in South and Southeast Asia, as well as less directly through their influence on other Communist parties. On the other hand, they have increased substantially their trade agreements with other parts of the free community.

d. In general, they have made clear that in the face of their present difficulties they do not intend to surrender any of their essential policy positions with respect to either Moscow or Washington. They have not been prepared to make any significant sacrifice of major political and strategic objectives to increase their chances of entering the UN or to acquire food supplies from the U.S. or the West.

21. *The Stick.* It is not clear whether a Chinese Communist state will ever evolve which is willing to live in reasonable harmony within the free community; if that evolution should take place, it will be a slow and uncertain process. *We may be able to enhance the chances of such evolution by making clear to Peiping, Moscow, and friendly countries that our objectives in the Far East are the same as elsewhere: We will use force to deter or deal with the Chinese Communists' military or indirect aggression wherever it occurs; we will not otherwise ourselves initiate aggression against Communist China; but we may not be content to meet Chinese Communist harassments of the free community, if these harassments expand, wholly within the borders of that community. The programs suggested elsewhere in this paper will give us a capability for directly harassing Communist China if Chinese Communist aggression should expand; any proposals for specific*

*enterprises should be carefully judged, however, in the event of such expanded Chinese Communist aggression, with respect to risk and to their net consequences for the national interest.*

22. *The Carrot. Concurrently, we should leave ajar possibilities for expanding commercial, cultural and other contacts with Communist China, by making clear that the bar to the entrance of Communist China into more normal relations with the U.S. is its basic unwillingness to modify its present aggressive policies. The specific kinds of modification that we would require as the price of more normal relations should be geared to our national interests in the Far East.*

*Thus, within the framework of current policy, and as part of our effort to build a community of free nations we should, as opportunity affords, move towards a posture vis-à-vis Communist China which will place the onus for continued hostility squarely on Peiping and keep open the possibility that, at some future time, Chinese Communist authorities might opt for a policy of less hostility and greater relative dependence on the West.*

Since the present Chinese Communist leadership has a vested interest in having the U.S. appear to the world at large and to its own populace as implacably hostile, we cannot now expect it to cooperate with U.S. efforts towards the ends outlined above. That being so, we must place primary reliance on U.S. actions which are unilateral, in the sense that they would advance U.S. interests in the absence of a ChiCom response. *For example:*

a. *Avoiding provocations, which do not increase the strength of the U.S. and the community of free nations relative to Communist China.*

b. *Pursuing informal negotiations with Communist China on specific matters of mutual concern, as in the Geneva and Warsaw talks from 1955 on, if needs emerge and opportunity affords.*

c. *Opposing Communist China's entrance into the UN in ways which make Communist China's non-inclusion appear to be the result of Peiping's unwillingness to accept reasonable conditions, rather than U.S. intransigence.*

The stance suggested by these actions should have the short-term effect of making clear where responsibility for the impasse with Communist China lies. Over the long run it is barely possible—no more—that it might contribute to the emergence of more moderate policies if a deepening of Communist China's difficulties in feeding its populace and building the industrial base for world power should result in a leadership split or change of regime. In this context it should be borne in mind that the present leadership is aging; that the pressures of the Sino-Soviet dispute are severe; and in the 1960's, the passing from the scene of Mao and the first generation of Chinese Communist leadership may conceivably signal a period of re-orientation in Chinese political and international life—for good or ill.

23. *Taiwan and Communist China.* To gain support for U.S. policy in an area where it is now somewhat unilateral, as well as to advance long run U.S. interests:

a. *We should use our influence and aid to promote the emergence on Taiwan of a political process increasingly based on popular consent, and to support economic development on an effective long-term basis.*

b. *We should work, within the limits which a useful relationship with the GRC will allow, for a dampening-down of the GRC-Chinese Communist civil war. It remains an objective of U.S. policy: (i) to disengage U.S. and GRC prestige from the defense of the offshore islands, if and when this can be done without damage to our position in the Far East; (ii) to persuade the GRC through means which include aid and support for its position on Taiwan; either to withdraw its forces from the islands or to regard the islands as outposts, to be garrisoned in accordance with the requirements of outpost positions, again if and when this can be done without damage to our position in the Far East. We should periodically review the situation to determine whether action to these ends would on balance, serve the national interest—taking into account both the continuing costs and risks of our present position concerning the offshore islands and the psychological effects of a change in that position on the Western Pacific area. We should not disengage in circumstances which would make of this action a signal of U.S. weakness, which would encourage the Communists to further aggression and discourage Asian resistance to such aggression. If there is to be a disengagement from the offshore islands, there might be some advantage in completing it before Communist China detonates a nuclear device (possibly 1963, but more likely 1964), since thereafter it might appear to be a response to Peiping's nuclear progress. The considerations involved here are so delicate, and so difficult to judge in advance, that the issue remains, as it has been for seven years, one which the President must judge in the light of circumstances as they evolve.*

c. *We should make plain our enduring commitment to sustain and defend a free government on Taiwan. We should make clear how, in our view, that government can most effectively influence the Overseas Chinese, and how it can best present itself on the world scene as an attractive counter to the Chinese Communist regime over the long term; and we should actively encourage, from the present forward, intensification of constructive ties between Taiwan and other nations, notably in Asia.*

24. *The Sino-Soviet Split.* These measures may enhance free world cohesion, but it is unlikely that they will prevent Communist China from continuing over the long term to grow in power and from acquiring, perhaps in the relatively near future, a nuclear capability.

This growth of Chinese Communist power may be slowed if the Sino-Soviet split persists at its present level of intensity, since the USSR has apparently reduced sharply its economic and technical assistance

to Communist China, refused to provide nuclear weapons or modern, long-range delivery vehicles, and curbed the release of information on nuclear technology and weapons production. Both directly and indirectly (in terms of assurance of Soviet support), the split may, at least in the short run, decrease Communist Chinese expansionist capabilities—even as it inclines the Chinese to argue within the Communist world the advantages of a more aggressive ideological and foreign policy stance.

The long-run implications of a Sino-Soviet split are even more important. It could give rise to increased factionalism in national Communist parties, weaken the overall thrust of world Communism, and facilitate the emergence of more independent and nationalistic Communist states, especially in Eastern Europe. Although the USSR might be driven by these trends to adopt a somewhat intransigent foreign policy, it is likely that it will at least experiment with a more accommodating policy toward the West, thereby opening up new opportunities for Western initiatives. Thus a Sino-Soviet split—despite the possibilities of competition in aggressiveness as between Moscow and Peiping—is definitely in the U.S. interest and in the interest of the free community.

25. *U.S. Exploitation of the Split. Although there is little that the U.S. can do to promote that split, we should at least avoid measures which might have the effect of healing it. We should, thus, not so openly favor Khrushchev's point of view vis-a-vis the Chinese Communists as to make it difficult for him to justify it within the Communist camp. We should—in the context of the Sino-Soviet dispute as well as for larger reasons—be prepared to encourage Khrushchev's stated preference for negotiation and peaceful settlements over war—but only when, indeed, Khrushchev acts in terms of that enunciated preference. And we should make clear, by deeds as well as words, that any contrary Chinese view is likely to prove unrewarding and self-defeating—recognizing that the character of the Sino-Soviet debate over "Wars of National Liberation" makes it critically important that South Viet-Nam maintain its independence and that the present North Viet-Nam offensive be frustrated.*

We should not become so fascinated with the Sino-Soviet split, however, as to lose sight of the larger prospect: that both states, whether closely knit or not, will continue to wax in strength, and that both will be basically hostile to us though perhaps in different degrees and in different ways. The only effective means of offsetting this prospect will be a continuing build-up of free world strength and cohesion, combined with efforts, when this is in the national interest, to isolate and consolidate any particular areas of overlapping interest between Communist states and the free community which may emerge. That is, in essence, the course proposed in this paper.

#### *E. Economic Policy Towards the Communist Bloc*

26. *General.* U.S. economic policy towards the Communist Bloc should be a function of the general policy objectives outlined in this

Chapter: frustrating Sino-Soviet expansionism, intensifying peaceful penetration of the Bloc countries, and attracting those countries into closer association with a strong and closely-knit free community. *Thus, the U.S. should, so far as is practicable and consistent with the U.S. national interest, encourage expanded economic contacts between East and West, and Bloc participation in international economic organizations in any cases where there is evidence that this participation would be constructive. At the present time—and notably in the light of the actively aggressive Chinese Communist posture towards South and Southeast Asia and Taiwan—this policy is evidently not applicable with respect to Peiping, and it is not applicable to Cuba.*

27. *Policy on Bloc Trade and Aid. Within this context:*

a. *We should oppose economic relations between the Communist Bloc and the free community which directly increase the net military strength of the Bloc, narrowly defined. We should seek a coordinated allied or NATO program for utilization of economic sanctions in cases involving overt or covert aggression by Communist nations.*

b. *We should take steps to avoid excessive dependence of particular nations of the free community on Bloc aid, trade, or services (e.g. shipping and airlines); and where such dependence develops beyond our control we should prepare contingency arrangements which would prevent Communist exaction of a political price by threatening to reduce the flow of Bloc trade, aid or service.*

c. *We should oppose, and where practicable preclude, Bloc technical assistance which would influence particularly susceptible groups in the underdeveloped countries (such as students, educators, labor unions, and so forth) or which would give the Bloc control or major influence over particularly sensitive sectors of the national life, such as communications, transportation, public administration, education, etc.*

d. *We should maintain a regular watch for occasions where Soviet commercial policy, by dumping or other means, threatens to disrupt essential Free World economic arrangements and be prepared to design and mount appropriate countermeasures. We should seek coordinated NATO programs for the accomplishment of tasks (b), (c), and (d)—and thus for preventing countering, checking, or limiting economic penetration and subversion of the less developed countries.*

e. *Within these four important limits, we should be prepared to encourage normal trade between the Bloc and the free community as part of the process of national involvement of Communist nations in the life of the free community. The present and foreseeable proportions of Bloc to non-Bloc trade and aid within the free community suggests that over-all this policy offers—with the exceptions noted above—more potentially significant advantages than dangers.*

F. *Communism as a Revolutionary Force*

28. *The International Aspects of Communism.* Aside from the threat of Soviet or Chinese Communist expansionism, and its nationalist

appeal on the issue of colonialism, there are two other aspects of Communism which merit attention: its ideological appeal, and its potentiality as a revolutionary force.

(a) *Ideology*: To some individuals and groups: Communism certainly carries intrinsic, if deceptive, appeals: an all-encompassing ideology, a concept—however hypocritical—of professed service to humanity, a system of organization and a strategy for attaining political power, a coherence and unity which may serve to prevent social fragmentation, an apparent example and a method of economic progress, and an authoritarianism which the Communists portray as the best way of making that progress. Communism may thus appeal to such groups and individuals because it provides a structured philosophy of life and action within which they can feel at home, because it may appear to them to be the best and swiftest way to organize and guide underdeveloped countries in the process of modernization, and because it purports to represent, in power terms, the “wave of the future” to which it is wise for men and governments to accommodate.

(b) *Revolutionary Force*: These appeals not only facilitate the extension of Sino-Soviet influence but enable indigenous Communists, with or without the support of the USSR or Communist China, to build up revolutionary organizations inside the countries of the free world.

Both these aspects of Communism must be dealt with, but in quite different ways.

29. *The Suppression of International Communism as a Revolutionary Force*. The efforts of the Communists to build up local parties, to infiltrate and weaken local governments, and to organize for internal political or paramilitary action can be checked in part, if the governments concerned employ effective intelligence and police methods, make use of countersubversive techniques, issue counterpropaganda, and adopt measures to expose the extra-national ties of the indigenous Communist parties. The U.S. should assist discreetly in these efforts by making available information about international Communism; by providing training in essential counter-intelligence, counter-subversive and police techniques; and by aiding in the development of effective information programs, overt and covert. It should also endeavor to guide indigenous police activities so that they bear upon the international Communist movement, and not upon bona fide opposition elements which are authentically national in their origins and orientation.

30. *Ideology*: However, the fundamental way to diminish the importance of Communism as a revolutionary force must be to sap its ideological sources of strength by strengthening and improving the performance of the free community in its defensive and constructive tasks. There is no doubt that the goal of the pluralistic community, based upon consent in relationship within and as among nations, commends itself, on balance, more than monolithic conformity to most of mankind.

Communist methods violate the personality of men and of nations; and perception of this fact grows with the passage of time. Despite its appeals, Communism encounters deep human and cultural resistances. Moreover, the institutions of Western democracy have been grafted upon many non-Western societies, and in some cases they have begun slowly to take hold. If we fail of support among free peoples, it will not be because we are moving in what most men consider to be the wrong direction. The ideas and ideals of democracy have wide popular appeal—even among peoples in Communist countries, and even in societies where democratic practice does not effectively match democratic aspiration. If, in fact, we succeed in binding up the northern nations of the world in an effective military and economic coalition; if we prove capable of dealing with various forms of Communist aggression on the frontiers of the Free World; if we make significant and self-evident progress in tasks of construction in the underdeveloped southern half of the Free World, the power of these Communist appeals will wane—notably if the process of fragmentation of the Communist Bloc proceeds and the Communists persist in agricultural policies in underdeveloped areas under their control which slow economic growth, and which leave men hungry as well as trapped within police-state systems.

*In addition, purposeful efforts should be made to project effectively the following specific themes:*

a. *The U.S. and its associates command the resources and the will to deal with any foreseeable Communist military aggression.*

b. *The techniques, resources and policies of the free community offer the opportunity for effective modernization while preserving the independence of nations and a continuity with their historic past and unique ambitions.*

c. *Communism is, in both its techniques and its historical vision, an old-fashioned and reactionary doctrine unsuited to the conditions of the second half of the twentieth century, and the abiding lesson of history is that an international community is most solidly built by the consent of sovereign governments representing a diversity of creeds and systems, just as a stable national society must rest on the consent of individuals judged and treated as dignified, responsible, and unique.*

d. *The underlying humane cultural heritage of nations now under Communist sway still exists and has vitality; and we are confident that, with the passage of time, it will grow in strength and yield changes in Communist societies which will draw them towards the free community.*

## V. THE DOMESTIC BASE

### A. Introduction

1. *Purpose.* The fundamental purpose of our policy is to provide a world environment which will permit our own society to continue to

develop in continuity with its past; but the creation, maintenance, and development of this environment demands much of our economy, our political process, and of the American people themselves. The success of the strategy developed in this paper thus depends on the capacity of the U.S. to sustain a performance at home which reaches deeply into our domestic arrangements and which requires widespread understanding and assumption of responsibility and sacrifice for public purposes by our people.

*B. The Economic Base*

*2. The strength of the American economy is fundamental to the policy incorporated in this paper. The task over the foreseeable future is to reconcile the following basic national objectives in ways which minimize direct government intervention in the economy:*

- (a) Relatively full and well-sustained levels of employment;*
- (b) A growth rate sufficient to meet the domestic and security requirements of our people;*
- (c) A balance of payments position adequate to support the overseas expenditures necessary for national security;*
- (d) A stable price level.*

*3. The Growth Rate. A high rate of economic growth is required of the American economy in the foreseeable future, not because rapid growth itself has inherent virtue but for three quite particular reasons:*

- (a) The U.S. must command a flow of resources which will permit it to deal with its military and other responsibilities on the world scene;*
- (b) The flow of increasing resources must, if at all compatible with national security, provide for an improvement in the standard of life and the quality of our domestic arrangements;*
- (c) An environment of rapid growth and relatively full employment is necessary if the U.S. is to generate rates of investment and plant modernization required for the maintenance of our competitive position and to play our part in adjusting to the trading requirements of the evolving free community: specifically, to permit an acceptance of trade on a liberal basis among the industrialized countries of the north and the absorption of an increasing flow of both raw materials and manufactures from the developing countries of the south. It is difficult to make the needed allocation of resources to international purposes or liberal trade adjustments in an environment of slow growth and chronic unemployment.*

*4. Allocation of Resources. Within the framework of a high rate of growth and of sustained low levels of unemployment the U.S. must be prepared to allocate, for purposes of defense and construction within the free community, an enlarging flow of resources. Unless the arms race is brought under early control the cost of effective deterrence systems and of their development is likely to increase; and over the decade of the 1960's legitimate requirements for assistance to underdeveloped areas will expand if our policies—which aim to increase their capacity to mobilize their*

own resources and to absorb productively resources from abroad—are successful.

5. *Full Employment.* Sustained and significant unemployment will not only make it difficult, as indicated, to make the resource allocations needed to carry out this strategy; it may also sap political morale and cohesion in a degree that would hinder its execution. This will be particularly true if the burden of that unemployment is concentrated in specific individuals, groups, or areas over long periods of time. *In addition to the broader programs for stimulating growth referred to above, specific measures should be devised and pressed as a matter of high priority in order to alleviate this burden—both on the country as a whole and on the specific groups and persons who have borne it longest. Retraining, relocation, counseling, education—all these should be promoted with the special procedures, talent, and resources that we reserve for matters of the greatest importance to the future security of our country.*

6. *Balance of Payments.* The ability of the United States to maintain the policy of leadership in the free community laid down in this paper requires that we continue to generate a large and regular balance of payments surplus in our commercial accounts. The expansion and appropriate allocation of American resources—at home and overseas—cannot be achieved unless the U.S. surmounts the chronic pressure which now operates on our balance of payments position. This in turn requires:

(a) *An increase in the productivity of the American economy in the major export fields and in certain older domestic industries which absorb large amounts of national resources but which have not acquired a satisfactory capacity to generate and to absorb the fruits of modern research and development—e.g., transport, construction, steel, and so forth.*

(b) *Wage policies which are accommodated (with appropriate flexibility in individual industries) to the average national increase in productivity.*

(c) *Price policies which are geared to both domestic and international competition.*

(d) *Systematic efforts to increase American foreign exchange earnings via tourism and exports.*

(e) *International measures designed to economize the free community's gold and currency reserves in the face of the radical expansion in the world trade and to ensure against short-term disruptive movements of U.S. gold and foreign holdings.*

(f) *Execution of overseas responsibilities in ways that minimize their cost to the U.S. balance of payments, and insofar as feasible, do not penalize the individual Americans involved in our operations abroad.*

(g) *Use of sustained diplomatic pressure to induce more industrialized nations of the free community enjoying surplus positions to cooperate in reducing pressure on the U.S. balance of payments.*

### C. The Political Base

7. *Knowledge, Poise, and Confidence.* But more than a full and discriminating use of the nation's human and material resources and a large,

stable export surplus are required. For Americans to live with poise in a world of continuing danger, amidst an inevitable series of crises, under circumstances where progress is bound to be slow and unsensational, requires that a purposeful and sustained effort be made better to acquaint the Congress and people with the contours of the world in which we live, of the positive objectives we intend to pursue, and of progress—even limited progress—towards those objectives.

*Specifically, we should within the minimum limits of national security, attempt to explain with candor the nature of the arms race and the problem of arms control; the inevitability of multiple crises in a world of new nations disengaging or newly disengaged from colonialism, experiencing simultaneously the vicissitudes of modernizing their social and political arrangements as well as their economies, and subjected to systematic Communist efforts to exploit this environment; and the inadequacy of traditional approaches to the solution of international problems. Finally we must project a sense that in this sea of danger and of trouble we have our own positive purposes and operational sense of direction.* This exposition should not be merely in general terms, but in forms sufficiently precise so that step-by-step practical movement forward is recognized and understood. We must generate a national perspective such that we confront the 1960's with a posture of national poise and confidence, and with a sense of forward movement towards well-understood objectives.

*The systematic exposition of the main lines of policy laid down in this paper, in forms appropriate for public presentation, is one means to this end.*

8. *The Projection Abroad of U.S. Purposes.* It is also essential to project abroad a more clear and vivid concept of our aims and of the measures we are taking to move towards them. *The understandable difficulties within a pluralistic society of developing and presenting such a concept make it all the more important that the government act consistently and with vigor to protect a positive image of U.S. intentions, as developed in this paper, and to dissipate the corrosive conception that our policy is defensive, negative, and reactive. The fundamental purpose of information policy abroad should be to dramatize the extent to which U.S. purposes and policies on the world scene overlap and harmonize with those of other peoples and governments. To this end, we should set forth to other peoples the broad goal laid out in this paper; that of creating an evolving community of free nations, in which these nations can fulfill their aspirations for progress, independence, and security more effectively than otherwise. If we can explain our varied and manifold actions in terms of this goal, other peoples may come to see the relation of these U.S. actions to each other and to their own interests; the confidence in U.S. leadership, sense of movement, and basic consensus on broad policy directives which are indispensable within the free community will be strengthened. In general, the purpose of U.S. information policy should be to define and to dramatize the limited but real*

areas of overlapping interest between the United States and other governments and peoples.

#### D. Other Elements of the National Base

9. *Reference to Other Policy Papers.* Many other elements enter into the development of a domestic base which can support U.S. national security policy: the scope and quality of education, the rate of growth of scientific knowledge and applied technology, the modernization and readiness of industrial facilities, etc.

*Pending re-examination of policies with respect to these matters (some of which are already under way<sup>3</sup>), the following paragraphs of NSC 5906/1, Basic National Security Policy, remain in force, pending the review referred to below:*

Para	Subject	Agencies Having Cognizance
57	Internal Security	Justice
59	Mobilization Base	OEP
60	Stockpiling	OEP
61	Intelligence	CIA
62	Peaceful Uses of Atomic Energy	AEC
63	Outer Space	NASC
64	Manpower	Labor and HEW
65	Research and Development	Special Assistant to the President for Science and Technology

*Where these policies are outdated or inconsistent with the thrust of this paper, and are not under review, the cognizant agency or agencies will initiate such a review, for consideration by the National Security Council.*

#### VI. A CONCLUSION

The policy set out here is, in its essence, quite simple. Our goal is to create an international community in which nations can cooperate to achieve their common purposes in freedom—and thus to help shape the world order that emerges from a half-century of war and revolution along lines that will be consistent with our national values and interests. To this end we aim to bind up in closer partnership the industrialized nations of Western Europe and the Pacific and to work with them to create a wider community of free nations, embracing Latin America,

---

<sup>3</sup> For example, the President has directed that an investigation be made of the program for the stockpiling of strategic materials (OEP Press Release, 12 Feb. 1962) and has ordered a review of emergency planning on the continuity of government (NSC Action Memo 127, 14 February 1962.)

Africa, Asia, and the Middle East. We aim to help create in this community an environment of material progress, peaceful reconciliation of differences, increasing social justice, and movement towards the norms of political democracy. We intend to defend this community against Communist aggression and to do so, if possible, in ways which will minimize the possibility that a nuclear war will come about; and we intend to draw the nations now under Communist regimes towards this community as opportunity may offer.

This policy will be pursued in a setting of hazard, tension, and crisis—the irreducible consequences of the weapons men now command; the fact of Communist ambition and power; and the revolutionary forces for change at work in the underdeveloped areas. It will be pursued under circumstances where the nation's will and ability to defend the vital interests of this community in a nuclear age will be chronically tested; and the nation's capacity to deal with swiftly changing circumstances—scientific and human—will be strained to the limit.

It is a policy which requires of us all a sustained combination of courage and circumspection; of initiative and patience; of resolute struggle against Communism and ability to work subtly with processes of change within the Communist bloc.

This policy promises no quick or cheap victory. It requires that we overcome powerful forces of resistance and inertia, if it is to move forward. But it intends that the principles of national independence and freedom shall, in time, peacefully triumph.

This is a policy we can pursue with deep inner confidence. It is consistent with powerful historical forces at work on the world scene; its demands fall well within the material resources available to us and the free community as a whole; and it is rooted in the oldest and most fundamental values and commitments of our society.

Time is on the side of the things our nation stands for, if we use time well.

June 22<sup>1</sup>**

June 22, 1962

**SUBJECT**

Military Force Levels and Nuclear Planning

A current review of the military aid program in Korea (the Cary Report) is being circulated through the agencies for comment. It appears to please no one since it does not come up with an easy solution to the problem of reducing force levels. The Joint Chiefs of Staff have also recently reviewed the matter and have come out strongly for the maintenance of present levels.

I have two observations to make on the matter. The first is that it is highly unlikely that responsible U.S. military authorities will ever recommend a reduction in Korean force levels unless assured of the availability of atomic weapons in case of the intervention in Korea of ChiCom forces in significant strength. With such an assurance, they would be justified in limiting the mission of South Korean forces to off-setting the North Korean establishment. Without that assurance and in the current atmosphere of growing reluctance to consider the use of any nuclears ever, there is no military ground to support a substantial cut in Korean conventional forces.

This thought leads to another, namely, that we should think through the questions of using atomic weapons outside of the NATO area. In connection with Berlin contingency planning, we have made considerable progress in establishing a role for nuclear weapons in the defense of Europe. However, we have not made a parallel study of the conditions for their possible use in the defense of non-European areas. Until some guidelines for these parts of the world are established, it will be difficult to arrive at realistic conventional force levels for either US or MAP-supported forces. Until we have such guidelines, we may anticipate a very conservative reaction to proposals to reduce MAP-supported forces, particularly in countries within reach of Chi-Com military manpower.

I suggest that Secretaries Rusk and McNamara be asked to develop for your approval policy guidelines for the contingent use of nuclear weapons in non-European areas which, after approval, can assist the development of the FY 64 aid programs and the military budget.

**Maxwell D. Taylor**

**273. Memorandum from Gen. Taylor to President Kennedy,  
June 22<sup>1</sup>**

June 22, 1962

In response to your recent request, attached is a memorandum which the Secretary of Defense, with the assistance of the Central Intelligence Agency, the Defense Intelligence Agency, and the Director of the Joint Staff, has written on the relative US and Soviet military buildups since January 1961, and on the probable effect of these relative buildups on Soviet attitudes toward the Berlin situation during the months ahead.

Secretary McNamara's covering memorandum concludes, on balance, that the relative improvement has been in our favor. It also concludes that, for reasons which include the US military buildup, the Soviets during the months ahead, although maintaining a rigid position in negotiations on Berlin, will not make any serious move to break them off.

There is only one point which I would call to your attention. When we complete the release of the reserve units later this summer, our overall military strength figure will fall by about 150,000—from the 2,825,000 which is shown on the last line of Secretary McNamara's first page to around 2,680,000. This will represent the loss, among other things, of two Army divisions, some tactical air fighters, and some naval units. Whether these reductions are to be permanent presumably will be considered in Secretary McNamara's current study on general purpose forces.

You may wish to refer this paper to State for comment.

**Maxwell D. Taylor**

## Attachment

### SUBJECT

US and Soviet Military Buildup and Probable Effects on Berlin Situation

### REFERENCE

General Taylor's Memorandum of 14 June to the Secretary of Defense,  
Chairman, Joint Chiefs of Staff and Acting Director Central Intelligence

General Taylor's memorandum asked for a comparison of the military buildup of Soviet forces with that of United States forces over the past eighteen months and for our views of the probable effect of the current relative strengths on Soviet attitudes toward the Berlin situation in the coming months. I shall treat these as two separate but related subjects in this report which has been prepared with the assistance of the Central Intelligence Agency, the Joint Staff and Defense Intelligence Agency and has the concurrence of the Director of Central Intelligence and the Director, Joint Staff.

### *Forces Buildup*

The size and composition of the USSR's military forces have been influenced importantly by Soviet policy decisions of the past year and a half, in which the Berlin crisis has been an important factor. A programmed reduction in military manpower and in older air and naval equipment was underway in 1960 and had cut total military strength to 3,000,000 men in the first part of 1961. In response to our reaction to the Berlin pressures, the process was reversed in the summer of 1961 by calling some key reserves and delaying the discharge of conscripts in the Fall of 1961. We believe that the force level now stands at about 3.25 to 3.5 million men. The increase in personnel strength seems to have been used to bring existing units up to strength and provide needed combat and service support units rather than to raise the number of divisions. We believe Soviet Army strength is now approximately 145 divisions, of which 79 are at 70% or higher strength and have an immediate combat capability. The remaining 66 vary in strength and training status but are essentially cadre units of 40% or less strength.

During the same period the United States armed forces have been increased by 325,000 to 2,825,000. More significant than the number is the form which our buildup has taken. We have made a major increase in operational missiles, both tactical and strategic. We have filled out skeleton combat units, relieved tactical forces of basic training missions, added needed support units, reequipped with modern weapons, increased mobility, improved the alert status of both strategic and tactical forces, eliminated critical shortages of equipment, and raised

forward stockage levels—in sum, we have put our forces on an increased war readiness basis.

It is difficult to be precise in cataloging specific measures taken by the Soviets and particularly in determining the timing of their moves. However, the Soviets have made important qualitative improvements, notably in mechanizing their ground forces, adding to their formidable submarine fleet, and in expanding their strategic nuclear capabilities. Soviet missile capabilities for nuclear delivery and air defense have continued to increase in the past 18 months, and the tempo of the ICBM program has quickened. At present, the USSR possesses a ballistic missile force capable of delivering massive nuclear attacks against targets in the European area, and a much more limited force of missiles and bombers suitable for attacking the United States.

In sum, we believe that the measures it has adopted since 1 January 1961 mean that the USSR is now retaining ground, air, and naval forces at levels higher than originally planned, while at the same time proceeding with an expansion of capabilities with advanced weapon systems. But, on balance, we believe there is no question that the relative improvement has been in our favor and that the Soviet leadership knows it. I have attached to this report two annexes, one showing, for both sides, strengths and changes in personnel and in key organizations and weapons and another describing measures taken to improve combat readiness in critical categories.

#### *Implications for Berlin*

With reference to Berlin, I feel certain that our improved military position and our firm response to provocation have had a major influence on Soviet attitudes. From the beginning Khrushchev has sought to develop his campaign against Berlin in such a way as to avoid serious risk of general war. At the same time, he evidently believed that Allied concern over a military confrontation would lead the West to compromise its position in Berlin.

While the Soviet leadership has received a firmer reaction than expected from the West, it has been beset with mounting than to resort to major unilateral action, such as a separate treaty. Most likely of all is a continuation for the present of the same rigidity in negotiations without at the same time any serious move to break them off. While this judgment in the NIE is derived from an interpretation of recent Soviet behavior, rather than from any significant body of intelligence data, we feel that it is the best evaluation which can be made at the present time. The chances are good that there will be a new round of Berlin harassments, intended primarily to keep pressure on West Berlin morale and on Western negotiators.

**Robert S. McNamara**

July 1962

274. Memorandum from Gen. Taylor to President Kennedy,  
July 2<sup>1</sup>

July 2, 1962

In connection with considerations of NATO MRBMs, Berlin contingency planning and similar matters, many questions have arisen with regard to the transfer, release and use of U.S. nuclear weapons. For my own guidance, I asked a member of my staff, Major William Y. Smith, to research these matters and give me a paper setting forth the authority of the President and SACEUR/CINCEUR with respect to them. The resulting paper reaches the following conclusions:

*I. The President*

1. The President has authority to transfer U.S. nuclear weapons to allies in the event of hostilities, for release and use under such procedures as the President "deems necessary in the interest of national defense."

2. Although the language of the Atomic Energy Act is not definitive on the point, the Executive Branch has agreed that the legislative history makes clear the view of Congress that the President does not have authority to transfer nuclear weapons to allies in peacetime, except by treaty, or an Executive agreement approved by a majority vote of each house of Congress.

3. The President may define in advance of the event certain contingencies under which he will delegate to a U.S. military commander authority to release nuclear weapons for use by U.S. forces.

4. The President, in time of peace, may make nuclear weapons available for use by a U.S. military commander while withholding the actual decision to use them.

5. *a.* For U.S. forces assigned to NATO, the President will release nuclear weapons to CINCEUR for use as directed by SACEUR on the authority of NAC or NATO member governments.

*b.* For non-U.S. NATO forces to which SACEUR has allocated U.S. nuclear weapons under NATO war plans, the President, in releasing nuclear weapons to CINCEUR, in effect authorizes CINCEUR to trans-

---

<sup>1</sup> Delegation of authority in the transfer, release and use of U.S. nuclear weapons. Secret. 3 pp. Kennedy Library, National Security Files, Meetings and Memoranda Series, Taylor 6/62-8/62.

fer the weapons to NATO members for use as directed by SACEUR on the authority of NAC or NATO member governments.

c. Exact procedures to be followed under *a* and *b* above in reaching a NAC decision to use nuclear weapons have never been officially defined.

## II. SACEUR/CINCEUR

1. In any war in which NATO is engaged, CINCEUR, upon receiving authority from the President, will transfer certain nuclear weapons in U.S. custody to non-U.S. NATO forces, and will release others to U.S. forces. Both categories of weapons would be used as directed by SACEUR.

2. In time of war, SACEUR receives from the North Atlantic Alliance the authority to engage in military operations, and from the U.S. President, via CINCEUR, the transfer of all or part of the weapons allocated for SACEUR use.

3. Thus, if a selective use of nuclear weapons were necessary in support of Berlin contingency planning, the President would release nuclear weapons to CINCEUR for employment by SACEUR as directed by NAC or by NATO member governments.

## III. *Multilateral NATO Nuclear Force, or a European Nuclear Force*

1. Without legislative changes or an international arrangement (as defined in the Atomic Energy Act), the maximum support the U.S. presently could give to a multilateral NATO nuclear force under the law would seem to be agreement beforehand to transfer to NATO, under certain contingencies in the event of hostilities, U.S. nuclear weapons allocated for NATO use. The decision to use the weapons then would be in the hands of the NAC or NATO member governments, and the U.S. President would have only the same degree of participation in that decision as the other heads of government.

2. Without legislative changes or an international arrangement, the maximum support the U.S. could presently give an independent European deterrent force would be agreement to transfer to the force, under specified contingencies in the event of hostilities, some U.S. nuclear weapons, and to abstain from any attempt to control the use of the transferred weapons.

The author of this study has done a conscientious job in arriving at the conclusions enumerated above but, by its nature, the study has no official validity. If you feel that it is important to establish these points in a more formal manner, I suggest that the Smith study be referred to Secretaries Rusk and McNamara for formal processing.

Maxwell D. Taylor

**275. Memorandum from Gen. Taylor to President Kennedy,  
July 12<sup>1</sup>**

July 12, 1962

By a memorandum of January 22, 1962, you asked Secretary McNamara how it would be possible to effect an early return of Army reservists to an inactive status while maintaining the current Army strength in Europe and a strong deployable Strategic Army Force in the United States, both within an end strength for Fiscal Year 1963 of 960,000. By the attached memorandum, he replies in effect that these four desiderata cannot be met simultaneously and that most of the impact of the discharge of the reservists next month will be absorbed by the Strategic Army Force in the United States.

Specifically, Mr. McNamara states that it is possible at this time to return only about 10,000 men from Europe so that, instead of a Strategic Army Force of 245,000 in the United States as planned, its strength will be 213,000—a shortage of 32,000. He indicates that in an emergency, support units might be taken out of Europe if it became necessary to deploy Strategic Army Force divisions into possible combat elsewhere in the world.

*(Comment: At this late date, there is no solution to the discharge of the reservists other than to accept this weakness in the Strategic Army Force. However, it is not a satisfactory situation for a prolonged period. There are only three ways out of this situation: (a) to increase the end strength of the Army to around a million men; (b) to bring home additional troops from Europe or Korea; or (c) to reduce the number of Army divisions from 16 to about 14. The first alternative would require additional funds for the Defense budget; the second and third pose complex political problems at home and abroad.)*

Secretary McNamara also replies to your questions with regard to the possibility of maintaining the combat readiness of the two National Guard division forces after their return to an inactive status. The problem of maintenance of readiness is largely one of keeping the divisions filled with personnel who have had a year or more of Federal service. Plans have been drawn to effect this continuity of experience. However, this will be difficult as the percentage of men who have received the year's active duty training will be down to 50–55% of the full strength of these divisions when they return to Guard status.

---

<sup>1</sup> Taylor's comments on McNamara's memorandum to Kennedy on the readiness of the Strategic Army Force. No classification marking. 2 pp. Kennedy Library, President's Office Files, Def 7/62–12/62.

In order to understand more clearly the status of readiness of the Strategic Army Force during the coming months, I suggest the dispatch of the attached letter to Secretary McNamara.

**Maxwell D. Taylor**

## August 1962

### 276. Memorandum from McNamara to President Kennedy, August 11<sup>1</sup>

August 11, 1962

In response to your inquiry of 12 July, there follows additional information on the status of the Strategic Army Force in the United States.

The proposed distribution of Army strength as of the end of Fiscal Year 1963 is set forth in the annexed table. You will note that the STRAF forces consist of eight combat-ready divisions and a pool of support forces broken down as follows:

STRAF combat divisions:

8 at an average of 14,250	114,000
---------------------------	---------

STRAF support personnel:

In the United States	106,000	
In Europe and SVN	<u>15,000</u>	<u>121,000</u>
Total		235,000

The pool of support forces permits the creation of division forces tailored to meet the requirements of the geographical area in which the division force will be deployed. For example, one type of division force would be used in Europe, and another type of division force used in Southeast Asia. These varying requirements will be met by drawing upon the support pool.

I also wish to point out that we are currently reviewing our use of personnel to see how we can use them more effectively. For example, one of the items on the annexed table is 30,000 personnel in non-deployable units. These units support schools, experimental activities, are in predeployment training, or have missions not directly associated with division forces. We are studying the possible reorganization of these units so that they, or at least a substantial portion thereof, could be used as a part of our STRAF division forces.

In summary, the whole matter of Army strength is under study at the present time in the Department of the Army. We are seeking to make the most efficient use of manpower within the Army's authorized

<sup>1</sup> Provides information on the status of the "Strategic Army Force in the United States" and a summary table of "Army Strength Planned as of June 30, 1963." Secret. 3 pp. Kennedy Library, National Security Files, Departments and Agencies Series, DOD, 7/62-8/62.

strength and to develop the most effective support possible for the 16 divisions which the Army now has. I will have the results of this analysis ready to present to you in connection with our discussion of the Fiscal Year 1964 budget.

**Robert S. McNamara**  
Secretary of Defense

**Attachment**

Summary of Army Strength Planned as of 30 June 1963

USAREUR: 5 divs. and support- ing forces	245,000	
STRAF units on TD	<u>12,500</u>	257,500
USARPAC: 3 divs. and support- ing forces		86,700
STRAF units on TD in SVN		2,500
Panama		8,200
Alaska		12,800
STRAF in U.S.—8 divisions and supporting forces		220,000
MAAGs, Army Security Agency and Misc. Foreign		28,400
Air Defense Command		22,400
CONUS Base (Continental Army Hqs, depots, schools, posts, camps and stations)	174,000	(probably can reduce by 12,000)
Department of Army—Admin. (principally Pentagon)	20,000	
Trainees	54,500	(possibly can reduce by 10,000 reducing trainees)
Students and cadets	24,300	
Combat troops assigned to schools and predeployment training, etc.	30,000	(possibly could have an alterna- tive assignment to STRAF)
Transients	15,500	(use of air may cut by 5,000)

Patients	<u>3,200</u> <u>960,000</u>
National Guard and Reserve personnel on 6 month active duty for training, not included above.	55,000 (in certain types of emergencies may be able to)

---

**277. Memorandum of Discussion, August 17<sup>1</sup>**

August 17, 1962

MEMORANDUM OF DISCUSSIONS CONCERNING THE  
APPOINTMENT OF CHAIRMAN OF SPECIAL GROUP (C-1),  
AUGUST 16, 1962

General Taylor reported he had exhausted the list of available candidates. The only man available who seemed eligible was Mr. Byroade. McCone endorsed Byroade, as did Alexis Johnson. Gilpatric was agreeable but noncommittal. Taylor and Robert Kennedy questioned his stature and the fact that he was not "near" the President. It was then proposed that the Attorney General accept the Chairmanship; Byroade to be Deputy Chairman or Executive Director. This seemed to be agreed by everyone. McCone expressed himself as perfectly satisfied with the Attorney General as Chairman from the standpoint of his ability, his interest and his enthusiasm. However he stated that in his opinion the American public would look upon the Attorney General as one of the most important posts in Government and there existed considerable concern in the mind of the public, and most particularly the business community, of the Attorney General's ability to devote himself to the tasks of his office if diluted by outside activities. He therefore felt that the image of the Executive Branch of the Government would be damaged once it became publicly known, and it would, that Robert Kennedy had, in addition to his tasks of Attorney General, accepted the responsibility for the Chairmanship of an important committee wholly unrelated to his office. Kennedy agreed and decision was postponed for further consideration.

---

<sup>1</sup> McCone's personal notes of the August 16 discussion of the appointment of a chairman for the Special Group. Secret; Eyes Only. 1 p. CIA Files, Job 80B01285A, DCI Memos for Record 4/7/62-8/21/62.

General Taylor and Bundy were very upset over McCone's position, and in a subsequent telephone conversation (overheard by McCone), Bundy stated to the Attorney General that he felt "McCone was completely wrong." This however was not persuasive with the AG.

NOTE: No circulation of this memorandum. Dictated just for my personal file.

**John A. McCone**  
*Director*

---

**278. Letter from McCone to Gen. LeMay, August 22<sup>1</sup>**

August 22, 1962

Dear Curt:

I agree completely with the statement in your letter of August 16, that we should leave no stone unturned to ensure that we understand the threat facing us today and tomorrow, and that our forces are shaped to this appraisal. It is for this reason that USIB spent more time on NIE 11–8 than any recent estimate, and they reached their conclusions after a most exhaustive, impartial, and deep study of every scintilla of intelligence available to the Community. During this process the evidence was also carefully reviewed by the Hyland Panel (the names of the members of which are attached) and this panel in a written report came to conclusions concerning this evidence supporting those reached by the Board of National Estimates and by a majority of USIB.

In view of this, I was obviously seriously shaken by your statement to me that after discussion with General Power, and a review of SAC's estimate, you were reaching a conclusion that the Air Force position, as reported as a footnote in NIE 11–8, although nearly double the agreed position, was low and that you personally were tending towards the SAC estimate. I saw no dissent from this position by either Secretary Zuckert or General McKee.

I was further shaken to have Secretary Zuckert quote numbers of identified ICBM launching sites which exceeded the number of such sites identified by any other member of the Intelligence Community.

---

<sup>1</sup> Ideas on resolving the differences in SAC and USIB estimates of the threat facing America. Secret. 3 pp. CIA Files, Job 80B01285A, ER Files–DCI Chron, 1/1–12/31/62.

The thrust of my report to USIB was to explain your position, to question whether acceptable intelligence existed upon which SAC might base its conclusions, and finally, to propose that another attempt be made to adjudicate this difference. In the ensuing discussion it was pointed out by several members of the Board that such an exercise would probably be futile, that all such attempts at adjudication had failed in the past (USIB examined and unanimously rejected the SAC position twice last year) and that the Hyland Panel, after hearing the SAC presentation during a detailed examination of the evidence over two full days, had been unable to accept the SAC conclusions.

Nevertheless, Curt, I propose that SAC appear before the United States Intelligence Board at an early date to present their estimate and the facts upon which they base their conclusions, and in doing so be prepared to discuss the subject in depth with representatives of the Board of National Estimates and other estimators of the Intelligence Community. If you so desire, the Joint Chiefs of Staff might also be present. I should point out that this procedure is not something that can be done in an hour, but will in all probability take the better part of a day as was the case in January of this year when General Maxwell Taylor and I went through this exercise in Omaha with General Power.

Sincerely,

**John A. McCone**  
*Director*

U.S. OVERSEAS INTERNAL DEFENSE POLICY

*I. Purpose and Scope*

A. A most pressing U.S. national security problem now, and for the foreseeable future, is the continuing threat presented by communist inspired, supported, or directed insurgency, defined as subversive insurgency. Many years of experience with the techniques of subversion and insurgency have provided the communists with a comprehensive, tested doctrine for conquest from within. Our task is to fashion on an urgent basis an effective plan of action to combat this critical communist threat.

B. It is the purpose of this document to provide the responsible executive agencies of the U.S. Government (State, DOD, AID, USIA and CIA) with policy guidance for the employment of U.S. resources to prevent or defeat subversive insurgency and to assist in the development of balanced capabilities for the total defense of free world societies against the threat of internal attack.

C. This document is concerned with the prevention and defeat of (1) communist inspired, supported, or directed subversion or insurgency and (2) other types of subversion and insurgency which are inimical to U.S. national security interests in all countries of the free world, primarily those that are underdeveloped, whether they are pro-Western, or basically neutral.

The scope of this document embraces the range of U.S. measures to assist vulnerable regimes in preventing and defeating subversion and insurgency described in (1) and (2) above. The tactical employment of U.S. Armed Forces in combat operations in direct support of governments under insurgent military attack is outside the scope of this document.

---

<sup>1</sup> "United States Overseas Internal Defense Policy." Printed in part in the print volume as Document 106. Secret. 40 pp. Department of State, S/S-NSC Files: Lot 72 D 316, NSAM 182.

## II. BACKGROUND

### A. *The Pattern*

In one generation the Chinese communists conquered the world's most populous state from within. Lessons learned in this long and complex struggle have been subsequently applied by various political movements in different parts of the world.

Insurgents used Chinese communist techniques against the French in Indo-China during the period 1945–1954. Using the same techniques, Castro with an initial dozen followers took to the hills of Cuba in December, 1956. Twenty-five months later he was able to take over the government.

Operating with a different political motivation, the Algerian nationalists gained their independence from the French through the protracted Algerian War of 1954–1962. In each case, a political movement employing subversive/guerrilla techniques and initially inferior, outnumbered forces, eventually succeeded against regular forces of the established authority which were supported by superior material resources.

There is little question that individuals and groups from various countries of Asia, Africa and Latin America are receiving support and training for subversion, from the USSR and Red China. Whereas in some countries the threat may not be apparent, the evidence is clear that we face a continuing and growing problem.

Although recent history illustrates the successful application of subversion and organized violence, the post-war examples of Greece, Malaya, and the Philippines demonstrate that such movements are not invariably successful. Success in preventing or defeating these movements depends on identifying and understanding the nature of the threat and combatting it with properly balanced action.

### B. *The Factors*

1. The employment of indirect aggression through the use of subversion and insurgency against Free World institutions is related directly to the fact that the world is dominated by two over-whelmingly strong centers of power. These power centers tend to become involved directly or indirectly in most of the critical situations that occur throughout the world. They tend at the same time to muffle any violent confrontation so as to avoid escalation to the nuclear level. On the part of the communists, this has resulted in an increased effort to seek their objectives by subversive insurgency rather than overt aggression.

2. These power centers also confront each other ideologically. Each has a means of reaching into other societies and influencing favorably disposed groups. Conflicting groups in third countries are thus able

to enlist the support of one or the other of these powers. One of the major tenets of communist ideology is the use of revolution and violent action. The ideological confrontation thus favors and intensifies internal conflict in third nations.

3. Social patterns and institutions in most underdeveloped nations are extremely malleable. They are often a legacy of shapeless, frequently illogical political units which are derived, in part, from a colonial past. The disturbance of man's mind and environment caused by the last World War still lingers on in the Cold War. Concurrently a concept is spreading that society is manipulable. These characteristics act to diminish respect for public order, and encourage initiatives which easily cross the line into disorder and violence.

4. Intensifying and exaggerating these factors, and sweeping on with a momentum of its own, a social and economic revolution of great force has been spreading throughout much of the world. Purposefully or otherwise societies are gearing themselves to higher levels of economic and social activity. The necessary substructures inevitably cut into traditions and habits fostered by rural isolation. Rural people crowd into the strange environment of cities that lack for them a satisfactory pattern of living. Social action, like land reform, manifestly alters accustomed social and often political relationships. These are but examples of the manifold ways in which the revolution of modernization can disturb, uproot, and daze a traditional society. While the institutions required for modernization are in process of being created, this revolution contributes to arousing pressures, anxieties, and hopes which seem to justify violent action.

### *C. Classic Models*

It is within this framework that communists have utilized internal subversion and violence during the post-war period. They have failed conspicuously several times, and have entered into numerous skirmishes without marked success, as in Indonesia, India, and Iran. Where they have met with success they have used four different models:

1. Subverted internal institutions or governments (Czechoslovakia),
2. Incited internal rebellion (China),
3. Dominated nationalist revolutions (North Vietnam), or
4. Captured revolutions of popular antidictatorial character (Cuba).

Each of the above represents a breakdown of internal security and demonstrates how vulnerabilities of free societies are exploited by communists.

### *D. Lessons*

The susceptibility of developing societies to dissidence and violence which can be exploited by the communists requires the development

of indigenous capabilities to cope with the threat to internal security in each of its forms. Reasonable stability is necessary for healthy economic growth, and the evolution of human liberties and representative government.

Sheer repression of political unrest seldom does more than buy time. Unless used to political advantage, this time may favor the subversives or their communist mentors. Rebels of today may be the governments of tomorrow unless their grievances where legitimate are redressed by needed reform. Legitimate nationalistic protests for social improvement which can deteriorate into organized violence or be exploited by the communists need not reach this stage if the local government accompanies its internal security measures with appropriate political and other reform action.

There are several lessons to be drawn:

1. An adequate internal defense will require the mobilization of a government's resources and their effective employment through political, social, economic, security and psychological measures. The problem is basically political but requires the full support of the local security forces.

2. It is essential to the U.S. interest that unrest or active dissidence be appraised in terms of causes to achieve a peaceful solution.

3. Friendly governments must be persuaded to take the proper remedial action without relying solely on repression.

4. In addition to attempting to penetrate all levels of a society, communists often infiltrate nationalist and reform movements. They can be prevented from taking over these movements if the government demonstrates political wisdom and maintains internal security.

5. The primary purpose of internal defense programs is to deal with and eliminate the causes of dissidence and violence. Once the internal security of a country deteriorates to the point where violence is sustained and continuing, the government must either defeat the insurgency or face civil war.

### III. *Nature of the Threat*

#### A. *The Environment*

The principal forces at work throughout the undeveloped world are: (1) the stresses and strains of the developmental process brought about by the revolutionary break with the traditional past and uneven progress toward new and more modern forms of political, social, and economic organization; and (2) the contest between communism and the Free World for primary influence over the direction and outcome of the developmental process.

Another factor influencing the internal stability of certain lesser developed countries is the circumstance of their geographic location. Because of the political, military, and economic relationships which stem from this circumstance of nature, traditional international animos-

ities or friendships, as the case may be, present many exploitable opportunities for the communists. The disequilibrium and unrest, the usual concomitants of a social progress, may be compounded by geopolitical and traditional regional relationships.

### *B. The Causes of Insurgency*

To succeed, insurgency must have an active indigenous base and some form of political direction and structure. Advanced stages of insurgency must have both an active domestic base of popular support and a political-military structure, i.e., a proto-government, in opposition to and competing with the central government.

Insurgency is grounded in the allegiances and attitudes of the people. Its origins are domestic, and its support must remain so. The causes of insurgency therefore stem from the inadequacies of the local government to requite or remove popular or group dissatisfactions.

It is during the interim, between the shattering of the old mold and its consolidation into a viable modern state of popularly accepted and supported institutional strength, that a modernizing state is vulnerable to subversion and insurgency.

*Politically and socially*, a transitional society may exhibit many of the following symptoms:

Deep rifts between various sectors of the population, complicated by lack of communication between the government and the countryside; lack of social cohesion stemming from inequalities in the old class structure, often exacerbated by racial and social discrimination and religious differences; aspirations of the under-privileged for a better life and greater participation in the life of the society; an inadequate educational system; weak governmental institutions lacking administrative capacity; corrupt political leadership; a government unresponsive to the aspirations of the people; a political system in which the military establishment is the ultimate arbiter of power, often in league with the traditional oligarchs; numerous political parties which complicate the formation of stable governments and the functioning of representative institutions; a frustrated but articulate segment of the youth and intelligentsia (often foreign-educated) which advocates radical solutions to speed modernization; a developing middle class which cannot yet control political processes; and extremes of Right and Left which contest the middle class rise to political and economic power.

*Economically*, a transitional society may exhibit these symptoms:

Widespread poverty and a grossly inequitable distribution of wealth and income; inadequate agricultural production and lack of diversification with little progress toward land reform or the development of an independent peasantry; an inadequate and unbalanced industrial structure with no coherent concept for economic growth

which will confer increased social benefits; inadequate economic infrastructure; inability to mobilize domestic resources or to marshal and reinvest savings; overdependence on exports of primary products; dissatisfaction with foreign private investment yet dependence on foreign capital assistance; inadequate low-cost housing; an inadequate tax and tax collection system; an unhealthy concentration of wealth and economic power in one class or in a few individuals or families; large-scale underemployment, including the impatient youth segment of the educated unemployed.

*Militarily*, developing states may be vulnerable in these respects:

They may have underestimated the internal threat and overestimated the external threat; they may have created "prestige" armed forces, organized along traditional lines; they may have failed to achieve an effective balance between military and police components; the military may be estranged from the people, and constitute a hindrance rather than a help in promoting nation-building and social cohesion.

*Psychologically*, few of the developing states comprehend how to battle the blandishments and false hopes aroused by communism among students, educated youth, intelligentsia, the rural dispossessed and the urban under-privileged. Except in a few of the modernizing states with articulate and social-minded leaders there is a psychological gap between the government and the people—students, labor groups and others who feel estranged from the government and the society as a whole.

Too rapid a tempo of development can be as dangerous as too little. Failure to move rapidly enough encourages opposition movements which often seize power through revolution. Forward movement generates future crises as the underprivileged seek to extend their gains.

### *C. The Critical Sectors*

The vital sectors within modernizing societies include the rural sector; the labor front; students and youth organizations; the intelligentsia; the educational systems; internal communications and informational media; the military and police; religious groups; the civil bureaucracy; the various middle-class elites; ethnic minorities; and the political parties, sometimes including a legal communist party but invariably an illegal communist apparatus operating underground or through various fronts.

Subversion and insurgency must be guarded against in both the cities and the countryside. In loosely constructed countries where the government has not gained the support of the peasantry, an apathetic rural population is a vulnerable target for communist political activity. In these situations, the battle must be joined in the villages which

normally represent the critical social and political organizational level. Discontented urban populations may also be a fertile ground for communist activities if the country is in the early stages of industrialization and urbanization or is recovering from the evils of dictatorship.

The U.S. must always keep in mind that the *ultimate and decisive target is the people*. Society itself is at war and the resources, motives and targets of the struggle are found almost wholly within the local population.

*D. The Threat: Communist Doctrine and Tactics*

Communist revolutionary strategy, both Soviet and Chinese, envisages the seizure of power by stages.

*Stage I* is the building of a power base. In Soviet thinking a power base in the urban proletariat is indispensable for further forward movement of the revolutionary process, though it need not involve violence. The rural population (peasants), in the Soviet view, plays a necessary but secondary and subordinate role in the total power base. Stage I, in Soviet thinking, may be gradually extended and deepened ("national front" with other political parties, increased parliamentary representation, acquisition of high government offices, infiltration of armed forces, propaganda media, etc.) until it is possible to take power without resorting to armed violence. The reverse is held to be true for Stage I in Chinese communist thinking. The latter believe that the control and/or support of the rural population is an indispensable primary step toward the seizure of power, and that this doctrine is particularly applicable to underdeveloped areas.

*Stage II* is the initiation and conduct of armed action at a tactical level in rural or urban areas, or both. It is the Soviet contention that Stage II is not inevitable but may be forced upon the communist party and its allies if resistance is sufficiently strong. The Chinese Communists, on the other hand, maintain that the seizure of power by peaceful means (i.e., the prolongation of Stage I) is not possible and that Stage II is therefore a requisite.

*Stage III* is reached when the insurgents have grown strong enough to engage the government forces in a war of movement. It represents an escalation of Stage II. As in the latter, there is a difference between Soviet and Chinese thinking regarding Stage III. The Soviets hold that the prolonged execution of Stages I and II may generate such opposition that a civil war will ensue. In the Chinese Communist concept, escalation to Stage III is unavoidable, because the non-communist holders of power will never relinquish it unless forced to do so through armed struggle.

It is also possible to retreat from Stage III back to Stage II and under more adverse circumstances, even from Stage II back to Stage

I. Hence, by doctrine and practice the communists are equipped to press their objectives across the whole spectrum of subversive action with great flexibility. In doing so, they study and exploit the vulnerabilities of societies; they are expert in political maneuver from indigenous footholds, and they understand and practice the various forms of internal war.

The communists have refined subversive insurgency into an instrument of political warfare that can be destructively applied to underdeveloped countries at almost all their points of vulnerability. The threat is formidable and all-pervasive, but its weakness lies in the same region as does its implicit strength; *it cannot succeed without the support of people.*

#### IV. *Framework of U.S. Overseas Internal Defense Policy*

##### A. *U.S. Internal Defense Objective*

The U.S. Overseas Internal Defense objective (hereinafter, internal defense objective) is to safeguard and assist less developed societies in fulfilling their aspirations to remain free and to fashion ways of life independent from communism or other totalitarian domination or control.

##### B. *U.S. Interests*

The broad U.S. interests in the underdeveloped world are as follows:

1. A political and ideological interest in assuring that developing nations evolve in a way that affords a congenial world environment for international cooperation and the growth of free institutions.
2. A military interest in assuring that strategic areas and the manpower and natural resources of developing nations do not fall under communist control; that these nations remain able to maintain effectively their internal security and to preserve independence from communist control.
3. An economic interest in assuring that the resources and markets of the less developed world remain available to us and to other Free World countries.
4. A humanitarian interest in assuring the achievement of the social, economic, and educational aspirations of developing nations.

##### C. *U.S. Internal Defense Role*

The overall U.S. purpose in the field of internal defense is to encourage and assist vulnerable nations to develop balanced capabilities for the internal defense of their societies.

To this end, the U.S. role is:

1. To assist in the immunization of vulnerable societies not yet seriously threatened by communist subversion or insurgency.

2. To assist countries where subversive insurgency is latent or incipient to defeat the threat by removing its causes before the stage of insurgency is reached.

3. To assist in the establishment or strengthening of intelligence and internal security organizations so that they are capable of dealing with the threat of subversion and insurgency.

4. To defeat subversive insurgency in countries actively threatened by assisting the government under attack with military as well as non-military means.

5. To minimize the likelihood of direct U.S. military involvement in internal war by maximizing indigenous capabilities of countering and defeating subversive insurgency and by drawing on, as appropriate, the assistance of third countries and international organizations.

6. To minimize the risk of escalation (without deferring to this risk) from subversive insurgency to civil, conventional, or nuclear war.

#### V. *The U.S. Strategy*

*It is vital that U.S. Country Teams continually assess, on the basis of sound intelligence, developments within a society to allow ample opportunity for the U.S. Government to determine what position it should take. When insurgency can be anticipated, the U.S. should induce local government leaders to take remedial action before a real crisis limits the alternatives and makes the use of force imperative.*

To persuade these leaders to act in the interests of their society is often a complex and subtle task. Any U.S. action may fail unless its representatives present and gain acceptance of certain facts that the local government may otherwise wish to disregard. It is therefore essential that U.S. Country Teams know where the points of strength and vulnerability lie. This done, they can determine how to strengthen those elements which most effectively support U.S. objectives.

#### A. *Non-Communist Insurgency*

The U.S. does not wish to assume a stance against revolution, *per se*, as an historical means of change. The right of peoples to change their governments, economic systems and social structures by revolution is recognized in international law. Moreover, the use of force to overthrow certain types of government is not always contrary to U.S. interests. A change brought about through force by non-communist elements may be preferable to prolonged deterioration of governmental effectiveness or to a continuation of a situation where increasing discontent and repression interact, thus building toward a more dangerous climax. Each case of latent, incipient, or active non-communist insurgency must therefore be examined on its merits in the light of U.S. interests.

## B. *Subversive Insurgency*

### 1. *General*

Where subversive insurgency is latent or incipient, U.S. strategy will be directed toward its elimination, lest it provide a communist foothold and escalate into active insurgency. The scale of U.S. involvement at the level of force should be as limited as the achievement of its objectives permit and only ancillary to the indigenous effort. It is important for the U.S. to remain in the background, and where possible, to limit its support to training, advice and materiel, lest it prejudice the local government effort and expose the U.S. unnecessarily to charges of intervention and colonialism.

In insurgency situations indigenous military action will be required. U.S. operational assistance may be a necessary adjunct to the local effort. In these situations, U.S. programs should be designed to make the indigenous military response as rapid and incisive as possible while parallel reforms are directed at ameliorating the conditions contributing to the insurgent outbreak.

The Philippine campaign against the Huks, led by Ramon Magsaysay, is a model of countering insurgency, and winning back the allegiance of the domestic popular base, thus destroying the foundations of guerrilla support. Magsaysay's strategy of combining the use of force with reform measures demonstrates what can be done. It is a pattern of action which may be applicable, with local modifications as necessary, to other vulnerable less-developed countries facing the reality or threat of communist-directed insurgency.

Anticipating, preventing and defeating communist-directed insurgency requires a blend of civil and military capabilities and actions to which each U.S. agency at the Country Team level must contribute. The safeguarding of the developmental process requires carefully evaluated intelligence, the ability to penetrate the enemy's organizations, and the training of adequate and balanced military and police forces. These, as well as bilateral and multilateral developmental assistance, advice, and information programs designed to ameliorate and bring understanding to local problems, are all indispensable components of an effective internal defense program.

Preventing and defeating subversive insurgency is therefore a total program for the local government and for U.S. agencies in support thereof. Success will depend on accurate information, a careful evaluation thereof and on a unified concept of operations based on a comprehensive plan tailored to the local situation in which civil and military measures interact and reinforce each other.

#### a. *The Local Problem*

In countering insurgency, *the major effort must be indigenous since insurgency is a uniquely local problem involving the aspirations and*

allegiance of local people. Only the local government can remove its causes, win back the support of the insurgents, and strengthen the society's cohesiveness.

Overly prominent participation of U.S. personnel in counter-insurgency operations can be counter-productive in that it may (1) dilute the nationalist appeal, and hence the acceptability, of the local government, (2) make the U.S. a target for anticolonialism, and (3) permit the communists to associate themselves with the forces of nationalism and anti-Westernism. Nevertheless, a clear demonstration of U.S. willingness to help may be an important factor in strengthening morale and local will to resist.

The U.S. task is to involve itself constructively and acceptably in the local situation. Its representatives must stay in the background to the maximum extent and conduct themselves unobtrusively. Any credit for success should accrue in the fullest possible measure to the local government. This requires the development and refinement of the Country Team's capability to:

(1) Acquaint itself thoroughly with the totality of the local situation through all its distinctive phases.

(2) Assist the local government, together with the society's constructive non-communist leaders, to see the relation of insurgency to socio-economic development, and the blend of political and military measures required for an adequate internal defense.

(3) Mobilize, coordinate, and effectively apply U.S. and, as appropriate, other Free World resources to develop techniques adapted to the local situation and to strengthen the local internal defense capability with minimal damage to the society and the momentum of development.

*b. Methods of Support*

*(1) Land Reform*

The underdeveloped world is predominantly agricultural with the majority of its people often living under primitive forms of tenancy and in oppressive conditions. For this reason, we should emphasize sound land reform, expanded communications and transportation facilities, and community development programs.

*(2) Civic Action*

Civic action is the use of military forces on projects useful to the populace at all levels in such fields as training, public works, agriculture, transportation, communications, health, sanitation, and others helpful to economic development.

The extent of participation of indigenous forces in civic action programs will vary. In countries fighting active campaigns against internal subversion, local forces should be encouraged to undertake

civic action projects to strengthen the society's economic base, and establish a link between the military and the populace. In countries threatened by external aggression, local forces should participate in civic action projects which do not materially impair performance of the primary military mission. In countries where subversion or attack is less imminent, selected military forces can contribute substantially to economic and social development. Such a contribution should be a major function of these forces.

(3) *Community Development*

Community development is a vital adjunct to the political and social modernization of a loosely structured country since it takes government to the countryside and establishes two-way channels of communication between the rural sector and the government. It is thus a potential mechanism for making government responsive to the peoples' needs.

(4) *Social Projects*

With respect to the critical sectors, the U.S. must emphasize programs that ameliorate mass discontent, i.e. low-cost housing, better sanitation, potable water, new schools and low-cost utilities.

(5) *Education*

The U.S. must also devote more attention to the educational systems of the new states, to assist them in extending education to more people and improving the quality of their curricula and teachers, to supply them with textbooks that will prepare students for the modern democratic world.

(6) *Labor and Youth*

Within societies, labor and youth will continue to have problems leading to dissatisfaction and disaffection. U.S. programs and resources should be directed to education, vocational training, creating more job opportunities and the development of healthy labor and youth organizations.

(7) *Leader Groups*

To deal more effectively with the critical sectors, the U.S. must build on those local assets which are favorable to U.S. objectives. Such groups may be the political leadership, the intelligentsia, the military and police, the civil bureaucracy, religious and educational elements, and the middle class generally.

When training foreign officers, the U.S. should seek to create in them an awareness of the political process of nation-building, bearing in mind that national leadership often emerges from the military ele-

ment of underdeveloped countries. It is U.S. policy, when it is in the U.S. interest, to make the local military and police advocates of democracy and agents for carrying forward the developmental process. Similarly, the U.S. should devote more attention and resources to training the civil bureaucracy in the administrative practices and problems of newly emerging societies.

(8) *Police*

To maintain internal order, most governments depend primarily on police which normally constitute the first line of defense against subversion and insurgency. They are the ones on whom the internal security burden falls in the pre-insurrectionary stage. Police are normally trained and equipped to deal with conspiracy, subversion, and the minor forms of violence. They are also a sensitive point of contact between the government and its citizenry, close to focal points of unrest, and acceptable as keepers of order over a long period of time.

Where feasible and politically desirable, the U.S. will therefore provide equipment, training, and technical assistance to the police forces of friendly foreign countries, particularly those threatened with subversion and insurgency. Such support shall be effected through the medium most appropriate and effective for the task—normally AID but also through the Department of Defense or CIA—depending on the nature of the threat, the type of force assisted, and the preferences of the country concerned.

(9) *Diplomatic*

Friendly governments cannot be expected to measure their interest in coping with internal tensions and upheavals as we do. Some will be less fearful of communist influence; others will place more reliance on repression. In some countries, the military establishments will be slow to relinquish the traditional forms of military organization in favor of modern methods of internal defense. Few governments will understand the *political* component of internal defense and its relationship to the development cycle.

Reluctance of governments to recognize and act upon the requirement for internal reform creates situations such as exist in many Asian and Latin American countries where the economic, social and political frustrations of underprivileged groups encourage subversive attitudes capable of hostile external exploitation. In their desire to assure smooth short-run relations with traditional oligarchies, U.S. representatives often tend to forget that in some cases local leaders may have no practical alternative to accepting the U.S. recommendations, particularly if specific reforms become prerequisites to the continuance of U.S. aid.

The U.S. must recognize, however, the existence of deep-seated emotional, cultural, and proprietary resistance to any change that diminishes power and privilege, regardless of how unrealistic and short-sighted this stubbornness may seem objectively. In bringing its influence to bear, the U.S. has three avenues open to it:

(a) Regular inter-governmental collaboration can facilitate the various forms of cooperative action required. U.S. representatives must establish and maintain sympathetic personal rapport with the leaders of the country. This rapport should be grounded on a deep understanding of the country's problems and traditions, but it should not be attained at the expense of realistic objectivity toward the current historical processes at work in the society. If there is sufficient mutual personal regard, U.S. representatives will be better able to speak persuasively about reform needs and to win acceptance for constructive proposals. *For such efforts to be successful, it is important that all levels of all elements of a mission thoroughly understand and support the agreed objectives.*

(b) In some countries, the leadership may be responsive to suggestions for reform and amenable to outside assistance, but other powerful domestic forces may resist them. Some leaders may fear branding as "imperialist stooges" by virtue of accepting U.S. help. In such cases, a nation's developmental efforts may be supported at least in part by more discreet means of assistance.

Where leaders are willing but not able to institute reforms, it may be necessary to strengthen other elements of the society which are willing and able to contribute to sound development. This applies specifically to the non-communist personalities, organizations, and media which have potential popular appeal but, for lack of resources and know-how, do not compete adequately with the communist instrumentalities.

(c) Finally, there are some cases where, despite the local suggestions for reform through normal U.S. diplomatic channels, the government and its leaders refuse to act. Experience has amply shown, in such cases, that through other means it is often possible with minimal risk to increase significantly the effectiveness of opposition leaders, political parties, institutional groups, and information media.

Through such means, or through enlisting where appropriate the assistance of other governments or international organizations, it may be possible to bring organized and broadly-based political pressures on a reluctant local government. Through the same means it is also possible, by strengthening the noncommunist voices and their organizational bases in such institutional groups, to wrest communist control from local labor movements, peasants' associations, and youth and student organizations.

## *2. Role of Multilateral Organizations and Allies*

Where appropriate, multilateral actions to prevent or defeat subversive insurgency may be preferable to unilateral U.S. action, even if there is some immediate sacrifice of operational efficiency.

It is the policy of the U.S. whenever it is in the national interest to:

(a) Take such action in and through the United Nations, NATO, the OAS, SEATO, CENTO and other multilateral and regional organizations as appropriate.

(b) Encourage, as appropriate, other nations to give diplomatic, political, economic, and where necessary, military support to threatened countries.

(c) Encourage, where feasible and desirable, the former metropolises, to assume major responsibility for assisting their former wards in developing an adequate internal defense.

(d) In countries contiguous to those under attack, encourage the maintenance of effective border security to prevent use of their territory as a sanctuary by insurgent forces.

## *VI. Application of U.S. Strategy*

### *A. Concept of Operations*

Apart from the normal day-to-day political actions by the United States in foreign countries, particular problems of coordination are found in those nations where potential or actual insurgency exists. This will require the major attention of both the threatened government as well as those governments seeking to assist it. In assisting a country to strengthen its internal defense system, the U.S. must be prepared to present a closely coordinated and integrated approach in which each operational arm of U.S. policy represented on the Country Team plays a unique and indispensable part in the attainment of U.S. objectives.

### *1. Intelligence*

An adequate effort in support of U.S. policy and action decisions is vital to the successful achievement of U.S. internal defense objectives.

Such an intelligence effort must:

a. Identify those free world countries where the threat of subversion or insurgency is potential, latent, or incipient.

b. Appraise the nature and scope of the threat, the underlying causes, and the significant factors related thereto.

c. Provide intelligence estimates and appraisals upon which U.S. courses of action can be planned.

d. Provide operational intelligence required to execute U.S. plans.

e. Provide the intelligence needed to appraise the extent to which U.S. internal defense objectives are being achieved.

f. Strengthen the intelligence capabilities of vulnerable countries.

Agencies having action responsibilities for overseas internal defense operations will contribute to the U.S. intelligence effort in accordance with their respective roles as set forth in the several National Security Council Directives. Abroad, the Chiefs of Mission and Principal Officers are responsible for the coordination of all U.S. activities within their respective areas of assignment. However, acting as the designated representative of the Director of Central Intelligence, the CIA Station Chief is assigned the specific task of coordinating clandestine intelligence collection.

## *2. Levels of Intensity*

The level of intensity of subversive insurgency at any time may be portrayed in terms of three general phases:

PHASE I. This phase ranges from circumstances in which subversive activity is only a potential threat, latent or already incipient, to situations in which subversive incidents and activities occur with frequency in an organized pattern. It involves no major outbreak of violence or periods of uncontrolled insurgent activity.

PHASE II. This phase is reached when the subversive movement, having gained sufficient local or external support, initiates organized guerrilla warfare or related forms of violence against the established authority.

PHASE III. The situation moves from PHASE II to PHASE III when the insurgency becomes primarily a war of movement between organized forces of the insurgents and those of the established authority.

The U.S. should seek to create situations of strength within the local society so that subversive activity can be dealt with at the lowest possible level. Plans and programs must, however, provide for an integrated capability to eliminate the root causes of disaffection and dissidence, to expose and counter communist efforts, and to cope with increased levels of violence.

At the lower levels of subversive activity, U.S. operations will consist primarily of training, advice, economic and military assistance and intelligence activities. Should the intensity of insurgency increase, and units of the indigenous armed forces be committed, the U.S. may also have to assist and support counter-insurgency military operations. At even higher levels of insurgency, or where there is a threat of communist takeover, the commitment of U.S. operational forces may be required.

In these situations the commitment of U.S. operational forces will require a decision at the highest level of government. If such a determination is made, a further Presidential decision will be necessary to prescribe the relationship between the U.S. Chief of Mission and the U.S. Military Commander, and their relationship with the Chief of State

in the country concerned. Operational command of U.S. Armed Forces so committed will flow from the President to the Secretary of Defense through military channels to the designated U.S. Military Commander in the field.

It is of the greatest importance that the situation within a threatened country be continually appraised. Therefore programs and operations will be continually reviewed in order that they are precisely responsive to the changing nature of the problem. The emphasis to be accorded and the responsibilities assigned in connection therewith should always reflect the nature and intensity of the threat.

### *3. Washington*

In recognition of the growing subversive threat, the Special Group (CI)<sup>2</sup> has been established to assure unity of effort and use of all available resources with maximum effectiveness in preventing and resisting subversive insurgency and related forms of indirect aggression in friendly countries.

The functions of the Special Group (CI) are to insure: proper recognition of the subversive insurgency threat; reflection of such recognition in training, equipment and doctrine; marshalling of resources to deal with the threat, and development of programs aimed at defeating it. The Special Group (CI) will insure the development of adequate programs aimed at preventing or defeating subversive insurgency and indirect aggression in countries and regions specifically assigned to it by the President, and resolve any interdepartmental problems which might impede their implementation. In performing the above functions, the members of the Special Group (CI) will act on behalf of their respective departments and agencies, and will depend for staff support upon their own staffs, and upon such country or regional interdepartmental Task Forces (normally chaired by a State Department Assistant Secretary) as may be established.

The Department of State will, in accordance with its traditional responsibility in the field of foreign affairs, provide policy guidance and coordination of overseas internal defense programs. Such guidance

---

<sup>2</sup> The Special Group (Counter-Insurgency) consists of:  
Military Representative of the President, Chairman  
The Attorney General  
Deputy Under Secretary of State for Political Affairs  
Deputy Secretary of Defense  
Chairman, Joint Chiefs of Staff  
Director of Central Intelligence  
Special Assistant to the President for National Security Affairs  
Administrator, AID  
Director, USIA

and coordination will be effected through the Chiefs of Mission and Principal Officers overseas and the Department of State in Washington.

To assure requisite support for the total effort, and to expedite intra-departmental as well as inter-departmental coordination and action, each agency (State, DOD, AID, USIA, CIA) will designate an element within its organization to be charged with the responsibility for continuing attention to overseas internal defense activities. These designees will:

a. Assure that internal defense problems and progress receive continuing attention and coordination.

b. Provide to responsible regional and country offices general policy and program guidance, together with the expertise gained from other areas on internal defense problems.

In order to achieve an integrated Washington effort, approximating the effort of the Country Team, officers of the department and agencies concerned with countries faced with a subversive threat will meet as required under the chairmanship of the Department of State to assist in the coordination of U.S. activities and programs in that country.

If the affairs of a country or region are in crisis, a Task Force may be established, normally under the chairmanship of the Assistant Secretary of State for the regional area in which the crisis country is located. The Task Force will have at least one senior representative from each of the responsible agencies (State, CIA, DOD, AID, USIA).

#### *4. Abroad*

At the country level, the Chief of Mission<sup>3</sup> is responsible for overall direction of the Country Team and the coordination of all U.S. programs. As the President's personal representative, he will ensure that the U.S. effort is developed and effectively applied through an integrated approach comprising all civilian and military programs employed in attaining U.S. objectives.

The United States will make every effort to determine which countries are likely to be imperiled. Chiefs of Mission in underdeveloped countries will make continuing assessments to insure that incipient insurgency is identified in time to take preventive action. In threatened countries detailed assessments will be made to analyze what basic factors contribute to the threat, the time available for remedial action, and what resources and courses of action are necessary to counter the threat. Such assessments will form the basis upon which integrated

---

<sup>3</sup> In those countries where there is no U.S. Ambassador, this responsibility will rest with the Principal U.S. Diplomatic Officer.

plans and programs can be developed—both by the country concerned and the United States.

The Ambassador in some cases may need outside assistance with those tasks of assessment, planning and program formulation. When required, special interdepartmental assessment and planning teams may be temporarily assigned to work under the Ambassador to assist in the task of threat assessment, planning, and program formulation.

Based on the assessment and courses of action required, a Country Internal Defense Plan (See Annex C for draft outline plan) will be developed by the Country Team. After its submission to Washington for consideration and approval by all departments and agencies concerned these plans will become the basis for program proposals. In formulating a Country Plan, the Ambassador should consider the full range of assets, both governmental and non-governmental, as well as possible non-American assets, which it would be useful to bring to bear. These include student exchange, Peace Corps, private business, labor organizations, foundations and international lending institutions.

These plans will serve the following purposes:

- a. To assure continuing attention by the Country Team to details of the local situation.
- b. To sharpen the Country Team's ability to forecast dangerous trends and suggest remedies.
- c. To provide a framework within which to assess programs suggested by the local government.
- d. To persuade the local government to adopt the most promising course of action.
- e. To facilitate planning and program coordination in Washington.

To assure continuing undivided attention to the problem of internal defense in an underdeveloped country, the Ambassador will, where appropriate, designate an officer to assist him in meeting his responsibilities for internal defense. This officer should be of senior rank and should be responsible for keeping the Ambassador and the Country Team fully informed as to the nature of the internal security threat; current internal defense operations, plans, and programs; matters requiring coordination; and developments warranting appropriate reports to Washington. The Ambassador should assure that all members of the Country Team contribute their full capabilities in a cohesive internal defense program.

#### *B. Roles and Missions*

The U.S. has many resources with which it can assist developing countries in preventing and defeating subversive insurgency. These resources can only be mobilized and harnessed by the development

of realistic integrated plans and programs, and the implementation of a unified concept of operations. This section delineates the role of each responsible agency with respect to overseas internal defense:

### *1. The Role of the Special Group (CI)*

The Special Group (CI) assures a coordinated and unified approach to regional or country programs, and verifies progress in implementation thereof. It undertakes promptly to make decisions on interdepartmental issues arising out of such programs.

### *2. The Role of the Department of State*

In its role as chief adviser to the President in the field of foreign affairs and executant of national foreign policy, the Department of State is responsible for providing overall policy guidance and assuring the coordination of internal defense programs. In so doing, it will:

(a) Assure that internal defense problems as they arise receive the continuing attention of our friends and allies.

(b) Provide intelligence on foreign political, economic, and socio-cultural developments.

(c) Assure the development of Country Internal Defense Plans, where required.

(d) Assess in conjunction with other responsible agencies the adequacy of the various U.S. programs which, in the aggregate, constitute the total U.S. internal defense effort in a country.

(e) In collaboration with other United States Intelligence Board agencies keep under constant review the internal security situation of all countries in order to identify those where subversion and insurgency require particular attention.

(f) Participate, with the other agencies involved, in providing training for selected U.S. civilian and military government officials in the field of internal defense and the problems of modernizing societies.

(g) Through the United Nations and other international organizations, increase the Free World's awareness of the threat of communist-bloc indirect aggression and, as appropriate, organize such field operations as would aid in promoting general U.S. objectives.

(h) Encourage foreign diplomatic, political, economic, psychological and military support for countries under indirect attack by the communists.

(i) Encourage U.S. private interests (business firms, foundations, etc.) to take action in support of U.S. policy and programs.

### *3. The Role of the Agency for International Development*

The Administrator of A.I.D. has primary responsibility for the administration of economic aid programs under P.L. 87-195. In addi-

tion, the Secretary of State has responsibility under section 622(c) thereof, for the continuous supervision and general direction of the assistance programs authorized by that Act, including, but not limited to, determining whether there shall be a military assistance program for a country and the value thereof, to the end that such programs are effectively integrated both at home and abroad and the foreign policy of the U.S. served thereby.

To further U.S. policy objectives directed toward the strengthening of internal defense in countries receiving U.S. assistance, A.I.D. will plan and implement programs having as their long-term aim the creation of economic and social conditions of sufficient vitality to eliminate the causes of discontent on which the communist appeal breeds and to sustain responsive, representative government and institutions. It also has the responsibility to plan and implement programs responsive to the degree of urgency of the potential or existing threat of subversive insurgency which will maximize the capability of civil police to deter and/or cope with subversive action, to develop and implement civilian counter-insurgency programs, and to support military civic action as appropriate.

Specifically included is the responsibility to:

(a) Plan, develop and implement civilian programs aimed at strengthening sectors of a society or of geographic areas threatened by subversion or insurgency (e.g., community development, emergency economic assistance, improvement of communications facilities, road construction, irrigation projects, etc.).

(b) Plan, develop and implement programs for technical assistance to help strengthen the vulnerable sectors of a society by increasing technical proficiency, broadening skills, and raising the quality of workmanship.

(c) Assess and evaluate the adequacy of those aspects of Internal Defense programs which are the responsibility of the Administrator to develop and implement in exercise of the responsibility delegated under Section 622(c) of the Foreign Assistance Act of 1961.

(d) Promote measures for self-help, where applicable in coordination with DOD, in such areas as the better utilization of resources, reduction of dependence on external resources, better utilization of manpower (including manpower engaged in internal defense), and effectiveness in public administration.

(e) In the mass communications field, where applicable in collaboration with USIA and/or DOD, assist in developing the host government's capabilities for reaching its citizenry, particularly those segments most vulnerable to subversion, by technical assistance and training and by supporting worthwhile host government information programs.

(f) Encourage as appropriate expansion of internal assistance from other free countries, international organizations, international lending institutions, and private capital sources.

(g) In coordination as appropriate with DOD and/or CIA provide assistance to:

1. Strengthen the capability of police and police paramilitary organizations to enforce the law and maintain public order with the minimum use of force.

2. Strengthen the capability of police and police paramilitary organizations to counter communist inspired or exploited subversion and insurgency.

3. Encourage the development of responsible and humane police administration and judicial procedure to improve the character and image of police forces, and bind them more closely to the community.

(h) Where appropriate in coordination with DOD and/or CIA, plan, develop and implement civilian counter-insurgency programs, such as village alarm systems, village communication systems and remote area aviation liaison.

(i) In collaboration with DOD and where appropriate with USIA, plan, develop and implement military civic action programs on such projects as public works, sanitation, transportation, communications, and education, and assure that such programs are coordinated and properly funded.

#### *4. The Role of the Department of Defense*

The Department of Defense has the major responsibility for assisting selected developing countries to attain and maintain military security. In discharging this responsibility it seeks to achieve in each country a proper balance of the capabilities to meet both external and internal threats. In nations not confronted with a real or credible external threat to their security, the task is primarily one of assisting in the development of an effective internal defense capability.

Where subversive insurgency is virtually non-existent, or incipient (PHASE I), the objective is to support the development of an adequate counter-insurgency capability in indigenous military forces through the Military Assistance Program, and to complement the nation-building programs of AID with military civic action. The same means, in collaboration with AID and CIA, will be employed to develop a similar capability in indigenous para-military forces. In this low intensity situation the task of U.S. Forces is essentially advisory in character.

If this aim is not realized in a particular country, and as a consequence insurgency develops to serious proportions (PHASES II or III), the task of U.S. Forces may become operational. The Department of Defense, when directed by the President, will provide operational

assistance in the form of U.S. Armed Forces units in support of indigenous forces to provide increased land/sea/air mobility, additional communications facilities, training assistance and advice on the conduct of counter-insurgency operations.

In fulfilling its internal defense role, the Department of Defense will:

(a) Develop U.S. military forces trained for employment in unconventional warfare and counter-guerrilla and other military counter-insurgency operations.

(b) Develop, test and maintain transportation, communications and logistic systems to support these forces.

(c) Develop military doctrine for unconventional warfare and counter-insurgency military operations to provide guidance for the employment of U.S. forces and for the training of U.S. and friendly foreign military personnel.

(d) Develop strategy and prepare contingency plans, in accordance with U.S. foreign policy objectives and commitments, to provide operational assistance and/or reinforcement with U.S. tactical units to friendly countries faced with a credible threat of internal and/or external aggression.

(e) Provide research and development activities in support of unconventional warfare and counter-insurgency operations.

(f) Conduct military intelligence operations to provide intelligence on foreign military and paramilitary forces.

(g) Be prepared to execute military operations in support of national objectives as directed.

(h) Plan, develop and implement civilian counter-insurgency programs where appropriate with AID and/or CIA (See Role of AID, paragraph c).

(i) Assess the adequacy of its part of the overall internal defense program in relation to those of other U.S. agencies.

(j) Develop language trained and area oriented U.S. forces for possible employment in training, or providing operational advice or operational support to indigenous security forces.

(k) Provide, in coordination with other interested governmental agencies, training and advisory assistance in all aspects of military intelligence.

(l) Maintain continuous surveillance of all U.S. and foreign military and paramilitary forces available to the Free World, evaluating their state of effectiveness and readiness, and making appropriate recommendations for their support and improvement.

(m) Develop the military sections of Country Internal Defense Plans.

(n) Support the psychological operations of USIA in pre-insurgency or counter-insurgency situations.

Through the Military Assistance Program the Department of Defense will:

(a) Provide, in collaboration with AID, military weapons and material within available resources to friendly indigenous military and paramilitary forces and training in the fields of guerrilla warfare and counterinsurgency.

(b) Encourage and support, in collaboration with AID and USIA where appropriate, the use of indigenous military and paramilitary forces of developing nations in military civic action programs, including such projects as public works, sanitation, transportation, communications, and other activities helpful to economic development.<sup>4</sup>

#### *5. The Role of the Central Intelligence Agency*

CIA is an active participant in the U.S. Internal Defense effort at both the national and country team levels. The role of the Director of Central Intelligence and of the Central Intelligence Agency in Internal Defense activities will be carried out in accordance with the provisions of statutory authority and executive direction.

#### *6. The Role of the U.S. Information Agency*

The U.S. Information Agency will orient its programs toward immunizing the vulnerable sectors of developing societies against communist propaganda and subversive activities, and helping the modernization process to maturity without impairing the progressive enhancement of sovereignty and national values of the recipient country.

Developing societies require professional advice and assistance in their public information services and psychological operations to develop and maintain effective channels of communication.

Accordingly, the United States Information Agency will:

(a) Employ informational techniques, in cooperation with the host government, in support of the latter's social, economic and military efforts, to strengthen the people's feeling of identity with their government and counter the propaganda efforts of hostile subversive or insurgent groups.

(b) Strengthen local understanding of the U.S. policies and objectives, and the U.S. role in assisting nations through the modernization process.

---

<sup>4</sup> NOTE: SEE ANNEX A FOR SUPPLEMENTARY ROLE OF THE DEPARTMENT OF DEFENSE.

(c) In coordination with AID and DOD, as appropriate, assist the host government in its psychological operations aimed at preventing or defeating subversive insurgency.

(d) In coordination with AID and DOD, as appropriate, assist the host government in improving its mass communication techniques; promote effective two-way communications between the government and its citizenry.

(e) In cooperation with the host government, work to improve distribution of effective informational and educational materials to all areas; produce in collaboration with the host government, such film, radio, TV and other information materials as will further the joint effort against the insurgency.

(f) Using whatever techniques are feasible, including public opinion research and motivational studies, provide information on political attitudes, the extent and causes of disaffection and dissidence, and other aspects of opinion relevant to potential or actual insurgency.

(g) *[text not declassified]*

(h) In cooperation with AID and DOD as appropriate, provide training to host country personnel in psychological operations and informational activities.

(i) Provide informational materials to the critical sectors (i.e., youth, labor, student, peasant, and intellectual groups) of the indigenous population.

(j) In collaboration with other responsible agencies, encourage U.S. private interests (business firms, foundations, etc.) to take actions in support of the U.S. Government policies and programs.

(k) Develop and maintain a flow of information to the rest of the world exposing communist inspired subversion and insurgency.

## **Annex A**

### *Supplementary Role of the Department of Defense*

TO BE DISTRIBUTED SEPARATELY.

## **Annex B**

### *GLOSSARY OF TERMS*

CLANDESTINE OPERATION—Activities to accomplish intelligence, counter-intelligence, and other similar activities sponsored or conducted by governmental departments or agencies, in such a way as to assure secrecy or concealment.

**COLD WAR**—A state of international tension, wherein political, economic, technological, sociological, psychological, paramilitary, and military measures short of overt armed conflict involving regular military forces are employed to achieve national objectives.

**COUNTERGUERRILLA WARFARE**—Operations and activities conducted by armed forces, paramilitary forces, or non-military agencies of a government against guerrillas.

**COUNTERINSURGENCY**—Those military, paramilitary, political, economic, psychological, and civic actions taken by a government to defeat subversive insurgency.

**COUNTERINTELLIGENCE**—That aspect of intelligence activity which is devoted to destroying the effectiveness of inimical foreign intelligence activities and to the protection of information against espionage, individuals against subversion, and installations or material against sabotage.

**COVERT OPERATIONS**—Operations which are so planned and executed as to conceal the identity of or permit plausible denial by the sponsor. They differ from clandestine operations in that emphasis is placed on concealment of identity of sponsor rather than on concealment of the operation.

**EVASION AND ESCAPE (E&E)**—The procedures and operations whereby military personnel and other selected individuals are enabled to emerge from an enemy-held or hostile area to areas under friendly control.

**GUERRILLA**—A combat participant in guerrilla warfare.

**GUERRILLA WARFARE (GW)**—Military and paramilitary operations conducted in enemy-held or hostile territory by irregular, predominantly indigenous forces.

**INSURGENCY**—A condition resulting from a revolt or insurrection against a constituted government which falls short of civil war. In the current context, *subversive insurgency is primarily communist inspired, supported, or exploited.*

**INTERNAL DEFENSE**—The full range of measures taken by a government to protect its society from subversion, lawlessness, and insurgency.

**INTERNAL SECURITY**—The state of law and order prevailing within a nation.

**MILITARY CIVIC ACTION**—The use of preponderantly indigenous military forces on projects useful to the local population at all levels in such fields as education, training, public works, agriculture, transportation, communications, health, sanitation and others contributing to economic and social development, which would also serve to improve the standing of the military forces with the population. (U.S.

forces may at times advise or engage in military civic actions in over-seas areas.)

**PARAMILITARY FORCES**—Forces or groups which are distinct from the regular armed forces of any country, but resembling them in organization, equipment, training, or mission.

**PARAMILITARY OPERATION**—An operation undertaken by a paramilitary force.

**PROPAGANDA**—Any information, ideas, doctrines, or special appeals in support of national objectives, designed to influence the opinions, emotions, attitudes, or behavior of any specified group in order to benefit the sponsor, either directly or indirectly.

**BLACK**—Propaganda which purports to emanate from a source other than the true one.

**GREY**—Propaganda which does not specifically identify any source.

**WHITE**—Propaganda disseminated and acknowledged by the sponsor or by an accredited agency thereof.

**PSYCHOLOGICAL WARFARE**—The planned use of propaganda and other psychological actions having the primary purpose of influencing the opinions, emotions, attitudes, and behavior of hostile foreign groups in such a way as to support the achievement of national objectives.

**SUBVERSION**—Action designed to undermine the military, economic, psychological, morale, or political strength of a regime.

## **Annex C**

### *MODEL OUTLINE OF COUNTRY INTERNAL DEFENSE PLAN*

#### **I.—BACKGROUND**

- A. Resumé of US-subject country relations.
- B. Strategic importance to U.S.
- C. Economic and social conditions prevailing.
- D. Past, present and future threats to internal stability.
- E. Orientation of foreign policy and relations with neighboring states.
- F. External threats.

#### **II.—DEFINITIVE STATEMENT OF SUBJECT COUNTRY'S VULNERABILITIES**

- A. Political.
- B. Socio-economic.

- C. Security (police, military and paramilitary) and intelligence.
- D. Psychological information.

### III.—POLICY AND OBJECTIVES

A. Statement of overall U.S. policy and objectives for subject country in context of I and II above.

B. Identify and explain any recommended changes to be made to approved objectives.

### IV.—COURSE OF ACTION

List under the following headings, the lines of action required on the part of the subject country, the U.S. and third countries and/or international organization necessary to attain U.S. objectives:

- A. Political.
- B. Socio-economic.
- C. Security (including intelligence).
- D. Psychological information.

### V.—RESOURCE REQUIREMENTS

For FY-63-67 (i.e. 5-year projections) summarize plan and program resource requirements for the subject country, the U.S. and third countries and/or international organizations. Employ the following system of categorization and relate program elements to lines of action contained in Section IV.

A. Socio-economic programs—List program totals and major projects for the following:

1. Long-range development (little immediate impact).
2. Short-range projects such as:

Community development.	Credit.
Housing.	Labor.
Health and sanitation.	Road construction.
Food.	Information.
Education.	

B. Civic action (military, paramilitary and police).

1. Employ same categories as for socio-economic programs.

C. Security programs.

1. Police and paramilitary.

- (a) Equipment
- (b) In-country advisory assistance.
- (c) Participant training.

2. Military (by service).

- (a) Equipment and material.
- (b) In-country advisory assistance.
- (c) Formal training.

3. Other

D. Psychological/information.

- 1. Mass media, including technical assistance.
- 2. Cultural exchange.
- 3. Libraries.

VI.—APPENDICES

A. Listing of U.S. resources available for application in subject—i.e., U.S. Corps of Engineers capabilities, Peace Corps, Ford Foundation-type operations, special forces augmentation teams, etc.

B. Additional non-USG programs and activities.

## November 1962

### 280. Memorandum from President Kennedy to McNamara, November 9<sup>1</sup>

November 9, 1962

In your memorandum of September 24, 1962, you answered several of my questions concerning fighter aircraft—our own and the aircraft of the Soviet bloc. Simultaneously, I had from CIA information concerning the Soviet fighter aircraft production.

Subsequently, on October 3, in a reminder memorandum from Mr. Kaysen, we raised additional questions, and from General Taylor on October 6, I had a brief answer on the state of our fighter aircraft production capability in relation to likely needs in Europe.

From this information, I have deduced the following:

That the Defense Department believes that our F4H—as a fighter-bomber—is superior to anything that will be in the Soviet operational inventory during the same time period as the F4H is operational, as far as we know;

That the Defense Department feels that the present procurement schedule for the Navy and the Air Force from now until 1968, at the anticipated production rates, is sufficient for our needs.

I note by your memorandum that you are conducting a comprehensive review of our tactical forces, which you will report to me this month. In the presentation of this review, it is my hope that these additional questions might be answered:

Based on our best estimate, if we were confronted with a conventional warfare situation in Europe and, at the same time, increased threats to ourselves and our allies by Communist China in the Far East—while we are engaged at the same tempo that exists now in Cuba—would our interceptor capability and our fighter-bomber capability meet these requirements? If not, what would be our best compromise solution?

I realize that I pose the most difficult question first, but let us suppose that the only front in which we were challenged would be East and West Germany: If we were to get into war in Europe, needing both fighter bombers and interceptor aircraft, do we now have an inventory that would enable us to attain air superiority? Approximately

---

<sup>1</sup> Questions posed by the President on status of U.S. and Soviet fighter aircraft production. Top Secret; Sensitive. 3 pp. Washington National Records Center, OSD Files: FRC 71 A 6489, 452 Tactical 1962.

what numbers of planes of the various types would make up our capability? Would they be able to hold their own against the Soviet inventory in 1963?

Continuing the above premise, and assuming the production schedule you outlined in your September 24 memorandum, would our requirements vis-à-vis the Soviet bloc be met in 1964 or 1965?

I know that aircraft attrition in warfare is difficult to estimate. From what you know of our production capability of the F4H, would production meet anticipated attrition if we were to go into a conventional war in the next 12 months? If not, should we expedite this orderly production schedule so that we will have the needed number of F4H—and other models—sooner than the schedule you now have set up?

Another concern of mine is our ability to re-deploy our interceptor aircraft and our fighter-bomber aircraft to the European Theater in time to prevent our losing air superiority over the battlefield. Have you any views on this subject?

Finally, knowing that pilot training and other maintenance and operational skills are required for the proper employment of fighter aircraft, if I directed that our fighter procurement be doubled in 1963 and 1964, would the trained pilots and other trained personnel be available to man the aircraft we would produce and deliver?

If your anticipated report does not respond to all of these questions, do not delay its submission. I know that these are not easy questions, and that it might be necessary for you to ask the Joint Chiefs of Staff to expedite a supplementary report that would include consideration of the points I have raised.

**John F. Kennedy**

**282. Memorandum of Discussion Prepared by McCone,  
November 16<sup>1</sup>**

November 16, 1962

MEMORANDUM OF DISCUSSION WITH PRESIDENT KENNEDY  
ON THE AFTERNOON OF FRIDAY, NOVEMBER 16th  
AT 5:15 P.M.—about one hour

No one in attendance except the President and DCI.

The purpose of the visit was to brief the President on the probable attitudes of General Eisenhower at meeting scheduled for following day. The President read DCI memorandum of October 21st and was informed that Eisenhower's most recently expressed views on the Cuban situation, which were on November 7th, did not deviate materially from those expressed in the memorandum. Secondly DCI reviewed memorandum of November 16th, outlining Eisenhower's views on organization. The President retained this memorandum and stated he would discuss the subject with Bundy. Kennedy seemed inclined to favor some form of organization different from that existing at the present time but questioned going as far as an OCB—Planning Board concept of the latter days of the Eisenhower Administration. In conclusion the President expressed gratification with the functioning of the Executive Committee; thought that perhaps the Executive Committee could be made a permanent organization subsidiary to the NSC and that it could be kept at about the same membership and that it would not be necessary to admit into the councils of the Executive Committee the large number of on-lookers who seem to have the privilege of attending NSC meetings.

If an arrangement was made, then the Executive Committee could meet regularly and be briefed by the DCI, could discuss intelligence findings and conclusions and also discuss problems and also prospective problems in the national field. McCone strongly supported this concept.

McCone pointed out that at the present time the Executive Committee meets, the principals are confronted with a series of unilateral papers prepared for the most part by State and Defense. These papers are not circulated in advance and therefore members of the Executive Committee outside of these two departments could not have the benefit

---

<sup>1</sup> Readout of McCone's briefing of President Kennedy for his upcoming meeting with former President Eisenhower. Secret; Eyes Only. 2 pp. CIA Files, Job 80B01285A, Mtgs. w/President, 7/1/62-12/31/62.

of advance study and advice from their respective organizations; therefore it was very difficult to establish a position. McCone pointed out that in the past, Planning Board which was made up of representatives of each of the interested Departments would consider a paper prepared by any one of the departments and then the representatives of the NSC members would brief the principals on the arguments pro and con, and the principals therefore come to the meeting with an informed and thoughtful position.

McCone also furthermore pointed out there was a danger of the staff “taking over” the basic responsibility or the basic thinking on policy positions and this had happened under the prior Administration. However the DCI felt that with the strong leadership such as exercised by McGeorge Bundy this danger could be avoided.

The President seemed inclined to formalize the Executive Committee along the above lines. No decision was made.

McCone then briefly reviewed the Killian Board letter and steps being taken to develop a report and in answer to the President’s question, I stated that in his opinion, our failures in Cuba which were not serious, were (1) timidity of overflights in view of the Sakhalin and ChiCom incidents; (2) fixation on the probable USSR policy of deploying missiles in view of present and past policy and (3) in view of (2), a great many refugee and agent reports had not been considered or permitted into the evaluation and reporting. DCI said he thought review would bring these points into focus, that they were not necessarily applicable to other danger spots throughout the world. The President expressed satisfaction with the functioning of the Intelligence Community; made an interesting comparison with the “intelligence” of the Washington Press Corps, which observed a period of several days where there was obviously a crisis but none had the “intelligence means” to uncover what was going on.

DCI then reported on the up-coming Fell case in London and the Wynne arrest in Romania and steps taken by CIA to review and appraise CHICKADEE reports for authenticity.

**John A. McCone**  
*Director*

January 1963

**283. Memorandum from Col. Legere to Col. Ewell, January 16<sup>1</sup>**

January 16, 1963

SUBJECT

Tactical Nuclear Study

1. This morning Carl Kaysen gave me the attached draft memo from himself to Gilpatric and amplified upon it orally. He has recently spoken with some high-level people in Defense, and they agree with his feeling that by 1 March it will be impossible for the Special Studies Group to turn out a definitive paper which might at least tend to silence the skeptics on one side or both of the argument. I might add right here that he is not dead sure he will send the attached draft, but has asked me for suggestions in modifying it.

2. I believe Kaysen's thinking, as known to you, comes through quite clearly in the attached draft. Just to nail it down, he expressly told me that Alain Enthoven wonders why Pershings cannot do everything the shorter-range stuff can. In short, the command and control tail is wagging the nuclear dog. However, the idea of extending the study deadline may be a good one; Kaysen notes in this connection that General Taylor would probably go along—with the understanding that the decisions on production for FY 65 would also be delayed and would not be pre-judged.

3. I would recommend holding my contacts with Kaysen on a sensitive basis.

**Legere**

**Attachment**

SUBJECT

Proposed Guidelines for Further Study of the Requirements of Tactical and Anti-submarine Nuclear Weapons for FY 1965

On January 7, 1963 you transmitted proposed guidelines for the above study. There are three areas in which it might be useful to ask

---

<sup>1</sup> Forwards comments and draft paper on tactical nuclear weapons. Secret. 3 pp. National Defense University, Taylor Papers, WH Staff Mtgs.

additional questions. All are of a rather broader scope than those posed in the guidelines.

First is the question of the relation of the tactical nuclear weapons singled out for particular study—ADM's, artillery and DAVY CROCKETT—to weapons of longer-range, especially SERGEANT and PERSHINGs. Are the military tasks for which the shorter-range weapons are intended by their nature so unamenable to targeting by the longer-range weapons that we must plan on including them in our arsenal despite the obvious and major problem which they will create in the area of command and control.

Second is a more fundamental question: the relation of the use of tactical nuclears to escalation to higher levels of violence in NATO. Specifically if, in a particular situation in Europe, it appears that tactical nuclears need to be called into play, what are to examine the extent to which the use of tactical nuclears gives each side the incentive to preempt on the strategic level. Further, in the European situation, does not the civil damage from extensive tactical nuclears make it more attractive from the point of view of our European allies to initiate the early use of strategic weapons?

Third is the question of the utility of tactical nuclear weapons after an exchange of strategic blows. In other words, how, after a strategic exchange, would the possession versus the non-possession of a wide variety of tactical nuclear ground weapons affect the outcome?

Since these three questions are broad and raise many important problems, it appears doubtful that answers to them can be achieved with present deadlines. Accordingly, I have requested the AEC to explore the possibility of extending the decision deadlines for the FY 1965 weapons production program until June 1. If this is possible without a substantial increase in the cost of producing the list of weapons under study or without a substantial delay in achieving the scheduled output then I think the proposed study should be given a broader scope and a later deadline.

**284. Notes on Remarks of President Kennedy, January 22<sup>1</sup>**

January 22, 1963

Following is the substance of a forty-minute talk by the President at 11:00 a.m., January 22, 1963, to the National Security Council and a large group of officers of the Government departments.

The subject was forthcoming National Security problems.

The President began by saying that he wanted particularly to review the problems and areas that are going to be before us in the coming months. U.S. responsibility is worldwide, he said, and the U.S. is the only power that can fully exercise that responsibility. He cited the commitments to NATO, SEATO and, in the case of CENTO, the U.S.'s role as the key country though it is not a member.

*CUBA*

The reason the Cuban crisis illustrates the importance of providing time during moments of confrontation between the big powers so that both sides can consider alternatives before moving to points of no return. He pointed out that it was a "very close thing" between a U.S. decision to mount an air strike against the Soviet installations and the final decision, the quarantine. The results, he said, emphasized the importance of the strategy we embarked on. It put the Russians in the position of having to act within a twelve hour period. During the four to five days leading up to the U.S. decision, he said, all the principals involved somewhat changed their original views. There is general agreement, he believes, that the final decision was the right one.

We should hope, he said, to approach future crises with a similar objective, namely to give the antagonist sufficient time to consider alternatives.

It is entirely likely, he said, that we will have another serious confrontation with the Russians somewhere in the next two years, according to the history of the past two years.

This likelihood is one of the important reasons for extreme emphasis on our present strategy of conventional force buildup in Europe. Also he said, we should not dismiss from our minds the possibility that we might have to consider again hitting Cuba in some way, either directly, or from sort of reprisal action or with some other major move

---

<sup>1</sup> A review of national security problems: Cuba; Europe; the Neutrals; domestic affairs; foreign aid, and military issues. Top Secret. 7 pp. Department of State, Central Files, 711.5/1-2363.

made necessary by either further Soviet activities there or by the conduct of the Cubans themselves.

Also he said, we should be prepared to have to move not only in Cuba but perhaps in Berlin simultaneously. We now have a hostage in this hemisphere just as the Russians have had one in Berlin for several years.

### *EUROPE*

Since 1958, the President said, we have been faced with General de Gaulle's proposal for a French, American, British directorate. The Eisenhower Administration rightly rejected this as a step that would give the French a veto over U.S. policy and strategy all over the world, and as one that would lead to the destruction of NATO.

The President is convinced that our refusal to accept the de Gaulle triumverate idea has not produced our present troubles with de Gaulle. In spite of what de Gaulle says, his present course is not based on a real distrust of us (in fact he is basing all his policy on reliance on U.S. power) but it is based on a strong historical conviction of the dominance of France in Europe having been rebuffed by the United States and the UK. He has now turned to the Germans in an effort to bring about this French hegemony. This is not much of a threat to us. We have attempted since the war to prevent Germany from turning East so this can be lasting value in developing Franco-German amity.

The French blockage of the UK entry into EEC is a definite setback for us and even worse one for the British. It is not as bad as some of our other problems in the world. We will have problems because the British don't get in but we are going to have some very serious economic ones if they did get in. The President said we are "going to have trouble" with Europe in the time ahead. This is all the more reasons, he said, why we must push hard and fast on the multilateral nuclear plan and on general strengthening of NATO. Perhaps the multilateral plan can't be worked out, but it is the best course, and one which would maintain our ability to influence Europe on behalf of our own interests and would keep them somewhat dependent on U.S. power.

The President recited the list of de Gaulle's non-cooperation in NATO, UN, Congo, Laos and Viet Nam, but concluded "he is there and we have to live with him".

The President spoke at some length on our trade and balance of payments problems and said that all those involved in trade negotiations are going to have to be very careful about protecting the interest of this country. He said, with great emphasis, that we have got to settle our balance of payments hemorrhage by 1964. If not, great pressure

will develop in the Congress for us to withdraw from the world to narrower policy. We have got to find ways to make Europe carry its full share. If the balance of payments continues to worsen it could be the beginning of fast deterioration of U.S. power. We have already lost most of our economic power, with the rise to prosperity in Europe, so we must use our military and nuclear power in negotiations for our interest. The point, he drove home, was that we have to look out for ourselves in months ahead and not expect that our allies are going to be particularly generous about helping us settle our own problems.

### *NEUTRALS*

The President recognized that there is considerable criticism here and among some allies that we do not distinguish between neutrals and allies. He said that Pakistan is a critic of this sort. We have got to be pretty cold about this the President said. India may be neutral, but it represents one-sixth of the world's population and 40% of the underdeveloped world. It is in our own interest to have a sub-continent that can protect itself externally and internally. Since the split with China, India represents a historical opportunity and we must coldly assess our interests as we consider each neutral government. He pointed out that we cannot tolerate the notion of any of our aid recipients that our aid should be used to settle some of their historical differences with their neighbors. Also he said, we can't have neutrals falling into the Communist camp. It may be personally obnoxious to have us to have to deal with Sukarno and Nassar but it is necessary.

### *AID*

Strong effort must be made in the next few months to tie our AID very closely to the security of the United States. The test of every Aid proposal is whether it serves the U.S. It was a mistake, the President believes, to call the program AID, a mistake made by this Administration. Mutual Security may have become a tired term but it is still a better one.

He said he particularly hopes that Defense officials will be more alert to the necessity of economic as well as military aid. They have better luck in getting military aid approved by the Congress but military aid is simply not enough. South Korea can't be kept alive by military aid alone.

The President expressed great concern that the Congress will badly mutilate the AID weapon this year unless the Administration really makes a case and drives it home to the American people. The way to do this, he said, is to make very clear to the American people how and why AID is in their interest.

The President said he was sure that nobody in this Administration wanted to be in power in a period where four or five or more countries fall to Communism.

#### *DOMESTIC AFFAIRS*

The President spoke at some length on the budget situation pointing out that we are going to have a deficit of 12 to 12½ billion dollars. He pointed out that except for Defense, Space and interest on debt (about which we can do nothing), the budget under the three years that has been presented by this Administration has been increased less than under the three years previously of the Eisenhower Administration.

He expressed deep concern about the slow growth rate of the U.S. in the past ten years—only 1 percent a year per capita. This was one illustration of why the Tax Reform Bill is very important. If we have another recession in this country it will seriously hurt our gold reserves and have an extremely bad psychological effect in the U.S. The very force of Khrushchev's progress in Russia while we drift could prove to be a tremendous victory for him if we do not end the drift and move forward.

The President said with great emphasis, "We have to prevent another recession." If we had one, he said, the presently contemplated deficit of 12 billion could go as high as 20 billion dollars and with disastrous effects.

#### *MILITARY*

The President said he was confident that some of the military were disturbed over the cut-backs in some programs such as B-70, Nike-Zeus and Skybolt but he reminded that the highest proportion of the budget by far is going to Defense.

In connection with Defense commitments he said that one of our biggest jobs is to persuade some of our Allies in Europe, under very adverse conditions, that they must do more themselves. The coming months are going to be rather decisive, particularly as they effect the multilateral question and our conventional strategy.

As he did in other places, the President stressed that we must consider very hard the narrow interest of the U.S. as well as the general interest of the world. Otherwise the voice of the U.S. will become less and less and if this happens free world power will also become less and less.

He remarked that DeGaulle's strategy is in fact based entirely on the power of the U.S.

*DISARMAMENT*

He placed heavy emphasis on the importance of a nuclear test ban. If the USSR really wants one and knows we must ultimately include Red China, then the conclusion of test ban negotiations can have helpful consequences that we are not yet able to define.

He expressed great concern about the possibility of the Chinese Communist nuclear capability. He thought a test ban agreement might produce pressure against development of such a capability. Any negotiations that can hold back the Chinese Communists are most important, he said, because they loom as our major antagonists of the late 60's and beyond.

The President spoke for approximately more than 40 minutes with considerable force and clarity. He used no notes but was obviously well organized in his train of thought and concepts. He expressed thanks to everyone at the meeting for the work they and their colleagues had done in the last year. He was pleased by the way various branches of the Government had been cooperating and hoped that this inter-relationship would grow even stronger in the next year.

---

**285. Memorandum for the Record Prepared by Gen. Taylor,  
January 22<sup>1</sup>**

January 22, 1963

SUBJECT

NSC Meeting, 22 January 1963

1. The meeting was primarily a 40-minute monologue by the President. He was very impressive, using no notes, and speaking lucidly and clearly. He went across the board of international issues.

2. *Cuba*. He said that one of the lessons from Cuba was the importance of giving the other side time to consider alternatives. He referred to the heated debates in ExCom as to whether we should execute an air strike at once against the Soviet missiles or first blockade the Island. The advantage of taking the second course was the fact that the Soviets had time to consider alternatives and to turn back the ships, thus

---

<sup>1</sup> Summary of President Kennedy's remarks to National Security Council on January 22. Top Secret. 3 pp. National Defense University, Taylor Papers, Taylor CJCS Memos.

avoiding a spasmodic response which might have initiated nuclear war. For that reason he is pressing hard for conventional forces since he feels that their use have the unique quality of gaining time for a consideration of alternatives. A nuclear exchange would defeat all parties, and only through proper utilization of conventional forces can we avoid such an exchange.

3. He said the time may come for intervention in Cuba, perhaps in the form of a blockade more intense than the previous one, of an invasion or of a reprisal against Cuba in compensation for Soviet aggression elsewhere, possibly in Berlin. He said military action against Cuba is always within the area of possibility; therefore, the military must always be prepared to move rapidly on Cuba. He said we should be ready for military intervention in Berlin and Cuba at the same time.

4. *Europe.* The President discussed at length the French situation and DeGaulle. Looking back on relations with DeGaulle, he felt there was nothing he could have done by way of reconciling DeGaulle to prevent the present situation. If he had made concessions in the nuclear field they would have been to no avail since DeGaulle had long since been committed to a Western Europe under French leadership. Any concessions would have been interpreted as appeasement and would not have diverted DeGaulle. Thus, the present conflict was inevitable.

5. The President noted the efforts of DeGaulle to pull the Germans closer to him. This does not really worry him so long as Germany faces the West and is not attracted to the East. The exclusion of Britain from the Common Market is unfortunate but we can live with this exclusion. As a matter of fact, we would have to make rather substantial economic sacrifices if Britain joined the Market. We were for it in order to strengthen the European economic stability. If the Europeans cannot work out the admission of Great Britain, he was sorry but this was not critical. In view of these trends, our policy should be the strengthening of NATO and the development of the multilateral concept. (He did not define the multilateral concept). It is through the multilateral concept that we increase the dependence of the European nations on the United States and tie these nations closer to us. Thus, we thwart DeGaulle who wants to cause a split between Europe and the United States.

6. *Economic matters.* He urged that all US representatives in economic negotiations be alert for those things which might work against our need to control the gold outflow. He noted that the downward trend in gold continues and that by 1964 this must be under control. By that time, if the rate continues, the dollar will be in real trouble. He said he was not worried about the domestic deficit in the budget but does worry about the international deficit. He reverted to the fact that we were spending too much relatively for the defense of Europe.

We must resist any proposal adversely affecting the gold reserves. A great deal of our loss of gold was due to the unfair division of effort in the NATO area. If we allow our economic strength to be drained off, we will lose our hold on Europe and will end up at the mercy of our former clients.

7. *Neutrals.* The President said he was aware of criticisms that we are going to the aid of neutrals at the cost of our allies. The fact is that we are proceeding in accordance with the interests of the United States. He didn't approve of the leadership of India but it is to our interest to have a sub-continent that can defend itself. The US can't undertake to settle all quarrels between third parties but it is our policy to keep important neutrals out of the Communist camp. It would look very bad indeed if in the next few years five or six countries would fall to Communism because of the failure of the United States to give them aid.

8. *Aid.* The President then talked about military and economic aid. He is very much afraid Congress will want to cut the heart out of the aid program. He asked all representatives, particularly the military, to stress the security interest of the United States in this program. We don't aid countries because we like them but because it is necessary to our security. He is counting on getting help from a report by General Clay on this subject.

9. *Budget.* It looks as though there will be a 12 to 12½ billion dollar deficit in the budget. He is not concerned about the deficit, but he is concerned about the lack of economic growth. On a per capita basis, we have not grown more than 1% per year for the last 10 years. The national debt has increased only 7% in 15 years, whereas the debt of the State of Virginia has increased 300%. He fears another recession which would result in continued gold outflow and loss of morale in the economic field. Hence, the tax cut was very important.

10. *Military programs.* He realized there is disappointment in some quarters that some programs are not being funded, such as the RS-70, Zeus, and Skybolt. He hoped that the military criticisms would take into account the global effect of the budget in spite of the omission of some programs.

11. *Disarmament.* He spoke of the importance of a test ban treaty if we could get a serious response from the Soviets. Such a ban would be instituted only with the understanding that if the Chinese started testing, the ban would be lifted. He hoped that a test ban agreement with the Soviets might act as a restraint on the Chinese and either prevent or retard them from becoming a nuclear power. If this potential exists, such a ban might be worthwhile.

12. In closing, the President expressed appreciation for the help in the past year and said he hoped that mutual confidence had increased. He asked that procedures be improved for speedy decision making.

*Chairman*  
*Joint Chiefs of Staff*

---

**286. Notes on Remarks of President Kennedy Prepared by a “CIA Rapporteur,” undated<sup>1</sup>**

January 22, 1963

I will start by reviewing areas of policy which will be before us in the coming months and indicate the general attitude which I have toward them and to emphasize where we might put our emphasis in the next few months.

The responsibilities of the United States are worldwide and the U.S. is the only country which is recognizing its wide responsibilities. We are part of NATO, SEATO, etc. and support other pacts even though we are not a part of them. Other nations are not doing their share.

Would like to say a word first about Cuba.

The indications are that the importance of timing is of paramount importance in reaching judgments—both by the USSR and the US. Our big problem is to protect our interests and prevent a nuclear war. It was a very close thing whether we would engage in a quarantine or an air strike. In looking back, it was really that it presented us with an immediate crises and the USSR had to make their judgment and come to a decision to act in twelve hours. In looking back over that four or five day period, we all changed our views somewhat, or at least appreciated the advantages and disadvantages of alternate courses of action. That is what we should do in any other struggle with the Soviet Union—and I believe we will be in one in the future. We should have sufficient time to consider the alternatives. You could see that the Russians had a good deal of debate in a 48 hour period. If they had only to act in an hour or two, their actions would have been

---

<sup>1</sup> President Kennedy’s remarks to National Security Council on January 22. Secret. 7 pp. Kennedy Library, National Security Files, Meetings and Memoranda Series, 508th NSC Meeting.

spasmodic and might have resulted in nuclear war. It is important that we have time to study their reaction. We should continue our policy even though we do not get Europe to go along with us.

The time will probably come when we will have to act again on Cuba. Cuba might be our response in some future situation—the same way the Russians have used Berlin. We may decide that Cuba might be a more satisfactory response than a nuclear response. We must be ready—although this might not come. We should be prepared to move on Cuba if it should be in our national interest. The planning by the US, by the Military, in the direction of our effort should be advanced always keeping Cuba in mind in the coming months and to be ready to move with all possible speed. We can use Cuba to limit their actions just as they have had Berlin to limit our actions.

In the matter of Europe, the US has been faced since 1958 with deGaulle's position . . . . nuclear veto by French . . . . President Eisenhower reviewed the problem and took the position that it should be reviewed by the NATO nations—the NATO nations would not act. . . . no agreement between the Three. That decision this Administration also supported. However, this decision has not produced the present contention with the French. Even when I was in Paris last June, de Gaulle said he would make some proposal in regard to NATO itself. All through his speeches and his memoirs he indicates it is his desire to have a Europe in which France would be a dominant power speaking to the USSR and to the Western World as an equal. If we had given him atomic weapons he would be difficult to deal with.

De Gaulle did not question our support of Western Europe because we have maintained strong representation there, but the French have not. They have not been aggressive as we have been and, therefore it is not a distrust of us that we will desert Europe but it is that he feels that France should assert a position as a strong France and cease its growing reliance on the U.S.

Having made such proposals to the US and Great Britain and been turned down, he has made the same turn to Germany. This is not so bad as it has prevented Germany moving to the East. And, historically, Germany's trade has been to the East. There is not much harm to us in this position. With Great Britain joining the Common Market, this would strengthen Europe but France will not let them in at this time. If G.B. does go in, it will cost us a good deal in trade, but it will be good for the stability of Europe. France keeping Britain out is a setback for us, but a more severe setback for G.B. They are going to have a difficult time in Europe. It is our interest to strengthen Europe and the unilateral concept, and deGaulle is opposed to this. By strengthening the multilateral concept, it strengthens NATO and increases their dependence on us. This strengthens our influence in Europe and gives

us the power to guide Europe and keep it strong. The events of the past two weeks makes it important for us to support the multilateral concept and that is why deGaulle is more opposed to it. It will be difficult to work this out, but it is important that we do so. But we should not be wholly distressed.

After all we have done for France in so many ways, deGaulle has opposed us in many places throughout the world—in NATO, in the Congo and other places—but he is there and we have to live with it. One way we can do so is to strengthen the multilateral force and NATO.

Our negotiators on trade matters will have to be very careful to protect our interests. Our trade balance is of great concern and is not under control. If we get down to the \$12 billion coverage of our national reserve we will be in trouble. We will have pressure on the dollar and pressure from the Congress and they will begin to follow a much narrower policy. We will be very tough about the actions that Europe takes. We maintain large forces in West Germany. If West Germany does not maintain sufficient forces but instead concentrates on agricultural production for instance to our detriment, we must take a strong position. At present we are paying half of Norway's air and sea power for instance and supporting NATO, and they are "living off the fat of the land" while we are paying for their protection. In the coming months we must concentrate on how we can protect the interests of the United States. We have pursued a very generous policy. We have lost our economic power over these countries. Now we are running out and if the French and others get atomic capacity they will be independent and we will be on the outside looking in. Do not think that the Europeans will do anything for us even though we have done a lot for them. So we must have all our representatives looking out very strongly for the U.S. interests. We must be sure our economic house is in order and use our military, political power to protect our own interests.

Regarding our attitude toward the neutrals. There is criticism about our lack of difference between the Allies and the neutrals. The Pakistanis are critical, but we must recognize the importance of the Indians. If they joined the Chinese we would have no free South Asia. The Pakistanis are struggling against the Indians and the Afghanistans. They will use or attempt to exploit our power. Our interest is to make a strong sub-continent. We will use the country that can help further that aim. We have used India lately. We do not like their present leadership, but we can use them. While doing this we have moved away from the Pakistanis and they are moving closer to the Chinese and against the Indians. We have not been able to persuade the Pakistanis or the Afghanistans to chance their policy on India. These forces were there long before we came on the scene and we cannot do much about

it—we cannot settle all the disputes, but we want to keep them free from the Communists. We cannot permit those who call themselves neutrals to be completely taken into the Communist camp. We must keep our ties with Nassir and others, even though we do not like the leaders themselves.

With regard to AID which is going forward under General Clay, we hope we can tie this whole concept of aid to the safety of the United States. This is the reason we give aid. The test is whether it will serve the United States and if we can equate it to that. AID is not a good word. Perhaps we can describe it better as Mutual Assistance—though this is an old term. Some countries can go it alone, but we must do all we can. We must make every effort to keep a country out of the communist bloc. It is more difficult to get a country out of a communist bloc once it is in. It sometimes seems hopeless. The Congress may cut the heart out of Foreign Aid and this is a great danger to the safety of the United States. Even the French give more aid than we do on a per capita basis. We will probably take a cut, but we do not want to hurt our Defense effort. We would not like four or five countries to suddenly turn communist just because we did not give a certain amount of aid. We must look this over very carefully and put aid on the basis it will best serve our own interest.

Turning to the domestic scene, we will have a deficit of about \$12 of \$12½ billion. We have made an effort to hold the deficit down and we have in the past three years. Except for Defense and Space and Interest on the Debt we have increased the National Budget but it has been increased less than it was under the previous Administration. With the tremendous movement from the country to the cities, we have had many problems. While the costs have increased, the receipts have dropped. We have only increased about 1% a year in the growth rate during the past ten years. This is serious, particularly with the great increase in population.

I think this Tax Bill is very important. If we get another recession in this country it will have a bad effect on the gold reserve. It will have a bad psychological effect on the people of the U.S. And when we see the strong position that Mr. Khrushchev is taking with regard to agricultural and other domestic sections of the economy—and if we just drift, we will look very bad to other nations.

Furthermore, the deficit is a reflection of the fight in the hot and cold war we have been fighting during the past fifteen years. If we go to a deficit of \$12 billion, this would be a most serious affair for the United States. If we can go forward with the present Tax Bill, we will be in much better shape. All of these matters—the tax program, AID, defense, etc. are all related.

The Military are disturbed because of our failure to go forward with certain programs. For instance: The B-70, Nike-Zeus, Skybolt. As

a matter of fact, we are going forward with a large program and there is a limit to how much we can do, and if the necessity develops we will do more. This Administration has spent a good many millions more than has been appropriated for Space and Defense—and perhaps we should spend more.

One of our big jobs will be to persuade our colleagues in Europe to do a better job themselves. If we maintain six divisions in Europe and they only maintain a force which will permit them to fight only two or three days—if we have sufficient force to fight and supply for ninety days and those around us can only fight for two or three days, then we should take another look. France carries their burden abroad, but not in Europe. We should consider very hard the narrow interests of the United States as well as the interests of the Free World. If we grow weak economically, our influence will grow less and less and if that happens, our Free World's position will grown weaker. De Gaulle is basing his whole position on the position of the United States. He can do this because he feels we will maintain our military power in Europe and he can bank on it.

Mr. Foster is engaged in the Test Ban. We might be successful here if the Russians need it and if they know that we will change this if the Chicoms develop an atomic capacity. If they do we will have great difficulty in protecting Asia. If the Test Ban Treaty is successful it will inhibit the Russians from starting a nuclear war and if so we should make every effort to conclude the treaty. But if the nuclear test ban includes only the Russians and the U.S. it is not worth very much. We should support Foster all we can until we see where it is going. If we get a successful treaty, we will fight it through if it will help us. (On the Hill?)

Thanks for your cooperation. All worked well together and harmoniously. Hope we can maintain the mutual relations which have been so good in this Administration.

**287. Memorandum for the Record Prepared by Col. Legere,  
January 23<sup>1</sup>**

January 23, 1963

SUBJECT

Daily White House Staff Meeting, 23 January 1963

1. Mr. Bundy presided throughout the meeting.

2. Bundy and Klein mentioned Prime Minister Fanfani and the Jupiter withdrawal from Italy. Fanfani does not want any North Atlantic Council presentation or consideration until 30 January, in part so as to permit President Kennedy to break the ground first at his press conference tomorrow.

3. The meeting this morning mostly addressed the subject of tactical nuclear weapons, in general and as specifically embodied in the currently active study by the Chairman's Study Group. Monday evening Kaysen showed me a new draft of his memorandum for Mr. Gilpatric on the proposed guidelines for the Tactical Nuclear Weapons study, and yesterday (Tuesday) noon I was able to show it to Major Smith. Attached is a copy of the paper as of 21 January. Apparently Kaysen wanted to clear his draft with Bundy before sending it to Mr. Gilpatric, and Bundy said that he had spent quite a bit of time last evening reading the paper and thinking about the problem in general. I feel that I should report that, throughout the discussion of this topic, Bundy's entire tone and approach conveyed a deep, even if contemptuously supercilious, mistrust of military motives and distrust of military minds. In any event, the following aspects arose, not necessarily or exactly in chronological order:

a. By way of extending Bundy's education on this subject, Kaysen noted that the Army at first, and then the Joint Staff in turn, had always been operating on the firm assumption that tactical nuclear weapons were indispensable. With reference to his draft memorandum to Gilpatric, Kaysen ventured to predict that the response of the AEC would indicate that they could only extend the deadline for their decision on FY 65 production if someone or other were to approve an additional loss (or cost) of \$X—Kaysen actually used \$32 million as an example, but on what basis I do not know. Bundy of course did not say that it would be all right to absorb an additional multimillion dollar cost, but

---

<sup>1</sup> White House staff meeting concerning the tactical nuclear weapons study, the nuclear test ban agreement, and Kennedy's January 22d comments to the National Security Council. Secret; Eyes Only. 3 pp. National Defense University, Taylor Papers, WH Staff Mtgs.

the “atmosphere” was such that I gather the impression that the money would probably prove no problem if the government, and especially the sluggish military, could be brought around to a more rational view of and planning for tactical nuclear weapons. Incidentally, Kaysen mentioned earlier in the discussion that Harry Rowen and Alain Enthoven were collaborating at Defense level on a similar and parallel paper for the SecDef, presumably keyed to the JCS deadline—and presumably (my own view) designed to undercut the anticipated views of the JCS.

b. At this point Bundy expressed a concern about tactical nuclear weapons which was somewhat in extrapolation of the usual New Frontier concerns. He wondered how it might be possible to tie this more or less purely military JCS study to the requirement for a rational US diplomatic posture. All this sounds a little turgid but Bundy did mention de Gaulle by saying that the latter, because he did not have any tactical nuclear weapons on the horizon and because he would probably like to have them, might be impressed to some degree with a US tactical nuclear weapons posture; at least that is the way I came out in trying to follow his thinking. Later on he stated somewhat more explicitly that the forces one wants for war are not necessarily those which one may want “diplomatically.” He asked Kaysen how this sort of thinking might be made to appear in any final governmental exercise on tactical nuclear weapons. Kaysen, who was probably a little behind Bundy for once, said that he thought the “interpretive paper,” which “General Taylor” would be doing in connection with the routine Joint Staff study, could be circulated at an appropriate time to the highly placed policy men in the government.

c. I got two requirements out of this morning’s discussion on tactical nuclear weapons. The first was to find out from General Taylor’s office what statements we had made or what assurances we had given to the Germans concerning tactical nuclear weapons; when Adenauer was here Bundy specifically referred to a statement which General Taylor may have made along the line of: “You Germans will have available to you just what we will have available to ourselves.” The second requirement was that I “keep in touch” with the progress of the Tactical Nuclear Weapons study within the Joint Staff and within the Office of the Chairman.

4. There ensued a brief, sprightly, and metaphysical discussion on the future of a nuclear test ban agreement, with emphasis on the Chinese and the French (“our Chinese,” as someone called them). The only point which I was able to pick up was that, in the event of a US-UK-USSR test ban agreement, the signatory powers might establish a “two year grace period” during which the likes of the French and Chinese, and anybody else who possessed the capability, could taper off their national tests.

5. Bundy thought that his Staff input into the President's NSC talk yesterday had been highly productive, especially Komer's ideas on the neutral countries and specifically on Nasser, and Dungan's ideas on foreign aid. Bundy called the President's talk a "Bravara" performance, and the expression "mood music" was also applied to specific subjects which the President covered. In connection with foreign aid, Bundy mentioned that the mood of the Congress and the people was one reason for having nominated a fine old hard rock like General Clay to the Chairmanship of this foreign aid Group. Someone said that General Clay seemed to be acting too toughly, but Bundy said that there were a lot of people in the Group to keep him in line; Max Millikan, MIT associate of Walt Rostow, came in for specific mention. It therefore looks to me as though the Administration is once again trying to use the Old Saddler as a stalking horse for their risky or unpleasant business.

## February 1963

### 288. Memorandum from Maj. Smith to Gen. Goodpaster, February 6<sup>1</sup>

February 6, 1963

#### SUBJECT

US Policy on Tactical Nuclear Weapons in Europe

1. In one of the first, and last, NSC policy documents approved by this administration, the unsympathetic attitude toward tactical nuclear weapons in Europe was made clear. The document was entitled, "NATO and the Atlantic Nations", (TAB A) and resulted from an Acheson report on the same subject. It was approved by the President on 22 April 1961.

2. Setting forth a "pragmatic military doctrine" the paper said (p. 5) the US should urge that:

"NATO continue . . . to prepare to meet nuclear or massive non-nuclear attack on the theater—but not to a degree that would divert needed resources from non-nuclear theater programs to meet lesser threats or from programs to assure an ample and protected US strategic power."

3. Later, (p. 7), with reference to nuclear forces the paper stated:

"a. The President should state that an offensive nuclear capability will be maintained in the European area and that nuclear weapons will not be withdrawn without adequate replacement. Nuclear weapons in NATO Europe may be regrouped as further studies may indicate.

"b. Additional resources should be used to strengthen the nuclear capability now in Europe only where (i) going programs are so far underway that they could not be changed without serious adverse political effects, or (ii) the increase will not divert needed resources from non-nuclear tasks and is clearly required to cover needs either for replacement or expansion that cannot be met from outside the theater. The 1963 goals, as well as the proposed 1966 goals, should be reviewed by the State and Defense Departments from this standpoint."

4. In Athens last May, Secretary McNamara clearly implied to our NATO Allies that the US believed the need for tactical nuclear weapons would be less useful in the future. He stated:

---

<sup>1</sup> "US Policy on Tactical Nuclear Weapons in Europe." Top Secret. 4 pp. National Defense University, Taylor Papers, Tac Nuc I.

"Battlefield nuclear weapons were introduced in NATO at a time when our Shield forces were weak and the Soviet atomic stockpile was small. In these circumstances it was reasonable to hope that NATO might very quickly halt a Soviet advance into Western Europe by unilateral application of nuclear weapons on or near the battlefield. Using nuclear weapons tactically might still accomplish a desired end in the early 1960's. . .

"But how much dependence should NATO place on these capabilities? We should succeed in deterring the Soviets from initiating the use of nuclear weapons, and the presence of these weapons in Europe helps to prevent Soviet use locally. But NATO can no longer expect to avoid nuclear retaliation in the event that it initiates their use. Even a local nuclear exchange could have consequences for Europe that are most painful to contemplate. Further, such an exchange would be unlikely to give us any marked military advantage. It could lead to general nuclear war.

"To be sure, a very limited use of nuclear weapons, primarily for purposes of demonstrating our will and intent to employ such weapons, might bring Soviet aggression to a halt without substantial retaliation, and without escalation. This is a next-to-last option we cannot dismiss. But prospects for success are not high, and I hesitate to predict what the political consequences would be of taking such action."

In the same speech, however, the Secretary stated:

"There exists a deep and natural interest particularly on the part of those Allies who maintain nuclear delivery systems, that US nuclear warheads for such delivery systems will be maintained in Europe. President Kennedy previously authorized Ambassador Finletter to state in the Permanent Council that the US will continue to make available to the Alliance the nuclear weapons necessary for NATO defense, and will consult with its Allies about any significant changes which might occur in present US programs for supplying nuclear weapons in support of NATO forces."

To old NATO hands, whenever the word "Alliance" is used rather than "NATO" by this administration, it usually means weapons outside Europe, i.e., strategic. Thus the Secretary's statement really does not necessarily mean that the US will maintain nuclear weapons "for the Alliance" in Europe. Rather the last sentence of the exalt in truth foreshadows possible reductions.

5. In Paris last December, Secretary McNamara, undoubtedly because of the known European fears that the US was in the process of a "nuclear withdrawal", did not speak out quite so strongly against tactical nuclear weapons. In fact, he seemed to retreat a bit. He referred briefly to his remarks at Athens on the escalatory possibilities of the use of tactical nuclear weapons, and commented:

"At this juncture, however, it is premature to suggest specific changes in our tactical nuclear programs. Because of the great strategic and tactical nuclear powers already at our disposal, we have time. I strongly urge that we use the time not only to review our programs

but also to re-examine the assumption on (sic) that tactical use of nuclear weapons by both sides would generally be to the advantage of the Alliance.”

Then significantly, the Secretary added:

“I want to make it perfectly clear that it is our intention to maintain and to increase tactical nuclear weapons in Europe. However, I doubt that they are the means by which we can compensate for non-nuclear weaknesses.”

In the remainder of the speech Secretary McNamara emphasized the need for NATO non-nuclear forces, asking \$8.5 billion more from our Allies for these forces over the next five years.

6. In summary, in 1961 the President approved a policy of restricting further the tactical nuclear build-up in Europe. Since then, all nuclear weapons productions schedules, dispersal plans, and the original directive for JCS studies on tactical nuclear weapons have been drawn up with emphasis on reducing the availability and restricting the use of tactical nuclear weapons. (This can be documented, if desired.) But then in Paris the US told its Allies we plan to increase tactical nuclear weapons in Europe. Nothing since December, however, has shown that the Paris speech in fact constituted a basic change in policy. This leads to a conclusion that while our Allies believe we have plans to increase nuclear weapons in Europe, our action policy still remains one of restricting any build-up and reducing the number of deployed weapons if possible.

W.Y.S.

February 7<sup>1</sup>**

February 7, 1963

SUBJECT

Views of Dr. Enthoven on Tactical Nuclear Warfare

1. The following views were expressed by Dr. Enthoven in a meeting with the Tactical Nuclear Branch, the Tactical Nuclear Ad Hoc Vice

---

<sup>1</sup> “Views of Dr. Enthoven on Tactical Nuclear Warfare.” Top Secret. 6 pp. National Defense University, Taylor Papers, Tac Nuc Wpns Study.

Chairman, and the Deputy Chairman, SSG on 4 February 1963. Meeting with Dr. Enthoven was requested by General Edwards to discuss current Study Group efforts and interpretation of memorandum from Mr. Kaysen of the White House.

a. Dr. Enthoven prefaced his remarks by stating that since our last meeting of 10 December he had gained a clearer view relative to where tactical nuclear weapons do and do not fit into our strategic posture. His conclusions are:

(1) It has been pretty well decided that it is feasible, desirable, and even necessary to have adequate deployed non-nuclear forces capable of holding an enemy conventional assault without the use of nuclear weapons. These deployed conventional forces can be feasibly backed up by necessary CONUS based reserves and with such a posture we have a good capability of achieving reasonable objectives without resorting to nuclears.

(2) When both sides have a comparable balance of tactical nuclears, he has concluded that it is not to our advantage to initiate their use in most situations. Any theater in which tactical nuclear weapons are used becomes an area of mutual disaster—both population and industry are destroyed. It looks now as if the mutual destruction disadvantage outweighs the military advantage.

(3) Based on the above points, tactical nuclear weapons are NOT required to substitute for a conventional force deficiency. Aside from weapons needed to demonstrate resolve, what then are tactical nuclear weapons for? The answer is that tactical nuclear weapons are required to:

(a) “Deter the other guy” from initiating tactical nuclear warfare, and

(b) If deterrence fails, to allow use to fight nuclear war in the theater. (In answer to a question later discussed, Dr. Enthoven acknowledged that a valid purpose of tactical nuclear weapons can be to deter the enemy from massing a decisive conventional force.)

(4) Tactical nuclear forces have three basic design implications:

(a) They must be able to survive and remain ready and capable during the conventional battle. They must live through the conventional phase without degradation of capability while continuing to provide an umbrella of nuclear deterrence. Safety (peacetime safety?) and stability are parts of the problem.

(b) They must have a second strike capability, i.e., they must be able to survive a nuclear onslaught initiated by the enemy.

(c) Having survived, they must then perform a useful military function, i.e., they must be able to provide effective nuclear fire when needed.

(5) Notwithstanding any views to the contrary, Kaysen, Rowen, and Enthoven believe that in any general war the strategic exchange will dominate the outcome.

b. The thought that an adequate level of conventional forces can be attained which can successfully fight in Europe without nuclear weapons is firmly established in the thinking of the President, the Secretary of Defense and “most of the people who work for them.” We should re-read McNamara’s December presentation to the NATO Council of Ministers in this regard. NATO outnumbers Warsaw Pact in population and soldiers; industrial production is 2½ times as great. Thus the present administration is convinced that proper organization of conventional forces can give us an adequate capability. Admittedly, there is currently a problem of convincing our allies. We must attack the myth of Soviet conventional superiority.

Further studies of our intelligence picture will have to be undertaken to examine this. The military and intelligence community appear to be overstating Soviet Bloc capability. It is not possible (unless McNamara has been “con-ed” by the Army) for the USSR to equip and support 100 divisions or anything approaching that number on the amount of money they are spending. This leads to the “PEMA paradox”: We are currently spending \$3.3 billion for PEMA for 22 divisions versus \$3.6 billion equivalent by Soviets. How can they equip such a force? Enthoven’s estimate is that it would take the Soviets \$15 billion annually to provide a 100 division force when the divisions equated to those of the United States. It would be, indeed, remarkable if they were able to produce modernized conventional forces for what they are spending.

(Dr. Enthoven acknowledged later in the conference that the above argument and the line of reasoning outlined in paragraph 1a are based on the premise that our intelligence picture has not been fully correct in reflecting the Soviet conventional threat, and that a deeper probe of the intelligence picture will affirm this. To what extent the concepts outlined by Enthoven would be altered if current estimates of the threat are upheld was not discussed.)

c. The conclusions expressed in paragraph a above interact with the question of Dual Capability. Tactical fighters, artillery and infantry battalions are now all designed for both conventional and nuclear roles. But in fact, dual capability may not be a good thing. It doesn’t meet the requirement and is not a realistic capability anyway. The time of greatest need for nuclear capability is during conventional conflict when we are faced with great danger of escalation by the Soviets—particularly if we are succeeding conventionally. Under present concepts of having dual capable forces we can’t really do either job well. We need two types of forces, as few weapons are really dual capable.

For example, land based tactical fighters do not meet the requirements of the design objectives for tactical nuclear forces (see above) and therefore are not really a dual capable system. They are vulnerable on the ground in nuclear war and therefore are suitable primarily for conventional operations. MMRBM can perform most of the nuclear missions now assigned to tactical fighters. Possibly carrier based aviation can be considered as dual capable—vulnerability may not be as great and weapons of both types are immediately available.

The problem presented with many nuclear weapons in the hands of the Army is survivability during the initial phase of nuclear war. Troops and weapons are not really protected against nuclear weapon effects. During the conventional phase the nuclear delivery vehicles are vulnerable to conventional weapon attacks and in the way. After escalation the conventional forces will be chewed up.

When we give a commander a dual capability there is a tendency to emphasize nuclear training at the expense of conventional training. Conventional training, doctrine, and equipment suffer.

The F4C is a good airplane for conventional war, however, it is too vulnerable for nuclear war. PERSHING is a partial answer pending development of other MMRMS's for this mission. PERSHING has a fair range. In peacetime and during conventional conflict, it can be kept back out of range of enemy non-nuclear forces and can perform a military useful function. In this regard Dr. Enthoven referred to the Lee Study on NATO interdiction as a useful employment. A mobile MRBM is probably not vulnerable except under blanket nuclear attack. It is recognized that they could be eliminated in such an attack if the Soviets want to destroy Western Europe. Under these conditions external forces are required to deal with the situation. Dr. Enthoven envisions that specialized nuclear forces would "stay lost" but alert during conventional war. They should not be intermixed with the conventional forces.

A real problem with DAVY CROCKETT is that it does not have adequate survival potential and cannot be adequately controlled under present organizational concepts. Objections to the DAVY CROCKETT and other short-range weapons are that they are up front and vulnerable and they are symbolic of intent to use nuclears from the outset of any conflict situation.

What we really need to do is figure out an approach to designing special purpose tactical nuclear forces.

The Howze concept (as expressed in his article in *Army Magazine*) may not be too valid for conventional conflict in Europe since it is limited in conventional firepower; however, some such concept might well fit into the development of special nuclear ground units. We should read "Rommel's Memoirs." Lines on maps are fine things,

but . . . The FEBA referred to in the Initial Project 23 Report is hardly a valid consideration in ground nuclear warfare<sup>2</sup> nor necessarily in conventional warfare. If we study current and past Soviet doctrine relative to mass and breakthrough, it is obvious that future war will not be fought along lines on a map. Have we not been over simplifying the war too much in this respect? Thus, the problem of ADM's is that they depend on the use of a nuclear defense line. They might be valuable to protect the border but this presupposes immediate escalation—or they could be useful on the Rhine. However, we can lay down a line of seared earth with PERSHINGs if required.

Insofar as ASW is concerned even the Navy does not see a net advantage to use by our side. We are better off non-nuclear because of the high risk of escalation and the problem of locating and identifying. On the other hand, attack submarines of Soviets have much better chances of locating and identifying our surface forces. Use of nuclears are then much to his advantage. (THIS IS AN IMPORTANT ADVANCE SINCE IT REPRESENTS THE FIRST CRACK IN MILITARY THINKING INDICATING THAT NUCLEAR WARFARE MAY NOT ALWAYS BE TO OUR ADVANTAGE.)

d. Kaysen, Rowen, and Enthoven are all convinced that the strategic exchange will dominate the outcome of a general war and may be decisive regardless of tactical nuclear weapons. As an indirectly related point, Dr. Enthoven indicated the possibility that our current SIOP guidance possibly should be changed to accept a lower level of damage expectancy in SIOP targeting. Perhaps retardation and interdiction targets in Europe should receive more emphasis. It is important to understand the role of tactical nuclears under these conditions and to understand what they will or will not do for us.

Evidence indicates that the Soviets have no nuclear warheads deployed outside the Soviet Union. They have re-usable MRBM launchers. MRMBs can give Soviet theater forces nuclear support. Couldn't PERSHING do the same for us and keep him from massing his units on the Western front? Twenty Tactical Recce squadrons are planned; can they keep track of enemy units for PERSHING to hit?

We realize today that our conventional forces are inadequate, but we do not assume that tactical nuclear weapons are a substitute. We must persuade our allies that the only acceptable defense against conventional attack is a conventional response. The British are starting to

---

<sup>2</sup> This is a misconstruction of Project 23 on this point. References to a "FEBA" were deleted in most cases from Project 23 for this very reason. The notion of a "zone of contact" was substituted.

feel we are on the right track, the French have and plan a big army, so we cannot assume that they will not accept this view.

e. In answer to a question, Dr. Enthoven stated that the Studies Group should not concern itself with the question of nuclear weapon requirements during the interval pending achievement of an adequate level of conventional forces.

## 2. Recapitulation of Dr. Enthoven's views.

a. If we build up our conventional forces, the Bloc would be hard pressed to "stay ahead." Economically they are now spending one-fourth of their GNP on defense and are obviously feeling the strain. Add this to our doubts about the number of effective divisions equivalents they now have and it makes the 50 percent increase in conventional forces in Central Europe even more desirable. "We can and will have adequate conventional forces."

b. Our strategic force structure is credible and deters general war. The day is fast approaching when the side which pre-empted will be expending his delivery capability without any real gain (assuming a highly survivable ICBM force on each side). Thus, the possibility of general war is receding. Our aim is to develop nuclear forces that present a credible deterrence to nuclear war below the general war level. Concurrent therewith we are going to develop conventional forces to respond to conventional assault. Today our conventional forces are inadequate—they need not be in the future.

c. Tactical nuclear weapons can't solve the problem if we don't have conventional forces. The military is saying "we can't do without nuclears" but the much broader question is "can we do with them." It now appears that we are inviting mutual disaster by planning to escalate to the nuclear level. If the Study Group can prove that it is to our net military advantage to use tactical nuclears, it will be very surprising. Tactical nuclear weapons are NOT a substitute for adequate conventional forces; we can have sufficient conventional forces to do the job. There are, however, two main reasons for the existence of tactical nuclear weapons:

- (1) To deter the Bloc from using them.
- (2) If this fails, to allow the theater forces to continue fighting the war.

d. Insofar as short-range, small-yield weapons are concerned, we must examine new organizations and concepts that will meet the "design objective."

e. The military is perpetuating what seems to be a myth relative to the invincibility of Soviet conventional forces. GNP and dollar equivalent comparisons indicate that the advantage can be on our side. We can and must examine this to see if it is a myth.

f. We must proceed to examine an organization comprised of two kinds of distinct and separate theater forces and “get off the dual capability kick”—one force specially tailored for nuclear war—one for conventional.

3. What does this all mean in our study efforts (as seen by Dr. Enthoven)?

a. If our analysis (or any other study) is based upon the premise that a conventional strategy is hopeless, we might as well not bother to do it. “Hearing aids will be turned off throughout the civilian levels and the studies will end up in a drawer unread.”

b. The real issues are not the fiscal year 1965 stockpile, but the longer range questions posed by Kaysen and the Secretary of Defense. The fiscal year 1965 stockpile is merely being used to “smoke out the issues.” The real problem of our study is to develop long-term policy objectives.

c. We should accept the fact that we will respond conventionally and get on with the problem of how we design the nuclear systems to provide:

- (1) Survivability during the conventional phase.
- (2) Survivability in nuclear warfare and second strike capability.
- (3) After surviving, they must then perform a useful military function.

d. The administration is not trying to take tactical nuclear weapons away. The issue is the type of force and what weapons we need for it. The issue is not whether we have theater nuclear forces but rather what do we need to make them effective.

March 22, 1963

## SOVIET MILITARY CAPABILITIES AND POLICIES, 1962-1967

### THE PROBLEM

To review significant developments in Soviet military thinking, policy, and programs, to assess the current Soviet military posture, and to estimate main trends in Soviet military capabilities and policies over the next five years.

### SCOPE NOTE

This estimate presents our main conclusions on the broad range of major Soviet military problems. It includes, *inter alia*, summary versions of recent National Intelligence Estimates, updated as appropriate, devoted to individual military missions and other related questions.

### SUMMARY AND CONCLUSIONS

#### *Basic Views on War*

A. The Soviets see military power as serving two basic purposes: defense of their system and support for its expansion. Thus, one of the most important objectives of Soviet military policy is to deter general war while the USSR prosecutes its foreign policies by means short of actual hostilities involving Soviet forces. The Soviets recognize that their deterrent must be credible in the sense that it rests upon powerful military forces. They also recognize that deterrence may fail in some key confrontation in which either they or their opponents come to feel that vital interests are under challenge. Against this contingency they wish to have a combination of offensive and defensive capabilities which will enable them to seize the initiative if possible, to survive enemy nuclear attack, and to go on to prosecute the war. We do not believe, however, that the Soviets base their military planning or their general policy upon the expectation that they will be able to achieve, within the foreseeable future, a military posture which would make rational the deliberate initiation of general war or conscious acceptance of grave risks of such a war. (*Paras. 1-3*)

---

<sup>1</sup> "Soviet Military Capabilities and Policies, 1962-1967." Printed in part in the print volume as Document 130. Top Secret; Controlled Dissem. 62 pp. Johnson Library, National Security File, Intelligence File, National Intelligence Estimates.

B. A number of Soviet statements in recent years have expressed the view that limited war involving the major nuclear powers would inevitably escalate into general war. While such statements are intended in part to deter the West from local use of force, this official view also reflects a genuine Soviet fear of the consequences of becoming directly engaged in limited war involving Soviet and US forces. This probably also extends to involvement of Soviet forces with certain Allied forces in highly critical areas, notably Western forces in the European area. Nevertheless, they might employ their own forces to achieve local gains in some area adjacent to Bloc territory if they judged that the West, either because it was deterred by Soviet nuclear power or for some other reason, would not make an effective military response. They would probably employ Soviet forces as necessary if some Western military action on the periphery of the Bloc threatened the integrity of the Bloc itself. Should the USSR become directly involved in a limited war with US or Allied forces, we believe that the Soviets would not necessarily expand it immediately into general war, but that they would probably employ only that force which they thought necessary to achieve their local objectives. They would also seek to prevent escalation by political means. (*Paras. 4–5*)

C. The Soviets recognize another type of limited military conflict, termed a “war of national liberation,” in which pro-Soviet or anti-Western forces challenge colonial or pro-Western regimes in a primarily internal struggle. The Soviets have rendered active assistance in some such conflicts, and little or none in others, depending upon such practical factors as accessibility, the risk of defeat, and the attitude of other powers involved. In addition, the USSR has given military assistance to friendly, non-Bloc regimes. As new and favorable opportunities arise, the Soviets will continue to offer these various kinds of assistance. We believe, however, that they will remain chary of any great commitment of prestige to the support of belligerents over whom they do not exercise substantial control or in circumstances in which they feel that winning is unlikely, and they will seek to avoid risk of widened hostilities which might result from “wars of national liberation.” (*Paras. 6–8*)

#### *General Trends in Military Doctrine and Policy*

D. Current Soviet military policy stems from Khrushchev’s plan, announced in January 1960, to cut back the size of the armed forces and to place main reliance on nuclear and missile forces. The plan reflected his view that a general war is almost certain to be short, with victory decided in the strategic nuclear exchange, and with conventional arms playing a quite secondary role. Khrushchev’s plan was accepted only reluctantly by the military leadership; both the plan and its strategic justification have since undergone substantial modification. Present Soviet military doctrine holds that a general war will inevitably

involve the massive use of nuclear weapons; it will begin with a strategic exchange, and its course and outcome may well be decided in its initial phase. Hence, doctrinal discussion emphasizes the importance of seizing the initiative by pre-emptive attack if, in the Soviet view, general war becomes imminent and unavoidable. However, the current doctrine holds that such a conflict will not necessarily be short, and it supports both the building of strategic attack and defense capabilities and the maintenance of large theater and naval forces. (*Paras. 13–16*)

E. The Soviet leaders evidently believe that the present overall military relationship, in which each side can exert a strong deterrent upon the other, will probably continue for some time to come. However, they almost certainly regard the present strategic posture of the USSR as inferior to that of the US, and they are aware of the continuing buildup of US forces for intercontinental attack programmed for the next few years. In this situation, they probably do not expect to be able to obtain a clear strategic superiority over the US, but we believe that the Soviets are far from willing to accept a position of strategic inferiority. Our evidence does not indicate that the Soviets are attempting to outstrip or even match the US in numbers of weapons for intercontinental attack; we believe, however, that they will attempt to offset US superiority by other means.<sup>2</sup> (*Paras. 21–26*)

F. The Soviets may see a possible solution to their strategic confrontation with the US in a combination of antimissile defenses plus very effective though numerically inferior intercontinental striking forces. We believe that deployment of anti-missile defenses may be the largest new Soviet military program in the period of this estimate. Hardened ICBM's and submerged-launch submarine missiles will contribute to Soviet strategic capabilities. In addition, over the next few years the Soviet arsenal will probably come to include new large ICBMs, armed with very high-yield warheads or capable of global ranges. Moreover, the USSR is almost certainly investigating the feasibility of space systems for military support and offensive and defensive weapons. (*Paras. 27–28*)

G. Official statements and military writings suggest that the Soviet leaders see in technological achievements the means by which they may improve their total strategic position relative to that of the US. They have made scientific military research and the development of

---

<sup>2</sup> The Assistant Chief of Staff, Intelligence, USAF, agrees that the Soviets probably do not expect to be able to achieve a position of clear strategic superiority over the US during the time period of this estimate and that they are far from willing to accept a position of strategic inferiority. However, he believes that the USSR is pursuing an intensive research and development effort in the hope of attaining technological breakthroughs which, when translated into weapon systems, will result in a clear strategic superiority at a later date.

new weapons matters of high urgency, and they have a demonstrated ability to concentrate human and material resources on priority objectives. If they develop new concepts or new weapons which give promise of military and political advantages, they will seek to add them rapidly to their arsenal and to gain maximum benefit from them. Thus, during the next five years, we expect the Soviets to be working on even more advanced weapons with which they may hope to enhance their strategic capabilities at a later date.<sup>3</sup> (*Para. 30*)

H. The USSR's military programs and space efforts impose costly demands upon Soviet resources. The effort to modernize and strengthen all arms of the Soviet forces simultaneously squeezes hard on resources available for investment and consumption goals to which the leadership is strongly committed. Thus, Khrushchev may once again seek a reduction in resources devoted to theater forces on the grounds that growing nuclear capabilities will permit this cutback without endangering Soviet security. But while such a reduction would reduce expenditures for military pay and release manpower to the economy, it would not significantly reduce the demands of the defense establishment on critically scarce, high quality resources and highly skilled manpower. (*Paras. 40–46*)

I. Despite the possibility of a future reduction in theater forces, Khrushchev's 27 February speech indicates that the Soviet leadership has recently taken economic decisions which reaffirm military priorities at the expense of consumer aspirations; beyond this it may reflect a decision to increase military spending above previously planned levels. The Soviet economy is capable of bearing a heavier military burden, but not without sacrifices in the program to raise living standards and perhaps also reductions in the future rate of industrial growth. For the present, the Soviets appear to have chosen to risk these consequences, but we believe that the problem of resource allocation will continue to plague the Soviet leadership. (*Para. 47*)

J. Soviet military policy will continue to be shaped, not only by a variety of strategic, technical, economic, and political factors, but also by differing views about the relative importance of these factors, and shifting compromises among these views. As a result, we believe that the numerous aspects of this policy will not always be wholly consistent with each other, and that force structure and future programming will reflect neither a fully-integrated strategic doctrine nor a firm timetable for achieving specific force levels. We do not believe that the Soviets conceive of existing weapon systems as the answer to their military problem, or that they have fixed and inflexible plans for their force

---

<sup>3</sup> See the Assistant Chief of Staff, Intelligence, USAF, footnote to Conclusion E.

structure in the period five to 10 years from now. Barring some major technical advance in weaponry, we believe that Soviet military policy is likely to continue along current lines, and that for at least the next few years large standing forces of all types will be maintained. Even in the absence of such an advance, however, we cannot exclude the possibility of new departures in military policy, perhaps resulting in major changes in the composition of the Soviet military establishment and in the relative emphasis given to forces designed to accomplish the major military missions. (*Paras. 29–30*)

#### *Forces for Long Range Attack*

K. Although missile forces for attack on Eurasia continue to grow, major emphasis in the building of long-range striking forces has evidently shifted to forces for intercontinental attack, primarily ICBMs. We estimate Soviet ICBM strength at the end of 1962 at 80–85 operational launchers, including a few silo-type hardened launchers. By mid-1964, the force will probably have reached 250–325, including 75–100 silos. The Soviet ICBM force estimated for the next two years will consist primarily of missiles equipped with warheads in the low megaton range; it could include a few missiles with very high-yield warheads. We believe that the major trends in this force to 1967 will be: growth of the force to some hundreds of launchers; hardening of a significant portion of the force; and availability of some missiles capable of delivering very high-yield warheads [*text not declassified*]<sup>4 5</sup> (*Paras. 48–57*)

<sup>4</sup> The Assistant Chief of Staff for Intelligence, Department of the Army, dissents to this projection of force levels. Since the Soviet ICBM launcher construction program for second generation systems has been under way for nearly three years and has resulted in only some 80 operational launchers, it appears most unrealistic to him to estimate that from 175 to 250 operational launchers will become operational during the next 16 to 17 months. He therefore estimates as follows:

	<u>END-1962</u>	<u>MID-1963</u>	<u>MID-1964</u>
Approximate Totals	80–85	120–140	175–225
Including Hard Launchers	(a few)	(10–25)	(30–50)

<sup>5</sup> The Assistant Chief of Staff, Intelligence, USAF, believes that available intelligence, collected over a long period of time, provides a basis for differing interpretations of the magnitude of the Soviet ICBM program and the approximate time required for site construction. Experience has shown that even with the best available intelligence, and where evidence appeared to be complete, continuing analysis has indicated that ICBM launch sites exist which were not initially identified. Because of the history of expanding ICBM locations and the absence of complete, up-to-date intelligence, he believes that undetected launchers in varying degrees of construction, now exist at the confirmed complexes. Further, he also believes there are additional complexes mostly under construction at yet unidentified locations. He would therefore estimate the number of operational ICBM launchers, including those at the Tyuratam test range, through mid-1964 as follows:

	<u>END-1962</u>	<u>MID-1963</u>	<u>MID-1964</u>
Totals	110–160	175–250	300–450
Including Hard Launchers	(10–20)	(25–50)	(100–150)

L. The Soviets now have operational about 45 ballistic missile submarines—nine of them nuclear-powered—which carry a combined total of about 125 short-range (350 n.m.) missiles designed for surfaced launching. The USSR is developing longer range missiles for launching from submerged submarines. In addition, the Soviets have developed submarine-launched cruise missiles, which are probably designed primarily for use against ships but could be employed against land targets. In mid-1967, the Soviets will probably have more than two dozen nuclear-powered ballistic missile submarines, and about 20 nuclear-powered cruise missile submarines. By that time, they will probably have initiated routine submarine patrols within missile range of the US. (*Paras. 64–68*)

M. Soviet Long Range Aviation, by reason of its equipment, basing and deployment, is much better suited for Eurasian operations than for intercontinental attack. However, the Soviets have given considerable emphasis to aerial refueling and to Arctic training. Excluding combat attrition, we estimate that the Soviets could put about 200 aircraft over North America on two-way missions; of these, about half would be heavy bombers. Long Range Aviation now comprises about 170–200 heavy bombers and tankers and about 950 jet medium bombers and tankers. We continue to estimate a gradual decline in numerical strength. A portion of the BADGER medium bomber force will be replaced by the new supersonic BLINDER, already in units, but our evidence does not indicate that any new heavy bomber is being developed for operational use. By mid-1967, Long Range Aviation will probably comprise some 110–140 heavy bombers and about 750 mediums.<sup>6</sup> (*Paras. 69–75*)

N. We estimate that the Soviet MRBM and IRBM force now comprises about 600 completed launch positions, deployed for the most

---

<sup>6</sup> The Assistant Chief of Staff, Intelligence, USAF, does not consider that this paragraph accurately reflects the capability of the USSR to put aircraft over North America on two-way missions. He believes that with due consideration of all relevant factors, such as number of aircraft in Long Range Aviation, numbers of aircraft tanker configured and peak availability rate, the Soviets could commit about 750 aircraft to initial two-way attacks on North America. From this number committed, about 300 bombers could reach North American targets.

The Assistant Chief of Staff, Intelligence, USAF, further estimates that a follow-on heavy bomber will probably be introduced in about 1964. The continued development of large aircraft capable of supersonic speed, and research in applicable materials, structures, and other components substantiate the Soviets interest in large supersonic vehicles and suggest an intent to increase their strategic attack capability by such means. The BOUNDER probably has served a most useful purpose as a test bed for many components, aerodynamic advancements, and a structural design which are directly applicable to a follow-on heavy bomber capable of supersonic speeds. He estimates the total Soviet heavy bomber and tanker strength will remain at approximately 200 aircraft throughout the period of this estimate, present strength levels being maintained by the introduction of modest numbers of a new heavy bomber.

part in western USSR within range of NATO targets in Europe. The bulk of these launch positions are soft, but a few silo-type hardened sites are probably operational. We believe that deployment of soft sites will have been virtually completed early this year, leveling off at about 600 launch positions; the hardened component of the force will continue to grow, probably reaching about 100–150 launchers in mid-1964. It is possible that as many as half of the soft launch positions are alternates, in which case the first salvo capability of the force would be considerably smaller, although still large enough to devastate Western Europe. (*Paras. 58–63*)

O. In the event of general war in the period of this estimate, the USSR would almost certainly employ against the US a mixed force of ICBMs, missile submarines, and bomber aircraft. By the mid-1960's the USSR will have acquired a substantially increased ICBM and submarine-launched missile capability to deliver nuclear weapons against the US, in addition to its already formidable forces for strikes in Eurasia. Significant portions of these forces will be relatively invulnerable to attack. The Soviets will be in a position to strike pre-emptively at the fixed bases of an important segment of the US nuclear delivery force, and they will have some prospect that a portion of their own force could survive an initial US attack and retaliate with high-yield weapons. With the forces which we estimate, however, the Soviets could still not expect to destroy the growing force of US hardened, airborne, seaborne, and fast reaction nuclear delivery vehicles. (*Paras. 78–81*)

#### *Air and Missile Defense Forces*

P. The significant improvements in the Soviet air defense system noted during recent years will be extended during the next few years, and successful penetration by manned bombers will therefore require increasingly sophisticated forms of attack. The Soviet air defense capability can be degraded by the increasingly complex forms of attack which the West will be able to employ, including air-launched missiles of present and more advanced types, penetration tactics, and electronic countermeasures. Even in such circumstances, the Soviets would probably expect to destroy a number of the attackers. We doubt, however, that they would be confident that they could reduce the weight of attack to a point where the resulting damage to the USSR would be acceptable. Unless and until the USSR is able to deploy a substantial number of advanced ABM defenses, the USSR's air and missile defense deficiencies and uncertainties will sharply increase as ballistic missiles assume a larger proportion of the West's total nuclear delivery capability. (*Paras. 82, 89–105*)

Q. The major development which we foresee in Soviet defense is the advent of a capability against ballistic missiles. For more than five

years, the Soviets have been conducting a high priority and extensive program to develop antimissile defenses, and we estimate that several different ABM systems are under development. We believe that in 1963 the Soviets will achieve some operational capability with an ABM system now being deployed around Leningrad. We have no basis for determining its effectiveness, but doubt that it would be effective against missiles employing decoys or other countermeasures. The USSR is probably also developing an antisatellite system. (*Paras. 83–84, 88*)

R. To counter the more complex long-range ballistic missile threat of the mid-1960's, the Soviets may seek to improve the Leningrad system, or may develop a more advanced system, or both. In any case, the USSR is likely to defer additional ABM deployment until a better system is available. If the Soviets develop an ABM system which they regard as reasonably effective against long-range missiles, a vigorous deployment program will probably be undertaken. We believe that such a program would contemplate the defense of some 20–25 principal Soviet cities and would require some five or six years to complete. We have no basis for judging whether or when the Soviets would consider their ABM system effective enough to warrant the initiation of such a program. (*Paras. 85–86*)

#### *Theater Forces*

S. The longstanding Soviet concern with concepts and forces for campaigns in adjoining theaters, especially in Europe, has resulted in a formidable theater force, strong in armor, battlefield mobility, and units in being. The tactical nuclear delivery capabilities of these forces are still limited, but they have been improved markedly over the past few years. In offensive operations, rapidly advancing theater forces would be in constant danger of outrunning their logistical tail, which is heavily dependent on railroads. Finally, the Soviets have traditionally exercised very strict supervision over the actions of their subordinates, but existing command and control systems do not permit this strict supervision over the widely extended deployment required on the nuclear battlefield or under the threat of use of nuclear weapons. (*Paras. 106–124*)

#### *Naval Forces*

T. The USSR's capabilities to conduct naval warfare in the open seas rest primarily upon the submarine force, which is capable of mounting a large-scale torpedo attack and mining campaign against Allied naval targets and sea communications in the eastern North Atlantic and northwestern Pacific. Its capabilities for operations near the continental US are more limited, but are growing. Capabilities against carrier task forces have been improved by the conversion of jet bombers to employ anti-ship missiles, by the introduction of submar-

ines equipped with cruise-type missiles, and by increased air reconnaissance of open ocean areas by Long Range and Naval Aviation. The Soviets have also placed increasing emphasis on improvement of ASW forces in coastal areas and in the open seas. We believe the Soviet Navy is capable of carrying out fairly effective ASW operations in coastal areas, but that it has a negligible ASW capability in the open seas. Despite the effort which they almost certainly are devoting to this problem, we believe that over the next five years, the USSR will be able to achieve only a limited capability to detect, identify, localize, and maintain surveillance on submarines operating in the open seas.<sup>7</sup> (*Paras. 125–147*)

## DISCUSSION

### I. SOVIET MILITARY POLICY

#### *A. Basic Views on War and Military Policy*

1. The Soviets see military power as serving two basic purposes: defense of their system and support for its expansion. Thus, one of the most important objectives of Soviet military policy is to deter general war while the USSR prosecutes its foreign policies by means short of actual hostilities involving Soviet forces. Military power is constantly brought into play in direct support of these policies, through the threats which give force to Soviet political demands, through the stress on growing power which is intended to gain respect for the Soviet state and its Communist system, and through the military aid and support rendered to allies, friendly but neutral regimes, and anti-Western movements.

2. The Soviet leaders realize that their deterrent must be credible in the sense that it rests upon powerful military forces. Moreover, they recognize that deterrence may fail in some key confrontation in which, despite their best efforts to retain control over risks, either they or their opponents come to feel that vital interests are under challenge. Against this contingency they wish to have a combination of offensive and defensive capabilities which will enable them to seize the initiative if possible, to survive enemy nuclear attack, and to go on to prosecute the war.

3. The Soviets evidently believe that the present overall military relationship, in which each side can exert a strong deterrent upon the

---

<sup>7</sup> The Assistant Chief of Staff, Intelligence, USAF, would delete the last sentence and substitute the following:

While over the next five years, it is probable that the USSR will have only a limited ASW capability in the open seas, it must be recognized that the effort being applied by the USSR toward solution of the ASW problem will reduce current deficiencies and possibly could result in marked improvement in Soviet open seas capabilities.

other, will probably continue for some time to come. The Soviets are vigorously pursuing programs of research and development in advanced weapons, hoping if possible to create a strategic balance favorable to them. It is possible that some future technological breakthrough or advance would persuade them that they had acquired a decisive advantage which permitted them to take a different view of the risks of general war. We do not believe, however, that the Soviets base their military planning or their general policy upon the expectation that they will be able to achieve, within the foreseeable future, a military posture which would make rational the deliberate initiation of general war or conscious acceptance of grave risks of such a war.

4. A number of Soviet statements in recent years have expressed the view that limited war involving the major nuclear powers would inevitably escalate into general war. While such statements are intended in part to deter the West from local use of force, this official view also reflects a genuine Soviet fear of the consequences of becoming directly engaged in limited war involving Soviet and US forces. This probably also extends to involvement of Soviet forces with certain Allied forces in highly critical areas, notably Western forces in the European area. Nevertheless, they might employ their own forces to achieve local gains in some area adjacent to Bloc territory if they judged that the West, either because it was deterred by Soviet nuclear power or for some other reason, would not make an effective military response. They would probably employ Soviet forces as necessary if some Western military action on the periphery of the Bloc threatened the integrity of the Bloc itself. Should the USSR become directly involved in a limited war with US or Allied forces, we believe that the Soviets would not necessarily expand it immediately into general war, but that they would probably employ only that force which they thought necessary to achieve their local objectives. They would also seek to prevent escalation by political means.

5. Recent Soviet military writings call for professional study of the problems of nonnuclear combat, which could lead to some modification of the official view on limited war. However, we believe that the attention now being devoted to this problem is primarily responsive to indications of US interest in building NATO's capabilities for nonnuclear combat. In our view, it does not reflect any new Soviet conclusion that the USSR can now launch such wars without great dangers of subsequent escalation.

6. The USSR has regularly recognized the importance of the "war of national liberation," in which pro-Soviet or anti-Western forces challenge colonial or pro-Western regimes in a primarily internal conflict. In practice, Soviet behavior has followed neither the course of full support to all these wars, as Soviet propaganda often alleges, nor the

course alleged by Khrushchev's Chinese critics, who claim that he withholds support entirely because of exaggerated fears that such a conflict might spark a general war. The USSR has rendered active assistance in some cases, such as Laos and Yemen, and little or none in others, such as Algeria and Angola, depending upon such practical factors as accessibility, the risk of defeat, and the attitude of other powers involved.

7. The USSR has also shown a recent willingness to provide some non-Bloc recipients of its military aid with more advanced equipment than heretofore. In some cases, notably Cuba and Indonesia, Soviet personnel have been employed to man this equipment, and are training indigenous specialists to operate it. This represents a significant departure from previous Soviet practice, which may be extended to other areas in the future.

8. As new and favorable opportunities arise, the Soviets will continue to offer these various kinds of assistance, and they may do this more frequently and aggressively in the future if their efforts to expand Soviet influence by political and economic means encounter continued frustration. We believe, however, that the Soviets will remain chary of any great commitment of prestige to the support of belligerents over whom they do not exercise substantial control or in circumstances in which they feel that winning is unlikely, and they will seek to avoid risk of widened hostilities which might result from "wars of national liberation." In particular, we believe that the Soviets will be very reluctant to commit their own forces openly in conflicts where they would risk a direct confrontation with US forces.

#### *B. Soviet Military Policymaking*

9. The application of these basic attitudes to particular situations and to the allocation of resources does, of course, pose serious policy problems. A number of additional factors have long affected the character of Soviet military policy. Geography and the traditions bound up with historical experience have inclined the Soviets toward a military preoccupation with Western Europe and a stress on large-scale ground combat. The capabilities and structure of US and other opposing forces influence directly both the size and shape of Soviet forces and exert a general upward pressure upon requirements in all fields. Perhaps most important is the technological and economic base of the nation, which constantly offers prospects for more effective weapons but also determines the extent to which these opportunities can be exploited without too great a sacrifice in other programs.

10. These factors, pointing in many contradictory directions, do not make for easy or unanimous decisions. Indeed, we have clear evidence of disagreement, compromise, and even reversal in the formu-

lation of military policy in the last three years. This process of policy-making in the USSR appears in large part to involve the same problems familiar to US decision-makers. In addition, however, certain special features stand out. Fully informed Soviet military discussion, for example, seems to involve a smaller circle than in the US. Beyond the political leadership, some military officers, and a limited number of scientists and engineers, we know of no body of civilian advisers or publicists in the USSR comparable to the social scientists involved in the evolution of US military thinking. This is in part due to the great Soviet emphasis on security, which has the additional effect of reducing the flow of information within the officer corps. As a result, the Soviet military appear to experience special difficulty in adjusting their doctrine and concepts to the rapid changes characteristic of the postwar period. The continuing major influence of World War II commanders and the vivid memories of the Soviet experience in that war also contribute to a resistance to new concepts which is evident in professional discourse.

11. Military programs have become more complex and expensive, and the professional recommendations of the military leadership on military problems have a greater impact on economic and foreign policy decisions. Furthermore, the political climate which has developed under Khrushchev is one which permits continuing discussion on a variety of problems, and the military leaders have used this opportunity to expound their views. With military and economic debates proceeding simultaneously and in close dependence on each other, it seems likely that the arguments of the marshals have been supported by those political leaders who did not wish to permit programs for consumer goods to impinge upon allocations to heavy industry.

12. We do not believe that the military aspires to an independent political role within the political system, and if it were to, party traditions and controls appear strong enough to defeat any efforts in this direction. But if, as we expect, the military and economic choices facing the USSR become more acute, the senior officers will probably find themselves more deeply involved in matters of general policy.

### *C. The Recent Course of Military Policy*

13. The most important viewpoints in the controversy over military policy of the last few years have been those represented by Khrushchev and a few military theorists, on the one hand, and the majority of the senior military leaders, on the other. Three major differences have distinguished Khrushchev's approach to defense policy from that of the military leaders. First, Khrushchev is heavily concerned with the political uses of military power, whereas the professional responsibilities of the marshals require them to look in the first instance to actual warfighting capabilities. Second, Khrushchev has asserted that a gen-

eral war is almost certain to be short, with victory decided in the strategic nuclear exchange and with conventional arms, particularly theater forces, playing a quite secondary role. Most military leaders, on the other hand, appear to believe that general war would probably, but not certainly, be short but that, in any event, its conduct would require high force levels for most of the traditional service arms, including a multimillion man army. Third, Khrushchev is far more concerned than the marshals to keep military expenditures in check in order to meet what he regards as pressing needs in the civilian economy.

14. All these considerations were involved in the reorganization of the armed forces which Khrushchev inaugurated in January 1960. The essence of his plan was to place main reliance on nuclear missile forces and, on this basis, to reduce military manpower substantially and to accelerate the retirement of older weapons. This, he asserted, was the force structure best suited both to deter war and to fight one if necessary; moreover, it would release men and money for the civilian economy.

15. From Khrushchev himself we know that this plan and its strategic justification were accepted only reluctantly by the military leadership. A controversial discussion ensued, encouraged by the regime, in which high officers debated, polemicized, and explored the military implications of modern warfare in a far more systematic fashion than previously. Several schools of thought became apparent, but a predominant view soon emerged which accepted the likelihood that the initial phase of a general war would be decisive, but went on to argue that even a relatively short war would require large forces of all types capable of defeating comparable enemy forces, overrunning base areas, and occupying territory in Eurasia. This discussion also focused attention on the enormous difficulties of mounting major military operations after receiving the full weight of a Western first strike, and the resulting importance, if in the Soviet view war became imminent and unavoidable, of seizing the strategic initiative by a pre-emptive attack.

16. At present, official military doctrine holds that a general war will inevitably involve the massive use of nuclear weapons, will begin with a strategic exchange, and will develop almost simultaneously along fronts of engagement as well. Strategic missile forces will play the primary role. The course and outcome of the war may well be decided in its initial phase by strategic nuclear weapons. However, the Soviets hold that such a conflict will not necessarily be short, and envisage the possibility of a long war involving protracted operations in Eurasia. Therefore, while current doctrine emphasizes a military policy of building strategic attack and defense capabilities, it supports as well the maintenance of large theater and naval forces, for use both in the initial and the possible subsequent phases of a general war.

17. We believe that debate continues in the USSR, not only over subsidiary propositions, but perhaps over some of the central tenets of this doctrine. The course of the debate was heavily influenced by external events in 1960–1961 which, intruding upon the discussion, undermined some of Khrushchev's contentions and permitted the military to retrieve some concepts which he had discarded. Thus the U-2 affair cast doubt on the adequacy of Soviet air defenses, on the efficacy of Soviet security, and on the wisdom of Khrushchev's efforts to relax tensions in relations with the US. In the following year, the US took decisions to step up both its strategic attack and general purpose forces. In Vienna, Khrushchev determined that the US did not regard the relationship of military power as requiring it to make major concessions on the Berlin question. All these developments called into question the adequacy of the Soviet military posture, both for supporting foreign policy and for conducting general war if necessary. In these circumstances, Khrushchev made such demonstrative military moves as the public suspension of the manpower reductions and the resumption of nuclear tests.

18. At about the same time, another burden was laid on Soviet military policymaking. For some months, US public disclosures had hinted that Soviet ICBM strength might be much smaller than had previously been believed. Beginning in the fall of 1961, the US began to assert this conclusion with great conviction, and to assert more strongly that the US was the strategic superior of the Soviet Union. From US statements and behavior, the Soviets could almost certainly judge that their security had been penetrated in an important way, probably one which, by permitting the US to locate Soviet targets, had a tangible effect upon the military balance. Their fears that no major Western concessions on Berlin would be forthcoming must have been strengthened. And the image of Soviet superiority, which they had heavily exploited to document their claims of the inevitable triumph of their system, was badly damaged.

19. It was against this background that the USSR took its decision to deploy strategic missiles to Cuba. This move involved a host of policy considerations and judgments which are not yet fully clear. In its military terms, however, it appears to have been a response to the question of how to create new opportunities for Soviet foreign policy by improving the strategic position of the USSR vis-à-vis the US, at some acceptable cost and at some early date. Even deployment at the levels detected promised a significant increase in first-strike capabilities for general nuclear war, and the Soviets may have intended to follow this up by establishing a larger missile force as well as a submarine base.

20. Khrushchev, however, probably considered its main impact to be psychological. At one level, the deployment and its acceptance by

the US was intended to demonstrate Soviet might and US inability to contain it, thereby reversing the tendency of world opinion to regard the West as strategically superior. At another, however, it was intended to increase the deterrence laid upon the US in cold war confrontations. Khrushchev evidently felt that, despite all the military problems involved in making effective strategic use of Cuba in wartime, the deployment would have a powerful impact on US opinion which would reduce resistance to his political demands, in the first instance those concerning Berlin.

*D. Problems of Future Military Policy*

21. The Cuban adventure and its outcome both highlighted and heightened the dilemma of the Soviet leaders. Both the deployment and its reversal constituted a tacit public admission that the USSR was in a position of strategic inferiority. Among its other results, the Cuban fiasco has almost certainly thrown the Soviets back onto a further re-evaluation of their strategic posture.

22. Programs already under way will largely govern the size and composition of Soviet strategic forces through about mid-1964, but new decisions taken this year could significantly affect force levels thereafter. We are unlikely to learn directly of such decisions. Moreover, the physical activities which might reveal their nature will probably not be apparent for another year or more. In considering future Soviet force levels, it is therefore necessary to explore the various alternatives now open to the USSR.

23. Confronted with the continuing buildup of US forces for inter-continental attack programmed for the next few years, Soviet planners may be considering a wide range of alternatives. At one extreme would be an attempt to achieve such a clear superiority over the US in strategic offensive weapons that they would have a high assurance of destroying US nuclear striking forces prior to launch. At the other extreme would be the acceptance of continued strategic inferiority, perhaps coupled with genuine efforts to reach agreement with the West on arms control.

24. The first of these extreme alternatives is probably now regarded as unattainable. Thousands of Soviet missiles would be required to give the Soviet leaders a high assurance of destroying even the fixed bases of US nuclear forces programmed for the mid-1960's. We do not believe that the Soviet leaders would be prepared to impose a strain of this magnitude upon the Soviet economy. In addition, the Soviets would almost certainly expect the US to detect such an effort, and thereupon to step up its own program so as to raise Soviet requirements still higher. Moreover, US warning capabilities, fast reaction times, and mobile forces (airborne bombers and missile submarines) already have reduced Soviet capabilities, against US retaliatory forces. We believe

that the Soviets will continue to estimate that, throughout the period of this estimate, the US will retain retaliatory capabilities which could not be eliminated by such striking forces as the USSR could acquire.

25. The second of these extreme alternatives might be considered by the Soviet leaders. Even if current strategic weapons programs were allowed to level off after 1964, the Soviets would possess a powerful deterrent force. Moreover, they might hope to reduce US superiority by means of disarmament agreements. But the main appeal of this alternative would be economic; resources would in time be made available to reverse the current slowdown in economic growth. However, we have seen as yet no persuasive indications that the USSR is prepared to move very far in this direction. The Cuban venture has indicated that, at least to date, the Soviet leaders are far from willing to accept a position of strategic inferiority.

26. Between these extreme alternatives, we believe that the Soviets have almost certainly considered an effort to attain rough parity with the US in intercontinental weapon systems. Soviet military leaders almost certainly have urged enlarged and improved forces of ICBMs and missile submarines. However, a major Soviet effort to attain parity in the near term would require either a substantial increase in the Soviet military budget or sharp cuts in other types of forces. Moreover, the Soviets would almost certainly reason that the US would detect an effort of such magnitude, and that they could have no assurance of winning the intensified race which would ensue. Our evidence does not indicate that the Soviets are attempting to match the US in numbers of weapons for intercontinental attack; we believe, however, that they will attempt to offset US superiority by other means.

27. Soviet statements and military writings suggest that the Soviet leaders see in technological achievements the means by which they may improve their total strategic position relative to that of the US. This consideration may lie behind the testing of very high-yield weapons, the claimed development of a global missile, the high priority given to the antimissile program, and the Soviet interest in military space programs. By such means, the Soviets may attempt to attain rough parity or even superiority in the total strategic context, although they remain numerically inferior in delivery vehicles. Hardened ICBMs and submerged-launch submarine missiles will contribute to Soviet strategic capabilities. In addition, over the next few years the ICBM force will probably come to include new large missiles, armed with very high-yield warheads or capable of global ranges. Moreover, the USSR is almost certainly investigating the feasibility of space systems for military support and offensive and defensive weapons.

28. In defense against strategic attack, the major new element is the antimissile program, where deployment of one system has already

begun at one location, and research and development toward a more advanced capability is continuing. The Soviets may see a possible solution to their strategic confrontation with the US in a combination of anti-missile defense plus very effective though numerically inferior intercontinental striking forces. The technical difficulties as well as the great expense of any extensive antimissile deployment will be restraining influences. Nevertheless, we believe that deployment of antimissile defenses may be the largest new Soviet military program in the period of this estimate.

29. Although we believe that Soviet military policy is most likely to continue along current lines, we cannot exclude the possibility of new departures in military policy, perhaps resulting in major changes in the composition of the Soviet military establishment and in the relative emphasis given to forces designed to accomplish the major military missions. Drastic cuts in the theater field forces remain a possibility; while Khrushchev's proposals for manpower reductions have been shelved for the present, economic pressures and developments in military technology almost certainly will cause this subject to be reconsidered. It is also possible that the increasing involvement of the USSR in the more remote areas of the world will lead to the development of new capabilities for distant, limited military action. In this connection, the Soviets may attempt to acquire base and logistical support rights in key non-Bloc countries, but we have no evidence that the USSR has raised this question with these countries.<sup>8</sup>

30. In general, Soviet military policy will continue to be shaped, not only by a variety of strategic, historical, technical, economic and political factors, but also by differing views about the relative importance of these factors, and shifting compromises among these views. As a result, we believe that the numerous aspects of this policy will not always be wholly consistent with each other, and that force structure and future programming will reflect neither a fully-integrated strategic doctrine nor a firm timetable for achieving specified force levels. In any case, we do not believe that the Soviets conceive of existing weapons systems as the answer to their military problem or that they have fixed and inflexible plans for their force structure in the period five to 10 years from now. They have debated and revised some of their ideas, and they will probably do so again. They have made scientific military research and the development of new weapons matters of high urgency, and they have a demonstrated capability to concentrate human and material resources on priority objectives. If they

---

<sup>8</sup> For a discussion of the limitations imposed on such Soviet overtures by the receptivity of other countries, see NIE 10-63, "Bloc Economic and Military Assistance Programs," dated 10 January 1963.

develop new concepts or new weapons which give promise of military and political advantage, they will seek to add them rapidly to their arsenal and to gain maximum benefit from them. Thus, during the next five years, we expect the Soviets to be working on even more advanced weapons with which they may hope to enhance their capabilities at a later date.<sup>9</sup>

## II. SOVIET HIGH COMMAND STRUCTURE

31. We believe that during the past two or three years the Soviet military high command structure has been modified to speed the process of initiating or responding to strategic nuclear attack. The growth of nuclear and missile forces on both sides has almost certainly persuaded the Soviets to establish the command and control channels necessary for the swift initiation of military operations upon the decision of the political leadership.

32. We have information, some of it from classified documents and some from public statements, about both a Supreme Military Council and a Supreme High Command. Khrushchev is chairman of the Council and Supreme High Commander. The Council, a body of high-level party, government, and military officials, has existed since before World War II to provide a forum for discussion and decision on major issues of military policy. The Supreme High Command directed military operations during World War II with Stalin at its head, but was disbanded thereafter. Such information as we have suggests that steps have been taken in recent years to designate membership in the Supreme High Command and to develop procedures to permit the quick assumption by this body of top level control of military operations under Khrushchev should events so dictate.

33. Adjustments in the structure of the Soviet high command have apparently been closely related to the growth of the USSR's strategic defense and long-range missile forces. A new rocket command was established in 1960 and designated a main component of the Soviet armed forces. This change followed by about five years the elevation of the Soviet air defense component to similar status. At present, there are five major force components administered by main directorates or equivalent headquarters within the Ministry of Defense: ground, naval, air, air defense, and rocket.

34. Highly centralized civilian control over the Soviet military establishment is exercised through the Council of Ministers, which includes the Minister of Defense. The Minister is assisted by the unified General Staff of the armed forces, which formulates the overall military

---

<sup>9</sup> With reference to paragraphs 23–30, see the Assistant Chief of Staff, Intelligence, USAF, footnote to Conclusion E.

program and would probably constitute the principal headquarters element of the Supreme High Command in time of war. Party and government leaders reportedly participate regularly in the deliberations of the Supreme Military Council. Additional channels for exercising party control over the military include the Main Political Directorate of the armed forces and the numerous party officials who are assigned to all levels of the military establishment.

35. The flow of operational orders from the Minister of Defense to the Soviet armed forces follows no rigid or consistent pattern. Commanders in Chief of the Strategic Rocket Forces, Long Range Aviation, the Air Defense Forces, and the Navy are believed to have direct operational control over the forces assigned to them. On the other hand, ground force components are operationally controlled by the commanders of the Military Districts and the Groups of Forces. The Commander in Chief of the Air Force similarly has no direct operational control over air components. The operations of other than Long Range Aviation air elements are controlled by the commands or forces to which they are assigned, i.e., commanders of Groups of Forces, Military Districts, Air Defense Districts, Fleets, and Airborne Forces.

### III. SIZE AND COMPOSITION OF THE SOVIET ARMED FORCES

36. The urgent need for additional manpower in the economy and the rising cost of maintaining a large military establishment have brought about substantial reductions in Soviet military manpower since the Korean War. We estimate that by 1959 these reductions had lowered the number of men under arms from about 5.75 to about 3.6 million men. In January 1960, Khrushchev announced a program aimed at further reducing military manpower to 2.4 million men. In mid-1961, after approximately half of the projected reduction of 1.2 million men had been made, the program was suspended, allegedly in response to the US military buildup prompted by Soviet pressures in Berlin. We believe that the force level now stands at about  $3\frac{1}{3}$  million men, of which nearly 2 million are in the theater ground forces.<sup>10</sup>

37. The early reductions were achieved without overt signs of objection by military leaders, who were apparently persuaded that postwar modernization and re-equipment programs had provided sufficient increases in firepower to offset the cuts in personnel. However, the military leadership raised strenuous objections to Khrushchev's 1960 proposals. These objections were elaborated during an extended debate among senior officers over the nature of modern war and the role and doctrine of theater warfare.

---

<sup>10</sup> For estimated personnel strength of the Soviet Armed Forces by mission, see Annex A, Table 1.

38. As of 1962, both political and military leaders acknowledge that new and costly demands for advanced weapon systems are imposed upon Soviet resources without easing the burden of maintaining large theater forces. The effort to modernize and strengthen all arms of the Soviet forces simultaneously squeezes hard on resources available for investment and consumption goals to which the leadership is strongly committed. Moreover, it produces a constant upward pressure on the size of the military establishment. This is to a large extent because Soviet missile forces for strategic offense and defense appear to require large numbers of operating, maintenance, and supporting personnel.<sup>11</sup> Although there will probably be some reduction in the size of other types of forces as older weapon systems are retired, there is no present evidence that normal reductions of this sort will free enough military manpower to operate the growing missile forces. Therefore, unless the Soviets decide on a deliberate program for compensating reductions in other forces, the continued expansion of missile forces along present lines will tend to push military manpower strength back up toward pre-1960 levels, and will require increasing numbers of trained specialists as well.

39. Thus, Khrushchev may once again seek a reduction in resources devoted to theater forces on the grounds that growing nuclear capabilities will permit this cutback without endangering Soviet security. If this occurs, the main candidate for reductions will still be the ground forces, with their very large numbers of units and men. The program of accelerated retirement of older equipment of other force components, such as obsolescent aircraft and surface naval ships might also be reinstated. We believe, however, that for at least the next few years large standing forces of all types will be maintained, although probably with some change in the distribution of manpower among the various components.

#### IV. TRENDS IN MILITARY EXPENDITURES

40. Soviet defense expenditures, after a decline in 1956–1957, have increased steadily in the past five years. (Our estimates of Soviet defense expenditures include the costs of the military establishment, nuclear weapons, and all space programs.) The main impetus for growth has been provided by operational programs for strategic attack and air defense forces and by the program of research and development, each of which has doubled in estimated cost during the past five years. The costs of the ground and naval missions, which together accounted for

---

<sup>11</sup> We estimate that 350,000–400,000 personnel are now in the missile components of long-range striking and air defense forces; on the basis of present trends, this total may be over 550,000 by mid-1964. See Annex A, Table 1, footnote c.

almost 45 percent of total expenditures in 1958, have changed much less over the same period and in 1962 accounted for approximately one-third of the total. The shift in the shares of total defense expenditures between the various missions between 1958 and 1962 is indicated in the following table.

ESTIMATED DISTRIBUTION OF SOVIET DEFENSE  
EXPENDITURES, BY PERCENT

	1958	1962
Strategic Attack Mission	10	17
Air Defense Mission	11	17
Naval Mission	12	10
Ground Mission	32	22
Expenditures not Allocable to Missions <sup>a</sup>	35	34

<sup>a</sup> Includes expenditures for reserve and security forces, research and development, command and support, and space programs. No research and development expenditures have been allocated to the missions.

41. Our calculations of both Soviet military expenditures and GNP are subject to considerable margins of error, but on the basis of all available information on Soviet programs and costs, we estimate that in 1962, total Soviet defense expenditures were about 18 billion rubles. This is one-third higher than the level estimated for 1958. Because GNP has also been expanding, this level of defense expenditures continues to represent on the order of one-tenth of estimated Soviet GNP in ruble prices. This share is roughly the same as that devoted to defense in the US, and represents in terms of US prices and production costs the equivalent of some \$45 billion, or about four-fifths of comparable US expenditures.

42. However, the real impact of defense expenditures on the Soviet economy is greater than this comparison implies. The growth in defense expenditures during the past five years has been accompanied by a change in the structure of these expenditures. The development, procurement, and maintenance of defense hardware including nuclear weapons represented about half of these expenditures in 1958, and nearly two-thirds in 1962. In 1962 defense consumed about 15 percent of nonagricultural production in the USSR, whereas it consumed about 10 percent of such production in the US. Similarly, defense consumed more than 35 percent of total Soviet production of durable goods in 1962, as compared with about 25 percent in the US. Moreover, although we cannot measure the effect, Soviet advanced weapons and space programs probably absorb a much higher proportion of critically scarce, high quality resources and highly skilled manpower than is the case in the US.

43. Evidence from Soviet discussions indicates an increasing concern with the impact of military requirements on the national economy. The defense burden not only impedes the industrial investment program which underlies general economic growth, but it stands in the way of Khrushchev's repeated attempts to make larger allocations to agriculture, on which his promises of higher living standards primarily depend. Khrushchev clearly had these problems in mind in January 1960, when he proposed a military reorganization with important economizing effects.

44. Even this 1960 proposal offered only a partial solution to the problem of rising defense costs. It promised ultimately to reduce annual expenditures by about two billion rubles; these savings would have resulted primarily from a lower bill for military pay and subsistence. The main benefit to the economy would have been the release of military manpower. However, the competition between military and civilian programs is most acute in the machinery industry, which must supply hardware to the armed forces and investment goods to industry and agriculture. Military deliveries from this industry rose by about 60 percent from 1958 to 1962, while production for the civilian economy grew at a substantially slower rate. Perhaps more important, the quality of Soviet advanced weapons in comparison with other goods clearly reveals that the defense establishment enjoys first call on the high-grade resources of industry—special materials and components, highly trained technicians, leading scientists and design engineers. This priority has significantly hampered the effort to modernize and automate Soviet industry on which the USSR's program for higher labor productivity and future growth heavily depends.

45. The future military programs of the Soviet leaders depend on their view of the requirements both for deterring a war while they push for political gains in the East-West competition and for fighting a war if one should nonetheless occur. To date, however, they have found their military power insufficient to enable them to accomplish their political objectives, notably in the case of Berlin. Moreover, the tenor of recent statements suggests that, as the Soviets observe the programmed growth of Western power, the question of the USSR's ability to survive a general war is being posed more sharply than ever. For both these reasons, the Soviets evidently feel themselves under heavy pressure to make further increases in their military allocations. This, however, would require them to stretch out, probably quite substantially, the time periods over which they hope to achieve other national goals.

46. There are a number of ways in which the Soviets, faced with these difficult choices, might ease the prospective military burden on the economy. Khrushchev might revert to the force structure which he

advocated in 1960 and try again to put through a sizable reduction of ground forces. The USSR might trim its space program by choosing, for example, not to compete with the US in a manned lunar landing. It might confine itself to tactics which carried less dangers of military confrontation, meanwhile settling on a military strategy which stressed deterrence rather than a full war-fighting capability. Or, it might try to promote a protracted relaxation of tensions in hopes of inducing a reduction in Western defense efforts, and perhaps even improving the relative Soviet military position. It is conceivable, although contrary to most present indications, that the pressures for higher military spending could cause the USSR to be more forthcoming in disarmament negotiations.

47. The November plenum of the Central Committee singled out administrative reorganization as the means to stimulate economic growth, and thereby demonstrated an unwillingness to make major changes in the pattern of resource allocations. Khrushchev confirmed this unwillingness in his speech of 27 February, in which he warned consumers against early hopes of high living standards because of the growing needs of defense. His speech indicates that the leadership has recently taken economic decisions which reaffirm military priorities at the expense of consumer aspirations; beyond this it may reflect a decision to increase military spending above previously planned levels. The Soviet economy is capable of bearing a heavier military burden, but not without sacrifices in the program to raise living standards and perhaps also reductions in the future rate of industrial growth. For the present, the Soviets appear to have chosen to risk these consequences, but we believe that the problem of resource allocation will continue to plague the Soviet leadership.

## V. FORCES FOR LONG RANGE ATTACK

### A. Soviet Policy Toward Long Range Striking Forces

48. The Soviets regard forces for long range attack as essential for supporting an aggressive political posture, deterring the West from resort to military action, and fighting a war as effectively as possible should one occur. In our view, they are attempting to build forces which they regard as appropriate to these objectives, rather than attempting to achieve the very high degree of superiority required to launch a deliberate attack on the West. In building these forces, the Soviets put initial stress on creating a massive capability against Eurasia and its periphery. Intercontinental capabilities were not neglected, but deployment of medium range delivery systems occurred earlier and in much larger numbers. Although MRBM and IRBM forces continue to grow, major emphasis has evidently shifted to the buildup of forces for intercontinental attack, primarily ICBMs. Other major recent developments

are the introduction of hardening for ground-launched ballistic missiles, efforts to improve missile reaction times, and the development of submarine ballistic missiles suitable for submerged launching. By these means, the Soviets are attempting to gear their long range striking forces better for either pre-emptive or retaliatory operations.

*B. Intercontinental Ballistic Missiles*<sup>12</sup>

49. In the past two years, the pace of ICBM development and deployment has quickened noticeably. At the Tyuratam test range two new ICBM systems—designated SS-7 and SS-8—have been under development. The more successful program has been the development of the second-generation SS-7 which probably became operational in the first half of 1962. Testing of the SS-8 has been conducted at a slower pace. The SS-8's relatively poor success record in the first half of 1962 and the lack of any test-firings for six months suggest that the Soviets have encountered technical difficulties with this system.

50. Construction of deployment complexes for second-generation ICBMs has proceeded concurrently with development testing. This method, aimed at early achievement of an initial operational capability, almost certainly relates to a Soviet decision to deploy the first-generation SS-6 system in only limited numbers; from the history of the SS-6 program, we judge that this decision was taken in about 1958 or 1959, when the second-generation systems were probably being designed. The SS-6 ICBM is a very large vehicle of about 500,000 lbs. gross takeoff weight, with nonstorable liquid propellants and radio-inertial guidance. Ground control and support facilities are correspondingly large and complex, and include rail service direct to launchers. The second-generation SS-7 system is simpler and considerably less bulky than the SS-6; the missile has a gross takeoff weight of about 280,000 lbs. and employs storable liquid propellants. Of the known Soviet ICBM systems, the SS-7 is by far the most widely deployed.

51. We have located some 17 ICBM complexes in the USSR, and, considering the nature of the evidence, we believe that no more than a few others exist. Most of these complexes—more than a dozen—are of a type clearly associated with the SS-7 system. A typical SS-7 complex consists of a rail-served support area and as many as 16 launchers which are deployed in pairs and are road-served. The system was first deployed in a soft configuration, but is now also being deployed in silo-type hardened sites, a few of which are probably already operational.

52. In addition to SS-7 complexes, the Soviets have deployed a few complexes of a somewhat different type. Launch sites are soft, road-

---

<sup>12</sup> For characteristics and performance of Soviet ICBMs, see Annex B, Table 1.

served, and probably for a relatively small ICBM—i.e. about the size of SS-7. We have not definitely associated this type of complex with a particular missile system. If the SS-8 missile is relatively small, the new type complexes are probably designed for that system. However, if SS-8 is very large, they are probably intended for the SS-7.

53. We are unable at this time to resolve the question of whether the SS-8 ICBM is relatively small or even larger than SS-6. If the SS-8 is small, the USSR may have undertaken its development along with SS-7 to insure the availability of at least one successful second-generation system. If the SS-8 is large, it is probably being developed as a delivery vehicle for very high-yield warheads, and presumably for space launchings as well. We have no evidence of new deployment complexes suitable for such a large ICBM.

54. *Estimated Force Levels to Mid-1964.* Our estimates of Soviet ICBM strength are derived primarily from the known magnitude of the program and the estimated lead times involved in new site construction. The range of the estimates allows for the possibility of additional sites and other unknowns, such as the present status of the SS-8 program. Evidence on second-generation deployment has led to an upward revision in our previous estimate of operational launchers for mid-1964. We now estimate a somewhat faster rate of deployment activity and a higher number of launchers per complex than were employed in previous calculations. Our revised estimates of numbers and types of operational ICBM launchers to mid-1964 is as follows:

#### OPERATIONAL ICBM LAUNCHERS<sup>13</sup>

	<u>END-1962</u>	<u>MID-1963</u>	<u>MID-1964</u>
Approximate totals	80-85	125-175	250-325
(Including hard launchers)	(a few)	(10-25)	(75-100)

NOTE: Soft launchers probably have two missiles each to provide a refire capability after some hours. We have no evidence as to whether hard launchers have a refire capability. The totals estimated in this table include launchers at the Tyuratam test range.

55. The Soviet ICBM force estimated for the next two years will consist primarily of second-generation ICBMs equipped with warheads in the low megaton range. We continue to believe, however, that the Soviets have a requirement for a very large ICBM, capable of delivering

<sup>13</sup> The Assistant Chief of Staff for Intelligence, Department of the Army, and the Assistant Chief of Staff, Intelligence, USAF, dissent to these projected force levels. See their footnotes to Conclusion K, page 6.

very high-yield warheads—[*text not declassified*]. The SS–6 ICBM could be retrofitted with warheads having yields in the lower portion of this range, but further tests would probably be required to develop a new nose cone.

56. Apart from this possibility, the time at which the USSR could have operational missiles capable of delivering warheads with yields [*text not declassified*] depends upon whether or not the SS–8 is a very large ICBM:

a. If SS–8 is in fact very large, we believe it could deliver such warheads. In this case, we estimate that a few suitable launchers could be operational by mid-1964; an earlier capability could be achieved by deployment of SS–8 at the four SS–6 launchers in the field and at two or three test range launchers.

b. If, on the other hand, SS–8 is relatively small, a new, very large ICBM [*text not declassified*] is probably under development; we estimate that it could become operational in late 1964, or more likely in 1965 or thereafter. In either event, we conclude that only a few large ICBMs with very high-yield warheads could be deployed in the USSR in the next year or so.<sup>14</sup>

57. *Implications for 1965–1967.* We continue to estimate an ICBM force level for mid-1967 of 300–600 operational launchers, although, if the Soviet goal is the lower side of this range, it will evidently be reached considerably earlier than mid-1967.<sup>15</sup> <sup>16</sup> Events of 1962, including the Cuban crisis, probably caused the Soviet leaders to re-evaluate their strategic weapon programs, and may have led to new decisions which could importantly affect the ICBM force in the mid-1960's. We have no information as to the nature of such decisions, and are unlikely to

---

<sup>14</sup> The Assistant Chief of Staff, Intelligence, USAF, continues to estimate that the SS–8 could be ready for operational use in 1963. Further, he believes that, in consideration of the large cost expended on the SS–6 research and development program, including site development, and other pertinent factors, the operational deployment of the SS–6 to only the four known SS–6 launchers in the field, does not appear realistic. It is quite likely in his opinion that other sites have been constructed and remain undetected because of deficiencies in available intelligence. Therefore, he concludes that more than a few large ICBM's with very high-yield warheads will be operational by mid-1964.

<sup>15</sup> The Assistant Chief of Staff for Intelligence, Department of the Army, believes that the force level is likely to be towards the low side of the estimate presented in this sentence. He believes the upper limit (600) too high for a purely deterrent force, and much too low for a counterforce concept.

<sup>16</sup> The Assistant Chief of Staff, Intelligence, USAF, continues to estimate for the long term a force level of 700–800 ICBM launchers. He would estimate that operational ICBM launchers for the period mid-1965 to mid-1967 to be as follows:

	MID-1965	MID-1966	MID-1967
Approximate Totals	450–550	550–650	700–800
(Including Hard Launchers)	(175–225)	(225–275)	(350–400)

obtain indications of resultant changes for a year or more. However, on the basis of present evidence, we believe that the major trends to 1967 will be: growth of the force to some hundreds of launchers; hardening of a significant portion of the force; and availability of some missiles capable of delivering very large warheads with yields of up to 100 MT.

*C. Medium and Intermediate Range Ballistic Missiles*

58. We estimate that the Soviet MRBM and IRBM force now comprises about 600 completed launch positions. The 1,100 n.m. (SS-4) MRBMs probably constitute the bulk of the force, but some 700 n.m. (SS-3) MRBMs may still be operational, and some 2,200 n.m. (SS-5) IRBMs are in service.<sup>17</sup> More than 90 percent of the force is deployed in a broad belt in western USSR stretching from the Baltic to the Black Sea, with a lesser concentration of sites in the Soviet Far East. From present deployment areas, MRBMs can cover targets in Norway, most of Western Europe, Turkey, Japan, Korea, Okinawa, Alaska, and northern Canada. IRBMs can extend this target coverage to include all of Spain, North Africa, Thule, Taiwan, and the northern Philippines.

59. Most of the MRBM and IRBM sites are soft, fixed, and road-served; each site consists of four launch positions. A program to construct hardened sites is underway; we believe that a few silo-type sites are already operational, and that this program is continuing.

60. We believe that all hard sites and soft IRBM sites are normally manned and equipped with launchers so that each launch position is capable of participating in an initial salvo. We are uncertain, however, that this is true of all the soft MRBM positions. Soviet doctrine calls for alternate launch positions to which MRBM units could move for subsequent firing of additional missiles. It may be that only about half of the soft MRBM positions are manned and equipped for a first salvo, and that for subsequent firings their launchers and crews could move to other soft positions. On the other hand, it may be that all of the soft MRBM launch positions are equipped with launchers and crews for a first salvo, and the units may be intended subsequently to move to unimproved alternate positions similar to the installations constructed in Cuba. Bearing these possibilities in mind, we believe that the present MRBM/IRBM force—estimated at 580 soft launch positions and 20 hard silos—may have a first salvo capability as large as 600 or as low as 325.

61. There is clear evidence that the Soviets intend to provide a substantial refire capability for this force. We believe that most if not all firing units using soft launch positions have a second missile avail-

---

<sup>17</sup> For the precise calculated maximum ranges and other characteristics of these missile systems, see Annex B, Table 1.

able for a second salvo, and that some further reserve may exist. We have no evidence as to whether hardened launchers are provided with additional missiles.

62. We believe that the Soviet deployment of soft MRBM and IRBM sites will be virtually completed early this year, leveling off at about 600 launch positions. The hardened component of the force will continue to grow, probably reaching about 100–150 launchers in mid-1964. Thus, we estimate that at that time the Soviet MRBM and IRBM force will comprise about 700–750 launch positions. Considering the possibility that as many as half of the soft launch positions may be alternates, we believe this force may have a first salvo capability as high as 750 or as low as 425.

63. In the 1965–1967 period, the size of the MRBM and IRBM force may level off, as we have previously estimated, or it may continue to rise. We are unable at this time to project a Soviet force goal for these weapons, which have already been made available in numbers considerably exceeding those predicted in earlier estimates. In order to have a larger force of protected MRBMs and IRBMs, the Soviets may continue to build new hard launchers throughout the mid-1960's. It is also possible that some soft sites will be deactivated. Finally, improved MRBM and IRBM models may be introduced in the mid-1960's; these could include road mobile systems designed for greater flexibility of operations.

#### *D. Missile Launching Submarines*<sup>18</sup>

64. Since the second half of the 1950's the USSR has been developing and producing ballistic missile submarine systems capable of attacking land targets. The Soviets now have operational about 45 ballistic missile submarines; nine of these are of the "H" class nuclear-powered type and the rest are "Z" conversion and "G" class diesel-powered submarines. This force can carry a combined total of about 125 short-range (350 n.m.) missiles. The effectiveness of these submarines is limited by their capacity to carry only two or three missiles each, the short range of the missiles, and the requirement for submarines to surface for launching.

65. The USSR is developing longer range ballistic missiles for launching from submerged submarines. Our evidence is inadequate to determine whether the system under development has a range of 650 or 2,000 n.m.; it is possible that two separate systems of different ranges are being developed. If a 650 n.m. system becomes available,

---

<sup>18</sup> For estimated characteristics and performance of Soviet submarines, see Annex A, Table 11; for characteristics and performance of naval-launched missiles, see Annex B, Table 3.

it will probably be retrofitted into some portion of the existing force of "G" and "H" class submarines; we believe that such a retrofit program could begin soon. Such missiles will probably also be incorporated into newly-constructed "H" class submarines.

66. If a 2,000 n.m. submerged launch system is under development—either instead of or in addition to a 650 n.m. system—it is almost certainly intended for use in a new, nuclear-powered class. In any case, new classes of nuclear-powered ballistic missile submarines will almost certainly carry submerged-launch missiles with a range of at least 650 n.m., and possibly as much as 2,000 n.m. There is evidence that the Soviets are constructing nuclear submarines of new classes whose characteristics are as yet unknown to us.

67. The Soviets have also developed a supersonic, 300 n.m. submarine-launched cruise missile system (SS-N-3), which is now carried by a number of converted "W" class submarines and six nuclear-powered "E" class ships. There is evidence that a longer range (450 n.m.) naval cruise missile is also under development. We do not know definitely what missions the Soviets contemplate for submarine cruise missile systems of these ranges. From Soviet discussions of naval missile systems and other evidence it appears that these systems are designed primarily for use against ships, but their effective use at extended range would require a forward observer within sonar or radar range of the target to provide target data. On the other hand, these missiles could also be employed—probably without a forward observer—to conduct low level attacks on land targets, and their employment would greatly complicate defensive problems.

68. Taking into account estimated Soviet capacity to construct nuclear-powered submarines, and with allowance for estimated construction of torpedo attack types, we believe that a gradual buildup of nuclear-powered missile launching ships will occur over the next five years. By 1967, the USSR will probably have more than two dozen nuclear-powered ballistic missile submarines, and about 20 equipped with cruise missiles. Construction of diesel-powered ballistic missile submarines will probably continue for the next year or so, building up to a total of more than 40. We estimate Soviet operational strength in missile-launching submarines over the next few years as follows:

#### SOVIET MISSILE SUBMARINES

	<u>END-1962</u>	<u>MID-1963</u>	<u>MID-1964</u>	<u>MID-1967</u>
<i>Ballistic</i>				
Nuclear ("H" and/or successor)	9	11	14	26
Diesel ("G" and "Z" class)	36 <sup>a</sup>	40	43	43

*Cruise*

Nuclear ("E" class)	6	7	9	20
Diesel ("W" class)	12	14	18	22

<sup>a</sup> We have previously estimated that construction of "G" class submarines would terminate by the end of 1962. Recent evidence has indicated, however, that this construction has continued. While we are unable to predict the future numbers of this class with certainty, our estimate reflects both the recent evidence and the possibility that construction will continue for about another year. The size of the "G" class construction program will be influenced by Soviet decisions regarding construction of nuclear-powered missile submarines.

*E. Long Range Aviation*

69. Soviet Long Range Aviation, by reason of its equipment, basing, and deployment, is much better suited for Eurasian operations than for intercontinental attack. We believe that as of December 1962, Long Range Aviation comprised 170–200 heavy bombers and tankers and about 950 jet medium bombers and tankers. The heavy bomber force includes 100–120 BISON jet bombers and 70–80 BEAR turboprops. Virtually all of the medium bombers are BADGERS; at least 25 new, supersonic BLINDERS have been delivered to Long Range Aviation units, and their introduction is continuing.

70. We continue to estimate a gradual decline in the numerical strength of Long Range Aviation. BLINDER, the only bomber in current production for Long Range Aviation, is being produced at a rate which is probably insufficient to offset the expected decline in BADGER numbers. Although research and development on heavy aircraft has continued and could be applicable to military purposes, our evidence does not indicate that any new heavy bomber is being developed for operational use. Although it remains possible that an advanced intercontinental aircraft could enter operational service in the next five years, this now appears highly unlikely. We therefore estimate the probable composition of Long Range Aviation through mid-1967 as follows:<sup>19</sup>

	<u>END-1962</u>	<u>MID-1963</u>	<u>MID-1964</u>	<u>MID-1967</u>
Heavy Bombers/ Tankers				
BISON	100–120	100–120	95–115	70–90
BEAR	<u>70–80</u>	<u>70–80</u>	<u>65–75</u>	<u>40–50</u>
	170–200	170–200	160–190	110–140

<sup>19</sup> The Assistant Chief of Staff, Intelligence, USAF, dissents to the estimates on heavy bombers in this paragraph. See his footnote to Conclusion M, pages 7 and 8.

	<u>END-1962</u>	<u>MID-1963</u>	<u>MID-1964</u>	<u>MID-1967</u>
Medium Bombers/ Tankers				
BADGER	925	900	800	500
BLINDER	25	50	100	250
	<u>950</u>	<u>950</u>	<u>900</u>	<u>750</u>

#### *F. Air-to-Surface Missiles*<sup>20</sup>

71. Although no large-scale bomber replacement program appears to be under way, the USSR has sought to extend the service life of its long-range aircraft and to improve their effectiveness by the deployment of air-to-surface missiles. A 350 n.m. supersonic missile, the AS-3, was developed to provide a standoff capability in attacks against land targets. Only the BEAR appears capable of delivering this large missile. More than half of the BEARs have been equipped to deliver these weapons rather than bombs, and there are indications that the modification program is continuing. A new air-to-surface missile, the AS-4, carried by a BLINDER in the 1961 air show, is now being tested and could probably be operational in 1964. It appears to be designed for high supersonic speed and a range of several hundred miles.

#### *G. Intercontinental Operations*

72. A major obstacle to the development of capabilities for intercontinental attack by Long Range Aviation has been the limited range of the aircraft which make up the bulk of the force. Consequently the Soviets have given considerable emphasis to aerial refueling and to Arctic training. The USSR has not developed an aircraft specifically for use as a tanker. Instead, BISONs and BADGERs are converted for use as tankers with their bomber counterparts. BLINDERs could possibly also refuel from these tankers. There is evidence that all Soviet BISON regiments and some aircraft from about half of the BADGER regiments have trained in aerial refueling. The recent sighting of a BEAR equipped with a nose probe indicates the possible development of an in-flight refueling capability for this aircraft, but we have no evidence as to how many BEARs have been so modified.

73. Even with aerial refueling, the range capabilities of Long Range Aviation for intercontinental attack remain limited. Refueled BADGERs on two-way missions from Arctic bases could cover many targets in Alaska, Canada and Greenland, but could reach only the northwestern portion of the continental US. The BLINDER is even more limited as to range. The BISON would require both Arctic staging and in-flight

<sup>20</sup> For estimated characteristics and performance of Soviet air-to-surface missile systems, see Annex B, Table 5.

refueling for extensive coverage of US targets on two-way missions, and many of these targets would be at extreme ranges. BEARs could cover virtually all US targets on two-way missions from Arctic bases. They could reach targets in northeastern US directly from their home bases, but would have to stage through the Arctic for extensive coverage of US targets when carrying AS-3 missiles or bomb-loads of 25,000–30,000 lbs. The recently observed BEAR with a nose probe was also configured to carry air-to-surface missiles; modification of BEAR for in-flight refueling would obviate the necessity for Arctic staging.

74. We believe that the Soviets would plan to commit their entire heavy bomber force and a portion of their medium bomber force to initial attacks on North America. In the past two years, the numbers of heavy bombers engaged in Arctic training have increased, while participation by medium bomber units has declined. Analysis of this training activity suggests that the Soviets might plan to commit as many as 350–500 aircraft through relatively few Arctic bases in initial attacks on North America. Considering a variety of operational factors but excluding combat attrition, we estimate that the Soviets could put about 200 bombers over North America on two-way missions; of these, about half would be heavy bombers.<sup>21</sup>

75. The Soviets have a larger potential for bomber attacks against the US, but to exercise it they would need to employ BADGERs on one-way missions and to use crews which had not participated in Arctic training. As Soviet ICBM forces grow, such use of the medium bomber force becomes increasingly unlikely.<sup>22</sup>

#### *H. Space Systems*

76. On the basis of evidence presently available, we are unable to determine the existence of Soviet plans or programs for the military use of space. The limitations of this evidence, however, are such that our chances of identifying military programs are poor. We believe that the USSR almost certainly is investigating the feasibility of space systems for military support and offensive and defensive weapons. Soviet decisions to develop military space systems will depend on their expected cost and effectiveness as compared with alternative systems,

---

<sup>21</sup> The Assistant Chief of Staff, Intelligence, USAF, disagrees with judgments expressed in this paragraph. See his footnote to Conclusion M, pages 7 and 8.

<sup>22</sup> The Assistant Chief of Staff, Intelligence, USAF, agrees that the need for the medium bomber force will diminish at sometime in the future because of the increasing size of the ICBM force. Further, in the immediate future, he considers that the need for these bombers in attacks against Eurasia is decreasing because of the growing MRBM/IRBM strength. He also notes that the Soviets are retaining large numbers of medium bombers and training them extensively. He believes, therefore, that medium bombers will be used on one-way missions in any attack on the US but that the number so utilized will diminish in time.

the political and military advantages which could be gained, and the Soviet estimate of US intentions and capabilities in comparable fields. We believe that the USSR will produce and deploy those military space systems which it finds to be feasible and advantageous in comparison with other types of weapons and military equipment.

77. Within this decade, the basic factors of reaction time, targeting flexibility, accuracy, vulnerability, average life, and positive control for an orbital bombardment system almost certainly will not compare favorably with ICBMs. We believe that a Soviet decision to develop and deploy an orbital bombardment system would depend in large part upon the extent to which these drawbacks can be overcome. A demonstration of an orbital bombardment satellite could occur at any time, but we believe that in the near term its military effectiveness would be minimal. If the Soviets decide to develop an orbital bombardment force, it would be preceded by a developmental system of limited military effectiveness which could appear as early as 1965.

#### *I. Implications of Capabilities*

78. The capabilities of Soviet long-range striking forces will be only in part a function of the numbers of weapons available, their performance, and the adequacy of supporting elements. Equally critical will be the way in which the Soviets employ their striking forces, their ability to maximize the effects of these forces under the various circumstances in which war could begin, and their assessment of Western capabilities and plans.

79. Should the Soviets conclude that the West was irrevocably committed to an imminent nuclear attack on the USSR, they would launch their available ready forces in a pre-emptive attack designed to blunt the expected Western blow. The mixed forces which they have available for such operations would permit flexibility of tactics and complicate Western defensive problems, but would pose severe difficulties of coordination. Initial missile and bomber attacks against the US would probably extend over a period of many hours, and those against Eurasia over at least a few hours.

80. The Soviets would almost certainly wish to assign US targets to attack by submarine-launched missiles in the event of general war. Considering the absence to date of patrols in US waters and the long time of transit from Soviet base areas, we believe that at present the Soviets would plan to employ few if any missile submarines in initial attacks against the US. Initiation of routine submarine patrols within missile range of the US could change this situation, and we believe that some such patrolling activity will have been instituted by the mid-1960's.

81. By the mid-1960's, the USSR will have acquired a substantially increased ICBM and submarine-launched missile capability to deliver

nuclear weapons against the US, in addition to its already formidable forces for strikes in Eurasia. Significant portions of these forces will be relatively invulnerable to attack. Reaction times will probably have been further reduced, and techniques for control and coordination improved. The Soviets will be in a position to strike pre-emptively at the fixed bases of an important segment of the US nuclear delivery force, and they will have some prospect that a portion of their own force could survive an initial US attack and retaliate with high-yield nuclear weapons. With the long-range striking forces we estimate that they will have in the mid-1960's, however, the Soviets could still not expect to destroy the growing numbers of US hardened, airborne, seaborne, and fast reaction nuclear delivery vehicles.

#### VI. AIR AND MISSILE DEFENSE FORCES<sup>23</sup>

82. The USSR has continued to devote large-scale efforts to improving and modernizing its air defense system.<sup>24</sup> Defenses against hostile aircraft, especially against medium and high altitude bombers, continue to be strengthened by the widespread deployment of surface-to-air missile systems, improved interceptors with air-to-air missiles, and advanced equipment for air defense warning and control. Antiaircraft capabilities will be further improved and extended, but the major future development which we foresee is the advent of a capability against ballistic missiles.

##### *A. Antimissile Program*

83. For more than five years, the Soviets have been conducting a high priority and extensive program to develop defenses against ballistic missiles. We believe that they are developing several different ABM systems to defend against missiles of various ranges, but our evidence is inadequate to support an estimate of the characteristics or effectiveness of any of these systems. Despite the intensity of Soviet R&D and repeated official claims, we are not aware of any Soviet breakthrough in ABM technology.

84. *Defense Against Long-Range Missiles.* We believe that the Soviets are deploying an ABM system around Leningrad which will achieve some operational capability in 1963. We have no basis for determining its effectiveness, but we think it unlikely that a system deployed at the current stage of Soviet R&D would be effective against missiles employing decoys or other countermeasures.

---

<sup>23</sup> For a fuller treatment of this subject, see NIE 11-3-62, "Soviet Air and Missile Defense Capabilities through Mid-1967," dated 31 October 1962, TOP SECRET.

<sup>24</sup> For estimated strength and deployment of Soviet air defense equipment, see Annex A, Table 4.

85. To counter the more complex long-range ballistic missile threat of the mid-1960's, the Soviets may seek to improve the Leningrad system, or may develop a different and more advanced system, or both. Should they follow the first course, deployment of the Leningrad system at additional locations would probably begin in the near future if it has not already begun. If sites are under construction now, initial operational capabilities could be achieved at one or more additional locations in about two years, and subsequent improvements would progressively increase the capabilities. We regard it as more likely, however, that the USSR will defer deployment at locations other than Leningrad until a new and better antimissile system is available. In this case, the requirement for further R&D would probably delay the beginning of deployment for another year or so. Initial operational capabilities would probably be achieved at one or more locations in 1965-1966.

86. If technical achievements enable the Soviets to develop an ABM system which they regard as reasonably effective against long-range missiles, a vigorous deployment program will probably be undertaken. Considering the vast effort required for a large program and the relative importance of the various urban-industrial areas in the USSR, we believe that a vigorous Soviet deployment program would contemplate the defense of some 20-25 principal Soviet cities. A program of this scope almost certainly would require some five or six years from its initiation to its completion. We have no basis for judging whether or when the Soviets would consider their ABM system effective enough to warrant the initiation of such a program.

87. *Defense Against Short-Range Missiles.* There are indications that the Soviets have been developing a modification of their standard antiaircraft SA-2 missile system for use against short-range ballistic missiles such as the Honest John, Corporal, and Sergeant. We have no evidence of Soviet progress, but we estimate that an improved SA-2 system having some effectiveness against tactical ballistic missiles could now be available. It is also possible that the Soviets have chosen to develop a completely new system; if so, it could also be available this year. We believe that whatever system is developed will be intended primarily for the protection of field forces and for this use will be mobile. It will probably also be deployed at fixed sites in border areas vulnerable to short-range missile attack.

88. *Antisatellite Systems.* We believe that the Soviet leaders almost certainly intend to acquire an antisatellite capability. Although we lack evidence, we think it probable that a development program exists. If the Soviets are utilizing components from existing systems, they might be able to intercept current models of US satellites now, and they would almost certainly be able to do so within the next year or so; in this

instance, the intercept problem could be solved by determining the orbits of the target satellites after a few passes.

*B. Surface-to-Air Missiles*

89. For defense against aircraft, the Soviets now rely primarily on SAMs emplaced near fixed targets, and upon fighters deployed to cover approach routes as well as gaps between missile defended locations. The Soviets now have operational three types of SAM systems. Two of these, SA-1 and SA-2 are designed primarily for defense against medium and high altitude attacks; the third, SA-3, is probably designed to provide improved capabilities at low altitudes. The SA-1 system is deployed only around Moscow, while SA-2's have been extensively deployed throughout the USSR. The newest system, SA-3, is in the early stages of deployment.<sup>25</sup>

90. Deployment of SA-2, the basic Soviet missile defense system, has been on a massive scale. More than 650 SA-2 sites have been confirmed in the USSR; each site has six launchers, together with additional missiles to provide a refire capability. Most of these have been deployed in defense of population centers, industrial complexes, and government control centers. They also defend long-range missile sites, airfields of Long Range Aviation, nuclear production and weapon storage installations, missile test ranges, and industrial facilities. Several sites in border areas suggest that the Soviets are also deploying peripheral defenses, which may eventually extend from the Kola Peninsula along the western and southern borders of the USSR into central Asia. Considering the pattern of deployment, the length of time the program has been under way and the extent of our intelligence coverage, we estimate that more than 800 SA-2 sites are operational in defense of more than 250 target areas in the USSR and that the Soviets will deploy a total of some 1,000–1,200 sites. This SA-2 deployment program will probably be largely completed within the next two years.

91. The SA-2 system is also being deployed to defend principal cities and major installations of theater field forces in the European Satellites. Nearly 100 sites have been observed to date, and we estimate that about 175–200 SA-2 sites will be deployed in the European Satellites during the next two or three years, including sites manned by Soviet field forces.

92. *Low Altitude Defense.* The USSR in 1961 began deployment of the SA-3 system. However, we have insufficient evidence to estimate characteristics for this system. A typical SA-3 site consists of four launch pads. We have identified more than 40 such sites, located in

---

<sup>25</sup> For estimated characteristics and performance of these systems, see Annex B, Table 4.

the Moscow and Leningrad areas and in certain coastal regions, particularly the Baltic and Black Sea areas. We believe that the Soviets will continue to deploy SA-3's to supplement existing SAM defenses, giving priority to those coastal areas which they regard as particularly vulnerable to low level attack. A mobile version of the SA-3 system will probably also be provided to field forces. The present limited deployment, however, does not provide sufficient basis for estimating the extent or pattern of future SA-3 deployment.

### *C. Fighter Aircraft*

93. Although the Soviets are clearly placing heavy reliance on surface-to-air missiles, they continue to maintain large numbers of fighter aircraft in service. As of December 1962, we estimate that there were about 11,900 fighters in operational units throughout the Bloc, with about 6,800 of these in Soviet units.<sup>26</sup> About 4,400 of the Soviet fighters are in Fighter Aviation of Air Defense (IA-PVO) with air defense as their primary mission. The remainder, which are in Tactical Aviation, are trained in air defense as well as ground support operations. The Soviet fighter force has been reduced by about one-third over the past few years, and we estimate a further reduction on the order of 40 percent over the next five years.<sup>27</sup> The more advanced performance characteristics of new model fighters and improvements in their weapons and control systems should more than offset reductions in numbers.

94. Day fighters—primarily the subsonic FRESCO (MIG-17)—make up over three-quarters of the Soviet force. However, since about 1955, the Soviets have been working to improve the all-weather capability of the force, bringing into service about 350 FLASHLIGHT A (YAK-25) all-weather interceptors and about 600 day fighters (FRESCOs and FARMERs) modified by the addition of airborne intercept (AI) radar. Under nonvisual conditions, the effectiveness of most of these aircraft is limited by the relatively short range of the AI radar, by the continued reliance on gun armament, and by the restriction to a lead pursuit attack.

95. In the past few years, a new generation of supersonic, missile-equipped Soviet fighter has appeared in peripheral areas of the USSR and Eastern Europe. The delta-wing FISHPOT, probably the best operational AW fighter, has been phased into PVO units; the swept wing

<sup>26</sup> For a detailed estimate of Soviet fighter strength, see Annex A, Tables 4-5. For a similar estimate on the European Satellites and Asian Communist nations, see Annex A, Table 6.

<sup>27</sup> The Assistant Chief of Staff, Intelligence, USAF, notes that Soviet fighter strength has remained nearly the same since mid-1961, and considers it may well be that a plateau has been reached.

FITTER and the delta-wing FISHBED C, which have a clear-air-mass capability, have gone largely to units of Tactical Aviation; the FISHBED D all-weather fighter has been identified in East Germany. In armament, fire control, and speed, these aircraft represent significant advances over the bulk of Soviet interceptors now in service.

96. Three new interceptor prototypes, all equipped with improved AI radar and AAM's, were displayed in the 1961 Aviation Day show: FIREBAR B, FLIPPER, and FIDDLER. FIREBAR B is an interceptor version of the tactical strike/reconnaissance aircraft, FIREBAR A. FLIPPER, a delta-wing type with a relatively short combat radius, is capable of speeds in excess of Mach 2 at 35,000–40,000 feet. FIDDLER has sufficient range and endurance to perform a loiter mission 500 n.m. or more from base. It may be intended for use against air-to-surface missile (ASM) carriers, but its potential for such missions is currently limited by the shorter ranges of Soviet early warning radars.

97. We believe that all three of these new fighters could start entering units in 1964–1965; we have limited evidence that FIDDLER and possibly FLIPPER may be in production now. Soviet production of fighter aircraft has dropped sharply in recent years, from a peak of about 5,000 in the early 1950's to about 400 in 1959. The annual rate for the period 1960–1962 was on the order of 600 to 800.

98. *Air-to-Air Missiles*.<sup>28</sup> We have firm evidence on the deployment of AAMs in the Soviet fighter force and in several of the Satellite forces as well. We believe that three types are now operational, a radar beam-rider (AA-1), an infrared homing missile (AA-2), and a missile which may be either an infrared homing missile or an all-weather semi-active radar homing missile (AA-3). Two prototype AAM's were displayed in 1961 (the AA-4 on FIDDLER and the AA-5 on FLIPPER) and we estimate that one or both could become operational during 1963–1965. It is probable that these missiles have improved semiactive radar homing systems and that they carry substantially heavier warheads, some of which could be nuclear. Soviet development of improved AAMs over the next few years will depend primarily upon the development of interceptors equipped with suitable AI radar and fire control systems.

#### *D. Antiaircraft Guns*

99. The Soviets continue to employ large numbers of antiaircraft guns for defense of field forces and fixed targets, primarily for defense at low altitudes where fighter and missile effectiveness is poor. The number of antiaircraft guns deployed with the Soviet forces, now about 12,000 has declined over the past few years and this trend is continuing.

---

<sup>28</sup> For characteristics and performance of Soviet air-to-air missile systems, see Annex B, Table 6.

Because of the widespread deployment of SAMs, we believe that most of the remaining medium and heavy guns used in the defense of fixed targets in the USSR will be phased out over the next few years. However, a large number of these probably will be held in reserve status near major target areas, and some will be retained to defend field forces. Continued transfer of some of this equipment to other Bloc countries is probable.

#### *E. Supporting Equipment*

100. We believe that about 1,800 heavy prime radars and about 5,400 auxiliary radars are deployed in various combinations at some 2,400 sites in the Sino-Soviet Bloc. Radar coverage now extends over the entire USSR and virtually all the remainder of the Bloc. Under optimum conditions the Soviet system of early warning (EW) radars can detect and track aircraft at high and medium altitudes more than 200 n.m. from Bloc territory; under virtually all conditions the system can detect and track such aircraft within about 135 n.m. Maximum effective range of Soviet ground controlled intercept (GCI) radars is about 100–200 n.m. Future Soviet radar development will seek to improve present limited capabilities against low altitude targets and air-to-surface missiles. With the wider deployment of improved radars and automated control systems, the total number of radar sites will probably decline.

101. The most important advance in Soviet air defense communications and control over the last few years has been the development and deployment of semiautomatic systems with data-handling equipment for rapid processing of air defense information and data link equipment for vectoring interceptors. A system similar in concept to the US SAGE system, but less complex, is widely deployed in Western USSR. We believe that its original ground element has been replaced by a second generation system, and that an improved semiautomatic fighter control system is being introduced. These new systems will probably also be widely deployed in the USSR and possibly in Eastern Europe within the next few years.

#### *F. Warning*

102. EW radar could now give Moscow and many other targets in the interior more than one hour's warning of medium and high altitude attacks made with Western bombers of the B-52 type. Soviet assurance of such detection would be reduced by low level penetrations. The supersonic bombers and ASMs now being added to Western inventories could reduce this warning time by as much as 50 percent. Moreover, the more limited EW time available in Bloc border areas would reduce the effectiveness of the defenses of even heavily defended targets in such areas. As the speeds of Western aerodynamic vehicles increase,

and as Western ballistic missiles become a greater part of the threat, the problem of providing warning time will become more critical.

*G. Current Capabilities and Future Trends*

103. The extensive deployment of SAMs over the past four years has significantly improved Soviet air defense capabilities. These capabilities are greatest against penetrations by subsonic bombers in daylight and clear weather at altitudes between about 3,000 and about 45,000 feet. Under such conditions, virtually all types of Bloc air defense weapons could be brought to bear against attacking aircraft. Most Soviet fighters can operate at altitudes up to about 50,000 feet; the FLIPPER will probably be able to execute attacks at about 65,000 feet.<sup>29</sup> The capabilities of the fighter force, composed largely of day fighters, would be reduced considerably during periods of darkness or poor visibility. In the increasingly widespread areas defended by SAMs, air defense capabilities are virtually unimpaired by weather conditions and extend to altitudes of about 80,000 feet.

104. Despite its recent and considerable improvements, however, the Soviet air defense system would still have great difficulty in coping with a large-scale air attack employing varied and sophisticated tactics, even in daylight and within the foregoing altitudes. In addition, the Soviet defense problem would be complicated by the variety of delivery systems which might be employed, including air and surface-launched cruise missiles and fighter-bombers. At altitudes below about 3,000 feet, the capabilities of the system would be progressively reduced; below about 1,000 feet, the system would lose most of its effectiveness. The Soviets will attempt to correct these deficiencies during the next few years by improving the capabilities of surface-to-air missile and fighter defenses for low altitude operations. Total system effectiveness will be increased by further application of automated command and control.

105. The significant improvements in the Soviet air defense system during recent years will be extended during the next few years, and successful penetration by manned bombers will therefore require increasingly sophisticated forms of attack. The Soviet air defense capability can be degraded by the increasingly complex forms of attack which the West will be able to employ, including air-launched missiles of present and more advanced types, penetration tactics, and electronic

---

<sup>29</sup> Current operational Mach 2 interceptors (FISHBED, FITTER, FISHPOT) are capable of performing a dynamic climb and reaching altitudes of around 65,000–70,000 feet. In such a climb, the aircraft would be at these altitudes for a short period of time (perhaps one to three minutes), during which it would have little maneuverability. The precision with which the climb must be planned and executed limits its effectiveness as an intercept tactic.

countermeasures. Even in such circumstances, the Soviets would probably expect to destroy a number of the attackers. We doubt, however, that they would be confident that they could reduce the weight of attack to a point where the resulting damage to the USSR would be acceptable. Unless and until the USSR is able to deploy a substantial number of advanced ABM defenses, the USSR's air and missile defense deficiencies and uncertainties will sharply increase as ballistic missiles assume a larger proportion of the West's total nuclear delivery capability.

## VII. THEATER FIELD FORCES<sup>30</sup>

### A. Ground Forces

106. The Soviet ground forces, which represent the largest part of the military establishment, are well-trained and equipped with excellent materiel. Combat troops are distributed among 15 military districts in the USSR and three groups of forces in the European Satellites. The strongest concentrations are in East Germany and the western and southern border regions of the USSR; a lesser concentration is in the maritime area of the Soviet Far East. Most Soviet ground forces are organized into field armies with combat and service support for the line motorized rifle and tank divisions. Combat and service support is generally stretched thin, and there is a low ratio of nondivisional support to the present divisional force. However, there are large numbers of artillery, missile, and antiaircraft artillery brigades and regiments which are either allocated to field armies or retained under higher command headquarters. Combat air support is provided by units of Tactical Aviation, organized into tactical air armies under the operational control of the military district or group-of-forces commander.

107. Of the nearly two million men in the Soviet theater ground forces, about half are in line divisions and the remainder are in combat and service support elements. We estimate that there are about 145 line divisions, of which approximately 80 are considered to be combat ready (at 70 percent of authorized personnel strength or greater), and the remaining 65 are at low and cadre strength (estimated to range between 60 and 20 percent of authorized strength and hence requiring substantial augmentation before commitment to combat).<sup>31</sup> At present,

<sup>30</sup> For a more detailed treatment of this subject see NIE 11-14-62, "Capabilities of Soviet Theater Forces," dated 5 December 1962, includes sections on the European Satellites, forces facing NATO, gross capabilities for theater campaigns, and capabilities for distant military action.

<sup>31</sup> The number of divisions confirmed since January 1961 is 119; most of the additional divisions included in our estimate are understrength units located in areas from which information is received only sporadically. Taking account of this and other factors, we conclude that the current total of divisions could lie within a range of 120 to 150, with the most probable figure being about 145. For a detailed estimate of ground divisions by location and type, and their estimated strength, see Annex A, Tables 6-7.

there are an estimated 34 tank divisions, 7 airborne divisions, and 104 motorized rifle divisions. The present force level represents a cut of about 20 combat ready line divisions and 5 low strength divisions since Khrushchev's announcement of force reductions in January 1960. The large number of cadre and understrength divisions retained indicates a continuing Soviet preference for maintaining a very large and partly skeletal ground force capable of being rapidly fleshed out with mobilization.

108. *Weapons and Equipment.* The program of modernization and reorganization has involved the introduction over the last several years of more advanced designs of practically all types of equipment, including surface-to-surface ballistic missiles of 150 n.m. range, tanks, armored personnel carriers, nuclear-capable free rockets with ranges up to 26 n.m., antiaircraft guided missiles, artillery and antiaircraft guns, recoilless antitank weapons, and a wide variety of transport vehicles. In some instances, there have been two successive generations of equipment since World War II. The increasing number of tracked and wheeled amphibians and amphibious tanks has greatly improved Soviet river-crossing capabilities, and we expect extensive equipping with the new amphibious armored personnel carrier.

109. Present trends in the ground weapons development program point to a continuing emphasis on firepower and mobility. Specific areas of concentration probably will include light gun and missile weapons to defend against low flying aircraft, a field antimissile system, air-transportable weapons and equipment, weight reduction of existing equipment, and improved reconnaissance and communications. Surface-to-air missiles (SAMs) are replacing medium and heavy antiaircraft guns; guided antitank missiles are being introduced and will probably replace some antitank guns.

#### *B. Tactical Missile and Air Support*

110. In their doctrine for theater operations in general nuclear war, the Soviets continue to employ the combined arms concept, but they have come to consider nuclear and missile weapons as the basic element of firepower. Soviet development of tactical guided missiles has greatly improved the fire support available to field forces.<sup>32</sup> Although nuclear warheads are probably the primary armament of these missiles, operational considerations might prescribe the use of chemical (CW) and high explosive (HE) warheads. Road mobile surface-to-surface ballistic missiles with maximum ranges of 150 n.m. (SS-1 and SS-1A) and 350 n.m. (SS-2) have been available for several years. The SS-1 and SS-2

---

<sup>32</sup> For estimated characteristics and performance of Soviet short-range missile systems, see Annex B, Table 2.

missiles are intended primarily for a ground support role, and missile units are assigned to direct operational control of field commanders.

111. Although there is little direct evidence on the deployment of these missiles, we estimate that about 35 SS-1 brigades (with 6 launchers each) and 30 SS-2 battalions (with 2 launchers each) are now operational. These missile units are believed to be in the artillery support structure of major Soviet theater force commands, although none have been firmly identified. We believe that the numbers of SS-1 and SS-2 units will remain fairly stable. However, the Soviets probably will soon begin replacing the SS-2 with an improved follow-on system of similar range, as they have done with the SS-1.

112. The number of aircraft in Tactical Aviation was reduced by half in 1960 and 1961. Since that time, it has been generally stabilized in overall strength, with phasing in of new model aircraft and continuing reductions in older models. As a result of reductions and transfers, Soviet Tactical Aviation is now mainly located in the areas adjoining major potential land theaters of combat. About half its total strength is with Soviet forces in Eastern Europe, and most of the remainder is in western and southern USSR. Tactical Aviation will continue to receive new models and to decline in numbers of aircraft—probably from about 3,100 to about 2,500 by mid-1964.<sup>33</sup> The estimated current and future numbers of Soviet tactical aircraft appear low in relation to estimated total ground forces and their likely missions in the event of general war.

113. A prime current deficiency of Soviet Tactical Aviation is the lack of modern aircraft, particularly fighter bombers. For offensive tactical air support, the Soviets still rely heavily on the obsolescent BEAGLE subsonic light bomber, but it is now being replaced by the FIREBAR A, a supersonic tactical fighter bomber. In addition, the FITTER and FISHBED C, while primarily interceptors, could also be employed for tactical support missions. The older types of Soviet tactical fighters, FAGOTs, FRESCOs, and FARMERs, were designed primarily as interceptors and have limited load-carrying and range capabilities when used in the ground support role. They can perform a variety of missions in support of ground forces and can be equipped to deliver nuclear weapons, but the newer types of tactical aircraft mentioned above appear better suited to these purposes. At present, about three-fourths of the fighters in Tactical Aviation are older types,

---

<sup>33</sup> The Assistant Chief of Staff, Intelligence, USAF, notes that combat elements of Soviet Tactical Aviation have not declined in total numbers since mid-1961 and he does not agree there will necessarily be the future decline forecast here. If the Soviet Union markedly reduces the ground element of Theater Field Forces over the next few years, Tactical Aviation may reflect a comparable reduction, but probably not otherwise.

mainly obsolescent, but the introduction of modern supersonic fighters has been accelerated, and these types now comprise about one-fourth of total estimated strength.

114. Some of the Soviet tactical fighter units have been equipped and trained only for the interceptor mission. Despite the limitations of the older aircraft, however, most units observed have also been trained and equipped to perform ground attack missions and could therefore be used for any one of several purposes depending on operational requirements: defending against air attack, providing close support to ground forces, or assisting ground operations by striking targets in the enemy's rear. The Soviets have conducted some training in fighter delivery of nuclear weapons. In addition, Tactical Aviation now has some 150 n.m. surface-to-surface cruise missiles (SHADDOCK, SSC-1).

#### *C. Military Air Transport*

115. Approximately 200 light transports of the CAB, COACH, and CRATE types, about 60 converted BULL piston medium bombers, and about 385 medium turboprop transports of the CAT, CAMP, and CUB types, are assigned by Military Transport Aviation to support of airborne troops. The assigned transports of the airborne troops are sufficient to airlift simultaneously a single airborne division or the assault echelons of two airborne divisions. Each divisional assault echelon would be limited to about 6,000 troops, including headquarters elements, nine rifle battalions, and light regimental support elements. Divisional combat and service support as well as transport vehicles of the infantry would not be included. The mobility of these echelons, once landed, would therefore be restricted, but a second sortie of the entire fleet could deliver the balance of the two divisions. Radii of the transport aircraft would permit operations of this type to be conducted to a distance of some 500–700 n.m.

116. The probable addition in the near future of more transports will enhance Soviet capabilities to lift large numbers of troops or cargo to peripheral areas; in several years, the present lift capacity may be doubled. Soviet airlift capabilities also could be augmented by about 375 jet and turboprop transports now in civil aviation; these aircraft have an airlift capability of nearly two additional divisional assault echelons.

#### *D. Amphibious Capabilities*

117. Soviet amphibious capabilities remain quite limited. They vary from one battalion in the Northern or Pacific Fleet area, to one regiment in the Black Sea, and two regiments in the Baltic. The USSR has a total merchant ship lift in all seas which is theoretically sufficient to transport approximately 20 motorized rifle divisions; however, such a lift would require port or other extensive off-loading facilities in the landing area.

The Soviets may seek to further develop their amphibious lift capability, but significant improvement will depend upon their acquisition of additional amphibious craft, extensive training, and development of a reliable logistic support system. There are no indications of such an improvement in the near future.

#### *E. Tactical Nuclear Weapons*

118. Tactical nuclear capabilities are still limited, but they have been improved markedly over the past few years. Soviet military planners are now in a position to think in terms of committing up to a few hundred nuclear weapons, virtually all with yields in the kiloton range, to a typical *front* operation. Limitations on the quantity and variety of nuclear weapons available to theater forces will have eased by the mid-1960's. The Soviets are probably developing subkiloton weapons, but we have no present evidence of work on delivery systems designed specifically for such weapons.

119. The Soviets evidently consider CW munitions as a standard and integral part of the Soviet arsenal for general war, to be used extensively in conjunction with nuclear and conventional weapons in support of *front* operations. Military forces of the USSR and Satellites regularly conduct training exercises involving the offensive use of toxic chemical agents as well as defense against them. We believe, however, that authorization from Moscow would be required before operational commanders could initiate the use of chemical weapons.

120. Although tactical nuclear delivery systems are integral to Soviet theater forces, the nuclear weapons themselves do not appear to be in their custody. In peacetime, such weapons are stored in depots operated by the Ministry of Defense and located within the USSR. Soviet procedures for controlling these weapons ensure the national leadership that they will not be used without authorization. Existing procedures, together with deficiencies in logistical support, appear to penalize the Soviets in terms of operational readiness and rapid response for tactical nuclear weapons employment. There is evidence that the Soviets are considering steps to overcome these deficiencies; such steps could include preparations to deploy tactical nuclear weapons to theater forces during periods of heightened tension.

#### *F. Capabilities for Theater Operations*

121. The longstanding Soviet concern with concepts and forces for campaigns in adjoining theaters, especially in Europe, has resulted in a formidable theater force strong in armor, battlefield mobility, and units in being. The tactical nuclear delivery capabilities of these forces, although improving, are still limited. In offensive operations, rapidly advancing theater forces are in constant danger of out-running their logistical tail, which is heavily dependent on railroads. Finally, the

Soviets have traditionally exercised very strict supervision over the actions of their subordinates, but existing command and control systems do not permit the strict supervision over the widely extended deployment required on the nuclear battlefield or under the threat of use of nuclear weapons.

122. The statements of Soviet leaders, as well as the deployment and training of Soviet theater forces, make it clear that the principal operations of these forces in general war would be directed against NATO in Europe. The Soviets plan in the initial days of a general war to move massive theater forces rapidly toward the Channel coast, and to secure the exit of the Baltic. This campaign would probably be augmented by operations in the Scandinavian area to acquire advance bases for the Northern Fleet. The Soviets evidently also contemplate operations toward the Mediterranean, and to secure the exit of the Black Sea. Other peripheral areas, such as the Middle and Far East, are apparently regarded as having lesser priority for theater force operations. Soviet capabilities to conduct theater operations against North America are limited to minor airborne and amphibious attacks against Alaska and Arctic bases elsewhere.

123. The adjustments in Soviet theater forces in the past few years have not materially impaired their capabilities to conduct nonnuclear operations. The USSR's highly mechanized forces have favorable characteristics for the dispersed operations required because of the constant possibility of escalation to nuclear warfare. Over the past two years, the nonnuclear firepower of ground units has not been significantly altered, but the supporting nonnuclear firepower which can be delivered by tactical aircraft has decreased. There are indications that the Soviets have recently given recognition to the possibility of nonnuclear war with NATO forces in Europe. They probably intend to retain capabilities for conventional warfare against NATO, but they do not appear to have revised their expectation that any major conflict with NATO would be nuclear from the start or would probably escalate.<sup>34</sup>

124. The Soviets have evidently not elaborated any doctrine for limited nuclear warfare by theater forces, involving the use of tactical weapons only. We think they would be severely handicapped in any

---

<sup>34</sup> The Assistant Chief of Staff, Intelligence, USAF, believes that the material reduction in the size of Tactical Aviation in 1960 and early 1961 markedly reduced Soviet capabilities for nonnuclear air support for ground operations. Since then, modernization of tactical air equipment for nuclear warfare has not impaired the residual quality or totality of nonnuclear capabilities for theater air support. Further, he notes the possibility of limited warfare involving Soviet forces has been no more than mentioned in Soviet writing. There is no evidence that any limited war doctrine, whether nuclear or nonnuclear, involving a direct confrontation of Soviet and US or NATO forces, has been discussed.

attempts to conduct such warfare at present. Moreover, thus far the Soviets appear to think that limited nuclear conflict in the NATO area would almost certainly escalate to general war.

### VIII. NAVAL FORCES

125. Until recent years, the Soviet Navy has been equipped and trained for a primarily defensive role. An intensive postwar shipbuilding program, concluded in 1957, produced a surface fleet, including cruisers, destroyers, and escort ships, which was limited for effective operations to the range of shore-based aircraft. Even the Soviet submarine force, largest ever assembled by a nation in peacetime, was composed for the most part of types capable of infesting the North Atlantic and the sea approaches to the USSR, but lacking the range for such extended operations as patrols off the US coasts. However, in the past few years, the Soviets have developed an increasingly diversified naval force with a new emphasis on weapons and equipment of greater range and effectiveness.

126. Much of the impetus for technological change in the Soviet Navy has come from the USSR's concern over the threat posed by US missile submarines and carrier task forces. To counter these forces at sea, the Soviets have introduced medium bombers equipped with air-to-surface missiles, submarines equipped with cruise missiles, and new classes of antisubmarine warfare (ASW) ships. They have also introduced ballistic missile submarines which can carry the attack to the homelands of opposing naval forces, and improved types of attack submarines, both nuclear and diesel, for interdiction of sea communications and enemy naval forces. Soviet surface forces have also been greatly strengthened by the addition of missile armament to cruisers, destroyers, and patrol craft, and by the introduction of new minewarfare ships.

#### A. Submarine Force

127. Soviet capabilities for conducting operations at long distances from the Soviet coast rest primarily upon the submarine force. The numerical strength of this force has changed little in the past few years, and we believe that for the period of this estimate it will remain stable at 375-400 first line ships. However, with the continued introduction of missile armament and nuclear propulsion, the capabilities of this force are changing significantly. For example, in 1958, the USSR had only about 20 submarines capable of conducting extended patrols off US coasts all of them diesel-powered, torpedo-attack types. The USSR now has more than 100 submarines with this endurance, including nuclear-powered ships, about half of them armed with missiles.

128. *Nuclear Submarines.* We estimate that the Soviet Navy now has about 25 nuclear-powered submarines operational. To date, we have

identified three classes of Soviet nuclear-powered ships: the “H” class ballistic missile submarine; the “N” class torpedo attack submarine; and the “E” class which is equipped with cruise-type missiles. We believe that within the next few years other classes of Soviet nuclear-powered submarines will be in service, including both torpedo attack and missile-launching types.

129. Two Soviet shipyards are currently engaged in nuclear submarines production: Severodvinsk in the northern USSR, and Komso-molsk in the Soviet Far East. Considering the construction of nuclear-powered submarines to date, our estimate of the USSR’s capacity to produce and install nuclear propulsion systems, and our estimate of the existing level of effort, we believe that the USSR is likely to build about 8–10 nuclear-powered submarines of all types per year. It is primarily on this basis that we estimate a buildup in the Soviet nuclear-powered submarine force to a total of 65 in mid-1967. Considering Soviet requirements, it is possible that they will seek to increase their production of nuclear propulsion systems and build a larger force. On the other hand, operational difficulties which they have apparently encountered with their nuclear power plants may retard the program somewhat.

130. *Torpedo Attack Submarines.* The Soviet force of attack submarines is capable of mounting a large-scale torpedo attack and mining campaign against Allied naval targets and sea communications in the eastern North Atlantic and northwestern Pacific. Its capabilities for operations near the continental US are more limited, but are growing. The bulk of the Soviet submarine force consists of diesel-powered, torpedo attack submarines, built for the most part in the early and mid-1950’s. These include some 177 “W” class, 19 “Z” class, 20 “R” class, and 30 “Q” class submarines. Of these older ships, only the “Z” class submarines are believed capable of conducting patrols off of US coasts from bases in the USSR. However, since 1958 the Soviets have produced about 25 diesel-powered “F” class submarines and 10 “N” class nuclear-powered submarines, both of which have sufficient endurance to perform such missions.

131. Soviet construction of diesel-powered, torpedo attack submarines may continue for another year or so, but future emphasis probably will be placed on nuclear-powered types. In view of the expressed Soviet concern with US missile submarines, we believe that the USSR has a strong requirement for attack submarines designed primarily for anti-submarine warfare. The “N” class, with its nuclear propulsion and improved sonar equipment, appears better suited to this role than any other class. If the “N” class is not intended for such use, we believe that a new class of Soviet nuclear-powered attack submarines, specifically designed for ASW, will appear within the next few years.

132. *Missile Submarines.* Soviet leaders have repeatedly stated that nuclear-powered submarines armed with various types of missiles represent the main power of their navy. We estimate that the USSR now has operational about 45 ballistic missile submarines, including both nuclear and diesel-powered types. These ships, their characteristics, and capabilities have been considered above (paragraphs 64–66) in terms of their contribution to Soviet long-range striking forces. In addition, it has become apparent within the past year that the Soviets are giving considerable emphasis to the development and deployment of submarines equipped with cruise-type missiles. We have now identified 6 units of the nuclear-powered “E” class, each equipped with six 300 n.m. cruise missiles designed for low altitude flight at supersonic speed. In addition, the Soviets have converted 12 “W” class submarines to carry two or four such missiles each, suggesting a desire to achieve an early operational capability. The Soviets are now developing a submarine-launched cruise missile of longer range—about 450 n.m. For the possible employment of submarine-launched cruise missiles see paragraph 67.

#### *B. Surface Forces*

133. Naval surface forces, which are heavily dependent upon land-based logistic and air support, appear suited primarily for defensive operations in waters adjacent to the USSR. Conventionally armed major surface units now comprise 14 cruisers, 88 destroyers, and 62 escort ships. In recent years, however, the Soviet Navy has considerably increased the firepower of its surface forces by the addition of missile armament, including surface-to-air missiles, which has extended the potential scope of effective operations. The only known major surface combatant ships now being built in the USSR are guided missile destroyers. The “Kynda” class, armed with both surface-to-surface and surface-to-air missiles, is being built at Leningrad, and a new destroyer class, believed to be equipped with missiles of an unidentified type, is probably in production at Nikolaev on the Black Sea. The Soviets have also converted a few older ships to missile armament.

134. The Soviets now have operational 14 destroyers, armed with cruise-type missiles for use against surface targets. These include 2 ships of the new “Kynda” class, 8 of the “Krupnyy” class, and 4 of the earlier “Kildin” class. The “Kildin” and “Krupnyy” classes employ SS-N-1 surface-to-surface missiles, which have a speed near Mach 1 and an effective range of 20–30 n.m. With the use of forward observers, maximum range can be extended to 80–100 n.m. We believe that the “Kynda” class employs the 300 n.m. SS-N-3. In addition to their missile armament, ships of these three classes also carry ASW gear. They are probably intended primarily for operations against both surface ships

and submarines in coastal areas, either in defense of the sea approaches to the USSR or in support of theater field forces.

135. Other new construction during the past few years has involved small specialized craft for use in antisubmarine warfare, amphibious operations, minewarfare, coastal defense, and logistic support. Two classes of patrol boats equipped with surface-to-surface cruise-type missiles are now operational.

136. We believe that the numerical strength of Soviet surface naval forces will remain fairly stable over the next five years. Soviet production of guided missile destroyers and of smaller specialized craft will probably continue at about present levels. Modernization of destroyer types will also continue, and additional surface ships will be retrofitted with missile armament. We estimate that by mid-1967, Soviet first line surface strength will consist of 30 missile destroyers, 16 cruisers (2 with missiles), 83 conventionally-armed destroyers, and 58 escort ships as well as more than 200 missile patrol craft.

137. The Soviet auxiliary fleet, composed primarily of older ships, is being augmented by newer tanker and cargo ships, and submarine support is being reinforced by the addition of submarine tenders, rescue ships, and repair ships. Additional logistic support could be provided by the growing Soviet merchant marine. In terms of net tonnage, additions to the Soviet merchant fleet during 1961 fell about 30 percent below the record-breaking 1960 increase, but were still well above any other previous year. The decline during 1961 was apparently a temporary phenomenon, reflecting a shift in production to more modern cargo ships and to super tankers (i.e., with a capacity of 25,000 tons or more). Our evidence indicates that the increase in 1962 approximately doubled the 1961 increment. The widespread Soviet fishing fleets can provide limited logistic support to submarines, and they have considerable utility for training, minewarfare, and collection of electronic intelligence.

### *C. Naval Aviation*

138. Soviet Naval Aviation underwent a drastic reduction and reorganization in 1960 with the deactivation or transfer of all naval fighter units. Naval Aviation is composed largely of jet medium bombers; it also includes jet light bombers, patrol aircraft, and helicopters. Its capabilities are focused primarily on reconnaissance and strike missions against maritime targets and on antisubmarine warfare. Air cover for naval operations would have to be provided either by shipborne SAMs or by fighters not subordinate to Naval Aviation.

139. Nearly 300 of Naval Aviation's 350 BADGER jet medium bombers are equipped to deliver antiship air-to-surface missiles. These missiles are of two types; the subsonic AS-1, which has a range of 55

n.m., and the supersonic 100 n.m. AS-2. Both are estimated to have a CEP of 150 feet against ships, and some of these missiles probably carry nuclear warheads. BADGERs can carry either two AS-1's or one AS-2. The majority of the missile-equipped BADGERs are configured for AS-2 delivery, and we believe that eventually all but a few of these aircraft will be so equipped.

140. Naval medium bomber strength will probably increase slightly over the next five years. We believe that Naval Aviation has received a few BLINDER supersonic medium bombers, and they will probably appear in greater strength within the next few years. Some of these may be equipped with a new air-to-surface missile, the AS-4, if it is suitable for antishipping use; this system could become operational in 1964.

141. Most of the naval BADGERs which are not equipped with missiles are assigned to reconnaissance units. Recent evidence indicates that medium and heavy bombers of Long Range Aviation have also carried out naval reconnaissance missions; recent overflights of US carrier task forces also suggest an attack training mission for these aircraft. We believe that the naval requirement for long-range aerial reconnaissance is growing, and that it will be met either by increased numbers of aircraft in Naval Aviation, or by selective use of Long Range Aviation aircraft in this role.

#### *D. Capabilities for Naval Warfare*

142. In recent years, the missions of the Soviet Navy have been expanded to encompass strategic missile attack against foreign territory and operations against Western naval forces, while retaining the more traditional roles of interdicting Western sealines of communication, defending the littoral of the Soviet Bloc, and providing support for the seaward flanks of ground field forces. In waters adjacent to the USSR, all types of Soviet naval weapons could be brought to bear against opposing naval forces. In the next few years, the Soviets almost certainly will give the greatest emphasis to strengthening naval capabilities for long-range attack (paragraphs 64-68) and for defense against Western carrier task forces and missile submarines.

143. *Against Carrier Task Forces.* The Soviets evidently regard the carrier task force as a major strategic threat. Their capabilities against such forces have been improved by continued conversion of jet medium bombers to carry antiship missiles and by the introduction of submarines equipped with cruise-type missiles. In the European area, BADGERs with antiship missiles could operate against surface ships in the eastern North Atlantic, the Norwegian and Barents Seas, and much of the Mediterranean. These capabilities are, of course, subject to problems of detection and identification. In the past year or so, reconnaissance

of open ocean areas by Long Range and Naval Aviation has increased. Submarine operations against carrier task forces could extend to US coastal waters.

144. *Against Sealines of Communications.* The threat of the Soviet submarine fleet to the vital sealines of communication of the Free World is greatest in the northeast Atlantic and northwest Pacific. The capability of Soviet submarines to interdict these supply lines would depend on a number of factors: endurance of the submarines, transit time to station, repair and overhaul requirements, logistic support, and the extent of opposition. Interdiction operations against North Atlantic supply routes would be undertaken largely by submarines of the Northern Fleet; this force includes about 85 submarines with insufficient endurance to operate in US coastal areas but which could operate in the Norwegian Sea and eastern Atlantic. Included in these are six "W-Conversion" class SSG which carry 300 n.m. antishipping cruise missiles. Not considering combat attrition, about 24 Northern Fleet submarines could be maintained on station continuously in the eastern Atlantic approaches to the UK and Europe. This force might be augmented by submarines deployed from the Baltic prior to hostilities. Some coverage of the approaches to the Mediterranean could also be achieved. The Soviets could also maintain some 5–10 nuclear-powered and long-range diesel-powered, torpedo-attack submarines on more distant stations for operations against shipping in the western Atlantic. This number could be more than doubled if the Soviets were able to provide logistic support during the patrol from a forward base such as Cuba.

145. In the Pacific, the Soviets have some 75 submarines which they could use in an effort to sever the US sealines of communications. While only one-third of this force has sufficient endurance to operate off the US west coast, the remainder can operate in those areas through which US sealines of communications must pass to support our Pacific island bases and Asiatic allies. Included in these 75 submarines in the Pacific, the Soviets now have six nuclear and three diesel-powered cruise-missile-launching submarines. We believe the Soviets intend to employ these submarines in an antishipping role but they could be employed against land targets. Considering the limitations of endurance, transit time to station, repair and overhaul requirements and logistic support, the Soviets could now maintain some 13–20 submarines in the ocean area between Hawaii and Japan and about five off the US Pacific Coast.

146. *ASW Capabilities.* Since the mid-1950's the Soviets have placed increasing emphasis on the improvement of ASW forces. They have made a major effort in the construction of ASW ships, particularly small coastal types, and are testing new ASW seaplanes and helicopters.

A new ASW aircraft may be introduced within the next few years. An ASW role may have been assigned to Soviet "F" and "R" class submarines, which feature improved sonar gear, as well as to the nuclear-powered "N" class. Detection equipment and weapons now in service include air-launched passive sonobuoys, airborne magnetic anomaly detection (MAD) equipment, multiple tube ASW rocket launchers, and passive homing torpedoes. ASW exercises have expanded in scope, and training doctrine has become more sophisticated. We believe that the Soviet Navy is capable of carrying out fairly effective ASW operations in coastal areas.

147. Soviet military writings reflect great concern with the threat posed by US missile submarines, and we believe that in recent years the Soviets have emphasized improvement of their ASW capabilities in the open seas. Much of the new and improved ASW equipment which is in service or under development is probably designed for such employment. However, several years of intensive training emphasizing coordinated operations by submarines, surface ships, and aircraft will be required before the Soviets can effectively employ any new ASW systems they may develop. Moreover, although the Soviets may be developing a long-range hydroacoustic detection system, the USSR's geographic situation would make it most difficult to maintain continuous surveillance by this means over large ocean areas except in the north-western Pacific and in the Arctic. We believe that at present the Soviet Navy has a negligible ASW capability in the open seas. Despite the effort which they almost certainly are devoting to this problem, we believe that over the next five years, the Soviets will be able to achieve only a limited capability to detect, identify, localize, and maintain surveillance on submarines operating in the open seas.<sup>35</sup>

## IX. SPECIAL WEAPONS

### A. Chemical and Biological Warfare

148. The Soviets have developed spray devices for disseminating chemical agents from aircraft; they are estimated to have CW-filled artillery shells, short range rockets, and warheads for tactical cruise and ballistic missiles. Chemical munitions might be used in areas of enemy contact in ground combat, and against enemy troop concentrations, command posts, missile launch sites, and other key targets. Using air and missile delivery systems, CW agents might also be used against naval concentrations.

---

<sup>35</sup> The Assistant Chief of Staff, Intelligence, USAF, disagrees with judgments expressed in this sentence. See his footnote to Conclusion T, page 11.

149. Based largely on the capacity of CW storage sites, we estimate that the USSR possesses an inventory of at least 200,000 tons of toxic agents in bulk and in filled munitions. At least half of this stockpile probably consists of nerve agents, principally tabun (GA), and the remaining half of various older standard agents. We believe that further development could produce only small increases in the toxicity of known agents and that some research is being directed toward development of new, lethal agents. The Soviets may develop nonlethal, incapacitating agents, and at least one could be available for use by 1965.

150. We believe that the Soviet Union has an active BW research effort which is suitable to support a complete BW program, but there is insufficient evidence on which to base a firm assessment of Soviet BW offensive activities. However, the USSR has a comprehensive biological warfare defensive program which could lead to an offensive capability. The Soviets have conducted research on antipersonnel, antilivestock, and possibly anticrop BW agents. Although we have identified no mass production facility for BW agents and have no evidence of Soviet stockpiling of such agents, research laboratories and existing plants for the production of vaccines could provide these agents in quantity.

#### *B. Electronic Warfare*

151. The Soviets have developed a wide range of active and passive ECM equipment, including improved chaff, radar, and communications jammers, and various deception devices to counter Western electronic systems. Soviet military ECM capabilities are complemented by the unique Soviet experience in extensive, centrally controlled, selective jamming of Western broadcasts. At present, the USSR has an appreciable capability for jamming at those frequencies normally used by Western radars and long range radio communications systems. Within the period of this estimate, we believe that the various types of Soviet equipment, taken together will be able to produce signals for jamming all frequencies likely to be employed by Western communications, radar, and navigation equipment.

152. Thus Soviet capabilities to interfere with Western strategic and tactical communications appear formidable. The Soviet ground-based jamming capability is most effective within about 500 miles of Soviet territory. In addition, the cutting of trans-Atlantic cables by Soviet trawlers has demonstrated the vulnerability of this Western communications system. The Soviets are aware of at least some of the effects of high altitude nuclear bursts on radar and communications, and have continued their program for investigation of these effects in 1962.

[Annexes A and B, comprising 30 pages of tables, and a dissemination notice are omitted.]

April 1963<sup>1</sup>**

April 1963

FURTHER STUDY OF REQUIREMENTS  
FOR TACTICAL NUCLEAR WEAPONS

*FOREWORD*

This study was conducted by the Tactical Nuclear Branch, Chairman, Joint Chiefs of Staff, Special Studies Group. The Chairman of the CJCS Special Studies Group during the period of preparation of this report was Major General P.S. Emrick, USAF, Director J-5 (Plans and Policy); Deputy Chairman was Rear Admiral Arthur R. Gralla, USN; Assistant Deputy Chairman was Colonel David Gould, USAF. Study participants were:

Ad Hoc Vice Chairman Brig Gen M.O. Edwards, USA

Col C.M. Talbott, USAF  
Capt G.F. Colleran, USN  
Col E.L. DuBois, USA  
Capt D.C. Stanley, USN  
Lt Col H.V. Huffstutter, USMC  
Lt Col C.M. Jones, USA  
Lt Col C.M. Hall, USA

Appreciation is acknowledged for the valuable assistance provided by various agencies within and outside the Department of Defense in the development of various portions of this study. Appreciation is also expressed for the services of highly qualified personnel made available by all the Services during the preparation of this study. In particular, Col W.F. Ahern, USA; Col R.P. McQuail, USA; Col R.B. Crayton, USA; Col G.M. Adams, USAF; Col R.G. Bulgin, USAF; Dr. E.L. Rabben; Lt Col W.A. Giles, USA; Lt Col P.J. Dolan, USA; Lt Col S. Irons, USAF; Maj J.V. Dunham, USA; Maj M.V. Ireland, USA; Maj A.L. Stamper, USA; Capt T.K. Hobby, USA and Capt J.E. Ranes, USA, have materially assisted in the assembly, interpretation and compilation of the technical data contained herein.

---

<sup>1</sup> "Further Study of Requirements for Tactical Nuclear Weapons." Top Secret; Restricted Data. 37 pp. Kennedy Library, National Security Files, Kaysen, 4/63.

*SUMMARY REPORT*

## INTRODUCTION

*THE PROBLEM*

1. The Secretary of Defense, by memorandum of 23 May 1962, requested the Chairman, Joint Chiefs of Staff, to organize a study of the requirements for tactical nuclear weapons. The initial phase of the study (Project 23) was to be limited to the use of tactical nuclear weapons in ground and supporting air-to-ground combat (the land battle) in Europe. This initial report was forwarded to the Secretary of Defense on 19 October 1962.

2. Subsequent review by the Services and by the Joint Chiefs of Staff concluded that the initial report constituted an incomplete analysis of the conduct of tactical nuclear warfare in Central Europe. It was considered that certain essential aspects of nuclear warfare were not addressed and that the initial study should not be viewed as a final answer to the subject. It was further concluded that this study did furnish an insight into the magnitude of numbers and yields of weapons that might be needed in Western Europe, but it was not considered as an adequate basis for determining weapons requirements.

3. At an interdepartmental meeting in December 1962, concerning the DOD recommended nuclear weapons stockpile for FY 64 and FY 65, it was decided that further study should be undertaken to provide more definitive substantiation for tactical nuclear weapons with particular emphasis upon small yield, short range weapons. Terms of reference were approved by the Joint Chiefs of Staff and forwarded<sup>2</sup> to the Secretary of Defense on 27 December 1962. Subsequent to the approval of the terms of reference, a memorandum<sup>3</sup> from Mr. Carl Kaysen, Deputy Special Assistant to the President for National Security Affairs, to the Secretary of Defense, dated 21 January 1963, raised questions of a broader scope than set forth in the initial terms of reference.

4. In order to respond to the expanded terms of reference within the time frame specified, the problem has been examined by two separate groups. The Special Studies Group has addressed the question of the basis for the military requirement for certain of the tactical and antisubmarine warfare (ASW) weapons. The Strategic Plans and Policy Division, J-5 Directorate, Joint Staff, has re-examined the quantitative aspects of the weapons in question with respect to levels required for FY 65.

---

<sup>2</sup> JCSM-1028-62, 27 Dec 62.

<sup>3</sup> Appendix I.

5. This study extends and elaborates portions of the initial Project 23 report and focuses principal attention on the following:

a. The role of tactical nuclear weapons in the land battle and in antisubmarine warfare (ASW).

b. The feasibility of conducting tactical nuclear warfare in Europe, without destroying Europe and her population in the process, considering the military capability to survive and conduct effective military operations.

c. An examination of the military need for small yield, short range tactical nuclear weapons in the land battle in Europe and in ASW under various conflict situations.

d. A comparative examination of the types of small yield, short range nuclear weapons providing the greatest utility in the land battle on the basis of cost and operational effectiveness.

e. An analysis of the extent and effect of tactical air in support of the land battle in conventional and tactical nuclear warfare.

f. Levels of certain tactical nuclear weapons which should be provided in the FY 65 stockpile.

#### METHODOLOGY AND LIMITATIONS

6. It is recognized that a multiplicity of war situations presents a wide variety of conditions that influence the use of tactical nuclear weapons. Because of the broad spectrum of situations, the terms of reference were written to narrow the scope of this study to manageable proportions. Consequently, there has been emphasis in this study on the requirement for small yield [*text not declassified*] nuclear weapons under conditions less than general war. The general war case was examined only in sufficient detail to permit the estimation of the effects of the strategic retardation of the westward movement of Soviet Bloc forces and its subsequent effect on the outcome of the land battle. While the effects of counterair and pre-planned interdiction were considered sufficiently to determine their effect on a sector of the land battle, specific attention was not given to the determination of the nuclear weapons requirement for these efforts; neither was special consideration given to the requirements for nuclear weapons for theater or fleet air defense or for MRBMs. Continuing study, and integrated war gaming could serve to further refine these aspects of this study.

7. The primary situation for analysis in this study is a large scale conventional attack by the Soviet Bloc in Europe in 1967. NATO, unable to contain this attack conventionally, escalates to use of tactical nuclear weapons and the Soviet Bloc retaliates. Both the US and Soviet homelands are assumed to be sanctuaries and are not attacked. A segment of the 7th (US) Army sector was analyzed in the context of a major battle situation to test the effectiveness of the concepts developed by separate analyses. A brief comparison of the battle situation with the results of an independent British study of a similar operation in the Northern Army Group sector was also made.

8. Volume I addresses the following aspects of the tactical nuclear problem: the role of these weapons and the objectives for their use, the military requirement, the major uncertainties associated with determining the requirement, alternatives considered, and recommended further study areas. Subsidiary analyses provided by various agencies within and outside the Department of Defense have been considered in the development of the conclusions reflected herein. These related studies and amplifying data are contained in the appendices to the basic report (Volumes II through VII). Volume VIII was prepared by the J-5 Directorate of the Joint Staff and contains recommendations relative to the FY 65 stockpile. This volume was developed on the basis of the conclusions drawn from this study, from submission of requirements from specified and unified commanders, and from dollar and material guidelines previously established for the FY 65 stockpile submission.

### *CONCLUSIONS*

The conclusions presented below apply to tactical nuclear warfare in the land battle including supporting air, and in antisubmarine warfare. Conclusions regarding air operations are based upon an air analysis of a theater conflict and air operations conducted in support of NATO ground forces. Conclusions regarding the land battle are based upon analysis of the Central Region of Europe and are pertinent thereto. They are also applicable generally to other areas of Europe or to any geographical area where modern forces armed with nuclear weapons may be engaged in a large-scale war of maneuver. The conclusions regarding antisubmarine warfare apply to the use of these weapons anywhere at sea.

### *FEASIBILITY OF MILITARY OPERATIONS*

9. NATO MC 26/4 forces in the 1967–1968 time period can conduct worthwhile nuclear military operations and can be expected to stop a Soviet Bloc advance into Central Europe under the assumptions, situation and constraints postulated by the Terms of Reference (Appendix I). However, the outcome of the ground battle is highly sensitive to the outcome of the air battle in both conventional and nuclear conflict. It is also sensitive to whether the Warsaw Pact forces initiate the use of nuclear weapons first or employ nuclear forces operating from the Soviet Union sanctuary.

10. NATO forces in Europe, as currently planned, cannot be expected to survive a Soviet Bloc attack which intends their destruction by using large numbers of megaton weapons without regard to consequent damage to civil resources and extensive fallout radiation. Retaliation against such a low constraint attack would require the use of strategic forces external to Europe.

11. In warfare in peripheral areas of the world against massive conventional forces not equipped with nuclear weapons a decided military advantage would accrue to the side which employed tactical nuclear weapons unilaterally on the battlefield.

#### EXTENT OF CIVILIAN CASUALTIES

12. Collateral damage from a representative tactical nuclear conflict (in which constraints are observed by both sides) in Central Europe including the Satellites would cause about five million casualties among the over-all population over the first two or three days after escalation. Of this, about three and one-half million result from attacks in NATO against fixed targets, one-half million from attacks against fixed targets in Eastern European Satellites, and one million from attacks of troop targets in the land battle.

13. Even when used in greater numbers, small yield weapons cause only a small fraction of civilian casualties relative to larger yield weapons. Civilian casualties resulting from subkiloton weapons are almost negligible by comparison with other nuclear weapons. To inflict a given level of military casualties, the use of high yield weapons will cause a higher number of civilian casualties than the use of low yield weapons.

#### MILITARY NEED

14. There is a requirement for small yield [*text not declassified*] tactical nuclear weapons. The more NATO's basic strategy is oriented toward a conventional defense of Western Europe, the more emphatic this requirement becomes. These weapon systems, which have short response times and meet friendly troop safety considerations, are the only types of nuclear weapons systems which can adequately deal with the close-in threat from forces initially in contact against NATO forces and those reserve forces subsequently coming into close contact. Inherent in these systems is the ability to acquire targets rapidly and to react against the large number of targets in the engaged zone.

15. Longer range [*text not declassified*] tactical nuclear weapons are needed to interdict and attack reserve forces in the land battle and can be highly effective in this role. Because of limitations in targeting, troop safety, systems responsiveness, and constraints these weapons systems cannot by themselves cope with the full land battle threat and cannot fully ensure against substantial reserve forces moving forward to engage NATO forces.

#### STRATEGIC RETARDATION

16. Preliminary analysis indicates that under present targeting concepts strategic nuclear and SACEUR scheduled nuclear strikes against deep interdiction targets would not inflict a major level of direct or collateral damage against Soviet Bloc reserve ground forces nor would a high level of retardation be attained.

## COMPARATIVE EFFECTIVENESS

17. In nuclear warfare, nonnuclear ammunition is competitive with small yield nuclear ammunition only if conventional artillery units and ammunition support units are greatly increased. However, the massing of the number of artillery units to deliver the equivalent rate of non-nuclear fire power is not practical in a nuclear environment in terms of dispersion or availability. Additionally, the logistic effort necessary for ammunition alone is prohibitive, particularly on a continuing basis.

18. On the basis of operational effectiveness, tube artillery systems (155-mm and 8-inch Howitzers) are the most useful small yield, short range ground nuclear weapon systems. The 155-mm Howitzer and 8-inch Howitzer are complementary nuclear systems with approximately the same range bracket. The 155-mm Howitzer [*text not declassified*] which provides effective fire against the small size targets in the range bracket without excessive collateral damage or risk to friendly troops. The 8-inch Howitzer [*text not declassified*] adequately cover the larger size targets in range.

19. There is a requirement for a highly mobile, all-weather, quick-responding, [*text not declassified*]. The value of a forward area nuclear weapon system lies in assuring powerful fire support at critical junctures in the small unit battle and in accomplishing this with economy of delivery means. Such a system can make small, mobile, dispersed units powerful self-contained combat forces which might otherwise be ineffective on the nuclear battlefield.

20. The current DAVY CROCKETT [*text not declassified*].

21. There is a requirement for atomic demolition munitions. This type of weapon is most effective under a strategy of early nuclear response in the defense of a forward area, but even under other possible defensive strategies, it would have a unique and useful capability in the rapid creation of obstacles. Other nuclear systems are less effective and non-nuclear systems are not competitive in the same role.

22. Air delivered tactical nuclear weapons and surface-to-surface missile systems provide an essential and complementary mix of weapons systems in Central Europe. Each system offers unique qualities that range from the superior flexibility of the strike/reconnaissance tactical fighter to the superior survivability of the mobile missile system.

23. Air delivered nuclear weapons are more efficient than air delivered nonnuclear ordnance against large radius, high density, and/or hardened targets. A net economy is realized because of the greatly reduced number of sorties required per target. The saving in sorties per target equates to a greater number of targets that can be attacked simultaneously.

## ANTISUBMARINE WARFARE

24. The requirement for tactical nuclear weapons in ASW is related directly to the submarine threat, and does not vary significantly with the response strategy adopted by NATO. In limited war, these weapons are primarily required to attack Soviet submarines which have missions of anti-shipping, short range missile support or covert operations. In general war, direct attacks on Soviet bases might reduce this requirement, but the necessity for successful destruction of Soviet ballistic missile submarines would more than offset such a reduction.

25. There is a requirement for small yield, short range tactical nuclear weapons in ASW. This requirement develops both from the critical lack of reliable and effective detection and classification capabilities and from the fact that the Soviet Bloc possesses the technical capability to counter conventional ASW weapons. If this Soviet technical potential is realized, nuclear weapons may be the only effective means of eliminating the Soviet submarines threat.

## FISCAL YEAR 1965 STOCKPILE REQUIREMENTS

26. Weapons required for the fiscal year 1965 stockpile are shown in Appendix N. (Distributed separately due to special classification.)

## IMPORTANT CONSIDERATIONS REGARDING THE ISSUES

During the development of the study, a number of propositions concerning the issues relative to the employment of tactical nuclear weapons have evolved and have been considered by the Study Group. They have a direct bearing on the broad issues of tactical nuclear warfare and are included to assist in placing the conclusions in perspective.

## ISSUE

27. *In general nuclear warfare, what is the role of tactical nuclear weapons in the land battle and in antisubmarine warfare? What is the role in limited nuclear warfare? In particular, [text not declassified] tactical nuclear weapons in the land battle and antisubmarine warfare?*

a. The primary roles of tactical nuclear weapons are:

(1) To deter the Soviet Bloc from initiating large-scale nonnuclear warfare on land or at sea by providing a secure and evident tactical nuclear back-up to non-nuclear forces. This includes deterrence of a massive conventional force build-up in Europe which might otherwise overwhelm NATO conventional forces.

(2) To deter the Soviet Bloc from initiating warfare at the tactical nuclear level.

(3) To contribute to deterring general nuclear warfare by providing nuclear forces which in combination with conventional forces are ca-

pable of safeguarding NATO from being overrun by Soviet Bloc ground forces.

(4) To contribute to deterring general nuclear warfare by providing increased capability to overcome the Soviet Bloc submarine threat.

b. The roles of tactical nuclear weapons in general warfare are:

(1) In the land battle, to contain Soviet Bloc advances during the early phase of warfare before the full impact of the strategic offensive has been felt by the Soviet Bloc forces engaging NATO, and to facilitate subsequent operations necessary to achieve desired objectives.

(2) In ASW to deter Soviet missile submarine participation in attacks on Allied territory and to destroy Soviet submarines, bases and facilities to reduce the magnitude of the Soviet attack.

c. The roles of tactical nuclear weapons in limited warfare are:

(1) In the land battle to:

(a) Deter Soviet Bloc forces from escalating non-nuclear warfare to nuclear warfare.

(b) Increase the flexibility of response to aggression by providing for options to limit nuclear warfare below the general war level.

(c) Provide the capability to execute a nuclear show of force in order to persuade transgressing enemy forces to halt and quickly withdraw, by demonstrating our resolve to pursue nuclear warfare if need be.

(d) To contribute to preserving NATO integrity in the event that Soviet Bloc forces initiate the use of tactical nuclear weapons or in the event that NATO nonnuclear forces cannot cope with the aggression at hand. This entails the capability to deny loss of NATO territory initially and if necessary to restore the territory subsequently.

(2) In ASW:

(a) To deter Soviet Bloc forces from employing nuclear weapons against naval forces and shipping.

(b) To assist in eliminating the Soviet Bloc submarine threat in the event they employ nuclear weapons at sea.

(c) To assist in eliminating the Soviet Bloc submarine threat in the event that nonnuclear weapons are unable to cope satisfactorily with the threat.

d. The roles of small yield, short range tactical nuclear weapons in nuclear warfare are:

(1) To cope with enemy forces which are engaged in close contact with NATO forces at the outset of nuclear warfare.

(2) To cope with enemy reserve forces which are not destroyed by longer range weapons and which ultimately come into contact with NATO forces.

(3) To counterbalance comparable enemy nuclear systems.

(4) To execute very limited forms of nuclear warfare where a high degree of restraint is desirable.

(5) To permit our forces to operate in a dispersed mobile pattern necessary to survive in a nuclear environment or under the threat of attack by tactical nuclear weapons.

(6) To give rapid, flexible and all weather response against targets of opportunity in the engaged battle.

e. The role of tactical nuclear weapons in war-terminating actions is to provide a residual margin of flexible tactical nuclear power over Soviet Bloc forces.

#### ISSUE

28. *Is the conduct of nuclear warfare in Europe a feasible course of action in the sense that military forces can survive and conduct worthwhile military operations without destroying Europe in the process?*

a. If nuclear war develops out of an initial large-scale conventional action, NATO force capability will depend to a large extent on the ability to convert rapidly from nonnuclear to nuclear posture. Planning for nuclear warfare must consider the preceding conventional action, and planning for nonnuclear war must consider the possibility of sudden conversion to nuclear war.<sup>4</sup>

b. The level of collateral damage resulting from use of tactical nuclear weapons in ASW is insignificant. It is of consequence in connection with only one phase of the campaign to reduce the submarine threat, that of attack on Soviet advanced tenders and bases established on NATO territory. Civilian casualties resulting from such attacks would constitute a negligible proportion of total casualties.

c. The small yield weapons used at sea in ASW cause only a fraction of all civilian casualties which may be attributed to antisubmarine warfare. Serious constraint on their use because of the presence of transiting merchant shipping or indigenous fishing craft are improbable, and such use, even in relatively large numbers, is unlikely to raise radiation levels in the sea significantly.

#### ISSUE

29. *What types of tactical nuclear weapons are needed for support of the land battle? In particular, what types of small yield, short range nuclear weapons are needed? To what extent can strategic nuclear forces support the land battle?*

a. The need for large numbers of small yield, short range tactical nuclear weapons would be significantly less for a strategy based on early nuclear response to any aggression above a minor incursion, than for a strategy oriented toward conventional defense. If a higher level of damage to civil resources can be accepted, with attendant increased risk of escalation to higher levels of violence, the requirement for small

---

<sup>4</sup> See Conclusions 11 and 12.

yield, short range weapons can be reduced by substituting higher yield weapons.<sup>5</sup>

b. Strategic nuclear forces are capable of performing an interdiction role against static targets, provided that adequate forces are available for these missions above those required for the strategic mission, and provided that response time and constraints criteria can be satisfied. However, interdiction is a function of theater forces and should remain primarily the responsibility of the theater commander. Strategic nuclear forces have limited utility in the attack of mobile reserve forces and in supporting ground forces in the engaged battle.<sup>6</sup>

c. Creation of a force organization with a separated tactical nuclear force would not eliminate the need for forward area nuclear weapon systems, dual-capable tube artillery systems, longer range land battle systems and tactical aircraft systems. The relative effectiveness of nuclear-integrated and nuclear-separated force organization has not been examined in this study.

#### ADDITIONAL QUESTIONS

This section addresses the questions posed by the Deputy Special Assistant to the President for National Security Affairs. The questions, together with summary answers, are placed here for convenience.

##### 30. Question

*To what extent can longer range weapons (SERGEANT, PERSHING, and air delivered nuclear bombs), perform the tasks now assigned to ADMs, artillery, and DAVY CROCKETT?*

##### Answer

The small yield, short range DAVY CROCKETT and artillery nuclear delivery systems [*text not declassified*] are employed against the targets immediately to the front and threatening friendly positions. These targets are the assault units of the enemy and while in the attack are almost constantly moving. To attack these targets effectively requires accurate, quick reacting systems delivering warheads of such yields so as not to unduly endanger friendly forces. The larger yield missiles cannot perform these missions because of length of reaction time, accuracy of delivery, size of yield and troop safety considerations. The air delivered bomb is restricted by availability of aircraft, uncertain reaction time, accuracy of delivery, and troop safety requirements.

The more NATO's basic strategy is oriented toward a conventional defense in Western Europe, the more emphatic the requirement for the small yields becomes because larger forces become engaged in close

---

<sup>5</sup> See Conclusions 14, 15, and 18 through 23.

<sup>6</sup> See Conclusion 16.

combat prior to escalation. This in turn places a higher number of targets in the close-in area that must be neutralized.

The number of small yield, short range weapons required could be reduced if improved target acquisition capability at longer ranges could be attained, or if a higher level of civil damage is accepted.

The objective of ADM employment is to create obstacles to impede and canalize enemy ground force movement, cause bottlenecks and concentrations and to reduce the enemy's flexibility of action in or near the area of contact. This requires a high degree of accuracy and yields sufficiently small so as not to endanger friendly troops. The longer range missiles (SERGEANT and PERSHING) cannot be adapted to this mission because of system accuracy and troop safety considerations. Low yield air delivered nuclear bombs could be employed on some occasions where troop safety and a lesser degree of accuracy are acceptable.<sup>7</sup>

31. *Question*

*Where it is not possible to substitute the longer range for the shorter range weapons, to what extent can the tasks now assigned to the latter be adapted so that they can be performed by longer range weapons?*

*Answer*

Adaptation of the tasks in question could involve disengagement of the combat forces in contact to permit attack of close targets with longer range weapons; however, disengagement of major forces throughout the width of NATO Central Region or for any large sector of the front would be extremely difficult to execute without detection by the enemy and consequent countermeasures on his part. Therefore, this tactic cannot be counted on.

Adaptation could also involve heavier attacks of reserve forces by the use of low constraint attacks such as blanket or terrain fire. This could result in fewer enemy units reaching the line of contact. However, the expected levels of target acquisition limit the capability of longer range weapons to attack reserve forces and thereby to reduce the threat which might ultimately have to be faced by NATO forward ground forces and small yield, short range weapons. If low constraints were assumed, with the consequent increase in civilian casualties and increase in the level of nuclear conflict, damage against the reserve threat can be increased.<sup>8</sup>

<sup>7</sup> For further details see the Main Report plus Appendix A, Part V, para D, E, F, G, H and I; Appendix C, D and K.

<sup>8</sup> Appendix A, Part V and Appendix K for further details.

## 32. Question

*Even though NATO limited its initial response to small yield, short range tactical weapons as implied in the study Terms of Reference, would not the Soviets respond with whatever size tactical weapons they deemed necessary to assure victory? Is there any reason to believe that the Soviets would accept defeat in battle in order to limit damage to the areas in Western Europe that they hoped to occupy?*

## Answer

Based on estimates of the threat, the Soviets will have the capability to respond with clearly decisive force in the situation stated above. The decision to so respond would be influenced by the extent to which they were deterred at the time by the threat of retaliation from residual nuclear forces in Europe in addition to the threat from external strategic forces. Whether deterrence would operate in our favor is a matter of speculative judgment. USCINCEUR in his recent paper addressing this specific question states:

"1. The degree of Soviet response would be related to their overall objective. In the event that the objective of the Soviets is limited, it is quite probable that their response would not be one of escalation. On the other hand, if the Soviet attack were one launched to attain major objectives in Western Europe it is likely that they could decide to use whatever size and number of tactical weapons they deemed necessary to assure victory.

"2. NATO should make it unmistakably clear in its response with small yield weapons that its objectives are to repel Soviet attacking forces and to demonstrate its resolve to employ whatever level of force may be necessary to defeat Bloc aggression, to include escalation of the conflict to general war.

"3. It is doubtful that Soviet leaders would regard success of ventures into Western Europe as so vital an objective as to be willing to escalate the level of conflict, especially in view of the risk of bringing about a general war from which the destruction of their homeland would result."

## 33. Question

*If, in a particular situation in Europe, it appears that tactical nuclears need to be called into play, what are the advantages of contemplating the resort to strategic striking forces instead? In dealing with this question it is important to examine the extent to which the use of tactical nuclears gives each side the incentive to pre-empt on the strategic level.*

## Answer

The advantages to the United States of a strategic first strike in this situation are not apparent. The strategic striking forces programmed for 1968 do not provide for a capability to start a thermonuclear war in which resulting damage to ourselves and our Allies could be considered acceptable on some reasonable definition of the term. Neither are the advantages apparent for the Soviets in their contemplation of a strategic

first strike. The Soviet damage resulting from US retaliatory attack by the strategic striking forces programmed for 1968 are shown in the following tables. (The Soviets are assumed to have a fallout protection program.)

SUMMARY OF SOVIET DAMAGE UNDER A US  
RETALIATORY STRIKE—1968<sup>a</sup>

<u>US Retaliatory Strike On:</u>	Soviet Union <sup>b</sup>		
	<u>Fatalities</u> (Nos. in Millions)	<u>Casualties</u> (Millions)	<u>Industry</u> (Percent)
Military and Urban- Industrial Targets <sup>c</sup>	83	107	50
Military Targets Only	17	27	9

<sup>a</sup> The study from which the above data were extracted is on file in the CJCS Special Studies Group.

<sup>b</sup> The Soviet population is estimated at 230 million. Twenty percent of the population is assumed to afford a median protection number of .1. In the absence of fallout protection at least 70 percent of the population could be potential casualties under urban-industrial attacks.

<sup>c</sup>After the retaliatory attack on military targets, [text not declassified] POLARIS missiles and surviving TITAN II's are used on urban-industrial targets.

### 34. Question

*In the European situation, might not the civil damage from extensive tactical nuclears make it more attractive from the point of view of our European Allies to initiate the early use of strategic weapons?*

### Answer

If the alternatives were extensive civil damage in Europe, or destruction of only Soviet Bloc countries and perhaps the United States, most Europeans would probably prefer the latter. However, the Soviet attack design is an uncertainty and the risks to Europe are formidable at the upper levels of the spectrum. The following table lists the predicted Western Europe mortalities across a range of possible Soviet retaliation responses in a general nuclear war in 1966 in which the outcome is more favorable to Europe (i.e., a US strategic first strike).

POSSIBLE SOVIET RESPONSES AFTER WESTERN FIRST STRIKE<sup>a</sup>

	<u>Target System Civil</u>	<u>Military- Civil</u>	<u>Military (groundburst)</u>	<u>Military (airburst vs soft)</u>
Western Europe Mortalities <sup>b</sup>	49–99m	39–70m	35–60m	5–8m

<sup>a</sup> Data from Office ISA report "Preliminary Report on MRBM's, Nuclear Sharing, and Related Issues," dated 1 Feb 62.

<sup>b</sup> The low number refers to the case of a low Soviet force posture receiving no usable warning; the high number, the case of a high Soviet force receiving tactical warning.

In the less favorable circumstance of a Soviet first strategic strike in general nuclear war the outcome for Europe would be even worse.

Alternatively, as shown in Annex A to Appendix E, the consequences computed in this study for an attack which both sides confined to the “engaged” battle area, but across the whole Central Front<sup>9</sup> would be on the order of 700,000 civilian casualties, including 400,000 mortalities.<sup>10</sup>

When this same battle situation is extended to include [*text not declassified*] the Western Europe civilian casualties rise to approximately 4.4<sup>11</sup> million including 2.6 million mortalities. This latter outcome results from a relatively heavy attack [*text not declassified*] detonated in Western Europe). The one-day nuclear battle resulted in a stalemate with the Soviet drive halted, reserve units damaged and resupply capacities curtailed. The resulting pause would permit both sides to consider alternatives to renewed attacks.

The casualties from the use of tactical weapons in the extended case described are far below those at the lower end of the range of Western Europe mortalities in general war shown in the table above.

### 35. Question

*What is the utility of tactical nuclear weapons after an exchange of strategic blows? In other words, how, after a strategic exchange, would the possession versus the non-possession of a wide variety of tactical nuclear ground weapons affect the outcome?*

### Answer

In the circumstance outlined the utility of tactical nuclear weapons is in denying Western Europe to the Soviet armies. With large scale ground forces in contact during and following a strategic exchange it would remain necessary to prevent overrun by the enemy. To cope with this threat a balanced mix of weapons appropriate to the ground battle target system would still be required. Some of the main uncertainties which would affect the utility and value of tactical nuclear weapons are:

- a. The design and constraints of the Soviet strategic attack.
- b. The types and relative numbers of residual nuclear delivery and reconnaissance vehicles on both sides after the strategic exchange.

---

<sup>9</sup> This case is one in which a pause results after one day of nuclear warfare. Both sides employ weapons only in the areas of the engaged battle zones, [*text not declassified*].

<sup>10</sup> In this same case the National Military Command System Support Center of the Defense Communications Agency computed 1.1 million civilian casualties. These results are shown in Annex A and C of Appendix E.

<sup>11</sup> These figures are the sum of three computations in Annex E; the “ISA-1” attack (page E9) the “D+4 total” attack (page EA-1), and the West German casualties resulting from the “attack on Soviet Second Echelon Armies,” (also on page EA-1).

c. The priority which the Western strategic attack had afforded to interdiction and ground force retardation targets.

d. The relative integrity of the opposing ground forces at the time of the strategic exchange.

As indicated in the study,<sup>12</sup> attacks by strategic forces added to those by theater forces could affect to some extent the strength and timing of Soviet Bloc reinforcements and possibly more critically their resupply in a protracted battle. The extent of the effect would probably be the greatest in a war which started with no prior build-up or forward deployment of Soviet forces. However, across a wide range of plausible strategic exchange situations sizeable and effective Soviet forces would survive and would have to be dealt with by the Allied Commander, Europe.

In circumstances where the enemy ground forces are prepared to exploit an advantage in Europe resulting from the strategic exchange, NATO forces without a wide variety of tactical nuclear weapons would be at a disastrous disadvantage against Soviet Bloc forces possessing a tactical nuclear capability. Moreover, even if the war stopped after the thermonuclear exchange, the possession versus the non-possession of a balanced family of tactical nuclear weapons could be an important asset in providing a means to end the war on terms favorable to the United States and NATO.

### 36. Question

*The study guidelines might be interpreted to assume that it would not be possible for NATO to contain by conventional means alone a large-scale conventional attack by the Soviet Bloc on Europe in 1967. To avoid assuming the answer to a central problem, it would appear desirable to consider for comparative purposes the outcome of a purely conventional response by NATO to the Soviet attack that is assumed in analyzing the effect of a nuclear response by NATO.*

### Answer

At the direction of the Secretary of Defense<sup>13</sup> a separate study is now under way in the Chairman, JCS Special Studies Group, to address the question of NATO force requirements to achieve a successful forward nonnuclear defense of the Central Front well east of the Rhine. This study will be completed 1 October 1963.

The main purpose of the study at hand was to examine the utility of tactical nuclear weapons assuming their employment becomes necessary. Therefore, the conflict situations herein were designed specifically

---

<sup>12</sup> See Appendix C.

<sup>13</sup> Sec Def Memo to the Chairman, JCS, subject: NATO Conventional Force Requirements, dated 14 Jan 63.

to suit that purpose. As it turned out in the development of one of these situations, because of the relative air superiority NATO was able to defend successfully on position “Hold” without resort to nuclear weapons. However, the assessments were not extended far enough to determine whether escalation might have been necessary at a later time in the conflict.

ATTRACTIVE FUTURE POSSIBILITIES

[text not declassified]<sup>14 15</sup>

In contrast, the effects from a [text not declassified] weapon, burst at the same altitude, would be as follows:

[text not declassified] Warhead Effects  
Burst height: 750 feet

<u>Radius</u>	<u>Area</u>	<u>Prompt Dosage</u>	<u>Blast</u>	<u>Thermal</u>
---------------	-------------	----------------------	--------------	----------------

[text not declassified]

[text not declassified] However, many targets in the land battle involve troops in the field not able to take effective shelter against this weapon. Of special interest here is that the over-all attenuation of earth is approximately independent of the distance from the burst and is primarily a function of the depth of earth cover. Standard open foxholes do not provide significant protection: a dosage reduction of about .5 would occur, which, on an average would cause less than a 10% reduction in the effective radius of the warhead. A standard foxhole with a one foot cover of earth would provide attenuation factors on the order of .25 and act to reduce the effective warhead radius about 20%. See RAND Memorandum RM-2853-PR, Jan 63, *Tactical Gaming of Special Low Yield Weapons* (U), Section IV p 45 for discussion of combat characteristics.

b. In contrast, in using the [text not declassified] to accomplish target destruction by blast, the area of possible collateral damage can exceed considerably that covered by effects of military significance. As a result, for the attack of targets located in or adjacent to populated areas and which are vulnerable to destruction or neutralization by [text not declassified].

42. Other Preliminary Considerations and Uncertainties

a. For many targets physical destruction is necessary (e.g., most interdiction type targets) and for others it is desirable (e.g., to provide

---

<sup>14</sup> Sec Def memo to CJCS dated 23 Apr 63.

<sup>15</sup> Data extracted from Memo for the Chairman, Military Liaison Committee to the US AEC, dtd 18 Apr 63, Subj: “Toyah Event—A Significant Tactical Weapon Test,” from the Director of Military Applications, AEC.

a blocking effect). For those targets in which these considerations do not apply, [text not declassified].

[text not declassified]

c. Current and programmed tactical aircraft and ground launchers of the HONEST JOHN and LITTLE JOHN type appear to be capable of delivering weapons of the [text not declassified].

[text not declassified] Further study should develop these as well as possible disadvantages. However, in view of the fact that even under optimum conditions, the weapon probably would not be available until late in 1965, it would not appear prudent to delay further the pending decisions on the Fiscal Year 1965 stockpile on its account.

#### CLEAN BOMB

44. As a result of AEC development and the recent test program, essentially clean weapons, [text not declassified].

45. There are several applications for this type of weapon. For example, in the engaged battle, when a clean weapon is exploded in enemy territory, friendly troops would be able to enter the area of ground zero to exploit the tactical advantage created almost as soon as they could arrive on the scene. Residual radiation would be of little consequence to overtaking troops.

46. It would appear that this weapon would have significant advantage against troops near population centers especially where laydown is required. Under present conditions of constraints, attacking enemy concentrations near cities is inhibited by dangers of fallout to a friendly populace. By use of clean weapons this consideration could become less significant.

47. Another application, in which the Navy has expressed interest, is a clean weapon to be employed in an ASW role. Fallout from radioactive rain and a contaminated base surge have been areas of concern with current nuclear weapons especially in shallow water. Again, since little residual radiation is present after the burst of a clean weapon, the problem associated with base surge and fallout would be largely eliminated. Attacking surface ships could proceed to the area of last contact without delay. Moreover, attacks near convoys or other protected ships could be made without danger of blanketing them with contaminated water.

48. Another promising application for the clean weapon is its use as an ADM. Emplacing a clean ADM of appropriate yield in or near cities where rail and logistic supply systems converge would be made feasible where before the commander might be restricted because of contamination considerations. It would appear that other clean ADM applications exist where early exploitation of the area of employment is necessary. For example, in areas involving engineering operations

such as harbor construction, obstacle elimination, or other earth-moving projects, these weapons could perform an extremely important function.

### MAJOR UNCERTAINTIES

49. *NATO Force Posture*. NATO force goals recommended in MC 26/4 except VSTOL aircraft and MRBMs, have been assumed to be available in 1967 for the purposes of this study. Current analyses regarding expected deficiencies in programmed forces indicate cause for considerable doubt relative to the achievement of these goals. At the conclusion of the Triennial Review 1962, SACEUR indicated that if current trends continue in country programming, there will be serious deficiencies in 1966 forces within all Services.<sup>16</sup>

50. *Soviet Objectives*. In the war situation examined in this study, it has been assumed that the Soviet Bloc objective in a major aggression in Central Europe would be to capture Western Europe with its industrial resources and civilian population relatively intact and that it would be likely to follow constraints to limit civilian damage. This is generally conceded to be a plausible objective of the USSR. Whether this, in fact, is a Soviet Bloc objective is open to question. To cause widespread destruction in Western Europe might be viewed by Soviet leaders not only as being a more feasible objective, but also more desirable. It can be argued that Soviet leaders would consider war-ravaged countries easier to control and would view the elimination of Western European prosperity as a means of increasing Soviet dominance in all of Europe and Africa.

#### 51. *Intelligence of Soviet Capabilities*

##### a. *Nuclear Weapons and Delivery Systems*

The estimates of the size of the Soviet nuclear weapon stockpile are based upon estimated production capacities and could vary. Any estimate of the Soviet nuclear stockpile projections, weapons capabilities, and deployment is not believed to be sufficiently accurate to use as a basis for computing our own requirements. The yield spectrum of their nuclear weapons is based upon known Soviet nuclear tests and is believed to be accurate to a reasonable degree. However, the possession of fractional kiloton weapons is uncertain since tests of such devices could have easily gone undetected. The USSR has the technological capability to produce small yield, short range weapons such as DAVY CROCKETT and tube artillery, although estimates cannot be supported by adequate evidence at this time.<sup>17</sup>

---

<sup>16</sup> For further discussion see Appendix K.

<sup>17</sup> See Appendix L.

b. *Forces*

United States intelligence estimates of Soviet Bloc military forces is an uncertainty since the force structure of the USSR appears to be undergoing changes to take advantage of more advanced weapons. Ground forces of the USSR have been reduced in the past few years, and further reductions or reorganizations are possible. Uncertainty exists regarding the estimate of a 25–50 percent reduction in the Soviet offensive air force during the next five years.

c. *Operational Concepts*

Much discussion is being conducted currently by the military as well as civilian agencies of the USSR concerning tactics and operational concepts of the armed forces. Future tactics employed will probably vary with the objective of the armed forces. These tactics and operational concepts will be an uncertainty in each situation as it develops.<sup>18</sup>

52. *Survivability of NATO Tactical Air Forces*

There is uncertainty as to the survivability of NATO tactical aircraft on the ground in a conventional conflict. The United States has tentatively adopted a shelter design and made some commitments toward a shelter program. Neither completion dates nor the NATO development of a similar program is known.

The effectiveness of Soviet air defense systems and the attrition of NATO air forces in penetrating these systems is also uncertain. Aircraft attrition factors utilized in this study are based on the assumption that improved penetration aids and anti-radiation missiles will degrade Soviet Bloc air defense systems to permit air operations with reasonable attrition rates. A detailed WSEG study on this aspect of the problem is due for completion in October 1963 and should help to narrow the range of uncertainty in these planning factors.

53. *Target Acquisition Factors*

The mix of tactical nuclear weapons requirements for the land battle is sensitive to the ability to acquire targets. The target acquisition portion of the initial study under Project 23, elaborated in considerable detail on the problems of reconnaissance and acquisition of battlefield targets. The factors developed in this study<sup>19</sup> are indicative of the likely range of capabilities for the 1967 time period in the absence of unforeseen developments. Achievement of an improved level of capability will be dependent upon aggressive implementation of tactical air reconnaissance and battlefield surveillance programs currently under consideration within the military services.

---

<sup>18</sup> See Appendix L.

<sup>19</sup> See Appendix D.

#### 54. *Other Areas of Uncertainty*

Listed below are a number of other areas of uncertainty which could have a significant influence upon tactical nuclear warfare. It is clear that these unknowns will have a major impact upon the requirement for forces and weapons to carry out NATO objectives.

- a. Psychological reaction of surviving forces and leaders in nuclear warfare.
- b. Attitudes within the alliance.
- c. Degree of warning and mobilization status.
- d. Effectiveness of command, communication and leadership in the employment of resources.
- e. Duration of hostilities.

#### CONSIDERED ALTERNATIVES

55. Two major alternatives to the employment of substantial numbers of small yield, short range weapons have been considered in this study. These are:

- a. *Place greater reliance upon larger yield [text not declassified] tactical nuclear weapons.*

Air delivered nuclear weapons, together with weapons systems such as SERGEANT and PERSHING, were examined in a variety of situations. The extent to which these longer range tactical nuclear systems could substitute for small yield, short range systems was considered.<sup>20</sup>

- b. *Place greater reliance upon long range strategic forces.*

The extent to which strategic forces might be expected to contribute to the action of the land battle under a number of assumed situations was examined.<sup>21</sup> The extent of civil damage from the strategic and tactical nuclear forces was also compared.<sup>22</sup>

56. As noted in the conclusions, it is evident that neither of these alternatives gives the United States and NATO a “full option” strategy, including a genuine capability for a forward defense, in Europe. A “facade” consisting of small numbers of tactical nuclear weapons would not suffice and would involve acceptance of high risk of prompt escalation to strategic nuclear warfare. In addition to other disadvantages such escalation would probably involve the loss of significant NATO

---

<sup>20</sup> See Appendix A and Appendix F; see Land Battle Requirements Section of basic report.

<sup>21</sup> See Appendix C.

<sup>22</sup> See Appendix E.

territory if the USSR possesses battlefield weapons at the time of aggression.

57. Other measures have been proposed at one time or another as at least partial alternatives to the provision of a substantial number of small yield, short range weapons. They have not been specifically addressed in this study, but are listed below for reference:

a. *Increase the quantity and quality of conventional forces above MC 26/4 levels, including increased NATO-wide reliance on classified nonnuclear munitions, and implement a peacetime forward deployment concept.*<sup>23</sup>

b. *Place greater reliance upon chemical and biological warfare.*<sup>24</sup>

c. *Develop an extensive conventional barrier system.*<sup>25</sup>

---

**292. Memorandum from McNamara to President Kennedy,  
May 27<sup>1</sup>**

May 27, 1963

SUBJECT

Free World Tactical Air Capabilities (U)

As a result of your memorandum of November 9, 1962, we have again re-examined the adequacy of our tactical air forces for nonnuclear conflict. I thought it would be best to delay my reply to the questions you have raised until I could carefully review all the pertinent data and particularly the views of the Joint Chiefs of Staff.

As the Chiefs pointed out to me, the problem of tactical air power cannot be divorced from the over-all problem of our military posture generally. They correctly note that "the air situation in a military operation must be judged in conjunction with that of the ground and naval forces. Without considering the complementary capabilities of all forces to deal with the broad range of threats, it is impossible to arrive at a specific requirement for any single weapon system such as a fighter aircraft." The Chiefs also noted that even with regard to tactical aircraft, alone, other critical factors such as airfields and the disposition of the aircraft on those fields, the availability of trained pilots and support personnel, other means of air defense, electronics countermeasures, logistics support, POL and munitions must also be taken into account in evaluating the adequacy of our tactical air power.

With all of these factors in mind, I believe it is fair to say that we have sufficient tactical aircraft programmed to cope with the kinds of military conflicts we are likely to encounter anywhere in the world. NATO Europe offers certain special problems: vulnerability of the aircraft on the ground and the lack of nonnuclear logistical readiness; however, these problems cannot be solved by simply increasing our procurement of tactical aircraft. The procurement schedules incorporated in our fiscal year 1963 and 1964 budgets and the procurement programmed for the next few years will, in my judgment, assure a significant over-all qualitative and quantitative tactical aircraft advan-

---

tage over the Sino-Soviet Bloc for the foreseeable future, providing the Bloc does not reverse the downward trend of its tactical aircraft force levels.

We have, of course, greatly increased our planned procurement of tactical aircraft over the number I reported to you in my memorandum of September 24, 1962, to which you refer in your memorandum of November 9, 1962. We previously planned on procuring 1,892 F-4 and RF-4 tactical aircraft for the Air Force and Navy; we now plan on 2,845, the increment being for the purpose of modernizing the Air Force, and increasing its reconnaissance capability. And, as you know, we are also starting the development of an even more advanced tactical aircraft, the F-111 (TFX), for both the Air Force and the Navy. As shown in Table I below, we have substantially increased the procurement of tactical and interceptor aircraft for modernization over the 1961 level, especially the higher performance aircraft.

TABLE I

TOTAL	580	727	909	804	843	708

In evaluating the adequacy of our over-all tactical force levels, we must take into account not only U.S. and Soviet forces but all tactical aircraft that are likely to be available to both the Free world and the Communist Bloc, now and over the next several years. While we know our own force projections and production schedules, we do not know as much about the plans of our Allies, and we have very little hard intelligence on what the countries of the Communist Bloc are likely to do in the next five years. Nevertheless, based on the best information available, the Free World and the Sino-Soviet Bloc are almost matched today in numbers of tactical aircraft assigned to operational units, and the United States and its Allies have a distinct edge over the Bloc with regard to quality and performance as shown in Table II.

A detailed analysis of the relative capabilities of the tactical air forces of the Free World and the Sino-Soviet Bloc is available if you wish further information on this subject.

<sup>3</sup> Based on NIE 11-4-63, approved March 22, 1963. The NIE showed minor variations in Sino-Soviet operational totals (7 per cent increase in 1963, 8 per cent increase in 1965, 3 per cent decrease in 1968), and that the Soviets are introducing somewhat fewer advanced type aircraft into operational inventories while retaining older aircraft longer. I agree with the Joint Chiefs of Staff that the variations noted do not warrant revision of the tables.

## Attachment

### ANALYSIS OF TACTICAL AIR CAPABILITIES OF FREE WORLD AND SINO-SOVIET BLOC

In addition to the roughly 11,500 aircraft shown on Table II for the U.S. and Allies, there are approximately 5,000 tactical combat aircraft

used for combat crew training and in the logistics pipeline. The corresponding number of such aircraft in the Sino-Soviet Bloc is unknown. While we are reasonably certain that no training aircraft are included in the 12,150 aircraft shown for the Sino-Soviet Bloc, we are by no means sure that the logistics pipeline aircraft are wholly excluded. From a preliminary review of the method by which intelligence on Bloc aircraft is collected, I do not believe that we can really distinguish between combat aircraft in operational units and those in the logistics pipeline. If we have indeed counted logistics pipeline aircraft in the Sino-Soviet Bloc total, we have understated the comparable figures for the Free World by approximately 3,000 aircraft, or about 25 per cent. In that case, the U.S. and our Allies may actually have about 20 per cent more tactical aircraft than the Bloc at the present time.

With regard to the future, it would appear that the Free World may have a slight numerical advantage by 1965 and a numerical superiority of almost 50 per cent by 1968. I should caution, however, that the 1968 figures for the Sino-Soviet Bloc are highly conjectural, considering the production leadtimes involved. The number of tactical aircraft the Sino-Soviet Bloc will have in operational units in 1968 depends upon decisions which may not yet have been made, and which need not be made until two years from now. Indeed, the estimated downward trend in the level of Soviet fighter forces could be reversed either through retention of currently active aircraft, by continuing production of aircraft longer than now estimated, by introducing new aircraft in quantity, or by a combination of these options. A complete reversal would be very difficult economically, but some reaction is probable in response to the buildup of U.S. tactical capabilities. Nevertheless, the best available information we now have on Bloc aircraft production, the age distribution of aircraft now in operational units, etc., indicates that the size of their operational force will decline substantially over the next five years.

Numbers of aircraft, alone, of course, are not the sole measure of effective air power. Equally important is the quality of performance of the aircraft. As shown in the tabulation above, the Free World now has a distinct advantage in this regard over the Sino-Soviet Bloc and, if our projections turn out to be correct, this margin of qualitative superiority will be considerably widened over the next five years.

Soviet tactical aircraft design appears to emphasize air defense and close support of ground forces in the manner of the World War II "Blitzkrieg". For these support missions, immediate responsiveness to the demands of the ground forces may be more important to the Soviet thinking than large bomb loads or combat ranges.

U.S. tactical forces have been developed to accomplish the entire spectrum of tactical tasks, but have particularly emphasized the long

range interdiction and counter-air missions. To achieve these long ranges, external fuel is carried on multiple (usually 4 or 5) fuselage and wing pylons. These same pylons can be used for carrying ordnance instead of fuel thereby increasing operational flexibility particularly in the close support role. Most Soviet aircraft have only two pylons. However, it may be possible for the Soviet Bloc to modify their aircraft to provide more pylons or multiple racks. Some representative examples of aircraft of comparable performance capability are listed below:

(1) In the advanced class, the F-4C, if used as an interceptor with four SPARROW III missiles has a combat radius of 280 miles at a maximum speed of 1350 knots. The FLIPPER, its Soviet counterpart, is slightly faster (1450 knots) but has a combat radius of only 100 NM at maximum speed. The F-4C, if used as a fighter-bomber, can only be compared with the Soviet FIDDLER, which has far less speed capability (900 knots) but has 10 per cent more combat radius at the same payload. Of course, both aircraft are subsonic with external ordnance. The F-4C has a combat radius of 325 NM with a 12,000 lbs payload, while the FIDDLER is estimated to be limited to only 2,200 lbs. In the dual fighter/interceptor role, the F-4C has no single counterpart in the Soviet inventory.

(2) Of the current aircraft, the F-105 can be compared with the FITTER and the FISHBED in speed capability; however, these aircraft have far less combat radius (67 per cent for the FITTER and 41 per cent for the FISHBED). The FIREBAR A, the primary Soviet tactical fighter-bomber aircraft, cannot match the F-105 in speed and again has only 66 per cent of its combat radius.

(3) In the older class of aircraft, the F-84 and the A-4 (A4D) have comparable maximum speeds but exceed the range of the FRESCO and FAGOT by a factor of three to five.

Table 1 of the Annex to this memorandum provides a more detailed breakdown of tactical aircraft assigned to operational units, Free World versus the Sino-Soviet Bloc, for the three years, 1963, 1965, and 1968. Table 2 shows the aircraft models included in each category. Table 3 shows the performance characteristics of the more important U.S. and Soviet tactical aircraft models. Table 4 provides a breakout of Sino-Soviet Bloc tactical aircraft by category and model for the three years, 1963, 1965, and 1968, and Table 5 shows the production estimates related to these force projections. Table 6 provides a breakout by category and model for U.S. and European Allied air forces and Table 7 shows U.S. production related to these force projections. Table 8 provides a summary of Free World Asian tactical air forces.

Although a direct comparison of U.S. and USSR tactical air capabilities is not as meaningful as a comparison between NATO and Warsaw Pact air forces, it is useful in bringing out the relative efforts being

made by the two principal antagonists. As shown below, the United States today has almost 50 per cent more tactical fighters and light bombers than the USSR, but the USSR has 50 per cent more air defense interceptors. (A more detailed breakdown is provided in Table 9 in the Annex.)

TABLE III

U.S. & USSR TACTICAL AND AIR DEFENSE AIRCRAFT ASSIGNED TO OPERATIONAL UNITS

	TOTAL Aircraft	6194	6400	6194	4600	6336	3300

In total we are about even. However, in terms of modernization we are far ahead of the USSR in both tactical aircraft and air defense interceptors. Over the next five years our margin of superiority in tactical fighters and light bombers is estimated to increase and by 1968 current intelligence projections suggest that we may have three times as many aircraft in these categories as the USSR. In the case of air defense interceptors, by 1968 we should have a substantial numerical margin, although the USSR could have a qualitative margin at that time. This is, of course, highly conjectural since we cannot be sure whether the USSR will actually produce the number of advanced interceptors reflected in the above tabulations. There is no evidence of any development or production tooling to support the estimate of the 570 advanced interceptors and 580 advanced tactical fighters which are assumed to be in production beginning in 1964.

As I noted earlier, the area of principal concern with regard to tactical air power is NATO Europe. But here the problem is complicated by the fact that U.S. air forces must be planned in context with other NATO air forces in that area, and indeed in context with the entire military situation there, particularly the status of the ground forces. In that connection, I reported to you last year in my memorandum on the General Purpose Forces:

While the forces proposed will not provide adequate nonnuclear forces for NATO, the remedies lie primarily with the other NATO countries rather than with a major increase in U.S. forces. Although the political obstacles loom large, and many of the deficiencies require considerable time to overcome, I think we can demonstrate to our Allies that the NATO nonnuclear inferiority stems from specific remediable deficiencies.

Elsewhere in that memorandum I pointed out that to carry out the forward strategy desired by SACEUR, a substantial number of M-Day units should be relocated and others provided with means for more rapid deployment. This strategy cannot be implemented without air superiority and effective tactical air support.

Although the problem in Europe involves much more than the adequacy of our tactical air power, we may be far better off in that regard than we are with regard to ground forces. As indicated in Table IV below, the NATO nations now have in Europe a total of about 5,100 tactical aircraft, including interceptors, compared with about 3,850 for the Warsaw Pact countries, including interceptors in the Satellite countries. U.S. and USSR interceptors for Homeland air defense have been excluded since their use would degrade strategic capabilities.

The margin in our favor is likely to be maintained through 1965 and may widen considerably by 1968. If both sides were to deploy tactical aircraft from their respective homelands into the theater of operations, this advantage should still prevail or even increase. However, because of their geographical position, the Soviets could probably move their aircraft forward more quickly and more clandestinely than we could. Nonetheless, even if the Soviets were able to get all of their deployable aircraft into the theater of operations before we were able to deploy any of our own, which is highly unlikely in view of our ability to move over 600 aircraft to Europe within 7 days, NATO would still have a small quantitative advantage over the Warsaw Pact countries during 1963, and both a quantitative and qualitative advantage in 1965. By 1968, this over-all superiority could be very substantial, as shown in Table IV.

TABLE IV  
COMPARISON OF NATO REGION AND U.S. DEPLOYABLE AIRCRAFT WITH SOVIET BLOC AIR FORCES<sup>1</sup>

EUROPEAN CONFLICT													
NATO Forces													
	In-Place						Deployable		US		Total

Total	<u>3181</u>	<u>941</u>	<u>4122</u>	<u>1617</u>	<u>5739</u>	<u>1800</u>	<u>800</u>	<u>2600</u>	<u>480</u>	<u>3080</u>

<sup>1</sup> Excludes US and USSR Homeland air defense aircraft. Some portion of the USSR air defense west of Urals (1365 in 1963, 1100 in 1965, 565 in 1968) could be employed against Allied aircraft penetrating Polish air space at the expense of a degraded strategic posture.

<sup>2</sup> Numbers provided by JCS.

Table 10, in the Annex, provides a detailed breakdown of the Soviet Bloc air forces available for a European conflict. Table 11 provides a similar breakdown for the NATO forces. Table 12 provides further detail on U.S. deployable aircraft.

The Joint Chiefs of Staff have stated that 2,411 U.S. aircraft could be committed in 1963 to Europe with 90 days strategic warning. This includes 1,027 U.S. aircraft in place in Europe, augmented by an additional 1,384 aircraft deployable from CONUS.

Such a commitment of only 50 per cent of our deployable aircraft assures us of a significant strategic reserve, particularly when compared to the Soviet commitment in Europe of between 84 per cent and 92 per cent of deployable aircraft. The remaining 2,300 to 2,500 U.S. aircraft in operating units, together with the 1,500 aircraft of our Pacific Allies, should be more than adequate to counter the 2,000 to 3,000 Chinese Communist and North Korean aircraft, of which 90 per cent are obsolescent and considerably inferior to our tactical forces.

Although, over-all, including deployable aircraft, NATO now has and probably will continue to have a qualitative as well as quantitative advantage, the qualitative advantage derives primarily from U.S. efforts. By 1968, the Warsaw Pact is estimated to have 710 advanced type tactical aircraft out of a total of 3,080 tactical aircraft, or about 23 per cent. For the U.S., 1,359 out of 4,020 or 34 per cent will be of advanced types. However, at that time only 160 out of 3,181, or 5 per cent, of the non-U.S. NATO aircraft are now programmed to be of advanced types. About one-third of the Allied (non-U.S.) aircraft planned to be in the inventory in 1968 are considered obsolescent by today's standards.

The only aircraft to be produced in large numbers for Allied countries is the F-104G, constituting 34 per cent of the planned Allied air forces in 1968. This aircraft, which had its first flight in 1954 and which was last procured by the U.S. in fiscal year 1957, will probably not be able to meet the threat of Soviet attack aircraft of the 1968 time period. Its military effectiveness is restricted by its short range and limited ordnance carrying capability. The very limited radar range and the lack of all weather intercept capability limits its usefulness in the European environment where close ground control of the SAGE type is not available and cloud cover is prevalent.

Only 109 F-104's are left in the active U.S. forces. However, our European Allies plan to procure 1,300 of these aircraft between 1961 and 1965. To date, approximately 220 have been produced. Although the F-104 is cheaper than the F-4C, the effectiveness of NATO air forces could be increased through procurement of smaller numbers of a more effective aircraft. As the Joint Chiefs of Staff have stated, "For modernization, we might encourage military assistance sales of F-

4C's for our NATO allies." Nevertheless, the F-104G program was undertaken about four or five years ago with the encouragement of the United States, and the European Consortium is only now beginning to work smoothly. This problem will require more study and discussion with our Allies.

Quite apart from numbers of aircraft and their operational capabilities, the nonnuclear capabilities of NATO air forces are seriously deficient because of three critical factors. These factors can be changed much more easily and quickly than the number and performance of aircraft, and should be given a high priority by both ourselves and our Allies. The causes of our weaknesses in nonnuclear air capability in NATO are:

- (1) The vulnerability of aircraft on the ground;
- (2) The lack of nonnuclear logistics preparedness; and,
- (3) The requirement to be responsive to both nuclear and nonnuclear tactical air operations.

Although our tactical air forces are now and will increasingly be larger and better equipped than the Warsaw Pact forces, several recent war games and studies on nonnuclear conflict in Europe have concluded that the enemy could achieve air superiority in one to three days, with or without tactical warning even if we were to initiate preemptive attack. The principal reason is, of course, the vulnerability of our bases and aircraft to enemy air attack. Our active air defenses in Europe are just barely adequate against high altitude targets and are very incomplete and very inadequate against low flying aircraft. There are no active air defense missile or gun systems in local defense of our airfields and almost no passive defense measures are now being practiced. In view of the fact that our main operating bases in Europe are located within 7 to 25 minutes flight time from forward enemy bases, it is not surprising that a very large part of the NATO air forces in Europe could be destroyed on the ground in a surprise attack with little loss to the attacking force and without the use of nuclear warheads or surface-to-surface missiles.

I believe that the theater commanders can, within their own resources, effect some reduction in the vulnerability of our forces. Major improvement will require funds in addition to the \$30 million provided in the FY 1964 budget for aircraft shelters for protection against nonnuclear attack. I have requested the Air Force to conduct a detailed study of additional required measures and expect a final report by October 1, 1963. I recognize that effective protective measures will have manpower and balance of payments implications. We will keep these to a minimum. However, in view of the very large investment in personnel and matériel now unprotected, I believe we must face up to this issue.

In reply to your specific question, aircraft attrition under future combat conditions is indeed difficult to estimate. The average World War II fighter attrition was 0.9 per cent per sortie (9 losses per 1,000 sorties). Korean jet fighter (F-80, F-84, F-86) attrition averaged 0.3 per cent per sortie. However, historical data may not be a reliable guide in view of vastly improved air defense environments and ordnance. Any future conflict in Europe probably will lead to attrition rates greatly exceeding those previously experienced.

As high as attrition rates are likely to be, we must insure that: (1) enemy attrition rates are at least as high; and (2) enemy aircraft production acceleration capability is no greater than ours. We must take additional steps to assure that the enemy's inventory will decline as rapidly or more rapidly than ours, thus at least denying him air superiority. Second, we must increase our capacity to rapidly accelerate production in order to prevent his gaining air superiority at some later date. These measures promise to produce far more capability per dollar for sustained nonnuclear operations than a peacetime expansion of forces or of production.

The ability of our forces to sustain operations in an overseas theater is as much a function of logistics support and command and control as it is of numbers of aircraft and the ability to deploy.

Current USAFE plans provide for the use of 17 bases, and 15 are presently being used by U.S. forces. In addition, there are 39 bases for which the United States has entry rights or which otherwise could be made available. Thus, a sufficient number of airfields exists to accommodate about 2,200 U.S. land-based aircraft.

While these bases are capable of accepting sizeable tactical forces, they are not now equipped logistically to support such forces on a sustained basis. While tactical squadrons deploy with fly-away kits containing sufficient spare parts for 30 days consumption, they must rely upon the deployment area for fuel, war consumables, support equipment and communications. These are critical factors in continuous operations. Adequate pre-stockage of nonnuclear ordnance and other war consumables is not now available in Europe. Assuming free interchangeability between bases and depots, there is enough modern ordnance available to permit about five sorties per aircraft, and even including obsolete ordnance, there is enough for only about 40 sorties per aircraft. (Further details are provided in Table 13 of the Appendix.) This situation will improve as a result of the increased procurement funded since fiscal year 1962, but much more needs to be done.

The nonnuclear readiness position of our NATO Allies is much worse. For example, as of January 1, 1963, they had only 38,000 units of nonnuclear ordnance, almost all of which are obsolete napalm and World War II or Korean vintage general purpose bombs. Some coun-

tries report little or no stocks. None report any modern ordnance such as CBU and BULLPUP which we are buying in large quantities and which greatly reduce the number of sorties required to destroy a given number of targets. It appears that, at best, our Allies can support only about 10 sorties per tactical aircraft with the ordnance reported, even assuming free interchangeability between countries.

Another fundamental problem in NATO is the requirement to be responsive to both nuclear and nonnuclear tactical air operations, i.e., to be dual capable. Over the past decade, the orientation of our tactical forces has placed primary emphasis upon nuclear capabilities. Substantial progress has been made in some areas in realigning these forces. Tactical air forces, especially stimulated by the Cuban crisis, have increased their training and readiness for nonnuclear conflict. In Europe, currently only the 72 U.S. F-84 aircraft located in France are assigned to nonnuclear missions as their primary tasks; and these will return to the U.S. in June 1963. While the remainder of our aircraft are technically dual capable, under current war plans, 12 aircraft in each U.S. wing of 75 are on 15-minute nuclear Quick Reaction Alert (QRA), and an additional 23 aircraft in each U.S. wing are to be nuclear ready in less than 3.5 hours. Under SACEUR's Nuclear Strike Plan, the balance of the available aircraft are committed to follow-up on secondary nuclear missions. Within the Sixth Fleet, an average of 71 per cent of the deployed carrier-based attack aircraft are committed to nuclear strike operations.

While nuclear commitment does not entirely preclude their use in a conventional role, it is readily apparent that the attention of our air forces overseas is focused primarily on nuclear conflict. At the present time, almost one-half of the NATO committed attack aircraft are planned for employment in the nuclear strike mission and only a little over one-half are available for nonnuclear attack. (See Table 14 in the Appendix.) On the basis of present NATO planning, of the 1,800 attack aircraft expected to be assigned to NATO on 1 January 1965, about three-quarters would be assigned to the nuclear strike mission and only about one-quarter to nonnuclear attack.

I believe that a better balance can be achieved between the nuclear and nonnuclear uses of our tactical air power. As long as tactical aircraft are kept on nuclear alert, or are committed solely to nuclear strike missions, serious limitations in nonnuclear effectiveness have to be accepted. These limitations include reduced nonnuclear training, reduced flexibility in deployment and limitation in ordnance handling and storage. Maintaining aircraft on constant alert imposes a severe additional strain on manpower resources as well as equipment, reducing at the same time their availability for nonnuclear training. For carrier attack force operations, additional problems are generated by

the limited storage space, the special handling required for nuclear ordnance, and the deployment restrictions imposed by the timing coordination requirements for nuclear targeted carrier-based aircraft.

In our forward planning, we should consider some shift in the allocation of tactical air to nonnuclear uses, especially since the improvements planned for our Strategic Forces and the increases in NATO mobile missiles (e.g., PERSHING and POLARIS) will enable those forces to take over many, if not most, of the stationary nuclear targets of particular interest to SACEUR in the next two or three years. Soviet mobile missile system targets and targets of opportunity will continue the need for a small amount of tactical air delivery of nuclear weapons. (Table 15 shows the NATO nuclear target list by type, location, and attack force, as of 1 January 1962.) In the interim, we should consider assigning a large portion of our tactical units the primary mission of nonnuclear readiness, with nuclear capabilities retained for a secondary role. This would place proper emphasis on nonnuclear capabilities while retaining flexibility in the use of tactical nuclear weapons. At the same time the primary mission of the units is changed, they should be relieved of their nuclear alert commitments.

In summary, I believe that our current production and force levels will assure us a quantitative and qualitative advantage for the foreseeable future. Our critical weaknesses are in vulnerability on the ground, the lack of nonnuclear logistics readiness, and the conflicting requirement to be responsive to both nuclear and nonnuclear air operations. We have already taken some steps to correct these weaknesses. Other steps are being subjected to detailed analysis.

The broader aspects of our tactical air posture and its readiness for nuclear and nonnuclear conflict will require further study. Within the near future I will forward to you specific recommendations as to what steps need to be taken so that we and our Allies may confront our enemies at any level of provocation with an appropriate military response.

SUBJECT

Cold War Strategy

Some time ago I asked Major General Lansdale to spell out for me a concept, which we had discussed together, for a review of U.S. cold war strategy. The attached paper is the result, and I think you will find it worth reading.

**Roswell L. Gilpatric**  
*Deputy Secretary of Defense*

**Attachment**

SUBJECT

A High-Level Look at the Cold War

What precise strategy will give the U.S. the win it seeks in the cold war?

After two and a half years of valiant effort by the Kennedy Administration, as well as with hindsight of the fifteen years of prior international strife since the cessation of World War II hostilities, the U.S. now has experience in depth to draw upon for a mature reappraisal and projection of U.S. strategy in the cold war. Such a reappraisal and projection, if done with calm wisdom and fortitude, should result in a clearly realistic blueprint of where we have been, where we are now, and where we should be going, in relation to both Moscow and Peking. This strategic blue-print would provide guidance for tactical or shorter-range actions, including practical definition of immediate U.S. objectives, and for the most effective and economic use of U.S. resources in the proper "mix" for sound teamwork.

---

<sup>1</sup> Transmits Maj. Gen. Lansdale's strategy paper on the cold war for their information. Secret. 12 pp. Department of State, S/P Files: Lot 70 D 199, Pol & Psych Warfare.

## I. CONCEPT

The reappraisal and projection of U.S. strategy in the cold war could be undertaken best by men who have had great responsibilities in U.S. actions and who will be free enough of other demands to give this subject the thorough and reflective thought required. The concept is to have a small group of senior Americans appointed by the President to undertake this work, at the White House level, for several months. It is suggested that the group would work under the guidance of the President's Assistant for National Security Affairs and be supported by a working group selected from top staff levels of U.S. departments and agencies. (I hope that I would have the privilege of being the Secretary of Defense's staff representative to support this effort.)

## II. TOPICS FOR STUDY

While it is expected that the senior group would make its own outline of study, the following topics are noted for consideration:

*Our Communist Opponents.* We need to know, with considerable precision, the strategic blueprint being followed by the Communists—their exact, phased objectives, the mechanism employed to reach those objectives, and the relative time-table being followed. (It is probable that the group will find the U.S. intelligence community unable to provide ready information in the depth required; this should lead to sharper definition of U.S. collection needs, as an imperative task.)

In such a study, penetrating questions will be raised. What are the critical points to the Communists in their strategy, in their assimilation of a foreign people when they are most vulnerable (conversely, were there times when a small but determined U.S. action could have upset Communist moves in Tibet, Cuba, and Laos, for example)? Is there merit (for possible U.S. emulation in our own way) in training of selected foreigners for political action, such as that given at the Lenin and Sun Yat Sen Schools? What precise role do the Communists assign their diplomats and to international agreements?

These broader questions could be highlighted by pinpointing on one or more critical areas, illustratively. For example, how is Communist strategy progressing in Venezuela? If large U.S. resources are applied, directly and indirectly, to the elimination of a handful of Communist guerrillas in the hills, does this really hurt the Communist effort or is it merely a side-play, draining our resources? Are there a handful of key Communists and key planned moves which are more realistic targets for the U.S., which require the skilled work of a handful of Americans instead of a large and expensive U.S. mission and program? Is much the same true of Vietnam, of Brazil?

Is it feasible to maintain a Communist order of battle, country by country, including the duty assignments of key individuals and

biographic data indicating their capabilities and weaknesses? If this is feasible and can be studied in conjunction with an analysis of the Communist strategy, country by country, would this not permit far more realistic guidance to the U.S. in devising U.S. programs and in selecting the right U.S. personnel for carrying out those programs successfully? Even at this late date, U.S. Country Teams abroad are all too unwitting of exactly who are their opposite numbers. Deep in the American character is the will to win, particularly when the contest is understood and the opponents clearly identified. How can U.S. Country Teams really pitch in to win when they don't realize fully that they are on a battleground and have real, live opponents who are working hard to defeat the U.S. effort?

*Economics.* We also need to know, with similar precision, the probable Communist strategy in the economic field. Is there a point of maximum U.S. vulnerability in the outflow of gold for which the Communists are awaiting, to saturate the world economy with the gold amassed by the Soviets and apparently held in reserve for just such a strategic play? What would be the effects on the world position of the U.S.? What would we have to do to remedy this? To prepare for such an event? What would be the best U.S. mechanism to monitor international Communist economic moves and, more importantly, to ensure the inclusion of correct economic measures in U.S. strategy and tactics?

Shouldn't the international commodity market also be placed under the purview of such a U.S. mechanism? It is noted that the political/economic action theory of the faculty at the Lenin School in Moscow is based, where applicable—such as in Latin America, on the vulnerability of a nation's economic over-dependence on one single item: Venezuelan oil, Brazilian coffee, Bolivian tin, etc. A drop in world price, a manipulation in the commodity market, can create an ideal climate favoring Communist political, psychological, and paramilitary actions in a specific target nation.

As necessity impels the U.S. to embark upon vital fiscal programs abroad, such as underwriting Vietnam's war or insisting upon monetary reforms in Brazil and Colombia, how can such programs be best controlled: to give the U.S. policy decision level an exact fix on progress and status, to clearly define cut-off points, to assess realistically the political effects on local resources needed to reach long-range U.S. goals (for example, the effects upon small business which is integral to building a middle class, which in turn is an integral need for the political base we must have to reach the U.S. objective), and to establish parameters which give the U.S. sufficient room for tactical maneuver?

*Philosophy of Operations.* By this time, the U.S. has built up a large and complex body of practices in its cold war operations. The huge budgets and the equally huge effort required to flex the effort of mam-

moth organizations from an accustomed groove into a dynamic action on a newly discerned target evokes the thought that it might be high time we reconsidered how we use what we have in this struggle. Simply because we have the reassurance of dedicated leadership and the comfort of numbers going through vigorous activities, can we be truly certain that we are fighting the right war in Vietnam the right way? Is it truly and fundamentally a sophisticated shooting war for us, with great dependence upon material means and need for control organizations extending all the way back into Washington?

One of the great truths which the U.S. should heed, as it designs its cold war operations, was confided to me once in Vientiane by General Sananikone. We were discussing U.S. help in building a road in Laos. He commented: "I hope you won't build this road for us, but instead show us how to do it. In turn, I hope we have the wisdom not to have just some Lao Army engineers or a civil works group from the capital city build this road. The people out in the provinces must participate, voluntarily—when we make it plain to them how they will benefit. Once the people are involved, by their own will, the road becomes theirs. They will make sure that it is kept repaired. Every village will take pride in it."

This basic truth, of course, applies to more than building a road. If the phrase "teaching political principles" were substituted for "teaching road building," for example, a glimpse of how broad this thought actually is would be gained. A handful of Americans applied this rule and helped stabilize the independence of Vietnam in 1954–56 (now looked back upon as "the good old days," although the threat of disaster and the complexity of problems were at least equal to today's, if not more so). A handful of Americans (literally, since they could be counted on the fingers of one hand) applied this same rule in the Huk campaign in the Philippines, by making sound use of the credit or influential repute they had inherited as Americans from generations of Americans who had preceded them in the Philippines; as this handful of Americans was true to the best of their inheritance, deeply-rooted memories of U.S. motives were awakened in the Filipinos and they responded.

What do the people in a foreign nation really hope, in their innermost beliefs, to get in the way of help from the United States? They must have some ideal pictured in their mind's eye—and it must be quite different from the picture their forefathers had of the English adventures of the Pax Britannica, the conquistadores of the Pax Hispanica, or the legionaries of the Pax Romana.

Are we seen as unselfish believers in the rule of law and in representative government, or as naive or rashly impolitic nouveau riche who are viewed with jealousy or with the suspicion that our hidden motives are short-term and self-serving? How much do we hinder our

own effectiveness by self righteousness, by imposition of complex rules and organizations, by emphasis on the pragmatic at the expense of the spirit, by over-riding the need for empathy?

Are we treating each nation, where we are heavily committed, as a nation where our touch is so wisely deft and so wisely helpful that we can afford to let go in the foreseeable future—and rightly expect it to continue growing strong in a way to ensure that our children can live in peace and honor with its children? Is our true aim to create such a brotherhood of nations or only to defeat the Communists?

*The Human Factor.* Let us describe a “cold war battle” as the defeat of a serious Communist attempt to conquer one nation, by means other than traditional war; the defeat usually will be marked by tacit Communist acknowledgment, through ceasing the immediate attempt and switching to a less visible strategy with a longer-range time-table. Then let us ask, which Americans can win the described “cold war battle”?

It is possible that, if such Americans can be truly identified and then employed with executive genius, the U.S. will have found its most priceless instrument for bringing about a decisive change in the outcome of the cold war favorable to the highest U.S. interests. Such a possibility certainly indicates the value of giving extraordinary consideration to the feasibility of doing this.

The problem is far more complex than appears on the surface. Essentially it entails the picking of an elite, moving individuals in this elite outside the customary career patterns which are so firmly established in U.S. departments and agencies, and then placing them on the battleground in such a way that their effectiveness wouldn't be dulled or seriously hampered by elements of the usual U.S. institutional approach. Candidly, this would cross the immediate self-interest of much and of many in the U.S. government.

There are subtleties in the criteria for the selection of such persons which seem to be outside the intricate mechanisms we have established in the art of personnel management. The statement is made based on long personal experience in seeking an exact means of selecting such persons. The only true criteria found yet is: if he proves to be the right person by his performance on the battleground, then he's the right person. It's a bit like Ramon Magsaysay's question when selecting his officers for promotion: “How many Huks has he killed?”; our question is: “What battle did he win?” In other words, the Americans who can win in this half-hidden struggle are still rather rare and probably will need to be hand-picked by someone with both trusted judgment and experience in winning cold war battles. The initial number might be as small as 10, the maximum possibly not even 100.

After the selection of such an elite group, means will have to be devised to employ and deploy them correctly. It would be preferable

that they be volunteers. They should be protected from career penalties in their parent service (whether it be the Military Services, the Foreign Service, [text not declassified] so that they could perform this specialized duty and not fall behind their contemporaries who serve in normal duty capacities which are customary requisites for promotion. Tours of duty should be for the "duration" rather than for arbitrary time periods of rotation. (George Washington, plagued as he was with the arbitrary tours of Continental militia, would understand why you don't pull a man who can win off the battleground just because a time period is up.)

One method of deployment, for consideration, would be to form the elite into teams, so that a complete U.S. Country Team composed of such persons could be sent to a critical area at one time, replacing the regular institutionally aligned U.S. Country Team, with simple orders to win the U.S. goals there. When it had won the goals, it would return home for deployment elsewhere, as a team or split into cadres upon which several teams of elite could be built. It would leave behind, as an inheritance for the regular U.S. Country Team which had replaced it, a blueprint of the follow-up actions required to assure full progress being made on reaping the benefits offered by the victory.

While the above "human factors" have dealt mostly with the Executive Branch of the U.S. government, consideration also should be given to the human resource potential in the Legislative Branch of the U.S. government. A win in the cold war is heavily dependent upon the correct political action; often, this political action requires an "instinct for the political jugular" and the practice of sound ward-level politics. The inclusion of a few seasoned politicians, hand-picked in similar manner to the rest of the elite, would add priceless political know-how right on the battleground where it would be most helpful to the highest interests of the U.S. Inclusion in such an elite group might be a most fitting next step for unusually skilled political veterans who are active and alert, but ready for service to the country beyond the demands of periodic electoral campaigns.

*School for Action.* Just before he passed away in the Spring of 1963, Joseph Z. Kornfedder was urging that the U.S. found a "School for Political Action" to satisfy what he felt to be the most desperately urgent need of the U.S. in the cold war: the creation of skilled free world leadership for political action capable of completely defeating Communism. Since this urging has the testamentary weight of a dying man who had renounced Communism after high-level training and service in Communist political action internationally, it is offered as a topic worthy of consideration by a Presidential group.

Such a school, ideally, would permit the free world to have a continuing fresh input of younger men moving up into leadership who

would further strengthen our political concept of individual liberty, bring the free world nations into ever more stable relationships, and contribute significantly to the defeat of Communism. Whether this ideal is attainable is a major point for thought. Who would instruct? Would the program of instruction encourage chauvinistic actions of expediency with long-range penalties? How would the students be selected? These are a few of the questions which arise.

As peripheral considerations, drawn from personal experience, there are the needs for an adequate political text-book and for assuring the livelihood of dedicated patriots who serve their country at the expense of self. These deserve attention, as worth doing even if a formal school or system is never created. As caveats, two examples might serve. A suggestion (to the proper place in the U.S. government) that a modern case history text of democratic leadership in the free world, for use at leadership levels as a sort of U.S. version of "The Prince," could evoke only a tired, old, institutional, hack response in trying to produce it. As for assuring the livelihood of dedicated patriots, the spirit of man's freedom demands something more than a pension type of subsidy; the conscientious American who undertakes to get younger foreign patriots to serve their country selflessly in the best interests of the free world will discover that he has taken on lifetime responsibilities.

It is possible that other courses of action would produce much the same results as a formal, single school. The elite envisioned in the topic, "The Human Factor," above, would be undertaking considerable on-the-job education of U.S. and foreign officials as part of its winning on the battleground. It is possible that this role can be enlarged. Some present and past studies on the larger subject of the education or training of foreign personnel in the U.S. should contain clues on the means of getting a really sharp focus on practical, realistic training for action (in the sense meant by Kornfedder) within the present large U.S. programmed ventures. However, it should be borne in mind that trainees will be competing eventually against persons trained in the Lenin and Sun Yat Sen Schools; standards and discipline will have to be exceptionally high.

*Forward Motion.* There is much that goes against the grain of the American character in the way we have been fighting the cold war. Perhaps the hardest of all on us is the defensive role we adopted with the containment policy, in which we have tried to hold onto free territory against cunning and continuous aggression without once ever striking back into the Communist heartland with a telling blow. We are forever the nice little boy told to stay on our side of the street and not cross over and punch the bully who has hit us with rocks, mud, and taunts.

Here then is a basic piece of thinking to be done, as wise Americans examine our strategy. How best can we hit back, tellingly? Shouldn't we?

In this basic piece of thinking, it would be well to examine the whole gamut of the use of force, ours as well as our allies' supported by us. The range of examination should run from the more obvious actions on into the more imaginative actions. They all need surfacing, a hard look, and reflective thought. The more obvious actions are seen as including everything from the concept of a pre-emptive strike on down to armed raids into Communist areas of immediate threat to us (such as Cuba and North Vietnam). The more imaginative actions would be such operations as generating raids on Soviet nuclear stockpiles by Free Russian partisans or initiating a massive sabotage campaign in Eastern European satellites. In the middle of the spectrum of force would be actions against Communist China.

Then, hard thinking should be devoted to the crux of the matter: How do we truly defeat the Communists and emerge as a nation stronger than ever? As a nation born in a revolution based on principles long cherished by men through the centuries, would we not be deeply true to ourselves to use these same revolutionary principles to cause the overthrow of despots in Moscow and Peking and satellite capitals by their own citizenry? If this could be done, wouldn't we emerge stronger than ever as a nation and open the way for the world brotherhood which is the deep yearning in our national character?

Personal experience in defense of nations resisting Communist aggression taught me that the principles of the American Revolution, the promise in our Declaration of Independence, and the Rights of Man expressed in the first Ten Amendments of our Constitution are far more movingly dynamic to mankind than are the doctrines of Communism—and will be so chosen when there is a fighting chance to make the choice. A strategy based on this almost untapped U.S. national strength, a strength of the spirit dominant over the material, deserves the finest thinking we can muster.

A strategy based on American Revolutionary principles would call for moves causing Communist citizenry to break with the old and start constructing anew. The moves would have the strongest, almost instinctive, backing of not only the U.S. public but by people throughout the free world. For example, an opening move might well be to re-introduce the Holy Bible into the Soviet Union, where copies are non-existent even in churches and monasteries, let alone being unavailable to the public. The next move might well be to pick up the free world ends of the long ties reaching back behind the Iron and Bamboo Curtains, the ethnic groups—such as our immigrant communities of Russians, Ukrainians, Eastern Europeans, and Chinese—and give them a

more dynamic role in the introduction of ideas into the Communist heartland: the rights of man, truly representative and responsive government, free enterprise—so that we speak with the voice of the people, not the government, to the people.

The existence of similar ethnic ties in Asia, with tribal groups, cries for more initiative on our part, instead of our partial moves defending against skilled Chinese Communist use of these minorities. Is there some way to use the organizing genius with tribal groups of a Li Mi or of establishing a tribal center of our own, a 20th Century, politically-alert version of the Carlisle Indian School, in Southeast Asia? Here are tremendous human potentials for seizing the initiative.

The strategy of undertaking the political offensive, of course, needs far deeper consideration than indicated in the sketches of opening moves noted above. These sketches were included merely to indicate how “natural” and “right” it would feel to Americans to start attacking the Communist system where it is vulnerable. The strategy should consider not only the vulnerable points for political-psychological moves into the Communist heartland, but also consider the strong points of the U.S. heritage there—the legend remaining from such activities as the Hoover Relief Mission in the Soviet Union and our myriad social endeavors in China—and make full use of these strong points. Reflective thought will show that much more of the American spirit and integrity came through than the mere image of a rich uncle doing out a few presents.

The end objective of such a strategy would be the moment when the people of Moscow or Peking, much more than the people of Budapest or East Berlin or Hanoi, would say of their own will and in their own way: “Prudence, indeed, will dictate that Governments long established should not be changed for light and transient causes; and accordingly all experience hath shewn, that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute Despotism, it is their right, it is their duty, to throw off such Government, and to provide new Guards for their future security.”

Is it not time to draw upon the great strength which gave us birth as a nation to provide the way to defeat the greatest enemy we have faced?

*The National Will.* In other wars remembered by living Americans, the United States declared war through the U.S. Congress exercising its power under Article I of the Constitution. This concentrated the will, energies, resources, and genius of the American people into winning the war, paramount above all other issues. Isn't it rational to assume

that much of the diffusion of U.S. effort has come about through the lack of our declaring cold war, through the U.S. Congress, and under the Constitution?

The Communist enemy has declared himself. We have never answered him with the single voice of all our citizenry . . . as we have our enemies in the past.

This difficult problem needs to be faced squarely by the proposed Presidential board. Admittedly, the subtle and not-so-subtle threats to our national security implicit in Communist moves are of a nature beyond that envisioned by the Founding Fathers. Yet they did endow us with a system capable of expressing the peoples' intent, strongly and clearly enough to unify the national will in times of great danger. We need to be wise enough now to find the way to do this. It might take the form of declaring our national aims in the cold war, identifying the character of precisely what it is that we find of utmost danger to us and the world, defining the boundaries over which such an enemy dare not step, and clarifying just whom we will help in this struggle, with the "how" and the "why" spelled out. Or, perhaps it might take some other form. But, the way needs to be found—and taken.

Once this step is taken, the Branches of the U.S. Government and our citizenry will be committed to the spirited teamwork in winning the goal which is the only true way the American people know how to fight—banded together and all out. The President will find the character of his leadership role firming up into a decisiveness, with the broad and dedicated support of the country, impossible to take up to now in the cold war—yet a decisiveness vital to the cause of freedom for mankind, now. Thus, again, the way needs to be found—and taken.

June 21, 1963

SUBJECT

Answers to your Questions on Nuclear Expenditures

1. *Current Military Expenditures of the United States on Strategic Nuclear Weapons Systems.*

(in billions of dollars)

	<u>1962</u>	<u>1963</u>	<u>1964</u>
Defense	9.0	8.5	7.4
AEC	<u>.5</u>	<u>.5</u>	<u>.4</u>
Total	9.5	9.0	7.8

(The Defense figure appears on page 62 of the President's budget; the AEC figure is Restricted Data.)

Secretary McNamara used the \$15 billion figure in Athens. It was pulled out of the air, and has been causing trouble ever since. Hitch's staff can build up to a \$15 billion figure only by including approximately \$3 billion for the tactical air force, on the theory that it is nuclear-capable, and \$2 billion for carrier-based air. The figures I have given you are an over-all figure for all strategic retaliatory forces, including MINUTEMAN, POLARIS, all SAC forces, and all other emplaced strategic missiles.

The following is the comparison with NATO defense budgets—for Calendar 1962. NATO defense budgets total \$18.950 billion, including Canada, whose budget is \$1.650 billion. The comparable figure for total U.S. defense expenditures is \$54 billion.

2. *Aggregate Expenditure of the United States on Weapons Research and Development from the Beginning in the Nuclear Field.* The best figure the Bureau of the Budget can give me today is \$30 billion, of which about \$20 billion is DOD and \$10 billion is AEC. This goes all the way back to the Manhattan District, and covers all the lab work, testing, contract, R&D, etc. The Bureau says use this figure with care, because the real figure might be plus or minus several billion. Shapley thinks the \$30 billion is a little on the high side. A related figure that has been used is \$100 billion for the development of our strategic forces. This would include all R&D and the actual procurement of weapons, training of personnel, SAC airfields, communications, etc.

Charles E. Johnson

SOVIET CAPABILITIES AND INTENTIONS  
TO ORBIT NUCLEAR WEAPONS

THE PROBLEM

To examine Soviet capabilities and intentions to orbit nuclear weapons, probable Free World reactions to such a development, and Soviet reactions to various US responses.<sup>2</sup>

CONCLUSIONS

A. We have thus far acquired no evidence that the USSR plans to orbit a nuclear-armed satellite in the near term, or that a program to establish an orbital bombardment capability is at present seriously contemplated by the Soviet leadership. However, the USSR does have the capability of orbiting one or possibly a few nuclear-armed satellites at any time, and at comparatively small cost. (*Paras. 1-3, 15-16*)

B. The limitations of existing hardware and facilities are such that the nuclear weapons which the Soviets could orbit during 1963-1964 would not add significantly to their military capabilities. Currently operational Soviet ICBMs would be capable of delivering comparable payloads with greater effectiveness. (*Paras. 4-14*)

C. A variety of political motives, such as the desire to restore the image of the USSR as the preeminent world military power, might nevertheless impel the Soviets to orbit a nuclear weapon in the near term for demonstrative purposes. Such a move would be more likely if the Soviets were already committed to the eventual establishment of an orbital bombardment force, or if convinced that the US was so committed. However, in seeking to impress world opinion, they would

---

<sup>1</sup> "Soviet Capabilities and Intentions to Orbit Nuclear Weapons." Printed in part in print volume as Document 134. Secret; Restricted Data. 24 pp. Johnson Library, National Security File, Intelligence File, National Intelligence Estimates.

<sup>2</sup> In this estimate, we concentrate primarily on multiorbit bombardment satellite systems, i.e., those designed to complete one or more revolutions of the earth prior to being detonated. We also have included, though at much abbreviated length, consideration of fractional orbit system, i.e., those designed to make less than one revolution of the earth before detonation. Although they do not follow a ballistic trajectory, fractional orbit systems are employed in a manner more closely related to that of an ICBM, and are therefore not germane to most aspects of the problem.

also encounter a variety of adverse reactions. Awe and alarm would be accompanied by resentment and dismay, and it would be charged in many quarters that the Soviets had extended the nuclear arms race into a new, more dangerous area. The Soviets would have to consider whether it would serve their interests to risk strong US countermoves, including an ambitious US military space program, and a general intensification of the cold war. (*Paras. 17–23*)

D. On balance, it appears to us that the disadvantages would outweigh the advantages, and we therefore believe that there is less than an even chance that the USSR will orbit a nuclear weapon in the near term. Nevertheless, the Soviets may weigh the balance differently than we do, and it remains possible that they will exercise their technical capability at any time. (*Para. 24*)

E. If the USSR should orbit a nuclear weapon for demonstrative purposes, it would almost certainly anticipate some form of US reaction. The Soviets would have to consider the possibility of a US attempt to destroy their satellite, and if the US threatened to do so, they would probably threaten retaliation against US satellites. They would be wary, however, of the risks involved in direct retaliation, including a possible “open war” on all satellites and the accompanying dangers of escalation. Official and popular opinion in most states allied with the US would expect and support US measures to counter the Soviet action. Opinion in the nonaligned states would favor some form of UN “solution.” The Soviets themselves might use the UN in an effort to deter US countermoves and to delay or forestall any US military program in space. (*Paras. 25–30*)

*Prospects for 1965–1970*

F. Based solely on considerations of cost and effectiveness as we now understand them, it would appear unlikely that the Soviets will during this decade deploy advanced orbital bombardment systems of military significance. We recognize, however, that the Soviets might reach different conclusions as to cost and effectiveness, or that other factors might be more weighty. Moreover, considering the pace of developments in the weapons field in general, it is extremely hazardous to estimate Soviet decisions for a period many years ahead. For these reasons, a firm estimate as to whether the Soviets will deploy an advanced orbital bombardment system within the 1965–1970 period cannot be made at this time. (*Paras. 31–34, 45–49*)

G. If the Soviets do proceed with an advanced orbital system, we believe that they are more likely to seek a small force of limited effectiveness than a very large and sophisticated one. The weapons of a small force could be maintained continually in orbit or could be held on standby on the ground for deployment as required. In any case,

developmental testing of an orbital bombardment system should be observable to us at least a year or two prior to attainment of an accurate, reliable system. (*Paras. 35–44, 50*)

## DISCUSSION

### I. INTRODUCTION

1. We have no direct evidence of any Soviet plan to orbit a bombardment satellite. However, we believe that the Soviets have a present and near term (1963–1964) capability to launch one or possibly a few such nuclear-armed satellites by employing existing hardware. With respect to the longer term (1965 and beyond), we are convinced that the Soviet leadership will, if it has not already, authorize feasibility studies and perhaps research and development tests on an orbital bombardment system.

2. Because of the lack of direct evidence, this estimate relies heavily on what is known of the Soviet and US states-of-the-art in the development of advanced missiles, space systems, and nuclear weapons. In employing this approach, we recognize that great uncertainties are involved, especially in the longer term. Knowledge of what is feasible and useful in the field of space weapons may change significantly as additional research and development work is performed in both countries. At present, however, the factors we can set forth with respect to Soviet capabilities for orbiting nuclear weapons include: (a) the known and theoretical capabilities of Soviet space and missile boosters if adapted to this purpose; (b) the estimated yields and effects of nuclear warheads detonated at various altitudes; (c) the techniques the Soviets might employ for orbiting and detonating such weapons; and (d) the likely accuracy, reliability, and costs of alternative techniques.

3. In considering the problem of this estimate, particularly with reference to the near term, we have sought to distinguish between the known performance characteristics and the theoretical possibilities of existing Soviet hardware and related equipment. We have, in addition, considered certain trade-offs the Soviets might also weigh, such as maximizing warhead payloads for higher yield detonations in orbit at the expense of lower altitude detonations with their greater ground effects. For the longer term, we have assumed continued Soviet development of large boosters and appropriate subsystems which could be employed for a variety of missile and space purposes, including an orbital bombardment system.

### II. SOVIET CAPABILITIES TO ORBIT NUCLEAR WEAPONS, 1963–1964

#### *Available Booster Systems*

4. The USSR could use any one of several launch vehicle systems it now possesses to orbit a nuclear weapon. The system considered

most suitable for the launching of such a weapon on the basis of known performance characteristics is the SS–6 ICBM booster, with either a Lunik or a Venik upper stage. Another launch system the Soviets conceivably could utilize is the SS–8 ICBM. We have not yet been able to determine whether the SS–8 is relatively small or very large.<sup>3</sup> If the SS–8 is very large, it could be used in conjunction with a Venik upper stage—a combination not tested to date—to provide the Soviets with their greatest present payload capability in a nuclear-armed satellite.

5. In addition, the Soviets could theoretically put a nuclear weapon into orbit with the SS–8 ICBM if it is relatively small, with the SS–7 ICBM, or with the SS–5 IRBM. However, their orbital payload capabilities would be much less than that of the SS–6. The use of these smaller boosters would probably require the development and testing of satellite or upper stage hardware of types not now known to be available.

#### *Warhead Yields and Effects*

6. Currently available evidence shows that the Soviets are interested in individual weapons of large megatonnage yields, for deterrence and intimidation as well as for actual military employment. The weight and thus the yield of a nuclear warhead which could be orbited by a given launch system would be dependent on the altitude at which the satellite was to be orbited, on whether or not the satellite was to be deorbited prior to detonation, and on other variables.<sup>4</sup> The highest yields could be achieved if the warhead were detonated while in orbit, because the satellite would need to have little on-board equipment other than the warhead. Using the SS–6, with a Venik upper stage, the Soviets could achieve a yield [text not declassified] in a weapon designed for orbiting and detonation at 100 n.m. altitude. If the SS–8 is large and was employed with the same upper stage, they might be able to attain [text not declassified] under the same conditions.

7. Our knowledge of the effects of high-yield warheads detonated at very high or orbital altitudes is subject to much uncertainty. We are confident, however, that if [text not declassified] were detonated at altitudes as high as 100 n.m., they would produce negligible blast, shock and fallout effects on the ground. Available data suggest that [text not declassified] at this altitude would create heat over large areas, provided that the atmosphere was clear, but this heat would not be of sufficient intensity to start fires or to cause second degree burns to

---

<sup>3</sup> For a discussion of possible performance characteristics of the SS–8 ICBM, see NIE 11–4–63, “Soviet Military Capabilities and Policies, 1962–1967,” dated 22 March 1963, TOP SECRET, paragraphs 49–56 and Annex B, Table 1.

<sup>4</sup> For a tabular summary of the estimated yields attainable with possible Soviet launch systems under various conditions in 1963–1964, see Table 1.

exposed human skin. Such detonations might cause temporary black-out of communications and radar over thousands of miles, but we have insufficient data at present to measure such possible effects reliably and we think it unlikely that the Soviets themselves possess such data.

8. In order to produce effects on the ground, therefore, a bombardment satellite orbited with existing hardware would have to be designed to de-orbit its warhead. In a satellite designed to be orbited at 100 n.m. and then to de-orbit and detonate its weapon at an altitude on the order of 150,000 feet, the SS-6 with a Venik upper stage could deliver a warhead capable of [text not declassified]. The SS-8, if large, and employed with a Venik upper stage, however, could still theoretically deliver a weapon with [text not declassified] under these conditions. In clear weather, such bursts at this altitude would cause severe damage to cities and other soft targets over a fairly large area, primarily by means of fire, although blast effect could be significant against some soft targets.

9. Detonation at even lower altitudes would be required to damage soft or hard targets by means of blast, shock and nuclear radiation. This form of delivery would require heat-shielding and other on-board equipment which would further reduce the size of the nuclear payload. However, by using the SS-6/Venik, the Soviets could still orbit at 100 n.m. and bring down to several thousand feet for detonation, a weapon with a yield of [text not declassified]. If the requirement were imposed that the nuclear weapon be recoverable, this possible yield would be further reduced [text not declassified]. The SS-8, if large, and employed with a Venik upper stage, could [text not declassified] for low altitude detonation, or [text not declassified] if the weapon was recoverable. However, as great or greater yields could be obtained with these launch systems if employed as ICBMs; accuracy and reliability would also be better.

#### *Other Characteristics*

10. In designing a system, the Soviets would also have to consider other trade-offs between its characteristics and the nuclear payload which could be orbited with a given launch system. In the examples given above, we assumed that the Soviets would employ minimal orbital altitudes (100 n.m.) and shallow de-orbiting paths in order to maximize nuclear payload. Orbital altitudes higher than 100 n.m. would result in a longer orbital lifetime, but at the expense of payload. There would also be a trade-off between accuracy and payload. Steep de-orbiting paths would result in greater delivery accuracy, but the vehicle would require more propellant for retrorockets and thus have reduced weapon yield.

11. While we believe the Soviets are now capable of orbiting a nuclear-armed satellite without prior testing, they could not have much

confidence in its reliability and accuracy as a delivery system. The deductions we have made from Soviet missile and space technology point to a technical capability of achieving a CEP on the order of 5–10 n.m. with warheads, of the yields mentioned above, de-orbited on shallow re-entry paths.<sup>5</sup> Soviet recoverable earth-satellites have contributed some experience in accurate de-orbiting of space vehicles, but the greater accuracy required for weapon delivery would call for developmental tests with new components. To develop such accuracy and to establish the reliability of nuclear-armed satellites would probably require a series of tests over a period of at least a year after an initial launching.

12. The effective orbital lifetime of nuclear-armed satellites the USSR could launch in the near term into 100–300 n.m. circular orbits is estimated to range from a week or so at the lower altitude to several months at the higher. The de-orbit propulsion system probably would be equally reliable at either altitude, although the longer storage period in space might have adverse effects on this system. Further, the Soviets must recognize that loss of ground control would result in eventual decay at an unpredictable point along the orbit. Therefore, they would almost certainly take precautions to build into the satellite safety devices designed to deactivate or destroy the warhead system if control of the vehicle was lost.

13. Existing Soviet facilities probably are adequate to control the operation of a single or a few nuclear armed satellites. These facilities could readily be employed to detonate a warhead over Soviet territory or the open ocean for demonstrative purposes. The Soviets would experience few difficulties in detonating a nuclear warhead on a north to south pass over the US, since all the retrorocket ignition points fall within line-of-sight of the USSR. This would not be so on south–north passes, but a satisfactory system could probably be developed by using a timer, set while the satellite was over the USSR.

14. Based on the foregoing considerations, we judge that the USSR could orbit and detonate a nuclear-armed satellite at any time. Because of uncertainties as to its performance, the Soviets would presumably consider it no more than a dramatic demonstration of technical capabilities. If, however, a series of test launchings began in the near future, there is a possibility that by the end of 1964 the Soviets could have a small force of perhaps 5–10 nuclear-armed satellites with predictable reliability and accuracies on the order of 5–10 n.m. CEP. In addition to the necessary boosters, satellites and warheads, such a force would

---

<sup>5</sup> As indicated above, a somewhat better accuracy could theoretically be achieved by employing steeper re-entry paths and sacrificing some payload weight, but we think this very unlikely in the 1963–1964 period.

probably require at least some additional ground facilities, which could be constructed concurrently.

#### *Cost Considerations*<sup>6</sup>

15. The Soviets could put one or more nuclear-armed satellites into orbit with present hardware, or acquire a standby capability to do so, at a cost on the order of \$50 million per satellite. Assuming an effective lifetime in orbit of several months, one such satellite could be maintained in orbit at all times at a cost on the order of \$100 million or more per year. Even with existing types of hardware, however, it would cost much more to develop weapons with predictable reliability and accuracy and to have a force of 5–10 such weapons in orbit at all times. To accomplish this, the Soviets would have to expend on the order of \$1 billion for test firings, hardware production, ground facilities, and other initial investment. Maintenance costs would probably be some \$½–1 billion per year thereafter. For purposes of comparison, total Soviet expenditures on long range attack forces of all types (bombers, ground-launched missiles, and missile submarines) are on the order of \$6–6½ billion per year, excluding research and development costs.

### III. LIKELIHOOD IN 1963–1964

#### *Current Evidence*

16. As indicated above, we have thus far acquired no direct evidence indicating that the USSR intends to orbit a nuclear weapon in the near term. To date, no test firings have been observed which can be identified with the development of such a weapon. We have, furthermore, no positive evidence that a program to establish an orbital weapon capability is at present seriously contemplated by the Soviet leadership. There have, however, been a number of public references by high ranking Soviet officials in the past two years with regard to the military uses of space. In these statements, they have frequently referred to “global rockets” and on a few occasions to their ability to launch rockets from orbiting satellites. Moreover, the Soviets have recently become increasingly critical of US space activities, focusing their comments on an alleged US intention to exploit space for military purposes.

#### *Potential Advantages and Disadvantages*

17. If only because of its high cost and limited effectiveness we believe it unlikely that the Soviets will deploy in the near term an

---

<sup>6</sup> We have no information on the ruble costs of Soviet ICBM or space systems. All cost figures presented in this estimate represent calculations of what such weapons might cost if produced in the US.

orbital force which would maintain as many as five to ten nuclear weapons in orbit. They could launch one or a few such satellites at comparatively small cost, but these would have negligible military value. Thus, we believe a Soviet decision to orbit nuclear weapons during the next two years or so would be based in the main on political and psychological considerations. The Soviets might conceive of such a move as a dramatic demonstration of technical and military prowess, one designed essentially to bolster their international prestige. We have pointed out elsewhere that the Cuban crisis had the effect of altering to the disadvantage of the USSR the view generally held of the balance of military power and that the Soviets have a strong incentive to restore plausibility to their claims of military superiority. They would hope that the consequent enhancement of the USSR's image as a great power could be used to persuade or intimidate other states into making concessions.

18. If, for primarily military reasons, the Soviets decide over the course of the next year or so to begin a major space weapons program for later deployment they might use an initial developmental vehicle for demonstrative purposes, hoping in this way to achieve immediate political capital. (They acted in much this way in the late 1950's when claims of a significant ICBM capability followed the decision to develop an ICBM force but preceded the deployment of such a force.) Further, whether or not the Soviets are now committed to a space weapons program, they might seek to demonstrate their own prowess first if convinced that the US was committed to such a program. They might even seek to forestall or delay the US effort by launching their own weapon in an attempt to arouse world pressure, particularly in the UN, against the militarization of space. They could plan subsequently to offer to withdraw their weapon in exchange for US adherence to a ban on space weapons.

19. Reactions in the Free World to the USSR's launching of an orbital weapon would vary with time and place, and much would depend on the extent and promptness of the US response. Reactions would also depend in part on the nature of the Soviet demonstration, on the claims advanced by Moscow concerning weapons capabilities and potential use, and on the credibility of these claims. We think it highly unlikely that the Soviets would assert that they had launched an orbital weapon without actually having done so. Their claims would have the greatest credibility if the Soviets actually detonated a weapon, but they could probably be made persuasive even in the absence of a detonation. (A test ban would presumably preclude a detonation.)

20. The orbiting of a nuclear weapon might provide the Soviets with a potent psychological weapon, a "sword of Damocles" which seemed to hang over everyone's head in a way which, logic and military

technology aside, ICBMs do not. The feat would stimulate respect for Soviet scientific excellence—though scarcely of post-Sputnik I proportions—awe of Soviet power, and fear of Soviet intentions. If the Soviets offered to remove their weapon in exchange for Western concessions, many individuals and not a few Free World governments would view the offer with relief and might urge the West to meet Soviet demands.

21. In seeking to gauge popular and official reactions in the Free World, the Soviets would also have to consider possible unfavorable responses. Though the Soviets would almost certainly characterize their move as a necessary “defensive” measure, much world opinion would view it as a new source of international tension and as a further obstacle to disarmament. It would be charged in many quarters that the USSR had extended the nuclear arms race into a new and more dangerous area, and in doing so, moreover, had placed all countries, not merely its potential enemies, in peril. In Western Europe, where the population has long lived under the Soviet threat, many would probably be receptive in time to official assertions that the orbital weapon added little or nothing to existing Soviet capabilities.

22. On balance, we do not believe that a Soviet demonstration would generate any massive or enduring shift of public sentiment. Despite the probable creation of considerable initial alarm, particularly if the Soviet move occurred during a period of high tension, pre-existing inclinations would for the most part be likely to govern both popular and governmental reactions. Among elements in the West favoring a conciliatory approach to Soviet pressures, for example, fear and concern would probably lead to mounting demands for official concessions, and resentment at the Soviet “violation” of space might be channeled more against the arms race and the cold war in general than directly against the USSR. Conversely, among those who advocate a more belligerent posture vis-à-vis the USSR, militancy would be heightened and would be accompanied by demands for some form of direct action to counter what would be regarded as a new Soviet threat.

23. Finally, in assessing the consequences of an orbital weapons demonstration, the Soviets would have to weigh the possibility that their act might stimulate a fateful turn in world affairs. They would have to consider very carefully whether it would serve their internal and international interests to risk possible strong US countermoves, a general intensification of the cold war, and an acceleration of the arms race. Specifically, if as yet uncertain as to US plans, the Soviets would be concerned that the launching of an orbital weapon for essentially political purposes might spark an ambitious US military program in space.

#### *Near-Term Intentions*

24. Thus, the specific factors likely to be involved in a Soviet decision to orbit a nuclear weapon tend either to conflict with one or

another or to rest on such imponderables as the Soviet estimate as to the likelihood of a US military program in space. Further, they depend in part on the overall US posture, the international climate as a whole, and the tactical line of Soviet policy at any given time. Thus, we cannot assess with confidence the likelihood of the USSR's launching a nuclear-armed satellite in 1963–1964. On balance, it seems to us that the disadvantages would outweigh the advantages, and we therefore believe that the chances are less than even that the USSR will make such a move. Nevertheless, the Soviets may weigh the balance differently from the way we do, and it remains possible that they will exercise their technical capability at any time.

#### IV. REACTIONS TO SPECIFIC UN AND US COURSES OF ACTION

25. If the Soviets do in fact orbit one or a few nuclear weapons, they would probably expect some form of UN response. A UN resolution condemning the Soviet action and calling for the removal of the weapons would probably be strongly supported by all Western European and most Latin American governments. A majority of the Afro-Asian States would also probably support their removal, though many might be reluctant to support a clear-cut condemnation of the USSR. The Soviets, if willing to entertain the idea of removing their weapons, could be expected to insist on some form of *quid pro quo* from the US. In this event, they could probably count on support from many nonaligned states. The outcome would, of course, rest in part on US policy at the time and the USSR's tactics in regard not only to the issue at hand but also its foreign policies in general. We believe, however, that the chances are better than even that the UN would eventually pass some form of resolution which criticized the Soviet move and called for a permanent ban on weapons in space. It might also appeal to other powers, most notably the US, to negotiate with the USSR in an effort to secure the removal of the Soviet weapons.

26. Moscow would probably expect an appeal for the removal of its weapon. The USSR might agree to remove its weapon from orbit if the UN passed a resolution condemning any military use of space. It is more likely, however, that the USSR would counter with a broader resolution dealing with other disarmament and cold war issues, maintaining that it could not be deprived of a military advantage without some recompense from the West. Or, it might offer to withdraw its weapon in exchange for US agreement to refrain from orbiting observation satellites.

27. The Soviets would also probably allow for a direct US response. In addition to a vigorous protest, which they would almost certainly reject, they might expect the US to demonstrate a comparable capability in the minimum time possible. Moscow probably would not seek to

destroy a US weapon deployed under these circumstances. An offer from the US to withdraw its weapon in exchange for similar Soviet action would probably receive considerable support from world opinion and from the UN. The Soviets might be receptive to such an exchange if it appeared at that time that their political objectives had already been well served.

28. The Soviets would have to consider the possibility of a US attempt to destroy their satellite, and if they did, there are various ways in which they could seek to avoid such a US action. They need not reveal the nature of their satellite until after detonating it. If they did reveal the nature of the satellite while in orbit, they might detonate it after only a few orbits, perhaps before it passed over US territory, thus minimizing both US reaction time and anti-satellite capabilities. The Soviets might also seek to deter US action by statements threatening some form of retaliation, such as the destruction of US satellites.

29. Whether the Soviets would in fact seek to destroy US satellites in the event that the US destroyed the Soviet weapon would depend on a number of circumstances, including the general US stance and the international climate. The USSR's response would also depend upon Soviet estimates as to the consequences of inaction in terms of its international prestige in general, and its possible plans for future space activity in particular. If the US had orbited a nuclear weapon, the Soviets would probably seek to destroy it in retaliation. If the US had not orbited a weapon, the Soviets might view the US move as providing an opportunity to frustrate any future US military activities in space; at the very least, they could cite the US actions as a precedent and threaten to destroy any future US orbital weapons. Indeed, Moscow might believe the US action provided a good pretext for the destruction of US observation satellites. The Soviets, however, would be wary of the risks involved in direct retaliation, including a possible "open war" on all satellites and the accompanying dangers of escalation.

30. Both governmental and public opinion in most allied states would expect a vigorous US response to a Soviet deployment of orbital weapons. While there might be some preference for at least an attempt to secure UN action, US measures to counter the Soviet action would in general receive firm support; indeed, US failure to act (particularly after an unsuccessful attempt to deal through the UN) would probably lead to considerable dismay. Opinion in the nonaligned states would probably be most sympathetic to efforts to achieve voluntary grounding of the weapon by Moscow. US action to destroy the Soviet weapon would probably stimulate concern as to the consequences for world peace but—once a possible crisis had passed—probably few would view the US move as anything other than a legitimate reply to Soviet provocation. If, instead, the US launched its own nuclear weapons, the

nonaligned states would probably see in the US response merely an inevitable countermove. Pressures on the US and the USSR to desist from extending the arms race into space would be strong, at least for a time.

#### V. SOVIET CAPABILITIES, 1965–1970

31. The Soviets will be able to improve their capabilities in bombardment satellites throughout the present decade even if they employ only the launch vehicles available today. Advances in Soviet nuclear technology would increase the yields of the warheads which could be orbited. For example, assuming continued nuclear testing, by about 1970 the SS-6/Venik combination could probably place a weapon of [text not declassified] into a 100 n.m. orbit for detonation at about 150,000 feet, as compared with [text not declassified]. We also expect advances in the techniques of guidance and control in the normal course of continued Soviet ICBM and space development. Even with these improvements, however, one or a few such weapons would continue to have negligible military value.

32. Any orbital bombardment system of real military significance would require satellite vehicles in some number, and would accordingly be extremely complex and expensive. Important developmental progress toward such a system within the decade would require a major Soviet effort to perfect hardware and to develop advanced techniques. In considering whether to authorize such an effort, the Soviet leadership would examine the likely military value of orbital bombardment systems in relation to the mix of forces for long range attack they would hope to have in the late 1960's and beyond, and the costs of the alternatives open to them. Further, considerations relating to political reactions, the risk of intensifying the arms competition, and other similar factors discussed above would become even more complex and weighty in connection with such an effort.

33. Although we have only a general idea of the probable composition of Soviet long range striking forces some years hence, our present information supports an estimate of several broad trends in the future development of these forces. It appears quite likely that present Soviet schedules call for the acquisition of some hundreds of ICBM launchers for missiles with multimegaton yield warheads. Efforts to improve readiness and reaction times are evidently being carried out to increase the effectiveness of strategic attack forces for pre-emptive or retaliatory strikes. The hardening of a portion of the land-based missile forces and the development of advanced submarine-launched missile systems point to Soviet concern to have protected retaliatory capabilities. All these developments, together with the trend toward higher megaton yields which has been evident in the nuclear testing program, are

designed to enhance both the deterrent value and military capability of the Soviet striking forces.

34. None of the recent trends in the Soviet strike forces suggest, however, that the USSR presently contemplates forces capable of completely neutralizing US strike forces in an initial blow, nor do Soviet programs appear designed to match the US in numbers of delivery vehicles. Thus far, the Soviets appear to be counting on continued deployment of their large and reliable missiles and on the added threat provided by the testing of very high yield weapons to attain credibility for their deterrent. We think, therefore, that they would be likely to view the development of orbital bombardment systems primarily as a means of supplementing their existing types of forces in this role rather than visualizing such weapons as replacement or substitute systems. They would probably also consider them as one way of introducing additional complications into US defense planning. Finally, they would probably regard them as a qualitative advance in weapon technology which could support Soviet claims to parity or even superiority in total strategic capabilities.

#### *Technical Considerations*

35. There is a wide range of delivery techniques and types of orbital forces which might be sought by the Soviets, with considerable difference in developmental requirements, costs, and effectiveness. Because we have no direct evidence of Soviet objectives in the field of orbital bombardment systems, we can examine Soviet capabilities only in terms of the broad alternative types of forces the USSR might consider as supplementary strike systems. In all cases, we have assumed that the Soviets' evident interest in very high yield systems would lead them to consider orbital vehicles capable of carrying warheads with yields of at least 25 megatons, and preferably 100 megatons or more.

36. For employment in the period beyond 1965, the Soviets could consider several broad types of multiorbital bombardment force, each of them capable of providing a continuous and visible threat of attack on US and other Western targets. To provide a threat of retaliation against population centers, they might find a relatively small force with limited effectiveness sufficient. For such a force, hardened command and control facilities would be required, but near-simultaneity of weapon delivery would not be essential, nor would precise accuracy be needed with very high yield warheads. For pre-emptive employment against smaller or harder military targets, however, a sophisticated force with high accuracy, short times to target, and near-simultaneity of weapon delivery would be necessary.

37. Some possible characteristics of representative forces of these two broad types, and estimated Soviet capabilities to achieve them are

discussed in the following paragraphs. In general, however, because of present uncertainties as to the effects of nuclear weapons detonated at altitudes above the dense atmosphere, a desirable feature of any orbital system under present consideration (other than a token force) would be a capability to detonate weapons at whatever altitude was later found to be most effective. In addition, the orbiting vehicles would need to be long-lived and reliable, and to be protected against counter-measures. Finally, factors of safety and cost would probably dictate the incorporation of techniques to recover warheads within Soviet territory.

38. *A force of limited effectiveness* might be designed to maintain a small number of weapons in orbit, which, while they would not provide continuous target coverage would be capable of detonation on specified targets over a period of hours as their orbits passed near. A representative force of this type might be programmed eventually to maintain some 10–25 weapons in orbit at altitudes of several hundred miles, able to attack targets within a few hundred miles of their orbital planes. The Soviets would probably consider CEPs of 5–10 n.m. adequate for this purpose. To carry warheads of 100 MT or more which could be detonated at any altitude or recovered, the system would require advanced spacecraft weighing on the order of 20 tons. To orbit such vehicles, the Soviets would need to employ a new, large booster with a thrust of 1½–2 million pounds.<sup>7</sup> If such a booster becomes available for flight testing as early as 1964, and is adapted to an orbital bombardment system, it is possible that weapons of this size and weight could be orbited in the 1965–1967 period. Further testing over a period of a year or two after the initial launching would be required to establish accuracy and reliability.

39. Such a force could be deployed and maintained in orbit with relatively few launching facilities, and it might even utilize facilities constructed for other purposes, although some additional control facilities probably would be required. If the Soviets pursued development and deployment of such a limited force, we think they could have it fully operational by 1970.

40. *A very sophisticated force*, on the other hand, might be designed to maintain a large number of weapons in carefully spaced orbits, with guidance and control capable of programming weapons against a specified target system within minutes of a decision to attack. A representative force of this type might eventually be programmed to maintain some 80–200 weapons in orbit at all times so as to be able to attack some 10–25 targets in the US with 100 MT warheads over a

---

<sup>7</sup> For a discussion of Soviet large booster development, see paragraphs 27–33 of NIE 11–1–62, “The Soviet Space Program,” dated 5 December 1962, SECRET.

period of an hour or two. Such a force would need to employ very advanced spacecraft with precise on-board attitude control and retro-rocket systems, and with side-ranging capabilities to attack targets several hundred miles from their orbital planes with CEPs approaching one n.m. Decoys and other measures to reduce vulnerability and mask the size and location of the force would be highly desirable.

41. The attainment of a force of this sort would require major Soviet advances in technology as well as a large-scale program to produce hardware and construct ground facilities. It is possible that the required spacecraft could be developed and proved out within the 1967–1970 period. In addition, however, a sophisticated force of this type would need to have numerous launching facilities, a very complex computation and control facility, and a substantial number of tracking and command stations spaced symmetrically across the USSR at the highest possible latitudes. Although the establishment of such a force could be in progress beginning as early as 1967, it seems highly unlikely, in view of the enormous complexities involved, that it could be fully operational until after 1970.

42. *Alternative systems* of a variety of types might be developed. For example, a somewhat smaller booster system could be employed to orbit spacecraft with advanced performance but weighing less than the vehicle required to deliver 100 MT weapons. If the SS-8 booster is large, and development of an advanced spacecraft is already underway, an initial developmental launching of [text not declassified] could probably occur in 1965.

43. It is also possible that a multiorbit bombardment force could be designed as a standby force, with some reduction in total vehicle requirements below those of a force of weapons in orbit at all times. Such a force would have its weapons stored at ground complexes, ready for launching at any time. If a standby force was intended solely for deployment during periods of international tension, hardening of ground facilities would not be necessary. On the other hand, if a retaliatory role was also assigned to a standby force, hardening of most if not all facilities probably would be required. A small standby force, with perhaps 10–25 weapons available for launching, might appeal to the Soviets as an alternative to a small multiorbit force which maintained the same number of equivalent weapons in orbit. As a practical matter, one launcher probably would be needed for each 2–4 standby weapons, so that launching of the entire force could be accomplished in a period of a few days. A large standby force of sophisticated weapons would not be a practicable alternative to a similar force maintained in orbit, primarily because of the exorbitant requirement for launch facilities.

44. Finally, we estimate that the Soviets are also capable of developing a fractional orbit<sup>8</sup> bombardment system within the 1965–1970 time period. A system of this type would be designed to launch weapons at the initiation of hostilities in a manner comparable to that of ICBM systems, but on near-global trajectories in an effort to avoid US warning systems. Fractional orbit weapons with yields ranging from 25 to 100 or more megatons could be developed with hardware comparable to that of multiorbit systems. Development time for the spacecraft could be somewhat shorter because on-board systems would be less complex. However, such a system would need very extensive and complex ground facilities, which could take at least as long to construct as those of a very sophisticated multiorbit force.

*Considerations of Cost and Effectiveness*

45. It is impossible to make any confident estimate about what sort of orbital bombardment system the Soviets are likely to develop, or even whether they will commit major resources to develop any such system. Indeed, it seems likely that they have not yet proceeded beyond the point of feasibility studies on advanced orbital bombardment systems, and of weighing the possible costs and effectiveness of such systems against those of other delivery systems capable of performing comparable missions.

46. The costs of orbital systems would depend on their size and sophistication, but in all cases they would be quite large when compared with ICBM costs. Rough calculations based on US experience suggests that the very sophisticated orbital system which we have described would require R&D expenditures on the order of \$2–3 billions. To establish and maintain a force of some 80–200 vehicles in orbit at all times would cost \$4–12 billions for initial investment and an equal amount annually thereafter for the life of the program, even assuming that the vehicles had an average orbital lifetime of 1 year. The force of limited effectiveness, with some 10–25 weapons continually in orbit, would probably require R&D expenditures of some \$2 billions, an initial investment on the order of \$½–1½ billion and an equal amount annually thereafter. This smaller force, however, even if its R&D costs were minimal, would over a five-year period cost more than five times the amount required to deploy and maintain for the same period an equal number of large, hardened ICBMs with 100 MT warheads.

47. A small, unhardened force, maintained on a standby basis, would be much less expensive than a force maintained in orbit. After an initial investment on the order of \$½ to \$1½ billion, operating costs

---

<sup>8</sup> A fractional orbit system is one which is designed to make less than one revolution of the earth before detonation, but which does not follow a ballistic trajectory.

could be as little as 100 million dollars annually, a portion of which would be expended to conduct one or two reliability and confidence firings. Even so, such a force would be more costly than an equivalent ICBM force. It seems likely that the Soviet leadership would have to be well convinced of the value of an orbital system before making such a large commitment.

48. For accomplishing military missions, we think that during the 1965–1970 period, orbital bombardment systems will not compare favorably with ICBMs in terms of reaction time, average life, reliability, vulnerability, accuracy, or targeting flexibility. In addition to being less effective militarily, an orbital bombardment system will be considerably more costly than an equivalent delivery capability with ICBMs. Based solely on considerations of cost and effectiveness as we now understand them, therefore, it would appear unlikely that the Soviets will during this decade deploy advanced orbital bombardment systems of military significance.

49. We recognize, however, that the Soviets might reach different conclusions as to cost and effectiveness, or that other factors might in their view be more weighty. It is possible that the Soviet leaders would be strongly attracted by what an orbital bombardment system might do to reverse the impression that they are now inferior in strategic capabilities. Moreover, considering the pace of developments in the weapons field in general, it is extremely hazardous to estimate Soviet decisions for a period many years ahead; it is possible that the rapid progress of space technology could result in weapons developments whose feasibility is not now manifest. It is also possible that the Soviets are deferring a decision while awaiting more information on their own technical progress as well as on US capabilities and intentions with respect to military space programs. For these reasons, a firm estimate as to whether the Soviets will deploy an advanced orbital bombardment system within the 1965–1970 period cannot be made at this time.

50. If the Soviets do proceed with an advanced orbital system, we believe that they are more likely to seek a small force of limited effectiveness than a very large and sophisticated one. The weapons of a small force could be maintained continually in orbit or could be held on standby on the ground for deployment as required. In any case, developmental testing of an orbital bombardment system should be observable to us at least a year or two prior to attainment of an accurate, reliable system.

	13,900 lbs/ [ <i>text not declassified</i> ]	11,000 lbs/ [ <i>text not declassified</i> ]	6,000 lbs/ [ <i>text not declassified</i> ]	8,800 lbs/ [ <i>text not declassified</i> ]	5,100 lbs/ [ <i>text not declassified</i> ]	8,400 lbs/ [ <i>text not declassified</i> ]	4,100 lbs/ [ <i>text not declassified</i> ]
SS-8, if large, with Venik upper stage <sup>e</sup>	21,000 lbs/ [ <i>text not declassified</i> ]	16,500 lbs/ [ <i>text not declassified</i> ]	9,000 lbs/ [ <i>text not declassified</i> ]	13,200 lbs/ [ <i>text not declassified</i> ]	7,500 lbs/ [ <i>text not declassified</i> ]	12,500 lbs/ [ <i>text not declassified</i> ]	6,000 lbs/ [ <i>text not declassified</i> ]

<sup>a</sup> The megatonnage yields for nuclear devices of weights equivalent to those used in this table are expected to be higher in the post-1965 period. For example, while in 1963-64 a nuclear warhead weighing about 5,400 pounds could deliver a device with [*text not declassified*] a warhead of the same weight could in 1970-1972 deliver a device with a [*text not declassified*] assuming continued nuclear testing.

<sup>b</sup> In addition, the Soviets could theoretically put a nuclear weapon into orbit with the SS-8 ICBM, it is relatively small, the SS-7 ICBM or the SS-5 IRBM. However, even with upper stages, their orbital payload capabilities would be much less than that of the SS-6, and in some cases would be extremely limited even under optimum conditions. Further, it would probably require the development and testing of satellite hardware of types not now available.

<sup>c</sup> The use of a 90-degree range angle for de-orbiting provides for greater warhead weight at the expense of accuracy. Conversely, a 30-degree range angle would result in a lighter warhead but a better CEP. These two values represent reasonable maximum and minimum range angles in this time period. A 300-nm side range capability during de-orbiting has been assumed so as to provide some targeting flexibility.

<sup>d</sup> Tested and proven satellite launch system.

<sup>e</sup> For a discussion of possible performance characteristics of the SS-8 ICBM, see NIE 11-4-63, paragraphs 49-56 and Annex B, Table 1. The SS-8 has not yet been tested in a satellite-launching role nor has it yet been tested in combination with the Venik upper stage.

**296. Memorandum from Forrestal to Bundy, July 19<sup>1</sup>**

July 19, 1963

Although the limits of Kaysen's empire, like that of Darius were undefined and expanding, Bob Komer and I have attempted to de-limit them for the purpose of establishing our condominium.

So far as we know, Carl operated in the following general areas:

International Economic Affairs

International liquidity problems	(F)
Balance of payments	(F)
Trade	(X)

Planning

Strategic military planning	(K)
State Department policy planning	(K)
Long range economic planning (CEA)	(X)

Budget Review

Defense	(F) (K)
CIA	(F)

Arms and Arms Control

Disarmament	(Johnson)
Weapons systems	(Johnson)
AEC Tests	(Johnson)

Regional

Africa	(Brubeck)
Okinawa	(F)

Although there is no way of replacing from your present staff Carl's professional expertise in economic matters, we think that a very informal reshuffling of functions will give you coverage at least of his major responsibilities. In the two areas marked "X", you may want to use someone from the CEA.

Bob feels that with the help he is getting from Harold Saunders on his regional responsibilities (NEA), he can take on the functions marked "K" above. I think that if we can find some junior to help on my regional responsibilities (FE), I could take on the additional responsibilities marked "F" above.

---

<sup>1</sup> Reassignment of Kaysen's portfolio. No classification marking. 2 pp. Kennedy Library, National Security Files, Meetings and Memoranda Series, Staff Memoranda, Carl Kaysen.

Since I do not have Carl's professional experience, my attempts to keep you abreast of the operations of the Treasury in international matters will have to be carried out in a somewhat different fashion. The result will be, I am afraid, that you will not have on your staff the strong kind of advocate for broad action in the balance of payments and international liquidity areas that you had in Carl. Since my background is more in line with that of Doug Dillon, it will be necessary to call more upon the staff of the Council to get the proper kind of balance.

Both Bob and I have over-lapping personal interests in getting into Defense Department matters; but I think that these can be sorted out in practical terms, given his talents on the planning and strategy side and my own proclivity for getting involved in the nuts and bolts.

Between us it is going to be more than we can do to fill Carl's shoes; but I think we can carry the operation along, at least well enough to protect you from too many surprises.

Incidentally, as a candidate for the Far East junior staff member, I would suggest that you consider Jim Thompson, who is now a special assistant to Roger Hilsman. He has a good academic background in Asian Affairs, and although he used to work for Chet Bowles, I think he is pliable enough to fit into our kind of operation. But you may have better ideas.

Bob has seen this and approves.

COMMUNIST CHINA'S  
ADVANCED WEAPONS PROGRAM

THE PROBLEM

To assess Communist China's progress toward acquisition of a nuclear weapons and missile capability and to estimate the effects of such a development on Chinese policy.

NOTE TO READERS

Since our most recent estimate on Communist China's advanced weapons program<sup>2</sup> we have received a considerable amount of new information, mainly from photography. This evidence leads us to believe that the Chinese, with Soviet assistance, had embarked in the latter 1950s on a more ambitious advanced weapons program than we had earlier thought likely. We further believe that they are still working on that program though forced to slow its pace materially since 1960. Nevertheless, the gaps in our information remain substantial and we are therefore not able to judge the present state or to project the future development of the Chinese program as a whole with any very high degree of confidence. Specific judgments given below about the stage likely to be reached by the Chinese program at particular dates should be read in the light of this general caution.

CONCLUSIONS

A. Peiping has given high priority to the development of nuclear weapons and missiles. Recent aerial photography has revealed a number of developmental facilities indicating a broad program which diverts Communist China's limited scientific and technological resources from other parts of the economy. (*Paras. 2–15 and 19*)

B. We have found what we believe to be a plutonium production reactor in China, located at Pao-t'ou. This reactor probably could not have reached criticality before early 1962. If it did go critical at that time, the earliest a first device could be tested, based on plutonium

---

<sup>2</sup> NIE 13–2–62, "Chinese Communist Advanced Weapons Capabilities," dated 25 April 1962. (TOP SECRET)

from this reactor alone, would be early 1964. If the Chinese run into even a normal number of difficulties, this date would be postponed to late 1964 or 1965. If the reactor reached criticality later than early 1962—or has not yet done so—the detonation would be even further delayed. Beginning the year after a first detonation the reactor could produce enough material for only one or two crude weapons a year. The Chinese have a few bombers which could carry bulky weapons of early design. (*Paras. 4–6 and 17*)

C. We believe that the eventual Chinese program calls for nuclear weapons containing both U-235 and plutonium. Such a program would require more plutonium production facilities than the one reactor that has been identified. Neither photographic coverage nor other significant evidence have disclosed another production reactor in China. The possible existence of another reactor cannot be ignored however, nor the possibility that one may be in production. We therefore cannot exclude the possibility that the Chinese could achieve a first detonation at any time. (*Para. 7*)

D. The gaseous diffusion plant at Lanchou will probably not be able, under the most advantageous circumstances, to produce weapon-grade U-235 before 1966. Considering the great technical difficulties involved and the large amount of additional construction needed, a more likely date for such production is 1968–1969. (*Paras. 2 and 3*)

E. Peiping is probably concentrating initially on a medium-range ballistic missile (MRBM) system of basically Soviet design, either the 630 mile SS-3 or the 1,020 mile SS-4. We do not believe that missiles would be ready for deployment before 1967. Because of the time and difficulties involved in producing a missile-compatible warhead, we believe China is not likely to develop such a warhead until 3 or 4 years after a first detonation. (*Paras. 16 and 18*)

F. The detonation of a nuclear device would boost domestic morale. Although it is possible that the leadership would experience a dangerous degree of overconfidence, we think it more likely that Peiping will concentrate on furthering its established policies to: (1) force its way into world disarmament discussions and other world councils; (2) overawe its neighbors and soften them for Peiping-directed Communist subversion; and (3) tout Chinese-style communism as the best route for an underdeveloped nation to achieve industrial and scientific modernity. In pursuing its policies, Peiping's increased confidence would doubtless be reflected in its approach to conflicts on its periphery.<sup>3</sup> (*Paras. 20–27*)

---

<sup>3</sup> "The Acting Director, Bureau of Intelligence and Research, Department of State, believes that China's leaders would recognize their limited capabilities had not altered the real power balance among the major states and could not do so in the future. In particular, they would recognize that they remained unable either to remove or neutralize the US presence in Asia and would not become willing to take significantly greater military risks."

## DISCUSSION

## I. PROSPECTS FOR COMMUNIST CHINA'S ADVANCED WEAPONS PROGRAM

A. *The Nuclear Program*

1. Soviet assistance was an important factor in the Chinese nuclear program until 1959, ranging from participation in uranium prospecting and processing through the supply of a research reactor and cyclotron to assistance in constructing a major facility for the separation of U-235. Strains in Sino-Soviet relations, however, disrupted this program and by mid-1960 we believe the Soviets had stopped providing technology and equipment for China's nuclear program and had withdrawn Soviet nuclear technicians. These blows have greatly retarded the Chinese nuclear program. The Soviets could not, however, undo what had already been done, and construction of the gaseous diffusion plant at Lanchou, for example, was already well under way.

*The Gaseous Diffusion Plant*

2. This gaseous diffusion plant is similar to such plants in the USSR. Photography of September 1959 shows that the exterior of the present main building was largely completed by that time, but the facility lacked a power supply. Photography of March and June 1963 shows that the nearby hydroelectric plant, which was apparently designed to supply the diffusion plant, has made some progress, but much work remains to be done. In the meantime, some power is available. Two transmission lines, one of which appears to be complete, connect the diffusion plant with a thermal electric plant at Lanchou. A substation has been built at the diffusion plant, and installation of transformers alongside the main building has begun, though only two of a probable 38 were shown in place in the latest photography.

3. The building at Lanchou is big enough to permit the production of low enrichment U-235, suitable for use in reactors. However, at least twice as much floor area as that provided by the present main building would be required to produce weapon-grade U-235. There is an adjacent area inside the security fence apparently intended for such expansion, and there is some sign that work may be beginning there. Even if work is under way and all of the highly specialized separation equipment was promptly available, the earliest date at which weapon-grade U-235 could be produced would be in 1966. Considering the great technical difficulties involved and the large amount of additional construction needed, a more likely date for such production is 1968–1969. It is extremely unlikely that the Chinese have developed alternative processes for quantity production of U-235.

*The Plutonium Production Reactor*

4. Recent photographic coverage of the Pao-t'ou area of Inner Mongolia has revealed an installation with elaborate security arrangements. This installation includes what we believe to be a small air-cooled plutonium production reactor, of about 30 megawatts capacity, with associated facilities for chemical separation and metal fabrication. An air-cooled reactor has the significant advantages of inherent simplicity of design and construction and less stringent purity requirements for the graphite moderator and uranium fuel. We have no knowledge of Soviet work with reactors of this type, but both the United Kingdom and France built such reactors for their initial production of plutonium and considerable unclassified design and operating data on air-cooled reactors has been available since 1955.

5. The chief disadvantage of an air-cooled reactor is its low productivity. The reactor at Pao-t'ou, when in full production, would be able to turn out only enough plutonium for one or, at most, two crude low-yield weapons a year. Peiping may have selected this sort of reactor as the quickest and surest way within its capabilities to achieve a nuclear detonation and acquire at least a token weapons capability. A sizable weapons program based on plutonium alone would require greater quantities of plutonium than can be expected from the Pao-t'ou reactor.

6. We cannot determine from the 1963 photography whether or not the Pao-t'ou reactor is now in operation. If it is in operation, we believe it could not have reached criticality before early 1962. After reaching criticality, one year would be needed for fuel element irradiation within the reactor and an additional 9 to 12 months for cooling of the irradiated fuel, chemical separation of the plutonium and fabrication of a device. Therefore, the earliest a first device could be tested, based on plutonium from this reactor alone is early 1964. However, this schedule assumes that virtually no problems arose in the achievement of reactor criticality or will arise in the operation of the separation and metal fabrication plants or in the fabrication of a nuclear device. Running into even a normal number of difficulties would postpone the date to late 1964 or 1965. If the reactor reached criticality later than early 1962—or has not yet done so—the detonation date would be even further delayed.

7. We believe that the eventual Chinese program calls for nuclear weapons containing both U-235 and plutonium. For such a program, the amount of plutonium which Pao-t'ou could produce would be far too small to be compatible with the amount of weapon-grade U-235 which Lanchou could produce when and if completed. Hence, we believe that the Chinese must at least have planned other plutonium production facilities. We have had photographic coverage of many of

the likely areas for reactor sites without identifying another production reactor, and there is no significant collateral evidence indicating the existence of such a reactor. Nevertheless, it is possible that there are other plutonium production facilities under construction elsewhere in China or, indeed, that such facilities may be in production. In these circumstances, we cannot exclude the possibility that the Chinese could have a first detonation at any time.

#### B. *The Missile Program*

##### *The Research and Development Facility*

8. A missile research and development facility was under construction in the spring of 1959 at Chang-hsin-tien, 16 miles southwest of Peiping. Construction appears to have moved ahead at a good pace since then. Its size indicates that the Chinese are aiming at a substantial independent missile program. It now includes three large static test stands with two large assembly/checkout type buildings, and what appears to be a propellants area. Adjacent areas contain ancillary buildings including several buildings suitable for research and development work. The facility appears suitable for developing surface-to-surface ballistic missiles of up to at least MRBM size and is large enough to permit limited production of missiles. Photography indicates that construction is sufficiently far along for the facility to be in at least partial operation.

9. We do not have comparable evidence on the state of the machinery and instrumentation inside the buildings nor on the ability of Chinese industry to supply the necessary materials and components for a missile development program. The electronics industry is the most advanced of China's technical industries and should be the least hard pressed to supply missile components. More difficulties might be expected in providing special alloys for rocket engines, and high-specification nonelectronic parts.

##### *The Test Range*

10. The second major element of the missile development program is the complex at Shuang-ch'eng-tzu, which includes a missile range, a major airfield and related facilities. The complex appears to be designed to permit the testing of surface-to-air missiles (SAM) and of surface-to-surface missiles (SSM) up to MRBM distances. Handling facilities and instrumentation at the Shuang-ch'eng-tzu airfield are similar to those used in the USSR for testing air-to-air (AAM) and air-to-surface (ASM) missiles. These facilities suggest that AAM and ASM programs were planned by the Chinese but there is no evidence as to the present status of these programs. The complex was started in early 1958 and by mid-1960 the range was far enough along to permit initial

firings for purposes of checking out the missile facilities and range instrumentation and for training Chinese personnel. Construction on the range has been continuing.

11. We do not know the extent to which the USSR was involved in the development of the Shuang-ch'eng-tzu complex. However, the facilities at the complex generally follow Soviet design. We believe that by mid-1960, when the major withdrawal of Soviet technicians had been accomplished, the Soviets had provided the Chinese with some SA-2s, cruise missiles, and SSMs, possibly up to SS-4s (1,020 n.m.).

12. There is no reliable evidence of flight-test firings of missiles occurring much before late 1961 except for some possible firings of shortrange tactical missiles in 1960. We believe some firings occurred in 1962 and 1963 (Photography of June 1962 showing a large crater about 1,500 yards from one of the pads indicates one rather spectacular failure), but the rate of firing can at most have been sporadic and very limited. No evidence of SS ballistic missile deployment has been found.

#### *Defensive Missiles*

13. Sites for coastal defense cruise-type missiles have recently been located at Lien-shan on the Gulf of Liaotung and possibly in an area near Port Arthur. The former may date back to 1959; the latter was still apparently incomplete in May 1963. The missile system at the Lien-shan site is apparently one which the Soviets adapted from their AS-1 missile and which is also being used at Cuban coastal defense missile sites. In March, 1963, there were photographed some 50 crates at Lien-shan which we believe to have contained cruise missiles. Review of earlier photography indicates that at least some of these crates were at Lien-shan in March, 1962. In May, 1963, only 21 crates were photographed. We believe Lien-shan is a training and development area rather than an operational site.

14. Ground photography of February 1963 revealed a probable KOMAR class guided missile patrol boat in Shanghai. KOMARs are equipped with two cruise missiles with an estimated range of 10 to 15 nautical miles and capable of carrying a warhead of 500 to 2,000 pounds of high explosives. We do not know if the Soviets supplied this craft, as they have done for the UAR, Indonesia, and Cuba, or if it is a Chinese-produced version. We have no evidence of a Chinese program to produce KOMARs, but to do so is probably within Chinese capabilities.

15. Communist China has at least 10 SAM sites designed for Soviet SA-2 missiles, not all of which are occupied. We believe that the SAMs now in Chinese hands were supplied earlier by the Soviets. Evidence is scanty but we believe the Chinese are not now producing this type of missile, though they probably plan to produce them in the future.

*C. Prospects*

16. About a year after an initial detonation the Chinese could probably produce their first crude weapon and thereafter produce one or two crude fission weapons a year. This would be the maximum rate unless and until production from the present Pao-t'ou reactor is supplemented from other facilities. The kind of testing program required to develop a missile warhead would consume most of the fissionable material likely to be available from that reactor for the next several years. Further, there are technical problems involved in achieving the reduced weight and size required. Consequently, we think it unlikely that the Chinese will be able to develop a fission warhead for missiles until three or four years after their first nuclear detonation. This could be even longer if the Chinese have only the Pao-t'ou reactor as a source of plutonium.

17. Even before missiles are available Communist China would have some capability for delivering an early unsophisticated nuclear weapon. It has around 15 TU-4 (BULL) piston driven aircraft with large bombbays and a bomb weight capacity of about 20,000 pounds. It has two TU-16 (BADGER) jet medium bombers which, if they are operational, could handle bulky bombs and carry a maximum of about 22,000 pounds. It is not likely that its 315 or so IL-28 (BEAGLE) jet light bombers could handle a bulky, early stage weapon, but they would be usable as more sophisticated weapons were developed.

18. Analysis of existing Chinese facilities and recognition of Pei-ping's need to concentrate its limited resources lead us to believe that the ballistic missile effort will focus initially upon a medium-range system of either the 1,020 n.m. SS-4 type or the 630 n.m. SS-3 type. The range and the facilities at the rangehead are of a scale which suggests an intention to test missiles of this size. Either of these systems would give the Chinese adequate coverage of peripheral targets. Even if the Chinese concentrate on a single system and give the program continued top priority in scientific and technical resources, we do not believe that the missiles would be ready for deployment before 1967. It is unlikely that a compatible nuclear warhead would be available by that date.

*II. IMPLICATIONS FOR CHINESE POLICY**A. Domestic Impact**Economic Burden of the Program*

19. China has relatively few top-flight scientists and is generally short of technical talent and deficient in industrial technology. The advanced weapons program has probably been a heavy drain on these limited resources. Only a very small part of this effort would contribute,

even indirectly, to the other sectors of an economy as underdeveloped as China's now is. In the meantime, other priority industrial programs in China's troubled economy have lagged. It is probable that at least some difficulties would have been eased had China's limited technical capabilities not been channeled so heavily into the weapons program.

#### *Rewards of Success*

20. The detonation of a nuclear device and subsequent moves toward acquiring a nuclear weapons capability would be intensively exploited inside Communist China in an effort to raise morale and increase nationalistic fervor. All the many forms of Peiping's pervasive propaganda apparatus would be put to work extolling the virtues of communism and the capabilities of the Chinese people to "progress without outside help." There would surely be a resultant increase in morale, especially among party members, youth, and the educated classes. Probably the mass of the peasantry would be little affected.

21. Although the Chinese Communist leadership might become intoxicated by its own propaganda following a nuclear detonation and adopt unrealistic domestic policies which could do great damage to the economy, it is much more likely that the effect on domestic programs would not be great. The pressing need for agricultural expansion remains so critical that it will almost certainly continue to receive considerable emphasis, as will industries supporting agriculture. However, the Chinese leaders will almost certainly continue to devote substantial effort to the development and production of advanced weapons, even though the cost of such programs may rise at a faster rate than overall economic growth.

#### *B. Military Policy*

22. Chinese Communist propaganda has generally played down the importance of nuclear weapons in war. The Soviet Union did likewise in the late 1940s, before it had nuclear weapons. This, of course, changed drastically after the USSR became a nuclear power. After Peiping has achieved a detonation and is on its way to getting weapons, it too may change its public attitude on their importance. This slowly developing capability will increase Communist China's already considerable military advantage over its Asian neighbors. However, even if it completes the program we believe was contemplated in the late 1950s, for the foreseeable future Communist China will not approach the advanced weapons might of the US or USSR, particularly in the field of long-range striking power. For this reason, among others, Peiping would be unlikely to attribute a decisive importance to modern weaponry. The regime would probably still rely primarily on its huge ground force and, unless confident of Soviet support, would try to avoid hostilities which might escalate into nuclear war. Considering

the chances of retaliation, it is difficult to conceive of any situation in which Peiping would be likely to initiate the use of nuclear weapons in the next decade or so.

*C. Foreign Policy*

23. Peiping will be sure to exploit its achievements to the hilt in its extensive propaganda. It will probably try to confuse the distinction between a simple detonation and a weapons capability and between having a small weapons capability and being a major nuclear power. Also the Chinese might well use a prototype MRBM, with one or more additional stages, to place a satellite into orbit. This could be accomplished some time before an MRBM was operable and well before such a system was nuclear armed. The purpose, of course, would be to give the impression of much greater strength than had actually been acquired and to persuade the people of neighboring countries that Peiping was riding the wave of the future which it was futile to resist. At the same time Peiping would work to persuade audiences in other underdeveloped countries that Chinese-style communism provides the most effective and rapid way to become a modern industrial, scientific, and military power.

24. A Chinese Communist nuclear detonation would increase the momentum of Peiping's drive for great-power status and acceptance in international councils. Peiping would argue that it is less dangerous to have a nation with nuclear arms in the UN and other international bodies than to keep it isolated, and would be in a position to claim persuasively that substantial progress toward world peace and disarmament was seriously hampered unless it participated in negotiations. Peiping has already gone on record as not being bound by any agreements made without its participation. It would demand international recognition, UN membership, or other prerequisites as the price of its participation. In any event, Communist China would reject a comprehensive nuclear test ban treaty.

25. We do not believe that the explosion of a first device, or even the acquisition of a limited nuclear weapons capability, would produce major changes in Communist China's foreign policy in the sense that the Chinese would adopt a general policy of open military aggression, or even become willing to take significantly greater military risks. China's leaders would recognize that their limited capabilities had not altered the real power balance among the major states and could not do so in the foreseeable future. In particular, they would recognize that they remained unable either to remove or neutralize the US presence in Asia.

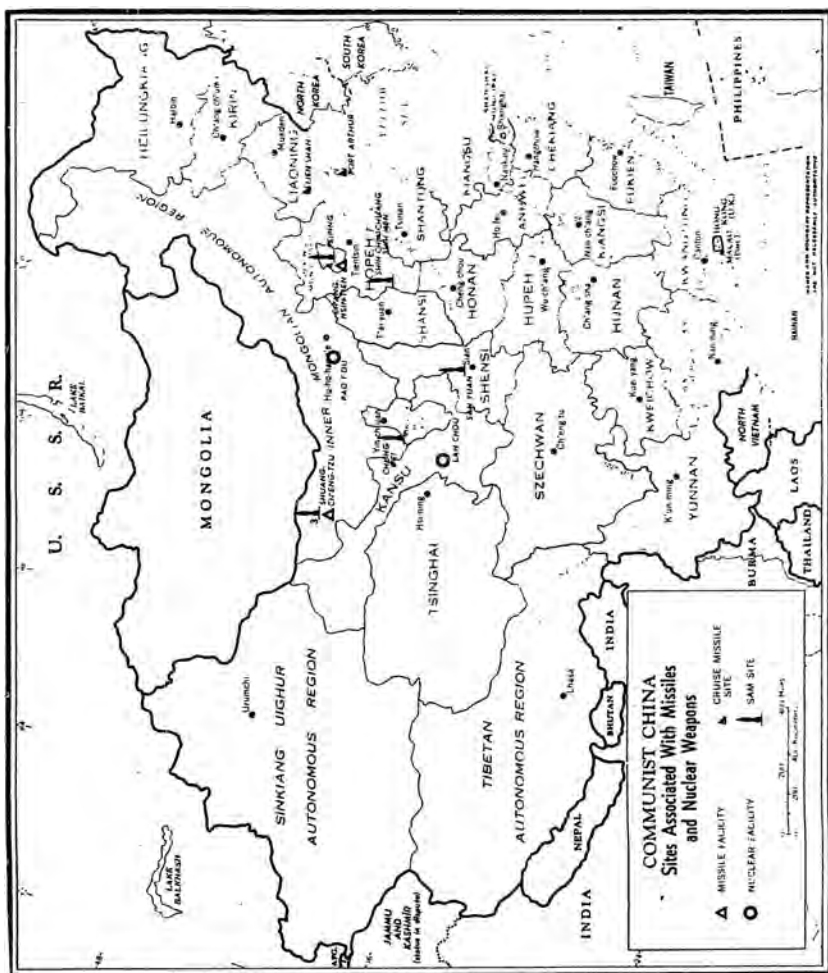

26. Nevertheless, the Chinese would feel very much stronger and this mood would doubtless be reflected in their approach to conflicts

on their periphery. They would probably feel that the US would be more reluctant to intervene on the Asian mainland and thus the tone of Chinese policy would probably become more assertive.<sup>4</sup> Further, their possession of nuclear weapons would reinforce their efforts to achieve Asian hegemony through political pressures and the indirect support of local "wars of liberation." Such tactics would probably acquire greater effectiveness, since the Chinese feat would have a profound impact on neighboring governments and peoples. It would alter the latter's sense of the relations of power, even if it made little immediate change in the realities of power, and to a greater or lesser degree would probably result in increased pressures to accommodate to Chinese demands.

27. The foregoing assumes that the Communist Chinese leaders will react rationally to their nuclear and missile achievements. On balance we believe that they will. Nevertheless we do not exclude the possibility that Peiping's leadership might overestimate China's capabilities dangerously and embark on radical new external courses.

---

<sup>4</sup> "The Acting Director, Bureau of Intelligence and Research, Department of State, feels that the first two sentences of this paragraph are inconsistent with paragraph 25 and that there is insufficient evidence to warrant such a definite statement about the Chinese appraisal of our intentions."

## SUBJECT

Defense Intelligence Agency (DIA)

Historical events having a bearing on the integration of military intelligence and on the ultimate establishment of DIA included: the 1946 Congressional Hearings on Pearl Harbor, which criticized the Army and Navy for not coordinating their intelligence effectively; the Doolittle Committee Report of 1954 and the Hoover Commission Report of 1955, both of which suggested the need for greater unification of intelligence efforts within the Defense establishment; the Reorganization Act of 1958, which established the Joint Chiefs of Staff in the chain of command running from the President through the Secretary of Defense to the JCS and then directly to the commanders of the unified and specified commands; the 1958 recommendation of President Eisenhower's Foreign Intelligence Board that a single office be established within the Department of Defense for all official dealings between Defense and CIA for the planning of both hot war and cold war operations having military implications; the Joint Study Group Report of December 15, 1960, which called for the establishment within OSD of a focal point for exerting broad management review authority over military intelligence programs and for providing over-all coordination of all foreign intelligence activities conducted by various Defense components; the January 1961 recommendation of President Eisenhower's Foreign Intelligence Board that military intelligence be brought into conformity with the Defense Reorganization Act of 1958; the approval by the President on January 18, 1961 of a National Security Council Action which called for the establishment, after study by the Joint Chiefs of Staff, of an integrated intelligence entity under the Secretary of Defense; and the July 1961 recommendation of President Kennedy's Foreign Intelligence Advisory Board that the President endorse the proposals which the Board had considered for the consolidation and centralized management of a variety of military intelligence activities through the establishment of a Defense Intelligence Agency in the Department of Defense.

Based on the foregoing, the Secretary of Defense on August 1, 1961, issued a directive establishing the DIA effective October 1, 1961.

---

<sup>1</sup> Provides background information on the Defense Intelligence Agency. No classification marking. 2 pp. Kennedy Library, National Security Files, Departments and Agencies Series, CIA Gen, 4-3/63.

Following the issuance of the basic directive by the Secretary of Defense, steady progress has been made by the DIA in meeting two of the major objectives involved: (1) the exercise by DIA of over-all management and direction of the intelligence activities of the Department of Defense, and (2) the strengthening of the intelligence capabilities of the unified and specified commands. While the assumption of DIA's total responsibility is an evolutionary one, improvements in the military intelligence posture are already in evidence in such areas as the reduction of undesirable duplication of effort among Defense intelligence elements; the central processing of the intelligence needs of the military services and commands; the close coordination of military intelligence activities with other components of the total U.S. intelligence effort; and the economical and effective consolidation of intelligence training and orientation previously provided by the several military services.

Under the guidance of the Secretary of Defense and the Joint Chiefs of Staff, and in keeping with Presidentially-approved recommendations of the President's Foreign Intelligence Advisory Board, measures continue to be taken by the DIA on a phased basis with a view to establishing and maintaining the capability to discharge its responsibilities for the integration, management and control of a consolidated military intelligence program geared to meet the requirements of national defense and security.

299. Memorandum from Maj. Smith to Gen. Taylor,  
September 20<sup>1</sup>

September 20, 1963

SUBJECT

State of the World

1. Mr. Rostow has written an extremely interesting and provocative paper dealing with two questions: (1) What accounts for the odd state of affairs of the world today, and (2) what should we do about it? I have redlined its key portions.

2. Mr. Rostow attributes the present situation to five factors: (1) the diffusion of effective power away from both Moscow and Washington; (2) the easing of tensions following the Berlin and Cuba crises; (3) the impact on the rest of the world of recent US-Soviet negotiations; (4) reduced fear of communism as a result of Khrushchev's setbacks in his post-SPUTNIK adventures; and (5) the Sino-Soviet split.

3. To meet this changed situation, Mr. Rostow suggests: (1) continuing an even greater US military presence abroad; (2) increased use of foreign aid for political purposes; (3) continued muted ideological conflict to dramatize the limits of the *détente*; and (4) more Western collective enterprises, including continued support for the MLF, moves toward a common strategy, and increased NATO political consultation.

4. Mr. Rostow's analysis of the present state of the world is better than his suggestions as what we should do about it, his description better than his prescription. As he admits, only one of the trends he mentions seems long term—the diffusion of power; the remaining items are essentially manifestations or derivatives of this central trend. Nonetheless, the diffusion of power thought is so compelling and on the mark that alone it provides an adequate base point for describing the unfolding state of the world. The US is confronted with a centrifugence of power, thus the disappearance of the bipolar world; and we must learn how better to deal with the new environment.

5. With respect to Mr. Rostow's prescriptions, intuitively there seems something wrong with suggestions which add up to a conclusion that we should face a changed world situation with policies of "more

---

<sup>1</sup> Comments on Rostow's paper on the present state of the world. Confidential. 3 pp. National Defense University, Taylor Papers, 40B2-B4.

of the same.” It implies that we have a “policy for all occasions”, one capable of handling any contingency, one like the proverbial speech, available to influence any audience on any subject. To me, such a condition can only mean (1) that our policies have been wrong in the past, (2) that they are so general in nature that they are not very useful at any particular time, or (3) that they are wrong for the future. I tend to accept the last alternative.

6. Few of the key policies mentioned by Mr. Rostow seem to recognize the diffusion of power, of which he speaks. Redistribution can only give smaller nations more latitude in their policies. Governments which want freedom of choice will not accept the firm political commitments to the West inherent in the permanent stationing of US forces on their soil. Nations in the middle will see themselves increasingly in a buyer’s market with respect to aid; they will choose the product with the fewest political strings. Finally, the MLF cannot satisfy the major European’s desire for a greater voice in nuclear matters unless the present US proposal is modified. Stripped to its essentials, our present MLF proposal is nothing more than an effort to extend the life of the US veto over the nuclear forces of NATO, while making the Europeans pay part of the nuclear bill.

7. Rather than planning to ride tired horses faster for another decade, we should seek new approaches. One approach would be to go the route of diffusion, accepting it and trying to mold it to our own purposes. Under this alternative, we should more and more substitute mobility exercises and temporary appearances for permanent military presence. We should accept that foreign aid will be increasingly used for economic rather than for political purposes; indeed, we should encourage this trend to diminish any growing political influence at our expense of our Allies, whom we wish to share a larger burden of economic (and eventually military) assistance, but whose policies may diverge from ours. We should support, if not encourage, measures which give Europe nuclear interdependence rather than nuclear servitude; the alternative is their aloof independence. We should slowly seek to expand trade between East and West within the limits of economic and political prudence, recognizing that this could have a multiplier effect on our Allies. (Economically, it used to be said that if we sneezed, Europe got pneumonia. This same effect may work in reverse with trade.) We should investigate international monetary mechanisms available to help solve the problems for other nations we will create by improving our own balance of payments position.

8. The fundamental rationale for such a policy is that, with the winds of change in the air, a policy of *status quo* that is blown over can only create greater uncontrolled change and chaos than could be the case. We should instead seek controlled instability through policies

accepting and encouraging moderate change. Key elements of such a policy as outlined in the previous paragraph would be greater engagement with the East, a further melting of the cold war, and fewer permanent overseas forces and bases.

9. An alternative to the policy described above would be to continue to apply, indeed even increase, pressure on the Bloc and thus attempt to maintain a bipolar world in all important matters through the medium of allocating such enormous resources to the East-West conflict that the efforts of the rest of the world would be dwarfed. The diffusion of power would be exploited to make the Bloc more subject to piecemeal attack—politically, and if necessary, in some cases, e.g., Red China, perhaps militarily. Our policy would in some respects resemble the course we followed in the World War II mobilization. We would make large material sacrifices in the short run to assure ourselves greater freedom in the long run. The over-all objective would be to place such strains on the Bloc's already precarious economic balance that the principal regimes would collapse from within. We would then be prepared to step in with a Marshall Plan to rehabilitate the Bloc in a non-communist image.

10. One or the other of the courses above—developed and refined—which recognizes and uses the changing distribution of power, would seem preferable to Mr. Rostow's suggestions. Given our American ethic, the first alternative seems the only acceptable route, but the second merits evaluation.

CM-946-63

October 15, 1963

SUBJECT

U.S. Support of Foreign Paramilitary Forces

1. Developments inimical to the best interests of the United States which have recently occurred in Vietnam and in Honduras may be attributed in some measure to the existence and improper employment of paramilitary units, other than the regular armed forces, which have been developed with U.S. support. In Vietnam, elements of the Special Forces have been used by the Diem regime as a political police for purposes of repression. In Honduras, the Civil Guard has been regarded as a political army of the ruling Liberal Party. In the latter case, the basic conflict of interest between the politically oriented paramilitary force and the regular armed forces appears to have been a substantial factor in the overthrow of constitutional government.

2. The fact that the Honduran Civil Guard was a political instrument of the Liberal Party was not unknown to the United States, nor was the fact that serious friction, involving armed clashes between personnel of the Civil Guard and the armed forces, had existed for some time. Nevertheless, U.S. training and material assistance were still provided for continued development of the Guard.

3. The events which have now taken place in Honduras bring into question the advisability of our having pursued a policy leading to the development of rival centers of armed power within the country, and suggest that U.S. programs in other countries should be reviewed to determine whether similar potentially dangerous situations are being fostered. I recommend that such a review of programs in countries on the critical list be accomplished by the interagency working groups which monitor internal defense plans, and that the results be reported to the Special Group.

**Attachment****SOVIET CAPABILITIES FOR  
STRATEGIC ATTACK****THE PROBLEM**

To estimate probable trends in the strength and deployment of Soviet weapon systems suitable for strategic attack, and in Soviet capabilities for such attack, projecting forward for about six years.<sup>2</sup>

**SUMMARY AND CONCLUSIONS***Trends in Strategic Attack Forces to Mid-1965*

1. The Soviet leaders look upon long range strike forces as a major element of their strategic position, intended to support their political objectives, to deter the West from resort to military action, and to fight a war should one occur. The available evidence supports the view that they are attempting to build forces which they regard as appropriate to these objectives rather than forces with which they could launch a

<sup>1</sup> "Soviet Capabilities for Strategic Attack." Printed in part in the print volume as Document 144. Top Secret; Restricted Data; Controlled Dissem. 58 pp. CIA Files, Job 79R01012A, ODDI Registry.

<sup>2</sup> The weapon systems considered are ground-launched missiles with ranges of 600 nautical miles or more, submarine-launched missiles, heavy and medium bombers, air-to-surface missiles, and advanced delivery and supporting systems such as orbital and suborbital vehicles.

deliberate attack on the West and count on reducing retaliation to levels that would be in any sense tolerable. (Paragraph 34)

2. Current Soviet military doctrine holds that a general war could begin with little or no warning, stresses the critical importance of the initial period in determining its outcome, and asserts that enormous advantages accrue to the side striking the first blow. However, the official doctrine also holds that the initial nuclear exchange might not determine the outcome, and that in any event large theater forces are necessary to prosecute a general war successfully. These views, when related to the strategic capabilities now deployed and programmed by the West, impose high and complex requirements upon the Soviet military establishment. Among the chief constraints in meeting these requirements are cost and skilled manpower. The Soviet strategic posture has also been heavily influenced by a concentration on the Eurasian theater, and by an apparent lag in military thinking on the implications of advanced weapons. Soviet military policy and doctrine have been considerably modified in recent years, and the process of change is continuing. However, for the immediate future, Soviet forces for long range attack will be characterized by capabilities against Eurasia far exceeding those against North America. (Paragraphs 35–37)

3. *ICBM Forces.* Evidence acquired during the past year has led us to modify our estimates as to the size and composition of the Soviet ICBM force in the near term. The most important single development was the interruption of the deployment program during the summer and fall of 1962. The primary reasons for this interruption appear to have been technical, including a probable modification to the second-generation SS-7 ICBM system and persisting difficulties in development of the SS-8. Whatever the reason, however, it is clear that 1962 was a year of reappraisal, in which Soviet planners apparently made important new decisions with respect to their ICBM program. Some of these, for example curtailment of SS-8 deployment, are already evident. For the near term, the result is a somewhat smaller force than previously estimated. (Paragraphs 39–40)

4. We have now identified a total of 18 ICBM complexes, all of which were begun before December 1961. The complexes now contain a total of about 220 launchers in various stages of construction. We estimate that 105–120 ICBM launchers, including about 20 hard silos, were operational as of 1 October 1963.<sup>3</sup> An additional 15 launchers were probably operational at Tyuratam.

---

<sup>3</sup> The Assistant Chief of Staff Intelligence, USAF, estimates that 145–160 ICBM launchers were operational as of 1 October 1963. See his footnote on page 15 at paragraph 60.

5. Of the three Soviet ICBM systems now in the field, the SS-7 has been the most successful in development and is the most widely deployed. Deployment of the large, first generation SS-6 was limited to four launchers at one complex. Deployment of the SS-8 had extended to four complexes before the program was interrupted. However, SS-8 deployment has now been curtailed, and it is believed that expansion of the ICBM force over the next year or so will be primarily in terms of the SS-7.

6. We estimate the number of Soviet ICBM launchers operational in mid-1964 at 205–235, and in mid-1965 at 250–350 (these totals include some 20–25 launchers at Tyuratam).<sup>4</sup> The force in this period will consist almost entirely of second-generation ICBMs; a few new type ICBMs could be operational by about mid-1965. We now believe that the SS-8, which we previously considered might be a very large missile, is comparable to the SS-7 in payload capacity.<sup>5</sup> At present, both of these ICBMs probably carry [text not declassified] warheads; initial deployment of [text not declassified] warheads with these ICBMs could begin in 1964. If new nosecones are developed, improved second generation missiles armed with higher yield warheads [text not declassified] could enter service by 1965, and the few SS-6's in the field could be retrofitted to carry [text not declassified]. Thus, it is probable that the great bulk of the Soviet ICBM force through mid-1965 will carry warheads in the 3–6 MT range. By mid-1965, the accuracy of the bulk of the force can probably be improved to about 1.0 n.m. CEP; if new guidance systems are introduced, some portion could achieve CEP's of 0.5–1.0 n.m.

7. The Soviet ICBM force represents a formidable nuclear delivery capability, but cannot maintain a constant readiness state approaching its US counterpart, and is vulnerable since about 80–85 percent of the present force is in soft sites. Successive modifications of soft sites have probably brought some improvement in reaction time, but procedures are still relatively slow, cumbersome, and complicated. We estimate that by mid-1965, about one-third of the ICBMs will be in hard silos, enhancing both the survivability and the reaction time of the force.

8. *MRBM/IRBM Forces.* We have now identified about 675 launch positions for the 1,050 n.m. (SS-4) MRBMs and 2,200 n.m. (SS-5) IRBMs,

---

<sup>4</sup> The Assistant Chief of Staff Intelligence, USAF, estimates 215–250 operational ICBM launchers by mid-1964, and 300–350 by mid-1965. See footnote, page 15.

<sup>5</sup> The Director, Defense Intelligence Agency and the Assistant Chief of Staff, Intelligence, USAF, believe that a confident selection between possible SS-8 delivery capabilities cannot be made at this time. In their opinion, available evidence and analysis do not permit excluding the possibility that the SS-8 may carry a nosecone of 10,000 lbs or a little more. [text not declassified]

of which almost 600 are soft and the remainder are deployed in hard silos. Considering the target coverage and geographic disposition of the force, together with evidence of a cessation or slowdown in site construction, we believe that deployment of MRBMs and IRBMs in the USSR is about complete. We therefore estimate that by mid-1964 this force will have levelled off at about 700–750 launch positions, including 90–110 in hard silos. Soviet MRBMs and IRBMs can presently carry warheads with maximum yields of 2–3 MT.

9. We continue to have difficulty in understanding the Soviet rationale for building such a massive capability to attack European targets. One factor influencing Soviet decisions was undoubtedly the strategic emphasis on Europe, and the concept of a hostage Europe probably played a part. Soviet planning to strike a wide variety of targets, including some in support of the theater forces, may also have exerted an upward pressure on the size of the force, particularly if most of these missiles were to be equipped with kiloton warheads. Finally, a contributing military factor may have been a desire to attain survivability through numbers. (Paragraph 65)

10. We now believe that virtually all MRBM and IRBM launch sites are primary firing positions, i.e., positions which are manned and equipped to participate in an initial salvo. There has been much evidence that the Soviets intend to provide a substantial refire capability for this force, and our evidence on missile production indicates that, by mid-1965, each soft site could have a second-salvo missile available. The same operational deficiencies which characterize the Soviet ICBM force—vulnerability, slow reaction time, and cumbersome procedures—appear in Soviet MRBM and IRBM forces. These have been alleviated somewhat by deployment of a part of the force in hard silos. A further improvement may be made by introduction of an improved missile system. We believe that a new MRBM could be operational in small numbers by mid-1965. (Paragraphs 68–73)

11. *Submarine Missile Forces.* Current Soviet submarine missile forces are the outgrowth of decisions taken in the middle 1950's to develop quickly a fairly extensive but unsophisticated capability. The USSR now has about 50 ballistic missile submarines, including 11 of the nuclear-powered H class; all are equipped with short range (350 n.m.) missiles capable of delivering warheads of [text not declassified]. The mission originally envisaged for these submarines probably included participation in initial strategic attacks. However, they have now evidently been assigned to second-strike roles, partly because of the growth in numbers of ground-launched systems, but probably also because of Soviet recognition of their limitations. Although this force represents a considerable potential threat, its operational effectiveness is limited by the small number of missiles per submarine (2 or 3), the

short range of the missiles, the need to surface before launching, the operational limitations of the diesel-powered units, and the unreliability of some nuclear powered units. These shortcomings probably account for the continued absence of essential operational training cruises to likely combat areas. (Paragraphs 74–76)

12. There is evidence that the Soviets recognize these deficiencies and that improved missiles and submarines will become operational in the near future. Development is far advanced on a new 700 n.m. ballistic missile designed for submerged launching. This missile will almost certainly be incorporated in any new class of ballistic missile submarine which appears in the near future; it could possibly be retrofitted into existing types as well. While we have no direct evidence, it seems probable that at least one new submarine class (either nuclear or diesel-powered) is under development to employ the new missile and that the first units could enter service in the near future. It is likely that new designs will incorporate more than the three missile tubes carried by the older classes. We estimate that by mid-1965 the Soviet force of ballistic missile submarines will have grown to a total of 55–65, including some 15–20 nuclear-powered submarines. (Paragraphs 86–87, 88–89)

13. In addition to ballistic missile submarines, the USSR now has operational some 19 submarines capable of surface launching 300 n.m. cruise missiles. Six of these are nuclear-powered E class, each equipped with six launchers; the rest are diesel-powered units equipped with two or four launchers each. This system was designed primarily for low altitude (1,000–3,000 feet) attack on ships at sea, but it can also be employed against land targets. We believe that the Soviets may now be placing additional emphasis on the cruise missile submarine program. We estimate that by mid-1965 this force will have grown to 25–30 submarines, including 10–12 nuclear-powered. (Paragraphs 82–85, 88–89)

14. Thus, we believe that in the near future the Soviets will bring into service submarine weapon systems better suited to attacks on Eurasian and North American land targets as well as Western naval forces at sea. Further, we continue to believe that by the mid-1960's at least some Soviet missile submarines will be engaging in routine patrols in open ocean areas. (Paragraphs 75, 90–93)

15. *Long Range Bomber Forces.* Continued investment in improving Long Range Aviation indicates that the USSR plans to maintain sizable bomber forces for at least the near term. Improvements over the past few years include introduction of a new medium bomber, introduction of air-to-surface missiles, and improved aerial refueling capabilities. Maritime reconnaissance is a secondary role of Long Range Aviation, and the use of both heavy and medium bombers in this role has been increasing. (Paragraph 94)

16. We estimate that Long Range Aviation comprises about 180–205 heavy bombers and tankers and 940–975 medium bombers and tankers. The heavy bomber force includes 95–105 BISON jet bombers and 85–100 BEAR turbo prop bombers. Of the medium bombers, about 40–50 are BLINDER, with supersonic dash capability, and the remainder are BADGERS. There are an additional 360–370 BADGERS and 10–20 BLINDERS in Naval Aviation. BLINDER is the only bomber known to be in current production, but there are indications that there may be some new production of BEAR in addition to modification. Although research and development on heavy aircraft is under way, no replacement for BEAR or BISON is in sight, and we consider it highly unlikely that a new heavy bomber could enter inventory before 1966. We estimate that in mid-1965 Long Range Aviation will comprise 170–200 heavy bombers and tankers and 825–925 medium bombers and tankers.<sup>6</sup>

17. Soviet Long Range Aviation, by reason of its equipment, basing, and deployment, is much better suited for Eurasian operations than for intercontinental attack. The capabilities of the BISON and BADGER aircraft which make up the bulk of the force are restricted by their limited range. The emphasis on aerial refueling and Arctic training of the past several years reflect Soviet efforts to overcome this limitation on capabilities for intercontinental attack. (Paragraphs 99–104)

18. In view of the training patterns of recent years, the capacity of the principal Arctic staging bases, and the range capabilities of Soviet bombers, we believe that an aircraft attack against the US (except Alaska) would involve heavy bombers almost exclusively. Considering the requirements for Arctic staging and refueling, and allowing for non-combat attrition, we estimate that, by committing their entire heavy bomber force to this mission, the Soviets could put 90–115 of these aircraft over the US on two-way missions. The scale of an initial intercontinental attack could be increased by the use of refueled BADGERS on two-way missions. Considering all operational factors, we estimate that the Soviets could put up to 150 of these medium bombers over target areas in Greenland, Canada, Alaska and portions of north-

---

<sup>6</sup> The Assistant Chief of Staff Intelligence, USAF, estimates the medium bomber/tanker force level for mid-1965 at 925–1025 aircraft. He considers the heavy bomber/tanker force will remain at approximately 200 aircraft although the BEAR/BISON mix may vary somewhat. Introduction of a longer endurance aircraft based on the BEAR could begin in late 1964 or early 1965. See his footnote to Page 23, paragraph 98 of the Discussion.

western US. Initial attacks would probably be mounted in successive waves and extend over a considerable number of hours.<sup>7</sup>

*Trends in Strategic Attack Forces, 1966–1969*

19. No well-defined strategic concept appears to have governed the long range strike forces which the Soviets have deployed to date, but a number of characteristics can be discerned in the building of these forces. Research and development programs have been vigorous. In contrast, the scale and pace of deployment programs have been uneven. This behavior has reflected, in part, technical problems and economic constraints, but it also suggests that the USSR is willing to tolerate a condition of limited intercontinental capabilities and considerable vulnerability over a long period of time. (Paragraph 125)

20. Perhaps the most consistent patterns apparent in Soviet policy toward long range strike forces over the past several years are to be found in the increased allocation of resources to this mission, the numerical expansion of these forces, the improvement of various weapon systems for long range attack, emphasis on high yield weapons, and continuing interest in diversified capabilities. During this period, emphasis has shifted from weapon systems best suited for Eurasian use to intercontinental systems. Our estimates for the next two years suggest, in the main, a continuation of these broad trends. The forces which we project for mid-1965 are stronger, both numerically and qualitatively, but they represent no substantial change in the overall strategic posture of the USSR *vis-à-vis* the West. (Paragraphs 126–128)

21. The prospects for the later 1960's are far less clear. We believe that the desire for an effective deterrent will remain one of the primary concerns of Soviet policy. None of the evidence available to us suggests, however, that the USSR contemplates forces designed to neutralize US strike forces in a single blow, nor do the Soviets appear to be seeking to match the US in numbers of delivery vehicles. Other programs, particularly strategic defense and space, will continue to compete with strategic attack programs, not only for resources but for scarce skills and quality materials. In general, we believe that the USSR would have great economic difficulty in pursuing a policy which called for antimissile defenses of major cities, competition with the US in space,

---

<sup>7</sup> The Assistant Chief of Staff Intelligence, USAF, considers this paragraph seriously underestimates the manned aircraft threat to the continental United States. In the event war should eventuate and the USSR attacks the United States with nuclear weapons, he believes this will be an all-out effort aimed at putting a maximum number of weapons on US targets. He would therefore estimate that the number of aircraft, including BADGERS on one-way missions, could exceed 500. See his footnote to Page 22, 23, Paragraph 102 of the Discussion.

and the higher sides of our estimates for long range strike forces which appear below. (Paragraphs 130–135)

22. Soviet long-range strike forces could also be heavily affected by political factors. In the present and prospective strategic situation which confronts the USSR, there is much which argues for a policy of safeguarding national security through some fairly moderate level of military strength or even, more radically, through international agreements to limit or reverse the arms race. Moreover, Khrushchev's advocacy of higher priority for certain civilian economic programs appears to be growing stronger. These political and military considerations suggest, not that the Soviets will cut back on their strategic programs, but rather that they are unlikely to undertake large-scale programs on a crash basis. Indeed, current trends in development and deployment indicate that in the absence of an arms limitation agreement, the Soviets will continue improving their capabilities, but at a moderate pace. In framing the estimates which follow, we have attempted to take into consideration the various factors—strategic, economic, military, political, and technical—which could influence the size and composition of Soviet long range strike forces deployed by mid-1969. (Paragraphs 136–138)

23. *The ICBM Force.* Our analysis of Soviet programming to date, and of the possible impact of new systems as well as other factors, indicates that by mid-1969 the USSR probably will have acquired a force of some 400–700 operational ICBM launchers.<sup>8 9</sup> Currently operational systems will still make up the largest part of the force, but it will probably also include significant numbers of follow-on or improved ICBMs. In general, any new ICBM systems to be deployed in quantity during the 1960's would need to be under development already or to begin development shortly. (Paragraphs 139–141, 151, 155, 164)

24. We believe that the Soviets are most certainly engaged in both improvement of existing ICBM systems and development of new systems, as well as to a continuing space effort. However, the available evidence does not indicate the specific nature of planned improvements to existing ICBMs or of follow-on systems. Our views on the Soviet need to correct current deficiencies, on tendencies in Soviet missile

---

<sup>8</sup> The Assistant Chief of Naval Operations (Intelligence), Department of the Navy, believes the force level is likely to be toward the low side (400) of the estimate presented here. See his footnote to paragraph 153, page 33, of the Discussion.

<sup>9</sup> The Assistant Chief of Staff Intelligence, USAF, considers the Soviet ICBM force by mid-1969 could range from 600 to as high as 1,000 operational ICBM launchers, depending on whether a new, small, easily-deployed system is introduced in the 1965–1966 period. See his footnote to the Table on page 33, paragraph 153 of the Discussion.

design, and on Soviet technical capabilities heavily affect our judgments about likely new and improved systems.

a. *Very Large ICBMs.* We continue to believe that the Soviets are developing a large vehicle (with a million or more pounds of thrust), which could be used as a space booster, as a "global" rocket, or as a carrier for warheads yielding up to 100 MT. If test firings begin within the next few months, such a large vehicle could probably have an initial operational capability as an ICBM in the period mid-1965 to mid-1966. Initial deployed sites would probably be soft, but the Soviets might find it feasible to incorporate hardening at some stage in the program. (Paragraph 144)

b. *Standard-Size Follow-on ICBMs.* We believe the Soviets would consider the primary qualitative improvements needed in the bulk of the ICBM force to be increased survivability, shorter reaction time, higher accuracy, and decreased logistic and personnel support. These requirements can probably be met almost as well, and at much lower cost, by improvement to the SS-7 as by a follow-on system in its general weight class. Improved SS-7's may be deployed in new configurations, possibly including semi-hard or single-silo hard sites. (Paragraphs 145-146)

c. *Smaller Follow-on ICBMs.* Soviet development of an ICBM system similar to the US Minuteman would run counter to trends thus far discernible in Soviet long range missile systems, and Soviet technology necessary for large grain solid propellants is weak. However, some of the operational attributes of the Minuteman concept would reduce the main deficiency in the Soviet force—namely its vulnerability to US attack—and might also reduce maintenance requirements. A new missile somewhat smaller than SS-7 and using improved propellants could reach operational status during the period. We believe it likely that such a new smaller missile would be deployed in hard sites. We believe that test firings of such a new smaller missile would not start for about a year and that operational launchers would not exist at deployed sites until 1966-1967. Should the Soviets elect to deploy a new missile in soft or semi-hard sites, test firings could begin in the near future, with an initial operational capability occurring in about mid-1965. (Paragraphs 147-148)

25. We believe that deployment of currently operational missiles in soft launch sites will cease by the mid-1960s. The low side of our estimate for 1969 (400 launchers) assumes that, in addition to deployment of a few very large ICBMs which begin to enter operational inventory in mid-1966, the Soviets will at about the same time introduce either a new, somewhat smaller ICBM or an improved SS-7, possibly in single-launcher hard sites. A moderate buildup of this sort, with emphasis on hardening, would in our view be consistent with a Soviet

effort to maintain and improve the credibility of its deterrent. The reasons why the Soviet force might develop in this manner include such economic considerations as the need to devote more resources to the civilian economy or to anti-missile and space programs as well as political factors. (Paragraph 151)

26. The high side of our estimate for mid-1969 (700 launchers), takes into account the possibility that the deployment of soft launchers, perhaps including some semi-hardened sites, is carried somewhat further than in the preceding alternative; that a very large system is introduced somewhat earlier than 1966; and that over 200 launchers of a new type—an improved SS-7 or a new, somewhat smaller hard system, possibly in single silo sites—are deployed. Such a buildup might reflect not only a Soviet concern for deterrence, but also an effort to put the USSR in a somewhat better position to undertake a preemptive attack if a Western strike appeared imminent and unavoidable. (Paragraph 152)

27. Although the force levels indicated by the upper and lower limits of the range are derived from technical and strategic considerations, other force compositions and force levels within this general range are equally possible. The Soviets would recognize that forces within this range fell far short of those required for a preemptive attack which might reduce devastation of the USSR to an acceptable level, but in any case, the force would include a protected component capable of devastating retaliatory blows if it survived. (Paragraph 153)

28. *MRBM and IRBM Forces.* We believe that Soviet MRBM IRBM force levels will remain fairly constant in the 1966–1969 period at about 700–750 launchers. The developments which we can foresee in Western forces are not likely to add to potential Soviet MRBM IRBM targets in a major way, although we do not exclude the possibility that a general strengthening of NATO forces would result in some incremental expansion. Improvements in Soviet MRBM IRBM capabilities in this period are more likely to be qualitative than quantitative. The Soviets may be developing a new MRBM, and it is possible that they also contemplate a new IRBM. If two separate systems are developed, the IRBM would probably phase in a year or so after the MRBM, i.e., in about 1966–1967. It is also possible that the Soviets have elected to work toward a single follow-on system which could cover all MRBM and IRBM ranges. In either event, follow-on systems are likely to feature hard or possibly mobile deployment. If, as we estimate, the size of the force remains fairly stable, improved systems will be deployed to supersede present systems, and may have largely replaced currently operational MRBMs by 1969. (Paragraphs 154–158)

29. *Submarine Missile Forces.* We think that the Soviets will continue to consider missile submarines an important adjunct to their ground-

launched missile capabilities, and we expect the requirement for capabilities to attack surface naval formations to continue. Thus we estimate continued construction of both ballistic missile and cruise missile submarines in this period. Although we have no specific evidence, we believe that longer range submarine-launched ballistic missile systems could become operational in about the 1966–1967 period. We do not anticipate significant technical changes in the cruise missile submarine force. (Paragraphs 159–163)

30. The size of Soviet missile submarine forces will depend upon a number of factors including the availability of militarily competitive but less expensive delivery systems (especially hardened ICBMs), construction capabilities, and allocation of nuclear submarines to other naval missions. Considering all factors, including estimated construction programs and the possibilities for improved systems, we believe that by 1969 the Soviets will have 65–80 ballistic missile submarines operational, of which 25–35 will be nuclear-powered. At that time, we estimate a cruise missile submarine force of 40–60 of which 20–30 will be nuclear-powered. (Paragraph 164)

31. *Long Range Bombers.* We estimate that by 1969 Long Range Aviation will have gradually declined in total strength to about 130–175 heavy bombers and tankers and 400–650 medium bombers and tankers. We believe that it will still consist of aircraft types now in service: BISONs, BEARs, BADGERs, and BLINDERs, with the last of these comprising about half of the medium bomber force. Considering the types and quantities of missile delivery systems they are likely to have, as well as the probable continued availability of existing heavy bomber types, we think it unlikely that the Soviets will bring any follow-on heavy bomber to operational service in the period of this estimate. However, the Soviets have the technical capability of developing and producing new, high-performance military aircraft of intercontinental range for operational use in the 1966–1969 period, should they come to consider this necessary or worthwhile. In the later 1960s they would probably employ bomber forces in follow-on, rather than initial attacks, and for increasingly specialized missions.<sup>10</sup> (Paragraphs 165–166)

---

<sup>10</sup> The Assistant Chief of Staff Intelligence, USAF, disagrees with this paragraph since he thinks that the Soviets will continue to consider manned strategic aircraft an important adjunct to their ground launched missile capabilities. He estimates that the USSR will introduce a follow-on heavy bomber. He further estimates the heavy bomber force will remain at about 200 or somewhat larger, depending on the timing of an expected follow-on bomber, and that by mid-1969 the medium bomber/tanker force probably still will include about 900 aircraft. See his footnote to the Table on page 36 and to paragraph 167.

32. *Space Weapons*. On the basis of evidence presently available, we are unable to determine the existence of Soviet plans or programs for the military use of space. However, we believe that the USSR almost certainly is investigating the feasibility of space systems for military support and offensive and defensive weapons. For accomplishing military missions, we think that during the 1966–1969 period, orbital weapons will not compare favorably with ICBMs in terms of cost and effectiveness. Based on these considerations as we now understand them, it would appear unlikely that the Soviets will during this decade deploy orbital bombardment systems of military significance. Moreover, we believe that the USSR would probably recognize that a Soviet deployment of nuclear weapons in space would produce an unfavorable reaction in other countries and strong US counteractions. Further, if the Soviets enter into a formal obligation to refrain from orbiting nuclear weapons, this will constitute still another factor inhibiting such deployment. (Paragraphs 168–171)

33. We recognize, however, that the Soviets might reach different conclusions as to cost and effectiveness, and in some future phase of East-West relations, political inhibitions might lose their effectiveness. Moreover, considering the pace of developments in the weapons field in general, it is extremely hazardous to estimate Soviet decisions for a period many years ahead. For these reasons, a firm estimate as to whether the Soviets will deploy an orbital bombardment system within the 1966–1969 period cannot be made at this time. (Paragraphs 172–173)

## DISCUSSION

### I. SOVIET POLICY TOWARD STRATEGIC ATTACK FORCES

34. The Soviet leaders look upon long range strike forces as a major element of their strategic position, intended to support their political objectives, to deter the West from resort to military action, and to fight a war should one occur. The available evidence supports the view that they are attempting to build forces which they regard as appropriate to these objectives, rather than aiming at forces which they could launch a deliberate attack on the West and count on reducing retaliation to levels that would be in any sense tolerable.

35. Soviet policy toward long range strike forces is heavily affected by the Soviet view of the character of future war. This Soviet view has become increasingly complicated in the last several years as the result of a continuing debate over the implications of modern weaponry for military doctrine. This debate persists, and may lead to further important changes, but at the present state it has produced several official conclusions which bear on long range capabilities:

(a) General war might begin in a variety of ways, including circumstances which provided very short warning times.

(b) The initial period is of critical importance and might determine the outcome.

(c) Enormous advantages accrue to the side striking the first blow.

(d) But the initial nuclear exchange might not determine the outcome, and in any event large ground campaigns would follow.

36. These propositions, when related to the strategic capabilities now deployed and programmed by the West, impose high and complex requirements upon Soviet long range strike forces. Among the chief constraints in meeting these requirements are cost and skilled manpower, which pose distinct problems to Soviet decision-makers. One of these problems is the proper balance of expenditure among military needs, the space program, and the civil economy. Another is the proper allocation of military funds among the various force components. This problem is made particularly acute by the insistence of the military leadership that all arms of service, including large theater forces, are necessary to prosecute a general war successfully and to provide the USSR with flexibility in a variety of possible circumstances.

37. Two other main factors have been involved in the past decisions which have determined present Soviet capabilities for long range attack. One is a concentration on the Eurasian theater, which is traceable to traditional Soviet preoccupation with this area as well as to the higher costs and greater technical complexity of intercontinental weapon systems. The other is an apparent lag in military thinking, which seems to have been relatively slow in working out some of the more sophisticated implications of advanced weapons. Both these factors are now changing, but for the immediate future Soviet forces for long range attack will be characterized by capabilities against Eurasia far exceeding those against North America, and by a considerable deficiency in certain performance characteristics—chiefly survivability and reaction times—relative to corresponding US forces.

38. A continuing Soviet emphasis on high yield weapons for long range striking forces was indicated by the 1961–1962 nuclear test series. The USSR's nuclear testing program has provided it with a wide variety of weapons for strategic delivery, with yields up to 100 MT. As new weapons enter the inventory they will progressively improve the total nuclear delivery capabilities of the strategic striking forces.

## II. *INTERCONTINENTAL BALLISTIC MISSILE FORCES, 1963–1965*

39. The Soviet ICBM program continues to be marked by change, innovation, and shift in emphasis. New aspects of the Soviet ICBM program include: (a) an interruption of the Soviet launcher construction program during the summer and fall of 1962; (b) further evidence that SS-8 has approximately the same delivery capability as the SS-7; (c) apparent curtailment of SS-8 deployment; (d) continued starts of soft sites and a continued low ratio of hard to soft sites.

40. Activity at the Tyuratam test range leads us to believe that new or modified systems are now under development and could reach flight test stage in the near future. Construction of operational launch sites for a new ICBM system could begin even before the first test firing, as was the case in other Soviet missile programs, but it is unlikely that more than a few missiles of new types could be operational before mid-1965.

*A. Deployed ICBM Complexes, Sites, and Launchers*

41. We have now identified a total of 18 ICBM complexes, all of which were begun before December 1961. We doubt that there are additional complexes, although we do not exclude the possibility that one or two unidentified complexes may exist. Any unidentified complexes which do exist probably have not progressed to the point of having more than a few additional launchers as yet.<sup>11</sup>

42. The 18 complexes now contain a total of about 220 identified launchers in various stages of construction, of which about 145 are soft and about 75<sup>12</sup> are hard. We cannot determine any “typical” number of launchers which each complex will ultimately contain.

43. We believe that about 100–115 of the identified ICBM launchers, including about 20 in hard silos were operational on 1 October 1963.

*B. ICBM Systems Deployed<sup>13</sup>*

44. Soviet ICBM development and deployment has emphasized a high degree of concurrency between system testing at the range and construction of operational sites in the field. The USSR has in the past five years developed three different ICBMs of the liquid-fueled type, together with the ground support equipment for each. At least some deployment has been undertaken for all three, with construction of deployment facilities beginning fairly early in the R&D phase. It now appears that in 1962 there were slippages and modifications in the deployment program for both of the second generation ICBM systems. The growth of operational forces has evidently been delayed once again, though not as seriously as was the case in 1958 when the SS-6 program was cut back. Thus concurrent programming, practiced successfully by the USSR in some other missile programs, has not resulted in a smooth and uninterrupted build-up in ICBM capabilities.

---

<sup>11</sup> For the view of Assistant Chief of Staff, Intelligence, USAF, see footnote to Table at page 13, paragraph 55.

<sup>12</sup> We have identified 25 hard sites, each containing at least two and probably three launch silos.

<sup>13</sup> For details of estimated characteristics and performance, see Annex A, Table 4.

*SS-6 Program*

45. The first generation SS-6 was deployed only in limited numbers, i.e., about four launchers. In addition there are two at Tyuratam. The SS-6 is believed to be equipped with [text not declassified] warheads at present.<sup>14</sup>

*SS-7 Program*

46. The SS-7 is the most successful Soviet ICBM in development, and it is the most widely deployed. Thirty-six of the last 38 test firings of this missile have been generally successful. Although the SS-7 is much smaller than the SS-6, it is comparable to the US Titan in size and probably carries a warhead of [text not declassified] at present. The currently operational Soviet force consists almost entirely of SS-7s. The SS-7 is deployed in both soft and hard (probably silo-type) configurations. We believe that the rate of SS-7 launch site initiation, and hence of launcher activation, has been uneven, and that an interruption occurred during 1962.

47. Although some uncertainty remains, we now believe that each of the hard SS-7 sites probably contains three launch silos, rather than two as previously estimated. We cannot definitely determine the degree of hardening, but on the basis of present evidence and analysis we believe these sites can probably withstand overpressures up to 100–300 psi. We estimate construction time for hard sites at 22–24 months.

48. We believe the SS-7's maximum nuclear payload will probably be increased [text not declassified] with initial deployment of the higher yield warhead beginning in 1964.

*SS-8 Program*<sup>15</sup>

49. In earlier estimates we were unable to determine whether the SS-8 was a very large missile or a relatively small one. Among the reasons for believing that the SS-8 might be very large was our judgment that the Soviets would want a missile delivery vehicle for a 100 megaton warhead and a new space booster. The case for a very large SS-8 has been weakened by the continued failure of the Soviets to use the SS-8 as a booster in the space program. Although there are still

---

<sup>14</sup> For the estimated maximum yields of Soviet long range delivery systems, see Annex A, Table 6.

<sup>15</sup> The Assistant Chief of Staff, Intelligence, USAF does not concur in the analysis contained in paragraphs 49 thru 51. He considers that the evidence can also be interpreted to show that the SS-8 is relatively large, capable of delivering a nosecone within the probable weight limits of 10,000 to 18,000 pounds to ICBM ranges. He believes that although strong arguments can be made for either a large or a small missile, the available evidence is so anomalous and subject to interpretation that a firm judgment is not possible at this time.

insufficient data to definitely determine the size of the SS–8 nosecone, the data available indicate that even if large, the SS–8 could carry to ICBM range a nosecone of only about 10,000 lbs. or somewhat more [*text not declassified*]. Such a booster would increase Soviet space payload capabilities only moderately, if at all, as compared with the SS–6 booster.

50. Considering all the technical and deployment evidence now available, we estimate that the SS–8 is a relatively small missile, i.e., one with about the same payload capacity as the SS–7, capable of carrying a nosecone of about 4,500 lbs. and a warhead [*text not declassified*].<sup>16</sup>

51. Renewed firings of the SS–8 at Tyuratam in 1963 [*text not declassified*] lead us to believe that an initial operating capability could have occurred in about mid-1963. We judge that the Soviets have decided to curtail deployment of the SS–8 and that, if any new sites are started in the future, they will probably be in limited numbers at existing complexes.

#### *C. Estimated Force Levels Through mid-1965*

52. Our estimate of the number and type of operational ICBM launchers through mid-1965 takes account of a variety of factors including the apparent trends in composition of the force, and the probable timing of deployment of follow-on systems. The estimate reflects a range of uncertainty regarding the scale and pace of deployment activity, and consequently regarding the Soviet strength in operational launchers, which increases as we project into the future.

53. *Soft Launchers.* SS–6 deployment is complete, and the SS–8 soft site program has probably been curtailed. Thus, expansion of the ICBM force for the next year or so will be primarily in terms of the SS–7. The high side of the estimate assumes that soft sites will be initiated at a fast pace through mid-1964, and that there will be no delays or slip-pages in their construction. The low side of the estimate assumes that almost all of the soft launchers programmed for second generation missiles are already under construction.

54. *Hard Launchers.* We believe that hard launchers now constitute only about 15 percent of the operational launchers in the field but that they comprise nearly half of the launchers now under construction. Since hard launch sites require 22 to 24 months for completion, launchers to be operational in mid-1965 must have already been under con-

---

<sup>16</sup> The Director, Defense Intelligence Agency, believes that a confident selection between possible SS–8 delivery capabilities cannot be made at this time; available evidence and analysis do not permit excluding the possibility that the SS–8 may carry a nosecone of 10,000 lbs. or a little more.

struction by mid-1963. The estimate is based on the probability that each hard site contains three, rather than two launch silos.

55. The table below summarizes our estimate of Soviet ICBM force to mid-1965:

ESTIMATED SOVIET OPERATIONAL ICBM LAUNCHERS\*  
MID-61 TO MID-65

	MID- 1961	MID- 1962	MID- 1963	1 OCT- 1963	MID- 1964	MID*- 1965
Soft Launchers						
1st Generation	4	4	4	4	4	4
2nd Generation	0	30	70-75	80-95	140-160	150-225
Hard Launchers						
2nd Generation	<u>0</u>	<u>0</u>	<u>15</u>	<u>20</u>	<u>40-50</u>	<u>75-90</u>
TOTAL	4	35	90-95	105-120	185-215	230-320
DEPLOYED LAUNCHERS (rounded)						
Tyuratam Test Range						
Soft	5	9	9	9	11	15
Hard	<u>0</u>	<u>0</u>	<u>6</u>	<u>6</u>	<u>9</u>	<u>9</u>
GRAND TOTAL (rounded)	10	45	105-110	120-135	205-235	250-350

\* A new ICBM, perhaps capable of carrying very high yield warheads, could begin to enter inventory by mid-1965, and the force may include a few improved second generation missiles in semi-hardened sites.

\* The Assistant Chief of Staff, Intelligence, USAF considers the estimate of current ICBM strength unrealistically low for two reasons:

1. The majority estimate makes insufficient allowance for the existence of unidentified launchers. How large the factor for "unidentified" launchers should be is debatable, but in view of the deficiencies in available intelligence, the Assistant Chief of Staff, Intelligence, USAF considers that the absolute minimum figure for such launchers should be 10 percent. Since some 220 launchers have been identified, of which about 100-115 are judged to be operational, a minimum of 11 operational launchers should be added to this total to compensate for unidentified launchers. The actual number of such launchers may well prove to be several times this many.

2. The majority estimate does not consider that some launchers nearing a full operational status would have an emergency combat capability and could support missile firings if the need arose. The ACS/I, USAF believes some 20 launchers fall into this category.

Both of the above comments exclude 15 probable launchers estimated to be operational at TTMTR. On the basis of the foregoing, the Assistant Chief of Staff, Intelligence, USAF believes the minimum number of launchers which should be estimated as operational on 1 October 1963 is 145-160, and he would project this as follows:

1 Oct 1963	Mid-1964	Mid-1965
145-160	215-250	300-350

*D. Operational Characteristics of the 1963–1965 Force*<sup>17</sup>

56. About 80–85 percent of the 1963 operational Soviet ICBM force is in soft sites. System characteristics and operational procedures at these sites make it a slow reaction force. Soviet soft site deployment concepts adversely affect both reliability and reaction time because of horizontal storage and check-out with subsequent movement to launchers. We estimate that roughly one-third of the ICBMs will be in hard silos by mid-1965, enhancing both survivability and reaction time.

57. *Reaction Time.* At the great preponderance of ICBM soft sites, an alert can be maintained indefinitely with the missiles and nosecones mated in the ready buildings near the launchers, propellants and ground support equipment at hand, and duty crews nearby. This is readiness condition 3,<sup>18</sup> and it appears to be the most likely normal state of readiness capable of being maintained by the force. From this state of readiness, the bulk of the force would require three or four hours to fire. From the highest state of readiness, with missiles erected and fueled, some 5 to 15 minutes would probably be required for launch. This state of readiness can be maintained for a number of hours, depending on weather conditions and other factors. At the hard sites, readiness condition 2 is most likely normal, with a reaction time of about half an hour. In general, therefore, the Strategic Rocket Troops are not believed to be able to maintain a constant readiness state approaching US systems, but there is evidence of Soviet concern for this deficiency. Some improvement in reducing reaction times for initial firings has probably been achieved by the successive modification of SS-7 soft sites.

58. *Simultaneity.* It appears that a missile from each launcher at an individual site could be fired within 5–10 minutes. Theoretically, the entire force could be launched within about 10 minutes. We believe, however, that even under the most favorable conditions and with a time to fire given sufficiently in advance, such portion of the deployed missile force as the Soviets could bring to Readiness Condition I probably could be launched in a salvo extending some 15 to 30 minutes from launch of the first missile. Lack of direct evidence as to the reliability of Soviet deployed missiles makes it impossible to estimate with confidence what portion of the total deployed force actually could participate in this salvo.

59. *Refire.* One additional missile is probably assigned to each soft ICBM launcher, providing a refire capability in about 10 hours for

---

<sup>17</sup> For detailed estimates of ICBM characteristics and performance, see Annex A, Table 1.

<sup>18</sup> For descriptions of Soviet missile readiness conditions, see Annex A, Glossary of Missile Terms.

SS-7 and about 16 hours for SS-6. It is unlikely that hard launchers have a refire capability.

60. *Reliability and accuracy.* Soviet SS-6 and SS-7 ICBM systems have apparently had excellent reliability and accuracy records under test range conditions. However, the effects of Soviet operational concepts and troop training standards are at least as important as technical characteristics in determination of system reliability, and we have no reliable basis for estimating these effects. We believe that the reliability of Soviet ICBMs would be considerably reduced under operational conditions. Operational accuracies can probably be improved so that by mid-1965 the bulk of the force could achieve CEP's of about 1 n.m. with a standard product improvement program; assuming improved guidance systems are introduced, some portion of the force could probably achieve CEP's in the 0.5-1.0 n.m. range at that time. We believe that there would be a considerable time lag before these improvements could be incorporated into existing deployed sites.

61. *Warheads.* The bulk of the Soviet ICBM force through mid-1965 will carry warheads in the 3 to 6 MT range. By 1965, the SS-7 and SS-8<sup>19</sup> might be modified to make them capable of delivering significantly larger nosecones, possibly with warhead yields [*text not declassified*]. Such an increased payload capability could be achieved by employing the missiles at somewhat reduced ranges. The SS-6 is capable of being equipped with [*text not declassified*] warheads for delivery to ranges of about 4,500 n.m. We believe that the Soviets would first have to test fire appropriately modified nosecones for any of these missiles.

### III. MEDIUM AND INTERMEDIATE RANGE BALLISTIC MISSILE FORCES, 1963-1965

62. About 675 launch positions for 1,050 n.m. (SS-4) MRBMs and 2,200 n.m. (SS-5) IRBMs have now been identified. Of these, almost 600 are soft positions deployed four to a site. We estimate that there are about 80 hard silos, deployed two to a site, but there is some evidence to raise the possibility that there are three launch silos per hard site.<sup>20</sup> Virtually all of the soft sites and most of the hard sites are operational at present.

---

<sup>19</sup> For differing views as to the warhead delivery capability of the SS-8, see the footnotes of the Director, Defense Intelligence Agency, and of the Assistant Chief of Staff, Intelligence, USAF, page 12.

<sup>20</sup> If MRBM and IRBM hard sites in fact contain three launch silos, there are about 40 more hard launchers.

*A. Development and Deployment*

63. The massive capability for attack on Eurasian targets which present Soviet MRBM and IRBM forces represent has been developed by the USSR in several overlapping stages:

(a) Beginning in 1957, a 650 n.m. (SS-3) MRBM was probably deployed in modest numbers, initially employing a field-type configuration without fixed sites. This system probably also occupied some early fixed sites. [*text not declassified*] it has probably been phased out of the operational inventory in favor of the SS-4.

(b) The construction of fixed, soft sites for the 1,050 n.m. SS-4 was undertaken at an intensive pace from late 1958 to about mid-1961, when about 350 launch positions were available. Since then this deployment has proceeded more slowly and has been supplemented by the construction of hard SS-4 silos, which now comprise slightly less than 10 percent of the total of about 575 identified MRBM launch positions. Very few MRBM sites have been started since the spring of 1962.

(c) In 1961, a less extensive program to deploy IRBMs in both soft and hard positions was undertaken. In this program, greater emphasis was placed on hardening, and about 40 percent of the nearly 90 identified IRBM launch positions are hard silos. This program, too, is evidently now slackening. Deployment of hard silo slowed and may have ceased early this year.

64. More than 90 percent of the MRBM and IRBM force is deployed in a broad belt in western USSR, stretching from the Baltic to the Black Sea. Other sites provide the USSR with potential coverage of other targets of particular importance in Europe, North Africa, and Middle and Far Eastern areas, and isolated sites can attack key installations in Greenland and Alaska.

65. We continue to have difficulty in understanding the Soviet rationale for building nuclear delivery capabilities of this magnitude against European target areas. One factor influencing Soviet decisions was undoubtedly their strategic emphasis upon Europe, evident from the size of the medium bomber program and the theater forces, and reflected in many Soviet military writings. The concept of holding Europe hostage while Soviet capabilities against the US were small probably played a part. The apparent Soviet intention (revealed in classified documents) to strike a wide variety of targets may also have exerted an upward pressure on the size of the force, particularly if the USSR planned to equip most of these missiles with kiloton warheads. Finally, contributing military factors may have included attaining survivability through numbers and meeting requirements for support of theater forces as well as for strategic attack.

66. Considering the target coverage and geographic disposition of the present MRBM and IRBM forces, together with the evidence of

slowdown or cessation in new site construction, we now believe with greater assurance than in our last estimate that the USSR has about completed the expansion of its SS-4 and SS-5 forces for employment against Western targets. We anticipate no important further increase in primary soft launch positions although we expect to identify a few additional sites with the passage of time. All hard sites that we know about will be operational by mid-1964. We think, however, that from time to time the Soviets may construct positions in additional locations to cover new targets or to supplement existing coverage.

67. We estimate as follows the number of operational launch positions for SS-4 and SS-5 missiles in the USSR through mid-1965:

	MID-1963	1 OCT-1963	MID-1964	MID-1965
1050 n.m. SS-4				
Soft	540-550	550-560	550-560	550-560
Hard Silo <sup>a</sup>	40-50	40-50	40-50	40-50
2000 n.m. SS-5				
Soft	60-70	65-75	70-80	70-80
Hard Silo <sup>a</sup>	20-30	40-50	50-60	50-60
TOTAL SOFT	600-620	610-635	610-640	610-640
TOTAL HARD <sup>a</sup>	60-80	80-100	90-110	90-110
GRAND TOTAL	660-700	690-735	700-750	700-750

<sup>a</sup> These estimates assume two launch silos per hard site.

68. In addition to the foregoing systems, the Soviets began in December 1962 to test fire a new missile to ranges of about 1,000 n.m. at Kapustin Yar. The pace of the testing program has been slow, with only about five firings to date. We know little about the new missile, except that it has unusual propulsion characteristics which could indicate either a liquid or a solid-fueled system. The new vehicle may form part of a follow-on development program for either MRBMs, IRBMs or both. It may be for ground or submarine launching, or both.

69. If a normal development cycle is followed with good success, a follow-on system of MRBM range could probably be operational in small numbers by mid-1965. Such a system might be designed to have better accuracy than existing MRBM IRBM systems (perhaps about 0.5 n.m.). In such a new system, the Soviets are also likely to be seeking simplified maintenance, reduced manning requirements, survivability, and fast reaction time. An improved liquid-fueled system might be designed for long service in a high readiness condition in hard silos, or for greater flexibility and security of deployment in a mobile configuration. A solid fueled system would be well suited to silo or submarine deployment, but its weight might make it impractical for road-mobile use in the USSR and East Europe. In any event, we think it likely that a follow-on system entering service in about 1965 would begin to

replace the older SS-4, rather than adding to the gross size of the MRBM/IRBM force.

*B. Operational Characteristics of the 1963–1965 Force*<sup>21</sup>

70. Documentary evidence on the original Soviet concept for deployment of MRBMs revealed that the USSR once contemplated a system of alternate sites to increase survivability. This concept apparently was not pursued extensively, and we believe that virtually all MRBM and IRBM launch positions, including those of soft sites, are primary positions manned and equipped to participate in an initial salvo.

71. There are probably exceptions to the general rule that soft sites are fully equipped. These sites would resemble those constructions in Cuba and fit the description of alternate MRBM launch positions in classified Soviet documents of 1960 and 1961, which indicated that MRBM units were to move to such sites for protection under certain conditions, usually after firing a first salvo from the primary site. It seems likely that some such sites will be constructed by the Soviets to improve the chances of survival of the MRBM force.

72. Firing procedures appear to be largely manual. We believe that even under the most favorable conditions and with a time to fire given sufficiently in advance, the bulk of the force could probably be launched in a salvo extending over a period of some 15–30 minutes from the time the first missile is launched. Reaction times are long, but are probably better for hard silos than for soft positions. We cannot definitely determine the degree of hardening at hard MRBM/IRBM sites, but on the basis of present evidence and analysis we believe these sites can probably withstand overpressures up to 100–300 psi.

73. There has been much evidence that the Soviets intend to provide a substantial refire capability for their MRBM/IRBM force. Based in part on information from classified Soviet documents, we believe that the soft sites are intended to be supplied with two missiles for each launcher. It is highly unlikely that hard silos are intended to have a refire capability. We now have fairly good evidence on Soviet production of MRBMs and IRBMs, which leads us to believe that a full second salvo is probably available to all IRBM soft positions, but not yet to all MRBM soft positions. This evidence also indicates that production is continuing despite the cutback in deployment of new sites, and we believe that by mid-1965 each soft MRBM position could have a second-salvo missile available to it.

---

<sup>21</sup> For detailed estimates of characteristics and performance, see Annex A, Table 1.

#### IV. SUBMARINE-LAUNCHED MISSILE FORCES, 1963–1965

74. Current Soviet submarine-launched missile forces are the outgrowth of decisions taken in about 1954–1955 to develop quickly a fairly extensive but unsophisticated capability. The USSR now possesses a considerable number of diesel-powered submarines and a much smaller force of nuclear-powered submarines equipped with missiles. The majority of these are designed to carry ballistic missiles suitable for employment against land targets; the remainder are equipped with cruise missiles, which were evidently designed primarily for use against surface ships but can also be employed against land targets.

75. Both public and classified Soviet statements indicate that the initial mission of the ballistic missile submarines was “to carry out strikes deep in enemy territory and to support ground force operations.” The advent of ground-launched systems in operationally significant numbers, together with limitations in the capabilities of the submarine systems, evidently led the Soviets in the late 1950’s to reconsider the role of the submarine missile force. Information from Soviet classified military writings as well as the operational practices of the force indicates that it is probably not now assigned the mission of participating in initial strategic attacks. Evidence indicates that both ballistic and cruise missile subs are to disperse and protect themselves in the event of war, and then to participate to the extent feasible in attacking Western targets. At about the time this concept was defined for the existing forces, however, the Soviets also initiated the development of more advanced missile submarine systems. We believe that in the near future these programs will give a new dimension to Soviet missile submarine forces, by bringing into service weapon systems better suited to attacks on Eurasian and North American land targets and Western naval forces at sea.

##### *A. Developments in Ballistic Missile Forces*

76. As of October 1963, the USSR possesses about 50 operational submarines capable of surface-launching 350 n.m. liquid-fueled SS-N-4 ballistic missiles. This force includes 11 nuclear-powered H class and 31–33 diesel-powered G class submarines, each of which is probably capable of launching its complement of three missiles within about 5–8 minutes after surfacing. Another 7 diesel-powered Z class submarines were converted to carry and launch two such missiles each. The 140–145 missiles of this force can carry warheads yielding [text not declassified] at present, and we believe that maximum yields of [text not declassified] could be introduced within the next year or so. Although this force represents a considerable potential threat, its operational effectiveness is limited by a number of factors: (a) the small number of missiles per submarine; (b) the short range of the missiles and the need to surface

before launching; (c) the operational limitations of the diesel-powered units, which comprise the bulk of the total force; (d) the unreliability of the propulsion systems of some nuclear-powered units; and (e) the continued absence of essential operational training cruises to likely combat areas.

77. Development is far advanced on a new ballistic missile designed for submerged launching. Our evidence on this system (now designated SS-N-5) remains very fragmentary, and there are critical uncertainties as to its size and the submarine class or classes for which it is designed. However, we estimate that SS-N-5 has a range of  $700 \pm 50$  n.m.

78. Because the G and H classes of submarines were designed in 1954–55, it is probable that both were designed to employ the 350 n.m. SS-N-4 surface-launched missile. The unusual height of their sails suggests that these subs carry their missiles in tubes which do not penetrate down into the pressure hull of the ships, but we do not know that this is the case. If the 700 n.m. SS-N-5, is about the same diameter as the 350 n.m. missile, it would probably need to be longer in order to carry a payload in the megaton range. Even greater tube length would probably be required to accommodate ejection gear for submerged launching if this gear were attached to the missile at its base.

79. We are unaware of any submarine project which we can point to as a candidate for a new class designed to employ the SS-N-5 missile. We continue to believe that there are probably one or more new submarine classes at some stage of development. Assuming that development schedules have paralleled that of the SS-N-5, an initial Soviet operating capability with this weapon system (in either nuclear or diesel-powered subs or both) could exist in the near future.

80. The SARK was displayed in Moscow parades in November 1962 and May 1963, and the Soviets described it as a submerged-launch missile. We cannot determine whether the SARK, a missile 48 feet in length and apparently equipped with ejection gear at its base, is the 700 n.m. submerged launch missile. Some calculations suggest that a missile of SARK's size and configuration could have a range of about 1,000 n.m.

81. We have again examined the possibility of retrofitting 700 n.m. submerged-launch missiles into existing G and H class submarines. If the SARK is the 700 n.m. missile, retrofitting would require such extensive modification to these submarines as to make it seem quite impractical. The incorporation of any missile longer than the SS-N-4 would require changing the basic design of the submarines if their tubes do not extend into the pressure hull, and this would be an expensive and difficult change. However, there is enough uncertainty in the evidence regarding tube configurations and the size of the 700 n.m. missile to raise the possibility that at least some submarines of the G and H

classes will be retrofitted with the new missile. As between the two, we think this possibility is somewhat greater for the H class because it is larger and nuclear powered.

#### *B. Developments in Cruise Missile Forces*

82. In addition to ballistic missile submarines, the USSR now has operational some 18 submarines capable of the surface-launching of 300 n.m. SS-N-3 cruise missiles. Of these, 12 are converted diesel-powered W class submarines, about half of them equipped to carry four missiles each and the remainder two each. The other six are nuclear-powered E class submarines, which carry six such missiles.

83. A new diesel powered submarine was sighted recently and has been designated the J class. Analysis of available evidence indicates that it is probably a cruise missile submarine and may carry two pairs of missile tubes similar to those carried by the E class.

84. The Soviet policy decision to acquire a cruise missile submarine force was made in 1956 or before. These systems were designed primarily to attack carrier task forces and other surface naval vessels, but can also be employed against land targets. Their low altitude flight profile (1,000–3,000 feet) and Mach 1 speed would complicate defensive problems. However, for attacking targets at ranges beyond the radar horizon the effectiveness of the system is limited by the requirement for a forward observer, such as an aircraft, ship, or submarine, to provide target data to the launching submarine.

85. The Soviets could add flexibility to the SS-N-3 system by programming the missile for high altitude flight, thereby extending its range to about 450 n.m. Such a development would provide greater diversification in the system's capability to attack both land and sea targets. There is also a possibility that the Soviets will incorporate a terrain-clearance guidance system to permit flight at 1,000 feet altitude over rugged terrain. Such a capability could be incorporated into operational systems within the next year or so, and could enable Soviet cruise missile submarines to direct either high or low altitude attacks at inland targets.

#### *C. Estimated Force Levels Through mid-1965*

86. The USSR will continue to expand its missile submarine forces, and improved missiles and submarines will probably become operational in the near future, but there is much uncertainty as to the scope and direction of the Soviet missile submarine programs at present. We believe that construction of G class subs ended in 1962, but it is possible that there will be additional construction of a modified version or a successor diesel-powered ballistic missile class. By this means the Soviets could increase the size of their force of ballistic missile submarines

even if there are continued limitations on their production of submarines with nuclear power.

87. Shipyard deliveries of nuclear submarines have been relatively constant at about 7–8 units per year since 1960, but we believe that this rate can be increased to some 10 or more per year. The Soviets have divided this output among ballistic missile, cruise missile, and torpedo attack classes, and we believe they will desire additional units of all three types in order to meet their varied operational requirements. It seems probable that, if a new nuclear powered ballistic missile class has in fact been developed to employ the 700 n.m. submerged-launch missile, the H class construction program is giving way to it.

88. With respect to cruise missile classes, we estimate continued construction of the nuclear-powered E class, and we believe that the appearance of the new J class means that additional diesel-powered units will also be built. We expect construction to be at least at the rates previously observed for building submarines of these general types, and it is possible that the Soviets may now be placing additional emphasis on the cruise missile program because of the capability of this weapon system for attacking both land and sea targets.

89. In the table below, the ranges arise not only from our uncertainty as to the scale and pace of introduction of additional missile submarines, but also from uncertainty as to whether new classes of ballistic missile subs are in fact under construction to employ 700 n.m. submerged-launch ballistic missiles. We have no basis for estimating the exact number of missiles which new classes of ballistic missile submarines will carry, but we think it likely that such designs would incorporate more than the three missile tubes carried by the older classes. It is also possible that there will be some retrofitting of G and H class subs with 700 n.m. missile over the next year or so. We estimate as follows the size and composition of Soviet missile submarine forces to mid-1965:

ESTIMATED SOVIET OPERATIONAL MISSILE SUBMARINES, 1963–1965			
	1 OCT 1963	MID- 1964	MID- 1965
Ballistic			
Nuclear			
H-class <sup>a</sup> and/or Successor <sup>b</sup> (3 or more tubes)	11	13–15	15–20
Diesel			
Z-class (2 tubes)	7	7	7
G-class <sup>a</sup> and/or Successor <sup>b</sup> (3 or more tubes)	<u>31–33</u>	<u>32–35</u>	<u>34–38</u>
TOTAL DIESEL	38–40	39–42	41–45

## Cruise

Nuclear, E-class (6 tubes)	6	8-9	10-12
Diesel, W-class (2 and 4 tubes)	12	12	12
J-class (4 tubes)	1	3-4	5-8
TOTAL DIESEL	13	15-16	17-20

<sup>a</sup> Some H and G class units possibly will be retrofitted with 700 n.m. submerged-launch missiles. G class, if retrofitted, may have two launch tubes.

<sup>b</sup> Successor classes would be equipped with 700 n.m. submerged-launch missiles.

*D. Operational Capabilities*

90. The pattern of submarine deployment indicates assignment of the bulk of the ballistic missile force to operations in the Atlantic and assignment of the preponderance of the cruise missile force to the Pacific area. At present, some 40 of the 50 operational ballistic missile submarines are part of the Northern Fleet, while the remainder are assigned to the Pacific Fleet. On the other hand, most of the cruise missile submarines (including all the nuclear-powered units) are with the Pacific Fleet.

91. Whereas the diesel-powered ballistic missile submarines could perform patrols of limited duration off the coasts of the continental US, the diesel-powered W-conversion cruise missile submarines would require regular replenishment at sea in order to perform extended anti-shiping patrols. All the nuclear-propelled subs possess adequate range for any operation, but engineering difficulties have plagued the H class since its introduction into the fleet. On at least five occasions in the past four years (the most recent known to us is October 1962) propulsion plant failures aboard nuclear submarines have necessitated their being towed back to base. The propulsion system aboard the nuclear H class is very noisy, and the normal operating depth limit of the submarine is estimated to be only about 800 feet, whereas the depth capability of the G class is estimated at about 900 feet.

92. A key missing ingredient in the development of operational capabilities continues to be the conduct of realistic patrols to potential launch areas. We know of no routine patrols off the US or even off Western Europe. However, routine patrols to these areas could begin at any time. We believe that by the mid-1960's at least some Soviet missile submarines will be engaging in routine patrols in open ocean areas.

93. According to Soviet classified documents, the main mission of cruise missile submarine forces is to aid in countering Western naval nuclear strike forces, particularly US carrier task forces. It is clear, however, that a capability exists to attack land targets, and recent missile improvements are enhancing this capability. We still do not

understand the exact method of employment of these cruise missiles. Soviet documents indicate that submarines and aircraft will be used to locate ship targets. Homing guidance against such targets is probably provided by active radar aboard the missile, perhaps supplemented by passive techniques. We do not know how the missile would be directed at any particular unit in a large task force.

*V. LONG RANGE BOMBER FORCES, 1963–1965*

94. Continued investment in improving Long Range Aviation (LRA) indicates that the USSR plans to maintain sizable bomber forces for at least the near term. Improvements over the past few years include introduction of a new medium bomber, introduction of air-to-surface missiles, and improved aerial refueling capability. Maritime reconnaissance is a secondary role of LRA, and maritime activity involving both heavy and medium bombers of LRA has increased during the past year or so.

*A. Force Levels and Equipment*

95. Soviet LRA, by reason of its equipment, basing, and deployment, is much better suited for Eurasian operations than for intercontinental attack. The bulk of the force is deployed in the Western USSR, the Ukraine, and the southern portion of the Soviet Far East. BLINDER is the only bomber known to be in production, but there are indications that there may be some new production of BEAR in addition to modification. The evidence also indicates a relatively stable number of medium bombers in inventory over the past two years or so. As of October 1963, LRA is estimated to comprise about 180–205 heavy and 940–975 medium bombers and tankers. The heavy bomber force includes about 95–105 BISON jet bombers and 85–100 BEAR turbo-props. Of the medium bombers, about 40–50 are BLINDER, with supersonic dash capability, and the remainder are BADGER. There are additional 360–370 BADGERS and 10–20 BLINDERS in Naval Aviation.

96. Recent trends point to little change in the aircraft strength of LRA over the next two years. While we cannot exclude the possibility that Khrushchev will institute a drastic reduction in the numbers of BADGERS in LRA, we believe that a phase out in BADGER strength is more likely and that it will be compensated in part by the further introduction of BLINDERS.<sup>22</sup> This aircraft has appeared in two configu-

---

<sup>22</sup> For a differing view see Assistant Chief of Staff, Intelligence, USAF footnote to Table at page 22, paragraph 98.

rations: the BLINDER "A", a bomb carrier, and the BLINDER "B", a missile carrier. Although only the BLINDER "B" has been observed with a refueling probe, a refueling capability could be developed for BLINDER "A" at any time. The small-scale deployment of BLINDER and relatively low rate of production lead us to believe that a modest force will be deployed in the next two years.

97. Although research and development on heavy aircraft is under way, no replacement for BEAR or BISON is in sight. Notwithstanding Khrushchev's recent assertion that the USSR has no strategic bombers in production and continued indications of Soviet emphasis on missiles for strategic attack, there is considerable evidence to support continued Soviet research on large manned aircraft, although no follow-on bomber program can be identified. BOUNDER, a large, supersonic bomber design of medium range, is apparently being used as a test bed and we doubt that it will enter inventory as an operational bomber. In any event, the lack of advanced testing or production evidence leads us to consider it unlikely that a new heavy bomber could enter the operational inventory of Long Range Aviation before 1966. Further modification and improvement of existing heavy bomber types is possible, and perhaps even some new production of BEARs.

98. We estimate as follows the probable composition of LRA through mid-1965:

ESTIMATED STRENGTH OF SOVIET LONG RANGE AVIATION, 1963-1965*			
	1 Oct 1963	MID- 1964	MID- 1965
Bombers and Tankers			
Heavy			
BISON	95-105	95-105	90-100
BEAR	<u>85-100</u>	<u>85-100</u>	<u>80-100</u>
TOTAL	180-205	180-205	170-200
Medium			
BADGER	900-925	800-850	700-750
BLINDER	<u>40-50</u>	<u>75-100</u>	<u>125-175</u>
TOTAL	940-975	875-950	825-925

---

\* The Assistant Chief of Staff, Intelligence, USAF sees no reason to expect reduction of the BADGER force in the 1963-65 period. He believes the medium bomber force will be quite stable in size, and might expand somewhat as the BADGER units attrit at a somewhat slower rate than BLINDERS are introduced into the force. Such a program would retain an established capability while re-equipment proceeds with new aircraft, a practice which has been noted before in Soviet aviation. The Assistant Chief of Staff,

Intelligence, USAF estimates the near-term medium bomber strength of the USSR as follows:

	1 Oct 1963	Mid-1964	Mid-1965
BADGER	900–925	850–900	800–850
BLINDER	<u>40–50</u>	<u>75–100</u>	<u>125–175</u>
TOTAL	940–975	925–1000	925–1025

He further believes the heavy bomber force will remain at approximately 200 bombers in this period, although the BEAR/BISON mix may change somewhat. Introduction of a longer-endurance aircraft based on the BEAR could begin in late 1964 or early 1965.

99. The Soviets have provided the BEAR aircraft with a standoff capability through the introduction of the Kangaroo (AS-3), a supersonic cruise missile with a maximum range against land targets of 350 n.m.<sup>23</sup> The AS-3 was probably designed for use against land targets, but may have limited effectiveness against naval formations, with greatly reduced accuracy and range. A major modification program has been under way since 1959 to equip BEARs for delivery of the AS-3, and 40–60 BEARs have been so modified to date.

100. We believe that all LRA medium bombers equipped with anti-shipping ASMs have been transferred to Naval Aviation. Both BISON and BEAR heavy bombers have conducted reconnaissance over US carrier task forces, and some of these aircraft were specially equipped for the reconnaissance role. This use of long range bombers was advocated in classified Soviet military writings, in which naval officers urged the use of these aircraft, particularly the BEAR, for maritime reconnaissance. In view of the naval reconnaissance missions performed by BEAR aircraft we cannot exclude the possibility that some BEARs will be transferred to Naval Aviation. However, we believe that attack on land targets remains the primary mission of most BEAR aircraft, and have made no allowance for transfers in our estimate of the future composition of Long Range Aviation.

101. A new supersonic ASM, the KITCHEN (AS-4) is being developed for the BLINDER “B.” Evidence on this missile is limited. It is either a boost glide or a sustained cruise missile. It was probably developed for use against land targets but some evidence indicates naval use as well. It could be operational by mid-1964.

---

<sup>23</sup> For estimated characteristics and performance of these and other Soviet air-to-surface missiles, see Annex A, Table 4.

### B. *Operational Capabilities*<sup>24 25</sup>

102. A major obstacle to the development of capabilities for intercontinental attack by LRA has been the limited range of the BISON and BADGER aircraft which make up the bulk of the force. The emphasis on aerial refueling and Arctic training of the past several years reflect Soviet efforts to overcome this limitation. The USSR has not developed an aircraft specifically for use as a tanker. Instead, BISONs and BADGERs are converted for use as tankers with their bomber counterparts. BLINDERS could possibly also refuel from these tankers, but because of their shorter range probably would not be used against the continental US, except Alaska.

103. Some BEARs are now being modified for in-flight refueling. This modification was probably undertaken because of the range penalty involved in carrying the AS-3 missile, and possibly to increase endurance for a reconnaissance mission. About 15 BEARs have been modified for probe and drogue refueling, and we believe that additional BEARs will be so modified. BEAR is probably refueled by a BISON tanker.

104. Even with aerial refueling, the capabilities of LRA for intercontinental attack remain limited. Refueled BADGERs would be able to reach targets in the extreme northwestern portion of the continental US on two-way missions from Arctic bases, but they would have little flexibility of routing and tactics. However, BADGERs on two-way missions could provide coverage of many targets in Alaska, Canada, and Greenland. An operating manual for the BADGER indicates that the range of this aircraft is less than we have estimated. These data are presently under intensive study. The BISON would require both Arctic staging and inflight refueling to cover the bulk of US targets on two-way missions. Unrefueled BEARs could reach many targets in northeastern US directly from their home bases, but would probably stage

---

<sup>24</sup> For detailed estimates of the characteristics and performance of Soviet medium and heavy bomber weapon systems, see Annex A, Table 5, Annex B, maps.

<sup>25</sup> The Assistant Chief of Staff, Intelligence, USAF differs in part from the argument in paragraphs 107 through 115. He believes attention should be focused on how many bombers could reach targets in the United States if, as could be expected in wartime, the USSR made an all-out effort to augment its still-small ICBM capability with strategic bombers. Such an all-out effort would appear particularly likely in view of Soviet concern over the importance of the initial nuclear exchange.

Considering all factors except combat attrition, the Assistant Chief of Staff, Intelligence, USAF estimates the USSR could put more than 300 bombers over North American targets on two-way missions and still leave several hundred medium bombers to attack targets in Eurasia.

Since the BADGER can carry a bomb with a yield four times as large as that of the warhead of an SS-7 missile, the Soviets might utilize BADGERs on one-way missions as part of the initial attacks, and in this case the number of bombers reaching the United States could exceed 500.

through the Arctic when equipped with AS-3 or bomb loads of 25,000 lbs. or more, in order to gain extensive coverage of US targets. Refueled BEARs carrying AS-3 could reach many US targets directly from their home bases.

105. Training patterns and range capabilities of Soviet bombers indicate that aircraft attack against the US (except Alaska) would involve heavy bombers almost exclusively. We have previously estimated that the Soviets would commit their entire heavy bomber force to this mission as weapons carriers and tankers. Considering the requirements for Arctic staging, refueling, and non-combat attrition factors, the Soviets could put 90–115 heavy bombers over target areas in the United States on two-way missions. However, the increasing use of Soviet heavy bombers in maritime reconnaissance roles leads us to believe that a few such aircraft might be diverted to this mission.

106. The scale of the initial bomber attack could be increased should the Soviets choose to commit BADGER medium bombers to two-way intercontinental missions. Considering the probable use of less suitable Arctic airfields as staging bases, refueling, and noncombat attrition factors, we believe that up to 150 medium bombers could arrive over North American target areas on two-way missions. These bombers could attack Greenland, Canada, and Alaska, and portions of northwestern United States.

107. The Soviets could further increase the number of bombers arriving over North America should they resort to one-way unrefueled attacks with medium bombers. In order to conduct such attacks they would need to use BADGER crews which had not participated in Arctic training. With the growing Soviet ICBM and missile submarine forces this use of the medium bomber force becomes increasingly unlikely.

108. We consider it probable that initial attacks would be mounted in successive waves and extend over a considerable number of hours.

#### VI. SPACE WEAPONS SYSTEMS

109. We examined in NIE 11-9-63<sup>26</sup> the military, economic, and political considerations involved in a Soviet decision on the orbiting of nuclear-armed satellites. At that time it appeared to us that, for the near term, the disadvantages to the USSR would outweigh the advantages, and we estimated that the chances that the Soviets would orbit a nuclear weapon during the next two years or so were less than even. The course of subsequent events, including the USSR's acceptance

---

<sup>26</sup> NIE 11-9-63, "Soviet Capabilities and Intentions to Orbit Nuclear Weapons," 15 July 1963, SECRET, RD. This estimate contains an examination of Soviet technical capabilities for orbital bombardment systems and the characteristics of various systems which the USSR might deploy in various time periods.

of a limited nuclear test ban and its cultivation of an atmosphere of relaxed international tensions, has strengthened this view. Gromyko's remarks before the UN in September 1963 suggest that the USSR may be willing to enter into a declaratory agreement with the US in which both sides undertake not to deploy nuclear weapons in space. Even if no formal agreement is reached, we think it unlikely that the Soviets will decide to orbit nuclear weapons in 1963–1965.

110. Should the Soviets nevertheless choose to place nuclear weapons in orbit during the next two years, we estimate that, using the SS-6 booster with suitable upper staging, they could assemble and launch a fractional or multi-orbit nuclear-armed satellite at any time without prior testing. The attainment of predictable reliability and accuracy, however, would require a series of tests extending over at least a year after an initial launching. With such testing, the USSR probably could deploy a small number of bombardment satellites with CEP's on the order of 5–10 n.m. and orbital lifetimes ranging up to several months. The nuclear payload could be *[text not declassified]* if a combination of the SS-6 ICBM and a Venik upper stage were used for launching.

111. While we think that the Soviets are unlikely to orbit a nuclear weapon in the next two years, we believe that they will continue to investigate the feasibility of orbital bombardment systems, weighing the possible costs and effectiveness of such systems against those of alternative delivery systems. We have observed no test activity or other indications that the Soviets are working along these lines, but we would not necessarily detect and recognize such work prior to an initial launching. Even without any special efforts, their capabilities in this field will improve in the normal course of continued development of nuclear technology, ICBMs, and space projects.

## VII. MAJOR SUPPORTING ELEMENTS

### A. *Command and Control*

112. During the past two or three years the Soviet military high command structure has apparently been modified to speed the process of initiating or responding to strategic nuclear attack. The growth of nuclear and missile forces on both sides has almost certainly persuaded the Soviets to establish the command and control channels necessary for the swift initiation of military operations upon the decision of the political leadership. Our information does not permit a firm assessment of the flexibility of response and operational control which the Soviet high command could exercise over long range striking forces during the course of combat operations, but the general picture is one of less sophistication and precision than in comparable US forces.

113. Khrushchev's position in the military command structure corresponds roughly to that of the President of the US. We have informa-

tion, some of it from classified documents and some from public statements, about both a Supreme Military Council and a Supreme High Command; Khrushchev is chairman of the Council and Supreme High Commander. The Council, a body of high-level party, government and military officials, has existed since before World War II to provide a forum for discussion and decision on major issues of military policy. The Supreme High Command directed military operations during World War II with Stalin at its head, but was disbanded thereafter. Such information as we have suggests that steps have been taken in recent years to designate membership in the Supreme High Command and to develop procedures to permit the quick assumption by this body of top level control of military operations under Khrushchev should events so dictate.

114. At the present time, there is not, so far as we know, a single, unified military command for all elements of the Soviet long range striking forces. Coordination of operations among the three long range striking forces is the responsibility of the Ministry of Defense, whose General Staff is responsible for planning and probably targeting for the entire military establishment. Long Range Aviation is a major air command, missile-launching submarines and some medium bombers are assigned to Soviet fleets, and the missile forces have been designated a separate main component of the armed forces. Documentary information indicate that low-echelon units of missile forces, bombers, and submarines can be operationally controlled directly from Moscow.

115. We have no reason to suppose that there are any major weaknesses in the communications and control of long-range bombers or of Soviet missile submarines. Long Range Aviation has existed as a separate command throughout the post-war period, and missile submarines have been assigned to fleets for about five years. Thus, both bombers and missile submarines are attached to older commands which have had a number of years to develop and refine their communications and control arrangements. On the other hand, the Strategic Rocket Forces have new and pressing requirements in this field which are shared by neither bombers nor submarines. Classified Soviet documents have indicated that as recently as 1961, these requirements were not being met, and that serious shortcomings existed in communications, control, and data-processing within the Strategic Rocket Forces. These shortcomings probably stemmed both from the newness of the organization (announced in 1960) and the novelty of its command and control requirements. They were probably aggravated by the relatively rapid pace of missile deployment in 1961, and evidently by shortages of data-handling equipment at unit level. At that time the Soviets were dissatisfied with communications and control procedures as they affected the reaction time of missile units, and they have been attempt-

ing to speed them up through automation. We believe that these deficiencies have been largely overcome.

*B. Long Range Reconnaissance*

116. We believe that the USSR has devoted considerable effort to pinpointing potential targets for strategic attack in the US and elsewhere. The Soviets are probably able to achieve satisfactory target location data without employing overhead reconnaissance. High competence in geodetic mapping provides the USSR with an excellent base; we currently estimate that the Soviet geodetic error in location of US missile launch sites is on the order of 500–1,000 feet. By exploiting the wealth of open source material available in the US and adding refinements through clandestine operations, the USSR can probably locate Minuteman silos, for example, within a general range of 300 to 1,000 feet. Considering the combination of probable geodetic and target location errors, we estimate that, in general, the USSR is able to locate US targets within a total error of less than half a mile.

117. Continuous and up-to-date information on the location and movement of key Western forces is a high priority Soviet requirement. In peacetime, this requirement is probably met in large part by the extensive Soviet direction-finding effort, which permits location of Western communications circuits and the units employing them. The Soviet direction-finding effort could retain a high degree of effectiveness under wartime or alert conditions in the absence of strict Western communications security measures and electronic emission control. The USSR supplements this effort by such means as the exploitation of open sources, clandestine observation, and signal intercept by a variety of means including trawlers.

118. Reconnaissance in support of Soviet long range striking forces could be further improved by the use of satellites employing electronic, optical and infrared sensors. We believe that in the past year the Soviets have employed the "Cosmos" satellites launched from Tyuratam on photographic missions. We cannot estimate detailed characteristics for this system, but the payload capability of these satellites (about 10,000 lbs.) provides a considerable potential for experimentation and growth.

119. In conducting any long range attack, the Soviets would desire to learn as rapidly as possible which targets had survived their initial strikes. We have no direct evidence on the Soviet approach to this problem. In theory, existing high-frequency back-scatter antennas located within the USSR could rapidly determine the general areas and yields of large nuclear explosions in the US. However, the Soviets could probably not be sure in advance whether this remote detection technique would be able to distinguish the exact locations and yields of a large number of nuclear warheads detonating over the US within

a short period of time. In any event, the information obtained would probably not be precise enough to be used for retargeting ICBMs. It might assist in programming post-attack reconnaissance more effectively.

120. For more precise post-attack reconnaissance, the USSR would probably use manned aircraft which would have the advantage of being able to seek out and strike at targets missed in the first phase, or targets of uncertain location, without having to relay information to other attack components. The Soviets have developed a high-altitude, reconnaissance aircraft (MANDRAKE), similar to the U-2, which has an operating radius suitable for use against Eurasian targets. In addition, some of their present bombers could be employed in a reconnaissance role. Unmanned reconnaissance of targets in Eurasia might be performed by surface-to-surface aerodynamic vehicles. Such vehicles could become operational within the next two years. More comprehensive damage assessment could be achieved by employing reconnaissance satellites.

### *C. Electronic Warfare and Countermeasures*

121. Soviet capabilities to disrupt Western strategic and tactical communications are considerable. The Soviets have developed a wide range of active and passive ECM equipment including improved chaff, radar, and communications jammers and various deceptive devices to counter Western defensive electronic systems, such as communications, air defense radar, and navigation aids. The USSR's present capability covers all the significant frequencies used by the West, from low frequencies up to 10,000 mc/s and possibly higher. Existing Soviet capabilities, however, are not likely to be effective against some of the more advanced US communications systems, such as those employing ionospheric and tropospheric scatter. The Soviets are continuing to enhance this capability, and equipment that will probably become available in the future will include such improvements as greater power and more sophistication.

122. *Airborne Systems.* The Soviets would probably employ some bombers in an ECM role. All units of Long Range Aviation are probably equipped and trained in the use of both mechanical and electronic ECM. All Soviet bombers can be equipped to carry chaff, and they have demonstrated capabilities for its employment under a wide variety of operational conditions. Air-to-surface missiles designed to home on radar transmitters, air-launched decoys to simulate bomber radar returns, and infrared decoy flares to counter heat-seeking air-to-air missiles could also be made available provided the Soviets see a requirement for them. Soviet aircraft are equipped with electronic jammers and have used them repeatedly in exercises. Future improvements

could include broader band jammers, higher powered and more automatic equipment, and increased use of deception techniques.

123. *Countermeasures for Naval Use.* In recent years, the Soviets have given increased emphasis to development of shipboard ECM equipment, but such equipment is of only limited value to the long range striking forces. Because of the risk of detection, we doubt that Soviet submarines would employ active jamming, but passive intercept gear would be used to provide warning of Western radar and sonar search activity.

124. *Missile and Satellite Application.* The Soviets probably are continuing research on the reduction of radar cross-sections of missile nose-cones, and may achieve significant results within the next five years. They have probably investigated various techniques for confusing radar, such as tankage vectoring and decoys to simulate missile nose-cones. They may also develop active ECM, multiple warheads, etc., for inclusion in ballistic missile reentry systems.

#### VIII. TRENDS IN STRATEGIC ATTACK FORCES, 1966–1969

##### A. General Considerations

125. From the preceding analysis we can derive a number of characteristics which have marked the building of long range strike forces in the USSR:

(a) The USSR's research and development programs, as reflected in the expansion of test ranges and the development of successive weapon systems, have been vigorous.

(b) In contrast, the scale and pace of deployment programs have been uneven. Some systems, particularly those suited for attacking Eurasia, have been deployed steadily and in large numbers. Others, such as individual types of heavy bombers, ICBMs, and missile submarines, have often been produced and deployed in relatively small numbers.

(c) This behavior has reflected, in part, technical problems and economic constraints. But it also suggests that the USSR is willing to tolerate a condition of limited intercontinental capabilities and considerable vulnerability over long periods of time.

(d) Both doctrinal discussions and some features of weapons design, such as vulnerability and relatively slow reaction times, indicate that Soviet thinking about the complex problems of long range attack has been less sophisticated than that of the US.

(e) No well-defined strategic concept appears to have governed the forces deployed to date. The present composition of the force does not suggest that it was designed primarily for either preemption or retaliation.

(f) Present deployment and developmental efforts indicate that the USSR, despite the frequent public stress on surface-to-surface missiles, has retained diversified forces.

126. In NIE 11–8–62, we examined the ways in which the Soviets might employ their long range attack forces in time of war. We concluded in that estimate that the Soviet target concept is very broad and that, while Western nuclear delivery capabilities top the list, the USSR plans to strike at other military targets and at centers of communication, administration, and industry, making no special effort to minimize civilian casualties.

127. We estimated that, in a preemptive attack during the near term, the USSR would probably direct ICBMs and bombers against North America and MRBM IRBMs, medium bombers, and missile submarines against Eurasian targets. We drew attention to the special difficulties of achieving simultaneity, locating US forces at sea, and attacking hard targets. We concluded that the Soviet long range strike forces would be inadequate to permit the USSR to launch initial attacks without expecting to receive devastating blows in return. In the same estimate, we noted the limitations on the USSR's ability to protect its long range strike forces against attack. We pointed out, however, that by virtue of hardening in the land-based missile force and improvements in the missile submarine force, the Soviets were reducing the vulnerability of a portion of the force in order to provide it with some prospect of survival and retaliation.

128. In the succeeding 15 months, the USSR has expanded its forces and has made improvements in the performance characteristics of various systems. There is evidence that questions of the character of general nuclear war and strategies for its conduct continue to be discussed. In none of these areas have changes appeared which substantially alter our appraisal of the USSR's near-term capabilities or indicate radically new approaches to questions of strategy. But if the outlook for the next two years is relatively unchanged, the prospects for the later 1960s are far less clear. A variety of factors could influence the numerical size, the mix of various systems, and the characteristics of individual weapon systems in the total force which will be deployed by mid-1969.

129. *Technical Factors.* Much will depend upon the specific successes achieved among the numerous R&D projects which now may be going forward. If, for example, the Soviets were to succeed in developing a new ICBM which could be dispersed and maintained at much less expense than current systems, they would probably concentrate on it in their deployment program. If not, present and improved versions of the SS-7 system would probably represent the bulk of ICBM capabilities added during the 1965–1969 period. We know that the USSR is developing a submerged launch submarine system of MRBM range, but because

of uncertainties about such factors as the time of availability and the operational effectiveness of the submarine and its missile, we cannot predict how heavily the USSR will invest in such a system.

130. *Strategic Concepts.* We are confident that the desire for an effective deterrent is one of the primary concerns in Soviet policy toward long range striking forces. We expect this concern to be reflected in an increasing emphasis on survivability through hardening of ground-based missiles, expansion of the submarine force, and perhaps the advent of a mobile MRBM. We believe that the Soviets also attach a high deterrent value to very-high-yield warheads calculated to intimidate opponents by threatening cities, although they probably also see some military utility in these weapons for such purposes as attacks on key hardened installations. We believe that the concept of deterrence is probably advocated by those who, for more general reasons as well, wish to aim at fairly moderate-sized forces. We have no basis for estimating the force levels which might be associated in the Soviet mind with a satisfactory deterrent posture.

131. Various classified and public statements suggest that, as Soviet military leaders have begun to comprehend the gigantic difficulties of prosecuting a war in which the West strikes first, they have urged a preemptive strategy upon the political leadership. The military requirements of a fully effective preemptive strategy are themselves gigantic, although we are not certain that Soviet military thought fully appreciates these requirements yet. Arguments derived from the concept of preemption may impart to Soviet programming during this period an upward pressure beyond levels which Soviet planners might associate with the concept of deterrence. On the other hand, evidence of current military programs and general political and economic trends in the USSR persuades us that Soviet policy in the latter half of the decade will not be governed by an all-out effort to achieve extensive capabilities for preemption against programmed Western strike forces.<sup>27</sup>

132. *Economic Constraints.* Expenditures on forces for strategic attack, plus those for strategic defense, have been the most active elements in Soviet military spending during 1958–1962, rising by some 115 and 70 percent respectively while total military expenditures increased by about 30 percent. These increases have greatly improved

---

<sup>27</sup> The Assistant Chief of Staff, Intelligence, USAF would reword the last two sentences as follows:

“Our evidence of current military thinking, even in view of general political and economic trends in the USSR, suggests that Soviet military policy in the latter half of the decade may be shaped to a considerable extent by further efforts to enhance preemptive attack capabilities. In any event, arguments derived from the concept of preemption probably will impart to Soviet programming during this period an upward pressure beyond levels which Soviet planners might associate with the concept of deterrence.”

Soviet strategic capabilities, but they have been among the important causes of the general economic slowdown of recent years, and this slowdown has become a chief concern of the Soviet leadership.

133. While forces best suited for Eurasian use accounted for the bulk of spending on the long range attack mission in 1958, expenditures on intercontinental systems have shown more rapid growth and consumed well over half of total 1962 outlays on long range attack. With the MRBM/IRBM force levelling off and BLINDERS being produced at a relatively moderate rate, R&D and investment in weapon systems designed for the Eurasian theaters will decrease substantially in the future, although operating expenditures will remain high. Thus, the USSR has some new flexibility in the current period which will enable it to increase expenditures on supporting elements and systems for intercontinental attack, or reduce spending on total long range strike force, or choose some intermediate solution. We believe that because of other demands, both military and nonmilitary, the Soviets probably will not continue increasing total spending for long range attack at the 1958–1962 rate, which averaged about 20 percent annually. We expect some continued although more gradual rise in these allocations.<sup>28</sup>

134. *Effects of Other Programs.* Other programs compete with strategic attack forces, not only for resources in the broad sense, but also for scarce skills and quality materials necessary to all technologically advanced programs. Strategic defense is a major claimant in this competition. We believe that R&D spending on antimissile defense will continue at a high rate during the period of this estimate, whatever decisions are taken about ABM deployment. The economic demands of the Soviet space program are also substantial and draw on the same resources. In general, we believe that the USSR would have great economic difficulty in pursuing a policy which called for antimissile defenses of major cities, competition with the space program which the US has scheduled for this period, and the higher sides—both in numbers and performance characteristics—of our estimates for long range strike forces which appear in succeeding paragraphs.

135. The present Soviet view of the likely character of future war also imposes on the USSR the requirement to maintain large theater forces. Expenditures on this mission, while they have declined somewhat in recent years, are still very large; in 1962, according to our estimates, they equalled about two-thirds of the combined expenditures on strategic attack and strategic defense. If the Soviets maintain theater

---

<sup>28</sup> The Assistant Chief of Staff, Intelligence, USAF considers it more likely that the rate of expenditure for strategic systems will continue to rise at least as rapidly in the coming years as it has since 1958, since these expenditures probably will include military space systems as well as follow-on missile and manned systems.

forces at their present size and pursue the attempt to provide them with improved equipment and adequate supporting elements, these expenditures cannot be substantially reduced, although they can probably be held at about the present levels. We believe that the proper level of manpower and expenditures in the theater forces is likely to be a subject of continuing contention in the coming period, and it is possible that at some point substantial cuts will be made, thereby easing economic pressures somewhat.

136. *Political Factors.* In the present and prospective strategic situation confronting the USSR, there is much which argues for a policy of safeguarding national security through some fairly moderate level of military strength or even, more radically, through international agreements to limit or reverse the arms race. The experience of the past five years should show the Soviet leaders that their chief opponent is well able to match and overmatch them in numbers of long range delivery vehicles and is no less able than they to develop improved systems with superior performance characteristics. Similarly, Khrushchev has had occasion, in a series of crises, to observe the limits on the role which a long range strike force can play in furthering Soviet political objectives. At the same time, his advocacy of a higher priority for certain civilian economic programs appears to be growing stronger.

137. Our survey of current evidence on both development and deployment of systems for strategic attack suggests no radical change responsive to these considerations, but rather a general Soviet intention to continue improving their capabilities. The possibilities of a more substantial change in Soviet policy hinge in large part upon more general political changes, such as a new sense of the Soviet position in world affairs arising out of the Sino-Soviet conflict, or a new Soviet judgment about the value of strategic attack forces in supporting the USSR's political objectives.

138. In framing the estimates which follow, we have attempted to take into consideration all these factors, along with the specific evidence available concerning the various categories of long range weapon systems. These estimates are necessarily imprecise and are expressed in ranges meant to indicate the upper and lower limits outside which, in the absence of an arms control agreement, actual strength in the period 1966-1969 probably will not fall.

#### *B. Intercontinental Ballistic Missile Forces*

139. There is now available to us a considerable body of evidence from many sources, both on the general patterns of Soviet military policy and programs and on the development and deployment of long-range striking forces in recent years, from which it is possible to identify several broad trends likely to apply to the future growth of ICBM

and other related forces. It appears quite likely that present Soviet programming calls for the acquisition of some hundreds of ICBM launchers for missiles with multimegaton warheads, though the specific size and composition of the force in the late 1960's could vary considerably within this general range. Efforts to improve survivability and readiness are evidently under way; the hardening of a portion of the land-based missile forces and the development of advanced submarine missile systems point to Soviet concern to have protected retaliatory capabilities.

140. None of the evidence available to us suggests, however, that the USSR contemplates forces designed to neutralize US strike forces in an initial blow, nor do the Soviets appear to be seeking to match the US in numbers of intercontinental delivery vehicles. Soviet strategic attack programs place great emphasis on ICBMs, but these weapons are sharing available resources with other land-based and submarine systems, and we believe the USSR is investigating the feasibility of space weapons systems. Moreover, past Soviet investment in air defense and the vigor of ABM research suggest that the USSR may see its security best served by a combination of antimissile defenses and enormously destructive, though still numerically inferior, intercontinental strike forces. Our evidence thus leads us to believe that the Soviets see technological achievements in a variety of military fields, including ICBMs, as the best way of improving the USSR's strategic position relative to that of the US.

141. Program lead times and the general character of present Soviet missile and nuclear weapon technology will significantly affect the size and composition of the ICBM force for the 1966–1969 period. The major Soviet long-range missile programs which have been observed to date have required some  $2\frac{1}{2}$  to  $3\frac{1}{2}$  years from the initiation of construction of research and development launch facilities to achievement of an IOC, and at least two years more to achieve a significant force level, say 100 operational launchers. It is doubtful that the lower limit of these lead time ranges can be appreciably reduced. In general, therefore, any new ICBM systems to be deployed in quantity during the 1960's would need to be under development already or to begin development shortly.

*Evidence of R&D Activities*

142. Research and development activities at the Tyuratam missile test range, indicate that the Soviets will continue to improve and expand their ICBM force in the period beyond 1965. Current activity at Tyuratam almost certainly includes preparation for further space ventures and product improvement on existing ICBM systems as well as development on new weapons systems.

143. Since the available evidence is inconclusive concerning the specific nature of planned improvements to existing ICBMs or follow-on systems, we have based our estimates on these matters in large part on the Soviet need to correct deficiencies in the current force, tendencies in Soviet missile design, and Soviet technical capabilities.

*Improved and Follow-on Systems*

144. *Very Large ICBMs.* We continue to believe that the Soviets are developing a large vehicle (with a million or more pounds of thrust) which could be used as a space booster, as a "global rocket," or as a carrier for warheads yielding up to 100 MT. Assuming that test firings begin within the next few months, such a vehicle could probably have an initial operational capability in the period mid-1965 to mid-1966. If such a vehicle is employed as an ICBM, the initial deployed sites would probably be soft. To reduce the vulnerability of such a system and to maximize its contribution to strategic deterrence, the Soviets would probably wish to incorporate hardening at some stage in the program, but there are high costs and technical obstacles which might limit the degree of hardness practicable, or perhaps preclude hardening entirely.

145. *Standard-Size Follow-On ICBMs.* We believe that the Soviets would consider the primary qualitative improvements needed in the bulk of the ICBM force to be increased survivability, shorter reaction time, better accuracy, and decreased logistic and personnel support. A Soviet decision to develop and deploy a basically new ICBM in the SS-7 size class would depend largely on their view of the possibilities of meeting their operational requirements through product improvement on current systems. These requirements can probably be met almost as well and at much lower cost by product improvements to the SS-7 system as by a follow-on system of the same general type and weight.

146. Either a new ICBM system or product improvement to the SS-7 would probably include new launch site configurations improving force survivability and decreasing support requirements. New configurations may include semi-hard sites, or new single launcher SS-7 hard sites providing for much greater dispersal. Deployment sites of improved configuration could be under construction in the near future and become operational in the period mid-1965 to mid-1966.

147. Soviet development of an ICBM system as small as the US Minuteman would run counter to trends thus far discernible in Soviet long range missile systems and weapons designs. The Soviet chemical industry, particularly those elements which have to contribute to the development of large grain solid propellants, is one of the basic weaknesses of Soviet technology. Further, at present we have very little evidence on recent Soviet research and development to support an

estimate that a solid or exotic fueled ICBM as small as Minuteman could become operational in the 1966–1969 time period. Nevertheless, some of the operational attributes of the Minuteman concept would reduce the main deficiency in the Soviet force—namely its vulnerability to US attack. The Soviets might find that a new system could go considerably further towards remedying this weakness than would an improved SS-7, and such a system might also reduce the high maintenance requirements associated with their present systems.

148. A new missile somewhat smaller than SS-7 using improved propellants could reach operational status in the period. We believe it likely that such a new smaller missile would be deployed in hard sites. We believe that a new, silo-launched, smaller missile would not start test firings for about a year and IOC would not occur until 1966–1967. Should the Soviets elect to deploy a new missile in soft or semi-hard sites, test firing could begin in the near future with an IOC in about mid-1965.

*Composition and Size of the ICBM Force 1966–1969*<sup>29</sup>

149. Whether through product improvement, introduction of new missile systems, or both, the Soviets will increase the effectiveness of their ICBM force significantly during the period. Inasmuch as the USSR has concentrated primarily on liquid propulsion in the post-war period, while emphasizing development of efficient large nuclear warheads, the bulk of the Soviet long range attack forces operational prior to mid-1969 will consist of liquid-fueled missiles capable of delivering warheads from roughly 3 to 13 MT. We believe that total deliverable megatonnage will be increased by increased load-carrying characteristics of standard sized missiles and possibly by introduction of a very large ICBM. The accuracy of missiles added to the operational force during the period may be about 0.5–1.0 n.m. CEP. Decoys, other penetration aids, and warhead shielding could be incorporated at any time, with a sacrifice in payload, should the Soviets consider that they are required. Although there is evidence of Soviet interest in decoys, there is no known Soviet program to develop them.

---

<sup>29</sup> The Assistant Chief of Staff, Intelligence, USAF disagrees in part with the analysis contained in paragraphs 158–162. See his footnote to Table on page 38.

150. We estimate that the deployment of currently operational missiles in soft launch sites will cease by the mid-1960's. The construction of sites for SS-7 may continue through the period, and may include improved hard or perhaps semi-hard configurations. A smaller system could become operational in the 1965-1967 period and could be deployed at a rapid rate. Very large ICBMs with warheads yielding up to 100 MT could enter inventory in 1965-1966, and would probably be deployed in relatively small numbers to supplement the force.

151. The low side of our estimate for 1969 (400 launchers) assumes that, in addition to deployment of a few very large ICBMs which begin to enter operational inventory in mid-1966, the Soviets will at about the same time introduce either a new, somewhat smaller ICBM or an improved SS-7, possibly in single-launcher hard sites. It further assumes that when the number of hard silos reaches a level of about 200 (about mid-1968) the Soviets will consider the resultant force, in conjunction with other strategic weapon systems, an adequate deterrent. The reasons why the Soviet force might develop in this manner include such economic considerations as the need to devote more resources to the civilian economy or to anti-missile and space programs as well as political factors.

152. The high side of our estimate for mid-1969 (700 launchers), takes into account the possibility that the deployment of soft launchers, perhaps including some semi-hardened sites, is carried somewhat further than in the preceding alternative; that a very large system is introduced somewhat earlier than 1966, and that over 200 launchers of a new type—an improved SS-7 or a new, somewhat smaller hard system, possibly in single silo sites—are deployed. Construction of such a force might reflect not only a Soviet concern for deterrence, but also an effort to put the USSR in a somewhat better position to undertake a preemptive attack if a Western strike appeared imminent and unavoidable.

153. Although the force levels indicated by the upper and lower limits of the range are derived from technical and strategic considerations, other force compositions and force levels within this general range are equally possible. Considering the probability of slippages in development and deployment programs for estimated new and improved ICBMs, we consider it unlikely that the operational force in 1969 will exceed 700 launchers. Considering the extent of present deployment activity and the Soviet requirement to maintain a credible deterrent, we doubt that the force will level off with fewer than 400 launchers. In both cases, the Soviets would recognize that the force fell far short of that required for a preemptive attack which might reduce devastation of the USSR to an acceptable level, but in either case, the

force would include a protected component capable of devastating retaliatory blows if it survived.<sup>30</sup>

*C. Medium and Intermediate Range Ballistic Missile Forces*

154. As indicated in our near-term estimate, we believe that the SS-4 and SS-5 deployment programs have about run their course. By 1965, the operational force will probably have leveled off at some 700–750 launchers (some 15 percent of them hard), a full refire capability for soft launchers will probably be available, and an improved MRBM may have begun to enter the force. Beyond this point, the course of the program will depend, not only on the general factors described in preceding paragraphs, but also on Soviet technical possibilities in the MRBM IRBM field and on trends in Western forces on the Eurasian periphery.

155. Among the technical possibilities, the most important is the Soviet option to proceed with development of a new IRBM having advantages over the SS-5 in accuracy, survivability, reaction time, maintenance, and sophistication of warhead design. If two separate systems are developed, the IRBM would probably phase in a year or so after the MRBM, i.e., in about 1966–1967. It is also possible that the Soviets have elected to work toward a single follow-on system which, by about the same time period, could cover all MRBM and IRBM ranges. In either event, follow-on systems are likely to feature hard or possibly mobile deployment.

---

<sup>30</sup> The Assistant Chief of Naval Operations (Intelligence), Department of the Navy believes the force level is likely to be toward the low side (400) of the estimate presented here. In addition to the reasoning set forth in paragraph 160 and the last sentence of paragraph 162, he would add that a force level of 700, while adding appreciably to the cost of the program, would neither increase the Soviet deterrent posture commensurately nor even approach an acceptable capability for preemptive attack.

ESTIMATED SOVIET OPERATIONAL ICBM LAUNCHERS,  
1966-1969<sup>1</sup>

CONFIGURATION	MID-1966	MID-1967	MID-1968	MID-1969
<i>Soft Launchers</i>				
1st and 2nd Generation <sup>2</sup>	150-250	150-250	150-250	150-250
Very Large ICBM <sup>3</sup>	a few-20	10-30	20-40	25-50
<i>Hard Launchers</i>				
2nd Generation (three silos)	100-125	100-125	100-125	100-125
SS-7 (single launcher) or new smaller ICBMs	a few-25	50-100	100-175	100-250
Tyuratam	25	25	30	30
TOTAL (rounded)	275-450	325-525	400-600	400-700

<sup>1</sup> The Assistant Chief of Staff, Intelligence, USAF believes the lower side of the ICBM-spread in this Table is unrealistically low, and he considers that if the Soviets elect to focus on a new, small, more easily deployed system, the high side of the Table is too low.

The Assistant Chief of Staff, Intelligence, USAF forecasts two alternative Soviet ICBM force structures and considers that while the lower of these appears to be the more likely as of the present, the higher alternative could well be indicated by developments within the next two years.

Alternative I, which represents a force of 600-750 ICBMs by mid-1969, is based on projection of present evidence of site construction and launcher activation rates. It is quite similar in composition to the high side of the spreads shown in the Table above.

Alternative II starts from the same base in mid-1965 as does Alternative I, but Alternative II includes a small, highly reliable ICBM, deployed in semihard or hard sites, which by mid-1969 would represent about half of the entire ICBM forces.

The Assistant Chief of Staff, Intelligence, USAF estimates the size of the Soviet ICBM force under these alternatives as follows:

	Mid-1966	Mid-1967	Mid-1968	Mid-1969
Alternative I	375-450	450-550	525-650	600-750
Alternative II	375-500	500-700	650-900	750-1000

<sup>2</sup> May include some semi-hardened sites.

<sup>3</sup> May include some hardening by 1969.

156. Assuming that the target system remains essentially unchanged and the new missiles are more effective, we believe the Soviets would feel under no pressure to expand their total MRBM/IRBM force in 1966-1969. Improved systems will probably supersede present systems, and may have largely replaced at least the SS-4 by 1969, when that system will have been in operational service for nearly 11 years. Thus the proportion of hard sites (and of mobile launchers if introduced) will probably increase as the period advances. The re-use of existing deployment and support areas by new missile systems is likely, but some redeployment can be expected as time passes.

157. The developments which we can foresee in Western forces within range are not likely to add to potential Soviet MRBM/IRBM

targets in a major way—for example, additional Polaris forces and possible mobile or seaborne MRBMs in NATO will be essentially untar-getable by ballistic missiles. We therefore believe it likely that Soviet MRBM/IRBM force levels will remain fairly constant in 1966–1969, but we do not exclude the possibility that a general strengthening of NATO forces would generate enough concern in the USSR to result in some incremental expansion. Assuming no arms control measures involving nuclear-free zones in Europe, it is possible that political and military developments in NATO and the Warsaw Pact will at some point lead the Soviets to move some MRBMs into the Satellites, but we believe the Soviets are highly unlikely to turn any over to Satellite control. The Soviets will continue to retain their capability, exercised in Cuba in 1962, to deploy these systems rapidly to remote areas.

158. We have also considered the possibility that the Soviets will come to view the Chinese as a threat requiring them to allocate a portion of their MRBM/IRBM capability to possible employment against China. The advent of a nuclear capability in the hands of a completely intransigent Chinese regime could conceivably bring this about. In general, however, we think that worsening Sino-Soviet relations over a long period would be more likely to influence Soviet ground force deployment in areas near China, and perhaps to motivate the Soviets to retain more bombers, such as BADGERS, capable of employing conventional as well as nuclear weapons.

#### *D. Submarine-Launched Missile Forces*

159. The combined ballistic missile force in mid-1965 is likely to be about 55–65 submarines, of which some 15–20 will probably be nuclear powered. A portion may be armed with 700 n.m. submerged-launch missiles. The number of missiles carried by this total force will be at least 160–190, and it may be considerably greater if new classes of submarines have more than three tubes each. Some submarines will probably be engaged in routine patrols in open oceans, including areas within missile range of US targets. The force will thus add an important element of survivability to Soviet strategic attack capabilities.

160. We think the Soviets will continue to consider missile submarines an important adjunct to their ground-launched missile capabilities, and we expect the requirement for capabilities to attack surface naval formations to continue. On the other hand, the growth of the force may be affected by the availability in the USSR of increasing quantities of militarily competitive but less expensive delivery systems, especially hardened ICBMs. Beyond these generalizations, our estimate for 1966–1969 depends in considerable measure on the technical possibilities for still further improvement in submarine missile systems.

161. Longer range missiles would have advantages over present systems, especially by allowing submarines to operate in broader ocean

areas while remaining within range of potential targets. Although there is no evidence indicating its ultimate use, if the new ballistic missile now being tested at Kapustin Yar to a range of about 1,000 n.m. is intended for submarine use, it could probably be operational in limited numbers of submarines by 1966, or perhaps even slightly earlier. If an even longer range missile is developed, it would probably require a new submarine class designed specifically for it, and such a weapons system could become operational later in the period. In general, we think that the chances of such a development would be greater if the Soviets can develop at some reasonable cost a system with a larger number of missiles per submarine. We have no evidence of work on new submarine projects beyond those about to become operational, but limitations in our ability to acquire such evidence are such that new projects can reach operational status without confirmation of their existence.

162. Considering all factors, including estimated construction capabilities and programs and the possibilities for improved systems, we believe that the number of additional nuclear powered ballistic missile submarines added to the force in 1966–1969 could range from 10 to 15. This range is due in part to our uncertainty about future Soviet allocations of nuclear submarines to the missions of torpedo attack and anti-submarine warfare. We believe that construction of diesel-powered ballistic missile submarines will probably be terminated by the mid-1960's. Existing units, with the possible exception of the older Z class conversions, are likely to remain in service throughout the decade.

163. We do not anticipate significant technical changes in the cruise missile submarine force in 1966–1969. A new missile with increased range could be developed but this would increase the problems of coordinating targeting and guidance. Conversion of additional numbers of aging W class submarines seems unlikely. Some of the newer Z and F class submarines, which are diesel-powered but of significantly greater range, could be converted to the SS-N-3 role in order to further enhance Soviet naval capabilities against Western naval surface forces and sea lines of communications. The number of nuclear-propelled units to be added to the forces in 1966–1969 may be in the range of 6 to 12.

164. On the basis of these considerations, we estimate as follows the trends in Soviet missile submarine forces in 1966–1969:

ESTIMATED SOVIET OPERATIONAL MISSILE SUBMARINES				
	1966–1969			
	MID-1966	MID-1967	MID-1968	MID-1969
<i>Ballistic</i>				
Nuclear	17–24	19–28	21–32	23–36
Diesel	41–45	41–45	41–45	41–45
<i>Cruise</i>				
Nuclear	12–16	14–20	16–24	18–28
Diesel	20–25	20–30	20–30	20–30

*E. Long-Range Bomber Forces*<sup>31</sup>

165. With the growth and improvement of missile capabilities, the Soviets would probably plan in the later 1960's to employ bomber forces in the follow-on attacks after initial missile strikes had been delivered, or to supplement the retaliatory blow if the USSR were attacked first. Aircraft equipped with penetration aids and nuclear weapons would probably be used for increasingly specialized missions, such as armed reconnaissance (including maritime) and attacks on selected hard targets, as well as on targets of uncertain location.

166. We believe that if the USSR actively pursues R&D work and commits funds for production and deployment, new military aircraft capable of intercontinental ranges could be brought to operational use in the 1966–1969 period. The Soviets are technically capable of developing either long endurance aircraft (for reconnaissance and/or low altitude penetration) or high altitude aircraft with maximum speeds of about Mach 2–3 in this time period. Considering the types and quantities of missile delivery systems they are likely to have in 1966–1969, as well as the probable continued availability of existing heavy bomber types, we think it unlikely that the Soviets will bring any follow-on heavy bomber to operational service during the period of this estimate. The Soviets will continue to advance their state-of-the-art in large and high speed aircraft, and their work on advanced transports will provide a technological and production base which they could shift to military purposes should they come to consider this necessary or worthwhile. If this occurs, US intelligence is likely to obtain indications of development and production at least a year or so prior to the entry of a follow-on bomber into operational units.

167. Barring this possibility, the increasing age of the BISON and BEAR, and continued phase-out of BADGER, will produce a reduction in both the heavy and medium bomber components of Long Range

---

<sup>31</sup> The Assistant Chief of Staff, Intelligence, USAF, disagrees in part with the analysis presented in Paragraphs 174–176. For his views see footnote following Table on page 41.

Aviation. The output of BLINDERS will probably continue to be shared between Long Range and Naval Aviation. BLINDER production may continue through at least the mid-1960's. It is possible that the further development of Soviet missile capabilities, coupled with renewed force reductions, will produce a sharper decline in the strength of Long Range Aviation. However, on the basis of present trends, and considering normal attrition, we estimate as follows the strength of Long Range Aviation in 1966-1969:

ESTIMATED STRENGTH OF SOVIET LONG RANGE AVIATION*				
1966-1969				
<i>Bombers and Tankers</i>	MID-1966	MID-1967	MID-1968	MID-1969
Heavy				
BISON	85-100	80-95	75-95	70-90
BEAR	<u>75-100</u>	<u>70-95</u>	<u>65-90</u>	<u>60-85</u>
TOTAL	160-200	150-190	140-185	130-175
Medium				
BADGER	550-675	400-525	300-400	200-300
BLINDER	<u>175-225</u>	<u>200-275</u>	<u>200-325</u>	<u>200-350</u>
TOTAL	725-900	600-800	500-725	400-650

\* The Assistant Chief of Staff, Intelligence, USAF, disagrees in part with the discussion in Paragraphs 174-176 and with this Table since he considers they represent an underestimation of the importance the Soviets will continue to give to manned strategic aircraft as an important adjunct to their ground launcher missile capabilities.

He estimates that the introduction of a follow-on heavy bomber, the continuation of both BEAR and BISON in service at or near present strengths, the continued production of BLINDER through 1969, and the retention of sizeable numbers of BADGER aircraft will result in composition of Long Range Aviation as follows:

<i>Bombers and Tankers</i>	MID-1966	MID-1967	MID-1968	MID-1969
Heavy				
BISON	100	95	90	85
BEAR	100	95	90	85
FOLLOW-ON	<u>0-10</u>	<u>0-30</u>	<u>10-45</u>	<u>20-65</u>
TOTAL	200-210	190-220	190-225	190-235
Medium				
BADGER	725-775	650-700	575-625	500-550
BLINDER	<u>175-225</u>	<u>225-275</u>	<u>275-325</u>	<u>300-350</u>
TOTAL	900-1000	875-975	850-950	800-900

While the evidence to date is not sufficient to enable identification of the specific type of follow-on heavy bomber on which the Soviets will concentrate, the Assistant Chief of Staff, Intelligence, USAF, considers that the follow-on bomber could be a long endurance aircraft developed from the BEAR which could be introduced by 1965, a supersonic-dash bomber using technology from the BOUNDER and introduced in 1966-67, or a nuclear powered bomber introduced about 1968. These uncertainties are reflected in the spread in the tabulation above.

#### F. Space Weapons Systems

168. On the basis of evidence presently available, we are unable to determine whether the Soviets now have plans or programs for the

military use of space. The limitations of this evidence, however, are such that our chances of identifying such programs are poor. We believe that the USSR almost certainly is investigating the feasibility of space systems for military support and offensive and defensive weapons. Soviet decisions to develop military space systems will depend on their expected cost and effectiveness as compared with alternative systems, and on the USSR's estimate of the reaction of other countries. In this connection, the Soviets would probably recognize that any deployment of an orbital bombardment system would be an act of major international import which would greatly intensify East-West hostility, prejudice the option of *détente* tactics, and give a strong new stimulus to Western military programs.

169. Any orbital bombing system of real military significance would require satellite vehicles in some number, and would accordingly be extremely complex and expensive. Important developmental progress toward such a system within the decade would require a major Soviet effort to perfect hardware and to develop advanced techniques. In considering whether to pursue such an effort, the Soviet leadership would examine the likely political military aspects of orbital bombardment systems in relation to the mix of forces for long range attack they would hope to have in the late 1960's and beyond, and the cost effectiveness of the alternative systems open to them. We think that they would be likely to consider orbital bombing systems primarily as a means of supplementing their existing types of forces rather than visualizing such weapons as replacement or substitute systems. They would probably also consider them as one way of introducing additional complications into US defense planning. Finally, they would probably consider them as a qualitative advance in weapon technology which could support Soviet claims to a parity or even superiority in total strategic capabilities.

170. There is a wide range of delivery techniques and types of orbital forces which might be sought by the Soviets, with considerable difference in developmental requirements, costs, and effectiveness. To provide a threat of retaliation against population centers, they might find a relatively small force of limited effectiveness sufficient. For preemptive employment against smaller or harder military targets, however, a large sophisticated force with short times to target, near-simultaneity of delivery, and an accuracy approaching that of ICBMs, would be necessary.

171. For accomplishing military missions, we think that during the 1966–1969 period, orbital bombardment systems will not compare favorably with ICBMs in terms of reaction time, average life, reliability, vulnerability, accuracy, or targeting flexibility. In addition to being less effective militarily, an orbital bombardment system will be consider-

ably more costly than an equivalent delivery capability with ICBMs. Based on considerations of cost and effectiveness as we now understand them, therefore, it would appear unlikely that the Soviets will during this decade deploy orbital bombardment systems of military significance. Further, if the Soviets enter into a formal obligation to refrain from orbiting nuclear weapons, this will constitute a factor inhibiting such deployment.

172. We recognize, however, that the Soviets might reach different conclusions as to cost and effectiveness, and in some future phase of East-West relations, political considerations might lose their effectiveness. Moreover, considering the pace of developments in the weapons field in general, it is extremely hazardous to estimate Soviet decisions for a period of many years ahead. For these reasons, a firm estimate as to whether the Soviets will deploy an orbital bombardment system within the 1966–1969 period cannot be made at this time.

173. If the Soviets do proceed with an orbital system, we believe that they are more likely to seek a small force of limited effectiveness than a very large and sophisticated one. In any case, developmental testing of an orbital bombardment system should be observable to us at least a year or two prior to attainment of an accurate, reliable system.

## Annex A

### GLOSSARY OF MISSILE TERMS

*Initial Operational Capability (IOC)*—Date the first operational unit is trained and equipped with a few missiles and launchers.

*Maximum Operational Range (n.m.)*

*Surface-to-Surface Systems*—Maximum range under operational conditions with warhead weight indicated. For long-range ballistic missiles, the maximum range figures disregard the effect of the earth's rotation. In general, ballistic missiles can be fired to ranges as short as approximately one-third the maximum operational range without serious increase in CEP and to even shorter ranges with degraded accuracy.

*Air-to-Surface Systems*—Slant range between launching aircraft and target at the instant of missile launch.

*Circular Error Probable (CEP)*—The radius of a circle in which, statistically, one-half of the impacts will occur. Inherent missile accuracies are somewhat better than the accuracies specified in the tables, which take into consideration average operational factors. For naval systems firing on coastal targets, an accurate determination of the launching

ship's position is necessary to achieve CEP's of the order indicated in the tables.

*Warhead Weight*—The weight of the explosive device and its associated fuzing and firing mechanism.

*Ready Missile Rate*—A ready missile is an in-commission missile with warhead mated, mounted on an in-commission launcher in a trained unit which is considered ready to be committed to launch. Ready missile rate is the percentage of missiles on launcher which are "ready missiles."

*Reliability, on Launcher*—The percentage of ready missiles which will successfully complete countdowns and leave their launchers at scheduled times or within 15–30 minutes thereafter.

*Reliability, in Flight*—The percentage of missiles launched which detonate as planned in the target area (i.e., within three CEP's of the aiming point).

*Readiness Conditions*—The following conditions of readiness apply to all ground launched ballistic missiles having ranges greater than 350 n.m.

*Condition 4:* Launch crews not on alert. Nosecone and missile checked but not mated. Missile guidance system not adjusted for particular target and missile not erected or fueled.

*Condition 3:* Launch crews in launch area and on alert. Missile and nosecone mated and checked, but in prelaunch storage building.

*Condition 2:* Launch crews on station. Missile with nosecone erected on launch pad. Propellant facilities in position, attached, and ready to start propellant loading. Guidance system set.

*Condition 1:* Launch crew on station, missile propellant loading completed. Guidance rechecked.

*Reaction Time*—Time required to proceed from a readiness condition to firing.

*Refire Time*—Time required to refire from the same pad or launcher.

Table 1  
SOVIET LONG-RANGE GROUND LAUNCHED SURFACE-TO-SURFACE MISSILE SYSTEMS ESTIMATED  
CHARACTERISTICS AND PERFORMANCE

CHARACTERISTICS & PERFORMANCE	SHYSTER SS-3 <sup>a</sup>	SANDAL <sup>b</sup> SS-4	SS-5 <sup>b</sup>	SS-6 <sup>c</sup>	DESIGNATION SS-7 <sup>b</sup>	SS-8 <sup>1,2</sup>

Hold Time Condition 1	1 hour	Many hours	1 hour	Many hours	About 1 hour
Refire Time	4–6 hrs	2–3 hrs <sup>g</sup>	4–6 hrs <sup>g</sup>	10 hours <sup>g</sup>	4–6 hrs <sup>g</sup>

\* *These reliability rates may be high, since the effects of Soviet operational concepts and troop training standards are at least as important as technical characteristics in determination of system reliability, and we have no reliable basis for estimating these effects.*

<sup>1</sup> The Assistant Chief of Staff, Intelligence, USAF believes that the SS-8 is as likely to be large as small. If large, some of its characteristics would differ from those shown.

It is unlikely that a large missile would have the extremely short reaction times listed; rather, it is likely that reaction times would more nearly approach those listed for the SS-6. In addition, the gross weight and warhead weight would probably be within the following limits:

Gross Weight	350,000 to 500,000 pounds
Warhead Weight	8,500 to 15,000 pounds
Nuclear Yield	[text not declassified]

<sup>2</sup> For the views of the Director, Defense Intelligence Agency as to the size of the SS-8, see his footnote, page 14.

<sup>a</sup> The SS-3 system has probably now been phased out in favor of the SS-4.

<sup>b</sup> The SS-4, SS-5, SS-7, and probably SS-8 are deployed in both soft and hard configurations.

<sup>c</sup> Early tests of the SS-6 indicated that a heavy nosecone weighing 13,000 to 15,000 lbs was delivered to about 4,500 n.m. Based on heat transfer techniques available at that time, the warhead was estimated to weigh 6,000 to 10,000 lbs. Based on present technology, the SS-6 probably can deliver a 10,000 to 12,000 lb. warhead to the same distance (4,500 n.m.) provided that a new nosecone were developed and flight tested. With a Venik upper stage, the SS-6 could deliver a 17,000 lb warhead to 4,500 n.m. range, but because of the probable degradation of accuracy and reliability, we consider such a combination highly unlikely.

<sup>d</sup> A radio beam may be used to establish direction reference.

<sup>e</sup> Probably somewhat higher for missiles in the hard configuration.

<sup>f</sup> Would probably be the normal readiness condition for hard configuration.

<sup>g</sup> For the soft configuration of these systems.

TABLE 2  
SOVIET SUBMARINE-LAUNCHED MISSILE SYSTEMS  
ESTIMATED CHARACTERISTICS AND PERFORMANCE

CHARACTERISTICS AND PERFORMANCE	DESIGNATION		
	SS-N-3 <sup>a</sup>	SS-N-4	SS-N-5 <sup>b</sup>
Initial Operational Capability Type	1961 Surface-launch cruise	1960 <sup>c</sup> Surface-launch ballistic	1963 Submerged-launch ballistic
Maximum Operational Range (n.m.)	300	350	700[ <i>text not declassified</i> ]
Speed	Low-supersonic	N.A.	N.A.
Cruise Altitude (ft.)	1,000–2,000	N.A.	N.A.
Guidance	Inertial with active terminal homing	Inertial	Inertial
Accuracy (CEP)	150 ft. with terminal homing against ships; 2 nm against land targets	1–2 nm	1–2 nm
Warhead Weight (lbs.)	500–2,000 (HE or nuclear)	1,500–3,500 (nuclear)	Unknown: 1,500? (nuclear)
Propulsion	Turbojet	Stor. liquid	Stor. liquid
Reliability on launcher*	80%	80%	70–90%
Reliability in Flight	85%	90%	80%
Reaction Time	5 mins	3–8 mins. to launch 3 missiles	Unk

<sup>a</sup> These reliability rates may be high, since the effects of Soviet operational concepts and troop training standards are at least as important as technical characteristics in determination of system reliability, and we have no reliable basis for estimating these effects.

<sup>a</sup> An improvement of the SS-N-3 is expected to appear in the near future. It will probably incorporate higher speed, and a higher cruise altitude, thereby increasing range capability to about 450 n.m. It could be incorporated in current cruise missile submarines, with little or no modification of the submarine.

<sup>b</sup> Characteristics estimated for the SS-N-5 are tentative. It has been launched from a submerged submarine to ranges of about 700 n.m. and there are indications in telemetry that it employs liquid propellants. The reaction time probably will be comparable with that of the SS-N-4 system.

<sup>c</sup> An interim operational capability probably was achieved about 1958 with a missile of lesser range.

<sup>d</sup> A radio beam may be used to establish direction reference.

<sup>e</sup> Probably somewhat higher for missiles in the hard configuration.

<sup>f</sup> Would probably be the normal readiness condition for hard configuration.

<sup>g</sup> For the soft configuration of these systems.

J (4 cylinder)	280/33	Unk	Unk	Unk	Unk	Unk	Unk	Unk		Unk	Unk	Unk	Unk

<sup>a</sup> These submarine types represent the bulk of the Soviet submarine missile forces. In addition, one Z class was converted to fire one SS-N-4, one W class was converted to fire one SS-N-3, and at least one modified G class diesel-powered submarine is capable of the submerged launch of the SS-N-5. These few variants probably all served as test-beds.

<sup>b</sup> The time on station and radii (distance to station) have been computed on the basis of various operational factors, principally those relating to “Sea endurance” and “Fuel endurance”.

“Sea endurance” is defined as the total length of time that a submarine can remain at sea without replenishment under combat conditions and is estimated on the basis of personnel endurance, general habitability, food, spare parts, and consumables other than fuel. The H and E classes of nuclear propelled submarines are estimated to have a “Sea endurance” of 60 days. The G and Z-Con. classes of diesel powered submarines are estimated to have a “Sea endurance” of 60 days, while the W-Con. is estimated to have a “Sea endurance” of 40 days.

“Fuel endurance” is defined as the total length of time that a submarine can remain on patrol under combat operational conditions without refueling. For diesel-powered submarines, it is computed on the basis of fuel consumption resulting from an arbitrarily assumed average transit routine of 8 hours surface, 8 hours snorkel, and 8 hours submerged operations daily; fuel consumption on station is computed on the basis of a few hours of snorkel operations daily, sufficient only to maintain the state of charge of the main storage battery for submerged operation the remainder of the day.

The endurance and maximum operating radii of nuclear-powered submarines are limited by factors other than fuel. For the purposes of this table it has been arbitrarily assumed that Soviet nuclear-powered submarines would transit to station using the following criteria:

Speed of 7 kts in area where ASW opposition is anticipated (assumed to be about  $\frac{1}{2}$  of the time).

Speed of 13 kts in areas where ASW opposition is not expected (about  $\frac{2}{3}$  of the transit time).

<sup>c</sup> Selected distances from Soviet ports:

FROM-TO Kola Inlet	NORTH WEST			BERMUDA OR NEW		NORFOLK		GIBALTAR		PANAMA	
	ICELAND	BRITISH ISLES	HALIFAX	YORK	LOS ANGELES	SAN FRANCISCO					
	1,500	1,600	3,350	3,950		4,000		2,950		5,600	
FROM-TO Petrovavlovsk	3,200	HONOLULU	MANILA		3,600	3,400		4,200		6,500	
Vladivostok	4,400	2,750	3,100		5,000	4,550		3,000		7,750	
		3,700	1,900								

<sup>d</sup> Torpedo capacities are the maximum numbers which can be carried. Any combination of torpedoes/mines could be carried, substituting two mines for each torpedo.

*\* Soviet operating manuals on the BADGER contain data which indicate that the range of the BADGER is less than we have estimated. These data are presently under intensive study.*

*\*\* These reliability rates may be high, since the effects of Soviet operational concepts and troop training standards are at least as important as technical characteristics in determination of system reliability, and we have no reliable basis for estimating these effects.*

<sup>1</sup> The range and radius figures given in this table are maximum figures. They are applicable to the most up-to-date models of these aircraft, flying optimum mission profiles on direct routes. The use of older model aircraft, standard mission profiles, indirect routes, low-level penetration or other tactics designed to delay or evade detection and interception would reduce the effective range. The calculation of degradation in range and radius resulting from sophisticated penetration tactics is a complex process which can best be accomplished for individual missions. As a rule-of-thumb for low-level operations of heavy bombers, the radius at optimum altitude will be decreased about 1.6 to 2 miles for every mile flown at sea level.

<sup>2</sup> BADGERS have been observed with 2 AS-1 missiles (55 n.m. range), KENNEL, or with 1 AS-2 missile (100 n.m. range), KIPPER.

<sup>3</sup> BEARs have been equipped to carry one AS-3 missile (350 n.m. range), KANGAROO, rather than a bombload. The AS-3 missile is estimated to weigh about 20,000 lbs. Some BEARs are being equipped for probe and drogue refueling.

<sup>4</sup> BLINDER A is a bomb carrier, which was observed without refueling probe: range and radius estimates assume a dash of 200 n.m. at M 1.2. A refueling capability could be developed for BLINDER A at any time. BLINDER B has aerial refueling equipment and carries one AS-4 KITCHEN; range and radius missions include 100 n.m. dash at M 1.1. Radius estimates for both versions include supersonic dash into and out of target area, while ranges include dash into area only.

<sup>5</sup> Bombing accuracies indicated are for visual bombing or radar bombing against well-defined targets with free-fall bombs. These figures are not applicable to drogue-retarded bombs, which would be much less accurate.

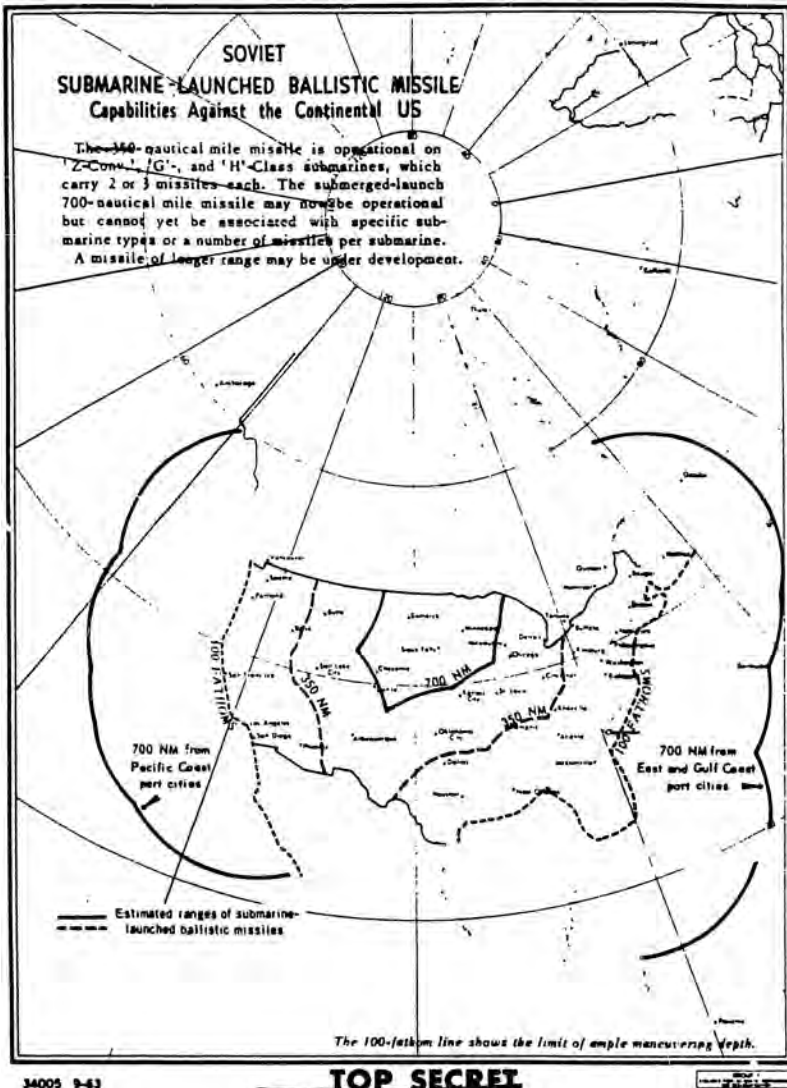

<sup>6</sup> Includes the following operational attrition rates, excluding combat attrition: (a) 90% of aircraft at home bases would be in commission after 5–10 day maintenance shutdown prior to initial operations; (b) 90% of aircraft in commission at home bases would be launched from staging bases; (c) 90% of aircraft launched from staging bases or directly from home bases on unrefueled missions would arrive in target areas; (d) 85% of aircraft launched on refueled missions would arrive in target areas. Calculations for BEAR with ASM are based on refueled flights direct from home bases. All others assume arctic staging and refueling of BADGER, BISON, and BLINDER aircraft. It should be noted that without prior maintenance shutdown, the in commission rate of heavy bombers at home bases would be about 70%, and for medium bombers about 60%.

October 25, 1963

Mac:

The attached is a comment on McNamara's Strategic Forces Memo in its own terms. I have given a copy to Spurgeon Keeny and, informally, to Alain Enthoven.

In reading this comment there are a number of things to bear in mind: (1) The loose connection between the argument and the numbers might indicate that it is McNamara's judgment that these numbers are the minimum the Services will accept. This is one way to interpret constancy of numbers in relation to changing arguments. (2) The Budget provides for a decision to procure only 50 of the 250 Minutemen additional to those already authorized which it sets as the force goal. A decision on the remaining 200 is yet to be made. The change downward of this year's over last year's force goal figure—although achieved mainly by faster retirements of Atlas E and Titan 1—may signify that the present 1200 figure need not represent a final commitment.

On the disarmament side it can be argued that there might be some advantage in the smaller figure if we made it explicit to the Soviets that we were reducing our force goals. Absent such communication, variation up or down of the magnitudes here involved probably would not affect the Soviets much.

On the other side it can be said that the DOD presentation concentrates rather narrowly on Soviet forces. If we look as far ahead as 1969 we should be considering the contingency of other significant forces. Whether an increased general reserve is best achieved in the form of Minutemen—which might have some difficulty in reaching certain targets—or in the form of more SSBN, is another question.

For all these reasons, especially the smallness of the saving achievable in FY 65, and the undesirability of presenting a target to Goldwaterism on this issue, I am content to let my argument rest where it is. I suspect that Enthoven's response to it will be to change the rationale of the DOD figures without changing the figures.

### COMMENT ON DOD MEMORANDUM: STRATEGIC STRIKING FORCES (August 31, 1963)

(1) The DOD paper examines the strategic retaliatory force in a somewhat different framework of argument than that of the previous two years. Our 1969 strategic forces other than Minutemen are assumed fixed, and the choice among 3 Minutemen forces is considered: 1200 (of which 920 are improved); 950, and some larger force than 1200. The conclusion is that a force of 1200 Minutemen is adequate; a larger force has little extra usable military power, and the smaller force does not give an appropriate degree of assurance against the possibility of highly unfavorable contingencies.

(2) The 1200 man Minutemen force goal for FY 69 is justified in terms of the concept of "assured destruction", defined as a high degree of assurance that, under pessimistic assumptions and adverse conditions, the programmed force can destroy a sufficient fraction of Soviet industrial capacity and kill a sufficient fraction of the Soviet population to put beyond question a deliberate nuclear first strike on the U.S. as a rationale Soviet policy.

(3) Beyond a capability to achieve assured destruction, we might seek two successively further goals: damaging limiting capability, and full first strike capability. As far as first strike capability, the paper argues that by the end FY 1969, Soviet hardened and submarine launched missiles will be sufficient in number so that even a very large increase in our strategic forces (to 1950 Minutemen) combined with a large increase in active and passive defenses (\$80 billion worth), could not prevent the Soviets from causing an unacceptably high level of U.S. casualties; i.e.: 30 million. This would be the case even if the Soviets built the level of forces we now expect. However, so large an increase in our own offensive and defensive programs could be expected to provoke a significant Soviet response, and further increase the expected level of U.S. casualties.

The increase in the damage limiting capacity that is achieved by extra Minutemen beyond the programmed 1200 is so small that the additional forces are not justified. However, the gain in this respect from the force increase between 950 and 1200 is judged worth-while. The figures summarizing these arguments are shown in Tables 1 and 2 which follow.

TABLE I

U.S. Second Strike Capabilities, FY 1969  
(Expected Results With Alternative U.S. Forces vs.  
Medium Soviet Threat)

	Force I (Incl. 950 MM)		Force II (Incl. 1200 MM)		Force III (Incl. 1400 MM)	
	(a)	(b)	(a)	(b)	(a)	(b)

Number	—	268	34	367	38	37
% of total	—	—31	4	43	S	44

TABLE 2

U.S. Second Strike Capabilities Against the Soviets, FY 1969

Number of Minutemen	Expected Factors		Pessimistic Factors	
	(a)	(b)	(a)	(b)
	%Industrial			
	% Fatalities	Capacity		
0	47	57	17	30
600	59	70	18	32
950	68	82	25	45
1200	71	88	30	51
1400	73	90	33	55

(4) The arguments used to support the choice of 1200 Minutemen are not such as to justify that figure with any precision. With small changes of emphasis, the same assignments could be used to justify 950 Minutemen.

How much "assurance" of how much destruction is enough? The difference between 68% and 71% of Soviet population killed under the expected conditions of Soviet defensive capability and U.S. operational efficiency clearly does not justify an increased force. Does the difference between 25% and 30% casualties under unfavorable assumptions? (See Table 2). The unfavorable assumptions on Soviet defenses, (a nationwide fallout program plus ABM protection for 10–15 cities); Soviet forces (top instead of middle of range of predicted future size; improved reliability, decreased CEP); U.S. forces (decreased reliability and survivability) form a quite unlikely constellation indeed. Each contingency is described as the worst consistent with the available evidence. But if each "worst case" is assumed to be as likely as the expected outcome—an assumption that gives little credit to our estimates—for these six factors (treating fallout protection plus AIBN deployment as one factor), then the combination of unfavorable outcomes has a less than 2% probability (1 in 64). How much insurance against this unlikely contingency should we buy?

It is clear that the smaller force would be just as effective as the larger one in causing the Soviets to harden and disperse their own missile forces. With a reduction in our Minutemen forces from 1200 to 950, the total ratio of U.S. ballistic missiles to Soviet missile launchers would change from 1967 to 1100 to 1726 to 1100. Certainly this difference would not justify the Soviet decision to stop hardening.

In terms of damaging limiting capability, the difference between 1200 and 950 is fairly small. Under favorable assumptions for us of adequate fallout protection and enough warning time to enable us to hit the Soviet striking force, the 250 extra Minutemen would reduce U.S. casualties by some 3½ million from 84.5 to 81 million. As for counter-force capability, the proposed force would permit attack on 865 time-sensitive targets (assigning defense suppression entirely to Hound Dogs on alert B–52's). With only 950 Minutemen, this number would be reduced to 685; enough to cover all Soviet missile launchers, bomber bases and sub-bases, but omit fighter bases and targets in the satellites.

The difference between the two programs, namely 1200 (920 improved) and 950, (with approximately the same proportion improved) would be about a billion dollars over the five year period. The saving in FY 65 would, however, be only the \$50 million to be spent in FY 65 on the procurement of the 50 additional missiles authorized for procurement.

(5) The comparison between the missile forces proposed in successive budgets, and the arguments used to support them is instructive. In 1961, the strategic force goal (for 1967) was justified in terms of a controlled counter-force capability, somewhat short, however, of a full-

first strike. In 1962, counter-force was de-emphasized, in favor of our ability to limit damage to U.S. should deterrence fail. This year, even damage limitation is accorded relatively small emphasis, and assured destruction becomes the keystone of the argument. Yet the changes in the relation of our proposed forces to our estimate of Soviet forces and other major elements in the Soviet target system, as shown in Table 3, do not reflect this change in rationale. Indeed, the little shift there has been is in the opposite direction. Soviet targets have been declining in number while our force goals have remained essentially constant.

TABLE 3

Proposed U.S. Missile Forces and Estimates of Selected Elements in the Soviet Target System

	1961 for 1967	1962 for 1968	1963 for 1969

*BASIC NATIONAL SECURITY POLICY*

I. The Basic Concept

One of the first statements of an American administration's Basic National Security Policy was made by President Polk when he told George Bancroft, on the day of his inauguration, that he had four main purposes: to re-establish the independent Treasury, to reduce the tariff, to acquire California, and to settle the Oregon boundary.

This statement met the chief requirements of any BNSP: Its goals were sufficiently specific, important, and feasible to be a useful guide to the President in the conduct of his administration and to future historians in appraising its record. Their attainment moved Bancroft to conclude that "viewed from the standpoint of results, this administration was perhaps the greatest in our history, certainly one of the greatest."

For the next quarter of a century, successive US administrations were able to focus on much the same goals—to extend and maintain the Union—because they could do so within the sheltering framework of a working international order.

This order—which ensured the West a century of predominant peace and unprecedented progress from the Congress of Vienna to World War I—rested on the strength and leadership of the great states of Europe, and particularly on the naval and economic power of the British Empire.

Two great European civil wars destroyed this order. Amid its ruins, an aggressive empire—the USSR—made ready to extend its power and to create a new international system cast in its image.

In response to this threat a new concept of US basic national security policy came into being. It was perhaps best summarized by George Kennan in his 1947 *Foreign Affairs* article as "long-term, patient, but firm and vigilant containment of Soviet expansive tendencies . . . the adroit and vigilant application of counterforce at a series of constantly

---

<sup>1</sup> "Basic National Security Policy." Top Secret. 14 pp. Department of State, S/P Files: Lot 70 D 199, TS-BNSP.

shifting geographic and political points, corresponding to the shifts and maneuvers of Soviet policy.”

The policy was eminently successful. It is, in part, because of its success that the international scene is now changing in several important respects.

In both the Western and Communist camps, previously polarized around Washington and Moscow, power is proliferating. The problems and opportunities we face in Europe, Asia, and other less developed areas are thus coming increasingly to resemble those of a traditionally multipower world. They arise out of a complex set of interacting trends which can no longer be successfully controlled merely by reacting defensively “to the shifts and maneuvers of Soviet policy”; although Moscow and Peking pursue systematic policies of exploiting [illegible in the original] nationalism in the Free World to their advantage and our discomfiture.

Resistance to Communist threats and pressures is as important as it ever was. But it is not enough. The establishment and maintenance of a viable world order calls for a protracted and creative effort on the part of the United States including, but going far beyond, mere holding operations against Communist encroachment.

Underlying the concept of “containment” was always [illegible in the original] term vision of such a constructive US goal. It is now become possible and necessary to place increasing emphasis on this.

The need for greater emphasis upon our constructive goal is not now. It has been increasingly evident over the last decade, and US actions have increasingly responded to it.

But it would now be useful to define the concept of US Basic National Security Policy on which this approach is based, so that US courses of action can be geared to this concept with increasing effectiveness.

## II. Four Main Goals

[illegible in the original] system congenial to our purposes and values [illegible in the original].

*First*, it must keep the peace—especially the nuclear peace. This means that we must maintain sufficient military strength to deter, or if necessary defeat, aggression with minimum risk of spreading hostilities.

*Second*, it must be responsive to the diverse interests of the entire non-Communist world. The less developed, as well as developed, countries must have an opportunity to achieve the progress and status they seek within its framework.

*Third*, it should be able to fend off Communist disruptive efforts and to contribute, by its attractive power, to long-term constructive trends in the Bloc.

*Fourth*, it must promote relationships among Atlantic [illegible in the original] which would harness effective European power to the [illegible in the original] and constructive purposes indicated above, in greater [illegible in the original] has been the case to date. The same is true of Japan, [illegible in the original] cooperation and sense of meaningful destiny, in concert with the United States and the West, the stability of the Pacific continues to depend.

Each of these four headings is discussed below.

### III. Defense

A viable international system presupposes a stable military [illegible in the original] in which aggression both large and small [illegible in the original] or defeated if it occurs, and in which there [illegible in the original] of general nuclear war occurring through escalation or miscalculation.

From this objective certain major US courses of action can be deduced.

*First*, we must deter the Soviets and Chinese Communist from rationally choosing all-out use of force, and we must be able to deal with such a conflict as rationally as possible if it nevertheless occurs. We thus need so powerful and invulnerable a strategic nuclear force, and so convincing a linkage between our vital interests and its use, that Soviet and Chinese leaders could never doubt that in any general nuclear war their power position would be drastically worsened.

*Second*, against that strategic nuclear backdrop but in the area beyond its direct and assured effects, we must deter lesser aggressions or defeat them with the least devastation if they occur. We thus need effective non-nuclear strength—including allied forces, ready US forces, and mobilizable non-nuclear US power backing them up. The object should be to maintain a capacity to deal with two simultaneous Communist aggressions in widely separated areas, as well as to maintain enough free world counter-insurgency capability to cope with likely guerrilla assaults on vulnerable countries.

*Third*. We must achieve these military goals in ways which reinforce the [illegible in the original] and confidence of other free nations. To do this, we must maintain substantial and visible power overseas, as tangible evidence of our will and ability to back up free nations with effective military strength.

*Fourth*. We must minimize the risk that general nuclear war will occur by accident, miscalculation, or unintended escalation. This

requires (i) safeguards to ensure effective Presidential control over US strategic forces and over tactical nuclear weapons in US and allied hands; (ii) that the design, protection, and planning of these nuclear forces be such as to reduce the need for their early or pre-emptive use in response to ambiguous evidence of impending enemy attack.

*Fifth.* Arms control should be envisaged as an additional means of contributing to a stable military environment; it should reinforce, rather than weaken, the contribution of our military programs to such an environment. Partial reductions in armed forces should not be envisaged which would jeopardize our strategic nuclear superiority or our ability to frustrate non-nuclear aggression. High priority should go to measures which would reduce the risk of miscalculation.

#### IV. Less Developed Areas

Whether a workable international system can be created will depend, in large part, on the outcome of present trends in less developed areas.

Emerging from colonialism and traditionalism of various kinds, political elites in these areas seek to achieve greater material progress and otherwise modernize their countries.

The obstacles they face are formidable: lack of resources, of trained manpower, of needed institutions, and of innovation-minded leadership.

To the extent that these obstacles prove insuperable these countries may well end by playing somewhat the same role in world affairs that the Balkan nations played before 1914; i.e., generating instability which creates tempting opportunities for external intervention and thus draws the great powers into conflicts equally ruinous for them and the nations over which they dispute.

In the degree, on the other hand, that these countries' constructive efforts to modernize seem to be making headway, the likelihood is increased that they will gradually emerge as responsible members of the international order, capable of maintaining their independence and of evolving slowly toward forms of government based on consent. The inherently revolutionary character of the modernization process makes it inevitable, however, that we will live and operate over the foreseeable future in a setting of chronic crisis.

A major US objective should, therefore, be to assist constructive modernization efforts in less developed areas. Arrangements within the US Government should be such as to ensure that this objective continues to receive high priority and emphasis, and is not overshadowed by day-to-day crises and problems. In line with this basic policy:

—The economic purpose of our aid should be to encourage and reward modernization efforts. We should hold to this criterion as firmly

as we can without damaging other US security interests, recognizing that diversions in one instance may quickly become precedents in another. In applying this criterion, it should be borne in mind that under-developed nations range over a wide spectrum and that the standard of self-help performance that can be expected—and the type and amount of aid that is needed under that standard—will vary with the degree of under-development.

—Since successful modernization will require far greater external resources than are likely to be provided under US appropriated aid, efforts to elicit a maximum contribution from other sources—the Exim-Bank, IBRD, IMF, other developed countries, and private investment—should receive increased emphasis.

—Since cultural change in less developed areas is one of the major prerequisites to their modernization, we should encourage the emergency of innovation-minded groups through exchanges of persons and information, assistance for education, programs and projects that will promote private enterprise, and like measures.

All of this will only bear fruit if the less developed countries are, at the same time, discouraged from pursuing disruptive external adventures. It should be a US purpose to apply external constraints, as necessary, for this purpose—using UN mechanisms, wherever possible.

## V. The Bloc

Our first objective *vis-à-vis* the Communists is to protect the constructive tasks on which we are embarked in the free world against disruption as a result of Communist pressures or diversions.

This means not only maintaining the military force referred to under III, above, but also making clear to the Communists that, if necessary, it will be used—and sometimes specifying the circumstances. We should promote communications—informal as well as formal—with Moscow to this end. And we should try, over the longer run, to develop tacit understandings with the USSR as to the ground rules governing our competition.

It also means trying to close out crises, when they erupt, (i) in such a way as to make crisis-mongering seem an unprofitable occupation to the Communists; (ii) with as little diversion of free world energies from our long-term constructive programs as consistent with this purpose.

Our second objective *vis-à-vis* the Communists is transformation of the imperialistic Communist dictatorships into regimes which can play a constructive role in the international order we seek to create. If such a transformation is to occur without conflict that would pose an intense danger to our security, it must be brought about chiefly by

pressures and trends within the Bloc. We can contribute to this evolution in two ways:

*First:* By the way in which the free world arranges its own affairs. The extent to which the Communists perceive that the emerging international free world order seems likely to work, i.e., to offer diminishing—rather than enlarging—opportunities for Communist trouble-making, cannot help but influence the Soviets' view of their own role in world affairs.

*Second:* By our posture toward the Bloc. We should seek to maximize the exposure of the USSR to the outside world, and to widen the contacts between the peoples of Eastern Europe and the West at every level. We should welcome temporary or partial *détente*, in the belief that this will be conducive to such exposure and contribute to long term evolution in the Bloc. We should evidence a willingness to enter into business-like negotiations on outstanding issues, and seek otherwise to suggest to the Soviet leaders that they can find rewarding opportunities for participation in the emerging international order if they are willing to do so on terms consistent with its basic purposes.

#### VI. The Atlantic Hard Core

If our only aim were only to prevent Communist expansion, US policy would have achieved its objective in Europe. This area has been strengthened to the point where its subjection by Communism is difficult to [illegible in the original].

If our purpose is to create a viable world order, however, then our European policy has fallen short of its objective in two respects:

*First:* The building of a workable international system requires that Europe's resources be available for defense and for aid to less developed areas in much greater amounts than has so far been the case. The European will to bear these sacrifices is lacking, in part, because individual governments remain preoccupied with relatively local interests and, shocked by the dramatic postwar decrease in their national power, do not believe that increased national effort could have significant effect. The situation might change, however, if decisions about increased effort could be taken by a single European Community for its members as a whole. Europe's potential for contributing to the defense and development of the free world might then become sufficiently clear to move the Europeans to needed external action.

*Second:* The existing situation in Europe makes it difficult to pursue the strategy *vis-à-vis* the Bloc outlined under V, above. For a Europe of fatherlands will, over the long run, include a German fatherland recovering its sense of national pride and purpose. The thought which the Soviets would perceive, rightly or wrongly, in this development could pose serious obstacles to a relaxation of tensions. Only in a

genuinely integrated Europe is the German sense of national identity likely to be submerged in sufficient degree to eliminate this problem.

It is for these reasons—related to our broader purposes *vis-à-vis* the Bloc and the free world as a whole—that the outcome of the contest in Europe between proponents of genuine integration and of a loose confederation of nationally conscious states is of vital moment to the US.

That issue will be decided in Europe, and by Europeans.

The US can influence the outcome, however, in three ways.

—By reiterating its dedication to genuine European unity with clarity and force, as was done on the President's recent trip to Europe.

—By avoiding actions which would give aid and encouragement to nationalist forces. It is worth remembering that de Gaulle represents, in some sense, both "European" and nationalist [illegible in the original] we must distinguish between them in responding to his [illegible in the original].

—By holding out clearly US readiness to enter into more meaningful partnership with a united Europe—i.e., our willingness to set up the political "directorate" de Gaulle proposes, but only if our opposite number could be a unified Europe; and our willingness to see the MLF evolve toward new forms of control if the Europeans can speak with one voice on this matter.

Europe's progress toward integration will be slow, however. In this instance, there are pressing items on the Atlantic agenda, which must be dispatched through such instruments as are feasible in the present state of Europe.

These will generally be instruments in which the US and other Atlantic nations deal with each other severally, rather than in which the US and a European entity confront each other bilaterally.

In the [illegible in the original] we must seek to concert domestic economic policies for more rapid growth, and to coordinate national programs of assistance for developing areas.

In NATO we must press ahead with efforts to build an agreed NATO strategy and to make allied political consultation more effective.

In the MLF working group we must progress towards an Atlantic missile fleet under multilateral manning.

In GATT we must get on with the Kennedy Round of trade negotiations.

In all these forums we must try to move ahead with the urgent business of the Atlantic partnership, even while the question "who speaks on behalf of Europe" awaits an answer.

## VI. Conclusion

The courses of action outlined in this paper are focused on the creation and defense of a viable world order, to replace the one which

existed before 1914 and which has been destroyed by a half century of war and revolution.

Implementation of these courses will involve slow and gradual progress in [illegible in the original] with very difficult problems.

By their very nature, the long-term, constructive trends which we seek to encourage in Western Europe, the less developed areas, and the Bloc will take time to work themselves out. We have a clear national obligation to lead the Free World, but US attempts to force the pace are likely to be unavailing or contra-productive.

We will, therefore, need consistency in holding to our goals and patience in pursuing them. We will need to resist the recurring temptation to seek ostensible short-term “successes” at the expense of our long-term objectives, in the face of the occasional set-backs and diversions which are unavoidable in such a long-term effort.

To this end, a clear articulation of our strategic concept is called for.

This paper suggests such a concept. The steps needed to give it effect are elaborated in more detail in the longer document that follows.

##### **SUBJECT**

15 November Budget Meeting with Secretary McNamara

The Bureau of the Budget has prepared a detailed briefing paper that you have received covering the principal issues which the staff believes should be discussed with Secretary McNamara at the 15 November meeting. Some of these issues, particularly in the R&D paper, are not very important and will probably not be brought up by Gordon at the meeting. Without attempting to comment on all of the questions raised by the BOB, I believe that the most important issues involved in the five draft memoranda submitted by Secretary McNamara are the following:

---

<sup>1</sup> Provides comments and agenda for November 15th budget meeting with McNamara. No classification marking. 5 pp. Johnson Library, National Security File, Agency File, Def Bud 65.

(1) *National Deep Underground Command Center (DUCC)*. Secretary McNamara recommends that a DUCC for the Washington area be approved now and that it be authorized at an austere size suitable for 50 men at a cost of \$110,000,000. The first issue is whether we should consider constructing a DUCC facility at all at this time. I believe that a DUCC facility would significantly increase the chance that the President or his successor would survive a nuclear attack and would be critical to our ability to attempt to direct a controlled response under top civilian and military direction. In the 1970 period without the DUCC, it is difficult to justify much of the expensive command and control apparatus that we are now purchasing. Although it is often argued that the President cannot support this proposal since it is directed toward his own safety; I do not believe that this should be a decisive consideration since this is not the basic reason for the facility and the facility would not, in any event, be available until after President Kennedy's second term was finished. While it might also lead to some adverse comment abroad, I believe it would help to make our talk about controlled response more credible and would drive home the implications of nuclear war both at home and abroad.

The second issue is the proposed size of the installation. I believe there is agreement in all quarters (DDR&E, JCS, OST, and BOB) that while the 50-man DUCC would protect the President and his successors, it would be entirely inadequate to fulfill the command and control mission. I believe, therefore, that it would be a mistake for the Administration to request a facility that clearly could not accomplish its advertised purpose. This would appear to invite the charge that the Administration is initiating a project and intentionally misrepresenting its ultimate cost. I recommend, therefore, that, if we decide to proceed with the DUCC, we either (1) approve the 300-man facility or (2) fund the 3500 foot shaft for the facility separately and indicate that further study must be given to the required size of the facility itself.

(2) *Air Force Tactical Aircraft Program*. The most interesting issue raised by OSD in their paper is the proposal to substitute Pershing missiles with QRA aircraft. I believe there is general agreement that this is a very good idea.

The BOB will question the OSD proposal to buy war consumables against 180-day objective as opposed to the existing plan to have a 90-day supply. The BOB will also make the new proposal that the European MACE force be phased out in view of extreme vulnerability. I believe the BOB is correct on both of these items.

The procurement program for F-4C aircraft presents a major issue that is not considered by the OSD or BOB memoranda and which we will bring up at the meeting. This program involves a total of about \$900 million in FY 65. In its present configuration, this aircraft is not

suited for the ground support role for which it is being procured and is not, in fact, particularly well suited as an interceptor which would be its secondary role. The aircraft will be substantially improved and made suitable for its intended role when new avionics become available in late 1966. A retrofit program would either be impossible or extremely expensive. I would propose, therefore, that the large FY 64 purchase of F-4C aircraft be stretched out until the improved version becomes available and that as much as possible of the \$900 million be deferred. It is estimated that this can result in a real reduction of FY 65 funds by \$700 million. This deferral should also make possible a more rational decision as to whether we really want to buy F-4C, F-111 or some other aircraft for future ground support in the European theater.

(3) *Attack Carrier (CVA Forces)*. This paper does not directly bring up the FY 65 budget issues. In general I believe it is a very poor paper that does not really make a case for the indicated force levels and does not address itself at all to the key issue of nuclear vs. conventional power.

In the event we should have a very tight FY 65 expenditures budget, I believe we should still consider deferring the FY 63 CVA which McNamara has just directed be constructed as a conventional carrier. No case has been made that there is a requirement for this carrier or that there is any urgency in proceeding with its construction. There is very widespread feeling that "if the carrier is built," it should be nuclear. Therefore, I believe that even at this late date it might be possible to defer actual initiation of the project on the basis of a desire to give further consideration as to whether it should be nuclear or conventional.

In any event it seems most unwise to commit the Administration firmly to construction of an additional carrier in FY 67 before the problem has been given serious study.

(4) *Research and Development*. In general, I believe that the proposed R&D program is very sensible. Most of the points raised by the BOB are small and not of real policy interest. I believe the most important issues for discussion are the following:

a. *Dynasoar*. While the R&D memo suggests that this program might be unnecessary, the actual decision is not faced. I believe that serious consideration should be given to cancellation of this project in connection with a reorientation of Gemini to a joint DOD-NASA undertaking.

b. *MMRBM*. Secretary McNamara wants to proceed with a full-scale MMRBM development. The BOB staff believes that the MMRBM project should be either cancelled or substantially cut back. I believe that an MMRBM type system might represent a significant capability in future as yet unforeseen circumstances. Therefore, I believe the MMRBM development program should be continued at a reasonable

rate; however, it should be made clear that the program is not developed to any specific systems concept such as road mobile truck system proposed for deployment in Germany.

c. B-70. In view of possible forthcoming decisions relating to "O" project, I believe that serious consideration should be given to eliminating the third aircraft in the present B-70 program which was conceived primarily as a test bed for equipment relating to the B-70 system. I understand that this could result in a saving of some \$90 million but would still permit flight of the first two aircraft which would yield information of aerodynamic interest to the supersonic transport program and give some yield for the billion and one half dollar investment in this program.

**305. Memorandum from Maj. Smith to Bundy, November 22<sup>1</sup>**

November 22, 1963

SUBJECT

FY 65 Budget Discussions

You undoubtedly will get comments on specific programs from BOB and Spurgeon Keeny. The attachments hereto are an attempt to put the budget packages I, II, and III into a somewhat broader perspective, with specific comments directed more to suggesting a sense of direction than to hitting hard particular programs. The attachments discuss the Budget's Message, DOD Analytic Methods, and Strategic Forces.

After reviewing the DOD memoranda, I agree with your judgment that there appear to be few burning dollar issues to concern the President. (The attachments raise some issues of tactics and procedures.) Ken Hansen mentioned some problems in TOA (Total Obligational Authority). If there is such a problem, I would think BOB would be asked to carefully sort out TOA, NOA, and expenditures. Only then can the dimensions of the problem be properly evaluated.

### The Budget's Message

Assuming that this year, as in previous ones, the SecDef will use rationale before Congress similar to that found in his draft memoranda, and further that much of this rationale will reach the press, the public probably will get this picture of the defense budget:

a. An across-the-board cutback (see attachment). As compared with the FY 62 budget, strategic offense TOA will have decreased 42%, defense 18%, and general purpose forces 10%.<sup>2</sup>

b. The completion of a reversal in overall strategic doctrine. The SAC sword of the 50's will become the shield in the late 60's; the ground forces in Europe are to become the sword.

c. Indecision with respect to active and passive defense of the United States.

d. A reappraisal and downgrading of the enemy threat.

Of these four points, three of them (a, b, and d) were found in abbreviated form in the SecDef's Economic Club speech. That speech created a small flurry in European newspapers; when this budget hits the streets the reaction will almost certainly be much more pronounced. Are we prepared diplomatically to explain our reasoning to our allies? The December NATO meetings become important in this connection. The Europeans may deduce that the US is not planning either to make sufficient resources available to make possible (even with increased European budgets) the local defense of Europe, or to build strategic offensive forces that would be used in the defense of Europe (because of their inability to strike first and reduce counterdamage sufficiently.) This realization may further accelerate the divisive trends within NATO. Such a development could have and—in an election year especially—probably would have domestic implications as well. In addition, if DOD arguments lend themselves to the criticism that this Administration is cutting back both our ability to strike the USSR and to defend ourselves against a Russian attack, more fuel would be available for the domestic political fires.

What all this adds up to is that the coming year is not a good time either at home or abroad to launch forth on educating the world in our new military thinking, especially since most people have not yet absorbed the materials (and different emphasis) from previous years.

STRATEGIC FORCES

If there is any controversy in the budget, it probably will range around strategic forces. Carl Kaysen showed me his comments on the earlier DOD strategic forces draft, and seemed to believe that 950 Minutemen could do almost the same job as 1200. He did not press for a reduction in the force goals, however. The DOD memorandum also is a bit open-ended on this point.

In terms of total force objectives, a case of sorts could be made for going above 1200, if one holds to the DOD approach of evaluating missiles in terms of possibly saving lives. Basically, DOD is saying that the cost of additional missiles beyond a certain point is not worth the lives they might save. How would this look if expressed in terms of cost effectiveness? According to TOA figures, 950 Minutemen cost \$10.2 billion. Following a US first strike such a force would insure the survival of about 372 million US and West European citizens (derived from table, p. 21). For about another \$2.7 billion (p. 15) one could get another 450 missiles and save 417 million people, some 45 million more. The cost per life potentially saved is about \$62. The cost figures used, however, are total program costs through FY 69. Assuming 1967 delivery, the cost per year for each life saved would be less than \$31 through FY 69—and the cost per individual per year would go down for some time longer. The cost per life potentially saved going from 950 to 1200 missiles is about \$57, or less than \$24 per year for the two year period.

Is it somewhat absurd to put a value on life that way, or to determine force requirements in such a way? It seems that is where the DOD approach must eventually lead. As long as one holds to the marginal theory, it is not merely enough to be in the area of diminishing marginal returns. As long as “marginal returns” exceed marginal costs, it is still “profitable” to build missiles.

The preceding is not designed to justify any particular number of missiles as an objective. It should cast some doubt on the numbers and the methods of reaching them in DOD.

In the FY 65 budget, rather than focusing solely on 950 or 1200 for FY 69, it would seem better to analyze what we need to attain our objectives between now and then. The DOD memorandum at present concentrates on what the situation will be as the President probably will be leaving office, rather than on what it will be while he is there. For example, if we adopt a Minuteman goal of 950, in 1967 we could have 1786 ICBMs and Polaris missiles facing the East, and the USSR could have some 1980 missiles (IR/MRBMs with soft missiles having a reload capability; ICBMs; all medium estimates) facing the West. Is that a satisfactory position?

With respect to the FY 65 build, I would be inclined to make it something between the 50 recommended by the SecDef and the 200 recommended by Secretary Zukert. My principal reasons are:

- a. In the absence of some political agreement, it is still too early to reduce pressure on the USSR militarily. (Nor should we now increase our pressure; we should continue along the same lines as in the past two years.)
- b. We are much more likely to reach some arms control agreements if the Russians believe such agreements are needed to reduce pressure on their allocation of resources. If we reduce unilaterally the Russians get what they want with the freedom to change courses later.
- c. It is still preferable to destroy the obsolescent sooner, if desired, than not to build the new.

November 29, 1963

NOTIFICATION OF SECRETARY'S POLICY PLANNING  
MEETING, 10 A.M., TUESDAY, DECEMBER 3, 1963, IN THE  
SECRETARY'S CONFERENCE ROOM

SUBJECT

*Comment on Key Issues Underlined by Assistant Secretaries*

The extremely able and terse summaries of current key issues developed by the Bureaus speak for themselves. It may be useful to underline one general reflection on them, which arose directly from their reading.

1. In general they dramatize the fact that in all parts of the world we are positioned in rather delicate balance between hopeful trends and political degenerative forces. With one arm we are pressing forward, with the other we are fending off danger. Relatively small shifts in policy, emphasis, or energy could violate those balances and create major problems for us.

2. In Africa there is the balance between friendship towards black Africa set off against the dilemma posed for us by South Africa and Portuguese Africa. Here, aside from the passage of civil rights legislation, the maintenance of some marginal leverage on the radicals (Ben Bella, Kwame Nkrumah, and Sekou Toure), plus continued support for the moderates, appears essential if the whole of our African policy is not to be endangered.

3. With respect to Western Europe, any faltering in our loyalty to Atlantic partnership would, of course, strengthen de Gaulle's hand and, at the same time, endanger the movements forward which we must make in both the Herter round of negotiations and in European cooperation on the U.S. balance of payments problem, which, in turn, could wreck the foundations of Western defense. Our stance at the NATO meeting and the manner in which we deal with the impasse in the development of a NATO strategy are critical. The most intimate bilateral consultation with the Germans is the requirement for success at almost every point.

---

<sup>1</sup> Addresses input from regional bureaus on key issues. Secret. 4 pp. Department of State, S/P Files: Lot 70 D 199, Secretary's PPMs.

4. In relations with Moscow, the critical issue appears to be whether we can keep the *détente* breathing—and, specifically, generate and negotiate a sufficiently persuasive package to compensate for the possible adverse reaction to the bilateral air agreement. The suggested elements are Soviet acceptance of our requirement for notification of and access to U.S. citizens detained in the USSR, plus the provision of a leased line teletype link to Moscow.

5. In the Middle East and Asia we confront the problem of maintaining delicate balances in the Arab-Israeli dispute and in the India-Pakistan affair. The need for balance in the case of the former is particularly important given the possible Jordan waters crisis in the spring or summer of 1964.

6. In the Far East we have a delicate balance in the Indonesian confrontation of Malaysia, as well as the two precarious military situations in Laos and Viet Nam.

7. In Latin America, again we have a problem of balance between the thrust of the Alliance for Progress and other elements of cohesion and the potential corrosiveness of both Latin American nationalism, exacerbated by Communist influence and pressures.

8. In the United Nations, all of these balances are reflected, but notably those in Africa and Asia; and the great issue is posed of the United Nations' role in helping keep the balances on the constructive side via peace-keeping machinery.

9. What I draw from this array (quickly and incompletely ticked off) is the need for us all, from the President on down, to perceive a general point that transcends any of these items; namely, that the President has come to responsibility at a time when we are working our way slowly through a whole set of major historical transitions: the transition of Africa from colonialism to responsibility; the transition of Western Europe from dependence to partnership; the transition of Russia, hopefully, from a vicious offensive to something like a stable, peaceful co-existence; the transition of the Middle East and South Asia from an obsession with post-colonial boundary issues, which have been the focus of the new nationalism, to a more stable maturity; in the Far East from the aggressive nationalism of Sukarno to an Indonesian concern with its domestic development; in old Indochina, hopefully, from limited probing aggression, sparked by Hanoi, to peace.

10. Every one of these balances is capable of being upset, if we falter or lose resoluteness in either pressing in the hopeful direction or in fending off potential degeneration. If the balances are upset, the U.S. could face major crises.

11. To see our way through these historical transitions will require that these balances be understood and that we be prepared to sweat

them out steadily; but it must always be remembered that the balances are dynamic. They do not maintain themselves without the steady application of energy to fend off evil and to promote the good.

12. It may be that if this general perspective on the bewildering array of specific situations we face could be widely understood and shared (assuming for the moment it is correct), we would be forwarder.

W.W. Rostow

**307. Memorandum from Keeny to Bundy, November 30, 1963<sup>1</sup>**

November 30, 1963

SUBJECT

November 27 Meeting on the DOD Budget

The principal points covered and decisions reached at the November 27 meeting with Secretary McNamara on the DOD budget were as follows:

*I. Strategic Retaliatory Forces*

1. *Minuteman*. Secretary McNamara did not accept the BOB proposals for reduced MM force level, slippage in improved MM production, or delay in the improved retrofit program, and it was agreed that these issues should be submitted to the President. Secretary McNamara expressed interest in Dr. Wiesner's question concerning the apparently excessive nature (10 per cent per year) of the reliability firing program and requested Drs. Brown and Wiesner to determine how this related to the production and retrofit programs. As a follow up, I have discussed this question with Dr. Brown's staff; and, while it is clear it represents a major policy issue for the future, a cutback here would not lead to significant savings in FY 65.

2. *B-70*. Secretary McNamara agreed that he was prepared to cutback the third of the three B-70's provided a positive decision was made on handling of the classified project with which you are familiar. It was noted that this would permit savings of the order of \$80 million and that some \$3 million per month was being spent on this aircraft.

---

<sup>1</sup> Readout of November 27th budget meeting with McNamara. Secret. 5 pp. Johnson Library, National Security File, Agency File, Def Bud 65.

Secretary McNamara suggested that he might enter the third aircraft under NOA but omit it under expenditures.

3. *B-47 phase down*. Mr. Gordon apparently decided to withdraw this issue.

## II. *Continental Air and Missile Defense*

1. *Phase down on active interceptor squadrons*. Secretary McNamara agreed that this should be done but felt that for political reasons they wanted to defer the question until next year.

2. *BMEWS Improvements*. After a technical justification by Dr. Brown with which Dr. Wiesner and I agreed, the BOB decided to withdraw their objections on this issue.

3. *FAA air traffic control systems*. After consideration of present FAA schedules for this new system, it was decided that it would be technically and operationally acceptable to defer \$42 million in this area.

## III. *Anti-Submarine Warfare*

1. *Nuclear attack submarines and submarine tender*. There was an extended discussion of the merits of nuclear attack submarines in which, I believe, the OSD representatives made a very poor case for the 6 submarines in the DOD budget. Mr. Gordon maintained the BOB position that all 6 submarines and the submarine tender should be deferred with a saving of \$502.5 million in FY 65 NOA. Dr. Wiesner suggested that a buy of 2 or 3 submarines, if this were necessary to keep the yards busy, would be the best solution. Secretary McNamara agreed he would give further consideration to the OSD position on this issue.

2. *SUBROC*. It was agreed to split the difference on this item and support continued production at the minimum sustaining level of 5 per month with a saving of \$20 million.

## IV. *Army and Marine Ground Forces*

Secretary McNamara indicated that he could take no position on the problems raised by the Bureau of the Budget until he had discussed each of the individual subject items with Secretary Vance.

## V. *Holdover Items*

1. *Command, control and communications*. Secretary McNamara stated frankly that he did not understand the mode of operation for command and control and directed that they operate within a budget of \$158 million rather than \$208 million. Dr. Wiesner reported that he had not yet been able to get a complete report on communication procurement from DOD but that, as far as he had gone, the program appeared to be in a pretty good shape with the possible exception of certain switching

equipment which might be incompatible. It was agreed that this question would be left open.

2. *F4C/D/E Aircraft*. There was an extended discussion of the technical characteristics of F4C/D/E aircraft and the nature of several alternative production programs. Unfortunately, neither Secretary McNamara nor Mr. Gilpatric were present during most of this discussion. Despite the instructions given at the last meeting, the technical analysis of the aircraft and alternative programs prepared by the Comptroller was not coordinated with Dr. Wiesner and was, in fact, not available until just before the meeting. Alternative I, which cuts 100 aircraft from FY 65 buy, was not acceptable to him since it saved only \$120 million in FY 65 and involved an increase of \$40 million in total program costs. He stated that Alternative 2, which cuts 326 aircraft from the FY 65 buy at a saving of over \$600 million, was unacceptable to him since it constituted too large a reduction in aircraft in a 66–68 time frame. He made a major point of the advantages of the ferry range of the F4C's over existing aircraft. It was agreed to keep Alternative I as a budget issue. [Subsequently, I have learned that the savings on aircraft alone (not including associated equipment) of Alternative I would, in fact, be \$40 million more than those reported by OSD on the basis of McDonald Aircraft estimates and that the additional program costs, because of deferral, would only be \$7 million and not \$40 million. On further investigation, we also question whether the ferry range argument is as important as McNamara believes. These factors might affect McNamara's thinking on this issue. There is a real split on this one within OSD since the Comptroller's office wants F4C's as fast as possible and DDR&E essentially agrees with our criticisms of the program. If we are to make any progress on this highly technical issue, I believe it should be directly with McNamara and not as a Presidential issue.]

3. *MMRBM*. It was reported that nothing was being done to direct the development of this system specifically toward land-based deployment suitable for use only in Germany. Secretary McNamara stated that the program would continue to be carried out in this manner.

4. *Nuclear weapons effects tests*. It was agreed that the items discussed in the previous meeting would be removed from the program.

5. *Program 437 (Thor-antisatellite on Johnson Island)*. Dr. Brown reported that the costs had indeed grown in the manner described by the BOB. Secretary McNamara stated that this was unacceptable and the Air Force had exceeded the authority he had given them. He could not understand why they could have a four-shot research and development program for \$24 million and then required an additional \$49 million for two additional shots. Secretary McNamara directed that FY 64 funds be frozen until the program was better defined and that additional funding for FY 65 should be limited to \$12 million.

6. *Typhon*. It was agreed that the system would be cancelled but that sufficient funds would be kept in FY 65 to permit test firing with equipment already procured since this system involved basically new types of radar equipment that might relate to future developments.

7. *Space*. The BOB space report was not discussed. It was agreed that a meeting with Mr. Webb would be scheduled for Saturday, 30 November. Secretary McNamara stated that he was anxious to cancel Dynasoar but could only do this if a deal could be worked out with NASA on the future of Gemini.

8. *MAP*. There was an extended discussion of the MAP problem. Secretary McNamara stated that the legislation should be modified so that the Secretary of State would not have to approve the MAP funds since this procedure essentially referred differences between State and DOD for Congressional resolution when this should be done within the Administration. He stated that the following steps should be taken: (1) cut \$1.4 billion from the military aid budget and (2) divide the \$1.4 billion into two components to be submitted by the DOD, namely: (a) one component as part of the normal DOD request to cover areas such as Viet Nam where U.S. forces are involved and (b) a second component for grant aids for areas such as Thailand which could be treated either as part of the normal DOD budget or as a separate bill submitted by the DOD.

9. *Classified projects*. It was agreed that these would be discussed after 6 or 7 December since the BOB would not have completed its review of government-wide classified projects until that time.

10. *Family housing*. Secretary McNamara spoke very strongly against any cuts in the DOD proposals for family housing and the BOB apparently withdrew this issue.

11. *Civil Defense*. Secretary McNamara stated that he had decided to assign \$350 million, including \$175 million for incentive shelters to civil defense. It would be Mr. Gilpatric's job to decide, in consultation with Dr. Wiesner, how the additional \$175 million would be allocated. In view of the complications introduced by the failure of Congress to act on the FY 65 Civil Defense appropriation, which influences the manner in which the \$350 million would be best utilized, it was suggested that civil defense be entered as a single line item in the budget without any breakdown at this time.

It should be noted that the outcome of the meeting on a number of items was probably effected by the fact that both Secretary McNamara and Mr. Gilpatric were forced to leave the meeting for extended periods during the discussion. For example, Secretary McNamara missed most of the discussion of the F4C and the nuclear attack submarine. Consequently, he did not have an opportunity to hear how unimpressive the response of his colleagues was to the various criticisms

that were advanced against these programs and heard only a summary of the alternative programs that one could adopt in these and several other fields.

308. Memorandum to Members of Policy Planning Council,  
December 6<sup>1</sup>

December 6, 1963

HIGHLIGHTS FROM THE SECRETARY'S  
POLICY PLANNING MEETING HELD  
DECEMBER 3, 1963

SUBJECT

Comment on Key Issues Underlined by Assistant Secretaries

In the introductory remarks on the paper under discussion two points were noted. First, in the last two years there has been a change in the balance of the problems we face. Whereas two years ago most of our problems stemmed from Communist pressure, today the internal problems of the Free World occupy us increasingly. Second, the trend of the times around the globe—and even in this country—is increasingly one of resurgent nationalism, and the task we face is that of the constructive organization of this nationalism.

In Western Europe and Japan there is still too much of the “Marshall Plan psychology” of leaning on US leadership. Likewise, the US still preempts the lead in situations where the allies could and should play a larger role. The time is ripe for the establishment of new machinery for cooperation in handling the world’s problems. Except in the Cold War confrontation against the Communists, it is unnecessary and undesirable for the US to always assume the lead, particularly in problems involving areas with ancient cultures where our experience is limited.

Before Europe can play a larger role in the outside world, however, she must organize herself, and, in this respect, 1963 has been a year of retrogression not advance. Systematic consultation and collaboration are needed among the US, Japan, and the European nations. Unfortunately, the latter too often enjoy their irresponsibility. In contrast to the type of cooperation they exhibit in forums such as the OECD, the European nations tend to pursue narrow selfish objectives on political matters in the outside world.

A greater focus on an Atlantic Community policy toward the outside world is desirable. Even should the US choose not always to lead,

---

<sup>1</sup> Highlights of December 3d Policy Planning Meeting. Secret. 4 pp. Department of State, S/P Files: Lot 70 D 199, Secretary’s PPMs.

still the US will have to initiate action to meet problems that are beyond the capacity of regional groups to solve. Machinery is needed that can transcend regional lines. It would be desirable for Japan to earmark troops for a UN peace-keeping force, but unfortunately her constitution prohibits this. At present only the “white” nations have earmarked forces for peace-keeping.

The Morocco-Algeria crisis is an example of a problem best resolved by a regional grouping rather than Big Power intervention. However, there are other problems, e.g., South Africa, in which the participants demand US intervention. The question is whether the US need always agree to intervene.

Discussion ensued on the problems of Portuguese Africa and the Union of South Africa. The participants were divided as to the pace at which the US should encourage movement toward independence or a multi-racial solution. On the one hand, it was held that to hasten this process is to invite chaos of the type experienced in the Congo and Algeria. The white settlers would leave and the door would be open for Communist penetration. At the present level of East-West tension a radical change of this sort would be dangerous at this time. Until the tensions of the Cold War are abated, we should slow down, not speed up, our support of the African nationalists. Further, an increase in nationalist terror tactics would only serve to make the Portuguese dig in more firmly and exacerbate the situation in general. On the other hand, it was held that the risks of a bloody upheaval were too great in the status quo. Forward movement is necessary in order to stave off African nationalist extremism; furthermore, movement works as an influence for restraint on the part of outsiders, such as the Asians, demanding African freedom. Forward movement is a better way to play for time than maintaining frozen positions. In the Union the Boer Government was gerrymandered to power and is not so strong and monolithic as it appears. There is hope for the opposition.

Concerning US involvement in regional disputes, the trend has been to give a guarantee to one country in a dispute. This policy has the adverse effects of fragmenting our influence and encouraging the “protectee” to assume a belligerent posture. However, there are limits to what US protection means in a regional dispute. As in the Pak-Indian dispute, there is often a gap between our word and our capacity to act. Thus US protection does not always act as a restraint, except when we have military power in the area.

It was agreed that it would be prudent to produce a contingency plan for the possible collapse or overthrow of the ChiCom regime. The internal situation has degenerated to the point where the Soviets might even be able to bring down the regime with an extended border quarrel. In the ChiCom elite at present there are two strands of thought on the

Sino-Soviet dispute: one strand adheres to classic Chinese nationalism versus Russia; the other disagrees with the hard line and places economic considerations first, holding that the denial of Soviet aid is too high a price to pay for the current polemics. Furthermore, reports of severe droughts in China indicate that there are still more troubles ahead for the regime.

There is a lack of an integrated policy on aid matters between the US and the European nations. The latter have improved their performance on burden-sharing, yet their foreign policies have been less adept at integrating the aid element than has ours. In European governments, for example, there is no back-to-back arrangement similar to our State-AID country desk system. A better political framework than the DAC is needed for a coordinated aid policy which would provide for a more rational division of labor. Again, better international machinery for cooperation was advanced as the answer to both the aid and the peace-keeping problem. The British Commonwealth is no longer serviceable for these tasks. It was suggested that the UN might establish regional sub-committees to deal with these matters. This, however, was held to be unnecessary provided the UN backstopped the efforts of other international bodies.

*Action:* the Assistant Secretaries of the geographical Bureaus were asked to submit a "box-score" (on a simple "plus" or "minus" basis) on whether relations between the US and each country in their area had improved over the past three years.

December 9<sup>1</sup>**

December 9, 1963

## SUBJECT

Additional adjustments in the Minuteman program

This memorandum outlines my reasons for believing that adjustments in the Minuteman program are feasible and desirable. The actions I have in mind would save \$571 million NOA in the 1965 budget and \$200 million in 1965 expenditures.

Fundamental to my recommendation is the analysis in the Secretary's draft memorandum to the President on Strategic Retaliatory Forces, dated November 13, 1963, which clearly indicates that the need for additional Minuteman missiles over and above the 950 approved in the 1964 budget for deployment by end-FY 1966 is questionable.

As stated in the Secretary's memorandum, the essential test of and most valid objective for our strategic forces is the capability in a second strike situation to assure destruction of 150 cities and 30 percent of the population of the Soviet Union (68 million fatalities), 50 percent of industrial capacity, and the Soviet Government and military controls. Against this objective of "assured destruction," the Secretary's memorandum analyzes four different force levels for end-FY 1969 under assumptions using both "expected" and "pessimistic" factors for relative US-USSR capabilities (see attached table which is from page 14 of the Secretary's memorandum). Two very striking conclusions from the Secretary's analysis are:

1. That U.S. forces without any Minuteman missiles could satisfy the objective of "assured destruction" under "expected" conditions and "median" Soviet force estimates as of end-FY 1969.

2. That U.S. forces, with the 950 Minuteman missile force approved in last year's budget for deployment by end-FY 1966, virtually meet the objective of "assured destruction" by end-FY 1969 under "pessimistic" conditions.

For these reasons, the relatively small reduction I am recommending in the Minuteman missile force in the period 1965–1967, as shown below, would not appear to affect significantly our capability to inflict "assured destruction."

---

<sup>1</sup> Provides rationale for adjustments to Minuteman program. Top Secret. 4 pp. Johnson Library, National Security File, Agency Series, Def Bud 65.

Deployed Minuteman Missiles

	End-FY <u>1964</u>	End-FY <u>1965</u>	End-FY <u>1966</u>	End-FY <u>1967</u>	End-FY <u>1968</u>	End-FY <u>1969</u>
Proposed	600	800	950	1000	1100	1200
Recommended	<u>600</u>	<u>750</u>	<u>850</u>	<u>950</u>	<u>1100</u>	<u>1200</u>
Difference	–	–50	–100	–50	–	–

If desired, the proposed end-FY 1969 objective of 1200 Minuteman missiles would continue to be used for planning purposes at this time, since it could still be achieved by providing the necessary funds in the 1966 and 1967 budget.

The Secretary has already reduced the end-FY 1969 Minuteman objective from 1300 in previous projections to 1200. He has also reduced the end-FY 1967 objective, so that the force increase proposed for approval in the 1965 budget is 50 missiles instead of 200 previously projected.

One of the reasons for the 150 missile reduction in the end-FY 1967 force, as stated in the Secretary's memorandum of November 13, is to "reduce the risks of extensive modification which can arise from difficulties discovered in the Improved Minuteman development cycle" and to "permit a more orderly deployment." This reasoning is also a basis for the further adjustments in the Minuteman program which I am recommending below. Proposed schedules for procuring improved Minuteman missiles are compared with schedules reflecting recommended phasing adjustments as follows:

	<u>FY 1964</u>	<u>FY 1965</u>	<u>FY 1966</u>	<u>FY 1967</u>	<u>FY 1968</u>	<u>FY 1969</u>
Proposed	30	293	249	301	176	80
Recommended	–	150	250	300	300	129

It should be noted that, in spite of the reduced 1967 force, the number of improved Minuteman missiles proposed for procurement in 1965 (and subject to the risks of extensive modification) is actually higher than under previous projections, largely because of early initiation of a program to retrofit the first 800 basic Minuteman missiles with improved missiles.

My recommendation involves three possibly separate actions as follows (in millions):

	Possible 1965 <u>NOA Reduction</u>
1. Refer 1965 approval and funding of 50 missiles (20th Squadron) over the approved 950 missile force	\$–167

2. Stretchout production of the 150 improved Minuteman missiles included in the 950 missile force by 6 months (missiles 801–950)	–176
3. Refer to 1966 initial funding of program to retrofit first 800 basic Minuteman missiles with the improved missiles	–228
Total recommended reduction	<hr/> \$–571

The arguments *against* the course I am recommending, as I understand them, are (1) the uncertainties necessarily involved in estimates of our relative position to the USSR; (2) the fact that the Secretary's recommendations represent a substantial reduction in the Air Force's recommendations and have been agreed to by the other Chiefs of Staff; (3) difficulties in gaining Congressional and public acceptance of a military budget which, for the first time, does not include a further build-up in strategic forces or weapons systems.

On the other hand, the arguments *for* my recommendation are: (1) there is a solid basis for our present intelligence estimates and forecasts; (2) the Secretary's analysis has made ample allowances for the relevant uncertainties, especially in his "pessimistic" case; (3) the force levels I am recommending are actually not significantly lower than those recommended by the Secretary—when all strategic missile and aircraft systems are considered the maximum difference is about four percent of operational vehicles at end-FY 1966; (4) the stretchout of the improved Minuteman production program would permit more development and testing prior to production, resulting in deployment of a more reliable and standardized missile and requiring fewer of the costly modifications which have been experienced in other missile programs; and (5) there is growing general recognition that our strategic forces are growing to the level where further additions serve no useful purpose and, therefore, a 1965 budget calling for a reduced rate of build-up in strategic forces may now be acceptable to the Congress and the public if given strong Presidential support.

## 311. Report by Task Force on the Balance of Payments to President-elect Kennedy, December 27<sup>1</sup>

December 27, 1960

### FOREWORD

The following Report contains an analysis of the balance of payments and reserve problems of the United States and recommends the measures deemed necessary and appropriate to achieve their solution. While the Report reflects the consensus of the Task Force, its members do not necessarily subscribe to every detail.

The Report is divided into five parts.

Part One outlines the principal recommendations of the Task Force for executive and legislative action and international negotiation.

Part Two describes the nature of our balance of payments and reserve problems and discusses the need for prompt and appropriate solutions.

Part Three analyses the causes of the balance of payments deficit and identifies the appropriate measures for reducing and ultimately eliminating it.

Part Four suggests measures necessary to strengthen the dollar as a reserve currency.

Part Five discusses proposals to strengthen the reserve position of the entire Free World.

The Appendix consists of the following tables:

---

<sup>1</sup> Balance of payments/reserve problems and recommended solutions. No classification marking. 11 pp. Kennedy Library, National Security Files, Kaysen Series, Balance of Payments, General, 12/60-6/62, Box 362.

*MEMBERS OF THE TASK FORCE ON THE  
BALANCE OF PAYMENTS*

	George W. Ball Myer Rashish	Chairman Secretary
Edward M. Bernstein	President, EMB (Ltd.); former Director of Research and Statistics, International Monetary Fund	
Otto Eckstein	Professor of Economics, Harvard University	
Richard N. Gardner	Professor of Law, Columbia University Law School	
Peter Kenen	Professor of Economics, Columbia University	
Stanley D. Metzger	Professor of Law, Georgetown University; former Assistant Legal Advisor (Economic Affairs), Department of State	
Paul H. Nitze	President, Foreign Service Educa- tional Foundation	
Joseph Pechman	Brookings Institution	
Robert Roosa	Vice-President, Federal Reserve Bank of New York	
Paul A. Samuelson	Professor of Economics, Massachusetts Institute of Technology	
Robert Triffin	Professor of Economics, Yale University	

PART ONE

RECOMMENDATIONS FOR ACTION

I

ACTIONS TO ELIMINATE BALANCE OF PAYMENTS DEFICIT

A. *RECOMMENDATIONS FOR EXECUTIVE ACTION*

1. *Making United States Products More Competitive*

(a) Direct Secretaries of Commerce and Labor to develop program for restraining cost-price increases in key industries (e.g., steel, machinery and automotive equipment).

(b) Direct Secretaries of Commerce and Labor to develop and recommend program for stimulating industrial productivity.

(c) Direct Secretary of Agriculture to recommend measures to adapt farm program to bring United States farm prices more nearly in line with prices in world markets.

### *2. Expanding Export Earnings*

(a) Direct Secretary of Commerce to take measures to encourage exports, including the following:

(i) Enlist cooperation of industry and labor in national export drive.  
(ii) Expand advisory services of Commerce Department to inform American business of opportunities for foreign sales.

(iii) Strengthen United States economic and consular staffs overseas to provide more assistance to American business.

(iv) Increase United States participation in international trade fairs.  
(v) Develop recommendations for legislative program to increase exports, including proposals for enlarging scope and adequacy of export credits.

### *3. Expanding Earnings From Tourism*

(a) Direct Secretary of Commerce to submit plans and programs for promoting tourism in United States, including proposals for legislation to make program effective.

(b) Direct Secretary of State to submit program for simplifying entrance and exit requirements of foreign visitors to United States.

### *4. Obtaining Close Surveillance Over Private Capital Outflow*

(a) Instruct Secretary of Treasury to take necessary steps to keep currently advised regarding prospective short-term capital movements.

(b) Instruct Secretary of State to establish necessary machinery for informal consultations with American companies before they make substantial overseas investments.

## **B. RECOMMENDATIONS FOR LEGISLATIVE ACTION**

1. Submit legislation embodying proposals for systematic machinery to restrain cost-price spirals.

2. Submit legislation to strengthen export credits and guarantees.

3. Request Congress to authorize and appropriate funds for program to encourage increased foreign tourism in the United States.

4. Obtain Congressional approval of the Convention creating the OECD (decision must be made as to whether convention is to be submitted for approval as a treaty or through joint resolution).

5. Obtain additional legislative authority to reduce American tariffs as essential condition to effective negotiations for removal of foreign

restrictions on United States exports (this legislation is being considered by the Task Force on Foreign Economic Policy).

### C. RECOMMENDATIONS FOR INTERNATIONAL NEGOTIATION

#### 1. *Reducing Foreign Import Restrictions*

(a) Direct Department of State to negotiate through GATT to seek complete elimination of restrictions discriminating against United States exports.

(b) Direct Department of State to negotiate through GATT to seek elimination of all non-discriminatory import restrictions imposed for balance of payments reasons by industrialized countries.

(c) Direct Department of State to utilize forthcoming GATT tariff negotiations to secure unilateral tariff concessions from the European Common Market and Free Trade Association countries.

(d) Direct the Department of State to negotiate through OECD and GATT with the Common Market countries for liberalization of European agricultural policies.

(e) Direct the Department of State to endeavor, through OECD and bilateral negotiations, to secure untying of European aid programs so that United States exports can share the benefit of such financing.

(f) Direct the Department of State to seek agreement of European countries through OECD to confine their programs for financing and insuring export credits to measures that do not have the indirect effect of subsidizing exports.

#### 2. *Eliminating Exchange Controls of Foreign Countries*

(a) Direct the Treasury Department to press within the International Monetary Fund for the removal by European countries with strong reserve positions of restrictions against the export of private capital to the United States.

#### 3. *Obtaining the Cooperation of "Surplus" Countries*

(a) Direct the Department of State to seek the recognition through OECD of the following principles:

(i) That problems of an individual nation's balance of payments should not be permitted to inhibit the accomplishment of the common economic objectives of the member countries.

(ii) That any "surplus" country accumulating foreign exchange as a direct result of expenditures by another member country in furtherance of a common military purpose or the provision of assistance to less developed areas, should accept the responsibility to take measures to increase its imports of goods and services, expand its foreign aid, and, in the case of a NATO country, increase its contribution to the common defense.

(b) Direct the Department of State to conduct bilateral negotiations, particularly with Germany, as a supplement to multilateral negotiations through OECD (pending final approval of OECD, the OEEC mechanism should be employed).

#### D. *RECOMMENDATIONS FOR FURTHER STUDY AND CONSIDERATION*

1. Initiate inter-departmental study (Treasury, State, Commerce) of desirability of changing the tax treatment of United States private investment abroad.

2. Direct Secretary of Defense to prepare recommendations as to how overseas military expenditures might be reduced, consistent with security objectives, by means of economies resulting from changing strategy and weapons technology.

## II

### ACTIONS TO RESOLVE THE UNITED STATES RESERVE PROBLEM

#### A. *RECOMMENDATIONS FOR EXECUTIVE ACTION*

1. In public statement outlining program for combatting economic recession and correcting payments deficit, reaffirm the intention of your Administration “to maintain the international convertibility of the dollar at its present gold parity.”

2. Direct Secretary of Treasury to make use of United States drawing rights in International Monetary Fund as the need arises.

3. Direct Secretary of Treasury to consult with Chairman of the Board of Governors of the Federal Reserve System on ways to maintain low interest rates on long-term securities while allowing sufficient flexibility on short-term rates to restrain the outflow of capital.

#### B. *RECOMMENDATIONS FOR LEGISLATIVE ACTION*

1. Obtain authority from Congress to issue special United States Government securities to foreign governments and institutions carrying higher interest rates than are payable to American holders.

2. Submit proposals for legislation eliminating the 25% gold reserve requirement at such time as confidence in the dollar is improving and in conjunction with other measures to strengthen our reserve position.

#### C. *RECOMMENDATIONS FOR INTERNATIONAL NEGOTIATION*

1. Direct Secretaries of State and Treasury to undertake negotiations for the accelerated repayment of loans owed to the United States by surplus countries of Western Europe.

2. Direct Secretary of the Treasury to press for revision of International Monetary Fund lending policy so that future drawings are mainly in currencies of surplus countries.

3. Direct Secretary of Treasury to explore possibilities of coordinating our short-term interest rate policies with those of the United Kingdom.

*D. RECOMMENDATIONS FOR FURTHER STUDY AND CONSIDERATION*

1. Direct Secretary of Treasury to study the desirability and feasibility of giving a gold guarantee to foreign official holders of dollars.

2. Direct Secretary of Treasury to study the quantitative effects and feasibility of a prohibition on the holding of gold abroad by residents of the United States.

3. Direct Secretary of Treasury to undertake study of desirability of continuing free gold markets and desirability and feasibility of direct and indirect United States intervention in such markets.

III

ACTIONS TO ACHIEVE INTERNATIONAL MONETARY REFORM

*A. RECOMMENDATIONS FOR FURTHER STUDY AND CONSIDERATION*

1. Direct inter-agency committee (Treasury, State, Federal Reserve Board) to study alternative proposals for meeting growing reserve needs of the Free World while protecting the United States and Britain against large scale capital movements.

IV

RESTRICTIONIST MEASURES NOT RECOMMENDED

The measures listed below are discussed in the Report. Your Task Force does not recommend the adoption of these measures. Some of them are impractical. Others would have serious adverse consequences for the security and prosperity of the United States and the entire Free World. On the other hand, an attempt has been made in the Report to appraise these measures in terms of their feasibility and adverse consequences, in the event that our problems cannot be fully resolved by the expansionist solutions recommended above.

1. Exchange controls on capital transfers.

2. Reduction of duty-free tourist allowance or direct limitation of spending by American tourists abroad.

3. Restriction of United States imports through increased tariff and quota protection and other restrictive measures.

4. Increase in the price of gold in terms of dollars or in terms of all currencies.

5. Reduction of foreign aid.

6. Reduction of overseas military spending below levels necessary for Free World defense.

7. Any measures which would resolve our payments and reserve problems by undermining the payments and reserve positions of other Free World countries in the security and welfare of which we have a vital stake.

# November 1961

## 312. Memorandum from Dillon to President Kennedy, November 7<sup>1</sup>

November 7, 1961

I am sending to you today my third report on the balance of payments and the measures we are taking pursuant to your Message to the Congress of February 6 on the Balance of Payments and Gold. I plan to distribute this report to the several Departments concerned in order to maintain their interest and cooperation in the overall program.

These are the highlights which I think are important enough to warrant your personal attention:

1. After disappearing entirely in the first half of 1961, our basic deficit is again emerging in the second half and threatens to grow in the first half of 1962. Comparative figures are: \$1.9 billion for 1960; 0 for the first half of 1961; from \$2 to 2½ billion, annual rate, in the second half of 1961; and from \$2 to 3 billion, annual rate, in the first half of 1962. The main reason is to be found in growing imports resulting from the demands of our domestic recovery. Exports are high but are not increasing.

2. For the moment short-term capital flow is under control. There will probably be very little outflow the rest of this year and early next year, and most of that will be of a non-speculative character. However, if the business and banking community here and abroad begins to become concerned over our widening basic deficit, speculative pressures may arise once more. This underlines the importance of bringing to quick completion negotiations for the creation of the new \$6 billion fund among the major industrialized countries which could be used to offset capital flows. We hope to sign up by the end of the year and obtain Congressional approval at the next session.

3. Since the entry into force last June of the prohibition on gold holdings abroad by Americans, we have received reports of sizeable illegal holdings. Reports of this kind are usually difficult to confirm but we are investigating.

4. Commerce and Eximbank have done an outstanding job in our efforts to eliminate the basic deficit. Commerce has shown imagination

---

<sup>1</sup> Third report on balance of payments and Treasury actions. Confidential. 4 pp. Kennedy Library, President's Office Files, Treasury, Balance of Payments, 10/61-12/61, Box 94E.

and drive in its new export promotion program and new travel program. These should begin to have some effect in the next two years. The new export credit insurance program worked out by the Eximbank is an excellent one and should begin to show results in 1962.

5. Defense is also doing a good job, especially in the recent negotiations with the Germans which Under Secretary Gilpatric has now brought to a successful conclusion. This will mean German payments to us which fully offset our dollar military payments in Germany at current levels. A problem will arise, however, when and if our forces in Europe are enlarged further, i.e. beyond the October deployments. I am discussing with Defense the possibility of negotiating improvements in our military payments arrangements with France, where we now have a net outflow on military account of more than \$300 million annually. Secretary McNamara said at the last Cabinet meeting that he was confident Defense could cut our world-wide dollar military outflow in half (that is, by \$1½ billion) over the next 18 months or two years. If this can be done, it will make a tremendous contribution to the balance of payments.

6. State has found it difficult to pull its weight in the export promotion program because of Congressional cuts in appropriations last year. The Administration should give full support to State in obtaining the necessary appropriations at the next session of Congress.

7. The policy of assuring maximum U.S. procurement with foreign aid money is operating effectively with one exception: rising dollar outlays for local costs in many of the underdeveloped countries. These dollars wind up in the central banks of the recipient countries and through imports from other industrialized countries are transferred to the latter where they become additional claims against our gold stock. It is hard to control this problem unless we are prepared to place reasonably stringent limits on the dollars which AID will make available for local costs in the developing countries. Treasury is working with AID on a possible formula designed to accomplish this purpose.

8. Secretary Freeman has given personal attention to the problem of liberalizing foreign trade barriers against our agricultural products and recently represented the United States in an OECD discussion on this subject. The immediate outlook for agricultural exports is not good. The main problem is cotton, where exports will be down in 1962 because of rising stocks and lower demand abroad. Meanwhile, the Department of Agriculture is considering a greatly expanded barter program which in my judgment would materially reduce further our dollar earnings from agricultural exports. These barter deals are being actively promoted by traders who gain from the large profit margins they are able to make through sales to the stockpile of imported minerals and other materials they obtain from bartered agricultural exports. Such barter

deals are not of any direct benefit to agricultural producers but do have the support of a small but vocal group of Congressmen in the Agriculture Committees. I have expressed my concern on this matter to Secretary Freeman and we are working with Agriculture and other agencies to see if we can formulate a barter program which will not materially hurt our net dollar income from agricultural exports.

9. As I mentioned at the Cabinet meeting the other day, we need strong Administration support to get our tax haven legislation through the Congress next year. If we succeed, this could reduce the basic deficit by \$250 million annually.

10. We must make a continuing strong effort involving cooperation by the White House, CEA, Commerce and Treasury in urging business and labor to maintain competitive costs and prices. I will be speaking to the Advisory Committee on Labor and Management on this problem late this month.

Douglas Dillon

**313. Memorandum from Heller to President Kennedy,  
November 28<sup>1</sup>**

November 28, 1961

SUBJECT

The Balance-of-Payments Dilemma

The United States is facing a cruel dilemma of economic policy. Decisions to resolve it are hard upon us. The dilemma is this:

1. *Economic expansion at home will, temporarily at least, worsen our balance of payments.* The principal reason is that U.S. imports rise along with domestic production. For example, they are running about \$2 billion per year higher now than in the spring.

2. *Measures for quickly improving the balance of payments and reversing the gold flow will check domestic economic recovery, prolonging and increasing unemployment.* Tightening of credit to keep funds from flowing abroad

---

<sup>1</sup> "The Balance of Payments Dilemma." No classification marking. 3 pp. Kennedy Library, National Security Files, Kaysen Series, Balance of Payments, General, 12/60-6/62, Box 362.

will also keep them from flowing to U.S. businesses and homebuilders. Raising taxes or cutting government expenditures to gain the “confidence” of bankers and currency speculators will reduce the flow of purchasing power at home.

The pressures to grasp the second horn of the dilemma are going to be very strong. But we urge you to resist them. We believe that it would be short-sighted folly to sacrifice the domestic economy for quick improvement in the balance of payments. There is a better way out.

### *1. The Costs of Incomplete Recovery*

Consider the consequences of checking the recovery far short of full employment of labor and full utilization of capacity:

- a. prolonged unemployment, increasing as the labor force grows
- b. danger of another recession
- c. excess capacity, low profits, high overhead costs
- d. little incentive for investment which will raise productivity and make American industry competitive in long run
- e. slow economic growth
- f. low profits at home, providing continued incentive for American firms to invest abroad
- g. political pressures for protectionism, for cutting foreign aid, and for isolationism
- h. deterioration of U.S. prestige abroad from continued inability of U.S. to get its economy moving
- i. dwindling chance of labor cooperation to hold wages and costs down—why should they without the prospect of full employment?

These are formidable dangers. Not only are the domestic costs of restrictive policy high, but the prospects of future permanent improvement in the balance of payments are sacrificed for a short-run improvement.

### *2. The Better Way Out*

- a. restore the U.S. economy to full employment by 1963, and take measures to modernize and expand our plant so as to advance productivity and competitiveness in world markets
- b. accept the fact that the balance of payments deficit cannot be eliminated during the coming 1½ to 2 years of recovery
- c. take measures to protect the dollar during the transition period

### *3. Protecting the Dollar*

Balance of payments deficits do not automatically lead to gold losses. Foreigners may hold the dollars we pay them, rather than cashing them into gold. The trouble is that they already hold \$18.2 billion (\$10.5 official, \$7.7 private) of short-term debt, and they may not have enough “confidence” to add more. We still have a lot of gold, and we can afford to lose some without dire consequences. However, there are

several things we can do to keep gold losses from assuming frightening proportions:

a. negotiate prepayment of more of the \$7½ billion long-term debts Europe owes us (half U.K., half continent)—even if we have to offer a premium it would be worth it

b. use the financial expertise of our Treasury and Federal Reserve in cooperating with other governments and central banks—not only directly, but through the Bank for International Settlements, and through OECD—to offset short-term capital movements

c. use the International Monetary Fund—that's what it's for

d. guarantee certain of our debts to foreign central banks against devaluation of the dollar—this would be proof positive of our determination not to devalue, and would greatly diminish the danger of large gold losses (in one sense we have already done this on a small scale (\$46 million) in the case of Switzerland by pledging the repayment of the loan in Swiss francs)

Many people will be ready to tell you the disadvantages of these techniques. But the techniques will work, and their disadvantages are as nothing compared to the costs of alternative measures which would hold down the domestic economy.

#### 4. *A Historical Parallel*

A final word: In 1925 Winston Churchill, then Conservative Chancellor of the Exchequer, resolved a somewhat similar dilemma the way the bankers wanted him to, i.e. in favor of a “sound” pound sterling and its world prestige, and against the domestic economy. The consequences (foreseen by Keynes in the “Economic Consequences of Mr. Churchill”) were: Britain had unemployment and depression long before 1929–30; labor was alienated by deflationary policy, and there was a bloody general strike in 1926; in the end the pound sterling was devalued anyway.

December 1961

314. Letter from Dutton to Rep. O'Hara, December 13<sup>1</sup>

December 13, 1961

Dear Mr. O'Hara:

In your letter of December 1 to Secretary Rusk, you requested our comments on a recent newspaper editorial which raised the issue of whether this country can or should continue to support a large foreign aid program in the face of the balance of payments deficits of the past few years and of the decline in our gold holdings.

In considering the relationship between United States aid and the balance of payments, it is important to bear in mind that it is the form in which the aid is extended, rather than the amount provided, which is significant. A high proportion of our aid funds has been used by the recipient countries for the purchase of American goods and services, and such expenditures have no adverse impact on our balance of payments. The fact that our foreign assistance has, historically, been largely accompanied by an outflow of American exports has not been well understood by those who seek to cure our balance of payments deficit by curtailing foreign economic assistance.

The agencies responsible for aid administration have for some time been concerned to achieve the objectives of the aid program, with the minimum possible effect on the balance of payments. In this connection, they have sought to increase to the maximum extent possible the relationship of foreign aid to the purchase of American goods and services. This policy was referred to by the President in his message to Congress of February 6 on the balance of payments and gold and in his message of March 22 on foreign aid. Secretary Dillon, when he appeared before the House Appropriations Committee on July 24 to testify on the new aid legislation, said: "For as long as our international payments situation requires, in administering the Act for International Development, insofar as the procurement of goods and services is involved, our objective will be to reserve between 75 and 80 percent of the available funds for the procurement of United States goods and services."

Because of earlier commitments, this goal cannot be achieved immediately, but we expect that our efforts in this direction will have an increasingly favorable effect on our balance of payments. Under

---

<sup>1</sup> Relationship between U.S. aid and the deficit. No classification marking. 2 pp. Department of State, Central Files, 811.10/12-161.

plans for the fiscal year which began on July 1, we hope to be successful in assuring, that of approximately \$2.3 billion in aid funds programmed by the Agency for International Development, at least 75 percent, or more than \$1.7 billion, will be spent in the United States. If Food for Peace is included, of the total of \$4.1 billion, our target will be to devote more than 85%, or about \$3.5 billion, to purchases of American goods and services. I think these figures demonstrate that under this policy the effect of our aid program on the balance of payments is strictly limited, and that by eliminating foreign aid we would not thereby solve our payments problem.

The measures in the aid field have been an important part of the Government's effort to decrease the immediate payments deficit through the taking of every possible step to lessen the balance of payments impact of our necessary foreign expenditures. Over the longer term, the more fundamental payments problem will have to be resolved by improving the performance and competitive ability of our domestic economy and by improving the functioning of the international monetary system. The basic objective of the United States remains the development of a free world economy in which economic growth and productivity are stimulated, and through which we can pursue a number of other constructive objectives, including the long-term solution of the payments problems of countries currently in deficit. The aid program is a weapon of primary importance in achieving these objectives in the less developed areas of the free world. If we are unsuccessful, the future economic and political security of the entire Western World will be seriously threatened.

I hope that the foregoing will be helpful to you and that you will advise me if I may be of further assistance.

Sincerely yours,

**Frederick G. Dutton**  
*Assistant Secretary*

315. Memorandum from Dillon to President Kennedy,  
January 18<sup>1</sup>

January 18, 1962

SUBJECT

Fourth Quarter Balance of Payments Figures

Sunday's Herald Tribune front page story referring to a large fourth quarter payments deficit was unfortunate since it gave an exaggerated picture of the situation on the basis of incomplete and tentative data. It also failed to focus attention on the improvement in the basic deficit, which is a much more important indicator of the underlying position of our international accounts. Instead it highlighted the over-all deficit which includes for the fourth quarter a variety of short-term capital flows some of which we suspect should not be included in our deficit at all.

Reliable figures for the fourth quarter are not likely to be available until early or mid-February. Our best guess is that the fourth quarter will show an unadjusted over-all deficit of \$1.2 billion, a substantial increase over the \$900 million in the third quarter. The seasonally adjusted figures would be \$1.4 billion compared with \$800 million. However, the *basic* deficit for the fourth quarter is now estimated to be somewhat smaller than the \$670 million for the third quarter. What appears to have taken place was a sudden increase in short-term capital movements in the fourth quarter as compared with a very small outward movement (about \$100 million) in the third quarter. Much of this shift may well be accounted for by the timing of the flow of payments and receipts passing through our balance of payments accounts. We also suspect that the large fourth quarter movements may include some deposits by Americans of dollars in Canadian banks which then reinvest the funds in our own money market through their New York agencies. There is some doubt whether such balances should be included in our deficit figures. We are working with the Commerce Department in an effort to analyze this problem further.

The presentation of our balance of payments statistics presents an important public relations problem. We have been able to obtain some

---

<sup>1</sup> "Fourth Quarter Balance of Payments Figures." Confidential. 3 pp. Kennedy Library, President's Office Files, Treasury, Balance of Payments, 1/62-8/62, Box 94E.

improvement in the standard tables published by the Department of Commerce but there is a considerable distance to go. In particular, it is important that the Department of Commerce introduce in its tables the concept of the basic balance which has been used in a number of your statements, in my speeches, and in the economic report of the CEA. At the same time, we must be careful to leave no impression that there is any attempt to juggle or conceal figures. We are discussing this whole question with the Department of Commerce in connection with its publication of the fourth quarter and full year 1961 payments figures which will be made available in the next six weeks or so.

Despite the increase in the deficit during the fourth quarter there was no undue pressure on the dollar in the exchange market and no significant gold transactions apart from the special sale of about \$300 million to the United Kingdom at the time they also made a repayment to the International Monetary Fund. Private foreign investors continued to build up their liquid dollar assets during the quarter. This is a sharp contrast to the experience in the fourth quarter of 1960, when the overall balance of payments deficit was also \$1.2 billion. At that time private foreign investors reduced their dollar holdings by over \$500 million, the dollar was under severe pressure in the exchange markets, and our gold losses were heavy.

The best picture we have of the 1961 results, compared with 1960, is provided by the attached table. As you can see, the basic deficit will probably be about \$500 million for the year, compared with \$1.9 billion in 1960, and the over-all deficit may be \$2.4 billion compared with \$3.9 billion in 1960. In 1961 the increase in official monetary authorities' dollar holdings plus their gold acquisitions will probably be only \$1.1 billion, whereas in 1960 almost all the deficit of \$3.9 billion resulted in foreign official acquisitions.

Despite the fact that, compared with 1960, the 1961 balance of payments will show a reduction of about  $\frac{2}{3}$  in the basic deficit, a reduction of about  $\frac{1}{2}$  in the gold outflow, and a decline of over  $\frac{1}{3}$  in the overall deficit, the large fourth quarter overall deficit may be disturbing to the market as the figures become more generally available. We are alert to the possibility that this may in itself stimulate additional short-term capital flows.

**Douglas Dillon**

U.S. BALANCE OF PAYMENTS  
(millions of dollars)

	1960	1961 (Tentative)
Commercial merchandise surplus	2,867	3,300
Commercial services surplus	1,664	1,800
Commercial surplus: goods and services	4,531	5,100
Net military expenditures abroad	-2,713	-2,600
Economic aid expenditures abroad and contributions to regional and international institutions	-1,226	-1,350
U.S. net private long-term investment	-2,544 <sup>1</sup>	-2,350
Other net non-trade payments	+80	+700 <sup>2</sup>
Net non-trade payments	-6,403	-5,600
Basic balance (i.e., balance on current, long-term capital, and government accounts)	-1,872	-500
U.S. private short-term capital flows less foreign commercial credits to U.S.	-1,409	-1,100
Errors and Omissions, including capital flows (outflow (-))	-648	-750
Overall "deficit"	-3,929	-2,350
(Of which on official monetary account) <sup>3</sup>	(-3,683)	(-1,100)

<sup>1</sup> Includes \$370 million single direct investment transaction involving cash payments abroad.<sup>2</sup> Reflects special debt prepayments to the U.S. Government of \$649 million.<sup>3</sup> Not seasonally adjusted.

March 1962

**316. Memorandum from Dillon to President Kennedy, March 28<sup>1</sup>**

March 28, 1962

In view of our discussion yesterday on the balance of payments, I thought you might be interested in a capsule version of my thoughts as to how and when the problem can be solved.

In the first place, we do have a definite plan of attack. It is not simple since the problem is many sided. The first and probably most important variable in the situation is the size of the average basic deficit which we must aim to cure. It is my view that this figure is about \$2.5 billion on a conservative basis. As you recall, the basic deficit last year was \$600 million whereas it was \$1.9 billion the year before and \$4.3 billion the year before that. The \$2.5 billion figure can be arrived at from last year's results by disregarding the \$700 million we received in advance repayments of foreign debts and by decreasing our commercial trade surplus from the actual \$3 billion figure to \$2 billion to make allowance for \$1 billion of the surplus in the first half of last year which was due primarily to an unusually low, recession induced, level of imports. With these adjustments, which assume an average commercial trade surplus of the same order of magnitude as we achieved during the last half of 1961, our basic deficit for last year would be \$2.3 billion which is rounded up to \$2.5 billion to be on the safe side. It must be realized that this \$2.5 billion average deficit is not an absolute figure but rather the median point around which the actual deficit will swing based on the state of business conditions in Europe and the United States. Changes in these conditions could be expected to produce swings of \$1 billion or so in either direction in our commercial trade surplus. This means that we are now operating with a basic deficit ranging from \$1.5 billion to \$3.5 billion and that what we are trying to do is to change this area by a \$2.5 billion improvement to one ranging between a deficit of \$1 billion and a surplus of \$1 billion depending on business conditions.

It should be possible to achieve this \$2.5 billion improvement by calendar year 1964, with steady improvement on the way. This can be done in accordance with the following table:

---

<sup>1</sup> Time frame/solutions to balance of payments problem. Secret. 4 pp. Kennedy Library, President's Office Files, Treasury, Balance of Payments, 1/62-8/62, Box 94E.

	Recent Average (in millions)	New Program (in millions)	Improvement (in millions)
Military expenses	\$3,000	\$2,000	\$1,000
Net long term capital flows	+\$300	+\$800	\$500
Foreign aid	\$1,300	\$1,000	\$300
Commercial trade surplus	+\$2,000	+\$2,700	\$700
TOTAL IMPROVEMENT			\$2,500

The savings in military expenditures can be broken down as follows:

	(in millions)
Increased German purchases	\$500
Increased offset purchases by others: Italy, France, etc.	\$100
Decrease in uranium purchases	\$100
Procurement shifted to United States	\$100
Reductions in logistic costs (fewer personnel, closing bases, etc.)	\$100
Total identifiable	\$900
General goal agreed by Secretary McNamara	\$1,000
Still to be identified	\$100

The most likely areas for finding the remaining \$100 million are in offset agreements with France and Italy.

The \$500 million saving in capital flows would be accounted for by roughly a 10% increase in the repatriation of earnings to this country coupled with a 10% decrease in investment overseas. These results will depend on the enactment of your original foreign tax proposals including the elimination of deferral for all foreign income in the industrialized countries. The present version of the tax bill now before the House would accomplish about half of this result.

The reduction in foreign aid dollar expenditures will require continuing attention and effort on the part of AID. State and AID have just about agreed with us that \$1 billion is an appropriate target as an overall ceiling for dollar expenditures but it will require close attention and continued effort on the part of all hands in State and AID to succeed.

The \$700 million figure for an improvement in our commercial surplus represents approximately a 2% shift in the overall total of exports and imports which is currently running around \$33 billion a year. If it is thought of only as an increase in exports, it would involve approximately a 4% increase from our current level. This is the item which is most difficult to be specific about since in the final analysis

it depends upon the efforts of private business. However, if we are successful in maintaining price stability and if the investment credit is enacted, the extra efforts of the Departments of Commerce and State in this field plus the new facilities for export credits should be able to produce an improvement of this nature by the end of 1963. Included in this \$700 million is \$100 million for reduction in tourist expenditures abroad which customs statistics indicate to be a reasonable estimate of the results of the reduced duty free allowance.

As to timing, the bulk of the savings in defense should be available for calendar year 1963, as should the savings in capital flows, provided the tax bill is enacted in satisfactory form. I would expect the hoped for improvement in exports and the savings in our foreign aid program would require a year longer which is the reason we aim for a balance in 1964.

This takes no account of short term flows which include the most volatile and dangerous elements in our payments situation. These can only be handled by maintaining confidence in the private holders of dollars and by maintaining a reasonable equilibrium between short term rates in the United States and abroad.

**Douglas Dillon**

April 1962

317. Memorandum from Coppock to Ball, April 18<sup>1</sup>

April 18, 1962

SUBJECT

A Proposed Status Report by You on Foreign Economic Policies before the Interdepartmental Committee of Under Secretaries

I suggest that you give the Under Secretaries' Committee a roundup on foreign economic policies and programs on May 2 or May 16. (Mr. Harriman is discussing the economic situation of Japan and related matters on May 31.) There has not been such a review since early in the present Administration and it would no doubt be good for Mr. Griffith Johnson, as well as the people from other agencies. Also, you might want to use the material for a report to the President. It seems preferable that this be done now rather than after Congress adjourns, since you would be able to point up issues that need pushing.

If you approve of this suggestion, I will assemble from appropriate sources a list of topics and background material. It would be desirable to announce the topic at this afternoon's meeting—subject to your wishes.

**Joseph D. Coppock**

*Director*

*Foreign Economic Advisory Staff*

**Attachment**

I suggested in a memorandum to you last week that you give a general run-down on foreign economic policy to the Interdepartmental Committee. Mr. Springsteen said you wanted to see a list of topics. Here is a list. Attached is a memorandum setting forth the gist of what I would cover. A list by itself is not very helpful.

I. Criteria for judging foreign economic policy.

II. Effects of foreign economic policy actions on domestic economy during the past year.

---

<sup>1</sup> Recommends Ball convene meeting of Interdepartmental Committee of Under Secretaries to provide status report on foreign economic policy. Official Use Only. Two attachments provide agenda and briefing material for May 2 meeting. 9 pp. Department of State, E Files: Lot 65 D 68, ICFEP.

III. The foreign impact of foreign economic policy actions.

- a. Trade and monetary matters.
- b. Economic development programs.
- c. International organizations.

NOTES FOR MR. BALL TO USE BEFORE THE  
INTERDEPARTMENTAL COMMITTEE OF UNDER SECRETARIES  
ON FOREIGN ECONOMIC POLICY

SUBJECT

Critical Review of Foreign Economic Policy

1. This Administration has been in power for over a year now and it seems worth while to have a comprehensive run-down on U.S. foreign economic policy.

2. Foreign economic policy has to be judged on two fronts, the domestic and the foreign. On the domestic front, the test is mainly the extent to which it contributes to economic prosperity. On the foreign front, the test is more complex but fundamentally it comes down to the contribution of foreign economic policy to our national security. In this framework, foreign economic policy is just one aspect of our general foreign policy.

3. The *domestic economy* has been operating substantially below capacity, so policies which foster increased imports tend to bring vigorous objections from those who might feel the increased competition. This was reflected in the tariff-reduction offers made by the U.S. at Geneva last year and conspicuously in the textile situation. Our balance-of-payments condition has also inhibited stronger domestic expansion measures. Under these conditions, expansion of exports has had an unusually strong appeal, as a stimulant for the economy generally and as a relief from balance of payments pressure.

4. Two important foreign economic policy actions should have some expansionist influence on the domestic economy. One is the completion of the Dillon round of tariff negotiations, in which we got more than we gave; the other is the negotiation of the special credits to deal with short-term capital movements, still before Congress. Neither of these has yet had any direct effect on the domestic economy. Some anticipatory actions are probably afoot by businesses in response

to the forthcoming lower duties, and the prospective availability of the special credits, even with all the strings attached, should make for a bit more monetary and fiscal ease domestically.

5. Restrictionist measures, such as the textile arrangement, limit the movement of goods to this country, reduce the competition from abroad, and make for higher prices. The proposal to increase the domestic share of the sugar market would have a similar effect. The actions on tourist purchases, carpets and glass are also of the same sort. There are pressures in shipping, oil and some other areas for increased restrictions. The underutilization of domestic economic capacity makes these restrictionist measures very appealing to parties directly affected by foreign competition, and the balance-of-payments situation provides an additional rationale. Fortunately, we have not yet felt the full force of Buy-Americanism pressures “dispassionately” interested in restoring equilibrium to the U.S. balance of payments.

6. The Council of Economic Advisers may wish to go into more detail on the effects on the domestic economy of foreign economic policy developments in the past year or so, but it is my impression that our foreign economic policy actions have *not* contributed much to domestic prosperity and economic well-being. Undoubtedly, the balance-of-payments restraint has been the most inhibiting influence. A year ago February we deliberately chose the present policy of dealing with the balance-of-payments deficit and the related problem large out-movements of short-term capital and gold. Our success is not so overwhelming that we can look forward to an early relaxation of this restraint. At some point, we may have to give serious consideration to more drastic alternatives. We can hardly consider it good foreign economic policy to be subject to a balance-of-payments restraint that seriously retards the rate of economic growth and contributes to a high level of unemployment. Our power position in the world depends heavily on a prosperous U.S. economy.

7. With respect to the *foreign impact* of our foreign economic policies, the underlying main purpose, as noted above, is to enhance our national security position. This is accomplished, however, by increasing the economic well-being and economic interdependence of the Free World. Policies which inhibit the economic progress of Communist countries are logically relevant, but we have very little unexercised power with which to influence them. Our trade with the Bloc countries is nominal, except for our wooing operation with Poland. Moreover, our European allies see expanded trade with the Bloc as a means of developing a pattern of political accommodation while providing some economic benefits. The principal opportunity to increase the relative economic strength of the Free World, as compared with that of the Communist Bloc, is to increase the absolute economic power of the Free World. This is the true national security task of our foreign economic policy.

8. At bottom, there are just two prongs of foreign economic policy that are involved here. One is to increase the trade opportunities among the countries of the Free World; the other is to provide means for increasing the rate of economic growth.

9. For the trade task, the proposed Trade Expansion Act of 1962 is at the top of the list. It has domestic implications, of course, but its largest thrust is to provide a new momentum to the effort to expand the trade and economic development of the Free World generally, with all this means for our policy of preventing the expansion of Communism and building up the political cohesiveness of the Free World. Failure of the U.S. to have a good Trade Agreements Act would unleash a new era of protectionism. As indicated earlier, there are numerous restrictionist pressures at work in this country and there are strong ones elsewhere. Without the example of the European Economic Community—and the competitive threat it poses—our drive to get a strong Trade Expansion Act would run into very strong opposition. Thanks to the European Economic Community and heavy press play, U.S. public interest in trade expansion is greater than it has been for many years. It is still a question whether Congress will respond adequately.

10. We are involved in a number of measures which restrict trade and which conflict with our proclaimed progressively liberal trade policy. None of these has been dropped during the last year. In fact, the tendency in coffee, sugar, oil, textiles and shipping—to cite prominent examples—is for more restrictions. These restrictionist moves may be explained in terms of national defense, market disruption, or related domestic assistance programs, but the undoubted effect internationally is to restrict trade. Other countries have their restrictionist measures too, but our position of leadership puts a special responsibility on us to apply and advocate liberal measures.

11. Very closely-related to the basic policy of expanding trade opportunities is the policy of developing and maintaining an international monetary mechanism that will facilitate trade (and of course international investment). Undoubtedly, the international monetary mechanism is better than it has been for thirty years, but we are now back on a gold-exchange standard with its inherent faults. Our efforts during this past year to counteract the disturbing effects of short-term capital movements and the frequently associated gold movements cannot be considered an outstanding success though the special credits for the principal countries are all to the good. This is an unsolved problem, which will be only ameliorated, not solved, when the U.S. balance of payments gets into "basic equilibrium," since there will still presumably be large foreign holdings of dollars and dollar-securities which can be offered against insufficient quantities of gold or foreign currencies. Quite aside from the domestic economic restraints imposed

by this problem, our trade expansion efforts for the Free World, if successful, are going to require a better international monetary mechanism.

12. Just a word on our balance-of-payments problem. Looking at it from the international angle, we must continue to resist restrictionist measures for dealing with it, whatever the nominal form of the measures. The more we apply Buy-American or capital-export controls, formal or informal, the more difficult will it be to make our foreign economic policy serve our national security needs. Hence, it is to be hoped that the balance of payments can be brought nearer to equilibrium by expert promotion and security-selling efforts. If it cannot, then we must face up to the unpleasant task of changing the exchange rate, whether or not this means cutting loose from gold. We simply must not hobble the domestic economy with depressive policies imposed by a balance of payments deficit, nor must we lapse into exchange controls, quantitative restrictions or higher duties, in view of our position of leadership in moving the Free World toward freer trading arrangements.

13. Some remarks now about the other international prong of our foreign economic policy, namely, the promotion of economic development in the less developed countries. Increased trade opportunities are extremely important in promoting economic development, but much more is involved, of course. What the United States does in this field is primarily to provide human and material resources which these countries would not be able to buy from their current earnings or accumulated foreign assets. The real push toward economic development must come from within the countries, despite our urging, cajoling, technical assistance and provision of capital. Our record in this field during the past year looks quite good. The aid program is now seen as a continuing enterprise; new lending institutions are getting underway; the Alliance for Progress is moving about as fast as could be expected; the Europeans are at least considering bearing part of the aid burden. The criteria for aid can never be very precise, but we can always strive to have the aid money used in what seems a reasonably efficient way in the light of detailed knowledge of the particular country's circumstances. The use of surplus agricultural commodities and the use of tied-loans or tied-grants should give way to straight-forward loans or grants fairly soon, since they involve economic inefficiency, and since they detract from the political effectiveness of our aid programs. We are certain to encounter nationalistic excrescences in the less developed countries, particularly the new ones, which will bring unfair taxes, discriminatory controls, and even expropriation without proper compensation. Good diplomacy can go far to make these actions bearable. It is uncertain how effective we can be in helping other

countries deal with their population problem, a major factor in their long-run economic development. We have not rushed into this field, which is full of political booby-traps, but we are in a position to help interested countries study the problem. This can be counted as one of the modest achievements of the past year. Fortunately, there are numerous non-governmental activities afoot in connection with economic development, so perhaps the most important thing government can do in this realm, outside the trade and aid fields, is to help clear the way for individual and small-group action. We must learn to take a long and patient view of the economic development or modernization problem for the backward countries. We cannot have a new Alliance for Progress or new Decade of Development every year.

14. Finally, there should be some mention of international organizations in the context of our foreign economic policy.

a. This Administration can take no credit for the establishment of the European Economic Community, but it can take credit for encouraging its progress and its projected expansion. Thus far, we have played our part well in this important development. There are obviously a great many unsettled issues. One of the emerging problems of importance is the relation between the OECD and the EEC. We got Congressional approval in 1961 for U.S. participation in the OECD as a vehicle for North Atlantic cooperation, both among the countries of the region and toward other countries. If the EEC progresses and if the global organizations, particular the GATT, the IMF and International Bank, serve their intended purposes, there will be a tendency for the OECD to be less useful. This means less rather than more relative emphasis on the Atlantic Community. It would obviously be unfortunate if NATO were weakened by a lack of economic cohesion among its members. This problem is not an urgent one, but it will become progressively important.

b. The problem of how to include Japan in some form of association of nations for purposes of economic cooperation has been considered over a number of years. The global organizations and ECAFE and the Colombo Plan do not seem to be sufficient. Japan's membership on the DAC of the OECD is hardly sufficient to meet this apparent need for "belonging." The pre-war co-prosperity sphere haunts new regional groupings in the Pacific. If the UK goes into the EEC, there might be a tendency for some Commonwealth countries to view a new grouping with interest. This problem, like that of the OECD, does not seem to be urgent, but it is real.

c. The UN Economic Commission for Africa may serve this purpose for the African states, but the Israel issue has long blocked the projected Middle East Commission. It is not entirely clear why there is such a push for these regional economic organizations, but the push has been

steady since the end of the war. The organizations have not done much, in a real economic sense, but they seem to satisfy in part a genuine desire to belong. It may be a reaction to the bigness of the U.S., the U.S.S.R. and now the E.E.C. The United States can help make these organizations of some use.

15. There is no easy way to summarize this critical review. Obviously, we have not been outstandingly successful in the foreign economic field. The Trade Expansion Act is still to be passed; failure would represent a serious set-back. We must of course use our tariff-cutting power promptly, after it is granted. We must not let the commodity-control arrangements, whether unilateral or multilateral, provide a back-door means of hyperprotectionism. The hot money—gold problem is the only problem in this field that could blow up in our faces without much advance notice. It will take some major institution-building to rectify that situation, but it must be done in due time. The balance of payments problem is still with us. The aid work, with all its headaches, must go ahead on a long-range basis. International organizations are a part of the furniture of our contemporary world and we must be prepared to devise them, use them, drop them as they serve our purposes.

June 1962

Under Secretary of State McGhee, who chaired the meeting, said that the subject of long-term private capital movements is of very great

---

<sup>1</sup> International private long-term capital movement and markets. Official Use Only. 8 pp. Department of State, E Files: Lot 65 D 68, ICPEP, June 13, 1962.

interest. One reason for our interest is the effect such movements have on the balance of payments. In addition, many industries, such as petroleum, are dependent on complete freedom of movements of capital. We are repeatedly approached by people about how our inflow-outflow position could be improved. The Business Council has been looking into this and wants to change the tax bill.

Commenting on the excellent Treasury paper, "Private Long-Term Capital Movements," Mr. McGhee hoped the discussion would include what we can do to affect the inflow-outflow to our advantage. Also, what international forum, if any, should be used to discuss it. There seems to be a need for us either to restrain other countries from raising money in our markets or be permitted to raise money in their markets, he said.

### *Presentation*

#### *The Balance of Payments Problem*

Under Secretary of Treasury Fowler made an over-all presentation of the subject, pointing out that with the balance-of-payments problem having the history and duration that it has had, as a Government we have to examine all the factors. In dealing with the balance-of-payments problem, it is necessary to consider the relationship to foreign policy and the world security situation. For discussion today, Mr. Fowler said, private long-term capital movements come under scrutiny as one of the important components in the balance-of-payments picture.

Mr. Fowler made some general remarks on the U.S. balance-of-payments situation. He referred to the distinction now being made which shows the commercial exports of goods and services (exclusive of those financed by government grants and bans) at about \$5 billion in 1961.

He pointed out that military expenditures abroad are a powerful factor in the imbalance. Defense has under way a very thorough-going and effective operation to cut down the drain that military expenses abroad are causing. A large part of the Defense effort has been concerned with arrangements with West Germany for purchases in the U.S. For the next year it appears as though the net impact of our military transactions abroad figure will be cut down from \$2.6 billion in 1961 to \$1.7 billion.

Foreign aid is the next most important item, and it will take a good deal of vigilance on everyone's part to keep down that portion of aid not spent for U.S. goods and services, although a good deal of progress is being made.

### *Private Investment*

The third thing in the balance-of-payments picture is U.S. long-term direct and portfolio investment. Figures of the last few years are

impressive, particularly when one looks at the other side of the ledger—foreign investment in the U.S., both direct and portfolio, and the fact that there is still a sizable system of restrictions which obstruct the use of foreign capital markets. If the restrictions of other countries were removed however, there is still a question of whether the inflow would tend to equate the outflow. Mr. Fowler said he receives different prognostications of the course of foreign investment when he talks to business representatives. Some say that this is the beginning of a process of investing abroad; others say that long-term capital outflow is going to top out.

European capital markets are not as well organized to deal with the capital raising process as is our New York market, and interest rates for long-term money in the U.S. still look fairly attractive compared with rates in Europe.

*Present US Outflow and Prospects*

Assistant Secretary of Treasury Leddy then discussed the Treasury paper dealing with long-term private investment.

He summarized the 1961 balance-of-payments picture, which showed a commercial surplus in 1961 of goods and services, exclusive of aid aspects of exports, of approximately \$5 billion. These and other receipts had to finance military expenditures, aid spent abroad and capital outflow.

*a. Military*

The military net figure was \$2.6 billion (gross outflow, \$3 billion, minus \$400 million of sales). On the basis of Defense Department plans, Treasury estimates this figure can be brought down to \$1.7 billion.

*b. AID*

The AID net outflow was \$1.3 billion exclusive of AID-financed US exports. This figure is composed of transfers to international institutions and direct cash transfers to countries under aid programs. This is a difficult area in which to reduce the outflow, but our objective is to get this figure down to \$1 billion. Many of the problems involve local currency financing, but we may be able to see that some of the dollars provided for this purpose are spent for U.S. exports.

Private remittances and pension payments which are continuing and run at about \$900 million.

Against the background of these facts, the figures on private long-term investment show \$2.1 billion net outflow in 1961.

As a result of these various movements, the U.S. had a deficit last year of \$600 million.

*c. Private Long-Term Investment*

From the tables in the Treasury paper, it can be seen that over the past 5 years about 60% of the outflow in long-term private investment was for direct and 40% for portfolio. Since 1958, there has been an upward trend in U.S. direct investment while portfolio investment has remained flat through 1961.

Selected years from the chart show that new outflow of direct investment moved up from \$1.1 billion in 1958 to \$1.5 billion in 1961, whereas portfolio net remained at about \$600 million. The tendency of direct investment to increase reflects an increase in manufacturing investment and a decrease in petroleum investment. This trend is also reflected in the geographic pattern—an increase in direct investment in Europe and a decline in Latin America. There is increasing direct investment toward the EEC, but investment in the UK remains still higher than the EEC. The outflow from the U.S. in direct investment to the EEC in 1956 was \$140 million and in 1960 it was \$282 million; to the U.K. it was \$278 million in 1956 and \$589 million in 1960. The latter figure, however, included the Ford transaction of \$367 million.

The first quarter of 1962 shows an increase in the portfolio sector, mainly because of foreign bond issues in our market. In 1961 issues of such securities in our market totaled \$269 million. So far in 1962 they total \$400 million. While interest rates are lower here than in Europe, foreign use of the U.S. capital market is not just a question of interest rates. There is also the matter of availability of markets and that is why we are putting so much stress on Europe to develop its own capital markets.

Over-all, in the first quarter of 1962, the total private long-term investment, direct and portfolio, is just about where it was in 1961. The total has not gone up.

*European Inflow-Outflow Picture*

In 1961 the UK outflow (gross figure) was \$1 billion and the EEC outflow was \$1 billion. (This compares to a total of \$2.5 billion for the U.S.) But the EEC inflow was \$1.6 billion, so that there was a net inflow to the EEC of around \$650 million. Much of the European outflows, probably at least half, were to other EEC countries.

*U.S. Policy and Objectives*

Mr. Leddy said that the U.S. Government has been resisting strongly the concept of placing controls on outflow of capital. Restrictions in that area would bring about a more restrictive policy in other areas. On the other hand, we have been urging that the Europeans do something themselves on removing the restrictions that they still have in effect and on developing their own capital markets. These actions

are being pursued basically through the OECD. The first important public announcement made on this was by Secretary Dillon in his Rome speech.

European responses have been mixed. The Germans and Swiss have been helpful. Following Dillon's speech, Carli of the Bank of Italy said Italy should remove some of the restrictions of its foreign investments by Italians. The French and Dutch and certainly the U.K. still tend to think in terms of controls. The U.K. in its present circumstances is not in a position to give up direct controls. Mr. Leddy pointed out that even if we get every hopeful progress, this is an area which will take quite a while for results since there are still the institutional arrangements in Europe which will take considerable time to change.

### *Discussion*

#### *Tax Legislation*

Mr. Fowler was asked how Treasury anticipated the tax legislation would affect the outflow and pointed out that it is only one element in the situation. Noting that there is strong pressure by some at home and abroad to impose controls on direct investment, he said the policy of this Government is to avoid such controls.

However, the least we can do as a response to this situation, Mr. Fowler said, is to try to adjust the tax laws so we can honestly say that they are not adding to the incentives to invest overseas. Those incentives exist particularly in the European area and will continue to exist, even when the tax incentive is abolished.

Mr. Fowler referred to the differences in sentiment on the tax haven problem which is more readily accepted in Congress compared to the great resistance to the Administration's proposal to eliminate the right of tax deferral on overseas investments. This was rejected by the House Ways and Means Committee, and the tax provision is now basically anti-tax haven. There is strong sentiment in the Senate Committee that something should be done, but that Committee may not go all the way to eliminate deferral.

#### *Assessment Needed of Political Reaction to U.S. Investment*

Mr. Fowler noted that the discussion had raised a political question of whether there is any substantial danger that a continued flow of American industrial capital into the Western European market would ultimately produce a political situation reminiscent of the recent reactions in Canada to our investment there? It was noted that the French have raised some questions about U.S. investment. Mr. Goldstein also observed that advanced European countries main capital controls to get the kind of investment flow that they want.

Mr. McGhee said that the State Department would take a look at this problem.

*Program for Promoting U.S. Securities in Europe Suggested*

Mr. Gudeman and others suggested it might be well for the U.S. Government to get American securities offered in Europe, either for dollars or for European currencies. Bearing in mind that it will take a long time to organize European markets, it was suggested that American securities might be listed, for example, on the Paris exchange; and that perhaps the U.S. Government might assist in advertising such action.

Mr. Leddy said that Treasury might discuss this with the financial community first. Mr. Fowler said that Treasury has a Committee with which it meets on debt management problems and it might discuss the matter with that Committee. Mr. McGhee suggested that Treasury circulate a memo about any thoughts that Committee might have about selling American securities abroad. We could then see what can be done. Mr. Fowler said that Treasury would be glad to do that.

*OECD Efforts in this Field*

It was pointed out that the OECD efforts are in two Committees—the Invisibles Committee and in Working Party 3 of the Economic Policy Committee. The Invisibles Committee had been drawing up a code of liberalization of invisible transactions and capital movements. Earlier this year our delegate suggested that the terms of reference be broadened to permit examination of the whole problem of the restrictions which block capital flows. This is now going ahead, and the first report is due July 1. That should supply further information of what the restrictions are in the various European countries.

In Working Party 3, which is at a higher policy level than the Invisibles Committee, we have been bringing up the subject of restrictions on capital movements ever since the end of last year. There have been mixed reactions, but we have gotten these people to focus on the problem and there should be some progress. The Europeans, while not enthusiastic, have shown signs of understanding.

*Other Approaches*

Mr. Fowler again reminded the group that there is no one solution to our balance-of-payments problem and that it is tremendously important that our export, travel, and other programs progress quickly. Mr. Fowler said there is also a question of whether OECD action should be supplemented by bilateral contacts and direct diplomatic efforts. Mr. Leddy suggested that far more information is needed before we can apply multilateral or bilateral pressure.

*Follow-up Action*

The discussion left it that: a) State would assess the likely political reaction in other countries to large U.S. investments, and b) Treasury

would circulate a memo on the possibilities of using the business community in a program designed to sell American securities abroad.

**319. Memorandum from McNamara to Secretaries of Military Departments, the Director of Defense Research & Engineering, the Joint Chiefs of Staff, the Assistant Secretaries of Defense, and the General Counsel, July 10<sup>1</sup>**

July 10, 1962

SUBJECT

Revised Project List—List of Projects and Actions for Reducing Defense Expenditures Entering the International Balance of Payments

As I stated at the 9 July 1962 staff meeting, our FY 1966 objective is to reduce the Department of Defense net adverse dollar balance entering the U.S. balance of payments to \$1 billion. This dollar objective is to be achieved without reducing our military power abroad.

Revised Project Eight, distributed at the staff meeting on 9 July 1962, incorporates and consolidates into a single project all previous projects (including those contained in the memorandum from my office, dated 26 June 1962) relating to U.S. defense expenditures and receipts entering the international balance of payments. It assigns the office responsible for submission of the replies and indicates the tentative due date for submission. If the due date cannot be met and a change is desired, please notify me.

Prior proposals which have been approved are incorporated as a Project Eight Action List. This list was distributed with the revised project list. The action list indicates the office assigned responsibility for implementation. As additional projects are submitted and approved, they will be added to the action list.

The Assistant Secretary of Defense (Comptroller), who has been designated to direct and coordinate the program, will issue such additional administrative instructions for preparation and submission of replies to these projects as may be necessary to supplement those issued from this office on 11 June 1962.

**Robert S. McNamara**

### REVISED PROJECT EIGHT

<u>Project</u>	<u>Assigned to</u>	<u>Tentative Due Date<sup>2</sup></u>	<u>Classification</u>
1. <i>Expenditures by U.S. military and civilian employees and their dependents.</i>			
a. Translate the Five-Year Force Structure and Financial Program into a Five-Year (FY 1963–1967) Deployment Plan for U.S. forces in foreign countries with a view to eliminating all non-essential units. This plan should be developed by country, by service, by unit, and fiscal year.	JCS	1 Oct 62	(S)
b. Through a series of steps, reduce USAREUR strength in Europe, now approximately 273,000, by a total of 44,000.	Sec Army	Next step recommendation due 1 Sep 62	(S)
c. Develop plan for accelerating withdrawal of B-47 units from overseas bases.	Sec Air Force	15 Aug 62	(S)
d. Develop plan to reduce other USAF strength in foreign countries.	Sec Air Force	1 Sep 62	(S)
e. Reduce dependents overseas by reviewing Air Force proposal to shorten unaccompanied tours to 15 months and increase accompanied tours from 3 to 4 years. (Include recommendations as to any modification to current policy re overseas tours.)	ASD (M)	15 Aug 62	(U)
f. Recommendation on Air Force proposal to return 366 Tactical Fighter Wing to the U.S. currently programmed to be returned in FY 1964.	JCS	1 Aug 62	(S)
g. Recommendation on Air Force proposal to retain 2 F-105B squadrons in CONUS (scheduled for deployment to USAFE in August 1962).	JCS	23 Jul 62	(S)

<sup>2</sup> If the responsible organization wishes a change in the due date, please notify me.

REVISED PROJECT EIGHT

<u>Project</u>	<u>Assigned to</u>	<u>Tentative Due Date</u>	<u>Classification</u>
h. Recommendation on Air Force proposal to inactivate Fighter Interceptor Squadron at Keflavik.	JCS	1 Aug 62	(S)
i. Recommendation on Air Force suggestion to reduce 5 expanded dispersed operating bases.	JCS	15 Aug 62	(S)
j. Recommendation on Air Force proposal to transfer MACE squadron and Sembach air base to Germany.	JCS & ASD (ISA)	1 Aug 62	(C)
k. Recommendation on Air Force proposal to cancel deployment of the 12th and 15th Tactical Fighter Squadrons to the Pacific (one currently scheduled for deployment for the 4th quarter of FY 1963 and the other FY 1965).	JCS	1 Aug 62	(S)
l. Investigate modification in overseas exchange systems to encourage purchase of U.S. goods.	ASD (M) (Assisted by Service Secretaries)		(U)
(1) Establish U.S. brokerage service concessions at selected military installations to promote savings and investments.	Sec Army	15 Sep 62	(C)
(2) Attempt to secure agreement of additional U.S. automobile manufacturers to the sale of their autos through overseas exchange.	Sec Army	15 Sep 62	(U)
(3) Consider establishment of charge and time payment sales in European Exchange System to improve competition with local merchants.	Sec Army	15 Aug 62	(FOUO)
(4) Consider establishment of insurance concessionaires to sell insurance, other than life insurance, through the European Exchange System.	Sec Army	15 Sep 62	(FOUO)
(5) Consider improvement of merchandising by nonappropriated fund activities and facilities	Sec Army	15 Oct 62	(FOUO)

REVISED PROJECT EIGHT

<u>Project</u>	<u>Assigned to</u>	<u>Tentative Due Date</u>	<u>Classification</u>
including quality of products sold to encourage patronage and divert personnel from local economy establishment.			
(6) Consider a proposal that U.S. made autos to be sold through the Overseas Exchange Service to Defense personnel be transported overseas by Military Sea Transportation Service at Government expense.	Sec Army	1 Sep 62	(C)
(7) Investigate the adequacy of maintenance facilities available for servicing U.S. manufactured autos, availability of spare parts, and make recommendations for required corrective action.	See Army	15 Sep 62	
(8) Review policy requiring nonappropriated fund supported billeting facilities to charge rates higher than those required to defray costs to nonappropriated funds.	Sec Army	15 Aug 62	(C)
(9) Review possibility of relief from requirement to sell foreign goods at a price at least as high as it is available in the local market.	ASD (M)	1 Oct 62	(C)
(10) Recommend further study of proposals made by certain foreign manufacturers to make payment for goods produced by those companies and purchased by the European Exchange Service to a blocked account of an associate firm located in the U.S.	Sec Army	15 Aug 62	(C)
2. <i>Review use of foreign nationals (direct and contract hire under military functions appropriations) to determine if requirements can be reduced.</i>	Service Secretaries	1 Sep 62	(C)

REVISED PROJECT EIGHT

<u>Project</u>	<u>Assigned to</u>	<u>Tentative Due Date</u>	<u>Classification</u>
3. <i>Procurement of Major Equipment.</i>			
a. Review FY 1963 program for procurement of CARIBOU aircraft (\$30 million) and ENTAC (\$24 million) with a view toward procurement in U.S. or offsetting purchases from U.S. before entering into these procurement contracts.	ASD (I&L)	1 Aug 62	(C)
b. Review programs for procurement of organization, base maintenance and related equipment in Germany, Japan and U.K. with a view toward returning such procurement to the U.S.	ASD (I&L) (Assisted by Service Secretaries)	1 Aug 62	(C)
c. Review plan of procurement of gas turbine propulsion units in U.K. for Denmark Military Assistance Ship-building Program with a view toward returning such procurement to the U.S.	Sec Navy	22 Jul 62	(C)
4. <i>Construction</i>			
a. Develop a program to reduce by 66% the foreign exchange cost of the FY 1963 construction program (including a 66% reduction in the foreign exchange cost of the overseas family housing program).	ASD (I&L) (Assisted by Service Secretaries)	1 Aug 62	(C)
b. Review plans for moving communications, logistical and supply facilities from Seoul to Pohang, Korea.	Sec Army	1 Aug 62	(S)
c. Review plans for construction of ammunition facilities in France.	Sec Army	1 Aug 62	(S)
d. Review the need for \$10.9 million family housing program for Canada and Okinawa in the FY 1963 MCA request.	Sec Navy	22 Jul 62	(U)
e. Review the entire program for constructing in Australia low frequency communications facilities for POLARIS submarines. Must the facility be located in Australia? If this	Sec Navy	22 Jul 62	(C)

REVISED PROJECT EIGHT

<u>Project</u>	<u>Assigned to</u>	<u>Tentative Due Date</u>	<u>Classification</u>
program must be continued in Australia, can more of the dollar expenditures be made in the U.S. than currently planned and can the foreign exchange requirement be offset by equivalent Australian purchase in the U.S.?			
f. Review the entire program for constructing an under water testing station in the Bahamas. Must it be located there? What is possibility of a U.S. location?	Sec Navy	22 Jul 62	(C)
g. Review plans for: (1) Adding a wing to Naval Hospital at Rota, Spain. (2) Building an airplane hangar at Rota, Spain.	Sec Navy	22 Jul 62	(S)
h. Review plans for constructing additional buildings for three Marine camps in Okinawa.	Sec Navy	22 Jul 62	(C)
i. Study question of a POLARIS submarine base in Spain. Is such a base essential?	Sec Navy	22 Jul 62	(S)
5. <i>Overseas Procurement of Materials and Supplies.</i>			
a. Develop a detailed action program to return a major portion (at least 40%) of petroleum procurement to U.S. sources.	ASD (I&L)	25 Jul 62	(C)
b. Develop a program to reduce by 50% subsistence purchases overseas.	ASD (I&L) (Assisted by Service Secretaries)	1 Sep 62	(C)
c. Explore feasibility of transporting milk and dairy products to Europe by Jet cargo or tanker aircraft to reduce expenditures on the local economy.	Sec Army	1 Aug 62	(FOUO)
d. Reduce by 50% the \$240 million estimated expenditures for miscellaneous materials and supplies procured overseas.	ASD (I&L) (Assisted by Service Secretaries)	1 Aug 62	(C)
6. <i>Contractual Services</i>			
a. Develop program to reduce the estimated \$270 million annual outlays for repairs, alterations, maintenance, etc., by 25%.	ASD (I&L) (Assisted by Service Secretaries)	1 Sep 62 (Report submitted on repairs & alterations)	(C)

REVISED PROJECT EIGHT

<u>Project</u>	<u>Assigned to</u>	<u>Tentative Due Date</u>	<u>Classification</u>
b. Review desirability of transferring depot maintenance to Spain.	Sec Army	1 Sep 62	(C)
c. Develop a program for modification in military postal operations to reduce dollar expenditures overseas.	Sec Army	15 Sep 62	(C)
d. Present plan for lengthening interior painting cycle in overseas facilities.	Sec Army	1 Aug 62	(U)
e. Develop a procedure for reimbursement to U.S. for training support provided to NATO countries.	Sec Army	1 Aug 62	(C)
f. Develop a procedure for reimbursement to the U.S. for custodial services provided for storage of special ammunition.	Sec Army	15 Aug 62	(S)
g. Consider the possibility of purchasing from other NATO nations support for U.S. combat troops in Europe in place of retaining U.S. support troops in Europe for that purpose.	ASD (ISA)	1 Sep 62	(C)
<i>7. Military Assistance</i>			
a. Review FY 1963 Military Assistance Program with a view to reducing overseas procurement of equipment, supplies and services, including construction, by at least 50%.	ASD (ISA)	15 Aug 62	(S)
b. Review operation of MAP supply depot in Japan with a view towards Japan assuming responsibility for operation in exchange for certain logistical support from U.S. Army.	ASD (ISA) (Assisted by Sec Army)	1 Sep 62	(S)
c. Develop plan either to eliminate vehicle procurement program in Japan or offset overseas dollar expenditures abroad by increasing Japanese military procurement in U.S.	ASD (ISA)	1 Sep 62	(C)
d. Develop plans leading toward a reduction in: (1) U.S. share of NATO infrastructure payments.	ASD (ISA)	1 Aug 62	(C)

REVISED PROJECT EIGHT

<u>Project</u>	<u>Assigned to</u>	<u>Tentative Due Date</u>	<u>Classification</u>
(2) Contributions to NATO International Headquarters.			
(3) Other cost sharing arrangements, e.g., NATO Pipeline System.			
e. Review urgently the proposed ACE ground environment plan, to be financed by NATO infrastructure, as to:	ASD (ISA) (Assisted by DDR&E)	15 Aug 62	(S)
(1) Basic cost and effectiveness, and			
(2) assuming the project should be undertaken, maximizing the U.S. procurement so that it at least offsets the U.S. participation share.			
f. Develop a plan with a view to having host countries assume greater share of administrative and support cost of MAAG's.	ASD (ISA)	1 Aug 62	(C)
g. Review participation in the Mutual Weapons Development Program and the Weapons Production Program with a view to reducing foreign exchange cost beyond present firm commitments.	ASD (ISA)	1 Aug 62	(C)
h. Investigate cost of cancelling G-91 aircraft commitment.	ASD (ISA)	1 Aug 62	(C)
8. <i>Receipts</i>			
a. Develop individual programs for negotiating offset arrangements with countries other than France, Germany, Italy and Japan in which the U.S. has a substantial adverse foreign exchange balance.	ASD (ISA)	1 Nov 62	(C)
b. Develop and formalize a credit sales program as a goal and procedural base for use in Government sales promotion of military equipment and services for use in negotiations.	ASD (ISA)	1 Sep 62	(C)
c. Initiate Government/industrial sales promotion and negotiation action which, with sales resulting from offset arrangements would bring total receipts to \$1 billion annually in FY 1964, 1965 and 1966.	ASD (ISA)	1 Jan 63	(C)

REVISED PROJECT EIGHT

<u>Project</u>	<u>Assigned to</u>	<u>Tentative Due Date</u>	<u>Classification</u>
9. <i>General</i>			
a. Develop and present in the form of a standardized quarterly financial report a Five-Year Program for U.S. defense expenditures and receipts entering the international balance of payments—FY 1961–1968.	ASD (C)	15 Sep 62	(C)
b. Review requirements for headquarters organizations overseas with a view towards reduction of the number (including elimination of any overlapping) and personnel assigned.	Office of Organization & Planning	Oct 1 1962	(C)
c. Develop techniques and procedures for a gold budget.	ASD (C)	1 Aug 62	(U)

320. Memorandum from Dillon to President Kennedy, April 5<sup>1</sup>

April 5, 1963

As Chairman of the Cabinet Committee on Balance of Payments, I am forwarding herewith the Committee's report on its re-examination of the balance of payments problem in response to your memorandum of March 2. As you know, the Committee is expecting to meet with you and discuss this report at 6:00 P.M. on Tuesday, April 9.

Douglas Dillon

MEMORANDUM TO THE PRESIDENT

from the

CABINET COMMITTEE ON BALANCE OF PAYMENTS

INTRODUCTION

The Cabinet Committee on Balance of Payments, assisted by the Long Range International Payments Committee, has concluded after a full re-examination that the United States balance of payments deficit is still a serious threat to national power and security and to international economic order, and will remain so at least through 1963 and 1964. The means are at hand, however, to hold the deficit within manageable size during this period. Thereafter, longer range forces already at work, if reinforced as suggested below, should begin to provide lasting correction. However, because of the uncertainty of the timing and magnitude of the correction, the situation needs to be kept under periodic review to determine the need for and nature of further actions.

A number of possible actions that might be taken to help meet this threat during 1963–64 have been reviewed by the Committee and are discussed in this Memorandum. Some of these promise early results and we have agreed that they should be put into effect as described in Sections II and III. Certain other measures having long-range impact

---

<sup>1</sup> Forwards report by Cabinet Committee on Balance of Payments. Prospects and solutions. Secret. 6 pp. Kennedy Library, President's Office Files, Treasury, Balance of Payments, JFK Reading, 4/17/93, Box 94E.

or requiring further study are discussed in Sections V and VI. Many of them can be initiated now and studies of the others will be pressed forward promptly.

Some other measures are so drastic and costly in terms of other policies that we believe no further consideration should be given to them under present circumstances—these are described in Section VII. There remains an intermediate group of measures, discussed in Section IV, as to which we are not in full agreement, but believe that—unpleasant and unwelcome as they may be—further study of specific proposals is warranted, leading to another review of needs and possibilities in July.

If at any stage during 1963–64 or later the pattern of development we now foresee is disrupted, one or more of these difficult intermediate measures will have to be used. Each would come at a high cost and involves great risks. But we hope that we may be able to avoid measures which could gravely impair or destroy one or more of the major objectives of U.S. policy—a strong defense system for the United States and its allies, a free and effective system of international payments, a free and expanding system of world trade. In the conditions of March–April, 1963, a decision to rely on the measures discussed in Sections II and III and to delay for the present any choice among the intermediate measures, is to take a calculated risk. But against the alternatives, it is a reasonable risk. The other measures can be taken as readily, and with equal or greater effect, if and when the risk might become a reality.

---

### 321. Memorandum from Heller to President Kennedy, April 6<sup>1</sup>

April 6, 1963

#### SUBJECT

Monetary Policy Today—The Uneasy Truce between Domestic and Balance-of-Payments Considerations

The stubbornness of our balance-of-payments deficit—combined with our reluctance to tap IMF or other multilateral monetary sources, or to inhibit foreign capital issues in the U.S.—has heightened interest in tighter money. Undoubtedly, higher U.S. short-term interest rates

---

<sup>1</sup> “Monetary Policy Today.” No classification marking. 4 pp. Kennedy Library, National Security Files, Kaysen Series, Balance of Payments, Cabinet Committee, 7/62–2/63, Box 363.

would hold and attract some funds, to the benefit of the balance of payments. But these effects are not clear-cut, and there would be costs in a diminished flow of funds into domestic long-term investments. This memo considers current developments and the benefits and costs of monetary tightening for balance-of-payments purposes.

#### 1. *Current situation*

Since the Fed's modest credit tightening of last December, the Treasury bill rate has held at around 2.9 percent. Although "free reserves" are still running around \$300 million, the rate on "Federal funds" has been tight against the ceiling of the 3 percent discount rate most of the time since January, an indication of considerable money market tightness. The rates on long-term Government bonds and "municipals" are up slightly, but corporate bonds and home mortgage rates continue at or a bit below their rates of 3 months ago.

A recent freshet of rumors and dope stories—starting with the Lee Cohn article—has confidently predicted higher rates of interest for balance-of-payments reasons. For example, Sylvia Porter's bond letter for March 29 reports: "The scales weighing the relative importance of international considerations against monetary requirements of the domestic economy seem to be tipping without hesitation toward the B-of-P side *which implies higher costs of money. . .*"

Rumor has it that Treasury (and even some say CEA!) is pressuring the Fed for tightening. But this has apparently had only a minor effect so far on investor expectations, possibly because of offsetting references, as in the April 1 Aubrey Lanston letter, to "the rather humorous report by a financial writer that the Treasury and Fed are at odds again, this time with the Treasury supposedly pressuring the Fed to tighten money."

In our Cabinet Committee on the Balance of Payments, it appeared for a time (perhaps erroneously) that the Treasury favored early "probing" in the direction of tighter money. But at last Wednesday's meeting, Secretary Dillon, in Chairman Martin's presence, clarified the Treasury's position:

1. He suggested that no tightening action be considered until a new Canadian Government has a chance to consider our request that Canada reduce its discount rate from 4 to 3 percent.

2. He indicated that, in any case, it does not now seem advisable to move toward tighter money before enactment of the tax program.

#### 2. *The international impact of tighter money*

The basic attraction of tighter money is the expected reduction of net capital outflow. The Treasury and New York Fed staff have estimated that a ½ percent rise in short-term rates would save as much as \$700 million in capital outflow in the next two years. This estimate

found little support from other members of the Balance of Payments Committee, and even the Washington staff of the Fed may not fully support it. We believe it to be a considerable overestimate. Moreover, Secretary Dillon indicated that well over half of the savings could probably be achieved by a change in the Canadian discount rate.

Also, the estimate depends on the proposition that the major continental countries—especially Germany—will *not* follow our lead and raise their own short-term rates. We have some assurances from our OECD Working Party-3 that they would cooperate on this score, but we also know that banking pressures on the Continent are strong for a boost in rates if we tighten money here.

In addition, in light of the U.K.'s relatively weak position, it is important that we not take credit action here that would attract funds from the U.K. money market.

### 3. *Domestic impact of tight money*

If balance-of-payments difficulties *do* drive us to tighter money, it would become extremely important for the Fed and the Treasury to make every possible effort to insulate our longer-term rates from the impact of higher short-term rates. After abandoning "bills preferably" early in 1961, the Fed engaged in fairly vigorous and successful twist operations, i.e., buying long-term bonds and selling short-terms. The Fed has continued to purchase some longer-terms in 1962 and even in 1963, but the amounts have been relatively small. It is true that long rates have stayed down, and that the Treasury has been able to lengthen average maturities without serious untoward effects. But if credit is tightened further, more vigorous Fed "twist" operations would be desirable—and the Treasury might have to slow down its maturity lengthening moves—to hold long-term rates close to the present levels.

Our staff calculates—tentatively, to be sure, but not without some foundation in economic experience—that an added  $\frac{1}{2}$  percent rise in the short-term rate (from roughly 3 to  $3\frac{1}{2}$  percent) might lead to a  $\frac{1}{4}$  percent rise in long-term rates, on the average. Though the effects are not easy to trace and measurement is necessarily subject to large margins of error, the restrictive effect of a  $\frac{1}{4}$  percent increase on housing, plant and equipment investment, and State-local capital outlays could easily cut GNP by \$4–\$5 billion. This may seem small, but if it were to occur now, it would in time add 0.2 to 0.3 percent to the unemployment rate (and it would add to the ire of Patman, Douglas, Reuss, Premier, and Russell Long).

### 4. *Conclusion*

Monetary tightening cannot be excluded from consideration as part of a carefully structured package to protect our balance-of-payments

flanks. But we urge that its limitations and costs be carefully weighed against its benefits. We urge further that it be saved for use in 1964—and then only if the domestic economy is healthy enough and the balance of payments sickly enough to justify it. If Congress backs you up in a truly expansionary fiscal policy, with favorable affects on output and employment, we can realize higher rates on both equity and borrowed capital as a natural consequence of economic expansion—*that's* the best way to have higher interest rates help the balance of payments.

Walter W. Heller

### 322. Telephone Conversation, April 8, between Heller and Ball<sup>1</sup>

April 8, 1963

WH: I got a kick-back from Dillon on this memo of ours. I told him, by the way, that you, I thought, were signing onto it too but that I wasn't committing you. He says it is terrible for two reasons. One, these things were not brought up Friday in the Executive Committee meeting, and that is just his staff lying to him. They had a pitch-battle at the meeting in which every one of these points that's in the supplementary statement was brought up. I didn't say they were lying, but I said that Gardiner tells me that these points were fought over and made strongly in the meeting Friday. Secondly, he thought it would be terrible to have two separate memos go to the President. I said of course we addressed it to him and not to the President, and he said he wanted to open up the report and adjust the report for these points and not have a separate statement go to the President.

GB: Well, if he wants to do that, let's do it.

WH: That's what I thought, so the procedure will be that his boys are going to suggest language to amend the report to put these points in, and then they will phone these to Gardiner. I suggested Gardiner could then convene the little group that's involved, and Dillon said he didn't think he needed to convene any group—that if I and he agree the others would accept, he was sure. I said “Well, you make us sound

---

<sup>1</sup> State views on a Treasury meeting and report (no subject mentioned). No classification marking. 3 pp. Kennedy Library, Ball Papers, Ball Telephone Conversations, Balance of Payments, 1963, Box 1.

like the ring-leaders. I can assure you this was a group movement. There was as much initiative on this from others as there was from us."

GB: That's right.

WH: I know that. And I said "for that matter (that's where I brought you in) the State Department wasn't in this, and it looks as if they want to sign on." That was why I was initially calling you, to find out whether you wanted to associate yourself with this.

GB: I do, very definitely. We are in a position, it seems to me, where we never had a meeting on the final version of the report at all.

WH: Yes, and had I really reminded myself at the time of how devious Douglas can be about these matters, I would have pressed our points more, but I thought that our alternative draft spoke for us, so I was just trying to conserve the time of the group. But I raised enough points without wanting to . . . . but I guess sometimes one should be a little more of an SOB about these things.

GB: I am learning that. One thing which occurred to me is we really did omit any serious reference to long-range revision of the payments system, didn't we?

WH: Well, it got in. We didn't put it in our supplementary statement, but at least it got in in pretty decent form into the basic report.

GB: I guess that's right.

WH: I raised that question too before I signed the supplementary statement. It's not too bad. Of course you know one other thing on which we get the hip from Treasury is that the British team is here right now meeting with Roosa, and we are invited to come in and present the picture on the domestic economy tomorrow morning, but in spite of the fact that I talked explicitly to Roosa about representation at all these meetings, nothing came through except this invitation to meet tomorrow morning. It's true it's not the top team, but even so those are supposed to be . . . originally we were supposed to be equal partners; then we let the Treasury serve as host; now they just have us there by suffrance. Were you planning to go over tomorrow morning?

GB: I haven't even heard anything about it. It may be down the line.

WH: A notice went out from Whidman inviting us to come over. In any event this is the same old story. I agree with you on the long-range thing. I just don't think we should . . . in effect, you see, it was your findings in Europe that chalked that off.

GB: That's right. But I want to make clear that that is a temporary thing.

WH: Yes. The wording of the report isn't too bad.

GB: No, it was all right.

WH: Of course Doug was saying these various things should be emphasized at the meeting with the President tomorrow, and indeed

they should. The way this thing is going now I'll make it clear when I have the opportunity that you are associating yourself with us on these things.

GB: Yes, that's right.

WH: And, Gardiner is now reviewing the document to make sure as to what changes he feels would be necessary to eliminate a supplementary statement; and then he will see whether the Treasury suggestions measure up to that.

GB: Good.

## 323. Memorandum from Klein to Bundy, May 10<sup>1</sup>

May 10, 1963

### SUBJECT

Redeployment of U.S. Forces in Europe

Last Saturday the Department of State was asked by Defense to concur in a proposed reduction of USAREUR strength—a move scheduled to take place in July, August and September of this year—by 15,600 spaces. Unlike the last withdrawal from Europe, this one would affect combat strength.

Defense's rationale is that these units were put in Europe "on a temporary basis" during the 1961 Berlin emergency and are not part of "our NATO commitment"; the action is "acceptable from the viewpoint of our combat posture both in Europe and worldwide"; and the net result would be a significant gold flow savings, estimated at \$4.7 million!

Three days earlier Defense proposed the reorganization of the Berlin garrison—a reorganization which would result in the reduction of our forces in that city by 700 men.

These separate actions may not be part of a single plan. (The Berlin exercise could be a separate and distinct operation.) But the fact is, the several major projects in train are closely interrelated in that the net effect could be a major redeployment and/or withdrawal of our forces from Europe.

There is a balance of payments exercise, in the context of which the Secretary of Defense has undertaken to produce substantial dollar savings. There is also an Army reorganization exercise to modernize and strengthen the forces. This, of course, ultimately has to affect Berlin. However, the situation there has some special aspects in that the Army, for sometime now, has been looking for ways and means to withdraw the Augmentation Battle Group put there in August 1961. It is not that these troops are less usefully employed in Berlin than they would be in West Germany or the United States. But the Army finds the Berlin arrangements administratively untidy, and is reluctant to have 1,500 men added to the sizeable force already bottled up in the exclave.

---

<sup>1</sup> "Redeployment of U.S. Forces in Europe." Secret. 2 pp. Kennedy Library, National Security Files, Subjects Series, Balance of Payments and Gold, 6/62-9/63, Box 292.

Over and above all this, there is the Palm Beach exercise with its focus on conventional force contributions—which has as its basic premise the proposition that unless the Europeans contribute in a more meaningful way to NATO’s conventional strength, the United States will reexamine its own commitments with a view to reducing its conventional force contribution.

As I understand the situation, the Secretary of State was asked to produce a political judgment in the context of the balance of payments exercise. One fact that stands out, however, is that certain projects are already under way in Defense in advance of any discussions with the Secretary of State. And to avoid some of the obvious pitfalls of this kind of an arrangement, I would urge strongly an early meeting of the two Secretaries with the President to discuss the issues in their broadest context, and to do so before too much fat is in the fire.

We have succeeded in putting a hold on the Berlin operation, with Defense now looking to some action in early September.

The Department still has under consideration the proposed 15,000 man withdrawal from USAREUR.

But the major problems are still ahead of us and some hard discussions are needed in which the Department should be given the opportunity to make its position known. For even if the judgment is made that financial and military considerations are over-riding, the Department of State should have the opportunity to come up with ideas on timing and the political context in which the military moves might be made.

To state it quite crudely, this is what we seem to be about at this juncture. We are calling for the creation of the MLF, with the proviso that the contributions to the conventional forces will *not be reduced*. But then we go on to say, *either* you put more into the conventional pot, and support our strategy, *or* we’ll pull back and support your strategy. And then before the Europeans can respond, we go on to the *or* of the *either-or* condition, and come out looking like good Gaullists.

In short, there are very significant political problems here which must be raised and considered; it is better to look at them now rather than later, when it will be considerably more difficult to pick up the political pieces.

David Klein

## SUBJECT

Military Cut-Backs and Balance of Payments

In the course of our work we have become aware of the plans to effect a substantial gold saving via troop withdrawals, pursuant to the Cabinet Committee meeting of April 18.

We are conscious, of course, of the extraordinary effort and staff work which has gone into the balance of payments problem. And I do not intend now to add to that vast literature.

I would, however, make one simple point. Thus far our negotiations on this matter have been with Central bankers. Having come to what the Treasury believes is the limit of such negotiations, we now contemplate unilateral actions which will have profound effects not only on our international position but on the position of the prime ministers and foreign ministers of governments allied to us. Only actions of this order of magnitude are likely to effect a net dollar paying of \$400 million.

I believe we owe it to our allies (as well as to ourselves) to explore all alternative routes for easing our balance of payments situation before deciding that troop withdrawals are the only means open to us.

I find it hard to believe that, if they are made to perceive the hard choices we must face, they would not cooperate in measures to ease our position or to buy time for our balance of payments position to right itself.

But I am sure we owe it to them to be placed before a responsible political choice, so that, at the worst, if the cuts take place they are part of an alliance scenario not a unilateral U.S. action.

A final word as an economist: history will judge us very queer folk indeed if, at a moment when troop withdrawals on the scale contemplated would hearten our adversaries and shake our basic alliance arrangements, we were unwilling to contemplate other cushioning measures and proceeded with such feckless propositions as Chrysler's purchase of Simon for \$400 million.

---

May 18, 1963

## SUBJECT

Troop Withdrawals from Europe

I should like to reinforce the memorandum from U. Alexis Johnson to you of May 17, with four points.

1. A withdrawal of the United States from Europe or a situation in which the Europeans believed that we were in a progressive process of withdrawal could lead not merely to the emergence of a nationalist Europe, with an independent nuclear force (or forces) but also to a fragmentation of NATO and a rise of neutralist sentiment in certain quarters, which, in turn, would give Moscow good grounds for hoping to expand its influence by a mixture of political and military means, notably in Turkey, Greece, Italy, and Scandinavia. The expectation of United States withdrawal would thus raise the possibility of two dangers to the United States interest which might, in fact, emerge simultaneously.

2. With respect to Berlin, this process would carry two dangers: it would tempt Moscow to initiate pressure on Berlin, perhaps military pressure; and it would leave us in a position of dealing with such a Berlin crisis with a thinner range of alternatives to nuclear engagement than we now enjoy. Specifically, our capacity to signal the seriousness of our intent to defend Berlin by actions short of nuclear engagement would be reduced, with grave consequences for the determination of our allies to defend Berlin.

3. The Berlin case illustrates a general proposition; namely, that in a nuclear age a detachment of the United States from European affairs is even more dangerous than it proved to be in 1914–17 and 1939–41. I have no doubt that our response to a potential loss of the balance of power in Europe would be as vigorous as it was on these other occasions; but, in the shadow of a progressive process of troop withdrawals, and having encouraged Moscow to take increased risks, we would be coming back to redress a threat to the balance of power in the shadow of a nuclear war with all that it implies. The case for our maintaining a steady deterrent presence and a steady involvement in the political, as well as military, affairs of Europe over the foreseeable future is, therefore, very strong.

---

<sup>1</sup> "Troop Withdrawals from Europe." Secret. 2 pp. Kennedy Library, National Security Files, Subjects Series, Balance of Payments and Gold, 6/62–9/63, Box 292.

4. With respect to the balance of payments, our problem is not merely "marginal and transitory"; but there are possibilities for its management alternative to military and political disengagement from Europe and Asia which justify intensified examination, given the consequences likely to flow from the expectations in Moscow and Europe that we had launched a process of progressive troop withdrawals, and from the fact of reduced conventional strength itself.

**326. Memorandum from Kaysen to Bundy, May 20<sup>1</sup>**

May 20, 1963

SUBJECT

Status Report on the DOD and the Balance of Payments

1. Attached at Tabs 1 and 2 are two tables showing the proposals now being discussed within the DOD to achieve Secretary McNamara's target of reducing the annual rate of DOD expenditures on foreign account by \$300-\$400 million. Table I presents the information by country, to the extent possible. It is based on Table II, which lists in detail the actions now under consideration in the DOD. The Comptroller has asked the services to examine these actions and he is discussing them with the Secretary of Defense.

2. As Table I shows, if all the actions listed were taken, the resulting saving would be \$400 million in FY 64 and the annual rate of saving would rise to almost \$500 million in FY 65. Of these savings, \$300 million in FY 64 and nearly \$400 million in FY 65 would be achieved through reduction of forces overseas, of which \$185 million and \$250 million, respectively, would be made in NATO. The other \$100 million would come from changes in procurement actions. The whole list of proposals would result in the withdrawal from overseas stations of 137,000 military personnel and 145,000 dependents and civilian personnel; 72,000 military personnel, and 111,000 civilian personnel and dependents from NATO countries.

3. Paul Nitze, in a memorandum to the Secretary of Defense dated April 18, 1963, transmits to him the comments of GPM in State as

---

<sup>1</sup> Status report on DOD's proposals to reduce expenditures on foreign accounts. Secret. 6 pp. Kennedy Library, National Security Files, Subjects Series, Balance of Payments and Gold, 4/63-7/63, Box 291.

shown in the attached memorandum from Jeffrey Kitchen to Bill Bundy dated April 12 (Tab 3). Nitze's memorandum, a copy of which is not now available to me, repeats the Kitchen comments, although somewhat more selectively. The reductions in MAP (B 2, Table I; Item 7, Table II) are described by Nitze as simply impossible. The reductions in overseas petroleum procurement (B 2, Table I; Item 10, Table II) are characterized in virtually the same way. The cancellation of further Caribou procurement is described as creating great political difficulty and of dubious value in making real savings. (This second judgment is probably not correct.)

Nitze's strongest condemnations, however, are reserved for the proposals to reduce Far Eastern forces (Item A 3, Table I) and to reduce our commitments in Germany (A 1, Table I). The reductions in forces in the Far East would make it necessary for us to commit ourselves in advance to an immediate nuclear response in the event of any serious threat in Korea and probably elsewhere in the Far East. Further, it would reverse the progress we have made in bringing Japan to face up to its defense problems, as well as having serious adverse consequences in NATO. We could not make it clear, especially to the Germans, why we are willing to make an immediate nuclear response in the Far East and not in Europe, even though there is a militarily plausible argument for differentiating the two situations. This argument, of course, is that the Soviets do, and the Chinese do not, have nuclear weapons themselves. However, before accepting this argument, it is necessary to ask whether our use of nuclear weapons against China or Chinese forces would invite a Soviet response.

In Nitze's view, the reductions of NATO forces would have equally or more undesirable effects. The most serious effects would arise from redeployments in Germany, the least serious from redeployments in the UK.

4. At Tab 4 is a memorandum from the Director of the Joint Staff commenting on a CINCEUR message discussing possible redeployments of NATO forces. Item b. in the memo corresponds to Item 2 b. in Table II; Item C 1, in the memo corresponds to Item 3 in Table II, but involves a somewhat lesser force reduction.

5. There is also a separate discussion of reducing the Berlin augmentation underway, independently of the balance of payments problem. As presently conceived it will result in the reduction of the present Berlin garrison by some 700 men, the difference between a battle group and a battalion. The change will arise from the Army-wide reorganization of divisions during June and July of 1963. The two battle groups in the regular Berlin brigade will disappear, to be substituted for by three battalions with the same number of men. However, the augmentation force of one battle group will be reduced to one battalion. The

addition of another battalion to this force would lead to the increase of a few dozens in present Berlin strength, instead of the reduction of 700 now planned. This should be possible, if it is considered desirable.

6. Secretary McNamara discussed the problem of troop withdrawals in NATO with the Secretary of State on Friday. As reported (by George Ball) Rusk was firm in his unwillingness to accept any major force reductions in Europe.

Further discussions (on Saturday) between McNamara and Hitch suggest that McNamara himself is withdrawing somewhat from the notion of troop cuts of the magnitude proposed in Table I. It is not clear what change in these quantities he now contemplates. However, to achieve his savings targets, McNamara apparently is now considering much deeper cuts in dependents or the total elimination of dependents from nearly all overseas activities. It is Hitch's judgment that the services would consider this entirely unacceptable. Further, the political consequences of this move would be impossible for the Secretary to face. From the point of view of both Army and Air Force, the elimination of dependents for troops in Europe would be a mortal blow to recruiting and would be viewed as the last unbearable step in the subordination of military to civilian needs, with predictable consequences in Congressional outrage.

7. A cursory glance at Table I, suggests that the most bearable items—reductions in France, the UK, Spain and Morocco, plus some reductions in overseas procurement—might save \$100 million to \$150 million without too much political pain. To go further would clearly pose political problems of the first order of difficulty. The discouraging results of this examination suggest that it is necessary to look again at the financial side of the picture.

8. In his memorandum to the Cabinet Committee on April 20, the President accepted the Committee's Report and Recommendations of April 8, after discussions on 9 and 18 April. Defense was directed to produce a program with a goal of reducing gross claims against foreign exchange by some \$300 to \$400 million below the FY 63 level. Only some \$100 million of this appears to be achievable at small political cost. This leaves a "gap" of about \$200 million in terms of the financial plan recommended by the Cabinet Committee (see Table IV of the Cabinet Committee Report reproduced at Tab 5). [This figure reflects the fact that the programmed savings could not be achieved all at once in any event.] Secretary Dillon made it perfectly clear in the course of the two discussions with the President that estimates of what can be financed by various methods are necessarily rough, and that the figures presented are conservative. The present plan relies on five methods of financing (see Table II of the Cabinet Committee Report reproduced at Tab 6): pre-payment of debt; borrowings denominated in foreign

currency; increased holdings of dollars by foreign central banks and private holders under exchange-value guarantees provided by swaps and forward operations (covered dollars); increased holdings of dollars without exchange value guarantees (uncovered dollars); and gold sales.

In the course of the 18 April discussion, Secretary Dillon gave his judgment that the financing figures shown were not maxima. It would appear possible to increase special borrowings and dollar holdings under forward cover, and to sell somewhat more gold, in such a way as to provide enough extra over the two-year period to eliminate the need for a drastic reduction in Defense expenditures.

It is clear that this policy would expose us to a somewhat greater financial risk, essentially the possibility that present holders of outstanding claims against the dollar (which are larger than our total gold stock) would seek to convert them into gold; this, in turn, would stimulate an outflow of U.S. liquid assets abroad and finally force us to devaluation. We have, however, two well prepared lines of defense should this threat begin to materialize: the regular resources of the IMF, and the special additional resources provided by the Paris Agreement. It was the clear and unanimous opinion of the Cabinet Committee that these resources, plus what other central banks would feel constrained to do in their own interests, are more than adequate to defend us against the dangers of a run.

If we were forced to draw heavily on these resources in the situation of an imminent run, we would have to undergo a critical review of our economic and financial situation at the hands of the Fund, and the Finance Ministers of the Paris Club. It is likely that this review would lead to a request that we tighten domestic credit by raising interest rates. Depending on just when such an event were to occur, its effect on the level of domestic economic activity might be adverse. But even if we resisted the demand for tighter money, we would get the resources we needed. Neither the Directors of the Fund nor the Finance Ministers Vienna Club would have any real alternative to giving us the help we request. Otherwise, they would be destroying the present international payments system and the Fund itself. Nonetheless, there might well be some domestic support for this demand, which would welcome the occasion for pressing it, and we might find that this was the price we did pay, whether or not we had to.

A more modest use of IMF resources would be available on essentially automatic basis whenever the Treasury decided it was useful to ask for it.

The problem, therefore, is to balance the political risks inherent in the suggested reductions of overseas military deployments and the financial risks inherent in the attempt to push our present financial measures somewhat further. Three considerations are relevant to strik-

ing an appropriate balance. First, the military redeployments have a once-and-for-all character. Once they are decided upon and we begin to execute them, the political bill falls due immediately. Second, we have in the past been more successful in extending our financing techniques than Messrs. Dillon and Roosa had anticipated. Their responsibilities have necessarily made them cautious. They remain so, and it is natural for them to emphasize their inability to guarantee success in arranging a predetermined volume of finance. Third, such independent examination of European financial opinion as is possible suggests that there is a widespread confidence in Europe that our balance of payments situation will improve over the next several years. The combination of this expectation, the availability of the IMF as a further resource, and the disagreeable consequences of any alternative course of action can be counted on to lead the Europeans to continue to provide such financing as we need.

The Europeans, in turn, may well be led to press for a more rapid evolution of the international payments mechanism than we have hitherto contemplated. This is in itself not undesirable. We have already gone much further in the evolution of the institutional arrangements under which the world payment system operates than anyone would have predicted in January 1961. In fact, given the situation of the pound, and the expectation on the part of some of the Common Market countries of balance of payments deficits of their own in the next several years, it can be argued that it is in our interest to stimulate this further, more rapid change. It is clear that the international financial community will be under continuing pressure from the British to do so. If we add our own pressure, we may have more opportunity to control the shape the evolution of the system takes.

9. In sum, an examination of the consequences of possible reductions in overseas expenditures of the Defense Department suggests the wisdom of shifting the burden of adjustment back to the Treasury Department rather than accepting Secretary Dillon's attempt to pass it on to the Departments of State and Defense. There is, however, a risk that, in the event of an unfavorable turn of events—which cannot be ruled out—Secretary Dillon would then press for a more restrictive domestic economic policy on the argument that it was necessary to satisfy our international creditors. Whether it was or not would be arguable; but this is a contingency which we can afford to face if and when it arises.

C. K.

**327. Memorandum from Bullitt to Executive Committee of Cabinet Committee on Balance of Payments, May 29<sup>1</sup>**

May 29, 1963

In his memorandum of April 20, 1963 to the Cabinet Committee, the President indicated that he wished to announce around July 1 the implementation of an action program, together with certain other proposals, to reduce the balance-of-payments deficit, as outlined in the Cabinet Committee's memorandum to him of April 6.

The following agencies have the responsibility for the specific programs indicated:

*1. State.*

- (a) Securities and Exchange Commission requirements concerning information provided by foreign borrowers in the U.S.
- (b) Assessing foreign tax advantages for exports.

*2. Defense.*

Actions to be completed by end CY 1964 with target of gross reduction in annual rate of dollar expenditures abroad between \$300–400 million below FY 1963 level.

*3. Commerce.*

- (a) White House Conference on Export Promotion.
- (b) Tourism—"See America Now" program.
- (c) Coast-wise and ocean shipping, and other noncompetitive freight costs.
- (d) Review of U.S. anti-trust legislation.

*4. Budget.*

- (a) Gold budget—screening and readjustment of expenditures abroad by departments and agencies other than Defense and AID to achieve indicated annual savings of \$50–75 million per year.
- (b) Government-wide uniformity in procurement practices.
- (c) Savings from improved use of P.L. 480 currencies.

*5. AID.*

- (a) Action to further reduce AID expenditures resulting in payments of dollars abroad, with target of keeping such expenditures to \$500 million or less in FY 1965.

---

<sup>1</sup> Assigns Agency responsibility for specific actions to address balance of payments deficit. Confidential. 3 pp. Kennedy Library, Herter Papers, Balance of Payments, Box 6.

*6. Agriculture—Director of Food for Peace.*

(a) Steps to achieve savings of \$35 million per year, in addition to those included within the gold budget review through administration of P.L. 480 programs.

(b) In addition, it is understood Agriculture has under review certain other measures which could substantially benefit the balance of payments. The President will want to include in his announcement as much of the results of this review as possible, and they should be included in Agriculture's submission.

Would you kindly submit to me, by June 7, a report on what has been done to accomplish the actions directed by the President in his memorandum of April 20 so that a report can be prepared for review by the Committee on June 17, prior to transmission to the President.

The Treasury Department is responsible for action on the Committee to Promote Investment in America.

**John C. Bullitt**

June 1963

328. Letter from Rusk to McNamara, June 22<sup>1</sup>

June 22, 1963

Dear Bob:

Our staffs have been in touch regarding recommendations to be forwarded to the President on your proposals for balance of payments savings, as a result of your letter of June 15. We gather your people are now in process of developing these proposals and that they will be made available to us at the earliest possible moment. As soon as we have received and reviewed them, I would propose that we meet to exchange views on any issues or questions which may arise. Presumably, we should shoot for recommendations to the President shortly after his return from Europe, though, of course, how quickly we here can move depends to some extent on how soon we receive your proposals and how far reaching they are.

In connection with the broader issues underlying our troop deployments in Europe and the Stikker exercise, your suggestion for a meeting later in July seems entirely appropriate, though I am not certain that the latter will by then have matured sufficiently to present major problems. I suggest July 11 as a date for such a meeting. I think it would be wise for us to limit our agenda to these two major items so that we can have a review in some depth. My staff will be preparing substantive papers on these subjects which they will coordinate with your people in advance of the meeting. This should give us a common point of departure for our discussions.

With warm regards,  
Sincerely,

Dean Rusk

329. Memorandum from U. Alexis Johnson to Rusk, July 2<sup>1</sup>

July 2, 1963

SUBJECT

Meeting with Mr. McNamara on July 11

During your absence we moved forward with Defense looking toward the July 11 meeting which you proposed to Mr. McNamara (Attachment A).

George Ball lunched with Mr. McNamara and was told that we should be receiving sometime this week the DOD proposals to the President on balance of payments savings. George reports that Mr. McNamara feels that we should not have too much difficulty with these proposals. However, Defense has been very careful not to tip its hand (I think primarily for internal reasons—Service pressures are great), so we have no real advance information as to what the proposals embody. (You recall Mr. McNamara was initially shooting for a \$400 million saving.) Beyond this there is the question of how we proceed with the Stikker exercise and, in this connection, there is some indication that Defense is already thinking in terms of alternatives which might be pursued in the event that the Stikker exercise does not materialize. The NAC will meet on the 17th to discuss the Stikker proposal and we may have a somewhat clearer reading as to how the French and others are likely to come down. Finally, and intimately related to the foregoing, are the broader political and military issues, underlying the force withdrawal question, which we still have to talk out with DOD at some point.

All of the foregoing suggests that it would be useful for a small group of us to meet with you on Monday, July 8, in order to discuss whether, in light of the circumstances described above and, more importantly, in light of the extent to which you have had an opportunity to crystalize your own thoughts growing out of your trip with the President, you would wish to go through with the July 11 meeting or, alternatively, would prefer to put it back to a somewhat later date.

---

<sup>1</sup> Background information for meeting with McNamara on DOD's deficit reduction plans. Secret. 2 pp. Department of State, Central Files, FN 12.

Subject to your approval, I have scheduled a meeting at 5:30 p.m., Monday, July 8.

*Recommendation:* That you meet with us on Monday.

---

### 330. Memorandum from McNamara to Rusk, July 3<sup>1</sup>

July 3, 1963

#### SUBJECT

Balance of Payments

In a memorandum dated April 20, 1963 to the Cabinet Committee on the Balance of Payments, the President requested that I submit recommendations on specific actions which could be completed by the end of 1964 with a target of a gross reduction in the annual rate of Department of Defense expenditures abroad of \$300–400 million below FY 1963 levels.

A draft memorandum to the President in response to his request is attached.

May I have your comments on the course of action recommended in the memorandum.

**Robert S. McNamara**

#### **Attachment**

#### SUBJECT

Reduction in Department of Defense Expenditures Entering the International Balance of Payments

This is in reply to your Memorandum for the Cabinet Committee on Balance of Payments, dated April 20, 1963, which requested, in part, that after consultation with the State Department, I recommend specific actions, capable of completion by the end of Calendar Year 1964, which would achieve a gross reduction in the annual rate of Department of Defense expenditures abroad of between \$300–400 million below the FY 1963 level.

---

<sup>1</sup> Solicits Department of State comments on attached memorandum to the President regarding DOD actions to reduce expenditures abroad. Secret. 10 pp. Department of State, Central Files, FN 12 US.

*Department of Defense Expenditures Overseas*

In the absence of action along the lines recommended and discussed below, Department of Defense expenditures entering the international balance of payments during FY's 1963–66 are estimated as follows:

	(\$ Millions)
FY 1963	\$2,739
FY 1964	2,686
FY 1965	2,700
FY 1966	2,698

These estimates are based on the currently planned deployment of our military forces and the continuation of all current Department of Defense programs designed to reduce expenditures overseas and increase foreign military receipts. They also reflect a moderate increase in price and wage levels overseas anticipated for this time period.

As you know, I have made a concerted effort during the past year to reduce the net adverse balance of Department of Defense transactions entering the international balance of payments. During the period FY 1961–63, the net Department of Defense adverse balance, i.e., gross expenditures overseas less receipts, was reduced by approximately \$850 million—from \$2,334 million to \$1,477 million. This reduction was achieved by holding our expenditures relatively constant despite increased international tension and inflation abroad, and by increasing receipts.

With respect to these greater receipts, Germany and Italy have agreed to offset all or part of our defense expenditures in these countries by increased spending for U.S. military goods and services. Our efforts to increase sales of U.S. military equipment to other allied countries will continue to be pressed. However, we believe that the \$1 billion of annual receipts projected for the period FY 1964–66 are a realistic maximum.

*Guidelines for Developing the Actions Proposed Herein*

Further actions to reduce Department of Defense expenditures overseas as outlined in Attachment A are based on the following:

1. U.S. commitments of effective military forces will continue to be met.
2. A gradually increasing capability of the Armed Forces to deploy rapidly will permit some reduction in other forces permanently in-place overseas.
3. Our increased strategic missile capability will permit, by the middle of CY 1964, somewhat less reliance on overseas based manned bombers.

*Summary of Recommended Actions*

The actions affecting our present deployments in Europe are:

1. The consolidation on four bases and some reduction (from 103 to 80) in our present B-47 Reflex posture by July 1, 1964.
2. The transfer of the responsibility for the air defense of Spain to the Spanish Government by January 1, 1965.
3. The return of the F-102 air defense squadron from Iceland by July 1, 1964.
4. The use of increased MATS capabilities to permit the return of 32 C-130 aircraft from France by April 1, 1964.
5. A reduction in the Army Line of Communications (LOC) in Europe predicated on some reductions in theater reserve stocks, relocation of issue stocks and placing in standby status certain facilities in Western France.

In the Pacific, the more important redeployment actions recommended are:

1. The elimination of the obsolescent B-57 wing in Japan 6 months earlier than programmed (i.e., July 1, 1964). The 12th Tactical Fighter Wing (F-4C aircraft) now programmed to deploy to Japan upon the phase out of the B-57 wing would be retained in the U.S. to increase our capability to respond to contingencies elsewhere in the world.
2. The return to the U.S. of 16 C-124 transports from Japan and 16 C-130 transports from Okinawa by October 1, 1964, using our increased airlift capabilities to meet much of the Pacific logistics requirements, reduced by the redeployments.
3. The return to the U.S. from Japan of the 66 F-102 aircraft (20 of which are presently programmed to be removed by July 1, 1964) and the transfer of the responsibility for the air defense of Japan to the Japanese Government by approximately January 1, 1966, utilizing the increased capabilities of the Japanese Air Self Defense Force, and the increased capabilities of the USAF to rapidly deploy F-4C aircraft to Japan during the periods of tension or at the outset of hostilities for air defense missions.

In addition, I recommend a series of actions which would produce foreign exchange savings in such areas as contractual services, POL procurement and construction. We also anticipate that savings will be achieved through better personnel management. All of these actions are discussed in greater detail in Attachment A.

*Effect of Recommended Actions*

My recommended actions would achieve in CY 1965 and FY 1966 a reduction in overseas expenditures of approximately \$300 million below the FY 1963 level as follows:

(\$ Millions)		
	<u>Current Estimate</u>	<u>Revised Estimate Under Proposed Actions*</u>
FY 1963	\$2,739	\$2,739
FY 1964	2,686	2,671
FY 1965	2,700	2,506
FY 1966	2,698	2,434

\* Attachment B provides a detailed analysis of U.S. defense expenditures overseas.

Although the redeployments of Air Force units reduces our forward deployed forces, they would have a desirable effect on our capabilities to respond to contingencies anywhere in the world. A smaller portion of our forces would be engaged in substituting for allied self-defense forces, more would be available for concentrated use as conditions may dictate, and a smaller number would be deployed on the more vulnerable forward bases.

Nevertheless, the actions relating to Japan go beyond the specific recommendation contained in Mr. Gilpatric's memorandum to you of February 8, 1963 relating to U.S./Japanese Defense Relationships. They involve a considerable withdrawal of aircraft from Japan. However, they are militarily desirable, apart from gold flow considerations, in the sense that they increase our reaction capability elsewhere. In addition, they emphasize for the Japanese our belief that Japan must depend more on its own self-defense capabilities in the future. In this connection I have been disappointed by the current level of Japan's defense expenditures.

I believe the minor adjustments of Army strength in Europe are desirable, gold flow considerations notwithstanding, in the interests of better organization and management of our resources. This applies particularly to the reorganization and streamlining of the Army Line of Communications (LOC) in France. However, the Joint Chiefs of Staff state:

"The reduction in the Army LOC in Europe could have an adverse impact on the Army combat capability. Three areas of principal concern are the ability of the Army to respond quickly to an emergency in Europe after the cuts are made, the concentration of stocks in the forward area, and the extremely important politico-military implications of placing a part of the LOC in Western France on standby and reducing war reserve levels to 90 days. I believe this adverse impact can be minimized by cooperative logistics agreements in the form of joint depot utilization in Western France, by maintaining a capability in CONUS and Europe for rapid expansion in an emergency and by insuring that adequate airlift and sealift are available for a rapid reconstitution of the LOC."

The possible termination of the Caribou program in Canada has been under review for some time. The FY 1963 procurement was under-

taken in part to retain the option of using that aircraft if no more desirable alternative developed in the future while at the same time permitting some continued improvement in Army capability. Continuing study of this matter has led to the conclusion that the 157 Caribou on hand and on order as of June 30, 1963 will be adequate to meet our requirements in view of the availability of C-130E's.

During your meeting with Prime Minister Pearson on 10–11 May 1963, you indicated that we were then reviewing our requirement for the Caribou. You will, of course, remember that we are committed to consult with the Canadian Government before any termination notice is announced. When I met on June 6 with Mr. Drury, the Canadian Minister of Defense Production, I told him that Caribou would have to compete on its own merits against other alternative solutions to the Army's air transport problem. Thus, termination of Caribou procurement will not surprise the Canadian Government even though it will undoubtedly be disappointing.

I have consulted with the Joint Chiefs of Staff with regard to the military acceptability of the foregoing measures. While recognizing the compelling economic issues inherent in the current balance of payments problem, they point out that "most of the measures designed to control gold outflow work against the military desideratum of maintaining a forward strategic posture based upon the deployment of substantial military forces in sensitive strategic areas overseas. The actions recommended in this memorandum which entail bringing home Air Force Units will, in varying degrees, increase the reaction time of our military response, particularly in the areas of the Western Pacific. The proposed reduction in the B-47 forces overseas [a reduction of 23 aircraft for a period of a few months] will occasion a readjustment of strategic nuclear targeting and, for a limited time, will reduce the weight of our nuclear attack. Also, the Joint Chiefs of Staff have expressed concern over the effect on base rights in Iceland, Spain, and Japan of a reduction of U.S. garrisons there unless such reductions are preceded by careful bilateral negotiations. However, if the contribution of these actions to the solution of the balance of payments problem is considered to outweigh the military risk involved, then the Joint Chiefs of Staff accept the proposals."

#### *Consideration of Additional Actions*

In arriving at these recommendations I have considered a number of other alternatives. These actions included possible redeployments of additional U.S. forces now in Europe and the Pacific, changes in dependents policies, early termination of the SAC Reflex posture in Europe, and a further reduction in overseas POL procurement. In the course of preliminary discussions, the Department of State expressed

concern over the possible adverse political and economic repercussions of substantial redeployments or a significant curtailment of POL procurement overseas.

To cite one example of these political constraints, we estimated earlier this year that approximately \$20 million of our FY 1964 requirement for aviation gasoline normally procured in the Caribbean area could have been returned to the U.S. by restricting bids to U.S. sources. The added cost of this action would have been only \$322,000. When weighed against the fact that other procurements for use overseas are being returned to the U.S. at premium differentials up to 50%, this proposal was very attractive from the budgetary standpoint, and was militarily sound. However, in view of the State Department objections, the procurement of the first half of our FY 1964 requirement was not restricted to U.S. sources.

In addition to the actions recommended herein, I am investigating the following areas which may result in additional savings over those now projected:

1. A review of personnel requirements for DOD communications activities overseas. My preliminary review indicates that some reductions in this area may be desirable.

2. A review of overseas headquarters with a view to streamlining and/or consolidating them.

3. A joint review with the State Department of our over-all force posture in Korea.

4. A review of the Air Force tactical maintenance concept with a view to establishing such maintenance in rearward areas, thus increasing our capabilities for non-nuclear conflict while reducing overseas costs.

5. A review of the possible redeployment of the 1st Marine Aircraft Wing from Japan to Okinawa and a review of the redeployment of the F-105 TFW from Kadena, Okinawa, to Guam.

6. A review of certain of our forces committed to NATO and deployed overseas, keeping in mind the possibility of redeploying some forces to the United States and in turn demonstrating frequently our ability to deploy to Europe in support of NATO commitments.

#### *Other Possible Savings*

I believe that savings of any substantial magnitude over those herein recommended or being reviewed could be accomplished at this time only through: (1) substantial redeployments to the U.S. or other dollar areas, and/or (2) significant reductions in the dependents authorized overseas.

*Recommendation*

I recommend your approval of the actions proposed in Attachment A.

I have discussed these actions with Secretary Rusk and he concurs in recommending approval. Secretary Rusk also stresses the necessity for a carefully coordinated information and consultation procedure to ensure that:

1. These actions will not be interpreted as a U.S. withdrawal of commitment to maintain the integrity and freedom of the Free World.

2. The specific countries involved in the proposed redeployments understand our reasons and are assisted in making any necessary adjustments in their own defense posture.

I suggest that a reaffirmation along these lines be included in the statement which you plan to make in July relating to the balance of payments problem.

---

**331. Memorandum from Meyers to Kitchen, July 8<sup>1</sup>**

July 8, 1963

**SUBJECT**

Balance of Payments: McNamara's Memorandum of July 3 to the Secretary

Following are some initial comments on the items pertinent to the general Balance of Payments considerations:

1. *Item 1A(2)(b): Iceland:*

I understand that the F-102 Squadron is a NATO-committed unit (to SACLAN). While the U.S. presumably can always withdraw a unit committed to NATO, this raises in addition the political problem of Icelandic attitudes towards the removal of air defense capabilities which protect them.

2. *Item 1A(3)(b) and (c): Spain:*

I think that, in replying to these proposals, we should note that these two items are obviously intimately related to our negotiations

---

<sup>1</sup> Item-by-item review of McNamara's proposals outlined in his July 3 memorandum to Rusk. Secret. 3 pp. Department of State, Central Files, FN 12 US.

with Spain with regard to renewal of base rights. It is quite possible that the Spaniards may insist that the U.S. provide air defense protection. If the U.S. retains interceptor aircraft in Spain, presumably the U.S. would also wish to operate the AC & W network. Moreover, it is pertinent to note that Henry Kuss, in his schedule for programmed military sales for FY 64, has included \$175 million in potential sales to Spain, funded from Eximbank, of which a good part would be fighter aircraft, presumably the same F-102s that the McNamara paper proposes considering offering to Spain in return for base rights.

3. *Item 1B(1)(d): Japan:*

Is it realistic to assume that we can transfer air defense to Japan, including the AC & W network, within the time scale assumed here?

4. *Item 2(a): Army LOC in Europe:*

This proposal assumes that we can close down LOC facilities in France, west of a line running north and south through Orleans, and induce the French to maintain these facilities on a standby basis. Thus, the successful implementation of the proposal requires French consent at a minimum. Moreover, we are presently engaged in trying to reach agreement with Germany on a joint combat logistics support system. Would the maintenance of these facilities in France be pertinent to achieving agreement with the Germans?

5. *Item 5: CARIBOU Cancellation:*

Mr. McNamara's proposed memorandum to the President explains that the Canadians are on notice that CARIBOU must compete on its merits against alternative solutions to the Army's air transport problem. However, since CARIBOU is the main item in the U.S.-Canadian co-production effort, the political aspects of this cancellation will have to be handled with some delicacy. I do not think we should protest the cancellation, particularly after General Williams' remarks to you today, but ought to note the political and economic sensitivities involved.

6. *Item 8: POL Procurement:*

As phrased, and in the light of Mr. McNamara's comment on pages 7 and 8 of the covering memorandum, this item seems to say DOD will not take steps to return Caribbean oil procurement to the U.S. However, it is so vague in its terminology that we should at least obtain a more, definitive explanation of what is contemplated.

7. *Item 10: Reorganized Army Depot Maintenance in Japan:*

This, also, is so vague that some more explanation should be obtained.

*8. Item 11: Maximum Use of Lower-Ranking Personnel:*

This sounds good, but is it practical? For example, how does one reorganize Army divisions or combat aircraft squadrons in such ways that they have more first-term personnel and junior grade officers than higher-ranking personnel, without substantially adversely affecting their combat efficiency?

*9. Item 12: Revised Construction Procedures:*

While we should not object to this in principle, I think it advisable to express our usual caveat that this may be restricted in application by the terms of the agreements with foreign governments on employment of local personnel and use of local material. In fact, this has proved to be the case in many instances in the actions taken under Project Eight.

---

**332. Telephone Conversation between Kaysen and Ball, July 9<sup>1</sup>**

July 9, 1963

CK: Chris would like to have a meeting with the President before he goes off. I was sure you and Mike should be there, but Mike thinks the center of our problem will be agriculture. What do you think, should Orville be along?

GB: It would be a good idea to have Orville there.

CK: OK, I'll so arrange it and let you know.

GB: By the way, how much do you know about the plans for the balance of payments announcement next week?

CK: I know this: That the President told Walter that he's going to hold off until two weeks. He's not going to make the announcement next week. That was yesterday. Whether anybody's told Doug this, I don't know.

GB: No, I was just over talking to Doug. Let me just say something to you which don't attribute to me or anything. One thing I think we should never do is to make a big announcement about this troop redeployment thing in the context of a balance of payment statement.

---

<sup>1</sup> Proposed Presidential announcement on balance of payments. No classification marking. 3 pp. Kennedy Library, Ball Papers, Ball Telephone Conversations, Balance of Payments, 1963, Box 1.

Particularly, we can't do it at a moment it's schedule now when Averell is in the Kremlin.

CK: This is mad. You mean this is all in Doug's statement?

GB: Yes, I'm sure.

CK: This is absolute madness.

GB: If we want to follow a program of moving troops around, it should be done fairly quietly and certainly with no reference to balance of payments. This is ridiculous.

CK: Yes. Didn't you say to Doug in the flatest terms that this couldn't be done.

GB: I didn't, no. He just threw this thing in at the last minute and I didn't comment.

CK: I would suggest you say to Doug you want the statement for comment. You understand the President is going to wait on it and it seems to me this is the kind of thing which Dean would simply write a little note, saying it's impossible.

GB: Yes. I think we have to hit this one head-on. The problem we're in, you see, is that the deal that's been made between Dillon and McNamara, I am sure, is that Bob says he can't get any of these things done unless he tells them under Presidential mandate to do it for balance of payments reason. Therefore, he wants it announced as a part of the balance of payments program. Dillon is telling me now unless we put this in the Hill is going to make us do it. This is utter garbage. All this would do is add cumulus to get the boys home. I think we get out a balance of payments statement which has some very good things in it. He certainly has come a long way along the route you and I would like.

CK: I'd like to see it.

GB: Well, let him tell you about it.

CK: Sure.

GB: But this troop thing has got to be out of there.

CK: Right.

GB: Otherwise, we're going to be negotiating from weakness and we're going to demoralize the Alliance.

CK: This is perfectly clear it's mad.

GB: Now, the question is how are we going to mobilize Harriman when he can be useful. I don't want to get him into this act yet.

CK: No. You see the real thing is, I think, you have to nail this standstill down. The President and Walter talked about it and I was there yesterday. Walter urged that he make no statement for two more weeks; that he hold it up so that he can get into the discussion; he's going to Paris and what's the hurry? I think Walter's perfectly right.

I think you can always get a procedural handle, so why don't you start out this way?

GB: I think maybe what I should do is to give Doug a little memorandum of my second thoughts on this thing. And just make the record that we're not taking this one lying down.

CK: Right. And I think you ought to say you understand that there has been this holdup. You see the President might not be able to hold Doug to it if Doug doesn't raise the issue. But if Doug raises the issue, it will come back to him.

GB: I'd just as soon not say I know about the holdup.

CK: You don't think so?

GB: No. Just say to Doug this is my feelings.

CK: Maybe I ought to call Doug about the holdup.

GB: All right. But don't indicate that you know anything about . . . that I talked to you.

CK: OK.

---

### 333. Letter from Ball to Dillon, July 9<sup>1</sup>

July 9, 1963

Dear Doug:

Since our conversation this morning, I have given further reflection to the balance-of-payments program that would be included in the President's press statement. As I told you, I think most of the program is excellent provided that, as you suggested, the action of the Federal Reserve in increasing short-term rates can be done in such a manner as to avoid deflationary consequences.

I mentioned to you, however, that I was troubled by the inclusion of a statement regarding military redeployment in the President's statement. Further reflection has only served to intensify my concern. It seems to me that the statement should omit any reference to military redeployment for the following reasons:

1. The statement is scheduled to be issued while Averell Harriman is in Moscow negotiating with Chairman Khrushchev. Any suggestion that the United States is reducing its military exertions overseas for

---

<sup>1</sup> Ball's concerns about President's statement on balance of payments. Secret. 4 pp. Department of State, Central Files, FN 12 US.

balance-of-payments reasons would inevitably appear as evidence of weakness.

2. Not only would this appearance of weakness impair our bargaining position with the Soviet Union, it would cause apprehension among our NATO allies. Many Western Europeans are already nervous about the Harriman talks, and I doubt that the Gaullist Government would resist the temptation to exploit the built-in suspicion, particularly on the part of the Germans. The announcement of troop deployment—no matter how phrased—could easily be served up as confirming the General's prediction regarding American staying-power in Europe.

3. You indicated that the statement would not spell out the manner in which we would effect a saving of \$300–400 million a year in foreign exchange in connection with our defense effort. But I am afraid that uncertainty would be more likely to create suspicion than allay it, since each area of the world would be likely to feel that it would be affected by redeployment. I have the dismal feeling that on the morning after a Presidential statement regarding measures to achieve a foreign exchange saving of this magnitude our doorstep would be crowded with Ambassadors.

4. Even if we phrased the statement merely in terms of "economies" on our overseas defense operations, I doubt that this would do much to allay suspicion, since economies of the magnitude of \$300–400 million a year would clearly be a signal of substantial troop redeployment.

5. I think, on balance, that there are grave dangers in any public justification of troop redeployment on balance-of-payments grounds—whatever may be the internal basis for our action. After all, defense is a matter of life or death, and this Administration should never repeat the Eisenhower Administration's mistake of suggesting that our defense posture should be dictated by any considerations other than our national security. It would, in fact, be particularly unbecoming for the Kennedy Administration to announce that it was adjusting its defense arrangements for balance-of-payments reasons, since the President played a leading role in 1958 in chastising the Eisenhower Administration for—as he put it—placing "fiscal security ahead of national security".

The President said: "We tailored our strategy and military requirements to fit our budget—instead of fitting our budget to our military requirements and strategy". The President referred to an alleged quotation from Lenin "that the destruction of the capitalistic world would come about as a result of over-spending on arms." After pointing out that Lenin never made this statement, he said: "I should think that in the future it would rank high among the slogans which had proved to be useful in the effort to destroy the capitalistic system." Finally, he said, "Surely our national security overrides budgetary considerations . . . ."

6. What the President said then about budgetary considerations would, it seems to me, apply *a fortiori* to considerations of our balance of payments, since informed Americans will know that there are a number of other measures that can be taken to achieve balance-of-payments equilibrium besides troop redeployment.

I do not think the difficulty could be avoided by any disclaimer that the proposed redeployment would impair our military strength. If that were true, the public would certainly ask why these actions have not already been taken without regard to balance-of-payments considerations.

In making these comments, I do not wish to appear as opposing a carefully-developed program of economies in our foreign exchange expenditures in connection with our defense arrangements, provided such a program can be developed without causing either military or political damage to the American position. But we should never announce such a program. We should undertake it quietly, seeking, so far as possible, to accomplish these economies as routine operations, undertaken in local situations in the interests of modernization and improvement of military strength. Any Presidential announcement of a world-wide program of military redeployment, undertaken out of weakness due to the deficit in our balance of payments, would be extremely costly to our national interest.

Yours ever,

**George W. Ball**

**334. Memorandum of Conversation, July 15, among Rusk, McNamara, and Ball<sup>1</sup>**

July 15, 1963

## SUBJECT

DOD Balance of Payments Proposals

## PARTICIPANTS

Secretary Rusk

Mr. Ball

Mr. U. Alexis Johnson

Mr. Jeffrey C. Kitchen

Mr. Robert Schaetzel

Mr. Seymour Weiss

Secretary McNamara

Mr. William Bundy

Mr. Robert Kovarik

1. In the absence of the Secretary, who was detained, *Mr. Johnson* opened the meeting by referring to the DOD proposal regarding Spain. *Mr. McNamara* stated it was intended that the F-102's should be offered to the Spaniards on a grant, not a sales basis, for a total cost to MAP of \$20 million. (In answer to *Mr. Weiss'* question, *Secretary McNamara* indicated that the \$20 million was on the assumption that the aircraft would be declared excess.) *Mr. Johnson* asked whether it would not be feasible to keep one of the three squadrons in Spain, manned by the US if that might be indicated in the base negotiations in order to deal with Spanish desires for an American "presence." *Secretary McNamara* replied in the negative stating that he would prefer, if necessary, to move out of Spain entirely, rather than keep one US squadron stationed there. However, he believed that the Spaniards would want the F-102. He also pointed out that the AC & W system would also be turned over to Spain. *Mr. Weiss* asked whether, in the event our withdrawal resulted in Spanish refusal to renew the other base rights facilities which we were now in process of attempting to renegotiate, (specifically including the Naval facilities) DOD was prepared to pay this price. *Secretary McNamara* said that if it came to that he would be.

2. (At this point the Secretary arrived.) *The Secretary* complimented the DOD effort, indicating it reflected a political awareness on the part of Defense staff. As a result the proposals advanced were manageable, though there were a few problems. He was particularly concerned, however, that the proposals not be treated as a package, but rather as individual undertakings.

---

<sup>1</sup> "DOD Balance of Payments Proposals." Top Secret. 11 pp. Department of State, Secretary's Memoranda of Conversation: Lot 65 D 330.

3. *The Secretary* then turned to Japan asking whether in this case, as well as Spain, it made any particular difference to Defense whether or not we explicitly turned over to our Allies the responsibility for air defense, thereby apparently detaching ourselves from our Allies. He pointed out that it would be advantageous from a political point of view not to have to do so. *Mr. McNamara* stated that he was sorry Defense had raised the issue, particularly in connection with Japan, in this way. He said this was not DOD's intention and particularly, as the Secretary had pointed out, in light of our continuing presence in Japan with large fighter aircraft units there was no need to do so. He said the Memorandum to the President would be changed to strike this proposal.

4. With regard to Spain, *the Secretary* asked whether there was any evidence that the Spaniards had asked for the F-102's. *Mr. McNamara* replied that we had no definite information. *Mr. Bundy* stated that he believed the Spanish would like to have the aircraft and that Defense had asked General Donovan to obtain a better appreciation of the problem. *Mr. Johnson* raised the question of the relationship of the proposal to the current base negotiation. *Mr. Bundy* agreed with *Mr. Johnson* that the aircraft proposal should be made a part of the total negotiation. *Mr. McNamara* stated that we should approach the Spaniards as soon as possible at least on the B-47 portion of the proposal, perhaps indicating as a part thereof that we were planning on re-deploying our fighters. *The Secretary* asked whether a military level approach, first, would be wise. *Mr. McNamara* said that the discussions should be in Madrid (moving it out of the hands of the Spanish Ambassador in Washington) with the US Ambassador participating to the extent and in the manner he deemed most suitable. *The Secretary* asked whether in *Mr. McNamara's* judgment, from a military point of view, the Soviets would be unlikely to attempt to attack Spain with aircraft in the event of war. *Mr. Johnson* pointed out that Soviet aircraft would have to transit wide areas of friendly territory before getting to Spain. *Mr. McNamara* stated that if the Soviets attacked with aircraft they would probably only do so after a missile attack. *The Secretary* summed up by saying that we were prepared to take the proposal up with our Ambassador checking as to whether the Ambassador or our military should try the proposal out on the Spaniards.

5. *The Secretary* then moved to the Icelandic issue, querying whether the F-102's had been requested by Iceland. *Mr. Kitchen* explained the change in Icelandic attitudes toward NATO and the US and the high importance which was attached by our Ambassador and military commanders in the area to a continuance of US presence in Iceland, if we were to retain effective working relationships between the two countries. *The Secretary* asked *Mr. McNamara* how we would handle

Soviet vessels in the area. *Mr. McNamara* said probably not with the F-102's, which he reiterated had very limited military utility. *Mr. McNamara* went on to point out that if this proposal presented serious political problems he was willing to strike it from the list since it represented an item of low priority. He hoped, however, we would be willing to check this out with our Ambassador. *The Secretary* and *Mr. Johnson* reiterated that it was our full intention to do so.

6. *The Secretary* then turned to the question of the contraction of the European LOC. *Mr. McNamara* stated that Defense may have been misleading in their presentation. He stated that they had no intention of introducing German personnel into France as a part of this proposal (though German participation was otherwise being sought as a part of other proposals), and, thus, no negotiation with the FRG was involved. With regard to the question of shipping back supplies, he stated that he hoped that there would be material to ship back (quoting a figure of 100,000 tons), though he stated that the information on this was very incomplete and that he was not sure whether there would be anything worth shipping home. In any event, he stated that any shipments home would be checked with the State Department in advance. *The Secretary* stated that his concern went to visualizing a half-dozen ships being loaded with tanks which would imply a major US withdrawal. He said he assumed that attrition would take care of part of the stocks, that we would try to sell part to our Allies and that only then would we ship home. *Mr. McNamara* confirmed this and reiterated that even under these circumstances any shipments would be checked with State. *Mr. Kitchen* asked, for information purposes, how and whether we would retain the LOC, under the Defense proposals. *Mr. McNamara* pointed out that the LOC was built to meet World War requirements. He stated we have no intention of carrying out a long conventional war in Europe. We do not need more than 90 days reserve for approximately 25 divisions. *The Secretary* asked whether we were, therefore, prepared to close out these facilities. *Mr. McNamara* said we were. *Mr. Weiss* asked whether this meant that if the French were desirous of taking over the facilities we would be willing to turn them over. *Mr. McNamara* said that we should begin to thin down our capability, pointing out that there was something of the order of 6000 out of the 230,000 people involved and he thought we should approach the French and talk about thinning down, but reserve on turning over the facilities if the issue arose.

7. In the foregoing connection, *Mr. McNamara* asked if he might digress for a moment to outline to the Secretary a proposal that he had in mind. He stated that we would soon be in a position to carry out large scale military redeployment exercises to Europe and the Far East. Sometime between October 15 and January 1, he would like to deploy

a full division and a full CASAF to Europe. The purpose of this move would be to (a) test our system, (b) demonstrate our capabilities to our Allies and (c) demonstrate our capabilities to the Soviets. He noted that we had 2 divisions of equipment stockpiled in Europe and the deployed division would be matched with this equipment. He said he would subsequently like to have a similar movement to the Far East, possibly Korea, and then perhaps next year undertake a two division movement. He said that our capability for undertaking such action was in part due to increased airlift, in part to long range fighter aircraft capabilities, and in part to increased Army stocks of equipment. He said that he hoped, within the next 10 days, to have a paper for review and concurrence by the Secretary which would then permit our Ambassadors to talk to the German, French and British about these deployment exercises. This might be useful, politically, in discussing the redeployments growing out of the balance of payments considerations.

8. *The Secretary* shifted the conversation by asking if the Soviets were to withdraw all forces from Hungary and one-half of their forces from East Germany whether this would make a significant difference, militarily, to the US. *Mr. McNamara* stated that he doubted that it would because of the NATO assumption of very rapid redeployment capabilities on the part of the Soviets (an assumption about which he had some personal doubts). He said he would, however, want to check this with the Chiefs.

9. With regard to the LOC proposal, *the Secretary* stated that we should send some people over to explain to our Ambassadors (in France and Germany) what the proposal involved. He did not feel that a cable would be suitable. *Mr. Ball* stated that we should avoid tying the adjustments to the gold flow rather attributing it to increased efficiencies or such other factors. *Mr. McNamara* agreed. *The Secretary* and *Mr. Ball* then exchanged views as to what might be said in a general statement on balance of payments, with *Mr. Ball* suggesting that we should avoid any mention of a dollar figure. *Mr. McNamara* stated that this was not needed, though he thought we should say that foreign exchange costs attributable to Defense were coming down.

10. *The Secretary* mentioned that in contacts with Ambassadors, discussion should be limited solely to the proposals which related to the Ambassador's country in order to avoid discussing the entire package. *Mr. Johnson* stated that this was our intention.

11. *The Secretary* then returned to the problem of Japan, stating that *Mr. McNamara's* earlier remarks had clarified the DOD proposal regarding a shift in air defense responsibility. With regard to the problem as to which base would be placed on a stand-by basis, *Mr. McNamara* indicated that to accept Itazuke would require a serious reduction in operational capability, but that if this provided important political

benefits he would be willing to live with it. In connection with the proposal to redeploy fighter squadrons from Japan, *Mr. Weiss* alluded to the fact that *Mr. Gilpatric* and Ambassador *Reischauer* had given recent reassurances to the Japanese that US forces would not be redeployed from Japan, and in this connection, asked how quickly *Mr. McNamara* felt it necessary to move with his proposal. *Mr. McNamara* said that he hoped to make the move over the next 12 months, but indicated that he appreciated that there was a need for careful handling of the proposal.

12. *The Secretary* touched briefly on the contractual services problem. *Mr. Kitchen* pointed out that our concern was that various reductions in contracts, hiring of personnel, housing, etc., not be concentrated in one area at one time. *Mr. McNamara* stated he thought this was no problem.

13. *The Secretary* then turned to MAP/OSP calling attention to the precautionary note in the State memorandum. He stated, however, that having been subjected to Congressional inquiries on this and related matters, over the past few days he was not too enthusiastic about protesting OSP. *Mr. McNamara* stated he was flatly opposed to additional OSP, though he agreed that he could not object to reviewing each case on its merits. *The Secretary* referred to the Church Amendment. *Mr. Ball* stated that the President was concerned and felt that the entire problem could become politically acute. *Secretary McNamara* stated that our position should be that OSP is being phased out except for prior commitments. *Mr. Bundy* said he thought we had a strong case. *The Secretary* said it was strong to us, but not the man in the street or Congress.

14. With regard to oil procurement, *the Secretary* asked where the most came from. *Mr. McNamara* said Venezuela, but that Defense would not cut down in any sensitive areas without State concurrence. *The Secretary* asked whether this might not be handled as an operational matter rather than a matter of policy. *Mr. McNamara* said by all means, but even so he wished to check it with State. He pointed out, for example, that over the last year purchases from the UK were up 4 to 5 million. *The Secretary* said it would not bother us to see such purchases cut back, though he preferred that this be done on an operational basis.

15. *The Secretary* then turned to the Caribou, asking *Mr. McNamara*, as the expert in the matter, if he were the Canadian Defense Minister what he would say the US commitment was. *Mr. McNamara* stated that he thought it was *Mr. Drury*, Canadian Minister of Defense Production, who was most directly involved in this matter and that he was satisfied with the US overall position. However, he offered to talk further with *Mr. Drury* if this seemed desirable. *Mr. Ball* noted that Ambassador *Butterworth* was in Washington and this might be discussed with him.

*Mr. McNamara* stated that the Army still liked the Caribou, but the Air Force is persuaded that it is not a good aircraft for US needs, and that he agrees with the Air Force. He said it would be at least 12 months before final tests were completed, and that the Army might, during this period, persuade him as to the merits of the Caribou, though he doubted it. *The Secretary* pointed out that we do not have a balance of payments argument to make with the Canadians since we were in a favorable position with them.

16. *The Secretary* and *Mr. McNamara* agreed that the proposal for handling the public relations problem was well taken. *Mr. McNamara* asked who the point of contact with State would be. After it was clarified that *Mr. McNamara* had in mind a single point of contact for the entire balance of payments proposal, including the public relations aspects, *Mr. Kitchen* was designated by State, and *Mr. Bundy* was designated by Defense.

17. *Mr. McNamara* stated he would like to send the memorandum forward to the President with State concurrence, but subject, of course, to review of detailed implementation plans, and subject to an appropriate public relations program. *The Secretary* stated that in addition he would want the condition imposed that the proposals not be treated as an entire package and that publicly they not be related to balance of payments considerations.

18. *The Secretary* and *Mr. McNamara* exchanged views on the problem of Defense representation overseas.

19. The meeting adjourned.

July 24, 1963

SUBJECT

Status Report on Balance of Payments and Troop Withdrawals

1. We dispatched cables to Tokyo, Madrid and Reykjavik setting forth the proposed force adjustments and have replies. These, in part, formed the basis of a meeting with Bill Bundy on Tuesday morning where we discussed the following:

a. *Iceland*. In light of Ambassador Penfield's position, Defense is prepared to withdraw from current consideration its proposal to remove the squadron.

b. *Spain*. The preliminary judgment is that the proposal should be politically manageable. The first approach will be through military channels in Madrid; with the Spanish Ambassador here informed as a matter of courtesy. Defense and State are drafting instructions.

c. *Japan*. Ambassador Reischauer expressed the view that the problem is manageable, if there is sufficient advance consultation with the Japanese. There remains the special problem of the Itazuke airfield, but there may be a solution which will meet the Ambassador's persuasive political arguments for closing Itazuke, while at the same time limiting the operational disabilities which are of understandable concern to DOD. (This may involve developing alternate facilities which are available and which the Ambassador believes the Japanese may prefer to do, despite the expense involved, if phasing out Itazuke is thereby facilitated.) We have, accordingly, agreed to draft guidance to permit Ambassador Reischauer to open negotiations with the Japanese and DOD is securing additional detailed military information from the field.

2. *Additional Problems*. Three additional problems warrant notation:

---

<sup>1</sup> "Status Report on Balance of Payments and Troop Withdrawals." Secret. 3 pp. Department of State, Central Files, FN 12 US.

a. In connection with Japan, General Smart, head of the USAF in Japan, has come in with a very strongly worded message for Ambassador Reischauer categorically labeling as untrue the DOD contention that planned redeployments would not lessen US ability to fulfill treaty commitments. We are pursuing the matter with Defense and Ambassador Reischauer.

b. Defense has provided an informal indication of the list of phase two adjustments which are being developed in response to the President's request to Secretary McNamara for additional balance of payments reductions. The list, while not as far reaching as we might have expected, does contain some significant force reduction proposals, including removal of the two US divisions from Korea, all B-47's from Europe and the entire complement of 252 fighter and reconnaissance aircraft currently stationed in the UK. In total, Mr. McNamara is shooting for an additional \$300 million in FY 1965 and \$450 million in FY 1966. It is not clear that the list of phase two adjustments will reach these magnitudes so that even more far reaching adjustments may be required in order to make the significant dent on the balance of payments which is desired. While we are taking this into account in our current considerations, the basic confrontation on the issues raised by the phase two proposals must await a more definitive identification by DOD.

c. Defense does not yet have a detailed proposal on the European LOC problem. Accordingly, we have not been able to dispatch anyone to brief Chip Bohlen, as you suggested. In the meantime, however, DOD is thinking of raising the general problem of European LOC (at least as it affects the FRG) during the imminent McNamara-von Hassel discussions. We are hopeful that this matter can be examined further in the meeting we previously recommended that you have with Mr. McNamara before his departure for Germany. (He leaves Tuesday morning, July 30.)

3. For your information, I am attaching the cables sent to the field and the replies received (Attachment A) and the minutes of our Interdepartmental Committee Meeting (Attachment B).

## SUBJECT

Balance of Payments and Force Withdrawal

In anticipation of the meeting with Secretary McNamara on Friday, I'd like to set down a few observations which arise out of the President's new request. If the major thrust of the President's recent request of Defense is to accelerate the present program then this is something that we may be able to work out without damage. If on the other hand it is a demand for more far-reaching reductions it seems to me that the following considerations should be borne in mind and that they must condition our judgment regarding cutbacks going beyond those presently under consideration.

We could not be moving into a more difficult period as far as European strategic thinking is concerned. De Gaulle's "nationalization" of French forces, French allusions to the reorganization of NATO, the unilateral withdrawal of the four Belgian battalions, the obscurity and internal contradictions of British defense policy, to say nothing of their imminent elections, all these elements add up to a highly combustible situation. A further factor is the cumulative effect of what the Europeans refer to as the abrupt shifts in US strategic doctrine. Finally, the test suspension treaty and discussions of a non-aggression pact unquestionably will be seized upon in Europe as rationalization for failures to reach agreed force levels or in fact to justify cutbacks from present levels of performance.

In sum, I am baffled by how we combine the following policy objectives: A greater European contribution to a flexible strategy including additional conventional European forces, initiate steps toward a détente with the Soviet Union, and, at the same time, move unilaterally toward significant cutbacks in our present commitments and drift back toward the plate glass doctrine.

A crash cutback program going beyond the carefully prepared and well-thought through Defense program, would seem to me to offer unacceptable risks of unraveling all we have been trying to do with NATO over the last ten years.

---

<sup>1</sup> "Balance of Payments and Force Withdrawal." Secret. 2 pp. Department of State, Central Files, DEF 6–8 US/NATO.

Ideally we ought to have Finletter here for the McNamara-Rusk meeting. I intend to suggest to the Secretary the possibility of Finletter accompanying McNamara to Bonn.

SUBJECT

DOD Balance of Payments Reductions: Phase Two

1. We have completed the analysis of the draft memorandum to the President which Mr. McNamara left for you on September 10. (Attachment A). In addition, the DOD, as a separate action not included in the Phase II reductions, has proposed the withdrawal of 6000 combat troops originally dispatched to Europe during the Berlin build-up, "Operation Roundout." (Attachment B). Because the timing of this latter proposal coincides exactly with consideration of the Phase II reductions and since the political effects would similarly be felt during the same period, we are also including our views on this proposal.

2. In summary, our conclusions and recommendations are as follows:

a. A portion of the total savings of approximately \$380 million proposed by DOD (\$375 million Phase II, plus \$4 million Operation Roundout) may well create some foreign policy problems. Nevertheless, since we have proceeded with our analysis on the assumption that it was your desire to exert every possible effort to accept reasonable recommendations for effecting balance of payments savings, to which the President, and all of us, attach such a high priority, we would accept the degree of risk involved in these particular Defense proposals. Included in this category would be such items as: close-out of the B-47 deployment by withdrawal of 40 aircraft from Spain and 40 from the UK, at a total savings of \$37 million; cancellation of planned activation of one squadron of reconnaissance aircraft for Japan, at a savings of \$25 million; reduction by 15% in US personnel in US military headquarters abroad, a savings of \$5 million; plus a reduction in foreign procurement resulting in savings amounting to approximately \$103 million. In this latter category are such items as reduction in employment of foreign nationals, reduction in military construction and some reduction in purchase of foreign POL. Thus, we propose that of the \$380 million savings projected by DOD, we concur in \$170 million. (A

---

<sup>1</sup> Analysis of DOD balance of payments reductions. Top Secret. 12 pp. Department of State, Central Files, FN 12.

description of each of these proposals and our analysis of its implication is at Attachment C.) This concurrence would, of course, be subject to DOD agreement to provide us with detailed implementation programs and schedules covering each of the various items to permit us to provide guidance on timing and tactics of presentation to foreign governments.

b. With regard to the remainder of the Defense proposed redeployments, we have concluded that our basic national security posture and foreign policy interests would be so seriously jeopardized through their acceptance that we should not concur in them, but should, in fact, present to the President our view of the probable consequences if they are implemented, strongly recommending against their approval. Included in this category of items are the following: (1) redeployment of US tactical fighter aircraft from Europe (a reduction from 796 to 354), (2) a reduction in US ground forces in Europe, largely in the logistical support category, of 30,000 men, (3) withdrawal of the two US divisions in Korea concurrently with a reduction in MAP support for Korean forces (which will require a reduction in those forces) and (4) reduction in foreign procured POL. All of the foregoing actions are contained in Secretary McNamara's Phase II reduction proposals. In addition, we include in this category of items which should be rejected, the separate DOD proposal for a withdrawal of 6000 combat troops which were part of the Berlin build-up (Operation Roundout). The total savings realizable from this category of items is \$210 million.

3. Our reasons for recommending against acceptance of the reductions described in paragraph 2, are as follows:

a. The withdrawal of the tactical aircraft from Europe (and the Far East) is, in part, militarily justified by DOD by the introduction into US inventories of the F4C aircraft with its substantially increased range. This would, according to DOD, permit basing of these aircraft in the US, with occasional rotation to the European and Far East theaters, and with a rapid redeployment capability to these areas in the event of hostilities.

Since the additional air force reductions in the Far East are relatively insignificant in magnitude, we would *not* propose that the Department take exception to this aspect of the DOD suggestion. The situation is, however, quite different with regard to Europe. Leaving aside entirely the military validity of the concept, we would view the political consequences attendant upon such a massive withdrawal of force to be of the utmost gravity. Even if the technical argument based on the F4C availability can be made, *it will not be politically persuasive*. The primary significance of the US force commitment in the European and Far Eastern theaters is not essentially based upon the intrinsic military utility of these forces, despite the fact that they do in fact have a highly important military significance. Their principal importance has always

been associated with the dramatic and unequivocal political commitment to the defense of Free World interests in these areas which they symbolize. We have, in effect, through this device guaranteed to our Allies in Europe and the Far East an immediate and massive US involvement in any outbreak of hostilities with the Communist bloc. This evidence is required no less today than in the past. Indeed, with various key Allies critically surveying our actions and motivations in connection with recent developments in East-West negotiations, *a massive removal of US military air presence located in Europe (even though sizable US ground forces would remain in the theater) might well be interpreted as the beginning of a major US disengagement* from the area. It might also be expected to give rise to speculation, abroad and in the US, that it represented a tacit if not explicit agreement between the US and USSR. Particularly if the Soviet Union, independent of our actions, effects certain force withdrawals from the satellites (this is predicted in some quarters), the notion of US-USSR collusion will be even more difficult to confront. With those such as DeGaulle, predicting precisely such a development, our ability to hold our multilateral and bilateral alliance structure together would be seriously impaired.

There is one further point related to the NATO aircraft. The aircraft in question are committed to NATO. There is at least a question in our minds as to whether their deployment to the US, even if they remained technically committed to SACEUR, would fulfill either the spirit or the terms of that commitment. If judged by our Allies or SACEUR not to be consistent with our NATO commitments this would represent the first time since the institution of the Alliance that the US had withdrawn forces committed to NATO, leaving a major void in our military commitment.

b. With regard to the ground force reduction of 30,000 men in Europe, it is important to understand that, even though largely concentrated in the logistics area, such a reduction is likely to have widely adverse consequences.

First, its very magnitude will raise a question of US disengagement. Granted that there has been a widespread feeling that US Army support was excessive in relation to combat numbers, it would be difficult to portray a reduction of this magnitude, coming on top of previous streamlining actions, as based solely on the foregoing consideration. Indeed, this is not the sole explanation for the proposed action. Though not pointed up in the DOD Memorandum to the President, we gather that implementation of this proposal involves a *de facto* and significant alteration in our previous strategic doctrine. Specifically, it involves acceptance of the widely held European view (heretofore vigorously rejected by the DOD) that the forces on the ground in Europe should place reliance on the use of nuclear weapons to meet any attack which

is not preceded by an extensive period of warning and with consequent opportunity for mobilization. Thus, e.g., the German divisions in the line are not normally at full strength, but instead depend upon availability of warning to fill out the existing deficiencies. Under the revised concept embodied in Secretary McNamara's proposal, DOD would be depending upon no less than two weeks of strategic warning as compared to the instantaneous responsive capacity of present forces.

In other words, the combat capability of US forces stationed in Europe to meet a conventional attack by the Communists, which was not preceded by significant warning time, would be *significantly degraded*.

As we understand it, Defense would not overtly admit that the 30,000 man reduction represented a fundamental change in our strategic doctrine (indeed, if even admitted in closed US councils) out of fear that such an acknowledgement would result in still further European short-falls below the resulting downward adjusted NATO goals. Our view is that in addition to the politically impressive numbers involved, which in and of themselves can be predicted to create major political problems, we are not at this point persuaded that the political and military implications involved in accepting the revised strategic doctrine implicit in the DOD proposals, permit us to accept it as consistent with US national interests.

c. Finally, in the NATO area, there is the proposed withdrawal of the 6000 combat troops which remain from last years Berlin crisis augmentation (Operation Roundout). (Attachment C). The accelerated withdrawal of these troops (at a savings of \$4 million in FY '64) would be particularly disruptive at this time:

(1) They would be the first sizable *combat* land forces which the US would have withdrawn. (You recall that you drew a sharp line against large combat force adjustments in your letter to Secretary McNamara of June 7, 1963.) (Attachment D).

(2) Allied and especially German concern over the possible hidden implications of US-USSR negotiations, noted in 3 a. above would be particularly pertinent in this case.

(3) The FRG sensitivity and concern which was evidenced over the removal of 600 troops from Berlin would unquestionably be reactivated and intensified.

However, since these forces are above and beyond our NATO commitment and could logically be justified for return as soon as a less fluid and unstable political situation is achieved, we would recommend our acknowledgement to DOD of a willingness to accept the present schedule for withdrawal (by end FY 1964) and even would be prepared to keep under constant review the possibility of accelerat-

ing that time schedule, should the political climate warrant such action. (Note: This item which, as previously noted, was submitted as a separate proposal by DOD and not as a part of the Phase II reductions, would not be raised with the President, as recommended below for other items, unless Mr. McNamara felt it desirable to do so.)

d. You are cognizant of the range of very serious problems associated with the proposed removal of the two divisions from Korea, together with a reduction in Korean force levels. (To refresh your memory, attached is the letter sent to General Taylor last May. Attachment E).

[*text not declassified*]

Our concerns with the proposal are several:

a. The effect of the foregoing upon our position in Japan (given Japanese aversion to nuclear weapons this policy adjustment could trigger a major reassessment of Japanese policy toward the US), the Far East in general and other areas of the world populated by the colored races, could be far reaching.

b. The removal of two US divisions could adversely effect our ability to exercise control over the internal situations in Korea. The present junta government in Korea contains untrustworthy elements some of which may be pro-Communist, and we would find it hard to maintain the UN command, and its authority, if we withdrew our divisions. Military rule has introduced factionalism into the ROK command. The UN command is needed to moderate that factionalism; we dare not increase the risk that important elements of the ROK armed forces may fall into armed conflict against each other. Moreover, we must be able to use fullest possible US influence to prevent ROK forces from being used to perpetuate military rule if it becomes apparent that the populace would revolt rather than accept it.

c. [*text not declassified*] All this would feed directly into the hands of Peiping's anti-US racist propaganda, would weaken our friendships and alliances throughout the area, and would induce accommodation to the Communists. [*text not declassified*]

d. Our two divisions and the United Nations command give us opportunities for exercise of control at the 38th parallel we cannot afford to surrender. Otherwise the present or prospective ROK leadership might, advertently or inadvertently, get into a border clash with the Communists. Alternately, a tempting opportunity might be presented to North Korea if ROK forces fell to fighting each other or the civil populace. [*text not declassified*]

e. The balance of payments savings cited by DOD are *not net savings to the US Government*. A very large proportion of these savings would have to be offset by US input through aid, given the direct dependency

of the South Korean economy on US resources. With the prospect of sharply declining appropriations for foreign aid, it is not clear how the additional burden could be met.

We have considered the feasibility of a one division withdrawal. While the availability of additional strength stationed in Asia but ready for flexible employment rather than being tied down in Korea, is appealing, it appears any withdrawal from Korea would remove the US forces from the Far East area entirely. (There is no readily available place for a division with the possible exception of the Philippines which would aggravate the balance of payments problem). The political visibility associated with a flexibly deployable force stationed in the Far East would thus not be gained.

Nevertheless, for tactical reasons you may wish to agree to further exploration of a one division adjustment.

f. Finally, the proposal for reducing still further POL imports from overseas will hit particularly in the Caribbean area. You are fully familiar with the Venezuelan political problem which we believe should not be further endangered by a prospective loss of US oil revenues. Of the \$35 million POL balance of payments reduction we are assuming that \$20 million will be attributable to the Caribbean area, principally Venezuela. This reduction should not be approved.

4. The DOD proposals, which we strongly recommend not be approved, in perspective, appear to suggest:

- a. Withdrawal of over 50% of US air forces from Europe.
- b. Reduction of about 15% of existing ground force strength.
- c. Withdrawal of over 100,000 US military and dependent personnel, primarily from Europe.
- d. A partial alteration in our existing NATO policy in support of high conventional force capability as contrasted to European desire of continued reliance on nuclear weapons.
- e. A major alteration in our Far East military posture, with implicit, if not explicit, increased reliance on nuclear weapons.

f. Possible serious injury to our relations with certain Latin American States,

—with all of the foregoing resulting in the—

g. realization of net balance of payments savings probably totalling less than \$150 million.

The price seems inordinately high in relation to the benefits.

5. Before jeopardizing the basic US security posture for such relatively modest balance of payments savings, we must first be satisfied that such savings will in fact accrue, and second we would think that other fiscal and monetary measures, however distasteful, should first

be implemented. Although Defense has not afforded a precise breakdown of figures, it is clear that the greatest portion of the recommended savings in Europe would fall in Germany where we have an offset agreement which the Germans would certainly adjust downward as the US reduced its military expenditures. The Defense staff argues that it cannot foresee future large purchases of US equipment by the Germans, but the history of modern military budgeting demonstrates few lulls in spending for military equipment. Indeed, the modernization of military forces seems to require continuous increased spending for ever more costly weapons systems. In connection with other fiscal and monetary measures, we think it important that you offer to the President an alternative package, embodying detailed programs for implementing such measures, for Presidential approval in order to provide the President with alternatives to the Proposed military cutbacks.

6. Consistent with the foregoing conclusions, we would propose the following:

a. That you indicate, first orally to Mr. McNamara, but then directly in writing to the President, your views as to the seriously adverse consequences of the more far reaching DOD proposals, recommending against implementation of these proposals (while at the same time concurring in proposals totalling almost 50% of the value of the package).

b. Indicating further to the President the relative advantage of attempting to solve or alleviate the balance of payments problem through adoption of other techniques as a first preference before turning to the drastic adjustments contemplated in our security position. In this latter connection, we would recommend that you offer to provide for Presidential consideration within the next thirty days specific and detailed proposals with a time schedule for their implementation.

*Recommendation:*

a. That you meet with Mr. McNamara to [discuss] your views, and

b. That you sign the attached Memorandum to the President which expresses views consistent with those set forth in the preceding paragraphs and which recommends a meeting with the President and other appropriate officials to discuss the foregoing proposals.

January 1961

339. Paper, January 10<sup>1</sup>

January 10, 1961

## *Proposed Settlement of Vested German Assets Problem*

### *Background*

German (and other enemy) assets located in the United States on December 7, 1941 were vested by the Alien Property Custodian under the authority of the First War Powers Act of December 18, 1941. The present value of the German assets originally vested is between \$300 and \$400 million.

In the Paris Reparations Agreement of 1946 the U.S. and 17 allied nations (excluding the Soviet Union and Poland) agreed to retain vested German assets within their territories as a form of reparations. They also agreed to hold or dispose of these assets in such a way as to preclude their return to German ownership or control.

In 1948 Congress enacted legislation (the War Claims Act) which provided that:

1. Vested German and Japanese assets would be retained by the United States without compensation to the former owners;

2. Priority would be given to using the net proceeds from liquidation of the vested assets for paying compensation to American civilian internees of the Japanese; to American servicemen captured by Germany, Japan and other governments which had failed to provide adequate subsistence as provided by the Geneva Convention; and to certain Philippine religious organizations that had rendered aid to American

personnel. About \$224 million of the proceeds of the vested assets have been used for purposes of the War Claims Act of 1948.

(The 1948 Act did not provide for the payment of war claims of Americans arising out of war-caused property damage but authorized a study of the problem.)

The War Claims Act in effect endorsed the principle of retaining vested assets as provided for in the Paris Reparations Agreement, by utilizing vested German assets to satisfy certain American war claims.

The Paris Reparations Agreement was followed by the Bonn Convention of 1952 between the U.S., U.K., France and Germany for the Settlement of Matters Arising Out of the War and Occupation. This Convention provided that: (1) Germany would compensate its own nationals for the loss of vested assets and (2) the U.S., U.K., and France would not assert any claims for reparations from current production or pending a peace treaty. In the Bonn Convention Germany reserved certain rights to pursue the question of vested assets even though it agreed not to raise objections against measures carried out regarding vested assets. The Bonn Convention was confirmed in the Paris Protocol of 1954, which came into force as a treaty on May 5, 1955.

For the past six years the German Government has been unceasing in its efforts to obtain a return of the German vested assets. Notwithstanding the Bonn Convention, return has become an important political issue in Germany and a continuing irritant in U.S.-German relations. Chancellor Adenauer has frequently intervened with President Eisenhower and other U.S. officials to press the German viewpoint.

Prior to World War II the United States had historically maintained the principle of the sanctity of private property even in time of war. (For example, the Settlement of War Claims Act of 1928 provided for the return of 80% of the property vested in World War I and vested Italian assets were returned to Italy after World War II.) Also, German agreement to American retention of vested assets in the Bonn Convention of 1952 was widely felt by the German public to have been extracted from the Germans at a time when they were in a weak negotiating position. On balance, the Department of State felt that, notwithstanding the undoubted legal rights of the United States, the Germans had a strong moral case.

Accordingly, on July 31, 1957 President Eisenhower announced the intention of the Executive Branch to submit to Congress a proposal to pay in full all United States war claims against Germany and to provide, as an act of grace, an equitable monetary return to former enemy owners of vested assets.

In March 1958 the Executive Branch was prepared to submit to Congress a plan under which (a) \$100 million would be earmarked

from the vested assets account for the payment of American war claims against Germany; (b) natural persons (but not corporations) who were former owners of vested German properties would be compensated up to \$10,000 per claim;<sup>2</sup> and (c) any additional available sums from liquidating the remaining vested assets would be used first to compensate American war damage claimants in the event the initial \$100 million proved insufficient, and second, to pay former owners of vested German properties who might not have received a full return under the \$10,000 program. If the \$100 million proved to be more than sufficient to satisfy all American war claims then the balance would be used for additional payment to former German owners.

This program was to be financed from the proceeds of vested German assets not wholly liquidated, plus an appropriation of \$100 million, representing a substantial part of the proceeds of German assets already liquidated and earlier used for the payment of American claims against Japan.

This plan was never submitted to the Congress because of the objections of the German Government, which felt that the plan would not provide adequately for a return to the larger former owners (i.e., corporations and large owners whose interests exceeded \$10,000). The Executive Branch thereupon decided to submit legislation to settle the American war claims problem alone, hoping in this way to remove one of the chief obstructions to the settlement of the vested assets problem. The Executive Branch had repeatedly informed the Congress that enactment of legislation authorizing the payment of American war claims out of the vested assets account was a necessary pre-condition to any return program. Legislation for this purpose passed the House of Representatives in 1960, but there was not time for its full consideration by the Senate. During the Congressional discussions of war claims it became clear that majority sentiment was opposed to any substantial return to Germany on the vested assets account.

The German Government has continued to press for a settlement of the vested assets problem. Late in 1959 they proposed that payment of the vested assets should be made from the amount owed by Germany to the U.S. under the GARIOA agreement.<sup>3</sup> The principal sum remaining under the GARIOA agreement is now \$787 million to be paid over a period of 27 years at 2½% interest, with no principal payments due during the period 1961–65. The Germans were informed that any payment of vested assets out of GARIOA debt would require approval by

---

<sup>2</sup> Estimated cost: \$50 million.

<sup>3</sup> Government and Relief in Occupied Areas. The Agreement of 1953 provided for German payment of \$1 billion, or about one-third of U.S. expenditures.

the Senate of a treaty amending the GARIOA agreement, which was originally approved as a treaty.

In the protracted discussions with the Germans on the vested assets problem the Germans have taken the position that an equitable settlement would be a two-thirds return of assets which they estimate at \$400 million, or a settlement of \$267 million. They have agreed, however, to accept \$200 million as a compromise lump-sum settlement. The position of the U.S. has been that an appropriate settlement would be the sum of the German assets used to pay American claims against Japan, plus whatever assets remain in the German vested assets account after payment in full of American war claims against Germany. Our best estimate is that this total sum would be \$175 million, calculated as follows:

	(In millions)	
Value of present (unliquidated) German Assets Account	\$152	
Less anticipated administrative expense	<u>11</u>	
	\$141	
Minus American war claims (estimated) <sup>1</sup>	<u>100</u>	
Net		\$41
German assets used to pay Pacific claims		<u>134</u>
Total		\$175

<sup>1</sup>Based on estimate of head of Foreign Claims Commission two years ago. There is no assurance, however, that actual validated claims will not be larger.

During the recent discussions with Germany on actions which it might take to assist the U.S. balance-of-payments, the Germans have indicated that they might now be prepared to prepay the GARIOA debt provided only that an amount could be deducted to settle the vested assets problem. This would mean a payment to the U.S. of approximately \$600 million, which would be of very substantial benefit to our present payments position and would also be a substantial savings to the U.S. in view of the very low interest rate and long term provided for in the GARIOA agreement. In fact, viewed as a straight business proposition prepayment of the GARIOA debt would save the U.S. an amount equal to the greater part of the cost of an equitable return on the vested assets.

It is not yet known whether the Germans would insist on conditioning prepayment of the GARIOA debt on approval by the Senate of an offset for the vested assets program, or whether they would be satisfied with a commitment by the Administration to submit an offset treaty to the Senate for approval. If the latter is the case, the Germans would

pay immediately all of the GARIOA debt except that amount determined to be needed for the return program; and only the allocation of the residual amount to the return program would be conditioned upon approval by the Senate.

In its most recent discussions with the Germans, the U.S. has indicated that because of the various political difficulties surrounding the vested assets problem the U.S., in undertaking a specific legislative program for the return of the vested assets, would wish to be assured that Germany would take action not only to prepay the GARIOA debt but also to assist the U.S. balance-of-payments in other fields, including additional military procurement in the U.S. and removal of certain trade restrictions against our agricultural exports. There is reason to believe that Germany is prepared to take these additional steps as a part of an overall package including settlement of the vested assets. They may also be prepared to pay for part of the cost of U.S. military aid programs to Greece and Turkey. An over-all arrangement of this kind would not only be beneficial to the United States but might also dispose the Senate to approve the proposed treaty providing for a return program.

*Recommendations:*

1. It is recommended that, promptly after the new Administration takes office, the U.S. should seek to conclude the current discussions with Germany on the basis of the following principles:

(a) Immediate prepayment by Germany of \$600 million of the GARIOA debt, leaving a residual of \$187 million.

(b) Conclusion with Germany of a treaty amending the GARIOA agreement to provide that the residual of \$187 million be cancelled in full settlement of the vested assets, with a specific understanding that Germany will compensate the private German owners. (The figure of \$187 million would split the difference between the German figure of \$200 million and the earlier American figure of \$175 million. The vested assets account of \$152 million—net \$141 million—would then be used exclusively for the payment of American war claims.)

(c) Action by the Germans in the fields of additional military procurement in the U.S., the elimination of certain trade restrictions to assist the American balance-of-payments and, if possible, German payment for part of the cost of our military aid programs for Greece and Turkey.

**340. Letter from Anderson to Dillon, January 18<sup>1</sup>**

January 18, 1961

Dear Doug:

With the express approval of the President, I am writing you concerning recommendations that this Administration was prepared to make to the Congress but has deferred so that these and other proposals may be appraised in the light of and in coordination with other actions which the next Administration may plan to recommend to the Congress.

As you know, on November 16, 1960, the President issued a directive setting forth measures to be taken by administrative action to reduce the United States balance of payments deficit. In further pursuit of the same objective, the President was prepared to recommend to the Congress to suspend temporarily part of the existing duty-free allowances for returning United States tourists.

The proposal in question would be to suspend for the time being provisions which the U.S. introduced unilaterally in 1948 and 1949 as one way of helping Europe in its post-war recovery. The relative positions of Europe and the U.S. have changed markedly since that time.

The adoption of this proposal by the Congress would lead to an improvement in the U.S. balance of payments which, I believe, would be of significant size.

Under existing provisions of the Tariff Act of 1930, as amended in 1948 and 1949, a resident who is outside of the United States for forty-eight hours or more may bring back up to \$200 in articles acquired abroad without the necessity of paying any customs duties on them. An additional \$300 allowance is available to persons who are outside the United States for twelve days or more. Originally this Act contained only a single \$100 allowance for returning residents. The present \$200 allowance resulted from a 1949 amendment. The \$300 allowance was separately added by an earlier amendment in 1948.

These amendments were approved at a time, unlike the present, when the balance of payments was running heavily in favor of the United States and it was in the interest of the United States to stimulate purchases abroad.

Accordingly, I recommend that a temporary suspension of the increases in such allowances, which resulted from the 1948 and 1949

---

<sup>1</sup> Outgoing administration thoughts on possible measures to reduce balance of payments deficit. No classification marking. 4 pp. Kennedy Library, Dillon Papers, Miscellaneous History, Box 41.

amendments, be considered for inclusion in proposals that may be made by the next Administration. In making this recommendation, I am persuaded that such action can be undertaken without impairing our objective of promoting a higher level of world trade through our commercial policies. For the longer run, I continue to recommend the adoption of strong Government and industry programs to attract foreign visitors to the United States. It is recognized that the Congress, in considering this recommendation, will wish to take into account the effect of such a change upon the magnitude of purchases of foreign goods by American citizens, as well as upon the revenues derived from customs duties. It would seem appropriate also to review in this connection the policies followed by other countries in providing allowances and the manner in which changes under consideration might be related to the question of reciprocity.

There is another field on which I hope that action can be taken at an early date. I am thinking of certain tax reforms, some of which also have a bearing on our balance of payments. As the President stated in his Budget Message, there is a continuing need for a reappraisal of the tax system to assure that it operates equitably and with a minimum of repressive effects on incentives to work, save, and invest.

I need not labor the importance of maintaining the level of receipts necessary, over a period of years, to meet our expenditures. Nevertheless, I believe it would be self-defeating long to postpone a review of our present depreciation allowances and procedures with a view to providing more liberal and flexible depreciation. The survey which we have undertaken will, I trust, be of assistance to you and your associates and to the Congress in examining this field.

I cannot at this time make a judgment as to whether the changes should best be statutory or administrative, other than to say that in either event it would be necessary, as the President proposed last year and again in his Budget Message this year, to treat income on disposition of depreciable property as ordinary income to the extent of the depreciation deductions previously taken on the property. Even apart from concepts of equity in tax policy, I am sure you are aware that many of the highly industrialized nations of the world with which we compete have depreciation allowances which are considerably more liberal than those of this country. To the extent that our world position is to be improved by the efforts of a vigorous and healthy private economy, liberalized depreciation may well be one of the most important contributions that can be made in our tax system.

When one considers the level of expenditures and the tremendous needs for revenue to meet our commitments properly, it is apparent that we will be faced with a very heavy tax burden that must be shouldered by the economy for many years to come. Under such cir-

cumstances, even apart from revenue needs, a number of proposals in the President's Budget Message must be pressed lest there be continued substantial tax differentials between competing enterprises that cannot be defended in terms of logic or fairness.

An important area in the tax law which we have had under study, and, as you know, had in mind for corrective legislation, is the present method of taxing income derived from sources abroad. International trade and investment make important contributions to the American economy and basic patterns of operation which have developed over the years should not be discouraged. However, there have been developments in this field in recent years which are cause for concern. These developments have been fostered in part by inadvertences in the tax system and in part by provisions that have been deliberately enacted, but under circumstances differing materially from those now prevailing.

Under present law, a foreign corporation is subject to United States tax only with respect to its income from United States sources, even though it is owned or controlled by American firms and individuals. Since the repatriation of profits derived abroad through such a foreign corporation would result in a United States tax, there is a strong incentive to retain profits indefinitely abroad in foreign tax "shelters" or "havens." It may be noted that the same factors which tend to promote the creation of foreign subsidiary corporations in tax-haven countries also induce a firm to maximize the amount of income derived by such foreign subsidiaries. This has generated practices among inter-related companies by which profits properly allocable to sources within the United States are shifted to sources outside the United States.

Because of these developments and their implications for the revenue, the tax system, and the balance of payments, it would seem appropriate to modify some of the features of the present income tax law. One approach would be to bring within the scope of the United States tax system profits derived by foreign subsidiary companies which are created in countries where tax exemption or other preferences are granted to holding companies or to those engaged in business primarily outside the country in which they are created. To minimize administrative problems and possible conflicts with existing treaty commitments, the tax would be imposed not on the foreign subsidiary corporation as such but on the United States parents of such foreign corporations. Such a tax would be analogous to that now imposed by the Internal Revenue Code to cope with the tax avoidance resulting from the use of foreign personal holding companies.

This proposal should, I believe, be limited to the removal of special tax advantages accruing to companies operating through "tax haven" subsidiaries, which advantages are not available for investments in the

United States. In recommending that legislation be considered in this area, I am mindful that no barriers should be imposed upon investment abroad and further that private investment in less developed countries should be encouraged. In making this recommendation I am persuaded that this is a step that can be taken without impairing our objective of promoting a higher level of world trade and of maintaining freedom from restrictions on capital movements.

Sincerely yours,

**Bob Anderson**  
*Secretary of the Treasury*

---

**341. Memorandum from Ball to Rusk, January 30<sup>1</sup>**

January 30, 1961

I am enclosing a memorandum regarding balance of payments negotiations with the Germans, with particular reference to the settlement of the vested German assets question.

I met today with Foy Kohler, Bill Macomber and Ed Martin to discuss some of the political elements that are involved. Foy Kohler is sending you an EUR memorandum evaluating the German political considerations involved in the negotiations and the vested assets question.

**Attachment**

**SUBJECT**

Balance of Payments Negotiations with Germans and Vested German Assets

This memorandum covers two subjects:

1. It responds to your request for my comments on Mr. Dillon's memorandum of January 13, 1961 (Tab B) regarding the present negotiations with the Germans on actions to support the United States balance

---

<sup>1</sup> German negotiations on U.S. balance of payments and settlement of vested German assets question. Attached is a February 1 letter from Rusk to Dillon noting reservations about a U.S. commitment to compensate Germany for vested assets. Confidential. 8 pp. Department of State, Central Files, 811.10/2-161.

of payments position. It deals specifically with the question of whether we should accede to the probable German demand for the settlement of the German vested assets issue.

2. It deals generally with the question of the German negotiations.

# I

## *German Vested Assets*

I recommend against the United States undertaking a commitment with respect to the return of German vested assets as a condition for German agreement. I do so for the following reasons:

1. We should, I believe, insist that the Germans take the measures under discussion without requiring as a *quid pro quo* that we satisfy a totally unrelated demand. The actions we are asking the Germans to undertake are consistent with their obligations as a responsible member of the Western community to help relieve our balance of payments deficit which is attributable to the heavy burdens we are carrying for the defense and economic development of the whole free world. It seems to me that we would detract from the logic of our position by acceding to an irrelevant demand of this kind.

2. We are under no legal obligation to compensate the Germans for the vested assets. Agreements made following the war explicitly provide that the United States is to retain the proceeds of the assets and that only the German Government has any obligations to reimburse the owners of the assets. The fact that the German Government has not seen fit to make such reimbursement is not our responsibility.

3. Nor do I believe that there is any moral basis for the German claim. It cannot even be justified on the ground that the proceeds would be restricted to small holders since there is no limitation of the amount which would be payable to any single claimant.

4. The question of the vested assets is, as you know, highly controversial. To agree to a settlement of the assets question along the lines proposed would provoke opposition on the part of Americans with war damage claims against Germany who have not yet succeeded in obtaining legislation to provide for their compensation. In addition, we can certainly expect that a settlement of the German assets problem would evoke renewed pressures for us to settle the *Interhandel* (General Aniline and Film) matter with the Swiss as well as other vested asset problems with the Japanese.

5. If the Administration were to accede to the German request it would then be in a position where it would either have to take the full responsibility for attempting to justify the German assets settlement on legal and moral grounds—which it could not do in good conscience—or disclose to the Congress that the settlement was being exacted by

the Germans as the price for their cooperation in assisting on balance of payments difficulty.

The first alternative would represent a burden that the Administration should not be asked to assume.

The second alternative might very well generate resentment against the Germans which could poison the atmosphere for our whole foreign aid presentation to Congress.

I think it would be unwise for the Administration to accept the onus of defending either position. This feeling is intensified by the fact that the Congress would quite likely refuse to approve the legislation which the Administration requested. It has been suggested that the Germans would be satisfied if the Administration merely sought legislation, even though unsuccessfully. But I do not think that the President should run the risk of having Congress turn him down on such an issue. He will have too many other important battles to fight.

6. To the best of my knowledge there are only three arguments that could be made in support of acceding to the German demands:

(a) The vested assets question is an important domestic political issue in Germany. The granting of the concession would help Chancellor Adenauer in the fall election.

(b) In 1957 President Eisenhower issued a statement expressing his willingness to submit legislation to Congress providing for compensation to former enemy owners of vested assets. The legislation proposed by the Eisenhower Administration pursuant to this declaration provided for an initial return limited to \$10,000 to natural persons. Further payments were authorized in the event an unexpended balance were available after making certain prescribed payments. The German Government rejected it as inadequate.

(c) The urgency of the United States balance of payments deficit problem requires that we take whatever action is necessary to obtain action by the German Government as promptly as possible. It may be contended that we cannot expect a prompt response from the Germans to assist us in this problem unless we agree to concede the German asset question.

7. In approaching this question I do not believe that the Kennedy Administration should feel bound by any statements of policy which President Eisenhower may have made on this question, nor do I think that we should feel committed to any preliminary negotiating positions that may have been taken during the discussions in Bonn. For the Kennedy Administration to risk defeat on such an unpalatable issue seems to me so disadvantageous as to override any countervailing considerations.

8. I strongly recommend that we take a whole fresh look at the problem of negotiating with our allies toward a solution of the balance of payments problem. To the extent possible it seems to me desirable

that these negotiations be undertaken on a multilateral basis. Our bilateral negotiations with the Germans have not produced a happy result so far. Most of the major issues remain unresolved and we are now waiting for the Germans to come forward with concrete proposals.

9. As you know, the President plans to present a message on the balance of payments early in February. In that message he will put forth a new set of measures to ameliorate the balance of payments problem. These will include action through the OECD to obtain commitments from balance of payments surplus countries (particularly Germany) for economic and financial policies to relieve the United States balance of payments situation. I think we might well prejudice our position in multilateral negotiations by establishing the precedent of a negotiated settlement in which we agree to pay for actions on the part of our European partners in an irrelevant currency.

10. I am attaching a suggested reply to Secretary Dillon for your signature.

## II

### *German Negotiations Generally*

During the last ten days I have had private talks with almost all the members of the Senate Foreign Relations Committee and have also had a long visit with Speaker Rayburn. From these conversations it seems quite clear that if we are to be successful in obtaining passage of adequate foreign aid legislation we must be able to produce tangible evidence that our European partners are prepared to carry a heavier burden in this area.

This means that we must press quickly ahead for a resumption of the German negotiations. So far, the Adenauer Government has been uncertain as to the attitude which the Kennedy Administration would take toward German political problems. I think we would be well advised to push forward for a larger German contribution to our common responsibilities before giving the Adenauer Government too many assurances regarding our sympathy for their position on any of the problems which concern us.

With that in mind I have proposed in the attached letter to Secretary Dillon that you, he and I meet very soon to review the whole situation. (Tab A).

I am having a comprehensive background memorandum prepared which I shall send you shortly.

*Recommendation:* that you sign the letter to Secretary Dillon at Tab A.

**George W. Ball**

**Tab A**

Dear Doug:

I have your memorandum of January 13 and attached memoranda relating to the negotiations with the Germans over actions they might take that would assist our balance of payments position. I have taken note of your recommendation that these negotiations be consummated as quickly as possible and, in particular, that the United States be prepared to reach an agreement to recommend legislative action for a limited return program for vested German assets as a contribution on our part to the satisfactory completion of the present negotiations. I am, of course, anxious to have these negotiations consummated quickly and successfully and would hope to proceed with them as soon as the Germans are in a position to translate their broad interest into specific proposals.

I do have substantial reservations with respect to any United States commitment to the provision of compensation for vested German assets. It is my understanding that this commitment would be directly related to the prepayment of the GARIOA debt and that the two items would constitute a separate component of the total package under negotiation. My reservations are briefly as follows:

1. The vested assets question is a highly controversial political issue in the United States and it is questionable whether it is wise or feasible at this time to seek Congressional approval to such a commitment given the past history of the matter. I would be reluctant to endorse a commitment to submit legislation if there were no reasonable assurance that approval for such legislation could be secured.

2. We are under no legal obligation to compensate the Germans for these vested assets. Any act of grace on our part would certainly provoke opposition on the grounds of equity, particularly from Americans with war damage claims against Germany who have not yet succeeded in obtaining legislation to provide for their compensation. In addition, such action would also lead to considerable pressure from the Swiss for the settlement of the Interhandel matter as well as from the Japanese for the settlement of their vested asset problems.

3. Although I regard constructive measures to solve our balance of payments problem as being of the highest importance, it seems to me that the Germans have an obligation to make a contribution to the solution of this problem without the need for any compensatory action on our part. Even if we should prejudice the prepayment of the GARIOA debt by our unwillingness to compensate for the vested assets or to consider the vested assets question as part of a negotiated package, I believe that adherence to this principle would outweigh the relatively

minor contribution that the GARIOA debt prepayment would make to a durable solution of our balance of payments situation or to an improvement in confidence in the dollar.

4. Finally, the new measures which the President will outline in his balance of payments message will, I trust, make a substantial contribution to the solution of our present balance of payments problem. In particular, negotiations through multilateral arrangements, such as the OECD, offer a good prospect of obtaining further contributions from our Western allies in a position to make such contributions. I fear that we might well prejudice our position in multilateral negotiations by establishing the precedent of a negotiated settlement involving compensation on our part.

George Ball and I would welcome the opportunity of meeting with you at your convenience to review the vested assets question as well as the whole subject of the German negotiations.

Sincerely yours,

**Dean Rusk**

February 1961

**342. Memorandum from Rashish to Ball, February 7<sup>1</sup>**

February 7, 1961

SUBJECT

Attached Memorandum on "Tax-sparing" provision in "double taxation treaties"

The attached memorandum from Ed Martin recommends that you approve the Department's continuing support of tax-sparing provisions in our double taxation treaties with less developed countries. I recommend that you give your approval. This has been a Departmental policy and apparently has the approval of President Kennedy (see Attachment B). In any event the Department could ill-afford to revise its policy given the fact that three tax treaties, containing tax-sparing provisions, have been submitted to the Senate Foreign Relations Committee for approval.

There are some aspects of this problem, however, that are worth noting:

1. The past Administration's commitment to tax-sparing came about, as I understand it, as a result of a visit by Secretary Anderson to an Inter-American conference and because of the pressure of a number of Latin American countries for negotiation of tax treaties containing such provisions.

2. It is not at all clear that the Congress approves of tax-sparing or, for that matter, that the Treasury Department will continue its adherence to the policy.

3. The Senate Foreign Relations Committee delayed in giving its approval to the first tax treaty containing a tax-sparing provision (that with Pakistan) and only did so after the Pakistani tax legislation had expired and the tax-sparing provision therefore was no longer operative. Stan Surrey, recently appointed Assistant Secretary of the Treasury for Tax Policy, led the side against the Pakistan treaty. Moreover Wilbur Mills has made plain his opposition to tax-sparing, both on policy grounds as well as on jurisdictional grounds, i.e., he does not like the

---

<sup>1</sup> Tax-sparing provisions in LDC double taxation treaties. Attachment provides additional background information. Official Use Only. 8 pp. Department of State, Central Files, 611.00431/2-761.

idea of the Senate enacting what is in effect legislation reducing the incidents of domestic tax on domestic corporations.

4. In view of the above facts it is not at all certain that the Treasury Department's position on tax-sparing will remain fixed. Indeed the Treasury may face opposition from within as well as from Congress in connection with the three treaties now before the Foreign Relations Committee. It is difficult to imagine how Surrey can defend the three treaties before this Committee having waged such a vigorous and successful campaign before the same Committee on the Pakistan treaty.

5. Therefore, although at the present time the Department's position should be reaffirmed by you as a matter of general policy, it would be well to anticipate the difficulties that are likely to arise in obtaining Senate approval for the treaties and in particular the prospect of Treasury Department defection. I would therefore recommend that you talk to Secretary Dillon about his disposition on the matter and determine whether he proposes to hold the line in support of the three pending treaties.

#### **Attachment**

May we have an H clearance on the attached memorandum to Mr. Ball from Mr. Martin on the above subject. We would appreciate your returning this package to S/S by noon, Friday, February 3.

**C.R. Hartley**

#### **Attachment**

##### **SUBJECT**

Background Information on "tax-sparing"

Among the legislative inducements passed by less developed countries to attract new industry, there is typically included reduction or suspension of income tax. If the investors affected by these incentives also pay income tax in the United States, the tax credit provisions of the U.S. Internal Revenue Code will often reduce or cancel the incentive effect of the tax holiday, since the credit allowed against U.S. tax is generally reduced in the same amount that the foreign tax is decreased, leaving the taxpayer's total tax liability unchanged. We seek to remove this frustrating effect of the U.S. tax credit by providing by treaty, in appropriate instances, a credit for the taxes spared, as if the spared taxes had in fact been paid.

There are at present before the Senate Foreign Relations Committee three treaties including such a provision—with India, Israel, and the

United Arab Republic. A brief discussion of the subject of tax treaties, with special attention to the tax sparing feature, taken from the testimony of Dan Throop Smith, Deputy to the Secretary of the Treasury, before the House Subcommittee on Foreign Trade Policy, is attached (Tab A). Passages dealing with tax sparing are marked in red. President Kennedy, in a letter to *Business International*, published in the October 28, 1960 issue (Tab B) declared, “. . . Specific resumes that should be considered include . . . a much more vigorous utilization of tax-sparing agreements abroad.”

There has been some opposition, spearheaded by Professor Stanley Surrey of the Harvard Law School, to the principle of granting credit for taxes spared. An extract of Professor Surrey’s testimony before the Foreign Relations Committee on August 9, 1957 concerning the tax-sparing clause of the Pakistan treaty is attached (Tab C). Neither the Senate nor the Foreign Relations Committee has expressed a position on the principle of tax sparing. The only treaty ever submitted to the Senate providing credit for taxes spared, with the exception of the three now before the Committee, was that with Pakistan (1957). In that case, the Pakistan tax-sparing law expired before the Committee voted on the treaty. The Committee’s report on the treaty called for deletion of the tax-sparing provision on the grounds that it was most, without prejudice to future consideration of the principle in case the Pakistan law should be reenacted. The Senate gave its advice and consent to ratification on the basis of the Committee’s report.

The Treasury Department, in answer to an inquiry from Senator John J. Williams, agreed in October 1960 not to undertake further negotiations of treaties containing tax-sparing provisions until the Senate’s position on the principle was known, except in cases where negotiations were already at an advanced stage. The State Department’s reply to a similar letter (Tab D) avoided making any commitment of this nature.

It has been proposed, as for instance, in H.R. 5 of the 86th Congress (the Boggs Bill) that credit for taxes spared be granted unilaterally by U.S. legislation. The Department of State and Treasury feel that the provision should remain in the field of treaties (or possibly of executive agreements, if statutory authorization were given). If such a credit were authorized unilaterally by tax legislation, the U.S. would relinquish a large degree of the relativity it now exercises over the foreign tax concessions eligible for credit. Moreover, the prospect of tax sparing is the principal inducement we can offer to lose developed countries to enter into tax treaties with us. If this benefit were granted unilaterally, its incentive effect would be lost.

**Tab A**

Extract from Statement of Hon. Dan Throop Smith, Deputy to the Secretary of the Treasury (in charge of Tax Policy), before the Subcommittee on Foreign Trade Policy of the Committee on Ways and Means, House of Representatives, in its hearings on Private Foreign Investment, December 1, 1958.

The basic provisions of the tax law applicable to income from foreign sources are supplemented by a network of 21 income-tax treaties which help eliminate tax barriers to the international movement of trade and investment. Their principal purpose is to set forth agreed rules of source, either explicitly or implicitly, through reciprocal tax-rate reductions and exemptions, which reduce the cases in which two countries impose tax on the same income without either one giving recognition to the tax imposed by the other.

Let me illustrate the problem.

While we allow a credit for the tax imposed by country X on income derived in that country, our concepts of source may differ from those accepted in the foreign country. As a result, there may be a flow of income to an American firm which is considered under United States law to be income from sources within the United States, but which under the laws of the foreign country may be considered income from sources within its borders. Both countries would impose a tax on that income, but we would not allow a credit for the foreign tax, since the income does not have its origin in that country so far as the United States law is concerned.

With tax rates as they are, the combined tax burden in such a case might well exceed the total income involved. This problem arises, in greater or lesser degree, in connection with various types of international transactions, including trading activities, the rendition of personal services, licensing arrangements, and the like.

Mr. Chairman, if I may, I would like to emphasize the importance of this point I have just mentioned. It is often, I think, overlooked in discussions on the subject and thought of as simply something of a technical nature to be worked out. But it is a thing that does call for bilateral agreements for each country to accede to some degree in its basic concepts. We regard it as a key element in our treaty program, and that is one reason why we are anxious to extend the treaties.

Of late we have undertaken another step in connection with the tax-treaty program which holds considerable promise of facilitating the international movement of investment. I refer to the credit for tax incentives or tax sparing which some less-developed countries have chosen to use as part of their programs to attract capital and know-how from abroad and to encourage reinvestment of profits.

The tax-credit mechanism designed to achieve equality of tax burdens operates so as to offset, to some extent, tax incentives granted by a foreign country. For, as the tax imposed in a foreign country is reduced, whatever the reason may be, the amount of the tax credit allowed against United States tax is also reduced. When the tax credit declines, the amount of United States tax payable tends to increase, and thus to negate the tax reduction offered by the foreign country.

This has been a source of irritation among some foreign countries. Though it may not be desirable from the point of view of an ideal tax system, uniformly administered, to give a credit for an amount of tax which has not been collected by a foreign government, it is our view that, in the interest of foreign economic policy, we should recognize, rather than nullify, the revenue sacrifices made by a foreign government under certain conditions. This question is developed more fully at a later point. . . . (pp. 46–47)

One objective of the tax proposals under review is to make it possible for American firms investing abroad to benefit from the tax inducements offered by foreign governments to attract new capital. As previously noted, such inducements can now be taken advantage of by a foreign subsidiary engaged in business abroad and seeking to plow back its earnings.

However, if a business is conducted abroad through a branch, or if the opportunity and desire to reinvest are lacking, then the tax incentive offered by a foreign country is offset by operation of our tax system. This problem has already been mentioned, but the declaration of policy which the administration has made in connection with the tax-treaty program may be repeated at this point.

It has announced that we are prepared to consider the inclusion in tax treaties with less developed countries of a provision by which recognition would be given to tax-incentive schemes under so-called pioneer industries legislation or laws for the development of new and necessary industries.

Briefly, what we are proposing is this:

If a country believes that by giving up tax revenues in certain cases, it will be serving the cause of economic development, we will forego the opportunity to increase our tax revenues by nullifying their concessions. However, we would be prepared to forego this only under certain conditions.

First, there should be a firm commitment to eliminate unnecessary and inequitable tax barriers to the flow of private investment in accordance with sound rules of taxation such as are generally embodied in our income-tax treaties. This includes agreement not to discriminate against American business enterprises.

Second, its tax incentive laws should be of general application, thus assuring maximum benefit to the economy from such legislation.

Third, the conditions and terms under which the tax incentives are available should be those provided in an existing law with full disclosure of the conditions under which they are granted, and with procedures for granting or withholding tax incentives which involve a minimum of administrative discretion.

Fourth, the tax incentive should be for a limited duration of time, and preferably limited in amount.

Finally, the tax from which exemption is granted must be a genuine part of the country's tax structure and not a spurious levy created for the occasion.

Whatever one may think about a credit for taxes spared as an element in an ideal tax system, and there are some who have misgivings, it is our view that this is a sensible way to approach an issue that is of considerable importance to foreign countries and that has the seeds of substantial growth in promoting private investment abroad at a minimum cost.

It may be said of the tax treaty programs that a credit for taxes spared permits foreign governments to determine the tax burden imposed on American firms and to vary that tax burden among American firms in different ways. In a broad sense, this is quite correct. However, it is a charge that is equally true of any method of taxing foreign income which in any way removes income from the scope of the United States tax. It is true in large measure today of income derived abroad through foreign subsidiaries. (pp. 51-52)

**343. Letter from Ball to Dillon, February 22<sup>1</sup>**

February 22, 1961

Dear Doug:

I would like an opportunity to discuss with you at your earliest convenience a matter of mutual interest—that of the negotiation of treaties with less developed countries for the avoidance of double taxation on income, with special attention to the subject of “tax sparing”.

As you know, the prospect of obtaining by treaty a United States tax credit for taxes spared to attract new investment is the principle, if not the only, inducement for less developed countries to enter into tax treaties with our country. In addition to the treaties with India, Israel, and the United Arab Republic, which are currently before the Senate Foreign Relations Committee, treaties including such a provision are in an advanced stage of negotiation with Ceylon, Chile, the Republic of China, Ghana, and Peru. The tax-sparing principle has also been discussed with Malaya and Thailand, although negotiations with those countries are less advanced. It is expected that other less developed countries will soon wish to negotiate treaties providing credit for taxes spared. The Ghanaian treaty is especially urgent because its entry into force by October 1961 is a condition of the pending Valco investment.

Because doubts as to the propriety of the tax-sparing principle have been expressed by various individuals, including members of the Senate, I wish to discuss the matter with you, with a view to affirming a joint State-Treasury position. It is my belief that inclusion of a tax-sparing clause is vital to our tax treaty program with the less developed countries. The treaty program in turn is important to our foreign policy objective of encouraging American private enterprise to contribute to the economic development of these countries. You will recall that President Kennedy is on record as having favored a much more vigorous utilization of tax-sparing agreements abroad.

I hope we can get together very soon on this matter.

Yours ever,

**George Ball**  
*Under Secretary for  
Economic Affairs*

Mr. A.C.I. Samuel  
Mr. John Thomson

The President opened the series of talks by expressing his great pleasure at the opportunity to welcome the Prime Minister to the United States again. He recalled Mr. Macmillan's meetings with his predecessors. The President extended a welcome also to the Foreign Secretary. He said he wished to make the visit as mutually beneficial as possible.

Turning to agenda item 1, "International Economic Problems", the President said the Prime Minister could be of special help to us in the economic field particularly in Western Europe. The US is facing some serious decisions posed by the outflow of gold and the necessity of obtaining a renewal of the Reciprocal Trade Act. What happened in Europe, what happened on the Sixes and Sevens problem, would have a deep effect here. The President requested the Prime Minister to give us his views.

Claiming that he was only an amateur, the Prime Minister said he wished to touch on two themes which he thought ran through all of our problems. The first was the relations of the Communists and the

---

<sup>1</sup> "International Economic Problems." Secret. 4 pp. Department of State, Presidential Memoranda of Conversation: Lot 66 D 149, January-April 1961.

West. During the past ten years the position of the Communists had grown stronger while ours had become weaker. They had gained and we had lost. This was because the free world was more divided than at any time since the war. Unity was essential. There must be unity in banking, monetary and trading policies. Then by trade and aid the West could help the underdeveloped countries. With the revival of Europe a third force had come into being. The European powers were not interested in problems elsewhere in the world. For example in Southeast Asia, Germany was not involved; France took a detached attitude; Italy stood aside. The Europe of the Six had declared itself non-interested. We must operate to reunite this dangerous division. Today Europe was doing to itself what it did in the 19th century. Under the leadership of the President the West must be reunited.

The second theme he wished to develop, the Prime Minister said, was economic and financial. The short-term and long-term aspects should be considered. Both Great Britain and America had balance of payments troubles. Yet ours were the reserve currencies of the world and thus carrying a double strain. He understood that plans developed by British and American experts were very close together. More pressure was required on the surplus countries. We must decide if the imbalances are epidemic and endemic. The German surplus was almost the same as the sums spent by the US and UK in that country for military purposes. This was an extraordinary paradox. As a short-term measure we should consider enlarging the IMF. Inducing surplus countries to permit currency drawings beyond their established quotas should enable us to get through this year. It is necessary to find ways to increase liquidity. The central banks have shown a most cooperative willingness to help. This cooperation might also help in the long term.

Regarding the longer term, the Prime Minister emphasized that he could not see how we could do four times the amount of trade with only two times the amount of credit. He referred to British experience during the depression of the 30's when Great Britain had allowed money to be the master and as a result had the worst unemployment ever experienced by a capitalist system. We must increase the amount of credit whether by the Triffin or Bernstein plan or some other way. We must also correct the imbalances. One player just could not collect all the digits and just sit on the money. There must be an understanding of the rules of the game. England in the 19th century was a rich country and reinvested its capital abroad. Since the war America has done the same. Now the new Europe must do the same. There was a practical political problem involved. De Gaulle had not forgotten how he and France were treated by Churchill and Roosevelt when they were down and out. We must work through the International Bank or central banks to prevent these imbalances. Capitalist society cannot survive unless

it is running at top speed. The only true thing Marx said is that capitalism must expand or collapse. Formerly, we used to consider these problems within our own countries. Now, unless the Free World as a whole can cope with them in the next few years, the Russians will attract more and more power and we will lose out in the game.

The President asked Secretary Dillon to comment. Mr. Dillon referred to the extensive talks we have been having with British experts and his continuing written exchanges with the Chancellor of the Exchequer. He said we are in fundamental agreement on what must be done immediately. We are addressing ourselves in the first instance to the short-term problem. We must get action promptly. Assets from Germany, Italy and France should be available to make an IMF drawing possible if it should be needed by the US or UK. He did not foresee such a need on the part of the US. We will meet resistance in the Fund as others will not wish to make their currencies available.

Mr. Dillon continued that we were still working on Germany but had not yet achieved the success the British had. We thought the German agreement to purchase military equipment from the UK was fine. It was the easiest thing the Germans could do to relieve the balance of payments problem.

The US is still studying the long-term matters itself, Mr. Dillon explained. The basic problem is not only to find the best solution, but to find something our Congress and the Parliaments of other countries will approve. We are really asking the countries to give up a portion of national sovereignty. We must anticipate substantial political difficulties. We should not prejudice the immediate short-term objectives by talking about the longer-term problems in a European forum now.

The Prime Minister agreed that we should concentrate on short-term matters and discuss the longer-term ones further between ourselves. The President concurred.

The President said we certainly do not wish to reduce our troops in Europe. If in another year we are still losing gold it will put us under tremendous political difficulties here. There will be pressure to reduce our aid or our military effort. We do not want to do either. It is not a satisfactory situation when keeping our troops in Europe costs \$150 million. We must have a suitable arrangement with Germany or we will be under great pressure.

The Prime Minister noted that the UK was spending 170 million odd pounds on British troops in Europe. Unless something is done this drain will continue as long as NATO continues. Should we reduce our troops or should we devise a plan by which our money going into Europe comes back out? We must examine this together or NATO may breakdown. Perhaps two brigades could be brought back to England

and used to protect Norway and Schleswig-Holstein from there. Maybe the UK should bring its troops back.

The President emphasized that we must dispel the unfortunate impression in Germany that our troops are semi-occupation forces. We are willing to bear the internal payments burden. The outflow must be stopped. This matter must be brought to a decision shortly.

June 1961

**345. Memorandum of Conversation, June 14, among Stikker, Ball, and Fessenden<sup>1</sup>**

June 14, 1961

SUBJECT

Balance of Payments Problems

PARTICIPANTS

Mr. Dirk Stikker, Secretary-General, NATO

Mr. A. Saint-Mleux, NATO International Staff

Mr. George W. Ball, Under Secretary for Economic Affairs

Mr. Russell Fessenden, Director, Office of European Regional Affairs

Mr. Stikker said that he wanted to discuss the U.S.-German bilateral discussions which are designed to help alleviate the U.S. balance of payments situation and to raise the question of whether these discussions might be in the NATO framework, given the fact that other countries, such as the U.K., also have similar difficulties. Mr. Stikker said that NATO might be able to be of assistance in this matter, and recalled that Spaak had in fact played a role five years ago when the British were having serious balance of payments difficulties affecting their forces in Germany. Mr. Stikker went on to point out that the Europeans are in fact doing more in the way of defense expenditures today than they had in the past. Figures show some increase—their infrastructure contribution also, in relation to the American share, has considerably increased. As far as aid to less-developed countries, recent OEEC figures show considerable increase, although there may be some question about the OEEC figures.

Mr. Ball said that this general problem is one that might be more fully discussed with Secretary Dillon. Briefly, however, the balance of payments situation seems to be as follows: The short-term capital aspects are well in hand and the situation seems satisfactory. The longer-term balance of payments problem is not so satisfactory. We are making some progress but the basic problem by no means appears to be solved. For the present, the balance of payments situation is temporarily benefiting from the fact of a high rate of economic activity in Europe and a relatively low rate in the United States. Mr. Ball confirmed that we are having bilateral discussions with the Germans,

---

<sup>1</sup> Balance of payments issues. Confidential. 2 pp. Department of State, Central Files, 811.10/6-1461.

covering two fields: 1) Procurement of military hardware from the U.S. is being discussed. The French and the British are also having similar discussions with the Germans. We do not feel that our discussions to date have been entirely successful. 2) We are also discussing with the Germans possible sharing of U.S. military facilities in Germany. This is a difficult and complicated problem in which progress is bound to be slow. As for the OEEC figures on aid to less-developed countries, there is some question as to their real significance with respect to the impact on the balance of payments. The OEEC figures are largely in the category of gross capital movements.

Mr. Stikker also asked what we had in mind in our reference in the February 17th Aide-Memoire to the Germans regarding urgent consideration of burden sharing in the defense field in NATO.

Mr. Fessenden replied that we do not have in mind an exercise designed to arrive at some sort of formula for relative defense contributions by NATO countries. Mr. Fessenden also pointed out that our current discussions of NATO planning and strategy do involve increased contributions towards the common defense. We in particular are stressing the need for increased effort in providing better conventional forces for NATO defense. We do not have in mind setting up special new NATO burden sharing machinery. We already have in the Annual Review process established procedures for examining relative defense efforts of member countries.

The Secretary called on Secretary Dillon to speak on the subject of the United States balance of payments. Secretary Dillon opened his remarks by stating that he would like to associate himself with the statement made earlier by Secretary Rusk about the GARIOA settlement. He expressed great pleasure that a mutually satisfactory settlement of this difficult and vexing problem had been reached.

Turning to the United States balance of payments situation, Secretary Dillon noted that there has been a considerable improvement in the first few months of this year, the upturn having begun late last year. For the past three years there have been very substantial deficits; for 1960 the figure was \$3.8 billion. However, an analysis of this figure discloses that there was a great improvement in the basic trade deficit, from \$4 billion in 1959 to \$1.9 billion in 1960; the remaining \$1.9 billion in 1960 was the result of short term capital movements.

In the first quarter of 1961 the overall deficit was at the annual rate of \$1.2 billion, made up of a deficit from short term capital movements at an annual rate of \$1.9 billion (identical to 1960) and a *surplus* in the basic trade account at an annual rate of \$700 million (compared with the 1960 figure of \$1.9 billion).

Several points should be made about these figures. The surplus in the basic account is not as favorable as it appears. It is largely the result of a decline in imports due to our business recession which reached the low point of the cycle during the first quarter. Imports (annual

rate) were \$1.3 billion less than last year. Thus, if imports had equalled those of last year, the basic trade account would show a deficit of \$600 million (annual rate) instead of a surplus of \$700 million. The business upswing has now begun and we should begin to see higher import levels in the fall. We expect that they will return to the December 1959 level which was \$2 billion over the level of the first quarter of 1961. This level of imports would create a deficit in the basic trading account of about \$1.25 billion.

While our imports have been temporarily low because of the business recession in the United States, the economies of Europe and Japan have been booming and our exports have been good. We hope this will continue. On the other hand, the temporary drop in our import level should soon be corrected and this will produce a continued imbalance in our international payments. We therefore believe we must continue with the President's program to preserve a reasonable balance in our international payments, for such a balance is essential to the maintenance of the value of the dollar.

Looking to the future, we hope, by carrying out the President's program, to reduce our out-payments by \$1 billion to \$1.5 billion. At the same time we expect our commercial imports will increase by about \$2 billion so that the other trading nations of the world will not be hurt by our reduced out-payments under the President's program.

With respect to the short term capital flow, the rate of the outflow for the first quarter of 1961 was the same as for the whole of 1960, but was much less than the very high rate reached last fall. This year the components of the short term capital outflow are also different. Last year there was a combination of substantial capital outflows for business reasons, such as the search for higher interest rates, plus large speculative outflows. The latter have all but disappeared, but the outflow for business reasons continued during the first quarter of 1961 at approximately the same level as 1960.

The short term capital outflow in the first quarter of 1961 had some interesting aspects. The largest amount went to Japan as financing for Japanese imports from the United States. The next largest amount went to Germany, where German businessmen were borrowing dollars in New York as a hedge against a possible further revaluation of the German mark. (We do not think the Germans will revalue the mark again.) Because of these special factors, we think the short term capital outflow situation during the first quarter of 1961 is better than it appears on the surface. Greater confidence is also being shown in the value of the dollar. There has been a net gold inflow of more than \$100 million since February.

Prime Minister Ikeda expressed his appreciation for Secretary Dillon's analysis of the balance of payments situation. He had watched

the situation very closely and considered that it was no longer a cause for great concern. On the Japanese side, gold and dollar reserves have been built up to about \$2 billion but there have been deficits on merchandise account of about \$600 million so far this year. This is a matter of considerable concern and is a question which the Japanese view as a real test for the Ikeda Cabinet. The Prime Minister said he anticipated that business conditions would improve in the United States in the second half of 1961 and expected that Japan's situation would be helped by substantially greater United States imports from Japan later this year. He expressed the hope that the United States could assist Japan in balancing its payments by continuing to make purchases in Japan from ICA and DLF funds.

Prime Minister Ikeda noted that there are two primary reasons for the imbalance in the Japanese payments situation. First, Japan has liberalized the importation of cotton and wool, and purchases of these commodities have increased considerably. Second, as a result of Japan's trade liberalization program, Japanese manufacturers feel they must improve the productivity of their plants by importing large quantities of expensive industrial equipment. Japan is devoting 20 percent of its GNP to capital investment. It needs this high rate of investment because it is the least developed of the well-developed countries. The rising imports are not for luxury goods but for raw materials and a greatly increased quantity of industrial machinery. Most of this machinery is being bought in the United States.

**347. Telegram 2670 from Paris, November 18<sup>1</sup>**

Paris, November 18, 1961

Pass Treasury for Roosa and Daane from Leddy. Subject: Special Resources Through IMF.

After series bilateral talks earlier in week reps of following countries met afternoon Nov 17 to discuss US-French draft "statement relating to creation of special resources for use by participating countries through IMF": Belgium (Janson), Netherlands (Lieftrinck), Canada (Plumptre), France (Sadrin and Esteva), Germany (Emminger and Schleiminger), Italy (Oscola of Bank of Italy and Cardinali), Sweden (Wickman), UK (Rickett and Portsmore), US (Leddy and Willis). Sadrin chaired. Jacobsson and Staff (Gold and Polak) participated. Holtrop and Van Lennep had left Paris but Leddy discussed paper with them earlier in week.

US-French statement, copies of which being brought by Undersecretary Fowler, is based on discussion NAC staff meeting Nov 9.

Results of meeting:

1. General approach of statement appeared acceptable most countries although none in position commit.

2. Agreed that French would call special meeting in Paris of proposed participating countries in advance NATO Ministerial in December, in order seek agreement on definitive text which could be approved by Ministers as document their govts prepared support in IMF Exec Board. Meeting would also consider any further understanding among PC's themselves on procedure to be followed in their consultations.

3. Jacobsson asked prepare draft of IMF decision in light US-French statement and views expressed by various countries. This would be considered at special meeting in Paris referred to above. Jacobsson agreed he would "use ingenuity" in drafting text which would meet views expressed by continental Europeans (especially France), which he specifically accepted, that participating countries must control decision over lending from special resources for specific transaction envisaged. He cited desire to accommodate legal and technical problems of IMF and maintain basic framework of IMF. Noted problem of "handling" LDC's. Sadrin emphasized problem of "handling" European industrial

---

<sup>1</sup> U.S.-French draft re creation of IMF special resources fund. Official Use Only. 5 pp. Department of State, Central Files, 398.13/11-1861.

countries, where parliaments not receptive to global use of funds, and stated French-US paper was "our Bible" as to major principles. Several countries, including UK, specifically asked that proposed Jacobsson draft be treated as working paper which would not be circulated to non-participating countries at this stage. We also consider this important. No clear commitment given by Jacobsson on this point.

(US in close consultation Jacobsson throughout week, prior to meeting. Following meeting he assured Leddy he would keep in close touch with US as drafting proceeded in Washington.)

4. Substantive points raised in discussion by other countries included following major questions:

A. Voting procedure. While most thought some weighted voting procedure possibly desirable none satisfied with US-French idea of 60 percent of non-borrowers and felt formula required much further clarification. Some tendency toward voting procedure limited only to decision to activate resources, with amount of loan and allocation among lenders left to less formal decision by negotiation. UK considered essential make each country judge of its own financial ability contribute to specific lending operations although accepted idea no country should be allowed arbitrarily refuse lend, without showing cause.

B. Reversibility. Dutch, Italians and Germans consider reversibility procedure inadequate since it would not permit them treat loans as demand assets which could be counted as part of reserves. This problem important since in case these countries and perhaps others, funds will come from Central Banks rather than govts. German rep stated his govt had indicated unwillingness proceed by budgetary approach. Dutch proposed that problem be handled by giving lender additional gold tranche drawing rights under ordinary resources of Fund equal to amount of loan. Germans cited IMF paper and referred to rights "similar to gold tranche". US inquired whether this meant larger claim on Fund's gold. Neth disclaimed this as motive. (US did not specifically raise at meeting various difficulties in relating this suggestion to major principles of US-French paper, such as limitation of use of special resources and counterpart to PC's, and problem of claim on Fund's existing gold without contributing gold as under quota, but has noted these objections privately with French. Problem needs further consideration, to find acceptable solution.)

C. Counterpart. British have expressed to us the view counterpart should not be sterilized but should be usable for relending by Fund to non-participating countries. No support expressed by others for this view at meeting, and UK did not raise matter clearly at meeting. Rather took line that in general paper required further study.

D. Security of loans. Italians and probably some others would favor having ordinary resources of Fund stand behind repayment of loans

from special resources in event of default by borrower. Italians raised point, and Jacobsson took affirmative view. US has pointed out to French, who agree, that such arrangement might prejudice basis for insisting that participating countries control specific lending decisions, as well as limitation of use of special resources to PC's.

Use of special resources by small PC's

Plumptre (Canada) indicated Canadian Ministers not yet decided whether to participate in lending arrangement, because of position as large importer of capital. Important consideration in decision is whether or not initial recourse to special resources limited to key currencies which alone could represent threat to impairment world payments situation. If so limited would rule out Canadians. Sadrin stated difficult to define clearly eligible transactions. Agreed give further consideration this point.

Summary of meeting by Sadrin (Chmn)

1. Jacobsson would prepare draft IMF decision emphasizing main points in US-French paper and discussions at meeting, and indicating points that might be more appropriate in separate understanding among participants, and which could include his supplementary comments.

2. A borrowing country will not ask help from special resources unless there is a serious situation, and potential lenders recognize that it would be a very serious matter to refuse help in such a situation.

3. French to take lead in calling Meeting of Experts before WP3 meeting in December (Emminger suggested Dec 4–5).

In separate US-French meeting prior to multilateral discussions reported above, Baumgartner said he confident successful negotiations could be completed by end of year. He will take lead at meeting of six Finance Ministers December 1 and 2 to develop full six support for approach desired by France and US.

Leddy, Willis and Smith will spend Monday, Nov 20, in London for further talks with UK.

December 1961

**348. Telegram 3001 from Paris, December 9<sup>1</sup>**

Paris, December 9, 1961

For Treasury from Leddy. Pass Southard. Reference: Embtel 2963.

As result discussions here December 8 and 9, draft agreement revised, made more concise and converted into form of letters addressed by French Finance Minister (in his capacity of Chairman Ministerial meeting) to each of other participants and short replies confirming understanding as set forth in letters. Text of exchange of letters, draft confirmations thereof, and suggested minute of Ministers meeting to be before Ministers next week, contained in immediately preceding telegram. Jacobsson is cabling over weekend full text of draft fund decision for distribution to EXED Board members. Southard can obtain copy from Fund Monday morning. Basis these documents request Treasury obtain NAC telephone poll accordance Secretary's request. Consensus of meeting here December 9 that only four major questions expected to be discussed by Ministers: (1) Amount of commitments of participants;

(2) Duration of Fund decision (3 or 5 years);

(3) Method of voting procedure (on which clear reservation only by Netherlands);

(4) Chairman of Ad Hoc Committee.

Paris, December 13, 1961

Pass Treasury and Southard. Ref: Embtel 3064.

Following is verbatim text of exchange of letters as agreed today by the Finance Ministers and other principal financial reps with respect to supplementary resources for IMF:

Begin text of letter from Minister Baumgartner to other participants:

Dear . . .:

The purpose of this letter is to set forth the understandings reached during the recent discussions in Paris with respect to the procedure to be followed by the participating countries and institutions. (Hereinafter referred to as "the participants") in connection with borrowings by the International Monetary Fund of supplementary resources under credit arrangements which we expect will be established pursuant to a decision of the executive directors of the Fund.

This procedure, which would apply after the entry into force of that decision with respect to the participants which adhere to it in accordance with their laws, and which would remain in effect during the period of the decision, is as follows:

A. A participating country which has need to draw currencies from the International Monetary Fund or to seek a stand-by agreement with the Fund in circumstances indicating that the supplementary resources might be used, shall consult with the Managing Director of the Fund first and then with the other participants.

B. If the Managing Director makes a proposal for supplementary resources to be lent to the Fund, the participants shall consult on this proposal and inform the Managing Director of the amounts of their currencies which they consider appropriate to lend to the Fund, taking into account the recommendations of the Managing Director and their present and prospective balance of payments and reserve positions. The participants shall aim at reaching unanimous agreement.

C. If it is not possible to reach unanimous agreement, the question whether the participants are prepared to facilitate, by lending their currencies, an exchange transaction or stand-by arrangement of the kind covered by the special borrowing arrangements and requiring the Fund's resources to be supplemented in the general order of magnitude

---

<sup>1</sup> Text of exchange of letters on supplementary resources for IMF. Official Use Only. 4 pp. Department of State, Central Files, 398.13/12-1361.

proposed by the Managing Director, will be decided by a poll of the participants.

The prospective drawer will not be entitled to vote. A favorable decision shall require the following majorities of the participants which take part in the vote, it being understood that abstentions may be justified only for balance of payments reasons as stated in para D:

(1) A two-thirds majority of the number of participants voting; and  
(2) a three-fifths majority of the weighted votes of the participants voting, weighted on the basis of the commitments to the supplementary resources.

D. If the decision in para C is favorable, there shall be further consultations among the participants, and with the Managing Director, concerning the amounts of the currencies of the respective participants which will be loaned to the Fund in order to attain a total in the general order of magnitude agreed under para C. If during the consultations a participant gives notice that in its opinion, based on its present and prospective balance of payments and reserve position, calls should not be made on it, or that calls should be for a smaller amount than that proposed, the participants shall consult among themselves and with the Managing Director as to the additional amounts of their currencies which they could provide so as to reach the general order of magnitude agreed under para C.

E. When agreement is reached under para D, each participant shall inform the Managing Director of the calls which it is prepared to meet under its credit arrangement with the Fund.

F. If a participant which has loaned its currency to the Fund under its credit arrangement with the Fund subsequently requests a reversal of its loan which leads to further loans to the Fund by other participants, the participant seeking such reversal shall consult with the Managing Director and with the other participants.

For the purpose of the consultative procedures described above, participants will designate representatives who shall be empowered to act with respect to proposals for use of the supplementary resources.

It is understood that in the event of any proposals for calls under the credit arrangements or if other matters should arise under the Fund decision requiring consultations among the participants, a consultative meeting will be held among all the participants. The representative of France shall be responsible for calling the first meeting, and at that time the participants will determine who shall be the chairman. The Managing Director of the Fund or his representative shall be invited to participate in these consultative meetings.

It is understood that in order to further the consultations envisaged, participants should, to the fullest extent practicable, use the facilities

of the international organizations to which they belong in keeping each other informed of developments in their balances of payments that could give rise to the use of the supplementary resources.

These consultative arrangements, undertaken in a spirit of international cooperation, are designed to insure the stability of the international payments system.

I shall appreciate a reply confirming that the foregoing represents the understandings which have been reached with respect to the procedure to be followed in connection with borrowings by the International Monetary Fund under the credit arrangements to which I have referred.

I am sending identical letters to the other participants—that is, Belgium, Canada, Germany, Italy, Japan, the Netherlands, Sweden, the United Kingdom and the United States. Attached is a verbatim text of this letter in English.

The French and English texts and the replies of the participants in both languages shall be equally authentic. I shall notify all of the participants of the confirmations received in response to this letter.

End text.

Begin text of replies of other participants:

Dear Mr. Minister:

This is in reply to your letter of . . . setting forth the understandings reached during the recent discussions in Paris with respect to the procedure to be followed by the participating countries and institutions in connection with the borrowings by the International Monetary Fund of supplementary resources under credit arrangements which we expect will be established pursuant to a decision of the Executive Directors of the Fund.

On behalf of . . . I am pleased to confirm that we are in agreement with the statement of understandings as set forth in your letter of . . . I am attaching, in accordance with your suggestion, the (begin bracket) French (end bracket) (begin bracket) English (end bracket) text of this letter of confirmation.

End text.

Gavin

February 1962

351. Memorandum from Dillon to President Kennedy,  
February 28<sup>1</sup>

February 28, 1962

As I mentioned to you on the telephone, the Ways and Means Committee has completed action on the tax bill by adopting provisions on foreign income. What they have done essentially is to tax all income of whatever sort accruing to tax haven companies anywhere in the world with the sole exception that if such income is promptly reinvested in an underdeveloped country it will not be subject to tax. This provision will probably cause great pain and anguish among American manufacturers who have been using tax havens abroad, particularly in Switzerland.

The action of the Committee was violently attacked by John Byrnes as isolationism and as unfair to American business operating abroad. I believe the legislation is moderate and long overdue. The fact is that other countries, with very few and limited exceptions, do not permit their industrialists to make use of tax haven techniques. This is largely an American invention of the last few years and is not at all necessary for the successful operation of our investments abroad.

(1) These measures do not prevent a United States company from competing abroad through a foreign subsidiary on equal terms with the local competitors in the line of business and the country chosen for its operations—it does not eliminate the deferral of United States tax on the foreign operations so long as it is not tax haven income or unreasonably accumulated income. For example, the nontax haven United States foreign subsidiary in Germany can defer paying tax to the United States on profits on its German operations provided it does not accumulate those earnings excessively—and then it can avoid the tax by investing them *in the line of business it has chosen* in Germany or in Western Europe or in *any* line of business in *any* of the less developed countries.

(2) Nor do these measures confuse the legitimate foreign subsidiary with the tax haven. They do not affect adversely the legitimate foreign subsidiary *if* less than 20 percent of its income is in the form of income usually regarded as tax haven income (either passive income such as

---

<sup>1</sup> Hill action on tax bill adopting provisions on foreign income. No classification marking. 2 pp. Kennedy Library, Dillon Papers, Memos to President, 1/62-4/62, Box 8.

dividends, interest, etc., or trading profits on transactions outside the country of incorporation), *and if* it does not excessively accumulate profits.

(3) These changes will deter the company which invests abroad largely because of tax haven advantages.

This action should have a substantial favorable effect on our balance of payments. We estimate that it will bring in at least \$75 million a year out of operations currently under way abroad and that it will remove a substantial part of the tax incentive for new investments abroad, thereby reducing the accumulation of capital for new direct investment overseas. It is not possible to estimate how much this will be.

Finally, if Mr. Byrnes decides to try to make this a political issue, I am confident that he has the wrong end of the issue as long as we continually make it crystal clear that what we are doing is attacking tax havens and not legitimate American business.

**Douglas Dillon**

March 1962

352. Memorandum from Trezise to Acting Secretary, March 20<sup>1</sup>

March 20, 1962

SUBJECT

Ways and Means Committee Bill on Tax Treatment of Foreign Income

The bill that emerged from the Ways and Means Committee is extremely complicated. In a meeting at Treasury on March 16 attended by Isaiah Frank, Stanley Surrey outlined its main features.

1. Income of a controlled foreign corporation is to be currently taxed without deferral if derived from the licensing or use of patents, copyrights and exclusive processes developed in the United States. Income of a controlled foreign corporation derived from sales of products manufactured in the United States is to be currently taxed to the extent that the profits are allocable to the parent company.

2. Tax-haven income other than that defined in 1 above—i.e., base company income from interest, dividends, rents, royalties and “trading profits”—is to be taxed as earned whether or not distributed to U.S. shareholders, except if it is reinvested in underdeveloped countries.

3. Income of operating companies engaged in manufacturing or mining is also taxable without deferral unless the profits are either left in the same business or reinvested in underdeveloped countries.

The definition of investment in less-developed countries which would qualify for deferral under 2 and 3 is rather narrow. It would apply to branch or equity investment, and, in the latter case, the subsidiary in the less-developed country must be controlled to the extent of more than 50 per cent by U.S. interests (unless the laws of the country prevent majority ownership). Surrey is giving consideration to proposing widening the qualifying investment to include loan capital, which is often more acceptable to the less-developed country, and also to making less stringent the rule relating to percentage of ownership.

Although Treasury has not fully worked through the complexities of the bill, it would appear to us to go a long way toward a sensible compromise among divergent views on this subject. It would eliminate most of the tax-haven abuses while permitting deferral for bona fide reinvestment in existing enterprises in advanced countries. At the same time it is consistent with our policy of promoting private investment in the less-developed countries by allowing deferral for reinvestment

---

<sup>1</sup> “Ways and Means Committee Bill on Tax Treatment of Foreign Income.” Official Use Only. 2 pp. Department of State, Central Files, 811.112/3-2062.

in less-developed countries either of tax-haven income or of income from operating subsidiaries. We are, of course, not in a position to assess the administrative feasibility of the new provisions and expect that they will be subject to continued attack on this score.

There are many other changes incorporated in the bill which would tighten the taxation of foreign-earned income—e.g., the gross-up provision, and the establishment for the first time of a limitation on the exclusion from tax of income of U.S. citizens establishing residence abroad. A fuller listing of the changes in tax treatment included in the Ways and Means bill is contained in the attached Treasury summary.

May 1962

**353. Memorandum from G. Griffith Johnson to U. Alexis Johnson, May 18<sup>1</sup>**

May 18, 1962

SUBJECT

General Objectives, Provisions, and Status of the Proposed Tax Legislation

The Administration objective in the proposed new legislation, as far as measures affecting U.S. investment and other interests abroad are concerned, is primarily to remove the existing tax advantages that encourage U.S. private investment in highly industrialized countries and in tax havens, in preference to investment in the United States and in the less developed countries. The sponsors of this tax reform expect that it will help control our unfavorable balance-of-payments position, contribute to the stimulation of the growth of our domestic economy, aid our policy of promoting investment in underdeveloped areas; increase the revenue; and help to equalize the tax burden.

The House of Representatives has already approved a bill (H.R. 10650) that includes a very large proportion (but not all) of the Administration recommendations. Among the principal innovations in this bill that would affect U.S. investments or other interests of American citizens abroad are: (1) abolition of the tax deferral privilege for the earnings of American controlled foreign corporations in industrialized countries, except earnings reinvested in the active conduct of the trade or business or reinvested in a less developed country; (2) imposition of a relatively low ceiling (\$20,000 per year for the first three years of residence, \$35,000 thereafter) on the exclusion from taxable income of the income of U.S. citizens who reside abroad; (3) subjection of real estate located abroad and owned by U.S. citizens to the U.S. estate tax; (4) provision for taxation of certain gains by U.S. citizens and corporations as ordinary income instead of capital gains, such as certain distributions by foreign trusts, gains from sales of stock in U.S. controlled foreign corporations and in foreign investment companies under certain conditions; (5) inclusion of the amount of the foreign tax paid in the basis upon which the U.S. tax is calculated (the "gross-up" technique) in allowing credit for foreign taxes paid by a foreign subsidiary of a U.S. corporation.

---

<sup>1</sup> Objectives, provisions, and status of proposed tax legislation. Official Use Only. 2 pp. Department of State, Central Files, 811.11/5-1862.

The House bill is now before the Senate Finance Committee. Hearings were completed May 11, and the Committee is scheduled to go into executive session on the bill on May 23. The Treasury Department is seeking a number of changes in the House bill, particularly adoption of the original Administration proposal for the general elimination of tax deferral for the operations of controlled foreign corporations in developed countries (the House bill would continue to permit rather extensive deferral in certain circumstances).

Business groups have registered strong protests against a number of the general proposals of the Administration and against specific provisions of the House bill. Among the principal objections are the following: (1) investments in developed countries stimulate U.S. exports, and elimination of tax deferral will destroy the stimulus; (2) elimination of deferral will place U.S. businesses abroad in a bad competitive position as compared with the businesses of other countries which will continue to enjoy tax favors; (3) recruitment of U.S. citizens for the staffs of foreign businesses will be made very difficult if they are denied the tax exemption to which they have been entitled in the past; (4) U.S. foreign investment produces a long-term favorable rather than unfavorable effect upon the U.S. balance-of-payments position, since a very large part of the investments are financed by foreign borrowing and reinvestment of earnings, and since a large part of the earnings are regularly repatriated; (5) the drastic provisions directed at tax-haven operations will do serious damage to the economies of certain under-developed areas, such as Panama, the West Indies, etc.

---

**354. Memorandum from G. Griffith Johnson to U. Alexis  
Johnson, May 25<sup>1</sup>**

May 25, 1962

SUBJECT

The Proposed Tax Legislation

The following information and comment regarding the proposed tax legislation is supplemental to my memorandum of May 18.

---

<sup>1</sup> Further information on proposed tax legislation. Official Use Only. 2 pp. Department of State, Central Files, 811.11/5-2562.

The proposal to abolish the tax deferral privilege for foreign subsidiaries of American corporations is probably the most significant part of the contemplated legislation as far as possible impact upon U.S. interests abroad is concerned. Under present law, undistributed earnings of American controlled foreign corporations are not subject to U.S. tax. The tax is deferred until the earnings are distributed as dividends, and then the tax liability is upon the shareholder.

The Treasury Department is convinced that tax deferral has given artificial encouragement to foreign investment and has deterred the repatriation of foreign earnings, thus contributing to the balance-of-payments deficit. This aspect of the matter has been greatly aggravated, in the Treasury view, by tax-haven operations, in which income of the U.S. corporations and their foreign subsidiaries is attributed to subsidiaries set up in countries with low income tax rates, such as Switzerland.

The Administration has recommended that tax deferral for controlled corporations operating in economically advanced countries be eliminated entirely. This would be done by assessing tax on a pro rata basis against the shareholders of the controlled corporation just as though the earnings had been distributed as dividends. It would continue to allow deferral for subsidiaries established in less developed countries, except subsidiaries clearly engaged in tax-haven operations.

The Ways and Means Committee accepted only in part the Treasury position on tax deferral. The bill it reported, which was approved by the House, contains a very complicated section on the subject. Its general effect, however, would be to tax to the shareholders the controlled corporation's income except the part reinvested in the required activities of the trade or business or reinvested in a less developed country. A large part of the provisions of the section are designed to assure that deferral privileges are not usually extended to income derived from passive investments or from tax-haven operations, while allowing freedom for the enterprise to plow back sufficient earnings to maintain its competitive status.

The Department of State has an important interest in the tax legislation from several points of view. Effective measures to reduce the balance-of-payments deficit are very important from the standpoint of our foreign policies. The relationship of taxation to our policies for encouraging investment in the less developed countries has always been regarded as a significant factor. We should be very much concerned, also, if the proposed new tax policies should so antagonize the business community as to stimulate opposition to other essential pieces of legislation, such as the Trade Expansion Act or the foreign aid legislation.

The Department has not up to the present, however, attempted to intervene with respect to any basic provisions of the proposed legisla-

tion, although it has been pressed to do so by private interests in a number of instances. The main features of the proposed legislation, including the elimination of deferral, were specifically recommended by the President in his tax message to Congress. The Department has joined with Treasury in seeking the elimination of a provision in the House bill that would interfere with the application of the existing treaties for the avoidance of double taxation. It has also referred to the Treasury for action (with successful results) protests of certain foreign governments against provisions of the bill that would require Americans serving as directors or officers of any foreign corporation to submit to the Treasury such information as it might require regarding the foreign corporation. Adverse criticism of the proposed legislation has generally been referred to the Treasury without recommendation or suggestion.

The elements of the business community involved in foreign investment contend that the Administration tax policy, if enacted into law, will seriously injure American business interests abroad. It is emphasized that other countries do not tax foreign earnings of their corporations, and that the competitive position of the U.S. enterprises will be seriously affected. Some of them take the view that because they have established their businesses under the tax deferral regime, it would be inequitable to deprive them of the privilege now. It is also argued that the special risks accompanying foreign operations entitle enterprises operating abroad to special tax advantages.

The Treasury Department has answered these arguments by asserting that taxation of the undistributed earnings will not make foreign investment generally unprofitable, although it may slow expansion somewhat; that the Finance Ministers of several European governments have advised the U.S. to discontinue tax incentives to investment in Europe in order to check the growth of the balance-of-payments deficit; that the policy of encouraging investment in both developed and underdeveloped countries, which was in the public interest in the early postwar period, is no longer necessary, and preferential tax treatment merely for private gain is not justifiable.

August 1962

**355. Memorandum from Sorensen to President Kennedy,  
August 10<sup>1</sup>**

August 10, 1962

SUBJECT

Report of Subcommittee on Gold and Monetary Agreement

The Subcommittee you appointed to outline the structure of a new international monetary agreement has decided with gratifying unanimity on the attached approach, worked out by Treasury with assistance from State and the Council of Economic Advisers. Representatives of all three agencies worked long and hard to produce this plan which all agree is large enough to safeguard our gold stock at a clearly sufficient level over the next two years.

This is an interim plan, designed to relieve the gold problem pressures of the next two years while a permanent plan is being negotiated. To start the more controversial deliberations over a permanent plan without some interim protection would only cause further trouble. This plan is primarily an expansion and formalization of the Treasury's current approach, requires other nations to agree not to convert to gold only their existing (not their future) dollar holdings, and requires a commitment of only two years—and should therefore be more quickly acceptable.

Participants from the Treasury have been careful, in drawing up this plan, not to commit themselves as to whether it would be more preferable to rely on existing efforts. Many of their concerns are, I believe, met by your Subcommittee's unanimous agreement on three preconditions to this plan: (1) First, that the initiative for such a plan must come from the Europeans and be kept highly confidential until implemented; (2) Second, that the U.S. must use the two-year breathing spell to achieve a balance-of-payments equilibrium, which will increasingly involve both tightening existing procedures and engaging in other difficult negotiations of a burden-sharing nature with Western Europe; and (3) Third, that negotiations for a permanent plan would need to have some prospect for success and begin early in the two-year period.

## January 1963

### 356. Notes on Dillon's Conversation with McNamara, January 23<sup>1</sup>

January 23, 1963

Notes on Secretary Dillon's conversation with Secretary McNamara, at the Treasury, 1:15 p.m., January 23, 1963 (based on the Secretary's oral briefing of Mr. Roosa and Mr. Bullitt)

Secretary McNamara felt that the gold budget project for controlling U.S. dollar outlays abroad had bogged down and was not proving effective. The Bureau of the Budget and the other technical people were spending too much time trying to reconcile statistical differences and that the BOB was doing little more than assemble agency submissions on their own plans and activities. He considered that the gold budget should be as binding a document as the regular Federal budget, and that agencies should face up to the necessity of changing their programs when they came up against ceilings. He agreed that the Treasury should have a major voice in policy decisions when the gold budget was drawn or revised; that it also should patrol major developments; and that the lines of communication with State and Defense in this area should be cleared.

Secretary Dillon said that for various reasons, including the habit of the State Department of using John Leddy to do a great many things which he shouldn't have had to do in his Treasury capacity, no effective working level group had been set up to act for the Cabinet Committee on the Balance of Payments. He proposed to remedy that by putting John Bullitt at the head of such a committee, at the Assistant Secretary level, and Secretary McNamara agreed that that would be a good idea.

Secretary McNamara was quite pleased with the outcome of his exchange-saving program for FY 1963, and said that it would come within around \$100,000 of the target figure of last July. But for FY 1964, the outlook was less good.

The figure for Germany was larger than the 1963 figure. Overall, a presently planned \$1,550 billion would have to be reduced to \$1½ billion net. Secretary McNamara had ordered the Defense Department to do that. The only way to make these reductions was for the Secretary himself to make it clear that the money had to be saved, and to tell the services how and what should be cut.

---

<sup>1</sup> U.S. dollar outlays abroad; DOD deficit proposals; and importance of balance of payments to administration. Confidential. 2 pp. Kennedy Library, Dillon Papers, Memcons, 1963, Box 15.

Meanwhile, Mr. McNamara has also run into trouble with his 50 percent figure because nothing like it was observed by other Departments, whose expenditures may not be large in comparison with those of Defense, but whose refusal to hold the line makes it harder for him to do so.

He expects squawks from the State Department when he has to take measures which cause them political problems, but considers that they have to be handled like the military departments. If, for example, they object to closing a depot in Japan, he will insist that they find an alternative there which saves an equal amount of money.

Secretary McNamara also said that he is going to get the British to start sharing in the costs of the Polaris development. He had had violent protests from Mr. Thorneycroft and from the State Department, but Mr. Thorneycroft had agreed that Secretary McNamara's position was perfectly reasonable, adding only that it came at an unfortunate time.

Secretary Dillon asked for a report on Project 8. Mr. McNamara did not respond directly but gave the Secretary to understand that he would rather not talk about that; he thinks, now, that the only way to secure meaningful further savings is to close bases or cut out other sorts of operations.

Secretary Dillon asked if it would not be useful that he be included in the State-Defense talks, to which Mr. McNamara agreed. Secretary Dillon could be very helpful, for example, in such matters as the Polaris case. He was sure Secretary Rusk would approve, and Secretary Dillon plans to talk to Mr. Rusk.

Secretary Dillon reiterated the importance of the balance of payments in making or breaking the Administration's ability to carry through its entire program; Mr. McNamara agreed wholeheartedly. They agreed it was especially important to the President, both as a matter of national policy and as a political problem. Secretary Dillon also described his plans for a White House Conference on Exports, and discussed monetary policy.

Secretary Dillon will now talk with Secretary Rusk and Budget Director Gordon, and then with the President.

**SUBJECT**

Conclusions from my trip to France (and OECD), Italy, Switzerland, Germany and England, February 25–March 6

This is a summary for the confidential record of conclusions already reported to you orally. My conversations were almost exclusively with financial officials and bankers (in addition to our ambassadors and embassy staffs). Since returning, I have had further discussions with European financial people at the meetings in Princeton, March 7–8. Some of my findings have been reflected in the report to you on "Financial Measures for the Balance of Payments Deficit, 1963–64," submitted on March 15 by the Long Range International Payments Committee.

1. The dominant financial concern in Europe is with the U.K., although the British themselves are trying to appear oblivious to this attention. The present balance of payments position of the U.K. is good, but many Europeans fear that it will soon deteriorate. Having lost the stimulus and momentum of the drive toward the Common Market, Macmillan and Maudling must do something. The worst would be early devaluation; the next worse, some kind of home expansion program that would cause capital flight and perhaps lead to devaluation.

---

<sup>1</sup> Provides read-out of Roosa's recent European discussions on balance of payments. Confidential. 6 pp. Kennedy Library, Herter Papers, Balance of Payments, Box 1.

Short of either, sterling will be subject to “bear raids” which could in themselves be disruptive.

2. The fear of sterling devaluation is giving the United States an unearned assist, in that Europeans are increasingly aware of the need to strengthen the framework of cooperation now identified with our operations in foreign currencies, including the swaps and the borrowings. In all five countries (as well as from the Dutch, Belgian and Swedish representatives at the OECD meetings), I heard that the accomplishments in cooperation among the leading industrial countries must not be impaired by the present splintering of other political and economic efforts toward unity of action. If anything, the desire for monetary cooperation is increased. This is true in France, too, particularly in the Banque de France.

3. The highest authorities are hoping that the United States will, in close confidence, take the lead in assuring a firm protection against the risk of sterling devaluation. None believes that sterling is in fact overvalued. All fear devaluation of sterling—not only because it would mean the final end of sterling as a reserve currency but also because it would gravely threaten the ability of the United States to maintain the \$35 gold price. All have full confidence that we intend to maintain our price. They hope that we will take appropriate action to avert any British move toward devaluation. Since they believe that any attack on sterling would be purely speculative, and not supported by a basic appraisal of the British position, they believe that another British drawing on the IMF would be entirely appropriate to withstand a raid. They hope we will urge this approach on the British and will make use of our own special defenses if needed to protect the dollar against any repercussions from a run on sterling or from a British drawing on the IMF.

4. Prospects are good for extending the use of our swap and borrowing arrangements, provided we move ahead through bilateral negotiations—but discussing the outlines of these arrangements on a multilateral basis, from time to time. Even if Germany, Italy and Switzerland should not have balance of payments surpluses in 1963 and 1964, their central banks will probably take substantial additional amounts of U.S. securities denominated in their currencies. Central banks will not, however, at present take maturities beyond two years (although they are prepared to renew, and Italy has just agreed to extend all its present holdings to 1965 maturities).

Borrowings of longer maturity (5 years or beyond) would have to be arranged on a government-to-government basis, which means that the internal counterpart of funds loaned to the United States would have to be obtained through a budget surplus (or borrowing in the home market by the government). Given the uncertain political situa-

tions in Germany and Italy today, nothing can be usefully explored along these lines for the present. The Swiss Confederation, having already purchased \$80 million equivalent of our under-two-year securities, foresees no budget surplus in the coming year and is reluctant to borrow on the home market for the purpose of making a longer-term government loan to the United States. Substantial possibilities do exist within the established maturity ranges for additional borrowing by the United States from the Swiss National Bank, and through it, from the Swiss banking system. The French may possibly extend us a modest loan, but only through the Banque de France and for 1 to 2 year original maturity. The Finance Ministry will continue debt prepayment in amounts related to the balance of payments surplus.

5. The Germans and Italians advise against a technical drawing on the IMF by the United States in existing circumstances. They regard our swap and borrowing arrangements as adequate for meeting any technical problems arising from the fact that the Fund presently holds dollars up to 74% of the United States' quota. They warned that a U.S. drawing, regardless of its size, would create doubts in their financial communities concerning the ability of the Fund to provide the full support needed to keep the monetary system functioning if sterling suffers a run over the months ahead. They believe the world is not ready for the spectacle of both reserve currencies drawing on the Fund at the same time—short of an unusual emergency which would make the reasons clear to everyone.

6. All central bank and treasury officials in the five countries (including the United Kingdom) stated confidentially their flat opposition to any devaluation. All are equally opposed to a "floating rate." The French, Germans and Italians consider a floating rate even more harmful and disruptive than an actual devaluation.

7. While concern continues over our balance of payments situation, the Europeans generally still believe that we can eliminate the deficit. They appreciate that we have not used exchange restrictions or trade restrictions or a slashing of military or economic aid to *stop* the deficit. Many recognize that our effort instead to *solve* the deficit by making lasting improvements in our competitive trade position must necessarily take time, and be difficult to predict in both timing and magnitude. Because most of them admire our effort to evolve a solution "in the right way" and because most also know that there is no usable substitute for the dollar, they will undoubtedly continue to cooperate—but we cannot take this for granted. Our own performance must show steady real improvement.

8. Many financial people continue to believe that much of our deficit is produced by capital outflows which could be limited or offset if our interest rates were higher. Some are beginning to understand

that our long-term rates are held low by the enormous volume of domestic liquid savings and that the only zone for effective action is the short-term area in which we have been operating with some success. Nonetheless, there is no question that a further rise in the short-term rate, if this were practicable, would not only help reduce our outflow of short-term funds but would also impress European financial people as evidence of further determined effort by us to reduce the balance of payments drain and preserve our gold reserves.

9. There is still much uneasiness over the prospective size of our Federal Government deficit, though understanding and support for the tax bill are widespread. Few realize that we have been able to finance the entire rise of the Federal debt in 1962 outside the commercial banking system—a result achievable within the existing structure of long-term rates because the volume of domestic liquid savings increased so impressively in 1962. As Europeans were informed of these facts, their concern over our domestic deficit was satisfied. It is clearly necessary to improve our communications with Europe in this regard (your Princeton speech of March 7 was an effective start; that was followed by a special press release on March 14).

**359. Memorandum of Conversation between President Kennedy  
and German Federal Minister Krone, May 15<sup>1</sup>**

May 15, 1963

SUBJECT

Balance-of-Payments and Trade Problems

PARTICIPANTS

*GERMANS*

Dr. Heinrich Krone, German Federal Minister for Special Problems

Ambassador Heinrich Knappstein

Counselor Heinz Weber (Interpreter)

*AMERICANS*

The President

Assistant Secretary William R. Tyler

Mr. Robert C. Creel, Director, GER

Following opening amenities, in which Dr. Krone extended his congratulations on the successful launching one hour earlier of the Faith 7 space capsule, Dr. Krone said that he had had talks with both Chancellor Adenauer and Vice Chancellor Erhard just before leaving on his trip and both had specifically asked him to convey their best wishes and greetings to the President. Dr. Krone said he had already had extensive and very useful talks here with Secretaries Rusk and McNamara and other U.S. officials. He would be glad to answer any questions the President might have.

The President said that relations between the U.S. and the Federal Republic were proceeding on a satisfactory basis. He was appreciative of the attitude shown by the Germans toward the MLF project, on which a general meeting of minds had been reached between us. The task now was to secure the participation of other major powers. The President was hopeful on this score. The contributions being made by the Federal Republic in building an expanded Atlantic community were very helpful. As concerned the military situation and Berlin, we were in a better position than in 1961. The primary problem facing us now was the economic situation, not only as concerned internal economic problems in Europe and America but on the international level. He was concerned that we should not let our monetary systems control

---

<sup>1</sup> "Balance of Payments and Trade Problems." Confidential. 3 pp. Department of State, Central Files, FN 12.

us to the point of deflation or of producing an imbalance in the community. The President did not think the Soviet Union would make any move against Berlin at this time. For one thing this would involve them in a direct confrontation with the U.S.; for another, they undoubtedly felt themselves to be in an exposed position in Cuba. Berlin was in a more secure position than it had been during the last four or five years. If we all met our obligations in the defense field, he felt that Europe would be in a relatively well protected position. Our primary job was to prevent an economic slowdown (he mentioned concern in this connection over the situation in Italy, Greece, Portugal and Spain), and he felt this was the central problem right now as concerned the defense of the Western community. We had had an outflow from the U.S. over the past seven years of \$15 to \$20 billion. This could not continue, bearing in mind that the U.S. was responsible for the liquidity of the Western community. It was essential that trade policies be developed which would enable us to meet our international obligations and at the same time permit the Western economy to continue to expand.

Dr. Krone said he was struck by how much the President had emphasized economic factors and problems. He had heard the same concern expressed on Capitol Hill yesterday. Everyone in Bonn, and this included the Chancellor, fully realized the importance of these factors to the U.S. and their relationship to our balance-of-payments problem. Since 1949 the Germans had carried forward a clear and consistent policy of partnership with the Free World. For a number of years there had been some resistance from other political parties in Germany to this policy but at the present time all parties were united in support of it. He considered the internal situation in the Federal Republic to be better than in some other European countries, and this was a stabilizing factor for Europe as a whole. The big problem was the farmers, who had political importance disproportionate to their numbers. It would be the Federal Government's policy to try to bring about changes in the German agricultural and crop structure (he mentioned particularly vegetables) in the interest of the common good. While he was no technician on this subject, he was fully aware of the political significance of the agricultural problem and wished to assure the President the Germans would do their best to help.

The President said that while his concern was partly with our own farmers, it was more generally with the balance-of-payments problem. No other country could continue to accept the prospect of losing \$3 billion a year. In addition to the amounts spent abroad by tourists, there were very heavy expenditures in the areas of defense and foreign aid. He appreciated the action taken by the Bundestag in the ratification process of the Franco-German Treaty. What primarily concerned him, however, was that we would find ourselves in a situation like that of

the British in the Common Market negotiations, where the French would insist on trade arrangements which the others in the Community would accept rather than see the Common Market destroyed; the Community would then enter into negotiations with the U.S. on a basis which would put us in a disadvantageous position. Unless Europe approached these trade negotiations in a way which would enable us to protect our balance-of-payments position—after all, the President interpolated, we did have a favorable balance of trade—we would be in difficulty. The President appreciated the declaration in the Treaty ratification by the Bundestag and hoped it would serve as a guide in the trade negotiations over the next 18 months. It was important not to let the French dominate these negotiations and end up by putting us in a position where we would be almost forced to withdraw from Europe, and then have the French say they had predicted this development all along.

Dr. Krone said that the Bundestag declarations in the preamble to the Treaty ratification, when enacted, would have the force of a law fully binding on the government. This would therefore establish very clearly the future course of German policy. The Germans had done things this way expressly in order to allow no room for doubt as to what this course would be. He wished to express his agreement with the President that the main concern was the balance-of-payments problem and not the farmers. Dr. Krone said we (the Germans) also have our worries about the French, since it is clear that they wish to protect their own agricultural system and make it dominant in Europe. He nevertheless felt that some progress had been made recently in Brussels toward a satisfactory solution through the efforts of Ministers Erhard and Schroeder. The Germans were in any event fully aware of what the Kennedy Round means for all of us.

The President said that in any case we did not wish to create any new farmers. Dr. Krone said he completely agreed.

## III

BALANCE OF PAYMENTS PROBLEMS  
AND FORCE LEVELS

*The Under Secretary* thought it appropriate to make some comment on the U.S. balance of payments situation. It appears likely that natural forces will bring an equilibrium in five or perhaps four years. Among the natural forces he had in mind were the trend toward inflation in

---

<sup>1</sup> Force levels and balance of payments problems. Secret. 7 pp. Department of State, Secretary's Memoranda of Conversation: Lot 65 D 330.

Europe and the slowing down of European growth rates. Nevertheless, in spite of the measures already taken, we are obliged to look very hard at what can be done, especially in attempting to work out a way of reducing the burden of maintaining our forces in Europe. He said we will have to be very firm on this within one or two years, and that the situation is complicated by the policy of the French in creating a *force de frappe* and submarine fleet.

*Ambassador Bohlen* pointed out that so far the French have received only an informal statement from us regarding the current status of Mr. Gilpatrick's offer last fall to consider favorably the sale of a skipjack type submarine. He felt that it was under the circumstances, more or less incumbent upon us to clarify our position. *Mr. Schaetzel* thought that a lot of water has gone under the bridge since then. *Ambassador Bohlen* asked if we intend to hold to this line, and if not, when do we drop it.

*The Under Secretary* said that the French are constantly calling into question U.S. intentions with regard to the maintenance of its forces in Europe, in effect calling into question our honesty. This was a point he had sought to draw to the attention of Couve de Murville in their conversation a few days previously. He asked if the initiative wasn't up to the French. *Ambassador Bohlen* felt it was important both that the American position should be made clear, notably in NATO, and at the same time that no inference should be permitted which would unjustifiably raise French expectations.

*Mr. Schaetzel* returned to his comment on how the situation has changed. He pointed out that there has been Nassau and also the MLF. He noted that any favorable action by the U.S. with regard to Skipjack would produce the worst possible impression elsewhere and, particularly, in Germany and Italy where we have been making strenuous efforts to convince these governments that the surface mode was the most desirable one to be used in connection with the MLF. In the past, suggestions have also been made to the Germans and the Italians which might have led them to believe the U.S. was prepared to cooperate in some way in the construction of nuclear-powered submarines.

*The Under Secretary* drew the discussion back to the balance of payments question. He said there has been some consideration of proposals for troop redeployment. He said there were two conditions for this: (1) that the military effectiveness of our forces stationed in Europe not be diminished; and (2) that it not create undue political problems. He asked for comments on this question, and suggested that it might be possible to reduce logistical support troops without reducing combat efficiency.

*Ambassador Bohlen* commented that there has been no effort on the part of the French to move the U.S. to disengage in Europe. He

expressed the view that General de Gaulle's remarks in this connection were made with a very long-term context in mind. He had never seen any statement indicating the French would like us to move out of Europe in the immediate future. He was of the opinion that, under the circumstances of the withdrawal of the Jupiter from Italy and Turkey so soon after Cuba, it was difficult not to give an impression of a deal with the Russians. He mentioned the effect closing some military installations in France would have on the French employment situation and argued that if there is to be any reduction in U.S. forces stationed in Europe we should have ample time to prepare the way. If we cannot present the reduction in a convincing fashion he thought the consequences would be undesirable.

*The Under Secretary* supposed that it would be necessary to argue convincingly in NATO that the cut in strength would not lead to a reduced combat capability. He asked whether it should also be discussed with the governments. *Ambassador Bohlen* thought this was the sort of thing we should discuss directly with General de Gaulle in order that he not receive misleading impressions from other sources.

*The Under Secretary* pointed out that if the European countries could give us help on our balance of payments problem we wouldn't have to reduce our forces in Europe. *Ambassador Bohlen* noted that the French had shown little responsiveness to our proposal to sell the residual rights in our \$4 billion MAP program for \$250 million. *Ambassador MacArthur* asked if the approach mentioned by the Under Secretary wasn't susceptible to misinterpretation.

*Ambassador Bohlen* expressed the view that we had made a mistake in the early '50s in committing ourselves to keeping six divisions in Germany in order to get the French to agree to German rearmament. We ought to try to get back to a situation in which our commitment under the North Atlantic Treaty for the defense of Europe is the essential American contribution. *The Under Secretary* noted that if Berlin were not a problem, the requirement for conventional forces would be a great deal different.

*Ambassador McGhee* emphasized that American troop reductions in Germany would be extremely sensitive, that any such reductions would have to be effected over a period of time and after a period of proper preparation and discussion with the Germans. He noted that from a balance of payments point of view, the Offset Agreements with the Germans would make the advantages of such a reduction illusory. He also noted that a reduction of the American division slice at a time when we are trying to encourage the Germans to increase theirs would be extremely awkward.

*Ambassador Bohlen* noted that under present circumstances the European allies are dependent on the U.S. for their defense notwith-

standing the fact that some reduction of our forces might be necessary, but that a very different problem and atmosphere would be created if the Russians were suddenly to change their position with regard to Eastern Germany. In this event strains within the Alliance could become serious.

*The Under Secretary* asked how the Germans view their own balance of payments situation. *Mr. Cronk* said that the balance of payments of the Federal Republic is now in bare equilibrium. The outlook is not too good but the Germans believe the situation will be controllable. *Ambassador McGhee* returned to the point that we would run into serious dangers with the Germans if we drastically reduced the size of our forces there. *Mr. Fessenden* said that he didn't think any reduction in our forces is politically feasible, citing the continuing presence of 20 Soviet divisions in East Germany.

*Ambassador Rivkin* said he had a different view. He thought there was a certain ambivalence on the part of some Europeans toward the presence of U.S. conventional forces in Europe. Some would find a reduction in these forces cause for rejoicing since they would interpret this to mean the end of the Taylor doctrine of the "pause". Many Europeans don't want a conventional war and feel that the only real deterrent is the nuclear one. A reduction in U.S. conventional forces in Europe would mean a reaffirmation of the U.S. intention to respond to any attack with atomic weapons. *Mr. Schaetzel* noted that the "pause" based on the presence of an adequate conventional force was a basic element of U.S. doctrine. *Ambassador Bohlen* remarked that American reliance on the "pause" is regarded with the greatest skepticism by most Europeans. *Ambassador Rivkin* thought that the "pause" thesis was not realistic, not practical in Europe.

*Mr. Williamson* thought that a reduction of our forces in Italy would create problems. He said that when the Jupiter missiles were being removed from Italy, the Italians were extremely sensitive to the timing of the arrival of the Polaris submarines in the Mediterranean so that there would be no time gap in their atomic defenses. He thought, on the other hand, that there was a great opportunity for the reduction in the number of U.S. support troops in Italy.

*Ambassador Bohlen* said that de Gaulle doesn't believe a war will take place. He is using the possibility of our withdrawal to sell the *force de frappe* to his own people. He thought that de Gaulle doesn't really believe we will withdraw and would be horrified if we did. *Ambassador McGhee* thought that our strategy is not really as different from what the Europeans would like as they seem to believe. If we could only get down to cases they would find that our strategy is not so different from theirs, *Ambassador Bohlen* agreed.

*Mr. Brown* said he was glad the question can now be considered with an open mind in Washington. He pointed out that our commit-

ment at the present time is stronger than it was in 1961 when we had fewer dependents stationed in Europe; there were fewer European troops and the nuclear balance was different. How much reduction in our forces is possible is hard to tell.

*The Under Secretary* thought there had not been any discussion of European use of the U.S. capital market either. *Mr. Brown* replied that this has been discussed. He went on to say that military items are dealt with by means of the Offset Arrangement, which is vulnerable.

*The Under Secretary* asked to what extent we can expect European help to maintain forces around the world, although this probably carried with it the obligation to consult with them on the use of these forces. *Ambassador Bohlen* thought we could not give any commitment to consult Europeans on problems in which they are not involved.

*Ambassador Bruce* expressed the opinion that it would be easier if policy were decided before it is discussed publicly. He thought that the desperate way in which our decisions with respect to other countries have to be announced is very bad. In his opinion, if we reduce our forces, we must show that the reduction will not reduce combat effectiveness. He thought that advance preparation is extremely important in the implementation of our decisions.

*Ambassador MacArthur* thought that our best chance of carrying out a reduction in U.S. forces lies in the combat effectiveness argument, if it is a reasonably credible one.

The meeting was adjourned with discussion to continue at Ambassador Bohlen's residence after dinner.

June 1963

361. Memorandum from Ball to President Kennedy, June 21<sup>1</sup>

June 21, 1963

SUBJECT

Talking Points for Your Conversation with Vice Chancellor Erhard

*General Approach*

This memorandum takes account of the comments in Bonn #3544 reporting an Erhard-McGhee conversation about Erhard's meeting with you. This telegram is attached as *Tab A*.

I think it important that you talk to Erhard, not as the German Economics Minister, but as the Chancellor-designate and a distinguished economics professor. The emphasis on these two latter capacities would, I think, tend to evoke the most useful response.

I suggest the emphasis on his role as Chancellor-designate because it is important that Erhard begin to think of himself as the potential leader of Germany, responsible for political as well as economic decisions. Not only will he respond to the implied flattery of being treated by the Head of State of the world's leading nation as the potential Head of the German Government, but he may be somewhat hurt and disappointed if you still appear to regard him merely as an Economics Minister. Finally, and most important, he desperately needs political education, and he will take it better from you than from anyone else.

I suggest a secondary emphasis on his role as a distinguished economist, because, in my experience, he responds far better to appeals to his intellectual purity as a classical economist on commercial and economic issues between our two countries than as a minister forced to make accommodations to domestic political forces.

*The Political Education of Professor Erhard*

As I have suggested in the memorandum I sent you entitled "The Mess in Europe and the Meaning of Your Trip", one of the great dangers we face in a post-Adenauer Germany is the fact that Erhard operates without a fixed political philosophy. I think it important, therefore, that you spend as much time as you can spare outlining the fundamental framework of East-West and Atlantic relationships. Erhard has never

---

<sup>1</sup> Talking points for the President's conversation with German Vice Chancellor Erhard. Secret. 9 pp. Department of State, Central Files, POL 7 US/KENNEDY.

progressed beyond thinking of Europe as a potentially big customs union, which he would like to expand to include not only the United Kingdom but also the United States.

It is important that he be made to understand our own conception of a Europe integrated, not merely economically but politically—a united Europe capable of playing an effective role in the Atlantic Partnership. He must be made to see this in the larger strategic and political terms, and must be made to understand clearly the motives and objectives of American policy.

#### *Balance of Payments*

It is in this context that the balance-of-payments problem might be touched upon. Erhard understands very well the nuts and bolts aspects. We have all been over them countless numbers of times, and he knows the answers as well as the questions. But what has not been sufficiently brought home to him is the security and political context of the present imbalance in the accounts of the Atlantic nations.

I understand that Douglas Dillon is sending you a detailed paper on the current state of our balance of payments, which contains details on offset arrangements, the present state of German reserves and the evolution of the German balance of accounts. What I think you should emphasize is that Germany has not merely an interest in, but some responsibility for, helping the United States manage the difficult transition period until equilibrium is restored.

Our deficit reflects our overseas expenditures for security and economic development, and Germany is the most direct beneficiary of our vast defense efforts. Now that Germany has achieved economic strength and good economic health—for which you can pay tribute to Erhard's leadership—she must begin to carry a commensurate share of responsibilities. And these responsibilities should include an obligation to help the United States weather the difficult days until balance-of-payments equilibrium can be restored.

Germany can do this by assisting the United States both to reduce and to finance her deficit. The reduction side includes such matters as offset arrangements. The financing side might include not merely German cooperation in funding some of our short-term dollar claims through three to five year loans, but also a German willingness to continue to increase the proportion of dollars carried in its reserves.

In this connection a flat, private assurance from you to Erhard that the United States will not devalue the dollar or revalue gold could be useful.

There is an interesting passage in Bonn's #3544 in which Erhard suggests that he has several ideas on the dollar problem which he feels "should be considered as a world-wide problem". I think it would be

useful to draw him out a bit on these ideas. It is possible that he is concerned with the liquidity question. As a background for that I would strongly urge you to read pages 2–4 and 12–15 of the brilliant chapter of recommendations from the forthcoming Brookings balance-of-payments study. I have attached that Chapter as *Tab B*.

### *Trade Negotiations*

Here I would emphasize Erhard's profound belief in sound classical economic theory.

It is important *not* to discuss trade negotiations in the context of our balance-of-payments problem. Such an emphasis would be taken to mean that we expect to profit from trade liberalization at the expense of Europe. I am personally convinced that we can improve our trade balance with Europe as the result of the Kennedy Round negotiations for a number of reasons. But this is not something to be said to Europeans, since it puts them on the guard against American ambitions to get a net advantage over them in the negotiations. This, they cannot accept, for obvious reasons.

Instead, you should emphasize that we have a mutual interest in bringing about a world of free and expanding trade. Erhard religiously believes in liberal trade, particularly through the reduction of tariffs on industrial products. Quite likely he regards access to the UK and EFTA countries as more immediately important for Germany than access to the US market. But he is, by conviction, a free trader. He devoutly believes in the most liberal commerce, particularly in industrial goods, all over the world. He understands the value for Germany of imports as well as exports and the advantages to everyone from the better use of resources that expanding world trade can bring about.

For these reasons he is firmly committed to the success of the Kennedy Round. He played a key role at Geneva—for which you should thank him—in pressuring the French to agree to a workable negotiating formula.

In this connection, I suggest that you develop two major lines of argument:

1. *The basic political role that the Germans will have to play if the Kennedy Round is to succeed.*

In view of the present evolutionary state of the European Economic Community, we find it difficult to know how to negotiate with the Six. Dealing with the EEC Commission and six separate governments puts a strain on the negotiating process. It buries important political objectives in a mass of technical detail. The great role that Erhard personally can play is to take the lead in the Council of Ministers, in order to assure that the Commission is given adequate leeway in negotiating. In this way we can avoid having the special and narrow

interests of individual Common Market countries impede the achievement of our common objective of trade liberalization.

With this in mind, the United States intends, so far as possible, to negotiate with the Commission, since, if we are forced to work with six separate governments, the French will be able to play one off the other—with the result that all of us would lose the leverage that can be applied to a reluctant French Government by having the Common Market countries thresh these problems out in the Council of Ministers.

2. *We do not intend to lose sight of the basic objective of these negotiations—trade liberalization.*

There is danger that the highly technical issues emerging can obscure the real objective of the Kennedy Round, which is large-scale trade liberalization. This is why we stood firm at Geneva in insisting that the Conference adopt the principle of equilinear cuts. The negotiating formula we proposed could make possible 50% cuts in the EEC and US tariffs. The EEC proposals, which concentrated on disparities in rates, would have limited cuts closer to a 10% average on both sides.

Our negotiators freely recognized that the problem of “high and low” tariffs (disparities) should be given attention when it affected the flow of trade, just as we recognized other special problems, such as structural peculiarities in the economies of certain of the major trading countries. But this could not be the main negotiating principle if we were to liberalize trade. (A further and more technical discussion of the disparity problem is attached as *Tab C*. This paper was prepared by the Trade Executive Committee.)

### 3. *Agriculture.*

In talking with Erhard you should have in mind that Germany is the leading obstacle to the liberalization of agricultural trade. Much of German agriculture is medieval. German prices are pegged at abnormally high rates to keep uneconomic production alive.

The French, with a far more efficient agriculture, are pressing for lower prices under the Common Agriculture Policy of the Common Market. On this issue, the French interests are much closer to ours than the German interests.

Unfortunately, Erhard’s Party, the CDU, depends for much of its support on the German farm vote, and the present German Government feels heavy pressure from farmers, particularly as its voting minority diminishes.

You should make it quite clear to Erhard that from the United States’ point of view it is essential that agriculture be liberalized through the current trade negotiations. To be most effective, you might appeal to Erhard as a good economist. United States agriculture is highly efficient, and it is to the interest of Germany and the whole Free World

that it have a cheap food supply. If Germany would only buy an increasing portion of our low-cost agricultural products this would lower food costs and reduce the inflationary pressures of wage increases. German industry would thus be able to compete even more advantageously.

Beyond that Erhard, as a distinguished economist, must understand that the principle of comparative advantage requires that Germany, should take more and more of her food from America, an efficient agriculture producer, thus releasing agriculture workers for the German industrial labor market where there is a persistent labor shortage.

While making these economic arguments you should, of course, sympathize with Erhard's problems as a politician facing heavy pressures from the farm sector. But you should point out that the United States has reduced its farm population from about 13% of its working force in 1950 to less than 9% today, while at the same time rationalizing agriculture. It is important that for the economic health of the Free World that Germany also get her men off the farms where they are inefficient producers and into the factories where they can produce with high efficiency.

#### *The Central Problem for Our Agricultural Exports*

The central question that must be faced in freeing agricultural trade is, of course, the wheat price. Here I think you should emphasize that the maintenance of an artificially high price, such as the present German average producer price of \$3.01 per bushel (as compared with the American price of \$1.83 and the French price of \$2.33) would only mean a perpetuation of all the worst distortions of the German economy. Moreover, it would mean the gradual extension throughout the European community of agricultural autarky.

You should indicate that we are prepared—and in fact, plan—to attack this problem on a global basis. We hope that serious negotiations for a world grains agreement can begin this summer. We recognize, of course, the complexity of such an undertaking and the lamentable consequences if it should fail.

If you feel you must deal with the problems of *poultry*, be blunt. You should state that we regard the bilateral negotiations between ourselves and the EEC as offering virtually a last chance for providing redress for the unquestioned trade damage we have suffered. Emphasize to Erhard that it is essential, if the broad trade negotiations are to progress in an amicable climate, that the Council of Ministers authorize the Commission to negotiate a fair settlement of the poultry problem.

In this connection you should be aware that Erhard, in his conversation with McGhee, took credit for the fact that the German Cabinet

had just decided to favor a 27 pfennig kilo reduction in the levy application to US poultry, such reduction to be subject to approval by the Council of Ministers. If it became operative, this would have the effect of lowering the present levy from 14.2¢ per pound to 11.1¢ per pound.

Such a reduction would be helpful and we would welcome it. However, there are indications that the French may block even this. Moreover, our minimum position in the US-EEC negotiations aims at a total levy under 10¢ per pound. At least for the time being, we should continue to have this as our target.

**George W. Ball**

July 1963

362. Memorandum from Heller to President Kennedy, July 8<sup>1</sup>

July 8, 1963

SUBJECT

A Program for the Balance of Payments

Rather than wait for my return from Paris, let me respond immediately to your challenge to CEA to provide *its* balance of payments program. (Whatever additional nuggets I may pick up in Paris I will report to you on Monday.)

We have no hidden panacea. If we had, it would have been brought out long before this. But it has been some time since we restated for you what has been, and still is, our basic approach. It can be easily summarized.

Essentially, our policy position rests upon the conviction that *basic* economic developments both in Europe and the U.S. are moving to restore payments balance—and the Brookings Study agrees. Our policies should be designed to reinforce these basic forces, and, in the meantime, to “finance” our transitional deficit. The measures we take need not and should not sacrifice vital domestic and foreign policy objectives of the United States. (We agree, of course, that if defense savings are possible without weakening our military or political posture, we should hasten to take full advantage of them.)

1. The two basic developments which will solve our balance of payments problem in the course of time are (a) the continued stoppage of inflation in the U.S. economy, and (b) the irresistible inflationary forces at work in Europe. We obviously cannot directly reinforce the latter forces. But we can and should continue to impress on the Europeans (through OECD and otherwise) the necessity—in their own interests and in the interests of the rest of the developed and underdeveloped free world—to maintain high demand and employment and to avoid restrictive and recessionary policies. The strength of the European commitment to full employment can probably be taken for granted; but we can encourage them to combat promptly any signs of weakness in the levels of their domestic demands, and urge that they use monetary policy for stimulus and fiscal policy for restraint (the

---

<sup>1</sup> CEA's program for the balance of payments. No classification marking. 4 pp. Kennedy Library, National Security Files, Kaysen Series, Balance of Payments, General, 4/63-7/63, Box 362.

obverse of their prescription for us). And we can insist that the tendency of their balance of payments to move from surplus toward deficit—as ours moves the other way—should provide no excuse for new trade restrictions.

2. Our developing price advantage must not be allowed to be dissipated by unnecessary price rises here. Renewed emphasis must be placed upon our wage-price guideposts, and there must be a demonstrated willingness to use governmental pressures to clamp down on incipient inflationary wage and price settlements. We in the CEA (with John Lewis taking the lead) have initiated a new hard look at the guideposts themselves, at the adequacy of economic intelligence in the Government to provide an “early warning system” of incipient trouble spots, and at the channels available for exerting influence on price and wage decisions.

In this context, the recent steel agreement is of crucial importance. It is clearly below the economy-wide productivity increase, and below the productivity increase in steel. It comes at an excellent time, and we should not hesitate to make the best use that we can of it (without unnecessarily offending Dave McDonald).

3. Rapid and sustained expansion of our own economy is not only an urgent domestic requirement (now made more than ever important by the new significance of Negro unemployment), but also it is the best means of stemming the outflow of long-term and short-term U.S. capital. It will affect both direct investment and financial investment abroad. When profits rise and investment opportunities expand at home, the attention of investors will shift to the domestic scene. When banks and insurance companies find ready borrowers at home, their lending abroad will taper off. This is a far better way to cut down outflows than to restrict the sources of lendable funds.

Because of the overriding importance of domestic recovery—for balance of payments as well as domestic reasons—we must take no action, such as higher long-term interest rates, that would imperil continued and accelerated expansion.

4. We should freely use our reserves—which are still large—to tide us over. We should not hesitate to draw on the IMF in the near future, not only to help supply our foreign currency needs but also to strengthen the IMF by making clear that it is an effective international mechanism for large and strong economies to use and not just for the underdeveloped ones. If necessary, we can activate the special borrowing arrangements.

5. Efforts like those you made in Europe can surely impress upon our allies the necessity—in their interest as well as ours—to maintain the strength of the dollar by

- Cooperating in its defense against speculative attacks;
- being willing to hold and to add to their holdings of dollars (while we in return, in one form or another, provide a guarantee for such holdings against exchange devaluation of the dollar—which is precisely what the Roosa bonds do on a limited scale);
- assuming larger financial burdens in behalf of the common defense and aid efforts;
- actively exploring with us interim and longer-range multilateral solutions to the problems that arise when major industrial nations encounter relatively intractable (in the short run) deficits that do not result from inflationary domestic policies.

6. In this connection, the joint studies now about to be initiated by the Finance Ministers of the “Ten” (the first meeting of their deputies will be held Thursday in Paris), should receive every support and encouragement of the U.S.; and we should make clear to the other governments that we regard this as an initiative of major significance for the reasonably near term, not the distant future.

7. Further steps to tighten U.S. procurement or to tie U.S. aid seem unwise. If anything, we should retreat slightly from some of the more obviously silly and inefficient things we have done, especially those that are purely cosmetic.

8. We must continue to pursue a hard bargaining line in the GATT negotiations, in the expectation that a general tariff reduction that is really reciprocal will help us more than it can hurt. The agricultural negotiations—and EEC agricultural policy—are, of course, crucially important.

9. If short-term money rates are to be raised, we must make sure that the Fed and the Treasury are committed to take all actions necessary to prevent any rise in long-term rates. They have the ability to do so—to do a twist operation on a really grand scale. It would mean that the Treasury would stand ready to finance the entire deficit and, if necessary, its refundings, by selling bills, and that the Fed would stand ready to supply all of the necessary reserves by buying long-terms, and, if called on, to buy even more long-terms while selling bills. If we decided to embark on such a spartan program, a rise in the discount rate could form part of the package.

10. If long-term capital flows persist at the level of the past year, we should—as a last resort—invoke controls on flotation or placement of foreign bond issues in our markets. This is not equivalent to, nor would it inevitably force us into, exchange controls, as both practice and experience in Europe so clearly demonstrate.

This is recognizably no panacea. But it is no less a program because some of its elements involve refraining from action rather than initiating it. It involves risks, but so does any policy. It will not satisfy those who feel that we court disaster unless we knuckle under to the prejudices

of the international bankers. The present division of Europe does not make it easier; but then, it exacerbates other problems as well. In our view, a calm, determined, non-crisis approach will find support and understanding in those places where support and understanding are crucial, and will in the end engender rather than impair confidence even in the financial community.

**Walter W. Heller**

---

**363. Telegram 255 to Moscow, July 19<sup>1</sup>**

July 19, 1963

For Harriman. FYI Only.

1. With reference President's July 18 balance of payments message, Defense proposals include some force reduction in Europe and Far East, principally in fighter squadrons and B-47 decreases; some reduction of LOC facilities in Europe; reduction in MAP/OSP; and miscellaneous other adjustments. No combat ground force reduction involved in either Far East or Europe.

2. Effort is being made to avoid treating proposals as a package to avoid leaving impression that US is making major withdrawals from its overseas commitments. (In actual fact, Department's view is that reductions proposed by Defense do not represent major withdrawals and are politically manageable. Nevertheless, dollar magnitude of adjustments being made, which total slightly less than \$400 million together with its world-wide distribution, could lead to interpretation by news media, or others, that major withdrawals were contemplated.)

3. Actual implementation of individual programs within total proposal will take place over a period of several months, some of the actions not being completed until 1964, and in a few cases until 1965. However, exact timing on implementation of programs, including timing on approach to governments involved, is awaiting receipt from DOD details of individual programs.

4. You should also be aware that DOD has been requested prepare for consideration within ninety days an additional package of balance of payments reductions. It will probably be necessary for this package

---

<sup>1</sup> U.S. troop reductions in Europe. Secret. 2 pp. Department of State, Central Files, FN 12 US.

to contain proposals for more far-reaching force reductions since availability of relatively marginal items has for most part been exhausted in first proposal.

5. If you desire further details, will be glad provide.

END.

**364. Memorandum of Conversation between Ball and Japanese Ambassador Takeuchi, July 29<sup>1</sup>**

July 29, 1963

SUBJECT

Interest Equalization Tax—Japan

PARTICIPANTS

Ryuji Takeuchi, Ambassador of Japan  
George W. Ball, Under Secretary of State  
Mortimer Goldstein, Deputy Director, OFE  
Thelma E. Vettel, Special Assistant to the Director, EA

Ambassador Takeuchi referred to his conversation of July 26 with Secretary of the Treasury Dillon and Under Secretaries Fowler and Roosa regarding this subject. As it stood following that conversation, the U.S. Government had indicated it was not prepared to extend an exemption to Japan. But, he said, the matter is still under negotiation. He said the Japanese economy was being greatly affected by this action. The stock market was again collapsing; on July 29 it fell another 59.54 points to the lowest postwar level. He said the stock market drop since July 18 was the greatest since World War II. The most recent drop was caused by press reports (based upon the statements of a “high U.S. Government official”) that after negotiations with Japan the U.S. had decided not to give an exemption to Japan.

The Under Secretary said that one of the problems the U.S. was facing was the fact that the dollar had been under attack. Any indication of a further broadening of the exemption would create problems for us.

---

<sup>1</sup> Interest equalization tax. Limited Official Use. 2 pp. Department of State, Secretary's Memoranda of Conversation: Lot 65 D 330.

The Ambassador said that Prime Minister Ikeda and Finance Minister Tanaka both wanted to minimize the effect of these new measures on Japan's economy. Therefore they had been saying that the future was not so dark; that the measures would somehow be moderated; and that even with the tax there would be some chance of future borrowings. Meanwhile, he had instructions to explain to the U.S. Government that this was not so. But, he said, the U.S. Treasury is apparently of the opinion that the tax will not greatly affect the Japanese economy. In Japan, however, they were very worried.

The Ambassador's call on Under Secretary Ball was for the purpose of determining whether the draft legislation would name certain countries for exemption or would leave the granting of exemptions to the discretion of the President. He explained that if the latter were the case the Japanese would have more time for negotiation. If certain countries were named, however, the question of discrimination and of the FCN Treaty would be raised immediately. Furthermore, the Ambassador said, if Canada were to be named in the draft legislation the Japanese must hurry their negotiations. He said his Government was considering sending two Cabinet Ministers to the U.S. for such negotiations. After Saturday's press statement, however, the Ambassador felt the U.S. would not be in such a hurry to say that Japan was excluded from exemption.

The Under Secretary said that although he had not seen the draft legislation, he was sure it would not name any countries. He said the Department would strongly oppose legislation which did not leave exemptions to the discretion of the President. He asked Mr. Goldstein to determine the status of the legislation and inform the Ambassador later in the day.

October 1963

**365. Memorandum from President Kennedy to Martin,  
October 14<sup>1</sup>**

October 14, 1963

I am asking the Secretary of the Treasury to form a Committee to review the United States position in the discussions now in progress on the evolution of the international monetary system.

The Committee is described in the attached memorandum. I would appreciate it if you would be willing to sit with the Committee when it meets.

**John Kennedy**

**Attachment**

Now that the Deputies of the Committee of Ten have begun their examination of possible improvements in the international monetary mechanism, I wish to insure that the U.S. positions in these discussions are formulated after thorough consideration within the Government.

I understand that Under Secretary Roosa has the assistance of a committee of experts from the departments concerned (the long-run International Payments Committee) which was set up last year to discuss possible changes in the international monetary mechanism. I think it would be useful to have this group's deliberations reviewed at a higher level, now that we are considering this problem in an international forum. Since the issues involved do not fall within the sphere of concern of all the departments and agencies represented on the Cabinet Committee on the Balance of Payments, I wish to designate a smaller committee consisting of the Secretary of the Treasury as Chairman, the Under Secretary of State, the Chairman of the Council of Economic Advisers, and my Special Assistant for National Security Affairs, to review the progress of the deliberations of the Deputies and the U.S. position in their discussions, and to report to me as appropriate.

I am also asking the Chairman of the Federal Reserve Board to sit with the Committee.

**John Kennedy**

<sup>1</sup> Martin's participation in meetings to review U.S. position on evolution of international monetary system. Confidential. 2 pp. Kennedy Library, National Security Files, Subjects Series, Balance of Payments and Gold, 10/63-11/63, Box 292.

**366. Memorandum from Dillon to Ball, Martin, Heller, and Bundy, October 17<sup>1</sup>**

October 17, 1963

Pursuant to the President's memorandum of October 14, I am sending you the attached draft memorandum which Mr. Roosa proposes to submit to the Deputies of the Group of Ten. Each of the ten Deputies has agreed to prepare a brief statement indicating the questions which his government considers relevant to the scope of studies being undertaken by the Deputies. While this initial indication of questions of interest to the United States does not, in any way, bind the United States to any position with respect to the questions, I thought you would like to review this—as the first document to come under our purview as the committee designated by the President to oversee the participation of this Government's representative in the work being carried out by the Deputies of the Group of Ten.

This memorandum, and the accompanying summary in abbreviated question form, represents the combined efforts of the Long-Range International Payments Committee. I hope you can send an indication of your approval, with any additional suggestions or questions, to Mr. Roosa no later than Monday morning, October 21. Mr. Roosa will then, under my direction, put this material in final form for immediate distribution to the other Deputies.

**Douglas Dillon**

MAJOR QUESTIONS TO BE DEALT WITH BY  
THE DEPUTIES IN THE STUDY OF THE GROUP OF TEN  
(Submitted by the United States Representative)

*GENERAL QUESTIONS*

The Deputies are, in effect, undertaking a study of the international payments system. What are the major objectives of the system? How does it relate to domestic economic policies and to the commercial policies of industrial nations? What are the necessary conditions for its effective operation? And what may be needed to assure those conditions over the years ahead? How can the system contribute to financial,

---

<sup>1</sup> Questions to be addressed by the Deputies in Group of Ten study. Limited Official Use. 5 pp. Department of State, Central Files, FN 1 US.

economic and political progress? Interest among the Ten necessarily centers on the functioning of the system in relation to the industrial countries—particularly with respect to the variations in their individual balance of payments positions, and to the interaction of economic forces among them. The implications of the system for the less developed countries are obviously of great importance, but need not at this stage be studied separately by the Deputies.

As presently constituted, the system presumes fixed (though perhaps infrequently adjustable) exchange rates, a fixed and continuing \$35 price of gold, and at least one currency freely exchangeable into gold at that price. It is also necessary, in order to economize gold, that most countries hold something in addition to gold in their international reserves—mainly key currencies widely usable in settling foreign accounts. Gold reserves may also be supplemented by quick drawing rights (gold tranche) on the International Monetary Fund. The reserve position may be bolstered by credits arranged with the IMF, or obtained from other countries.

These are the major elements of the system. The Deputies should attempt, however, to describe this system more precisely, noting current practice, but especially those features which appear to be essential conditions for the most effective performance of the system. This effort to formulate an agreed description of the present system, in its most efficient form, will lead to four sets of questions: (1) what are the essential parts of the mechanism for balance of payments adjustment among convertible-currency countries and how is the function of this adjustment mechanism interrelated with the use of reserves, and (2) what is the appropriate role of a reserve currency, including the duties of the country supplying it and the obligations of countries making use of it, bearing in mind the advantages and disadvantages of reserve currencies to the respective participants; (3) what determines the adequacy of foreign reserves for any country, in amount and in composition; and (4) what is the acceptable scope for credit arrangements to supplement existing reserves, either through the IMF or between and among countries, and when are short, medium, or long maturities appropriate?

Once so described, in terms mutually agreed by the Ten, the system must meet even sterner tests: (1) where does present practice fall short of model conditions? and (2) where does this prescribed model itself fall short of the needs and potentialities that a fully satisfactory international monetary system should fulfill? Or put differently, what is not now being done the way it should be, under existing arrangements; and what should be introduced to strengthen and expand the structure for the future?

In this appraisal, we suggest that projections and suggestions relate to roughly the decade extending from 1965 to 1975. Secondly, it might

be assumed for at least part of the analysis that the United States would not on average over this period run a balance of payments deficit; thus it could only provide an increase in the reserves of the rest of the world through deliberate action, such as adding to the level of gross reserves of other countries by acquiring their currencies for dollars.

The two following sections and the attached outline suggest further points that may arise in considering the process of adjustment, and the financing of imbalances.

# Foreign Assistance Policy

March 1961

**367. Memorandum from Rostow to President Kennedy,  
March 13<sup>1</sup>**

March 13, 1961

## SUBJECT

Draft of Crucial Portion of Foreign Aid Message

If the principles I have outlined are followed we cannot now state with confidence and precision how much external capital can be productively absorbed by the underdeveloped nations over the coming years. That amount will be determined by the energy and the talent they apply to the mobilization of their own resources.

But it may be useful to set a target. I should like to see the underdeveloped nations growing at the rate of about 2% per capita each year. That rate of progress—if widely spread among each nation's citizens—should convince men and women that growth is a reality—that the lives of their children and grandchildren will be better than the lives of their parents and grandparents.

Such a growth rate requires, however, a higher level of investment in most developing nations than is now taking place. Most of that increase in investment they must generate themselves. Some of the increase must come from abroad.

In what terms should we envisage the responsibility of the more developed nations. What is the gap in aid if a growth rate of 2% per capita is our common goal in the underdeveloped areas.

The answer appears to be about \$2 billion a year, on average, over the next four years. Very substantial programs of assistance are now under way: American, British, French, German, Canadian, as well as

---

<sup>1</sup> Thoughts on foreign aid message: getting the Congress and Allies on board. Confidential. 4 pp. Kennedy Library, National Security Files, Meetings and Memoranda Series, Staff Memoranda, Rostow-Foreign Aid, 3/61.

significant contributions from smaller developed nations. They now amount to something like \$5.5 billion each year. But taken together they fall below a critical minimum by something of the order of \$2 billion. If regular growth is to become a widespread reality in the underdeveloped areas we must all increase our efforts. The independent calculations of many experts suggest that total Free World development aid each year should be about \$7.5 billion.

Let me repeat: We cannot now tell precisely how much additional aid will be required and justified until the underdeveloped nations themselves organize careful forward looking programs; but it may be helpful if we envisage as a first approximation Free World capital assistance programs averaging some \$2 billion higher than they are at present.

How should this extra burden of the Free World be allocated? That is an urgent job for the OECD. But again it may be helpful if I suggest an initial target. Right now the United States—aside from military assistance—is furnishing something like 75% of the long-term capital assistance available to the underdeveloped nations. We are a rich and a large nation. We should be prepared to meet our communal responsibilities without flinching. But I believe the percentage of our contribution is now too high. In an expanded program I believe the extra burden should be shared on an even 50–50 basis. Roughly speaking this may involve an extra \$1 billion each year from the United States; an extra \$1 billion each year from the rest of the Free World. I am confident that this increase will be promptly pledged and fairly apportioned in the forthcoming negotiations of the OECD.

On this basis the American aid proportion would decline from about three-fourths to about two-thirds. That is where it more fairly belongs at this stage of Western history. The major developed nations would then be contributing about 1% of their GNP to long-term development purposes.

As an indication of our nation's seriousness in launching this Decade of Development, I propose that the Congress authorize our new economic assistance agency to make long-term development loans of \$2 billion over the next four years. The level of lending in fiscal year 1961 would be little more than planned in the Eisenhower budget; but if the underdeveloped nations do their job, it would rise in subsequent years. A program on that scale would permit us both to shift some of our present aid from a grant to a loan basis; and it would permit us to play our part in the international scheme which will be taking shape in the next weeks and months.

I believe it is essential that the Congress act at this session to signal to all the world that this is the road we are prepared to follow. Among the contributors—although the burden will be more equitably shared than in the past—we shall remain the leaders. And a leader must lead.

In the underdeveloped nations it is essential that the governments and peoples understand that there is a solid basis for them to think through their programs; to work hard this year on how they propose to develop their assets; and to look to a future where the whole of the industrialized Free World is prepared to assist them in bringing to life the possibilities that exist within their human and material resources.

The whole enterprise is, of course, contingent on what others are prepared to do. But I am convinced that to mark this watershed in modern history—to launch this decisive Decade of Development—the American people, the American Congress, and the American President must firmly lead the way.

This great barn-raising is a thoroughly realistic and possible effort. But it must begin here and now; and it must begin with us. I tell you most solemnly that our nation's security—and the Free World's security—do not permit us to wait.

If this line is taken, I would propose:

1. Macmillan, Adenauer, Diefenbaker, and De Gaulle be informed of your proposal before it is delivered.

2. A personal message to Adenauer should state that, despite the difficulties with Congress, despite the forthcoming German election, you judged the position in the underdeveloped areas so urgent that we would all have to make order of magnitude commitments promptly. We need urgently a new element in the equation if we are to deal with the underdeveloped areas. You are counting on him to back you in this matter; for in your view the capacity of the North Atlantic Alliance to deal with the pressures in Asia, the Middle East, Africa, and Latin America hinge on a display of boldness and unity among us in this as in other matters on the common agenda which you look forward to discussing personally with him soon. It would be useful if a German order of magnitude, interim commitment could be made on the occasion of Under Secretary Ball's forthcoming visit to Bonn. Although U.S.-German relations involve many other matters—Berlin, NATO, etc.—much hinges on prompt unambiguous German support.

3. A personal message to Macmillan should state that, despite his short term balance of payments problems, you are counting on his prompt support. This program would supply a new under-pinning to the Commonwealth and to our relations with the underdeveloped areas in general. This was a moment when, setting aside immediate pressures, we must all step off into the dark together; and that you are confident that he will respond, as well as Adenauer and others. You look forward to an early order of magnitude interim British commitment and to your discussions with him in April.

4. A personal message to De Gaulle should state that, despite his understandable preoccupation with the Algeria affair and despite

France's great efforts in Africa that you are counting on his support for a long-term commitment to this effort. You should recall his own earlier inspiring statements in this direction. You should explain that you believe we need an initiative of this kind and a display of allied unity in this area if we are going to be able to deal effectively with the crisis areas in the southern half of the globe.

5. Parallel message to Ottawa.

6. Raise with Erlander, Dutch, Swiss, etc.

---

**368. Letter from Bowles to Goodwin, March 18<sup>1</sup>**

March 18, 1961

Dear Dick:

I am concerned about the lack of a sense of urgency and importance in the present draft of the President's message on foreign aid. While it adequately explains the serious need for improved organization of our aid operations, for long-range planning, and for clear concepts and more effective operations in the handling of the aid programs, I feel that it fails to put these ideas in a framework that reflects the challenge which we face.

More specifically, I am concerned that the message as drafted does not make clear to the American people the appalling problems we face in the lesser developed areas of the world, and the fundamental adjustments in the dimensions and direction of our policies which must be made if America is to remain a major influence in world affairs.

Most Americans are pretty well aware of the tremendous importance of the military challenge from the Soviet Union and Communist China, which we are now moving to meet more effectively. In the longer run, however, I believe that the future of Western civilization is more likely to be determined by political and economic considerations, and I think the political and economic challenge at this moment is even more acute and in many ways more difficult to deal with than the military challenge.

Our task is made more difficult by the fact that most Americans are only dimly aware of the proportions of the revolution in the lesser

---

<sup>1</sup> Concerns about present draft of President's message on foreign aid. No classification marking. 3 pp. Department of State, Central Files, 700.5-MSP/3-1861.

developed half of the world—the dimensions of the needs and demands—the critical importance of the time factor—and its implications for the future of our own society.

I believe they are unaware of the fact that time is running rapidly against us unless we are able to offer substantial assistance quickly in meeting the demands and needs of the lesser developed nations.

Up until the present time the Soviet Union and Communist China have contributed smaller resources to the lesser developed areas than we have. However, with the growing economic power of the Communist societies, these resources are rapidly increasing.

Furthermore, because of their controlled economies, the Communist governments have proved capable of using their limited resources with considerable effectiveness, by applying them selectively in critical situations.

In the case of Cuba, for example, we contributed approximately \$10 million a year to Cuban economic development over a period of years, while the Soviet Union, since the beginning of the Castro regime, is committing more than \$500 million.

I am well aware of the limitations on the size of this year's aid request, including the balance of payments problem and the desire to keep the budget within bounds. However, unless we move immediately to inform the American people about the nature of the position we are facing, I fear it will become impossible to do so at a later date.

If we want an adequate aid program in the years ahead, we must begin now to help the people and the Congress to understand the real nature of the situation we are facing and the initial significance of the decisions we are making.

I know there are many who believe that the American people are incapable of understanding, much less meeting, the challenge. They say that the economic needs of the lesser developed areas are too tremendous—that the Communist economic offensive is too enormous and fierce. They say that we cannot possibly persuade the Congress and the people to commit the resources required.

Yet our present-day skeptics are no more vociferous or determined than these who opposed F.D.R. in 1941 when he proposed the Lend Lease program and Truman when he proposed the Marshall Plan. By clearly describing the challenge and the response necessary to meet it, they demonstrated that large ideas are easier to sell the American people than small ones.

I strongly suspect that if the Marshall Plan had been limited to two or three countries and perhaps a half billion dollars, it would never have been approved by the Congress.

I think our responsibility is to put the full facts and their implications to them clearly and to ask the right questions.

I believe the speech is now cast in a rather low key and that it deals too much with technical considerations which are likely to be more appealing to professionals than to the general public.

I would like to see the entire speech emphasize points which I have made in this letter, with a broad, bold sweep which will help us to capture the public imagination.

As a minimum, I suggest a new introduction to the speech, together with a few other specific moderations in its text, which I am attaching to this letter.

It is impossible for me to overestimate the importance I attach to this matter. I believe that the future history of this country and the world may well depend upon the boldness of our concepts at this critical moment and upon our ability to communicate these concepts widely. If we fail to do so now, when the President's popularity is so great, I seriously doubt we will be able to do so in 1962, 1963, or 1964.

I have written frankly, as I know you would want me to do.

With my warmest regards,

Sincerely,

**Chester Bowles**

SUBJECT

New U.S. Aid Program and Proposals for Fourth DAG Meeting

State Secretary van Scherpenberg welcomed Under Secretary Ball on behalf of the German Government, and hailed the opportunity to examine with friendly frankness and a cooperative spirit common problems in preparation for the Fourth DAG meeting.

Under Secretary Ball responded in kind. He then referred to the opening of a new period of Atlantic cooperation. He mentioned that the Senate had just ratified U.S. participation in the OECD which the President regarded as an important instrument of such cooperation. One of the most vital tasks confronting the OECD would be the problem

---

<sup>1</sup> Aid commitments and proposals for Fourth Development Assistance Group meeting. Confidential. 6 pp. Department of State, Conference Files: Lot 65 D 366, CF 1819.

of justifying the developing countries' hope for reasonable progress. This was important not only as a moral obligation of the West but also as a means of channeling those countries' energies constructively so that they might not be drawn into the Soviet orbit. In the short time the Under Secretary was here he realized the Federal Republic also viewed this problem in the same light.

Under Secretary Ball wished to make suggestions to help the [illegible in the original] meet its challenge more effectively and to make known in advance to his hosts the substance of a new U.S. aid program which would shortly be announced by the President. This program would call for a very large effort by the U.S., with authority to commit resources over a long period since development aid was a problem which could not be met by a single-year, or even a two- or three-year program. Secondly, a long-term program would enable the U.S. to respond more effectively to the following basic types of situations encountered in the less developed countries: (1) Countries in which little hope of real economic development existed, although strategic and political considerations required the extension of financial aid. He cited Jordan as a country in this category. (2) Countries which required social and economic infrastructure assistance as a prerequisite in development. (3) Countries already in the development stage, which had to be assured of external resources in order to plan effectively further advances and to undertake the requisite internal measures to ensure such progress.

Specifically, the President was asking the Congress for authority to centralize the somewhat diffuse aid efforts of the U.S. within a single new agency under the overall authority of the Secretary of State. This would enable the U.S. to achieve the maximum of efficacy in its aid programs by commanding a flexible mix of various types of aid to meet the variable requirements of the developing countries. For example, the new agency will be empowered to extend grants for technical assistance, very long-term credits at low interest rates and repayments in soft currencies if necessary (and the bulk of this aid) would probably be in this category), and the utilization of surplus agricultural products. U.S. overseas missions responsible for [illegible in the original] country aid programs would also be strengthened to facilitate country [illegible in the original] and to prevent too little attention being paid to the impact of any one project on the country's overall needs to realize self-sustaining growth.

Under Secretary Ball emphasized this program because of the large funds being requested of Congress at a time when revenues were substantially reduced because of the domestic recession. This action underlined the importance which the Administration attached to development aid.

The Under Secretary also wished to discuss the substance of the proposals which he would present to the DAG. He would recommend a general agreement on the [illegible in the original] obligation of the advanced countries to help less developed countries [illegible in the original] self-sustaining growth. A general consensus would be required on the means to meet this goal. In the U.S. view, two principles were involved here. One was quantitative for which he had no precise formula, but believed that the aggregate contribution of DAG members might approximate one percent of [illegible in the original] annually on a systematized budgetary basis as much as possible. In this respect, however, he would suggest that other relevant factors such as military contributions should also be taken into account and that the principle of progressivity be adopted in which the richer countries would assume a larger relative share of the common burden. These were, however, all matters for the experts to discuss.

The second principle referred to the qualitative nature of development aid which had to be considered in conjunction with the quantitative measure. In the U.S. view, foreign aid should meet the three general types of situations to be encountered in the less developed countries listed above. Under Secretary Ball would exclude primarily commercial, short-term (under seven years), high-interest credits since they generally represented a burden on a developing country's resources rather than a net addition thereto. The U.S. definition of genuine foreign aid embraced grants, loans repayable in local currency, or if in hard currency then for very long amortization periods (20 to 50 years) and at very low rates of interest (2 percent or about 2 percent). The Under Secretary recognized that the latter involved a substantial element of grant assistance and he thought that this was desirable. Moreover, aid to be effective had to be considered within the framework of the recipient country's overall development needs rather than on the isolated virtues of a single project. The Under Secretary also wished to mention that in his view the balance of payments was relevant in determining not the amount but the form of assistance, that is, whether or not aid should be tied.

The second general proposal to be presented to the DAG would be a recommendation to establish a reporting mechanism which would represent an improvement over and expansion of the present system. It was important that DAG members be collectively informed about the details of each member's individual programs in every country. He himself had been unfavorably impressed by the fact that U.S. officials working in Far Eastern countries did not possess exact information on the assistance programs of other friendly countries in those areas. Precise and complete exchange of information was an indispensable first step in a more effective free world aid effort.

Thirdly, the Under Secretary proposed to recommend that membership in the DAG be assigned at high levels in order to enable decisions to be taken more effectively and rapidly. He would also recommend that a permanent chairman be appointed who would be able to spend full time on DAG problems. A permanent chairman, equipped with full information on member capabilities and programs, would be able to suggest specific programs to individual countries or to several countries acting in consort. The chairman should be an American in view of the past experience of the U.S. in this field and [illegible in the original] of its aid effort.

State Secretary van Scherpenberg expressed his appreciation for the Under Secretary's statements which he thought were very important. With regard to sharing the burden of development aid, he said that a one percent GNP annual aid contribution as modified by a progressivity formula was basically not unacceptable to the Federal Republic. However, it would be difficult to determine relative national wealth in order to apply progressivity. He also suggested for consideration per capita income adjusted by relative purchasing power as a more accurate criterion of ability to contribute [illegible in the original] or the balance of payments. Among possible distortions he cited the fact that Communist China would be in the forefront if GNP alone were used as a yardstick of national wealth, while the U.K. would come off poorly if only the balance of payments were looked at. The State Secretary then quoted some 1959 data, on per capita income for several countries: the United States—\$2,700; Switzerland—\$1,500; Sweden—\$1,500; the United Kingdom \$1,260; Belgium—\$1,260; France—\$1,140; and the Federal Republic \$1,100. Corrections for relative external purchasing power would scale the U.S. per capita income down to \$1,800. However, the absolute magnitude of a country's GNP should also be taken into account so that its ability to contribute would not be magnified by unadjusted per capita income nor minimized by taking the lower figure but would fall somewhere in between. He mentioned these factors as points that would have to be considered in arriving at an acceptable and realistic measure of a country's capacity to contribute to development aid but he believed that the problem was not insuperable, although adjustment and flexibility would be required.

Dr. van Scherpenberg expressed more concern about a qualitative definition of aid. For example, the availability of export capital, including grants, from the smaller developed countries was proportionately less than from the larger developed countries since the former had limited internal markets and required relatively more foreign capital to sustain a desirable level of productivity. He stressed the importance of considering private credits in determining a country's total aid contribution. In this respect he cautioned that the usefulness of commercial

credits should not be minimized since these often financed the soundest investments. Dr. van Scherpenberg acknowledged that special assistance including grants might be appropriate particularly when a country was at a very primitive level of development. However, he believed that grants should be the exception rather than the rule and that even long-term, low interest credits repayable in soft currency are preferable to outright grants. It was important in his view that the DAG should develop procedures and rules relating to qualitative criteria most carefully. This would also obviate the possibility of invidious comparisons by LDCs on the different types of assistance extended by donor countries.

Although Dr. van Scherpenberg was not too well acquainted with the organizational framework of the DAG, his initial reaction was favorable to Under Secretary Ball's proposal for a permanent chairman who would be an American. He also agreed that DAG should act as a clearing-house of information on members' aid programs but he believed that detailed exchanges could probably be worked out more satisfactorily at the field level. He said that elements of competition would continue to exist so long as export-type of assistance was given by all countries including the U.S. This might [illegible in the original] a full exchange on all projects a difficult goal to achieve. He expressed surprise at the Under Secretary's statement that U.S. foreign aid officials in the War past did not have data on German programs in these countries as he was under the impression that this was in fact being provided.

The meeting adjourned at this point.

**SUBJECT**

U.S. Proposals for Fourth DAG Meeting

Under Secretary Ball began by saying that he would like to mention two points regarding the matters discussed during the morning meeting. He believed, first of all, that the defense effort of each country should be an element considered in trying to arrive at a fair sharing of the burden of development aid. Secondly, he wished to explain the U.S. attitude toward commercial investment. He believed that in the past the U.S. tended to overestimate the value of financing from private industry. In 1947 the reconstruction of Europe could not have been achieved so rapidly if the major part of the financing had been extended on a commercial basis. Now the situation of the underdeveloped areas is considerably more difficult. The less-developed countries do not have the stable governments, established institutions, technical skills and capital which were available in Europe. It is very difficult to squeeze savings out of people in the less-developed areas and still provide for their minimum needs. Thus capital will have to come from abroad, and most of it from foreign governments. Commercial credit, moreover, does not meet the balance of payments problem of the recipient countries. This kind of credit will create problems so that

---

<sup>1</sup> Continued discussion of aid proposals. Confidential. 4 pp. Department of State, Conference Files: Lot 65 D 366, CF 1819.

these countries will have to be bailed out by others. Thus while commercial credit may play an ancillary role, it can do no more than that. Also, commercial credit should be put in the context of the development plan of the recipient country. There have been cases where the supplier has encouraged developing countries to embark on foolish and uneconomic projects. Therefore, U.S. experience shows that the bulk of the financing must be made available from the public sector on very favorable terms.

Dr. van Scherpenberg replied that there cannot be much difference of opinion on these points. The Federal Government believes that private investment should be included in the total assessment of aid effort. Private investment, however, cannot be distributed evenly; about 40 per cent of German foreign investment goes to Latin America while other countries like Ghana and Ethiopia have little chance of attracting private investment. This does not mean that we should take full account of investment in calculating the aid burden, although it does come from the economy of the donor country. With regard to the balance of payments position, Dr. van Scherpenberg said the Federal Republic has been accused of extending too much in the way of 5-year export credits. He believed, nevertheless, that this type of financing was sound, and that commercial transactions should not be made to compete with longer-term credits. At the same time, he added, a large proportion of these export credits cannot be met on time and the Federal Republic is therefore required to arrange refinancing. Dr. van Scherpenberg thought that all types of financing should be assessed within the total program of the recipient country, and should be related specifically to the balance of payments position of the recipient. Thus there would appear to be no basic difference between the German and the U.S. views on this issue.

Dr. van Scherpenberg went on to say that he thought private investment was the best possible form of financing since payments are not made until the project has become profitable. With regard to internal capital formation in the less-developed countries, he believed that one must accept that this can only be done by governments; it is necessary to have government planning and government financing. He also stressed the importance of good will and cited the example of penniless refugees who had formerly been successful businessmen. Many were able to recoup their fortunes rapidly largely on the basis of their good reputations.

The State Secretary also pointed out that in most cases it was not the supplier who persuaded the developing country to undertake uneconomic projects but the other way around. He said he was of the opinion that steel works had very little to do with economics.

Under Secretary Ball suggested that the two sides try to agree on the terms of reference for the experts working group. He thought that

while there may be some differences, it might be possible to agree on the basic figures. He believed that the qualitative aspects were as important as the quantitative aspects because over the long term a grant is a greater burden than a loan. He thought that it might be possible to agree on general principles, including recognition of defense effort and the element of progressivity as well as assigning values of different types of aid.

Dr. van Scherpenberg agreed that the experts should consider both qualitative and quantitative aspects. He considered it important to examine first the possibility of finding a simple measure of general burden on the basis of GNP and, secondly, a simple answer to the question of progressivity, perhaps on the basis of per capita income. He also thought that it might be useful to examine what other elements might be added to the standard. He doubted the value of trying to define progressivity and believed the other elements entering into the picture, such as defense effort, should be borne in mind but without calculating them. With regard to qualitative considerations, he thought the experts should somehow try to develop ideas on the needs for different types of aid—grants, hard and soft loans, subsidized loans, etc.

The members of the technical working group were then designated and the meeting was adjourned.

### 371. Memorandum from Weiss to Bell, March 21<sup>1</sup>

March 21, 1961

SUBJECT

Marshall Study

1. I met yesterday with Mr. Bowles, Mr. Marshall, Mr. Hughes and Mr. Newman to discuss the assignment of Mr. Marshall to a restudy of the MAP.

2. Mr. Bowles (who had to leave midway through our meeting to keep another appointment) outlined his views as to what the Marshall study should attempt to achieve. He emphasized that it should be an objective effort to get at the real motivations which underlie our military programs. He acknowledged that we might for a variety of reasons

---

<sup>1</sup> MAP study and Mr. Marshall's role. Secret. 2 pp. Department of State, Central Files, 700.5-MSP/3-2161.

have to strike a posture of justifying the programs on grounds other than their real motivations but that when we did, this should be a conscious act. Thus if we were required to undertake military aid for political rather than military reasons we should be candid at least to ourselves and thus be in a better position to assess the implications of our action. While stressing the theme of objectivity and indicating that the result of the study might well show the need for an increased fund availability, Mr. Bowles made it clear that he would hope that the opposite result might demonstrate itself.

3. Mr. Marshall asked a series of questions, most of them substantive in nature, presumably as a effort to begin to re-acquaint himself with some of the major trends of thinking on military assistance, its problems, virtues, etc. So far as I can tell on the basis of this exchange, it appeared to me that Mr. Marshall was approaching the job with a quite open mind, (but this is necessarily a judgment based on fragmentary evidence).

4. Mr. Marshall requested various documents, memoranda, etc. which were mentioned in our conversation, and I have provided him with this material. He will be out of town today but will return on Wednesday to take up the task full time. So far as I am concerned the first and most immediate problem which he must face is that of timing. Mr. Bowles is still thinking in terms of about May 1. Since Mr. Marshall will begin his effort on March 22, I think such timing is entirely out of the question if any useful end product is to be hoped for. This is a matter on which you can personally be helpful. You mentioned that you planned to talk to Mr. Marshall at an early opportunity and I would suggest that you begin to inject a more realistic consideration of the time factor into his thinking. Assuming I have the opportunity to do so I propose to raise this matter with him myself.

The following para. was *not* included on the copies of this memorandum which were dispatched as shown below.

**372. Telegram 1524 from Bonn, March 22<sup>1</sup>**

Bonn, March 22, 1961

Paris for Ball; Brussels for BUSEC. Embassy telegram 1504. US and Federal Republic technical affairs discussions held March 20 and 21 on quantitative and qualitative elements of foreign aid. At meeting morning 22nd attended by Under Secretary Ball, Ambassador, Van Scherpenberg (Foreign Office) and others, suggestions of US experts on possible areas of agreement were examined. Van Scherpenberg expressed substantial agreement with US suggestions but proposed some minor modifications. Also stated he would discuss suggestions more fully with Federal Republic experts and possibly with Cabinet prior DAG meeting London on March 27. Both sides agreed this morning's discussions would be set forth in informal minutes, and these follow:

"Possible areas of agreement:

"1) With respect to the principles of burden sharing and their application the following points of possible agreement were identified:

"A. A figure of roughly one percent of the combined GNP's of the DAG countries is an appropriate general target for foreign aid.

"B. The DAG should serve as an instrument for discussing and proposing a fair allocation of this joint aid effort.

"C. The determination of fair share should not await agreement by experts on a precise formula since the final determination of what is fair is necessarily a political matter.

"D. The principal test of what is each country's fair share is 'capacity to pay', as measured by its national product or income, adjusted to take due account of the use of its population demand perhaps of divergences between actual exchange rates and the purchasing power of national currencies.

"E. The final allocation should reflect some measure of progressivity—the richer nations should contribute a larger fraction of their income than those who are less rich. The reduction of gross national product or national income by an exemption of 100–200 dollars per capita to arrive at a 'contribution base' might be a good way to achieve such progressivity.

"F. In determining fair share for aid, appropriate account should be taken of contributions to the common defense.

---

<sup>1</sup> Readout of bilateral foreign aid discussions. Confidential. 3 pp. Department of State, Central Files, 611.62A/3–2261.

“2) With respect to qualitative aspects of aid, i.e., the types of financial flows to less developed countries which will qualify as aid, the following points of agreement were reached:

“A. Private and public financial aid which is extended to the less developed countries on commercial terms is both useful and to be encouraged.

“B. The appropriate composition of assistance of the less developed countries—the combination of grants, long-term soft loans, long-term hard loans, short and medium term assistance—should be determined by the needs and stage of development of the recipient country.

“C. There is today a need for a substantial expansion of long-term assistance on terms more liberal than appropriate for private finance.

“D. The governments of the DAG countries must meet this need for long-term non-commercial assistance.

“E. In the determination of fair shares, account must be taken of the fact that aid provided on such terms constitutes a greater burden on the donor country than public or private finance on commercial terms.”

US experts accompanying Under Secretary Ball inclined believe that foregoing maximum Federal Republic willing explicitly agree to at this stage.

**Dowling**

May 1961

373. Memorandum from Freeman to President Kennedy, May 5<sup>1</sup>

May 5, 1961

SUBJECT

Agriculture and Problems of Foreign Policy

For several works I have wanted an opportunity to discuss some important questions with you, but under the current pressures of problems relating to Laos, Viet Nam, Cuba, et al, I have not felt it appropriate to take any of your time. If and when this pressure lets up a bit, I would appreciate the opportunity to discuss with you the matters that I am presenting here, because I believe they have an important relationship to the immediate problems we face in these trouble spots in the world.

We in the Department of Agriculture are particularly concerned with (1) the use of food as an instrument for economic development and human well-being in the world; (2) the development of an efficient agriculture in the developing nations; and (3) the development of a political climate and political instruments under which people in these nations can grow toward both freedom and a higher standard of living.

I am concerned, not only as Secretary of Agriculture but also personally, with this third point, because in a very small way years ago we took part in some counter measures which resulted in the effective purging of communist influence in our political party back home. At that time we learned that we can't beat something with nothing—that you have to both have a program and be decisive and tough minded in carrying it forward if you expect to meet the kind of financial zeal and twenty-four-hour-on-the-job service that the communist [illegible in the original] mount so effectively.

There are a number of areas which relate to this objective with which we are concerned.

A. I have previously reported to you how we are seeking, for the first time, to assemble adequate information on the nutritional needs around the world and the effectiveness of our food programs. We organized, for this purpose, an interagency committee headed by our

---

<sup>1</sup> "Agriculture and Problems of Foreign Policy." No classification marking. 5 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 65 A 481, Administration, FY 1962.

director of the Foreign Agricultural Service. Its first report, a preliminary evaluation of the world's nutritional gap, has been issued. The second step in this study will be an evaluation of the results of our own food programs.

I am asking that this second phase, originally scheduled for completion in September, be speeded up—and expanded to include the state of agricultural technological development in underdeveloped areas. I would hope that this report will be useful to the new economic aid agency, so that it would not need to start with fast gathering but could immediately get on to the job.

B. I would like to bring to your attention some of my thinking in connection with this new economic aid agency. I hope that it will be so set up and administered that it can be most effective in planning and negotiating the kind of economic aid programs that will best serve our foreign policy and our national interest. At the same time I am concerned lest it be set up in such a way that would militate against making the best possible use of our resources. I believe that the latter would be the result if the new economic aid agency sought, in itself, to operate every program for economic aid.

Let us be more specific. It would appear to us that the new economic aid agency should certainly have the central responsibility for economic assistance as a whole and for each particular country involved, and that in carrying out that responsibility it should be charged with planning, coordination and negotiation, with authority to make final recommendations to the President. In that planning it would, of course, need to consult with other Departments:—for example, it could not plan a food program except in consultation with agriculture. Once the plan was made, I would envisage that the economic aid agency would have over-all direction of the total program in each country.

At this point, however, it seems to us that the actual operation of each program should be carried out by the Department (be it Agriculture, Health, Education and Welfare, or Commerce) in which that function normally resides and in which are found the expert knowledge and experience. Only in this fashion can the maximum resources of each operating agency be available.

I am sure such a plan of operation could be worked out satisfactorily. As I envision it, the new economic aid agency would assign, to each country for which a program had been worked out, a director who, with the assistance of whatever staff might be necessary, would be responsible for the total program. But under his coordination and broad general direction—and under his final authority—there would be assigned to the Department of Agriculture the responsibility for these parts of the program that deal with distribution of food and assistance in developing local agricultural programs. Those operating

the agricultural programs would report both to the economic aid director in the country concerned and to this Department, just as our foreign agricultural attaches now report to the ambassador in the country to which they are assigned and to this Department.

In this matter I believe we could get the most effective operation of our program both in the field of food utilization and in the field of technical assistance to agriculture. Any other form of organization would, it seems to me, involve a duplication of both personnel and work and would tend to militate against the assuring of our highest ability for the economic aid program. To succeed in this important field we will need access to all of the best of our human resources—in ability and experience. It hardly seems possible that a new operating agency could duplicate all the scientific and technological resources of ability that we have in the many agencies of the Department of Agriculture.

I would suggest to you that our capacity is limited in terms not only of dollars, but of personnel. It will not be utilized to the fullest, if the foreign economic aid agency attempts to operate each specific program on its own by calling an specialists from the present operating agencies. For one thing, these will be an absence of permanency, and it will be exceedingly difficult to recruit and hold the most competent people. As a result, the present high level of morals, efficiency and knowledge in our operating agencies could not be as effectively harnessed as if the agencies themselves conducted the actual operations.

In this connection I would emphasize the great variety of our resources and operating programs, ranging from the Extension Service, Rural Electrification Administration, Farmers Land Administration, and our Foreign Agricultural service to all of our scientific and technological services. I would point out how much there is in common between the kind of programs we are launching in our own rural distressed areas and programs needed in many foreign areas. We have experience, ideas and know-how in this field that can be of value and should be used.

C. I believe that the present situation in the developing areas of the world, and particularly in most of these in which the threat of communism is the greatest, is such that there is a tremendous opportunity and a tremendous challenge for the kind of leadership that we find in agriculture in this country. It is clear, it seems to me, that the communist appeal is being made to farmers and peasants rather than to workers. Even in a kind of cynical paragraph, in a recent news magazine, forecasting what might happen in Laos and predicting that Soviet and Red China military advisers would be invited in and that technicians from India, Cambodia, Burma, and Thailand would also be invited, the forecast concluded "and from the United States a few

agricultural experts". This indicates not only our area of leadership but our area of challenge and opportunity.

I believe that in this regard we ought to use every resource we have, openly and clandestinely, publicly and privately. We need to concern ourselves with means whereby we can assist and develop local leadership for freedom, to combat communist infiltration.

I think that in the one single area of building cooperatives and credit unions in the rural areas of the countries involved the opportunity is tremendous. I believe that some of this could be done through government and some through our cooperative and credit union leadership, perhaps with essential government aid. There exists convincing evidence of the success that kind of effort has already achieved in the very small and limited fields in which it has been tried.

I would like to point out two special advantages to be expected from this kind of encouragement of cooperatives in the countries in which we find it most essential to bolster the force of freedom: (1) Economic development through cooperatives avoids the tinge of "imperialism," that, whether justified or not, is bound to be a by-product of private development in the hands of private corporations. Yet cooperatives in this country are strong in both experience and talent to provide the leadership for economic development particularly in rural areas that is so badly needed.

(2) Cooperatives are by their very nature organizations of people through which could be developed democratic leadership among the citizens of the country involved, and such democratic leadership could be most effective politically in opposing the communist threat and in building strong, democratic friendly governments. We can assist in finding and developing such leadership most effectively by means of working through organizations of the people themselves—and labor unions and cooperatives provide the most fertile fields for this kind of effort. Here in agriculture we not only have knowledge and experience in organizing and assisting cooperatives, but we have the nucleus of a fine relationship with voluntary cooperative associations and federations here in the United States.

I have planned to reactivate an advisory committee on cooperatives that used to perform an important function in connection with the Department but was allowed to languish for the past eight years. As it was previously used, this committee met with and advised the Secretary of Agriculture with regard to the domestic scene and proved to be a helpful instrument. I have intended all along to reactivate this committee but it now occurs to me that in reactivating it, and at its first meeting, I might ask the cooperative leaders that constitute this committee what they can do for their country instead of what we can do for them. If you approve, I would like to mention specifically in

my call for the first meeting of this committee a request that they come prepared to discuss to what extent and in what ways the cooperatives of the United States can help us to meet the challenge we face in the developing countries of the world in which democracy is not yet secure and in which we must exert every possible effort to combat the threat of communism.

May 9, 1961

*CONGRESS ASKED TO EXPAND FOOD-FOR-PEACE PROGRAM*

President Kennedy has asked the Congress for a multi-billion dollar authorization for a long-range Food-for-Peace Program. The request is based on the conclusions and recommendations of the President's Food-for-Peace Director, George McGovern, and is contained in the omnibus farm bill which, among other things, extends and strengthens the core of the Food-for-Peace Program—the Agricultural Trade Development and Assistance Act (PL-480). The President has stated that the revised bill will enable the US to correlate its agricultural programs more efficiently with our foreign aid and permit the US to maximize the rise of our agricultural productivity to further economic development, peace and freedom in the world. The President has also set up an American Food-for-Peace Council composed of prominent citizens to advise the Food-for-Peace Director, develop public information on world hunger, and enlist support for the attack against hunger.

The McGovern recommendations specifically emphasize the need for a vigorous program for the utilization of US surplus agricultural commodities as a part of economic development programs and for improving nutrition in the developing countries. The request to Congress is for authority for a five-year \$7.5 billion program for Title I sales as well as other amendments to PL-480. The Secretary of Agriculture would still determine the quantities and commodities which are to be disposed of under PL-480 but the right to determine which

---

<sup>1</sup> Expansion of Food for Peace Program. Unclassified. 5 pp. Washington National Records Center, RG 59, E/CBA/REP Files: FRC 72 A 6248. Current Economic Developments.

countries should get surpluses would be shifted from Agriculture to the President.

*Title I* According to McGovern's report to the President, the surplus agricultural disposal program has been hampered by the difficulty of entering into long-term agreements under Title I (sales for local currencies). A particular problem is the fact that total obligations under all agreements must remain within the current total authority, which for 1960 and 1961 is \$1.5 billion per year. Authority to commit funds for this calendar year had been depleted as the commitments for the May 1960 multi-year Indian agreement had to be met. To correct this weakness in the program, the President asked the Congress for increased authority for the remainder of calendar year 1961 and for a long-term extension of PL-480. The House and Senate have already approved the request for \$2 billion in additional authority for this year, and the President on May 4 signed the legislation. Committees are holding hearings on his request for extension of Title I until 1966 and for an authorization of \$7.5 billion over the next five years, no more than \$2.5 billion of which would be committed in any one calendar year. This authorization, the Administration believes, would provide the flexibility needed for long-term agreements, at the same time eliminating the possibility that all funds would be expended in the first year or so of operation. (It might be noted that a \$2.2 billion multi-year agreement has already been signed with India and that long-term Food-for-Peace agreements are under consideration for Brazil and Pakistan. These latter agreements would run about four years and provide for the sale of approximately \$600 million of commodities to each country.)

The President has also asked the Congress to amend Title I to authorize the building of national food reserves. Under this provision, the President would be authorized to make surplus agricultural commodities available through the CCC for the establishment of such reserves. Agreements with the recipient country would require payment in dollars or local currency depending on the terms of the agreement, but the payment would not be made until the commodities were withdrawn from the reserve. Enactment of this amendment would encourage the creation of badly needed reserves, since many of the underdeveloped countries are susceptible to drought and other natural disasters which cause wide fluctuations in crops. Even those countries which have storage facilities have found it difficult in the past to fill them with US commodities, because they have had problems in financing such purchases.

Another amendment would allow reuse of foreign currencies which represent principle and interest from PL-480 loan repayments. The present bill is silent on the use of such repayments and in the past

this has not been a matter of concern because repayments had not yet started to accumulate. Repayments now, however, have started to grow and will continue to do so.

*Title IV Amendments* Particular emphasis has also been given to long-term dollar sales under Title IV. This Title was added to PL-480 in September 1959 but no agreement under the Title has yet been completed. The Title would be broadened to encourage increased dollar sales through long-term supply agreements and through the extension of credits. Safeguards for usual marketings, the use of private trade channels, etc., would be required as under Title I.

*Titles II and III* The benefits of emergency feeding programs and their continued use is also emphasized in the McGovern Food-for-Peace report. While these programs have been successful as a visible demonstration of US help to the needy, McGovern believes that they have been too limited in number and volume. In addition, the food that has been offered is limited and generally supplied for a relatively short period of time. He recommended that the Administration encourage new programs of this type and expand old ones. Authority for such programs is contained in Title II (which provides for famine relief and grants) and Title III (which provides for donations of food to voluntary agencies for foreign assistance to the needy.)

To meet this objective, the President has asked the Congress to extend Title II through December 31, 1966 and to continue the present yearly authorization of \$300 million in addition to any carry-over. There is no statutory limit of Title III expenditures since such donations are simply treated as losses by the CCC which receives an annual appropriation to cover losses.

The McGovern report stresses quality as well as quantity as a factor in Food-for-Peace aid. It calls for an improvement in the variety of our food package, including the addition of protein and fat which are badly needed. The US has in the past included frozen poultry under Title I programs but only in special cases. The President has, therefore, requested authority to have the CCC make available not only commodities from its surplus stocks but also commodities from private stocks.

In connection with this increased emphasis on nutrition, a special task force was appointed to survey the world's food needs not only in terms of quantity but in terms of the types of food required to maintain normal physical activity and health. The study reveals that total calories, total proteins, and particularly animal proteins, are on the whole very low for the underdeveloped areas. Initial calculations on these needs, however, are considered a "first approximation" only, which should be followed by a more detailed, thorough, and refined calculation including a fuller account of each country's special situation.

The McGovern report calls for increased coordination with voluntary agencies to find out if any further changes are required to render

Title III more effective. Food-for-Peace help in the development of truly national programs in needy countries is recommended in addition to the establishment of programs in needy areas where no assistance is presently given.

A large expansion of Title II and III grant programs has been recommended. The McGovern report foresees an especially significant role for the Peace Corps in this respect. Peace Corps services should be made available to voluntary agencies as well as to governments.

Certain grant programs are also emphasized. The school lunch program is particularly stressed, whether it be on a government-to-government basis or through voluntary agencies. The US has used surplus agricultural commodities for this purpose in Japan, Italy and Tunisia. Difficulties were encountered, however, when some governments were unable to continue the programs on their own. The McGovern plan would permit US support of school lunches for longer periods of time.

Another unique plan which McGovern desires to expand is the food-for-work-program. Under this program, surplus commodities are used as wages in economic development projects such as small dams, irrigation and drainage canals, wells, cisterns, rural roads, reforestation, and soil protection and restoration. A pilot project has worked very well in Tunisia where for about eighteen months workers have received approximately one-third of their pay in surplus food. On May 4 the US signed a \$17.8 million work project agreement with Morocco. Under this program, the largest of its type ever undertaken by the Food-for-Peace program, 200,000 tons of US wheat will be utilized by the Moroccan Government as partial wage payments to 200,000 workers employed in economic developments projects. Negotiations nearing completion will result in additional work programs in Dahomey, Eritrea, Greece, Indonesia, Iran, Republic of China and Tunisia.

*Latin American Mission* The use of surplus agricultural commodities in connection with agrarian reform and other land projects is an additional program which the McGovern report emphasizes. This is especially significant for Latin America and is closely allied to the President's "Alliance for Progress."

Early this year, a special mission was sent to Latin America to determine how US abundance could serve to further programs of social and economic development in these countries. In all of the ten countries visited, the mission found a need for surplus commodities which could be supplied under one or more of the provisions of PL-480. For example, wheat sales for local currency could contribute materially to Brazil's food and economic development needs, whereas famine relief and private agency grants would do much to help the drought stricken northeast area. Title II aid could play a significant role in Colombia's

school construction effort and rural resettlement projects. Furthermore, the increased use of feedgrains toward the production of hogs and poultry in countries such as Brazil might increase the availability of protein for consumption. As a direct result of the Latin American Food-for-Peace mission, Title I agreements have been signed with Ecuador, Bolivia, and Brazil.

The Latin American mission, however, pointed out that food by and of itself cannot provide an answer to the overall development needs of Latin America. Some of the countries must first develop better ideas of the funds, materials, and technical assistance that will be available to carry out their programs. Even donation programs can be effectively implemented only to the extent that financial and technical problems of preparation, transportation, and distribution can be solved.

*Multilateral Programs* Multilateral programs do not conflict with the Food-for-Peace program. On the contrary, such programs as UN activities to relieve hunger through multilateral food distributions complement the US effort. At a recent meeting of the FAO Advisory Committee on Surplus Food Utilization, the US took the initiative by proposing a \$100 million multilateral food fund and offered to contribute \$40 million in commodities. It is hoped that other nations will make similar contributions to help meet the needs of the underdeveloped nations.

May 18, 1961

RESEARCH AND DEVELOPMENT  
IN THE NEW DEVELOPMENT ASSISTANCE PROGRAM

I—INTRODUCTION

Since the end of World War II it has been the policy of the United States to stand ready with financial assistance for those foreign countries where resources were insufficient to meet pressing needs. Initially, this assistance was directed to the rehabilitation of the devastated areas of Western Europe and, when this task was well in hand, to their

---

<sup>1</sup> Research and development unit to help manage the U.S. development assistance program recommended. Official Use Only. 5 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 65 A 481, White House, FY 1962.

economic recovery. Later, emphasis was placed upon the ability of those nations, and others, to defend themselves against aggression. But in recent years, as the industrialized nations have achieved and surpassed their pre-war capabilities, the focus of attention has become fixed upon the less developed nations of Latin America, the Middle East, Africa and Asia. It is clear that in the future American foreign aid, augmented now by those nations which were themselves its recipients only a few years back, will be directed predominantly to the complex task of assisting in the economic and social development of nations, new and old, in the less developed areas of the world.

The development assistance program that is now being shaped is intended to meet these new responsibilities. They differ both in kind and in scope from those of the past. The fundamental problems with which the new agency will deal are not problems which will be resolved in one year, or five, or ten. The task is not to rebuild, but to build; not to restore economies but to create them. The needs are urgent. The United States must not only manage its own effort, but must coordinate its activities with those of the other industrialized nations which are joining in the task, and must help provide leadership for the less developed countries themselves as they strive to further their own ambitions. These are new dimensions in foreign aid programs, necessitating profound re-examination of means and mechanisms.

The people of the United States have come to realize that freedom at home is affected by the fate of freedom in the rest of the world, and that human misery and social chaos anywhere in the world imperil free men everywhere. Both our present concern for the state of the world and our historic commitments to human dignity and freedom justify our continuing attention to the grave problems facing less developed countries.

In doing this, we associate ourselves with men of understanding and good will wherever they may be. We do not see this as a matter of an advanced nation helping less advanced nations—we have by no means solved all our own problems. Nor do we see it as a matter of a big nation helping smaller nations. It is a matter of men of conscience, here and everywhere—men concerned with the state of the world and the condition of man—joining hands in the ancient battle against the afflictions of mankind.

Our goals are these:

1. To assist in the growth of social orders responsive to the needs of the individual.
2. To bring about a steadily rising level of living in the less developed nations.
3. To help the developing nations learn the difficult art of accomplishing change within a framework of order.

4. To help create an international order that will serve the maintenance and the improvement of mutual security.

There is a faith that goals such as these can be met by means of a development assistance program, but there is also an awareness that we will encounter difficulties along the way. Earlier tasks of rehabilitation, of economic recovery and of military assistance could be approached confidently and expertly. The problems encountered were those to which we are accustomed in our own society, and the solutions were as familiar to those who needed our aid as to those who brought it to bear. Indeed, it was often the foreign country itself which identified its problem and suggested the form that aid should take. This is no longer the case. The economies, the customs, the political structures and the resources of the less developed countries have little or nothing in common with our own. Each of these nations has special problems which the industrialized nations, in their evolution into modern societies, were never called upon to face; their economic, cultural and social differences rule out any single, simple solution. Rarely can we rely upon basic resources which normally we take for granted, such as minimal public health standards or widespread literacy. Before we can hope to see answers, we must wage our own intellectual struggle to recognize the questions in their proper perspective.

No development assistance program can hope to be effective unless it is built firmly upon two broad foundations. The first of these is the organization of skilled inquiry to define the needs of the nation we hope to assist; to develop techniques by means of which the process of inquiry itself may be made more efficient; to establish the knowledge that can be brought to bear on these needs and the framework within which that knowledge can be applied; to discover means of stimulating the flow of human resources, here and in the less developed nations, into the stream of development assistance. The second broad foundation is the detailed and imaginative engineering of each proposed solution in terms of its actual application in the field, and the education and training of those who will be called upon to apply it.

#### *SUMMARY OF REPORT*

#### DEVELOPMENT ASSISTANCE PANEL

#### PRESIDENT'S SCIENCE ADVISORY COMMITTEE

Estimates of the scope, pace and long-term efforts required to meet the explosive problems of the emerging nations and regions are rising rapidly. Imaginative programs to meet this challenge call for the effective mobilization of diverse talents and resources—public and private, national and international. The private business and academic communities, in particular, must be more fully tapped as a source of study,

knowledge and experience as well as a source of qualified personnel. A Research and Development Unit to serve the pending consolidated U.S. Development Assistance Program is needed to help bring about such a mobilization of effort and to ensure that the aims of the new Program will be efficiently met and the huge investments involved protected.

The R & D Unit would have as its tasks to improve developmental planning, to identify requirements and priorities, and to define the most effective forms and channels of external assistance to the emerging countries; to help generate new knowledge and techniques to meet the problems of the emerging nations; to conduct appropriate experiments and pilot projects in the less developed areas; to assist in the transition from pilot program to operation; in doing so, to utilize existing institutions and to help them to provide the necessary trained personnel; to create, where necessary, new institutional resources; to coordinate relevant R & D activities outside the Development Assistance Program and to serve as a unifying factor among the elements of the assistance program and to ensure that the entire effort is responsive to our foreign policy objectives.

The areas in which the Unit may expect to be active include the natural sciences, and intimately involve the full range of social, political and cultural sciences. It must deal particularly in the identification of those forces which mold a society, with the adaptation of existing technology, with the pursuit of problems that were by-passed in the evolution of our own society but which are nevertheless central to less developed societies, and to a limited degree in basic research. Its primary criterion must be the needs of the operational programs in the field.

The Unit itself is envisaged as small and compact, with a director of high eminence, a small professional staff and a large body of able and energetic consultants. Special steps should be taken to ensure the participation of individuals from private industry.

The Unit should lay great stress upon the promotion of international cooperative activities and the creation of joint institutions with other industrialized nations and the emerging countries. It should employ the services of academic institutions by means of grants and contracts designed to maintain and strengthen those institutions, should work with industrial firms, particularly in the area of adaptive engineering, and should enter into joint ventures with private foundations, international agencies and other governmental institutions. It should promote action-oriented conferences and studies, and design ambitious field activities around consultant teams.

The budget may be expected to attain a level of approximately \$95 million in four or five years; the Panel recommends a first-year budget on the order of \$50 million.

**376. Letter from Bowles to President Kennedy, May 22<sup>1</sup>**

May 22, 1961

Dear Mr. President:

Last week I discussed the outlook for the foreign aid legislation with Bill Fulbright at considerable length. Bill feels that the need for a strong foreign aid bill with truly adequate funds and a long-term commitment has been vastly increased by recent developments in Cuba and Laos.

If the Administration's reaction to these set backs appears to be largely military and paramilitary, followed by substantial Congressional cuts in our economic aid program and a rejection of your proposals for long-term commitments, the impression created abroad will be most unfavorable.

As you know, the hearings are expected to start around the early part of June. This should mean that the legislation will reach the floor of the House and Senate early in July.

Our efforts to develop the kind of strong public organization and support for this program that we had at the time of Lend Lease and the Marshall Plans have, unhappily, not worked out as we had hoped.

I almost persuaded Bill Benton to act as head of a major volunteer organization, but he was too involved. I then tried Chuck Percy, whom you may know as a rather liberal Republican who was chairman of the Republican Platform Committee. He was also unavailable.

There is, of course, some advance public relations work going on, although I am afraid the scope is nowhere near adequate. Because of this, I hope that you can agree to speak at the Eighth National Conference on International Economic and Social Development to be held here in Washington either June 15–16 or 19–20, depending on your schedule.

David Lloyd who is handling the arrangements, was in to see me last week, and I believe it will be of major importance. I am enclosing a letter which I wrote Mac Bundy outlining the details.

I am also hopeful that you will agree to take the dramatic step of going before a joint session of Congress to make a special personal plea for the passage of truly adequate foreign aid legislation.

This speech would give you an opportunity to reaffirm some of our positive objectives in world developments which have been inevitably confused by the military nature of the Laotian and Cuban emergencies.

---

<sup>1</sup> Foreign aid bill and the Hill: Bowles conversation with Fulbright. No classification marking. 4 pp. Department of State, Central Files, 700.5–MSP/5–2261.

It would also place your own prestige and influence solidly behind the new program which, with adequate funds and long-term commitments, represents our greatest single opportunity for positive action in foreign affairs.

It would be most reassuring to people throughout the world in affirming our constructive objectives in dealing with problems of poverty, injustice, and lack of development.

More than that, it would have a profound effect on the American people in bringing their own minds back into proper balance in foreign policy matters.

Bill Fulbright also stressed the importance of a limited number of private talks with legislative leaders either just before or just after the new legislation goes before Congress. He felt the most important individuals were the following:

*Dick Russell*—As you know, Dick has been opposed to foreign aid generally ever since the days of the Marshall Plan. However, Bill feels he is beginning to understand the requirements, and that he would be so flattered if you paid him some special attention that he might become a powerful and perhaps decisive force in support of your efforts.

*John McClellan*—As you know, John is now in charge of the subcommittee on appropriations for foreign aid, and a very key individual. Fulbright felt that he too would be flattered by any attention you might give him and that would have a great influence.

*Bourke Hickenlooper*—Fulbright feels that Bourke is by all odds the most important Republican as far as this legislation is concerned. If we win his support, we will be a long way toward getting what we must get. I often wonder if Hickenlooper might not be induced to picture himself as Vandenburg in the days of the Marshall Plan, and to take a major role in getting this legislation through.

*Jerry Ford*—Ford, as a rule, has been favorable to foreign aid but critical of some aspects of it. Fulbright felt that he might be persuaded to see himself in the role that Chris Herter took in the House during the Marshall Plan.

*Otto Passman*—It would be foolish to assume that we could get Passman really to support our views. At the same time, a visit with him stressing long term requirements of foreign aid with the view of making the system more effective would help a great deal. I know that your visit with him on the Latin American aid bill was instrumental in getting him to go along.

Fulbright also made a strong personal “suggestion” that I ask you to invite the Foreign Relations Committee and also the Foreign Affairs Committee to come to the White House for a personal talk with you. He feels that this will pay very great dividends. He felt that they should

be asked separately but that the Appropriations Subcommittees of each House could probably be included.

Let me finally say that I think Bill Fulbright can be easily persuaded to be one of the strongest supporters of the administration and you personally. Right now, however, he feels slightly left out.

He has not been in the regular leaders' conference at the White House, yet as Chairman of the Foreign Relations Committee, he has to deal with virtually all important problems. His itchiness grows from the belief that his opinions have not adequately been sought out.

What Fulbright would like to do is to feel that he could stop by the White House and have a drink with you every week or two. If it were possible to set this up and if on every other occasion he would bring some individual he feels is in a key position to help, it would pay big dividends.

In view of the pressures you are under, this is a lot to ask of you. But Bill spoke with such feeling and conviction that I thought his views and my impressions of them should be passed on to you.

With my warmest regards,  
Sincerely,

**Chester Bowles**

---

### **377. Letter from Bowles to President Kennedy, May 23<sup>1</sup>**

May 23, 1961

Dear Mr. President:

I understand there is some difference of opinion as to whether you should go before Congress in behalf of the new economic aid program and the new agency we hope Congress will authorize.

This is simply to establish myself as strongly in favor of such an action for two reasons.

The first relates to our appearance to the world: Inevitably during the next few weeks the Administration will become connected in the public mind with measures which in spite of their essential nature are militantly negative, i.e. further increases in military expenditures, an

---

<sup>1</sup> President's Hill appearance in support of new economic aid program. No classification marking. 2 pp. Department of State, Central Files, 700.5-MSP/5-2361.

increased space program to help to catch up with the Soviets and the possible resumption of nuclear testing.

However essential to our security, these moves all tend to strengthen the image of a nation striving to keep bad things from happening rather than striving to create the kind of free societies throughout the world to which you are so deeply committed.

The second reason relates to the support of the aid program by the American public and the Congress. I'm sure I need not stress to you the concern with which friends of the bill in both Houses view the difficulties confronting it—particularly the long-term aspects which are the key to its success. A personal presentation by you after you return from Vienna and immediately before hearings in both Houses would be in the tradition of the special appearances of President Truman in behalf of Greek-Turkish aid and the Marshall Plan in 1947.

I know that you believe as I do that a truly adequate long-term economic aid program is an essential and very likely decisive element in American foreign policy. A personal appearance by you before Congress in behalf of this program will go far to assure its acceptance and at the same time enable you to underscore our affirmative objectives in world affairs.

With my warmest regards,  
Sincerely,

**Chester Bowles**

---

**378. Personal Memorandum from Bundy to Rusk, May 25<sup>1</sup>**

May 25, 1961

I would like to put in one more word about the organization of the AID agency, and in particular the rank and salary of its Administrator and four Regional Directors.

Two propositions seem to me fundamental about AID. One is that it should be under the Secretary of State, and the other is that it should command the best possible talent. The first point, which has been much debated in the past, now seems settled in everyone's mind. Not only is it clear that the Administration will be in the Department—it is

---

<sup>1</sup> Organization of AID. No classification marking. 1 p. Kennedy Library, National Security Files, Departments and Agencies Series, AID, 1/61–12/61, Box 268.

crystal clear that you as Secretary will have direct authority and responsibility and can exercise it through any staff officer you choose. This is parallel to the decisions being made about Disarmament.

But this is only half the battle. We shall soon need to recruit half a dozen men of the highest quality for AID. It is the universal judgment of men close to this kind of talent that this will be just about impossible if the Administrator cannot rank with the Under Secretary, and the Regional Directors with the Assistant Secretaries. This "with" should be "with, but after," and in no case should the title of Under Secretary or Assistant Secretary be used. It is, oddly enough, salary that is decisive in terms of prestige; we can get men at \$20,000 that we cannot touch at \$19,000. And for the agency as a whole, the extra \$500 for the Administrator will be worth millions in morale.

I understand and share your conviction that *The* Under Secretary must be the Secretary's alter ego and full deputy. It seems to me that this is a standing and a role which, with your support, any Under Secretary can always fulfill, as long as no one actually outranks him. All the cards are in his hand as long as you put them there.

Finally, let me say only that the whole concept of foreign aid is both so important and so hard to defend, that we ought to give its soldiers the very best send-off we can. They will surely need it as time goes by.

I have had a word with Bob Lovett on this general topic, and I think that in general he agrees with the views of this memorandum, which is not an official document but a personal note.

McGeorge Bundy

---

**379. Letter from Freeman to Rusk, May 25<sup>1</sup>**

May 25, 1961

Dear Dean:

Pursuant to our brief discussion at the Cabinet meeting this morning I would like to elaborate a bit further. If you have time, it might be useful to review the enclosed memorandum which I sent to the Economic Aid Task Force for it outlines our feeling here in Agriculture.

---

<sup>1</sup> Agriculture's role in the new AID Agency. No classification marking. 2 pp. Department of State, Central Files, 411.0041/5-2561.

We feel very strongly about the matter of the Economic Aid Agency from the standpoint of our anxiety to contribute to doing a good job. The crux of the matter, I expect, as a new aid agency develops will be contact and consultation at a high level on the plans and programs.

Here in the Department it is felt rather keenly that Agriculture has been generally ignored and more or less regarded as a kind of procurement agency. We envisage that to have the best program possible the resources of this Department must be mobilized, both in terms of the use of food and also in terms of agricultural technical assistance and development programs. I am sure you know that running across the board from research through extension, loan programs, forestry, conservation, marketing, and I could go on, there are some of the best qualified and most dedicated people that can be found anywhere in the Department of Agriculture. I am most anxious that they be motivated and organized to give on a long-term basis with real continuity of effort the best that they have for this essential foreign aid program that you will head.

You will note in the memorandum that it is our judgment that subject to operating responsibility in the country and subject to the authority in the Secretary of State to develop a plan for said country, we feel that the delegation of responsibility to Agriculture and other operating departments will be the best way to get an effective, long-term program which will have continuity and call forth the best efforts and all the resources of the operating departments. There may well be, of course, problems of control and direct lines of responsibility which have existed in the past, but I think this will depend upon the nature of the delegation and the kind of attitude of the operating departments.

In any event, I did want you to know our thinking and I wanted you to know that foreign aid programs occupy a top priority in this Department and we feel keenly the responsibility for serving to stimulate land reform and agricultural development in the countries which will have priority for the attention that is needed.

I have talked and conferred with Chet Bowles about this before and I am sending along a copy of this letter to him. Perhaps some time we might have a chance to discuss this.

Warmest personal regards.

Sincerely yours,

Orville

P.S. It is good to have you home. Hope you can be around for a while.

**380. Telegram 5184 to Paris, May 27<sup>1</sup>**

Verbatim text. For Ball from Martin. Terms of US Assistance.

1. Increasing concern in Department, which I share, over disparity between terms contemplated within USG for future US loans and what other governments willing offer. Indian Consortium April meeting illustrative: We had assumed India would qualify for softest terms feasible under new US aid program, (i.e., minimum interest, 50 year maturity 10 year grace). Other free world governments offered assistance to India at conventional interest rates (5½–6%) maximum maturities 25 years, except Canada which on grant basis. Soviet terms on aid to India at 2½% but maturities only 12 years.

2. Such marked differences between terms US and others, likely have following consequences:

a. US in effect would be financing repayments interest and principal to others countries, including Soviet Bloc,

b. Distorts value US long-term credits by comparison others. Country extending three 15-year credits of same amount considered to provide three times amount US 45-year credit,

c. Extremely difficult explain to Congress why US soft terms necessary and how justifiable in face performance other countries,

d. Relieves pressure on other donors liberalize terms, even over time.

3. On other hand, also argued within Department that would be serious mistake to attempt establish US terms substantially harder than 50-year, zero or low interest.

a. Congress might regard harder terms as an upper limit and would therefore be unlikely to provide authority for the desired degree softness.

b. Having settled for less than the desirable upper limit, it might be difficult to move toward softer terms, if this proved feasible on basis performance by others. Experience in past has been that difficult within USG obtain agreement any softening of terms once hard loans accepted by borrower. Effect is to “lock” oneself in on harder terms.

c. The less-developed countries now expect us to seek and use authority for loans on very soft terms. In some cases, e.g., Pakistan, we plan use such loans as means moving away from grant aid. We

---

<sup>1</sup> Terms of U.S. assistance loans. Confidential. 4 pp. Department of State, Central Files, 700.5–MSP/5–2761.

may already have at least implied to some countries at we would provide loans on IDA-type terms. At India meeting US indicated very large opposed commitment probably would be extended on terms comparable IDA. May also have even similar understanding to Brazilians.

d. Liberalization of the terms offered by other donors will at best be a slow success. If we do little more than match their terms, the LDC's will be losers in the long interim period. Countries not now receiving assistance in significant amounts from others (e.g., Korea, Taiwan) would in particular be penalized by a general policy at limited softness of US terms because of terms of other free world donors relatively few countries.

e. US use of relatively hard terms may result in reduction of IBRD participation in consortium.

4. I believe US posture should be willingness extend assistance on at least equivalent of, probably in most cases a little better than, best terms offered by important other sources assistance, but we should not be much more than step ahead of others. We can always review US terms in future and soften if warranted. Much more difficult to restrict after very soft terms in wide use. Softest terms referred to in President's Aid Message could be considered as desirable objective for which we require authority, but not as starting norm. This language reads "The terms of repayment will vary from as long as 50 years for those countries just starting on the road to development, to much shorter period of time for those countries nearing stage of self-sufficient growth."

Purpose this approach not to impose tougher conditions on recipients. On contrary, intended to exert pressure for general liberalization of terms. Balance payments burden on recipients can be minimized by appropriate means. In case India, for example, above approach would probably force periodic review terms by all donors and agreement on revisions necessary in terms in order avoid payments problem. It would help insure our participation in such reviews on more equal basis and thus with more influence on liberalization.

5. Recognized here that may not be possible resolve this issue quickly. Most immediate instances where question US terms may arise are reconvened India Consortium (May 31) and Pakistan Consortium (June 5). Plan leave matter at these meetings in general terms described para 4. This along lines consistent with May 25 reply by President to May 13 Nehru letter: we working hard secure Congressional actions and cooperation other donors, both necessary if our aid to be forthcoming in amount and on terms which we have in mind.

Would indicate importance terms to other members Consortia but not repeat not bind US to fixed maturities or interest rates. In my

judgment not necessary for US to provide details on terms at India or Pakistan meetings.

Appreciate any guidance you wish to provide.

**Rusk**

---

**381. Letter from Martin to McGovern, May 31<sup>1</sup>**

May 31, 1961

Dear Mr. McGovern:

Mr. Ball has asked me to comment on your memorandum of May 9, 1961 to the President with regard to the possibility of exchanging wheat and feed grains for imported foods, such as coffee and cocoa. It is suggested that the coffee and cocoa could be retained in Civil Defense stockpiles, and that its acquisition might assist in stabilizing world market prices.

As I see it the first consideration would be whether Civil Defense as a matter of policy would consider that a stockpile of cocoa beans and coffee beans was essential in an emergency. There is the further consideration of whether the quantity of wheat exchanged would really be in addition to normal commercial sales and sales under Public Law 480, and thus represent a demonstrable increase in our surplus disposal. Producers of cocoa and coffee would of course only be interested in an exchange if the quantities involved were clearly in addition to what they could otherwise sell for cash. They would also want assurances that the cocoa and coffee would not be thrown on the market later and depress prices.

Unfortunately the magnitude of the coffee surplus is such that storing a pound of coffee for each person in the United States would make no appreciable reduction in the surplus. In cocoa the threat of low prices recently eased when the market absorbed a record crop. Steps are well under way toward intensive discussions of international commodity agreements for both commodities. Thus I feel that further

---

<sup>1</sup> Proposal to exchange wheat and feed grains for imported foods. Attached is a copy of a May 9 memorandum from McGovern to Kennedy explaining proposal. No classification marking. 3 pp. Department of State, Central Files, 800.03/5-961.

study of the exchange proposal may suggest that the timing is not propitious for its advancement.

Sincerely yours,

**Edwin M. Martin**  
*Assistant Secretary*

**Attachment**

SUBJECT

Exchange of Wheat and Food Grains for Imported Foods

To further the Food-For-Peace effort, this office is considering with interested U.S. agencies the desirability of exchanging some of the U.S. stocks of wheat and food grains for imported foods such as coffee and cocoa for retention in Civil Defense stockpiles.

It is contemplated that such exchanges, developed on a mutually beneficial basis, would assist in stabilizing world market prices and enhance United States relations with the supplying countries.

For many years, the exporting countries of Latin America have been especially interested in establishing price stabilizing stockpiles. The operating problems have been considered in a number of international bodies including the Food and Agriculture Organization and the United Nations Committee on International Commodity Trade with which the United States only last year became affiliated.

We do not propose to discuss this idea publicly because it might raise unwarranted expectations both here and abroad.

**George McGovern**

June 1961

382. Letter from Humphrey to Rusk, June 12<sup>1</sup>

June 12, 1961

Dear Mr. Secretary:

Take 10 minutes and read the attached. Garst is right and somebody ought to do something about it.

Sincerely,

**Hubert H. Humphrey**

**Enclosure**

Dear Hubert,

I wrote George McGovern this morning and thought some of sending you a copy of the letter I wrote him—but I have decided it's better to write you directly and along the same lines.

I write to you as a member of the Senate Foreign Relations Committee—as a former member of the Agricultural Committee—as the man who first used the phrase “Food for peace”—and as a leader of the Senate—and a close friend of President Kennedy and a close friend of Adlai Stevenson. That's quite a few hats I give you to wear—but they all fit perfectly.

Everyone in the United States—everyone in the world, for that matter—realizes that there is a contest going on between the Communist bloc countries and the industrial countries of Western Europe and North America—a contest for mens' minds—a contest to see who—which basic type of political and economic situations can produce the best standard of living—and the happiest situations—for the countries which have not been so fortunate.

Practically all of Central and South America, most of Africa—the Caribbean Islands—and Southeast Asia, all suffer from many things but two things they specifically suffer from. First, they suffer healthwise from a lack of the meat type of protein for human consumption. Secondly, they suffer terribly from illiteracy.

---

<sup>1</sup> Garst's Food for Peace ideas. No classification marking. 4 pp. Department of State, Central Files, 800.03/6-1261.

In the United States, we know how to tie these two shortages together. We produced plenty of the meat type of human protein—and we feed it to the school children in school lunch programs.

We and we alone are able to make contributions to all of the backward countries of the world—we have the know how—in fact, we even have the necessity. And this is wholly because we are so productive agriculturally. We ought to do as you suggested quite a few years ago—we ought to use this “Food” for “Peace”. You have been right!

The techniques are not difficult, Hubert. Our biggest move should be chickens. We have roughly speaking, 1.5 billion bushels of corn, grain sorghums and offgrade wheat. We are going to have a very great deal of soybeans this fall so we will have at least reasonably satisfactory supplies of protein.

We know exactly how to raise chickens—and in immense numbers. We know that it takes three weeks after setting an egg to hatch the chicken and nine weeks more to make it into the finest broiler anyone ever ate. We can have broilers three months after the egg is set. We can have eggs from a pullet six months after the egg is set. They are the most efficient converters of feed grain into the meat type of protein for human consumption that has ever been devised. They are not dependent upon the weather. They are not dependent upon the fertility of the soil.

Furthermore, we have the technicians—we have the models—we know exactly how to do it. We know the cost would not be terrific. We would have to have good unloading facilities—and good warehouses at the port cities for a boatload and a half of grain—we would have to have a good feed mill at each port or near each big city—but we know how to do all of these things. There is no difficulty about the technique.

It does not even require refrigeration because people in the poorer countries of the world have always bought chickens alive and taken them home and butchered them in the backyard or the kitchen and used them without any refrigeration.

Believe me, the techniques are not difficult—the experts are available in quantity—and I think all that it would take would be about a three million dollar expenditure for port facilities, feed mixing plants, bulk feed trucks etc. quite near to every principle hungry port city. We could have the country involved take the responsibility for borrowing the money from The World Bank—the only insistence being that we insist that at least half of the poultry and eggs be fed to the school children in a school lunch program. The foreign government could sell the other half and pay the World Bank back—because we are going to furnish the feed free.

I have given the matter a lot of thought and I know that President Kennedy is momentarily most insistent on our help to Central and South America—where this would work wonderfully. So it would at first seem wise to try to carry it out through the organization of American states. But I think the thing has broader aspects so I am inclined to think that it ought to be done through the United Nations. I can't think of any one thing that would improve our prestige on a worldwide basis as much as to have Adlai Stevenson get up in the United Nations and just point out that we are able and willing to be helpful—and that this is the plan we propose to use as a first step—and my thought is that it might be best to offer all friend and foe alike—specifically including China.

Not one of the Communist countries are currently producing [illegible in the original] of the meat type of protein for human consumption [illegible in the original] of their own needs. So we have a tool to use that is [illegible in the original] way available to them—and won't be available to them for another ten years at the earliest.

And we have the necessity of getting rid of surplus grains. Secretary of Agriculture Freeman, with his Food Grain Program, is being extraordinarily effective. But even that program—and I believe it to be the most effective program in history—will only get our production down to about our current needs.

It must be costing us something like 200 million dollars annually for storage of corn, grain sorghums and offgrade wheat that we really need to get rid of.

How dramatic it would be to have Adlai Stevenson come back to tour South America and rise up in the United Nations and make that offer. What it would do for the prestige of the United States is hard to imagine.

You are the guy to put in charge so far as I am concerned of setting this program. I think you ought personally go over it with the President. You know as much about the possibilities as I do. And you are a salesman—and you are the originator of the idea.

With highest personal regards,  
Sincerely,

**Roswell Garst**

**383. Memorandum of Conversation, June 14, among Stikker, Saint-Mleux, Kohler, and Finletter<sup>1</sup>**

June 14, 1961

SUBJECT

Military Aid

PARTICIPANTS

Mr. Dirk Stikker, Secretary-General, NATO

Mr. A. Saint-Mleux, NATO International Staff

Mr. Foy D. Kohler, Assistant Secretary for European Affairs

Amb. Thomas K. Finletter, US Permanent Representative to NATO

Mr. Russell Fessenden, Director, Office of European Regional Affairs

Mr. Stikker indicated an interest in discussing military aid questions saying that long-term knowledge of military aid programs is of course very important to the International Staff in its planning. He also raised the question of aid being terminated for certain countries, noting that he understood The Netherlands had been told not to expect further military aid.

Mr. Kohler said that he thought he could best deal with Mr. Stikker's question by commenting on the current FY '62 assistance program as it affected Europe. This program, as Mr. Kohler's recent statement to the House Foreign Affairs Committee makes clear, is essentially a holding program, being confined largely to existing commitments. However, we also have in mind that the review of NATO military planning and strategy currently under way, with the emphasis on the build-up of conventional forces, may well lead to some modifications in the program. In our statements to Congress, therefore, we have made clear that this may be the case. In addition, special provision will be made for the draw-down from the Department of Defense stocks of up to \$400 million worth of equipment, some of which can be used for NATO purposes. The Department of Defense would of course have to be reimbursed later for the value of these stocks.

Mr. Stikker raised the question of the extent to which forthcoming military aid figures had been made available to the NATO International Staff. Such figures are important to the International Staff in its advance planning, in connection with its review of planning and strategy now getting under way.

---

<sup>1</sup> Military aid programs. Confidential. 2 pp. Department of State, Central Files, 740.5-MSP/6-1461.

Mr. Kohler and Ambassador Finletter pointed out that the current figures for NATO countries were highly tentative in nature and that there was no general provision for making these automatically available at this time. Mr. Kohler undertook, however, to see what could be done in the case of specific requests from the International Staff. Mr. Saint-Mleux noted that it would be very useful, for example, if the NATO "Wise Men" to be set up to look into the Greek and Turkish economic situation could have available the contemplated aid figures for Greece and Turkey.

---

### **384. Memorandum from Bowles to Rusk, June 14<sup>1</sup>**

June 14, 1961

#### **SUBJECT**

The Need to Improve the Administration of Foreign Policy

Our ability to create a more effective, more realistic, and more affirmative American foreign policy rests in large measure on the ability of the top echelon of the Department of State under the general direction of the President and in conjunction with other agencies to produce wise decisions.

It is equally dependent on greatly improved administrative State Department operations, reaching into every section and country desk in Washington and out to every overseas mission, that will assure that these decisions are carried out.

The following measures to achieve this greater effectiveness are either now being taken or are immediately contemplated.

#### *I. Improvement of our Operations here in Washington*

At a recent meeting in my office, I asked each bureau head personally to review the operations of each country desk and other working components within his bureau.

These studies are now being completed, and with the help of Roger Jones, Bill Crockett and Herman Pollack, I am holding meetings with each bureau head to discuss whatever personnel changes and adminis-

---

<sup>1</sup> Improvement needed in administration of foreign policy. No classification marking. 7 pp. Yale University Library, Bowles Papers, Box 300, Folder 536.

trative changes are required to assure both the necessary experience and fresh perspective at all levels of each bureau.

We should avoid the appearance of a shake up, yet those who have been too long on a single assignment and who have become somewhat stale and fixed in their views should be switched to posts which will offer them a fresh challenge.

I am also making personal visits to each bureau. These visits include an hour or more of frank discussion with the thirty or forty top people dealing with the new administration's policies and the specific problems which concern the particular bureau in carrying out these policies.

## *II. Improvement of our Operations Abroad*

The letter from the President to all Ambassadors which went out two weeks ago establishes each Chief of Mission as responsible for the combined U.S. effort in the country to which he has been assigned and entrusts him with necessary working authority. This action has had a most favorable reception.

To help assure a tactful and effective response to this letter, we are sending out a series of guidance letters to all mission chiefs. These letters will deal with the following subjects:

- a. The broad role of the Ambassador as leader, coordinator, and administrator.
- b. Methods of improving the reporting and policy guidance provided by each mission.
- c. Techniques for establishing closer working relationships within the American official community.
- d. Techniques for improving the impression created by American officials (and Americans generally) in each country.
- e. Methods to insure closer contacts with the internal culture, institutions, and people.

The press of daily business makes it difficult for even the ablest of mission chiefs to give sufficient priority to programs which involve basic changes in working relations and habits.

To help assure the necessary thought and action, each Ambassador will be asked to write me a letter within one month of the receipt of these guidance memoranda outlining precisely what changes have occurred in his mission's operations as a result.

In this way we may persuade each Ambassador to focus personally on these fundamental operating questions. The response from each mission chief should also give us valuable insights into his understanding of his own mission. Further status reports will be asked for at periodic intervals.

As a second stage in the campaign to freshen up our operations abroad, I am planning to hold approximately nine regional Chiefs of

Mission Conferences abroad between the end of July and the end of October.

These conferences, which will last for two or three days, will be somewhat larger than the usual Chiefs of Missions' Meetings. The Ambassador will be asked to bring with him his Administrative Officer, the AID Mission Director, the USIS Public Affairs Officer, and in some cases his Deputy.

I expect to take with me from Washington the appropriate Assistant Secretary for each region, Roger Jones, or one of his Deputies, and high level representatives from the new AID Agency and from USIA.

I shall personally attend each of these meetings. We will cover not only policy discussions but the practical problems involved in coordinating the activities of our various agencies abroad; personnel selection, training and management; improved reporting; and so forth.

I believe such meetings are essential to assure that the new emphasis and direction on foreign policy questions the President has approved carries through into action at all operating levels abroad.

We are now working on initial planning for the first three of these conferences. They have tentatively been scheduled for the period from July 25th through August 11th and will probably be held in Lagos, Beirut or Cairo and New Delhi. In September and October we will follow up with similar meetings in Latin America, East Asia and Europe.

We are also planning to lengthen the normal tour of duty at all posts to three years and in some cases longer. Although this will require legislation and considerable adjustment, it is essential if we are to develop knowledge of each country in greater depth, closer personal contacts and better language abilities.

I have also asked for a study of the reports now required of each Embassy and the extent to which the number, frequency and scope of these reports can be reduced. This is essential if we are to free our mission chiefs and their top associates for increased travel outside the national capital.

### *III. A study of U.S. Personnel Overseas*

In 1958 studies were completed by the old Operations Coordinating Board dealing with the broad range of questions resulting from the total U.S. presence abroad, military and civilian. The objective was to persuade the agencies now operating overseas to tighten up administrative practices, personnel selection, attitudes, etc.

The OCB made a number of thoughtful recommendations. Some of these have been carried out in the intervening period. In other instances, however, there appears to have been little improvement.

In any event, the time has come to review this report in light of our present operations, to bring its recommendations up to date, and to establish the procedures that will assure that they are carried out.

Because of the large number of military personnel and dependents now overseas, the Pentagon has a particularly important role to play. In this regard I have discussed procedures with Ros Gilpatric, and a preliminary meeting has been set up with Herman Pollack and Bill Bundy. Procedures will then be agreed upon to explore all questions involving living areas, PX's, general attitudes, preliminary training, indoctrination, and so forth.

Each regional Assistant Secretary will be asked to follow through with the Pentagon and other agencies which are involved in his geographic area.

Roger Jones had an excellent meeting with Elmer Staats and some of the Budget Bureau people here on June 8th. A number of the problems involved in reaffirming State's responsibility for asserting primary authority in the overall field of U.S. international activities were discussed at length.

Elmer Staats and the Budget Bureau are taking a most constructive and helpful approach to all these questions. A special liaison man is being brought in to assure the necessary follow through between the Bureau and State.

#### *IV. Foreign Military Personnel in the U.S.A.*

Another area of our overseas operations which we should consider most carefully is the thousands of military personnel from foreign countries who are brought each year to the United States under the Military Assistance Program for training by the U.S. military in the use of new weapons and techniques. (Ed Murrow tells me that the total budget for this effort is half as large as that of the entire USIA.)

These many contacts provide a ready-made opportunity to create a better understanding of our country, its beliefs, and policies.

In cooperation with Defense we are planning to reexamine the handling of these foreign nationals who are exposed during their stay in this country. Together, we shall then work out a program that will improve their general understanding of the United States, its people and its policies.

I am asking Phil Coombs to coordinate this effort.

#### *V. Reorganization of the Economic Aid Organization*

I am deeply impressed with the present aid program which has been prepared for Congress. In my opinion it deals most effectively with the objectives and requirements of foreign assistance.

However, as I read it, I was again conscious of the urgent need for a highly competent administrative operation to carry out the program.

Criticism of the past operations have often been overstated, but many are valid.

If we are going to get this program through Congress and if the program itself is to live up to the objectives set by the President, we must vastly improve the administrative set up and personnel.

Hank Labouisse and his staff are, of course, acutely conscious of this need. Yet, with their heavy load of Congressional contacts and day-to-day administrative problems, I cannot see how they can devote the necessary time to the immediate task of creating a new, highly competent organization with the necessary new faces.

I suggested to Hank Labouisse the possibility of bringing in (perhaps on a temporary basis) a high level administrator in public administration who would concentrate exclusively on the problem of personnel, organization, and assignments. I shall explore this possibility further.

In my opinion, it is also important to find more effective ways to use the talent in Labor, Agriculture, HEW and elsewhere in operations and planning overseas. It is essential that the State Department keep close control on policy questions. Yet, there are many highly expert people in these agencies with wide overseas experience whom we should learn how to use. At present many of them feel shut out.

I am having lunch with Orville Freeman today to discuss this question. I have already talked in general terms to Abe Ribicoff.

Cabinet members, themselves, with an interest in foreign affairs can play a most constructive role. It is our task to find an effective way to put their energies to work without disrupting or diffusing our normal operations.

This will give you an idea of the effort that is being made. Please give me any thoughts that may occur to you.

**385. Letter from Freeman to Bowles, June 30<sup>1</sup>**

June 30, 1961

Dear Chet:

Enclosed you will find some correspondence with Ted Sorensen which resulted from a New York Times story commenting on what they took to be a different approach to Food for Peace by the President and the Secretary of Agriculture. The contents are, I think, self-explanatory.

I surely enjoyed lunching with you the other day. If I recall rightly, you were going to send me over some material. If so, it has gone astray and I wonder if you would check for I would like to see it.

I have thought a good deal about our conversation and we are going ahead here in the Department along the lines that we reviewed. I hope that by October we will have the study referred to, which is described in the memorandum from Dr. Cochrane attached hereto. If it is as good as I hope it will be, it should provide some useful help in developing our country-by-country plans. I am still strongly of the opinion, Chet, that the actual operation of such plans ought to be made the responsibility of operating departments and, if I may say so, particularly Agriculture, which is so important to the countries in question. I acknowledge your admonition that we may not here at all times have approached these problems either with a very deep understanding or wisdom, yet extensive technical knowledge is available here and also very broad experience, and, in the long run, it would be my feeling that in this fashion we will get the best execution of necessary programs.

In any event, please do keep me informed. We are seeking to contribute in every way we can. Agriculture needs to be a vital force in American foreign policy, and we hope to make it exactly that.

Warmest personal regards.

Sincerely yours,

**Orville**

<sup>1</sup> Agriculture and the Food for Peace program. No classification marking. Attached is a June 29 letter from Freeman to Sorenson on Freeman's remarks on Food for Peace program. 2 pp. Department of State, Central Files, 800.03/6-3061.

## Enclosure

Dear Ted:

Enclosed is the clipping from the *New York Times* which we discussed on the telephone. I felt sure that I was not expressing a policy contrary to that of the President, but it is reassuring to be verified in that feeling. I enclose also a copy of my address to the Food for Peace Council which incorporates what I said to them, although I did not follow the script strictly. I am also taking the liberty of sending you a copy of a letter that I wrote to Dave Bell in connection with this whole matter a few days ago, which relates to the policy question involved, which you and I have reviewed a number of times.

I would paraphrase here briefly the direction in which I hope we can move which is outlined in some detail in my letter to Dave. By October we hope to complete our inventory study which is expected to bring together for the first time with reasonable accuracy, data in connection with food needs country-by-country, what we have done with our food in connection with those needs, what could be done, and an evaluation of our technical assistance programs where agriculture is concerned in the various developing countries. (See memorandum from Cochrane). With this information we will have some guidelines as to the scope and extent of the program we ought to envision where food is concerned. Then it would be, I believe, sound public policy and have tremendous impact both domestically and around the world if we boldly stated that we stood prepared to meet a given percentage of that need. Such a statement would challenge the rest of the world to join us in both filling hungry bellies and furthering constructive economic-development programs. Such a challenge to the Soviet and to the balance of the free world would project dramatically the kind of concept of free America we want to convey. Then we would proceed to implement such a program through the medium of country-by-country plans, developed along the lines outlined in the economic assistance program and its new organizational structure. So far as carrying out these plans in detail there is still, I think, some bedrock thinking to be done and perhaps some experimenting. The vital thing, I believe, is that we are ready to use the magnificent productivity that we have for constructive purposes. If we are able to do it methodically, systematically, and sensibly and to dramatize it appropriately, it will mean, I think, a great deal in the world struggle for freedom.

Sincerely yours,

July 1961

386. Memorandum from Rostow to U. Alexis Johnson, July 11<sup>1</sup>

July 11, 1961

Country Task Forces and the review of the MAP program have emphasized on several occasions the desirability of using local military forces and equipment in civil works and other projects helpful to economic growth. We understand that in a number of cases military personnel and equipment are being used for road construction, village projects, literacy and other basic educational activities of major non-military usefulness. It would be useful to have information in Washington about the current scale of such activity and plans for increasing it in the future.

While the MAAGs probably have most of the information we desire, there may be projects using military forces funded or supervised by the USOMs or the Embassies. We suggest that you ask the field to supply information on the allocation of military resources and people by the U.S. (including non-appropriated funds) and by the local government for these kinds of programs in FY 1961. They could also be asked what specific plans, if any, they now have for expanding this activity and what problems they anticipate. Since we are after facts it should be possible for answers to be received promptly, perhaps before final Congressional action on the FY 1962 appropriation. We are certain the Department of Defense will provide any assistance you may need.

The information received can be used to help judge how much expansion may be feasible and to suggest ways of making an expansion effective. It may also point out problems, perhaps of the method of funding or project approval, which can then be solved prior to the initiation of FY 1962 operations in the summer.

**W.W. Rostow**

*Deputy Special Assistant  
to the President*

**387. Letter from Rusk to Humphrey, July 22<sup>1</sup>**

July 22, 1961

Dear Senator Humphrey:

Thank you for bringing to my attention Mr. Jonathan Garst's suggestions on diet and the use of feed grains in underdeveloped countries.

We are interested in this approach to improvement of nutrition and education in less-developed countries, and in fact it was discussed with Mr. Garst before his recent trip to Brazil. If our surplus grains could be used to buy eggs and poultry from producers in less-developed countries on a payment in kind basis, and the eggs and poultry then distributed through school lunch programs and institutional feeding, the resulting benefits could be substantial. In addition to immediate improvement in nutritional levels, the change in eating habits would build markets for the future and the local industry would be encouraged to expand. Our direct costs would be the surplus feed grains, plus transportation, but this would be offset by savings in storage costs.

The principal obstacle we encounter in establishing programs of this kind is the shortage of able and devoted officials in less-developed countries who can devote the time and personal drive necessary to assure the program's success. Many of these countries also lack the money to pay internal distribution costs, or they assign a low priority to this type of program. Established commercial interests are inclined to oppose such projects, as they fear the increased production will destroy their markets. The lack of schools in many of the countries that most need help also means that the most desirable channel for distribution of protein foods is of limited availability.

The successful use of surplus foods in needy countries through a program as envisaged by Mr. Garst depends upon the recipient country's stage of economic development, the existence of an adequate school system, and above all on organization. You can be assured that we will continue to support the development of this type of program wherever feasible, working through our foreign aid and Food-For-Peace programs.

Sincerely yours,

**Dean Rusk**

August 1961

388. Letter from Rusk to Freeman, August 3<sup>1</sup>

August 3, 1961

Dear Orville:

I regret the delay in replying to your letter of May 25, following our discussion at Cabinet that morning on the administration of the agricultural aspects of the foreign aid program. I did review the memorandum which you enclosed, and then passed it along for further study.

Your statement that the Department of Agriculture has felt that its role has been minimized or largely ignored in the foreign aid program disturbs me, for I know for a fact that Mr. Bowles, Mr. Labouisse and others in the Department believe that the role of the USDA is most important, and that a close, harmonious, integrated working relationship between the AID and the USDA is essential to the success of our agricultural progress abroad.

As for the proposal in your memorandum that actual operating responsibility be delegated to the Department of Agriculture, however, I am convinced that it would be a mistake to further fragment the aid program. The delegation of operational responsibilities to the specialized departments could only run counter to the objective we are seeking in centralizing responsibility for the aid program in a single agency. Consequently, I must endorse the substantive position of the Department on this issue as stated by Mr. Bowles in his letter to you of May 19.

Nevertheless, your letter was most welcome in its affirmation of USDA's desire to make available its resources and expertise in assuring the success of the foreign aid effort. I was assure you that they shall be needed and called for. I understand that informal staff level discussions between the Department of Agriculture and the proposed Agency for International Development have already been instituted looking to the development of arrangements for more effective utilization of the Department's resources.

Under Secretary Bowles will undoubtedly wish to discuss this with you further upon his return from the Regional Operations Conferences abroad.

With kindest regards,

Sincerely,

Dean Rusk

**389. Memorandum from U. Alexis Johnson to Rostow, August 5<sup>1</sup>**

August 5, 1961

## SUBJECT

Civic Action

In response to your memorandum of July 11, 1961, on the use of local military forces and equipment in civil works and economic projects, we are now accumulating information in Washington on the current scale of such activities and on the plans for their future expansion. To augment this information, we are sending an instruction to the field along the lines of your memorandum requesting the missions to supply us with current information on plans and progress in the Civic Action program area.

The information now available to us, while limited, does show some program activity and accomplishment. Over the past year and a half, a number of policy documents and implementing memoranda have been dispatched by the Department of Defense, the Department of State, and ICA. In some instances these have been issued independently; in other cases they represent joint instructions. The principal instruction to the field, attached at Tab A, was forwarded on May 13, 1960, requesting our missions to assess carefully the contribution which could be made to the economic and social welfare of underdeveloped countries by their military and paramilitary forces. The missions were further encouraged to support local forces in economic, social and psychological activities which would benefit the host countries. A Department of the Army letter of November 16, 1960, attached at Tab B, provided the Unified Commanders with an "SOP for Civic Action Teams." This document not only detailed the concept of Civic Action in a meaningful fashion, but also summarized the procedures and ground rules for assignment and utilization of Department of the Army Civic Action teams by local MAAGs and Missions. On the program planning side, guidance to MAAGs and Unified Commanders is contained in the Mutual Security Objectives Plan and in the FY 1962-67 Military Assistance Plan guidance, attached at Tab C.

Certain actions have already been taken in response to field requests generated by the above instructions or in response to recommendations by the Task Forces on Vietnam and Iran. These actions

---

<sup>1</sup> Interim response for information on use of local military forces and equipment in civil works and economic projects. Secret. 5 pp. Department of State, Central Files, 700.5-MSP/8-561.

are, of course, in addition to any projects that may be carried out from time to time by U.S. forces stationed abroad (such as the Armed Forces Assistance to Korea program). The first Civic Action team requested under this program was sent to Guatemala in November 1960. This team was composed of two officers. It remained in Guatemala for a period of sixty days, and was successful in developing for the country an effective Civic Action program with specific recommendations which were accepted by the United States Country Team and by the President of Guatemala.

There are also other projects under way. A Civic Action Team is operating in South Vietnam and another team is being selected for Iran. A Civil Affairs/Civic Action Mobile Training Team will depart soon for Laos, and a survey of the potential for Civic Action programs in Colombia, Bolivia, El Salvador, Honduras, Costa Rica and Nicaragua is now being conducted in the field by an officer from the Civil Affairs Office of the Department of the Army. A program for the European Command is also being considered, with proposed application to Iran, Ethiopia and Libya. In addition to activities having U.S. encouragement, the local military forces of many countries engage in "civil relations" or "civic action" activities wholly on their own initiative. Most of these activities are not at present reported to Washington. When field responses to our recent query are submitted, we will be able to provide data on these activities, which are undoubtedly quite extensive. In the meantime, I am sure that you would still find useful the summary report made for the Draper Committee on this question; it may be consulted in Volume II of the Committee's Report, at page 122.

While there has been encouraging progress in the Civil Relations/Civic Action area, our preliminary analysis leads us to the conclusion that we should now make a very hard assessment of the needs of various countries within the total context of our political, economic and military policies to ensure even further progress in countries where the need is greatest. It is our feeling that perhaps some of our overseas programs reflect habits of thinking and operation that have built up over the years and that do not yet reflect the new thrust of our assistance policies. This is due in large measure to the lack of experience in such activities of many of our personnel—both civilian and military—stationed overseas. And too, perhaps, our guidance has not been sufficiently forceful to bring about the desired reactions to changing needs and situations.

There are many difficult problems involved in making proposals for a more effective program in the future. We must first of all recognize that we are dealing with sovereign nations which are not always willing to follow U.S. advice or suggestions in regard to such activities. Secondly, there is the necessity of balancing economic against military

requirements. As expressed in the current policy directives, local Civic Action activities "should not significantly detract from the capability of the indigenous forces concerned to perform those military missions which the United States considers essential." There is also the problem of appointing civil relations or Civic Action experts to our overseas staffs within the limits of established personnel ceilings. Another major question is whether there should be some kind of special funding operation or separate resources set aside for Civic Action projects, or whether they should continue to be funded in the current manner. These questions cannot at present be given a definitive answer. To help us evaluate them and to arrive at a more dynamic program in the future, we are currently undertaking in Washington a review of the total Civic Action program. Additionally, as mentioned above, we have solicited information from the field to aid us in this evaluation (attached at Tab D). We shall certainly keep you informed of developments in this important area.

**U. Alexis Johnson**  
*Deputy Under Secretary*

Dear Dean:

I am enclosing a memorandum which outlines the growing political importance of the rural population in underdeveloped areas and which proposes several steps to give emphasis and effectiveness to the interest of the United States Government in promoting integrated rural development in these areas. Among these steps is a proposal to establish a small unit of expert personnel within the new Agency for International Development to provide direction and stimulus to this coordinated and comprehensive approach to rural modernization.

You and I have discussed this matter from time to time. It has also been discussed with various people in the Department and in ICA as well as with experts outside the government.

I hope you will be able to read the memorandum while I am away and that immediately after my return we can move ahead to carry out its recommendations.

Sincerely,

**Chester Bowles**

## Enclosure

### SUBJECT

#### A Coordinated Approach to Rural Development

The new emphasis on U.S. foreign aid stresses the importance of a coordinated country-wide approach to economic and social development.

As an important element of this approach, there is an urgent need for a *more systematic, integrated attack on the problems of rural society in underdeveloped lands*. This is true because:

a. *During the next five to ten years the greatest single challenge to American vision and leadership is likely to come from the rural areas of the underdeveloped two-thirds of the world.* The peasants who control the food supply and constitute a substantial majority of all underdeveloped countries are in a crucially important political position. While in many countries they are still the least politically aware class, in another decade they could form an irresistible revolutionary tide.

There is an irreversible trend in every country toward a wider understanding that life need not be one of misery and despair. Apathy is being replaced by a demand for justice, opportunity and security. Yet frustration in reaching these goals is inevitable unless positive steps are taken to alleviate the conditions which inhibit progress.

b. Rural poverty will be *an increasingly focal point of Communist pressure*, notably in Latin America where the pro-Castro forces, skillfully aided by the peasant-oriented Communist Chinese, are building on agrarian discontent.

The Stalinists never understood the peasantry. But Mao Tse-Tung does and everywhere in the underdeveloped world local Communists are adopting Communist Chinese methods to a rural poverty they find. In Cuba, the Castro approach rural problems, the real heart of the Cuban revolution, a truly comprehensive one, with the Instituto Nacional la Reforma Agraria active in every field of rural life.

c. *Piecemeal approaches to rural problems usually fail to achieve results* which generate continued sustained growth. Improvement in one respect, without parallel improvement in others, can easily lead to increasing rather than diminishing real discontent. Growing better crops without being able to market them can only yield frustration; teaching better [illegible in the original] making without making possible the building of better uses can sow new seeds of discontent.

d. In particular in recent years there seems to have been *an inadequate understanding of the relationship* between experts to expand productivity through new agricultural techniques, better health, more educa-

tion, etc.—all that was embraced by the terms “community development” or “fundamentalization”—and approaches to complex problems of economic contribution and political power reflected in systems of land measure, taxation, credit, etc. The best intentioned efforts to improve the lot of the sharecropper will fail if he is able to keep a fair share of his increased productivity.

e. A coordinated attack on rural problems would be more likely to recognize the critical importance of *building the Institutions* on which continued progress depends by involving of the elements of society concerned with rural development.

Fortunately, *there exists a substantial body of knowledge* [illegible in the original] from United States’ (and others’) experience in assisting in the growth of successful rural societies abroad. Land reform in Japan, the Joint Commission on Rural Reconstruction in China, Community Development in India, Pakistan, the Philippines, AIA’s “supervised credit” program in Latin America, all provide data of enormous value. There are skilled practitioners, in and out of government, such as Douglas [illegible in the original], Wolf Ladejinsky, Albert Mayer, Msgr. Luigi Ligutti, Carl Taylor, Clarence Senior, Robert Hudgens, and others.

Moreover, the United States in its own rural development has used a variety of valuable techniques to preserve and enrich family farm living. The land grant college, the extension service, soil conservation, rural electrification, assistance to farm housing, and many others, provide valuable experience on which to draw.

*This knowledge is not being adequately utilized.* Despite pioneer programs such as the comparative rural extension program at Cornell, our experience abroad and at home does not seem to have been systematically collected or made available to personnel working on similar problems in all parts of the world.

*Nor has the United States made crystal clear to the entire world that it stands firmly on the side of deep-rooted rural reform*—including changes in feudalistic land holding systems which concentrate great wealth in the hands of a few.

The over-riding importance of speeding up the evolutionary process by which rural people can find security on the land demands much more from the United States than a passive willingness to contribute to this process when requested. *We should be prepared actively to persuade other nations to initiate comprehensive programs of agrarian betterment and to recommend the substance and procedures of such programs.*

To emphasize the United States’ solid commitment to the fundamental regeneration of rural society, I therefore propose:

1. *That the President issue a public directive, and re-emphasize it in public addresses overseas, that coordinated rural development, includ-*

ing land reform, is a major element of U.S. foreign policy and foreign operations.

2. That our *representatives overseas and at international conferences make similar statements* and initiate and support appropriate steps which demonstrate our concern.

3. That this government propose an *International Conference on Rural Development* (perhaps patterned on the Conference on World Land Tenure Problems held in 1951 at the University of Wisconsin with government sponsorship) to be held in 1962 in connection with the observance of the 100th anniversary of the Morrill Act.

4. That each regional operating bureau of the AID have a *rural development and land reform specialist on the assistant administrator's staff*.

5. That a *small but highly expert unit be established* within the Office of Development Research and Assistance in the new AID to draw together and disseminate the wisdom and know-how in the total area of rural improvement.

This unit should be, or become, expert in such matters as:

a. *Political procedures* for inaugurating a multi-element approach to rural development, at national and community levels.

b. *Stages of growth* and the proper relationship at various stages among land reform (distribution of large holdings, consolidation of small holdings, etc.), improved credit, better marketing procedures, tax systems, crop diversification, rural industries, literacy, health and recreational services, etc.

c. How to create the *permanent economic and political* institutions of democratic rural society so as to preserve and defend the progress being made. Here the emphasis must be on the instruments of mutual help and self-government: cooperatives, village improvement associations, local militia, etc. Real rural development will bring a new sense of justice, of belonging to a community worth defending—and this new spirit must be mobilized to resist efforts to undermine or destroy what has been accomplished.

d. *Cultural factors in rural development*. A sensitive awareness of the cultural values which can and should be preserved amidst change, as well as those which are obstacles to effective progress, can greatly enhance our assistance to the process of rural modernization.

e. *The relationship of rural progress to other fundamental questions*, such as international commodity stabilization, population pressures, etc., as well as to the total country development program.

This unit could serve as a center for such activities as:

a. *Providing expert advice to underdeveloped countries on comprehensive rural development*. Working through the geographical operating bureaus of AID, a team of experts could make a survey of a country's needs

and prepare specific recommendations as to the financing, manpower and legislative requirements for an integrated program.

b. *Assisting the operating bureaus of the foreign aid program on the rural development component* of country plans and keeping in close touch with such programs as they grow.

c. *Stimulating and guiding further research* and publication in rural development problems.

d. *Holding meetings on rural problems* such as the international conference suggested above as well as regional meetings of land reform and rural development specialists.

e. *Providing representatives for the U.S.* (or back-stopping our representatives) in the UN and other multilateral bodies on rural development problems.

f. *Developing training courses and materials*, both within the government and in private institutions, for the orientation of present and prospective AID personnel in rural development problems.

g. *Helping locate and recruit* rural development experts for government service.

The need is urgent and the time is short. We must act promptly if we are to grasp the great opportunity truly to become the champion of a better life of hope for the millions of men and women now desperately seeking a way out of rural poverty and despair.

---

### 392. Memorandum from Joseph S. Toner to Bell, September 20<sup>1</sup>

September 20, 1961

#### SUBJECT

Secretary Freeman's Proposals on Organization

Although Secretary Freeman's proposals on administering the agricultural portion of foreign assistance have been broached repeatedly and to a variety of people, the responses recorded in our files appear to have been coordinated and consistent.

---

<sup>1</sup> Secretary Freeman's proposals on administering the agricultural portion of foreign assistance. No classification marking. 3 pp. Washington National Records Center, RG 286, AID Administrator Files; FRC 65 A 481, Agriculture, FY 1962.

The subject was first brought up in an exchange between Mr. Labouisse and Mr. Charles S. Murphy, Under Secretary of Agriculture, and although Mr. Labouisse did state ICA's position on the question of ICA-USDA relationships, the scope of the correspondence was then confined to the Secretary of Agriculture's testimony on the Hill concerning Title II, PL 480. The conclusions of this correspondence were tentative and phrased in terms of there being no need at that time for USDA to comment on ICA's specific position, of agreement that the issues had been narrowed, and of Mr. Labouisse's intention to speak to Messrs. Murphy and Freeman about ICA-USDA relationships as soon as the legislation marathon was over.

Later, in response to Mr. Freeman's letter of May 12 and his memorandum of May 5 to the President, ICA and Department of State policy was clearly stated in Mr. Bowles' letter of May 19 to the Secretary of Agriculture. This policy was endorsed by Secretary Rusk in his letter of August 3, and elaborated in a Briefing Memorandum of August 22 for Secretary Rusk's use in connection with the discussions proposed by Secretary Freeman for a Cabinet luncheon on August 23.

Stanley Andrews has made a number of proposals concerning the new AID program and these have run the gamut from suggestions for a [illegible in the original] the agency and personnel (including himself) to suggestions on actual reorganization. The most important piece done by Mr. Andrews was a nine country report tracing what had happened in the course of ten years to programs initiated under Point IV when Andrews administered the program. This was sent to us by President Hannah of Michigan State University on April 20. Mr. Labouisse replied and the report was sent to the Task Force. Earlier, on April 5, Mr. Andrews himself had sent to Mr. Cooley a paper comprising "roughly drafted suggestions of the general structure" of the new agency. Mr. Cooley acknowledged receipt and it was forwarded to the Task Force. So far as I know, no communications have gone to Mr. Andrews from ICA touching on the question of USDA-ICA relationships. I understand that Mr. Andrews has done a paper for the Secretary of Agriculture on this question, but we do not yet have a copy and we were not requested to comment on its preparation.

Mr. James G. Patton, President of the National Farmers Union, wrote to the President on May 26 giving the opinion that Food for Peace should be retained in the White House and not placed under either USDA or AID. A copy of this letter was sent to Mr. Labouisse by Mr. Patton, and on June 1 Mr. Waters replied and cited the President's statement on Food for Peace contained in his transmittal letter accompanying the AID legislation to the Hill. The President's transmittal letter stated the relative responsibilities of USDA, AID and Food for Peace for the use of agricultural commodities, etc. as an instrument of devel-

opment assistance. Mr. Waters' reply simply referred to this statement and voiced agreement on the need to work out day-to-day working arrangements with Food for Peace, with no further mention being made of USDA.

I know of no other correspondence on this subject. All of the above appear consistent in their statement of the AID-State position.

Copies of the most important relevant documents are attached for your reference. We should be glad to send you the complete file if you wish.

**Joseph S. Toner**  
*Executive Secretary*

October 1961

393. Letter from Tetro to Gardner, October 6<sup>1</sup>

October 6, 1961

Dear Mr. Gardner:

Regardless of how we deal with this difficult subject in our positions for the forthcoming international meetings, I would like to place before you and others in the U.S. Government some of the thoughts we are considering in USDA with respect to jurisdictional problems of multilateralized economic aid.

First, I would like to say that the concern some of us feel with respect to such jurisdictional aspects of the problem of multilateral "food aid for economic development" is perhaps not fully justified. The one real goal we should strive for is the proper coordination and integration of *all* resource availabilities within a country's total investment or development program. All foreign aid, including food aid should thus be subject to the rule that all types of financial and commodity assistance a country receives from abroad, including such assistance through international channels, must be fully integrated with each other and with the domestic resources devoted to current investment within the total investment program of each receiving country.

*This* is the overriding requirement. It is a requirement for any kind of aid, food aid or financial aid, bilateral aid or multilateral aid. But surely such integration cannot be done by FAO. Neither can it be done by the U.N. Special Fund. It cannot be done by any other international agency, nor by the United States through bilateral program machinery, nor by the IMF or the IBRD, or the IDA, without special arrangements that call for a great deal of cooperation on the part of other governments or agencies.

It is true, of course, that at times some of these givers may have had much leverage for compelling receiving countries to yield on an integrated total investment program. But if there was such leverage it was because of the great importance of the aid given by such an agency or country. Obviously, even an expanded initial program of multilateral food aid for any one country would be too small to carry such a leverage—quite apart from the fact that neither the U.N. nor the U.S. may want to rely on this type of compulsion.

---

<sup>1</sup> USDA and jurisdictional problems of multilateral economic aid. No classification marking. Attached is an October 18 reply from Gardner to Tetro. 3 pp. Department of State, Central Files, 811.0000/10-661.

The point I am trying to make is that proper integration can only be carried out at the country level by the country's own government. And what we ought to seek is machinery and procedures that would assure *such* integration. Perhaps each receiving country could be made to agree that it would appoint an experienced economist (acceptable to all those giving aid) as international advisor for its total investment program. The advisor would help in the process of integration and would report to all aid-giving countries and agencies concerned. In such efforts an effective role for the U.N. resident representative might be highly valuable, particularly in the case of countries that do not have an effective government. In other cases a different approach might be more promising, for example, in a country where IBRD assistance is especially important and where an IBRD economist might be called upon to give that help.

We have been wondering for some time whether it may be feasible to pursue this approach. Personally, I favor a United States position calling for arrangements that acknowledge the necessity of integration of all resources devoted to investment; and we did put a specific reference to this into our positions for FAO earlier this year. Beyond that, our suggestion could perhaps call for the appointment of overall advisors, one in each country, to help governments towards such integration. In this activity they might as much represent the United Nations as they might represent other sources of outside aid—including countries giving bilateral aid. It is also my personal view that the United States might even offer to consider such an arrangement for its own bilateral programs so far as legal requirements permit. I raise all these questions without prejudice to a final official position of my Department. But I think it would be useful to have some preliminary exchange of views.

If the approach I mention were to be found constructive and feasible, it would focus not on a formal problem but on the essence of the question. We could still call for a U.N. role in the development of multilateral programs for economic and social development. But as FAO and as any other individual source of aid it would have to subordinate itself to the total integration effort at the country level. Needless to say, that similar integration at the country level seems desirable for technical assistance from all sources. And indeed there should also be integration of technical and educational assistance with economic aid. Perhaps this would be asking too much. But I believe it should be our goal and should be openly proclaimed, even if we have to approach it in stages.

With kind regards,

Sincerely yours,

**Robert C. Tetro**  
*Administrator*

## Attachment

Dear Bob:

I want to thank you for your letter of October 6 which reflects some of the thoughts you are considering in USDA with respect to jurisdictional problems of multilateral economic aid. Your letter opens up an exchange of views which I warmly welcome.

There is much in what you say with which I fully agree. As a matter of fact, I believe we see eye to eye on most of the basic issues raised. In particular, I strongly endorse your emphasis on integration on the country level, possibly by way of the appointment of experienced economists as international advisers to less developed countries for their total investment programs, and certainly by way of strengthening the position of the Resident Representatives. It may well be that we shall need both such top-level advisers to individual governments and stronger Resident Representatives. The task of the latter would be to help pull together the views and programs of the various international agencies operating in a given country and to assist them in the implementation of country development plans. The Resident Representatives should also have the important function of consulting with the country directors of bilateral technical assistance programs. This kind of coordination on the country level will, as I see it, require closer cooperation at the center, i.e., the headquarters of the participating agencies. I do believe that in this context a special role should be assigned to the management of the Special Fund.

I am very much looking forward to discussing these and related matters when we meet for luncheon.

With warm regards.

Sincerely,

**Richard N. Gardner**  
*Deputy Assistant Secretary  
for International Organization Affairs*

**394. Letter from McGovern to Hamilton, October 7<sup>1</sup>**

October 7, 1961

Dear Fowler:

I enjoyed lunching with you and Secretary Freeman on Tuesday and feel certain that together we can achieve many of the important objectives involving both the Act for International Development and the Food For Peace Program.

In President Kennedy's State of the Union Message, reference was made to the storage of some of our agricultural abundance in national or regional food reserves abroad. In subsequent reports, I have referred to the Administration's desire for such an off-shore storage program, which many of us feel would have substantial advantages.

The storage of part of America's surplus in areas that periodically experience famine or food shortages because of economic and natural causes would tend to make available to hungry peoples in these areas foodstuffs when needed, rather than months later, which is often the best that can be done under a crash program. Further, off-shore storage in marginal food supply areas would have an impact on the economy, in that during periods of threatened shortages the presence of surplus foodstuffs would minimize speculative tendencies. Planned development of off-shore storage facilities would result in efficient use of shipping facilities as contracted with the difficulty of rushing significant quantities of foodstuffs to troubled areas in crises. In this connection, the impact of military need for bulk bottoms in these critical times is a significant consideration.

One problem throughout the world in connection with off-shore storage has been the availability of adequate facilities which would insure the ability to hold surplus foods over a period of time in such quality that the foodstuffs would be edible when needed. Very few consuming countries in the world have adequate storage facilities, either in terms of physical space, or where such space is available, from the standpoint of rodent infestation and natural deterioration. Secretary Freeman recently stated that studies by the Food and Agriculture Organization indicate an annual loss of about 53 million tons of stored grain

---

<sup>1</sup> Food for Peace: Off-shore food storage proposal/survey team. No classification marking. 4 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 65 A 481, Food for Peace, FY 1962.

due to infestations and inadequate handling facilities. This figure is about equal to the total volume of grains moving in world trade.

It is our thought that United States food programs would be substantially advanced if off-shore storage facilities could be developed in various countries or regions throughout the world where food shortages periodically occur. If possible, such off-shore storage should be on a regional basis although it is recognized that political factors may preclude the establishment of facilities in some areas.

In order to establish an off-shore storage program, which to date has been rather dormant, we recommend that the following steps be taken: (1) an analysis to determine which regions and countries lend themselves to off-shore storage facilities; (2) a delineation of countries where the U.S. Government has uncommitted local currencies; and (3) an immediate move toward the establishment of off-shore storage facilities in specific areas.

In order to initiate first steps to accomplish the above, it is recommended that prompt, on-the-spot surveys be conducted by a team of experts. Among the countries which might lend themselves to either country or regional off-shore storage programs would be Morocco and/or Tunisia; one or more of the West African countries; one or more East African countries, such as Kenya or Tanganyika; one or more Middle Eastern countries, such as Israel and an Arab state; one or more South American countries, such as Brazil and Chile. Consideration might also be given to a Central American country and a Southeast Asian country.

In our consideration of this proposal, we have found the advice and suggestions of Robert Nathan Associates of Washington, D.C., extremely helpful. They would be eminently well-qualified to cooperate on the survey team which might also include a Food For Peace official from AID or Agriculture, and one or two consultants.

It has been suggested that the survey team visit Israel, Morocco, Tanganyika and/or Nigeria on the first expedition of roughly 14 days' duration and an additional 5 days to prepare a report.

If this proposal meets with your approval, an estimated budget and transportation arrangements can be prepared.

In view of the importance of this project and the fact that no specialized exploratory work has yet been done, I would hope that a survey team could be dispatched within the next few weeks.

Sincerely yours,

**George McGovern**  
*Special Assistant to the President*  
*Director, Food For Peace*

October 10, 1961

*ECONOMIC HIGHLIGHTS OF THE FIRST SESSION, 87th  
CONGRESS*

The first session of the 87th Congress, which completed its work September 26th in the longest session in ten years, took action on many measures affecting foreign economic policy. The new Administration's Peace Corps and Disarmament Agency measures were approved, as was US participation in the Organization for Economic Cooperation and Development. Foreign aid appropriations totaled more than last year but considerably less than the Administration had asked for, and while authority was granted to make long-term loan commitments in advance of appropriations, the Administration's request to finance such loans by borrowing from Treasury directly instead of relying on annual Congressional appropriations was rejected. Long-term authority was given for disposals of agricultural surplus commodities under PL-480.

On the trade side, no major legislation was before the Congress, but protectionist sentiment was strong, foreboding a serious Congressional battle when the trade agreements legislation comes up for renewal next session. A host of bills was introduced designed to protect the domestic industries, but very few were passed and none that threatens serious harm in our foreign relations.

*Foreign Aid Programs*

*Aid Program a Partial Victory* On the final day of the session, the Congress gave its approval to the foreign aid appropriations bill. The session was marked by lengthy and at times acrimonious debate, particularly over the \$7.2 billion in public debt borrowing authority sought by the Administration for long-term, low-interest, dollar-repayable development loans.

The legislation finally enacted grants the President the authority to make long-term commitments in the magnitude requested but does not provide for public debt borrowing authority which has the focus of Administration efforts.

Overall, the President sought \$4.8 billion for foreign economic and military aid for FY '62. Congress authorized slightly over \$4.2 billion and finally settled on an appropriation of approximately \$3.9 billion.

---

<sup>1</sup> Economic Highlights of the First Session, 87th Congress. Official Use Only. 9 pp. Washington National Records Center, RG 59, E/CBA/REP Files: FRC 72 A 6248, Current Economic Developments.

This compares with an appropriation of \$3.8 billion for the previous year.

A breakdown of the funds provided for the major items of the foreign aid program is as follows (in millions of dollars).

<u>Category</u>	<u>Requested</u>	<u>Authorized</u>	<u>Appropriated</u>
Development Loans	\$1,187	\$1,200	\$1,112.5
Development Grants	389	380	296.5
Investment Surveys	5	5	1.5
International Organizations	158	153.5	153.5
Supporting Assistance	610	465	425
Contingency Fund	500	300	275
Military Assistance	1,885	1,700	1,600
Administrative	51.55	.50	47.5
Development Research	20	—	—
TOTAL	4,805.55	4,253.5	3,911.5*

\*The above tabulation excludes \$110 million appropriated for additional investment in the Inter-American Development Bank, \$61 million for a subscription to the International Development Association, \$30 million appropriated for the Peace Corps, \$600 million for Inter-American Cooperation, and \$3 million appropriated for Administrative expenses (State). Also reappropriated were unobligated balances of \$69.5 million which were not allocated except for \$8.9 million for the Contingency Fund.

The new law stresses the importance of sound economic planning for economic and social development in the recipient countries, an emphasis which the President also gave in presenting his program to the Congress. The enabling law provides that assistance shall: be based upon sound plans and programs; be directed toward the social as well as economic aspects of economic development; be responsive to the efforts of the recipient countries to mobilize their own resources and help themselves; be cognizant of the external and internal pressures which hamper their growth; and should emphasize long-range development assistance as the primary instrument of such growth.

*Congressional Debate* The Congressional Committees devoted most of their questioning of principal witnesses to the Administration's request for public debt borrowing authority. Acknowledging the need for longer-term commitments and advance planning, the Congress generally took the position that these ends could be achieved without eliminating the traditional surveillance of the Appropriation Committees and their authority to appropriate funds on an annual basis.

Restoration of public and Congressional confidence in the foreign aid program by the introduction of new leadership and by a general organizational overhaul of ICA held a strong second place in the Congressional debate.

Generally speaking, the authorization bill passed by the Senate adhered closely to the original Administration request. The House bill did not. It restored the existing annual appropriations system, struck the Administration's request for the use of previously unobligated funds, and largely rejected the innovations proposed by the Executive Branch. The Conference Committee, however, produced a bill generally in line with Administration views.

In similar fashion the appropriations bill fared well in the Senate but ran into very rough sledding in the House.

*Features of the New Legislation* In addition to the expanded program of development lending on a long-term, low-interest basis, the Congress also approved certain measures to induce expanded American investment abroad. Specifically, the President is authorized to issue all-risk guaranties to cover up to 75 percent of the loss of any investment subject to the limitation that no more than \$90 million of such guaranties may be outstanding, and further, that no one guaranty contract exceed \$10 million. An additional \$10 million in all-risk guaranty coverage is provided for investments in housing projects in Latin America. These measures are included as part of a \$1 billion guaranty authority assuring protection against political risks (inconvertibility, expropriation and war) which has been broadened to include losses from revolution and insurrection. Political risk coverage is expanded to investments by wholly-owned foreign subsidiaries of US corporations, including their reinvestments of earnings.

The new Agency for International Development (AID) is also empowered to finance up to 50 percent of the cost of surveys of investment opportunities undertaken by private companies. Financing of such surveys may take place only if the private company concerned does not undertake the investment opportunity surveyed. In this case the results of the survey become the property of the US Government which may make them available to other interested firms.

Some existing aid categories are redefined in the new legislation. Specifically, the old Defense Support and Special Assistance categories are amalgamated into Supporting Assistance. Technical Cooperation concepts have been expanded and redesignated as Development Grants. The new legislation also eliminates, transfers, and clarifies several other existing activities. The Section 402 surplus agriculture commodities function is eliminated. Responsibility for administering refugee and escapee activities is deleted from the legislation, and the responsibilities of the Secretary of State for administering the Battle Act are clarified.

The law specifically prohibits assistance to Cuba and authorizes the President to establish and maintain a total embargo upon all trade between the US and Cuba.

The Hays-Douglas amendment to the Mutual Security Act of 1960 has been eliminated. This linked principles of free transit and economic cooperation among nations to US aid. This legislation was aimed at the continued refusal of Egypt to allow transit of ships of all nations through the Suez Canal.

The new legislation provides that "it is the policy of the US to support the principles of . . . freedom of navigation in international waterways."

*AID, the New Agency* Congress approved a new organization pattern for the Agency for International Development, with greatly strengthened regional bureaus. With rank equal to that of an Under Secretary, the AID Administrator, Fowler Hamilton, is responsible to the Secretary of State and the President. Congress also wrote into the law a provision which empowers the President, within the sixty days designated for the abolition of DLF, ICA, and the office of the Inspector General, notwithstanding any other provisions of law, to transfer such personnel from these entities to the new AID agency as he determines necessary. Effective September 30, AID was formally established as an agency within the Department of State.

*Latin American Aid Program* Congress appropriated \$500 million to implement the US commitment for the Inter-American Program for Social Progress. Authorization for this program had been granted in the second session of the 86th Congress. Congress this year also appropriated \$100 million for assistance in the reconstruction and rehabilitation of Chile as authorized by the previous Congress.

Of the \$500 million appropriated for the Social Progress Program, \$394 million will be loaned under a trust agreement with the Inter-American Development Bank (IDB) to individual countries to finance improved land use; to facilitate housing for low-income groups, including assistance to institutions providing long-term housing finance; community water supply and sanitation facilities; and advanced education related to economic and social development. Another \$100 million of the \$500 million, will be distributed by AID, primarily as grants, for education and training programs, public health projects other than water supply and sanitation, and support of Latin Government institutions working toward improved land use, low-cost housing, and improved use of domestic resources. The remaining \$6 million will be used by the Economic and Social Council of the OAS to coordinate the projects.

Some controversy attended the question of the interest rates that could be charged by Latin American lenders. A Senate amendment to limit interest to a ceiling of 8 percent on all funds loaned or reloaned was amended to provide that funds shall not be loaned or reloaned at interest rates considered to be excessive by the IDB or higher than the legal rate of interest of the country in which the loan is made.

*Peace Corps Gains Permanent Status* The Administration bill to give permanent status to the Peace Corps was approved by Congress and signed into law as PL 87–293. An Administration request for \$40 million to finance the Peace Corps was authorized by the Congress, but only \$30 million was appropriated. Originally set up on a pilot basis by Presidential order on March 1, the Peace Corps had been financed out of the President's Contingency Fund.

Since its establishment the Peace Corps has drawn more than 13,000 applications from Americans seeking to serve as volunteers. Some 450 of these have completed their training and 369 are currently serving in eight different countries: Tanganyika, Colombia, Chile, Ghana, St. Lucia (West Indies), Nigeria, and the Philippines.

*PL–480*

*Long-Term Authority Granted* In keeping with the Administration's foreign assistance concepts, the President requested and received long-term Congressional authorization for sales for local currency of surplus agricultural commodities in the amendments extending the provisions of the Agricultural Trade Development and Assistance Act of 1954 (PL–480). The Congress added new provisions to the law regarding the sales deposit rate in local currency, the use of loan repayments, and the uses of foreign currencies accruing from the sales of surplus commodities. The Act was also amended to re-define surplus commodities, requiring that such commodities be surplus "at the time of exportation or donation." The amendments to the disposal law are contained in Title II of the Agricultural Act of 1961 (PL 87–128).

*Title I* The most significant provision of the revised law grants the President authority to enter into agreements under Title I (sales for local currency) over a three-year period—from January 1, 1962 to December 31, 1964. Furthermore, Congress approved a \$4.5 billion authorization for Title I sales, not more than \$2.5 billion of which may be committed in any one calendar year. (The Administration had asked for a five-year program and an authorization of \$7.5 billion). Authority to make commitments for more than one year is considered important for proper planning and development. In addition, friendly governments have made it clear that they hesitate to approve substantial PL–480 programs if there is no assurance that such programs will be continued for a reasonable time. The revised Act does not provide for the carry-over of unused funds.

Earlier in the session, Congress granted an additional authorization of \$2 billion for Title I sales to the original calendar 1961 authorization of \$1.5 billion. The added authorization was designed to restore funds previously committed under the \$2.1 billion (estimated CCC cost with transportation) multi-year Title I commodity sales agreement with the Government of India.

*Title II* The amendments to PL-480 also extend Title II for the three-year period and provide for this purpose an annual authorization of \$300 million, plus carryover for calendar years 1962 through 1964. (Title II, under Section 201, authorizes the President to furnish emergency assistance to friendly peoples in meeting famine or extraordinary relief requirements and, under Section 202, to grant surplus agricultural commodities to assist in economic development programs of friendly governments or voluntary relief agencies.) The new language of the legislation puts the authorization on a program commitment basis, beginning with calendar year 1961, instead of on a funds expended basis. Congress in July had repealed a section of the Mutual Security Act of 1960 which limited to June 30, 1961 the use of Title II commodities for economic development projects.

*Other Amendments* An important Administration proposal which Congress approved was the inclusion of authority under PL-480 to use the loan repayments of principal and interest in the same way as newly generated proceeds of sales agreements. The basis on which these local currencies will be made available for use will be delineated in an Executive Order which is expected to be issued soon. Congress also amended Section 104 of the Act, which deals with the uses of foreign currencies, to eliminate the language which had the effect of requiring an appropriation before foreign currencies made available for country use as grants or loans could be used for health, education, nutrition, or sanitation projects. The purpose of the amendment is to make it clear that funds for such developments need not be specifically appropriated by the Congress. All currencies to be applied to projects which are not developmental in nature or are primarily concerned with programs of US agencies (as distinguished from country use) would continue under the appropriation procedure.

Congress rejected some changes the Administration proposed for PL-480. One such proposal called for authorization to permit establishment of "food reserves" located in foreign countries. This was the third time that such a proposal had been rejected by the Congress. Also rejected was a plan to expand Titles II and III. The Administration proposal would have increased disaster relief, economic development and voluntary agency programs by making eligible for donation those products not in the inventory of the Commodity Credit Corporation but declared surplus by the Secretary of Agriculture. The purpose of this proposal was to improve the nutritional balance of our assistance programs.

A number of amendments were passed by Congress which were not a part of the original Administration sponsored bill. One such amendment relates to the exchange rate used for sales deposits in Title I, PL-480 agreements. In the future, the US will have to obtain the

same exchange rate for sales deposits as that available to it for official US Government transactions. Under the previous practice, the rate governing PL-480 sales was normally the rate generally applicable to imports. This rate was in some instances less favorable to the US than the rate applying to official US Government expenditures in the country.

Amendments to Section 104 (uses of the local currency sales proceeds) give Agriculture greater authority to use such funds for market development, requiring that not less than 2% of the proceeds of PL-480 sales and loan agreements be convertible into other currencies for this purpose; and permit sales of foreign currencies to American tourists for dollars.

### *Commodities*

Major action in the commodity field concerned lead and zinc, sugar and wool, and called for an investigation of national fuels policy. The Executive in September submitted for Congressional approval a program for the disposal of tin from the national stockpile and hopes for action early in the next session.

*Lead and Zinc Subsidy Law Approved.* Of the multitude of bills introduced at this session to stabilize the mining of lead and zinc, only one (H.R. 84) became law. It provides for a decreasing scale of subsidy payments over the next four years to small lead and zinc producers (those producers who have produced or sold during the base period ores or concentrates, the recoverable content of which did not exceed 3,000 tons of lead and zinc in any ore year). The Secretary of the Interior is authorized to make stabilization payments to small producers for the sale of newly mined ores or concentrates with payments made only with respect to the metal content as determined by assay. Lead payments are to be made as long as the market price of common lead is below 14.5 cents per pound at a rate of 75% of the difference between 14.5 cents and the average market price for the month in which the sale occurred. Zinc payments are to be made as long as the price of prime western zinc is below 14.5 cents at a rate of 55% of the difference between 14.5 cents and the average market price as outlined above. The total maximum subsidy payment would decrease from a high of \$4.5 million in calendar 1962 to \$3.5 million in 1965.

The House Ways and Means Committee in the meantime has reported the Baker Bill (H.R. 5193) which would raise substantially the tariffs on imports of lead and zinc. The Administration is opposed to the Baker Bill and others like it because such programs would prejudice the broader interests of the US both in the development of its own economy and foreign trade and in its political relations with other countries, especially such friendly countries as Peru, Mexico, Canada,

and Australia. Liberal subsidy payments would only raise lead and zinc production and exert a downward pressure on domestic prices. An increased tariff, on the other hand, would be inconsistent with our general policy of leaving to the machinery set up in the Trade.

---

**396. Memorandum from Battle to Bundy, October 28<sup>1</sup>**

October 28, 1961

SUBJECT

United Nations Food for Economic Development Program

At Harlan Cleveland's request, I am transmitting for Mr. McGovern a draft entitled United Nations Food for Economic Development Program. Mr. Cleveland requests Mr. McGovern's reaction to the attached draft which resulted from a meeting in Mr. Ball's office on October 25th.

**L.D. Battle**  
*Executive Secretary*

**Attachment**

*UNITED NATIONS FOOD FOR ECONOMIC  
DEVELOPMENT PROGRAM*

1. The amount that has been suggested for the multilateral program through the UN is \$400 million. Whatever portion of this amount is assumed by the U.S. should be outright without any conditions attached. This would permit the program to get underway without undue delay.

2. This is not intended to operate on an annual basis. It is a special stimulant to the UN in connection with the UN Development Decade proposed by the President.

3. As will be illustrated in the next paragraph, the food transfer portion of the program would be bilateral with the U.S. determining those countries to which its food shall go.

---

<sup>1</sup> Transmits for McGovern's reaction a draft on the UN Food for Economic Development Program. Official Use Only. 2 pp. Department of State, Central Files, 800.03/10-2861.

4. In a typical case it is suggested that the procedure would be as follows:

(a) Country X would apply to the Special Fund of the UN for a combination food-economic development program.

(b) The Special Fund and the FAO would make two related and simultaneous determinations. The FAO would discharge its normal function of determining the amount and kind of food that could move into the applicant country without disturbing normal market functioning. The Special Fund would determine the practicability of the utilization of the counterpart for economic development programs as later defined. If the Special Fund and FAO concur, the country application would then be submitted to the U.S. and/or any other contributing country for acceptance or rejection as to the food program.

(c) In the event a given application is accepted, the food would be transferred in the same fashion as under a bilateral program. The counterpart would be made available to the Special Fund for such programs and projects.

(d) In the Special Fund utilization of the counterpart its customary practice would be applied of assigning to specialized agencies and others the execution of its programs. For example, FAO could conceivably play two roles: (i) its basic role of making the finding; and (ii) in the execution of an agricultural development project in the country.

5. It has been suggested that the total counterpart made available shall be limited in its use by the Special Fund to its present program of pre-investment projects, i.e. surveys, training, etc. While such a condition is acceptable, yet it would seem desirable to permit the utilization of some portion of the counterpart for limited number of labor-intensive development projects particularly where the executing agency is able to provide additional funds.

# November 1961

## 397. Memorandum from McGovern to Rusk, November 2<sup>1</sup>

November 2, 1961

With reference to multilateral food surplus programs and the United Nations system, two fundamental questions have been raised:

1. Should the United States commit itself in the forthcoming U.N. General Assembly to a large program involving several hundred million dollars in surplus commodities to be used for economic development purposes.

2. Should any such program operate through the U.N. Special Fund or primarily through the Food and Agriculture Organization.

After considering these questions, I have reached the conclusion that the United States should not commit itself this year to a multilateral U.N. food distribution effort which goes beyond the offer which I made on behalf of the United States at the FAO Advisory Committee meeting in Rome last April.

That offer, announced by President Kennedy on April twenty-second, would commit the United States to contribute \$40 million in commodities toward an initial multilateral fund of \$100 million in commodities and cash with the FAO playing the major programming role in cooperation with the United Nations system. This initial effort would be limited largely to famine or other emergency needs with pilot activities in child-feeding and labor-intensive projects.

My conclusion is based on the following factors:

1. It is not clear that the United Nations system would more effectively execute large food programs than is now the case with our bilateral programs.

2. The initial proposal put forth at the April meeting in Rome is admittedly small, but it is large enough for us to test the effectiveness of the multilateral approach.

3. We have little indication of real support for a substantial multilateral program on the part of other nations.

4. There is clear evidence that powerful Congressional opposition would develop if we were to use at this time the authority of P.L. 480 for a large commitment of U.S. commodities through the U.N. system.

---

<sup>1</sup> Multilateral food surplus programs and the UN system. Official Use Only. 4 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 65 A 481, Agriculture, FY 1962.

Such opposition may develop even to the \$40 million offer, but the chances are much better of winning Congressional support for this more modest proposal.

If the United States were to offer a much larger commitment in the General Assembly this year, Congress might amend existing authority to prevent any kind of multilateral action.

Attached is a background summary of the issue prepared in the State Department for an interagency discussion in Under Secretary Ball's office on October twenty-fifth.

I would appreciate learning as soon as possible your reaction to the above conclusion so that I can discuss the various alternative possibilities with the President.

**George McGovern**

*Special Assistant to the President*

*Director, Food for Peace*

## **Enclosure**

### *Background Summary*

#### **Use of Surplus Food for Emergency and Development Purposes through Multilateral Channels (FAO and UN)**

1. *\$100 million proposal for the use of surplus food through the FAO primarily for emergency purposes.*

Broad agreement has been reached on the staff level in the Department and with Agriculture and AID on a Position Paper (attachment 1) regarding this \$100 million proposal which, in the first instance, and omitting details, was submitted last April to the FAO by Mr. McGovern. The proposal provides for pledges of grant surplus food and a small cash component to be used primarily for emergency needs, with lesser employment for child feeding and pilot labor-intensive development projects. Such projects would be confined to agricultural development, such as irrigation schemes, reforestation, etc. The FAO would be primarily responsible for the administration and operation of the program. UN cooperation would be assured by the requirement that the development aspects of any projects would be elaborated by the FAO in agreement with the Managing Director of the Special Fund; by the assignment of a few development specialists from the UN to the FAO staff in Rome; and by giving ECOSOC a review function regarding these development components.

Mr. McGovern's statement committed the U.S. to provide \$40 million in commodities, with the possibility of a supplementary cash con-

tribution to be explored in Washington. In the course of the review of the position paper on the staff level, the point was made that any 40% limitation on the U.S. commodities contribution to the program would probably make the proposal unworkable and might result in its rejection by the FAO.

*Required Action:*

- (a) Approval in broad outlines of the above proposal.
- (b) A decision as to whether, possibly after Congressional consultations, any specific percentage limitation on contributions of surplus food need to be imposed.

2. *Larger program (possibly up to \$400 million) for the use of surplus food through the UN for development purposes.*

Suggestions for such a larger program were made by the Director-General of FAO and have been actively considered in the U.S. government for some time. The possibility of such a larger program has been widely discussed in UN circles and was referred to by Mr. Klutznick in his speech of October 5 in Committee 2 of the General Assembly on the UN Decade of Development.

The issue will formally arise in the General Assembly when the Assembly takes up Item 28(e) "Provision of Food Surpluses to Food Deficient Peoples Through the UN System", probably toward the end of November.

To date no agreement has been reached in the U.S. government on this subject. It was impossible to reach agreement even in principle on whether the U.S. should advance in the General Assembly such a larger program, and further consideration of a Position Paper on that subject (attachment 2) was deferred pending such agreement in principle.

The larger program would place the emphasis on the use of food for general development purposes (not agriculture alone). Major responsibility for the operation of the program would be shifted to the UN Special Fund, although the FAO would continue to be responsible for the survey of food needs and for assuring the application of FAO principles for surplus disposal in order that ordinary commercial trade will not be impaired. Local currencies derived from the sale of surplus food in any given country would be used for development projects by that country under agreement between the Special Fund and the country concerned. In the discussion of the proposal a great many possible variants were advanced as regards details of the organization of the program, its operation and administration.

*Required Action:*

- (a) A decision of principle as to whether the U.S. Delegation to the General Assembly should be authorized to propose a larger program for the multilateral use of food surpluses for development purposes.

(b) If this decision is affirmative, an authorization to proceed with the elaboration of a detailed plan in the light of the discussion in the meeting.

---

**398. Letter from McGovern to Rusk, November 6<sup>1</sup>**

November 6, 1961

Dear Mr. Secretary:

Several members of the Congress have expressed their concern over the question of loans and grants in P.L. 480 Title I agreements. As you know, Senator Ellender stated his view on this subject in a letter to you dated September 29, 1961.

The success of our Food For Peace Program depends not only upon Public Law 480, but also upon vigorous and imaginative execution of that Law. We are realizing more and more that the Law can be a powerful and effective instrument of economic development abroad. I have long believed that our agricultural resources represent a tremendous national asset which ought to be meshed into our foreign policy objectives. Indeed, this was the President's chief reason for creating the Food For Peace office with his Executive Order of January 24, 1961. Likewise, the Secretary of Agriculture has publicly underscored the economic development possibilities in Food For Peace.

If such a broad purpose is to be accomplished, it is my view that we need to exercise *more, not less*, flexibility in the grant-loan component of Title I agreements.

I am persuaded to this view further because of the accumulation of inconvertible currency derived from Title I sales and the repayment of Title I loans. As was so clearly pointed out in the "Mason Report" instigated by Secretary Dillon in 1960, the accumulation of these currencies far beyond any practical U.S. use constitutes a serious political danger for us and a potential fiscal hazard for the host country. It is certainly a political risk for the United States to acquire a potential claim on the resources of a country to a degree that we could dictate the development plans and fiscal conditions of that country.

---

<sup>1</sup> Congressional concern regarding loans and grants in PL-480 Title I agreements. No classification marking. 2 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 65 A 481, Agriculture, FY 1962.

It would not seem to be very good sense, therefore, for us to follow a tough line on grants in those countries where we have already accumulated more currency than we can ever use to good advantage.

I am informed that an interagency group of experts is now working on the problem of grants as defined in Senator Ellender's letter. May I suggest that this group broaden its effort to cover the problem in its full setting, including the areas covered by the Mason study.

After informal interagency discussions have proceeded to the proper point. I would like to convene a meeting with yourself or your designee, the Secretary of Agriculture, the Secretary of the Treasury, the Administrator of AID, and the Director of the Bureau of the Budget for the purpose of developing an Administration position on the great problem and the related matter of currency accumulation.

I should appreciate learning whether this procedure meets your approval.

Sincerely yours,

**George McGovern**  
*Special Assistant to the President*  
*Director, Food For Peace*

**399. Memorandum from Hamilton to Rusk, November 17<sup>1</sup>**

November 17, 1961

SUBJECT

Request for Economic Assistance

This memorandum answers your inquiry concerning the number of requests for financial assistance outstanding and indicates when decisions will be reached on these requests.

As you are aware, the aid program is developed in a manner which precludes a simple listing of requests and U.S. responses. The program develops through the annual budgetary process, commencing with field requests for assistance which are refined here, presented to Congress, and acted on by that body. Our request to Congress for economic

---

<sup>1</sup> Status report on outstanding requests for assistance. No classification marking. 4 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 65 A 481, State Department, FY 1962.

assistance, representing requirements presented from our country teams and other sources, amounted to \$2,921,000,000 for FY 1962. Since a considerably smaller amount, \$2,373,000,000, was made available, it was necessary for AID to review all programs and relate existing requirements, in each appropriation category, to funding availabilities. Although this review process is of a continuing nature, the initial funding plan for FY 1962 was completed on October 10, 1961.

This funding plan provided for the reservation of funds to meet those requirements judged to be of highest priority. Judgment as to priority was influenced by numerous exchanges of correspondence between the field and Washington and by discussions with the State Department Regional Bureaus. All but about \$255.0 million of the funds available to AID were reserved to meet these requirements.

In addition to those priority requirements for which funds were reserved, there are a number of other possible requirements representing requests of lower priority. These possible claims initially totalled approximately \$730 million. Since that time we have become aware of yet other claims. These are of various degrees of firmness: some will materialize as firm or probable requirements during the course of the year, while others will disappear or be funded from non-AID sources such as the Export-Import Bank, the IDB regular lending authorities, Social Progress funds or other sources.

A distinction was made within the requirements for which funds were reserved. A substantial portion of the funds were approved for immediate implementation. However, in a number of instances it was considered necessary to review the composition of programs further. Such a review was deemed necessary to insure that these programs adhere to the new AID criteria (e.g., self-help, program concentration, etc.). This review not only will effect FY 1962 programs but the direction of our endeavors in subsequent years. It is not possible to predict with precision the amount of time required for careful review of individual country programs, but I can assure you every effort will be made to complete this process quickly.

A brief summary of the status of each economic assistance appropriation category reflected in the initial funding plan follows:

*Development Loans.* Initial requirements for development lending exceeded the availabilities of \$1,112,500,000 by approximately 50 per cent. The current forecast of loan activity by region is as follows: Far East \$123.0 million, Near-East-South Asia, \$653.1 million; Africa \$111.1 million; and Latin America, \$225.0 million. Lending in any specific instance will depend upon the priority nature of the activity, the formulation of sound project loan applications, the refinement of [illegible in the original] plans, the mounting of self-help efforts and the interest in the projects to other available funding sources. A substantial portion

of the funds have been committed to accommodate requirements in India, Pakistan, and Brazil. However, unlike other categories of economic assistance, development lending activity is not firmly programmed on a country to country basis.

*Development Grants.* A total of \$296.5 million was appropriated. All but approximately \$14.5 million has been reserved to meet programs approved for implementation (\$111.1 million) or other probable requirements. Other possible requirements of \$90 million were recognized.

*Supporting Assistance.* Funds available total about \$465 million, including new obligational authority of \$425 million and the carryover of unobligated balances. The account was fully programmed and, in addition, \$30 million in Contingency Funds were reserved to meet firm or probable requirements. Approximately 50 percent of the funds to meet Supporting Assistance requirements have been approved for implementation. Other possible requirements amount to approximately \$200 million.

*Contributions to International Organizations.* The \$158.4 million available is fully reserved to meet requirements. Other possible claims of approximately \$35 million are recognized, although it appears unlikely that all such claims will materialize.

*Other Programs.* Availabilities include approximately \$48.5 million for AID Administrative Expense, \$3 million for State Administrative Expense, and \$1.5 million for Investment Surveys. No appropriations were made available for Refugee and Migrant programs including the Cuban Refugee operation. Administrative Expense availabilities are extremely limited. Problems cannot be refined specifically until the organizational structure is further refined. Contingency Funds must be used if Refugee and Migrant programs are to be accommodated. Possible requirements total about \$25 million.

*Contingency Fund.* To the maximum extent consistent with U.S. interests, the Contingency Fund will be used only for requirements not included in the Congressional presentation. As indicated above, \$30 million has already been reserved of the \$284.2 million available to accommodate Supporting Assistance requirements. Another \$13,560,000 has been approved to implement Cuban Refugee requirements, leaving an unprogrammed balance of \$240.6 million.

The funding situation will be subject to constant change during the course of the year as new requirements materialize. In order to accommodate changing circumstances, it is my intention to review the total funding plan on a monthly basis. This review will result in the periodic modification of our plan. Provision will be made for financing new requirements or for approving as firm requirements programs currently listed as only possible claimants on available resources. Dur-

ing this year of transition to the new AID criteria, there is a need for providing centralized program direction and control of fund availabilities. I recently have issued instructions concerning the routing of aid requests to insure that decisions as to the validity of program requests subsequently presented can be made with a minimum of delay.

**Fowler Hamilton**

December 1961

400. Memorandum from Dungan to Hamilton, December 8<sup>1</sup>

December 8, 1961

Last week when we spoke I promised you that I would set forth some of the problems which I see in the AID agency to which I think we should address ourselves. Here they are:

*Program Policy—Coordination Military Economic*

All the reports which I have had indicate that neither the Kitchen operation nor Chenery really are on top of the military economic aid problem. I believe that your Program Review shop has to be vastly strengthened and that a person who can deal hardheadedly with both State and Defense needs to be put in charge of it. It may be that L will be able to undertake this task with the support of another person who is strong on the military side. I have had very highly recommended to me a former MAAG chief in Tokyo who is now retired, one William Biddle. I do not recall Biddle but the MAAG in Tokyo was always well run and they were sensitive there to the problem of military economic balance as anywhere in the Far East. My recommendation on this problem at this point would be to present a strong person like Biddle into the picture and place him in the Program Review shop on an equal level with Chenery with L taking major responsibility for the coordination of the program and taking care of most of the Agency's recommendations to Defense.

*Congressional Presentation*

I believe we discussed this enough for you to have an idea of how strongly I feel about the need to come up with a more simple congressional presentation than we have had in the past. This ties very directly to what I hope will be a streamline program presentation within the Agency itself which may not be possible to fully install before the congressional presentation has to be made. The advantages of a simplified presentation are fairly obvious—reduced manpower, the possibility of joint presentation to Foreign Affairs and Foreign Relations Committees, less detail, etc. The point here, however, is that someone or a small group should be set to work promptly to develop a new pattern for the congressional presentation so that you can be

---

<sup>1</sup> AID internal problems and possible resolution. No classification marking. 2 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 65 A 481, White House, FY 1962.

set on this as early as possible in January. Then it will be necessary for you to go and sell this new mode of presentation to the appropriate members of the House and Senate. I might also add that a revised mode of presentation would have the advantage of dramatizing the “new look”—who knows, in the process we may even be able to get a new look.

*Assistant Administrator for Administration*

While I do not lack confidence in the present incumbent, I think it could be most salutary if we could settle on a new and vigorous person in this slot which, as you know, controls the vital financial, personnel, and other housekeeping aspects of the agency. You may in your trip have already found this fellow. I certainly hope so. In addition to the Assistant Administrator I think it is terribly important that we appoint a personnel fellow in whom both you and we have complete confidence. I need not tell you what a difficult job this is or how important it is.

I think we covered most of the other points in our conversation the other evening. I would like an opportunity to discuss these and other problems at your earliest convenience. If possible I would hope that we can have a regular meeting perhaps once a week. To save time perhaps I might sit in on some of the staff meetings which you mentioned that you are now going to have on a regular basis.

**Ralph A. Dungan**  
*Special Assistant  
to the President*

**401. Steering Group Report Conclusions, December 12<sup>1</sup>**

December 12, 1961

*CONCLUSIONS*

7. In many free world countries, Military Assistance Programs inaugurated since World War II have helped to create, equip, and maintain significant indigenous military establishments which have contributed importantly to a sense of local security. These forces, particularly in the six countries covered by this study, are far beyond the ability of the recipient country to maintain from their own resources at present levels of forces and equipment.

8. Moreover, the continuing military threat which MAP aid has been primarily designed to meet is a less serious long-term threat to these underdeveloped countries than the failure of their governments to meet, in an acceptable degree, the expectations of their citizens for improved standards of living, education opportunities, and national development.

9. If social and economic progress is not accelerated, some of these governments are certain to fall and the ensuing redistribution of power might well cause these countries to choose neutralist or pro-communist courses.

10. The Group believes, therefore, that since U.S. and local resources will be inadequate to cover all aspects of the threat spectrum, we must make some difficult decisions, accepting greater risks if necessary in meeting the less likely threats. Although sufficient military strength must be maintained to help deter local aggression and to assure internal security, the main thrust of U.S. aid in the 1960's should be to further economic development and nation-building. This requires that total US aid be directed more toward dynamic growth in the economies and toward developing more resilient domestic political institutions capable of dealing creatively with the social ferment incipient in most of these countries.

11. As a consequence, we believe that the risks which may be involved in some reduction or stretch-out of MAP are outweighed by the risks involved in not concentrating a larger share of US aid and local effort on economic and social development. If we confront special crises that affect individual countries—as the Iraq crisis did for Iran in 1958 and the Offshore Islands crises have done for the GRC—we would

---

<sup>1</sup> MAP policy guidelines. Secret. 6 pp. Department of State, S/S-NSC Files: Lot 70 D 265, Guidelines for Military Aid Program.

do much better to treat them as aberrations rather than to plan now in terms of aid for them.

12. Although the local forces in these six countries have a substantial military potential, the main deterrent to overt aggression from across the borders has been the realization that an attack on any of these countries would inevitably bring into play the UN, regional defense arrangements or in all likelihood U.S. forces. In gradually shifting the emphasis of our aid program, neither the communist Bloc nor the countries themselves should be allowed to gain the impression that we are any less resolute in our intent to assist them in maintaining their independence nor that their military establishments are being so emasculated as to invite overt aggression or internal revolt.

13. Thus our programs should be planned to stretch out modernization, to provide more gradual and selective equipping of existing forces, and to avoid introduction of advanced and sophisticated matériel in countries whose finance, manpower and skills resources are inadequate to absorb them. Economic supporting assistance to local military budgets should be phased downward as rapidly as is consistent with a realistic assessment of local resources and the effect of development aid. Recipient countries should be urged to devote only that part of their total resources to military budgets which would permit acceptable development budgets.

14. In connection with the new emphasis of our AID programs on nation building, integrated economic development programs and self-help, we should exert every effort to convince local governments that the primary focus of their efforts should be on building viable societies which can resist cold war pressures. They should be urged, and our programs should be planned, to give increased consideration to the potentialities of civic action and similar measures by which local forces can contribute directly to the nation building process; where appropriate, greater emphasis should be placed on the creation of counter-subversion and counter-guerrilla capabilities.

15. Redirection of our military assistance programs will of necessity be gradual. But the significant characteristic of U.S. aid in the 1960's should be that it is clearly moving with determination toward greater emphasis on economic development. For this purpose, gradually increasing proportions of U.S. aid and local resources will need to be shifted from military to economic and developmental programs. As our economic programs grow in size, within what we hope will be a larger total aid program and budget, some part of this proposal will take place of itself. We believe, however, that carefully considered reductions in the military side can be made as indicated in the country recommendations set forth at the end of this paper. This conclusion must be related to evolving political situations in each of the countries,

and of course to any possible sharp changes for the worse in the world situation.

16. Balancing all the foregoing considerations, the Steering Group recommends a significant net reduction in MAP ceilings for the six countries. *For example*, if all the country alternatives discussed were approved, and *were carried out* right away for the full period FY 1962–67, total defense expenditures for the six countries as a group would be reduced by approximately 9% below the current rate and 36% below rates projected in the Six-Year Plan, and manpower would be reduced by 25%, within a six-year period. Military and related defense support aid would decrease more, by 25% from current rates and 37% from the Six-Year Plan. While there would be increases in local budgets somewhat in excess of 15% above the total of the past six years, this would be 10% under those projected in the Six-Year Plan. However, the Steering Group believes that such reductions could be carried out only gradually, and in the case of the GRC could not be carried out at all pending resolution of overriding political issues. Therefore, the above orders of magnitudes represent a reduced level which could only be reached, if at all, in the later years of the FY 62–67 planning cycles. In those countries where force reductions are not recommended it was assumed that local defense budgets would rise as projected in the Six Year Plan to cover gaps left by decreased Supporting Assistance. Where significant force reductions are recommended both local defense budgets and Supporting Assistance decrease.

17. Nevertheless, for illustrative purposes it is useful to summarize the six-country alternatives assuming that the reduction could be carried out in full for the entire period FY 62–67.

	<u>Six Countries</u>		
	<u>Deliveries for 1956–61</u>	<u>Deliveries for FY 1962–67 Plan</u>	<u>Suggested Alternative</u>
		(in \$ millions)	
MAP	\$ 4,897	\$ 5,533	\$ 3,525
Supporting			
Assistance	991	1,463	850
Local Budget	<u>4,079</u>	<u>5,250</u>	<u>4,725</u>
Total Defense			
Expenditures	\$ 9,967	\$12,246	\$ 9,100
Manpower	2,111,000	2,047,000	1,587,000

18. The purpose of these proposed MAP cuts is to provide the U.S. greater flexibility in the use of aid resources, either by transferring military aid to other geographic areas or by seeking to redirect MAP dollars to economic assistance. If the resources saved merely resulted

in a reduction of over-all U.S. aid levels, instead of more optimal utilization, however, the Group would *not* recommend such cuts. Moreover, to the extent that reduced MAP is offset by increased local defense budgets at the expense of social and economic development budgets there is little benefit to achievement of broader U.S. objectives, though certain advantages in political terms may accrue from the posture of emphasis on civil activities.

19. The significance of total defense data for the six disparate countries is limited since for each item the significant changes are concentrated on one or two countries. Manpower reductions are a feature in the alternatives for GRC, Korea, and Iran; MAP reductions are most important for Korea but significant also for the others with the exception of Pakistan; supporting assistance would remain a large budgeting element in the case of Korea.

---

**402. Letter from McGovern to Freeman and Hamilton,  
December 20<sup>1</sup>**

December 20, 1961

Dear Orville and Fowler:

I believe that we would be well-advised to make a greatly expanded overseas school lunch program the Number One target of Food For Peace in 1962. It would seem to me that we could aim at a goal of feeding 500 million children within the next five years. This objective can be reached through a combination of government-to-government and voluntary-agency school lunch projects.

Nothing is more important than the health and well-being of the world's children. Providing one nutritious meal a day for these youngsters is the highest task this Nation can undertake. I am convinced that the use of our agricultural abundance in this way will accomplish more constructive results per dollar than any other foreign assistance.

Multiple benefits of an overseas school feeding program include the following:

- 1) vastly improved health of the children;

---

<sup>1</sup> Food for Peace and overseas school lunch program. No classification marking. 2 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 65 A 481, Executive Secretary, FY 1962.

- 2) sharply increased school attendance;
- 3) better academic performance; and
- 4) improved U.S. relations with the citizens of receiving countries.

At the present time, there are three government-to-government school feeding programs in Italy, Tunisia, and Peru which involve nearly two million children. A previous U.S. program in Japan has been taken over by the Japanese Government, and the Italian Government is now preparing to assume responsibility for continuing the program in Italy.

United States voluntary agencies, supplied by Food For Peace food grants, are conducting school feeding programs in 81 countries and territories, involving nearly 30 million children.

The Peruvian program, which I signed for our Government with Prime Minister Beltran last May, was the first and only U.S. Government school lunch program in Latin America. It has already resulted in a 40% increase in school attendance—aside from its basic purpose of improving the nutrition of children.

From previous discussions with your associates, I know that there is widespread agreement as to the urgency of this suggested target. I look forward to working with you toward its implementation.

With every good wish in the New Year, I am

Sincerely yours,

**George McGovern**

**403. Memorandum from Komer to President Kennedy,  
January 17<sup>1</sup>**

January 17, 1962

SUBJECT

Report on Long-Range MAP Guidelines

Attached report by the Military Assistance Steering Group is the first major effort in your Administration to reshape our military aid program, both to complement the AID turnaround and to make MAP itself more responsive to the needs of the Sixties. While this process will inevitably be lengthy, we can now put up to you certain tentative decisions which could have a decisive influence on program direction from here on.

The Steering Group, set up by Rusk and McNamara for this purpose, focussed on six key client states—*Korea*, the *GRC*, *Pakistan*, *Iran*, *Greece*, and *Turkey*—which absorb about 50% of MAP outlays. For over a decade in most cases the bulk of our aid to them has gone to equip and maintain large forces well beyond their own capabilities to support. All are in the underdeveloped category, with insatiable needs for development aid as well.

While the Steering Group sees a continued need for large MAP programs to help deter Bloc aggression against these countries, it questions whether so large a proportion of available US (and local) resources should continue to go for this purpose instead of for meeting other pressing needs. On the principle that total US aid to any country must be designed for the best overall impact, it proposes a gradual reduction in planned MAP outlays of well over \$1 billion during the next five years (Table at Tab I). It argues that, although overt Bloc aggression remains a major threat to the six countries, the greatest threat they are likely to face is that of indirect aggression.

To meet this threat, the Steering Group proposes that we push the new AID concept of economic development with self-help as the main thrust of US aid policy in the Sixties (together with greater emphasis on internal security programs). It sees us as still putting too much money into MAP programs designed primarily to meet Korea-style

---

<sup>1</sup> "Report on Long-Range MAP Guidelines." Secret. 5 pp. Kennedy Library, National Security Files, Meetings and Memoranda Series, NSC Meetings, No. 496, Box 313.

aggression, and which in such respects as their local budgetary impact compete with our efforts to get local sights fixed more firmly on well-planned growth.

Therefore, it urges that a substantial portion of MAP be redirected into AID programs or re-programmed to other higher priority areas than those to which the bulk of it now flows (e.g. Southeast Asia instead of Korea). As you put it in the State of the Union message, AID is "reorienting our foreign assistance to emphasize . . . more economic aid instead of military. . . ." *The Steering Group Report is a vehicle to this end.*

*The exercise has already had considerable impact.* It helped stimulate DOD to defer some \$80–85 million from FY 1962 and influenced the setting of the FY 1963 budget mark at \$1.5 billion, which has led DOD to cut over \$125 million from the six programs. However, it has also generated adverse reactions. Many of these are the usual bureaucratic defenses of those wedded to a program of fifteen years standing (the JCS, for example, refused to take the exercise seriously); others bear on timing and flexibility.

1. *Admittedly MAP reductions would entail at least marginally greater military risks*, despite the Bloc's apparent preference for indirect aggression and civil war instead of risky Korea-style attacks.

*But* the Steering Group is far from "dismantling" the MAP; at minimum it proposes a tidy \$3.9 billion for the six in FY 1962/67, only about \$1 billion below the comparable 1955/61 level. Moreover, it argues that it is *US deterrent power*, not local forces, which chiefly deters the Bloc. None of these local forces could halt major aggression unaided. In any case we cannot look only at military risks. Other acute threats confront us in the six countries; where we cannot insure fully against all of them, we must make some hard choices.

2. *Even so, is now a good time to start cutting MAP?* The JCS say flatly that this is no time to make, or even plan reductions. With crises in Berlin and Southeast Asia, big cuts now might give the wrong signal to friends as well as enemies. Greece and Turkey in particular are now participating in the build-up of NATO readiness. Even in a period of relative tranquillity it would be difficult to sell a turnaround to countries whose force build-ups we've encouraged, particularly until how much compensatory economic aid we're prepared to give becomes more clear.

The Steering Group itself recognizes the force of these considerations; it emphasizes the importance of starting now on a long term shift in direction rather than going for large, immediate cuts. There will never be a "good" time to start a turnaround, but several techniques can be used to cushion the impact—spreading it out over several years,

re-emphasizing the key deterrent role of growing US forces, pointing to increased AID programs as indicating no diminution of US interest.

3. *However desirable in theory, can we really shift resources from MAP to AID?* Aside from the political repercussions it might create in recipient countries, could they absorb more economic aid? Despite their insatiable appetites, none of them except Pakistan has yet developed enough viable projects which meet AID criteria. But this situation is changing. And unless we can convince our own ambassadors that they can in fact get more economic aid in lieu of military they will have little incentive to recommend MAP cuts. Others argue that MAP and AID funds are not really fungible, in view of Congressional attitudes. But a strong Administration lead, plus such devices as transfer provisions, could accomplish a great deal.

*ISSUES FOR NSC DISCUSSION.* Despite the above reservations, most senior officials (except the JCS) applaud in principle some gradual reductions in MAP. But they disagree over where, how fast, and how much. The Steering Group six-country ceilings are only a first cut at the problem—some need further refinement and fleshing out before firm decisions can be made. The central questions at this point are: (a) how much of a general push you wish to give to a MAP turn-around—this will have major impact on how seriously the agencies take such follow-on studies; and (b) what specific if tentative guidelines you favor for Korea, Iran, Greece, and Turkey on which there are split views.

The draft NSC Record of Action (Tab II) reflects the position which we recommend you take on the major issues which we expect to arise:

A. *Should we articulate a general policy of primary US emphasis on development during the Sixties, with implicit recognition that there should be some shifts from MAP to AID (para. 2)?* Such a general statement of your intent would set the tone of subsequent country reviews. However, some like George McGhee (who favors most country cuts) hold to the old Draper Committee philosophy that military and economic aid are really separate programs which don't compete with each other and should be handled separately (his personal views at Tab III). He may raise this issue by suggesting we drop para. 2.

But few go as far as McGhee. The dollars come out of the same US pocket, and the size of the six countries' own military budgets directly affects their ability to devote resources to nation-building. For example, the DOD FY 1962/67 Plan would require *local* military outlays of some \$5.2 billion, a rise of some \$1.2 billion from FY 1956/61 levels (this in addition to almost \$1.5 billion in some form of US supporting assistance).

B. *Korea (para. 5c).* By far our largest MAP program, it epitomizes our dilemma. Since 1953 we've spent billions in Korea, largely to main-

tain 600,000 man ROK forces (on top of major US deployments) against a renewed attack. [text not declassified]

State and AID are much in favor, but DOD, which has for years opposed such changes, argues rightly that more study is needed (including the possibility of cutting US forces rather than ROK). NSC Action calls for prompt study, but asks you to lean in Steering Group direction to make it a serious one. DOD and probably JCS will want to be heard.

C. [text not declassified]

D. *Greece and Turkey (para. 5e)*. Here our dilemma is that, while both are not only unable to carry alone their present forces but badly need aid for accelerated economic developments, both are NATO members most willing to shoulder military burdens. At a minimum we should defer action until Berlin crisis has died down. Even then State and Defense are reluctant to cut MAP even modestly as the Steering Group proposes (its ceiling of \$80 million annually for Greece is only \$5 million above 1956/61 level, while proposed \$134 million annually for Turkey is only \$34 million below 1956/61 delivery level. We propose restudy of alternative programs for your post-Berlin decision. State and Defense will probably agree.

*RECOMMENDATION*: I believe that all agencies, after voicing their concerns, will go along with draft Record of Action (since it in effect postpones the key decisions pending further studies). Therefore, I urge that, if you approve it, you emphasize your determination to reduce MAP and switch more resources into development even if willing to reserve final judgment on Korea, Iran, Greece, and Turkey. Mac Bundy suggests that if you prefer to do so, you can well reserve decision on any point until after further consideration with the Secretaries of State and Defense. On the other hand, if your judgment is clear, a quick decision in the meeting will make an immediate impact on all.

**R.W. Komer**

**404. Memorandum from McGovern to Waters, January 22<sup>1</sup>**

January 22, 1962

*Office of Food For Peace: Responsibilities and Procedures*

On January nineteenth, a discussion luncheon was held at the White House with the following persons present: Secretary Orville Freeman, Assistant Secretary John Duncan, and Mrs. Dorothy Jacobson, USDA; Assistant Secretary Ed Martin, State; Herbert Waters, State (AID); Director David Bell, Bureau of the Budget; Myer Feldman, Deputy Special Counsel to the President; and George McGovern.

The participants agreed that the President's executive order of January 24, 1961, establishing the Food For Peace Office, has served a useful purpose in expediting, expanding, and dramatizing the Food For Peace Program. The group concluded that there are two broad continuing functions of the White House Food For Peace Office:

1. It shall keep under surveillance all Food For Peace activities and make suggestions to the operating agencies relative to program problems or opportunities. New ideas received or generated by the Food For Peace Director will be made known to the operating agencies. While the Interagency Staff Committee will continue to review Food For Peace proposals, the Food For Peace Director will provide leadership in preventing unreasonable delays or difficulties.

2. It shall provide a centralized focus for Food For Peace publicity. All news releases shall be informally noted, presumably by telephone, by State (AID), USDA, the Food For Peace Office, and, when necessary, by the Budget Bureau, before they are released. Important announcements will be referred by the Food For Peace Director to the White House Press Secretary for release by the President. The Director will serve as the coordinator for all Food For Peace publicity, but any announcements from this office shall give due recognition to the roles played by the operating agencies. We will also maintain liaison with USIA, the American Food For Peace Council, and the U.S. Freedom From Hunger Foundation (FAO).

**George McGovern**

February 1962

**405. Check Points from Komer to Hamilton, February 1<sup>1</sup>**

February 1, 1962

(Hamilton was away at time of NSC Meeting at which President talked about getting best "mix of military and other forms of aid.")

1. AID must take the total over-view of our aid programs called for by President in NSC Action 2447. Finding the best mix is AID's responsibility.

2. Hamilton is the guy who must mesh the MAP with AID programs. These run into each other at so many points, e.g. Korea, that we've got to take hold and make them run in harness.

3. Moreover, AID and MAP are competing for what, as President said, is liable to be an inadequate total pie in any given year. They are also competing for local budget resources. It is up to Hamilton to divide the pie and then listen to the squawks. There will be plenty, but JFK inclined to decide them in AID's favor if it has a case.

4. AID badly needs a top, savvy guy to deal with DOD/ISA on equal terms. Chenery may not be up to this. It also needs a staff (Jack Bell had 100 people in State).

5. Hamilton must also pay more attention to police programs. These are vital to any counter-insurgency emphasis. Indeed, they enhance the stability so essential if economy to have time to grow. These programs are withering away under new AID criteria.

**R.W. Komer**

**406. Memorandum from Ball to Hamilton, February 8<sup>1</sup>**

February 8, 1962

SUBJECT

Your Memorandum of February 6, 1962, on Terms of AID Development Loans

I have looked over your memorandum and have a few comments. I think, however, that this is a matter on which you should make the final decision, since you have the problem of defending the program before Congress. Consequently, I am prepared to recommend to the Secretary that he forward your memorandum to the President, if you wish me to do so.

In making the following comments, I do not mean to appear too categorical. I recognize that this is a question on which there can be varying shades of opinion.

I shall address my comments to the numbered paragraphs, beginning at the bottom of page 2 under the heading of "*Advantages of AID Policy.*"

*Paragraph 1.*

It seems to me that you overstate Gene Black's position. As I understood his views, he felt that if AID terms were hardened very much, the IBRD might feel that it had to reduce, not eliminate, its participation in the consortia. It was my impression that he was speaking primarily of interest rates and not of the maturity of the loans. The maturity of loans might be reduced, for example, from 40 years to 25 or 30 years, without greatly affecting the Bank's willingness to participate in consortia.

Black seemed primarily concerned with the burden of annual payments. While this burden reflects not only interest rates but also the amortization schedule, it would, I should assume, be possible to shorten the maturity of loans and still maintain a low level of annual amortization payments provided one were prepared to see a substantial balloon of unpaid principal left at the end. The repayment of such a balloon could then be a matter for negotiation at that time.

With respect to interest rates, my feeling, after talking with Black, was that both he and Burke Knapp were doing a certain amount of bargaining. I cannot believe that an increase in interest rates to 2½%

---

<sup>1</sup> Terms of AID Development Loans. No classification marking. 5 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 65 A 481, Development Financing, FY 1962.

for example, would materially affect the amount of the Bank's contribution to consortia.

*Paragraph 2.*

As an abstract proposition, the statement seems to be eminently correct. It does not, however, seem to me to meet the point—which is whether the United States alone of all lenders should, through its aid program, take the full responsibility for meeting the inadequate transfer capacities of borrowing countries.

*Paragraph 3.*

I disagree completely with this paragraph so far as it relates to Germany and the other European countries. I have spent as much time as anybody—perhaps more—trying to persuade the Germans to liberalize their credit terms—not only in the course of two trips to Bonn, but two DAG meetings. We have, it seems to me, exhausted the possibilities of exhortation. I think the only chance we have of getting the Germans to move appreciably is by proposing to narrow the gap, which would enable them to come more closely within range of our approbation and thus acquire the kind of self-respect they are looking for. If, however, we continue our present policies further pressure on the Germans to liberalize would merely be nagging and likely to have a negative effect.

The effect on the International Development Association raises different questions. I am not clear as to whether the movement of AID to harder terms and the isolation of IDA as the single agency committed whole-heartedly to soft lending would work for or against larger contributions to IDA. I am certainly not persuaded that it would impair IDA's situation and one can argue that it might improve it.

*Paragraph 4.*

I have never thought that we were talking about having AID loan terms approach those of the IBRD or the Export-Import Bank. What has been suggested is a modest move in the direction of hardening the terms. But this would still leave AID loans far softer than those of the World Bank or Export-Import Bank. I can't imagine that Congress would seriously attack the AID program on the ground that it was moving toward harder loans. Congress has never shown any great enthusiasm for the IBRD.

*Paragraph 5.*

I cannot argue with the conclusions of this paragraph that AID loan term policy ought to be flexible.

*Paragraph 6.*

The complaint of borrowing countries about our policy of tied loans relates to the amount of funds available. This sense of outrage is unlikely to be assuaged by the fact that they can delay for ten years payment of amortization with no or low rates of interest.

*Comments on paragraph 2, under heading “Objections to AID Policy”:*

The statement in this paragraph “If Germany makes half of its loans on relatively hard terms and half on short terms comparable to those of AID, therefore, its total lending policies would be comparable to ours” seems to misstate the situation. There is no possibility that Germany will make half of its loans on terms comparable to those now provided by AID. The question remains how we can justify the fact that liberal AID loans are indirectly supporting both hard and relatively hard loans made by such countries as Germany.

*Comments on section of memorandum headed “Proposals to Deal with Objections”.*

*Paragraph 1.*

I can’t believe that this is a very serious proposal. Even if Libya, for example, were to develop the greatest oil production in the world, it would take generations for it to become anything other than an underdeveloped country. In spite of the fact that it might have large gold and foreign exchange balances, it would still make a poor mouth. We would, I suspect, be extremely reluctant to push it very hard for faster repayment.

In any event, I have assumed that the really important question was not so much the maturity of the loans as interest rates. The ability to accelerate repayment would thus be of only limited value to us.

I have absolutely no confidence in the power of continued exhortation to bring about a softening of terms on the part of our European friends. We have long since passed the point of diminishing returns and, I’m afraid, we would merely produce an attack of *ennui* if we promoted a DAC Ministerial meeting in Paris in the spring with the sole purpose of providing a forum for further admonishment to persuade other countries to hit the sawdust trail. I have a strong feeling that we have a chance of making further progress, particularly with the Germans, only if we change the dialogue—if, for example, we have something to offer in the way of a prospect that we ourselves would be prepared to move slightly in the direction of slacking the gap if they move themselves.

In any event, I was told this morning that there will probably be an OECD Ministerial meeting toward the end of May and that present plans suggest the likelihood of having the DAC Ministerial meeting held at the same time and combined with it.

April 3, 1962

SUBJECT

Statement of State/AID Relationships

This morning at the Bundy staff meeting I mentioned to Mac our meeting with Hamilton and Lingle on this matter. Mac indicated that he was troubled by the key provisions in the draft memorandum with regard to handling of disputes between Assistant Secretaries and Assistant Administrators. I shall not try to cover his entire argument, but essentially he made the following case:

1. It is too much to expect, given the current staffing of AID that Hamilton and his principal assistants will be able to make the kind of over-all judgments that the memorandum implies; i.e., neither the Chenery-type economic criteria boys or the IBM businessman have enough knowledge or experience to be permitted to "sign off" on all these aspects of political-military on AID matters.

2. The process contemplates a procedure whereby "appeals" would have to be made over the head of Hamilton by the Assistant Secretaries—and at the least this would inhibit an adequate process of decision making.

3. We must engineer this process around the facts of the personalities involved now that we have a greater appreciation of their attributes and shortcomings, and this would on the basis of performance appear to preclude giving such rigid and final authority to the AID people.

4. It would be preferable to handle this kind of problem by having such a mechanism as a weekly or bi-weekly meeting between Hamilton and Ball so that these matters can be discussed without the appearance of an appeals procedure.

We had a short discussion of the other considerations involved in this matter; i.e., the need to reverse the previous situation whereby many of the so-called "political decisions" rode roughshod over long-term economic considerations, the situation whereby the assistance

---

<sup>1</sup> Statement of State/AID Relationships. Administratively confidential. 2 pp. Kennedy Library, National Security Files, Kaysen Series, Foreign Aid, General, 5/62-11/63, Box 373.

agency was not even in fact a junior partner to the decision-making process, and the fact that the new AID criteria and our new policy approach call for more steadfast adherence to the longer term criteria for a better foreign assistance program.

I suggested to Mac that there be a more thorough discussion of this matter between you and him before we got too far down the road, and I urge that this be done as soon as possible.

Jake Lingle called me this morning with regard to the memorandum, and indicated that he was pressing Hamilton to attempt to have a meeting with Rusk and Ball (with you present) because he felt that Rusk particularly should get into this question before we attempted to negotiate out further language on the memorandum. I told him that we would certainly concur in any move which would bring Rusk, Ball and Hamilton together on this important matter so that there could be a meeting of minds in substance before any piece of paper were further negotiated.

I therefore recommend:

(1) An early meeting with Mac Bundy and Ralph Dungan on this question before Hamilton/Lingle proceed too far in the State Department, and

(2) A real look at this question ourselves in terms of the pragmatic considerations which Mac Bundy raises and with which we have increasingly been concerned in our own reviews.

I continue to opt for a written statement of these relationships along the lines we have proposed, since I believe that regardless of the problems of individual competence we cannot really develop the country program approach, which is the keystone of policy formulation, without active continuous debate between so-called economic and political elements of the Department.

## 408. Unofficial Record of Discussion at the AID Executive Staff Meeting, April 5<sup>1</sup>

April 5, 1962

### ATTENDEES

Mr. Rubin	Mr. Vance	Mr. DeAngelis
Dr. Chenery	Mr. Woods	Mr. Easum
Mr. Waters	Mr. Bayley	

### 1. *Development Loan Terms*

The staff discussed the revised paper on Dollar Repayable Development Loan Terms [ES/D-26 (Revised)] which reflected the views of the staff at the April 5 meeting. It was noted that two countries in Latin America have not been classified as yet. Syria which erroneously appears in two categories in the paper, should be listed under the unclassified country category. The staff approved the terms set forth in the paper.

There then followed a discussion of the steps to be taken to inform the White House, the Development Loan Committee, and the NAC. Mr. Coffin was asked to take the necessary steps to accomplish this.

ACTION: Mr. Coffin

Mr. Hamilton asked whether there should be a policy paper issued on the extent of AID involvement, if any, in private investment in developing countries both to be sure that we are not supplanting private capital, and also to be sure that the terms do not put too heavy a drain on their foreign exchange. Mr. Lingle said this should be put on the list of policy issues as a possible subject for clarification.

ACTION: Mr. Shooshan

Mr. Hamilton asked Mr. Rubin to look into the scope of the NAC jurisdiction over our development lending activities.

ACTION: Mr. Rubin

SUBJECT

AID Draft on Methods for Improving the Coordination of Military and Economic Aid Programs

Our meeting on April 30, and the preliminary agency comments, all convince me that the exercise called for in NSC Action 2447 is of crucial importance. In effect, the purpose of the exercise is *to give the AID Coordinator the necessary tools to do his job*. Without these tools we will not get the unified and optimized overall aid program which the Administration seeks. Therefore I feel that we should take the time necessary to refine the draft report, assimilate the experience of the Greek, Turkish and Korean restudies and achieve inter-agency consensus if possible.

Viewed in the above light, Charles Wolf's draft marks a definite step forward. While one may cavil with some of his ideas, in general he seems on the right track. For example, his three suggestions for meshing the MAP and AID planning and programming cycles seem non-controversial; as essential groundwork for any coordination process, perhaps they should be carried out as soon as feasible, without waiting on the rest.

However, I believe that the report needs to be strengthened in several respects.

1. Most important, the basic objective toward which we are working is to devise techniques and machinery for achieving the best possible

---

<sup>1</sup> AID draft on improving coordination of military and economic aid programs. Secret. 4 pp. Kennedy Library, National Security Files, Kaysen Series, Foreign Aid, General, 5/62-11/63, Box 373.

“mix” of total US aid, military and economic. To this end we want to unify foreign aid planning as much as possible, while preserving the freedom of the agencies concerned with various aspects of US aid to make the case for their own programs. Hence I feel that how to get the best “mix” should be the central theme of the report and more fully developed.

2. On this score, I feel that the so-called “high-low” approach to constructing alternative “mixes” is, despite the many complexities involved, the best available technique for assessing the pros and cons of various options open to us. Admittedly, it is as yet a very rough technique, which we’ll have to refine as we go along. But only by presenting alternative program options can we get a rational framework for choice.

“High-low” of course is a misnomer. What we really mean by “low” is the *minimum* program the US could support without taking wholly unacceptable military or political risks. By high we mean the *optimum* program we would like to undertake within the constraints of available local resources and absorptive capacity. In effect the MAAG would outline both what it would really like and what it could get along with if it had to. So would the USOM. Then we can have a useful dialogue as to which program we want to optimise and which to try to carry at minimum ongoing cost.

In some cases, we may want to optimize both the MAP and AID programs (Turkey may be one); in others we may want to “carry” a country at minimums on both. In yet other cases we may want to split the difference in some way. Moreover, we always want to retain flexibility to shift emphasis from one country to another, if there is a case for doing so. For these reasons, while agreeing with Bill Bundy’s point that “high” and “low” military and economic programs will seldom be of similar dollar magnitudes I don’t see this as a bar to the “alternatives” approach.

3. The paper as presently drafted confines itself primarily to techniques for coordinating MAP and AID programs; it is very lean on the bureaucratic machinery needed to ensure that these techniques are effectively carried out and that the inevitable differences which will arise are suitably aired and resolved. For example, what happens after the two planning and programming cycles are meshed, and a number of alternative mixes for MAP and AID programs have been proposed? What machinery is there for adjudicating these differences and if necessary pushing them up the line for decision? This is of course the function of the Coordinator, but I would like to see this function spelled out so that everyone would have it clearly in mind. It might run as follows: (1) PRCS would prepare a list of issues arising from the comparison of MAP and AID programs, etc.—this list with its recommendations

for solution would be sent to the Coordinator; (2) the Coordinator would rule on these issues, after suitable hearings; (3) If AID, State, or DOD still objected to certain of his decisions, the Coordinator would submit these issues to the Secretaries of State and Defense jointly; and (4) if unresolved at that level, they would be taken to the President.

Therefore, the report should have a section on machinery for carrying out coordination.

Equally important is adequate machinery for achieving prior agreement on overall program guidelines before each five year guidance is sent to the field. I regard this as a very important exercise, because it tends to set the pattern for the annual program cycle. Yet, while AID and DOD each devote great effort to working out the guidelines for their own programs (and Congressional presentations), any impression is that all too little time is spent on the inter-relationships between these programs. The “alternatives” approach to key countries would almost force a more meaningful exercise along these lines.

4. Shouldn't greater emphasis be placed on the role of the country team in doing the first stage analysis of the optimum mix desired in a given country. We want the Ambassador himself to consider meaningful choices between MAP and AID inputs and to render the initial judgments. But we will not be able to get him to do so unless he has real reason to believe that if he opts for a road instead of a Hawk battalion he'll have a fair chance of getting it. *None of the techniques for developing meaningful alternatives will be worth a hoot unless we actually decide back here to pursue one or the other in a few key cases, and thus prove we mean what we say.* But perhaps I'm putting the cart before the horse.

5. The AID report should specify *when* the recommendations are to be put into effect. I gather that there is some testing this should not be done before the FY '65 planning cycle. Shouldn't we at least consider moving up the date for the meshing of the planning cycles to FY '60 instead of trying to take everything in one big [illegible in the original]. We should begin moving as soon as possible in the directions suggested by the report.

6. More emphasis might be given to expounding the essential rationale for MAP and AID coordination which underlies the report. Pages 6–9 of Wolf's draft make a good start but could be somewhat beefed up.

7. Finally, while AID ought to be allowed the time to do the job right, an interim report would be useful to show that you're moving and to keep the momentum. It will relieve the pressure for an early final report, and justify your taking another two months or so. Propose a new final deadline and we'll concur.

R.W. Komer

June 1962

**410. Memorandum of Conversation, June 6, among Hamilton, Nitze, Coffin, Bundy, and Defense Representatives<sup>1</sup>**

June 6, 1962

SUBJECT

Meeting of Messrs. Hamilton, Nitze, Coffin, Bundy, Gordon, Tank, General Palmer and representatives from the Department of Defense, on June 5, in Mr. Nitze's office

General Palmer outlined the operations of his office in planning and programming the military assistance program. He reviewed chronological phasing of the program and points coordination with the Department of State and A.I.D. He presented the position of the DOD that AID/State required an inordinate amount of time to clear the program once the final changes have been made in it by DOD after the appropriations bill has been enacted by Congress. He stated that AID/State was fully consulted in the preparation of the program prior to its presentation to Congress and that any changes that occurred as a result of a cut by the Appropriations Committees was not significant from a policy point of view. Therefore a protracted review of the program after appropriations had been made was unjustified. He quoted Secretary McNamara, and was confirmed in this by Mr. Nitze that one week was sufficient for clearance by AID/State. Mr. Nitze added that Mr. McNamara had instructed him that, after one week, Mr. Nitze was to report the delay to Mr. McNamara and he would personally be in touch with Mr. Hamilton. Mr. Hamilton, as coordinator of military and economic aid, is responsible for the final approval of the program and Mr. Hamilton stated that he could not at this time say that one week could be sufficient for the clearance.

Mr. Hamilton asked if criteria or standards could be established for review, inasmuch as only particular cases would need to be reviewed by the various desk officers in AID/State. He agreed that, if policy had already been decided earlier in the process, he could see no reason why delay was necessary in approving whatever changes may have occurred as a result of appropriations action. Mr. Gordon said that, on occasion, changes in circumstances in the recipient country and in the

---

<sup>1</sup> Military assistance program clearance procedures. No classification marking. 3 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 65 A 481, Military Assistance, FY 1962.

general diplomatic position made a thorough review of the MAP at this stage a necessity.

Mr. Hamilton then suggested the following procedures: He would ask each Assistant Secretary in charge of the Regional Bureaus in State Department to appoint one man from each bureau to sit with one man from each regional bureau in AID. These two men in each regional area would review the program submitted by DOD after the appropriation bill was enacted. Any discrepancy or disagreement between AID/State and DOD would then be presented to Mr. Hamilton. If he felt it necessary, he would refer the matter to the desk officers in AID/State. In those areas where no issues were raised, and this presumably will be in the vast majority of cases, immediate approval would be given and sent back to the DOD for implementation. It was generally agreed that this procedure would lessen considerably the time necessary for review by AID/State and it could, conceivably, be done within a week. Mr. Hamilton agreed to set up the above procedure immediately.

There followed a brief, general discussion of Latin America determinations with no action being indicated or taken.

July 1962

**411. Memorandum from Saunders to Komer, July 5<sup>1</sup>**

July 5, 1962

SUBJECT

Police Committee

At the Police Committee meeting on 25 June, Coffin presented AID's new organizational plan (attached). It simply makes Joe Wolf Coffin's special assistant for internal defense and Chenery's deputy for politico-military affairs and adds 4-7 officers to regional staffs. Joe would head an inter-agency coordinating committee.

This isn't the final word. Even Johnson balked at the absence of a core of public safety experts to anchor the program, and Coffin promised to take another look. He was also caught short without any idea of how to fit the proposed police academy into his scheme.

A clear but perhaps reconcilable difference remains between the AID approach and what the Technical Subcommittee and DOD recommend. Engle's report cites the need for a core of professionals researching police techniques, equipment, and doctrine and keeping a central file on police matters. Obviously the two-man Public Safety Division (PSD) AID proposes can't do this job, which Engle says would take at least 8-10.

Engle and DOD still favor pulling all public safety advisers out of the regions into PSD. However, even the staff level people in AID who back the police program wholeheartedly believe one or two advisers must remain in each region. Neither AID nor BOB, as you know, would buy Engle's position. However, what still seems possible is a compromise (along the lines of BOB proposal) developing a much stronger PSD while leaving PSD outposts in each region. The door is still open, too, for MAP funding.

Johnson raised the possibility of starting a new category of AID funds for "internal defense." Coffin receptive, and Amory discussing with Bell. This, of course, would be a year off.

Will see Maechling today or tomorrow to discuss next meeting on organization question and final report. His program adequacy report

---

<sup>1</sup> Police Committee meeting readout. Secret. 1 p. Kennedy Library, National Security Files, Kaysen Series, Foreign Aid, General, 5/62-11/63, Box 373.

will be out tomorrow. You will get a crack at the organization plan when Coffin presents his revision.

HHS

**412. Memorandum from Cooper to Kaysen, July 13<sup>1</sup>**

July 13, 1962

SUBJECT

Quick observations on Ambassador Galbraith and bilateralism

1. It is necessary to draw the distinction, which Ambassador Galbraith seems to confuse, between the real effect of aid on the balance of payments and its apparent effect as presented in the accounts—which take into account neither feedback nor substitution effects. Galbraith's opening paragraph sounds as though he is concerned with the apparent effect; the rest of the memorandum seems to be concerned with the real effect.

This is an important distinction, for while aid could suffer in Congress because of the balance of payments, it can also suffer in the field because of the balance of payments. Just at the moment the second possibility may be more likely than the first. If investment in a school has the highest social return, and the U.S. has to bribe a country to build it if it is to be built at all, then elimination of this type of expenditure can hurt U.S. aid objectives as much as Congressional penuriousness.

Reducing the apparent impact on the balance of payments of the aid program may be desirable for the purposes of Congressional presentation. Segregated accounts may serve that function well. Galbraith's recommendations go beyond that and attempt to improve the real position as well. This is good if the cost of not doing so is high, or if the cost of doing so is really low. Galbraith seems to hold the cost of not doing so higher than I think it is, and he is therefore willing to pay a higher price.

2. The "costs" of Galbraith's proposal for "mild bilateralism" are:

---

<sup>1</sup> Observations on Galbraith's views on effect of aid on the balance of payments. Confidential. 3 pp. Kennedy Library, National Security Files, Kaysen Series, Balance of Payments, AID, Box 362.

(a) retaliation in the field—Europeans are more likely to seek restrictive agreements favoring their own position, or hold on to the ones they already have. Galbraith is right in asserting that the scope for increased European bilateralism here is small; Europe runs a trade surplus with every major trading area except Japan and North America. But European anxiety to hold onto existing preferential and bilateral arrangements—e.g., the Commonwealth trading system and the French franc system—may be strengthened considerably by U.S. moves away from its former preachments on multilateralism toward a new kind of bilateralism of its own.

(b) European resistance to multilateralism may be stiffened considerably closer to home. We are not sufficiently confident about the future orientation of the Common Market to risk obvious moves toward bilateralism in our own affairs. Already there are pressures in the EEC for maintaining and strengthening various kinds of bilateralism—the special position being cut out for Africa is the most obvious case—and any substantial U.S. moves toward bilateralism would weaken the position of those in the EEC pressing for fewer “special arrangements”. This could result in a non-trivial direct loss to the U.S. and indirect losses through areas with strong commercial ties to the U.S., such as Japan and Latin America. There are many Europeans and others who fear U.S. competition (see the statement of the Italian, of all people, in Southard’s report of the IMF Executive Board meeting on the U.S.) and would welcome a chance to reduce it.

(c) The proposed bilateralism would certainly weaken the European interest in other, preferable ways to reduce or finance the U.S. deficit, such as military offset payments (which so far have been negotiated successfully only with Germany), advance debt repayments, and easier monetary policy in Europe.

3. Using the “balance of payments” as a special plea for bilateralism without prejudicing the case for a general multilateral trading system will not work, because of the universality of deficits and the existing asymmetry in viewing deficits and surpluses; deficit countries look at the *sign* of their balance; surplus countries look at the sign of the *change* in the balance (or low reserve countries look to the level of reserves, high reserve countries to changes in the level). Acknowledging the *existence* of a liquidity problem is not sufficient to keep a card as a professional economist; Galbraith should also recognize the bearing of the liquidity problem on the response of Europeans to U.S. moves toward bilateralism. It is very doubtful that many European countries, with their high internal demand, would provide more aid on credits to maintain exports formerly financed directly or indirectly by U.S. aid. Closer bilateral ties of their own would more likely result.

4. It is true that former colonials have powerful commercial bonds with former rulers, and aid tied in a sensible way is one method for loosening some of these bonds. LDC’s learn that it is not as difficult to buy in the U.S. as they might have thought. But the strength of former connections should not be exaggerated. Germany, which did not rule in India, sells about as much to that country as Britain, which

did. Britain, which had no political connection in Laos, sells nine times more to that country than France, which did. I suspect a little selling ingenuity can go a long way toward overcoming time-honored commercial ties.

SUBJECT

Galbraith's Latest on Aid

1. Stripped of its rhetoric Galbraith's message contains three proposals:

1. That we cut cash grants and purchases of local currency for dollars to an absolute minimum.

2. Wherever we still are forced to make such grants or purchases, we use segregated accounts.

3. That we go beyond tying aid to some form of super-tying or bilateral clearing. We should insure that any country which received substantial aid from us spends not only the whole of the aid but also at least as much of its other foreign exchange receipts in the U.S. as it did before receiving aid and, if possible, more than this.

2. Recommendations 1 and 2 are already being followed. As you will remember in your review with AID, they are cutting cash grants and local currency purchases down to the minimum. When it is necessary to give aid in these forms, the U.S. funds are being put in segregated accounts for expenditures in the U.S. This is not always possible. The need for cash grants arises in political bargaining situations in which

---

<sup>1</sup> Transmits copy of a July 13 memo from Kaysen to Kennedy on Galbraith's latest aid proposals. Confidential. 4 pp. Department of State, E Files: Lot 64 D 452, AID, General.

we are trying to help a government crisis, or situations in which we are paying for a base or other military facility. We cannot always successfully demand segregated accounts in these situations, but AID has been instructed to do its best and is being reminded currently of the importance of continuing to try.

3. It is the third of Galbraith's proposals which is novel, and important. What he is suggesting can be explained in terms of the following example. Assume that before we gave some country aid, it spent \$50 million per year in foreign exchange earnings in the U. S. Suppose we now give it \$50 million in aid, increasing its dollar receipts to \$100 million. Then what Galbraith proposes is that we try to secure an arrangement which will result in the recipient country's spending the whole of \$100 million in the U.S. What can and does happen now is that all of the \$50 million in aid, being tied, is spent in the U. S., but some of it is used to buy imports which were previously paid for out of the free earnings of \$50 million. Thus, after the aid grant, perhaps \$70 million is spent in the U.S. and \$30 million in Europe. It is this substitution of aid for other dollar earnings that Galbraith wishes to avoid. This appears a desirable goal; how feasible is it, and what would it cost to achieve it?

4. An attempt to persuade the governments that receive aid from us to enter into bilateral clearing arrangements—insuring that all their receipts from the United States were spent in the United States—would run directly counter to our whole trade policy, which is to widen the area of free multilateral trade. This is not only a matter of principle, it is a matter of practical import as well, since we have a large surplus of exports over imports. Thus, the path of bilateralism would ultimately be painful to us if others followed it as well. There is no doubt that if we pressed hard in the direction that Galbraith suggests we would provoke retaliation. While the Europeans cannot readily retaliate in India, because they already sell more than they buy there, they could retaliate elsewhere. Further, the repercussions would go beyond direct retaliation. We are pressing the Europeans to loosen their bilateral arrangements with Africa and other arrangements which exclude Japanese and Latin American production from their markets. To the extent that we ourselves resorted to extensive bilateralism, it would be less easy for us to go on doing so, with the result that we would suffer from the fact that these areas, which trade so heavily with us, could not increase their total foreign exchange earnings and thus their imports from the U.S.

In addition to these indirect repercussions, there would almost certainly be some direct repercussions in the aid receiving countries. In India itself, an attempt on our part to force the Indians to shift trade away from the European countries toward the United States would

hardly be consistent with our effort to get the Europeans to contribute more in the Indian Consortium. The next meeting of the Consortium is 30 July, 1962. We are trying to get the Europeans to increase their pledges by more than \$100 million. It is the judgment of Bill Gaud that any attempt to explore with the Indians at this time the bilateral arrangements that Galbraith suggests would be damaging to the prospects of the Consortium.

5. Finally, there is a broad political argument against substantial bilateral tying. Engaging in it would give substance in the neutralist and underdeveloped world to the Communist charges that our aid is an instrument of neo-imperialism and neo-colonialism. Thus, we would be undermining the very political purposes it is the goal of the aid program to achieve.

Carl Kaysen

#### 414. Memorandum from Dillon to President Kennedy, July 17<sup>1</sup>

July 17, 1962

##### SUBJECT

Aid and the Balance of Payments

I wholeheartedly agree with the general approach outlined by Ken Galbraith in his recent telegram to you on aid and the balance of payments. Simply stated, our objective should be to assure as far as we can that our aid is matched by additional exports from the United States. To the extent that we are successful in this, the effect of aid on our balance of payments will be neutral. This idea of additionality is one that we should keep constantly in mind in administering the new segregated accounts to be set up under AID.

One of Galbraith's specific suggestions—developed in the last paragraph of page 6 of his telegram—seems to me to go much too far. This is his idea that we should apply a simple formula designed to prevent other industrialized countries from earning dollars from any underdeveloped country to which the United States gives aid, whether those dollar earnings are attributable to the aid we give to the underdevel-

---

<sup>1</sup> Observations on Galbraith's proposals on aid and the balance of payments. Confidential. 1 p. Kennedy Library, President's Office Files, Treasury, 7/62, Box 94E.

oped country or to the exports of the underdeveloped country to the United States. In some cases this formula would go far beyond neutralizing the effect of our aid on the balance of payments, when what we should aim for is solely to make as certain as possible that all aid expenditures result in additional purchases from the U.S. To go further would run counter to our basic trade policies based on free multilateralism. This criticism does not in the least detract from the main thrust of Galbraith's recommendations. Moreover, I am confident that he is entirely correct in saying that we need not fear retaliation from the other industrialized countries for action which we can defend as being necessary to prevent aid from hurting our balance of payments.

Douglas Dillon

**415. Memorandum from Coffin to the Special Group (CI),  
July 18<sup>1</sup>**

July 18, 1962

SUBJECT

A.I.D. Supported Counter-Insurgency Activities

The long-term aim in the planning and programming of economic assistance administered by the Agency for International Development over the period since January 1961 has been to create economic and social conditions of sufficient vitality to eliminate the causes of discontent and to sustain representative government and institutions. In this broad general sense a wide-ranging program has been developed and implemented to strengthen internal defense capabilities. To identify each one of these without giving a full listing of a large part of the whole program would not be practical. This summary report is therefore confined to a description of the specific major measures taken to enhance local counter-insurgency efforts and to the adjustment of internal procedural arrangements in support of these efforts.

*BROAD PROGRAM TARGETS*

The extent of the threat in the various regions has dictated, in most instances, the character of the programs planned and executed in the

---

<sup>1</sup> "AID Supported Counter-Insurgency Activities." Secret. 6 pp. Kennedy Library, National Security Files, Departments and Agencies Series, AID, 1962, Box 268.

period under discussion. The actions taken in each of the areas can be highlighted as follows:

A. The Far East including Southeast Asia

A substantial part of A.I.D. resources in this area were used to support efforts to counter active insurgency and direct aggression, U.S. economic aid resources were used for military and civil budget support in Vietnam and Laos. Funds were used for military construction, alarm systems, communications and transport, education, health and community development throughout the whole area of Southeast Asia. Anti-communist minority groups fighting communist-led guerrillas received a variety of basic assistance necessary for their subsistence. Programs in other countries of the area were developed to improve the economic and social conditions of groups potentially exploitable by communists.

B. Africa

The program in this area has been developed to assist governments to realize an accelerating pace for economic and social development. Through the Food for Peace program significant projects to create employment through land clearance, reforestation and road construction were initiated, technical assistance and other resources were provided to expand education, health facilities and communications.

C. The Near East and South Asia

Throughout the region there were extensive development loan programs, and development grant programs in human resource development, vocational training, community development and public administration.

D. Latin America

Throughout fiscal year 1962 over \$65 million was earmarked for economic and social development programs through the Alliance for Progress. This program will reach the hundred million level in this fiscal year in such fields as agriculture, education, health, labor affairs, community development, communications and transportation. These projects are of an impact nature and contribute to the greater stability of the area.

*SPECIFIC COUNTER-INSURGENCY PROGRAMS*

A. Civic Action

Over the years the U.S. has supported a number of Civic Action Programs and these are continuing. In early 1962 in conjunction with the Department of Defense new emphasis was given to Civic Action and the highlights of this expanded effort are reflected in the programs recently initiated.

1. The Far East

A larger program for Korea was initiated in the spring of 1962. This program is an expansion of the large construction program involving

13 engineer construction units. A new program was initiated in Burma under the auspices of the Burmese Army to open up an area for land settlement and colonization. Other Civic Action programs in Thailand and Cambodia are under consideration and a major program is being supported in South Vietnam.

## 2. Africa

The military forces in Senegal are receiving MAP support and will soon become involved in economic development projects with A.I.D. materiel support. A project for the Cameroon is now under consideration and as additional forces acquire a Civic Action capability additional programs will be developed.

## 3. The Near East

The military forces of Turkey and Greece have had for a number of years a U.S. supported Civic Action program and these are continuing. A new program to develop water resources in Jordan was approved in fiscal year 1962 at a cost of \$135,000, and a substantial Civic Action program for Iran is in the process of development to be funded in fiscal year 1963.

## 4. Latin America

The Civic Action program in this area was expanded significantly in 1962, reaching a level of almost \$2 million by the end of the year. Programs are underway in Honduras, Paraguay, Bolivia, Peru, Ecuador and Chile. Guatemala and Brazil have had programs for a number of years without the need for U.S. assistance.

Civic Action for fiscal year 1963 is projected at twice the level for this present fiscal year and it is anticipated that a larger number of countries and military units will participate in a wide variety of projects.

## B. Public Safety

### 1. Far East

Since 1961 the police support program has been expanded in the Far East to cope with the increased threat. The program in South Vietnam is being increased 100% and the support level for the Thai Border Police for equipment and training has been increased by \$2.7 million. Arms and equipment have been provided to the Cambodian police and the Mobile Brigade in Indonesia will receive \$6.1 million over the next three years for communications, transportation and training. All of these programs provide for an increased internal defense role.

### 2. Africa

In Africa new programs to support the police in the Ivory Coast, Upper Volta, Niger, Dahomy, Togo, Central African Republic, Malagasy Republic and Ethiopia were initiated. Programs were continued in the Somali Republic, Libya, Tunisia, and Liberia and a police acad-

emy was opened in Liberia in the spring of 1962 which should train a minimum of 1,000 police officials each year.

### 3. Near East

New programs in Cyprus and Egypt are under consideration and an expanded program for Iran to improve riot control has been approved. In October 1961 over \$4 million in excess equipment was made available to the Indian police.

### 4. Latin America

The Public Safety Program in Latin America has been increased over the FY 1960 level. The number of technicians assigned almost doubled in 1962 and will further increase in 1963. The number of police officials trained at U.S. expense increased by 100 in 1962 over the 1961 level. By far the most significant development during the last eighteen months was the establishment of an Inter-American Police Academy in Panama. This school was opened in July 1962.

The entire thrust of the Public Safety Program is now under inter-agency review to develop new concepts, techniques and organizational responsibilities. The recommendations stemming from this review will further strengthen the U.S. supported police program.

## *ADMINISTRATIVE MEASURES*

A.I.D. has made specific assignments of personnel in the counter-insurgency effort both at the coordinating and the regional levels. Qualified personnel have been given new responsibilities for developing plans and programs and to assure their effective execution. Listing of the A.I.D. training programs were outlined in response to NSAMs 131 and 162 and have been expanded to familiarize personnel with the new emphasis in U.S. supported counter-insurgency efforts. Six training programs are already underway including a police program which in 1961 trained 360 officials. A.I.D. is now studying methods to develop a reservoir of qualified personnel to be sent to crisis areas on short notice.

## *FUTURE MEASURES*

The major measures planned for the future fall into the following broad general categories:

### A. Coordination

The A.I.D. Administrator has submitted to the President on May 25 his plan to strengthen the coordinating function of all U.S. aid efforts. This proposal was accepted and circulated to the field as a forerunner to specific guidance on procedures for the submission of future country programs. Planning in future years is to be on a five year basis and will include both military and economic proposals. (Economic planning was previously on a one year basis.)

### B. Guidance

The economic guidance for the next fiscal year will reflect the new emphasis to be given to counter-insurgency programs. This guidance will serve as the basis for fiscal 1964 programs and calls for a thorough analysis of internal defense programs and resources required for their greater effectiveness.

### C. Planning

1. Greater emphasis in the planning process is to be placed on the side-effects of all aid components.

2. A.I.D. is participating in the inter-agency program to develop internal defense plans for all friendly countries threatened by subversion.

### D. Personnel and Staffing

A.I.D. is continuing to recruit experienced personnel to staff key positions in the field and in Washington for positions in the counter-insurgency field. Some 25 positions in the Public Safety field are to be filled as quickly as qualified personnel become available. Additional positions in Washington are also in the process of being established. All personnel scheduled for counter-insurgency positions will receive specialized training. A.I.D. will also participate in the inter-agency committee recently established to evaluate the adequacy of this training.

Much of the A.I.D. effort in the field of counter-insurgency was concentrated in the last half of the period under discussion. Problems of reorganization, new program direction, earlier commitments and program emphasis required review and evaluation. A new momentum has been started in the direction of improving the stability of areas threatened by subversion and more flexibility in programming development has been established.

**Frank M. Coffin**  
*Deputy Administrator  
for Operations*

**416. Cedto 137 from Paris, July 31<sup>1</sup>**

Paris, July 31, 1962

From Riddleberger. Chairman's report on annual aid review encountered no objection when submitted to Council for information and was issued to press thus completing publication of DAC decisions.

As recent session was first high-level meeting of DAC since Tokyo in 1961, it may be appropriate to supplement USRO reporting with some additional observations on activity of past year. In brief, Tokyo decisions led to (a) annual aid review to compare relative burden and general aid policies, (b) expansion of total aid effort, and (c) improved coordination. It can justifiably be stated that first two purposes were accomplished and progress made on third. Total flow of resources from DAC countries rose from \$7.4 billion in 1960 to \$8.7 billion in 1961. Official contributions rose from \$4.9 billion to \$6 billion in same period representing increase of more than 20 percent. As a group, therefore, commitment of London resolution for expanded aid program was fully met. Simultaneously, there was progress toward easier terms, with respect to coordination there was likewise progress if less spectacular. Although no countries were specifically cited in Chairman's report as laggard, it is clear from statistics that Canada and Italy are far behind other members.

I believe process of AAR led to a greater understanding that no one form of extending aid has an inherent primacy and that a doctrinaire approach should give way to the concept of an aid package which takes into account overall needs and circumstances of a recipient country. The plan for coordinating groups which was approved in January provides mechanism for this improved approach. This does not mean that problem of better coordination is solved but start has been made and it should be possible to develop this concept during coming year. Negotiations are under way to establish groups for three East African territories, Thailand, and possibly Colombia in conjunction with IBRD. Vietnam group was launched in DAC but is being continued outside. Annual aid review process itself should likewise influence member governments to link their aid policies more directly to development objectives.

As the London resolution of March 1961 placed upon the chairman responsibility for leadership in the areas discussed above, it was naturally source of satisfaction that resolution adopted on July 26 corre-

---

<sup>1</sup> Annual aid review. Confidential. 3 pp. Department of State, Central Files, 800.0000/7-3162.

sponded so closely with recommendations set forth in the report, which in turn had been fully endorsed by us. Therefore I believe that mandate given me before Tokyo meeting has now been executed and ratified at Paris meeting, following intense efforts of past year.

Some progress has likewise been made in domain of technical assistance and while this is an extraordinarily complex subject, committee has succeeded in expanding the amount of such assistance to Latin America. Some steps have been undertaken which should eventually lead to better coordination.

The committee has added to its membership with admission of Norway on July 25 and henceforth this country, having accepted obligations and decisions of DAC, will participate fully in the joint endeavor. Accession of Norway brings total membership to eleven governments and EEC. The committee also decided in 1962 to admit Swiss Government to observer status in technical assistance sub-committee on assurance that Switzerland intended to coordinate its activities with other members. Informal discussions with Danish representative to OECD have taken place and there is some reason to think Denmark may eventually come in.

Several meetings have been held with respect to Latin America and while these were largely devoted to exchange of information to date, they may lead to more concrete results later. The first coordinating group meeting was held on results of Punta del Este Conference, and while not entirely satisfactory to all participants, on balance the session was useful for information purposes. One result was establishment of a permanent Paris office of Inter-American Development Bank under direction of Mr. Gonzalez del Solar.

The foregoing represents principal accomplishments of DAC in past year. When the unique character of this endeavor is recalled, i.e. an effort to expand, improve and coordinate the foreign aid programs of ten countries and EEC with all that is involved in the way of national legislation, policies, regulations and political considerations of importance, I believe we can draw satisfaction from our own initiatives and results they have brought in consolidating the efforts of free world in this domain.

#### Recommendations:

1. AAR process should be vigorously pursued and increased attention given to comparison of burden and efficacy of aid.
2. Additional efforts should be made in Rome and Ottawa to increase Italian and Canadian contributions and our ambassadors be fully briefed and instructed to maintain continued pressure.
3. US should support vigorously and assist in every way study on tied aid.

4. Efforts should be made to assure success of coordinating groups now-proposed and careful preparation made for future groups.

5. US position on multilateral investment guarantees should be determined in near future and decision made whether to pursue this idea.

6. Consideration of chairman for 1963 should now (rpt now) start and informal consultations begun by September with other delegations.

**Durbrow**

## August 1962

### 417. Letter from President Kennedy to Hamilton, August 7<sup>1</sup>

August 7, 1962

Dear Fowler:

Today I approved the recommendations of the inter-agency committee created under NSAM 146 to study our foreign police assistance program. As I wrote you on February 19, I consider this program an important part of our effort to help the less-developed countries achieve the internal security essential if our major economic development aid is to help create viable free nations.

I regard the committee's report as an excellent guide to the course we should follow in this field. However, policy on paper will not get us very far unless we get able and enthusiastic people to carry it out. I hope that you and Frank Coffin will give your personal attention to hiring the best professionals you can find to launch this re-invigorated effort and will give them every support in making the program count.

Sincerely,

**John Kennedy**

October 1962

**418. Memorandum from Coffin to Bundy, October 30<sup>1</sup>**

October 30, 1962

SUBJECT

National Security Action Memorandum No. 150  
Use of U.S. Military Engineers on A.I.D. Projects

Following up the June 1 response to NSAM-150, the Departments of State and Defense have engaged in consultations and exchange of views which have led to an improved climate for cooperation. Each has explored its situation in relation to the intent of NSAM-150, and certain concrete conclusions, which it is hoped will be of significance for future cooperation between the two agencies, have emerged.

These main conclusions are that:

1. A new effort should be undertaken to negotiate an AID-DOD participating agency agreement to serve as a basis and framework for arrangements on individual projects. Hopefully, this agreement will provide: (a) more flexible arrangements for engineering personnel assignments, and (b) improved channels of communication to facilitate matching of A.I.D. requirements and military engineering availabilities.

2. A mechanism should be established to give each USAID direct and immediate access to a specific military engineer district headquarters as a source of engineering advice, and, where necessary, of full-time engineering staff.

Accordingly, the Departments of Defense and State are taking action to implement these proposals. A progress report will be furnished by 1 January.

The Department of Defense concurs in this report.

**Frank M. Coffin**  
*Acting Administrator*

November 1962

**419. Memorandum from Moorman to AID Administrator,  
November 9<sup>1</sup>**

November 9, 1962

SUBJECT

NSAM 150—Use of Military Engineers

In Mr. Coffin's memorandum of October 30 to Mr. Bundy there are two courses of action proposed which are to be reduced to a participating agency agreement with the Department of Defense. I find that point No. 1 generally agrees with the intention of the Executive Staff as expressed in the minutes of September 25. However, point No. 2 reads as follows:

"2. A mechanism should be established to give each USAID direct and immediate access to a specific military engineer district headquarters as a source of engineering advice, and, where necessary, of full-time engineering staff."

In considering what point No. 2 means to this Agency I can only conclude that the intention is to set up a mechanism which would permit each Mission Director (by "direct and immediate access") to go to the nearest military engineer district headquarters to obtain advice and full time engineering staff. This could be done without consulting AID/W and indeed without the knowledge of the Regional Bureaus. It will immediately generate conflicting opinions on engineering and construction problems and robs the Regional Administrator of control of engineering operations in his Region. I can think of nothing more disastrous to the orderly administration of capital development projects than to turn the engineering operations over to an organization which has no grasp nor background in the objectives of the AID program and which is completely beyond the control of the Administrator.

I would like to call your attention to some other matters which I believe you should consider. This Agency has approximately 645 engineers in the field in various Missions around the world. These engineers are not answerable in any fashion to the engineering organizations in the Regional Bureaus. They work under the Mission Director

---

<sup>1</sup> Discussion of Coffin's October 30 memorandum on use of military engineers. Confidential. 3 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 67 A 1530, Chron Files, Nov. 9-19, 1962.

and to the extent that there is any backstopping from Washington engineers, it is couched in such organizations as Agriculture and Natural Resources Division, ESD; Health Division, ESD; Industrial Division, ESD; Public Safety Division, ESD; and Transportation Division, ESD. The only relationship with the engineering staff of the Regional Bureaus comes about through professional interest and personal friendship. I am not able to say how well they do their job; however, in terms of the contribution they make in relation to capital development their efforts more often result in confusion than in any helpful contribution. This is accounted for by two factors: lack of understanding of the program and lack of ability on the part of the regional engineering staffs to provide the direction so necessary to bring about a reasonably orderly operation.

In addition to the above, I understand from our conversation of November 7, that you hope to develop recommendations from a group of private industrialists of very high caliber toward a better system of implementation of the capital development program. It appears from my limited information that so far their recommendations have been pointed toward the substitution of a consulting engineers staff for an agency staff in the implementation of capital development projects. From my knowledge of available talent and skill in the private consulting engineer field except for perhaps 10 or 12 firms which are exceedingly broad in their capability, it would not be possible to find the kind of experience which this Agency needs to carry on its operations. It may very well be that limited application of this suggestion might be successful in a few places. At the same time it would seem desirable for the Agency to consider the proper organization and effective use of the talent which it already has in the organization in large numbers to do this job.

It seems to me that we are in a position of the juggler who has three balls in the air but doesn't have time to scratch his head. I hope that in the consideration of this problem you will consider all of the possibilities and not fail to recognize the latent capability within the present organization which could be brought to bear on engineering problems simply by an adjustment in the organizational relationships of engineers to engineers and engineers to operating functions.

I appreciate this opportunity to put my views on this important matter before you.

**R.L. Moorman**  
*Deputy Director  
of Engineering*

**420. Cedto 505 from Paris, November 28<sup>1</sup>**

November 28, 1962

From Leddy. Brussels for USEC. Geneva for GATT. Subject: OECD Ministerial Meeting, Development Assistance.

Most statements covered same or similar topics such as Kristensen thesis that aid should be continuing function of govts, AAR, coordination, effectiveness of aid, Convention of Protection Foreign Property and multilateral investment guarantee, and Development Center. Among highlights was Danish declaration that they applied to join DAC and Japanese statement on their desire for closer participation in work of organization. Several delegations welcomed Danish move and chairman replied to Japanese that he certain Permanent Council will give Japanese request most serious consideration.

After Riddleberger's report, highlights of which were summarized in Cedto 479, Kristensen spoke. He welcomed mandate for closer coordination trade and aid and pointed out that organization can also contribute to talks of development in fields of science, education, agriculture and industry. Expressed concern that 1) private investment flowing to LDC's has been stagnating, 2) proportion of grants in total flow declining, 3) recent appropriation measures in some member countries presage leveling off of aid volume in '62 '63. Such would likely bring about major adverse political and psychological repercussions in LDC's. It is for these reasons he proposes that aid should be made well established govt function in industrialized countries not dependent on vicissitudes balance of payments and similar considerations.

Also necessary that quality and effectiveness aid be improved. Kristensen announced agreement establishment Development Center and exchange letters with Japanese Ambassador on Japanese participation in Center.

Under Secretary Ball supported Kristensen thesis that aid should be continuing international public responsibility of governments. He encouraged those not yet members of DAC to join. He emphasized need to liberalize aid terms. He joined in Kristensen's concern of serious effect leveling of aid would have on LDC's. He welcomed Development Center. Referring to earlier Belgian intervention re Convention on Protection Foreign Property he said if sufficiently favorable reaction by LDC's US would no doubt look upon it with favor. Re multilateral investment guarantee he pointed out its effectiveness would depend

---

<sup>1</sup> OECD Ministerial: Development Assistance. Official Use Only. 4 pp. Department of State, Central Files, 374.800/11-2862.

upon widespread support and contributions by industrialized countries. If this forthcoming US would probably support and would certainly encourage further study.

Highlights of other countries' statements as follows:

UK agreed aid should be constant and growing function of govts. Stressed usefulness coordinating groups on selective basis and expressed satisfaction results East Africa, Thailand group accomplishments. On Development Center pointed up role of training economic administrators from LDC's.

Denmark made interesting comparison that U.S. with economic potential of about 40% of world against 20% of Western Europe should naturally continue to exert leadership although Europe should increase its share in aid burden. On other hand Western Europe's 40% share in world trade, vs 20% U.S. share places responsibility on Europe to take lead in providing markets for LDC's. Denmark wishes to assume its responsibilities in field of aid, has preferred multilateral channels in past but in future will also extend bilateral aid. Application for DAC membership submitted to SecGen.

Belgium encourage others to join. Argued that DAC itself should pay attention to TC. Expressed support for Foreign Property Convention and multilateral investment guarantee and asked views others.

Japan stated desire for closer participation in other work OECD. Welcomed selective coordinating group activities especially in Far East. Emphasized close relationship between trade and aid and requested to be informed on outcome those discussions.

Netherlands supported multilateral investment guarantee and argued against aid tying even on B/P unless coupled with serious under utilization resources.

Greece in long emotional statement, criticizing sharp distinction being offered pleaded for highest political decisions in favor of Greek aid.

Norway constant external deficits place limitation what Norway can do. One fourth percent income tax earmarked for aid introduced in Norway with view achieving favorable political, psychological effects. Will be glad to report on experience.

Italy after long expose problems southern Italy, endorsed coordinating groups which should help to sort out priorities. Also supported consortia in general and Greek and Turkish consortia specifically. Approach to development aid should be on global and long-term basis.

Switzerland spoke in favor Convention Foreign Property and multilateral investment guarantee.

Germany stressed importance effectiveness of aid and in favor convention foreign property.

**Finletter**

**421. Cedto 507 from Paris, November 28<sup>1</sup>**

Paris, November 28, 1962

Brussels for USEC. Geneva for GATT. From Leddy. OECD Ministerial Meeting: Highlights of discussion November 27 on "trade and aid", trade work of organization and agricultural trade follow:

1. Trade and aid. US trade-aid initiative welcomed as ministers adopted "trade and aid" resolution referred to them by heads of dels (CES/62.95). (US had previously withdrawn its revised draft resolution this subject at Nov. 24 heads of delegation pursuant to Toted 314.)

Kristensen referring to Trade Committee exercise under which OECD members have been asked to describe their trade policies vis-à-vis LDCs and ideas re possible role of organization this field, stated bluntly that responses from members not very encouraging, with "several members showing hesitant attitude." Warned of growing gap between LDC's import needs and foreign exchange earnings, difficulties being met by traditional LDC exports, need for price stabilization in basic commodities (though reorganizing this raised difficult problems production control), and need to increase LDC exports of manufactures. Noted that comprehensive Secretariat study under way on entire range of relationships between OECD members and outside world and hoped to say more about this next year.

Under Secretary Ball stressed intimate connection between trade and aid policies, reviewed difficulties facing LDCs in trade field and possible lines remedial action, noting that challenges this field provided opportunity for OECD to give effect to concept that it should operate as economic conscience of free world. (Text under Secretary Ball's remarks on this and other trade aspects being cabled separately). Erroll (UK President Board of Trade) agreed both sides of problem required coordinated attention. Felt UK had already made notable efforts to help solve LDC trade problems by providing liberal markets for both primary and LDC manufactured goods, and by considerable UK efforts in readaptation structure UK textile industry. Problem was not only barriers to trade but possibilities of adaptation of economic structure both in industrialized countries and LDCs. Agreed there were limits beyond which OECD could not carry burden of problem without causing resentment elsewhere, stating OECD (a) cannot discuss individual tariffs (b) should not discuss detailed operation of commodity agree-

---

<sup>1</sup> OECD Ministerial: Trade and Aid. Official Use Only. 4 pp. Department of State, Central Files, 374.800/11-2862.

ments (c) cannot do more than discuss in general terms diversification in countries not OECD members.

Brasseur (Belgium) warned that OECD members must avoid impression they concerned only with own problems. Zijlstra (Netherlands) viewed OECD task as helping implement ideas contained in GATT Nov. 1961 Ministerial declaration. Lamalfa (Italy) viewed OECD role as one of making studies and exchanging views on ideas which could be given effect in other international forums concerned with LDC problems. Lange (Sweden) felt trade-aid resolution in line with recognition long given "in this house" to need assist LDCs in trade field. De Murville (France) specifically welcomed US initiative but noted serious substantive differences between OECD members on approach to LDC problems. Recalled French view of need to guarantee continuing "take" of primary commodities through organization of markets. Maintained that, though EEC-African relations frequently criticized, these have already raised living standards in associated African countries. Felt solution of problems would be facilitated if others refrained "from insisting on negative aspects" and if all LDCs could be given "similar guarantees." Called on others to raise their efforts to French level. While recognizing need for increased exports of LDC manufactures, argued this must be gradual with LDCs imposing self discipline to avoid market disturbances and countries should avoid creating uneconomic industry for prestige reasons. Muller-Armack (Germany) regarded OECD as forum in which necessary political decisions could be taken to move together toward solutions of LDC problems. Wyndham-White (GATT Executive Secretary) stated that duplication of effort often good in good cause but draw attention to manpower problem resulting from proliferation of effort. Felt increasing problem of suitable representation at intergovernmental meetings might undermine effectiveness total result. Congratulated OECD desire to contribute to success of enterprise already initiated by GATT in this field.

2. Trade work of organization. Kristensen noted that, until negotiations looking to expanded Common Market completed, difficult to predict future trade patterns and role of organization in trade field. Likewise difficult see at this stage what OECD role might be in negotiations under Trade Expansion Act (TEA), noting necessity of direct contacts among interested countries and fact formal negotiations would be in GATT. Noted Trade Committee (TC) emphasis on successful negotiations on broadest possible basis. Felt OECD had contribution to make re adaptation of member countries' economic structures, especially shifting manpower out of agriculture, as essential part of effort for economic growth and increasing trade.

Under Secretary Ball called on organization to develop habits of consultation on policy matters, noting that US prepared consult on any

aspect its economic policy and such consultation more useful when policy in formative stage. Re trade matters US prepared consult on procedures designed influence member countries' policy and practices on continuing basis. US also prepared examine possibilities of harmonizing with trade policies other measures affecting trade. OECD should also be forum for consultations on problems which LDCs would raise at UN Trade Conference.

Belgium called for continued study of administrative and technical trade obstacles and work on removal of QRS. Felt Trade Committee might develop discipline to ensure that tariff reductions not offset by other restrictive practices and welcomed US readiness discuss these. Netherlands felt TC could play role as "Platform of Industrialized Countries" to facilitate successful outcome negotiations under TEA. Stressed importance continued OECD drives against QRS.

Sweden welcomed growing importance of TC and development its work program. In addition to work on LDC problems, felt TC should help prepare "for activity in GATT to liberalize trade among industrialized countries via TEA." France felt OECD has useful role in trade field in context its concerns with economic policy matters generally.

3. Agricultural trade. While recognizing necessity for EEC Common Agricultural Policy (CAP), Under Secretary Ball noted policy could be liberal or restrictive. Recalling Secretary Freeman's recent statement to Agriculture Ministers meeting, he underlined US concerns with evidences of restrictionist trend in development of CAP. Noted importance of CAP grain price level in determining future levels agricultural trade.

Recognized need for global approach in some cases and stated US willingness participate serious discussion possibilities global grain arrangement. Also stated US willingness join in considering its own policies affecting agricultural trade as part of general effort towards more liberalized trade in temperate agricultural products. De Murville noted CAP too young to have judgment passed on it. Agreed central question was level at which internal EEC prices would be fixed. However, felt it unreal to talk about "traditional trade patterns" in rapidly changing world. Welcomed US readiness to discuss its own restrictions on agricultural trade and stated EEC always ready participate discussions this general problem.

**Finletter**

December 1962

**422. Memorandum from Taylor to Bundy, December 7<sup>1</sup>**

December 7, 1962

SUBJECT

Police Assistance Programs

At its meeting of December 6, the Special Group (CI) considered AID's report on police assistance programs, submitted for the President on December 1, in compliance with National Security Action Memorandum 177. Implementation of the directives contained in the NSAM has been slow. However, a centralized Office of Public Safety has now been established, and arrangements have been made for the assignment of professional personnel to provide adequate staff support. Further, the Administrator has established an interagency police group to assist him in fulfilling his responsibilities in this field. A review of police training has been completed by an outside consultant. It emphasizes the need for the early establishment of an International Police Academy in the Washington area.

Action to establish the International Police Academy, and to coordinate U.S. police support efforts with similar programs conducted by friendly countries, has not yet been initiated. Also, AID has yet to develop ways of expediting delivery of equipment.

The Special Group (CI) has requested a further progress report for consideration during March 1963. In the meantime the Group will continue to monitor the police programs and to encourage the Agency to take action on those projects referred to above as not yet initiated.

**Maxwell D. Taylor**  
*Acting Chairman*

---

<sup>1</sup> AID's compliance report on police assistance programs. Confidential. 1 p. Kennedy Library, National Security Files, Meetings and Memoranda Series, NSAM 177, Police Assistance Programs.

**423. Memorandum from Forrestal to Bundy, December 10<sup>1</sup>**

December 10, 1962

## SUBJECT

## Police Assistance Program

From an administrative point of view, this program has not been going too well until recently. Despite the President's directive (NSAM 177) of last August, AID did virtually nothing to set up a central administration for the police programs until early in November. The reasons are a basic lack of philosophic sympathy with the program in the regional bureaus where it is looked upon as a dangerous interference in the orderly development of their economic programs. The effect of this antipathy was reinforced by the fact that the program lacked a single head who felt responsibility for its execution.

Under the whiplash of the Attorney General's technique of offensive cross examination in the Special Group (CI) more was accomplished in the first two weeks of November than was accomplished since last August. Byron Engle, was made head of the Office of Public Safety in AID, and has now been given more than adequate authority and responsibility to spark this program. Furthermore, he seems to me to be the kind of man who would carry the ball once he got his hands on it. There is some nervousness in the Budget and from Ralph Dungan over whether we have not gone too far in centralizing the police program; but I think that if we have erred, it has been in the right direction.

Nothing has been done, however, on the International Police Academy here in Washington; this is a matter on which we are now concentrating.

AID has also shown some resistance to "civic action", i.e. small-scale public works carried out by indigenous military forces. Here the problem has been not only philosophical antipathy but, even more, AID procedures which are incredibly cumbersome and inflexible. Some progress has been made on this front, especially in Indonesia, but it is a matter which requires constant goading on a case-by-case basis.

One of the difficulties we are having in the Special Group (CI) is that the group has moved from the stage of initiating new policies and actions in the field of counterinsurgency to the stage of monitoring the progress made on directives which were issued many months ago.

---

<sup>1</sup> Thoughts on AID's handling of Police Assistance Program. Secret. 2 pp. Kennedy Library, National Security Files, Meeting and Memoranda Series, NSAM 177, Police Assistance Programs.

This is a boring procedure for some members of the group and intensely irritating for others. Nevertheless, my own feeling is that the exercise is definitely worthwhile provided we can keep the group from flying off into attempts to manage the entire foreign policy of the United States in underdeveloped countries.

**Michael V. Forrestal**

February 1963

424. Memorandum from Kaplan to McGhee, February 11<sup>1</sup>

February 11, 1963

SUBJECT

Geographic Distribution of Bilateral Economic Assistance by DAC Countries  
Other Than the United States

I. *Status and Trends.*

A. *Germany*—Apart from reparations the German aid program began on a significant scale in 1960. By the end of 1961 Germany had foreign aid commitments to 38 countries. By the end of 1962 the list had grown to 61 countries. The list covers all continents and countries ranging from Iceland to Liberia, Israel and Turkey to Afghanistan and Korea and Argentina. There is no particular pattern of concentration. German aid officials have stated that they prefer not to accept primary responsibility for any developing country, but would rather play a secondary role to U.S. (or France). Their motives in extending aid are partly political—discourage recognition of the East German government—respond to U.S. and French pressures as well as those of developing countries to share the burden of foreign economic assistance, help countries where German influence has been traditional (Turkey, Iran, Togo, Tanganyika) or where there are significant German populations (the Latin American countries). In part their program was stimulated by the U.S. decision to tie its project lending and the subsequent pressure from German firms which had previously obtained attractive contracts under the U.S. aid program. In part, their purpose is to strengthen ties with countries in which Germany is interested in expanding its trade, investment and economic relations generally.

B. *France*—The very large French foreign aid program is concentrated almost entirely on countries in the franc zone. Only 2% or some \$23 million of disbursements in 1961 went to other countries. When the French government decided to grant independence to its African colonies a few years ago, it stepped up its aid programs to these countries. Ninety percent of such aid is in the form of grants. In 1961 40% of French aid went to Algeria, 9% to Sahara, 3% to Morocco and Tunisia and 40% to other African states and Madagascar. France has

---

<sup>1</sup> "Geographic Distribution of Bilateral Economic Assistance by DAC Countries Other than the United States." Official Use Only. 4 pp. Department of State, Central Files, AID 1.

participated in various collective arrangements such as the rescheduling of the commercial indebtedness of Argentina, Turkey and Brazil and in the India consortium. It prefers, however, to confine its effort for non-franc zone countries to export credits up to 10 years in duration at commercial rates of interest but guaranteed by the government. In brief, the French have accepted and seem prepared to continue to carry primary responsibility and to provide assistance in generous amounts to former dependent territories in order to retain French political, military, cultural and economic influence. Aid to Algeria and Sahara is in part related to French oil interests. France is concerned lest it be frozen out of attractive markets in other developing countries, particularly Latin America and India; it hopes for the present to evidence its political interest and maintain its market position in such countries by means of credits on commercial terms.

C. *United Kingdom*—The U.K. is providing assistance to approximately 30 countries and dependent territories. Ninety percent of the money goes to colonies and less developed independent countries within the British Commonwealth. The remainder helps NATO partners, such as Turkey, and countries where the U.K. has strong commercial interests, such as Brazil and Chile. In the aftermath of Mr. Hamilton's visit to the U.K. last fall, the Foreign Office pressed within the U.K. government for a larger sum with which to serve the U.K.'s political interests outside the British Commonwealth. Thus far only Laos has been added to the list for a small sum. The Chancellor of the Exchequer is showing an increasing interest in using the foreign aid program for economic purposes. Thus he has spoken recently about an increase in the British foreign aid program on a tied basis in order to provide orders to underutilized industrial capacity in particularly depressed areas in Britain and to help U.K. commercial interests. Nevertheless, as of the moment the U.K. program is heavily concentrated in the Commonwealth and within the Commonwealth is heavily concentrated on dependent and very recently independent territories. Thus about a quarter of the 1961 program was directed to East Africa and almost as much to other African dependencies.

D. *Japan*—Japanese aid in 1960 went to more than 15 countries, mostly in Asia and the larger countries of Latin America. Reparations and indemnification payments still loom large in Japanese aid though loans have become about 2/3 of the total. Small amounts of aid have been made available to Turkey, Yugoslavia and Sudan, and Japan is interested in helping Nigeria, largely in view of a very large trade surplus. Japan is reluctant to accept a primary responsibility for helping individual countries and prefers to cooperate in areas where the U.S. in particular is active. While Japan tends to concentrate on Asian countries for political as well as economic reasons, Japan's acute awareness

of its dependence on trade is perhaps the principal motivating factor in a trend toward aiding non-Asiatic countries that show promise of becoming attractive markets for Japanese exports.

E. *Italy*—Italy's modest aid program is heavily concentrated in countries in the Mediterranean basin and East Africa. It also has provided some assistance to 8 countries in Latin America and 5 Asiatic countries. Motivating factors seem to be some feeling of responsibility for areas previously occupied by or dependent on Italy and its strong commercial and cultural interests in Latin America. The emigrant Italian population in such countries as Argentina, Brazil and Tunisia accounts in part for Italian interest in those countries.

F. *Canada*—The even more modest Canadian aid program has been extended to 19 countries, mostly members of the British Commonwealth or the Colombo Plan. It recently established a bank similar to our Export-Import Bank, which made loans in 1961 to the four largest Latin American countries. The new bank is clearly oriented toward promoting Canadian exports; it seems likely that the number of countries receiving loans will increase as the bank comes into full operation.

G. *Netherlands, Belgium, Portugal*—Bilateral assistance from the Netherlands, Belgium and Portugal is essentially confined to dependent territories or former dependent territories. Netherlands and Belgium, however, are increasingly conscious of the need to participate in development assistance, partly for burden-sharing reasons but more to protect their traditional worldwide exporting interests.

## II. Policy Issues.

Presumably the major U.S. interest in the degree of proliferation or concentration of the aid programs of other donor governments is in inducing an expansion of their aid levels and thus a better sharing of the burden. The recent history suggests that as a country's aid program expands, it proliferates to an increasing number of countries, largely to promote commercial interests in developing countries whose imports seem likely to increase.

This U.S. interest in expanding other donor programs raises a series of policy issues which are being discussed with the Clay Committee. The choices are not always apparent and clear-cut. A.I.D. is still in the process of reaching its own conclusions. Among the issues to be resolved are the following:

Would a reduction in U.S. assistance to former dependencies of European metropolises induce a commensurate increase in their assistance to these countries? Would this increase be likely to occur with sufficient promptness to avoid major political risks in such countries or would the increased assistance be likely to take place only after the critical effect of the reduction in U.S. aid has become apparent?

Should we urge countries to which we are giving substantial aid to refuse commercial export credits or other assistance on hard terms of repayment in the hope that commercial pressures would force the other donors to provide aid on terms consistent with the debt service capacity of the recipient country?

Should we urge countries whose import requirements from the U.S. are largely financed by our aid programs to limit their imports from other DAC members unless such potential donors are prepared to finance a significant part of such exports?

In the case of those African countries where U.S. aid performs essentially a presence function, should we eliminate such programs? Would our own security interests be damaged if these countries had no alternative source of assistance other than the former metropolises and the Communist bloc?

Should we ask former metropolises to diversify their aid programs so as to lessen the dependence of the former colonies on them and to permit a more varied pattern of relations with the free world to develop?

Should we encourage a multiplicity of aid donors to each recipient country in order to promote a healthier pattern of multilateral trade and avoid and consolidation of trading blocs?

February 14, 1963

**SUBJECT**

Policy Guidelines for A.I.D. Administration in Countries Receiving Communist Bloc Aid

**REFERENCE**

AIDTO CIRCULAR XA-17 (July 7, 1962)

This message transmits the policy guidelines adopted by the Acting Administrator of A.I.D. on January 11, 1963, which are to apply in

---

<sup>1</sup> "Policy Guidelines for AID Administration in Countries Receiving Communist Bloc Aid." Confidential. 6 pp. Department of State, Central Files, AID (US) 1.

situations in which U. S. and Communist Bloc assistance activities seem likely to become associated.

The following is the text of the guidelines, which is being issued by A.I.D. as a Policy Determination, as a Manual Order, and in such other documentary form as may prove appropriate:

*U. S. Assistance Policies and Procedures in Countries  
Receiving Communist Bloc Aid*

I. (a) *General.*

The foreign assistance programs of the United States must be conducted so as to avoid furthering Communist Bloc interests inimical to the U. S. The use of U. S. aid in conjunction with Bloc assistance may, under some circumstances, result in damage to U. S. interests. Under other circumstances it may yield a net advantage to the United States. This is likely to be a growing problem and must be examined on a case-by-case basis. The following procedures have been developed to assure that U.S. actions in such cases are carefully analyzed with respect to their implications for U.S. interests. Washington agencies and country teams are required to remain alert to developing situations, to assess them, and to take action in the manner prescribed below.

(b) *Definitions.*

(1) Project. The term "project" as used herein refers to specific, current undertakings of identifiable scope and duration, including ongoing assistance to a particular institution, plant or training program. The term does not normally apply to the product of completed project assistance unless it continues to be clearly identified with the aid donor. Nor does it apply to an entire economic sector or an entire governmental department or public body parts of which are receiving foreign assistance.

(2) Non-Project Aid. The term "non-project aid" refers to all forms of assistance, including PL 480 commodities, which are not attributed to specific projects.

(3) The Communist Bloc. The "Communist Bloc" for purposes of this paper includes: Albania, Bulgaria, mainland China, Czechoslovakia, East Germany, Estonia, Hungary, Latvia, Lithuania, North Korea, North Vietnam, Outer Mongolia, Poland, Rumania, Tibet, Cuba and the U.S.S.R.

(4) Bloc Project. A "Bloc Project" is a project sufficiently assisted by the Communist Bloc to be so identified. It is normally a project to which an official agency of a Communist Bloc government is a primary contributor. It does not include projects of the host country using purchased Bloc materials, nor projects assisted by technicians of Bloc countries serving the U.N. or other international agencies.

## II. *Project Aid.*

(a) The United States normally will not provide funds, commodities or personnel, nor agree to the release of counterpart funds or U.S.-owned or controlled local currency, to Bloc projects or to projects whose primary utility would be to support or facilitate Communist Bloc projects. The United States normally will not agree to the provision of such direct support from the Communist Bloc to projects identified with the United States. Exceptions to these policies will be made on the recommendation of the Ambassador and the senior representative of the Agency for International Development (A.I.D.) in the country concerned and on the approval of the Administrator of A.I.D. Considerations upon which exceptions will be based include opportunities for advancing the interests of the United States through exceptional action, the degree of Communist Bloc or United States identification with the project, likely consequences of enforcement and of waiver of this policy, political relations bearing upon the issue, and proposed means of assuring favorable consequences of a waiver, such as local publicity on the U.S. action.

(b) The United States, at its option, may withhold further funding from a project for which the cooperating country accepts Communist Bloc project assistance. With respect to grant projects, authority for this action is derived from the interrelationship of Standard Provisions C and P of Project Agreements. With respect to project loans, a provision such as that given below will henceforth be incorporated in loan agreements.<sup>2</sup> The applicability of these Provisions to the particular circumstances dealt with herein shall be explained as promptly as feasible following issuance of this directive to appropriate officials of countries where there are actual or prospective Bloc assistance programs. It shall be explained subsequently to host government officials of additional countries at such time as Bloc aid programs may be initiated or contemplated in those countries. A record of such explanation, including the date, form, to whom made, and host government response, shall be sent to AID/W. The exercise by the United States of this option shall

---

<sup>2</sup> *Other Contributions to the Project.* The Borrower and A.I.D. may obtain the assistance of any third party, public or private, in carrying out their respective obligations under this Agreement. However, except as financed under this Loan, the Borrower covenants that unless A.I.D. otherwise agrees in writing, it shall obtain the express consent of A.I.D. before any property, services, facilities or funds may be furnished, whether by loan, grant, sale or otherwise, by any third party, public or private, for use in connection with the Project or before any such third party may participate in carrying out activities related to the Project. (This provision is designed to accomplish purposes similar to those of Standard Provision C in Project Agreements.)

NOTE: It is intended that the foregoing clause be substituted for the current Standard Provision, if any, of project loan agreements governing "*The Source of Other Goods and Services Utilized on the Project*".

be determined by the considerations brought out in paragraph II(a) above. This provision does not preclude the use on a U.S. project of goods of Communist Bloc origin and available on the local market, except when such use is found by the Ambassador and the senior A.I.D. representative to be against the interests of the United States.

(c) Equipment and supplies provided by the United States for a project shall not be made available to, or used in support of, a Communist Bloc project without advance approval by the United States. This policy shall be implemented through timely explanation to the host government of the applicability to the situation of (1) the present Standard Provision H in project agreements and (2) the comparable language, if any,<sup>3</sup> in loan agreements, and through enforcement of said provisions. A record of such explanations, including the date, form and to whom made, shall be sent to AID/W.

(d) The United States normally will not undertake to train cooperating country technicians whose *known* future assignment is to be to Communist Bloc projects. Exceptions to this provision may be made in the field on a finding by the A.I.D. Mission Director or Representative that the placement of U.S.-trained technicians in Communist Bloc projects would be likely to serve U.S. interests. This provision does not preclude training of technicians for service in cooperating country institutions or facilities established by completed Communist Bloc aid or in cooperating country governmental agencies dealing with Communist Bloc aid.

### III. *Non-Project Aid.*

(a) The United States will not agree to the use of counterpart funds or other U.S.-owned or controlled local currency for purposes which are likely, in its judgment, to serve the interests of the Communist Bloc.

(b) The United States will not undertake to provide funds or commodities under non-project programs for the known purpose of facilitating a Communist Bloc project. This provision also applies to financing non-project imports for a State-owned enterprise which is publicly

---

<sup>3</sup> It appears that most loan agreements now in force do not contain a provision comparable to Standard Provision H in project agreements. Accordingly, all project loan agreements hereafter entered into shall contain a provision substantially similar to the following:

*"Utilization of Goods and Services.* The Borrower shall cause all goods and services financed by the Loan to be used exclusively for the Project described in Sec. \_\_\_\_; provided that in the case of any goods which are not fully expended through their use for such Project, the foregoing provision shall apply until completion of the Project or until such time as such goods can no longer be usefully employed for the Project and thereafter may be utilized for any purpose at the discretion of the Borrower subject, however, to such terms and conditions concerning utilization as A.I.D. may impose during the period of repayment; and provided further that no goods financed by the Loan shall be exported from (country) without the prior approval of A.I.D."

identified as a Communist Bloc “project”. In administering this provision, A.I.D. Missions and Representatives shall inform themselves, to the extent practicable, of the degree to which proposed U.S.-financed commodity imports would be likely to facilitate Communist Bloc projects. A.I.D. Missions and Representatives shall consult with appropriate country officials regarding the basis for estimates of commodity import requirements reflected in Procurement Authorization Applications, with the objective of avoiding U.S. aid-financing of the principal commodity import requirements of Communist Bloc projects. The United States will not, however, require guarantees by cooperating country governments that commodities imported through U.S. non-project programs for commercial sale will be withheld from Communist Bloc projects.

(c) The United States will require that, in applications for non-project assistance, cooperating countries guarantee that commodity imports financed by the United States under such aid programs and *retained* under the title of the government or of state-owned enterprises of the cooperating country will not be sold, transferred, or otherwise made available directly to Communist Bloc projects.

(d) The United States normally will not provide balance of payments assistance (i.e. cash transfers, local currency purchase or commercial commodity financing) at a time when the cooperating country is transferring significant amounts of its foreign exchange resources to the Communist Bloc in repayment of credits. Special circumstances which may seem to justify exceptions to this policy should be fully explained to AID/W.

(e) Exceptions to the foregoing provisions covering non-project aid shall be governed by the procedures and criteria, where applicable, set forth in paragraph II, above.

## March 1963

### 426. Memorandum from Forrestal to Bundy and Dungan, March 11<sup>1</sup>

March 11, 1963

#### SUBJECT

Clay Committee Report

I have glanced rather quickly at the draft report of the Clay Committee which Carl was kind enough to let me look at. It confirms my earlier suspicions about what a committee of this membership might come up with. It is basically nothing more than a re-hash of all the tired-out shibboleths in the business community about foreign aid. The tragedy is that more important parts of the business community have gone far beyond this kind of thinking to a more sensible, albeit still critical, view.

Nevertheless, having made our bed, we now have to lie in it, and I offer the following comments for what help they might be in the redrafting process.

At the outset I think we should be quite clear that to the outside world this is going to be a *Presidential* report and will be interpreted—unlike the Mansfield report—as a direct expression of this Administration's views. I don't see how we can escape this difficult fact. That is why it is essential that we take the time and effort to try to reconstruct something out of the mess which will not be positively harmful.

*Page 2:* I don't think a report of a Presidential commission should conclude that the American people are against foreign aid. Indeed, I believe there is a recent Gallup Poll indicating that the contrary is true.

*Page 3:* The gold flow problem must be kept separate from foreign aid. It is a phenomenon which is the result of the totality of our foreign transactions and other pieces of it are far more significant and susceptible of adjustment than the foreign aid program, i.e. military expenditures in Europe. It should be sufficient to point to the fact that we have reduced the Aid burden on the balance of payments by two-thirds in two years.

*Page 4:* Criticism of aid to "unaligned" countries must come out. We do not give aid in order to persuade countries to "abandon their

---

<sup>1</sup> Comments on the Clay Committee Report. Secret. 3 pp. Kennedy Library, National Security Files, Subjects Series, Foreign Aid, Clay Committee, 3/11/63-9/27/63, Box 297.

strongly held views” which may differ from ours. The purpose of our aid is to establish and preserve the independence of weak nations from permanent domination by Sino-Soviet Communism, not to export the philosophy of some members of the Committee.

*Page 5:* Are references to the Hickenlooper Amendment and the amendments prohibiting aid to Communist countries helpful, especially in view of our efforts to get the latter modified?

*Page 7:* Criticism of the Marshal Plan is hardly something which should appear in any Presidential committee report. This is the first time in recent years that I have heard such a thought expressed—even from Henry Alexander. The facts are that of the \$17 billion which were programmed under the Marshal Plan, only 12 were actually spent, and the whole operation was conducted in considerably less time than had been anticipated.

*Page 8:* Here again is the discredited argument that we should not help countries whose economic system is “inconsistent with our beliefs.”

*Page 11:* The implication here is that we should cut off military assistance to countries which are not aligned with us. This ignores our efforts in civic action, internal security, and training in countries like Cambodia and Indonesia.

*Page 15:* The above principle is applied to exclude all of Africa.

*Page 17 through 21:* The entire discussion of Latin America proceeds on the assumption that our problems in Latin America arise from the fact that those countries have not taken all the orthodox financial steps necessary to make themselves attractive to American investment. This would seem to miss the point completely. The report says on page 20 that Latin American countries “must begin to accumulate wealth before (they) can effectively redistribute it.” I know some people in Latin America who have accumulated a great deal of wealth. Part of the problem is to get *them* to redistribute it. The major part of the problem, however, is to get the governments of Latin American countries to make a serious start on social and economic reform.

*Page 29:* I do not understand what is meant by the statement that the United States should not provide MAP “where the principal protagonist (sic) of the recipient country is a non-Communist neighbor with which the U.S. also maintains friendly relations.” Does this mean no help to either Pakistan or India, or what?

*Page 29:* The remarks about the private sector are a distinct regression from the accomplishment of the last Administration, where a similar committee was at least able to distinguish between the impracticality of imposing U.S. conceptions of private versus public sectors on under developed countries and the real problem involved in so

administering the aid program as to encourage U.S. private investment in these countries.

It seems to me that the report as a whole fails to meet the President's request that it address itself to the problem of using economic assistance to promote the United States' interest in maintaining the strength of the free world. Instead of talking about foreign aid as a positive means of advancing U.S. interests, it addresses itself mainly to ways in which the U.S. can diminish its responsibilities by withdrawing from non-allied countries and from those countries which do not mirror the American pattern of private enterprise. Such countries, which comprise the bulk of the world's less developed resources and population, are presumably left for exploitation by the enemy. One might have thought we had progressed beyond this sort of approach.

Michael V. Forrestal

#### 427. Memorandum from Komer to Dungan, March 14<sup>1</sup>

March 14, 1963

The latest version of the Blank Report is a whale of an improvement, though still far less a cohesive rationale for US aid programs than a mishmash of *ex cathedra* pronouncements.

My only major concern is that it still comes out (especially Section IV) with a strong plug for reduction of aid. Isn't this precisely what will get picked up and add to the already shaky outlook on the Hill? How about one more effort to persuade the group that foreign aid must fluctuate with the exigencies of cold war policy, that some programs can be reduced but others may need to be strengthened, and that the Committee should hesitate to express a judgment about the overall level of foreign aid? Also note inconsistency between conclusions and new p. 8 which says "it is clear that reductions in foreign aid can only be accomplished by reducing the military strength of the Free World or by failing to meet specific commitments in other important areas."

I have one other major worry. The old wheeze on p. 9 that "US should not aid a foreign government in projects establishing government-owned enterprises which compete with existing private endeav-

---

<sup>1</sup> Comments on Blank Report on U.S. aid programs. Secret. 1 p. Kennedy Library, National Security Files, Kaysen Series, Foreign Aid, Clay Report.

ors” can come back to haunt us, especially in India. These countries simply lack a developed private economy which would make a restriction like that proposed viable. We’re asking for trouble if we leave this in.

**R.W. Komer**

---

**428. Memorandum from Forrestal to Kaysen, March 19<sup>1</sup>**

March 19, 1963

SUBJECT

Clay Report

Herewith the most recent draft of the Clay Report.

I refrain from commenting any further on the Report as a whole; but I do call your urgent attention to the sentence on page 37 which I have underlined. The first clause of this sentence is murderous. It is what a lawyer would call an admission against interest and in effect puts AID in the position of blessing not only the total conclusion of the Report that assistance could be reduced \$500 million, but also of endorsing the underlying calculations that go into this figure. I don’t see how the President can now go to Congress with a program that is one cent more than \$500 million less than last year’s. The effect of the sentence is to compel the President to argue only against the criteria of the Report and to preclude him from arguing against the process by which the \$500-million figure was deduced.

This is particularly disturbing, since it seemed to me to be the one statement in the entire report that Bell could control.

**Michael V. Forrestal**

# April 1963

## 429. Memorandum from Reuter to Freeman, April 2<sup>1</sup>

April 2, 1963

Sales of agricultural commodities under Public Law 480 have had a positive impact in helping to reduce our balance of payments deficit. Yet there is a tendency to ignore this resource when considering actions in the present drafts and even some call for restrictions on our Food For Peace efforts to avoid interference with dollar-earning agricultural exports. The 1960 Mason Report on U.S. local currency holdings suggested there exists wide-spread confusion and misunderstanding concerning both their use and value. This is still true.

We have been reviewing the use of P.L. 480 to improve our balance of payments position. Obviously this is not the major factor in the dollar problem. But a positive and imaginative use of P.L. 480 resources might provide up to the half billion dollars net additional balance of payments assistance in the fifteen months to the end of Fiscal Year 1964. Part of this will result from the very momentum of the present expanding program. Part will result from changing attitudes, allowing us to "sell" programs where we have significant local currency needs. Part will come from wider use of U.S. Treasury foreign currency holdings, presently standing at some \$2½ billion equivalent.

These major areas of earning and saving dollars (primarily Title IV dollar sale and barter) are covered in some detail in a separate Food For Peace staff report. The following five points covering local currency use are illustrative of the possible short-term dollar actions under Title I alone.

### 1. *Uses of unexpected holdings:*

During fiscal year 1962 the U.S. Treasury purchased \$642 million worth of local currencies in 32 countries in which we showed no unallocated currencies but actually were holding local currency balances of almost \$1½ billion equivalent (primarily in market development [5%] and contract adjustment [2%] funds and in unexpended but committed loan or grant money).<sup>2</sup> "Buying" these monies with our appropriated dollars or "borrowing" them could have saved us up to \$104 million

---

<sup>1</sup> Positive impact of agricultural commodity sales under PL-480 on balance of payments. No classification marking. 10 pp. Kennedy Library, National Security Files, Kaysen Series, Balance of Payments, Cabinet Committee, 3/63-7/63.

<sup>2</sup> List attached

last year—and at the same time provided safeguard against devaluation of balances so used. Under current G.A.O. ruling this may take either Congressional action or clear indication of intent. Bureau of the Budget is studying both this possibility and action required.

2. *Increased Title I U.S. use:*

In food-deficit areas, Title I sales of agricultural commodities can generate local currencies for U.S. use. In fiscal 1962, we paid \$271 million worth of bills in local currency. This can be increased by raising the U.S.-use percentage in contracts and by deliberately developing programs under Title I where local currency is needed. Our needs are the key—for we can't "save" more than we use. Including the above transfer of dollars under Point I the U.S. Treasury last year purchased a total of \$1½ billion worth of local currencies for U.S. use overseas.<sup>3</sup> Economic and political factors prevent the use of food to generate the local currency in probably 85% of these cases. However, the balance of almost \$200 million would have been subject to Title I currency action. With our expanding U.S. expenses for embassies and missions in newly-free countries, and with Peace Corps local currency needs of about \$15 million a new factor this year, these U.S.-use local currency needs in applicable countries will rise above the \$200 million 1962 balance not met. However, in the 15-month period \$200 million might be a *maximum* reasonable volume rate. The \$104 million saved under the above provision would leave us a net dollar saving addition on last year's figures of \$96 million. The balances generated could replace the funded monies borrowed under the *Use of Unexpended Holdings* if this use of frozen balances were utilized to gain an immediate advantage.

3. *Sale of Currencies to Tourists:*

We have for years sold U.S.-held foreign currencies for dollars to U.S. personnel overseas. Recently in Egypt we made our first sale to a tourist. At least limited sale of local currency to tourists is now allowed under 13 Title I sales agreements. Extension of this plan, particularly in excess currency countries, should be encouraged and special arrangements made with major travel agencies and issuers of travelers' checks. Even in the present 13 countries the U.S. holds over \$365 million equivalent of local currencies. The value of this for the United States will depend on our ability to develop tourist exchange in the large excess currency countries.

---

<sup>3</sup> List attached.

#### 4. *Sales of Currencies to Contract and Registered Groups:*

Voluntary agencies registered with the Advisory Committee on Voluntary Foreign Aid transferred overseas in the six months from January through June 1962 a reported \$22.8 million. Of this amount \$9.7 million was in excess currency countries and \$5.1 million in other Title I countries. Assuming this rate is maintained, we have at least \$30 million a year subject to U.S. purchase for foreign currency holdings.

A.I.D. contracts with colleges, business groups and other organizations have long contained clauses covering use of local currencies by such contractors. However, the expansion of Title I to provide currencies where not now available and the use of allocated but unexpended balances should develop further dollar savings. The possibility also exists for small quantities of local currencies, particularly in excess currency countries, being sold to business firms, foundations, missionary groups and others not directly financed by U.S. agencies.

A final area of consideration here might be the payment of certain veterans' retirement and disability benefits to foreign residents in U.S. foreign currency holdings.

The proposals under this section may require a legislative amendment to P.L. 480 similar to the provision authorizing tourist sale. A significant dollar drain might be plugged by such action without limiting the activities of such groups.

#### 5. *Third Country Use:*

Consideration should be given to possible third country use of local currencies. For example, East African pounds and the French trading community francs might be generated in one country and used in others within the bloc. We should investigate the use of Egyptian pounds in other Arab countries; and perhaps even dinars and zlotys for certain U.S. uses in Communist-bloc countries.

We presently are paying \$4.1 million of U.N.R.W.A. costs with Egyptian pounds and \$2.7 million with Syrian currency in addition to \$6.7 million equivalent through direct food shipments. This is more than half of our U.N.R.W.A. support. During 1963 Fiscal Year we have budgeted \$239 million for support of the United Nations and other international organizations and special programs. "Third country use" such as the payment of Indian rupees as part of our Congo peace-keeping support might be possible and to the degree that excess currency country funds were used the United States would have savings in both dollar outflow and cash budget spending.

To accomplish this important effect on our balance of payments position would indicate more careful management of current holdings of currencies, some increase in the U.S.-use portion of contracts, and

the more deliberate use of Title I where we need local currencies. It may well mean an increased rate of Title I sales during 1964 Fiscal Year. This will require a change in Agriculture Department priority from Title IV to Title I in currency deficit countries.

Greatest obstacle to this increase will be considerations of normal marketings. The past approach to this has tended to be conservative. If balance of payments is given a priority consideration we may find greater objections from other food exporting countries. Department of State concurrence in this expanded Title I use would be required. It should also be emphasized that the cutting off of dollars supplied by normal U.S. expenses could work a hardship in some countries and presumably increase A.I.D. expenses. (Korea is a good example.)

However, we have adequate foodstocks and adequate Congressional authority for their use. In general the “demand” is present. A country-by-country review, using the broadest possible “shopping list”, should provide direction for a Title I “sales campaign” to reach our goal. Careful relationship of this projection to A.I.D. country goals would be essential to effective program development.

Title I step-up offers us our greatest potential for quick additional dollar impact and should provide more than half of our additional dollar savings. However, the expanded use of barter under the new regulations should allow Defense and A.I.D. offshore procurement of materials and services and some additional stockpile requirements through the use of food in place of dollars. The present artificially low barter rate of \$80 million per year presumably will be greatly increased, although we do not yet have an experience on the acceptability of this for current-use procurement. The eventual impact will probably be determined by the aggressiveness of A.I.D. and Defense in utilizing barter and the willingness of State to approve such expanded use.

One final proposal might be considered. Title IV sales legislation provides a moratorium of *up to* two years following last shipment in any year. More rigorous restriction of this provision and shorter term contracts with higher interest rates might allow for earlier and larger dollar earnings under Title IV contracts. This would make Title IV more nearly the transition step to full normal commercial transactions.

In summary then, we contend that for many purposes food and dollars are synonymous. When we spend local currency for U.S. uses, we are spending food and the dollars remain in this country. When we lend the local currencies back to the receiving country what we are really doing is lending food to help develop that economy.

It is this “food-for-dollar attitude” which has frequently been lacking in overall foreign programming and in previous recommendations on this subject. Our ability to grow food can be important to us here—

and at the same time contribute to the world struggle for freedom from hunger.

**Richard W. Reuter**

*Special Assistant to the President*

*Director, Food For Peace*

**430. Memorandum for Interdepartmental Committee of  
Undersecretaries on Foreign Economic Policy, April 3<sup>1</sup>**

April 3, 1963

The meeting of the Undersecretaries Economic Policy group on April 11 will take up some of the problems in administering foreign assistance programs that are of interest to several of the Departments. Background material for this discussion is provided in the preliminary version of the *Proposed Mutual Defense and Assistance Programs for FY 1964* (attached). The basic framework for aid administration is outlined

---

<sup>1</sup> Background material for April meeting. No classification marking. 4 pp. Department of State, E Files: Lot 64 D 452, ICFEP, 1963.

in the introductory section. The Clay Committee report is also attached for reference.

Some possible specific topics for discussion are summarized in the attached memorandum.

### **Attachment**

#### Some Elements of A.I.D. Programs of Particular Relevance to the Interdepartmental Committee of Undersecretaries on Foreign Economic Policy

##### *1. More effective promotion of U.S. private investment in the less developed countries*

There is general agreement that for many specific purposes private U.S. investment is the most effective form of assistance, carrying with it not only capital contributions but also technical assistance of a highly relevant sort. The importance of foreign investment has been re-emphasized by the recent Clay Committee report.

The main question has always been one of how to stimulate private foreign investment more effectively; private investment by its nature cannot be "programmed." The A.I.D. investment guarantee program is making a major contribution. Congress is being requested to enlarge this program by almost doubling the dollar amount of guarantees that can be outstanding at one time. In addition, it is being proposed that the Internal Revenue Code be amended to provide tax incentives for further investment in less developed countries. Are there further efforts that could be made by other Departments of the U.S. Government to contribute to stimulating U.S. private investment in less developed countries? Other private investment in these countries?

##### *2. More effective utilization of all available resources in supplying technical assistance personnel*

Here again the Clay Committee report has highlighted a continuing problem. The importance of technical assistance is well understood and generally accepted. The most critical limitation to its effective use is the availability of highly qualified personnel. A number of further approaches recently have been and now are being explored.

The Association of State Universities and Land Grant Colleges established in November, 1962 an Executive Secretariat and a supporting committee to work with A.I.D. and the Assistant Secretary of Agriculture for International Affairs to channel more qualified agricultural specialists into technical assistance.

Among the sources of personnel utilized in A.I.D. missions during the past year were the Department of Agriculture, the Bureau of Public

Roads, the Department of the Interior, the Bureau of the Census, the Public Health Service and the Housing and Home Finance Agency. Under the Humphrey Amendment to the Foreign Assistance Act, A.I.D. in 1962 signed interagency agreements with the Housing and Home Finance Agency and the Department of Labor under which experts from these agencies might be loaned to A.I.D. on a reimbursable basis, without break in the expert's career record with his agency. An interagency agreement with the Federal Home Loan Bank Board is expected to be signed early in 1963 and several other agreements are in preparation.

A.I.D. is presently undertaking a review of its implementation procedures and, as part of this process, we are examining present methods for drawing upon outside communities for the skilled people needed for effective foreign assistance. Increased attention will be given in the development of our new procedures to facilitating the use of outside resources. In addition to increased efforts on the part of A.I.D. this will require efforts by the communities to organize themselves so that skilled members of their staffs can be released for foreign assignment on a regular basis without loss of rights or status. Training programs and staffing patterns will need to be designed so that people who have a basic understanding of the relationship of their own profession or discipline to the development process can become increasingly familiar with and available for assignments in underdeveloped countries.

### *3. A.I.D. and Commodity Trade*

A.I.D. relies on PL 480, usually Title I foreign currency sales, to provide all grain, cotton and edible oil imports needed by recipients of non-project assistance which can be supplied by the U.S. This is particularly important in Korea, Taiwan, Vietnam, India, Pakistan, Egypt, Israel, Turkey, Greece, Tunisia, and Brazil. Diminution of availability of surplus commodities in these instances would increase A.I.D. requirements.

A.I.D. will in the future generally finance petroleum fuel and crude oil, rubber, wool, sugar, tin and other U.S. net imports only on a basis of release from the stockpile or barter for surplus agricultural commodities under usual USDA procedures. In this way the burden of the larger remaining part of A.I.D. offshore procurement on the balance of payments will be relieved.

A.I.D. encouragement of other exports from less developed countries through continued procurement on a basis competitive with the U.S., but not with the 19 industrial countries, will continue. Close consultation on this with State/E and other interested agencies is desirable. We feel it would be very shortsighted to debar industrializing

countries from competing for A.I.D. orders at the same time that we are focussing on increasing their export potential as a key element in the transition to self-sustaining growth.

4. *How much further concentration on the best developmental prospects should be introduced into the foreign assistance program by reductions of present limited programs?*

The foreign assistance program is already a highly concentrated one. The two largest elements are development lending, including Alliance for Progress loans, and military assistance. Of development loans, nearly two-thirds in FY 1964 is expected to go to six countries that are showing favorable development efforts and prospects. The increases in the total program proposed for FY 1964 are almost entirely in these same programs. (In military assistance, about two-thirds is planned for the eight major programs to countries on the periphery of the Communist bloc.)

Further concentration along these lines would be largely at the expense of the programs designed particularly to achieve short-term political purposes such as a U.S. presence or some sort of holding action. Some further concentration is in order, but this is a matter of degree. This kind of question cannot appropriately be answered with finality other than on a case-by-case basis. But the general views of other interested departments on the desirability of a rapid reduction of assistance programs largely related to short-run political objectives would be of interest.

5. *Should an increasing portion of the foreign assistance program be through multi-lateral institutions?*

Substantial shifts in this direction were proposed in the Clay Committee report. Advantages of having some portion of the assistance program on a multi-lateral basis are clear. On the other hand, there is a real question of the degree to which specifically U.S. objectives could be equally well achieved if a larger portion of assistance were channeled through such institutions as IDA. Another aspect of the same question is the degree to which the Congress would believe that larger appropriations for international institutions were in the U.S. interest.

6. *Other donor countries—the DAC forum*

Economic assistance from other developed countries is of large and growing importance. One issue of major importance is that of improved terms of aid from the DAC members. A DAC meeting on this subject is taking place in Paris at the present time (April 3) the results of which, if significant, will be discussed with the ICFEP.

**431. Circular Airgram CA-11942 from Rusk to Certain Diplomatic Missions, April 24<sup>1</sup>**

April 24, 1963

Personal for Chief of Mission from Secretary. I have delegated to David Bell my responsibilities under section 622(c) of the Foreign Assistance Act for the continuous supervision and general direction of the economic and military programs authorized by it, to the end that such programs are effectively integrated both at home and abroad and the foreign policy of the United States is best served thereby.

The following message from him, with which the Department of Defense concurs, has my full endorsement and support and I request you to give it your most earnest personal attention:

PREPARATION AND JUSTIFICATION OF MILITARY  
AND ECONOMIC FOREIGN ASSISTANCE PROGRAMS

The purpose of this message is twofold. First, to improve the understanding between our Missions abroad and the responsible agencies in Washington on the reasoning upon which requirements in the U.S. national interest for Foreign Assistance Programs, both military and economic, are based. Second, to insure that the foreign assistance resources of the United States are being applied, as between countries and as between military and economic programs, so as to best serve the United States national interest.

You will have received instructions on the preparation of the 1964 and 1965 AID programs in accordance with the AID Program Guidance Manual and with the approved statement of country assistance strategy. The MAAG Chief will also have received military assistance guidance documents from the Unified Commander. These documents constitute guidance for the development of programs beginning in FY 1965 and the refinement of FY 1964 programs.

While the Secretary of Defense has primary responsibility for the determination of military end-item requirements and other aspects of the MAP program, and the Administrator of A.I.D. is responsible for the economic aid programs, these two programs must be mutually complementary parts designed to support the efforts of friendly nations to attain growth in freedom and to foster constructive economic and social change and development while forestalling the opportunities of Communism to exploit the situation.

---

<sup>1</sup> Bell's responsibilities under Section 622(c) of Foreign Assistance Act. Confidential. 3 pp. Department of State, Central Files, AID (US) 1.

The closest coordination between State, including A.I.D., and Defense is, therefore, essential at all stages of the development, review, and implementation of both economic and military assistance programs in Washington and in the field. Interagency program review in Washington is established on a continuing basis. In order that this review proceed from a sound basis, we look to you, as Chief of Mission and head of the Country Team, for personal leadership in making program preparation a truly joint effort in the field, and for personal review of the composition, content, and justification of recommended programs to insure that they constitute the best balance of U.S. action necessary to attain U.S. objectives.

You are uniquely situated to view the complex of U.S. programs in the country as an integrated whole and to judge in detail the adequacy of their scope, articulation and balance. I need your personal judgment and advice on this, taking into account and expressly recognizing the differing points of view that may exist within the Country Team.

The programming process of foreign assistance is a continuing one. However, at least once a year we try to get a fresh, broad look at the scope and direction of our programs, the basic strategy and approach. This year that basic review is requested in the spring for both economic and military assistance, giving us more time for thought and a better chance to ensure adequate integration. Pertinent approved plans will be given due consideration, such as Internal Defense Plans for those countries where these have been approved and, in Latin American countries, plans approved by the Latin American Policy Committee.

You are requested to send to the Department at the time the respective programs are forwarded your detailed views and comments. I can assure you that your thoughts will be given the most thorough attention and will be a most important element in the interagency reviews of military and economic assistance programs in Washington.

Messages giving the timing and content of program submissions will follow shortly.

## August 1963

### 432. Memorandum from Bell to Wolf, August 22<sup>1</sup>

August 22, 1963

In view of its lateness, I have signed the report to the Special Group on A.I.D. Counter-Insurgency Activities. It does not, however, seem to me to be as informative a report as we should submit. It seems to me to present mainly a series of interesting facts, without putting them into any kind of framework. How are our overall counter-insurgency efforts going? (Indeed, what do we consider our overall counter-insurgency efforts to be?) Are we doing more or less, better or worse? What main problems have we encountered and how many have we solved? And what do we expect by way of major changes and/or achievements in the future? These are among the kinds of questions I don't find answered in this report.

I would appreciate a chance to see the next one in draft.

**David E. Bell**

---

**433. Memorandum from Bell to Executive Secretary, Special Group (CI), August 22<sup>1</sup>**

August 22, 1963

## SUBJECT

A.I.D. Progress Report on Counter-Insurgency Activities (January 1–August 1, 1963)

*Civic Action and Other Counter-Insurgency Programs*

Civic action constitutes a major counter-insurgency effort in Latin America with the level of funding for civic action projects increasing considerably in the last seven months. Important new projects funded include: assistance to Chilean National Police to expand a program furnishing medical assistance to remote areas, assistance to the Colombian Army in constructing a highway to open up a priority violence area, and assistance to the Brazilian Army Engineers to construct an important road link in the Northeast.

All A.I.D. projects identified in the Thai Internal Security Plan are proceeding on or close to schedule. To concentrate and accelerate rural programs in security threatened areas, the A.I.D. Mission in Thailand has organized all rural programs under a new Office of Rural Affairs. This coordination of program will allow for more effective coordination of the Thai-initiated Mobile Development Unit operations (military civic action) with other important A.I.D. rural development programs. A.I.D. is funding the installation of a radio transmitter to be installed in northeast Thailand and funded a civic action project carried out by U.S. forces during the recent SEATO exercises. [text not declassified] The program of aid to the tribal montagnards in Vietnam is being broadened to include schooling and vocational training to promote permanent ties with the government. Commodity support for the Vietnamese Army's medical civic action programs is continuing.

In the Korean civic action program \$1.7 million has been provided for road and bridge projects and support continues for the Brumece Army's resettlement project at Namsang, a civic action program designed to resettle loyal veterans in an insecure area. A.I.D. has continued large shipments of refugee supplies to the [illegible in the original] and to other non-Communist groups in Laos and, in April, funds were provided to purchase rice and other subsistence items for Laos armed

---

<sup>1</sup> "AID Progress Report on Counter-Insurgency Activities, January 1–August 1, 1963." Secret. 2 pp. Washington National Records Center, RG 286, AID Administrator Files: FRC 67 A 1530, Special Group (CI).

forces and the Neutralist forces. The Indonesian Army civic action program received \$670,000 in equipment during the reporting period, and plans were developed to provide American university training for senior military officers now in key government jobs. A new project in the field of civic action in Iran was initiated in June 1963 with a \$45 thousand procurement of medical supplies to support a gendarmerie program of medical aid for villagers. Also in June, an agreement with Algeria was signed providing for a major work relief program utilizing PL 480 foodstuffs as partial payment for some 60,000 otherwise unemployed on public works projects in four sections of the country and for U.S. technical assistance to support implementation of the various projects. A.I.D. has agreed to furnish materiel to the Central African and Malagasy republics to support development projects by civilian youth organizations in those countries.

#### *Public Safety Activities*

There are now programs in 31 countries, of which four are new and four expanded, and there are limited activities in 9 other countries. The substantially increased funds made available in FY 63 have proven adequate and funds requested for FY 64 would be sufficient to maintain current or expanded emphasis. A.I.D. has 247 personnel in the public safety program as compared with 189 on December 1, 1962. Assistance in filling vacancies has been provided by several agencies including the Department of Defense which, at A.I.D. request, is providing 20 qualified military officers, 9 of whom are on duty, for two-year tours of duty with A.I.D.

The Agency's capability to respond to emergency requests for police assistance in Latin America has increased significantly with establishment by DOD of a stockpile of standard riot control equipment for A.I.D. in the Canal Zone. Complementing this forward deployment of police equipment are newly instituted administrative procedures designed to greatly reduce request-to-delivery times for procurement of public safety commodities. Since January 1963, emergency airlift delivery of riot control equipment was made to Pakistan, Peru, Bolivia and Ecuador. The student capacity of the Inter-American Police Academy has been nearly doubled and plans for the December 1963 opening of the International Police Academy in Washington, D.C. are on schedule.

#### *Training*

Fifty-two A.I.D. officers attended the Interdepartmental Seminar during this reporting period and two participated in counter-insurgency programs [text not declassified]. Production began in June on a

joint A.I.D./DOD training film, *First Line of Defense*, stressing the complementary roles of civil police and military forces in counter-insurgency.

August 26<sup>1</sup>**

August 26, 1963

SUBJECT

Military Sales Policy

Joint State/AID/Defense message. According to the wishes of the President, addressee posts are advised of the importance of prosecuting a program of selling U.S. military equipment to allies as an essential element of tying military aid to foreign policy and of decreasing the net outflow of gold from this country.

Posts should remain alert to opportunities for military sales and, in advising Washington as to these possibilities, making recommendations thereon, and prosecuting such sales, posts should be aware that, in keeping with the President's expressed desire, military sales programs are to be supported which are consistent with other foreign policy considerations. Questions such as the degree to which military sales could divert resources from higher priority economic development objectives, particularly where we are extending economic aid, should be brought to bear. The degree to which the arms which a country proposes to purchase are compatible with the objective of focusing military resources on internal defense as opposed to "arming against neighbors" is also a factor for careful analysis. All sales, whether government-to-government under the Foreign Assistance Act or direct commercial, are to be encouraged within the context of overall foreign policy considerations and should be fully coordinated within the Country Team. In Washington, the concerned Departments will take account of potential competition between military sales and grant military assistance for funds to finance either the sales or the grant assistance.

# Trade and Commercial Policy

February 1961

## 435. Memorandum from Martin to Jones, February 2<sup>1</sup>

February 2, 1961

### SUBJECT

Export Promotion

I understand you have been informed of the attitude of Senator Magnuson and some of his colleagues on the Senate Interstate and Foreign Commerce Committee in respect of reinstituting a separate Department of Commerce Foreign Service. Such a separate foreign service was included among the recommendations of a recent summary of the Committee's forthcoming report on trade. This followed a staff report of last April which took a strong position on this point. It is apparent that several of the Committee members strongly favor such a development and are supported by some elements in the business community which feel, probably with some reason, that our commercial facilities abroad in recent years have been inadequate.

This situation was brought to sharp focus in a meeting in Secretary of Commerce Hodges' office January 30, which Mr. Ball attended. Its purpose was to allow a group of businessmen representing some of the largest firms interested in foreign trade and investment abroad to present their views on what the United States Government should do to correct our balance-of-payments situation. Besides some ten or more businessmen, representatives of the President's Council of Economic Advisers, Treasury, the Department of Labor, and the Export-Import Bank were present. The presentation by these businessmen elaborated on various sections of a report prepared by a committee of 14. It is of significance that the new Assistant Secretary of Commerce for Interna-

---

<sup>1</sup> Export promotion: Congressional interest in a stronger Department of Commerce role. No classification marking. 3 pp. Department of State, Central Files, 102.7/2-261.

tional Affairs, Mr. Rowland Burnstan, was a member of this group. The pertinent section of their report follows:

*"Foreign Service for Export"*

Export promotion could be drastically improved by greater US Government initiative. Our government representatives stationed abroad today are not adequately trained in commercial reporting or representation. Further, they are more concerned with diplomatic niceties than in promotion of US commercial interests. Capable men should be recruited from the business community itself, by and under the charge of the Commerce Department. More funds and facilities should be put at their disposal, and they must be instructed to be active promoters of US exports. The fact that these men would, of course, continue to report to the Ambassador would advance the knowledge and sophistication of foreign service personnel from the top down in commercial matters."

This comment follows the line also taken by the staff of the Magnusson Committee that export promotion requires the services of businessmen experienced in foreign trade under our Ambassadors, but reporting directly to the Department of Commerce. Mr. Elliott Haynes, editor of *Business International* and member of the group, said that they expected much more support by our embassies to promote American commercial interests than heretofore and that perhaps some 50 large U.S. corporations doing business abroad would make available one or two of their executives on a loan basis for an export drive under the Department of Commerce.

Those of us in the Department who have studied this problem believe that the present unified service is the most satisfactory means for sustained support of American business and that the present Foreign Service Act is sufficiently flexible to accommodate stepped-up personnel and activities if resources are made available. There is no question that we need to improve the commercial services offered by our embassies, for which reasonable amounts of financial support have been requested in the FY 1962 budget. The situation we face, however, is one which might result in unsatisfactory legislation from the standpoint of this Department and over-all U.S. interests.

I believe it would seriously impede our export efforts if we were now to dismantle the present commercial service and to establish it in another agency with all the problems of recruitment and organization, wholly apart from the fact that it would be expensive and wasteful. In this respect, I believe the Department's position is fully defensible.

In regard to the employment of businessmen, however, there is some question as to the availability of the right type of people, at least in any number. Moreover, there is always the difficulty of such people

adapting themselves readily to government organization. For general staffing in the middle grades, it is most difficult to attract competent business people at government salary levels without permanent status. Some top business executives experienced in foreign operations could undoubtedly contribute considerable spark and drive to the present export program if they could be fitted into our foreign service establishments.

I believe the Department should take the initiative in meeting this situation and propose as a suggestion the employment of 10 FSR-1's from the business community to act as regional export promotion advisers to our various Ambassadors. I am informed that this can be done within our present personnel system. These advisers would be posted at London, Paris, Bonn, Tokyo, Bangkok, New Delhi, Buenos Aires, Beirut, Salisbury, and Mexico City, or such alternative posts as might be determined. These officers would require adequate travel and representation funds. As I envisage it, they would not be responsible for the day-to-day commercial reporting and activities but would be given special assignments on the export promotion aspects of commercial activities. They would be expected to travel extensively, make speeches, and establish highest level contacts in the business community. In some areas they would be accredited to several governments and operate on a regional basis. They would help and supplement the work of our regular commercial attaches and their staffs.

The highest rank for commercial attaches is currently FSO-2, with 8 officers serving in these posts, of which 6 are Department of Commerce employees. It would not be anticipated that the new higher adviser positions would be considered permanent or would be filled from the Foreign Service or from regular Department of Commerce employees, but only from the business world. These advisers would be nominated by Commerce, with the Department having the right to accept or reject such nominees.

This proposal is designed to test out the thesis that highly competent business people are available and could give real impetus to our export efforts. It would avoid the risks of drastic change at a time when our present export expansion program is just getting under way. Moreover, I believe such a proposal might satisfy the Magnuson Committee and obviate legislation unsatisfactory to the Department. If you concur, Mr. Ball may wish to sound out Secretary Hodges on the subject.

This proposal has been discussed with Mr. Herman Pollack and Mr. William Crockett.

**436. Memorandum from Martin to Ball, February 10<sup>1</sup>**

February 10, 1961

## SUBJECT

Export Promotion

Mr. Jones has now approved my memorandum (Tab A) recommending the employment of ten top-flight businessmen as regional export promotion advisers at the FSR-1 grade, with the understanding that the cost would be financed in the FY 1962 budget. You will recall that this memorandum suggested that you would sound out Secretary Hodges on this subject. I now recommend that you do so at the earliest opportunity, recognizing that this proposal may open up the whole subject of a separate commercial foreign service under direction of the Department of Commerce as recently recommended in a release of the Interstate and Foreign Commerce Committee which Senator Magnuson authorized. A statement on this subject is attached (Tab B).

The proposal for businessmen to serve as export promotion advisers is a natural follow-up to the President's message to Congress on Balance of Payment and Gold. Since it requires reopening the FY 1962 budget for funding, I recommend that we include also a request for funds to purchase market surveys in foreign countries for American products. This activity is not now provided for but should prove most useful to supplement the work of our commercial staffs abroad. According to several despatches from the field, such surveys are readily obtainable in some countries at a cost considerably less than staffing our foreign service establishments for increased activity in this field. The nature of these surveys would be worked out by the Department of Commerce in consultation with various industries or trade associations. This too is a logical follow-up to the President's request for vigorous action in the export promotion field. I suggest you also make this proposal in your talk with Secretary Hodges.

Recommendation: That you discuss the above two points with Secretary Hodges.

**Tab A**

## SUBJECT

## Export Promotion

Mr. Martin's memorandum of February 2, 1961 proposes the assignment of 10 FSR-1's from the business community to act as regional export promotion advisers to our various Ambassadors.

I agree with the proposal in principle. However, it should be clearly understood that there are no funds in sight at the present time to proceed with such appointments. It may be that prospective appointees would not be recruited, cleared and ready for entrance on duty until near the end of the current fiscal year.

In this event, we would have to seek an increase in the 1962 ceiling to fund them or provide for them within whatever funds are finally appropriated.

In view of the President's remarks on export promotion in his recent Message to the Congress, I plan to seek an increase in the budget ceiling.

**Tab B**STATEMENT ON INTEGRATED COMMERCIAL ACTIVITIES  
IN THE FOREIGN SERVICE

1. In the conduct of foreign affairs, a high percentage of the problems are economic in nature and require staffing of our missions abroad with officers competent in this field. The work done by these officers is of direct concern and interest to American business. Commercial work is now an integral part of economic and other mission activities. Our Ambassadors must continue to direct the economic work of our missions, including all but the most routine commercial tasks.

2. Our improved trade position today is attributed in large part to successful negotiating efforts by our missions to achieve relaxation of foreign trade and exchange controls. A unified service facilitates such team operations which require the participation of diplomatic, economic and commercial officers. Thus, a unified service, including commercial officers, is stronger than an independent commercial service, since the Chief of Mission and key officers are more fully informed at all times and better able to place the full weight of the United States Diplomatic Mission behind our commercial activities.

3. Commercial work is thus handled as a function of our missions with different officers contributing to it. Designated commercial officers by arbitrary definition are those who devote over one-half of their time

to this work. Virtually all economic officers and many consular officers spend part of their time on commercial matters. Moreover, commercial work is further supported by permanent staffs of competent commercial specialists native to the area. Only by these means is a truly worldwide commercial service possible without great waste and expense.

4. As presently administered, the Departments of State and Commerce work jointly in the recruitment, selection and placement of commercial officers. The two Departments collaborate in planning and instructing our missions on commercial and many general trade matters. The present system avoids duplication of administrative costs, representation, and reporting, which otherwise would obtain, and provides clear lines of responsibility and authority in the field.

5. Any shift of commercial work to another service would perforce mean the loss of expertise built into the career foreign service over the last twenty years. There are presently some three hundred officers with identified skills in commercial work, and some three hundred others who have backgrounds identified as desirable for commercial specialization. A new commercial foreign service would not be expected to attract more than a few volunteers from this group. In any circumstance, the problem of recruiting competent personnel for a new service would be formidable.

6. Functionally, a separate commercial service would mean either the loss of economic and consular officers' services or would require continued dependence upon the Foreign Service for a large part of the needs of the Department of Commerce and the American business community. The alternative would be costly duplication of Embassy economic staffs.

7. The urgent need to maintain a favorable trade balance dictates that commercial work be strengthened by the most expeditious means within the present organizational framework, rather than risk the confusion and problems obviously inherent in setting up a new service.

8. The Foreign Service is sufficiently flexible to accomplish all that a separate commercial service could do, providing budgetary resources are made available and reasonable priority is accorded the commercial function. In addition to the present complement of officers experienced in commercial work, new officers have been and can be recruited from business, or from Department of Commerce personnel, and trained for foreign assignment. Moreover, joint operations in the commercial work by the Departments of State and Commerce, and direct administration in the field by our Chiefs of Mission, reflect with reasonable accuracy the respective responsibilities of the two Departments in the foreign and domestic fields.

April 1961

437. Ecbus 416 from Brussels, April 15<sup>1</sup>

Brussels, April 15, 1961

Washington pass Schaetzel. Commissioner Rey and Mansholt invited me yesterday to call at Commission this afternoon. Inasmuch as the subject of the conversation was to be the present impasse in US-EEC Article XXIV: 6 negotiations, Corse, on my invitation, came and accompanied me. Commissioner Rey presented me with two aide-mémoires. One dealt exclusively with the question of wheat, which was handed we understand, in identical version, to the Canadians today and will be subject of separate telegram. The other and more important dealt with the Commission's deep anxiety over what they now consider to be a hopeless opposition of views and expectations between the two delegations in Geneva. Rey stated categorically that community had exhausted agricultural and industrial concessions that it could consider offering to the US during the Article XXIV: 6 phase. He spoke of the astonishing paradox that outstanding difficulties with the UK had been resolved satisfactorily whereas difficulties with the US, the trusted friend of the European Community, continued to place us far apart. He stressed the vital importance of the establishment of a common agricultural policy without which a United Europe of the Six could not be achieved. He dwelt therefore upon the agricultural aspect of the Geneva negotiation expressing conviction that EEC offers met XXIV: 6 obligations not only for CXT as whole but also specifically for agricultural sector. Mansholt agreed with Rey and stressed willingness community to negotiate maximum levies on wheat. Mansholt warned that under the status quo there was a danger that export opportunities, for reasons unrelated to tariffs, were more likely to decline than if the Commission is permitted to move ahead with the common agricultural policy.

I responded that Washington understood the vital importance of a common agricultural policy as essential in development of Common Market. However I stated that the Commission's offers in the agricultural field were "entirely inadequate" and that serious effort should be made to meet Washington's formulation of minimum requirements. Corse dealt illustratively with a number of commodities upon which

---

<sup>1</sup> US-EEC Article XXIV:6 negotiations; impasse continues. Official Use Only. 3 pp. Department of State, Central Files, 394.41/4-1461.

he had tried without success to obtain concession from Donne, the Commission's chief negotiator in Geneva.

Our meeting adjourned with no narrowing whatever of the gap which divides us and Six. On basis this session and my frequent previous conversations with Commissioners, I am firmly convinced that this deplorable state of affairs attributable, to a considerable extent, to Washington's prolonged and continuing delays in coming up with a minimum package of demand to which it would be reasonable to expect the community to attempt to achieve settlement. The longer we stand upon our previously defined "minimum package" the less likely it is that the Commission will be willing and able to obtain from the Council of Ministers authority to make further compromises. As the community settles its problems with other negotiating partners there will of course be less and less premium for them to settle with US.

I am not hopeful that the present gap in EEC-US thinking can be easily closed. I am sure however that it is imperative that, as contribution to maximum overall result from "Dillon phase", and in consistent fulfillment of our overall political objectives, a realistic minimum package must be provided Corse at the earliest possible date in hope that this difference between US and EEC be resolved.

**Butterworth**

---

**438. Aide-Mémoire, April 29<sup>1</sup>**

April 29, 1961

The Department has been informed by its Delegation to the tariff conference in Geneva that the EEC has completely rejected the proposals made by the United States Delegation on April 22 for settlement of outstanding issues with respect to certain agricultural commodities in the current negotiations under Article XXIV:6 of the General Agreement on Tariffs and Trade. The Belgian Ambassador is requested to convey the following views urgently through his Government to the Chairman of the Council of the European Economic Community, in

---

<sup>1</sup> Demarche to EEC on rejection of U.S. agricultural package. No classification marking. Attached memo from Martin to Ball provides background information for Ball's meeting with Belgian Ambassador. Official Use Only. 5 pp. Department of State, Central Files, 394.41/4-2961.

order that they may be considered by the EEC Council at its meetings scheduled for May 2 and 3.

1. The United States Government is seriously disturbed to learn that the EEC has summarily rejected the proposals of the United States Government for a settlement on the agricultural aspects of the Article XXIV:6 negotiations which the United States Delegation put forward in Geneva on April 22. In informing the United States Delegation of the rejection, the EEC spokesman indicated that his instructions precluded further negotiation and that the Community was unwilling to work toward mutually acceptable solutions through further discussion and negotiation. The United States agricultural proposals were developed with great care within the United States Government, and were reviewed at the highest levels in the appropriate Departments of the United States Government, in an effort to develop a list of requests which could reasonably be submitted to the EEC for consideration.

2. The United States Government has now also been informed that in a meeting of the Trade Negotiations Committee in Geneva on April 28 the EEC Delegation has taken the position that the EEC would not be prepared to begin Phase II negotiations with the US or other countries until the Article XXIV:6 negotiations have been concluded. The US has for its part declared its willingness to begin Phase II negotiations with all countries including the EEC, in the expectation that solutions to the unresolved problems under Article XXIV:6 would be found while the reciprocal negotiations progress. The United States Government believes that the urgent business of Phase II of the tariff negotiations cannot be further delayed and believes that the EEC must reflect seriously on the situation which will result if the EEC on the one hand will not further negotiate for acceptable settlements under Article XXIV:6, but will not on the other hand open Phase II negotiations until settlements under Article XXIV:6 have been reached.

3. The United States Government is confident that the European Economic Community shares its desire to avoid actions that would endanger the harmony of the GATT and of the wider Atlantic Community.

4. The United States Government recognizes the special problems with which the EEC has to cope in carrying the Geneva negotiations to a successful conclusion. Taking these difficulties fully into account, there nevertheless appears to be insufficient recognition of the important political and economic interests of third countries which are affected by arbitrary decisions based on factors internal to the Community.

5. The peremptory position adopted by the Community will inevitably lose support for the EEC in the United States and elsewhere. It will encourage active opposition on the part of those who will be

directly and adversely affected by EEC refusal to negotiate or to make appropriate tariff adjustments to which they believe themselves entitled under the GATT. It may well alienate those who have in the past given full support and encouragement to the development of the EEC and who have defended it against unwarranted criticism.

6. Similarly, it makes it more difficult for the United States to maintain a liberal trade policy toward the EEC, if the Community invites the criticism that it is moving in a protectionist direction. Evidence of a restrictive trade policy on the part of the EEC will lend new encouragement to protectionist forces in the United States.

7. The United States Government therefore urges that the Community give full and immediate consideration to the list of requests submitted by the United States Delegation in Geneva on April 22, so that negotiations may lead to an early resolution of the problems remaining unresolved. The United States Government invites the Council to put forward suggestions which will enable the outstanding differences to be resolved in a mutually satisfactory manner and which will preserve the close relationships which have been maintained with the EEC since its inception.

#### **SUBJECT**

Démarche to EEC on Rejection of U.S. Agricultural Package

Carl Corse in Geneva has reported that the EEC has already rejected the revised agricultural package which was presented to them on April 22. Apparently this rejection was without benefit of careful consideration or reference to the EEC Council and was not tempered by any suggestion for further negotiations. Carl Corse has urged, and Ambassador Butterworth agrees, that a démarche be made urgently to the EEC, in order to bring the matter before the EEC Council at its meeting on Tuesday, May 2. Accordingly, arrangements have been made for you to see the Belgian Ambassador, Mr. Scheyven, who would in this instance act as the channel to the Chairman of the EEC Council, the Chairmanship being filled by Belgium at the present time.

There is attached an Aide-Mémoire for presentation to the Ambassador. It is suggested that you orally make the same points to the Ambassador.

May 1961

439. Letter from Udall to Ball, May 1<sup>1</sup>

May 1, 1961

Dear Mr. Secretary:

I am glad to have your letter of April 13 which should serve to initiate necessary conversations to enable us to reach a concerted point of view with reference to the pending lead-zinc bills.

We are aware of the importance of international trade in lead and zinc, and we have, as you know, participated fully in the work of the International Lead-Zinc Study Group. We have been keenly disappointed at the unwillingness of the Study Group to recognize the problems which our domestic lead and zinc industries face. Not until this last meeting in Mexico City was there any real effort to cope with the fundamental problem of excess world supply of lead. Even these efforts were conditioned in part on the announced willingness of the United States to acquire through barter surplus lead stocks outside of the United States. The Group has made no effort to deal with the problems of zinc since early 1959.

We do not wish to underestimate the value of the Lead-Zinc Study Group, and we expect to continue to work with this body. We cannot agree, however, to the proposition advanced in your letter to the effect that considered unilateral action would jeopardize these efforts. We believe many foreign participants in the Group will admit that the imposition by the United States of quotas on imports in late 1958 had a salutary effect upon producers and governments, and that such unilateral action has been, to a large degree, responsible for the limited success of the international effort to date. Nor do we believe we can continue to defer additional action by the United States while awaiting more effective action of the Study Group.

Our domestic lead and zinc industries, as you point out, are gradually losing their economic strength. Hundreds of small, independent mines have closed. Independent smelters are finding it difficult to keep going. One of our largest integrated companies has shown heavy losses for two consecutive years. We have reason to believe that exploration and development, plant modernization, and other capital expenditures are lagging because of the uncertainty of the outlook.

---

<sup>1</sup> Domestic lead-zinc industry relief and foreign policy considerations. No classification marking. 2 pp. Department of State, Central Files, 411.004/5-161.

In contrast, the industries of Europe, Australia, Japan, Canada, and even Latin America are proceeding with development. Peru, whose reaction to imposition of the quotas was described in the dispatch attached to your letter, has increased its mine production of lead from 124,000 metric tons in 1957 to 131,000 in 1960. Peruvian smelter production of lead has increased from 69,000 metric tons to 73,000 over the same period. For zinc, Peruvian mine output has increased from 158,000 metric tons in 1957 to 169,000 in 1960 while smelter production fell off slightly.

Since 1957, production of refined lead in the United States has fallen 205,000 tons as contrasted to an increase in the balance of the free world of 115,000 tons. For zinc, U.S. smelter output declined 173,000 tons between 1957 and 1960, while production in the rest of the free world increased 154,000 tons.

It is quite apparent that despite the imposition of quotas, the industry outside of the United States is in comparatively satisfactory condition when measured against the situation in the United States. We are deeply concerned that if foreign producers continue to take advantage of the relatively easy access to the U.S. markets we shall lose much of our remaining productive capacity for these two important commodities.

The Area Redevelopment Program will do little, if anything, for that segment of the lead-zinc industries still operating. It will in time provide assistance to stranded mining communities, but even this limited contribution is probably quite a few months away.

We cannot accept the premise that any action to relieve the domestic industry would meet insuperable objections from the standpoint of foreign policy. The Department is firmly of the view that a program must be developed to prevent further deterioration of the domestic lead and zinc industry and to enable the industry to regain some of the ground lost in the past four years.

We should be pleased to discuss this matter with you in detail.

Sincerely yours,

**Stewart Udall**  
*Secretary of the Interior*

**440. Circular Telegram 1771 to Certain Diplomatic Missions,  
May 10<sup>1</sup>**

May 10, 1961

Paris for USRO and Embassy. Brussels for USEC and Embassy. Geneva for GATT. Re Depcirtels 1707 and subsequent.

A. As preliminary background, following is summary of tentative plan under study here for approach to multilateral understanding on textiles and textile products. Being readied for exploration with other governments beginning with May 15 US-UK-Canada London talks. Not yet fully cleared here and therefore subject to change. Subject to further change later in light discussion other governments.

B. Plan envisages 2-stage multilateral arrangements among major consuming and exporting countries, along following lines:

1. Interim arrangement:

(a) Acceptance following objectives: (i) widening total export market by relaxation existing import restrictions in certain countries; and (ii) providing for major consuming countries acceptance of systematically increasing quantities textile imports, under controlled orderly arrangements with exporting countries to avoid disruption established markets.

(b) Commitment by governments to adapt policies and procedures to work toward those objectives and refrain from action inconsistent with them. Some escape provisions may be added. *Note:* Specific formulas not suggested as part of initial interim proposal. However, if long-term arrangement does not mature quickly enough, commitment might be later extended to include interim formulas (perhaps 6-month adaptations of long-term formulas).

(c) Establishment multilateral Study Group to maintain surveillance international textile situation and call attention to any significant developments. This or a separate group to act as Preparatory Committee to develop specific terms of long-range arrangement GATT facilities will be drawn on to provide Secretariat support for preparatory work and subsequent conferences.

(d) Individual consuming countries remain free to negotiate agreements with supplying countries re level of exports from latter to former.

---

<sup>1</sup> Textiles: tentative U.S. approach. Confidential. 4 pp. Department of State, Central Files, 411.006/5-1061.

2. Long-term arrangement: multi-year agreement (1962–64) on cotton textile products—yarn, cloth, garments, etc—with following main provisions:

(a) Countries now without import quotas or other discriminatory restrictions on imports from low-cost countries agree—perhaps subject to escape provision—refrain introducing such restrictions. Apparent eligibles: US, Canada, Switzerland, UK, and BENELUX, latter two except as to Japan.

(b) Countries now maintaining discriminatory restrictions on imports from low-wage countries agree relax such restrictions gradually. (Formula in mind would permit cooperating low-cost countries access to at least 5% of domestic markets by end 1964.) Apparent eligibles: France, Germany, Italy, Austria; also UK and BENELUX, as to Japan.

(c) Low-cost exporting countries agree maintain controls—by categories—over exports to “a” countries—or any other countries later falling within category—with view to limiting annual increases in exports to each such country, according to some formula. (Formula in mind is a percentage increase—perhaps 5%—in exports to that country during base period, e.g. 1960–61.) Apparent eligibles: Japan, Hong Kong, Taiwan, Korea, India, Pakistan, Egypt, Spain, Portugal.

(d) Continuation of Study Group.

C. COMMODITY COVERAGE: US concerned about entire range textiles and textile products from all fibers. However, considering giving priority attention to categories of widest international interest and urgency—i.e. cotton textiles, as in para B-2 above.

D. PROCEDURE:

1. Series of exploratory bilaterals and trilaterals, beginning London May 15, continuing in certain European capitals, and then picking up in Washington and/or through US missions, with other countries including Japan. Expect cover at least most key countries this way before multilateral talks. Possible UK and Canada may also undertake coordinated bilateral approaches.

2. Multilateral meetings: (a) Seeking Paris session May 29 under OECD aegis, with major consumers attending, for agreement—at least in principle—on lines US approach. (b) Official-level mid-June Geneva meeting major consuming and exporting countries, under GATT aegis, hopefully to accept interim arrangement, establish Study Group, and arrange earlier follow-up policy-level conferences. (c) Policy-level late July or mid-September Geneva meeting same countries, again under GATT aegis, to seek reach long-range agreement. Further meeting to be scheduled if necessary with view reaching final agreement before end December. (d) GATT endorsement of effort for multilateral understanding and authorization for use GATT Secretariat will be sought.

*Acting*

**441. Memorandum from Palmer to Jones, May 11<sup>1</sup>**

May 11, 1961

## SUBJECT

Commercial Work in Field

I recently attended the first regional conference of commercial officers in Hong Kong, stopping off also at Bangkok and London where the first permanent US trade centers are to be located; at Kuala Lumpur and Duesseldorf where there are pilot projects for commercial work; and at other posts en route, i.e., Tokyo, Beirut, Vienna, Frankfurt, Bonn, and Paris. This trip enabled me to get a first-hand view of commercial work at different missions and to discuss certain of its aspects with our Ambassadors or principal officers.

Proposals for a separate commercial foreign service under the Department of Commerce were uniformly opposed by our people, as well as by Commerce's own people assigned in the field as commercial attaches. It was generally recognized that it is not feasible to make an arbitrary division between economic and commercial work which a separate commercial service would require. Therefore, such a service would result in wasteful duplication. Moreover, the top echelons of our embassies are of necessity concerned with such matters as liberalization of trade, the removal of restrictions against US goods, tariff and customs problems, all of which are basic to the promotion of US exports.

I was impressed by the fact that present organizational arrangements permit trade promotion under such different conditions as obtain in Malaya and in Duesseldorf. In the former, the principal medium for trade promotion is a newsletter sent out to business people giving information concerning American firms wishing to sell in the Malayan market. In the second case, the commercial staff concentrates on setting up trade information booths at various specialized trade fairs and soliciting from people attending the fair expressions of their interest in importing specific American products. Both methods have been productive, although these excellent markets for American goods have not yet been fully exploited by American business. There is also a vast difference between our commercial work in the UK, which is centralized in London, and in Germany where markets and commercial activities are dispersed throughout the country. Also, our present organizational set-up for commercial work in the field facilitates cooperation with ICA and the furtherance of our commercial interests in those

---

<sup>1</sup> U.S. trade promotion abroad. Official Use Only. 2 pp. Department of State, Central Files, 400.11/5-1161.

countries where a substantial segment of imports is financed by U.S. aid programs.

The present close coordination of commercial and economic work provides flexibility of work assignments of both American and local staffs. Thus in 1960, the Foreign Service was able to increase the number of trade opportunities developed by 75 per cent, and take care of 40 per cent more business visitors with only a nominal increase in total staff. However, we have now stretched our resources to the limit, and there is no slack to handle the still increasing workload. Our principal commercial officers find themselves pretty much deskbound and unable to get out to make the personal contacts so important to trade promotion. In both London and Bangkok, it is apparent that additional help must be provided to cope with the extra load on the commercial staff which will result from the establishment of permanent trade centers. In these circumstances, we must fund a substantial increase in commercial officers and supporting staff this year if we are not to provide further ammunition to those who advocate a separate commercial service.

I also had occasion to discuss with our top people and others the proposal to provide special commercial advisers to operate on the regional basis. Practically all of the people with whom this was taken up were enthusiastic about the idea, including commercial attaches who are presently on loan from the Department of Commerce to the Foreign Service. Specifically, Ambassador McClintock of Lebanon thinks that such a special commercial adviser in Beirut could serve a most useful purpose. Similarly, Ambassador Dowling in Bonn believes this is an excellent idea and thinks that we should have at least two such advisers in Europe. He would be pleased to have one of them stationed in Frankfurt which is a logical location, being both an airline crossroads and a large commercial center. Ambassador Young would like to have one stationed in Bangkok.

Delegate of the Federal Council for  
Negotiations, Dept. of Public Economy  
Ambassador Soldati, Head of Delegation to OEEC  
Mr. Claude Caillat, Assistant to Mr. Weitnauer  
Mr. Begle, Swiss Delegation to the OEEC

Mr. Ball outlined the textile problem as seen in Washington and made the following points:

- a) the need for orderly development of international trade in textiles to avoid pressures for import controls in industrialized countries that might frustrate expectations in developing countries regarding their ability to earn foreign exchange from such exports;
- b) the domestic political importance of the problem in the US;

---

<sup>1</sup> "Textile Problem." Confidential. 5 pp. Department of State, Conference Files: Lot 65 D 366, CF 1874A.

c) the desire of the US Administration to avoid unilateral imposition of quotas on textile imports that would represent a setback for liberal commercial policy;

d) the general nature of the multilateral arrangement which we hoped could be established for dealing with the problem.

Mr. Ball also noted that:

a) Canada, the UK, France, Germany and Italy had recognized the problem and the desirability of exploring some multilateral arrangement;

b) we were still exploring such questions as the precise framework in which further discussions could be carried on, and their timing;

c) cooperation between OEEC and GATT in this matter would be useful;

d) we must avoid any impression of "a color line in textiles" or ganging up by the industrialized countries.

Mr. Weitnauer (Switzerland) recalled that it had always been liberal in its treatment of imports from less-developed countries. As regards imports of textiles from Japan, Switzerland now has in effect a price control system which excludes from entry into Switzerland textiles whose prices are lower than average Swiss prices by certain fixed percentages. Switzerland has not invoked Article 35 of the GATT against Japan and imports from that country now account for 10 to 15 percent of Swiss domestic consumption. Switzerland maintains no special control on textile imports for the less-developed countries. As regards imports from Hong Kong these need present only proof of Hong Kong origin. Such imports have increased by 3 to 4 times over the past few years but have showed signs of levelling off recently. Switzerland's own textile industry was gradually shifting toward high priced specialty lines. Switzerland would be glad to join an international meeting on textiles as envisaged by the US.

Mr. Dienzl (Austria) noted that the problem raised by Mr. Ball was of great concern to Austria whose textile industry employed 25 percent of the Austrian labor force. Imports from OEEC countries have risen by 30 percent over the past year. Even with respect to imports from less-developed countries, Austria was an important buyer, taking imports from such sources to the amount of 82 percent per capita per annum compared with \$1.40 in the US, 22 cents in Germany and 3 cents in Italy. Austria felt it necessary to maintain certain restrictions on textile imports, which were applied on a nondiscriminatory basis. It was difficult to see whether it would be possible to reduce these restrictions particularly in view of the fact that Austria's imports from the OEEC area were increasing steadily while their exports were not doing so well.

Mr. Forthomme (Belgium) noted that the textile problem, along with the wider problem of imports from low-wage countries, was

taking a lot of time of the Common Market people in Brussels. However, it had not thus far been possible to develop an agreed view. Various schemes had been considered, but all had disadvantages as well as advantages. As far as Benelux was concerned it maintained a reasonably liberal policy on textile imports. In addition, it had developed an arrangement with Japan under which the Japanese limit exports to Benelux, principally cloth.

Mr. Forthomme emphasized that it would be a great advantage if a common solution could be worked out in agreement with exporter countries. Such solution could provide a pattern of cooperation not only on textiles but also on other manufactured products from low priced countries moving in international trade. He expressed the personal view that restrictions on textile imports, even if these were developed in agreement with the exporting countries, were not the real answer to the problem. For example, it would introduce a significant amount of control into international trade with undesirable long term implications for the liberal commercial policy written into the GATT. Another argument against this approach was that the low prices at which even limited quantities might be permitted to enter importing countries would not benefit either exporters or consumers, but would simply provide windfall profits for the middleman. The scheme of "managed" textile trade outlined in the paper circulated informally by the US did not take into account the situation of other textile manufacturing countries. Many of these such as Mexico and Colombia, have their own well-established textile industries, but continue to maintain severe restrictions on textile imports. These should not be left out of any multilateral textile agreement. Mr. Ball agreed that provision should be made for entry into the world market of new textile exporters and that account must be taken of the possibility of shifts of textile production from countries which are now important exporters to other areas.

Mr. Forthomme thought that perhaps the problem might be dealt with through the imposition of some kind of import tax designed to eliminate substantial price differential between textiles produced, for example, in Hong Kong and those produced in Benelux. Such import levies might be negotiated with the exporting countries and the proceeds could accrue to a fund on which the exporters could draw for basic development projects. In this connection, the low wage position of the less-developed countries could be presented not as an advantage, but as the result of unfortunate circumstances which meant that these countries were not getting the full benefit of their labor. The development fund financed by special charges on low cost textile imports could help these countries attain greater benefits from the use of their labor force.

Mr. van Oorschot (Netherlands) noted that the Benelux allowed practically free entry of textiles, except from Japan with whom they have a special control arrangement. Mr. van Oorschot wondered whether it was intended to discuss the problem of all textiles or only some categories. Mr. Ball replied that we regarded this as primarily a cotton textile problem. Mr. van Oorschot felt that the kind of arrangement being suggested did not really represent liberal commercial policy but rather "managed international trade." He wondered whether this would serve as a precedent for other manufactured goods exported by low wage countries. Mr. Ball replied that the exercise on textiles should not necessarily be regarded as a precedent for anything, but simply as an exercise designed to avoid retrogressive steps in the field of textile trade. While a completely liberal solution was not realistic for the foreseeable future, the US objective was to preserve as much liberalism as possible by building into any multilateral agreement possibilities of growth textile exports from less-developed countries. Mr. Ball agreed with the comment of Mr. van Oorschot that we should continue to present our long term objectives in this respect in terms of liberal commercial policy.

Mr. Forthomme (Belgium) felt that, if we must envisage quantitative restrictions as part of a multilateral arrangement on textiles, these should be part of a long term scheme aimed at replacing them with something else. While he recognized that we would have to use the GATT for this purpose, he felt strongly that the OEEC should first be the site of informal consultations among importing countries. Mr. Ball agreed that, because of the sensitiveness of other GATT members, it was necessary to utilize the GATT as the meeting ground of importers and exporters. Such meetings could be preceded by further ad hoc consultations among consuming countries to explore various possible formulae which might be advanced at the GATT meeting.

Ambassador Bobleter (Austria) argued that the importers should have thorough informal consultations in the OEEC before taking up the matter with exporting countries. When Mr. Ball referred again to the problem of avoiding suspicion on the part of other GATT countries, Mr. Forthomme noted that this raised a long-term problem of relations with the less-developed countries. He felt that, if these were to object each time the OECD looked at relationships with the less-developed countries, the Organization would not be able to do much in this direction. He again urged that the importing countries first thrash out the problem. He was not trying to "fix things up," but felt that prior consultation among importers was essential.

Mr. van Oorschot felt that conflict between the OEEC/OECD and other GATT members should be avoided and suggested that preliminary consultation among importers might be carried on in an *ad hoc*

group. Then it might be possible to consider a joint OECD/GATT meeting as had been previously suggested. Ambassador Bobleter again argued that preliminary consultation should take place in the Organization in Paris. If this were not done, it would be clear that important trade problems would not be dealt with in OECD. He noted that it would be difficult for Austria to make any trade moves on a global basis if European trade questions remained unsolved. Ambassador Ockrent noted that it would be difficult to set up a restricted group in the OEEC to discuss textiles.

Ambassador Tuthill suggested that it might be desirable first to have a public announcement of the textile meeting to be held in Geneva, before convening an *ad hoc* meeting of importing countries. This would clearly stamp the importers meeting as preparatory to full scale discussion between importing and exporting countries. Mr. Forthomme suggested that the US circulate a new paper which would summarize the reactions obtained by Mr. Ball to the US proposals during his current visit to Europe and any new thoughts the US might have in view of these reactions. This paper might serve as the basis for further discussion among importing countries.

In response to a question as to the results of his various talks, Mr. Ball stated that, in general, the indications were that the various countries were prepared to cooperate in exploring the problem along with possible solutions, including the procedural arrangements which might serve as the framework for discussion.

Mr. Forthomme suggested that perhaps the paper to be prepared by the US might be submitted for consideration to the OEEC Steering Board for Trade in order to obtain the reaction of the expert members of the Board. This might be a prelude to the meeting of the importing countries discussed above. The discussion closed with the comment that if any such consideration of the paper were to take place in the OEEC, it would be better to use an informal group rather than the Steering Board. In any case, the question of precisely how consultation among importers would take place needed further thought.

**443. Memorandum of Conversation, June 19, between Ball and Nobuhiko Ushiba, Economic Affairs Bureau, Foreign Office, Japan<sup>1</sup>**

June 19, 1961

SUBJECT

Textiles

PARTICIPANTS

*JAPAN*

Mr. Nobuhiko Ushiba, Director, Economic Affairs Bureau, Foreign Office

Mr. Akira Nishiyama, Minister, Embassy of Japan

Mr. Nobuyuki Nakashima, First Secretary, Embassy of Japan

*UNITED STATES*

Mr. George W. Ball, Under Secretary of State for Economic Affairs

Mr. J. Robert Schaetzel, Special Assistant, Office of the Under Secretary for Economic Affairs

Mr. Edwin M. Martin, Assistant Secretary for Economic Affairs

Mr. Sidney B. Jacques, Director, Office of International Resources

Miss Edelen Fogarty, Commodities Division, Office of International Resources

Mr. Clifford C. Matlock, Economic Special Assistant, Bureau of Far Eastern Affairs

Mr. Leonard Bacon, Acting Director, Office of Northeast Asian Affairs

Miss Thelma E. Vettel, Special Assistant, Office of Northeast Asian Affairs

Since Mr. Ball was delayed at another meeting, Mr. Schaetzel opened the discussion with a brief description of the U.S. domestic political situation and its relationship to the textile problem. He described the pressures being exerted by influential members of the Congress and the textile industry for unilateral U.S. restrictions on textile imports. He then referred to the President's seven-point statement of May 2 on textiles, with particular reference to point 6 calling for an international conference of major importing and exporting countries to consider the textile problem.

At this point Mr. Ball arrived. Mr. Ball expressed the view that it was indispensable to the solution of the textile problem that the consuming countries provide an expanding market for textiles. It would be necessary, therefore, to persuade some of the major European countries to accept this principle and to try to work out a formula which

---

<sup>1</sup> Discussion of textile problem. Confidential. 4 pp. Department of State, Central Files, 110.12BA/6-1961.

would permit a progressive increase in the acceptance of textiles. Noting the increasing number of textile producing countries throughout the world, Mr. Ball said that to avoid closing the market for textiles the problem must be worked out multilaterally. He said the U.S. would attempt to be as liberal as possible and to take Japan's restraint into account. The alternative would be to let the situation go, and Mr. Ball expressed serious doubt as to our ability to prevent a deterioration of the situation.

Mr. Ushiba agreed that a reasonable solution could be found only in a multilateral way, as long as provision is made for experience and equitable treatment for the exporters. He said the Japanese attach great importance to the proposed international meeting and that it is receiving serious consideration in Japan. The Japanese Government and industry have formed a council to prepare for the meeting. Mr. Ushiba pointed out that many pressures are exerted on the Japanese Government on this question.

Mr. Ushiba said that Japan has long experience in dealing with the European countries on the question of import restrictions. Based on that experience the Japanese see a great deal of difficulty in the path of the conference. He said the Japanese hope the conference will succeed and are very conscious of the bad effect its failure would have on world trade. Therefore, Mr. Ushiba said, so long as the conference moves in the right direction, the Japanese will try to cooperate to the best of their ability.

Mr. Ushiba said he doubted whether the European countries were ready to help expand the textile market. He added that of course they would pay more attention to the U.S. and much would depend on the policy of the U.S. According to Japanese experience, however, the European countries are sometimes very unreasonable and the Japanese believe the conference will not be easy.

Mr. Ushiba expressed the view that so long as the basic idea of quota restrictions is maintained there is no reasonable basis for determining amounts, etc. As a basic principle, he said, the right approach should have full liberalization as a target. There might be a period of preparation and then liberalization across the board. After liberalization, in the event of market disruption, he said, there are safeguards under the GATT, and if they are not sufficient, the Japanese are ready to discuss other means to safeguard and help restore equilibrium. He said that the fear of European countries that opening the gates would result in an immediate flood of imports from Japan is not justified. In his view those countries should follow the example of Canada and the U.S.

In the coming conference, Mr. Ushiba said, this principle should be stated. Otherwise the Japanese see no usefulness in discussing levels of imports or some interim agreement. With this in mind the Japanese will cooperate to make the conference successful.

Mr. Ushiba added that there is a tendency to treat the European countries as a bloc and give the member countries some preferential status. This Mr. Ushiba believed was not right but the Japanese do not object to a European community taking form so long as their conventions comply with the GATT. Mr. Ushiba said, however, that with respect to textiles, it would be very unfortunate for the European countries to meet before the international conference to build a united front giving the non-European countries a fixed level.

Mr. Ball responded that that was not our intention in convening the meeting of major European consuming countries. The purpose is to try to persuade them to provide for expansion. Mr. Ball believed it was better to get together with them first.

Mr. Ushiba said the objective as stated by Mr. Ball would give comfort to the Japanese. He pointed out that Portugal and Spain are exporting countries; therefore there is no reason for treating European countries differently. He said the textile problem should be studied in its entirety and the underdeveloped countries should be consulted.

Mr. Ball said we were trying to introduce an element of rationality to the textile problem. Mr. Martin said we draw the line between primarily importing and primarily exporting countries rather than between European and non-European countries.

Mr. Ushiba observed that the Japanese are regularly negotiating with France, Italy, Norway, etc. on these matters. He said the Japanese may be able to furnish the U.S. with some useful information stemming from this experience.

Mr. Ushiba expressed gratification that Mr. Wyndham-White was coming to the Washington meeting. Mr. Nishiyama expressed some concern over EEC participation in the Washington meeting.

Mr. Nishiyama asked what made Mr. Ball believe the forthcoming meeting would be successful. Mr. Ball responded that it was the general concern of the European countries that unless the problem can be worked out under a multilateral arrangement it would mean unilateral quotas in the U.S. He said our European friends are interested in helping us avoid this.

Mr. Ushiba said Japan is also concerned about the possibility of unilateral U.S. quotas.

Mr. Schaetzel said that in Bonn the Germans had indicated that they were having trouble with their industry over their efforts to liberalize, and they welcomed this approach.

Mr. Ball said a multilateral approach helps producing countries with their industries. He pointed out that we are using a multilateral approach in increasing our aid to less-developed countries. Now we are saying that new producers need markets. Mr. Martin observed

that any one country attempting to liberalize feels that everyone will concentrate on it; a multilateral approach makes this easier.

In response to Mr. Nishiyama's question Mr. Ball said no formulae or figures had yet been developed. He said this was a difficult and complicated problem.

Mr. Nishiyama observed that before World War II Japan had very difficult discussions with India on such a problem; now the problem is much more complicated. He added that there were some suspicions in Japan as to what kind of proposal would be made.

Mr. Ball closed the meeting with assurances that the Japanese would be kept fully informed as to the meeting in Washington.

#### 444. Letter from Hodges to Bowles, June 21<sup>1</sup>

June 21, 1961

Dear Chet:

I have your letter of May 26, setting forth the views of the Department of State relative to the establishment of a separate Foreign Commerce Corps as proposed in S. 1729, a bill introduced into the Senate of the United States by Senator Engle.

I agree with you that advancements have been made in our approach to the commercial work performed by the Foreign Service of the United States in recent months. There remain, however, important fundamental weaknesses which are most difficult of solution under the present system.

The President has asked me "to provide emphatic leadership to American industry in a drive to develop export markets." Present administrative arrangements do not give us in the Department of Commerce the resources needed to carry out this important and difficult responsibility. In my contacts in several embassies in recent months, as well as my constant contacts with American exporters, I find a great lack of strength as well as interest on the part of our commercial people. I think we both need to take a "new look."

---

<sup>1</sup> Establishment of a separate Foreign Commerce Corps. No classification marking.  
1 p. Department of State, Central Files, 411.0041/6-261.

It is my understanding that Senator Engle is determined to go ahead although none of our people have given him any encouragement to do so.

Sincerely yours,

**Luther Hodges**  
*Secretary of Commerce*

**445. Memorandum of Conversation, June 21, between President Kennedy and Japanese Prime Minister Ikeda<sup>1</sup>**

June 21, 1961

SUBJECT

International Economic Groupings and US-Japan Economic Relationships

PARTICIPANTS

*U.S.*

The President

Mr. James J. Wickel—LS/I

*Japan*

Prime Minister Ikeda

Mr. Miyazawa, Member, House of Councillors, Japan

The President introduced the subject of the OECD, pointing out that the United States consulted fully with Japan before becoming a member. In spite of Japan's great desire to enter the OECD the President did not think this to be the best time to press for admission. The President described the European nature of the institution and its attempt to involve the United States and Canada in its affairs, but pointed out that Japanese membership in the OECD would naturally lead to a demand by the British for admission of Commonwealth nations such as India, Pakistan and Australia, thus destroying its basic character. The President expressed a preference for leaving the matter in abeyance for awhile.

The President commented on the role of the OECD in promoting the flow of capital among its members and wondered if it might not be desirable to establish a similar organization to do the same in non-

---

<sup>1</sup> "International Economic Groupings and US-Japan Economic Relationship." Secret. 3 pp. Department of State, Conference Files: Lot 65 D 366, CF 1914.

European areas. The President indicated that the United States would consider such a proposal carefully.

The President noted that an inquiry by Japan on the question of Japanese admission to the OECD had been received prior to the Prime Minister's visit but pointed out again that the Atlantic nature of the organization would be basically altered by the admission of Japan, which would open the door for applications by other Commonwealth nations.

He explained that most European peoples view the OECD as a means to promote greater unity in the Atlantic Community. Therefore, he concluded that it might be better to leave the matter in abeyance and instead, during the summer and fall, consider the establishment of a similar organization for the other Free World nations.

The Prime Minister noted that Japan is asked to join organizations which finance projects in underdeveloped nations, for example the DAG, but is excluded from trading blocs. He considers this to be most unfair. Should Britain enter the Common Market he feels that Japan's trade position will deteriorate since such membership will no doubt lead to greater restrictions against her.

The President noted that British membership would pose a problem for the United States as well as Japan, as would the development of a Latin American trading bloc, both of which would decrease America's export market. Perhaps trade could be increased with the former French colonies of Africa in place of the Latin American market.

However, the President felt that the integration of West Germany into the economic life of Europe is sufficient reason to support the development of the Common Market, because the orientation of post-Adenauer Germany is as yet unknown. He admitted that the United States would have to make a sacrifice to achieve this purpose and recognized that Japan's sacrifice might be greater. In any event, these matters could be discussed with Mr. Ball.

The Prime Minister expressed particular pleasure with the establishment of the Joint Economic Committee. He also expressed his own and his nation's appreciation for the generous manner in which the United States had negotiated a settlement of the troublesome GARIOA EROA problem. Referring to the importance of Japanese-American trade the Prime Minister emphasized his view that the United States offers the greatest possibility for expansion of Japan's export market.

The President assured the Prime Minister that the United States values all trade, including that with Japan. He reaffirmed the free-trade position of his administration and his intention to encourage trade liberalization. The President noted that American reciprocal trade legislation will be up for renewal by Congress next year, and observed that

American cotton exporters do not articulately support such legislation despite the fact that they export more cotton to Japan than this country's total cotton textile imports. Since those American manufacturers who are affected by imports are most articulate and energetic in their public opposition to it, the President forecast difficulty in securing renewal of the legislation next year. He emphatically stated his endorsement of liberal trade and promised to do his utmost to secure passage of the extension.

(At this point the President himself drew a graph, charting the constant level of Japanese imports from 1957 to 1961 under voluntary export controls in contrast to the sharply ascending line of imports from Hong Kong, which have this year surpassed those from Japan.)

The President considered this to be a most serious situation because of its inherent inequity. He indicated that demands for relief by the depressed American textile industry are a source of concern to him, for these articulate demands are focused on Congress. He promised to do his best to maintain a liberal trade policy in both the national and the world interest.

The Prime Minister explained that Japan has embarked on a ten year program to double the national income. As advances are made Japan will increase her imports from the United States from the present \$1.5 billion level annually to \$3 billion annually at the completion of the program. The Prime Minister doubted that Japan could increase her purchases in the United States without reciprocal sales.

The President promised that Under Secretary Ball would maintain a continuing interest in this matter. He regretted again that those who benefit from liberal trade policies remain silent in politics while only those who are adversely affected are articulate. He hoped to find a way to stimulate an articulate reaction by those who benefit from their exports to Japan.

June 21, 1961

SUBJECT

Liberalization of Trade and Payments

PARTICIPANTS

*Japan*

Mr. Zentaro Kosaka, Foreign Minister  
Mr. Shigenobu Shira, Deputy Vice Minister for Foreign Affairs  
Mr. Toshiro Shimanouchi, Counselor, Ministry of Foreign Affairs  
Mr. Koichiro Asakai, Japanese Ambassador to the United States  
Mr. Nobuhiko Ushiba, Director, Economic Affairs Bureau, Ministry of Foreign Affairs  
Mr. Akira Nishiyama, Minister, Embassy of Japan  
Mr. Tadao Kato, Counselor, Embassy of Japan

*United States*

Mr. Dean Rusk, Secretary of State  
Mr. Chester Bowles, Under Secretary of State  
Mr. Edwin O. Reischauer, United States Ambassador to Japan  
Mr. Walter P. McCaughy, Assistant Secretary of State for Far Eastern Affairs  
Mr. Paul Nitze, Assistant Secretary of Defense for International Affairs  
Mr. Leonard L. Bacon, Acting Director, Office of Northeast Asian Affairs  
Captain John J. Reidy, USN, Assistant to Director, Far East Region, International Security Affairs, Department of Defense  
Mr. Richard L. Sneider, Officer-in-Charge, Japanese Affairs, Dept. of State  
Mr. James J. Wickol, Interpreter, Department of State

The Foreign Minister remarked that, as had been indicated in the course of the conversation between President Kennedy and the Prime Minister on June 20, he wished to discuss the question of Japanese liberalization of trade. Japan is hampered by low productivity and other difficulties. It is, nevertheless, anxious to accelerate its liberalization program. At the same time, the Japanese are concerned by the apparent rising tide of protectionism in the United States, particularly with respect to textiles which are observed to have considerable political ramifications. The United States Tariff Commission has already recommended increases in tariffs on such items as ceramic tile and plate glass. Such actions may be expected to create serious economic and social difficulties in Japan. In addition, it has been noted that there are various moves to exclude Japan-made goods from the United States. Japan appreciates the efforts of the United States Government to defeat

---

<sup>1</sup> "Liberalization of Trade and Payments." Confidential. 2 pp. Department of State, Conference Files: Lot 65 D 366, CF 1914,

such moves in respect to woolen items. Nevertheless, organized labor is making strong efforts to limit the import of woolen suits. Finally, certain state laws appear designed to limit the use of imported articles. An example is Texas where the demand has been made that only American steel products be used in Texas highway construction. These moves give concern to Japan, and if Japan is to continue to liberalize its trade it would like to see the spirit of free trade observed on both sides for our mutual benefit.

The Secretary replied that it was certainly true that political sensitivity to imports is higher than in the earlier post-war period. This sensitivity has no special connection with imports from Japan. In fact, it dates back to the beginning of the Industrial Revolution. However, one factor which seems to suggest that this sensitivity is new is the circumstance that in the earlier post-war period our producers were not affected by competitive imports, since the industrial countries of the world, particularly in Europe, had been devastated. Now their industries have been restored and other industrial countries have entered the international market in a very vigorous fashion. We are impressed by Japan's enterprise. Problems have arisen which are not easy to resolve and which will probably continue to demand attention. Nevertheless, it is the firm resolution of this Administration to work toward general liberalization of trade because we believe that the world's economic health depends on an expanding trade. A "Great Debate" is expected in the coming year in Congress on our international trade policy. This should be helpful in acquainting the public with the issues. Unfortunately, our exporting industries are not so vocal as those industries which feel themselves hurt by imports. We appreciate the Foreign Minister's remarks, and questions raised by him are under review. There is, however, no question as to the policy which the United States wishes to pursue.

The Foreign Minister noted that a similar situation obtains in both Japan and the United States. In conclusion, he wished to point out that the United States favorable merchandise trade balance is some \$5 billion yearly, to which Japan contributes substantially. Japan's imports from the United States are actually increasing despite a continuing adverse trade balance with the United States. The Japanese Administration hopes to educate its people on the benefits of liberalized trade as does the American Administration.

**447. Memorandum of Conversation, June 23–June 24, between Jacques and Feldman<sup>1</sup>**

June 23–24, 1961

SUBJECT

Textiles—Congressional Letters to President

PARTICIPANTS

Myer Feldman, The White House  
S.B. Jacques, E/OR

1. As instructed by Under Secretary Ball, I telephoned Mr. Feldman on June 23 to inquire about the Congressional textile “petitions” which had been delivered to the White House that morning. Mr. Feldman asked me to stop in at his office the following morning for the letters.

2. On June 24, I called on Mr. Feldman. He handed over to me the two identical letters (copy attached) which had been received, one (Senate Committee on Appropriations letterhead) signed by 33 Senators and the other (Chairman of the House Armed Services Committee letterhead) signed by 122 Representatives. These letters criticized the Department’s plans for a multilateral arrangement on textiles.

3. Mr. Feldman said the letters had been delivered to him separately, by Senator Pastore in the one case and by Congressmen Vincent and Dorn in the other. He said he told them that they were being unfair to Mr. Ball in their criticisms; that Mr. Ball had simply given them a frank—perhaps, under the circumstances, too frank—appraisal of what he thought might come out of the negotiations; and that Mr. Ball was nevertheless not giving up but, instead, would try to get the most he could in the negotiations, perhaps even more than he currently anticipated. Mr. Feldman felt that, while he had not satisfied his visitors, he had nevertheless calmed them down.

4. On the question of replying, I mentioned that Mr. Ball was planning on drafting replies for the President’s signature. Mr. Feldman indicated some question as to the desirability of this. I said my impression was that, in view of the criticism and the accusations that he was not complying with the President’s directive, Mr. Ball apparently felt that the “laying on” of the Presidential hand at this stage was important to solidify his negotiating position. Mr. Feldman said his concern was at getting the President personally involved. I observed that this was really not a matter for me to discuss, and it was left on the basis that

---

<sup>1</sup> “Textiles: Congressional Letters to the President.” Limited Official Use. 2 pp. Department of State, Central Files, 411.006/6–2461.

Mr. Ball would have the replies drafted as he thought appropriate and the matter could then be pursued by him.

5. In closing, Mr. Feldman said that he had told the Congressmen it would be important for Mr. Ball to have their support in his upcoming negotiations and urged them to provide such support.

October 1961

**448. Memorandum from Schaetzel to Ball, October 6<sup>1</sup>**

October 6, 1961

SUBJECT

Comments on Howard Peterson's Trade Legislation Proposals

Attached you will find a memorandum which sets forth Peterson's preliminary ideas on the trade program. Before reacting to these you will of course want comments from E. You will find it helpful to look over the record of the afternoon Consultant's meeting last Tuesday, and I call your attention to Ray Vernon's notes which he prepared at my request.

A few observations on Ray's notes—which apply as well to Peterson's proposals:

First I think it needs to be carefully considered how one handles this whole business within the Government. It seems to me that Peterson's essentially conservative notion of tactics ignores the atmosphere within which we must work in Washington, namely a constant process of chiseling away. The result of starting low, as Willard Thorp pointed out in the meeting, is that we would end up with a perfectly impossible proposition even before we present the matter to the Congress. I think this observation ought to be taken into account in reviewing the totality of Peterson's proposal.

Related somewhat to this point is the danger implicit in Peterson's retention of both the framework of the reciprocal trade agreements program and the peril point. It seems to me that the Congress and the protectionists are thus given an ideal opportunity to pump back into the legislation all the old and restrictive language, excising in the process the new ideas put forward. This is much what happened with the AID legislation.

You will also remember that when we were working over the Stevenson and the various task force reports we thought there was tremendous advantage in putting forward something new which would force the enemy to fight on new ground and in the process establish new positions. I am very fearful that the Peterson approach, while attempting to garner whatever residual support exists for the

---

<sup>1</sup> Comments on Petersen's trade legislation proposals. Confidential. 2 pp. Department of State, Central Files, 411.0041/10-661.

“known evil” as contrasted to the “unknown”, ignores the extent to which he elects terrain highly favorable to the enemy.

I also attach importance to the point that Ray makes, namely, that the Europeans will act adversely and strongly to anything that smacks of the peril point procedure.

Finally, it seems to me Ray’s proposal that we should go ahead with this bill and if it becomes subject to crippling amendment then we withdraw it is basically naive. The loss of governmental prestige, the sense of victory which the protectionists would have, discouragement abroad, would put us in an absolutely impossible position to go back after the 1962 election.

---

#### **449. Memorandum from Kaysen to Petersen, October 7<sup>1</sup>**

October 7, 1961

Your memorandum of October 4 sketches out a line of policy with which I am broadly in agreement. However, I come to a different conclusion than the one implicit in the memorandum about the extent to which it is desirable to continue some of the present forms under which the procedure of tariff negotiation operates, even though their substance is materially changed by redefining the standards under which they are applied. In part, this judgment rests on matters of substance. In part, it raises questions of the tactics of legislative action and public appeal. While I have my own sense of these tactical issues, I pretend to no political expertise, and I advance that part of my argument which rests on them with an appropriate measure of diffidence.

In my own judgment a new program would do better to dispense with the whole peril point procedure. Continuing the procedure with the modifications in the standards of its application that you propose can be justified on two grounds: first, that it provides an opportunity for those affected by tariff negotiation to be heard; second, that its removal would be bitterly fought by the protectionists in the Congress. There are other ways to meet the substantive issue. In particular, the Interdepartmental Trade Committee could arrange for informal consultation with interested businessmen in advance of a tariff negotiation.

---

<sup>1</sup> Comments on Petersen’s trade legislation proposals. Confidential. 4 pp. Kennedy Library, Petersen Papers, Trade Policy Memorandum, Box 2.

These consultations need not result in formal findings or determinations, but would simply inform the negotiating officials as to what particularly sensitive or difficult problems might be. The absence of formal findings need in no way diminish the extent to which the responsible officials would take into account the information, but they would not be bound as they are now by the peril point procedure. The problem of injury to American business could then be handled after the negotiations by a combination of escape and adjustment assistance. I would suggest a provision that permitted injured industries to petition for escape and/or adjustment assistance in a period after one, and not more than four, years following a change in tariffs. The Tariff Commission would hear these petitions and, on a finding of substantial injury under the criteria proposed in your memorandum, could then recommend either a temporary import quota or a temporary rise in tariffs, or adjustment assistance, or some combination of these. This finding would then go to the President as it now does. It is important that the standard of injury be such that significant section of an industry, at least, be involved so that no small group of firms, or single locality should qualify. This method would have the virtue of substituting actual experience under the new tariffs for speculation as to their effect. This alone would be a great gain. Further, the fact that an interval of at least a year would have to pass before relief was asked would mean that affected businesses would be stimulated to make some attempt to adjust on their own, rather than be encouraged as they are now to foresee as many perils as their advisers can invent.

By contrast the peril point proceeding is bound to err on the side of caution, notwithstanding the proposed new standard which would take into account the total effect of a new trade posture rather than merely a change in duty on a particular commodity and which would be directed toward a finding of idling of facilities or displacement of workers. The Commission would still be required to draw conclusions from what were at best speculative forecasts. In these circumstances, all the pressures on them would be in the direction of caution, i.e., finding that a proposed change would in fact create injury.

Disclaimers of expertise in matters of tactics are usually made as cover for views thereon; mine is no exception. It seems to me that the protectionists in the Congress will in fact fight hard on whatever legislation is offered. In particular, if the peril point procedure is kept in, they will seek through a series of technical actions on the committee level to push it in its present direction. The President's problem in presenting new legislation is to get something which will rally the supporters of more liberal trade policy to a large positive effort. This is more likely to be achieved by broad changes in the form of the legislation than by redefinitions of technical criteria and procedural

changes. While the latter form a very good battleground for the experts in the Ways and Means Committee, they offer a very poor one for a public struggle. It is hard to see the League of Women Voters excited over the subtleties of industrial definition. Further, the fact that the technical battles have been fought and refought and, unfortunately by the same participants, further strengthens my preference for a larger measure of novelty.

On these, as well as on more general grounds, I am quite favorably struck by Kermit Gordon's suggestion that over and above the other features of the proposed new legislation, there be a clause giving the President power specifically to negotiate a broad trade treaty with the common market subject to the approval of both houses of Congress by concurrent resolution. It seems to me this does provide the new concept around which a dramatic appeal can be made. I would judge that it would be too risky to rely on this alone, and therefore that it should appear as an addition to a legislative proposal along the lines you have suggested, with such modifications as my and other comments lead you to adopt.

**Carl Kaysen**

#### **Attachment**

Dear Howard:

I attach a comment on your memorandum of October 4. I would be glad to discuss them with you at your convenience.

Since I will be leaving Wednesday afternoon for ten days or so, it perhaps would be better to try to set it up before then.

DISCUSSION

*Trade Program.* Mr. Ball asked Mr. Petersen to speak about his trade proposal and the representatives of the various Departments to express their views.

1. *Petersen Proposal.* Mr. Petersen assumed that those present were familiar with the proposals set forth in his memorandum of October 4. The memorandum was sent to the Departments most concerned and Mr. Petersen has since had discussions with them. There was a large

---

<sup>1</sup> Discussion of Petersen proposals. Official Use Only. 6 pp. Department of State, E Files: Lot 65 D 68, ICFEP, Trade Proposal.

degree of agreement to many of his proposed features—the quantum of authority, the term of five years, retention of the escape clause, the proposed change in criteria in definition of serious injury and the proposal for some form of trade adjustment assistance. There was disagreement, however, on retention of a modified form of peril point procedure, which several Departments thought would make impossible meaningful negotiations in the future. There was also a great difference of opinion on the tactics to be employed in getting legislation.

Mr. Petersen described the measure of modification he proposed. First, the new definition of serious injury (based on the idling of US labor and productive resources) would be applicable to peril point findings as well as to escape clause proceedings. Second, by putting peril point findings in a different context in the negotiations (against an internationally agreed goal), it is hoped there would be a change in the peril point findings. While it is impossible to predict the effect the new criteria and different context would have on Tariff Commission findings, at least a new reason would have been given to forsake the path of the past. Also, with adjustment assistance and the escape clause, lack of peril pointing is not necessarily fatal to an affected industry. Third, if the Commission did do excessive peril pointing, the President would still be able to free his hands for international negotiations by doing a massive breaching of the peril points on broad political grounds. Adjustment assistance and escape clause procedure could be brought into the act for the seriously injured.

Mr. Petersen felt it would be best to keep the formal hearing as an essential ingredient of our procedure as it has been since 1934; informal consultation with industry is no substitute for the more formal proceeding. He also favored the Tariff Commission as the agent for selection, believing that it would be almost impossible politically to attempt to have this done by the President, the Trade Policy Committee, or some other such forum.

As to tactics—whether the Administration should ask for more than it hopes to get and thereby get more than it would have otherwise or whether to go up on a modest basis—opinions differ sharply.

2. *Objections to the Proposal.* Mr. Leddy said the major objective is to get the sort of tariff negotiating authority we need to accomplish an effective negotiation with Europe (the Common Market as enlarged) which will adequately provide access for American products. Our experience indicates almost conclusively that the only way we can make an arrangement with the Six that will provide for American exports is the linear approach, which is the way the Europeans are cutting their tariffs externally and internally.

The problem Mr. Leddy has with Mr. Petersen's proposal is that it implies a selective process of tariff cutting. It would be a contradiction

for the President to recommend to Congress a peril-point procedure and then to have to make a major overruling of the peril point judgment in order to carry out the linear approach. If Congress thought the President had in mind a massive overruling, it would probably write in a provision preventing him from doing so.

Also, Mr. Leddy felt it would be nearly impossible to negotiate a tentative agreement multilaterally and then have the peril point procedure. Other countries would not put a reliable proposition on the table unless we could put forward a proposal on which they could rely. Mr. Ball agreed that we would be unable to get concessions in a negotiation if what we negotiate on our side is subject to subsequent peril point findings.

Mr. Leddy thought it would be a mistake to put the tremendous push that will be necessary to get trade legislation into something we are not convinced will do the job after we get it. Mr. Hansen of the Budget Bureau and Mr. Gudeman of Commerce endorsed Mr. Leddy's approach.

3. *Adjustment Assistance.* Mr. Fowler said the thing to do is to make application of peril point procedure the trigger for adjustment assistance. Instead of going back and modifying our offers, we could take adjustment action at home. The question is when and under what circumstances trade adjustment would begin to apply. What is the area of tolerance? What are the changes that everyone should take as a part of the general burden and the price for the general opportunity of getting our products into the Common Market? Adjustment aid, as he saw it, would just take care of the peaks of displacement.

Mr. Hansen asked how we would put a budgetary price on adjustment assistance. He thought it would be most difficult to estimate and that we would be asked by Congress just how much assistance we mean.

Mr. Ball said the discussion pointed up the need to get recognition that there is a degree of adjustment which must be borne before aid is given. People must think of adjustment as a normal thing, but know there is a point at which the Government will come to their assistance.

Mr. Werts commented that when unit costs abroad are very substantially below US unit costs, that is where injury occurs. Ruttenberg (AFL-CIO), however, sensibly does not want differences in wage rates and costs associated with the tariff mechanism. He considers it more desirable to have GATT and ILO exhort countries to improve the income of workers.

4. *Need for New Terminology.* In his original presentation Mr. Petersen criticized the present terminology—the impreciseness of “peril,” the strong implication of “breaching” peril points. This discontent with terminology was reflected throughout the discussion.

Mr. Ball said he felt we would do ourselves a great disservice by accepting the present terminology and he thought serious consideration should be given to changing it. This view was pretty generally endorsed. A suggestion was made that an industry incurring "serious injury" might instead be considered "eligible for adjustment assistance." In reply to the suggestion that the new terminology might be related to export expansion, Mr. Petersen said export expansion did not encompass the whole objective, including the problem of expanding the trade of LDC's; that actually economic growth is the idea. He doubted whether, in the short time we have available, we could educate people to new ideas and concepts.

Mr. Ball said if the terminology is simplified, the educational process might be made easier. Mr. Gudeman felt it essential to use new terminology. Mr. Hansen said that export expansion has a one-sided sound; what we are talking about is adjustment to changes in trade patterns.

5. *Need for New Concept.* Mr. Hansen pointed out that there is a significant difference between our objectives in the past legislation and our objectives now. Whereas before our objectives have been liberalizing and expanding trade, we are now faced with a particular thing happening in the world (the Common Market) which calls for very consequential changes and we are asking for authority to accomplish something that isn't really spelled out yet. Our past trade relationships were in the context of our being the greatest market in the world; now we are confronted with a market potential much larger than ours and in an area which has a higher growth rate. There are opportunities for American products and in many ways these are greater than we can offer foreign producers. If we are forced to use the tools of the past with only minor changes, we will not have equipped ourselves with the implements necessary to enable American producers to take advantage of the opportunities. Therefore, they will export capital rather than goods, and that could be fairly disturbing for our economy.

Mr. Ball said we have to get recognition that the trade legislation is an effort to enable American industry to meet the challenge of the new market or else face the dangers it poses for us. This merits a departure from old concepts. We have to argue that the European integration movement presents a challenge not only to our industry but also to our political leadership. We must make clear to labor that it must accept the need for local adjustments which are necessary counterparts of the opportunities to establish markets for our products.

Mr. Gudeman agreed that we must mount a whole new program. It is essential to have new ideas, new terminology and a publicity campaign as soon as possible aimed at businessmen as well as at Congress. If there is enough time to put it across at the next session,

fine. If there isn't, we should not go up with a program at this time, as it is so important. We must have a new concept; there is very little understanding of the Common Market problem.

Mr. Kelly said Interior did not think we could put forward a "rehash"—we must have something new and different to offer.

6. *Form of Agreement.* There followed some remarks on the possible form of agreement—treaty, executive agreement, enabling legislation, etc.

Mr. Gordon said he was under the impression the President needed no further authority to negotiate an agreement ad referendum and submit it to Congress for action by both Houses. That would make it possible to dramatize the issue in simple form and convey the meaning of the action to the public in a way in which renewal of authority, with its technical issues, never would. If the public begins to see that Europe is moving ahead and we are drifting away and that this has disturbing economic and political implications, this kind of a negotiated agreement could appeal to the country and to Congress. It is this kind of a political and psychological climate that has to be created to get what we want.

Mr. Ball said it would be folly to talk about merging two major trading areas (the expanded Common Market and the US) as that would do violence to our relations with the rest of the world. He thought it would be possible to draft a piece of legislation which would have a new look but which would not be so far from the basic idea of reciprocity.

7. *Political Considerations.* Mr. Gordon recalled that the history of the Trade Agreements Act has been one of progressive limitation. Protectionism in Congress is stronger today than ever. There is even a semi-respectable argument for protectionism—the balance-of-payments deficit. How do we propose to reverse this historical trend? We should address ourselves much more directly to what we can do to this proposed agreement with the Europeans to give it an appeal it does not now possess.

Mr. Murphy said that agriculture's interest in export markets is very great and that this interest might be sufficient to mobilize support.

Mr. Ball asked whether it isn't possible that, with the expansion and rate of development of the Common Market and so much energy and capital being employed, the American market is not likely to be injured seriously by the Common Market procedures in the next few years. This might be worth looking into to see if we could relieve some anxieties. Also, Mr. Ball thought Treasury should look into the possibility, from a balance-of-payments standpoint, of stimulating the import of capital into the US. We must make the point to labor, he continued, that one way it can protect itself from American industry

sending its capital abroad for production there rather than in the US would be to make possible exports at advantageous prices and that this can be done only by tariff negotiations. If we can make them understand this, we have a fairly appealing argument.

8. *Conclusion.* Mr. Ball said the main purpose of the meeting had been to have a discussion and that was accomplished. He would find it most difficult to give the consensus of the meeting.

**451. Memorandum from Ball to President Kennedy, October 23<sup>1</sup>**

October 23, 1961

SUBJECT

Obtaining the Tools Necessary to Meet Our Negotiating Requirements in a Trading World Undergoing Revolutionary Changes

Mr. Petersen's memorandum ably argues the proposition that you should request the next Congress to extend existing trade agreements legislation with modifications to reduce the restrictive effect of the "peril point" machinery. Mr. Petersen bases the case for staying generally within the traditional pattern on the contention that this is the most authority that can be obtained in the present atmosphere of conservatism and protectionism.

I do not agree with Mr. Petersen's underlying assumption or with the proposals that he erects upon it. I am convinced that a more radical approach might yield better tactical results. Even granting that Mr. Petersen is correct in his pessimistic appraisal as to what Congress might ultimately accept, I feel moreover that it would be unwise to concede so much at the outset.

But the issue does not have to be posed with such narrow options. The times and the circumstances call, I feel, for a quite different approach.

I urge, therefore, three propositions:

---

<sup>1</sup> Trade legislation: Ball's counterproposal. Confidential. 15 pp. Department of State, Central Files, 411.0041/10-461.

1. The mere renewal of negotiating authority within the structure of traditional trade agreements legislation, even though modified as proposed by Mr. Petersen, is not good enough for our purposes. It would not provide us with the powers we need if the United States is to make full use of the opportunities and avoid the dangers implicit in the newly emerging trading world.

2. The requirements of this new trading world make it necessary for the Executive to be equipped with a whole new arsenal of tools.

3. The Administration should not seek new trade agreements authority in the 1962 Congressional session. We should devote the next year to an intensive education of the American people and the Congress in the nature and significance of the new world trade patterns that are now emerging. As soon as those patterns become clearly defined, we can design the tools we need, tailoring them so as to enable us to deal effectively with these new conditions. We should request the legislative authority for such tools in the 1963 Congressional session.

## I

### THE CONDITIONS OF WORLD TRADE ARE RADICALLY CHANGING

Between now and the end of next year the following developments will shape a new trading world:

(A) *The British Government's application for membership in the European Community will, if successful, unite the major trading nations of Western Europe in a single vast market.* The conditions for trade negotiations will this be fundamentally altered.

Traditionally the process of negotiating industrial tariffs has been characterized by a large number of nations each seeking to make a satisfactory bargain with the nation that is the principal supplier of each product. The results have been generalized through the application of the most-favored-nation principle.

In the new trading world the principal suppliers of the greatest proportion of industrial products will be contained within two markets—the United States and the expanded EEC. The task of American negotiators will be to trade off reductions in the common external tariff of the expanded EEC against reductions in our own trade barriers, while again applying the most-favored-nation principle.

We shall never achieve our objectives if our representatives are limited to trading on an item-by-item basis. The internal tariffs of the expanded Common Market are being eliminated by a phased series of across-the-board cuts. If the differential between external and internal tariffs is to be substantially lowered (and we must reduce this differential if we are to avoid having our exports placed at a major disadvan-

tage) the common external tariff of the EEC must also be reduced on an across-the-board basis. This in turn requires across-the-board action on our part.

It is impossible to achieve this result if on our side we retain the obsolete machinery of "peril points" as Mr. Petersen recommends. The use of peril points, no matter how liberally defined, would inevitably require highly selective, product-by-product tariff negotiations inconsistent with an across-the-board approach.

*(B) Over the next year, trade in agricultural products, both temperate and tropical, will become a major issue in international relations. Trade agreements legislation in the traditional pattern is neither relevant nor adequate to deal with these products.*

Two developments are bringing about this situation:

First, the arrangements for the adherence of the United Kingdom to the Common Market necessarily involve a solution of the highly complex problem of Commonwealth preferences. These preferences affect both temperate and tropical agriculture. Their solution is related, in turn, to the system of preferences presently extended to the Associated Overseas Territories of the Common Market.

These preferential systems must ultimately be eliminated in order to avoid discrimination against our domestic producers and producers in Latin America. Yet these preferential systems can be adequately disposed of only if we are in position to cooperate in the development of global arrangements for important agricultural commodities. We began exploratory negotiations along this line with respect to certain tropical products as early as last February. Within the past fortnight we have begun preliminary talks regarding possible global arrangements covering key temperate agricultural products.

Second, Western Europe is on the verge of becoming a net surplus agricultural producer. The technological revolution in farming methods has already achieved this result for France. As the results of the revolution are more widely applied, both the United States and Europe will be spewing out surpluses to the remaining parts of the world, which, under present conditions, will be unable to pay for most of them.

The imminence of this problem requires that we work with European and other major agriculture producers, to arrange for the coordination of pricing policies. This is necessary if we are to protect our diminishing market position. In addition we must seek to establish the machinery for orderly marketing arrangements around the world and closely coordinated operations for the provision of surpluses on non-commercial terms to the underdeveloped nations.

Legislation providing the traditional pattern of reciprocal trade agreements powers would be irrelevant to, and thus totally inadequate

for, the pioneering task of forging a system of global agricultural arrangements.

(C) *The present decade of economic development is generating many new low-wage sources for primary commodities and industrial goods which must be accommodated in world markets. Their problems cannot be solved with traditional trade legislation.* The success of our foreign aid programs may well turn, in the case of a number of key countries, on the ability to solve their export problem.

To a large extent we hope to be able to meet the problems created by an improved production of primary products through global commodity arrangements. But, as is explained later, we shall also need a new bargaining mechanism for assuring that a wide range of raw materials from underdeveloped countries are granted free entry by the advanced countries.

The trading problems that will result from widespread industrialization will be even more sensitive and difficult than for primary products. I cannot overstate the pressures that will be generated as the underdeveloped countries pour out larger and larger quantities of labor-intensive manufactures onto world markets. We have had a foreshadowing of this problem in the case of textiles during this past year. I do not recommend that the pattern of the Geneva textile agreement should be generalized—it was merely an effort to make the best of a bad bargain. But the continuance of the existing pattern of trade-agreements legislation is clearly inadequate to deal with the problem.

## II

### TO DEAL EFFECTIVELY WITH THE CONDITIONS OF THE NEW TRADING WORLD WE SHALL NEED A NEW KIND OF TRADE LEGISLATION

The trade agreements legislation passed in 1958 authorized a twenty percent cut in tariffs over a period of four years. This was intended to enable the United States to negotiate reductions in the common external tariff of the EEC in phase with the reduction in internal tariffs as provided by the Rome Treaty. In practice, however, the bargaining authority of our negotiators was eroded away before the negotiations began. This resulted from the operation of internal procedures developed over the long history of trade agreements legislation, including the “peril point” machinery.

When bargaining began our representatives found themselves in position to offer tariff reductions equivalent to less than 5% cut in our industrial tariffs in exchange for the 20% across-the-board cut we were seeking in the common external tariff for industrial products of the EEC.

This one time we shall probably be able to achieve close to a 20% across-the-board reduction on industrial tariffs from the Europeans in

spite of the weakness of our own bargaining posture. But this will require a major breaching of "peril points" on our side. Besides, we cannot expect that the Europeans will be so generous with concessions in the future. Their current willingness to treat us liberally springs in large part from the fact that the United Kingdom and the EEC have a motive for reducing their industrial tariffs in cadence because they wish to facilitate the merger of the United Kingdom into the EEC trading system. But during the next year that merger should be consummated. Thereafter the expanded Common Market will have no similar incentive for generosity.

We should not, therefore, take much comfort from this experience. In order to protect American trading interests in the future we shall need a much more powerful piece of negotiating machinery than that offered by legislation in the traditional framework of the trade agreements act, even as modified by Mr. Petersen.

The drafting of legislation adequate for the new trading world will involve the radical revision of the concepts that have circumscribed our trading powers in the past.

Most important of all we must not merely redefine but, in fact, eliminate the concept of injury. I suggest the substitution of a new concept which might be called "absorbable adjustment".

The genius of a dynamic industrial economy is its adaptability. Our economy has adjustments forced upon it every day by changes in public taste, population shifts, the application of new technology, the refinement of automation techniques, etc. Compared with these normal adjustments those brought about by tariff reductions are marginal. The adjustments that would be required even if we were to eliminate industrial tariffs entirely would, in fact, be relatively small for the economy as a whole. But admittedly they would fall heavily on certain industries.

If we are to meet the demands of the times it is imperative that our new trade legislation recognize that the process of tariff reduction involves the acceptance of structural adjustments in individual industries. European industry already has accepted this concept, with some startling effects upon investment and innovation. For the most part the required adjustments take the form of the shift of resources from one type of production to another, design changes, the substituting of materials, etc.

Up to a certain limit of tolerance individual industries and companies might be expected to assume the burden of such adjustments for the good of the economy as a whole. This is the assumption implicit in many types of legislation—taxes, regulatory arrangements, etc.

Beyond that limit of tolerance the adjustments should be cushioned by the provision of Federal assistance to facilitate the conversion to

new types of production, the modernization of plant, the retraining of workers, etc.

Beyond a certain further limit it would probably be necessary to restrict, or at least to provide a long transition for, tariff reductions. And in addition a limited list of products, for one reason or another, might have to be dealt with by special agreement, as in the case of List G items under the Rome Treaty.

We should not deceive ourselves as to the need for this conceptual change. The opening up of the trading world will be possible only if we are able to secure the acceptance of the concept of “absorbable adjustment” by the United States industrial community. This acceptance implies a repudiation of the traditional concept of “injury”—and there is great reason for making this explicit. The very fact of forcing a debate in Congress on this new concept would be a means of educating the Congress and the American people to the requirements of an adequate philosophy for approaching the whole trade problem.

Other changes in nomenclature as well as concept would be useful. I have already recommended that the new legislation not be treated as merely an extension of the trade agreements pattern; I would, in fact, suggest that it should be given a fresh name. The new proposals might take the form of a “Trade Expansion Act”.

(A) *We may require legislative authority to negotiate global arrangements for agricultural products.*

An adequate trade bill should not be limited to creating a mechanism for a reduction in barriers to the movement of industrial products. It should provide the President with the authority he needs to undertake the kind of global arrangements for agricultural products both temperate and tropical which have been outlined earlier in this paper. Just what form this authority should take deserves further study as the form of such arrangements becomes clearer.

(B) *The new legislation should provide for dealing with the products of the less-developed nations.*

As has been mentioned before we must provide techniques for assuring access to world markets for the products of the less-developed nations. Two types of legislative authority may be necessary for this purpose.

First, we should have authority to bargain with other industrialized countries for agreements under which the industrialized world as a whole will provide free access for a wide range of raw materials produced for the most part by the underdeveloped nations south of the equator. This power would complement the powers to work out global agricultural arrangements which we have mentioned earlier.

Second, we should design new mechanisms for the orderly acceptance of an expanding volume of labor-intensive manufactures pro-

duced by the underdeveloped nations. The textile agreement was an improvisation and its techniques should not be generalized. But we should seek to devise longer-term plans that might be facilitated by new powers provided in a new trade bill. This is a problem of considerable urgency. It should be given a great deal of attention by the interested Departments of the Government.

### III

#### WE SHOULD POSTPONE THE SUBMISSION OF NEW TRADE LEGISLATION UNTIL 1963

##### *(A) Action Recommended.*

Instead of asking Congress for legislation during the coming session we should give serious consideration to postponing the submission of a program until 1963. Meanwhile the Congressional leadership should be consulted as to whether the existing Trade Agreements Act need be extended for one year or whether we should let the authority under existing legislation lapse next June 30. So far as existing trade agreements are concerned, a lapse of one year or so is of small practical consequence. The domestic political consequences might, however, be different.

While we recommend that the decision be made now to postpone submission of the legislation we do not recommend that the decision be announced in those terms. Instead we would suggest a program along the following lines:

(1) The appropriate Administration leaders should in a series of speeches make clear to the American people that developments now in process in Europe and around the world are resulting in a wholly new free world trading pattern.

(2) They should make it clear that the Administration is determined to press on toward even more liberal policies. It intends to advance such measures as are necessary to enable American industry and agriculture to take advantage of the expanded opportunities that the new trading world will offer while at the same time defending the vital interests of the United States economy.

(3) To this end the Administration is working on a whole new set of tools to enable it to deal with the requirements of the new trading world. Those tools cannot be finally designed until the shape and pattern of the new world become more clearly evident. But the Administration should announce that as soon as that time arrives it proposes to go to Congress with a basically new trade bill.

(4) In the course of these public statements we should make it clear that we recognize the revolutionary challenge and opportunity offered by the growth of the European Economic Community. We should emphasize that we see in its growth a partial answer to Khrushchev's challenge of economic competition issued to the free world in his speech at the XXII Congress.

(5) We should emphasize also that there are values in the mutual opening of the European economy and our own to each other and to friendly third countries. The acceptance of this new competition offers us a spur to innovation and an important check on the wage-price spiral.

(6) We should also make it clear that any Administration proposal will include provision for adjustment assistance to facilitate the redeployment of labor and capital to more productive and competitive pursuits in the United States economy.

The reasons for recommending the postponement of the submission of trade legislation fall into two categories. One is substantive; the other is based on a political judgment.

*(B) Arguments Favoring a One-Year's Postponement.*

*(1) Substantive Arguments.*

*(a) Interference with the UK-EEC negotiations.*

If we engage in a trade legislation fight in the United States Congress during the time when the most intricate negotiations are being carried on between the UK and the EEC we shall run the grave risk of "cross-talk". The resultant passions, pressures, and misapprehensions could gravely endanger international relationships. They could also impede our own ability to influence the shape of the newly emerging European arrangements while seeking at the same time to protect our trading interests.

The process of negotiation initiated by the British application to the Common Market countries will be complex, delicate and difficult. Involved in this negotiation will be the whole delicate problem of evolving and substituting a new trading system for the existing preferential systems both of the Commonwealth and of the Associated Overseas Territories of the Common Market. It will mean a tense and difficult period for the neutral members of the OECD as well as for other Free World countries whose interests will be intimately involved.

At certain points the United States Government will have to become intimately involved in the negotiating process. At other points it will be just as necessary for us to remain aloof. If the United States' interests are to be adequately protected the Executive must maintain the closest control over our relationships with this negotiating process.

There are great hazards in inviting a Congressional debate on trade legislation at a time when this intricate process of negotiation is going forward. By doing so we run the risk of focusing all the forces of United States protectionism on the UK-Common Market negotiations and of having our own ability to negotiate embarrassed by imposed Congressional restrictions or by ill-advised and ill-informed Congressional speeches. A trade debate at such a time would be more likely to evoke Congressional insistence that the United States act to impede the devel-

opment of the Common Market than on providing the tools for well-conceived US moves to influence the shape and form of the Common Market in a direction compatible with our long-range political and economic interests.

At the same time that our own bargaining position in Europe might be impaired by the Congressional debate, the protectionist forces in the United States would be provided with potent ammunition by speeches and statements made in Europe in the course of the Common Market negotiations. The dangers of such "cross-talk" are formidable.

*(b) We cannot yet foresee the precise shape and character of the new trading world.*

Until the European negotiation has progressed much farther it will be difficult to predict with precision the form which the new trading world will take. As a consequence we cannot ask Congress with full confidence for the precise tools that we will need to protect our interests within that trading world.

It may be argued, of course, that our failure to ask for new trade agreements legislation in the Spring would weaken our ability to influence the negotiations in Europe. On the contrary we feel that if we submit to Congress traditional trade agreements legislation, even as modified by Mr. Peterson, we would betray to the Europeans that we were not going to have the tools to deal with the problems. We are on the strongest basis if we say to the Europeans that if this or that arrangement is made we shall undertake to obtain from Congress the authority that we need to play our part. The experience of both the UK and the EEC with our last piece of trade legislation (the 1958 extension) has convinced them that we will not be able to play a major role if we are not equipped with better weapons.

## *(2) Political Reasons.*

In the present climate—or the climate likely to prevail next Spring—neither the Congress nor the American people is likely to grant the United States Government the powers necessary to deal with the new trading world. At the moment neither the Congress nor the public has more than a dim perception of the revolutionary nature of the change taking place in the trading world. Hopefully the accession negotiations will be completed in about a year. At that time it should be generally apparent that we are dealing with a totally altered trading world—a world which presents enormous opportunities for the expansion and development of American industry provided we are able to take the necessary negotiating steps which the conditions require.

If we carry on a systematic program of education in the meantime American opinion should be ready by the spring of 1963 to grant the kind of authority we shall need.

That will not be an election year and hopefully unemployment will have declined from its present high level.

**George W. Ball**

**452. Memorandum from Petersen to President Kennedy,  
October 26<sup>1</sup>**

October 26, 1961

My associate Mr. Myer Rashish has made an analysis of the fundamental differences between the two approaches suggested by me and Under Secretary Ball on tariff policy. Although it tends to over-draw the sharpness of these differences I think it helpful in delineating the fundamental problems.

Under Secretary Ball suggested that I forward it to you for your consideration. I hate to burden you further with reading material but the importance of the question would seem to warrant it.

**Howard C. Petersen**

**Attachment**

**THE CONTENT AND TIMING OF US FOREIGN TRADE  
LEGISLATION**

The following views are set down in an effort to make a contribution to the resolution of the issue of the kind of trade policy legislation the Administration should recommend and when it should recommend it. I confess that I do not feel any great degree of confidence that I know which course to take. There are too many aspects of the issue which I know too little about to offer a judgment that is persuasive.

I do fear, however, that whatever decision is made, there is danger that it will be made for the wrong reasons and without a clear appreciation of the implications of the alternative courses of action. The following discussion is, therefore, animated by the hope that it will

---

<sup>1</sup> Transmits analysis of differences between Ball and Petersen approaches to foreign trade legislation. Confidential. 6 pp. Kennedy Library, Petersen Papers, Trade Legislation, 1/13/62–11/5/62.

contribute to a more reasoned and informed decision, whatever that decision may be.

### *The Two Approaches*

There is, it seems to me, a basic difference in concept behind the approaches identified with Howard Petersen on the one hand and George Ball on the other. I suggest that the following characterizations of these two approaches will reveal the underlying differences between them:

1. The Petersen approach starts from the basic premise that the fundamental purpose of the next step in the US trade policy should be negotiation with the Common Market for the purpose of moderating the margin of discrimination inherent in its external common tariff so that American exports can maintain their access to this vast and growing market. The approach is essentially an "economic" one. It finds its basic logic as well as its argument in the need to expand American exports. It draws for support on the fairly conventional range of arguments in support of liberal trade—expanding trade, efficiency, lower prices, free world cohesion, etc.—plus the new one of the US balance of payments problem whose resolution requires the discipline of the international market place. Given these objectives of trade policy, it concludes that (a) the United States should husband its negotiating power in order to gain the maximum leverage on the common external tariff for the benefit of American exports (in contrast to the exports of other countries), and (b) since American export interests are only one among a host of economic interests involved in trade, of which the interests of import-competing industries are the most important countervailing ones, due regard must be paid to the interests of import-competing industries in the construction of our trade policy. The implications of these two conclusions are that our negotiations for tariff reduction must necessarily be selective in character because (a) we necessarily will be selective in the bargain that we want to strike since we wish to maximize the opportunities for American exports, and (b) selectivity is necessary to take account of the differing circumstances and interests of domestic import-competing industries.

The recommendations for legislation therefore necessarily take on what appears to be a more or less conventional cast. The peril point concept is, in general, preserved as is the escape clause provision, although the content of each is substantially modified. There is a minimum of tinkering with the accepted forms and rubrics of the trade agreements legislation. The next extension is designed to have an organic continuity with the 27-year history of the trade agreements act. Its ethos is to a substantial degree the same as that which has animated the policy over this period. It is bolder in negotiating author-

ity and less protectionist in its “safeguarding” provisions because our present needs and those of the foreseeable future call for a bolder and more aggressive approach if we are to succeed in achieving the objectives which have been basic to the program since its inception.

2. The Ball approach starts from a different premise. It views trade policy as an essential instrument of foreign economic policy and one which must be adapted to the new set of circumstances confronting the United States position in the world. It emphasizes the newness of these circumstances and, even more, the newness of the objectives which we must have.

In his exposition, Ball is less explicit than one may wish but it is fair to say that the objectives which he emphasizes are basically of a political character. They involve the organization of the Western community. In brief, he visualizes a much more intimate and cohesive institutional and political relationship between the United States and Europe (and including as well Canada and Japan). The evolution of European economic integration from the early OEEC through the Coal and Steel Community, the Common Market of the Six and now the broader Common Market of Western Europe will inexorably extend to a broader arrangement embracing the North Atlantic countries as well. The OECD is the beginning of the institutional apparatus that will serve the broader Atlantic community. As it has within Europe, commercial policy will be the first bridge to the larger regional economic undertaking.

To serve these objectives, he would contend, commercial policy must make a clear break with the past. Although it must necessarily have conventional, commercial undertones comparable to those discussed in the Petersen approach (and indeed it must rely on the economic advantages to the United States economy in support of the innovations in American policy that are indicated), it must be much broader, bolder and ambitious in scope and conception. It conceives our objectives in trade policy as involving an approach to free trade within the Western world on an MFN basis. It addresses itself to areas of problems in trade relations that are not part of the traditional configuration of trade agreements policy, e.g. the treatment of temperate agricultural products, the treatment of exports of manufactures by the developing countries, etc. In fact, this approach comes close to saying that we can afford to dismantle all tariffs because they are an imprecise and irritating way of trying to manage international trade; that international trade on the whole should not be managed; but that where special problems arise that require management, they should not be managed on a unilateral basis (e.g. the escape clause), but through the development of internationally agreed upon arrangements that will force the concerting of policies (including domestic policies) among the participants in the particular areas under consideration.

This approach concludes that we must make a clean break with the past because what we propose to do in the future will be different from what we have done in the past. It suggests further that such a departure and innovation can only be supported if it is rationalized in terms of overriding political needs and considerations and that, in fact, such needs and considerations do exist.

### *The Question of Timing*

The above does not represent an exhaustive treatment of the different approaches, nor does it do justice to either. Each approach has displayed more of the characteristics of the other than has been suggested. I have emphasized the differences because it is the differences between the two approaches which have to be clearly understood in order to appreciate the difference in attitudes with regard to the question of timing. It is my contention that the differences on the question of timing relate directly to the differences in concept as to what the needs and requirements of US foreign trade policy are.

1. The Ball approach leads to the conclusion that we had better defer action beyond 1962. He has adduced a variety of reasons in support of his recommendation. The essential reasons seem to be to be the following:

We have not begun to appreciate and to understand the needs and requirements of US foreign trade policy. It will not be long, however, before these become apparent to us and with the negotiation for United Kingdom membership in the Common Market, and the broadening of the Common Market to virtually the whole of Western Europe, the important issues will soon become apparent. Moreover, in the field of international politics, crises in the West will soon make plain the need for measures to coordinate and fix a common Western policy in the military-political area. Because these needs are not yet felt or understood, it would be folly to make a move on trade policy in 1962. To do so would commit the US Government (and the Congress and public opinion) to a course of action that may within a year or two become patently inadequate. The result will be that we will not be in a position to come back to Congress for the right kind of authority before the 1962 extension of the trade agreements legislation expires and this may be too late.

The other arguments advanced by Ball are ancillary in character. The most important of these is the question of prejudicing the next stage (extension of the Common Market to the whole of Western Europe) in the evolution of an integrated Atlantic community. The launching of a great public debate on trade policy could have the adverse consequence of creating hostile attitudes toward European integration in the United States as a result of the fact that such integration would have

discriminatory consequences for US foreign trade. This result would be insured because the Administration would have to support its 1962 recommendation precisely on the grounds that, without negotiating authority, we will be foreclosed from access to the Common Market and this will have profoundly adverse consequences for our economic position. The ingredient of fear which must always be present cannot be controlled and may be transformed into hostility. If this should happen, the prospect for the evolution of a truly Atlantic community will have been seriously impaired. The European negotiations will go forward on the basis that there is no prospect for constructive accommodation with America in the future and native isolationist instincts in the United States will have been reinforced. The achievement of our long-term objectives will then have been frustrated with the consequence that the total Western position vis-à-vis the Soviet bloc and vis-à-vis the less developed areas of the world will have been seriously compromised.

2. The Petersen view is not unmindful of the longer term political-institutional objectives of US policy with regard to the West. It regards these, however, as possible of achievement sometime in the more distant future. It views the approach by the US to these objectives as being necessarily more gradual and evolutionary. The UK-EEC negotiations are currently in progress and will not be concluded until late in 1962. A number of important trade policy issues will arise from these negotiations which will be of direct interest to the US and to Latin America, Japan and other countries for whose economic welfare we have a concern. These issues must be resolved in a satisfactory fashion and this can only be accomplished if the President is equipped with authority so that he may, during the course of these negotiations, be able to exercise an influence from a position of strength. If the Congress does not act, our position will be uncertain and the European negotiations may lead to results which will be very difficult, if not impossible, to undo. Moreover, with regard to the general issue of negotiating reductions in tariff levels, a major step such as broadening of the EEC to include the UK and other OEEC countries cannot be expected to be followed immediately by radically new departure in trade policy which would embrace the Atlantic community. A gestation period will follow and it is during this period that we can undertake negotiations for the significant reduction of tariffs, particularly on industrial products.

It concludes that American approaches even toward the long-run goals (which, in its view, should probably not be articulated at this time) must, at best, proceed along the traditional path of gradual, though substantial, negotiated reductions in tariffs. The Petersen view might even agree that the 1962 extension of the trade agreements legislation would be the last extension of the legislation and that the broad

scope of the issues in the field of trade policy that will have to be treated in the future will not permit the use of conventional techniques, but might involve, for example, the use of the treaty device. Under the present circumstances, however, it regards discontinuity in the trade agreements legislation as a disadvantage, as a loss of forward momentum, and a mark of indecision. In short, it views the trade issues that confront us today as being more difficult and requiring more activity and forthrightness on the part of United States policy, but not as being different in essential character from those that we have confronted and have attempted to deal with, particularly in the last few years.

I would, therefore, suggest that these two approaches are more different than has generally been accepted in the discussions that have gone forward in recent days. They represent a different concept of needs and objectives and these differences are reflected in the differing views on the content of legislation and its timing. The basic policy objectives must be resolved first before either the substance of policy or the timing of the legislation is decided.

The following is, at least, a partial catalogue of the questions that have to be answered before we can come to an intelligent decision:

1. What should our basic long-term policy objectives in the field of trade policy be and how do they relate to our broader political objectives?
2. Can they be articulated and supported adequately so that we can move in 1962 or would they be compromised by acting now?
3. What is disposition of Europeans, Canadians, Japanese toward these objectives? Can they be expected to subscribe to them and when?
4. What bearing do the European negotiations have on the attainment of these objectives? Will these negotiations prejudice the attainment of US objectives or must we accept the results (on European terms) of these negotiations as a prerequisite to the attainment of US objectives?
5. Should we desire to do so, how can we best influence these negotiations to produce results which are consistent with US interests? Can we do this better with or without negotiating authority for the President? Can the issues be identified sufficiently clearly now so that we know what kind of negotiating authority is needed?

# November 1961

## 453. Despatch 416 from Tokyo, November 13<sup>1</sup>

Tokyo, November 13, 1961

### SUBJECT

First Meeting of the Joint United States-Japan Committee on Trade and Economic Affairs, November 2, 3, and 4, 1961.

### I. *Introduction*

This despatch, together with the additional references cited immediately below, contains the full record of the first meeting of the Joint Committee which took place in Hakone November 2–4, 1961. As agreed during the preparatory discussions between the two countries, no verbatim record of the Conference was made and the only official account of the Conference proceedings is the final communiqué. Each side was responsible for maintaining its own record. The attached report constitutes the record as compiled by the U.S. rapporteur, and approved by the senior advisors from the Embassy who attended the Conference. Time did not permit any portion of this record to be reviewed by the U.S. members themselves.

It proved possible during the Hakone Conference to utilize simultaneous interpretation only when statements were available in written form sufficiently in advance of oral delivery for translation into Japanese. With a view to conserving Conference time for spontaneous interchange of opinions, both the Japanese Ministers and U.S. Cabinet officers delivered a number of “lead-off” statements on various agenda items from prepared texts. All such statements which were made available to the U.S. rapporteur are reproduced as enclosures to this despatch.

Additional Embassy reports on the Hakone Conference are:

Embassy Despatch 398, November 3—Text of opening addresses by Prime Minister Ikeda, Foreign Minister Kosaka and Secretary Rusk.

Secto 12, November 2—Telegraphic resume of morning and afternoon sessions November 2.

Secto 16, November 3—Resume of November 3 meeting.

Secto 21, November 4—Text of final communiqué.

---

<sup>1</sup> Record of first meeting of Joint U.S.–Japan Committee on Trade and Economic Affairs. Official Use Only. 25 pp. Department of State, Central Files, 411.9441/11-1361.

## *II. Morning Session, November 2, 1961*

### *A. Opening Ceremonies—9:00–9:15 A.M. (Televised)*

Prime Minister Ikeda welcomed the U.S. members of the Committee, referred to his faith in the role of the Committee in strengthening the ties of partnership between Japan and the U.S., and expressed the hope that the meetings would permit both sides to chart the future course of economic relations between the two countries with free and unbiased minds. Foreign Minister Kosaka, in his opening statement, drew special attention to the significance of the Committee as an organizational forum for economic cooperation between the two countries and the absence, heretofore, of such a link which the OECD provides in U.S. relations with Western Europe. Secretary Rusk, in his formal response, emphasized that the purpose of the meeting was to consult rather than to negotiate; he assured the Committee that the U.S. is committed to a liberal commercial policy and that he foresaw no necessary limit to the expansion of mutually profitable exchange of goods between the two countries which President Kennedy's Administration intended to encourage. For full texts of the three foregoing statements see Embassy Despatch 398, November 3.

### *B. Restricted Session—9:20 A.M.–12:00 Noon*

Foreign Minister Kosaka began with several procedural announcements including the designation of members of the committee to draft the final communiqué (on the Japanese side, Deputy Vice Foreign Minister Shima, and Messrs. Kato, Tsurumi, Ueda, and Nara; on the U.S. side Assistant Secretary Martin, and Messrs. Feldman, Hatcher, Lindley, and Doherty). Kosaka drew attention to the 8-point agenda which had been developed for the Conference:

1. General survey and outlook for Japanese and American economies.
2. Current financial and balance of payments situation in the two countries.
3. Wage systems and labor productivity in Japan and the United States.
4. Expansion of trade and promotion of economic relations between Japan and the United States.
5. Promotion of Japanese and United States economic and commercial relations with other parts of the world.
6. Economic assistance to less-developed countries.
7. Proposals for stabilizing primary commodity prices and their relationship to terms of trade.
8. Other business. [Which would include the political and security implications of national economic and trade policies, including consideration of recent developments in the economic policies and tactics of the Communist Bloc.]

Kosaka stressed there was no need to adhere rigidly to the order of the agenda which he said was drawn up purely to assist him as Chairman in guiding the discussion. Secretary Rusk's response to Kosaka's invitation for comments on conference procedure included the comment that great countries such as the U.S. and Japan have a considerable number of issues requiring solution and that it is in the nature of free economies that there is always unfinished business. He said there were pressures from nationals on both sides to take up matters of special interest but if the Committee were to create an impression that it had attempted to negotiate specific issues and failed the great basis of agreement which does exist between the two countries would thereby be underestimated. The Secretary said this unprecedented committee must not be used to negotiate specific issues or there would be enormous pressure to extend the mechanism to bilateral relations with other countries which the U.S., for its part, did not contemplate doing. The Secretary concluded his remarks with the hope that both sides would remember to stress common interests when dealing with the press.

Minister Kosaka suggested State Minister Fujiyama and Dr. Heller lead off on agenda item 1—General Survey and Outlook for the Japanese and American Economies.

Minister Fujiyama delivered a prepared statement, the text of which is reproduced as *Enclosure 1*. As can be seen therein, the main emphasis of Mr. Fujiyama's presentation was the importance of exports as the determining factor in Japan's ability to carry out its ten year plan and the vital role of the U.S. as an export market for Japan's goods; the statement also reflected Japan's unhappiness over "Buy America" and "Ship America" policies, textile import restrictions, etc.

Dr. Heller's opening presentation dealt with (a) the U.S. economic outlook, (b) "the hard policy questions, even dilemmas we face", and (c) implications of U.S. economic policy for areas of mutual Japanese-American interests.

Dr. Heller said at the outset of 1961 the U.S. was plagued by a \$50 billion gap between U.S. actual output of \$500 billion and the U.S. potential output of \$550 billion (annual rates). This gap was the result of a mild recession which was super-imposed on an incomplete recovery in 1959–60 from the previous recession. The gap was reflected in a 7 percent unemployment rate and over 20 percent excess or idle capacity in industry. Natural cyclical forces plus vigorous government action produced quick improvement in 1961: GNP rose from \$500 billion in the first quarter to \$515 billion in the second and to \$526 billion in the third quarter. Dr. Heller said he thought the present quarter would remain close to \$540 billion.

Turning to the prospect for 1962, Dr. Heller said the GNP should reach \$565 billion in the second quarter, a 13 percent recovery from

the first quarter of 1961. (i.e. the same rate of recovery as took place after the recessions of 1954 and 1958.) Output for 1962 as a whole was expected to be in the range of \$565–570 billion. Unemployment was expected to drop to about 5 percent by mid-1962.

Dr. Heller said the basic policy question the U.S. faces is: can we achieve full recovery and faster growth and still maintain reasonable price stability and progress toward equilibrium in our balance of payments? With regard to the prospects for full recovery, Dr. Heller drew a distinction between positive and negative aspects: on the positive side, full recovery would depend on rising plant and equipment investment and further increases in consumption and government expenditures. Beyond mid-1962 Dr. Heller said the picture was not yet clear in terms of the source and composition of demand required to make use of the economy's expected capacity to produce at a rate of over \$600 billion. On the negative side, Dr. Heller said full recovery depends on the price level and balance of payments questions; should U.S. prices rise or the b/p situation worsen, restrictive monetary and fiscal measures might be needed before full equilibrium is reached. Dr. Heller said he hoped this would not be necessary, noting that expansionist monetary and fiscal policies had been followed thus far in 1961 and that the outlook was for the continuation of a relatively easy money policy. Before the Berlin crisis, Dr. Heller said there had been hope for a tax reduction but this had now vanished.

Dr. Heller said much the same dilemma exists with regard to policy for economic growth. The ability to change the  $2\frac{1}{2}$  percent rate (at which the U.S. economy has been growing in recent years) to achieve its current potential of  $3\frac{1}{2}$  percent and to achieve the objective of a  $4\frac{1}{2}$  percent rate involves the same dilemma and requires the incentive of full utilization of resources. Dr. Heller looked to equipment investment and consumption as the prime contributors to a 4 or  $4\frac{1}{2}$  percent growth rate.

Turning to policy problems bearing on mutual interests, Dr. Heller made a statement which became one of the focal points of discussion during the remainder of the Hakone Conference. He said Japan has a vital stake in full recovery and faster growth in the U.S.: with a GNP of \$565 billion in 1962, U.S. merchandise imports could be expected to rise to \$15½–16 billion from the current level of \$13.6 billion (approximately 3 percent of U.S. GNP). Dr. Heller also said the figures do not tell the full story because liberalization of trade thrives on full employment and recovery. Japan also has a vital interest in price stability and b/p equilibrium in the U.S. Regarding prices, Dr. Heller noted that Japan's interests were somewhat conflicting in that higher U.S. prices would lead to larger Japanese exports but that U.S. price stability would contribute to higher U.S. growth rates which, as noted above,

would redound to the benefit of Japan's exports prospects in the U.S. Dr. Heller also noted a similar conflicting interest in b/p considerations: While Japan had an obvious interest in increasing its exports to the U.S. to help its own payments problems, a deterioration of U.S. accounts could lead to the imposition of additional restrictive measures by the U.S.

Dr. Heller closed by observing that it was necessary to strike a proper balance between a desirable expansion of U.S. imports and improving the U.S. competitive position on the one hand while avoiding b/p complications on the other. He suggested the Conference could make a significant contribution to this problem of mutual concern.

Minister Kosaka opened the meeting to questions on the two initial statements. Fujiyama and Dr. Heller engaged in a series of questions and answers in which the following points were brought out: the expectation of a \$570 billion GNP is the anticipated result of a series of programs initiated by the Kennedy Administration plus natural growth factors expected in the course of 1962. A policy of easy money will continue in the U.S. and the federal budget will move from a deficit to a surplus in the first half of 1962. In Dr. Heller's view, the anticipated \$2 billion increase in U.S. imports under the expanded GNP he had forecast implied that Japan's exports to the U.S. would also increase, maintaining approximately the same relative share of total U.S. imports as at present. U.S. policy for recovery from the recession was a combination of measures including easy money and the stimulation of growth through increased expenditures on education and training. To stimulate business growth a plan for special tax credits for plant investment had been drawn up. The Berlin crisis had given rise to increased military expenditures (which Secretary Rusk pointed out had been raised by \$6 billion (annual rate) since the beginning of 1960) which had a stimulating effect on the economy; both Dr. Heller and Secretary Goldberg stressed how much the Administration would have preferred a tax reduction instead.

Replying to Minister Sato's inquiry, Dr. Heller confirmed that the prospects for the U.S. he had presented took into account trends in the international economy with particular reference to Europe where, Dr. Heller said, the consensus was that there would be a slower rate of growth because that area was in general operating at full employment and full capacity.

Secretary Rusk asked Mr. Fujiyama to comment on the role of the government in giving guidance to Japanese industry with a view to carrying out the ten year plan for doubling the national income. Fujiyama replied that in a free economy such as Japan, the role of government is rather small. The goals set by the ten year plan were established in the first instance by a special commission composed of economists

and representatives of industry; government policy employs these goals as guides in determining action in fiscal, monetary and trade fields. With the actual growth rate nearly double the 9 percent planned rate because of excessive equipment investment in anticipation of liberalization, it was the role of the government at this stage to take measures to reduce the rate of equipment investment and so reduce the growth rate to a more healthy and stable figure. Replying to Dr. Heller's inquiry concerning inflationary measures in Japan, he said wholesale prices were remaining steady with the exception of lumber but retail prices had risen 4.7 percent since last year, occasioned largely by wage increases in medium and small scale industry, plus increased charges for services; he said the government was not considering measures to encourage savings and to suppress consumption somewhat. Dr. Heller raised two other questions: Has Japanese monetary policy been effective and how does the government's plan to reduce taxes fit into the general picture of the Japanese economy at present which is characterized by high consumption and high investment? Mr. Fujiyama's brief response was to the effect that the GOJ must consider the need for a tax reduction as well as the need for additional funds for public welfare (sic).

After a brief coffee break, Minister Kosaka called on Finance Minister Mizuta to lead off on agenda item 2. The latter's prepared statement is reproduced as *Enclosure 2*. The Financial Minister declared that the deterioration of Japan's international account differed from earlier crises in that it reflected basic trends in Japan's position in the international economy rather than temporary factors such as speculative imports; consequently he anticipated considerable difficulty in regaining balance in Japan's accounts and, in this context, requested U.S. assistance and cooperation, especially in the field of short term capital from U.S. commercial banks and the Export-Import Bank to permit continued coverage of the current account deficit by capital account receipts.

Under Secretary Fowler made a lead-off statement for the U.S. on agenda item 2 with a prepared statement, the text of which is reproduced as *Enclosure 3*. Mr. Fowler's presentation laid stress on the need for cooperation and joint efforts to manage the common problem both countries face in the management of imbalances in external accounts. The Under Secretary's presentation included an explanation of the necessity for the U.S. to maintain a large surplus on private current account to finance U.S. expenditures for security and economic development of the Free World, as well as of the need for the U.S. to correct its own serious payment imbalance to protect the soundness of the dollar as a key reserve currency. Mr. Fowler outlined specific areas of cooperation in meeting the need of both countries for substantially

increased exports: continued trade liberalization between each other and with other industrialized areas, assistance to less developed areas, and cooperation in the maintenance of a sound trade and payments system for the Free World. The Under Secretary cited the record of U.S. capital outflow to Japan and stated the U.S. was not unhappy over this assistance to Japan's industry and government notwithstanding the adverse effect on the U.S. balance of payments: He urged that the overall balance of payments relationship between the two countries (which has been unfavorable to the U.S.) be given the same degree of attention as Japan's unfavorable balance of merchandise trade with the U.S.

Minister Kosaka suggested the Committee adjourn for lunch. Before doing so the Committee briefly discussed and approved (with some modification) the general outline presented by Deputy Vice Foreign Minister Shima for the press briefing which he and Ambassador Reischauer would jointly conduct immediately thereafter.

End of Morning Session.

### III. *Second Session*—3:00 P.M.—November 2

Foreign Minister Kosaka proposed that the discussion shift to agenda item 3 concerning wages and labor productivity, follow with introductory statements on item 4, and then return to a free discussion of agenda item 2 and 4 at the same time, since the two were closely related. He invited Secretary Goldberg to lead off on item 3.

Secretary Goldberg began by commenting that Japan and the U.S. are partners in a basic principle governing labor-management relations, namely that both are committed to a free enterprise system with the right of workers to organize into unions of their own choosing and to engage in free collective bargaining including the right to strike protected by law. He noted that each country has problems, as do the best of partners, and he proposed to deal with these while concentrating on "... what unites us rather than what divides us" (reference President Kennedy's Inaugural Address). Secretary Goldberg said that U.S.-Japanese labor relations are characterized by four major misconceptions:

1. The U.S. labor movement has the conception of Japan as one of the lowest wage countries in the world, a conception shared by many U.S. citizens.

2. The Japanese think of the U.S. labor movement as a protectionist one, hostile to liberal trade policies and in particular hostile to Japanese products.

3. The American labor movement believes the Japanese labor movement to be primarily a political movement not related to trade union objectives.

4. The Japanese apparently think of the U.S. labor movement as an instrument of, or controlled by, governmental policy so that American union action is deemed to be U.S. Government action.

Secretary Goldberg said misconception number one is the key issue and that liberalization of U.S. trade policies would depend on removal of this misconception. He said the strides made in Japan, especially recently, to improve workers' wages and standards of living were not sufficiently understood in the U.S. He suggested that European countries' invocation of GATT Article XXXV seemed to reflect the same misconception. Secretary Goldberg said it was in order to set the record straight on misconception no. 1 that the U.S. had introduced its proposal for a joint study. He noted that the GOJ had submitted a counter-proposal (circulated as Conference Document JS3) and reported that he and Labor Minister Fukanaga had discussed the matter at lunch, in the light of which he proposed a further compromise: that the communiqué should contain a statement that both governments propose to consult through regular channels on all aspects of the labor scene bearing on trade relations between the two countries. The Secretary suggested this statement would not only give explicit recognition to the importance of consultation between the two countries in this field but would enable both parties to express their common desire to remove substandard conditions.

Turning to the second misconception, Secretary Goldberg said the facts are that to a surprising degree the labor movement in the U.S. has supported a liberal trade policy. He acknowledged that recently, largely as a result of unemployment, there has been a rise of protectionist sentiment within the labor field. He noted that the U.S. had been the beneficiary of an over-all favorable balance of bilateral trade with Japan but that it was extremely difficult for an individual unemployed worker to take a broad view.

With regard to the third misconception, Secretary Goldberg suggested the mutual task of correcting it would be much easier if the Japanese labor movement were to take a more active role in the ICTFU, the Free World organization of bona fide trade unions. On the fourth misconception, Secretary Goldberg referred to the recent boycott of Japanese suits by the ACW and commented that just as Japan's labor movement does things the GOJ does not like, so U.S. unions are free to do things the U.S. Government does not like: this, said Secretary Goldberg, is part of the price of freedom.

Concluding his remarks, Secretary Goldberg said he wished to endorse the desirability of continuing the labor exchange program between the two countries which had political as well as economic benefits. Recognition by U.S. labor of the advances made by Japan would lead to a better understanding in the U.S. and help to induce continued support for liberal trade policies.

Labor Minister Fukanaga said he was gratified to learn of the U.S. interest in removing misconceptions in this field. He stressed that cash

wages were not an adequate measure of international labor cost comparisons but that the entire structure of the economy must be taken into account. He then turned to his prepared statement, reserving the right to supplement it after studying Secretary Goldberg's remarks in more detail. The full text of Minister Fukunaga's remarks is reproduced as *Enclosure 4*. The main burden of his presentation was for a broadening of the joint study group proposed by the U.S. so as to deal with all fundamental problems relating to the promotion of Japan-U.S. economic relations.

After concluding the reading of his statement, Minister Fukunaga referred to his luncheon discussion with Secretary Goldberg, which, he said, indicated there was considerable flexibility in the U.S. proposal. He felt that Secretary Goldberg's remarks during the meeting were very close to what he himself had in mind and suggested that the two Ministers continue their discussion privately and report back to the Conference the following day or Saturday morning.

After ascertaining that this proposal was acceptable to the Committee, Minister Kosaka invited Secretary Hodges to make the lead-off statement for the U.S. on agenda items 4 and 5.

Secretary Hodges delivered a prepared statement, the text of which is reproduced as *Enclosure 5*. One of the central themes of his presentation, which is reflected in the text of paragraph 12 of the final communiqué, was that Japan must trade to live and grow and the U.S. must trade to grow and meet the commitments of the security and growth of the Free World. The Secretary referred to the openness of the U.S. (and Canadian) markets to Japanese goods which places on us the main burden of adjustment to changes in the Japanese economy. He stressed the restraint with which the U.S. had invoked the Escape Clause (3 out of 129 applications), stated that in his view Japan can expect a continued rise in its exports to the U.S., and urged removal of restrictions (both Japanese as well as those of other countries) which impede Japan's full participation in the pattern of Free World trade and investment which must be developed. The Secretary outlined in this connection U.S. policy toward the Common Market and other regional economic associations and stressed the importance of removal of other countries' discrimination against Japan under GATT Article XXXV.

MITI Minister Sato responded with a prepared lead-off statement on agenda item 4, the full text of which is reproduced as *Enclosure 6*. This statement contains a full catalogue of all of Japan's trade grievances against the U.S.: Minister Sato commented at length on what he regarded as the trend toward additional U.S. restrictions on imports from Japan. He described the Geneva Agreement on cotton textiles as a deviation from the principle of free trade, stated that recent U.S. moves

to regulate ocean shipping run counter to internationally accepted standards, and described the refusal of the U.S. to grant more liberal rights to Japanese airlines "New York and beyond" as unfair to Japan. He also referred to European restrictions on Japanese goods as a great bottleneck and expressed concern over the impact of European regional integration as a potential new source of discrimination.

After Minister Kono had remarked that he would defer his planned statement on agenda item No. 5 until tomorrow in order to conserve time, Minister Kosaka opened the session for questions and discussion. Minister Sato said he wished to supplement his prepared statement with a few additional observations: He understood the U.S. responsibility for assistance to less developed areas but he did not feel that this was relevant to the practical problem Japan faces at the present time. Japan's trade and payments difficulties cannot be resolved by generalities, he said, when the U.S. is the *only* large market open to Japan. Only by increasing sales in this market, could Japan hope to sustain its imports from the U.S. Commenting on Secretary Hodges' presentation, Minister Sato said that 75% of Japan's imports of items falling into the broad category of machinery were of U.S. origin and that this category constituted 20% of Japan's total imports. He also hoped there could be some further opening up of the Japanese market to imports in the near future. To underline the importance of Japan's trading relationship with the U.S. in comparison with other countries and areas, Minister Sato circulated a statistical table reproduced as *Enclosure 7*.

Under Secretary Fowler said he wished to comment on measures taken by the Kennedy Administration to redress the U.S. balance of payments deficit. Noting that some GOJ Ministers had implied that these steps adversely affected Japan, Mr. Fowler referred to the President's statement of February 6 where the alternatives of restrictive measures or an expansion of exports were squarely faced: Mr. Fowler quoted the President's policy—" . . . in seeking equilibrium, we must place maximum emphasis on expanding our exports . . . (and) a return to protectionism is not the solution". Under Secretary Fowler acknowledged that Japan's export opportunities had been somewhat reduced as a result of changes in ICA procurement policy but said Japan tended to overlook the compensatory actions by the U.S. which prevented an adverse over-all effect on Japan's balance of payments. He cited the fact that in the first half of 1961, Japan's net receipts of long term U.S. capital amounted to \$71 million compared with only \$7 million for all of 1960; assuming a continuation of this rate throughout 1961, Japan's receipts would be almost as high as Japan's maximum receipts arising from ICA procurement (\$147 million in 1960). Under Secretary Fowler concluded that when full account is taken of all items entering into balance of payments it was clear that U.S. policy to redress its own deficit involved no direct threat to Japan.

Minister Sato replied that he did not intend to criticize the U.S. Administration's efforts to protect the dollar and noted that Japan was in the same position of trying to increase its own exports. He wondered, however, whether the U.S. policy actions were taken with Japan's needs in mind. He asked why the U.S. insists on sending cement under ICA procurement all the way from the U.S. to Japan's close neighbors.

Minister Fukanaga intervened that he hoped the afternoon session would not terminate with the impression that each side's position was stiff; he said each needed better to understand the other's position, especially in matters of finance. Minister Kono commented at this point that he was sorry he had not been born a politician in such a wealthy country as the U.S. He said that Japan's neighbors consist of countries of the Communist Bloc and large numbers of underdeveloped countries. He said it was not possible to create a common market in this area and the U.S. is the only real market for Japan in the whole Pacific area. While agreeing it was possible to talk about the long-run need for equilibrium, Minister Kono said it might be a long and dark path unless an answer could be found for Japan's very practical trade difficulty arising from the geographic position to which he referred and its unusual dependence on the U.S. market. Minister Kono concluded with the hope that the "white heat" of the discussion indicated both sides were becoming close friends, since only close friends would speak so freely to one another.

Minister Sato said he would be very interested in knowing what the U.S. expected when the Reciprocal Trade Agreement Act came up for renewal and also what prospects there were for revision of the Bonner Bill, and whether there was any real room for negotiation on air routes between the two countries. Secretary Hodges said, in view of the lateness of the hour, he would defer a reply until the next morning. Secretary Rusk said he would have been disappointed if temperatures had not risen today, since frank exchanges of this kind were the very purpose of the meeting. He said he wished to reply to Minister Sato's query as to whether the U.S. took Japan's interests into account in framing its own economic policies to redress the U.S. balance of payments deficit. Secretary Rusk said U.S. balance of payments measures were adopted as a matter of global policy but that to the extent possible, special country problems, including those of Japan, were taken into account: he cited the reversal of U.S. policy with regard to the return of U.S. military dependents, restoration of local procurement for commissaries and military exchanges in Japan, and exceptions to ICA procurement policy in the case of fertilizer shipments to Korea. While Japan might not feel that the U.S. had done as much as it could, Secretary Rusk said that he wished to emphasize that Japan's position was taken into account.

Minister Kosaka reminded the Committee that Dr. Heller had wished to comment on item 2 but that this would now have to be deferred until morning. He then called on Deputy Vice Foreign Minister Shima to present an outline for the press briefing. After fifteen minutes of discussion in which Ministers Fukanaga and Kosaka and Secretaries Goldberg, Hodges, Rusk, Freeman, and Ambassador Reischauer participated, Secretary Rusk's formulation of the afternoon's discussion was accepted.

End of Afternoon Session.

IV. *Morning Session*—November 3—9:00 A.M.–12:15 P.M.

Foreign Minister Kosaka opened the session with a prepared statement on agenda item 5 concerning U.S. policy toward the OECD and the EEC and Japan's problems in trade with less developed countries. The full text is reproduced as *Enclosure 8*. In this statement, Minister Kosaka expressed deep disappointment over the trend toward permanent exclusion of Japan from the OECD and Japan's apprehension about the Common Market with particular reference to UK accession. Kosaka said Japan has no objection to the political objectives of European integration but urged the U.S., in framing its policy, not to overlook the position of Japan as the only industrialized country outside the area. One of the Foreign Minister's main points in his comments on Japan's trade with less developed countries was the latter's insistence on bilateral balancing of merchandise trade with Japan.

Secretary Rusk referred to Minister Sato's query of the previous afternoon concerning U.S. expectations with regard to renewal of the Reciprocal Trade Agreements act. He drew the Committee's attention to the wire service report on Under Secretary of State Ball's address before the National Foreign Trade Convention, copies of which he promised to distribute to all delegates later in the day. Secretary Rusk said this constituted the "opening gun" in what is likely to be a long battle in the U.S. He said that although specific legislative steps could not be promised, he wished to stress the Administration's recognition of the need for broader and more effective tools to deal with far-reaching changes in trade patterns. He said these changes are not only due to Common Market developments, although the latter symbolized the need for new U.S. negotiating authority in the tariff field to improve U.S. and Free World access to that growing market. Secretary Rusk said the U.S. objective is to create an open competitive free world trading system in which all free countries can take an active part. The Secretary referred to the need for the U.S. to make adjustments to new trade patterns which was not an easy task. He said that to refer to domestic politics in this context is simply to acknowledge that all democracies, including Japan, are subject to the same shortcomings.

The Secretary said the American people take exports for granted while imports are regarded as threats to the well being of the economy. The fact that 4½ million U.S. jobs depend on exports is a fact not sufficiently recognized by the American people. Secretary Rusk said that during the “great debate” on the Reciprocal Trade Agreements renewal in the coming months, there will be statements made which will no doubt irritate America’s friends. He asked for Japan’s understanding when this situation arises. After noting that there were still strong forces in the U.S. favoring a liberal trade policy, the Secretary described the dilemma facing many supporters in the remarks of a senator who said, “if you want to be a liberal senator, you must start by being a senator”.

Secretary Rusk said Japan could be of help during the next few months if in Japan’s informational activities, stress were placed on what a good customer Japan is for American goods. The Secretary said he intended to seek Ambassador Asakai’s help on this matter.

Secretary Rusk said he did not wish to shy away from the substantial bilateral gap in U.S.-Japan trade merchandise trade: He said the basic fact remains that so long as the U.S. carries such a heavy defense and foreign aid burden, the U.S. must maintain a substantial surplus in ordinary trade patterns. He added that U.S. defense outlays have an economic effect on the well being of other countries, including Japan, and that U.S. foreign aid expenditures in other areas help develop those countries as markets for Japanese exports. He concluded, however, with the observation that the U.S. is not content with existing U.S.-Japan trade relations nor is the U.S. content with discrimination imposed on Japanese goods by other countries.

Minister Kosaka expressed his great appreciation for the Secretary’s remarks and asked Dr. Heller to comment on agenda item 2 for which there had been insufficient time yesterday. Dr. Heller said he wished to comment on the effects of domestic economic policy on balance of payments. He said internal economic policy is a crucial factor in the solution of external payments problems. He illustrated this point by referring to the conjuncture in the first half of 1961 when, under the delayed impact of the 1960 recession, Japan’s exports to the U.S. fell 16 percent while under the impact of domestic U.S. recovery, U.S. imports from Japan during July-August were up 3.2 percent over the comparable months of 1960. Thus the success of U.S. domestic policy for growth, said Dr. Heller, is of prime importance for Japan as well. Dr. Heller also said the feverish pace of economic growth in Japan—i.e., domestic Japanese economic policy—was the principal basis for the 30 percent increase in Japanese imports. Dr. Heller said these illustrations simply underlined the obligation on both parties to adjust their internal economic policies in the light of their respective external positions.

Minister Sato said he was most impressed with Secretary Rusk's comments on trade policy and that he placed great expectations on the Secretary's statement that the U.S. is not satisfied with the present situation. He urged Secretary Rusk to expand on his ideas on ways in which Japan could be helpful at this time.

Secretary Rusk said that in Japan's superb department store in New York, Takashimiya, Japan could have appropriate displays reminding American buyers how much Japan purchases from the U.S. He said another example could be for Ambassador Asakai to visit an Eastern seaport when a large U.S. export shipment to Japan is due to leave in order to draw press attention to Japan as an export market for U.S. products.

The Secretary added that it is an objective of U.S. policy to reach a stage in terms of our balance of payments where the U.S. can return to more normal handling of foreign aid expenditures; many detailed problems which are a current source of difficulty between the U.S. and Japan on this score can be solved only in the context of an expanded world economy. The Secretary said this is a "mountain-top in the future" and that the Committee could not ignore the thickets which stand in the way of reaching that goal.

Minister Sato said differences of views are to be expected but he was glad to hear that the U.S. understands Japan's position better, to which Secretary Rusk replied that he hoped there would be better understanding on *both* sides.

Secretary Goldberg said he felt not enough attention had been given to the significance of Dr. Heller's comments yesterday concerning the prospect for a substantial growth of U.S. imports under conditions of recovery and growth in the U.S. economy, an increase in imports in which Japan should be able to maintain a significant share. Secretary Goldberg said one of the difficulties on the U.S. side in establishing a climate where such an increase could take place was the isolation of Japan's trade union movement from that of the U.S. due to Communist influence in the former. Minister Sato said Secretary Goldberg's comment indicated the importance of maintaining the labor leader exchange program which, he understood, Congress had not approved. Secretary Goldberg replied that he fully agreed on the importance of the labor exchange program and while it was true that Congress had not approved the Administration's request, it seemed likely that with the cooperation of Secretary Rusk it would be possible to permit a limited continuation next year using AID financing. Minister Fukunaga noted how active both the USSR and Communist China were in inviting union leaders to their countries and he said he looked forward to the efforts of Secretaries Rusk and Goldberg in enabling continuation of the exchange with the U.S.

Finance Minister Mizuta said he wished to comment on Under Secretary Fowler's observations with regard to U.S. capital outflow covering Japan's current account deficit. Minister Mizuta said that in the period January through September 1961 Japan's exports decreased 10 percent while its imports increased 40 percent. To offset the \$700 million deficit on current account Japan had a short term capital account surplus of only \$480 million, 90 percent of which was in the form of import usance reflecting the rapid rise in imports; when Japan's imports level off, Mr. Mizuta said the capital inflow of this type will correspondingly decrease and he said this trend was already noticeable. The Finance Minister said that while the short term inflow has helped to cover Japan's deficit in the past and while Japan was very grateful for the cooperation of U.S. commercial banks, this was not a stable mechanism to which Japan could look as a source for covering its current account deficit when imports return to a more normal level.

Under Secretary Fowler said he would be interested in hearing more about specific measures Japan contemplates taking to increase its exports to the U.S. and other countries. Minister Kosaka said he knew Minister Sato and Secretary Hodges and Minister Kono and Secretary Freeman were discussing these matters privately. He said Secretary Rusk's suggestion regarding publicity in the U.S. was an excellent idea and he thought U.S. farmers in particular should appreciate how good a market Japan is for U.S. agricultural products. Secretary Rusk cautioned that tact would have to be exercised in this field to avoid any risk of a charge that Japan is intervening in a political debate in the United States.

Secretary Udall commented that he felt that not all members of the U.S. Cabinet have been as active as they can and should be in demonstrating the importance of liberal trade policies. He noted in passing that Japan is one of America's best customers for coking coal and expressed the view that each Cabinet officer could take a more active role vis-à-vis Congress with regard to trade items within their respective spheres of responsibility. Secretary Rusk said it would be helpful if Japan could keep the U.S. better informed as to the trends of its economy with special reference to sudden increases in purchases from the U.S.; the Secretary said that sharp increases such as 40% in a period of months made adjustment in the U.S. very difficult.

State Minister Fujiyama quickly responded that advance information could certainly be given. He outlined the procedure through which Minister Sato meets with industry leaders and said that in the monetary field, Japan could be influential through over-the-counter or "loan window" controls. Based on these and other contacts between government and industry and financial entities, Minister Fujiyama said projections result which could be communicated to the U.S. Minister Mizuta

endorsed the desirability of such an interchange in order to keep the U.S. fully informed of Japan's long term goals. Minister Sato, in agreeing, said that he felt U.S.-Japan cooperation in the political field has not been matched to date in the economic field. He said staff level contacts could carry out the cooperation of the kind under discussion.

(An informal break in the proceedings occurred at this point as a result of the circulation of a cartoon by Herblock which appeared in the *Washington Post* recently. Ten copies are attached as *Enclosure 9*.)

Minister Kono said Secretary Rusk's statements during the morning had given him great hope but that he wished to express his attitude toward the current status of relations between the U.S. and Japan. In the field of foreign policy Mr. Kono said U.S.-Japanese cooperation is the foundation of Japan's foreign policy while, in the economic field, the relationship between the U.S. and Japan is regarded as one to be developed. He said Japan thinks of the U.S. first: Japan buys from America first and he hoped the U.S. would buy from Japan first. Minister Kono said Americans keep telling Japan to look for other markets and that this was very unexpected. He referred to trade in agricultural products, noting that the normal expectation would be for Japan to buy such items from less developed countries and sell them Japanese manufactured goods in return; but this was not the case at all: even in raw materials Japan puts first priority on the U.S. and this whole policy of primary reliance on the U.S. as a trading partner had led to the current balance of payments difficulties. Minister Kono said that at the outset of the present Conference the U.S. attitude had not seemed very favorable for an improvement in the present situation but that in the light of Secretary Rusk's statements, things seemed to be changing. He concluded by noting that the Committee would turn to trade relations with the Communist Bloc later in the day and reminded the Committee that Japan finds itself between the Sino-Soviet Bloc and the Free World.

Secretary Rusk said he appreciated Minister Kono's remarks but was just a little concerned that Minister Kono may have thought he had written a blank check which Japan could fill in at will.

#### Coffee Break

Secretary Hodges said he planned to discuss privately with Minister Sato a number of specific issues which need not take up Conference time but wished to make several general observations on U.S.-Japan trade relations. Secretary Hodges referred to American restiveness regarding unemployment in the U.S. and the very expensive measures the Kennedy Administration had adopted to deal with it. He said Japan must take this into account when requesting the U.S. to permit greatly expanded imports from Japan. Secretary Hodges said it was indispens-

able that international trade be really two-way and drew attention in this connection to the very poor response Japan had made to the U.S. offer for tariff reductions under GATT (Secretary Hodges said the U.S. benefits whose value was calculated at about \$100 million met with a Japanese list valued at only \$19 million). Secretary Hodges also drew attention to Minister Sato's prepared statement on textiles where a "rather harsh" reference to "honesty not paying" had appeared: Secretary Hodges said that if Japan had not applied voluntary controls, the problem would simply have arisen much earlier. Secretary Hodges said there were a number of measures both the U.S. and Japan needed to take in world trade: both needed to know their markets, both needed to give greater attention to research-oriented industries, both needed to emphasize quality products and both needed to do a better job of trade promotion and public relations. Secretary Hodges concluded with an observation that he was enthusiastic about future potentialities and foresaw a bright future for world trade.

Minister Sato expressed appreciation for these frank observations. He regretted that a satisfactory conclusion to the Geneva "Dillon Round" negotiations could not be found but noted that Japan's tariff level is quite low compared to that of the U.S. Regarding shipping matters and air routes, Minister Sato said he realized how serious both these issues were for the U.S. and recognized they could not be resolved easily. Concerning textiles, Minister Sato said he wished to correct any implication that his reference to honesty not paying was intended as a criticism of the United States which was not the case: it was intended to refer to Hong Kong having taken over Japan's market in the U.S. Minister Sato said he was aware of the frequent criticism that Japan tends to concentrate on too narrow an export market and assured the Committee that it was GOJ policy to seek markets in other parts of the world and over a wide range of goods. He said that discrimination under Article XXXV was a barrier in this connection and expressed the hope that the U.S. would continue its helpful support in obtaining its removal. Agreeing with Secretary Hodges on the need for improved quality and control standards, Minister Sato said it was Japan's intention to continue to obtain guidance and cooperation from the U.S. in this field.

Secretary Goldberg said that since he did not expect to participate in the private talks on shipping matters, he wished to point out that the U.S. maritime fleet is in serious trouble while Japan's is flourishing. He said the number of U.S. flagships had declined to below one thousand and that the great bulk of U.S. commerce was now carried in non-U.S. bottoms. He said the high wage policy in the U.S. merchant marine was a contributing factor and that the decline had reached a stage where national security considerations were involved.

Minister Sato commented that this illustrated one of the many jungles in the path of reaching the mountaintop Secretary Rusk had referred to.

Minister Kosaka invited the Committee to turn to item 7 and suggested Secretary Freeman lead off.

Secretary Freeman said that agenda items 6, 7 and 8 were all inter-related and that his statement would deal with some aspects of all of these items. He referred to the extraordinary technological explosion taking place in agriculture in the U.S., Japan and some other countries as well. The Secretary said that if this technology could be effectively applied in other areas of the world, it would be possible to meet the food needs of the world. He said there was an acute need in many parts of the world. The Secretary quoted several brief excerpts from the recently-released U.S. Dept. of Agriculture "World Food Budget 1962-66".

The Secretary of Agriculture said he wished to clarify U.S. policy in the Food for Peace Program in relation to U.S. domestic agricultural policy. The Secretary said the U.S. has not, does not, and he felt confident, will not engage in dumping practices or disruptive undercutting of markets in U.S. agricultural export programs. The U.S. proposed to maintain its historic markets and its historic share of markets as they expand. U.S. domestic agricultural policy is one of seeking to manage the enormous productivity of the American farmer, a program of "managed abundance"—and to utilize this capacity in a sensible way. The Secretary said the U.S. had not turned U.S. agriculture loose to produce what it could. The Food for Peace Program is not an international relief feeding program. It is designed to fill a gap when emergency situations arise but it is primarily aimed at promoting capital formation in under-developed countries.

With regard to international commodity agreements, Secretary Freeman said the Kennedy Administration policy is to work with other countries and through various international organizations to examine what can realistically be done to minimize extreme price fluctuations of agricultural and mineral products around the world. He said he expected that 50 years from now there would have to be very many commodity agreements to avoid complete chaos. The Secretary said that one serious problem both the U.S. and Japan should face is the prospect that in a few years, perhaps five or even less, Indonesia and perhaps the Philippines would become rice self-sufficient. When that happens Burma and Thailand will face a grave crisis because of their extreme dependence on rice exports. The Soviet Bloc can be expected to move into this situation with massive barter deals if the Free World permits this situation to develop without advance planning. Secretary Freeman said that in addition to the need for diversification of agricul-

ture in these countries (for example introduction of corn into Thailand), there was also need for careful consideration of an international rice agreement.

Minister Kono noted that it was time for the press briefing and said that Minister Kono's response and discussion of this item would be put over until the afternoon. The Committee then approved the general outline of the press briefing as presented by Deputy Vice Foreign Minister Shima.

End of Morning Session.

V. *Afternoon Session*—November 3—3:00 P.M.

The session opened with a prepared statement by Minister Kono on agenda item 7, the full text of which is reproduced as *Enclosure 10*. In this statement Minister Kono drew attention to the greater difficulties the Free World (including Japan) has in comparison with the Soviet Bloc in accepting large quantities of agricultural products from the less developed areas of the world.

After Minister Kono and Secretary Freeman had exchanged brief comments on the need for private discussions between the two governments on agricultural problems, Minister Kosaka said it was clear there was need for close cooperation at staff levels in the agricultural field. He mentioned in this connection the possibility of U.S.-Japan cooperation in Peace Corps activities.

Minister Kosaka invited Secretary Rusk to make his presentation on U.S. economic policy toward the Soviet Bloc.

Secretary Rusk noted that this was a highly sensitive topic and urged that all Committee members be discreet in dealing with the press. The Secretary said the U.S. does not believe that trade with the Communist Bloc can be considered in economic terms alone but that it involves political implications of the gravest and most far-reaching consequences. He said there is a crisis in history represented by the clash of two basic ideas, the idea of the inevitability of the Communist revolution on the one hand, a belief that is backed by the resources and power of the entire Sino-Soviet Bloc, and on the other hand, the conception of world society embodied in the UN Charter involving relations across national boundaries in keeping with international law. The Secretary said if there is any doubt as to what the Sino-Soviet Bloc is after it is only because the Free World does not believe what the Bloc has said in unmistakable ways. The Secretary cited in this connection the December 1960 Party declaration, Khrushchev's statement of January 6 and the 22nd Party Congress just completed, as well as during the Vienna meeting with President Kennedy. Secretary Rusk said that when Khrushchev says he will bury us or that our children will be Communists by 1980, it means that he intends to use all the resources at his command to bring this about.

The Secretary posed the question of what kind of trade policies are appropriate to pursue with countries that are determined to destroy us. He suggested that we should not make a direct contribution to the strategic strength of the Bloc and said he greatly appreciated Japan's cooperation in this regard. The Secretary said we should take care to deny recent technological developments, noting how clearly the Soviet Bloc benefits by picking up the final result of heavy research expenditures in the Free World. He added that he could see no reason to extend special advantages to the Soviet Bloc such as in the field of credits which would make it easier for the Soviet Bloc to obtain what they need. Finally, Secretary Rusk said he was especially concerned that some countries might become so dependent on the Soviet Bloc through trade as to be vulnerable to political pressures. The Secretary said that the trade relationship with the Bloc can become an extremely dangerous one if on the part of the Free World the relationship is approached as a purely commercial arrangement while the Soviet Bloc uses trade as an instrument of total policy. The Secretary said he recognized the argument of keeping open contact with the Soviet Bloc through the channel of trade but pointed to 15 years of experience marked by the tombstones of obstacles placed by the Soviet Bloc in the path of friendly relations. Secretary Rusk said U.S. policy in this field had been forced on the U.S.; quiet efforts in 1961 to improve relations have been met by outrageous rebuffs and demands for surrender of vital interests.

The Secretary said he did not wish to suggest there should be no trade with the Soviet Bloc, noting that the U.S. itself had such relations as well as many close friends. He said also he would not wish to suggest that Free World policy should be based on the notion that others are doing the U.S. a favor by adhering to the same general policies as does the U.S. because the issue transcends that of the individual interests of the U.S. or other individual countries.

The Secretary said his presentation was intended to indicate some of the reservations he has in this field. He strongly endorsed economic integration and inter-dependence within the Free World and expressed the hope that trade with the Soviet Bloc would be marginal so that no Free World country becomes dependent and thereby susceptible to political pressures.

Minister Kosaka replied that the points raised by Secretary Rusk were well-understood. He stressed that Japan's position is one of full commitment to democracy and cooperation with the Free World. He noted, however, that certain forces in Japan oppose this policy. Minister Kosaka then delivered a prepared statement the text of which is reproduced as *Enclosure 11* after which he quickly terminated the discussions by stating that he understood there was broad agreement on this topic and that any specific questions would be taken up elsewhere. He then suggested the Committee turn to agenda item 6.

Minister Sato led off with a prepared statement, the text of which is reproduced as *Enclosure 12* concerning Japan's policy in the field of assistance to less developed countries. This statement includes an appeal for closer cooperation between the two countries and, where practicable, joint projects.

Secretary Rusk said that President Kennedy feels strongly about the need to meet rising expectations around the world and that this means building the kind of world in which we ourselves would wish to live. He said that when the President took office it was apparent that there was a need for careful review of the previous 15 years experience with foreign aid; such a review has been completed and he wished to comment on several elements in the new U.S. approach.

Secretary Rusk said steps were needed to ensure that investment lead to the results expected. He said the U.S. did not intend to give assistance to countries whose own indigenous capital flows off to Swiss banks. While the U.S. does not presume to tell others how to manage their own affairs, the U.S. reserves the right to decide what is a good investment. The Secretary said the U.S. considers it unpromising to invest in areas whose regimes are indifferent to the welfare of their own people. More stringent rules have been written into the U.S. aid program with these factors in mind.

Secretary Rusk said it was not money but trained people which constituted the critical bottleneck in Free World assistance programs and this included shortages of people in recipient as well as donor countries including the U.S. He said the U.S. welcomed the increasing number of trained Japanese experts.

Referring to Minister Sato's reference to cooperation among developed countries, Secretary Rusk said all countries in a position to do so must make their best efforts if the Free World is to succeed. He expressed his respect and appreciation for the large contribution Japan has made in this field in recent years. The Secretary said there are many areas for joint cooperation between the two countries especially in Asia, although he cautioned that the U.S. could not make Japan "an agent" for U.S. aid.

The Secretary noted that the U.S. had sought Congressional authorization to use GARIOA repayments for foreign aid programs but Congress had declined, and therefore the Executive Branch does not have the means for direct linking it had hoped for. The Secretary said Japan should not, however, consider that its request had been completely rebuffed. He said there are ways the U.S. and Japan can cooperate on a case-by-case basis and he assured the Committee that the U.S. was interested in partnership in this field. The Secretary said that wisdom lies in the direction of flexibility and that he personally believed there would be dozens of occasions for cooperation between the two countries.

The Secretary said the U.S. balance of payments problem and especially the gold outflow precludes the U.S. from permitting unrestricted global procurement financed by U.S. assistance programs. He said he did not wish to appear apologetic for this because what the U.S. was trying to do was extend the maximum amount of aid it could with the resources at its disposal; the U.S. reserves of free gold were insufficient to permit unrestricted bidding at this time.

The Secretary concluded with an expression of hope that Japan would find ways to increase its aid especially in the field of training young people. He also hoped that as Japan's financial situation permitted, the government would move in the direction of longer term loans at lower interest rates because, he said, it was this kind of capital that the less developed areas needed. Finally, Secretary Rusk said he welcomed the partnership which the U.S. has already enjoyed with Japan in the field of assistance to developing countries.

State Minister Fujiyama said he was somewhat surprised to hear the strict attitude the U.S. has in this field. He noted that Japan expected to devote about 2.9% of its GNP to external assistance under the 10 year plan to double the national income. He agreed that the two nations could and should cooperate more fully in this field not only in agriculture but in creating new industry. Mr. Fujiyama said that aid by the industrialized Free World thus far has paid insufficient attention to small and medium sized industry which can best absorb the labor force of emerging countries. He suggested both countries should do more along this line rather than helping various leaders in less developed countries build monuments to themselves.

Minister Fukanaga referred to Secretary Rusk's comment to the effect that Japan could not be an agent for U.S. aid. Minister Fukanaga said his experience in less developed areas indicated an urgent need for the use of an agent and while the word "agent" might not be the best term, he urged the U.S. to consider making better use of Japan to increase the effectiveness of U.S. assistance. Minister Fukanaga cited the case of Burma which he said did not want to accept assistance openly from either the U.S. or the Soviet Bloc. In the field of technical assistance, he pointed to Soviet Bloc activity in sending technicians to Southeast Asia and declared that Japan was prepared to do more than it had to date. He closed by reiterating his hope that the Cabinet would go back to the U.S. Congress on the question of GARIOA repayments and point out the benefits which could accrue to the U.S. through such a device.

Under Secretary Fowler said he wished to commend Minister Fujiyama for his emphasis on the need to develop small and medium sized industry in less developed areas. He said Japan was an excellent source of skilled personnel for this kind of effort and said the U.S. would

welcome further exploration of cooperative steps to promote this objective.

Secretary Freeman drew attention to the fact that more than 80% of the people in the developing countries are engaged in agriculture and that there had to be development in this field also.

Secretary Rusk, returning to the question of Japan as an “agent” for U.S. aid, said he may have spoken too briefly in his earlier remarks which were in no sense directed at Japan specifically but applied with equal force to the U.K., France or any other industrialized country. After reiterating that there are many ways in which the U.S. and Japan can work together and that the U.S. is looking for situations where such cooperation looked promising, Secretary Rusk said he wanted to make it clear that if a country would welcome U.S. money at the back door but did not welcome the U.S. at the front door, the U.S. did not wish to be a party. He said the U.S. had its sensitivities and its pride, and moreover as Secretary of State he had to face the American people.

Minister Mizuta said he was pleased to hear that the U.S. appreciated Japan’s efforts. Commenting that he thought Japan deserved to be commended, he referred to the heavy burden of reparations payments which remained to be met (\$312 million paid thus far, \$700 million remaining). He also referred to the recent Burmese demand for hundreds of millions of dollars from Japan and said the Burmese negotiators had stated they would refuse assistance from the Soviet Bloc if Japan met their request. Minister Mizuta concluded with an appeal for special consideration by the U.S. on such matters as ICA procurement in view of the substantial efforts Japan is already making in the face of balance of payments difficulties and the burden of reparations.

Minister Kosaka drew attention to the fact that the spirited discussion during this session had continued for more than 2 hours without a coffee break and that it was now time to consider the press briefing. Before doing so, he asked Secretary Goldberg to comment on the unfinished labor items which he understood had been the subject of private discussions.

Secretary Goldberg first mentioned the exchange of agricultural workers which he said did not appear suitable for inclusion in the communique but wished to inform the Committee that the U.S. was prepared to work out a procedure which would permit continuation next year on a somewhat smaller scale. Secretary Goldberg informed the Committee that he had received a telegraphic report on the latest unemployment figures in the U.S.; the figure had fallen below 4 million but, unfortunately, the seasonally adjusted rate was still 6.8%. Secretary Goldberg said this pointed up the desirability of including in the communique some reference to the *joint* concern of both the U.S. and Japan over the need for an improvement of labor standards which, he stressed,

do affect trade policy. Secretary Goldberg said such a reference would demonstrate to U.S. labor that the GOJ also, rather than just the U.S., is concerned over this subject.

Minister Kosaka commented that he was very interested in continuing to send young agricultural workers to the U.S. and Minister Kono added that the Japanese farmers were grateful for the opportunity offered by this program and that the figures mentioned to him privately for the coming year were fully satisfactory.

The Committee approved the outline for the press briefing presented by Deputy Vice Foreign Minister Shima and agreed to meet at 10:00 A.M. Saturday, November 4, to consider the final communique.

End of Afternoon session.

VI. *Morning Session*—Saturday, November 5—11:15–11:25 A.M.

[NOTE: Formal convocation of the Committee was delayed while the drafting Committee met privately to negotiate last-minute changes in various paragraphs of the communiqué. Individual sentences of the communiqué which presented difficulties for one side or the other were taken to the respective Ministers concerned for approval.]

Minister Kosaka said he understood agreement had just about been reached in the drafting committee and while awaiting receipt of the text of the draft communiqué he asked if any of the Ministers wished to raise any other topics.

Minister Kono drew brief attention to the several outstanding issues between the U.S. and Japan agricultural matters which had been discussed privately with Secretary Freeman and urged continued cooperation on both sides.

Secretary Freeman referred to the U.S. quarantine on Japanese beef and mandarin oranges which he stressed were not imposed to restrict trade in any way but to prevent infestations. Noting that Minister Kono had declared there was not such danger, Secretary Freeman said technicians from both sides should thoroughly re-examine the question. Secretary Rusk confirmed that the U.S. does not use health regulations as a concealed method of trade protection.

Secretary Freeman urged that each question be considered on its merits and that both sides should avoid an attempt to horsetrade. The Secretary expressed his hope that Minister Kono would agree that, in this connection, importations of lemons into Japan should promptly be liberalized, without relating the question to that of U.S. restrictions on mandarin oranges.

Minister Kosaka reported the drafting committee had reached agreement and noted that he and Secretary Rusk were due to make a television appearance in a few minutes. He quickly concluded with an

expression of deep appreciation for the exchange of views during the past three days which, he said, covered more ground than could have been achieved in three years through normal channels. He said he looked forward eagerly to the next meeting. He closed with an expression of appreciation to the Committee staff and especially the interpreters. Secretary Rusk said time precluded his making an adequate closing statement but he felt certain the full committee realized how deeply he and his colleagues appreciated the unparalleled hospitality which had been extended to them.

The text of the final communiqué is reproduced as *Enclosure 13*.

Ten copies of a summary of November 4–5 Japanese press coverage of the Hakone Conference, prepared by the Embassy's Translation Services Branch, are attached as *Enclosure 14*.

December 1961

**454. Memorandum of Conversation, December 2, between Rusk and Japanese Newsmen Watanabe<sup>1</sup>**

December 2, 1961

SUBJECT

Hakone Talks

PARTICIPANTS

The Secretary

Mr. Zenichiro Watanabe, Foreign News Editor, *Mainichi Shimbun*

Mr. Minoru Omori, Bureau Chief, Washington Office *Mainichi Shimbun*

Mr. Henry L.T. Koren, Director, Northeast Asian Affairs, State

Mr. John M. Gregory, Jr., Far East Public Affairs, State

Mr. James J. Wickel, Language Services, State

Mr. Watanabe stated that he felt that the attitudes being shown in the United States on restrictions on textile imports and bidding on AID fertilizer contracts had the effect of blunting the promise shown in the Ikeda-Kennedy Communiqué and the Hakone Conference.

In reply the Secretary indicated that on the textile matter we believe that the Japanese complaint is legitimate because of the good will shown by Japan in imposing voluntary export controls while other textile producers were exporting all they could to the United States. We are interested in helping Japan to enter other markets. We must now ask Congress for new kinds of trade authority to resolve problems like the present one of Japanese textiles. The Secretary said that the fertilizer matter is related to the gold-flow problem. He realized Japan was on the other side of the gold flow but we have to make our adjustments relative to the overall position of our gold holdings. He further commented that Japan is in a period of vigorous growth in which it needs capital and equipment for its ten-year plan. We cannot keep up with the adjustments needed to keep our trade with Japan balanced while Japan is running so fast. Another part of the problem is that Japan does not import what it produces and that it does not have domestic complaints about import competition. On the other hand, in the United States Japanese goods are very obvious to our people when they are displayed in stores and shops. No one sees things like the generating plants and capital goods that we export to Japan.

---

<sup>1</sup> Trade with Japan. Official Use Only. 2 pp. Department of State, Secretary's Memoranda of Conversation: Lot 65 D 330.

United States importers are not vocal but the people who think they are being injured by Japanese imports are very vocal. We hope to try between our Governments to anticipate probable trade levels in order to balance them. But in the short run, we cannot balance our trade levels item for item. However, we shall do our best to work them out.

The Secretary said he wanted to impress Mr. Watanabe with his disbelief that a decision effecting one fertilizer transaction since the Hakone Conference erases the effect of Hakone. He observed that free nations are always trying to do more. The dynamism of our economics precludes complete harmony. We must remember that while one item, such as fertilizer, is disrupted, thousands of other items are being traded equitably.

#### 455. Telegram 1470 to Tokyo, December 8<sup>1</sup>

December 8, 1961

Department and White House have noted heavy volume Japanese criticism President's request for Tariff Commission Section 22 investigation on cotton textile equalization fee. Suggest Ambassador consider giving speech before suitable forum at early date on general subject US-JAPAN commercial relations in which equalization fee problem can be put in perspective. Following points can be made:

1. US not repeat not departing from traditional foreign trade and foreign economic policies which continue to be based on proposition that interests of US and free world are bound up with liberal multilateral trading system. You may say that Department and White House have informed you that Administration proposes to go before Congress with far-reaching trade policy legislation which will be based on fundamental proposition of unconditional most favored nation treatment. We intend seek broad authority negotiate with Common Market, which is major new factor in international trade, but we intend generalize tariff concessions as in past. New departures in trade policy legislation, if accepted by Congress, will not harm or isolate Japan but rather will strengthen and expand multilateral trading system to benefit of all participants, among whom Japan is so important a member.

---

<sup>1</sup> Strategy to blunt Japanese criticism of cotton textile equalization fee. Confidential. 3 pp. Department of State, Central Files, 411.006/12-861.

2. President's request of Tariff Commission for Section 22 investigation raw cotton export subsidy reflects continuing concern US Govt over obvious inequity that two price cotton system imposes on US textile industry. However, Tariff Commission has been asked to study and investigate. There will be a full examination this matter, including public hearings where all interested parties may make views known. There is no Tariff Commission recommendation impose equalization fee and cannot be until investigation completed. There is no way to anticipate its conclusions since procedure not yet under way. Its recommendation, when made, will represent judgment as to whether sufficient case has been made to warrant application equalization fee as means mitigate effect export subsidy on US cotton support price system.

3. While USG has identified cotton textiles as special problem case US approach is not intended be restrictive and narrow one. On contrary, we have undertaken to find answers through multilateral discussions and on the basis that the interests of the free world call for orderly expansion international trade in cotton textiles. We are actively seeking agreement to cover a period of several years during which the traditional and the new exporting nations will have access increasing markets in the importing nations.

In addition public address, Ambassador should take early occasion discuss with Hara of Cotton Spinners' Association and other textile industry leaders equalization fee question. Ambassador should stress that examination of equalization fee approach by Tariff Commission is one aspect of search for solution to genuine problem facing US industry (which Hara and others understand fully). It is not only possible solution but it is one we are committed to study and explore. Tariff Commission procedures will allow all interested parties to be heard and Ambassador should be free encourage Japanese put forward their case as they see it. He should express hope, however, that Japanese industry will show understanding that USG proceeding in orderly and careful way come to a decision on how best deal with inequity caused by two price cotton and that no unconsidered or hasty actions intended or even possible.

Believe both speech and discussions with textile leaders should be undertaken soonest in order clarify US position in Japan before view becomes fixed in Japanese public that equalization fee already has been imposed and Japanese interests ignored in process.

**Rusk**

May 1962

**456. Letter from Ball to U.S. Ambassadors, May 11<sup>1</sup>**

May 11, 1962

Dear Mr. Ambassador:

The President's program for dealing with our persistent balance of payments deficits places special emphasis on the Export Expansion Program. Effective export expansion activities by our Government urgently require renewed, vigorous efforts on the part of the Foreign Service on behalf of the Department of Commerce and the American business community. With a view to achieving a more effective contribution on the part of the Foreign Service, the Departments of State and Commerce have jointly reviewed their mutual responsibilities in this field. As a result, a new agreement has been reached between the two Departments which provides for a Commercial Specialist Program within the Foreign Service. This Agreement, dated November 15, 1961, has been concurred in by the Budget Bureau subject to a further examination of the budgetary procedures within the next year.

It is clear that your personal understanding and support are necessary to make this Agreement effective in your Post. I am therefore transmitting for your personal attention a copy of the Agreement, and wish to take this opportunity to make a few comments about it. I shall not discuss individual provisions. Rather, I want to stress the importance of the Agreement to the Export Expansion Program and to the Foreign Service.

Basic to the Agreement is the understanding which Secretary Hodges and I have reached that export expansion functions can best be provided within a unified Foreign Service but with a greater degree of specialization than we have known in the recent past. If we all do our share, this Agreement will work and work well.

The Agreement's substantive provisions are designed to stimulate a professional career specialization in commercial work. To this end, the Agreement provides for a series of new and improved personnel procedures; improved opportunities for promotion via the commercial specialist route; budgetary procedures designed to provide adequate resources for this activity; and for increased participation by the Department of Commerce in trade promotion matters.

---

<sup>1</sup> Establishment of Commercial Specialist Program within the Foreign Service. No classification marking. 2 pp. Department of State, Central Files, 611.0041/5-1162.

Secretary of Commerce Hodges and I ask that you and your principal assistants give maximum support to our export drive in terms of your own time and effort and by giving guidance to the officers under your jurisdiction directly engaged in commercial work. We also ask that you draw these Commercial Officers into discussions of commercial and economic policy which substantially affect the commercial interests of the United States and the country to which you are accredited. These officers have a real contribution to make in this respect, and we must utilize it to the fullest.

Secretary Hodges and I plan to have senior officers representative of both Departments visit with your Commercial Officers in a series of regional meetings. These meetings will provide an effective forum for discussing the opportunities and responsibilities under the Commercial Specialist Program. They will also afford officers an opportunity to become acquainted with the Program in depth and to ask questions about it before making their choice of a career speciality.

We would welcome any comments or suggestions you may have about the Agreement both now and as it becomes operative.

Sincerely yours,

**George W. Ball**  
*Acting Secretary*

July 1962

**457. Minutes of Cabinet Textile Advisory Committee, July 18<sup>1</sup>**

July 18, 1962

PRESENT

Luther H. Hodges, Secretary of Commerce, Chairman  
George W. Ball, Under Secretary of State  
Charles S. Murphy, Under Secretary of Agriculture  
Meyer Feldman, Deputy Special Counsel to the President  
G. Griffith Johnson, Assistant Secretary of State  
Hickman Price, Jr., Assistant Secretary of Commerce  
W. Michael Blumenthal, Deputy Assistant Secretary of State  
E. Wayne Weant, Deputy Assistant Secretary of Commerce  
Daniel P. Moynihan, Special Assistant to the Secretary of Labor  
Robert A. Wallace, Special Assistant to the Secretary of the Treasury  
Stanley Nehmer, Department of State  
Robert C. Sherman, Department of Agriculture

The meeting was called to order by Secretary Hodges, as Chairman.

*Woolens*

Mr. Feldman led a discussion on woolens. He described recent discussions with representatives of the National Association of Wool Manufacturers and submitted a draft of a letter from him to the President of that Association, on which he asked for approval or suggestions.

The report of the Ad Hoc Subcommittee, consisting of representatives of Departments of State, Commerce, and Labor, dated July 13, 1962, was then considered and approved. A copy of this report is attached hereto as Annex A.

The State Department was requested to take necessary steps to call a meeting of the International Wool Study Group and to prepare a press release covering this. Mr. Price was instructed to call a meeting of the Wool Advisory Committee after the State Department has arranged for the organization of the proposed meeting of the International Wool Study Group, and immediately prior to issuance of the press release to inform the members thereof as to proposed action.

Mr. Feldman observed that it would be desirable at the same time to inform a selected list of Senators who are interested in the wool and

---

<sup>1</sup> Discussion of import restrictions. Attached is a June 27 letter from President Kennedy to Congressman Vinson on textile concerns. Confidential. 13 pp. Department of State, Central Files, 100.4/7-2762.

woolen textile problem of this new development of the Administration's program, and said that he would prepare a letter for this purpose.

The Committee then instructed the Interagency Textile Administrative Committee to expand its functions to include monthly and continuing studies of importations of textile products manufactured from fibers other than cotton and to report to the Committee any significant changes of import trends, this being in line with the last paragraph of the recommendation of the Ad Hoc Subcommittee.

The Administration's policy to hold imports of wool textile products to approximately the present level was reiterated.

#### *Short Term Arrangement*

The next item on the agenda was import results and problems arising therefrom during the first eight months of the Short Term Arrangement.

Mr. Feldman explained to the Committee the history underlying the letter dated June 27th from the President to Congressman Vinson. Mr. Feldman explained that the President was attracted to the principle of the ratio of imports to domestic consumption, the basis for restrictions to be the quantitative import level of FY 61. The President's idea is to set a limit of 6% on imports to domestic consumption during the life of both the Short Term and Long Term Arrangements on the theory that it is virtually impossible to administer a program involving so many nations and categories in such a way as to hold to an exact total such as the quantitative figure of FY '61.

Secretary Hodges read appropriate sections of the President's letter of June 27, 1962, to Congressman Vinson, which is attached hereto as Annex B.

The Chairman gave a report on imports during the first eight months of the Short Term Arrangement, which are summarized as Annexes C, D and E hereof.

Mr. Blumenthal stated that due to the large number of categories presently under restraint from a number of countries, he anticipated that imports for the 12 months ending September 30, 1962, would be somewhere between 115 and 120 percent of FY '61, and that imports in the last month of the Short Term Arrangement year might be as low as 2%. He further said that the State Department's estimates were that this would result in an import/consumption ratio for the 12 months ending September 30, 1962, of slightly less than 6%. Mr. Price agreed that this was a theoretical possibility but that experience has shown that imports from countries not under restraint tend to increase sharply in those categories where one or more important countries were under restraint and that as a result these estimates were a bit too hopeful.

Discussion ensued as to possible means of curtailing imports during the remainder of the 12 months ending September 30, 1962, so as

to achieve the lowest possible excess above the level of FY 1961. There was some discussion as to how far it was feasible to request restraint from countries not now restrained in categories which are under restraint in the case of one or more other countries. It was concluded that restraint actions should be taken wherever feasible in order to prevent further disruption in such categories and to cut down further the total flow of imports during the remainder of the Short Term Arrangement year, but that caution should be exercised not to accentuate international complications by requesting restraint from countries whose exports in such categories are not significant in relation to the total. ITAC was requested by the Committee to restudy the entire import situation under the Short Term Arrangement and to take such action as may be necessary under the above criteria.

#### *Long Term Arrangement*

Conversation then progressed to the Long Term Arrangement. The question was raised as to the possibility of negotiations with one or more countries who have shipped during the Short Term Arrangement year quantities substantially in excess of the level of FY 1961. Mr. Blumenthal said that the State Department was prepared to open discussions with Portugal, from which country in the first 8 months imports had reached 147% of its total FY 1961 base level and which had continued to export large quantities of carded yarn to the United States after it had advised the State Department that no further shipments would be permitted after March 12th. It was proposed that the United States would request Portugal to delete from any restraint level requested under the Long Term Arrangement the amount of yarn exported from Portugal during the Short Term Arrangement year after March 12, 1962.

Further discussions developed as to the possibility of requesting cut backs from other countries based on excessive shipment in the 12 months ending September 30, 1962, from which agreement was reached on four basic points:

(a) The United States will not reopen negotiations of the Long Term Arrangement;

(b) The United States will undertake negotiations with the largest five or six exporting countries, particularly those which are under restraint in important categories, to prevent an undue concentration of exports in the first few months of the Long Term Arrangement following the end of the restraint and/or embargo period of October 1. The limited time in which to accomplish this was emphasized.

(c) A plan is to be developed in the immediate future with all of the large exporting countries toward the end of spacing shipments under the Long Term Arrangement at an even rate of flow in order to avoid undue concentration in any one period, since the Long Term

Arrangement does not specifically make provision for such even spacing;

(d) ITAC is to undertake a study toward the end of ascertaining best base periods under which to effect restraints under the Long Term Arrangement, following the first 12 out of the previous 15 month formula.

A subcommittee within ITAC was appointed to prepare a program of guide lines and procedures for operation under the Long Term Arrangement. This subcommittee will consist of Hickman Price, Jr., W. Michael Blumenthal and Daniel P. Moynihan.

There was some discussion with regard to the rights of a minority within ITAC. The Chairman read from minutes of the meeting of this committee of May 7, 1962, as follows:

"Secretary Hodges stated that it was necessary to regularize the operations of the Interagency Textile Advisory Committee so that at its meetings each representative of the Departments concerned would have full authority, if possible, to act at the meeting. In the event this were not possible, or if the representative of any Department desired to appeal a decision being taken on majority vote by ITAC, such representative should appeal the decision within two days in writing to Secretary Hodges as Chairman of the President's Cabinet Textile Advisory Committee."

The principle contained in the minutes as above quoted was reconfirmed, including the rights of either a majority or a minority of ITAC to appeal to this Committee.

The Chairman advised that it was most important for all of the members of ITAC to operate on a team basis and to cooperate to the fullest extent amongst themselves toward the end of achieving the objectives of the President's Textile Program of May 2, 1961.

## Annex A

### *Report of Ad Hoc Subcommittee*

On May 7, 1962, the Cabinet Textile Committee appointed a Subcommittee to study the implementation of the President's Seven-Point Program with respect to textiles other than cotton. In view of the strong feeling expressed by the Cabinet Textile Committee that there should be no international negotiations, there is a need to make recommendations to the Committee that could be employed in providing a positive response to the requests by representatives of the woolen and man-made fiber textile industries for governmental assistance.

After a detailed appraisal of the situation, the Subcommittee reaffirms the Cabinet Textile Committee's decision not to undertake inter-

national negotiations on woolen and man-made fiber textiles. The Subcommittee also recommends that the Tariff Commission should not be asked to undertake a study on imports of these items at this time in view of the fact that the industries concerned desire action rather than the promise of another study.

However, in view of the representations made by industry leaders that the domestic market in woolen and man-made fiber textiles and products is being substantially depressed by imports from foreign countries, the Subcommittee recommends that the Management Committee of the International Wool Study Group be requested to call a meeting of its member countries to explore those present and future problems of international trade in wool and woolen products and competing fibers and products that are of mutual concern to them.

The Department of State would first informally approach the United Kingdom Government and such other governments as it considers necessary to lay the necessary groundwork for the United States request to the Management Committee. The Department would indicate that it is not the intention of the United States to propose an international agreement at the meeting of the International Wool Study Group, but rather to reconvene a forum for all countries to discuss and study the commodities concerned and the problems confronting these commodities in international trade.

The Subcommittee also recommends that the terms of reference of the Interagency Textile Administrative Committee be broadened to permit it to consider textiles other than cotton textiles, pursuant to the President's Seven-Point Program of May 1961.

## Attachment

Dear Carl:

I have carefully studied your letter of June 13. The arguments you make and the statistics you present are very persuasive.

It seems to me important to maintain a relationship between the volume of imports of cotton textile products and domestic consumption in such a manner as to prevent dislocation of domestic production, thus permitting the textile industry and individual mills to plan intelligently, on the basis of estimated demand. Such programing of imports and domestic production will permit the industry to assume its rightful place as a growing, vital factor in the economy.

As you know, the imports of cotton textile products are now subject to limitation under the Short-Term International Cotton Textile Arrangement expiring September 30, 1962. There has also been negotiated with 18 other nations a Long-Term International Cotton Textile Arrangement, expiring September 30, 1967, which will become effective October 1, 1962, upon adherence by the nations involved.

I note particularly your reference to the level of imports of cotton textile products during the first seven months of the Short-Term International Arrangement. Since it has been our intention to use imports during Fiscal Year 1961 as the base period for calculating the appropriate relationship between imports and domestic consumption, the excessive imports in recent months have been disappointing. It occurred due to temporary factors associated with the newness of the Arrangement and the lack of authority for dealing with nations not participating in the International Arrangement which was corrected by PL 87-488.

I am informed that these temporary factors have not been substantially resolved. Nevertheless, I am requesting the Departments of Agriculture, Commerce, Labor, State, and Treasury, which are represented on the Interagency Textile Administration Committee, to take such measures as may be necessary to limit imports of cotton textile products during the remainder of the Short-Term Arrangement to the desired level.

Similarly, it is our intention to use the terms of the Long-Term Arrangement in such a way as to limit imports of cotton textile products during its life to a level designed to achieve the objectives of the second paragraph of this letter. This would mean that the ratio of imports to consumption would be approximately that of Fiscal Year 1961, adjusted to such mandatory increases as are provided by the Arrangement. To prevent hardship to any one sector of the industry, the level of imports in each category will be held as closely as possible to the same desired level.

It is my intention that these agreements, together with such other powers as are available to the Executive department, be implemented and exercised in such a way as to prevent any further deterioration in the relationship between imports and domestic consumption.

With regard to textile products manufactured from fibers other than cotton, imports are being carefully scrutinized monthly. If a rising trend of imports above present levels affects adversely domestic industry, such measures will be taken as may be necessary to prevent deterioration in the imports/domestic consumption relationship.

I appreciate the assistance you have rendered in helping meet this objective.

Best personal regards.

Sincerely,

JFK

# August 1962

## 458. Memorandum from Ball to President Kennedy, August 21<sup>1</sup>

August 21, 1962

### SUBJECT

Woolen Textile Problem

There is only one rational way to tackle the import problem of the woolen textile industry. This is by coming to grips with raw material costs.

In this memorandum I suggest a course of action that would accomplish this in a way that would benefit the woolen textile industry, the raw wool growers, the consumer, and U.S. foreign relations.

### *The Present Structure of Protection*

1. Our woolen textile industry presently depends on imports for two-thirds of its raw wool. This comes primarily from Australia, but also from such countries as New Zealand, Argentina and Uruguay.

2. Raw wool imports are subject to a duty of 25½¢ per pound. In addition our wool growers receive a compensatory payment that in 1961, approximated 45% of their total receipts from their raw wool sales. The National Wool Act of 1954 limits compensatory payments to 70% of the aggregate amount of duties collected on raw wool and woolen textiles.

3. There is a tariff on woolen textiles consisting of an ad valorem duty plus a specific duty of 37½% a pound.

A. The *specific* duty component of this tariff is intended to equalize raw wool costs to the U.S. textile industry; in fact, it contains an element of extra protection.

B. The *ad valorem* component of the woolen textile tariff was increased, as of January 1, 1961, to a point approximately equal to Smoot-Hawley levels.

### *Recommended Course of Action*

In order to assist the woolen textile industry and to improve its competitive position as against imported wools, we recommend the following courses of action:

---

<sup>1</sup> "Woolen Textile Problem." Confidential. 3 pp. Department of State, Central Files, 411.006/8-2162. September 1962

1. Negotiate with Australia a reduction in the tariff on raw wool by 50% using the authority of the Trade Expansion Act. As a *quid pro quo* for such a reduction Australia is prepared to offer some especially valuable concessions such as a raising of the embargo on the export of Merino sheep to the United States. This should materially help U.S. wool growers to build up their flocks of fine quality sheep.

2. In order to avoid loss to the wool growers from this reduction in import duties, the ceiling on compensatory payments should be revised so as to assure them of at least the same level of income that they are now receiving.

3. Both the ad valorem and specific duty components of the tariff on woolen textiles should be maintained at present high levels. Under our GATT commitments, if we reduce the duty on raw wool, we are required to reduce the specific duty. However, we could probably avoid paying substantial compensation to other countries for failure to do this, since we would have the support of Australia and other Commonwealth countries to a GATT waiver.

#### *Advantages*

This course of action offers the following advantages:

A. The competitive position of the woolen textile industry would be substantially improved as against imports, since its raw material costs would be reduced by roughly 12–15%. Its competitive position would also be improved as against the competition of fabrics domestically produced from man-made fabrics.

B. The United States wool-growing industry would be guaranteed the same level of income it now receives. In addition it would obtain special concessions, such as the opportunity to import Merino sheep.

C. The U.S. consumer would benefit by lower woolen textile prices.

D. Our foreign relations would benefit by our ability to reduce our tariffs on wool from Australia, New Zealand, Argentina, and Uruguay. These tariffs have been a source of galling complaint for a long time.

We have not computed the cost to the American treasury of the additional compensatory payment to the wool growers but the top limit would probably not exceed \$25 million.

The foregoing is proposed not as a substitute for our proposed approach through the Wool Study Group, but as a supplement to that approach.

**George W. Ball**

**459. Letter from Hodges to Ball, September 14<sup>1</sup>**

September 14, 1962

Dear George:

Attached herewith are the minutes of the President's Cabinet Textile Advisory Committee held Monday, August 27, 1962, at the White House.

The delay in getting these to you is regretted.

James S. Love, Jr., Department of Commerce

Secretary Hodges called the meeting to order and directed the discussion through five major topics.

---

<sup>1</sup> Conveys minutes of August 27 meeting of President's Cabinet Textile Advisory Committee. Confidential. 6 pp. Department of State, Central Files, 394.41/9-1462.

### *1. Correction of the two-price cotton system.*

Mr. Feldman stated that we should be prepared for a negative decision on the off-set fee by the Tariff Commission. He reviewed the President's intention in such an event to (1) make an announcement at the time of the Tariff Commission's decision that the Department of Agriculture was directed to find another solution and (2) to make a conditional statement along these lines to Senators with whom he is meeting this week. Secretary Hodges pointed out that these statements would be very helpful in achieving favorable action on the Trade Bill in the Senate.

Dr. Cochrane indicated that the Department of Agriculture was preparing several proposals to compensate for half of the price differential, and that all contemplated a payment for this amount. Mr. Feldman asked why the plans didn't cover the complete differential, and Secretary Hodges explained that while it was originally proposed that the other half would be made up by a partial off-set fee it had been decided at the meeting with the President on August 21 that compensation and/or price reduction would be the only methods used. Dr. Cochrane agreed to prepare plans on this basis.

Assistant Secretary Duncan expressed concern that the textile industry might not support a compensation plan, but Assistant Secretary Price replied that while the industry might be reluctant to propose such a plan he felt confident it would vigorously support one proposed and backed by the Administration. Mr. Feldman indicated he would favor a price reduction of as much as two cents so that the compensation could be correspondingly less, but he was not sure that the President would support more than a one-cent reduction at this point.

### *2. Short Term Arrangement.*

Secretary Hodges reviewed import levels for the first nine months of the Short Term Arrangement and then pointed out that preliminary figures for the first ten months, just received, would bring total imports through July to 110% of the base year, Fiscal 1961. Assistant Secretary Price stated that this was somewhat more than had been expected for the tenth month and that this might indicate that imports for the full short term year might be slightly over the previously estimated 120% of the base year. Mr. Feldman questioned the significance of this, and Mr. Love replied that if imports exceeded 120% of the base year they would also likely exceed 6% of domestic consumption. Assistant Secretary Price thought that this would be only a slight excess of perhaps 6.1%, and Mr. Feldman thought that such a small excess would not be too disturbing to the President's commitment to hold imports at 6%.

### *3. Japanese Bilateral.*

Secretary Hodges then turned to the Japanese Bilateral, and it was pointed out that the Japanese have now agreed not only to stay within

the total limit but also to stop shipments of the disputed categories. It was generally agreed that the State Department had done an excellent job in handling this situation and that in addition there had been excellent press on the announcement over the weekend. Under Secretary Ball passed out copies of the State Department press release on this matter.

#### *4. Long Term Arrangement.*

Secretary Hodges reviewed the President's commitment to hold imports below 6% of domestic consumption over the five years of the Long Term Arrangement. He stated that while a Presidential commitment should be sufficient, certain key Congressmen were insisting on more tangible assurances from the Departments who would be administering the Arrangement. Various possibilities were discussed, and Assistant Secretary Price pointed out that a Subcommittee of ITAC was in the process of drawing up a policy for administration of the Long Term Arrangement. It was agreed that the matter would be reconsidered when this paper was ready, probably in the next few days.

Mr. Feldman raised the question of obtaining adherences to the Long Term Arrangement, and Under Secretary Ball pointed out that probably few if any others would adhere until we did so ourselves. He further indicated that we would not do so until the Trade Bill was out of the way or at least further along so that we could maintain flexibility and freedom to maneuver depending upon what happened to the Trade Bill. Secretary Hodges was concerned that our waiting would delay others, but Under Secretary Ball was emphatic that we should maintain this flexibility.

Assistant Secretary Price emphasized the importance of immediate discussions with exporting countries to space out shipments under the Long Term Arrangement, particularly because of the long pipelines involved and the fact that ships may be loading even now or certainly very shortly. Mr. Nehmer reported on discussions already held with Israel and Taiwan and commented on discussions to be held with Hong Kong, not only for proper spacing but also for reducing the base applicable to the Long Term Arrangement. Assistant Secretary Price indicated that the embargo on Portugal might have to be continued. Assistant Secretary Johnson agreed that spacing of shipments was extremely important and suggested that it might be worth giving something on the totals in order to achieve this; this point however was dropped. Under Secretary Ball stated that whatever is required would be done, and Secretary Hodges pointed out that it should be all nations involved and not just a few principal ones.

Assistant Secretary Price stated that ITAC had also agreed to call all important categories and countries on October 1, but Assistant

Secretary Johnson raised the question as to whether this was necessary if an adequate job was done of getting to agree to spacing out shipments.

Mr. Feldman advised that the President would see the Senators on August 31. He raised the question of an OEP decision since the President said the Senators know we can control this decision to some extent. Mr. Feldman said however that he was not in favor of an OEP decision because of possible pressure to take other actions with this authority. He suggested assurances be given the Senators that imports would be held in total and by categories.

#### 5. *Wool.*

Secretary Hodges reviewed the discussion at the meeting with the President on August 21, at which it was decided that bilateral agreements with the United Kingdom, Italy and Japan would be attempted in October after the Long Term Arrangement has been signed by enough countries.

Under Secretary Ball raised the possibility of solving the wool import problem by other methods and suggested that the used wool products from Prato, Italy, were the most serious and that if these could be controlled it would largely solve the wool import problem. He further suggested tightening the labeling requirements or imposing sanitary restrictions, indicating that this line of inquiry had been suggested to him by the wool industry whom he used to represent. Mr. Feldman stated that there were no sanitary restrictions, and Secretary Hodges expressed the belief that tightening labeling requirements would not solve this problem.

Dr. Cochrane asked whether the higher fabric duty could be applied to unfinished garments through an escape clause action, and Mr. Moynihan pointed out that the tariff on apparel is considerably lower than that on fabric. Under Secretary Ball suggested a fast escape clause action on all apparel or on at least those items where imports were most serious. Mr. Feldman stated however that any fast action was impossible due to the workload of the Tariff Commission and that at least six months would be needed.

Dr. Cochrane read a paper prepared by the Department of Agriculture on steps for controlling wool imports—principally modernization of the wool industry and reduction by 5¢ per pound in the tariff on raw wool with a corresponding increase in compensation to the wool growers. He pointed out that the Department was recommending only 5¢ in order to avoid a revision of the Wool Act and was not going along with a 50% or 12.5¢ reduction proposed by State. Under Secretary Ball complimented Dr. Cochrane on this paper and endorsed it. Mr. Feldman commented that a reduction in the raw wool tariff would simply substitute one problem for another and would not be sufficient

to solve the problem. In addition, it was agreed that it would cost heavily on votes for the Trade Bill with Western Senators.

Assistant Secretary Price commented that all of the suggestions on other methods to solve the wool import problem were helpful but that the real question was how to meet the commitment of the President to keep imports at current levels. He further stated that none of these suggestions would be sufficient and that some sort of overall restriction would be needed to prevent imports from rising to 20% of domestic consumption by the end of the year. Dr. Cochrane stated that the Department of Agriculture agreed with the 20% projection. Secretary Hodges pressed for State's agreement to begin negotiations as promised in the President's meeting, and Under Secretary Ball said that the State Department would find a way to control the wool imports but that he would rather trade with the other countries on a tariff increase rather than a quota.

Secretary Hodges asked Mr. Love to explain the charts on the import projections which he did, pointing out that the biggest problem is in apparel imports where there is a very marked seasonal variation. Mr. Moynihan stated that apparel has a higher value than other imports and therefore on a value basis the problem was even greater. Under Secretary Ball requested a detailed analysis of wool imports in the apparel group with as much information on value as possible. It was agreed that this would be made available by Commerce by Thursday.

The question of what could be done to stop the imports of Italian fabric through the Virgin Islands was raised by Assistant Secretary Price, pointing out that the Treasury Department had advised that there was no administrative remedy. Assistant Secretary Reed, however, took issue with this, stating that an administrative remedy was possible through voluntary restraint. Mr. Feldman at that point suggested that this was a matter that should be settled later.

Mr. Feldman mentioned the possibility of an OEP action on wool only as one way to get fast tariff action. However, this course involves the usual objections to an OEP action.

Assistant Secretary Johnson advised that there was pressure from some countries to delay the meeting of the International Wool Study Group until January. It was agreed, however, that we should continue to push for the earliest possible date.

The various immediate actions to be taken were reviewed, and Secretary Hodges then adjourned the meeting.

**460. Letter from Hodges to Feldman, September 19<sup>1</sup>**

September 19, 1962

Dear Mike:

This refers to our telephone conversation yesterday regarding the cable on woolen textile discussions.

I had just finished talking to George Ball about the same matter. My concern was not with sending the cable to correct any impression that the U.S. Government had changed its mind or would not live up to its promises. (Even though it could have been bad judgment to have made the original promises.)

My concern was the same that I expressed quite strongly on wool, you may recall, at our last Cabinet Level Textile Committee Meeting, namely that, with the delays indicated at that meeting and in the cable, we were going to be in serious trouble again.

It was entirely my fault that I momentarily forgot about the promises given other nations regarding wool textiles when I very honestly answered a question as to how the President's promise to hold wool imports at "current levels" could be implemented.

But as I indicated to George, the cable intimated to other nations that we wouldn't discuss the woolen import situation until after the International Wool Meeting, which I understand has been postponed until December. This procedure, if made public as it surely will be, will make things embarrassing to all of us including the President because I am sure as I can be that the import situation will worsen as the weeks and months pass.

We were in rather serious trouble last spring on our short-term agreement because of delays and "international" arguments by State Department representatives. Although relations have since improved and all of us are becoming more realistic, I don't think we are out of the woods. Unless we are continually realistic, positive, firm and timely, we shall be in trouble with the long-term cotton textile arrangement.

And I reiterate that the wool textile situation is getting worse and unless, as George Ball said to me yesterday, "without necessarily waiting for the International Wool Meeting we are going to find ways and means to implement *the President's decision*"—(to hold imports at current levels which were around 17% at the time the President gave his promise to the Senators and even less than 17% when you wrote the Wool Manufacturers' Association).

---

<sup>1</sup> Woolen import situation. No classification marking. 3 pp. Kennedy Library, Feldman Papers, Wool, Box 26.

So we still have before us the problem of what to do on wool but I am sure you agree with me that it must be solved. However, the textile situation is just a part of a larger problem we face in our relationships and our actions.

As much as I regret having to say it, I think I should point out, as a loyal member of the Administration and being interested in seeing that the President's promises are met, whatever the industry or the circumstances, that the image of the State Department in negotiation or carrying out trade negotiations is not good. This "image" is held by the members of both houses of Congress and by the public, especially the business community. This is not generally true in other trading nations as there is much closer cooperation between business and government especially in world trade, and they do not mix as we do our political and our commercial.

Rightly or wrongly our lawmakers and our business people feel that the State Department (they usually except the Secretary of State as an individual) looks after the interests of other nations and doesn't really try to protect the business interests of the U.S. This attitude, if true, might have been understandable 10-15 years ago when we were trying to help other nations get on their feet but not today when the USA is having real competition and continuing problems of trade and balance of payments.

I would fervently hope we can work much closer together in the various Departments especially at top levels for too many times we find the State Department making unilateral statements or "promises" rather than discussing with interested and affected agencies.

I would hope also that we will be able to more clearly define our U.S. policy regarding our negotiations with other countries on trade and commercial matters.

Sincerely yours,

**Luther H. Hodges**

October 1962

461. Letter from Rusk to U.S. Ambassadors, October 19<sup>1</sup>

October 19, 1962

Dear Mr. Ambassador:

I am gratified that, even though no specific reply was requested, a large number of our Chiefs of Mission have responded to Under Secretary Ball's letter of May 11, 1962. That letter renewed the call, in conjunction with the implementation of the State-Commerce Agreement on International Commercial Activities, for maximum support of the export drive.

I am also heartened that our Chiefs of Mission realize that the Export Expansion Program is not a bureaucratic device to export more work to our posts but a fundamental effort to increase our exports and thereby to improve our balance of payments. It is apparent to me, as I know it is to you, that there is a direct correlation between the level of our exports and our ability to accomplish many of our important foreign policy objectives.

The Executive, from the President on down, is vitally interested in expanding the volume of American exports. We know that in order to succeed we must have a direct and active participation in trade promotion by all of our Chiefs of Mission.

The role of our Chiefs of Mission is subject to change. What was traditional and helpful yesterday may be outmoded and inadequate today. I have come to the conclusion that this is the case as regards trade promotion. Mission Chiefs, their deputies, and indeed all top officials of the mission have many acquaintances in host government ministries and in business and other circles who can be sources of trade leads for our manufacturers and exporters. Not only commercial officers but the entire mission is obligated to be alert to these opportunities.

In today's competitive markets we can do no less than our competitors, short of participating in actual sales or giving unfair competitive advantage to one American company over another. In the absence of explicit restrictions in the regulations, it is left to the discretion of the Chief of Mission as to how far to go in assisting American businessmen establish trade connections.

---

<sup>1</sup> Trade promotion efforts. No classification marking. 2 pp. Department of State, Central Files, 400.116/10-1962.

Admittedly, competitor nations historically have a larger dependence on export trade than we. The governments of those countries therefore have a deeply imbedded tradition of assistance to their traders which they continue to follow. But we have no mean tradition ourselves. In the early years of our Republic, our Ambassadors and Consuls had a primary mission of promoting our commerce and trade, and made a significant contribution to the success of the "clipper ship" era in world commerce. Perhaps we need to recapture some of the zeal of our forebears, for we are in the export business not just for today and tomorrow but for the long haul. Accordingly, I am requesting that you as well as your principal aides be alert to and seek out export opportunities for American business.

I should like to add a word about relations between the mission and the local American business community. Where such a community exists, the success of your trade promotion effort is heavily dependent upon the strength of these relations.

I therefore urge that you re-examine this situation as it concerns your mission as well as the Consular Officers under your supervision. Many Ambassadors have found it useful to meet regularly with the leaders of the American business community in order to brief them on foreign policy developments and to obtain from them whatever assistance they may have to offer in both foreign policy and trade promotion matters. I am confident that such cooperation cannot help but work to our mutual benefit.

Sincerely,

**Dean Rusk**

November 1962

**462. Memorandum of Conversation, November 27, between  
Herter and Schaetzel<sup>1</sup>**

November 27, 1962

SUBJECT

Trade Expansion Act

PARTICIPANTS

Governor Herter  
J. Robert Schaetzel

Mr. Herter said he was not quite sure why he had accepted the job and that in his discussion of the matter with the President he had made it quite clear that his willingness to take it on turned on a broad mandate. As this was the kind of task outlined by the President, Mr. Herter had asked if he would be prepared to give him a letter to this effect, which the President had done the following day. Mr. Herter also said that he had an understanding that he would take time off from the job as he was no longer as young as he once was. Mr. Herter indicated that David Bell and Mike Feldman had been in touch with him and they had promised to bring before him the draft Executive Order. He also showed me a memorandum from Mike Feldman which indicated again the broad concept of the position suggested earlier by the President. Mr. Herter said he expected to be sworn in on December 10 but that he would be going away on December 17 until early in January due to a previous commitment.

We discussed at some length the problems of staff, relationship to the White House and the State Department. Mr. Herter seemed to accept the merits of a simple Executive Order with no reference to intradepartmental committees other than the "Agency" set forth in the Act. He seemed intrigued by the manner in which the Department might support his efforts as I outlined it to him. I said that there were four parts of the Department which should be considered an extension of his own staff, the principal point being the Economic Bureau, then the Legal Adviser's office, my responsibility and, finally, the Public Affairs area. I suggested that one responsible officer in each of these bureaus should be designated as individuals on whom Governor Herter

---

<sup>1</sup> "Trade Expansion Act." Confidential. 4 pp. Department of State, Central Files, 411.0041/11-2762.

and his staff had priority claim. In other words the work of Mr. Herter's office was their first order of business. I said that in addition there ought to be a more senior group willing to work with him and be of assistance at any juncture. In this connection I suggested Griff Johnson, Abe Chayes, Bob Manning and myself. (I had earlier had a chance to discuss this type of arrangement with Dave Bell who felt it was entirely sensible.)

As far as his own staff was concerned it was clear that Mr. Herter was almost overwhelmed by the volume of congratulations, inquiries and suggestions. He told me Gossett was about 95 per cent firm as his Deputy. He was impressed by the amount of White House support and McNamara's endorsement of the man. One reservation was Gossett's own ambition to be President of the Bar Association which seemed a likely prospect if he were to remain outside the Government. Mr. Herter took a telephone call while I was there and said subsequently that some people seem to be pulling back a bit from Gossett but he personally felt a commitment had been made and he wanted to move ahead with the appointment.

Mr. Herter said he had also had a discussion with Mike Rashish and that the latter was very sensitive about his status, the emoluments of the job and the "need" for a special position to carry on effective intradepartmental work. In this connection Mr. Herter said he did not like the idea of more than one Deputy. We discussed as well the dangers implicit in establishing several positions requiring Senatorial confirmation in that this would turn the Governor into a focal point for special interest group pressures. He said he had already had recommendations from the textile industry that Hickman Price should be a Deputy; there were also recommendations coming from the agriculture interests. Due to the limitations of the Act, the Governor thought it might be necessary to go back to the Congress for authority to hire a small staff. I said that in my view, if he were to start out with himself, Gossett and Mike Rashish he would have an ideal nucleus.

I discussed quite candidly with Mr. Herter the problem he would have to deal with in Mike Feldman. I said that I approached this subject not in any ad hominem fashion or indeed in terms of policy disagreements between the Department and Feldman but rather that the Governor and Feldman had different concepts about the objectives to be served by the Trade Expansion Act. The Governor agreed that it was his task to keep uppermost the broad national interest and particularly to mobilize those United States interests which would support Trade Expansion authority.

Mr. Herter's reservation about an early trip to Europe as well as involvement in such problems as the wool issue are due to his desire to brief himself. He emphasized his need to know more about the way

the legislation would work. Nonetheless, he said he would be willing to meet with Walter Hallstein if the latter happened to come to Washington on December 7 or 8 (subsequently ruled out by a telegram from Brussels).

Mr. Herter brought up the wool problem himself. He had discussed the matter with Mike Feldman, and quoted the latter as saying his letter was not a commitment to the textile industry. Governor Herter said he was somewhat at a loss to see how the language could be interpreted as other than a form of commitment. I took the occasion to outline the situation as we saw it following, but not referring to Mr. Ball's memorandum to Mr. Feldman. It is clear that Mr. Herter is not anxious to be drawn into the middle of this difficult problem. His feeling seems to be that either it should be kept in abeyance until he can look into it and have a major voice in the decision or that it should be settled by others and that he will then take over a finished piece of business.

In a considerable discussion of the agricultural question, Mr. Herter was appreciative of the European interest in expanding agricultural production, their extensive agricultural pressures, and a realistic awareness that Secretary Freeman and others in Washington are to some extent transferring domestic agricultural pressures onto the European scene. He also was aware of the danger that the Department of Agriculture might want to make excessive use of the Trade Expansion Program as a means of dealing with difficult internal political problems.

I outlined in some detail the evolving situation in Europe, the new difficulties in the UK-Six negotiations, the fact that one cannot assume automatic European interest in moving quickly and broadly on trade negotiations. I also outlined to him the problem on poultry and the reasons why we were laying such emphasis on this commodity. He showed a keen awareness of the economics of the poultry business and the extent to which Europeans are already and will increasingly in the future employ in Europe the advanced poultry production techniques developed in the United States.

Governor Herter asked me about the private organizations active in this field and how they should be used in the future. He particularly inquired into the Committee for a National Trade Policy. I said they certainly should be kept in being and should be encouraged to do two tasks: first, to generate support in Europe for a major reciprocal reduction of trade barriers and, second, to support him domestically against the special interest groups. For specific information I suggested that I have Mrs. Morgan get in touch with him, noting that she had done very effective work in this area for Howard Peterson. He welcomed this suggestion and I arranged for Mrs. Morgan to see him the following day.

We also discussed some of the demands he was already receiving from organizations asking him to speak or meet with them. He said he was turning all of these down. As he had mentioned Blough of the Business Advisory Council, I said Jean Monnet had been asked to meet with the same group in January. Mr. Herter felt it would be helpful if Monnet and he could meet with a key group such as Blough and his associates during January at the time of Monnet's visit.

Mr. Herter asked if it would be possible to get Ambassadors Tuthill and Leddy and Evans over to meet with him in January. I said this was an excellent idea and we would be glad to arrange it at his convenience.

March 1963

463. Paper on "The Wool Textile Import Problem," March 4<sup>1</sup>

March 4, 1963

THE WOOL TEXTILE IMPORT PROBLEM

A. Commitments to contain wool textile imports have been made repeatedly:

1961 *May 2*—The President's 7-Point Textile Program expressed a desire to achieve "a basis for trade that will avoid undue disruption of established industries."

*June 30*—The President to Congressman Vinson stated that the contemplated cotton textile negotiations are "one of a series of efforts . . . to get the best possible relief, not only for cotton, but for other fibers."

1962 *January*—Lawrence O'Brien to Senator Pastore and Congressman Vinson stated "after the conclusion of the permanent (cotton) textile agreement, the problems of the wool and man-made fiber industries will certainly be attacked."

*February 26*—The President to Congressman Vinson said he had "requested the Departments involved to implement my program for the wool, man-made fiber, and silk divisions of the industry."

*May 10*—Hickman Price, Jr. to the National Association of Wool Manufacturers said "The President's Cabinet Textile Committee last Monday appointed a three man ad hoc committee to consider and report upon, as rapidly as possible, the implementation of the President's 7-Point program relating to textile products manufactured from fibers other than cotton."

*August 7*—Myer Feldman to the National Association of Wool Manufacturers said "we intend . . . to prevent market disruption such as would result from an increase over current levels of imports."

*August 24*—The President to a group of Senators and Congressmen reaffirmed the intention to "hold imports of wool textiles to current levels."

*December 11*—Michael Blumenthal, Deputy Assistant Secretary of State, to the International Wool Study Group, stated "there is . . . a

---

<sup>1</sup> Commitments enumerated and current status of problem. No classification marking. Attached tables reflect amounts of raw wool and all-fiber import totals for years 1957–1962. Official Use Only. 4 pp. Kennedy Library, National Security Files, Kaysen Series, Trade Policy, Trade Expansion, 10/62–3/15/63, Box 378.

commitment by the President to the Industry that . . . the Administration will not permit excessively large imports or rapidly rising imports, which have a disruptive effect, effectively to destroy the stability and the survival of all sectors of this industry."

1963 *January 18*—Senator Pastore told newsmen that "the President promised to propose within a month measures to limit (wool textile) imports."

B. *Import Level* has risen rapidly in the latter half of 1962, either on the previous (raw wool) method of calculating the ratio of imports to domestic consumption or on the new (all-fibers on the wool systems) method. By the previous method the ratio for 1962 is 20.2 (Exhibit 1), which is 36% higher than 1961 and 9% higher than 1960. By the new method the ratio for 1962 is 18.0 (Exhibit 2), and the increase is greater—40% over 1961 and 15% over 1960.

By either method imports have increased above those that members of the Congress and the industry understood would be maintained, and the prospect is for further substantial increases.

C. *Various solutions* have been studied, so far without finding an entirely acceptable one:

*Agreements* have been explored in indirect ways but not on a direct government to government approach. Some are reluctant to pursue this solution in view of possible international reactions.

*Tariffs* are high already, and preliminary investigations indicate that legal limits would prevent adequate increases to make this a meaningful solution. Experience on higher fabric tariffs has already shown this approach to be ineffective as exporters adjust to the higher rates. In addition, rates sufficient to deter lower wage countries would exclude EEC countries entirely.

*OEP* has been held out to interested members of Congress and the industry as a last resort solution.

D. *Recommended action*: While some think it unwise to make an all out effort on a direct government to government approach to achieve an international agreement, this remains the most feasible solution. The countries involved have been well prepared for such an approach but understandably are not going to take the initiative and are going to put up at least a show of resistance.

March 7, 1963

SUBJECT

Wool Textile Problem

In anticipation of your talk tomorrow with Senator Pastore, here are my views on the current wool textile situation:

In attempting to fulfill its commitment to the industry, the Administration has two possible courses of action:

We can seek an agreement with the exporting countries; or we can take unilateral action.

The effort of the Administration to secure an agreement has not been successful and in the present circumstances could not be successful without the use of coercive measures. Even if coercion were successful, its use would foredoom hopes of success in the Kennedy Round, and might jeopardize the cotton textile agreement.

There are manifold risks involved in taking unilateral action, whether taken under the national security provisions, the escape clause provision or pursuant to new legislation. United States trade policy is already under suspicion and attack in Europe. To take such action in the wake of the EEC rejection of the UK, and the current Japanese contortions in adjusting themselves to the restrictions under the cotton textile agreement would provide the basis for violent attacks upon the United States and would strengthen the French position that United States trade policy is essentially protectionist.

Any such development at this time would impair our negotiating position on the eve of the important Ministerial Conference of the GATT, which is to take place in May, and inevitably would seriously weaken our negotiating position in the Kennedy Round. The effect of unilateral action would be mitigated if it came after a finding of injury under the escape clause provisions of the Trade Expansion Act.

Any unilateral action to establish quotas at this time, regardless of how it was taken, would require under the GATT the payment of compensation to the exporting countries involved, in the form of decreased tariffs on other items. The payment of the large compensation required undoubtedly would have a substantial impact upon other

---

<sup>1</sup> Background paper on wool textile problem for Kennedy's meeting with Senator Pastore. No classification marking. 2 pp. Kennedy Library, National Security Files, Kaysen Series, Trade Policy, Trade Expansion Act, 10/62–3/15/63, Box 378.

segments of the economy, including loss of employment. If the compensation offered were rejected, as it could be, the impact of retaliatory action would be even greater and more damaging because we could not control it.

The Kennedy Round of negotiations provides the best opportunity to work out a satisfactory arrangement for wool textiles. It could be a product of the broad give-and-take exchange of concessions that will occur there.

It must be emphasized, however, that we are not in a position to give any assurance that we will emerge from those negotiations with a package that is satisfactory to the wool textile industry.

**Christian A. Herter**  
*Special Representative  
for Trade Negotiations*

---

**465. Paper Prepared in White House for President Kennedy,  
March 7<sup>1</sup>**

March 7, 1963

SUBJECT

Your Meeting with Senator Pastore on Wool Textiles

You are seeing Senator Pastore tomorrow at 10:00 A.M. As I think Mike Feldman has already reported to you, the group of some thirty industry people and three union leaders who met with Governor Herter went in expecting no satisfaction and got none. Herter talked to them about what had been done, and about problems of compensation and retaliation that a negotiation would raise. Mr. Blumenthal told them why past attempts at negotiation had failed. As agreed, Governor Herter did *not* promise them that he would try to do something for wool textiles as part of the general trade negotiations. The consensus of Governor Herter and Secretary Ball (see attached papers) on what you can safely say to Senator Pastore is:

---

<sup>1</sup> Background information for meeting with Senator Pastore on wool textiles. 2 pp. No classification marking. Kennedy Library, National Security Files, Kaysen Series, Trade Policy, Trade Expansion Act, 10/62-3/15/63, Box 378.

1. The present situation in Europe is radically different from that in which your promise to him was made. The European countries, and especially the UK, are feeling edgy about their own trade problems, and any renewed attempt to negotiate an agreement will be even less likely to be successful now than previously. Although we have already made a substantial effort through Blumenthal and Wyndham White, their record of lack of success is clear. Accordingly, if we try to negotiate a wool textiles agreement now, it is our best judgment that it would fail. Further, the effort itself is likely to destroy the cotton textile agreement, because the Japanese are already complaining about our administration of it, and to poison the atmosphere in Europe for a general trade negotiation. The surplus in our trade with Europe is almost \$2 billion; this is a handy measure of the economic importance to us of expanding our trade through the success of the Kennedy round negotiation.

2. We can bring up the wool matter again in the course of the general negotiations next year. We cannot be certain that even then we will be successful, but the probability of success at that time is greater, because the problems of compensation can be dealt with in terms of the general deal that we make with the Europeans rather than separately. Further, since we will be making a general deal, the problem of retaliation will be avoided. If we do not avoid retaliation, we may find that the imposition of quotas on wool would lead to harm to industries in a much more sensitive and difficult position than the woolen manufacturers. The larger woolen manufacturers are prosperous, and the smaller ones who are not, are being affected by causes other than imports.

April 1963

**466. Letter from Herter to President Kennedy, April 17<sup>1</sup>**

April 17, 1963

Dear Mr. President:

I am enclosing a Memorandum which raises two points on which I hope I may have your decision or judgment within the reasonably near future.

In view of the fact that the second question in particular has political implications, I have taken the liberty of sending a copy of this Memorandum to each member of your Cabinet, and to Ted Sorensen and Larry O'Brien. I have also asked them to express any views in order that you might have the benefit of any comments they care to make. These should all be in hand within a week and if at that time you would wish me to discuss this matter with you, I shall be glad to do so.

Most sincerely yours,

**Christian A. Herter**  
*Special Representative  
for Trade Negotiations*

**Attachment**

There are two matters on which a determination by you in the near future will be essential in order that we can proceed with participations for the coming round of tariff and trade negotiations.

1. The Trade Expansion Act requires that you present to the Tariff Commission a public list of articles, consisting of five categories, on which both the Tariff Commission and this office would hold hearings and report to you within a period of not more than six months. The less important categories are those dealing with (1) tropical products, (2) certain agricultural products, (3) items subject to tariff duties of 5 per cent or less, (4) items on which 80 per cent of world trade is confined to the Common Market and the United States (probably only airplanes and some edible vegetable oils). The fifth category, and the most important one, covers products on which the United States can negotiate

---

<sup>1</sup> Transmits April 17 memorandum requesting decisions on upcoming tariff and trade negotiation matters. Secret. 4 pp. Kennedy Library, Herter Papers, Memoranda to the President, USTR, Box 4.

tariff reductions up to 50 per cent spread over a period of not less than five years.

On this latter category, the law requires that the United States reserve from any negotiation all articles where escape clause action has been taken or where a finding has been made that articles (i.e. petroleum products) are subject to quota limitations for reasons of national security. Other reservations which the United States might make would come in that group of articles where affirmative escape clause action had been taken by the Tariff Commission but had not been approved by the Executive. These, at the request of the affected industry, would require re-study by the Tariff Commission in the light of present conditions. You would, of course, be free to exempt further articles after you had studied the summary of the hearings and received advice from the Tariff Commission, this office, and other government agencies.

The question to be decided deals with the all inclusiveness of the articles which are to be published and furnished to the Tariff Commission. It is my recommendation that all items subject to tariffs, with the exception of those noted above, should be presented by you to the Tariff Commission for the appropriate hearings and report to you by the Tariff Commission and this office.

This office has already received a number of requests from manufacturers that certain products be excepted from the list to be published and sent by you to the Tariff Commission. I feel that it would be a serious mistake if the Executive, whether through this office or on recommendation of any other interested agency of our Government, made an arbitrary determination that such items should be excluded from the list. To do so would involve a judgment on certain products without the benefit of the investigating and reporting procedure provided for in the Trade Expansion Act, and if granted in certain cases would subject you to the criticism of having played favorites based purely on Executive judgment and seriously impair our negotiating position. I therefore hope that you will approve publishing and sending to the Tariff Commission the full list with the exceptions required by law as recommended above.

2. While we cannot at this moment fix with precision the date at which we will have completed the procedures required by law in order to allow us to enter into the next round of negotiations, it nevertheless would appear that the 15th of April, 1964, would be the earliest practicable date. It is impossible to estimate how long these negotiations might last, but those familiar with this type of negotiation and the very large issues which are involved in it make an estimate of six months. Should such a timetable be accurate, this would mean a conclusion of the negotiations in the middle of October, 1964, a date which would precede

the Presidential elections by a brief span of time. We have had from some Europeans who will be directly involved in the negotiations, expressions of opinion that we would not want to complete negotiations until the Presidential election was over.

The question on which I should like your judgment is the question of timing. We could perhaps conclude the negotiations in (1) a three months period (which I doubt), (2) drag out the negotiations so that announcement of any agreement would not come until after the elections, or (3) indicate that we should prefer not to begin negotiations until perhaps June or July of 1964, thereby making certain that they would not have been concluded until late in the year of 1964.

My reason for raising this question at this time is that it is expected that at the May 16th Ministerial Meeting of GATT, a date for the beginning of negotiations will be definitely set. The Working Party now sitting in Geneva, which is preparing the agenda for that Ministerial meeting, will undoubtedly make a recommendation for a specific date, and therefore it would be desirable if we could express our views as soon as possible.

**467. Memorandum from Feldman to Herter, April 24<sup>1</sup>**

April 24, 1963

SUBJECT

Trade Negotiations

The President asked me to write you in response to the two questions you raise in your memorandum of April 17.

The President approves your recommendation that all items subject to tariffs, with the exception of those noted in your memorandum, should be presented to the Tariff Commission for appropriate hearings and report to you and to the President.

---

<sup>1</sup> President's decisions on Herter's April 17 memorandum. Secret. 3 pp. Kennedy Library, Herter Papers, Memoranda to the President (10), Box 4. May 1963

Your second question is more complicated. The President shares your doubts concerning prompt consideration of the actual negotiations. They will probably be sufficiently complex to take a minimum of 6 months. Accordingly, even if they begin during the latter part of April 1964, it is unlikely that they can be concluded before November 1964.

Larry O'Brien shares your feeling that they should not be an issue in the campaign. Certainly, the worst thing that could happen would be to have the results of the negotiations announced just before the election. However, assuming that our estimate of the length of time they would take is accurate, we could begin the negotiations late in April, and they would just be coming to an end at the time of the election. There would be no publicity until sometime after the election.

On the other hand, if we deferred initiating the negotiations until June or July, there might be a serious risk that they would not be concluded until sometime in 1965, and we see no reason for holding them up that long. Therefore, assuming that it is still your feeling that the negotiations will continue beyond election day, the President feels they should be initiated toward the end of April.

**Myer Feldman**

May 1963

**468. Memorandum of Conversation, May 1, between Ball and Luxembourg Foreign Minister Schaus<sup>1</sup>**

May 1, 1963

SUBJECT

EEC and Trade Negotiations

PARTICIPANTS

*For United States:*

Acting Secretary of State,  
Mr. George Ball  
Assistant Secretary of State,  
Mr. William Tyler  
Ambassador William R. Rivkin  
OIC, Luxembourg Affairs,  
Mr. George R. Andrews

*For Luxembourg:*

Foreign Minister Eugene  
Schaus  
Chief of Protocol,  
Luxembourg Foreign  
Office, Mr. Andre Phil

Mr. Ball said that he was glad to be able to continue the discussion with Mr. Schaus which they had had the previous day with the President. Mr. Ball continued that, as the President had made clear, the development of the EEC position on trade negotiations was a matter of real concern to us. We look forward to the negotiations resulting in real liberalization of trade. The US has definite positions on two matters, Mr. Ball stressed. Firstly, we felt that agricultural commodities should be included in the trade negotiations. Mr. Ball noted that the Foreign Minister, during his conversation with the President, had expressed agreement in principle to the inclusion of agriculture, despite the difficulties involved. Secondly, Mr. Ball emphasized the necessity for acceptance of the principle of linear tariff cuts across the board with only a limited exception list. We had been advised before drafting the Trade Expansion Act by some members of the EEC, including the French, that the principle of linear cuts was the only basis on which the EEC could negotiate, and that for structural reasons negotiations on a commodity by commodity basis would not be feasible for the EEC. Therefore, we had drafted the Trade Expansion Act to negotiate on a linear cut basis. Our experience during the Dillon Round a year ago confirmed the difficulty of negotiating on a commodity by commodity basis.

---

<sup>1</sup> "EEC and Trade Negotiations." Confidential. 5 pp. Department of State, Secretary's Memoranda of Conversation: Lot 65 D 330.

Mr. Ball noted that the French had raised the *ecretement* problem. Most EEC tariffs fall within a narrow spectrum in the middle. On the other hand, Mr. Ball continued, while there are some high US tariffs, we have many low tariff items and there are, moreover, many on the free list. As an example of a US low tariff Mr. Ball cited the case of automobiles, in which the US duty is only 6%, as compared to the EEC tariff of 22%. Mr. Ball said he had had to explain to the US Congress that a reduction from 28% to 22% for the EEC was as important as a reduction from 8% to 6% for us. A cut of 50% in a high tariff would probably result in more trade than a 50% cut in a low tariff. Therefore, we feel that there is no real problem in certain US high tariffs, as the French do. We believe that a linear cut is far preferable to the French *ecretement* proposals and we can have discussions on individual adjustments for specific high tariff items after agreement on a linear cut. Mr. Ball stressed that we hope that the EEC Ministerial Meeting on May 7–9 and the subsequent GATT Ministerial Meeting will result in the EEC accepting the principle of linear cuts, without injection of the French *ecretement* proposals.

Mr. Schaus replied that he thought the Six would be prepared for a linear cut. His personal opinion was that this was the only method which could be adopted. He continued that while exceptions should be as rare as possible, there would definitely have to be exceptions. Mr. Schaus then said that he imagined that in many cases US tariffs would be higher than equivalent European tariffs. If a 60% US tariff were reduced by half to 30%, the US would still have 30% protection, while a comparable reduction of a lower European tariff from 20% to 10% would provide practically no protection. Mr. Ball indicated that we were prepared to examine the facts in such instances. Foreign Minister Schaus then raised the question of the US reaction, as expressed by Mr. Blumenthal in Geneva, to the recent EEC proposals based on the French *ecretement* formula. Mr. Schaus quoted from a message from EEC representatives at Geneva, saying that the US reaction to these proposals had been very negative. The US Representative (Mr. Blumenthal) was reported to have said that the US could not participate in the trade negotiations if they were based on the *ecretement* principle. Mr. Schaus remarked that he thought this was “too radical” (i.e., extreme) a position by the United States.

Mr. Ball replied that he felt that perhaps the problem has been overstated. We feel that this is really not a very large problem. Where high US tariffs exist, we are willing to examine individual cases. However, under the Trade Expansion Act, reciprocity in cuts is required, which is difficult to reconcile with the French *ecretement* formula. We also have much more on the free list than the EEC and have many low tariff products in addition.

Mr. Schaus asked whether he could speak frankly and proceeded to read the recommendation<sup>2</sup> from the EEC representatives at Geneva that he (Schaus) should stress to the US Government how important the question of US high tariffs is to the EEC. The message went on to say that the EEC had not yet taken a position on the US proposals for inclusion of agriculture in the negotiations but that it would be "difficult" for the EEC to accept the US proposals.

In reply Mr. Ball indicated he would also be frank. He noted that before drafting the Trade Expansion Act, we had discussed the question of linear cuts with the French, Germans, and others as well as with the EEC Commission. Nobody had mentioned the ecretement problem at that time. Therefore, the French, by raising it now, were interposing an objection after the fact. We do not know whether the motivation behind the French proposals is to create an obstacle to the negotiations or whether it is a question of principle. We do not think the ecretement problem is as serious as the EEC does, and believe that exceptions can be worked out in a spirit of good will later. We could perhaps also make a serious issue out of the fact that we have so many items on the free list. Mr. Schaus agreed that there might be a possibility that the French are using the ecretement issue as a pretext. On the other hand, if the French do have serious objections, it would be better for them to air them now than at the very end, as in the case of the UK/EEC negotiations. Mr. Schaus felt that basically the French were not opposed to negotiations and that they would not risk the isolation involved in opposing them. At the same time, Mr. Schaus remarked, the French were not alone in their position and there were other members of the Six who were "quite hard" ("assez durs"). Mr. Schaus mentioned Germany and Italy as supporting a liberal policy along with Luxembourg.

It would be helpful, Mr. Ball stated, if at the May 7-9 EEC Ministerial Meeting, the US view were fully understood. The US view, he reiterated, is that the principle of across-the-board cuts be accepted. Mr. Tyler added that the Europeans should understand that Congress authorized the President in the Trade Expansion Act to negotiate only on a basis of reciprocity.

Mr. Schaus remarked that the Trade Expansion Act was drafted on the assumption that Britain would be a member of the EEC. Since it appears certain that Britain will not be a member of the EEC for some time, the utility of the Act has perhaps been lessened. Mr. Ball replied that while it was true that the Act did provide for 100% reduction in tariffs for those items comprising 80% of our trade (as would

---

<sup>2</sup> to him

have been the case if the UK were a member) this was secondary to the central element in the Act providing for 50% reduction regardless of the volume of trade. In fact, Mr. Ball continued, some Europeans had felt that 100% reduction in tariffs might even compromise the integrity of the Community by diluting the elements of cohesion in the Community.

In response to a question by Mr. Schaus, Mr. Ball said that we were reviewing the whole problem of anti-dumping and would be prepared to discuss it with the EEC. We are considering an international approach to the problem, although the US position has not yet been fully formulated. Mr. Ball indicated that we were also prepared to discuss other non-tariff problems and, in reply to Mr. Schaus, stated that we were prepared to discuss cereal prices on a global basis in the Cereals Committee in GATT.

Mr. Schaus emphasized that he was very glad to know US thinking on these important problems since he would be presiding over the May 7–9 EEC Council meeting. He would, he indicated, “do his best” at this meeting. The negotiations would have to succeed, he stated. They would be a test of the continuation of the EEC as well as of the EEC’s relations with the U.S. At the same time, Mr. Schaus insisted (“J’Insiste”) that the U.S. understand the problems of the EEC and be ready to make certain concessions. Mr. Tyler observed that much depends on our respective attitudes not being too rigid. Mr. Schaus stated that the climate in the EEC is “difficult” which makes it difficult to reach agreement.

Mr. Ball said it was important for Europe to understand that, although there was naturally disappointment in the US about the rupture of the UK/EEC negotiations, there had been no loss of faith in the EEC and in its ultimate success. Far from wishing to have the Five attempt to frustrate integration, we wish to have the Six keep up momentum toward integration.

Mr. Schaus asked whether he should understand that the US supports the continuing development of the EEC and does not wish it to regress. Mr. Ball agreed. Mr. Schaus continued that he had asked this because amongst the Six there are some elements that feel that no further forward steps should be taken until the UK is admitted as a member. Mr. Ball answered that he did not think the US could endorse that view. The EEC would have to continue to move forward to leave. Mr. Schaus said the UK view was similar to Mr. Ball’s and noted that he had reacted against tendencies within the EEC to “freeze” the situation. He continued that it seemed to him that the April 2 EEC Council meeting had resulted in the renewal of forward movement.

The Schroeder proposals for synchronization were useful, Mr. Ball felt, and it would be a mistake to have certain members of the EEC

setting preconditions. Mr. Schaus agreed fully and said that such preconditions would be impossible. Mr. Tyler noted that the German position on agriculture might be somewhat difficult. Mr. Schaus replied that he did not think that the Germans would adhere to their "hard" position on agriculture in the last analysis, since they were anxious for the success of the Kennedy Round.

In conclusion, Mr. Ball said that it had been a great pleasure to discuss these matters with the Foreign Minister and that we would look forward to the results of the forthcoming EEC Council meeting. He continued that Luxembourg had played an important role and would continue to. Mr. Schaus replied that the future of Luxembourg could only be assured in an integrated Europe in partnership with the United States. Mr. Tyler observed that we were fortunate that in Mr. Schaus we had a Chairman of the EEC Council who understood these basic truths. Mr. Tyler noted that Mr. Schaus had presided over the EEC Council during other crises, as in the discussions of a common agricultural policy last year. Mr. Schaus said that he had had to act as the spokesman of the Six at that time, with the result that he had to express the view of the least common denominator. He commented that much had been learned since then.

May 2, 1963

US Mission Geneva for GATT. Trade negotiations and EEC matters discussed in scheduled call today on Acting Secretary Ball by FonMin Schaus during State Visit Grand Duchess Charlotte.

Ball reiterated President's statement yesterday in separate meeting that development EEC position on trade negotiations matter great concern to us. We look forward real liberalization trade resulting from negotiations. US has definite positions on two matters: firstly, inclusion agriculture in trade negotiations. Ball recalled Schaus' statement yesterday to President that despite many difficulties, this acceptable in principle. Secondly, Ball stressed necessity acceptance principle linear tariff cuts with only limited exception list. After negotiation linear cuts, could be adjustment individual commodities, US hopes EEC Ministerial

---

<sup>1</sup> Readout of Schaus' meeting with Ball on trade negotiations. Confidential. 3 pp. Department of State, Central Files, FT 7 GATT.

Meeting May 7 and GATT Ministerial later will result in EEC accepting principle linear tariff cuts without French *ecretement* proposals. Ball noted 50% cut in high tariff item could result in greater flow trade than 50% cut in low tariff item.

Schaus believed Six prepared for linear cuts. Although exceptions should be rare as possible, there would nevertheless have to be exceptions. Schaus commented EEC probably had more low-tariff items than US, and problem would be that 50% cut in high-tariff US items would still result in some protection, whereas 50% cut from European low tariff for example of 10% would leave only 5%, affording practically no protection. Ball replied we prepared look at facts and examine possible exceptions.

Speaking frankly, Schaus said he thought opinion expressed by Blumenthal in Geneva that US could not participate in negotiations based on *ecretement* principle was "too extreme". Schaus read message from EEC reps Geneva urging Schaus impress USG how important adjustment high US tariffs is to EEC. Message also said US proposal include agriculture in negotiations would be "difficult".

Ball said he would also speak frankly. Before drafting trade expansion legislation, we had discussed problem informally with French, Germans, and others, as well as with EEC Commission. On basis European desire linear cut principle, we drafted TEA for linear cuts. Nobody had mentioned *ecretement* problem at that time. French, in raising it now, interposing objection after fact and we wonder if motivation create obstacle successful negotiations. US does not believe this problem as serious as EEC does. Individual exceptions can be examined and worked out in good faith later. Ball also noted US had many items on free list as well as many low tariff products.

While agreeing possibility French raising *ecretement* as pretext, Schaus believed French would not oppose negotiations in view risk isolation. On other hand, better have possible French objections expressed early date than after lengthy negotiations as in UK/EEC negotiations. Ball indicated would be helpful if US view necessity principle across board negotiations fully understood at EEC Ministerial meeting May 7. Schaus replied it most important have benefit US thinking since he would chair meeting and said he would "do his best". Schaus stated he conscious importance success negotiations both sides, including future EEC itself. Negotiations test continuation EEC and success imperative. Schaus emphasized however US must understand EEC problems and make concessions. Climate in EEC was "difficult".

Schaus also raised anti-dumping question. Ball replied we reviewing whole problem and would be prepared discuss it. We considering international approach to problem although US position not yet fully

formulated. In reply question from Schaus Ball indicated we prepared discuss cereal prices on global basis in Cereals Committee in GATT.

On broad question future EEC, Ball said although we disappointed failure UK/EEC negotiations, we still had faith ultimate success EEC. Far from wishing Five attempt frustrate integration, we hope Six keep up momentum toward integration. Schaus said he pleased have this clarified because "some elements" within Six advocate no further progress toward integration until UK accepted as member. Schaus thought UK view was similar to US view and he had reacted against tendencies to "freeze" situation. He thought April 2 Ministerial meeting resulted in renewal forward movement. Ball remarked Schroeder proposals for synchronization were very useful. Schaus agreed and said would be impossible situation have some members Six insisting upon preconditions.

Mr. Robert Schwenger, Chief, Division of Foreign Economic Policy, Office of International Organization Affairs, Department of Labor

The morning's conversation centered upon the possibility of arranging new Interim Agreements on agriculture to cover the period during which the Kennedy Round negotiations take place. There was also discussion of opening negotiations under the Standstill Agreements concluded during the Dillon Round.

The United States position, as presented by Undersecretary Murphy and Mr. Blumenthal, was that negotiations on agricultural products, particularly commodity agreements on cereals and wheat, are likely to be long and difficult. Since it will be so long before the agreements take shape, we feel that at the outset the parties to negotiations should make a simple statement to the effect that during the course of negotiations, they will make no change in regulations or policy that would adversely affect the access of agricultural imports into their markets.

The new Agreements need be no more complicated, Undersecretary Murphy maintained, than the Standstill Agreement on quality wheat. The principle would be the same as that reflected in the Standstill Agreements concluded in 1961. This principle is regarded by the United States as a test of how agricultural trade is to operate. Since the Dillon Round, Governor Herter said, U.S. experience has led us to fear that in the period while negotiations are in progress, we may be faced with a sudden change in the *status quo* of our agricultural access to the EEC which will require us to negotiate on a new basis.

Mr. Rey and Mr. Rabot then described the Commission's view as follows: the Cereals and Meat Groups, they agreed, should be set up to try to work out commodity agreements. It will be difficult enough, however, to obtain these agreements, and the problem would be further complicated and deliberations much delayed if the negotiating parties had to spend time arranging an Interim Agreement. Such an Agreement would create considerable problems among the Six and would probably be quite difficult to obtain. The EEC countries, said Mr. Rey, would not want to commit themselves on agriculture before the terms of the agreement on industrial goods were clear.

Mr. Rey reported that when he had last seen Mr. Mansholt, the latter had not been in favor of trying to obtain Interim Arrangements at the start of agricultural negotiations, though he was quite willing to try to do something about the poultry problem. Poultry, said Mr. Rey, is currently a subject for discussion in the Council, and he saw no difficulty standing in the way of the Commission's recommendation.

The Europeans repeatedly made it clear that while Interim Agreements would be very difficult, there would be no problem if the United States wished to open negotiations on the basis of the 1961 Standstill Agreements. Undersecretary Murphy felt that this might be a good idea; he envisaged the United States using its rights under the Standstill Agreements to negotiate new Interim Agreements. This point did not seem completely clear to the EEC delegation, and for a time conversation continued with the impression that a satisfactory basis for agreement had been found.

This impression was eventually shown to be quite weakly founded. Mr. Blumenthal reiterated the United States and other countries' con-

cern over EEC agricultural price levels. Suppose, he said, the EEC agrees on a wheat price near the German level—this would suddenly present wheat-exporting countries with a damaging *fait accompli*, possibly at a time when international negotiations on wheat were in progress.

At this point, Mr. Marjolin interjected his frank opinion that it would be impossible for the Commission, through an Interim Agreement, to agree to give non-member countries a voice in setting the EEC's internal price levels. There would be very great objections to the suggestion that the EEC must clear its price arrangements with the United States.

On the other hand, Mr. Marjolin did not believe that there were serious grounds for fear, on the part of the United States, that EEC agricultural prices would be set in the midst of the Kennedy Round. He was not optimistic on a speedy settlement of the differences between France and Germany on prices. And in any case, the United States had excellent representatives in Brussels who would know of pricing proposals well in advance of a decision and could present the U.S. case.

Governor Herter then put two specific questions to the EEC delegation:

1) How does the EEC justify the very high Netherlands tariff on imports of flour, much higher than the Netherlands flour tariff previously bound in international agreements? And how does it justify the apparently substantial subsidy to flour exports from Italy and other countries to the Middle East and elsewhere? Governor Herter pointed to the Netherlands flour tariff, which vitiated a long-standing U.S. agreement with the Netherlands providing for an allotment of duty-free imports, as a good example of the sort of unilateral action that worries the United States.

Mr. Rabot agreed that the Dutch protection for its millers was perhaps too high. He would look into this and the other points and reply to Governor Herter's questions before the Ministerial Meeting.

2) When can negotiations with the EEC on manufactured tobacco begin?

Mr. Rey replied that the EEC would be ready just after the Ministerial Meeting, in late May or early June. It was agreed that they would be held before July 1, probably in Brussels, though final agreement on the site would have to await clarification of Mr. Wyndham White's feelings and possible conflicts with other meetings.

At the end of the session, the question of the scope of commodity agreements was brought up. Governor Herter said that they should clearly be on a global basis. Mr. Hijzen agreed that work should begin on cereals and meat, and that a committee should be established to decide whether other commodities should be treated in the same way.

Mr. Rabot, in response to a query, concurred in the view that commodity agreements should certainly not be limited to the question of access, that prices should also be discussed.

Governor Herter closed the meeting with a request that certain agricultural points be raised again at the afternoon session, after the U.S. representatives had had a chance to discuss them among themselves.

The greater part of the afternoon's discussions was devoted to agriculture, since the other questions on the agenda raised hardly any difficulties between the United States and the EEC.

*Agriculture: I*

Governor Herter began with a strong statement of the United States view of recent EEC actions on agricultural trade. The implementation of the Common Agricultural Policy (CAP) on poultry, the Netherlands flour tariff, and possible similar actions that may be taken in the future are unilateral steps seriously affecting U.S. trade. The United States, he said, could make a good case to the effect that they are in violation

of GATT and that this country is therefore entitled to take retaliatory action. So far, we have held off from retaliation—the United States does not wish a trade war. But the EEC, Governor Herter noted, had not hesitated to retaliate when the United States had raised tariffs on carpets and glass under last year's escape clause actions.

The Trade Expansion Act, Governor Herter went on, directs the President to retaliate against countries which maintain unjustifiable restrictions contrary to trade agreements. The U.S. Government is under heavy political pressure to take such action, and from a political point of view, the time is almost over before retaliatory action must be resorted to.

The United States does not want, he stressed, to be faced with a situation in which it has to negotiate in the Kennedy Round on the basis of unilateral actions that impair past tariff concessions. Governor Herter made clear that the United States would not trade concessions on industrial products for bargains on agricultural tariffs unilaterally imposed by the EEC since the Trade Expansion Act went into effect.

Under Secretary Murphy added the point that negotiations under the Standstill Agreements do not offer a solution for the United States' current difficulties with all the products involved. This country may, he said, call for negotiations under those Agreements on a commodity-by-commodity basis, as seemed appropriate. On poultry, we would wait to see what action the EEC Ministers take on the Commission's recommendation before we decide whether to invoke our Standstill rights.

Negotiations under the Standstill Agreements, he pointed out, are a bilateral matter between the U.S. and the EEC. The need for a new Interim Agreement is of interest to a variety of countries and the Agreement must be worked out multilaterally.

Mr. Rey, in replying, seemed somewhat taken aback by the firmness of Governor Herter's remarks, and the tone of the discussions sharpened noticeably at this point. He restated the difficulties which the Commission foresaw concerning an Interim Agreement, and he repeated his recognition of the poultry problem and his intention to reply to Governor Herter's queries on flour prior to the Geneva meeting.

He was greatly surprised, he said, by two points in Governor Herter's statement:

- 1) The challenge to the legality of the implementation of the CAP, and the comparison of the CAP to the U.S. carpets and glass case. The agricultural tariffs of the Six had been unbound under Article XXIV:6, and their re-establishment under the CAP had been agreed to in principle by the GATT contracting parties.

- 2) He was quite concerned at the prospect of returning to the Council of Ministers meeting with reports of threats of retaliation by

the United States. This would certainly make more difficult the problem of obtaining the Ministers' agreement to a negotiating mandate. He would much prefer to discuss Governor Herter's remarks with Dr. Mansholt and then raise these points again with the U.S. delegation before the Geneva meeting.

Governor Herter said that he appreciated Mr. Rey's feelings, but that he felt it was only proper that the United States should state its concerns with complete candor and that they should be reported to the EEC Ministers.

There followed an interlude of intramural discussions on both sides of the table. Mr. Rey then reported that his colleagues shared his surprise at the U.S. attitude; they had thought on the basis of the morning's meeting that the United States would ask for negotiations under the Standstill Agreements and that this would settle the immediate U.S. concerns about agricultural negotiations. If now the EEC was being threatened with retaliation on poultry, there seemed little reason for negotiation under the Standstill Agreements. Besides, they could not see the legal basis for retaliation in view of Article XXIV:6.

The United States has not decided on retaliation, Governor Herter declared. But the Administration is under considerable pressure in this direction. He stressed the common objective of trade liberalization which the Commission and the U.S. shared, and he said that in this context each side should make its position completely clear to the other. Mr. Gossett urged that U.S. Standstill rights not be underestimated. They were based on the situation as of September 1, 1960, and would be so negotiated.

#### *Tropical Products*

Governor Herter at this point changed the subject to Tropical Products, which the EEC had indicated that it wanted to discuss. Mr. Rey told of the EEC's reduction by 40 percent of the margin of preference which it extends to the Overseas Associated Territories on coffee, cocoa, bananas, and vegetable oils. It also stood ready to go to zero on tropical woods and teak if the United Kingdom would also do so. The main beneficiaries of this liberalization would be the Latin Americans.

Mr. Marjolin expanded this point to say that given the extent of this EEC liberalization on tropical products, and given the EEC's obligation to uphold the interests of the OACs, it would be unrealistic to expect the EEC to make further reductions in their tropical products tariffs.

Mr. Blumenthal noted that the Report of the Special Committee on Tropical Products contained some disagreements. Some countries, including the United States, recommended consideration by the GATT Ministers of the Nigerian proposal on free entry of tropical products,

standstill agreements, and implementation of the coffee and cocoa agreements in the realm of tariffs. In particular, he urged, the Latin Americans had to be made to feel that the GATT holds some possibility of solution of their commodity problems. They had been often frustrated in this regard in the past.

Mr. Marjolin replied that the EEC's 40 percent reduction should not be taken for granted, and that the EEC would deal with the Latin Americans when the time came.

### *Agriculture: II*

The discussion then returned to agriculture. Governor Herter asked whether the EEC's variable levies would be construed as tariffs during negotiations.

In the course of their replies, Mr. Rey and Mr. Marjolin made clear that the Commission does not feel that agricultural products should be subject to the linear tariff reductions. The U.S. suggestion that agriculture be separated into three categories—those covered by tariffs, those covered by other restrictions, and those to be the subject of commodity agreements—could not be accepted. It does not make sense, Mr. Marjolin argued, to reduce a tariff automatically on one agricultural product while another very similar to it is not automatically liberalized because it is not bound by a tariff. To tie agriculture to a linear cut, Mr. Rey added, would make agreement on the linear cut much more difficult.

Mr. Rey felt that agriculture should be recognized as a special problem. In response to a question by Mr. Renne, the EEC representatives agreed that all agricultural products would be open to negotiation. But they could not specify what the type of negotiations or form of trade liberalization contemplated would be. These questions, they suggested, should be studied during the remainder of the year. They did not object to Governor Herter's suggestion that the points to be studied should include support prices, subsidies, and variable levies, among others.

Governor Herter and Mr. Blumenthal then underlined the importance which the United States lays upon the need for clarifying the negotiating processes and objectives for agriculture. This should take place before general preparations for overall negotiations have gone too far. Governor Herter reiterated the U.S. "terrible feeling of uncertainty" created by such EEC actions as maintaining its canned fruit restrictions long after the balance-of-payments justification had passed away. This is symbolic, he said, of the general U.S. worry on the score of nations making agreements and then not holding to them. We must be clear, he stressed, on what is negotiable and what is not. The United States cannot repeat its experience in the Dillon Round, when agriculture was ultimately laid aside.

Mr. Blumenthal asked when the EEC felt it could be more precise on the nature of the agricultural liberalization that it could contemplate and the degree of the linear cut.

Mr. Rey replied that he hoped agreement on the tariff reduction formula could be worked out before August. The autumn could then be devoted to studies of special problems.

Such a timetable assumed, Mr. Blumenthal noted, that the Ministerial Meeting would produce no more than a decision in principle to hold trade negotiations. This was a possibility, he admitted. But the United States was not sure, he said, that it could proceed with its domestic hearings and other prenegotiation processes on so vague a basis. We had hoped that the Ministerial Meeting could at least settle the outline of the tariff negotiating formula and the general extent of agricultural liberalization.

Mr. Rey expressed some surprise at this comment. He had thought that it was only *after* its domestic hearings, not before, that the United States would be in a position to know what bargain it could offer. One cannot settle all the problems of a trade negotiation in advance; they must be worked out while the negotiations are in progress. He said that he would frankly consider it a success if the Council simply gave the Commission a mandate to conduct a new round of negotiations. He expected that there could be considerable progress made on specific problems in the Trade Negotiating Committee during 1963 since there is a good deal of time.

Mr. Gossett quoted the draft Working Party Report concerning agricultural negotiations and asked what was the EEC attitude. Mr. Marjolin remarked that he was not optimistic about the possibility of an early clear answer from the EEC on this score. The internal EEC dispute on prices would delay things. The United States is bound by the Trade Expansion Act, he said, and the EEC by the Common Agricultural Policy. The problem, he suggested, is to find a common ground that would respect both these frameworks. On the side of the EEC, the variable factor which offers the basis for a solution to this problem is agricultural prices.

Mr. Rey at this point agreed with Governor Herter that a clarification of the nature and extent of agricultural negotiations ought to be possible by the end of 1963. If the basic issues are not clear by then, Governor Herter cautioned, the negotiations themselves may have to be postponed.

Mr. Marjolin raised the question of other European countries with other methods of agricultural trade protection, specifically the UK. If the EEC is to study liberalization of its agricultural trade policy, it is only fair, he asserted, that the UK make concessions on its part. Gover-

nor Herter agreed, adding that he expected that the UK was worried about its farm subsidy program.

The subject of agriculture was then left, with agreement that all delegations should work out a basis for negotiation by the end of the year.

#### *Other Business*

Governor Herter said that he was pleased to report that the Tariff Commission had issued its Sixth Supplementary Report, and that practically all the items of major concern to the EEC had been taken care of. In those cases where adjustments had not been possible, a full explanation was provided. The text would be delivered to Mr. Pringel.

Mr. Rey brought up the subject of Non-Tariff Barriers. Preliminary discussions in this field, he felt, could be held over until the autumn, and he suggested that the initiative for opening discussions should lie with the EEC. He recommended that the initial sessions, at least on "fair trade problems", should be bilateral between the U.S. and EEC. Governor Herter agreed to hold discussions in the autumn, provided that they were not held off until late November or December.

Governor Herter said that he was unclear on the distinction which the EEC seemed to draw between "non-tariff barriers" and "fair trade problems". Mr. Rey explained that the only distinction he could see lay between matters such as customs valuation and nomenclature, which are directly related to tariffs, and all other factors—subsidies, anti-trust laws, anti-dumping regulations, and the like—which do not pertain to tariffs.

At the close of the session, Mr. Rey expressed his delegation's appreciation and thanks for the opportunity to hold the discussions and the cordiality in which they had been conducted. He looked forward to their meeting in Geneva, and to future bilateral meetings, which he believed would be most useful. In view of the U.S. trip to Europe later that month, he said, it would be the Europeans' turn to come to Washington once more.

Governor Herter thanked Mr. Rey and his colleagues, expressing his own gratification at the frank and open discussions that had been held. The meeting ended with handshakes and good-byes.

**472. Circular Telegram 1903, May 7<sup>1</sup>**

May 7, 1963

Rey-Marjolin visit. Rey and Marjolin, while stating that ecretement proposal did not represent fixed EEC position, proceeded to discuss as if in fact it were and made stiff defense.

U.S. position on negotiating plan as presented by Blumenthal in Geneva was reiterated. Marjolin asked for U.S. recognition of high tariff problem and invited a substitute for ecretement. The U.S. rejecting ecretement as basis for discussion, held firmly to linear approach.

On agriculture, Rey and Marjolin made clear that inclusion of agriculture in negotiations was not in question. EEC prepared to discuss all agricultural products in negotiations, but would make no commitments now as to nature or extent of liberalization. They rejected U.S. proposal to treat agriculture in three categories—those covered by tariffs, those covered by other restraints, and those for which commodity agreements are to be negotiated. Linear cuts should not necessarily apply to agriculture, they maintained. Agriculture should be treated as a special problem.

EEC firmly resisted proposed interim arrangements on agriculture under which each contracting party shall pledge not to increase agricultural import restrictions while negotiations are in progress. U.S. reiterated its belief that such an agreement is necessary to dispel fears of unilateral EEC action doing further damage to U.S. agricultural trade.

Herter pressed for clarification of how agriculture would be treated in negotiations by the end of 1963 at the latest. He made clear that U.S. could not proceed with industrial products negotiations if prospects for significant liberalization of agricultural trade were not reasonably good. Rey agreed on end of 1963 as reasonable deadline.

On nontariff obstacles, EEC suggested preliminary discussions should begin this fall. Herter agreed, with proviso that these should not be long delayed. EEC wanted have initiative in this field.

In view of these discussions, probability is that GATT Ministerial will not resolve major problems on tariff reduction formula and agriculture, but Rey hopes that these will be settled before August and the end of the year, respectively.

Rey and Marjolin suggested that Ministerial meeting might result only decision that negotiations would take place along lines of agreed principles of Working Party report. Schedule and negotiating machin-

## August 1963

### 473. Letter from Rusk to U.S. Ambassadors, August 2<sup>1</sup>

August 2, 1963

Dear Mr. Ambassador:

You will recall that in my letter of October 19, 1962, I emphasized the role which our Chiefs of Mission and their senior staff members would need to play in order for us to succeed in our joint efforts to expand adequately the volume of American exports.

I am sure you are aware that our balance-of-payments situation remains a very real and stubborn problem, even though our current export volume constitutes some improvement over the recent past. The facts are that imports in 1962 increased by \$1.7 billion while exports increased by \$800 million (from \$20.1 to \$20.9 billion). Hence our net surplus on merchandise trade declined. International payments of all types, which include military expenditures and foreign aid, of course, continued to exceed receipts and our balance of payments remained in the red by some \$2.2 billion.

As a companion piece to the export drive, the Administration is taking all actions which it believes are currently possible—consistent with our foreign policy objectives and position of leadership in the free world—to moderate the balance-of-payments impact of our governmental activities and programs abroad. Clearly these actions need to be kept within those bounds which will neither impair our national security and other foreign policy objectives nor circumscribe the latitude which our citizens enjoy in their trade and financial relationships abroad. If the United States can push its exports to a substantially higher plateau, many elements of our balance-of-payments problem will disappear without resort to actions which would be unpalatable both domestically and internationally. The rough road of restrictive retrogression is the last thing that we would wish to contemplate.

Since I wrote to Chiefs of Mission last fall on the importance of their personal participation in and support of export promotion, I have had many gratifying reports as to what they and their senior staff members have been doing to further this vital activity.

Because of the special emphasis which we in Washington attach to the Export Expansion Program for balance-of-payments reasons, I

---

<sup>1</sup> Report summarizing Mission's export promotion activities requested. No classification marking. 3 pp. Department of State, Central Files, FT 4 US/TEA.

should appreciate it if your Embassy would prepare for my guidance and that of the Secretary of Commerce a summary of your Mission's recent activities in line with the concepts expressed in my earlier letter. I should like such a report to cover the specific ways in which the Embassy has found it possible to give support to this program. I would also like to know of the particular difficulties encountered in promoting United States exports, what the Embassy thinks needs to be done to solve these problems, as well as any suggestions for improving our export expansion work as a whole. Material already submitted need not be repeated but only brought up to date.

I look forward to receiving such a report and I am confident that it will reflect that degree of participation and support necessary to ensure the success of our export drive.

Sincerely,

**Dean Rusk**

#### **SUBJECT**

Signature of letters to Ambassadors regarding Export Promotion

Pursuant to your approval of July 30 there are attached for your signature draft letters to 102 Chiefs of Mission concerning continued emphasis on export promotion.

Because of the very favorable reaction by the American business community to the public release of your letter of October 19, 1962, to Chiefs of Mission on this subject and in view of the White House Conference on Export Expansion scheduled for September 17-18, a similar release of the present text is contemplated. If you approve, it will be released Friday, August 2.

**474. Telegram 1080 to London, August 15<sup>1</sup>**

August 15, 1963

For Ambassador from Ball. Deliver 9:00 a.m. August 16, 1963. At meeting last week with Senators interested in wool Textiles, the President was informed British Industry now unanimously supporting idea of international arrangement to regulate trade in wool textiles. According to US industry, the UK National Wool Textile Export Corporation has discussed matter with BOT and was encouraged by reaction of British officials. On basis of this meeting, British wool textile industry thinks HMG would consider favorably an approach by the US to an international wool textile arrangement.

I have been instructed by the President to have the Embassy discuss this matter with Alan Green of the BOT and to point out to him the interest of the US in initiating steps to work out an international arrangement covering wool textiles. The President has asked for a report on the conversation with Green as soon as possible.

**475. Letter from Eleven Congressmen to President Kennedy, August 21<sup>1</sup>**

August 21, 1963

Dear Mr. President

This letter is a desperate appeal for action to save the domestic wool textile industry. There can be no doubt that the time for such action is long overdue.

---

<sup>1</sup> Domestic wool textile industry deterioration. No classification marking. 4 pp. Kennedy Library, Herter Papers, Congressional Relations, Box 8.

As you know, the steady deterioration of the nation's wool textile industry has contributed substantially to the growing and unsolved problem of chronic unemployment. While there may be honest differences of opinion as to the efficacy of programs which purport to create new jobs, there can be no dispute as to the wisdom of guarding against the further loss of jobs in an industry already determined to be necessary to the nation's security.

The impact of the depression of the wool textile industry has already been felt in related domestic industries—from wool growing to apparel manufacture. The circle of uncertainty continues to widen.

It is with reluctance that we remind you of the direct and explicit promises that have been made by you, Mr. President, and officials high in your administration, that relief would be forthcoming. For example, on August 31, 1960, you wrote to Governor Hollings of South Carolina as follows:

"Clearly the problems of the Industry will not disappear by neglect nor can we wait for a large scale unemployment and shutdown of the Industry to inspire us to action. A comprehensive industry-wide remedy is necessary. . . .

"Imports of textile products, including apparel, should be within limits which will not endanger our own existing textile capacity and employment, and which will permit growth of the Industry in reasonable relationship to the expansion of our over-all economy. . . .

"The Office of the Presidency carries with it the authority and influence to explore and work out solutions within the framework of our foreign trade policies for the problems peculiar to our Textile and Apparel Industry. Because of the broad ramifications of any action and because of the necessity of approaching a solution in terms of total needs of the textile industry, this is a responsibility which only the President can adequately discharge."

On June 30, 1961, you wrote Congressman Carl Vinson as follows:

"It should be borne in mind that the contemplated (cotton textile) negotiations are designed as one of the series of efforts to assist the textile industry. Our objective is to assist the industry to overcome all of the handicaps which it faces. The State Department is being instructed to get the best possible relief, not only for cotton, but for other fibers."

In January 1962, your Special Assistant, Lawrence F. O'Brien, wrote Congressman Vinson and Senator Pastore, saying:

"After the conclusion of the permanent (cotton) textile agreement, the problems of the wool and man-made fiber industries will certainly be attacked."

On February 26, 1962, in a letter to Congressman Vinson, you stated:

"I have also requested the Departments involved to implement my program for the wool, man-made fiber and silk divisions of the industry. Almost all of the points in the program announced on May 2, 1961, apply equally to each of these."

On August 28, 1962, your Secretary of Commerce, Luther Hodges, in a letter to Congressman F. Bradford Morse, stated:

"We are determined that imports of wool textile products will not be permitted to exceed current levels and we will take all necessary steps to prevent this."

On January 18, 1963, a Washington press dispatch stated:

"A group of Senators from wool and wool textile states said they received assurances from President Kennedy today that 'something will be done' to restrict imports on wool products. Senator John O. Pastore (D-R.I.) told newsmen . . . that the President promised to propose within a month measures to limit such imports."

In spite of the foregoing promises and commitments, Mr. President, no action has been taken to stem the flood of woollen textile imports that threaten to destroy the industry.

1. Wool textile imports increased by 78 per cent between 1961 and 1962.

2. The record shows that wool textile imports in the first quarter of 1963 were 41 per cent above the comparable 1962 figure and are currently at an annual rate in excess of 160 million square yards.

3. In the year ending March 30, 1963, 85.4 million pounds of wool textiles were imported.

4. The ratio of imports to domestic production rose from 15.1 per cent in 1961 to 23.2 per cent in the year ending March 30, 1963.

5. 305 woollen textile mills have closed their doors in the past fifteen years displacing 105,000 workers.

It has been clear for some time that this situation is not going to improve unless prompt action is taken by your Administration. We cannot wait for the conclusion of an International Wool Agreement. As the Senate Special Subcommittee to Study the Textile Industry said on July 18, "We favor resolution of the problems by such means as an effective international agreement to limit imports of wool textile and apparel products. If this is not achieved, however, the United States must take unilateral action to insure that the defense-essential wool textile and apparel industries are not irreparably damaged by the unrestrained flood of imports."

Each of us has seen the personal hardship and despair of the people who suffer from the decline of the domestic wool textile industry. The remaining plants and mills are struggling to keep their place in the market and provide jobs for 60,000 textile workers.

But they cannot keep their heads above water for very long without executive action. Not long ago a plant, newly modernized, was forced

to shut down due to the competition of goods produced abroad by workers who are paid as little as 14 cents an hour.

It is too late to save the jobs and the investments in the mills already closed. But you can still preserve the livelihood and self-respect of the 60,000 remaining textile workers and their families; they deserve the relief that has been promised for so long.

We believe, Mr. President, that your first-hand knowledge of the problem faced by the people in our districts would make a meeting with you particularly productive. We respectfully request an opportunity to discuss this matter with you personally at your earliest convenience.

Sincerely yours,

**476. Memorandum from Roth to Bundy, August 28<sup>1</sup>**

August 28, 1963

SUBJECT

Policy Issues Concerning the Trade Negotiations

I have tried to set out briefly below the major policy issues and considerations that confront us as we move closer towards the so-called “Kennedy Round”:

*1. Schedule of Negotiations*

When, in view of necessary preliminaries in the U.S. and the preparation which other countries want to perform, are the trade negotiations proper (as opposed to the preliminaries) likely to begin? And how long are they likely to last? May 4, 1964 was the date chosen by the GATT Ministers for the start of the negotiating conference, but it now seems unlikely that specific bargaining will take place before the fall of 1964. Experienced trade negotiators expect the conference to last at least a year. The negotiating period and its preliminaries will of course be a time of extra sensitivity for the foreign commercial policy of the U.S.

*2. Nature of the Tariff Cut*

Should, and can, the United States continue to press for a linear cut of 50 percent? Which of the industrialized countries should be allowed to vary from the formula adopted, and in what way? On the latter point, Canada, Australia, and Japan, among others, have claimed that the special structure of their economies prohibits them from making general and uniform tariff cuts.

*3. Exceptions*

What rule should be adopted prior to the negotiations to govern the exceptions which countries will inevitably wish to make to the general formula of tariff reduction? At present it seems likely that no rule will be devised more specific than the principle agreed upon by the GATT Ministers in May: that there will be “a bare minimum of exceptions which shall be subject to confrontation and justification.”

What items should the U.S. add to the list of exceptions made mandatory by the Trade Expansion Act? This decision must await completion of the public hearings, the Tariff Commission’s report to the President, and investigation by the various agencies. This issue can

---

<sup>1</sup> Trade negotiations: policy issues and considerations. Limited Official Use. 7 pp. Kennedy Library, National Security Files, Subjects Series, Trade, General, 8/63, Box 309.

be expected to generate considerable domestic political pressure on the Administration.

Which products likely to be claimed as exceptions by other countries are of major trade interest to the U.S.? This will be the subject of analysis by "country teams" which will also assemble material to be used in the "confrontation and justification" process.

#### 4. *Disparities*

At the Ministerial Meeting in May, it was agreed that "in those cases where there are significant disparities in tariff levels, the tariff reductions will be based upon special rules of general and automatic application," with a view to reducing the disparities. This clause grew out of the EEC's insistence that disparities between certain high U.S. tariffs and the EEC's more moderate rates on the same items would create a major problem of reciprocity for them under a rule of linear cuts.

What sort of special rule for disparities should the U.S. agree to? To what extent should the U.S. insist that a disparity be proven "significant" (in trade terms) before submitting it to this special rule?

The Trade Negotiating Committee (TNC) of the GATT is to resume consideration of this issue at a subcommittee meeting October 23–November 1.

#### 5. *Agriculture*

The U.S. has made clear that the trade negotiations must include significant liberalization of agricultural as well as industrial trade. How is this to be achieved—particularly vis-à-vis the U.S.'s largest overseas agricultural market, the EEC—in view of the following problems:

a. Agricultural trade is of three types: that governed by fixed tariffs, that governed by non-tariff restrictions as well as or in place of tariffs, and that which the GATT Contracting Parties have agreed to try to regulate by means of Commodity Agreements. Different arrangements will probably have to be made for these various categories in the course of the trade negotiations. A subcommittee of the TNC is to consider this problem in a meeting October 2–9.

b. The products for which Commodity Agreements are to be explored are, so far, Cereals and Meats. What form of agreement should the U.S. favor for these commodities, and what are the political chances of Senate ratification of these agreements? The GATT Cereals Group will probably meet some time in October.

c. The Common Agricultural Policy (CAP) of the EEC is so designed that the level of levies on imports from non-members depends upon the target price agreed on for each product covered by the CAP. Due to the agony of formulating the CAP among the Six and to the continued

political sensitivity of farm prices, the EEC is strongly reluctant to negotiate internationally on the levels of its target prices either before or after these levels have been agreed on internally. As in the Dillon Round, the CAP and the sensitivity of the EEC member governments to agricultural problems is probably the major obstacle to significant negotiations on agricultural trade.

#### 6. *Non-Tariff Barriers*

The trade negotiations are to include discussions aimed at liberalizing trade restrictions other than tariffs. A TNC subcommittee will open talks on this subject at a meeting from October 21–November 1. The main targets of foreign criticism of the U.S. in this regard are likely to be:

a. *American Selling Price (ASP)*. On certain products, notably synthetic organic chemicals and rubber-soled footwear, the duty charged on imports into the U.S. is calculated not on the basis of the invoice price, as is normal, but on the basis of the U.S. market price of the equivalent product. To what extent should we be willing (or able—ASP was imposed on chemicals by legislation) to negotiate abolition of ASP in the course of the Kennedy Round?

b. *Anti-Dumping Legislation*. Foreign exporters and U.S. importers complain that they are harassed by the prolonged and complex procedures under which dumping cases are handled in the U.S. They are particularly critical of early “withholding of appraisement” by the Customs Bureau, which subjects their business to uncertainty lasting often several months. On the other hand, there is mounting pressure in industry and Congress to tighten rather than liberalize administration of dumping cases. Should the U.S. agree, in the course of the trade negotiations, to liberalize its anti-dumping procedures, and if so, should this be done on the basis of (i) administrative changes, (ii) attempted revision of the legislation, or (iii) conclusion of an international convention on dumping?

c. *Procurement Policies*. U.S. government procurement regulations under the Buy American Act will be criticized as overly restrictive. The U.S. must determine what modification in procedures regulations it might be willing to make in the course of negotiations. This decision, of course, will have to be made in the light of the current review and probable modification of procurement regulations.

#### 7. *Less Developed Countries*

At the Ministerial Meeting of the GATT and elsewhere, the LDC's have contended that they cannot make any concessions of their own in the course of trade negotiations. The U.S. position has been that the LDC's, while not expected to participate in the full linear cut, should consider the possibility of modifying some of their commercial policies

in such a way as both to benefit their own economies and to expand world trade. Up to now, the LDC's have reacted to this suggestion with coolness and some suspicion. On their part, they have proposed that the industrialized countries should extend preferential trade treatment to LDC's and should sanction preferential trading arrangements among the LDC's themselves.

The LDCs' attitude grows largely out of their long-standing resentment of GATT as essentially a rich man's club whose rules are designed for trade among developed countries and take no account of the special problems of the underdeveloped world. Their bargaining position is strengthened by the imminence of the U.N. Conference on Trade and Development, to be held in the spring of 1964, at which the LDC's and the Soviet bloc are expected to demand that the U.N. be given further responsibility in regulating world trade.

A GATT Working Group on Preferences is to meet from October 7-11. The U.S. must determine what reaction it should make to the LDC proposals on preferences, and, more broadly, to what extent the GATT itself should be modified in order to meet any legitimate complaints of the LDC's. An October 14-18 meeting of the GATT Committee on Legal and Institutional Framework is expected to deal with this problem.

#### *8. Delegations and Interagency Staff Work*

Members of this Office will head all U.S. delegations to GATT meetings preparatory to the trade negotiations. Selection of other agencies' representatives on these delegations may raise problems, in that very often agencies wish to be represented even on delegations in which they have no direct interest. We plan to keep delegations as small as possible.

In order to prepare for the negotiations proper, we plan to form "country teams" which would be devoted to research and analysis on the trade of the major countries that will participate in the negotiations. The staff of these teams will be drawn from the various agencies, and they will be chaired mainly by senior Foreign Service Officers of the State Department. We are now investigating whether it would be practical or advisable (a) to hire non-government people to chair or serve on these teams, or (b) to put officials of agencies other than State and this Office in the chair of any of the teams.

#### *9. Poultry*

The EEC appears currently to be scrambling to agree to some modification of their poultry levies before the U.S. withdrawals are proclaimed, but so far the only proposal of which we have heard is an 11 pfennig/kilo reduction which, we have informed the Germans,

would be insufficient to enable us to delay the withdrawal procedure. The proclamation of withdrawals will, however, be postponed at least until the EEC Council of Ministers has had a further meeting on the subject, expected September 24–25 at the latest.

The main issue is whether the U.S. should agree to submit to the GATT for adjudication the figure of \$46 million, which is our estimate of the U.S. trade affected by the poultry levies in 1960 as a base year. The EEC has repeatedly challenged this valuation as too high, and it seems clear that they would bring formal action in the GATT if and when we put our \$46 million of withdrawals into effect. Prior adjudication of the figure would forestall prolonged litigation in the GATT and remove the possibility of counter-retaliation.

It has been agreed by Governor Herter, Secretary Freeman, and Under Secretary Ball that the next move in the situation is up to the EEC. If they come to us with proposals for solving the poultry problem, we should then consider whether we should not suggest GATT adjudication of the trade figure.

October 1963

**477. Memorandum from Feldman to President Kennedy,  
October 15<sup>1</sup>**

October 15, 1963

SUBJECT

Wool trade

I

I have just returned from a meeting of the National Association of Wool Manufacturers. While there, I met with Senators Pastore and Kennedy, Mr. Nicholas Schilling, who is the wool industry representative from the Common Market nations, Mr. Douglas Hood, who is the wool industry representative from EFTA, and industry leaders.

Mr. Schilling and Mr. Hood both told me, in confidence, that they felt that the wool industry of the nations they represent is very anxious to enter into a multilateral agreement like the cotton agreement. Mr. Schilling went farther. He said that the Common Market governments also supported the industry. If the Common Market did not succeed in negotiating a multilateral agreement with quantitative limitations on wool trade, they would probably take action themselves, unilaterally.

It seems to me that we should be prepared to meet with the Common Market and EFTA to develop a position on this question. In the meantime, the American industry would discuss these questions with their counterparts in Japan. Then, sometime toward the end of January 1964, we might have a meeting of all wool producing and consuming nations. This would be of benefit to every nation. The Common Market, which now excludes Japanese wool textiles, would be willing to take some. EFTA would also be willing to reduce its barriers to Japan in exchange for assurances from the United States of a portion of our market. Our wool industry would get the stability that it has sought. With wool textile imports approaching 25 percent of consumption, I believe this is a feasible proposal.

If we do not cooperate in some such procedure, wool textile trade will be a source of friction during the GATT negotiations next year.

---

<sup>1</sup> Wool trade and a multilateral agreement. No classification marking. 3 pp. Kennedy Library, National Security Files, Subjects Series, Trade, General, 10/11/63-11/7/63, Box 309.

## II

There was considerable discussion at the meeting about the United Nations conference in March to discuss trade relationships. I believe someone should watch the planning for this very carefully. It has the following potentialities for trouble:

1. If the United Nations takes over some of the GATT responsibilities, we will have a less receptive organization. GATT has no Soviet veto and is less unwieldy.

2. The officials organizing the conference are predominantly from non-industrial nations. The Secretary General is from Argentina, one committee head is from Czechoslovakia, etc. It is not too early to make sure that the interests of industrial nations are protected.

3. If this is a Soviet Union initiative to give them a base from which they can discuss world trade, and an organization in which they can seek economic advantages, we should make certain we have some degree of control over it.

**Myer Feldman**

### **Attachment**

Attached is a copy of a memorandum I gave the President. Item I is very highly confidential. Everyone involved understands that this must not get into the public press. However, we should be prepared to meet with the Common Market and EFTA representatives at the appropriate time. I will mention this to George Ball, and I will continue to follow the progress of the proposal.

Item II has very serious implications. The President asked that a letter be prepared for his signature to Dean Rusk, asking that we develop a policy toward the proposed United Nations organization.

I discussed this with Grif Johnson and with Ken Hansen. We had agreed that the leadership should lie in the Department of State, and Grif Johnson informs me that they are already working on the many problems involved.

I assume, from our conversation, that you will undertake the responsibility for seeing that an appropriate letter to Dean Rusk from the President is sent.

November 1963

**478. Memorandum of Conversation, November 29, Ball and John Chadwick, British Embassy<sup>1</sup>**

Part II of II

November 29, 1963

SUBJECT

Kennedy Round

PARTICIPANTS

Mr. John E. Chadwick, British Embassy  
The Under Secretary  
Mr. Robert Anderson, U  
Mr. Deane R. Hinton, EUR/RPE

Mr. Chadwick said that in London's view the Kennedy Round was highly political and "all of a piece" of what went on in NATO. We were getting nowhere on disparities in Geneva and the French were stalling the EEC. The French were resisting any cut in tariffs below 5 percent. With respect to agriculture, while the French wanted to settle the outstanding CAP regulations they did not accept the German position that the CAP should be negotiable in GATT and they resisted the concept of comparable access. While the French argued that they needed to maintain negotiable levels of protection, the UK saw this as a political position. Agriculture posed difficulties for the UK. It was particularly concerned that the CAP should not make eventual UK entry into the Community more difficult. Moreover, as agriculture becomes an issue in the Kennedy Round, the UK would like to push in the right direction. The question was how. The UK was very conscious of the delicacy of these matters and the danger that if the wrong thing were said it would be counterproductive. He noted that the French appear to be prepared not to settle the cereal question now although Mansholt wanted to go ahead. In general, however, he believed the Mansholt plans were acceptable to the Six, although not to the U.S. and the UK.

Mr. Ball said there were two Mansholt plans, one regarding cereals and one regarding rules for agricultural negotiations. The second, as it now stood, was most unacceptable to the U.S.

With respect to the cereals proposal, Mr. Ball thought Chancellor Erhard would like to take bold incisive action. Erhard would like to

---

<sup>1</sup> "Kennedy Round." Confidential. 3 pp. Department of State, Secretary's Memoranda of Conversation: Lot 65 D 330.

establish his authority by dealing with this troublesome problem well before the elections. He has said there would be need for assurances regarding the level of imports from third countries and had mentioned 10 million tons, although this figure did not seem to have been seriously thought through. The German price levels would have to be reduced sooner or later.

The French, Mr. Ball said, saw virtue in settling the common price but were concerned over the inflationary impact. Both Couve and Giscard appeared not to be in a hurry. The French still showed signs of interest in a comprehensive but ambiguous global arrangement. But they disliked access assurances. He thought there was some honest confusion in their thinking. They also appeared to be having second thoughts on disparities. They wanted to retain bargaining power and a reasonable CXT to delineate the EEC. This Gaullist logic was old in some respects. In any case, they were trying to limit tariff cuts in the Kennedy Round.

Mr. Ball commented that for the moment the U.S. was taking a long look at the situation and listening more than talking. We need a strategic plan for the negotiations. It looked like the French and Germans would be ready early in 1964 to proceed to serious negotiations.

Regarding agriculture, Mr. Ball said third country suppliers were important. Their interest must be recognized by full consultation before decisions are taken within the EEC. Moreover the CAP decisions should be negotiable including cereal price levels.

Mr. Ball thought perhaps we should ask the Community, "What do you want to accomplish in these negotiations?" We might be able to resolve some issues if we understood better what the Community objectives were. The U.S. wanted to use its negotiating powers to the full.

Mr. Chadwick said there was pessimistic talk in Geneva about ending up with a 30–35 per cent cut instead of 50 percent. Mr. Ball reiterated that we wished to use our authority to the full and would be unhappy with a 30 percent cut. We should stay with the 50 per cent formula and limit disparities to as few items as possible.

At this point Mr. Ball was called to the White House. The discussion continued briefly, but no further significant points of substance were developed, although Mr. Chadwick again warned of the dangers of exerting "pressure" on EEC member countries. Apparently he feared we might overplay our hand with the Germans. Finally, Mr. Chadwick said he had not yet received an analysis from London on the Mansholt proposals but hoped to have something in hand soon. Mr. Anderson hoped we could have a further exchange of views when an analysis had been received. Mr. Chadwick thought this desirable and useful and said he would telephone as soon as he heard from London.

December 1963

**479. Telegram 2046 from Bonn, December 7<sup>1</sup>**

Bonn, December 7, 1963

Brussels also for USEC; Paris also for USRO.

Poultry. State Secretary Lahr called in DCM (in absence Ambassador who at Berlin) to receive reaction to announcement suspension US tariff concessions.

Lahr said list of tariff concessions selected by US for withdrawal caused "very bad echo" in FRG. Germans could not understand why with only 40 percent of EEC exports to US they should bear 54 percent of burden withdrawals. In overall interests of Community, Federation Government had not sought special treatment from US re withdrawals. Instead had assumed burden would be allocated in proportion to each country's share of EEC exports to US. Lahr said Italians however had pleaded for special treatment and now had received their reward.

Lahr read from German Embassy's report of Washington meeting and said he found it "completely unbelievable" that from list of items totaling \$110 million US had not been able make more equitable selection. US statement that impossible devise list distributing burden in proportion exports to US was "completely unsatisfactory."

Lahr asked why Germans had been hit hardest. Such treatment was not deserved. FRG had been only country to open its market to imported poultry. French had told Germans they were stupid (schoen dumm) ever to have opened market and US action now confirmed that French had been right. At time, however, FRG had taken different view of matter, had opened market and trade had flourished as long as national German regime applied. Subsequently competence for policy in this field was taken over by EEC. FRG had not liked policies articulated in Common Market CAP but had accepted them in larger interests of Community. Now Germany, who deserved the least punishment, had received the worst.

Lahr then said matter also had to be considered in broader context. 1) FRG had been best cooperator with US on balance of payments problems. Its performance under offset arrangement had been good. It had met foreign exchange costs of troops who were defending not only Germany but also other European countries. French, British, Belgi-

---

<sup>1</sup> Poultry: German reaction to U.S. suspension of tariff concessions. Confidential. 6 pp. Department of State, Central Files, INCO-POULTRY US.

ans and Italians were however not helping offset costs of US forces. 2) FRG had been and continues to be excellent trading partner. US had extremely favorable balance of trade and trend has continued improve. Thus for first nine months 1963 total FRG imports increased 5.2 percent, imports from rest of EEC 7.2 percent, and imports from US 17.6 percent. 3) FRG was best cooperator US had in Kennedy round. Federation Government was glad to cooperate and placed no price on its cooperation. Was cooperating in its own interest, and Lahr was glad US and German interests were in such harmony.

Lahr went on to say FRG would be under great strain in year-end EEC Council meetings at Brussels. FRG was best supporter of US viewpoint at these meetings. He was not asking that FRG be treated better than others, but only on equitable basis. He therefore had to reproach US bitterly for its action. Moreover, US action made FRG position (and Lahr's personal position) at Brussels look ridiculous. Lahr recounted how he had consistently taken position that chicken war should be given quiet burial, and that he had made clear he would prevent counter retaliation. He had taken considerable risk in following this line and now had been struck from behind. FRG and he personally were now in an impossible situation. "US action was a disaster."

Lahr said foregoing facts described new situation and problem now was to find way of removing FRG from its impossible position. When DCM referred to Herter statement stressing that concessions would be suspended, not withdrawn, and could be reinstated when agreement reached, Lahr reverted to question of 11 pfennig reduction. List of withdrawals selected by US greatly reduced chances of making such reduction, since Italians and Belgians, being safely off the hook, would have little interest in matter for which Germans would be paying price. Effort should be made to find better solution, however. If no more equitable settlement of matter were found, bad blood would continue for long time. In this connection, Lahr said though Berg (President German Industries Association) and Schneider (President German Chambers Commerce) made public statements in strong support Kennedy round, at level of individual industries there was distinct lack of enthusiasm for tariff cuts, and sour taste left by inequitable US withdrawals could have significant braking effect on Kennedy round.

Lahr concluded by saying he simply did not understand how US could have come to take such inequitable action, and again noted that Italy had been completely spared.

DCM responded along lines Circulars 1005 and 1017. Lahr completely unpersuaded that more equitable list could not have been worked out. DCM again pointed out US readiness to reverse withdrawal action if US poultry given reasonable access. Lahr's reply was that would be hard to do anything, since US action removed any incentive

Belgians or Italians had for constructive solution. Lahr terminated call by saying he had never thought US would take such action. Had hoped poultry war could be brought to quiet end, but this hope was obliterated by US action stirring up controversy.

In separate conversation, Krapf, head of Political Division II in Foreign Office, told DCM that Erhard during visit would probably raise inequitableness of US action with President.

Comment: Lahr's words, which we have reported without embellishment, need not comment. We wish stress following:

1. Forcefulness of Lahr's expression of dismay and disappointment was not diminished by calm and deliberate tone. He was deadly serious and obviously felt that he and FRG had been let down badly by US action. Symbolic aspect has obviously assumed importance far beyond any economic loss involved for FRG exporters.

2. It seems clear that hope suspension concessions would bring chicken war to quiet end has not been fulfilled.

3. In all matters relating to trade and agricultural policy, Lahr is German official in best position directly influence matters affecting US interests. His words about bad blood and Kennedy round should be given considerable weight.

4. At very least, we require clear demonstrations that no other selection of items would have imposed burden of suspensions more equitably among EEC countries. Request such material soonest.

5. More constructively, we consider US interest in matters in which we are relying importantly on German cooperation require careful re-examination of poultry question with view to possibility of reaching some better solution. Specifically, prospective approval of reduction levy for West Berlin by 28 pfennig, and 11 pfennig reduction in supplemental levy, could be examined as possibly offering basis for holding up suspensions. If this should prove be case, we would urge that at least for trial period we see whether 11 pfennig reduction would do our poultry trade some good, instead of standing on legal requirement that reduction be bound.

**McGhee**

**480. Draft Paper by Auchincloss, December 10<sup>1</sup>**

December 10, 1963

The Trade Negotiations

*The Tactical Situation*

The principal feature of the international preparatory work on the negotiations to date has been the EEC's unreadiness to enter into serious bargaining on any aspect of the negotiating plans. On disparities, even though it was the EEC that insisted on special language on this subject in the May resolution, it has not since then come forward with constructive proposals of specific disparities rules which it could support. On agriculture, it has marked time in the Cereals, Meat, and Dairy Groups, being unprepared to discuss these fields internationally until its own internal regulations are set.

This virtual paralysis on the EEC's part is a symptom of a critical divergence of interests within the Community itself and of the tactical positions adopted by members of the Six in response to this divergence. In France there appears to be considerable skepticism (and President de Gaulle seems to share it) as to whether a sizable EEC tariff cut is in her best interests, particularly since it would partially dismantle the common tariff wall that divides the EEC, economically and symbolically, from the Anglo-Saxons. The Germans, on the other hand, whose trade and political ties are with the U.S. are by far the greatest of all the Six, seem strongly in favor of a substantial liberalization of trade. In simple terms, the issue lies between the "inward-looking" and "outward-looking" conceptions of the Community. It was most recently brought to a head by France's veto of Great Britain's application for membership. The veto led to a crisis of confidence between France and the other five last winter, in which the five would make no concessions to France for fear that France would not reciprocate with future concessions to them.

Last spring Germany, recognizing that France was frustrated by the five's refusal to agree to further steps implementing the common arrangements of the EEC and the others (particularly Germany) were frustrated by France's refusal to move on the Kennedy Round, proposed that in the future measures in these two fields be synchronized in order to break the stalemate. This synchronization plan, which calls for a series of compromises but no action in between among EEC

---

<sup>1</sup> Trade negotiation tactics. Confidential. 5 pp. Kennedy Library, Herter Papers, K. Auchincloss (5), Box 1.

members is obviously a ponderous procedure. By linking the EEC's decisions on the Kennedy Round to its own internal institutional steps, it means that the EEC will delay taking positions on crucial trade negotiations issues until an internal issue arises for the German faction to use as currency in buying the French's faction's agreement to a liberal stand on trade.

The EEC's indecisive behavior in Geneva, therefore, stems largely from this background. We have now reached a point, however, where internal and Kennedy Round issues have converged within the EEC so as to trigger a decision on both under the synchronization mechanism. The French are pressing strongly for settlement of the CAP regulations on rice, meats, and dairy products and for a price decision on grains. Germany, being a relatively high-priced area for grains especially, would be called upon to make the greatest concessions in these internal arrangements. The Germans therefore, if they agree to these agricultural measures, will have considerable leverage over the French in persuading them to agree to reasonable settlements of outstanding issues in the Kennedy Round.

The two main issues in the negotiations at the moment are disparities and agriculture. The U.S. objective is to secure a disparities rule that would not undermine the linear cut and to ensure that the implementation of the CAP agricultural arrangements, particularly on grains, does not take place in such a way that non-member countries' interests are not disregarded. Our tactics, therefore, should be to persuade the Germans to insist that the French agree to acceptable agreements on both these scores as a *quid pro quo* for German adherence to the EEC agricultural measures. Also, we should beware of the Germans making so definitive a concession on these agricultural measures at this time that they are left with little or no bargaining power within the EEC at later and equally critical stages of the Kennedy Round.

The time for this internal EEC bargain will be during the next six to eight weeks. If, during that time, the Germans are not successful in obtaining EEC agreement to a satisfactory negotiating plan, we shall have to review our own objectives in the Kennedy Round.

**481. Circular Telegram 1053 to Bonn, December 11<sup>1</sup>**

December 11, 1963

Brussels also for USEC—Paris also for USRO. REF a) BONN 2046, b) Circular 1005. From Herter.

*POULTRY*

1. We are concerned by Lahr's expression of indignation over suspension US tariff concessions. We would like to be able give him more satisfactory reply than cold comfort of reiterated assurances that result was governed by technical and not political considerations. But this is the fact, and we can only note sadly that much as EEC became honestly caught up in complexities of poultry CAP, so did we become caught up in complexities of suspension list.

2. Absolutely no substance to charge that Italians (or Belgians) requested and have now received special treatment.

3. We do appreciate helpful role of Germans in general and Lahr in particular on range of issues Lahr cites.

4. Difficult to provide requested QTE clear demonstration UNQTE that no other selection of items would have resulted in more equitable burden of suspensions among Six. We suspect Germans will not be satisfied by technical explanations however complete, and we are concerned that to open our decision to detailed review might plunge us deeper into controversy on a variety of points. Therefore we strongly advise against using following material.

5. Nevertheless, if essential in Embassy's view, you may review with Lahr original list from which items for suspension were to be withdrawn (CA-1506, Aug 6). German share of \$112 million total was \$29.4 million. Of this, \$12.9 million was trucks. Balance of \$16.5 million consisted of 19 items ranging in trade value from \$4 thousand to \$3.9 million. Any combination of these items that would total \$10.4 million (40% of \$26 million, which would be proportional to German share of total EEC exports to US) would have made package more out of proportion to total exports of other EEC countries to US than it is now, or would have greatly increased third country impact, or both.

6. For example, largest of 19 items was wine (\$3.9 million), but inclusion of wine on list would have serious impact on third countries and would make French share of burden even more out of proportion with normal trade patterns than German share is now. Second largest

---

<sup>1</sup> Follow up to German reaction to tariff concession suspension. Confidential. 4 pp. Department of State, Central Files, INCO-POULTRY US.

of 19 items is silver halide papers (\$2.7 million), which would disproportionately hit Belgians and also third countries. Imports of third largest item—stainless steel cloth (\$2.1 million)—involve US Government procurement, requirements for US defense purposes, some manufacture by US interests abroad and third country interests. Of remaining 16 items affecting Germany, none amounts to as much as \$2 million in trade, and inclusion of any number of them to reach \$10.4 million total would have multiplied problems outlined above.

7. Thus, once original \$1.2 million list established and hearings held, technical considerations led to conclusion that Germany's trade should be included in package in form of trucks. Prior to GATT determination, when we were planning \$46 million package, German share would have been almost exactly proportional (42%) to share of total EEC exports to US. Within limitations of \$26 million package, however, German share inevitably had to be larger. We regret this result, but we are sure FRG happier with 54% of \$26 million package than with 42% of \$46 million package.

8. Re Lahr's suggestion that way must be found to settle matter and your para 5 reffel A, following points can be made:

a. We continue to prefer to avoid suspensions and would gladly consider any significant offer that the EEC makes to reduce its poultry levies. To be significant, reductions would have to be substantially more than 11 pfennig cuts called for in any case under CAP regulations. We do not see that West Berlin reduction or 11 pfennig would offer grounds for delay, although they would if combined with adequate guaranteed global access assurances.

b. Alternatively, under GATT rules, EEC may offer compensation on other products. We would consider any such offer, but of course it would be far easier to gain acceptance for it within US government, which will be difficult in any case, if compensation items include significant agricultural product or products. FYI We would be tempted by Hartogh suggestion to have EEC withdraw tariff increases on chemical items made in retaliation against US. (See Hague's 935 to Dept.) END FYI

c. In any case, timing of suspensions (now scheduled for January 7) cannot practicably be altered, and if suspensions are to be prevented, settlement must be made before that date.

9. If suspensions put into effect, we sincerely hope that all concerned will realize package is best that could be done in unfortunate situation and will accept losses with best possible grace. Thereafter, as promptly as possible, we should move on to less vexed subjects than poultry concentrating on larger issues in Kennedy Round.

10. FYI Fritz Berg has informed Gov Herter that suspension list would be acceptable at least to him if Volkswagen microbuses excluded. See separate telegram to follow for Herter reply. END FYI

**482. Memorandum from Read to Bundy, December 20<sup>1</sup>**

December 20, 1963

SUBJECT

Wool Textiles

The attached memorandum provides information concerning United States imports of wool textiles and quantitative limitations imposed by Italy and the United Kingdom on wool textiles exported by Japan. This information was requested in a letter to the Under Secretary from Mr. Feldman dated November 20, 1963.

**Benjamin H. Read**  
*Executive Secretary*

**Enclosure**

*1. United States Imports of Wool Textiles*

The information in the New England senators' letter to President Kennedy on imports of wool textiles is generally consistent with data for the first eight months of 1963 contained in the October 1963 issue of the "Wool Situation" published by the Department of Agriculture. The "Wool Situation" reports imports in pounds of raw wool equivalent.

According to this publication, the percentage increases in imports of wool tops and apparel over the first eight months of 1962 are exactly as given in the letter from the New England senators, i.e., 23 percent and 47 percent, respectively. The increase in total imports of wool textiles is one point higher (14 percent) and that for wool yarn is one point lower (10 percent) than in the letter. Also, the "Wool Situation" does not break out "apparel cloth" from woven wool fabrics. The letter to President Kennedy states that "Woven wool apparel cloth imports are up 9% while American production is down 8%." However, imports of woven fabrics, including apparel cloth, were up 5 percent, according to the "Wool Situation." Production of woven wool fabrics, which is reported in this publication on a quarterly, rather than a monthly, basis

---

<sup>1</sup> Transmits undated memorandum on U.S. wool textile imports and restrictions on Japanese wool textiles exported to Italy and UK. Also attached is a November 14 letter from 12 Senators to Kennedy expressing concern over wool textile and apparel imports. No classification marking on Read memorandum. Attachments are unclassified. 7 pp. Department of State, Central Files, INCO-WOOL 17 US-JAPAN.

was running only 2 percent less than a year ago as of June 30, 1963. The marked drop in output of apparel fabric was partially offset by a 74 percent increase in production of blanketing.

## 2. Quantitative Restrictions by Italy and the United Kingdom

Both Italy and the United Kingdom have bilateral trade arrangements with Japan which include highly restrictive quantitative limitations on some types of wool manufactures. In point of fact, since World War II most industrialized countries have restricted low-cost imports from Japan, not only of textiles but of many other commodities as well. However, the trend in recent years has been toward liberalization of such trade rather than the reverse, and the United States has taken the lead in encouraging such liberalization. For example, under the Anglo-Japanese Commercial Treaty concluded in November 1962, the United Kingdom lifted all restrictions on Japanese wool tops and yarn, and with effect from April 1963, withdrew its invocation of Article XXXV of the GATT, which permitted unilateral discrimination against Japanese exports. Under this agreement Japan exercises voluntary control over exports of the following items to the United Kingdom, *inter alia*:

<u>Description</u>	<u>Unit</u>	<u>Quotas for</u>		
		<u>1963</u>	<u>1964</u>	<u>1965</u>
Woven wool fabrics	Syds.	400,000	500,000	600,000
Knitted fabrics and apparel of cotton, wool or man-made fibers	[illegible in the original]	500,000	600,000	700,000
Gloves and mittens, wholly or mainly of cotton, wool or man-made fibers	[illegible in the original]	125,000	140,000	160,000

Specific information on Italy's current import quotas for Japanese wool textiles is not immediately available. The Embassy in Rome has been asked to report.

Since 1957 Japan has voluntarily controlled exports to the United States of "low quality" wool fabrics and types of wool apparel. The annual quota for fabrics is currently 5.25 million square yards, but this has not served to prevent a substantial rise in overall exports of wool fabrics to this country, with high-quality goods accounting for the entire increase.

**Attachment**

SUBJECT

Wool Textiles

The attached memorandum has been prepared in response to Mr. Feldman's letter to the Under Secretary (Tab B) on imports of wool textiles.

As indicated in our reply, the import figures cited in the letter from New England Senators to the President are accurate. As a further check, we obtained from Commerce (Office of Textiles) the following figures on total U.S. imports of wool textiles calculated in accordance with the formula approved by the Cabinet Textile Advisory Committee earlier this year, which also show a continuing rise:

*Wool Textile Products: Imports, Exports, Domestic Consumption and Rate of Imports to Apparent Domestic Market (in millions of pounds of clean fiber equivalent)*

	<u>1960</u>	<u>1962</u>	<u>January–August</u>	
			<u>1962</u>	<u>1963</u>
1. Imports (including Virgin Islands)	62.9	79.6	52.2	59.3
2. Exports	3.2	2.6	1.6	1.9
3. Domestic Production	333.1	365.6	250.0	243.4
4. Apparent Domestic Market	392.8	442.6	300.5	300.8
5. Ratio 1:4	16.0%	18.0%	17.4%	19.7%

Mr. Feldman's letter asks that we comment only upon two points of fact, and we have prepared our reply accordingly.

**Attachment**

Dear Mr. Ball:

The President will see these members of Congress in the near future. I would appreciate it if you would furnish me with a memorandum commenting upon:

1. The second paragraph of the letter and the accuracy of the statistics
2. The statement that quantitative limitations against Japanese textile products imposed by Italy and the United Kingdom.

Senator Pastore told me on the telephone that this was the information that concerned him the most. He said that if Italy and the UK

were already imposing quantitative limitations objections by them to similar limitations would come with poor grace.

I will be back from Japan on Wednesday. The meeting will probably be arranged for shortly after that time.

Sincerely,

**Myer Feldman**  
*Deputy Special Counsel  
to the President*

### **Attachment**

Dear Mr. President:

Our concern as members of Congress over wool textiles and apparel imports expressed in our letter to you of August 20, 1963, has now reached a point of alarm.

For the first eight months of this year such imports exceed by 13% those for the same period in 1962. Woven wool apparel cloth imports are up 9% while American production is down 8%. Wool top imports are up 23%; wool yarn imports up 11%; imports of wool apparel are up 47%. Inevitably imports for the consumption of wool textiles and apparel in 1963 will exceed the all-time 68,200,000 pound record established in 1962.

Nations which resist restrictions advanced by the United States are themselves limiting imports to their countries. We refer specifically to the quantitative limitations against Japanese textile products imposed by Italy and the United Kingdom.

What "principle" can possibly baffle our State Department in equally and equitably protecting the interests of the United States textile industry?

We believe that our State Department with proper persistence and insistence can achieve an international arrangement limiting wool textile and apparel imports into the United States.

If efforts fail to resolve this problem by voluntary agreement then we assert our firm support of the recommendation contained in the most recent Report of the Special Senate Textile Subcommittee—that in such an event it is imperative that the United States act unilaterally to prevent the utter extinction of the wool and apparel industry with its investment and employment so vital to the New England economy.

In behalf of management and employees who are our constituents, we respectfully ask that you direct the proper agencies to take firm and summary action to avert this mortal threat.

Respectfully,
